Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.
5. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
6. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
7. Power ON/OFF sequence
   In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual. The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The following documents apply to the RH850/U2A-EVA Group. Make sure to refer to the latest versions of these documents. The newest versions of the documents listed may be obtained from the Renesas Electronics Web site.

Document Type	Description	Document Title	Document No.
User's manual for Hardware	Hardware specifications (pin assignments, memory maps, peripheral function specifications, electrical characteristics, timing charts) and operation description Note: Refer to the application notes for details on using peripheral functions.	RH850/U2A-EVA Group User's Manual: Hardware	This User's manual
User's manual for Hardware	Hardware specifications of flash memory programming and erasure	RH850/U2A-EVA Group Flash Memory User's Manual: Hardware	R01UH0832EJxxxx
User's manual for Hardware	Hardware specifications of intelligent cryptographic unit/master and Secure Watchdog Timer	RH850/U2A-EVA Group Security User's Manual: Hardware	R01UH0868EJxxxx
User's manual for Hardware	Hardware specifications of virtualization support function	RH850G4MH Virtualization User's Manual: Hardware	R01UH0865EJxxxx

Conventions

Data significance:	Higher digits on the left and lower digits on the right
Active low representation:	$\overline{xxx}$ (overscore over pin or signal name)
Note:	Footnote for item marked with Note in the text
Caution:	Information requiring particular attention
Remark:	Supplementary information
Numeric representation:	Binary ... xxxx or $xxxx_B$
	Decimal ... xxxx
	Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1,024$

M (mega): $2^{20} = 1,024^2$

G (giga): $2^{30} = 1,024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.

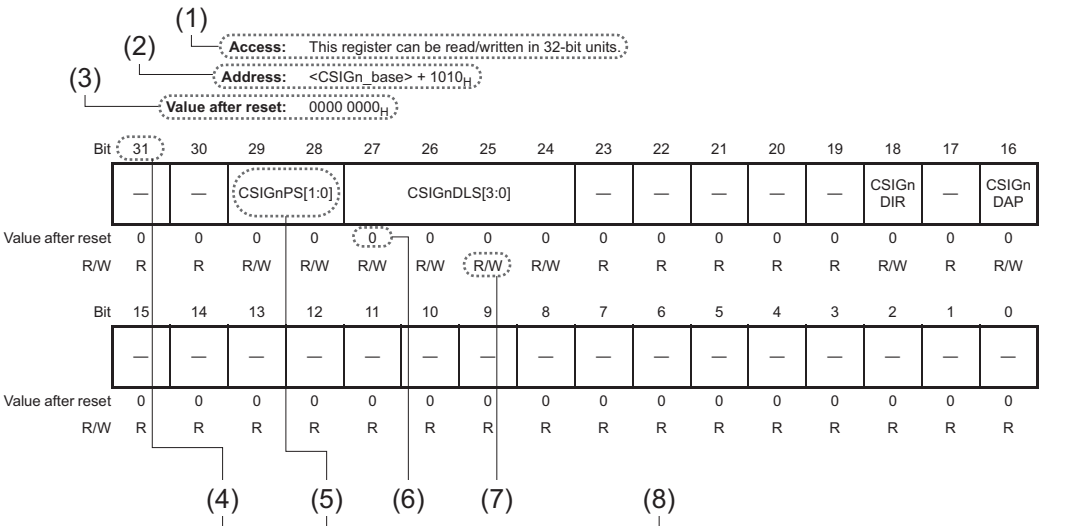

Table 14.19 CSIGnCFG0 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
29, 28	CSIGnPS[1:0]	Specifies parity.
27 to 24	CSIGnDLS [3:0]	Specifies data length. 0: Data length is 16 bits 1: Data length is 1 bit 2: Data length is 2 bits ... 15: Data length is 15 bits **CAUTION** Do not set bits CSIGnCFG0.CSIGnDLS[3:0] for a value 1 to 6 when the extended data length function is disabled with bit CSIGnCTL1.CSIGnEDLE set to 0. It is forbidden to transmit two consecutive data with a data length of less than 7 bits.
23 to 19	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

CSIGn PS1	CSIGn PS0	Transmission	Reception
0	0	No parity transmitted	No parity is waited for.
0	1	Add parity bit fixed at 0	Parity bit is waited for but not judged.
1	0	Add odd parity	Odd parity bit is waited for.
1	1	Add even parity	Even parity bit is waited for.

(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0	:	The value after a reset is 0.
1	:	The value after a reset is 1.
—	:	The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W	:	The bit or field is readable and writable.
R	:	The bit or field is readable. Note that all reserved bits are indicated as R. When written, the value specified in the bit chart or the value after a reset should be written. In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.
W	:	This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Table of Contents

Section 1 Overview

The RH850/U2A-EVA is an emulation device of RH850/U2A16 (516 pins), RH850/U2A16 (373 pins), RH850/U2A16 (292 pins), RH850/U2A8 (373 pins), RH850/U2A8 (292 pins), RH850/U2A6 (292 pins), RH850/U2A6 (176 pins), RH850/U2A6 (156 pins) and RH850/U2A6 (144 pins) production devices which are the single-chip microcontroller RH850 series from Renesas Electronics.

This section describes an overview of the RH850/U2A-EVA (516 pins), RH850/U2A16 (516 pins), RH850/U2A16 (373 pins), RH850/U2A16 (292 pins), RH850/U2A8 (373 pins), RH850/U2A8 (292 pins), RH850/U2A6 (292 pins), RH850/U2A6 (176 pins), RH850/U2A6 (156 pins) and RH850/U2A6 (144 pins).

1.1 Outline

This product is a 32-bit single-chip microcontroller that incorporates multiple CPUs of the RH850 Series, code flash, data flash, RAM, DMA controllers, high-speed communication interfaces including CAN, FlexRay, Ethernet, RHSIF, LIN, SENT, PSI5S, PSI5, peripheral functions including A/D converters, timer units and many communication interfaces that are used in the automotive applications. This product also conforms to the Automotive Safety Integrity Level (ASIL) that is highly demanded in the recent automotive field (ASIL D level).

(1) Includes multiple RH850 cores

This product contains multi RH850G4MH2 cores (each CPU is referred to as CPU0 to CPU3 (U2A8, U2A6: CPU0 to CPU1) hereafter). Each CPU supports RISC-type instruction sets and have significantly improved the instruction execution speed with basic instructions (one clock cycle per instruction) and the optimized 10-stage pipeline configurations. Furthermore, this product also supports multiplication instructions using a 32-bit hardware multiplier, saturated product-sum operation instructions, and bit manipulation instructions as instructions best suited for various fields. In addition, this product also support CPU virtualization function.

Two-byte basic instructions and high-level language instructions improve object code efficiency for the C compiler and reduce the program size. Furthermore, this product is suited for advanced real-time control applications by offering a high-speed response time including the processing time of the on-chip interrupt controller.

(2) On-chip code flash and data flash

This product incorporates a 16-MB (U2A8: 8MB, U2A6: 6MB) code flash allowing high-speed accesses, which enables each CPU to access this flash memory efficiently. This memory can be reprogrammed while it is placed on an application system. This can shorten the system development period and significantly improve the serviceability after the system is delivered.

This product also has a 576-KB (U2A8: 320-KB, U2A6: 256-KB) data flash that is available for storing EEPROM data.

(3) Rich peripheral functionality

This microcontroller supports common communication interfaces such as SPI (CSI), I^2C as well as automotive oriented communication interfaces such as Ethernet, RHSIF, FlexRay, CAN-FD, LIN, CXPI, SENT, PSI5, PSI5S. As internal peripheral modules, this microcontroller have A/D Converter, Long-Term System Counter, Generic Timer Module, timer units and dedicated Peripheral Interconnect module which connects the functionalities of these peripherals. It also has the global standard on-chip Nexus JTAG as a debug interface. This allows construction of systems without the need to provide these functions externally, which reduces cost, quantity of components, and PCB footprint.

(4) Functional safety support

This product equips several dedicated functionalities including the Dual Core Lock Step configuration for the CPU, the memory protection with ECC, the bus protection with ECC/EDC, the peripheral module protection, and voltage / clock monitors to support the functional safety standard (ISO26262) required in the automotive applications.

(5) Security support

This product provides various security features and utilizes the Intelligent Cryptographic Unit/Master (ICUMHA) as an on-chip Hardware Security Module (HSM).

1.2 Features

CPU0/1/2/3 core	RH850G4MH2:	4 units [For U2A-EVA and U2A16 Only] 2 units [For U2A8 and U2A6 Only] (for high-speed operation and control)
CPU0/1/2/3 instruction cache memory (for Code Flash)	16 KB	
CPU0/1/2/3 data buffer (for Code Flash)	4 lines (256 bit/line)	
Minimum CPU0/1/2/3 instruction execution time	2.5ns (during internal 400 MHz operation)	
General CPU0/1/2/3 registers	Thirty-two 32-bit registers	
CPU0/1/2/3 instruction sets	Signed multiplication (32 bits × 32 bits → 64 bits): 1 to 2 CPU clocks Saturated operation instructions (with overflow/underflow detection function) 32-bit arithmetic/logical shift instructions: 1 CPU clock Bit manipulation instructions Load/store instructions with long/short formats Signed load instructions	
Inter-Processor Interrupt (IPIR)	Support of inter-Processor interrupt function of 4 channels Support level detection of interrupts Accessible from all clusters and all PEs identification of interrupt request source PE is possible. Unintended inter-PE interrupts can be prevented by masking interrupt requests. SET1, CLR1, and NOT1 can be executed as atomic operation instructions to IPIR.	
Barrier-Synchronization (BARR)	The 16-ch barrier synchronization registers are provided. Barrier synchronization can be implemented using the same code for all the cores. Accessible from all clusters and all PEs within the system	
Time Protection Timer (TPTM)	Interval timer × 2ch (down counter), free-run timer × 1ch (up counter), up timer × 2ch (up counter) Start, Stop and Restart of counter for the interval timers, the free-run timer and the up timers. Divided counter of the timers can be configured for the interval timers, the free-run timer, up timer respectively. Simultaneous count control for the interval timers belonging to the same PE. Simultaneous count control for the up timers belonging to the same PE using registers prepared for each PE. Globally simultaneous count control registers are prepared. A PE can control all up counters including ones owned by other PEs. Underflow interrupt for the interval timers. Comparison value matching interrupts for the up timers. Each timer set has 3 control signals to stop timers while in debug mode. One is for interval timers and the free-run timer, another is for up timer 0, the other is for up timer 1.	
Memory space	4-GB address space (common to program and data)	
Code flash	• Two types of memory area – User area: 16 MB (common to each CPU, ICUMHA) [For U2A-EVA and U2A16 Only] – User area: 8 MB (common to each CPU, ICUMHA) [For U2A8 Only] – User area: 6 MB (common to each CPU, ICUMHA) [For U2A6 Only] – User boot area: 64 KB high-speed reading through cache enabled. • OTA (Over-the-Air) update support	
Data flash	512 KB + 64 KB (dedicated to ICUMHA) [For U2A-EVA and U2A16 Only] 256 KB + 64 KB (dedicated to ICUMHA) [For U2A8 Only] 192 KB + 64 KB (dedicated to ICUMHA) [For U2A6 Only]	
RAM	Local RAM: 64 KB (CPU0/1/2/3 [For U2A-EVA and U2A16 Only]) Local RAM: 64 KB (CPU0/1 [For U2A8 and U2A6 Only]) Cluster RAM: 3328 KB (common to each CPU) (256 KB: Retention RAM) [For U2A-EVA and U2A16 Only] Cluster RAM: 1664 KB (common to each CPU) (128 KB: Retention RAM) [For U2A8 Only] Cluster RAM: 640 KB (common to each CPU) (128 KB: Retention RAM) [For U2A6 Only] Cluster Emulation RAM: 2 MB (1 MB for each cluster 0 & 1) [For U2A-EVA Only] Cluster Emulation RAM: 32 KB (cluster 0) [For U2A6 Only] Global Emulation RAM: 2 MB [For U2A-EVA Only]	

Serial Flash Memory I/F (SFMA)	1 unit incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292) and U2A6 (QFP-176) Only] One serial Flash Memory device can be connected. A data bus width of 1 bit, 2 bits, or 4 bits can be selected. 4 GB address space Efficient data reception due to built-in read cache (64-bit line × 16 entries) Arbitrary bit rate settable by the on-chip baud rate generator
Multimedia Card Interface (eMMC)	1 unit incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292) and U2A6 (QFP-176) Only] • Compliant with JEDEC STANDARD JESD84-A441 (neither DDR mode nor 1.8-V operation is supported). • Supports 1-/4-/8-bit MMC bus widths. • Supports the backward-compatible mode. • High-speed mode is supported. • MMC Clock frequency = MMCA module clock frequency/2k (k = 1 to 10). • Supports block transfer. • Supports boot operation. • Supports high priority interrupts (HPI). • Supports background operation. • Interrupt requests: normal operation and error/timeout. • DMA transfer requests: buffer write and buffer read.
Interrupts/exceptions	1 non-maskable interrupt (NMI pin) 1 FE level interrupt 768 maskable interrupts (high-speed: 32, low-speed: 736) Simultaneous distribution of interrupt sources to multiple cores (each CPU) • Applicable sources: non-maskable interrupt (NMI pin), FE level interrupt, 32 high-speed maskable interrupts External interrupt input function (IRQ pins) Software interrupt function (SINT) Inter-processor interrupt function (IPIR) 64-level priority specifiable for maskable interrupts For RH850G4MH2 exceptions, see **Section 3.2.4, Exceptions and Interrupts**.
sDMA controller	32 channels incorporated (16 channels × 2 units) Transfer data length: 1 byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes Parallel reads and writes (fly-by) Address mode: dual address mode Transfer requests: auto request, peripheral hardware request. Bus modes: normal speed mode, slow speed mode Arbitration modes: fixed priority mode, round-robin mode Interrupt requests: termination of descriptor step, the termination of data transfer, the occurrence of address error. Descriptor memory: 8 KB (shared at all channels). Scatter-gather transfer Transfer target: On-chip memory, on-chip peripheral modules (excluding DTS and sDMAC)
DTS controller	128 channels incorporated Transfer unit: 8 bits/16 bits/32 bits/64 bits/128 bits 64-bit × 2-burst transfer Dual-address transfer mode Address reloading function Chain transfer function Three transfer modes: Single transfer, block transfer 1 (specified by number of transfer times), and block transfer 2 (specified by address count) Transfer target: On-chip memory, on-chip peripheral modules (excluding the DTS and sDMAC) Transfer requests can be set by interrupt sources and the software.
I/O	Output driving ability of specific input/output pins is selectable Inversion or non-inversion of output values of specific input/output pins is selectable Pull-up or pull-down off of specific input/output pins is selectable

Safety functions	Flash memory ECC error detection function RAM ECC error detection function Peripheral module RAM ECC error detection function (e.g. FlexRay, CAN, GTM) Clock monitor Error Control Module (ECM) Duplexing of modules (e.g. CPUs, ECM, error output pins) Automatic Power-on BIST execution after reset Standby Resume BIST (SR-BIST) execution selection after wake-up from DeepSTOP mode.
Error Control Module (ECM)	Collects information for each error check system and safety function and indicates error status. When an error is detected, an error signal can be output from the error pin to the external. Interrupts and internal reset signals can be generated upon detection of an error. Provided with a function to generate a pseudo-error for debugging and self-diagnosis.
Data CRC Function (KCRC)	The data CRC (Cyclic Redundancy Check) function can verify or generate data streams protected by a CRC with various lengths and different bit widths.
Window Watchdog Timer (WDTB)	5 units incorporated [For U2A-EVA and U2A16 Only] 3 units incorporated [For U2A8 and U2A6 Only] Can generate a signal to the ECM when a counter overflows (timer expires). Can generate an interrupt at 75% of the counter overflow value. An interrupt request can be generated at any function of the counter value. A window open period can be set to any function of the counter value.
Long-Term System Counter (LTSC)	1 unit incorporated 64-bit counter without overflow. • Free-run up counting • Atomic read/write access to all registers • Anytime read access to counter registers • Application reset (SW reset) can be masked. When masked, counter keeps running on reset occurrence and counter register will not be initialized.
OS Timer (OSTM)	10 units incorporated [For U2A-EVA and U2A16 Only] 8 units incorporated [For U2A8 and U2A6 Only] • A 32-bit timer assuming use by OS • Interval timer mode or free-running timer mode selectable • Synchronous start between units available
Timer Array Unit D (TAUD)	3 units incorporated The TAUD has the following functions: • 16 channels, 16-bit counter and 16-bit data register per channel • Independent channel operation • Synchronous channel operation (master and slave operation) • Generation of different types of output signal • Real-time output • Counter can be triggered by external signal • Interrupt generation The TAUD can operate independently or synchronously (combine with other channels)
Timer Array Unit J (TAUJ)	4 units incorporated The TAUJ has the following functions: • Independent channel operation function (operated using a single channel) • Synchronous channel operation function (operated using a master channel and multiple slave channels) The TAUJ can operate independently or synchronously (combine with other channels)

Motor Control Timer (TSG3)	2 units incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292) and U2A6 (QFP-176) Only] 1 unit incorporated [For U2A6 (BGA-156) and U2A6 (QFP-144) Only] • 18-bit timer counter • Count clock resolution: Minimum 12.5 ns (count clock = 80 MHz) • Operating mode corresponding to various motor control methods • Compare registers with reload buffer • 10-bit dead time counter • A/D conversion trigger signal generation • Forced output stop function by TAPA • Reload (simultaneous rewrite) or anytime rewrite • HT-PWM mode with 0-100% duty cycles output • Semi-automatic cruise function • Three-phase encoder function (hall sensor signals can be input). • Fail-safe function (warning interrupt or error interrupt can be generated) – Simultaneous active output detect function for positive and inverse phase. – Abnormal input detection function of the three-phase encoder
Timer Option (TAPA)	4 units incorporated [For U2A-EVA, U2A16, U2A8 and U2A6 (BGA-292) Only] 3 units incorporated [For U2A6 (QFP-176) Only] 2 units incorporated [For U2A6 (BGA-156) and U2A6 (QFP-144) Only] Combine with the peripheral interconnect (PIC) to provide the following functions: • Asynchronous Hi-Z control function • Interrupt signal output function • A/D conversion start trigger selection function
Timer Pattern Buffer (TPBA)	2 units incorporated • Count clock resolution: Minimum 12.5 ns (count clock = 80 MHz) • 16-bit counter • 16-bit duty register • 16-bit period setting register • 7-bit address counter register • 7-bit pattern number setting register • Interrupt request signals – Period-matched detection interrupt – Duty-cycle-matched detection interrupt – Number-of-patterns matched detection interrupt • Number of duty patterns – 64 patterns (16 bits) or 128 patterns (8 bits) • Automatic duty generation according to the number of patterns • Output control by software • The count clock can be selected from PCLK, PCLK/2, PCLK/4, and PCLK/8 according to the prescaler set value. • Synchronous start with another timer
PWM Output/Diagnostic (PWM-Diag)	1 PWBA block for generating clock signals. • Generates a count clock signal for PWGC 96 PWGC blocks generate PWM signals. [For U2A-EVA, U2A16, U2A8 and U2A6 (BGA-292) Only] 76 PWGC blocks generate PWM signals. [For U2A6 (QFP-176) Only] 50 PWGC blocks generate PWM signals. [For U2A6 (BGA-156) Only] 64 PWGC blocks generate PWM signals. [For U2A6 (QFP-144) Only] • Outputs PWM waveforms and A/D conversion trigger to PWSD 1 PWSD block for generating triggers for A/D conversion. • Transmits the required setting information to the A/D converter and outputs the A/D conversion start trigger

Real-Time Clock (RTCA)	1 unit incorporated Count clock selection from 240 kHz to 2.5 MHz Counters for years, months, day of the month, day of the week, hours, minutes, seconds, and a subcounter. One Hz pulse output function Fixed interval interrupt function Alarm interrupt function
Peripheral Interconnect function (PIC1)	1 unit incorporated • Simultaneous start trigger function • INT signal output selection function • PWM/Delay pulse output function with dead time • Trigger pulse width measurement function • Encoder capture trigger select function • Two-phase encoder control function • Three-phase pulse input control function • Three-phase encoder control function • TAUD input select function • Hi-Z control function • Timer output monitor function (PWM-Diag) • Timer input monitor function • TSG3 Synchronous Clear Function
Peripheral Interconnect function (PIC2)	3 units incorporated • ADCJ trigger select function • Signal routing function for GTM: – Baud Rate Measurement for an UART (RLIN3) – Hi-Z Control Function Over External Pin for GTM Output – GTM Output Monitor for PWM Diagnostic – ENCA Trigger Selection Function – PSI5S Timestamp and the Sync Pulse Signal Selection Function – GTM Timer Input (TIM) Selection Function – ENCA Encoder Input Selection
Serial Communication Interface 3 (SCI3)	3 units incorporated [For U2A-EVA, U2A16 and U2A8 Only] • Clock synchronization or start-stop system selectable • Full-duplex communication enabled • Arbitrary bit rate selectable by the on-chip baud rate generator • LSB first or MSB first selectable
Multi-channel Serial Peripheral Interface (MSPI)	10 units incorporated [For U2A-EVA (BGA-516) and U2A16 (BGA-516) Only] 9 units incorporated [For U2A16 (BGA-373) and U2A8 (BGA-373) Only] 6 units incorporated [For U2A16 (BGA-292), U2A8 (BGA-292), U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (BGA-156) Only] 4 units incorporated [For U2A6 (QFP-144) Only] • Chip select: Up to 8 for each unit • Three-wire serial synchronous data transfer • Master mode or slave mode selectable • Settable up to eight channels with phase of clock and data settable • Transmission rate up to 40 Mbps • Arbitrary bit rate settable by the on-chip baud rate generator

CANFD interface (RS-CANFD)	16 channels incorporated [For U2A-EVA, U2A16 and U2A8 Only] 12 channels incorporated [For U2A6 (BGA-292) Only] 11 channels incorporated [For U2A6 (QFP-176) Only] 8 channels incorporated [For U2A6 (BGA-156) Only] 7 channels incorporated [For U2A6 (QFP-144) Only] • Classical CAN mode (RS-CAN software compatibility mode) – Conforming to CAN-FD ISO 11898-1 (2015) – Transfer speed up to 1 Mbps – A total of 16588 message buffers (Individual 1024 buffers + Shared 15564 buffers when 8 byte data payload) provided for 16 channels [For U2A-EVA, U2A16 and U2A8 Only] – A total of 3301 message buffers (Individual 384 buffers + Shared 2917 buffers when 8 byte data payload) provided for 12 channels [For U2A6 (BGA-292) Only] – A total of 3026 message buffers (Individual 352 buffers + Shared 2674 buffers when 8 byte data payload) provided for 11 channels [For U2A6 (QFP-176) Only] – A total of 2200 message buffers (Individual 256 buffers + Shared 1944 buffers when 8 byte data payload) provided for 8 channels [For U2A6 (BGA-156) Only] – A total of 1926 message buffers (Individual 224 buffers + Shared 1702 buffers when 8 byte data payload) provided for 7 channels [For U2A6 (QFP-144) Only] – Reception filtering • CAN FD mode – Conforming to CAN-FD ISO 11898-1 (2015) – Transfer speed up to 8 Mbps – A total of 5120 message buffers (Individual 1024 buffers + Shared 4096 buffers when 64 byte data payload) provided for 16 channels [For U2A-EVA, U2A16 and U2A8 Only] – A total of 1152 message buffers (Individual 384 buffers + Shared 768 buffers when 64 byte data payload) provided for 12 channels [For U2A6 (BGA-292) Only] – A total of 1056 message buffers (Individual 352 buffers + Shared 704 buffers when 64 byte data payload) provided for 11 channels [For U2A6 (QFP-176) Only] – A total of 768 message buffers (Individual 256 buffers + Shared 512 buffers when 64 byte data payload) provided for 8 channels [For U2A6 (BGA-156) Only] – A total of 672 message buffers (Individual 224 buffers + Shared 448 buffers when 64 byte data payload) provided for 7 channels [For U2A6 (QFP-144) Only] – Reception filtering
FlexRay (FLXA)	2 units incorporated [For U2A-EVA, U2A16 and U2A8 Only] 1 unit incorporated [For U2A6 only] • Conforming to Protocol Specification v2.1 • Buffer size: A 8-KB space is divided into up to 128 sections (for transmission, reception, and receive FIFO) • Message filtering: slot counter filter, channel filter, cycle counter filter • Bit rate: 10 Mbps
LIN/UART interface (RLIN3)	24 units incorporated [For U2A-EVA (BGA-516), U2A16 (BGA-516), U2A16 (BGA-373) and U2A8 (BGA-373) Only] 12 units incorporated [For U2A16 (BGA-292), U2A8 (BGA-292), U2A6 (BGA-292) and U2A6 (QFP-176) Only] 8 units incorporated [For U2A6 (BGA-156) Only] 10 units incorporated [For U2A6 (QFP-144) Only] • Conforming to LIN Protocol Spec versions 1.3, 2.0, 2.1, 2.2, and SAE J2602 • Three operating modes – LIN Master mode – LIN Slave mode – UART mode (half-duplex, full-duplex) • Arbitrary bit rate is selectable by the on-chip baud rate generator • LIN Self-test mode with internal data loop back
Clock Extension Peripheral Interface (CXPI)	4 units incorporated [For U2A-EVA, U2A16 and U2A8 Only] Baud rate: 9.6 kbps/10.4 kbps/19.2 kbps/20.0 kbps Master or Slave Mode Event trigger method / Polling method Output and sample the PWM waveform by PWM encoding/decoding function

I^2C Bus Interface (RIIC)	2 units incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (BGA-156) Only] 1 unit incorporated [For U2A6 (QFP-144) Only] I^2C bus format with master mode or slave mode selectable Transfer rate up to 400 kbps
Single Edge Nibble Transmission (RSENT)	8 units incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (BGA-156) Only] 6 units incorporated [For U2A6 (QFP-144) Only] • Conforming to the SENT (Single Edge Nibble Transmission) protocol specified in the SAE J2716_201604 standard and the SPC (Short PWM Code) extension to the SENT specification • Unidirectional or bidirectional transfer is possible through a single pin • Bidirectional transfer is possible through two pins • Data transfer protected by a CRC is possible
Peripheral Sensor Interface 5 (PSI5)	4 channels incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (BGA-156) Only] 3 channels incorporated [For U2A6 (QFP-144) Only] • Conformance with PSI5 protocol specification V2.0 • Bit rates: Low speed(125 kbps), High speed(189 kbps), PAS compatibility mode(250 kbps) • Communication Mode selectable
Peripheral Sensor Interface 5 serial communication module (PSI5S)	2 units incorporated [For U2A-EVA, U2A16, U2A8 and U2A6 (BGA-292) Only] 1 unit incorporated [For U2A6 (QFP-176), U2A6 (BGA-156) and U2A6 (QFP-144) Only] • Support the UART based communication for PSI5 transceiver • Conformance with PSI5 protocol specification V2.2 • Generate a PSI5 message from the UART transfer data • The bit rate of the UART can be set by the built-in baud rate generator
RHSIF	1 unit incorporated [For U2A-EVA, U2A16 and U2A8 Only] • Asynchronous high speed LVDS interface based on IEEE 1596.3-1996 reduced range link • Asynchronous high speed LVDS interface supporting maximum data rates of 320 Mbps • Four channels, including one channel with data streaming capability • Bus master interface which is used by a target node to access shared memory
Ethernet Controller (ETNB)	1 channel of 100Mbps ethernet incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (QFP-144) Only] 1 channel of 1Gbps ethernet incorporated [For U2A-EVA, U2A16 and U2A8 Only] • Conformance with the IEEE 802.3 MAC layer standard • PHY interface: MII (Media Independent Interface) and RMII (Reduced Media Independent Interface) for 100Mbps; SGMII (Serial Gigabit Media Independent Interface) is for 1Gbps • Supports 1Gbps and 100 Mbps or 10 Mbps • Supports full-duplex mode • built-in DMA transfer function

Analog to Digital Converter (ADCJ)	94 channels incorporated [For U2A-EVA (BGA-516), U2A16 (BGA-516), U2A16 (BGA-373) and U2A8 (BGA-373) Only] 79 channels incorporated [For U2A16 (BGA-292), U2A8 (BGA-292) and U2A6 (BGA-292) Only] 64 channels incorporated [For U2A6 (QFP-176) Only] 29 channels incorporated [For U2A6 (BGA-156) Only] 39 channels incorporated [For U2A6 (QFP-144) Only] • A/D conversion method: Successive approximation • Configuration of analog input pins – ADCJ0/ADCJ1/ADCJ2 high accuracy inputs: 20/20/20 [For U2A-EVA (BGA-516) and U2A16 (BGA-516), U2A16 (BGA-373) and U2A8 (BGA-373) Only] – ADCJ0/ADCJ1/ADCJ2 high accuracy inputs: 20/20/5 [For U2A16 (BGA-292), U2A8 (BGA-292) and U2A6 (BGA-292) Only] – ADCJ0/ADCJ1/ADCJ2 high accuracy inputs: 14/14/5 [For U2A6 (QFP-176) Only] – ADCJ0/ADCJ1/ADCJ2 high accuracy inputs: 8/8/0 [For U2A6 (BGA-156) Only] – ADCJ0/ADCJ1/ADCJ2 high accuracy inputs: 10/10/0 [For U2A6 (QFP-144) Only] – ADCJ0/ADCJ1/ADCJ2 low accuracy inputs: 10/14/10 [For U2A-EVA, U2A16, U2A8 and U2A6 (BGA-292) Only] – ADCJ0/ADCJ1/ADCJ2 low accuracy inputs: 10/14/7 [For U2A6 (QFP-176) Only] – ADCJ0/ADCJ1/ADCJ2 low accuracy inputs: 6/7/0 [For U2A6 (BGA-156) Only] – ADCJ0/ADCJ1/ADCJ2 low accuracy inputs: 3/10/6 [For U2A6 (QFP-144) Only] • Resolution: 12-bit • Conversion speed: 1.0 µs • Scan groups for five systems for each converter • Two scan modes (multicycle scan mode and continuous scan mode) • ADCJ0: Up to 64 virtual channels • ADCJ1: Up to 64 virtual channels • ADCJ2: Up to 64 virtual channels • Addition mode A/D conversion functions incorporated • Can enter data directly to the Generic Timer Module. • Safety functions • Supporting an upper / lower-limit-excess-notice-function for the ADC Voltage Monitor Secondary Error Generator in each virtual channel • Track & Hold (T&H) input channels 4 channel inputs per unit can select T&H circuit for synchronize conversion.
Power supply	Supports both of 5 V, 3.3 V and 1.09 V power supplies with the exception of the core supply. The power on / off sequence has no constraints.
Power supply voltage monitor	• The power supply voltage monitor is used for monitoring power domain E0VCC, VCC, ISOVDD and AWOVDD. • The power supply voltage monitor has High-side (HDET) and Low-side (LDET) voltage detectors, which detect if the monitored voltage is more or less than the specified voltage. • The power supply voltage monitor have two types detection function of Primary detection and Secondary detection. • The Primary detection function is performed by Voltage Monitor. The Secondary detection function is performed by the ADCJ. • The Delay Monitor (DMON) assists the VMON which detects the Low-side voltage of ISOVDD. • Primary power supply voltage monitor can control on or off for the VMON reset generated by high level/low level detection of ISOVDD, VCC and E0VCC. • The Primary detection voltage value is fixed, secondary detection voltage value can be set by the ADCJ.
Secure Watchdog Timer (SWDT)	1 unit incorporated Can generate an error signal for the Interrupt Controller in response to an error. Confirmation of matching with a specified Program Counter (PC) value of the CPU0.
Intelligent Cryptographic Unit Master (ICUMHA)	The ICUMHA is an on-chip Hardware Security Module (HSM). The ICUMHA supports user-defined security services to the overall system based on cryptographic primitives.

Debugging and Calibration	Nexus JTAG: One channel incorporated LPD (4-pin): One channel incorporated AUDR: One channel incorporated [For U2A-EVA Only] Aurora Trace Interface: One channel incorporated [For U2A-EVA Only]
Boundary scan	Supports boundary scan conforming to the IEEE1149.1 standard
Clock controller	The user is able to select the crystal resonance frequency (16 MHz or 20 MHz or 24 MHz or 40 MHz). Incorporates a crystal resonation circuit (Main OSC), which is used as a reference clock for the PLL. Incorporates High Speed Internal Oscillator (HS IntOSC) and Low Speed Internal Oscillator (LS IntOSC), which are used as the start-up clock and backup clock. Incorporates High Voltage Internal Oscillator (HV IntOSC), which is used as digital noise filter clock for VMON. Incorporates a PLL circuit to generate high speed internal clocks by multiplying the Main OSC input. Generates clock pulses used inside the chip from the internal oscillator, main oscillator and PLL. Software configurable external clock output.
Operating modes	Operating modes ● Normal Operating Mode ● User Boot Mode ● Serial Programming Mode ● Boundary scan mode
Standby controller	This product supports various power-down modes. The power consumption of the MCU can be reduced by selecting one of the modes: • RUN mode RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode. • STOP mode STOP mode is a chip-level stand-by mode in which the clock supply to a certain clock domain can be stopped. • DeepSTOP mode DeepSTOP mode is a chip-level stand-by mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area is switched off. • Cyclic RUN mode Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. • Cyclic STOP mode Cyclic STOP mode is a STOP mode in cyclic operation, and one CPU halts its operation. • Module standby
Reset controller	7 reset functions • Power On Reset • System Reset 1 • System Reset 2 • Application Reset • DeepSTOP Reset • Module Reset • JTAG Reset External Reset output pin: $\overline{\text{RESETOUT}}$ Automatic RAM initialization after reset (include DTSRAM, sDMAC Descriptor RAM, GTM RAM, MMCA RAM and MSPI RAM).
Clock monitor	• Up to 10 clock monitors depending on the device configuration. • Detects clock disturbances that results in lower or higher frequency than target frequency, and sends an error notification to the ECM. Supports the self-diagnosis function.
Low-Power Sampler (LPS)	1 unit incorporated [For U2A-EVA, U2A16, U2A8, U2A6 (BGA-292), U2A6 (QFP-176) and U2A6 (QFP-144) Only] Support checking the digital input ports and analog input ports to monitor the external input without consuming CPU resources.

Temperature sensor	1 sensor incorporated. • Out of range detection of temperature. • Operating modes – Single measurement mode – Continuous measurement mode • Interrupt generation – Temperature Measurement End Interrupt (INTOTSOTI) – Temperature Rise/Drop Interrupt (INTOTSOTULI) – Abnormal temperature error signal (OTABE) – Temperature Sensor Error (INTOTSOTE) • Support self-diagnosis function
Generic Timer Module (GTM)	1 unit incorporated GTM v3.5 is a modular timer unit and consists of the following submodules. • Advanced Routing Unit (ARU) • Clock Management Unit (CMU) • Cluster Configuration Module (CCM) • Time Base Unit (TBU) • Timer Input Module (TIM) • Advanced Timer Output (ATOM) • Dead Time Module (DTM) • Multi Channel Sequencer (MCS) • Interrupt Concentrator Module (ICM) • Output Compare Unit (CMP) • Monitoring Unit (MON)
Encoder Timer (ENCA)	2 units incorporated [For U2A-EVA, U2A16, U2A8 and U2A6 (BGA-292) Only] 1 unit incorporated [For U2A6 (QFP-176) and U2A6 (QFP-144) Only] • Generation of the counter control signal from the encoder input signal, and count operation. • Capture function for capturing the counter value with an external trigger signal • Compare function for compare match judgment with the counter value • Two capture compare registers that can be set separately for capture operation and for compare operation • Interrupt mask function for masking the interrupt request signal output as a result of the compare match judgment during compare operation • Function for loading the value of the capture compare register to the counter upon underflow occurrence • The Encoder input signal can be applied to the timer counter clear condition • Edge or level can be selected for clearing the encoder input signal of the timer counter clear condition • Detection of counter overflow and underflow and output of error flags and error occurrence interrupts • Five interrupts: two capture compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt.
Package	[For U2A-EVA (BGA-516) and U2A16 (BGA-516) Only] 516-pin plastic FBGA (0.8 mm ball pitch) (25mm × 25mm package size) [For U2A16 (BGA-373) and U2A8 (BGA-373) Only] 373-pin plastic FBGA (0.8 mm ball pitch) (21mm × 21mm package size) [For U2A16 (BGA-292), U2A8 (BGA-292) and U2A6 (BGA-292) Only] 292-pin plastic FBGA (0.8 mm ball pitch) (17mm × 17mm package size) [For U2A6 (QFP-176) Only] 176-pin plastic HLQFP (0.5 mm pin pitch) (24mm × 24mm package size) [For U2A6 (BGA-156) Only] 156-pin plastic LFBGA (0.65 mm ball pitch) (10mm × 10mm package size) [For U2A6 (QFP-144) Only] 144-pin plastic HLQFP (0.4 mm pin pitch) (16mm × 16mm package size)

1.3 Application Fields

- Automotive field (including body control and chassis & safety)

1.4 Ordering Information

Table 1.1 Product Name List (1/2)

Name	Package	On-Chip ROM	Operating Temperature (Tj)	External Oscillator	Maximum Operating Frequency	MSPI restriction *1	SVR restriction *3	Note
R7F702Z19AEDBG (RH850/U2A-EVA)	Plastic FBGA-516 0.8-mm ball pitch 25 mm × 25 mm (RENESAS code*2 = PRBG0516GC-A)	16 MB	max. 160°C	16/20/24/40 MHz	400 MHz	Yes	No	*4
R7F702Z19BFDBG (RH850/U2A-EVA)	Plastic FBGA-516 0.8-mm ball pitch 25 mm × 25 mm (RENESAS code*2 = PRBG0516GC-A)	16 MB	max. 160°C	16/20/24/40 MHz	400 MHz	No	No	—
R7F702300EBBG-C (RH850/U2A16)	Plastic FBGA-516 0.8-mm ball pitch 25 mm × 25 mm (RENESAS code*2 = PRBG0516GC-A)	16 MB	max. 150°C	16/20/24/40 MHz	400 MHz	Yes	Yes	*4
R7F702300EBBB-C (RH850/U2A16)	Plastic FBGA-373 0.8-mm ball pitch 21 mm × 21 mm	16 MB	max. 150°C	16/20/24/40 MHz	400 MHz	Yes	Yes	*4
R7F702300EABA-C (RH850/U2A16)	Plastic FBGA-292 0.8-mm ball pitch 17 mm × 17 mm	16 MB	max. 160°C	16/20/24/40 MHz	400 MHz	Yes	Yes	*4
R7F702300AEBBC-C (RH850/U2A16)	Plastic FBGA-516 0.8-mm ball pitch 25 mm × 25 mm (RENESAS code*2 = PRBG0516GD-A	16 MB	max. 150°C	16/20/24/40 MHz	400 MHz	No	Yes	*4

R7F702302FAFK-C (RH850/U2A6)	Plastic HLQFP-176 0.5 mm pin pitch 24 mm × 24 mm	6 MB	max. 160°C	16/20/24/40 MHz	400 MHz	No	No	—
R7F702302FABD-C (RH850/U2A6)	Plastic LFBGA-156 0.65 mm ball pitch 10 mm × 10 mm	6 MB	max. 160°C	16/20/24/40 MHz	400 MHz	No	No	—
R7F702302FAFM-C (RH850/U2A6)	Plastic HLQFP-144 0.4 mm pin pitch 16 mm × 16 mm	6 MB	max. 160°C	16/20/24/40 MHz	400 MHz	No	No	—

Note 1. Refer to **Section 19.8, MSPI restrictions**.

Note 2. Refer to **Section 54.1, Package Outline**.

Note 3. Refer to **Section 10.10, SVR restriction**.

Note 4. As sales of these products is limited, please contact your sales representative first when considering these products for purchasing and project development.

FBGA is hereafter referred to as BGA unless the complete abbreviation is required.

The RH850/U2A-EVA series has 21 variants. Select the proper product according to the table below.

Table 1.2 RH850/U2A-EVA List

Frequency	Package					
	FBGA-516	FBGA-373	FBGA-292	HLQFP-176	LFBGA-156	HLQFP-144
400 MHz	R7F702Z19AEDBG (RH850/U2A-EVA)*1 R7F702Z19BFDBG (RH850/U2A-EVA) R7F702300EBBG-C (RH850/U2A16)*1 R7F702300AEBBC-C (RH850/U2A16)*1 R7F702300BEBBC-C (RH850/U2A16)	R7F702300EBBB-C (RH850/U2A16)*1 R7F702300AEBBB-C (RH850/U2A16)*1 R7F702300BEBBB-C (RH850/U2A16) R7F702301EBBA-C (RH850/U2A8)*1 R7F702301AEBBA-C (RH850/U2A8)*1 R7F702301BEBBA-C (RH850/U2A8)	R7F702300EABA-C (RH850/U2A16)*1 R7F702300AFABA-C (RH850/U2A16)*1 R7F702300BFABA-C (RH850/U2A16) R7F702301EABG-C (RH850/U2A8)*1 R7F702301AFABG-C (RH850/U2A8)*1 R7F702301BFABG-C (RH850/U2A8) R7F702302FABB-C (RH850/U2A6)	R7F702302FAFK-C (RH850/U2A6)	R7F702302FABD-C (RH850/U2A6)	R7F702302FAFM-C (RH850/U2A6)

Note 1. As sales of these products is limited, contact your sales representative first when considering these products for purchasing and project development.

1.5 Differences in the Specifications of RH850/U2A-EVA Products

The table below lists the differences in the specifications of RH850/U2A-EVA products.

(1/3)

Product			RH850/U2A-EVA 516 pins	RH850/U2A16 516 pins	RH850/U2A16 373 pins	RH850/U2A16 292 pins	RH850/U2A8 373 pins	RH850/U2A8 292 pins	RH850/U2A6 292 pins	RH850/U2A6 176 pins	RH850/U2A6 156 pins	RH850/U2A6 144 pins
CPU	Frequency		400	400	400	400	400	400	400	400	400	400
	Main Core		4	4	4	4	2	2	2	2	2	2

Each CPU has its own set of CPU peripherals. These CPU peripherals are assigned to the common address: CPU peripheral (self), separately from their respective address. For example, access by CPU0 to a register of a CPU peripheral (self) is to the register in the CPU peripheral of CPU0; access by CPU1 to a register of a CPU peripheral (self) is to the register in the CPU peripheral of CPU1.

Section 2 Pin Functions

This section describes the pin connections and respective pin functions.

2.1 Term Definition

The following terms are used in this section:

Pin

Denotes the physical pin. Every pin is denoted by a unique pin number.

A pin can be used in several modes. Each pin is assigned a name that reflects its function, which is determined by the selected mode.

Port group

Denotes a group of pins. All the pins of a specific port group are controlled by the same port control register.

This product provides the following port groups, indicated by the numbers in the table below.

Table 2.1 Port Group

Package	BGA516	BGA373	BGA292	QFP176	BGA156	QFP144
Number of port group	27	21	17	14	13	12
Port Group Name	JP0, P0 to P6, P8 to P12, P17 to P24, AP0 to AP5	JP0, P0, P2 to P6, P8, P10, P11, P17, P20 to P22, P24, AP0 to AP5	JP0, P2 to P6, P10, P17, P20 to P22, P24, AP0 to AP4	JP0, P2 to P6, P10, P17, P20, P21, P24, AP0, AP2, AP4	JP0, P2 to P6, P10, P17, P20, P21, P24, AP0, AP2	JP0, P2 to P6, P10, P17, P20, P24, AP0, AP2

Port group index n

Each port group is identified by its own index “n” throughout this section; e.g.

PMCn for the port mode control register of the Pn port.

Port mode and ports

A pin in port mode works as a general purpose input/output pin. It is then called “port”.

The corresponding name is Pn_m. For example, P0_7 denotes port 7 of port group 0. It is referenced as “port P0_7”.

Alternative mode

In alternative mode, a pin can be used for various non-general-purpose input/output functions.

It is such as MSPI and INTP.

SHMT1/SHMT4/TTL

Denotes input buffer types. Each types have a different DC characteristics.

For details, refer to **Section 55, Electrical Characteristics**.

2.2 Pin List

2.2.1 Pin List and Function assignment

For detailed information, refer to Appendix “E02_01_List_of_Pin_Assignment.xlsx”.

Pin Function			Pin Status					
				$\overline{\text{RESET}}$ = H				
Category		Pin Name	$\overline{\text{RESET}}$ = L	During Internal Reset	FBIST0 *1	After Internal Reset	DeepStop mode	FBIST1/ FBIST2*1
Debug	BSCAN	JP0_0	I (pull-up)	I (pull-up)	—	I (pull-up)	—	—
		JP0_1	Z	Z	—	Z	—	—
		JP0_2	I (pull-up)	I (pull-up)	—	I (pull-up)	—	—
		JP0_3	I (pull-up)	I (pull-up)	—	I (pull-up)	—	—
		$\overline{\text{TRST}}$	I (pull-down)	I (pull-down)	—	I (pull-down)	—	—
		JP0_5	Z	Z	—	Z	—	—
	—	$\overline{\text{EVTI}}$	I (pull-up)	I (pull-up)	pull-up	I (pull-up)	I (pull-up)	pull-up
		$\overline{\text{EVTO}}$	O	O	O	O	Z *2	O

Note: I: Input
O: Output
Z: Hi-Z
pull-up: On-chip pull-up resistor
pull-down: On-chip pull-down resistor

Note 1. FBIST0/FBIST1/FBIST2 are executed only when $\overline{\text{TRST}}$ = L

Note 2. If $\overline{\text{TRST}}$ = H, the pin keeps output

Note 3. The pin is in I/O buffer hold state. For details, refer to **Section 15, Standby Controller (STBC)**

Note 4. LVDS input/output function become disable even if LVDSCTRLA or LVDSCTRLB register is set.

Note 5. If reset mask function is enable, the pin keeps output. For details, refer to **Section 50, Debugging and Calibration**.

Note 6. The pin is Hi-Z when FLMD0 = L

Note 7. The pin is Hi-Z when FLMD0 = L or P6_13 (FLMD1) = L

Note 8. The pin is Hi-Z when FLMD0 = L or P6_13 (FLMD1) = L or P6_14 (FLMD2) = L

2.2.4 Handling of Unused Pins

Handling of unused pins are listed in following table.

Table 2.4 Handling of Unused Pins (1/2)

Category	Pin Name	Handling of Unused Pins
System Control	X1 RESET FLMD0 SYSVCC VCC VDD VSS AWOVCL	(These pins will always be used.)
	X2 PWRCTL VMONOUT	These pins can be left open.
	P6_10 (RESETOUT)	[Input mode] This pin can be left open and the settings are to disable input (when PMCn_m = 0, PMn_m = 1, PIBCn_m = 0) This pin can be left open and the settings are to enable on-chip pull-down resistors (use PDn_m) This pin can be connected to VSS via individual resistor. [Output mode] This pin can be left open.
SVR	SVRPGATE SVRNGATE	These pins can be left open.
	SVRAVCC SVRDRVCC	These pins must be connected to SYSVCC.
	SVRAVSS SVRDRVSS	These pins must be connected to VSS.
ECM	ERROROUT_M	This pin can be left open.
PORT	Pn_m (excluding P6_10)	[Input mode] These pins can be left open and the settings are to disable input (when PMCn_m = 0, PMn_m = 1, PIBCn_m = 0) These pins can be left open and the settings are to enable on-chip pull-up/pull-down resistors (use PUn_m, PDn_m) These pins can be connected to power supply or ground of each pin via individual resistor. [Output mode] These pins can be left open.
	APn_m	[Input mode] These pins can be left open and the settings are to disable input (when PMn_m = 1, PIBCn_m = 0) These pins can be connected to power supply or ground of each pin via individual resistor. [Output mode] These pins can be left open.
	E0VCC E1VCC E2VCC	(These pins will always be used.)
	LVDVCC	This pin must be connected to E0VCC.
Debug	JP0_0 JP0_1 JP0_2 JP0_3 JP0_5 EVTI EVTO	These pins can be left open.
	TRST	This pin must be connected to VSS via individual resistor.

Table 2.4 Handling of Unused Pins (2/2)

Category	Pin Name	Handling of Unused Pins
Aurora	CICREFP CICREFN TODPn TODNn MSYN	These pins can be left open.
	$\overline{\text{AURORES1}}$ $\overline{\text{AURORES2}}$ $\overline{\text{AURORESPD}}$	These pins must be connected to VSS via individual resistor.
	EMUVCC EMUVDD DVCC DVDD	(These pins will always be used.)
ERAM	$\overline{\text{ERAMRES2}}$ $\overline{\text{ERAMRESPD}}$	These pins must be connected to VSS via individual resistor.
	ERAMVDD ERAMVCC	(These pins will always be used.)
AUDR	AUDATAn	These pins can be left open.
	$\overline{\text{AUDSYNC}}$ AUDCK	These pins can be left open These pins can be connected to E0VCC via individual resistor.
	$\overline{\text{AUDRST}}$	This pin can be left open This pin can be connected to VSS via individual resistor.
SGMII	RX_CLKN RX_CLKP RX_DATAN RX_DATAP TX_DATAN TX_DATAP	These pins can be left open.
	GETH0PVCC GETH0RVCC	These pins must be connected to E0VCC. (When E0VCC = E1VCC = E2VCC then these pins can be connected to each of them.)
	GETH0BVCC	This pin must be connected to 3.0V to 3.6V voltage power supply, or VSS with 1 kΩ or more pull-down resistance.
	GETH0VCL	This pin can be left open.
ADC	A0VCC A0VREFH	These pins must be connected to E2VCC.
	A1VCC A1VREFH	These pins must be connected to E1VCC.
	A2VCC A2VREFH	These pins must be connected to E0VCC.
	A0VSS A1VSS A2VSS	These pins must be connected to VSS.

2.3 PORT Overview

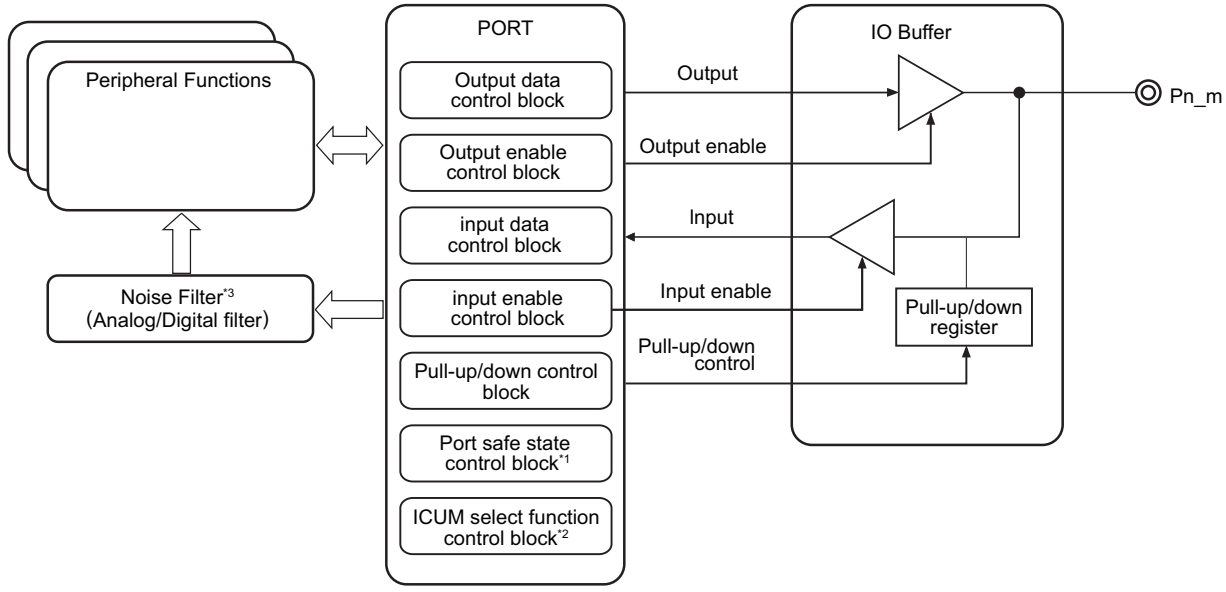
The product has various pins for input/output functions, known as ports. The ports are organized in port groups. Each pin is configurable to be used as GPIO or input/output function of internal IP.

Features summary:

- Configurable for individual pins.
- Each pin is multiplexed GPIO and many input/output functions of internal IPs.
- Electrical characteristics is configurable for most of the pins.
- Support port safe state function.
- Noise filter (Analog or Digital filter) is available for some functional signals of internal IPs.
- Supports LVDS function for high-speed interface.
- Shared analog pins with some GPIO pins are available for ADC.
- Write access protection is available for specific registers or whole port group.

2.3.1 Introduction

The port is an interface between external devices and the internal resources (IPs) and usually consists of IO buffer and the control logic as it is shown below.



Note 1. For details of port safe state function, see **Section 2.4.2, Port Safe State Function**
Note 2. For details of ICUM select function, see **Section 2.4.3, ICUM Select Function**
Note 3. For details of Noise Filter, see **Section 2.7, Noise Filter & Edge/Level Detector**

Figure 2.1 Functional Block Diagram

2.3.2 Register Base Addresses

All port addresses are given as an offset from the individual base addresses, <JPORT_base> and <PORT_base>.

Table 2.5 Port Group

Base Address Name	Base Address	Bus Group
<PORT_base>	FFD9 0000$_H$	P-Bus Group 2L
<JPORT_base>	FFDA 0000$_H$	P-Bus Group 2L

2.3.3 Clock Supply

The clock supply to ports is shown in the following table.

Table 2.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
PORT	Register access clock	CLK_LSB

2.3.4 Operation Mode

Pins can operate in three operation modes.

- Port mode (PMCn.PMCn_m = 0)
  A pin in port mode operates as a general purpose input/output pin. The input / output mode is selected by setting the PMn.PMn_m bit.
- Alternative mode software I/O control (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 0)
  In this mode, the pins operate as alternative functions. The input / output mode is selected by setting the PMn.PMn_m bit.
- Alternative mode direct I/O control (PMCn.PMCn_m bit = 1, PIPCn.PIPCn_m bit = 1)
  In this mode, the pins operate as alternative functions. Unlike the alternative mode software I/O control, however, the input / output direction is selected by the alternative function.

The following is register effect related to operation modes and pin I/O direction.

- PMCn.PMCn_m bit
  This bit selects port mode (PMCn_m = 0) or alternative mode (PMCn_m = 1).
- PMn.PMn_m bit
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) when the port mode (PMCn_m = 0) and alternative mode software I/O control (PMCn_m = 1, PIPCn_m = 0) have been selected.
- PIBCn.PIBCn_m bit
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0, PMn_m = 1).
- PIPCn.PIPCn_m bit
  This bit selects alternative mode software I/O control or alternative mode direct I/O control.
- PBDCn.PBDCn_m bit
  In output mode or output enabled by alternative function, when this bit is set to 1, the pin enters the bidirectional mode.

The input/output direction and each modes by register setting is shown below **Table 2.7, Pin register setting**.

Table 2.7 Pin register setting

PMCn_m	PMn_m	PIBCn_m	PIPCn_m	PBDCn_m	Modes	I/O Direction
0	0	X	X	0	Port mode Output mode	Output
				1	Port mode Bi-directional mode	Input/Output
	1	0		X	Port mode Input mode (input disabled)	–
		1			Port mode Input mode (input enabled)	Input
1	0	X	0	0	Alternative mode Software I/O control Output mode	Output
		X*2		1	Alternative mode Software I/O control Bi-directional mode	Input/Output
	1	0*1		X	Alternative mode Software I/O control Input mode	Input
	X		1	0	Alternative mode Direct I/O control Input or output	Controlled by the alternative function
		X*2		1	Alternative mode Direct I/O control Input or bi-direction	Controlled by the alternative function

Note 1. Setting PIBC 1 is prohibited.

Note 2. Setting PIBC 0 in Bi-directional mode makes propagate the pin level to alternative input function.
Setting PIBC 1 in Bi-directional mode does not make propagate the pin level to alternative input function.

Table 2.8 Alternative mode selection table

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	Alternative input mode 1 (ALT-IN1)
			0	Alternative output mode 1 (ALT-OUT1)
		1	1	Alternative input mode 2 (ALT-IN2)
			0	Alternative output mode 2 (ALT-OUT2)
	1	0	1	Alternative input mode 3 (ALT-IN3)
			0	Alternative output mode 3 (ALT-OUT3)
		1	1	Alternative input mode 4 (ALT-IN4)
			0	Alternative output mode 4 (ALT-OUT4)
1	0	0	1	Alternative input mode 5 (ALT-IN5)
			0	Alternative output mode 5 (ALT-OUT5)
		1	1	Alternative input mode 6 (ALT-IN6)
			0	Alternative output mode 6 (ALT-OUT6)
	1	0	1	Alternative input mode 7 (ALT-IN7)
			0	Alternative output mode 7 (ALT-OUT7)
		1	1	Alternative input mode 8 (ALT-IN8)
			0	Alternative output mode 8 (ALT-OUT8)

NOTE

Some input or output functions is assigned to more than one pin. Only activate one single pin to one given alternative input function. Do not activate a input function on multiple pins at the same time.
Do not set alternative mode selection to a place where the alternative function is not assigned.

2.3.5 Pin data input/output

The registers used for data input/output are described below.

The location that is read via the PPRn register differs depending on the pin mode.

(1) Output data

In the port mode (PMCn.PMCn_m = 0), the value of the Pn.Pn_m bit is output to the Pn_m pin.

(2) Input data

When the PPRn register is read, either the value of the Pn_m pin, the value of the corresponding bit of the port register Pn.Pn_m, or the value output by the alternative function is returned.

Which value is returned depends on the pin mode and setting of several control bits. The different PPRn read modes are shown in the **Table 2.9, PPRn_m Read Values**.

Table 2.9 PPRn_m Read Values

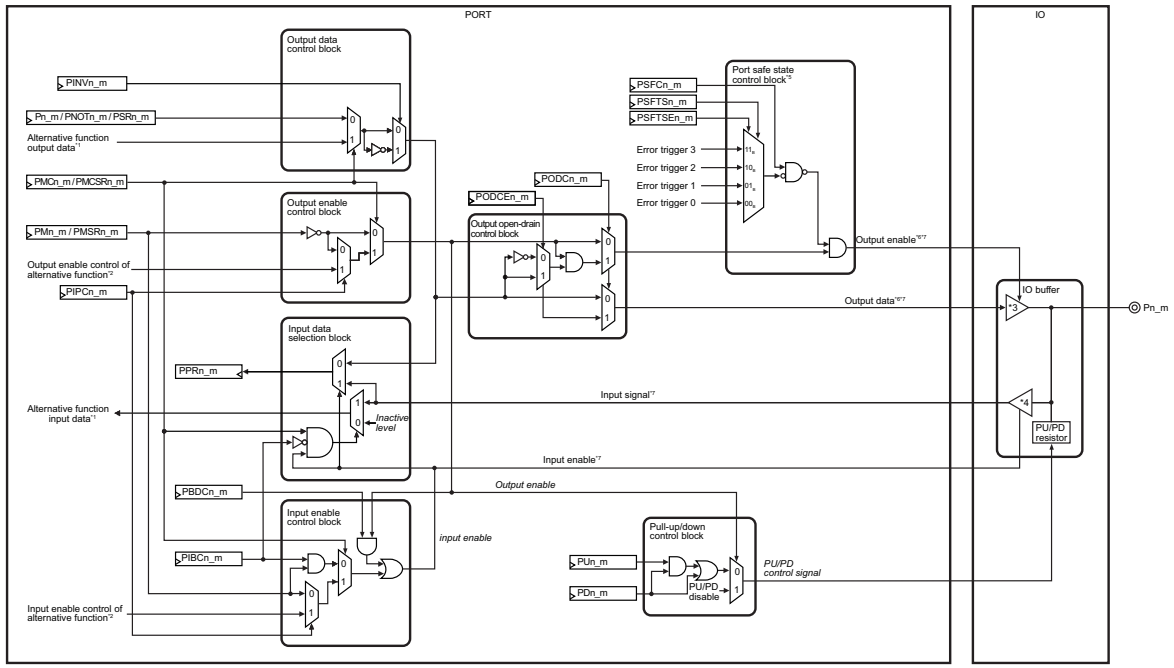
PMCn_m	PMn_m	PIBCn_m	PIPCn_m	PBDCn_m	Mode	PPRn_m Read Value
0	0	X	X	0	Port Mode Output Mode	Pn.Pn_m bit
				1	Port Mode Bi-directional Mode	Pn_m pin
	1	0		X	Port Mode Input Mode, (Input disabled)	Pn.Pn_m bit
		1			Port Mode Input Mode (Input enabled)	Pn_m pin
1	0	X	0	0	Alternative Mode Software I/O control Output Mode	Alternative-function internal output signal
				1	Alternative Mode Software I/O control Bi-directional Mode	Pn_m pin
	1			X	Alternative Mode Software I/O control Input Mode	Pn_m pin
	X		1	0	Alternative Mode Direct I/O control Input or output	I/O port in alternative mode: Input: Pn_m pin Output: Alternative-function internal output signal
				1	Alternative Mode Direct I/O control Input or bi-direction	I/O port in alternative mode: Input: Pn_m pin Bi-direction: Pn_m pin

2.4 Port Functions

This section explains port control logic functions.

2.4.1 Port Control Logic

The following figure shows the logical circuitry of the port control functions. The diagram is only a logical reference and does not show the real circuitry.



Note 1. Alternative function signal selected by PFCn_m, PFCEn_m and PFCAEn_m.

Note 2. Only functions exist in **Table 2.29, Alternative functions require "Direct I/O Control" (Must Set PIPCn_m=1)** are supported this configuration.

Note 3. The output drive strength can be set by PDSCn_m and PUCCn_m.

Note 4. The input buffer type can be set by PISn_m and PISAn_m.

Note 5. Detail of Port Safe State function is described in **Section 2.4.2, Port Safe State Function.**

Note 6. P10_0, P10_1, P17_0 and P17_1 are target pins for ICUM select function which requires additional higher priority control. For details, refer to **Section 2.4.3, ICUM Select Function**.

Note 7. The alternative functions which are supported LVDS buffers have additional control logic from LVDS registers. For details, refer to **Section 2.4.5, Functions incorporated LVDS Buffers**.

Figure 2.2 Port Control Logic Block Diagram

2.4.2 Port Safe State Function

Pn_m and APn_m have Port Safe State Function which can operate the output enable of each pins individually by selecting error triggers for the defined application. This product supports up to 4 error triggers named ERROROUT0Z, ERROROUT1Z, ERROROUT2Z, and ERROROUT3Z, and the trigger can be selected by setting of PSFTSn_m and PSFTSEn_m registers. For details of error triggers behavior, refer to **Section 45, Error Control Module (ECM)**.

The output enable control of a pin is forcibly disabled in case that an error trigger is issued when Port Safe State Function is enabled by setting PSFCn_m register. Even Bi-directional mode output data is suppressed by Port Safe State function during an error trigger is issued.

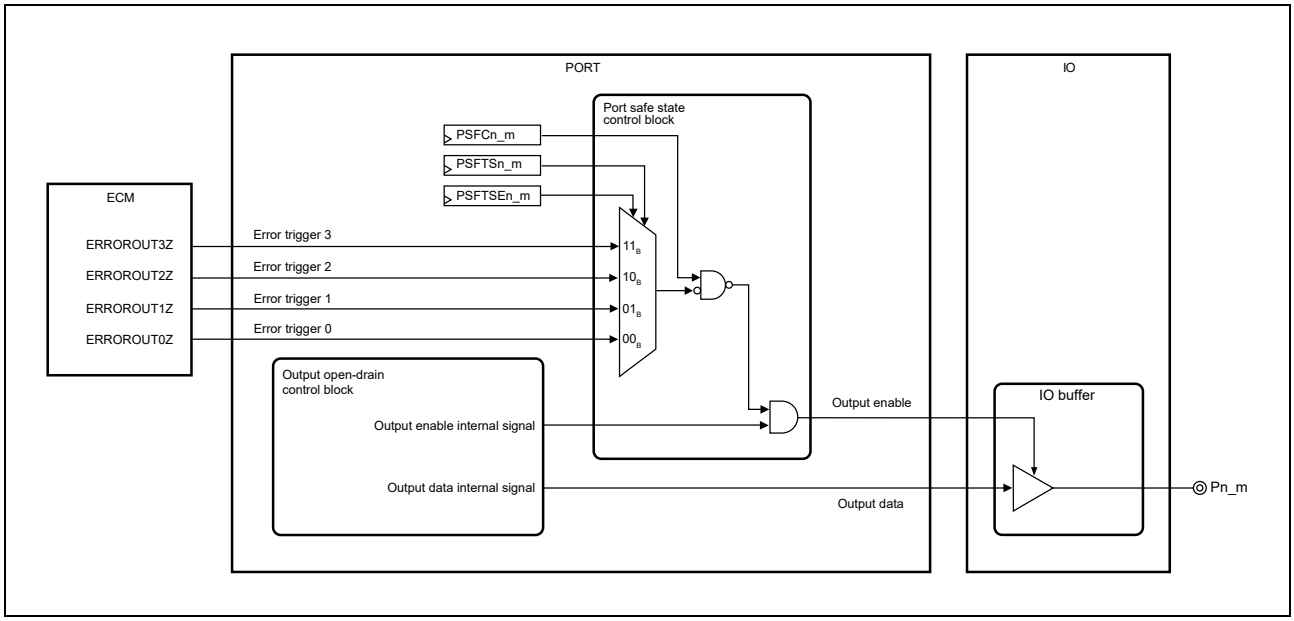


Figure 2.3 Block Diagram of Port Safe State Function

The following table shows the register configuration for Port Safe State Function

Table 2.10 Configuration for Port Safe State Function

PSFCn_m	PSFTSEn_m	PSFTSn_m	Function
0	X	X	Port Safe State function is disabled
1	0	0	Port Safe State function is enabled. Error Trigger 0 is selected for Port Safe State function.
		1	Port Safe State function is enabled. Error Trigger 1 is selected for Port Safe State function.
	1	0	Port Safe State function is enabled. Error Trigger 2 is selected for Port Safe State function.
		1	Port Safe State function is enabled. Error Trigger 3 is selected for Port Safe State function.

CAUTION

Error triggers from ECM are triggered by DeepSTOP Reset and the status of a pin located to AWO area becomes high impedance when Port Safe State Function is enabled.

2.4.3 ICUM Select Function

Target pins: P10_0, P10_1, P17_0 and P17_1.

The ICUM Select Function takes highest priority in port functions to control output value of these target pins.

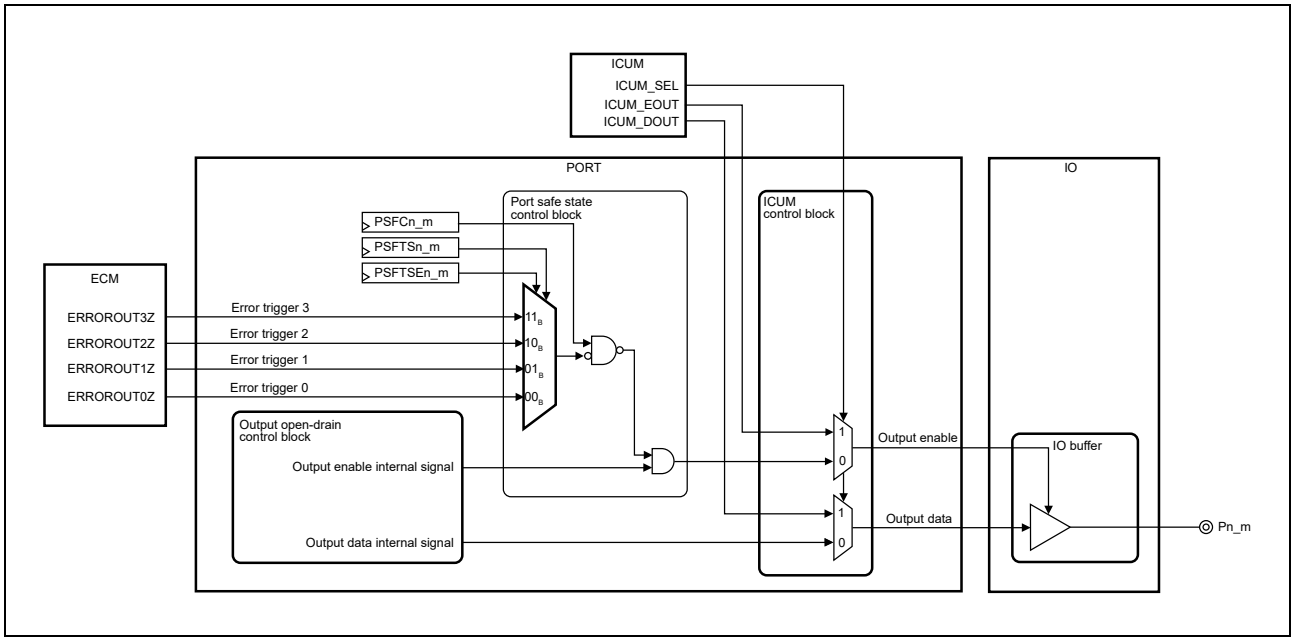

Figure 2.4 Block Diagram of ICUM Select Function

For more details how to use the ICUM function, refer to *RH850/U2A-EVA Group Security User's Manual: Hardware*.

2.4.4 $\overline{\text{RESETOUT}}$ Function

P6_10 has $\overline{\text{RESETOUT}}$ function to handshake with external device. To support this, P6_10 will drive out low level to external device during and after reset which is effective for any kind of resets (except DeepSTOP Reset, Module Reset and JTAG Reset).

This function is realized by having a special reset value of PM6[10], PDSC6[10] and PUCC6[10], which are inverted in contrast to the others.

P6_10 keeps driving out low level until the related registers are changed by user program.

The following figure shows behavior of $\overline{\text{RESETOUT}}$.

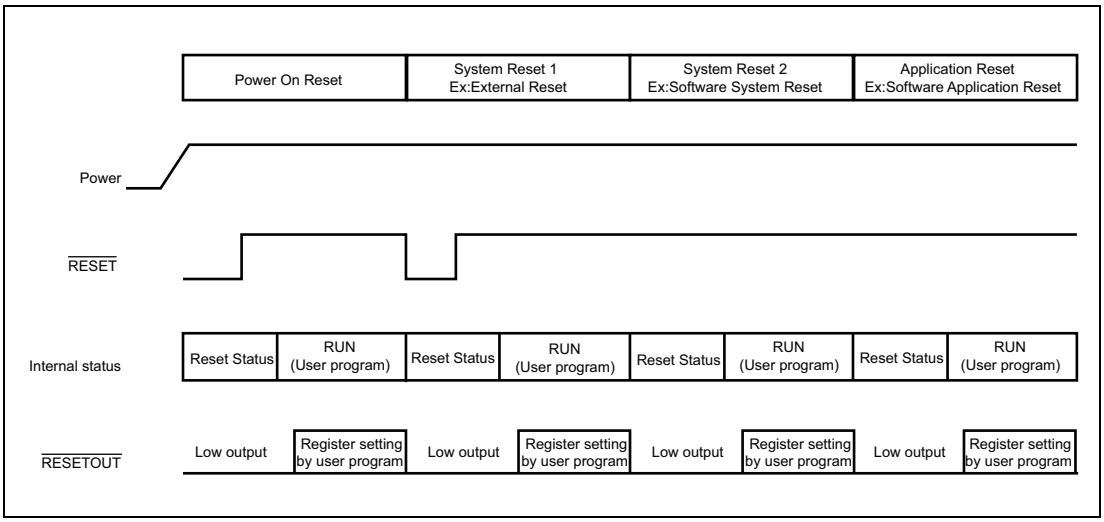

Figure 2.5 Timing Chart of $\overline{\text{RESETOUT}}$ function for each reset factor

CAUTION

To avoid data collision, the outside circuit connected to this pin must not drive in high level at any case.

2.4.5 Functions incorporated LVDS Buffers

When the LVDS buffer is used, set the LVDSCTRL[A,B] register to enable input/output. Also, set whether the supply voltage of LVDS buffer is 3V or 5V.

Table 2.11 LVDS Control Register Assignment

Control Register		Power Domain	I/F	Pin Name (A pair of P-ch, N-ch)	I/O	Control	Related Function (A pair of P-ch, N-ch)
Register	Bit						
LVDSCTRLA	[3]	LVDVCC	IEEE	P2_13/P2_12	OUT	OE	MSPI0_SOP/MSPI0_SON
							HSIF0_TXDP/HSIF0_TXDN
	[0]			P2_11/P2_10	IN	IE	MSPI0_SIP/MSPI0_SIN
							HSIF0_RXDP/HSIF0_RXDN
	[16]					VSEL	MSPI0_SIP/MSPI0_SIN
							HSIF0_RXDP/HSIF0_RXDN
	[5]			P2_15/P2_14	OUT	OE	MSPI0_SCKP/MSPI0_SCKN
	[4]				IN	IE	MSPI0_SCKP/MSPI0_SCKN
	[20]					VSEL	MSPI0_SCKP/MSPI0_SCKN
LVDSCTRLB	[5]	E0VCC	IEEE	P4_9/P4_10	OUT	OE	MSPI1_SCKP/MSPI1_SCKN
	[4]				IN	IE	MSPI1_SCKP/MSPI1_SCKN
	[20]					VSEL	MSPI1_SCKP/MSPI1_SCKN
	[3]			P4_7/P4_8	OUT	OE	MSPI1_SOP/MSPI1_SON
	[0]			P4_5/P4_6	IN	IE	MSPI1_SIP/MSPI1_SIN
	[16]					VSEL	MSPI1_SIP/MSPI1_SIN

CAUTION

Input/output from the LVDS buffer actually being enabled/disable takes at least 10 µs after setting LVDSCTRLA, LVDSCTRLB, IOHOLD0.IOHOLD_P2, and IOHOLD0.IOHOLD_P4.

For pins have not only functions incorporated LVDS buffers but also GPIO and alternative functions. These cannot be used at the same time. Refer to Section 2.6.4, LVDS Function Setting in case LVDS buffers are used.

2.4.6 Debug Interface

The switch between debug interface and port mode is controlled by a combination of mode pins and option byte settings. For details, see **Section 50, Debugging and Calibration**.

2.5 Port Register Description

For detailed list control registers of each port group, refer to Appendix “E02-02_List of Port Functions.xlsx”.

In the bitmap field, “x” means an effective bit and “—” means a reserved bit. Reserved areas are always read as the values after reset. The write value also should be the value after reset. The registers of unimplemented pins should not be modified after reset.

The list of port control register types are described below.

Table 2.12 Port Register Overview (1/2)

Port Register Name	Port Symbol	Address	Access Protection		
			PBG	Other	
				Excluding P2, P6, JP0	P2, P6 *1
Port register	Pn	<PORT_base> + 0000_H + 40_H*n	Refer to Appendix “E02-02_List of Port Functions.xlsx”	—	PWE
	APn	<PORT_base> + $0C80_H$ + 40_H*n		—	—
	JPn	<JPORT_base> + 0000_H + 40_H*n		—	—
Port Set Reset register	PSRn	<PORT_base> + 0004_H + 40_H*n		—	PWE
	APSRn	<PORT_base> + $0C84_H$ + 40_H*n		—	—
	JPSRn	<JPORT_base> + 0004_H + 40_H*n		—	—
Port NOT register	PNOTn	<PORT_base> + 0008_H + 40_H*n		—	PWE
	APNOTn	<PORT_base> + $0C88_H$ + 40_H*n		—	—
	JPNOTn	<JPORT_base> + 0008_H + 40_H*n		—	—
Port Pin Read register	PPRn	<PORT_base> + $000C_H$ + 40_H*n		—	—
	APPRn	<PORT_base> + $0C8C_H$ + 40_H*n		—	—
	JPPRn	<JPORT_base> + $000C_H$ + 40_H*n		—	—
Port Mode register	PMn	<PORT_base> + 0010_H + 40_H*n		—	PWE
	APMn	<PORT_base> + $0C90_H$ + 40_H*n		—	—
	JPMn	<JPORT_base> + 0010_H + 40_H*n		—	—
Port Mode Control register	PMCn	<PORT_base> + 0014_H + 40_H*n		—	PWE
	JPMCn	<JPORT_base> + 0014_H + 40_H*n		—	—
Port Function Control register	PFCn	<PORT_base> + 0018_H + 40_H*n		—	PWE
	JPFCn	<JPORT_base> + 0018_H + 40_H*n		—	—
Port Function Control Expansion register	PFCEn	<PORT_base> + $001C_H$ + 40_H*n		—	PWE
	JPFCEn	<JPORT_base> + $001C_H$ + 40_H*n		—	—
Port Mode Set Reset register	PMSRn	<PORT_base> + 0020_H + 40_H*n		—	PWE
	APMSRn	<PORT_base> + $0CA0_H$ + 40_H*n		—	—
	JPMSRn	<JPORT_base> + 0020_H + 40_H*n		—	—
Port Mode Control Set Reset register	PMCSRn	<PORT_base> + 0024_H + 40_H*n		—	PWE
	JPMCSRn	<JPORT_base> + 0024_H + 40_H*n		—	—
Port Function Control Additional Expansion register	PFCAEn	<PORT_base> + 0028_H + 40_H*n		—	PWE
Port output value Inversion register	PINVn	<PORT_base> + 0030_H + 40_H*n		PWE	PWE
	APINVn	<PORT_base> + $0CB0_H$ + 40_H*n		PWE	—
	JPINVn	<JPORT_base> + 0030_H + 40_H*n		—	—
Port Input Buffer Control register	PIBCn	<PORT_base> + 4000_H + 40_H*n		—	PWE
	APIBCn	<PORT_base> + $4C80_H$ + 40_H*n		—	—
	JPIBCn	<JPORT_base> + 4000_H + 40_H*n		—	—

Table 2.12 Port Register Overview (2/2)

Port Register Name	Port Symbol	Address	Access Protection		
			PBG	Other	
				Excluding P2, P6, JP0	P2, P6 *1
Port Bi-Direction Control register	PBDCn	<PORT_base> + 4004_H + 40_H*n	Refer to Appendix "E02-02_List of Port Functions.xlsx"	—	PWE
	APBDCn	<PORT_base> + $4C84_H$ + 40_H*n		—	—
	JPBDCn	<JPORT_base> + 4004_H + 40_H*n		—	—
Port IP Control register	PIPCn	<PORT_base> + 4008_H + 40_H*n		—	PWE
Pull-Up option register	PUn	<PORT_base> + $400C_H$ + 40_H*n		—	PWE
	JPUn	<JPORT_base> + $400C_H$ + 40_H*n		—	—
Pull-Down option register	PDn	<PORT_base> + 4010_H + 40_H*n		—	PWE
	JPDn	<JPORT_base> + 4010_H + 40_H*n		—	—
Port Open Drain Control register	PODCn	<PORT_base> + 4014_H + 40_H*n		PWE	PWE
	APODCn	<PORT_base> + $4C94_H$ + 40_H*n		PWE	—
	JPODCn	<JPORT_base> + 4014_H + 40_H*n		—	—
Port Drive Strength Control register	PDSCn	<PORT_base> + 4018_H + 40_H*n		PWE	PWE
	APDSCn	<PORT_base> + $4C98_H$ + 40_H*n		PWE	—
	JPDSCn	<JPORT_base> + 4018_H + 40_H*n		—	—
Port Input buffer Selection register	PISn	<PORT_base> + $401C_H$ + 40_H*n		—	PWE
	JPISn	<JPORT_base> + $401C_H$ + 40_H*n		—	—
Port Input buffer Selection Advanced register	PISAn	<PORT_base> + 4024_H + 40_H*n		—	PWE
	JPISAn	<JPORT_base> + 4024_H + 40_H*n		—	—
Port Universal Characteristic Control register	PUCCn	<PORT_base> + 4028_H + 40_H*n		PWE	PWE
	JPUCCn	<JPORT_base> + 4028_H + 40_H*n		—	—
Port Open Drain Control Expansion register	PODCEn	<PORT_base> + 4038_H + 40_H*n		PWE	PWE
	APODCEn	<PORT_base> + $4CB8_H$ + 40_H*n		PWE	—
	JPODCEn	<JPORT_base> + 4038_H + 40_H*n		—	—
Port Control register	PCRn_m	<PORT_base> + 2000_H + 40_H*n + 4_H*m		PWE	PWE
	APCRn_m	<PORT_base> + $2C80_H$ + 40_H*n + 4_H*m		PWE	—
	JPCRn_m	<JPORT_base> + 2000_H + 40_H*n + 4_H*m		—	—
Port Safe State Control register	PSFCn	<PORT_base> + 6000_H + 40_H*n		PWE	PWE
	APSFCn	<PORT_base> + $6C80_H$ + 40_H*n		PWE	—
Port Safe State Trigger Selection register	PSFTSn	<PORT_base> + 6010_H + 40_H*n		PWE	PWE
	APSFTSn	<PORT_base> + $6C90_H$ + 40_H*n		PWE	—
Port Safe State Trigger Selection Expansion register	PSFTSEn	<PORT_base> + 6014_H + 40_H*n		PWE	PWE
	APSFTSEn	<PORT_base> + $6C94_H$ + 40_H*n		PWE	—
Port Keycode Protection Register	PKCPROT	<PORT_base> + $2F40_H$	PBG20#12	—	—
Port Write Enable register	PWE	<PORT_base> + $2F44_H$	PBG20#12	PKCPROT	PKCPROT
LVDS control A register	LVDSCTRLA	<PORT_base> + $2F50_H$	PBG20#12	PWE	—
LVDS control B register	LVDSCTRLB	<PORT_base> + $2F54_H$	PBG20#12	PWE	—

Note 1. P2 is intended to protect the LVDS outputs which belong to LVDVCC. P6 is intended to protect the $\overline{\text{RESETOUT}}$ output.

2.5.1 Pn/APn/JP0 — Port Register

This register defines port pins output levels for port output mode.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Pn_15	Pn_14	Pn_13	Pn_12	Pn_11	Pn_10	Pn_9	Pn_8	Pn_7	Pn_6	Pn_5	Pn_4	Pn_3	Pn_2	Pn_1	Pn_0
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.13 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of pin m (m = 0 to 15): 0: Port pin drives low level 1: Port pin drives high level

NOTES

1. Reading Pn returns the register value independent from other register settings.
2. The value on this register bit is reflected to a pin level in the following conditions.
   Case : Port Mode (PMCn_m=0) & Output Mode (PMn_m=0)

2.5.2 PPRn/APPRn/JPPR0 — Port Pin Read Register

This register reflects the actual pin level when the input buffer is active.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PPRn_15	PPRn_14	PPRn_13	PPRn_12	PPRn_11	PPRn_10	PPRn_9	PPRn_8	PPRn_7	PPRn_6	PPRn_5	PPRn_4	PPRn_3	PPRn_2	PPRn_1	PPRn_0
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.14 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	This register reflects the actual pin level when the input buffer is active 0: Port pin is at low level 1: Port pin is at high level

2.5.3 PMn/APMn/JPM0 — Port Mode Register

This register selects the pin direction as input or output.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMn_15	PMn_14	PMn_13	PMn_12	PMn_11	PMn_10	PMn_9	PMn_8	PMn_7	PMn_6	PMn_5	PMn_4	PMn_3	PMn_2	PMn_1	PMn_0
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.15 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

2.5.4 PMCn/JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PMCn_15	PMCn_14	PMCn_13	PMCn_12	PMCn_11	PMCn_10	PMCn_9	PMCn_8	PMCn_7	PMCn_6	PMCn_5	PMCn_4	PMCn_3	PMCn_2	PMCn_1	PMCn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.16 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

2.5.5 PFCn/JPFC0 — Port Function Control Register

This register selects the alternative peripheral functions together with PFCEn, PFCAEn and PMn in Control Mode (PMCn = 1).

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PFCn_15	PFCn_14	PFCn_13	PFCn_12	PFCn_11	PFCn_10	PFCn_9	PFCn_8	PFCn_7	PFCn_6	PFCn_5	PFCn_4	PFCn_3	PFCn_2	PFCn_1	PFCn_0
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.17 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies the alternative function of a pin. See **Table 2.20, Setting Alternative Functions**.

2.5.6 PFCEn / JPFCE0 — Port Function Control Expansion Register

This register selects the alternative peripheral functions together with PFCn, PFCAEn and PMn in Control Mode (PMCn = 1).

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

			0	Alternative peripheral function 8 (Control Mode 8) Output

2.5.8 PNOTn/APNOTn/JPNOT0 — Port NOT Register

This register provided a method to flip the bit values of Pn register. The bits of Pn register are flipped if the PNOTn register is written with the corresponding bit values being 1.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.21 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	0: No effect on the value of Pn_m bit 1: The value of Pn_m bit is flipped

2.5.9 PSRn/APSRn/JPSR0 — Port Set/Reset Register

This register provides an alternative method to write/read data on Pn register.

The upper 16 bits of PSRn act as a mask which specifies whether or not the value Pn.Pn_m is set by the corresponding bit in the lower 16 bits of PSRn.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.22 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit PSRn_m value is written to Pn_m. 0: Pn_m is not affected by PSRn_m 1: Pn_m is PSRn_m Example: When PSRn.PSRn_31 = 1, the value of PSRn.PSRn_15 is written to bit Pn.Pn_15 and output. When read, 0000_H is always returned.
15 to 0	PSRn_[15:0]	Sets the output level of pin Pn_m (m = 0 to 15). 0: Low level is written on Pn_m when it is enabled by PSRn_(m+16) 1: High level is written on Pn_m when it is enabled by PSRn_(m+16) When read, Pn register value is returned.

2.5.10 PMSRn/APMSRn/JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method to write/read data on PMn register.

The upper 16 bits of PMSRn act as a mask which specifies whether or not the value PMn.PMn_m is set by the corresponding bit in the lower 16 bits of PMSRn.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.23 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Specifies whether the value of the corresponding lower bit PMSRn_m value is written to PMn_m. 0: PMn_m is not affected by PMSRn_m. 1: PMn_m is PMSRn_m Example: When PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. When read, 0000_H is always returned.
15 to 0	PMSRn_[15:0]	Data bits that specify the PMn_m value if the corresponding upper bit (PMSRn_[31:16]) PMSRn_m is 1. 0: PMn_m = 0 1: PMn_m = 1 When read, PMn register value is returned.

2.5.11 PMCSRn/JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to the PMCn register.

The upper 16 bits of PMCSRn act as a mask which specifies whether or not the value PMCn.PMCn_m is set by the corresponding bit in the lower 16 bits of PMCSRn.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.24 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_ [31:16]	Specifies whether the value of the corresponding lower bit PMCSRn_m value is written to PMCn_m. 0: PMCn_m is not affected by PMCSRn_m 1: PMCn_m is PMCSRn_m Example: When PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. When read, 0000_H is always returned.
15 to 0	PMCSRn_ [15:0]	Data bits that specify the PMCn_m value if the corresponding upper bit (PMCSRn_[31:16]) PMCSRn_m is 1. 0: PMCn_m = 0 1: PMCn_m = 1 When read, PMCn register value is returned.

2.5.12 PINVn/APINVn/JPINV0 — Port Output value Inversion Register

This register inverts the output value of the port.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.25 PINVn Register Contents

Bit Position	Bit Name	Function
15 to 0	PINVn_[15:0]	This register inverts the output value of the port. 0: No effect 1: Inverted value is output

2.5.13 PIBCn/APIBCn/JPIBC0 — Port Input Buffer Control Register

When a pin is being used in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), this register enables or disables the input buffer. However, when the pin is used as an input pin in S/W I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m = 0) or direct I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m = 1), set PIBCn.PIBCn_m = 0.

When pins are in bidirectional mode (PBDCn.PBDCn_m = 1), the shared output level loop-back function and pin output level-read function can be selected by setting PIBCn.PIBCn_m. Refer to **Section 2.5.14, PBDCn/APBDCn/JPBDC0 — Port Bi-Direction Control Register**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.26 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer: 0: Input buffer is disabled. 1: Input buffer is enabled.

NOTES

1. To enable port pin's input buffer, the IO direction must be set as input mode by PM=1 during Port Mode (PMC=0).
2. By keeping this register at a reset value of 0, port pin's input buffer does not consumes current even when the pin level is at an intermediate voltage. When the input buffer is disabled, in port mode, through current does not flow even when the pin level is Hi-Z. Thus the pin does not need to be fixed to a high or low level externally.
3. During this register set 1 with Port Mode (PMC=0), the values for peripheral macro are fixed.
4. During "Software I/O control alternative-function input" Mode (PMC=1, PM=1, PIPC=0), this register bit must be set to 0.

2.5.14 PBDCn/APBDCn/JPBDC0 — Port Bi-Direction Control Register

This register enables the input buffer when a pin is used in output mode, and permits bidirectional mode. The Pn_m pin level is read via PPRn.PPRn_m in bidirectional mode.

- Alternative output level loopback function
  When the Pn_m pin is used as the alternative output function, the actual pin output level based on the alternative output function can be looped back to the alternative input side by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 0. For example, the pin output level based on the first alternative function can be looped back to the same alternative input side. Also the pin output level can be read via PPRn.PPRn_m.
- Pin output level read function
  When the Pn_m pin is used as the general output port function or the alternative output function, the actual pin output level can be read via PPRn.PPRn_m by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 1. Under this setting, the pin output level will never be looped back to the alternative input side even in alternative output mode.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"
Address: Refer to **Table 2.12, Port Register Overview**
Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.27 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn_[15:0]	Enables/disables bi-direction mode of the corresponding pin. 0: Bi-direction mode disabled 1: Bi-direction mode enabled

NOTE

Loopback is enabled after four cycles of APB Low freq clock (CLK_LSB) since this register is written.

2.5.15 PIPCn — Port IP Control Register

This register specifies whether the I/O direction of pin Pn_m is controlled by the port mode register PMn.PMn_m or by an alternative function. If pin Pn_m is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function requires direct control of the I/O direction, then PIPCn.PIPCn_m must be set to 1 as well. This transfers I/O control to the alternative function and overrules the PMn.PMn_m setting.

The list of alternative functions that require direct control of the I/O direction is **Table 2.29, Alternative functions require "Direct I/O Control" (Must Set PIPCn_m=1)**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.30 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether a pull-up resistor is connected to the corresponding pin. 0: No pull-up resistor connected 1: Pull-up resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The pull-up resistor has no effect when the pin is operated in output mode.

2.5.17 PDn/JPD0 — Pull-down Option Register

This register specifies whether to connect an internal pull-down resistor to an input pin. For the electrical characteristics for each setting, refer to **Section 55, Electrical Characteristics**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"
Address: Refer to **Table 2.12, Port Register Overview**
Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.31 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether to connect an internal pull-down resistor to the corresponding pin: 0: No internal pull-down resistor connected 1: An internal pull-down resistor connected

NOTES

1. If a pin is configured such that both an internal pull-up resistor (PUn.PUn_m = 1) and pull-down resistor (PDn.PDn_m = 1) are connected, the pull-down resistor is automatically selected and the pull-up resistor is not connected.
2. The internal pull-down resistor has no effect when the pin is operated in output mode.

2.5.18 PODCn/APODCn/JPODC0 — Port Open-drain Control Register

This register selects push-pull or open-drain as the output buffer function.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PODCn_15	PODCn_14	PODCn_13	PODCn_12	PODCn_11	PODCn_10	PODCn_9	PODCn_8	PODCn_7	PODCn_6	PODCn_5	PODCn_4	PODCn_3	PODCn_2	PODCn_1	PODCn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.33 PODCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PODCEn_ [15:0]	Refer to **Table 2.34, Port Open Drain Control Expansion** for the detailed operation on PODCE.

Table 2.34 Port Open Drain Control Expansion

PODCEn_m	PODCn_m	Function
0	0	Push-pull
0	1	Emulated N-channel Open Drain
1	0	Push-pull
1	1	Emulated P-channel Open Drain

2.5.20 PDSCn/APDSCn/JPDSC0 — Port Drive Strength Control Register

This register, together with the PUCCn registers, specifies the output buffer drive strength of a pin. Specific driving ability settings may be required, depending on the pin function to be used. For details, refer to **Section 55, Electrical Characteristics**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDSCn_15	PDSCn_14	PDSCn_13	PDSCn_12	PDSCn_11	PDSCn_10	PDSCn_9	PDSCn_8	PDSCn_7	PDSCn_6	PDSCn_5	PDSCn_4	PDSCn_3	PDSCn_2	PDSCn_1	PDSCn_0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Note 2. PDSCn except PDSC6: 0
PDSC6: 1

Table 2.35 PDSCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDSCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. See **Table 2.37, Port Output Buffer drive Strength Selection**.

2.5.21 PUCCn/JPUCC0 — Port Universal Characteristic Control Register

This register, together with the PDSCn registers, specifies the output buffer drive strength of a pin. Specific driving ability settings may be required, depending on the pin function to be used. For details, refer to **Section 55, Electrical Characteristics**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUCCn_15	PUCCn_14	PUCCn_13	PUCCn_12	PUCCn_11	PUCCn_10	PUCCn_9	PUCCn_8	PUCCn_7	PUCCn_6	PUCCn_5	PUCCn_4	PUCCn_3	PUCCn_2	PUCCn_1	PUCCn_0
Value after reset	*1	*1	*1	*1	*1	*1*2	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Note 2. PUCCn except PUCC6: 0
PUCC6: 1

Table 2.36 PUCCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUCCn_[15:0]	Specifies the port drive strength of the output buffer of the port pin. See **Table 2.37, Port Output Buffer drive Strength Selection**.

Table 2.37 Port Output Buffer drive Strength Selection

PUCCn_m	PDSCn_m	Output Buffer drive Strength
0	0	Drive strength = 5 (very low)
	1	Drive strength = 4 (low)
1	0	Drive strength = 3 (medium)
	1	Drive strength = 2 (high) Drive strength = 1*1 (very high)

Note 1. Only P2_0, P2_5, P22_0, P22_4

NOTES

1. For details of selectable input characteristics, refer to the appendix "E02_01_List_of_Pin_Assignment.xlsx".
2. JP0_1 is selected to "Drive strength = 3" when the pin is used as Nexus, LPD-4 pin and Boundary SCAN interface.
3. JP0_5 is selected to "Drive strength = 3" when the pin is used as Nexus, LPD-4 pin interface.

2.5.22 PISn/JPIS0 — Port input buffer selection register

This register and the PISAn specifies the input buffer characteristics. Specific input characteristic settings may be required, depending on the pin function to be used. For details, refer to **Section 55, Electrical Characteristics**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISn_15	PISn_14	PISn_13	PISn_12	PISn_11	PISn_10	PISn_9	PISn_8	PISn_7	PISn_6	PISn_5	PISn_4	PISn_3	PISn_2	PISn_1	PISn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.38 PISn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISn_[15:0]	Specifies the input buffer characteristic. See **Table 2.40, Port Input buffer Characteristics Selection**.

2.5.23 PISAn/JPISA0 – Port Input buffer Selection Advanced register

This register and the PISn specifies the input buffer characteristics. Specific input characteristic settings may be required, depending on the pin function to be used. For details, refer to **Section 55, Electrical Characteristics**.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISAn_15	PISAn_14	PISAn_13	PISAn_12	PISAn_11	PISAn_10	PISAn_9	PISAn_8	PISAn_7	PISAn_6	PISAn_5	PISAn_4	PISAn_3	PISAn_2	PISAn_1	PISAn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.39 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISAn_[15:0]	Specifies the input buffer characteristic: See **Table 2.40**.

Table 2.40 Port Input buffer Characteristics Selection

PISAn_m	PISn_m	Function
0	0	SHMT1 input buffer is selected
	1	SHMT4 input buffer is selected
1	X	TTL input buffer is selected

NOTES

1. For details of selectable input characteristics, refer to the appendix "E02_01_List_of_Pin_Assignment.xlsx".
2. Input buffer type of JP0_0, JP0_2 and JP0_3 is selected to TTL type when these pins are used as Nexus, LPD-4 pin and Boundary SCAN interface.

2.5.24 PCRn_m/APCRn_m/JPCR0_m — Port Control Register

By going through this register, it is possible to have access to the registers of each port group, and the individual pins is specified all functions by 1 PCR register setting.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	PINV	—	PODC	PODCE	—	PUCC	PDSC	—	PISA	—	PIS	PU	PD	PBDC	PIBC

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.41 PCRn_m Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	PINV	Same as the m bit of PINVn/APINVn/JPINV0 register.
29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	PODC	Same as the m bit of PODCn/APODCn/JPODC0 register.
27	PODCE	Same as the m bit of PODCEn/APODCEn/JPODCE0 register.
26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	PUCC	Same as the m bit of PUCCn/JPUCC0 register.
24	PDSC	Same as the m bit of PDSCn/APDSCn/JPDSC0 register.
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22	PISA	Same as the m bit of PISAn/JPISA0 register.
21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	PIS	Same as the m bit of PISn/JPIS0 register.
19	PU	Same as the m bit of PUn/JPU0 register.
18	PD	Same as the m bit of PDn/JPD0 register.
17	PBDC	Same as the m bit of PBDCn/APBDCn/JPBDC0 register.
16	PIBC	Same as the m bit of PIBCn/APIBCn/JPIBC0 register.
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	P	Same as the m bit of Pn/APn/JP0 register.
11 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	PPR	Same as the m bit of PPRn/APPRn/JPPR0 register.

Table 2.41 PCRn_m Register Contents (2/2)

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	PMC	Same as the m bit of PMCn/JPMC0 register.
5	PIPC	Same as the m bit of PIPCn register.
4	PM	Same as the m bit of PMn/APMn/JPM0 register.
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	PFCAE	Same as the m bit of PFCAEn register.
1	PFCE	Same as the m bit of PFCEn/JPFCE0 register.
0	PFC	Same as the m bit of PFCn/JPFC0 register.

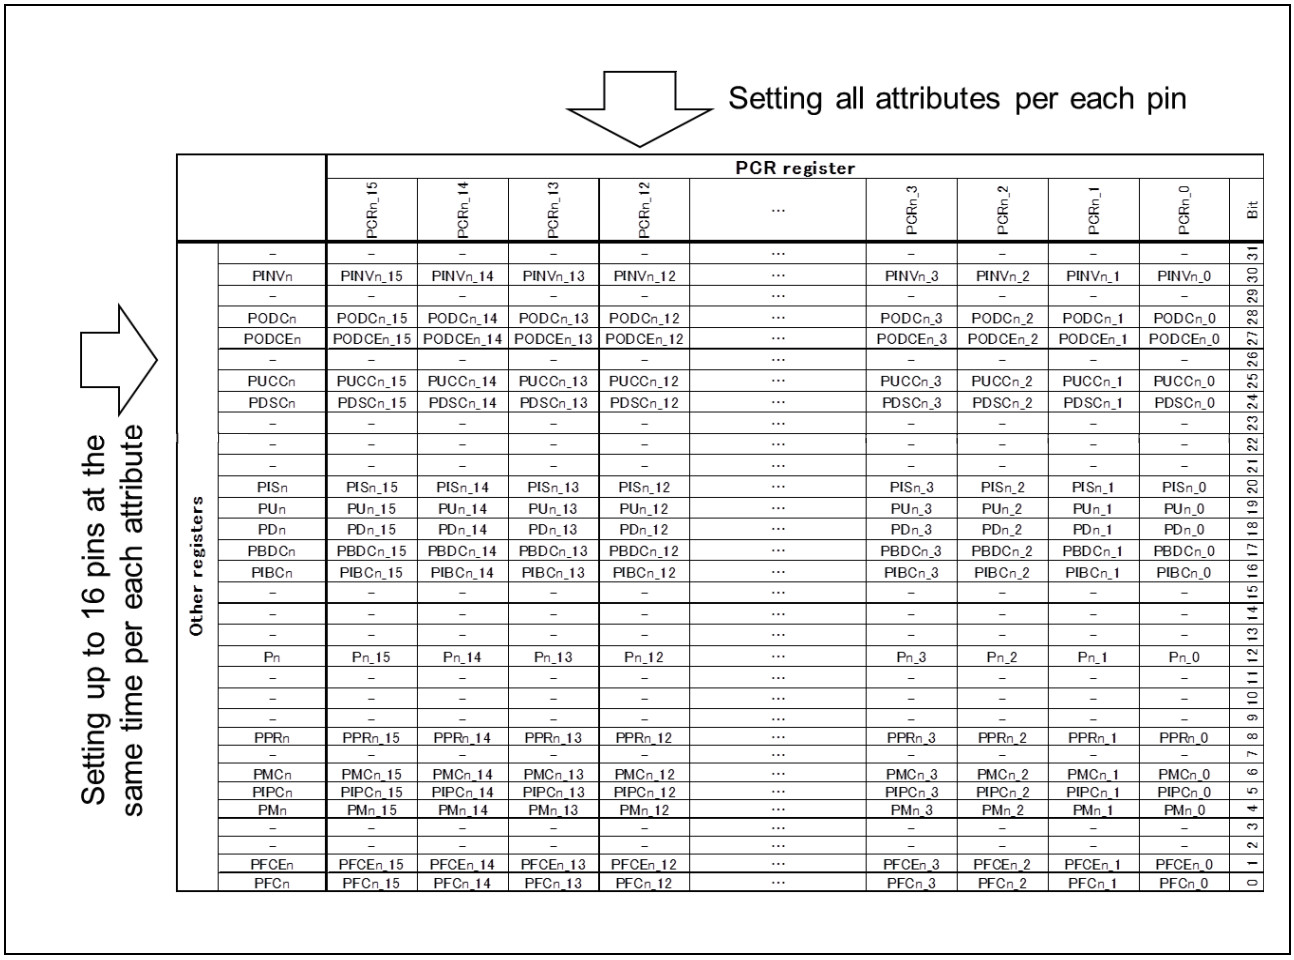

Figure 2.6 Relationship between Other Registers and PCR(Port Control Register)

2.5.25 PSFCn/APSFCn — Port Safe State Control register

This register controls Port Safe State function.

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.42 PSFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PSFCn_[15:0]	Control Port Safe State function: 0: Port Safe State function is disabled 1: Port Safe State function is enabled

2.5.26 PSFTSn/APSFTSn — Port Error Trigger Selection register

This register selects the defined application in Port Safe State mode (PSFCn_m = 1).

Access: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Address: Refer to **Table 2.12, Port Register Overview**

Value after reset: Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PSFTSn_15	PSFTSn_14	PSFTSn_13	PSFTSn_12	PSFTSn_11	PSFTSn_10	PSFTSn_9	PSFTSn_8	PSFTSn_7	PSFTSn_6	PSFTSn_5	PSFTSn_4	PSFTSn_3	PSFTSn_2	PSFTSn_1	PSFTSn_0

Note 1. Refer to Appendix "*E02-02_List of Port Functions.xlsx*"

Table 2.44 PSFTSEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PSFTSEn_[15:0]	Select Error trigger for Port Safe State function. See **Table 2.10, Configuration for Port Safe State Function**.

2.5.28 PKCPROT — Port Keycode Protection Register

This register is used for protection against writing operation to the PWE register.

Access: This register can be read or written in 32-bit units.

Address: <PORT_base> + $2F40_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PKCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PKCPROT[15:1]															PWEE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 2.45 PKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	PKCPROT[31:1]	Enable or disable modification of the PWEE bit. The value written is not retained. These bits are always read as 0.*1
0	PWEE	PWE Enable bit 0: Disables write access of PWE register 1: Enables write access of PWE register

Note 1. Write $A5A5A500_H$ to this register to disable writes to PWE register.
Write $A5A5A501_H$ to this register to enable writes to PWE register.

2.5.29 PWE — Port Write Enable register

This register is used to control which protected registers could be written. When PKCPROT.PWEE = 1, this register could be written. When PKCPROT.PWEE = 0, this register could not be written. For the target register, refer to **Table 2.12, Port Register Overview**.

Access: This register can be read or written in 32-bit units.

Address: <PORT_base> + $2F44_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

2.5.30 LVDSCTRLA — LVDS control A register

This register specifies whether to use LVDS function.

Access: This register can be read or written in 32-bit units.

Address: <PORT_base> + $2F50_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	LVDSCTRLA20	—	—	—	LVDSCTRLA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	LVDSCTRLA5	LVDSCTRLA4	LVDSCTRLA3	—	—	LVDSCTRLA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W

Table 2.47 LVDSCTRLA Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	LVDSCTRLA20	Specify the voltage for the LVDS function: 0: LVDS function of P2_12, P2_13, P2_14 and P2_15 is used in 5V mode 1: LVDS function of P2_12, P2_13, P2_14 and P2_15 is used in 3V mode **CAUTION** Be sure to specify the same values with LVDSCTRLA[16].
19 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	LVDSCTRLA16	Specify the voltage for the LVDS input function: 0: LVDS input function of P2_10 and P2_11 is used in 5V mode 1: LVDS input function of P2_10 and P2_11 is used in 3V mode **CAUTION** Be sure to specify the same values with LVDSCTRLA[20].
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LVDSCTRLA5	Specify whether to use LVDS function: 0: Disable LVDS output function of P2_14 and P2_15 1: Enable LVDS output function of P2_14 and P2_15
4	LVDSCTRLA4	Specify whether to use LVDS function: 0: Disable LVDS input function of P2_14 and P2_15 1: Enable LVDS input function of P2_14 and P2_15
3	LVDSCTRLA3	Specify whether to use the LVDS function: 0: Disable LVDS output function of P2_12 and P2_13 1: Enable LVDS output function of P2_12 and P2_13
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LVDSCTRLA0	Specify whether to use LVDS function: 0: Disable LVDS input function of P2_10 and P2_11 1: Enable LVDS input function of P2_10 and P2_11

2.5.31 LVDSCTRLB — LVDS control B register

This register specifies whether to use LVDS function.

Access: This register can be read or written in 32-bit units.

Address: <PORT_base> + $2F54_H$

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	LVDSCTRLB20	—	—	—	LVDSCTRLB16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	LVDSCTRLB5	LVDSCTRLB4	LVDSCTRLB3	—	—	LVDSCTRLB0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R	R	R/W

Table 2.48 LVDSCTRLB Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	LVDSCTRLB20	Specify the voltage for the LVDS function: 0: LVDS function of P4_7, P4_8, P4_9 and P4_10 is used in 5V mode 1: LVDS function of P4_7, P4_8, P4_9 and P4_10 is used in 3V mode **CAUTION** Be sure to specify the same values with LVDSCTRLB[16].
19 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	LVDSCTRLB16	Specify the voltage for the LVDS input function: 0: LVDS input function of P4_5 and P4_6 is used in 5V mode 1: LVDS input function of P4_5 and P4_6 is used in 3V mode **CAUTION** Be sure to specify the same values with LVDSCTRLB[20].
15 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	LVDSCTRLB5	Specify whether to use the LVDS function: 0: Disable LVDS output function of P4_9 and P4_10 1: Enable LVDS output function of P4_9 and P4_10
4	LVDSCTRLB4	Specify whether to use the LVDS function: 0: Disable LVDS input function of P4_9 and P4_10 1: Enable LVDS input function of P4_9 and P4_10
3	LVDSCTRLB3	Specify whether to use the LVDS function: 0: Disable LVDS output function of P4_7 and P4_8 1: Enable LVDS output function of P4_7 and P4_8
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LVDSCTRLB0	Specify whether to use LVDS function: 0: Disable LVDS input function of P4_5 and P4_6 1: Enable LVDS input function of P4_5 and P4_6

2.6 Port Setting Flow Example

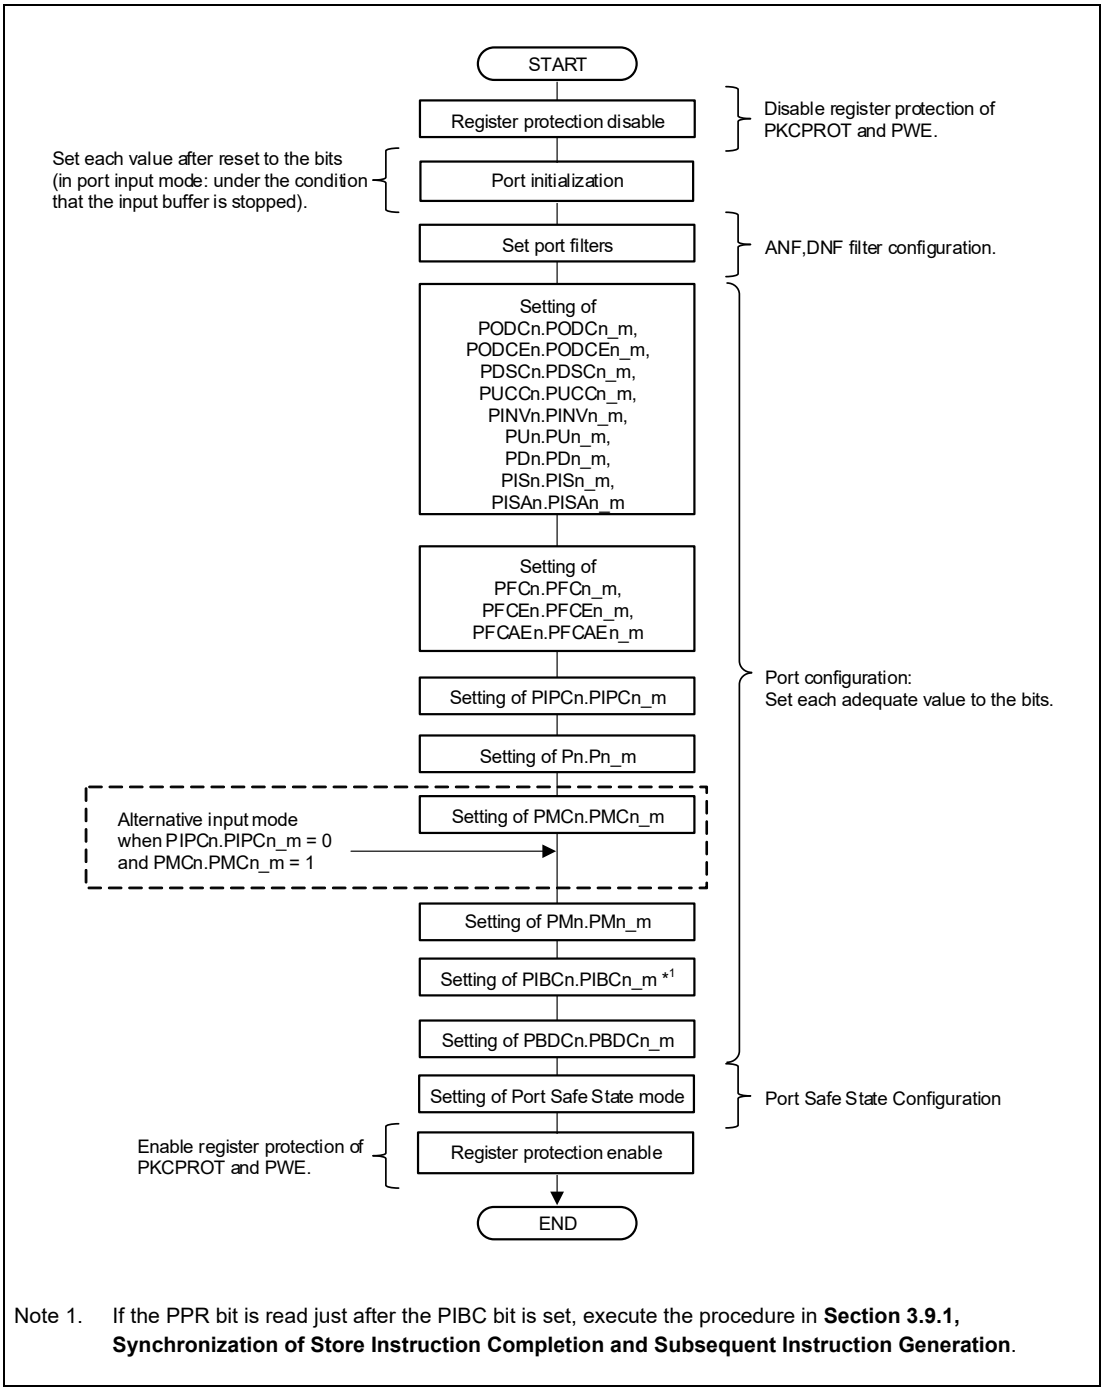
Port setting flow examples are shown in this section.

CAUTIONS

1. **When a pin is set to an alternative output mode while the PIPCn.PIPCn_m bit is 0, it may be temporarily switched to an alternative input mode. This occurs during the period between setting of the PMCn.PMCn_m bit to 1 and setting of the PMn.PMn_m bit to 0. Due to this possibility of a pin being temporarily switched to an alternative input mode, if a pin has an interrupt related signal as an alternative function, disable the interrupt or make sure that it is ignored. Also, when using ERRORINx (x = 0 to 3), set port later than the pins which other ERRORINx (x = 0 to 3) are assigned.**
2. **In PCR configuration, do not change the value of the invert value register (PINVn_m) and output value register (Pn_m) at the same time after output enable is active. If these registers are changed, set them again from the start of the register setting flow.**
3. **When returning to the "Port initializing" state after port setting has been configured, set port register again in the inverse order with Port Group Unit register. At that case, it cannot be used with PCR configuration.**

2.6.1 Batch Setting

The following figure indicates an example of setting a port group collectively.



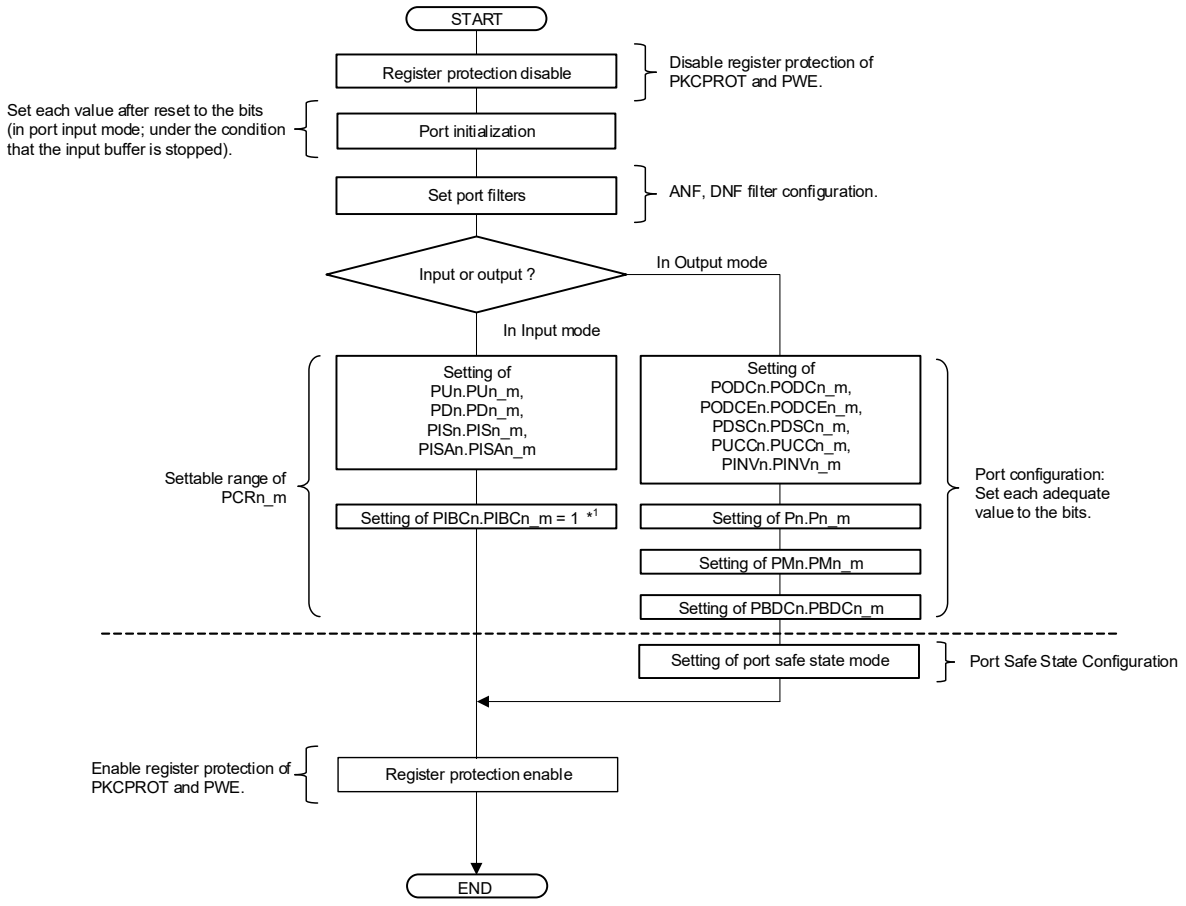
Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation**.

Figure 2.7 Port setting flow example (setting collectively)

2.6.2 Individual Setting

The following figure indicates an example of setting an individual port.

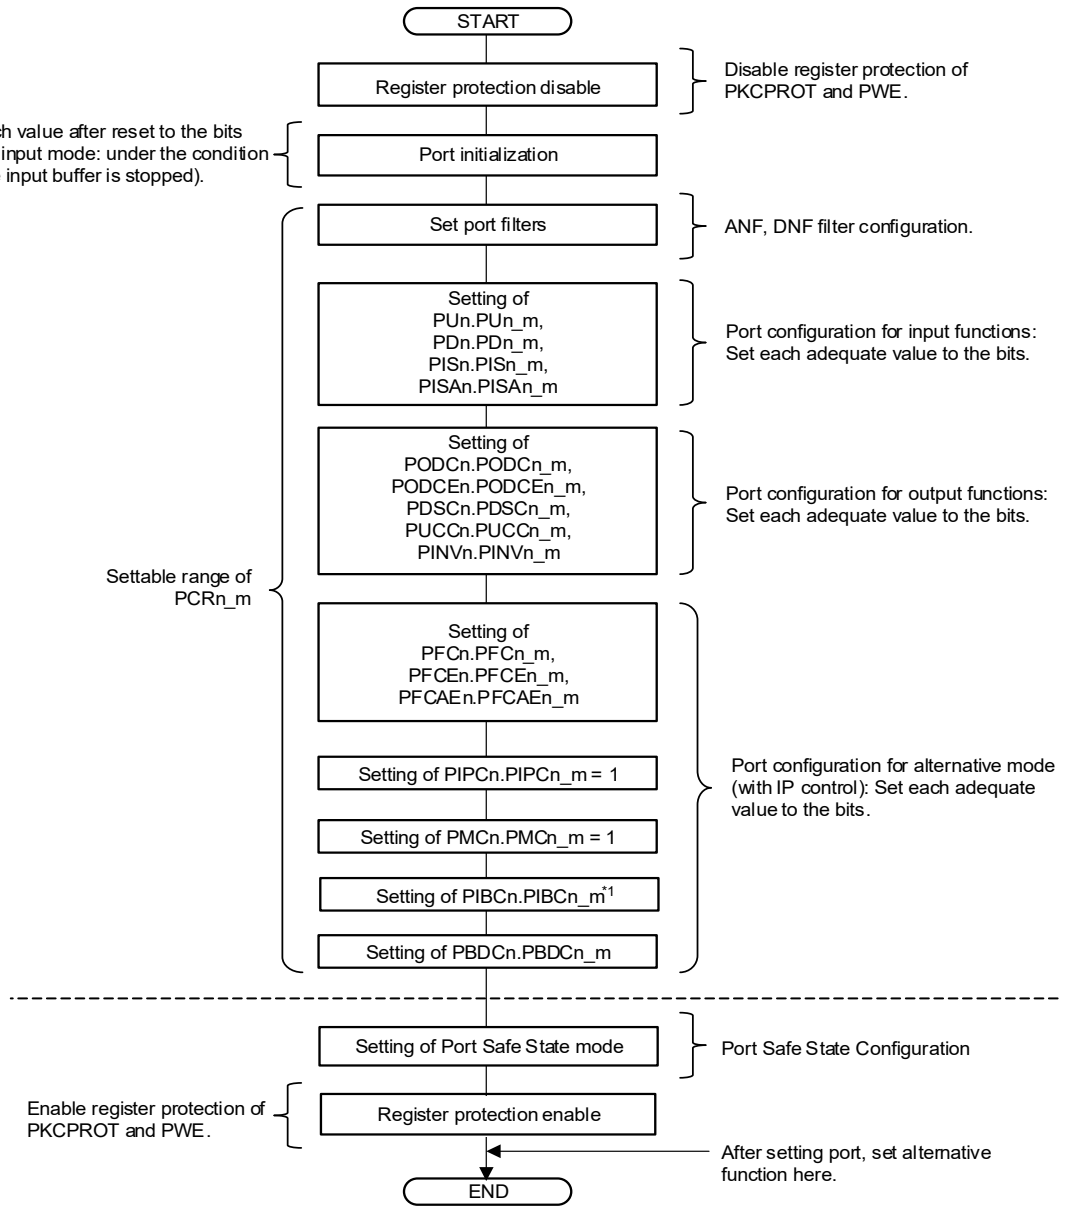
By going through this register, it is possible to have access to the registers of each port group, and the individual pins is specified all functions by 1 PCR register setting.



Note: The individual pin state changes less than 100ns after setting this flow.

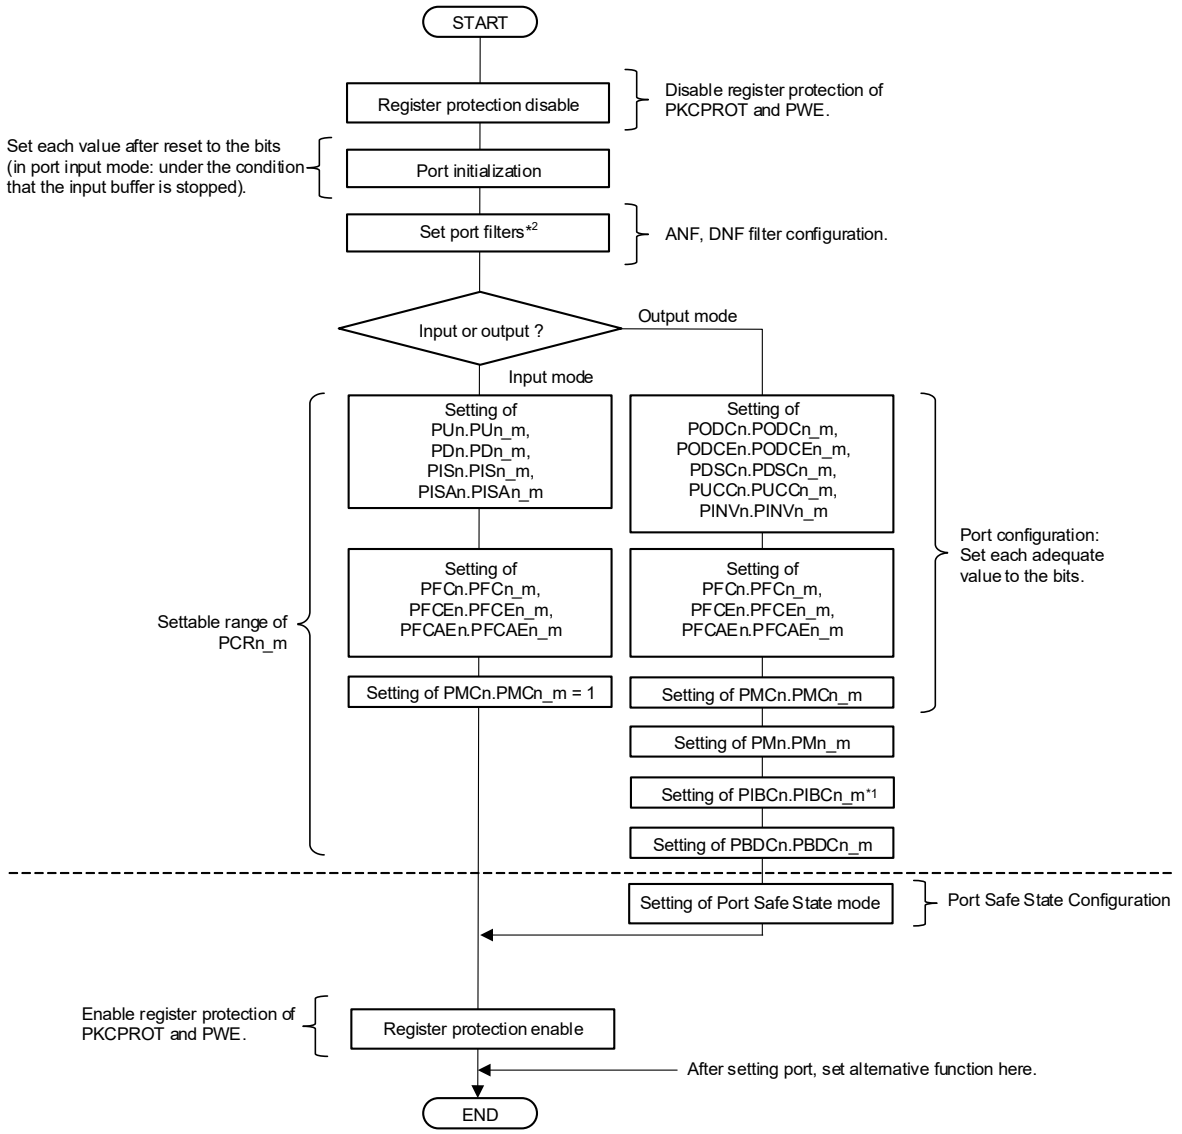
Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation**.

Figure 2.8 Port setting flow example (Port mode)



Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation**.

Figure 2.9 Port setting flow example (Alternative mode with IP control)



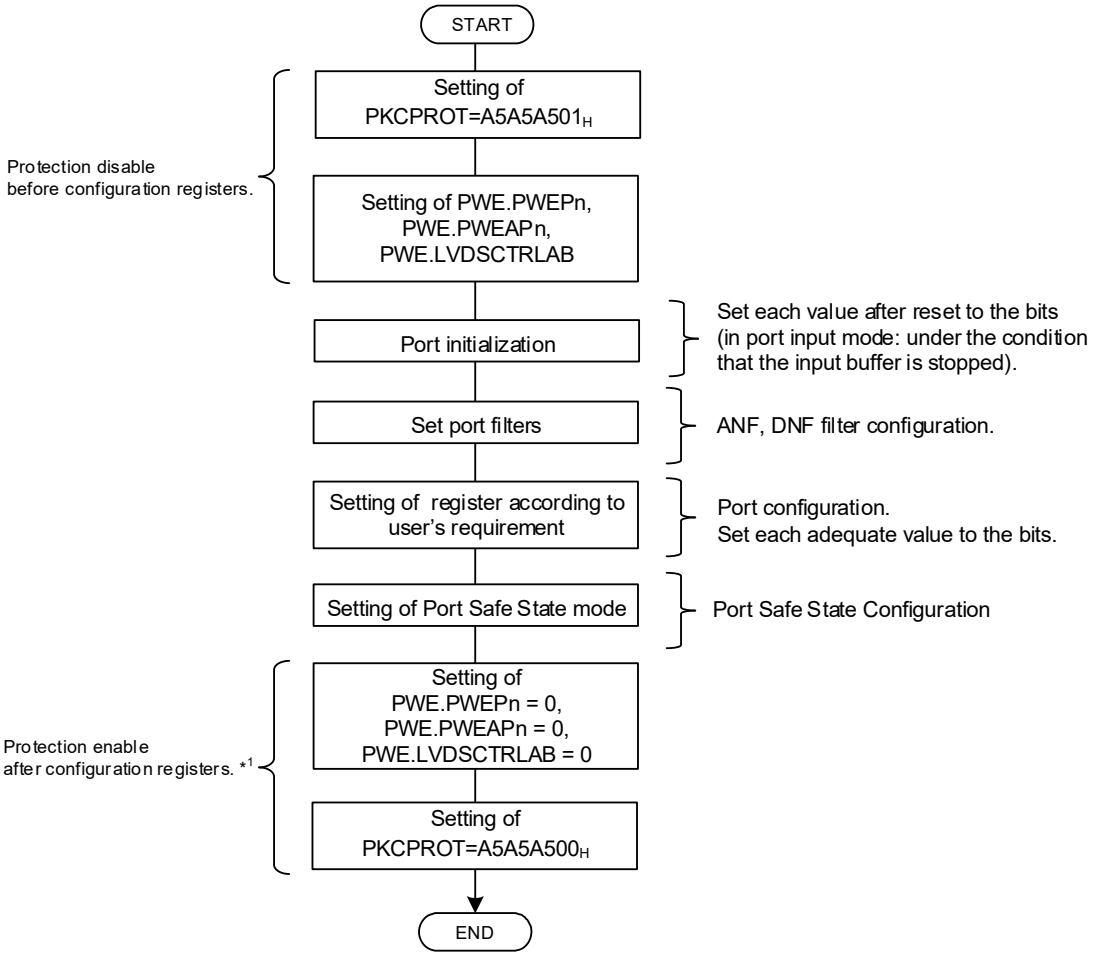
Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation**.

Note 2. In order to avoid the unintended interrupt occurrence, NMI and INTPx (x = 0 to 39) should be set according to **Section 6.5.3, External Interrupt Processing Flow**.

Figure 2.10 Port setting flow example (Alternative mode without IP control)

2.6.3 Protection Setting

The following shows an example of setting register protection.



Note 1. Disable the protection sequence of PKCPROT and PWE as needed. (If not needed, this sequence can be skipped.) When PKCPROT is set to $A5A5A500_H$ to disable write access but PWE remains set to 1, access to the specific Pn group registers remains enabled.

Figure 2.11 Protection setting flow

2.6.4 LVDS Function Setting

The following shows the flow to use LVDS function.

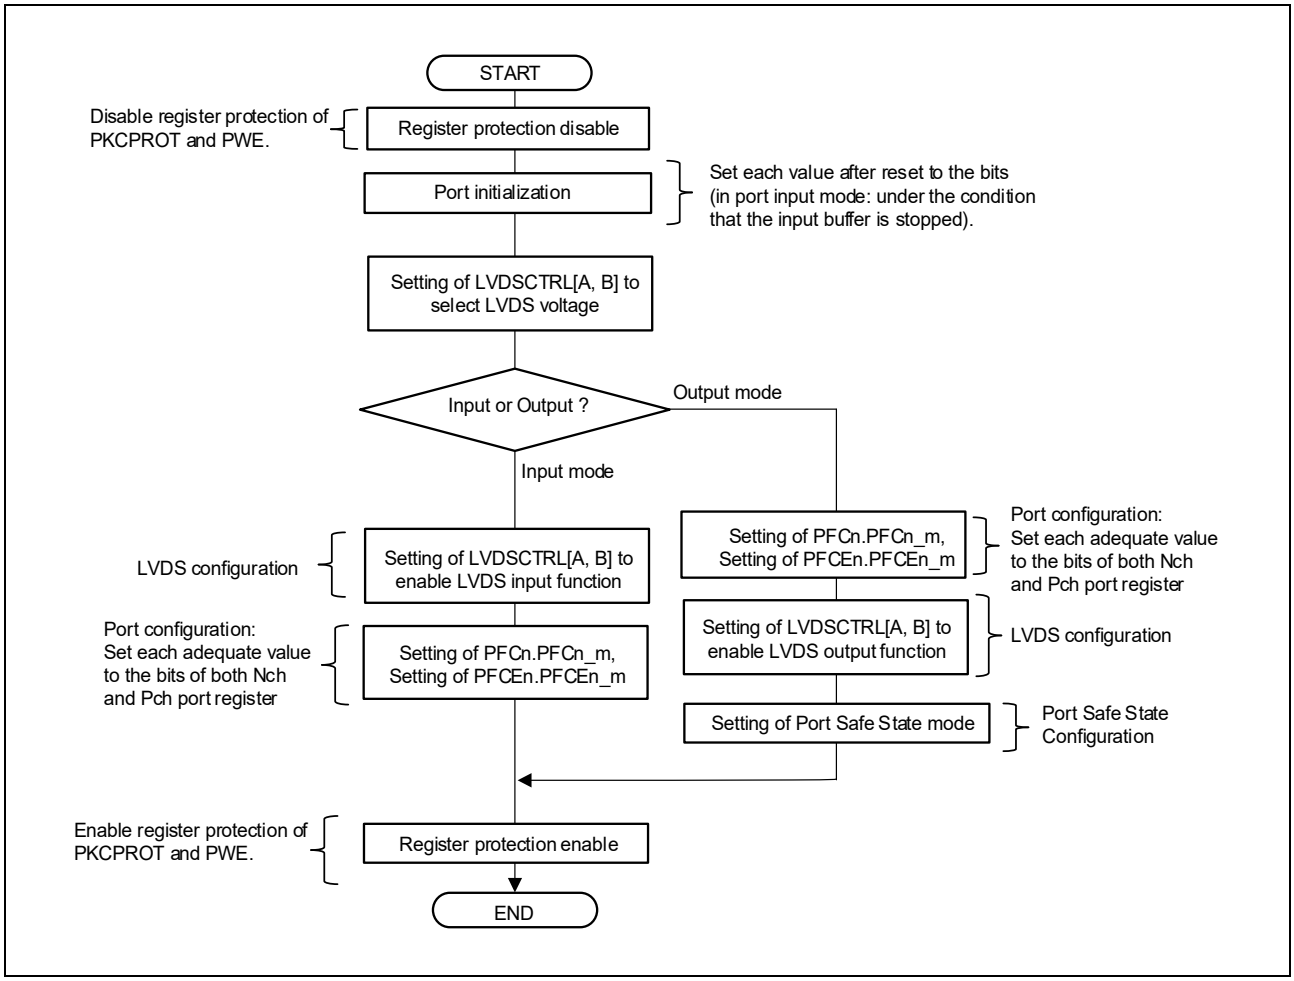


Figure 2.12 LVDS function setting flow example

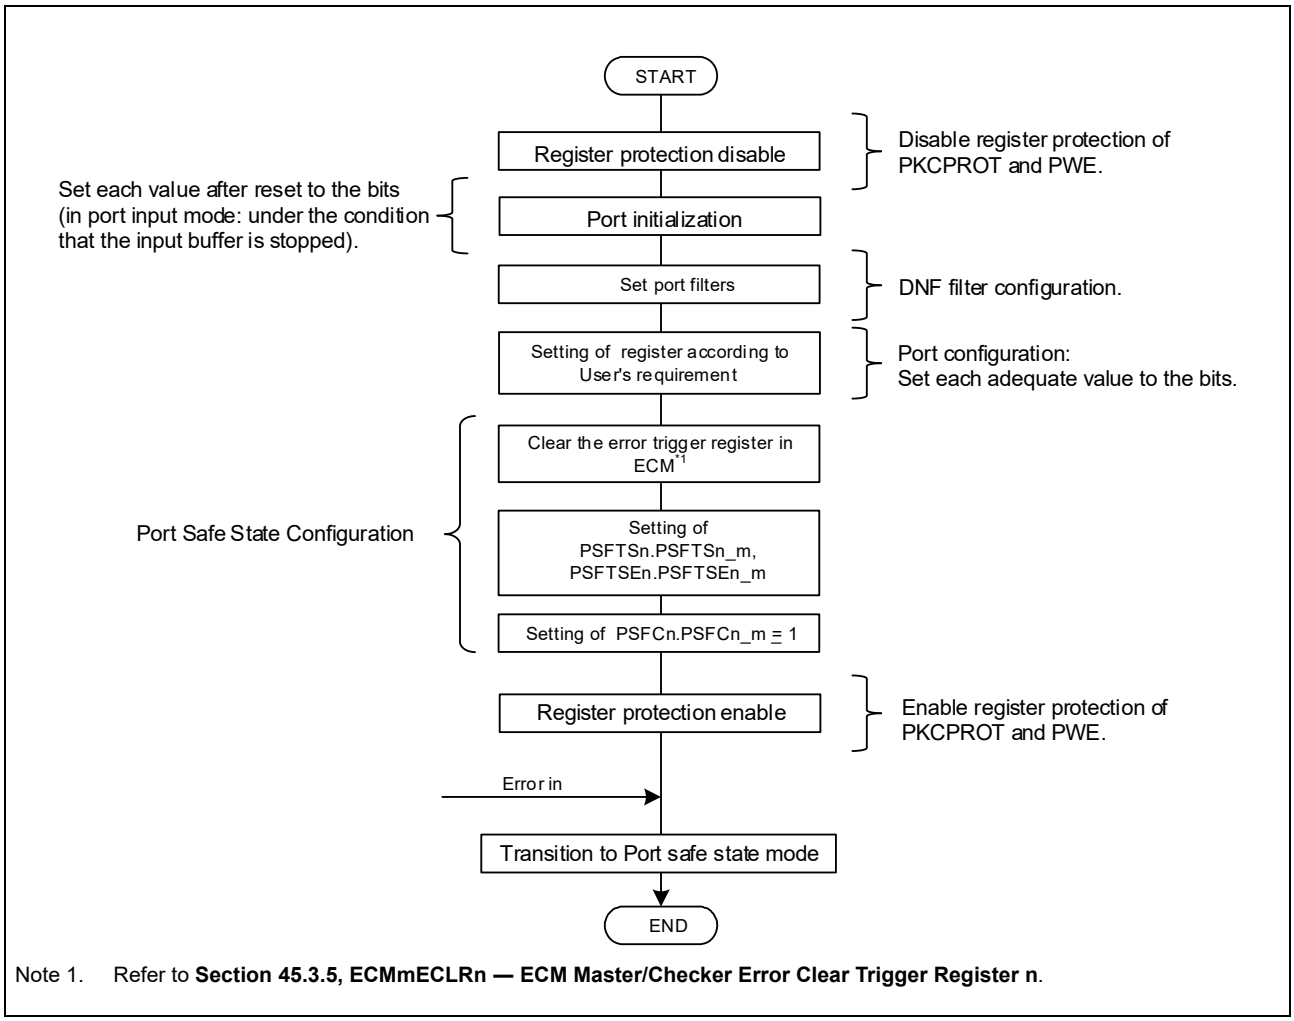
2.6.5 Port Safe State Function Setting

The following shows the flow to use port safe state mode. If the function is not used, port safe state configuration sequence can be skipped.



Note 1. Refer to **Section 45.3.5, ECMmECLRn — ECM Master/Checker Error Clear Trigger Register n**.

Figure 2.13 Port safe state function setting flow

2.7 Noise Filter & Edge/Level Detector

The input signals at some pins are passed through a filter to remove noise and glitches. This device supports both analog and digital filters. It also supports the function for edge and level detection after the signals have passed through a filter. The first part of this section provides an overview of port input signals that are equipped with a filter and the filter type, noise filter & edge detection control registers and bits, and register addresses.

2.7.1 Noise Filter Assignment

The noise filter type of each function is shown below.

Table 2.49 Noise filter Assignment (1/5)

Function		Noise Filter									Detector Type				Clock Supply
			Filter Control Register		Digital noise elimination control register		Digital noise elimination enable register

Note 5. For the setting for TAUJn edge detection, see **Section 34.3.3.4, TAUJnCMURm — TAUJn Channel Mode User Register m**.

2.7.2 Description of Port Noise Filter & Edge/Level Detection

2.7.2.1 Analog Filters

(1) Analog Filter Characteristic

Analog filters have fixed characteristics. See **Section 55, Electrical Characteristics** for the input conditions for signals input to pins that incorporate an analog filter.

(2) Analog Filter Control Registers

A dedicated FCLACTLm_<name> register or control register in the peripheral macro is provided for input pins that incorporate an analog filter.

The assignment of the input signals to the control registers and their addresses are given in **Section 2.7.1, Noise Filter Assignment**.

CAUTIONS

1. **When the output signal from the analog filter is set to an input for an alternative function, allow at least the period of pulse rejection to elapse after the port pin switch to the alternative function.**
   The period of pulse rejection is referred to Section 55 Electrical Characteristics.
2. **When enabling the edge detector in the analog filter, allow at least the period of pulse rejection to elapse after the port pin switch to the alternative function, and then set the edge detection mode.**

2.7.2.2 Digital Filters

(1) Digital Filter Characteristic

Digital filters allow adjusting the filter characteristics to the needs of the application.

The input signal is sampled with the sampling frequency f_s.

If a specified number of successive samples yield the same (high or low) level, the signal level is judged as valid and the filter output signal is set accordingly.

If an external signal level change is detected within the specified number of samples (same level samples), the signal level is judged as noise and the filter output signal does not change.

The length of an external signal pulse to be judged as noise depends on the sampling frequency and the specified number of same level samples.

Both parameters can be specified:

- DNFACTL_<name>.PRS[2:0] allows to select the sampling frequency to

  $f_s = f_{supply}/2^{PRS[2:0]}$

  where f_{supply} is the sampling clock supply frequency. About “Sampling clock supply” of each DNF, refer to **Section 2.7.1, Noise Filter Assignment**.

- DNFACTL_<name>.NFSTS[1:0] determines the number of level samples, “s”, (2 to 5):

  $s = NFSTS[1:0] + 2$

External signal pulses shorter than the following are always suppressed.

$s \times 1/f_s$

External signal pulses longer than the following are always judged as valid and are passed on to the filter output.

$(s + 1) \times 1/f_s$

External signal pulses in the following range may be suppressed or judged as valid.

$s \times 1/f_s$ to $(s + 1) \times 1/f_s$

The filter operation is illustrated in the figure below with DNFACTL_<name>.NFSTS[1:0]= 01_B, i.e. s = 3 same level samples.

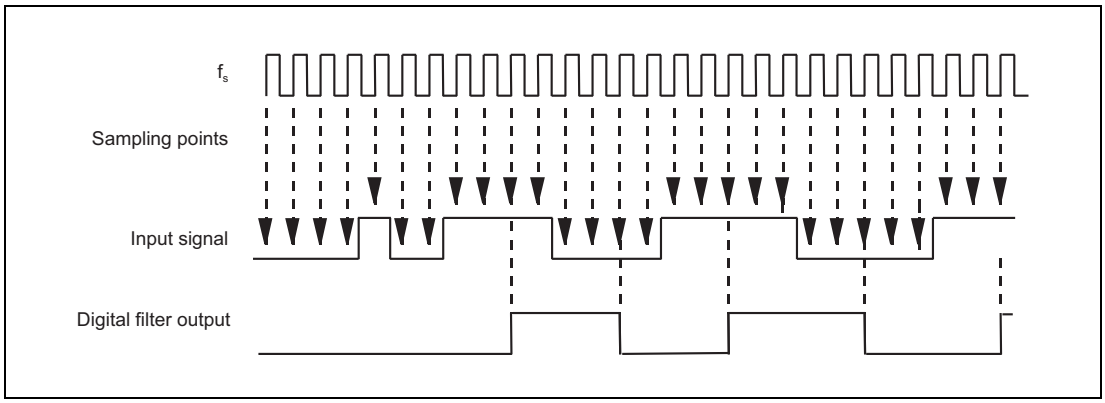

Figure 2.14 Digital Filter Function

(2) Digital Filter Groups

The input signals processed through digital filters are ordered in groups of up to 16 signals.

The digital filter characteristics, specified by DNFACTL_<name>.PRS[2:0] and NFSTS[1:0] apply to the signals.

However, the digital filter for each signal can be enabled or disabled separately by DNFAEN_<name>.NFENHm (m = 0 to 7) and DNFAEN_<name>.NFENLm (m = 0 to 7).

CAUTIONS

1. **When the output signal from the digital filter is set to an input for an alternative function, allow at least the following interval to elapse after the digital filter is enabled (DNFAEN_<name>.NFENHm (m = 0 to 7) = 1 and DNFAEN_<name>.NFENLm (m = 0 to 7) = 1) for the port pin to switch to the alternative function.**

   s = DNFACTL_<name>.NFSTS[1:0] + 2

   $s \times 1/f_s + 2 \times 1/f_{supply}$

2. **When a digital filter's output signal is used as an interrupt signal, only enable the digital filter (DNFAEN_<name>.NFENHm (m = 0 to 7) = 1 and DNFAEN_<name>.NFENLm (m = 0 to 7) = 1) while interrupts are disabled. Furthermore, only enable interrupts after enabling the digital filter, waiting for the time below to elapse, and then clearing the interrupt request flag.**

   $s \times 1/f_s + 3 \times 1/f_{supply}$

(3) Digital Filter Control Registers

For each group consisting of up to 16 digital filters, the digital noise elimination control register DNFACTL_<name> and digital noise elimination enable register DNFAEN_<name> are used to set all the filters in the same group (<name> = peripheral function group).

DNFACTL_<name> register specified he characteristics of the digital noise elimination filter for the digital filter of <name>.

DNFAEN_<name> register enables/disables each filter by setting the corresponding bit in DNFAEN_<name>.NFENHm (m = 0 to 7) and DNFAEN_<name>.NFENLm (m = 0 to 7).

The edge detection setup is done via the filter dedicated control register and the registers for individual peripheral functions.

The assignment of the input signals to the control registers and their addresses are given in **Section 2.7.1, Noise Filter Assignment**.

CAUTION

Do not change any control register settings, while the concerned digital filter is enabled by DNFAEN_<name>.NFENHm (m = 0 to 7) = 1 and DNFAEN_<name>.NFENLm (m = 0 to 7) = 1. Otherwise an unintended filter output may be generated.

2.7.3 Registers

2.7.3.1 List of Registers

The digital noise filter is controlled and operated by the following registers.

Table 2.50 List of Digital Noise Filter Registers

Register Name	Symbol	Address	Access Protection	
			PBG	Other
Filter control register	FCLACTLm_<name>	See **Section 2.7.1, Noise Filter Assignment**.	PBG20#13	—
Digital noise elimination control register	DNFACTL_<name>		*1	—
Digital noise elimination enable register	DNFAEN_<name>		*1	—
Digital noise elimination enable register H	DNFAENH_<name>		*1	—
Digital noise elimination enable register L	DNFAENL_<name>		*1	—

Note 1. PBG20#13 other than DNFACTL_TAUD2, DNFAEN_TAUD2, DNFAENH_TAUD2 and DNFAENL_TAUD2.
PBG51#3 for DNFACTL_TAUD2, DNFAEN_TAUD2, DNFAENH_TAUD2 and DNFAENL_TAUD2.

NOTE

<name> is a representative. For the actual name and existence of these registers, see **Section 2.7.1, Noise Filter Assignment**.

2.7.3.2 FCLACTLm_<name> — Filter Control Register

This register controls the analog and digital filter operation.

Access: This register can be read or written in 8-bit units.

Address: See **Table 2.49, Noise filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	BYPS	—	—	—	—	INTL	INTF	INTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R/W	R/W	R/W

Table 2.51 FCLACTLm_<name> Register Contents

Bit Position	Bit Name	Function
7	BYPS	Bypass mode selection 0: Select filter signal 1: Select filter-bypass signal **Note:** This bit is only valid for ANF/DNF Type E1 and F1. For other than these types, this bit should be the value after reset.
6 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	INTL	Detection mode selection: 0: Edge detection 1: Level detection **Note:** This bit is only for ANF Type A1. For other than these types, this bit should be the value after reset.
1	INTF	See **Table 2.52, Detection Mode Configuration**.
0	INTR	See **Table 2.52, Detection Mode Configuration**.

Table 2.52 Detection Mode Configuration

INTL	INTF	INTR	Detection Mode	Function
0	0	0	Edge detection	Disable edge detection
	0	1		Rising edge detection
	1	0		Falling edge detection
	1	1		Both rising and falling edge detection
1	X	0	Level detection	Low level detection
		1		High level detection

2.7.3.3 DNFACTL_<name> — Digital Noise Elimination Control Register

This register specifies characteristics of the digital noise elimination filter.

Access: This register can be read or written in 8-bit units.

Address: See **Table 2.49, Noise filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	NFSTS[1:0]		—	—	PRS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R	R	R/W	R/W	R/W

Table 2.53 DNFACTL_<name> Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6, 5	NFSTS[1:0]	Specify the number of samples used to judge whether an external signal pulse is valid. **NFSTS[1:0]** / **Number of Samples** 00_B / 2 01_B / 3 10_B / 4 11_B / 5
4, 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PRS[2:0]	Digital filter sampling clock selection **PRS[2:0]** / **Sampling clock Frequency** 000_B / Sampling clock supply/1 001_B / Sampling clock supply/2 010_B / Sampling clock supply/4 011_B / Sampling clock supply/8 100_B / Sampling clock supply/16 101_B / Sampling clock supply/32 110_B / Sampling clock supply/64 111_B / Sampling clock supply/128 About "*Sampling clock supply*" of each DNF, refer to **Table 2.49, Noise filter Assignment**.

2.7.3.4 DNFAEN_<name> — Digital Noise Elimination Enable Register

This register enables and disables digital noise elimination for a specified input signal.

Access: This register can be read or written in 16-bit units.
The upper- and lower-order bytes (NFENH[7:0] and NFENL[7:0]) are accessible in 8- or 1-bit units respectively by setting DNFAENH_<name> and DNFAENL_<name>.

Address: See **Section 2.7.1, Noise Filter Assignment**.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NFENH7	NFENH6	NFENH5	NFENH4	NFENH3	NFENH2	NFENH1	NFENH0	NFENL7	NFENL6	NFENL5	NFENL4	NFENL3	NFENL2	NFENL1	NFENL0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.54 DNFAEN_<name> Register Contents

Bit Position	Bit Name	Function
15 to 0	NFENH[7:0] NFENL[7:0]	Enable/Disable digital noise elimination: 0: Disabled 1: Enabled **Note:** For the correspondence between these bits and input signals. See **Section 2.7.1, Noise Filter Assignment**.

2.7.3.5 DNFAENH_<name> — Digital Noise Elimination Enable H Register

Setting in this register correspond to those of the 8 upper-order bits of DNFAEN_<name> register.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: See **Section 2.7.1, Noise Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NFENH7	NFENH6	NFENH5	NFENH4	NFENH3	NFENH2	NFENH1	NFENH0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2.7.3.4, DNFAEN_<name> — Digital Noise Elimination Enable Register**.

2.7.3.6 DNFAENL_<name> — Digital Noise Elimination Enable L Register

Setting in this register correspond to those of the 8 lower-order bits of DNFAEN_<name> register.

Access: This register can be read or written in 8-bit or 1-bit units.

Address: See **Section 2.7.1, Noise Filter Assignment**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NFENL7	NFENL6	NFENL5	NFENL4	NFENL3	NFENL2	NFENL1	NFENL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2.7.3.4, DNFAEN_<name> — Digital Noise Elimination Enable Register**.

Section 3 CPU System

3.1 Overview

3.1.1 Block Diagram

For the block diagram of the CPU system, see **Section 1, Overview, Figure 1.9** to **Figure 1.14**.

The CPU system consists of the following modules.

CPU0 (PE0), CPU1 (PE1), CPU2 (PE2), CPU3 (PE3)

The RH850G4MH2 core is included as the main CPU. The CPUs also include a checker core for safety assurance.

NOTES

1. **CPU2 (PE2), CPU3 (PE3) are not implemented in RH850/U2A8 and RH850/U2A6.**
2. **In this Section 3, "G4MH core" is understood as "G4MH2 core".**

ICUMHA

Refer to the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Local RAM

Each PE has a high-speed accessible local RAM.

Cluster RAM

The cluster RAM is a mass on-chip RAM that all PEs share. Some areas of this RAM function as the retention RAM.

Code Flash

A mass code flash is included for program storage. All PEs and ICUMHA share the code flash and they are connected with each other via the Local/Global FLASH Bus.

Emulation RAM

This is RAM to emulate the code flash. The programs can be replaced by control from an external tool without rewriting the code flash. It is supported in RH850/U2A-EVA and RH850/U2A6.

Data Flash

This is a flash memory rewritable by the CPU.

Instrumentation RAM

Instrumentation RAM is data holding RAM area incorporated as the RH850 2nd generation debugging function for tools to output. It is supported only in RH850/U2A-EVA.

P-Bus and H-Bus and I-Bus

Peripheral IPs are connected on P-Bus, H-Bus and I-Bus.

U2A-EVA, U2A16, U2A8: The P-Bus consists of 10 groups, P-Bus Group 0 to 9.
The H-Bus consists of 4 groups, H-Bus Group 0 to 3.
The I-Bus consists of 3 groups, I-Bus Group 0 to 2.

U2A6: The P-Bus consists of 10 groups, P-Bus Group 0 to 9.
The H-Bus consists of 2 groups, H-Bus Group 1 and 3.
The I-Bus consists of 3 groups, I-Bus Group 0 to 2.

Refer to each section on peripheral IPs for information on bus groups.

INTC1, INTC2

INTC1 is an interrupt controller exclusive to each PE. INTC2 is a common interrupt controller that all PEs can share, which is able to set the destination PE for binding interrupt requests by the registers.

DMA

Two DMA transfer modules, sDMAC and DTS, are included. DTS includes the checker logic for safety assurance.

3.2 CPU

3.2.1 Core Functions

3.2.1.1 Features

Table 3.1 lists the features of the RH850G4MH core. See the *RH850G4MH User's Manual: Software.*

Table 3.1 Features of the RH850G4MH Core

Item	Feature
CPU	• High performance 32-bit architecture for embedded control • 32-bit internal data bus • Thirty-two 32-bit general-purpose registers • RISC-type instruction sets Long/short type load/store instructions Three-operand instructions Instruction sets based on C • Supports Hardware-assisted Virtualization – CPU operation mode, register access privileges, and instruction execution privileges for virtual machines – Independent exception processing/interrupt acceptance processing for virtual machines – Nested memory protection function for virtual machines – Context high-speed save/return function for virtual machines • CPU operating modes – User mode, supervisor mode • Address space: 4-GB linear space for both data and instructions • Out-of-Order execution
Coprocessor	• A floating point operation coprocessor (FPU) Supports single precision (32-bits) and double precision (64-bits). Supports IEEE754-compliant data types and exceptions. Rounding mode: Nearest, 0 direction, +∞ direction, and -∞ direction Handling of non-normalized numbers: These are truncated to 0, or an exception is reported to comply with IEEE754.
Exception/Interrupt	• 64-level interrupt priority that can be specified for each channel • Vector selection method that can be selected according to performance requirements and the amount of consumed memory Direct branch method exception vector (direct vector method) Address-table-referencing indirect branch method exception vector (table reference method) • Support for high-speed context save and restore processing on interrupt by using dedicated instructions (PUSHSP, POPSP) • Support for high-speed context save on interrupt by using the register bank feature • Support for restoration from the register bank using a dedicated instruction (RESBANK) • The following functions are added for Hardware assisted Virtualization – Exception handling for Host mode and Guest mode can be used independently. – Exception vector for Host mode and Guest mode can be used independently. – Interrupt assigned to Host Mode is given priority over any other interrupts assigned to Guest Mode. – Interrupt channel can be assigned to Guest mode. – High priority interrupt for background Guest can be accepted promptly.
Memory Management	• Memory protection function (MPU): 32 areas settable.
Cache	• Instruction cache 16 KB

Notes: • For details of Virtualization and Hypervisor, see the *RH850G4MH Virtualization User's Manual: Hardware.*
• FXU (extended floating-point operation unit) is not supported in RH850/U2A.

3.2.2 Processor Model

This CPU defines a processor model that has basic operation functions, registers, and an exception management function.

This section describes the unique features of the processor model of this CPU.

3.2.2.1 CPU Operating Modes

This CPU has two operating modes of the supervisor mode (SV) and the user mode (UM). Whether the system is in supervisor mode or user mode is indicated by the UM bit in the PSW register.

- Supervisor mode (PSW.UM = 0): All hardware functions can be managed or used.
- User mode (PSW.UM = 1): The usable hardware functions are restricted.

(1) Definition of CPU Operating Modes

(a) Supervisor Mode (SV)

All hardware functions can be managed or used in this mode. The system always starts up in supervisor mode after a reset.

(b) User Mode (UM)

This operating mode makes up a pair with the supervisor mode. In user mode, address spaces to which access is permitted by the supervisor and the system registers defined as user resources can be used. Supervisor-privileged instructions cannot be executed and result in exceptions.

Restriction in user mode (PSW.UM = 1)

- Privileged instruction violations due to SV-privileged-instruction operating restrictions (→ PIE exceptions)

For details about privileged-instruction operating restrictions, see **Section 3.2.2.1(3), CPU Operating Mode and Privileges**.

(2) CPU Operating Mode Transition

The CPU operating mode changes due to three events.

(a) Change due to Acknowledging an Exception

When an exception is acknowledged in user mode, the CPU operating mode changes to privileged mode.
When an exception is acknowledged in supervisor mode, the CPU operating mode remains as is.

(b) Change due to a Return Instruction

When a return instruction is executed, the PSW value is restored according to the value of the corresponding bit backed up to EIPSW and FEPSW.

(c) Change due to a System Register Instruction

The CPU operating mode changes when an LDSR instruction is used to directly overwrite the PSW operating mode bits.

CAUTION

The CPU operating mode cannot be changed in user mode because the higher-order 31 to 5 bits of the PSW register cannot be overwritten while the mode can be changed in supervisor mode. This CPU guarantees that if an LDSR instruction is used to update the PSW register, the new setting will be reflected when the subsequent instruction is executed. However, this CPU does not guarantee that the new setting will be reflected in the memory protection by the MPU for instruction fetch of the subsequent instruction. Therefore, for changing the higher-order 31 to 5 bits of the PSW register, it is recommended to use a return instruction. For details, see Section 3.2.7.3, Hazard Management after System Register Update.

(3) CPU Operating Mode and Privileges

In this CPU, the usable functions can be restricted according to usage permission settings for specific resources and the CPU operating mode. Specific instructions (including instructions that update specific system registers) can only be executed in the defined operating mode. The permissions necessary to execute these specific instructions are called “privileges”. In operating modes that do not have privileges, these instructions are not executed and exceptions occur.

This CPU defines the following two types of privileges (usage permission).

- Supervisor (SV) privilege: Privilege necessary for important system resources operation, fatal error processing, and user-mode program execution management
- Coprocessor use permissions: Permissions necessary to use a coprocessor

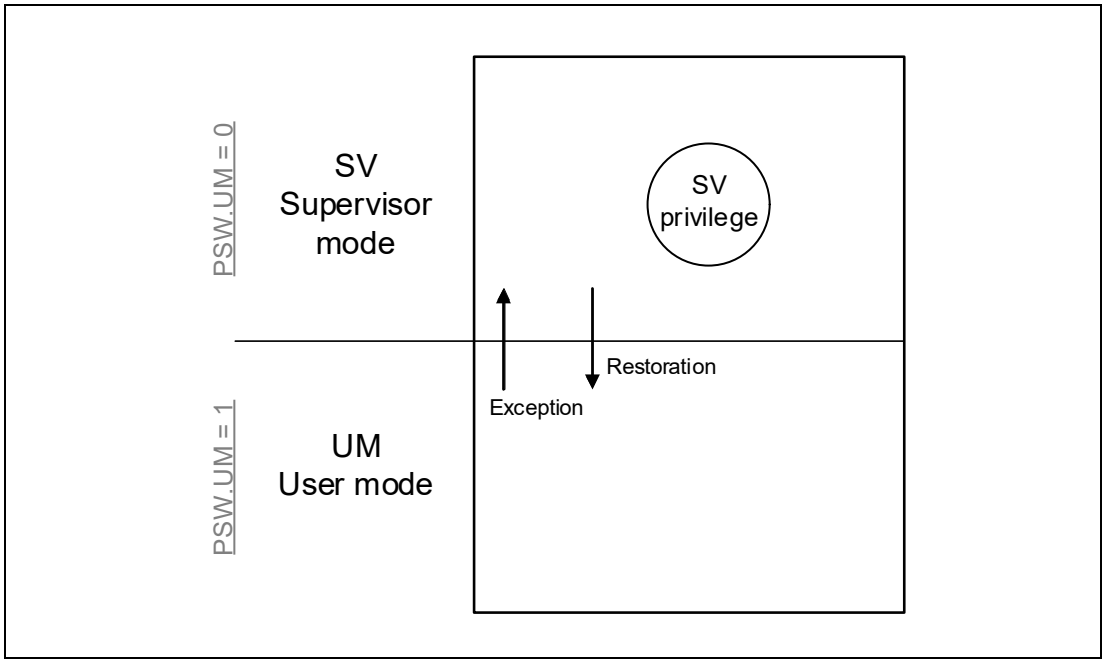

Figure 3.1 CPU Operating Modes and Privileges

(a) Supervisor Privilege (SV Privilege)

The privilege necessary to perform the operation for important system resources, fatal error processing, and user-mode program execution management is called the supervisor privilege (SV privilege). This privilege is available in supervisor mode. The SV privilege is generally necessary to execute instructions used to perform the operation for important system resources, and these instructions are sometimes called SV privileged instructions.

(b) Coprocessor Use Permissions

Regardless of the CPU operating mode, it is possible to specify whether coprocessors can be used.

The CU2 to CU0 bits in the PSW register are used by a supervisor to specify whether coprocessors can be used by each program. If the CU 2 to CU0 bits are not set to 1, a coprocessor unusable exception occurs when the corresponding coprocessor instruction is executed or the system register is accessed.

If no coprocessor is installed, it is not possible to set the corresponding CU bits to 1. The setting of the CU2 to CU0 bits is valid regardless of the CPU operating mode, and, if the supervisor accesses coprocessor system registers, it is necessary to set the CU2 to CU0 bits to enable coprocessor use.

(c) Operation when there is a Privilege Violation

When a privileged instruction is executed by someone who does not have the required privilege, or when a system register for which access permission is specified is accessed by someone who does not have the required permission, a PIE exception or UCPOP exception occurs.

The relationship between instructions that can be executed according to operating mode and use permission are shown in **Table 3.2**, and the relationship between system registers that can be accessed according to operating mode and use permission are shown in **Table 3.3**.

Table 3.2 Operation when Violating Execution Permission

Instruction		PSW				
Execution Permission	Classification	UM	CU2	CU1	CU0	Whether Instructions can be Executed
SV privilege	*1	0	—	—	—	Possible
		1	—	—	—	Not possible (PIE exception occurs)
User	Coprocessor 0 instruction	—	—	—	0	Not possible (UCPOP exception occurs)
		—	—	—	1	Possible
	Coprocessor 1 instruction	—	—	0	—	Not possible (UCPOP exception occurs)
		—	—	1	—	Possible
	Coprocessor 2 instruction	—	0	—	—	Not possible (UCPOP exception occurs)
		—	1	—	—	Possible
	Other than above	—	—	—	—	Possible

Note: —: 0 or 1

Note 1. Coprocessor instructions with SV privilege are not defined in this CPU.

Table 3.3 Operation When Violating Access Permission to System Registers

System Register		PSW				
Access Permission	Classification	UM	CU2	CU1	CU0	Whether Instructions can be Executed
SV permission	Coprocessor 0 Permission	0	—	—	0	Inaccessible (UCPOP exception occurs)
		0	—	—	1	Accessible
		1	—	—	0	Inaccessible (UCPOP exception occurs)
		1	—	—	1	Inaccessible (PIE exception occurs)
	Coprocessor 1 Permission	0	—	0	—	Inaccessible (UCPOP exception occurs)
		0	—	1	—	Accessible
		1	—	0	—	Inaccessible (UCPOP exception occurs)
		1	—	1	—	Inaccessible (PIE exception occurs)
	Coprocessor 2 Permission	0	0	—	—	Inaccessible (UCPOP exception occurs)
		0	1	—	—	Accessible
		1	0	—	—	Inaccessible (UCPOP exception occurs)
		1	1	—	—	Inaccessible (PIE exception occurs)
	Other than above	0	—	—	—	Accessible
		1	—	—	—	Inaccessible (PIE exception occurs)
UM permission	Coprocessor 0 Permission	—	—	—	0	Inaccessible (UCPOP exception occurs)
		—	—	—	1	Accessible
	Coprocessor 1 Permission	—	—	0	—	Inaccessible (UCPOP exception occurs)
		—	—	1	—	Accessible
	Coprocessor 2 Permission	—	0	—	—	Inaccessible (UCPOP exception occurs)
		—	1	—	—	Accessible
	Other than above	—	—	—	—	Accessible

Note: —: 0 or 1

(4) Halt State by a HALT Instruction

Executing a HALT instruction brings the CPU core to a HALT state.

A HALT state is terminated when a request for a terminating exception is made to the CPU. At this point, if the conditions for acknowledging the terminating exception are met, control is transferred to the exception handler address. Even if they are not met, the HALT state is terminated when the request is made; therefore, operation is resumed from the instruction following the HALT instruction.

(5) Temporary Halt State by a SNOOZE Instruction

A SNOOZE instruction is an instruction to reduce the use of bus bandwidth during a spinlock. After this instruction is completed, the CPU core is brought to a temporary halt state to restrict the execution of the subsequent instructions. Programmers can avoid the unnecessary use of bus bandwidth that results from short-term repetition of a locking process, by inserting this instruction into a spinlock loop.

A temporary halt state is terminated if any of the following conditions is met:

- After the time specified by the SNZCFG register elapsed, the execution of the subsequent instructions is resumed.
- The occurrence of a terminating exception causes control to be transferred to the exception handler address. If the conditions for acknowledging the exception are not met, execution is resumed from the instruction following the SNOOZE instruction. Also, if the exception is acknowledged, the instruction following the SNOOZE instruction is interrupted, and the PC restored indicates the instruction following the SNOOZE instruction.

(6) Timing Adjustment by Instruction

If there is a necessary to adjust timing for program execution, SYNCP can be used as a specific instruction. When execute SYNCP in a row, the number of cycle which costs for 1 instruction depends on the CPU core. In case of G4MH core, this cycle number is 3. To adjust timing, the other instructions are not guaranteed.

3.2.2.2 Instruction Execution

The instruction execution flow of this CPU is shown below.

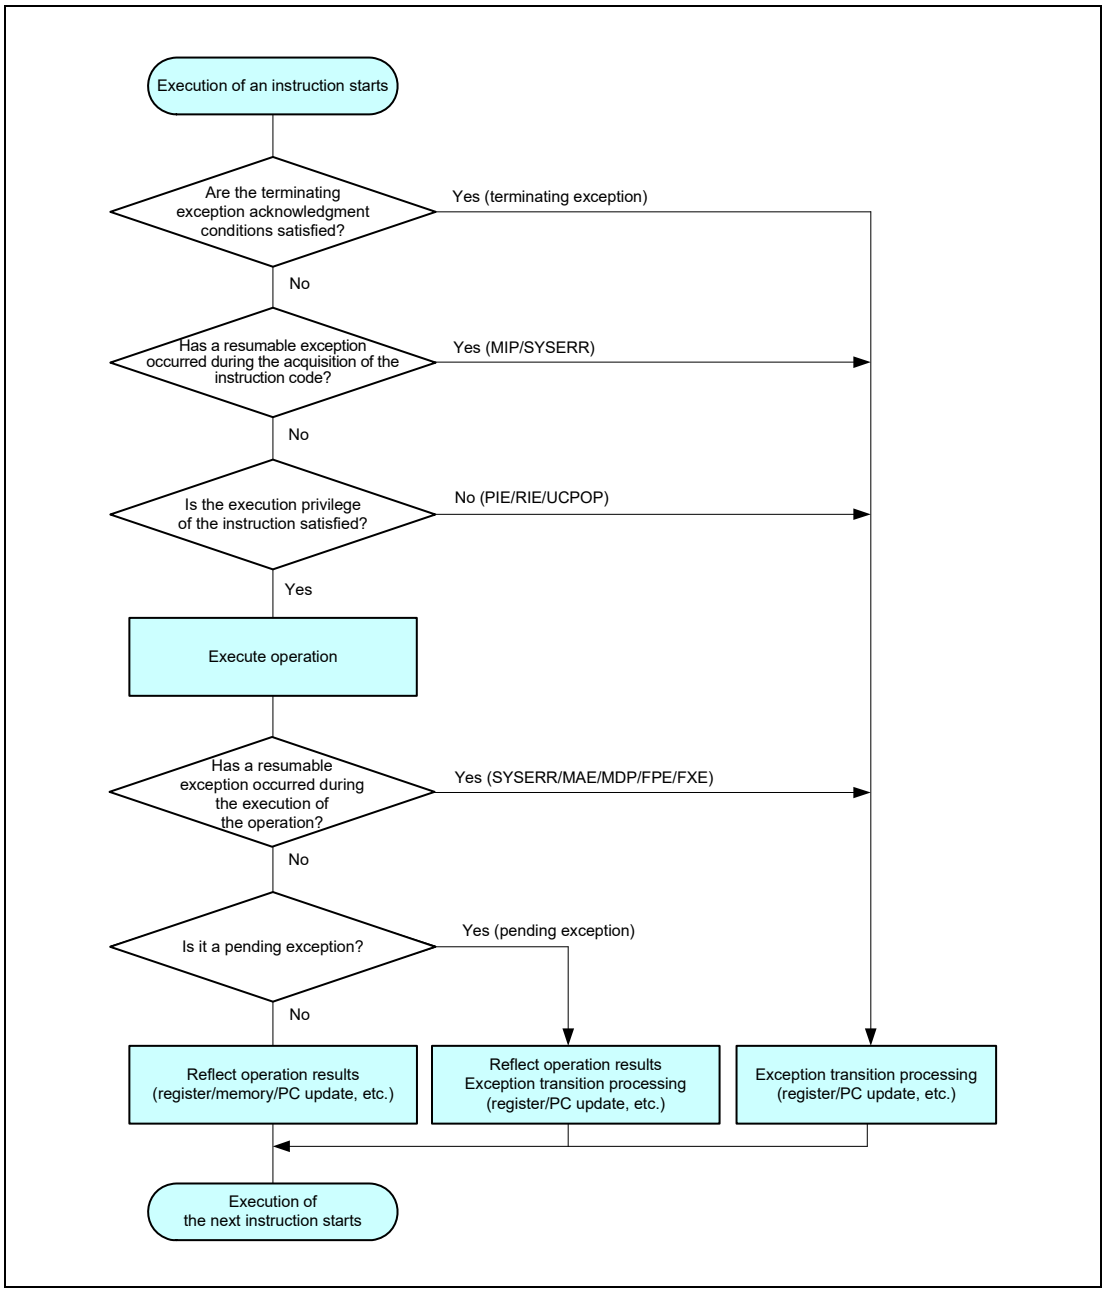

Figure 3.2 Instruction Execution Flow

If terminating exceptions can be acknowledged, if an exception is detected during the acquisition of instruction code, or if the execution privilege of the instruction is not satisfied, an exception occurs before the instruction is executed. If a resumable exception occurs while the CPU is executing the operation, it interrupts the execution of the operation and acknowledges the exception. In these cases, the result of instruction operation is, in principle, not reflected in registers or memory and the CPU retains its state that is established before executing the instruction.*1

For a pending exception such as a software exception, the exception is acknowledged after the result of instruction execution has been reflected.

For details of the types of exceptions, refer to **Section 3.2.2.3, Exceptions and Interrupts**.

Note 1. If an exception is acknowledged during the execution of the following instructions, intermediate results may be applied to memory or general-purpose registers. However, SP/EP is not updated.

- PREPARE, DISPOSE, PUSHSP, POPSP, STM.MP, LDM.MP

3.2.2.3 Exceptions and Interrupts

Exceptions and interrupts are exceptional events that cause the program under execution to branch to another program. Exceptions and interrupts are triggered by various sources, including interrupts from peripherals and program abnormalities.
For details, see **Section 3.2.2.3, Exceptions and Interrupts**.

(1) Types of Exceptions

The exceptions of this CPU are divided into the following three types according to the purpose of the exceptions.

- Terminating exception
- Resumable exception
- Pending exception

(a) Terminating Exception

A terminating exception is an exception that is acknowledged by interrupting an instruction before the execution of the operation for the instruction. Terminating exceptions include interrupts, etc.

This type of exceptions, such as an interrupt or hardware error, start another program irrelevant to the currently processed program.

(b) Resumable Exception

A resumable exception is an exception that occurs during the execution of the operation for an instruction and that is acknowledged without the completion of the instruction. It is also referred to as a precise exception because it is precisely acknowledged without the completion of the relevant instruction or the execution of the subsequent instruction.

Unlike a terminating exception, a resumable exception occurs during the execution of an instruction, and cancel the execution of the instruction, and so it allows the instruction to be executed again after exception handling. Therefore, it is possible to perform complex memory management while maintaining the consistency of the logical operation of programs, by executing the same instruction again after appropriate configuration by exception handling.

(c) Pending Exception

A pending exception is an exception that occurs as a result of the execution of the operation for an instruction, and that is acknowledged after the completion of the instruction. Pending exceptions include software exceptions, etc.

The occurrence of a pending exception is defined as a normal operation of an instruction; therefore, unlike a resumable exception, a pending exception normally completes the instruction that caused it, and never re-executes the instruction. This exception is intended mainly for use in call gates, for example, for calling a management program.

(2) Exception Level

In this CPU, if an exception with a high degree of urgency occurs while another exception is being processed, the urgent exception will be processed. To make it possible to return to the interrupted exception handling after acknowledging the urgent exception, even if the context had not been saved to the memory, exception causes are managed in the following two hierarchical levels.

- EI level exception
- FE level exception

EI level exceptions are used for processing such as regular user processing, interrupt servicing, and OS processing. FE level exceptions are used to enable interrupts with a high degree of urgency for the system or exceptions from the memory management function that might occur during OS processing to be acknowledged even while an EI level exception is being processed.

3.2.2.4 Coprocessors

In this CPU, single-precision and double-precision floating-point unit (FPU) and extended floating-point operation unit (FXU) are incorporated. Note that these coprocessors may not be available depending on the specification of the product.

(1) Coprocessor Use Permissions

To execute a coprocessor instruction, permission to use the corresponding coprocessor instruction is necessary. Coprocessor use permissions are specified by the PSW.CU2 to PSW.CU0 bits, and, if an attempt is made to execute an instruction for which the corresponding coprocessor use permission is cleared to 0, a coprocessor unusable exception (UCPOP) occurs.

In the following cases, the values of the PSW.CU2 to CU0 bits are fixed at 0 and cannot be changed.

- Coprocessor functions are not incorporated in the product
- Coprocessor functions are made unavailable according to the functions of the product

(2) Correspondences between Coprocessor Use Permissions and Coprocessors

This CPU defines coprocessor use permissions to control the availability of the coprocessor for each program during CPU operation. There are three coprocessor use permissions (CU0 to CU2), and their correspondences with the coprocessors are shown in the following table. This CPU does not have a coprocessor function with the coprocessor use permission CU2. The coprocessor use permission CU2 is a function reserved for future CPUs that have compatibility with this CPU.

Table 3.4 Correspondences between Coprocessor Use Permissions and Coprocessors

Coprocessor Use Permission	Coprocessor	Exception Cause Code
CU0	Single-precision FPU	80_H
	Double-precision FPU	
CU1	FXU	81_H
CU2	Reserved	82_H

(3) Coprocessor Unusable Exceptions

A coprocessor unusable exception occurs if an attempt is made to execute a coprocessor instruction or access a system register of the coprocessor without having the corresponding coprocessor use permission (PSW.CUn = 0).

For details about the opcodes of the coprocessor instructions, see the *RH850G4MH User's Manual: Software*. For details about the system registers of the coprocessors, see **Section 3.2.3.4, FPU Function Registers** and **Section 3.2.3.5, FXU Function Registers**.

If the register bank function is used, the FPSR register, which is a system register of the FPU, is accessed when the automatic context saving and the RESBANK instruction is executed. In this case, even if the coprocessor use permission is not given (PSW.CU0 = 0), a coprocessor unusable exception does not occur.

(4) System Registers

Some coprocessor functions have system registers as the part of their functions. The coprocessor use permission is necessary to access the system register of a coprocessor function. For some system registers, the supervisor privilege (SV privilege) is necessary in addition to the coprocessor use permission.

For details about the permissions necessary to access system registers, see **Section 3.2.2.5, Registers**.

3.2.2.5 Registers

This CPU defines program registers (general-purpose registers and the program counter PC) and system registers for controlling the status and storing exception information.

(1) Program Registers

The program registers include general-purpose registers (r0 to r31) and the program counter (PC).

Table 3.5 Program Registers

Category	Access Permission	Name
Program counter	UM	PC
General-purpose registers	UM	r0-r31

Note: Access to the registers with UM (user mode) access permission is always allowed.

For details about program registers, see **Section 3.2.3.1, Program Registers**.

(2) System Registers

System registers are placed in dedicated address spaces defined based on two types of address information: selection ID and register number. Up to 32 selection ID can be defined, and one selection ID includes up to 32 system registers. Therefore, up to 1024 system registers can be defined in the address spaces for system registers. Basically this CPU allocates selection ID as shown below:

Selection ID 0 to 3:	Registers related to basic functions
Selection ID 4 and 5:	Registers related to the memory management function
Selection ID 10 and 11:	Registers related to functions expanded from the legacy architecture
Selection ID 12 and 13:	Registers related to this CPU specific hardware functions
Other ID:	Reserved for future expansion of CPUs compatible with this CPU

For details about system registers, see the relevant sections in **Section 3.2.3, Register Set**.

(3) Register Updating

There are several methods used to update registers. Normally, no particular restrictions apply when updating register by using an instruction. However, when updating registers by using the following instructions, some restrictions might apply, depending on the operating mode.

- LDSR
- STSR

(a) LDSR and STSR

The LDSR and STSR instructions can access all the system registers.

However, if a system register is accessed without the proper permission, a PIE exception or UCPOP exception might occur. For details about the access permission for each register, see the description of system registers in **Section 3.2.3, Register Set**. For details about behaviors when a privilege violation occurs, see **Section 3.2.2.1(3), CPU Operating Mode and Privileges**.

Figure 3.3 shows the flow of executing the LDSR and STSR instructions.

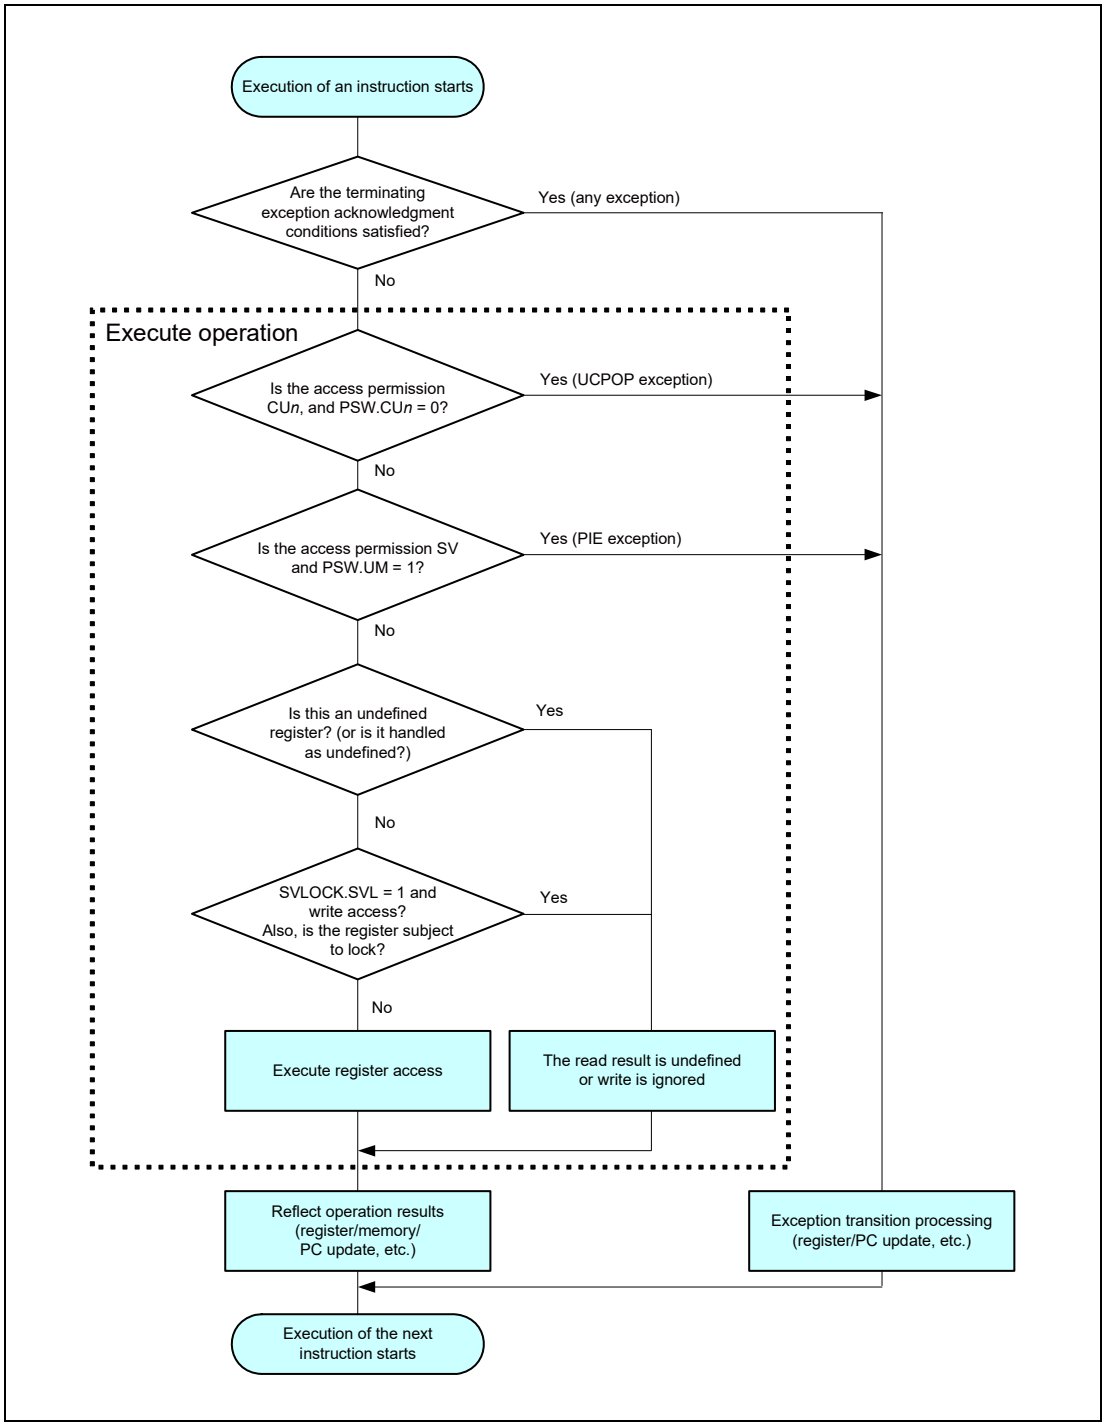

Figure 3.3 Flow of Executing the LDSR and STSR Instructions

(4) Accessing Undefined Registers

If a system register number without any register assigned is accessed or if an inaccessible register is accessed, the following results occur.

- Undefined registers are handled as having the SV permission. When they are accessed by an LDSR or STSR instruction in user mode (PSW.UM = 1), a PIE exception occurs.
- For a read operation, the read result is undefined. If the read value is used in a program, unexpected behaviors might occur.
- For a write operation, the write operation is ignored.

(5) Supervisor Lock Setting

If the SVLOCK.SVL bit is set (1), the following system registers cannot be updated even in supervisor mode:

SPID, MPM, MPLA, MPUA, MPAT, MPIDn, and MPBK

However, if the SVLOCK.SVL bit is set (1), an attempt to update the system registers above does not cause a PIE exception.

Also, even if the SVLOCK.SVL bit is set (1), it is possible to read the system registers above.

This function is intended for the safety of systems that incorporate this CPU. It prevents a program running in supervisor mode from abruptly changing memory protection setting due to a programming error, etc., to make illegal memory access possible, and to impair safety.

3.2.2.6 Data Types

(1) Data Formats

This CPU handles data in little endian format. This means that byte 0 of a halfword or a word is always the least significant (rightmost) byte.

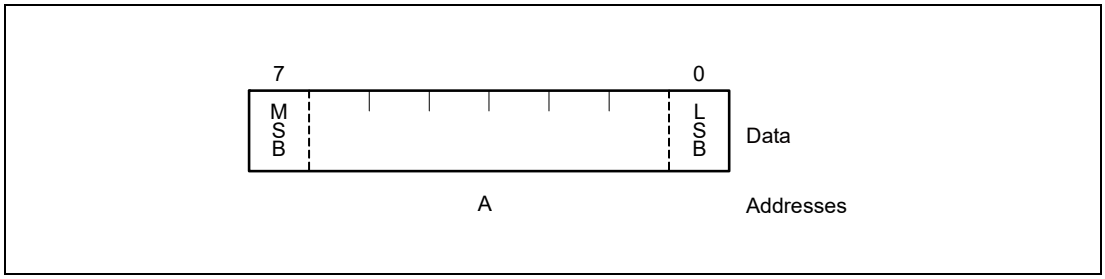
The supported data format is as follows.

- Byte (8-bit data)
- Halfword (16-bit data)
- Word (32-bit data)
- Double-word (64-bit data)
- Quad-word (128-bit data)
- Bit (1-bit data)

In this CPU, a memory access of double-word data is divided into two non-atomic memory accesses of word data, and a memory access of quad-word data is divided into four non-atomic memory accesses of word data.

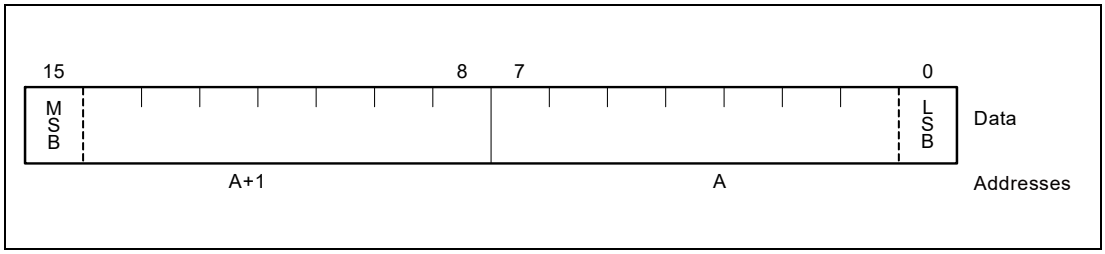
(a) Byte

A byte is 8 consecutive bits of data that starts from any byte boundary. Numbers from 0 to 7 are assigned to these bits, with bit 0 as the LSB (least significant bit) and bit 7 as the MSB (most significant bit). The byte address is specified as “A”.



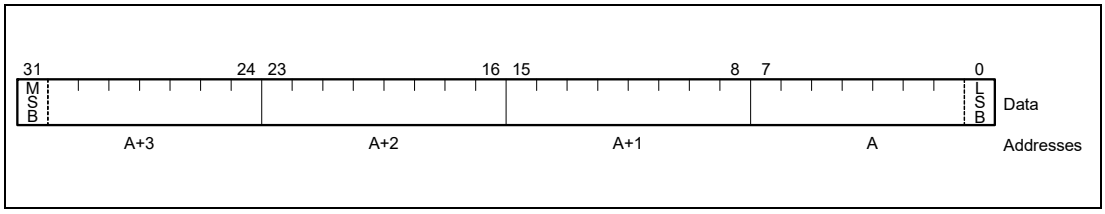
(b) Halfword

A halfword is two consecutive bytes (16 bits) of data that starts from any byte boundary. Numbers from 0 to 15 are assigned to these bits, with bit 0 as the LSB and bit 15 as the MSB. The bytes in a halfword are specified using address “A”, so that the two addresses comprise byte data of “A” and “A + 1”.



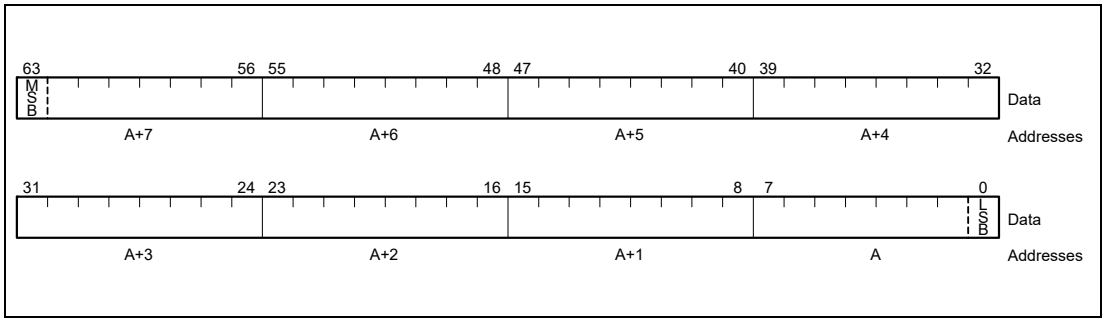
(c) Word

A word is four consecutive bytes (32 bits) of data that starts from any byte boundary. Numbers from 0 to 31 are assigned to these bits, with bit 0 as the LSB (least significant bit) and bit 31 as the MSB (most significant bit). A word is specified by address “A” and consists of byte data of four addresses: “A”, “A + 1”, “A + 2”, and “A + 3”.



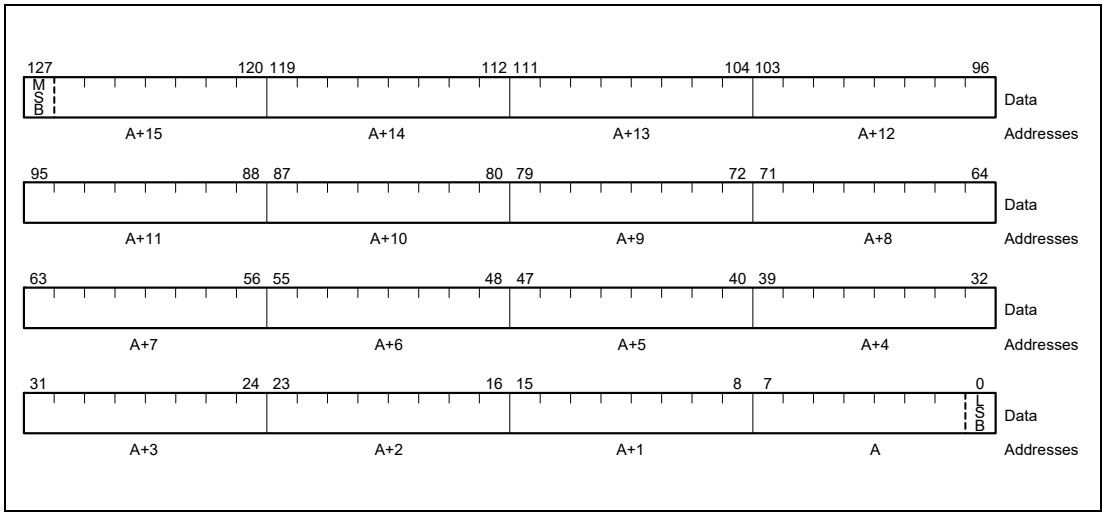
(d) Double-word

A double-word is eight consecutive bytes (64 bits) that start from any 4-byte boundary. Numbers from 0 to 63 are assigned to these bits, with bit 0 as the LSB and bit 63 as the MSB. A double-word is specified by address “A” and consists of byte data of eight addresses: “A”, “A + 1”, “A + 2”, “A + 3”, “A + 4”, “A + 5”, “A + 6”, and “A + 7”.



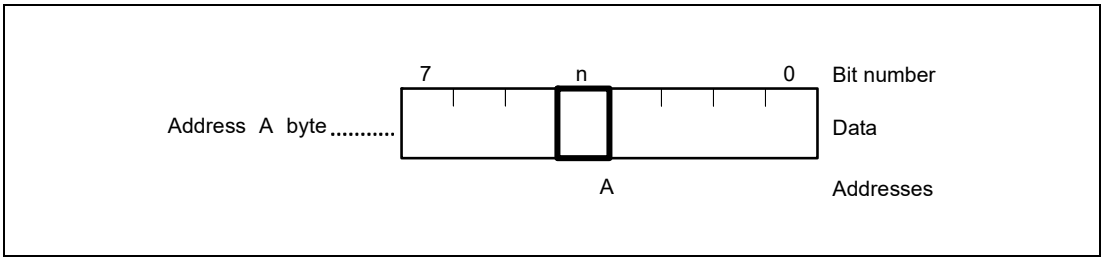
(e) Quad-word

A quad-word is sixteen consecutive bytes (128 bits) that start from any 8-byte boundary. Numbers from 0 to 127 are assigned to these bits, with bit 0 as the LSB and bit 127 as the MSB. A quad-word is specified by address “A” and consists of byte data of sixteen addresses: “A”, “A + 1”, …, and “A + 15”.



(f) Bit

A bit is bit data at the nth bit within 8-bit data that starts from any byte boundary. Each bit is specified using its byte address “A” and its bit number “n” (n = 0 to 7).



(2) Data Representation

(a) Integers

Integers are represented as binary values using 2's complement, and are used in one of four lengths: 64 bits, 32 bits, 16 bits, or 8 bits. Regardless of the length of an integer, its place uses bit 0 as the LSB, and this place gets higher as the bit number increases. Because this is a 2's complement representation, the MSB is used as a sign bit.

The integer ranges for various data lengths are as follows.

- Double-word (64 bits): −9223372036854775808 to +9223372036854775807
- Word (32 bits): −2147483648 to +2147483647
- Halfword (16 bits): −32768 to +32767
- Byte (8 bits): −128 to +127

Although data format of quad-word (128 bits) is defined, data representation of quad-word is not used in this CPU. This is because quad-word data consists of four-word data or two-double-word data, but this CPU does not process quad-word data directly.

(b) Unsigned Integers

In contrast to "integers" which are data that can take either a positive or negative sign, "unsigned integers" are never negative integers. Like integers, unsigned integers are represented as binary values, and are used in one of four lengths: 64 bits, 32 bits, 16 bits, or 8 bits. Also like integers, the positioning of unsigned integers uses bit 0 as the LSB and gets higher as the bit number increases. However, unsigned integers do not use a sign bit.

The unsigned integer ranges for various data lengths are as follows.

- Double-word (64 bits): 0 to 18446744073709551615
- Word (32 bits): 0 to 4294967295
- Halfword (16 bits): 0 to 65535
- Byte (8 bits): 0 to 255

(c) Bits

Bit data are handled as single-bit data with either of two values: cleared (0) or set (1). There are four types of bit-related operations (listed below), which target only single-byte data in the memory space.

- Set
- Clear
- Invert
- Test

(3) Data Alignment

In this CPU, misaligned data allocation is inhibited. When the result of address calculation is a misaligned address, a misalignment exception (MAE) occurs.

Misaligned access indicates the accesses to the data size with the addresses listed below:

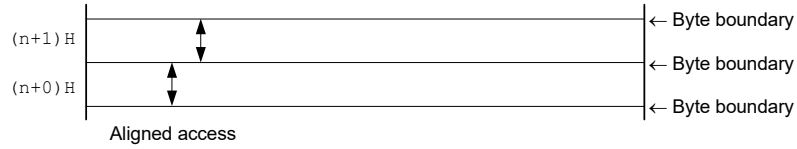
- Halfword size: The access to an address that is not at the halfword boundary (where LSB of the address = 0)
- Word size: The access to an address that is not at the word boundary (where the lowest two bits of the address = 0).
- Double-word size: The access to an address that is not at the double-word boundary (where the lowest three bits of the address = 0).
- Quad-word size: The access to an address that is not at the quad-word boundary (where the lowest four bits of the address = 0)

For the double-word format only, a misaligned access exception does not occur when data is placed at the word boundary but not at the double-word boundary, and data can be normally accessed in double word.

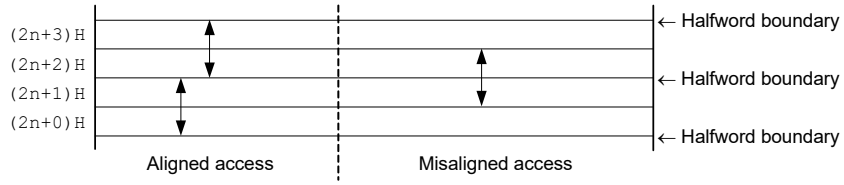
CAUTIONS

1. **The following instructions might possibly cause misaligned access. For details, see the relevant descriptions in the *RH850G4MH User's Manual: Software*.**
   - **LD.H, LD.HU, LD.W, LD.DW**
   - **SLD.H, SLD.HU, SLD.W**
   - **ST.H, ST.W, ST.DW**
   - **SST.H, SST.W**
   - **LDL.HU, LDL.W, STC.H, STC.W, CAXI**
   - **LDV.W, LDV.DW, LDV.QW, STV.W, STV.DW, STV.QW**
   - **LDVZ.H4, STVZ.H4**
2. **The following instructions do not cause misaligned access, because the address is rounded as the instruction specification when a misaligned address is specified.**
   - **PREPARE, DISPOSE**
   - **PUSHSP, POPSP**
   - **STM.MP, LDM.MP**

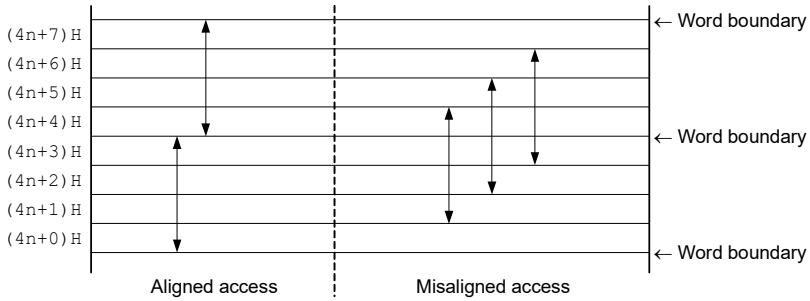
(a) Byte Access



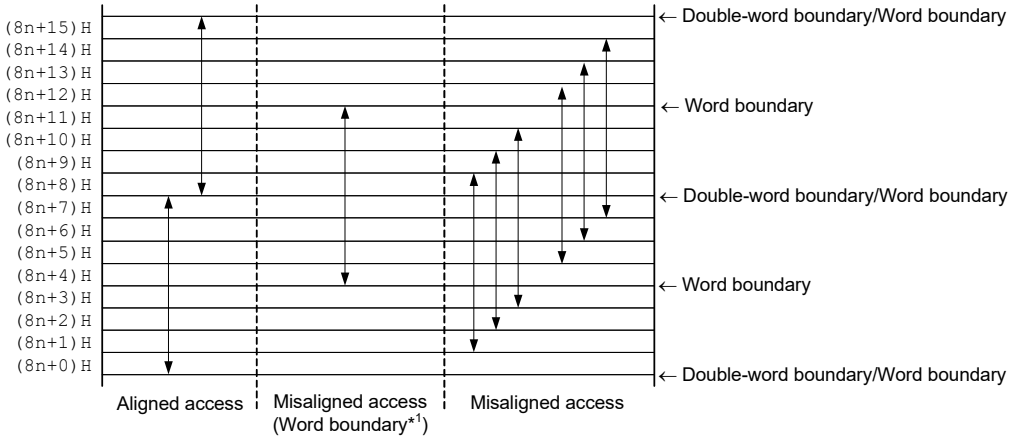
(b) Halfword Access



(c) Word Access



(d) Double-word Access



Note 1. No misalignment exception (MAE) occurs for LD.DW and ST.DW instructions. For details, see LD.DW and ST.DW in the *RH850G4MH User's Manual: Software*. An MAE occurs for other double-word access instructions.

Figure 3.4 Example of Data Placement for Misaligned Access (1/2)

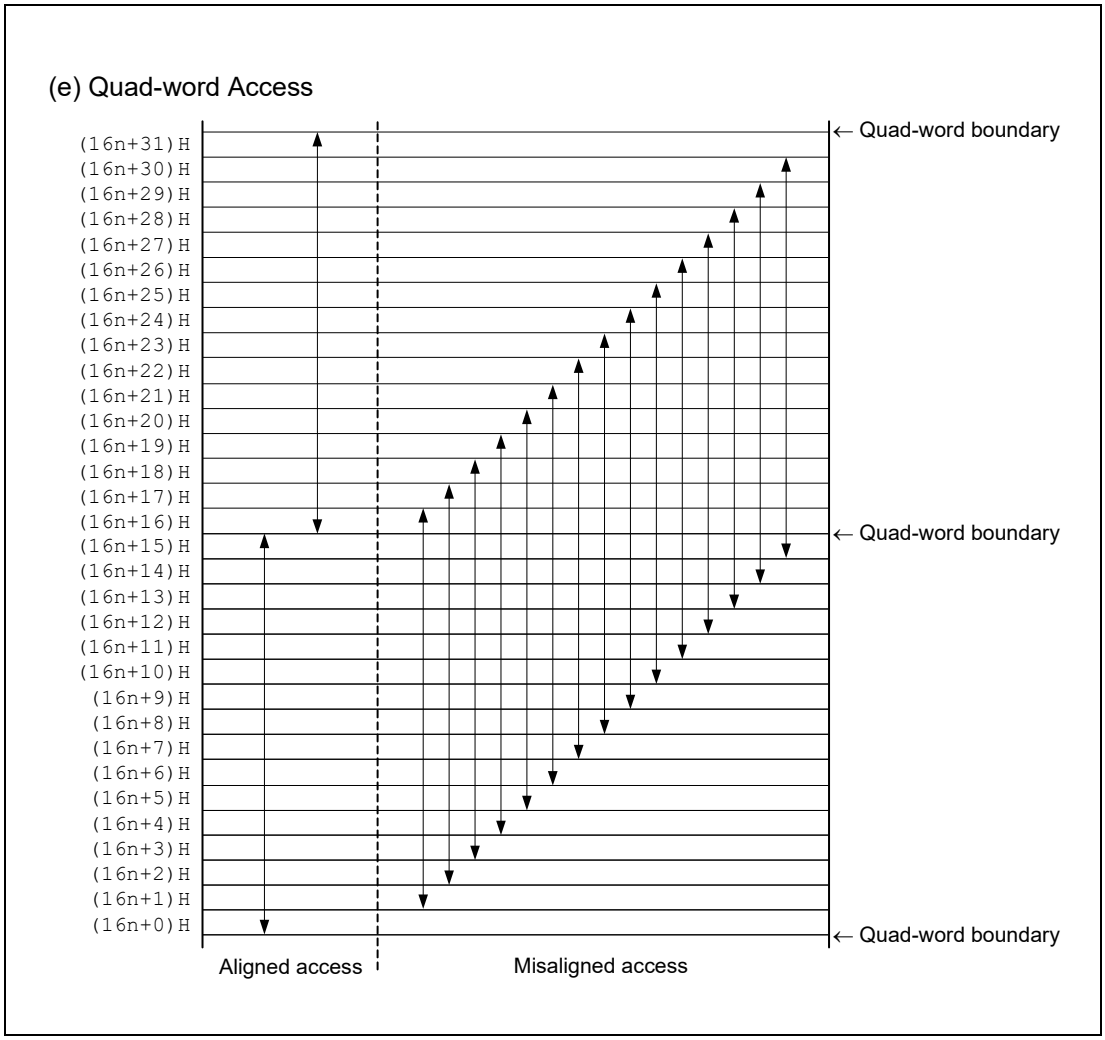


Figure 3.4 Example of Data Placement for Misaligned Access (2/2)

3.2.2.7 Address Space

This CPU supports a linear address space of up to 4 Gbytes. Both memory and I/O can be mapped to this address space (using the memory mapped I/O method). The CPU outputs a 32-bit address for memory and I/O, in which the highest address number is "$2^{32} - 1$".

The byte data placed at various addresses is defined with bit 0 as the LSB and bit 7 as the MSB. When the data is comprised of multiple bytes, it is defined so that the byte data at the lowest address is the LSB and the byte data at the highest address is the MSB (i.e., in little endian format).

This manual stipulates that, when representing data comprised of multiple bytes, the right edge must be represented as the lower-order addresses and the left side as the higher-order addresses, as shown below.

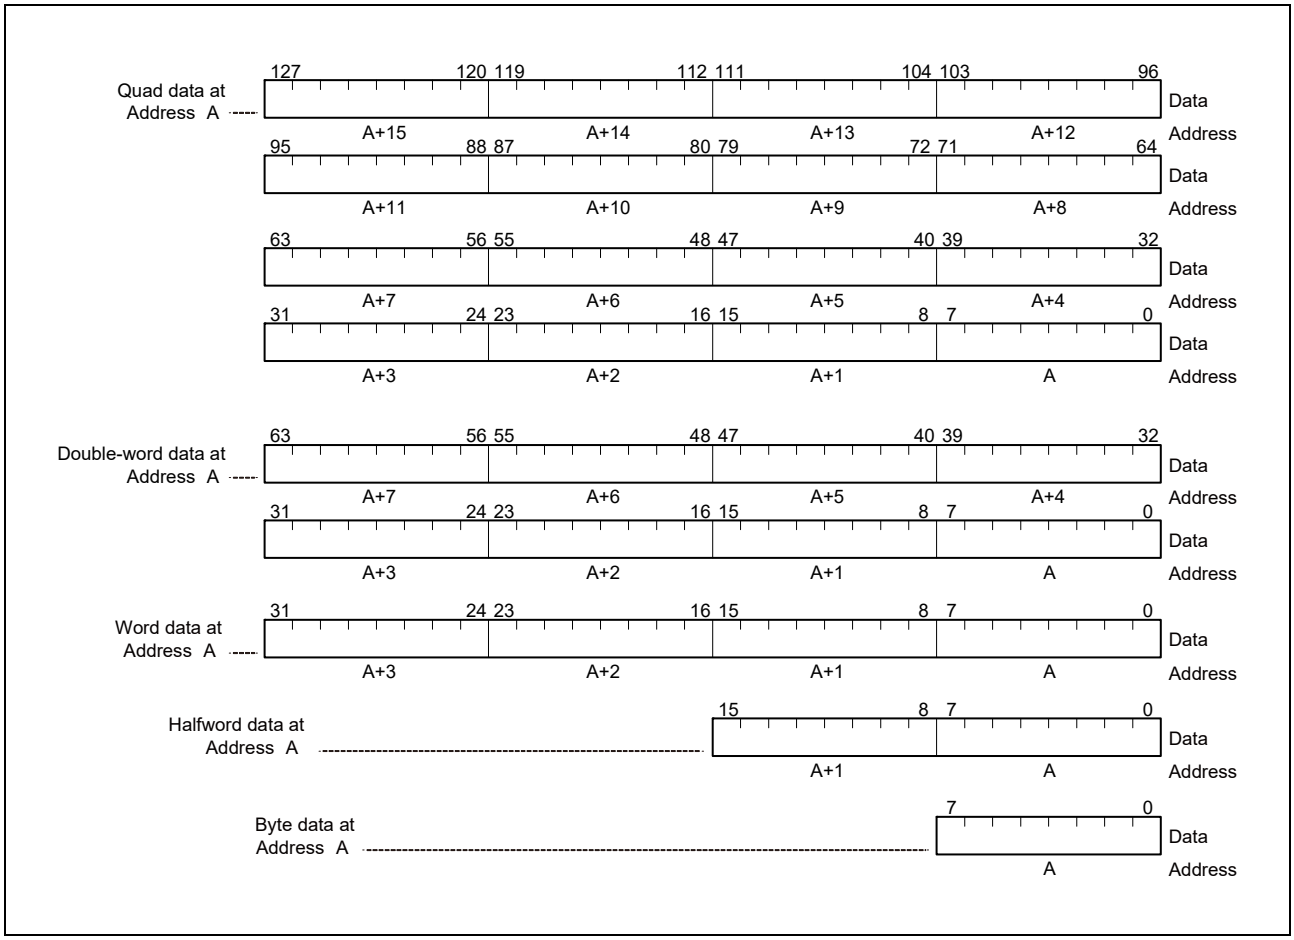

Figure 3.5 Address Space Byte Format

(1) Memory Map

This CPU is 32-bit architecture and supports a linear address space of up to 4 Gbytes. The whole range of this 4-Gbyte address space can be addressed by instruction addressing (instruction fetch access) and data addressing (data access).

A memory map is shown in **Figure 3.6**.

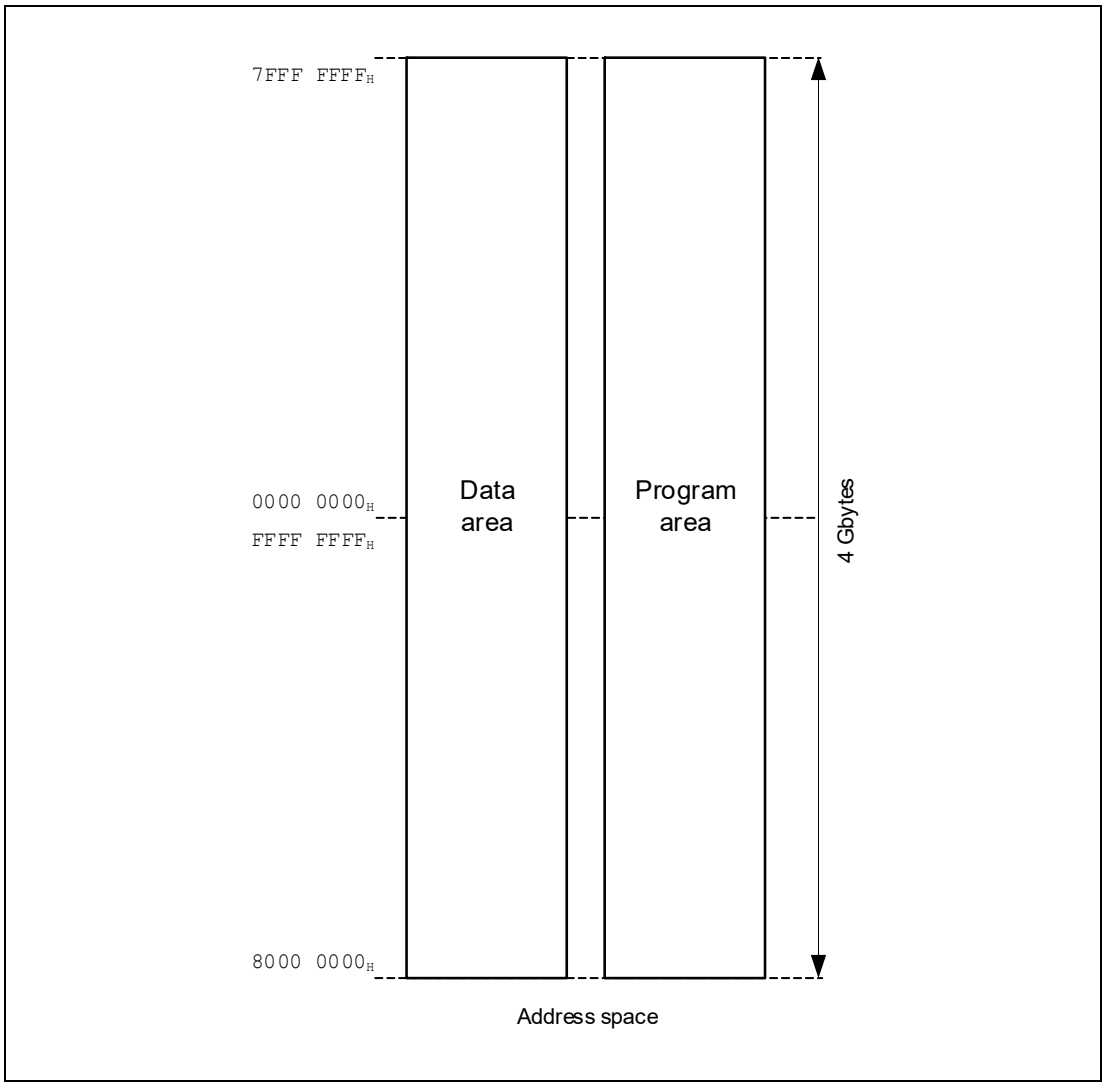

Figure 3.6 Memory Map (Address Space)

(2) Instruction Addressing

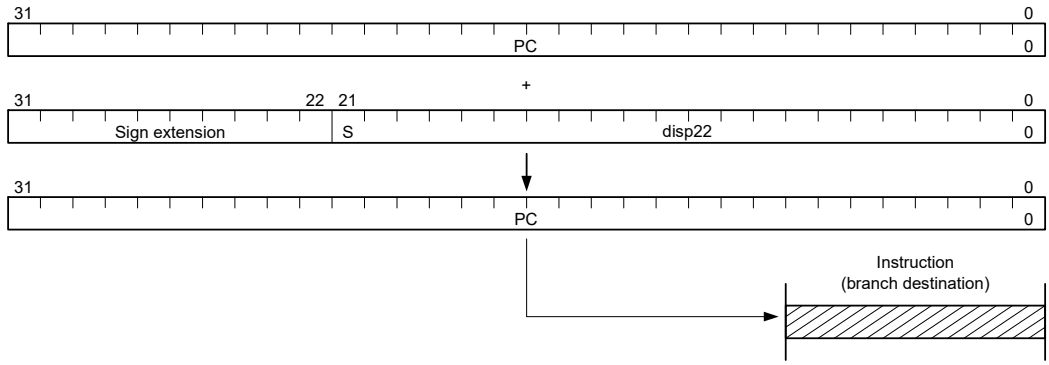
The instruction address is determined based on the contents of the program counter (PC), and is automatically incremented according to the number of bytes in the executed instruction. When a branch instruction is executed, the addressing shown below is used to set the branch destination address to the PC.

If the result of address calculation exceeds the positive maximum value FFFF $FFFF_H$ by addition, it is wrapped around to 0000 0000_H. If the result of address calculation falls below the positive minimum value 0000 0000_H by subtraction, it is wrapped around to FFFF $FFFF_H$.

(a) Relative Addressing (PC Relative)

Signed N-bit data (displacement: disp N) in the instruction code is added to the program counter (PC). In this case, displacement is handled as 2's complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher-order bits are sign-extended (N differs from one instruction to another).

The JARL, JR, and Bcond instructions are used with this type of addressing.



Note: This is an example of 22-bit displacement.

Figure 3.7 Relative Addressing

(b) Register Addressing (Register Indirect)

The contents of the general-purpose register (reg1) or system register (regID) specified by the instruction are transferred to the program counter (PC).

The JMP, CTRET, EIRET, FERET, and DISPOSE instructions are used with this type of addressing.

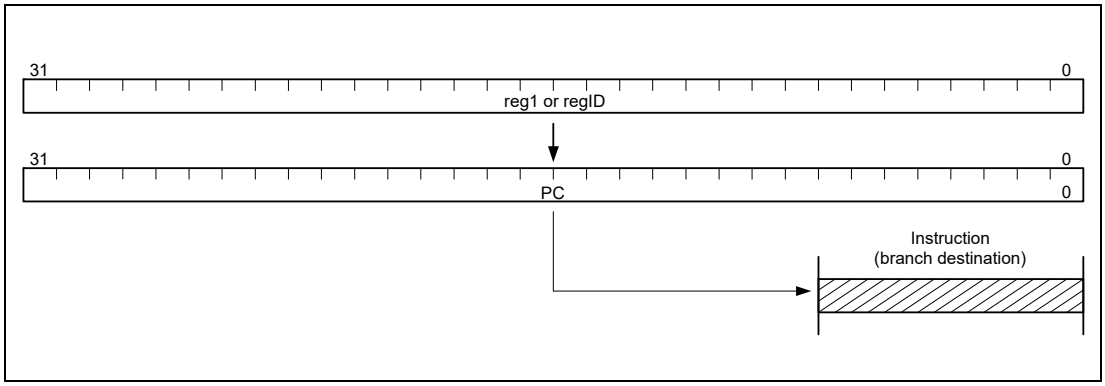


Figure 3.8 Register Addressing

(c) Based Addressing

The contents of the general-purpose register (reg1) and the N-bit displacement (dispN) specified by the instruction are added and transferred to the program counter (PC). At this time, the displacement is handled as a 2's complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher bits are sign-extended (N differs from one instruction to another).

The JMP instruction is used with this type of addressing.

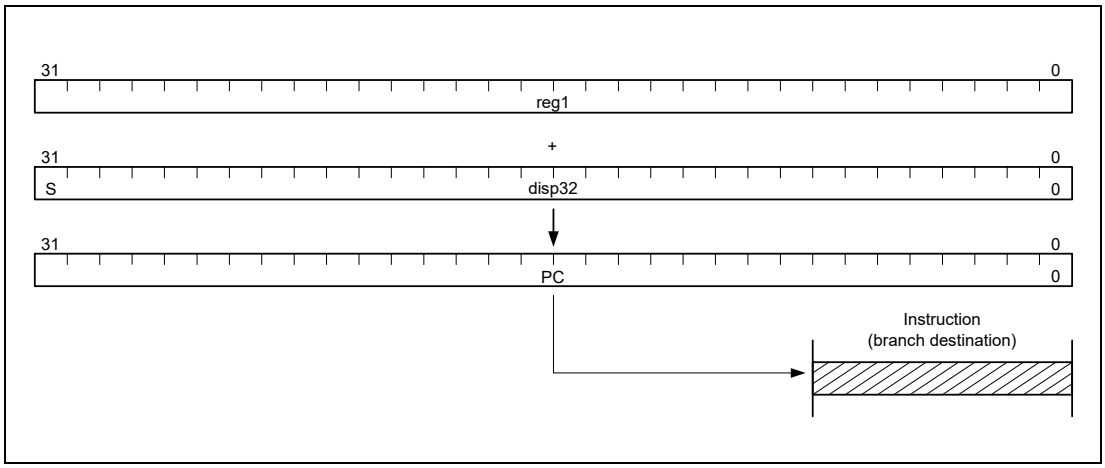

Figure 3.9 Based Addressing

(d) Other Addressing

A value specified by an instruction is transferred to the program counter (PC). How a value is specified is explained in [Operation] or [Description] of each instruction.

The CALLT, SYSCALL, TRAP, FETRAP, and RIE instructions, and branch in case of an exception are used with this type of addressing.

(3) Data Addressing

The following methods can be used to access the target registers or memory when executing an instruction.

If the result of address calculation exceeds the positive maximum value FFFF $FFFF_H$ by addition, it is wrapped around to 0000 0000_H. If the result of address calculation falls below the positive minimum value 0000 0000_H by subtraction, it is wrapped around to FFFF $FFFF_H$.

(a) Register Addressing

This addressing method accesses the general-purpose register or system register specified in the general-purpose register field as an operand.

Any instruction that includes the operand reg1, reg2, reg3, or regID is used with this type of addressing.

(b) Immediate Addressing

This address mode uses arbitrary size data as the operation target in the instruction code.

Any instruction that includes the operand imm5, imm16, vector, or cccc is used with this type of addressing.

NOTE

vector: This is immediate data that specifies the exception vector (00_H to $1F_H$), and is an operand used by the TRAP, FETRAP, and SYSCALL instructions. The data width differs from one instruction to another.

cccc: This is 4-bit data that specifies a condition code, and is an operand used in the Bcond instruction, CMOV instruction, SASF instruction, and SETF instruction.

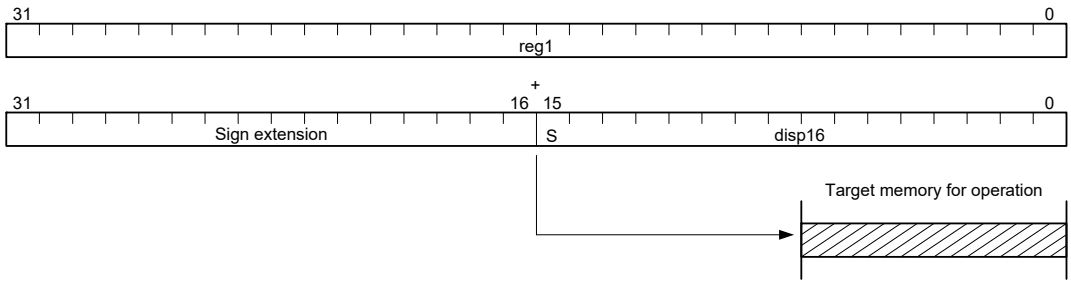
(c) Based Addressing

There are two types of based addressing, as described below.

Type 1

The contents of the general-purpose register (reg1) specified at the addressing specification field in the instruction code are added to the N-bit displacement (dispN) data sign-extended to word length to obtain the operand address, and the target memory is accessed using the operand address. At this time, the displacement is handled as a 2's complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher bits are sign-extended (N differs from one instruction to another).

The LD, ST, LDV and STV instructions are used with this type of addressing.



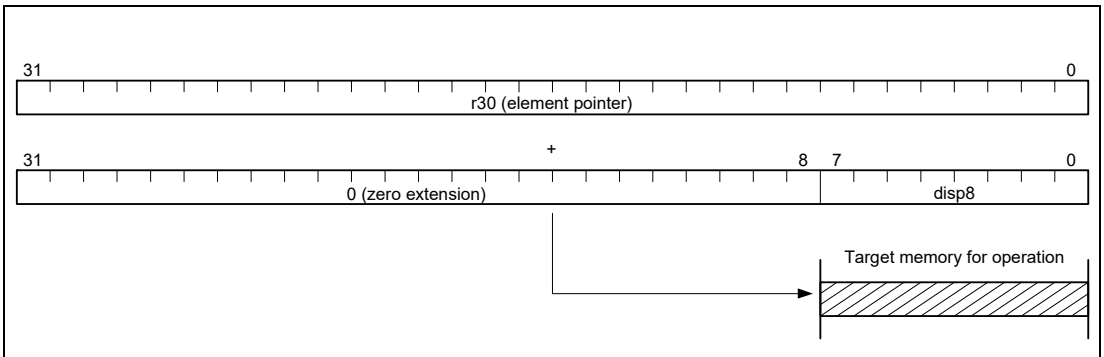
Note: This is an example of 16-bit displacement.

Figure 3.10 Based Addressing (Type 1)

Type 2

The contents of the element pointer (r30) are added to the N-bit displacement data (dispN) zero-extended to a word length to obtain the operand address, and target memory is accessed using the operand address. If the displacement is less than 32 bits, the higher bits are zero-extended (N differs from one instruction to another).

The SLD and SST instructions are used with this type of addressing.



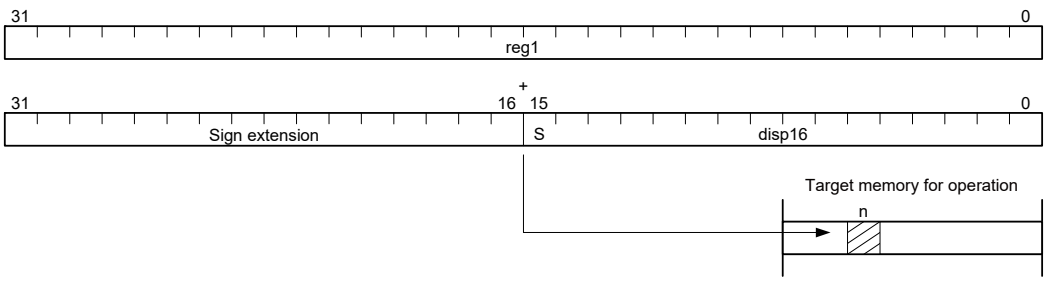
Note: This is an example of 8-bit displacement.

Figure 3.11 Based Addressing (Type 2)

(d) Bit Addressing

The contents of the general-purpose register (reg1) are added to the N-bit displacement (dispN) data sign-extended to word length to obtain the operand address, and one bit (as specified by 3-bit data “bit #3”) in one byte of the target memory is accessed using the operand address. At this time, the displacement is handled as a 2’s complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher bits are sign-extended (N differs from one instruction to another).

The CLR1, SET1, NOT1, and TST1 instructions are used with this type of addressing.



Note: n: Bit position specified by 3-bit data (bit #3) (n = 0 to 7)
This is an example of 16-bit displacement.

Figure 3.12 Bit Addressing

(e) Post Index Increment/Decrement Addressing

The contents of the general-purpose register (reg1) are used as an operand address to access the target memory, and then the general-purpose register (reg1) is updated. There are two types of the general-purpose register updating, by incrementing or decrementing.

If the result of incrementing the general-purpose register (reg1) value exceeds the positive maximum value FFFF $FFFF_H$, the result wraps around to 0000 0000_H, and, if the result of decrementing the general-purpose register value is less than the positive minimum value 0000 0000_H, the result wraps around to FFFF $FFFF_H$.

Type 1

The general-purpose register (reg1) is updated by adding a constant that depends on the type of accessed data (the size of the accessed data) to the contents of the general-purpose register (reg1). If the type of accessed data is a byte, 1 is added, if the type is a halfword, 2 is added, if the type is a word, 4 is added, and if the type is a double-word, 8 is added.

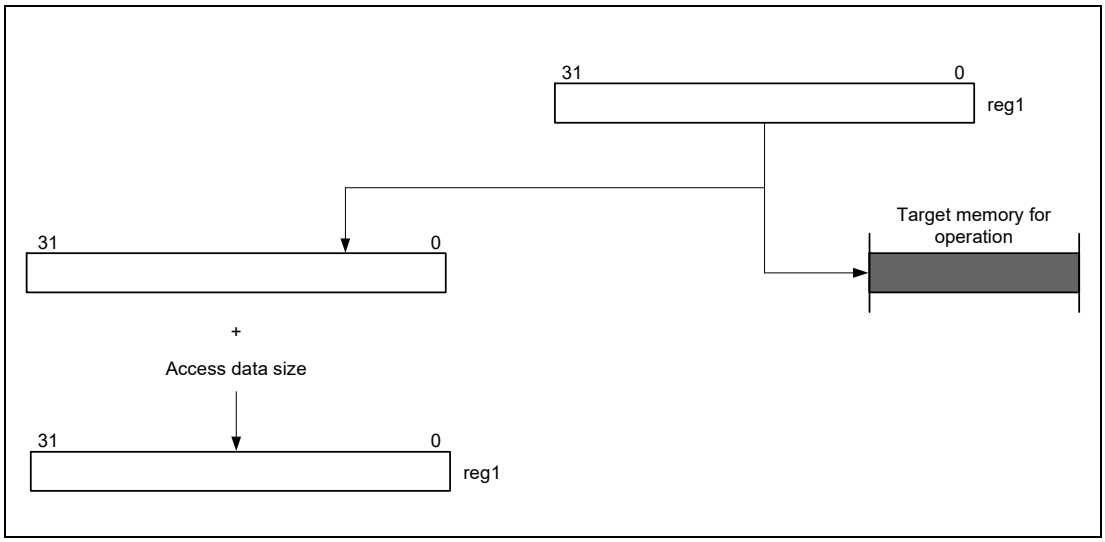


Figure 3.13 Post Index Increment/Decrement Addressing (Type 1)

Type 2

The general-purpose register (reg1) is updated by subtracting a constant that depends on the size of the accessed data from the contents of the general-purpose register (reg1). If the size of accessed data is a byte, 1 is subtracted, if the size is a halfword, 2 is subtracted, if the size is a word, 4 is subtracted, and if the size is a double-word, 8 is subtracted.

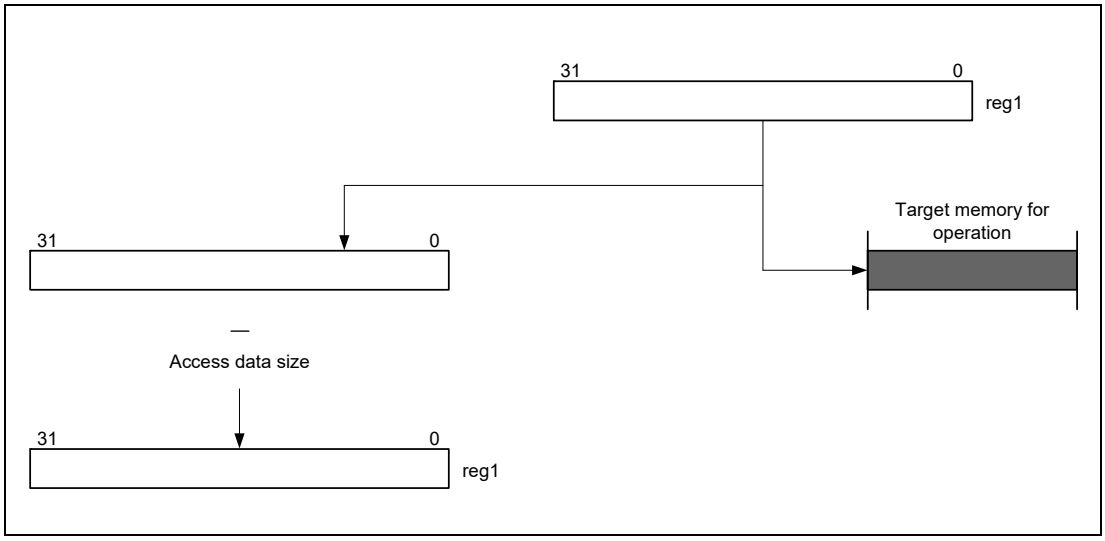

Figure 3.14 Post Index Increment/Decrement Addressing (Type 2)

(f) Other Addressing

The target memory is accessed using a value specified by an instruction as the operand address. How a value is specified is explained in [Operation] or [Description] of each instruction.

The SWITCH, CALLT, SYSCALL, PREPARE, DISPOSE, PUSHSP, POPSP, STM.MP, and LDM.MP instructions are used with this type of addressing.

3.2.2.8 Execution Timing of a Store Instruction

Completion of writing by a store instruction may differ depending on the type of the memory to be accessed. For details, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

3.2.2.9 Memory Ordering

This CPU guarantees that memories are accessed in the programmed order. However, in the system that incorporates multiple bus masters such as the bus system with DMA or multi-core, the order of accesses to memories needs to be considered. For these cases, see **Section 3.2.7.1, Synchronization Processing**.

3.2.2.10 Acquiring the CPU Number

This CPU provides a method for identifying CPUs in a multi-processor system.

In the multi-processor configuration, you can identify which CPU core is running a program by referencing the PEID register. A unique number within a multi-processor system is assigned to the PEID register according to the specification of the product.

3.2.2.11 System Protection Identifier (SPID)

In this CPU, memory resources and peripheral devices are managed by system protection groups. By specifying the group to which the program being executed belongs, you can assign accessible memory resources and peripheral devices to the program.

The program being executed belongs to the group specified by the SPID, and whether the memory resources and peripheral devices are accessible is decided using the SPID. A value can be set to the SPID register by the supervisor.

CAUTION

According to the value of the SPID, how operations are assigned to memory resources and peripheral devices is determined by the specifications of the product.

3.2.2.12 Timestamp Counter

This CPU has a 64-bit timestamp counter. It can measure long time, and so can be used as specific information for time identification.

Since the timestamp counter is allocated to system registers, it can be accessed quickly by using a LDSR/STSR instruction.

If an overflow occurs during counting operation, no exception will occur.

(1) How to Operate the Timestamp Counter

The value of the timestamp counter is initialized to 0 by a reset. Therefore, if you want to retain the value of the counter across a reset, then before the reset, save the value of the counter in a memory that is not initialized by the reset, restore the value to the counter after the reset, and restart counting.

The counter is 64-bit width, so the counter consists of two 32-bit system registers, TSCOUNTL and TSCOUNTH. Both registers need to be accessed by using LDSR/STSR instructions.

When the counter is not running (the value of the TSCTRL.CEN bit is 0), no special care is needed to access the two registers.

However, if the counter is running (the value of the TSCTRL.CEN bit is 1), it is not recommended to update the counter by using LDSR instructions. In this case, the timing of update of the counter is not guaranteed. It is recommended to update the counter when it is not running.

Also, when reading the value of the counter by using STSR instructions while it is running, it is recommended to follow the procedure below.

```
TSCNTRD:
        STSR    1, r21, 11      - Read the upper side of the counter
        STSR    0, r20, 11      - Read the lower side of the counter
        STSR    1, r22, 11      - Read again the upper side of the counter
        CMP      r21, r22       - Compare the two values read from the upper side of the counter
        BNE      TSCNTRD        - If they are not identical, a carry has occurred. Read again.
```

Even if the CPU core is not in operation after the execution of a HALT or SNOOZE instruction, the timestamp counter continues counting.

3.2.2.13 Performance Measurement Function

This CPU has the performance measurement function. The performance measurement function can measure the performance of programs executed, the effects of interrupts generated during operation, etc. by counting the occurrence of the event specified by the PMCTRLn.CND bit.

The system registers used by the performance measurement function can be accessed only in supervisor mode after a reset. However, it can be accessed in user mode by changing the setting of the PMUMCTRL register.

The performance measurement function itself works in user mode regardless of the setting of the PMUMCTRL register. Even if all performance measurement channels are made inaccessible in user mode by using the PMUMCTRL register, configuration in supervisor mode allows performance measurement during operation in user mode.

This CPU has eight channels of system register set for the performance measurement function.

3.2.3 Register Set

This chapter describes the program register and system register mounted on this CPU.

3.2.3.1 Program Registers

Program registers includes general-purpose registers (r0 to r31) and the program counter (PC). r0 always retains 0. The values of the general-purpose registers r1 to r31 after a reset are undefined. The value of the PC after a reset is the value of RBASE register.

Table 3.6 Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains 0
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for addresses and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

Note: For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the manual of each software development environment.

(1) General-purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables.

Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

(a) r0, r3, and r30

These registers are implicitly used by instructions.

r0 is a register that always retains 0. It is used for operations that use 0, addressing with base address being 0, etc.

r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

r30 is used as a base pointer when the SLD instruction or SST instruction accesses memory.

(b) r1, r4, r5, and r31

These registers are implicitly used by the assembler and C compiler.

When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

(c) r2

This register is used by a real-time OS in some cases. If the real-time OS that is being used is not using r2, r2 can be used as a register for address variables or data variables.

(2) PC — Program Counter

The PC retains the address of the instruction being executed.

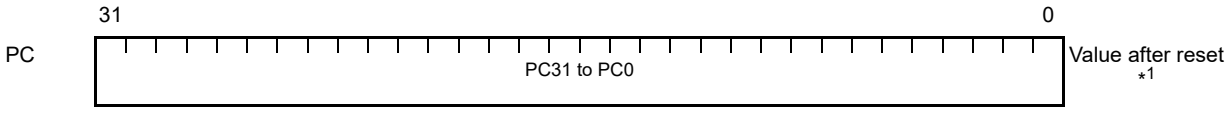

Table 3.7 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	PC31 to PC1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0, and branching to an odd number address is disabled.	R/W	0

Note 1. For details, see **Section 4, Address Space**.

3.2.3.2 Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

The basic system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.8 Basic System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	(See **Section 3.2.3.4, FPU Function Registers**)	CU0 and SV
SR7, 0	FPEPC	(See **Section 3.2.3.4, FPU Function Registers**)	CU0 and SV
SR8, 0	FPST	(See **Section 3.2.3.4, FPU Function Registers**)	CU0
SR9, 0	FPCC	(See **Section 3.2.3.4, FPU Function Registers**)	CU0
SR10, 0	FPCFG	(See **Section 3.2.3.4, FPU Function Registers**)	CU0
SR13, 0	EIIC	EI level exception cause	SV
SR14, 0	FEIC	FE level exception cause	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer	UM
SR21, 0	SNZCFG	SNOOZE control register	SV
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR0, 1	SPID	System protection identifier	SV
SR1, 1	SPIDLIST	List of system protection identifiers that can be specified in SPID	SV
SR2, 1	RBASE	Reset vector base address	SV
SR3, 1	EBASE	Exception handler vector address	SV
SR4, 1	INTBP	Base address of the interrupt handler “address” table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID	SV
SR8, 1	SVLOCK	Supervisor lock	SV
SR11, 1	SCCFG	SYSCALL operation setting	SV
SR12, 1	SCBP	SYSCALL base pointer	SV
SR0, 2	PEID	Processor element identifier	UM
SR1, 2	BMID	Bus master identifier	UM
SR6, 2	MEA	Memory error address	SV
SR8, 2	MEI	Memory error information	SV
SR15, 2	RBCR0	Register bank control 0	SV
SR16, 2	RBCR1	Register bank control 1	SV
SR17, 2	RBNR	Register bank number	SV
SR18, 2	RBIP	Register bank initial pointer	SV

Note 1. The access permission differs depending on the bit. For details, see **Section 3.2.4.1(3), Types of Exceptions.**

(1) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see **Section 3.2.4.1(3), Types of Exceptions**).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

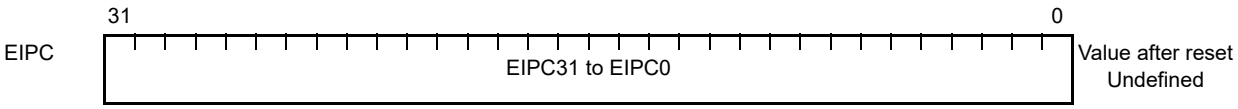

Table 3.9 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	EIPC31 to EIPC1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(2) EIPSW — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

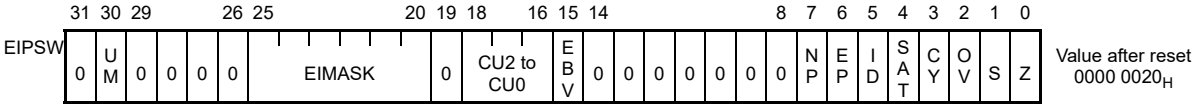

Table 3.10 EIPSW Register Contents

Bit	Name	Description	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 20	EIMASK	This bit stores the PSW.EIMASK bit setting when an EI level exception is acknowledged.*1	R/W	0
19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	CU2 to CU0	These bits store the PSW.CU2-0 field setting when an EI level exception is acknowledged.*2	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

Note 1. Only if INTCFG.EPL is set to 1, the value other than 0 can be set in this field. If INTCFG.EPL is cleared to 0, the value of this field becomes 0. Note that If INTCFG.EPL is cleared to 0 when the value of this field is other than 0, the value of this field becomes 0.

Note 2. CU2 is reserved for future CPUs that are to be made compatible with this CPU. It is always set to 0 in this CPU.

(3) FEPC — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see **Section 3.2.4.1(3), Types of Exceptions**). Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

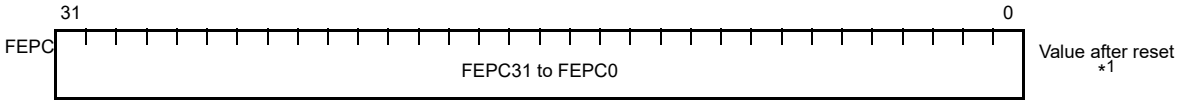

Table 3.11 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	FEPC31 to 1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	*1
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	*1

Note 1. When a reset occurs, among the instructions that completed execution before the reset occurred the value of the program counter of the instruction that was executed last is saved. If there is no execution completed instruction before the reset occurs, the value after reset is undefined. There is no information that identifies whether the value after reset is the value of the program counter of the execution completed instruction or undefined.

(4) FEPSW — Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

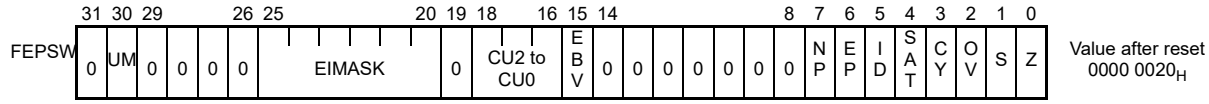

Table 3.12 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 20	EIMASK	These bits store the PSW.EIMASK field setting when an FE level exception is acknowledged*1.	R/W	0
19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	CU2 to CU0	These bits store the PSW.CU2-0 field setting when an FE level exception is acknowledged*2.	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

Note 1. Only if INTCFG.EPL is set to 1, the value other than 0 can be set in this field. If INTCFG.EPL is cleared to 0, the value of this field becomes 0. Note that If INTCFG.EPL is cleared to 0 when the value of this field is other than 0, the value of this field becomes 0.

Note 2. CU2 is reserved for future CPUs that are to be made compatible with this CPU. It is always set to 0 in this CPU.

(5) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

CAUTIONS

1. **When the LDSR instruction is used to change the contents of this register, the changed contents become valid from the subsequent instruction. For details, see Section 3.2.7.3, Hazard Management after System Register Update.**
2. **The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.13 for the access permission for each bit**

Table 3.13 Access Permission for PSW Register

Bit		Access Permission when Reading	Access Permission when Writing
30	UM	UM	SV[*1]
25 to 20	EIMASK		SV[*1]
18 to 16	CU2 to CU0		SV[*1]
15	EBV		SV[*1]
7	NP		SV[*1]
6	EP		SV[*1]
5	ID		SV[*1]
4	SAT		UM
3	CY		UM
2	OV		UM
1	S		UM
0	Z		UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

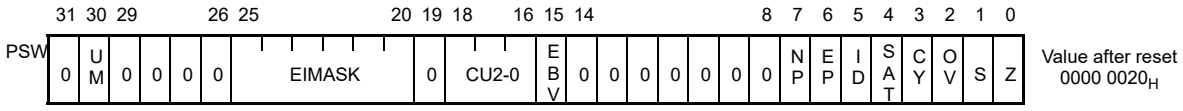

Table 3.14 PSW Register Contents (1/2)

Bit	Name	Description	R/W	Value after Reset
31	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (in UM mode). 0: Supervisor mode 1: User mode	R/W	0
29 to 26	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
25 to 20	EIMASK	This field indicates the interrupt priority boundary between enabling and disabling an acknowlegement of an interrupt (EIINTn). For an interrupt (EIINTn) with higher priority than the value set in this field, the acknowlegement is enabled. For an interrupt (EIINTn) with priority less than or equal to the value set in this field, the acknowlegement is disabled. 0: All priorities are not acceptable 1: Acceptable priority is 0 2: Acceptable priority is 0 to 1 ... 62: Acceptable priority is 0 to 61 63: Acceptable priority is 0 to 62 Only if the INTCFG.EPL is set to 1, interrupt acknowledgment control is performed by the value of this field. If the INTCFG.EPL is cleared to 0, interrupt acknowledgment control by the value of this field is not performed*1. If the INTCFG.EPL is set to 1 and an interrupt (EIINTn) is acknowledged, the interrupt priority is saved in this field as part of PSW change due to acknowledgment of interrupt (EIINTn). The interrupt (EIINTn) specified as 63 as the priority is always disabled. However, the CPU halt state due to HALT or SNOOZE is also released by an interrupt (EIINTn) with priority 63.	R/W	0
19	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
18 to 16	CU2 to CU0	These bits indicate the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor unusable exception occurs if an instruction for the coprocessor is executed or a coprocessor resource (system register) is accessed. Bit 18 (CU2): Fixed to 0*2. Bit 17 (CU1): FXU Bit 16 (CU0): FPU CU2 to CU0 are fixed to 0 in the devices that do not have corresponding coprocessors.	R/W	000
15	EBV	This bit indicates the reset vector and exception vector operation. See **Section 3.2.3.2(16), RBASE — Reset Vector Base Address** and **Section 3.2.3.2(17), EBASE — Exception Handler Vector Address.**	R/W	0
14 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see **Table 3.102, Exception Cause List**. 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0

Table 3.14 PSW Register Contents (2/2)

Bit	Name	Description	R/W	Value after Reset
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see **Table 3.102, Exception Cause List** This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: The acknowledgement of EI level exception is enabled. 1: The acknowledgement of EI level exception is disabled.	R/W	1
4	SAT*3	This bit indicates that a saturation arithmetic operation instruction resulted in overflow and saturation processing is applied to the result. This is a cumulative flag, that is, it is set (1) once a saturation occurs and not cleared (0) by subsequent instructions with unsaturated results. This bit is cleared by the LDSR instruction. Note that execution of an arithmetic operation instruction neither set nor clear this flag. 0: The result was not saturated 1: The result was saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry and borrow have not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*3	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*3	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative.	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. Only if INTCFG.EPL = 1, the value other than 0 can be set in this field. If INTCFG.EPL = 0, the value of this field becomes 0. Note that if INTCFG.EPL is cleared to 0 while the value of this field is other than 0, the value of this field becomes 0.

Note 2. The coprocessor use permission CU2 is reserved for future CPUs that are to be made compatible with this CPU.

Note 3. Saturation processing is applied to the operation result in accordance with the contents of the OV and S flags. The SAT flag is set (1) only when the OV flag is set (1) in the saturation arithmetic operation.

Operation Result Status	Flag Status			Operation Result after Saturation Processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF FFFF$_H$
Exceeded negative maximum value	1	1	1	8000 0000$_H$
Positive (maximum value not exceeded)	Value prior to operation is retained	0	0	Operation result as is
Negative (maximum value not exceeded)			1	

(6) EIIC — EI Level Exception Cause

The EIIC register retains the cause of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause (see **Table 3.102, Exception Cause List**).

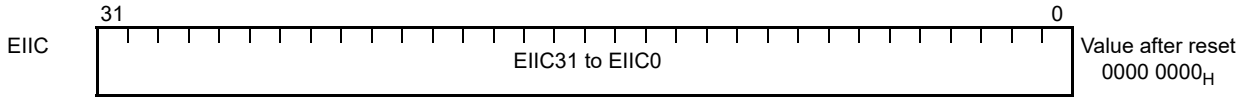

Table 3.15 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	EIIC31 to EIIC0	These bits store the exception cause code when an EI level exception occurs. The EIIC15-0 field stores the exception cause codes shown in **Table 3.102**. The EIIC31-16 field stores detailed exception cause codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(7) FEIC — FE Level Exception Cause

The FEIC register retains the cause of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause (see **Table 3.102, Exception Cause List**).

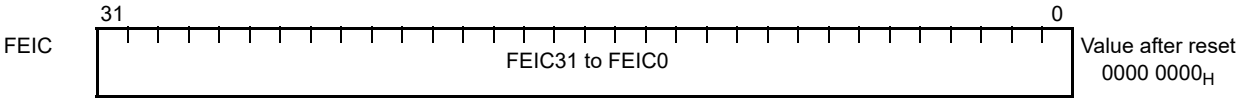

Table 3.16 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	FEIC31 to FEIC0	These bits store the exception cause code when an FE level exception occurs. The FEIC15-0 field stores the exception cause codes shown in **Table 3.102**. The FEIC31-16 field stores detailed exception cause codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(8) CTPC — Status Save Register when Executing CALLT

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC.

Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

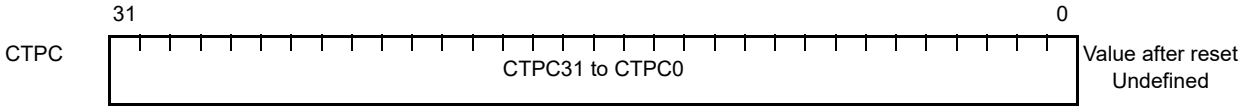

Table 3.17 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	CTPC31 to CTPC1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(9) CTPSW — Status Save Register when Executing CALLT

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

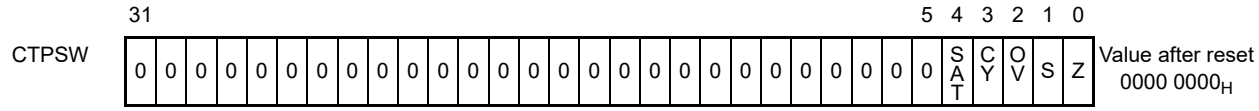

Table 3.18 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(10) CTBP — CALLT Base Pointer

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a halfword address.

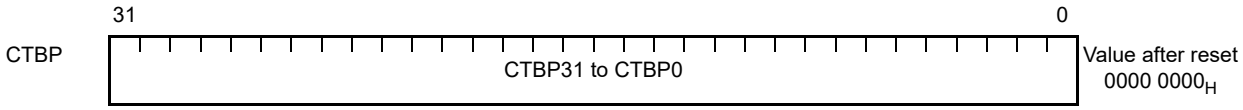

Table 3.19 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	CTBP31 to CTBP1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction.	R/W	0
0	CTBP0	This bit indicates the base pointer address of the CALLT instruction. This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0.	R	0

(11) SNZCFG — SNOOZE Configuration

The SNZCFG register is used to configure the operation of the SNOOZE instruction.

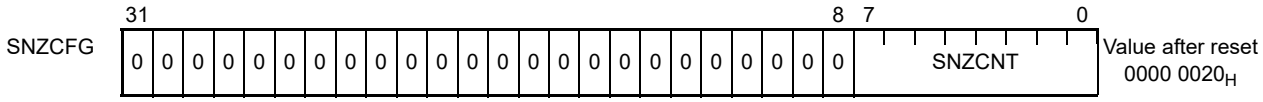

Table 3.20 SNZCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SNZCNT	These bits specify the number of clock cycles in which execution is to be temporarily halted by the SNOOZE instruction.	R/W	20_H

(12) EIWR — EI Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

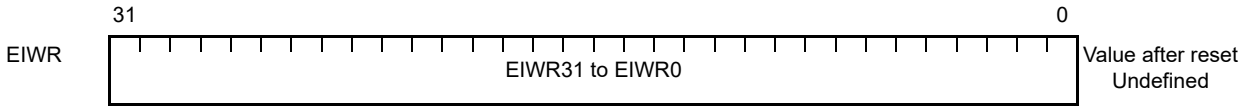

Table 3.21 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	EIWR31 to EIWR0	These bits constitute a working register that can be used for any purpose during the processing of an EI level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(13) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

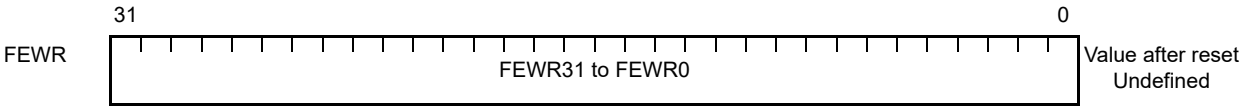

Table 3.22 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	FEWR31 to FEWR0	These bits constitute a working register that can be used for any purpose during the processing of an FE level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(14) SPID — System Protection Identifier

The SPID register holds the system protection identifier of the CPU.

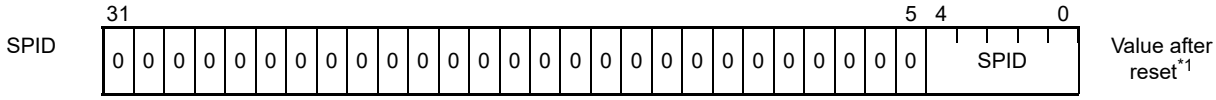

Table 3.23 SPID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	SPID	These bits indicate the system protection identifier. The system protection identifier is a variable ID that is used for access protection in a product which consists of two or more bus masters including this CPU. For its uses and constraints on its value, see **Section 3.9.7, Product information of initial value for G4MH register** . Within this CPU, the SPID is used to check for area matching by the MPU. It allows the system specifications defined for the product to be reflected in the MPU's protection feature. The settable system protection identifiers are given by the SPIDLIST register. If an attempt is made to set an illegal system protection identifier, the SPID register is not updated and retains the original value.	R/W	*1

Note 1. See **Section 3.9.7, Product information of initial value for G4MH register**.

(15) SPIDLIST — Legitimate System Protection Identifier List

The SPIDLIST register contains a list of system protection identifiers that can be set to the SPID register.

The bits corresponding to the settable system protection identifiers are set to 1. The bits corresponding to illegal system protection identifiers are cleared to 0. These values are set outside the CPU as system specifications and cannot be altered by this CPU.

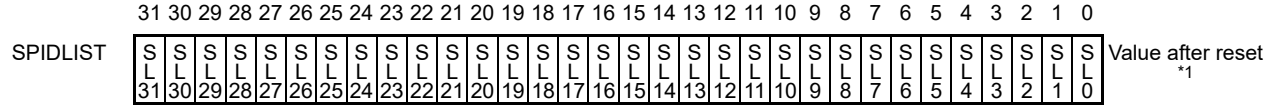

Table 3.24 SPIDLIST Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	SL31	This bit indicates whether or not 31 can be set as a system protection identifier.	R	*1
30	SL30	This bit indicates whether or not 30 can be set as a system protection identifier.	R	*1
29	SL29	This bit indicates whether or not 29 can be set as a system protection identifier.	R	*1
28	SL28	This bit indicates whether or not 28 can be set as a system protection identifier.	R	*1
27	SL27	This bit indicates whether or not 27 can be set as a system protection identifier.	R	*1
26	SL26	This bit indicates whether or not 26 can be set as a system protection identifier.	R	*1
25	SL25	This bit indicates whether or not 25 can be set as a system protection identifier.	R	*1
24	SL24	This bit indicates whether or not 24 can be set as a system protection identifier.	R	*1
23	SL23	This bit indicates whether or not 23 can be set as a system protection identifier.	R	*1
22	SL22	This bit indicates whether or not 22 can be set as a system protection identifier.	R	*1
21	SL21	This bit indicates whether or not 21 can be set as a system protection identifier.	R	*1
20	SL20	This bit indicates whether or not 20 can be set as a system protection identifier.	R	*1
19	SL19	This bit indicates whether or not 19 can be set as a system protection identifier.	R	*1
18	SL18	This bit indicates whether or not 18 can be set as a system protection identifier.	R	*1
17	SL17	This bit indicates whether or not 17 can be set as a system protection identifier.	R	*1
16	SL16	This bit indicates whether or not 16 can be set as a system protection identifier.	R	*1
15	SL15	This bit indicates whether or not 15 can be set as a system protection identifier.	R	*1
14	SL14	This bit indicates whether or not 14 can be set as a system protection identifier.	R	*1
13	SL13	This bit indicates whether or not 13 can be set as a system protection identifier.	R	*1
12	SL12	This bit indicates whether or not 12 can be set as a system protection identifier.	R	*1
11	SL11	This bit indicates whether or not 11 can be set as a system protection identifier.	R	*1
10	SL10	This bit indicates whether or not 10 can be set as a system protection identifier.	R	*1
9	SL9	This bit indicates whether or not 9 can be set as a system protection identifier.	R	*1
8	SL8	This bit indicates whether or not 8 can be set as a system protection identifier.	R	*1
7	SL7	This bit indicates whether or not 7 can be set as a system protection identifier.	R	*1
6	SL6	This bit indicates whether or not 6 can be set as a system protection identifier.	R	*1
5	SL5	This bit indicates whether or not 5 can be set as a system protection identifier.	R	*1
4	SL4	This bit indicates whether or not 4 can be set as a system protection identifier.	R	*1
3	SL3	This bit indicates whether or not 3 can be set as a system protection identifier.	R	*1
2	SL2	This bit indicates whether or not 2 can be set as a system protection identifier.	R	*1
1	SL1	This bit indicates whether or not 1 can be set as a system protection identifier.	R	*1
0	SL0	This bit indicates whether or not 0 can be set as a system protection identifier.	R	*1

Note 1. See **Section 3.9.7, Product information of initial value for G4MH register**.

(16) RBASE — Reset Vector Base Address

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this register indicates the exception handler vector address and the selection method of exception handler address.

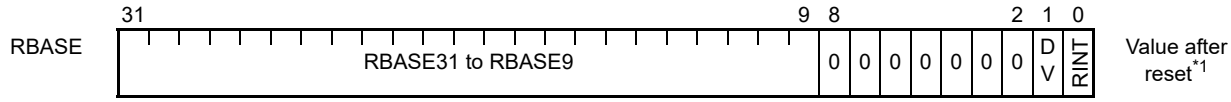

Table 3.25 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	RBASE31 to RBASE9	These bits indicate the reset vector when there is a reset. When PSW.EBV = 0, this address is also used as the exception vector. The RBASE8 to RBASE0 bits are not assigned as names because these bits are always 0.	R	*1
8 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	DV	When the DV bit is set, the exception handler address for interrupt is determined by using the direct vector method. For details, see **Section 3.2.4.4(1)(b), Table Reference Method**. This bit is valid when PSW.EBV = 0.	R	*1
0	RINT	When the RINT bit is set, the exception handler address for interrupt processing is reduced. See **Section 3.2.4.4(1)(a), Direct Vector Method**. This bit is valid when PSW.EBV = 0.	R	*1

Note 1. See **Section 3.9.7, Product information of initial value for G4MH register**.

(17) EBASE — Exception Handler Vector Address

This register indicates the exception handler vector address and the selection method of exception handler address. This register is valid when the PSW.EBV bit is 1.

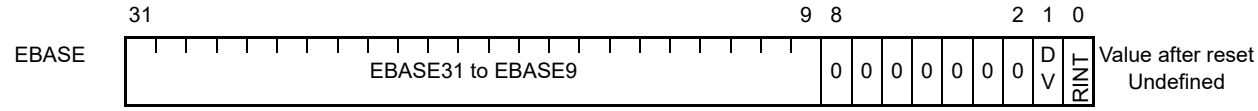

Table 3.26 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	EBASE31 to EBASE9	The exception handler routine address is changed to the address resulting from adding the offset address of each exception to the base address specified for this register. The EBASE8 to EBASE0 bits are not assigned as names because these bits are always 0.	R/W	Undefined
8 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	DV	When the DV bit is set, the exception handler address for interrupt is determined by using the direct vector method. For details, see **Section 3.2.4.4(1)(b), Table Reference Method**.	R/W	Undefined
0	RINT	When the RINT bit is set, the exception handler address for interrupt processing is reduced. See **Section 3.2.4.4(1)(a), Direct Vector Method**.	R/W	Undefined

(18) INTBP — Base Address of the Interrupt Handler Address Table

This register indicates the base address of the table when the table reference method is selected as the interrupt handler address selection method.

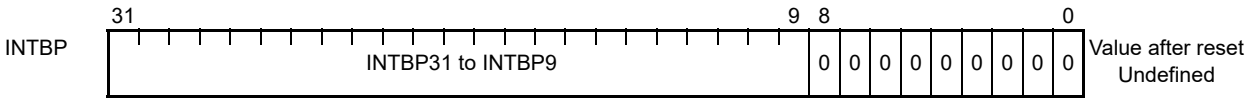

Table 3.27 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	INTBP31 to INTBP9	These bits indicate the base pointer address for an interrupt when the table reference method is used. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINTn) is acknowledged. The INTBP8 to INTBP0 bits are not assigned as names because these bits are always 0.	R/W	Undefined
8 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(19) MCTL — Machine Control

The MCTL register is used to control the CPU.

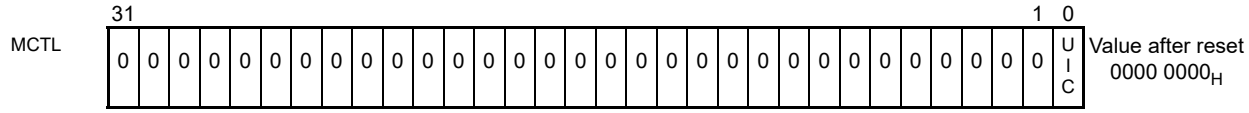

Table 3.28 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction in user mode become possible.	R/W	0

(20) PID — Processor ID

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

CAUTION

The PID register indicates information used to identify the incorporated CPU core and CPU core configuration. Usage such that the software behavior varies dynamically according to the PID register information is not assumed.

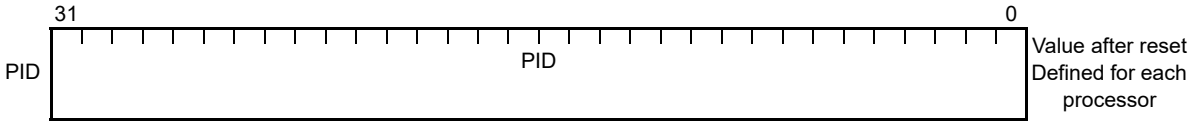

Table 3.29 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 24	PID	Architecture Identifier This identifier indicates the architecture of the processor.	R	*1
23 to 8		Function Identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bit 23 to 19: Reserved Bit 18: Register bank Bit 17 to 12: Reserved Bit 11: Extended floating-point operation function Bit 10: Double-precision floating-point operation function Bit 9: Single-precision floating-point operation function Bit 8: Memory protection unit (MPU) function **Note:** If a double-precision floating-point operation function is implemented (when bit 10 is 1), a single-precision floating-point operation function is also always implemented (bit 9 is 1).	R	*1
7 to 0		Version Identifier This identifier indicates the version of the processor.	R	*1

Note 1. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

(21) SVLOCK — Supervisor Lock

The SVLOCK register is used to restrict the CPU operation in supervisor mode.

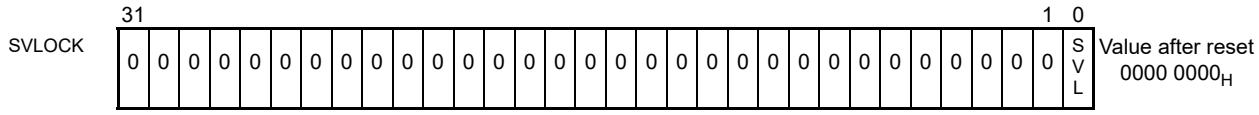

Table 3.30 SVLOCK Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	SVL	This bit specifies whether to restrict the CPU operation in supervisor mode. 0: Does not restrict the CPU operation in supervisor mode. 1: Restrict the CPU operation in supervisor mode. If the SVL bit is set to 1, the following system registers*1 cannot be updated even when the CPU is in supervisor mode: SPID, MPM, MPLA, MPUA, MPAT, MPIDn, MPBK For details, see **Section 3.2.2.5(5), Supervisor Lock Setting**.	R/W	0

Note 1. The target system registers are those registers that are associated with memory accessing. This register prevents these registers from being rewritten carelessly and unintentional memory access from being performed outside the CPU.

(22) SCCFG — SYSCALL Operation Setting

This register is used to set operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

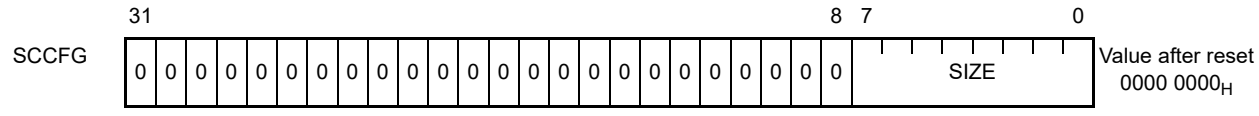

Table 3.31 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If a vector exceeding the maximum number of entries is specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	0

(23) SCBP — SYSCALL Base Pointer

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

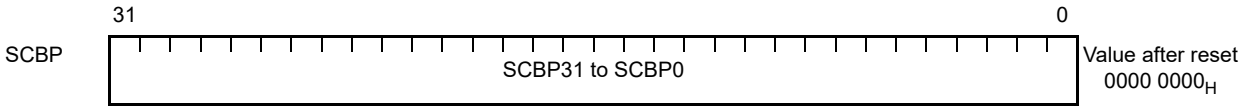

Table 3.32 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	SCBP31 to SCBP2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction.	R/W	0
1, 0	SCBP1, SCBP0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the start address of the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(24) PEID — Processor Element Identifier

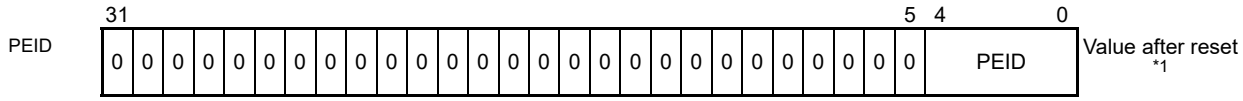

Table 3.33 PEID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	PEID	These bits indicate the processor element identifier.	R	*1

Note 1. The processor element identifier of the CPU which is defined by the product specification is read. Writing to these bits is not possible. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

(25) BMID — Bus Master Identifier

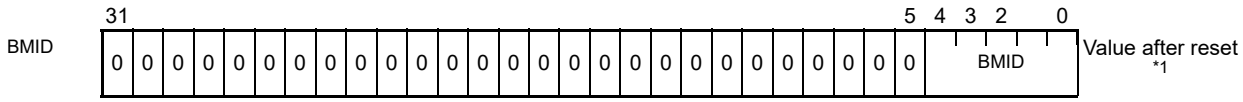

Table 3.34 BMID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	BMID	These bits indicate the bus master identifier.	R	*1

Note 1. The bus master identifier of the CPU which is defined by the product specification is read. Writing to these bits is not possible. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

(26) MEA — Memory Error Address

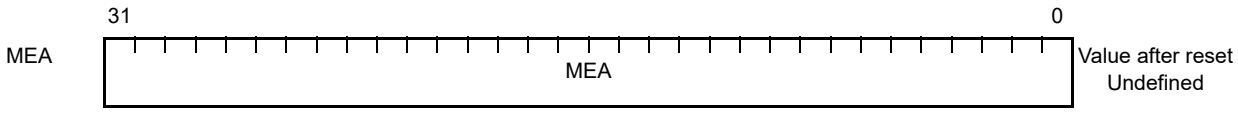

Table 3.35 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MEA	These bits holds the address in which an MAE (misalignment) or MPU violation occurred.	R/W	Undefined

(27) MEI — Memory Error Information

The MEI register holds the information about the instruction that caused a misalignment exception (MAE) or memory protection exception (MDP). The information can be used as hint information for the emulation by software.

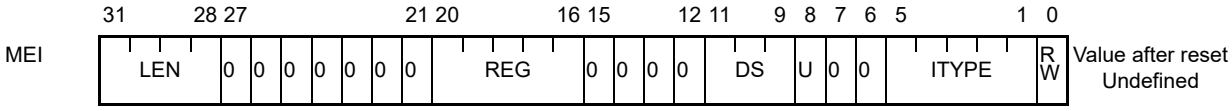

Table 3.36 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 28	LEN	These bits indicate the code size of the instruction that causes the exception. 0: Non-instruction factor 2: 16 bits 4: 32 bits 6: 48 bits 8 :64 bits Values other than those listed above are reserved for future use and never stored here. For details, see **Table 3.37**.	R/W	Undefined
27 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	REG	These bits indicate the source register number or destination register number of the instruction that caused the exception. For details, see **Table 3.37**.	R/W	Undefined
15 to 12	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
11 to 9	DS	These bits indicate the data type of the instruction that caused the exception*1. 0: Byte (8 bits) 1: Halfword (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) 4: Quad-word (128 bits) Values other than those listed above are reserved for future use and never stored here. For details, see **Table 3.37**.	R/W	Undefined
8	U	This bit indicates the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3.37**.	R/W	Undefined
7 to 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 1	ITYPE	These bits indicate the instruction that caused the exception. For details, see **Table 3.37**.	R/W	Undefined
0	RW	This bit indicates whether the operation performed by the instruction that caused the exception is a read (Load-memory) or a write (Store-memory). 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3.37**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.37 Instructions Causing Exceptions and Values of MEI Register (1/2)

Instruction	LEN	REG	DS	U	RW	ITYPE
SLD.B	2 (16 bits)	dst	0 (Byte)	0 (Signed)	0 (Read)	00000_B
SLD.BU	2 (16 bits)	dst	0 (Byte)	1 (Unsigned)	0 (Read)	00000_B
SLD.H	2 (16 bits)	dst	1 (Half-word)	0 (Signed)	0 (Read)	00000_B
SLD.HU	2 (16 bits)	dst	1 (Half-word)	1 (Unsigned)	0 (Read)	00000_B

STVZ.H4 (disp 16)	6 (48 bits)	src	3 (Double-word)	0 (Signed)	1 (Write)	11111_B

Note: dst: Destination register number; src: Source register number

Note 1. Specific to this CPU.

Note 2. This exception occurs when the instruction executes a read access.

Note 3. When the destination is r3, 0 is stored.

Note 4. When an exception occurs during a table reference that is triggered by an interrupt for which the table reference method is selected,

Note 5. In instruction format (1), “4 (32 bits)” is set.

Note 6. In instruction format (2), the value is selected as follows according to the value of the ff field in the instruction code:

ff = 00_B: 4 (32 bits)
ff = 01_B: 6 (48 bits)
ff = 10_B: 6 (48 bits)
ff = 11_B: 8 (64 bits)

(28) RBCR0 — Register Bank Control 0

The RBCR0 register controls the operation of the register bank function.

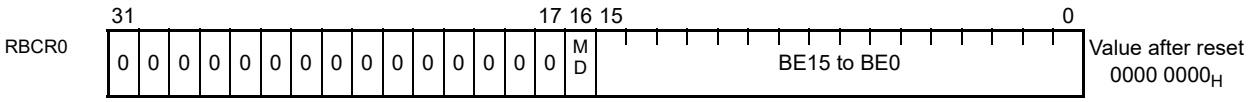

Table 3.38 RBCR0 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	MD	This bit specifies the save mode of the register bank. 0: Save mode 0 1: Save mode 1 List of Registers to be Saved Target Register / Save Mode 0 / Save Mode 1 PC ✓ ✓ PSW ✓ ✓ EIIC ✓ ✓ FPSR ✓ ✓ r1-r19 ✓ ✓ r20-r29 — ✓ r30 ✓ ✓ r31 — ✓ ✓: Saved —: Not saved	R/W	0
15	BE15	This bit specifies whether to use a register bank on an interrupt (EIINTn) with priority 15 to 63. 0: Do not use the register bank on an interrupt with the priority 15 to 63. 1: Use the register bank on an interrupt with the priority 15 to 63. While this bit is set to 1, if EI level interrupt (EIINTn) with priority 15 to 63 is acknowledged, the register bank function can be used.	R/W	0
14 to 0	BE14 to BE0	These bits specify the priority level of the interrupt on which the register bank is to be used. 0: Do not use the register bank on an interrupt of the level corresponding to this bit. 1: Use the register bank on an interrupt of the level corresponding to this bit. The bit positions correspond to the priority levels of the interrupts as follows: Bit / Priority Level 0 Level 0 (highest priority) 1 Level 1 : 14 Level 14 The register bank is used when an interrupt (EIINTn) of a level is accepted while the bit corresponding to that level is set (1).	R/W	0

Note 1. As the definition of this function, the interrupt (EIINTn) with priority 63 is included. However, since interrupts with priority 63 are always masked by PSW.EIMASK and PLMR registers, the register bank function is not used by the priority 63 interrupt (EIINTn).

(29) RBCR1 — Register Bank Control 1

The RBCR1 register controls the operation of the register bank function.

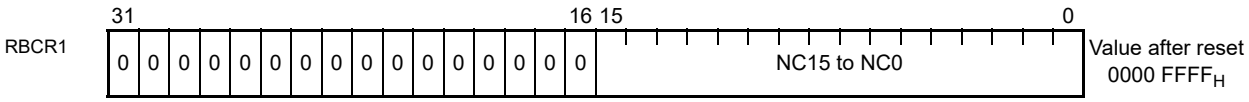

Table 3.39 RBCR1 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15	NC15	At the time accepting an interrupt (EIINTn) with priority 15 to 63*1 is acknowledged, the value to be set in the PSW.ID bit is specified. 0: Set PSW.ID = 0 for interrupt acknowledgment with priority 15 to 63 1: Set PSW.ID = 1 for interrupt acknowledgment with priority 15 to 63 (initial setting) However, this setting is valid only when the interrupt handler address selection method is Table Reference Method and the register bank is usable.	R/W	1
14 to 0	NC14 to NC0	These bits specify the values to be set to the PSW.ID bit when an interrupt (EIINTn) of the priority level corresponding to the bit position is accepted. 0: PSW.ID is set to 0 when an interrupt of the priority level corresponding to the bit position is accepted. 1: PSW.ID is set to 1 when an interrupt of the priority level corresponding to the bit position is accepted (initial value). This setting, however, is enabled only when the interrupt handler address selection method is set to the table reference method and the use of the register banks is enabled. The bit positions correspond to the priority levels of the interrupts as follows:	R/W	7FFF$_H$

Bit	Priority Level
0	Level 0 (highest priority)
1	Level 1
	:
14	Level 14

Note 1. As the definition of this function, the interrupt (EIINTn) with priority 63 is included. However, since interrupts with priority 63 are always masked by PSW.EIMASK and PLMR registers, the register bank function is not used by the priority 63 interrupt (EIINTn).

(30) RBNR — Register Bank Number

The RBNR register indicates the bank number of register bank function which is used next.

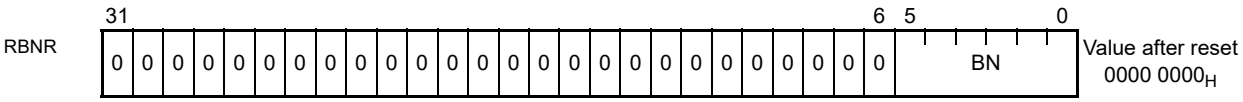

Table 3.40 RBNR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 0	BN	These bits indicate the number of the register bank to be used next. The value in these bits is incremented by 1 when an interrupt (EIINTn) that uses a register bank is accepted. If the value of BN is larger than INTCFG.ULNR, or if the value of BN is 63, if an interrupt (EIINTn) using the register bank occurs, a SYSERR exception is generated. That interrupt is not accepted, and it is put on hold. The value of BN is decremented by 1 when a RESBANK instruction is executed. If the RESBANK instruction is executed when the value of BN is 0, the instruction is not executed and a SYSERR exception is generated. In this case, BN is not updated and its value remains the same.	R/W	0

(31) RBIP — Register Bank Initial Pointer

The RBIP register indicates the start address of the memory area where the register bank is located.

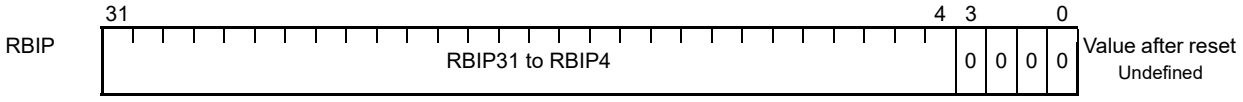

Table 3.41 RBIP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 4	RBIP31 to RBIP4	These bits indicate the initial pointer to the register bank. The values of RBCR0.MD and RBNR.BN together with this value determine the memory address to which the next register bank to be used is allocated as follows. • Save mode 0 (RBCR0.MD = 0): RBIP − RBNR.BN × 60_H • Save mode 1 (RBCR0.MD = 1): RBIP − RBNR.BN × 90_H	R/W	Undefined
3 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

3.2.3.3 Interrupt Function Registers

(a) Interrupt Function System Registers

Interrupt function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.42 Interrupt Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR10, 2	ISPR	Priority of interrupt being serviced	SV
SR11, 2	IMSR	Interrupt mask status	SV
SR12, 2	ICSR	Interrupt control status	SV
SR13, 2	INTCFG	Interrupt function setting	SV
SR14, 2	PLMR	Interrupt priority masking	SV

(1) ISPR — Priority of Interrupt being Serviced

The ISPR register holds the interrupt priority of the EI level interrupt (EIINTn) being processed by the CPU for each priority, priority ceiling by interrupt priority is performed when multiplexed interrupts occur.

For the ISPR register, the function becomes enabled if INTCFG.EPL is cleared to 0. When INTCFG.EPL is set to 1, the function of the ISPR register is disabled and acknowledgment of interrupt (EIINTn) is not controlled.

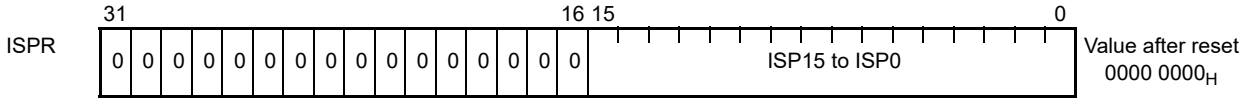

Table 3.43 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 0	ISP15 to ISP0	These bits indicate the acknowledgment status of an EIINTn interrupt with a priority*1 that corresponds to the relevant bit position. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core. The bit positions correspond to the priority levels of the interrupts as follows: Bit / Priority 0 / Priority 0 (highest) 1 / Priority 1 : 14 / Priority 14 15 / Priority 15 (lowest) When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1*4. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set (0 is the highest priority) is cleared to 0*2. While a bit in this register is set to 1, same or lower priority interrupts (EIINTn) are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*5. For details, see **Section 3.2.4.1(5), Interrupt Exception Priority and Priority Masking**. When performing software-based priority control using the PLMR register, be sure to clear this register by using the INTCFG.ISPC bit*6. If INTCFG.EPL is set to 1, the function of this field is disabled.	R*3	0

Note 1. For details, see **Section 3.2.4.1(5), Interrupt Exception Priority and Priority Masking**.

Note 2. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

Note 4. If the priority of the acknowledged interrupt (EIINTn) is 16 to 63, neither bit of the ISP is set to 1.

Note 5. When an interrupt (EIINTn) with priority 16 to 63 is notified from the interrupt controller, if any bit of the ISP is set to 1, the interrupt (EIINTn) is masked.

Note 6. It is recommended that priority control by software using the PLMR register is performed with the INTCFG.ISPC bit set to 1 and automatic updating of ISPR disabled.

Note 7. The function of the ISPR register changes depending on the setting of INTCFG.EPL and INTCFG.ISPC.

INTCFG setting		Function of ISPR		
EPL	ISPC	Interrupt mask	ISP automatic update	Access by LDSR, STSR
0	0	Enabled	Enabled	Can Read Only
0	1	Enabled	Disabled	Can Read and Update
1	—	Disabled	Disabled	Treated as an undefined register

(2) IMSR — Interrupt Mask Status

The IMSR register is a register that indicates that interrupts notified to the CPU are masked for acceptance by the mask function in the CPU. Note that, for details of interrupt requests for updating each bit, see **Section 3.2.3.3 (a), Order of updating IMSR**.

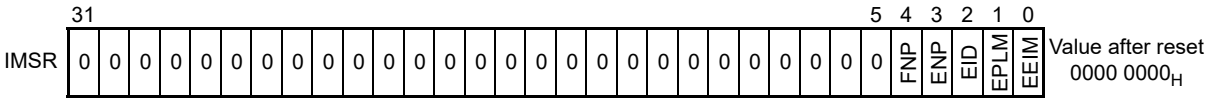

Table 3.44 IMSR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4	FNP	This bit specifies the existence of FEINT whose acceptance is masked by PSW.NP. 0: FEINT masked by PSW.NP does not exist 1: FEINT masked by PSW.NP does exists	R	0
3	ENP	This bit specifies the existence of EIINT whose acceptance is masked by PSW.NP. 0: EIINT masked by PSW.NP does not exist 1: EIINT masked by PSW.NP does exists	R	0
2	EID	This bit specifies the existence of EIINT whose acceptance is masked by PSW.ID. 0: EIINT masked by PSW.ID does not exist 1: EIINT masked by PSW.ID exists	R	0
1	EPLM	This bit specifies the existence of EIINT whose acceptance is masked by PLMR.PLM. 0: EIINT masked by PLMR.PLM does not exist 1: EIINT masked by PLMR.PLM exists	R	0
0	EEIM	This bit specifies the existence of EIINT whose acceptance is masked by ISPR.ISP when INTCFG.EPL is cleared to 0 or PSW.EIMASK when INTCFG.EPL is set to 1. 0: EIINT masked by ISPR.ISP or PSW.EIMASK does not exist 1: EIINT masked by ISPR.ISP or PSW.EIMASK exists	R	0

(a) Order of updating IMSR

In the interrupt notified to the CPU, the acceptance conditions are confirmed in the order of ISPR or PSW.EIMASK (selected by INTCFG.EPL), PLMR, PSW.ID, PSW.NP. If the acceptance condition is set to the value that masks the interrupt, the interrupt request is masked there, and the acceptance conditions that are in the subsequent order are not confirmed. Note that depending on the type of exception, the confirmation of conditions that are not acceptance conditions do not.

Since the interrupt (EIINTn) has multiple acceptance conditions, it is set one bit at a time according to the order of confirmation of the acceptance conditions as follows.

Table 3.45 Conditions which each bit of the IMSR are set (1) by masked of the interrupt (EIINTn)

Which bits are set (1)	Acceptance conditions				Value of IMSR			
	PSW.NP	PSW.ID	PLMR	*1	ENP	EID	EPLM	EEIM
ENP is set (1)	Disable	Enable	Enable	Enable	1	0*2	0*2	0*2
EID is set (1)	—	Disable	Enable	Enable	0*3	1	0*2	0*2
EPLM is set (1)	—	—	Disable	Enable	0*3	0*3	1	0*2
EEIM is set (1)	—	—	—	Disable	0*3	0*3	0*3	1

Note 1. If INTCFG.EPL is cleared (0), the acceptance condition is specified by ISPR, and if INTCFG.EPL is set (1), the acceptance condition is specified by PSW.EIMASK.

Note 2. If the interrupt (EIINTn) is masked under the acceptance condition, that interrupt is not masked by acceptance conditions at the right side of that condition. The bits corresponding to such unmasked acceptance conditions are cleared (0).

Note 3. If the interrupt (EIINTn) is masked under the acceptance condition, that interrupt is not confirmed by acceptance conditions at the left side of that condition. The bits corresponding to such unconfirmed acceptance conditions are cleared (0), even if the acceptance conditions is set to the value that masks the interrupt (EIINTn).

(3) ICSR — Interrupt Control Status

This register indicates the interrupt control status in the CPU.

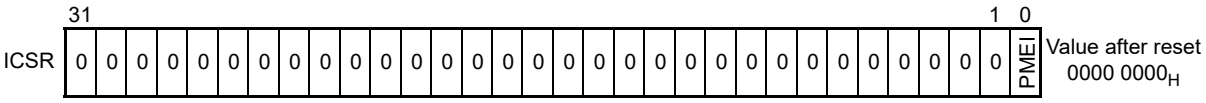

Table 3.46 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	PMEI	This bit indicates that an interrupt (EIINTn) with the priority level masked by the PLMR register exists. For details, see **Section 3.2.4.1(5), Interrupt Exception Priority and Priority Masking**.	R	0

(4) INTCFG — Interrupt Function Setting

This register is used to specify settings related to the CPU's internal interrupt function.

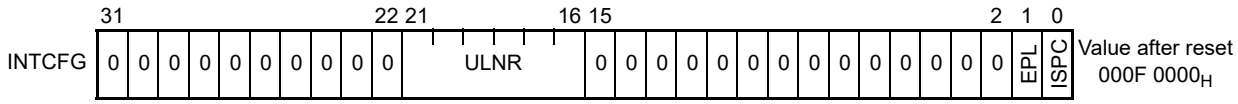

Table 3.47 INTCFG Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 22	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
21 to 16	ULNR	Specifying the maximum value of available register bank numbers. If the value of the RBNR.BN is bigger than the ULNR, or the value of the RBNR.BN is 63; and the interrupt (EIINTn) whose register bank function is enable occurs, the SYSERR exception will occur. Note that the interrupt (EIINTn) is not accepted and is held.	R/W	$0F_H$
15 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	EPL	For the interrupt (EIINTn), specify whether to enable interrupt priority level extension function. 0: Interrupt priority level extension function is disabled 1: Interrupt priority level extension function is enabled The following is the overview of interrupt operation by setting this bit. For details, see **Section 3.2.4.1 (5), Interrupt Exception Priority and Priority Masking** , **Section 3.2.4.4, Exception Handler Address**, **Section 3.2.4.5, Register Bank Function**.	R/W	0

Interrupt function		Value of EPL = 0	Value of EPL = 1
Number of interrupt priority level		16	64
Mask Function	ISPR	Function is enabled	Function is disabled
	PSW.EIMASK	Function is disabled	Function is enabled
	PLMR	Function is enabled	
	PSW.NP	Function is enabled	
	PSW.ID	Function is enabled	
INTCFG.ISPC		Settings can be changed	Fixed 0
ICSR.PMEI		Function is enabled	
IMSR		Function is enabled	
Handler generation	Direct vector method	Each vector can be used by each priority	Each vector can be used by priority 0 to 14. The priority 15 vector is shared with the priority is 15 to 63.
	Table reference method	Available	
Register bank		The usage can be set by each priority	Priority 0 to 14 can be individually settable. The priority 15 setting is shared with the priority is 15 to 63.

Table 3.47 INTCFG Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
0	ISPC	This bit changes how the ISPR register is written. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, the bits are not updated by an LDSR instruction executed by the program. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared. When performing software-based priority control, however, set this bit (1). For details, see **Section 3.2.4.1(5)(b), Interrupt Priority Mask**.	R/W	0

(5) PLMR — Interrupt Priority Level Mask

This register masks the interrupts (EIINTn) whose priority level is not higher than the level specified by these bits.

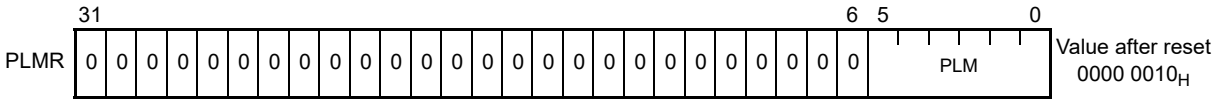

Table 3.48 PLMR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 0	PLM	These bits are used to mask the interrupts (EIINTn) whose priority level is not higher than the level specified by these bits. When an interrupt (EIINTn) is masked by this register, it is not accepted. The correspondence between the value of the PLM bit and the highest priority of interrupts to be masked is shown below. **Value of PLM Bit / Highest Priority of Interrupts to be Masked** 0 — Priority 0 (All priorities are not acceptable) 1 — Priority 1 (Acceptable of priority 0 only) : 14 — Priority 14 (Acceptable priority is 0 to 13) 15 — Priority 15 (Acceptable priority is 0 to 14) : 62 — Priority 62 (Acceptable priority is 0 to 61) 63 — Priority 63 (Acceptable priority is 0 to 62) Since the highest priority level of an interrupt that is defined for this CPU is 0, if 0 is specified in the PLM bit, all interrupts (EIINTn) are masked by this register. Since the lowest interrupt priority level defined by this CPU is 63, the interrupts (EIINTn) with the interrupt priority of 63 are always masked. Regardless of INTCFG.EPL setting, the interrupt mask by PLMR is done by the value of the PLM bit and the value of the interrupt priority notified from the interrupt controller. If the value of PLMR is altered by the LDSR instruction, the new PLMR value is reflected in the instructions following that LDSR instruction.	R/W	10_H

3.2.3.4 FPU Function Registers

(a) Floating-Point Registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations.

- Single-precision floating-point instruction:
  Thirty-two 32-bit registers can be specified. These general-purpose registers correspond to r0 to r31.
- Double-precision floating-point instruction:
  Sixteen 64-bit registers can be specified. Paired general-purpose registers are used as register pairs ({r1, r0}, {r3, r2} … {r31, r30}). Each register pair is specified in the instruction format with an even numbered register. Because r0 is a zero register (always holds 0), in principle {r1, r0} cannot be used by a double-precision floating-point instruction.

(b) Floating-Point Function System Registers

The FPU can use the following system registers to control floating-point operations. Floating-point function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

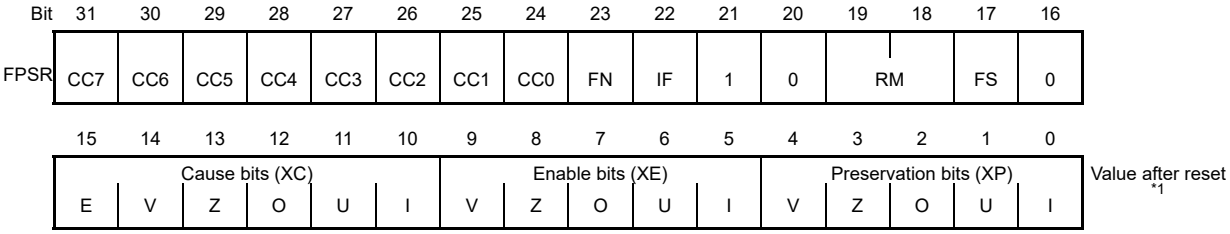
- FPSR: This register is used to control and monitor exceptions. It also holds the result of compare operations, and sets the FPU operation mode. Its bits are used to set condition code, subnormal number flush enable, rounding mode control, cause, exception enable, and preservation.
- FPEPC: This register stores the program counter value for the instruction where a floating-point operation exception has occurred.
- FPST: This register reflects the contents of the FPSR register bits related to the operation status.
- FPCC: This register reflects the contents of the FPSR.CC (7:0) bits.
- FPCFG: This register reflects the contents of the FPSR register bits related to the operation settings.

Table 3.49 FPU System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation configuration/status	CU0 and SV
SR7, 0	FPEPC	Floating-point operation exception program counter	CU0 and SV
SR8, 0	FPST	Floating point operation status	CU0
SR9, 0	FPCC	Floating-point operation comparison result	CU0
SR10, 0	FPCFG	Floating-point operation configuration	CU0

(1) FPSR — Floating-point Configuration/Status

This register indicates the execution status of floating-point operations and any exceptions that occur. For details about exception, see **Section 3.2.6.1 (5), Floating-Point Operation Exceptions**.



Note 1. See the descriptions of each bit.

Table 3.50 FPSR Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 24	CC[7:0]	These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. For details, see **Section 3.2.6.1 (9), Flush to Nearest**.	R/W	0
22	IF	This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see **Section 3.2.6.1 (8), Flushing Subnormal Numbers**.	R/W	0
21	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
19, 18	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions.	R/W	00

RM Bits		Mnemonic	Description
19	18		
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward +∞. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward −∞. The result is nearest to a value equal to or less than the accurate result with infinite accuracy.

Table 3.50 FPSR Register Contents (2/2)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th><th>R/W</th><th>Value After Reset</th></tr>
<tr><td>17</td><td>FS</td><td>This bit enables values that could not be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign. Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode.

</table>

Cause Bits (XC)

Bits 15 to 10 in the FPSR register are cause bits, which indicate the occurrence and cause of a floating-point operation exception. If an exception defined by IEEE754 is generated, when an enable bit is set to 1 corresponding to the exception, a cause bit is set, and the exception then occurs. When two or more exceptions occur during a single instruction, each corresponding bit is set to 1.

If two or more exceptions are detected, as long as the enable bit corresponding to one of the exceptions is set to 1, the exception occurs. In this case, the cause bits of all the detected exceptions, including exceptions whose enable bits are cleared to 0, are set to 1.

The cause bits are rewritten by a floating-point instruction (except the TRFSR instruction) where the floating-point operation exception occurred. The E bit is set to 1 when software emulation is required, otherwise it is cleared to 0. Other bits are set to 1 or cleared to 0 depending on whether or not an IEEE754-defined exception has occurred.

When a floating-point operation exception has occurred, the operation result is not stored, and only the cause bits are affected.

When the cause bits are set to 1 by an LDSR instruction, a floating-point operation exception does not occur.

Enable Bits (XE)

Bits 9 to 5 in the FPSR register are the enable bits, which enable floating-point operation exceptions. When an IEEE754-defined exception occurs, a floating-point operation exception occurs if the enable bit corresponding to the exception has been set to 1.

There are no enable bits corresponding to an unimplemented operation exception (E). An unimplemented operation exception (E) always occurs as a floating-point operation exception.

If the corresponding enable bit has not been set to 1, no exception occurs and the default result defined by IEEE754 is stored.

Preservation Bits (XP)

Bits 4 to 0 in the FPSR register are preservation bits. These bits store and indicate the detected exception after reset. An exception defined by IEEE754 occurs, and if a floating-point operation exception is not generated, the preservation bit is set to 1, otherwise it does not change. The preservation bits are not cleared to 0 by the floating-point operation. However, these bits can be set and cleared by software when an LDSR instruction is used to write a new value to the FPSR register.

There are no preservation bits corresponding to unimplemented operation exceptions (E). An unimplemented operation exception (E) always occurs as a floating-point operation exception.

NOTE

For details about the exception types and how they relate to particular bits, see **Figure 3.37, Cause, Enable, and Preservation Bits of FPSR Register**.

(2) FPEPC — Floating-point Exception Program Counter

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

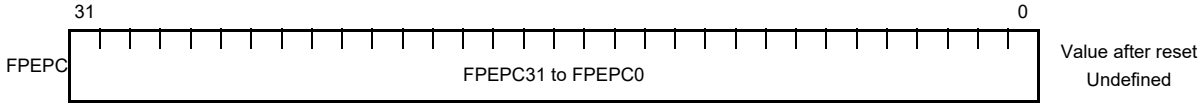

Table 3.51 FPEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	FPEPC31 to FPEPC1	These bits store the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R/W	Undefined
0	FPEPC0	This bit stores the program counter (PC) of the floating-point instruction that caused the exception when a floating-point operation exception that is enabled by an enable bit occurs.	R	0

(3) FPST — Floating-point Operation Status

This register reflects the contents of the FPSR register bits related to the operation status.

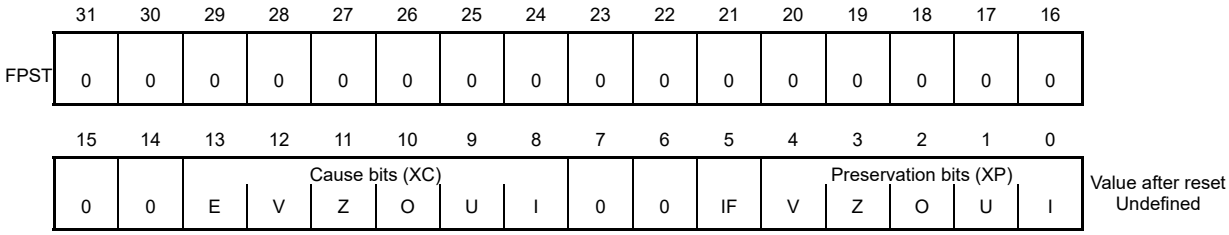

Table 3.52 FPST Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E, V, Z, O, U, I)	These are cause bits. For details, see **Section 3.2.3.4(1), Cause Bits (XC)**. Values written to these bits are reflected in FPSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see **Section 3.2.6.1 (8), Flushing Subnormal Numbers.** Value written to this bit is reflected in FPSR.IF bit.	R/W	0
4 to 0	XP (V, Z, O, U, I)	These are preservation bits. For details, see **Section 3.2.3.4(1), Preservation Bits (XP)**. Values written to these bits are reflected in FPSR.XP bits.	R/W	Undefined

(4) FPCC — Floating-point Operation Comparison Result

This register reflects the contents of the FPSR.CC7 to FPSR.CC0 bits.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	0	0	0	0	0	0	0	0	CC7	CC6	CC5	CC4	CC3	CC2	CC1	CC0	Value after reset Undefined

Table 3.53 FPCC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7 to 0	CC[7:0]	These are CC (condition) bits. They store the result of a floating-point comparison instruction. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. Values written to these bits are reflected in the CC7 to CC0 bits of FPSR. 0: Comparison result is false 1: Comparison result is true	R/W	Undefined

(5) FPCFG — Floating-point Operation Configuration

This register reflects the contents of the FPSR register bits related to the operation settings.

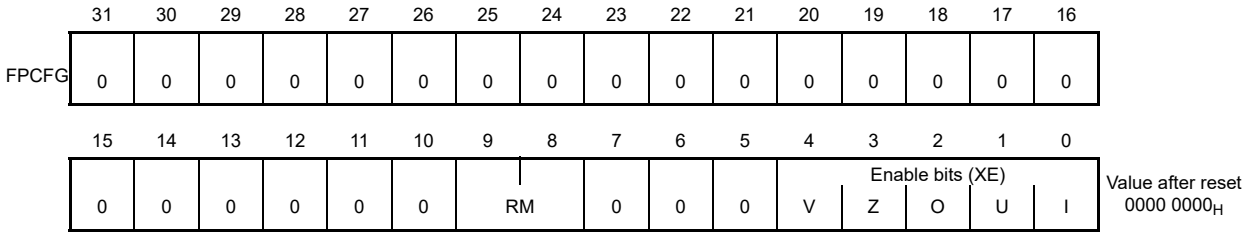

Table 3.54 FPCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9, 8	RM	These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. Values written to these bits are reflected in RM bits of FPSR.	R/W	0
7 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	XE (V,Z,O,U,I)	These are the enable bits. For details, see **Section 3.2.3.4(1), Enable Bits (XE)**. Values written to these bits are reflected in the FPSR.XE bits.	R/W	0

RM Bits 9	RM Bits 8	Mnemonic	Description
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward +∞. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward −∞. The result is nearest to a value equal to or less than the accurate result with infinite accuracy.

3.2.3.5 FXU Function Registers

(a) Vector Registers

32 vector registers (wr0-wr31) are provided as data registers dedicated to the extended floating-point operation unit (FXU). All of these registers can be used to store data variables. The data width of these registers is 128 bits. The values of the vector registers wr0 to wr31 after reset are undefined.

As shown in **Figure 3.15** and **Table 3.55**, one vector register consists of 4 operation ways. One single-precision floating-point data is stored in one operation way. This allows four single-precision floating-point operations to be performed with one extended floating-point operation instruction.

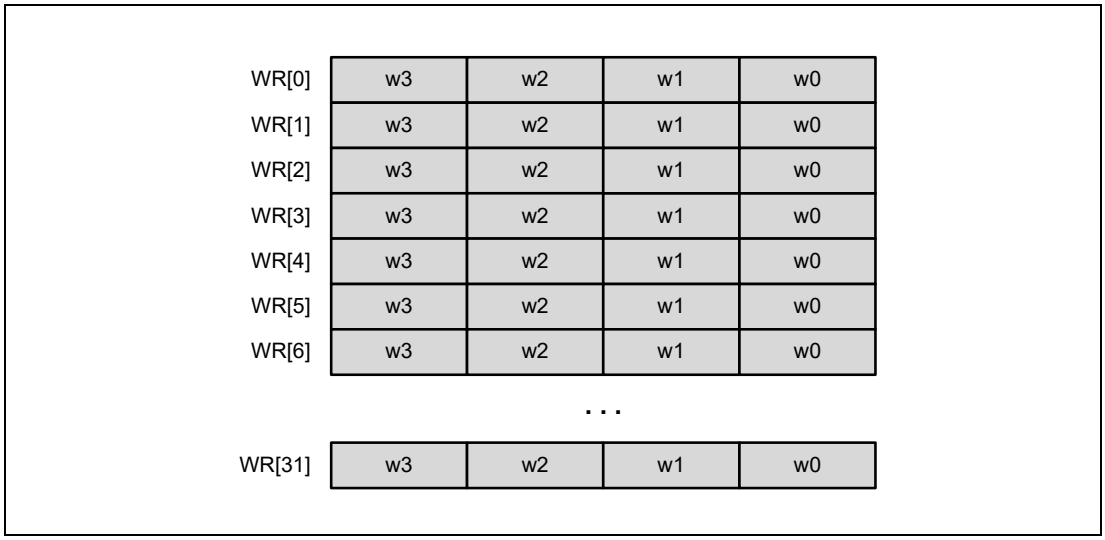

Figure 3.15 Vector Register Configuration

Table 3.55 Way Configuration of Vector Registers

Name	Bits	Function
W0	[31:0]	Way 0 data
W1	[63:32]	Way 1 data
W2	[95:64]	Way 2 data
W3	[127:96]	Way 3 data

(b) Extended Floating-point Function System Registers

The FXU can use the following system registers to control arithmetic operations. Extended floating-point function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

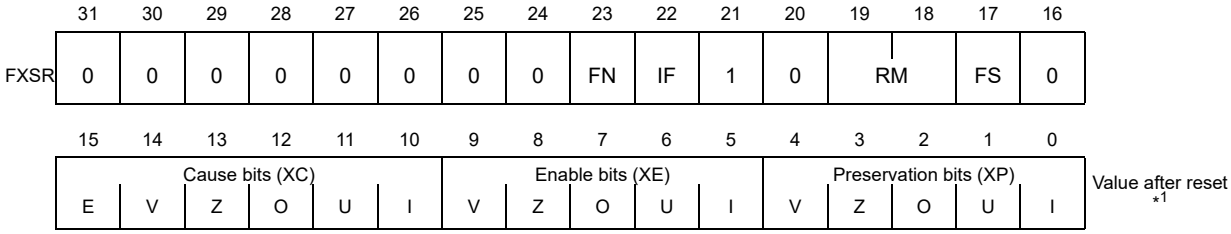
- FXSR: This register is used to control and monitor the extended floating-point operation exceptions. It is also used to set the operating mode of the FXU. It has bits for subnormal flush enabling, rounding mode control, exception cause, exception enabling and preservation.
- FXST: This register reflects the contents of the FXSR register bits related to the operation status.
- FXINFO: This register reflects the information about the configuration of the FXU.
- FXCFG: This register reflects the contents of the FXSR register bits related to the operation settings.
- FXXC: This register holds the XC (cause) bits of extended floating-point operation exceptions for each operation way.
- FXXP: This register holds the XP (preservation) bits of extended floating-point operation exceptions for each operation way.

Table 3.56 List of Extended Floating-point Function System Registers

Register Number (regID, selID)	Name	Function	Access Permission
SR6, 10	FXSR	Extended floating-point operation configuration/status	CU1 and SV
SR8, 10	FXST	Extended floating-point operation status	CU1
SR9, 10	FXINFO	FXU configuration information	CU1
SR10, 10	FXCFG	Extended floating-point operation configuration	CU1
SR12, 10	FXXC	XC (cause) bits for each operation way	CU1
SR13, 10	FXXP	XP (preservation) bits for each operation way	CU1

(1) FXSR — Extended Floating-point Operation Configuration/Status

The FXSR register indicates the execution status of extended floating-point operations and occurrence of exceptions.



Note 1. See the descriptions of each bit.

Table 3.57 FXSR Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 24	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
23	FN	This bit enables flush-to-nearest mode. When the FN bit is set to 1, if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. For details, see **Section 3.2.6.1 (9), Flush to Nearest**.	R/W	0
22	IF	This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see **Section 3.2.6.2 Section 3.2.6.1 (8), Flushing Subnormal Numbers**.	R/W	0
21	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
20	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
19, 18	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FXU uses for all extended floating-point instructions.	R/W	00

RM Bits 19	RM Bits 18	Mnemonic	Description
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward +∞. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward −∞. The result is nearest to a value equal to or less than the accurate result with infinite accuracy.

Table 3.57 FXSR Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
17	FS	This bit enables values that could not be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception (E). An input operand that is a subnormal number is flushed to 0 with the same sign. Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode. **Operation Result that is a Subnormal Number** / **Rounding Mode and Value after Flushing**: RN[*1] / RZ / RP / RM Positive: +0 / +0 / $+2^{Emin}$ / +0 Negative: −0 / −0 / −0 / -2^{Emin} Note 1. If the rounding mode is RN and the FXSR.FN bit is set to 1, flushing will occur in the direction of higher accuracy. For details, see **Section 3.2.6.1 (9), Flush to Nearest**.	R/W	1
16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 10	XC (E,V,Z,O,U,I)	These are the cause bits. For details, see **Section 3.2.3.4(1), Cause Bits (XC)**.	R/W	Undefined
9 to 5	XE (V,Z,O,U,I)	These are the enable bits. For details, see **Section 3.2.3.4(1), Enable Bits (XE)**.	R/W	0
4 to 0	XP (V,Z,O,U,I)	These are the preservation bits. For details, see **Section 3.2.3.4(1), Preservation Bits (XP)**.	R/W	Undefined

Cause Bits (XC)

Bits 15 to 10 in the FXSR register are cause bits, which indicate the occurrence and cause of an extended floating-point operation exception. The FXSR.XC bits hold the OR of the detection results of extended floating-point operation exceptions that occurred in the operation ways. If an exception defined by IEEE754 is generated, when an enable bit is set to 1 corresponding to the exception, a cause bit is set, and the exception then occurs. When two or more exceptions occur during a single instruction, each corresponding bit is set to 1.

If two or more exceptions are detected, as long as the enable bit corresponding to one of the exceptions is set to 1, the exception occurs. In this case, the cause bits of all the detected exceptions, including exceptions whose enable bits are cleared to 0, are set to 1.

The cause bits are rewritten by the extended floating-point operation instruction that caused the extended floating-point operation exception. The E bit is set to 1 when software emulation is required, otherwise it is cleared to 0. Other bits are set to 1 or cleared to 0 depending on whether or not an IEEE754-defined exception has occurred.

When an extended floating-point operation exception has occurred, the operation result is not stored, and only the cause bits are affected.

When the cause bits are set to 1 by an LDSR instruction, no extended floating-point operation exception occurs.

Enable Bits (XE)

Bits 9 to 5 in the FXSR register are the enable bits, which enable extended floating-point operation exceptions. When an IEEE754-defined exception occurs, an extended floating-point operation exception occurs if the enable bit corresponding to the exception has been set to 1.

There are no enable bits corresponding to an unimplemented operation exception (E). An unimplemented operation exception (E) always occurs as an extended floating-point operation exception.

The FXSR.XE bits cannot be set on an operation way basis. The same setting is used for the all operation ways.

If the corresponding enable bit has not been set to 1, no exception occurs and the default result defined by IEEE754 is stored.

Preservation Bits (XP)

Bits 4 to 0 in the FXSR register are preservation bits and accumulate and indicate the exceptions that have been detected since a reset. An exception defined by IEEE754 occurs, and if an extended floating-point operation exception is not generated, the preservation bit is set to 1, otherwise it does not change. The preservation bits are not cleared to 0 by the extended floating-point operation. However, these bits can be set and cleared by software when an LDSR instruction is used to write a new value to the FXSR register.

There are no preservation bits corresponding to unimplemented operation exceptions (E). An unimplemented operation exception (E) always occurs as an extended floating-point operation exception.

NOTE

For details about the exception types and how they relate to particular bits, see **Figure 3.38, Relationship among the Cause and Enable Bits of the FXXC and FXSR Registers** and **Figure 3.39, Relationship among the Preservation and Enable Bits of the FXXP and FXSR Registers**.

(2) FXST — Extended Floating-point Operation Status

This register reflects the contents of the FXSR register bits related to the operation status.

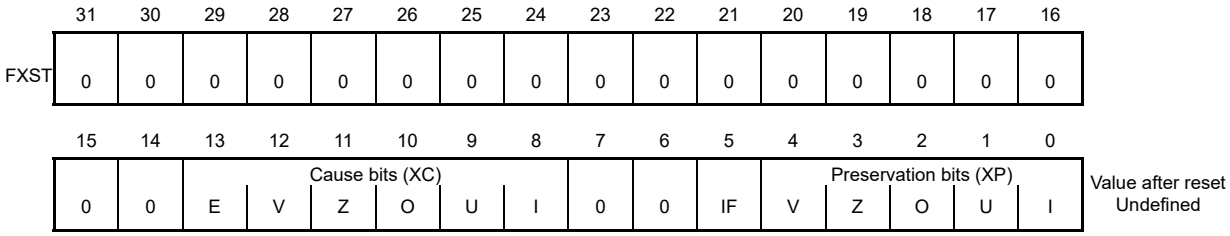


Table 3.58 FXST Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC (E,V,Z,O,U,I)	These are cause bits. For details, see **Section 3.2.3.4(1), Cause Bits (XC).** Values written to these bits are reflected in FXSR.XC bits.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	IF	This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see **Section 3.2.6.1 (8), Flushing Subnormal Numbers**. Value written to this bit is reflected in FXSR.IF bit.	R/W	0
4 to 0	XP (V,Z,O,U,I)	These are preservation bits. For details, see **Section 3.2.3.4(1), Preservation Bits (XP)**. Values written to these bits are reflected in FXSR.XP bits.	R/W	Undefined

(3) FXINFO — FXU Configuration Information

This register reflects the information about the configuration of the FXU.

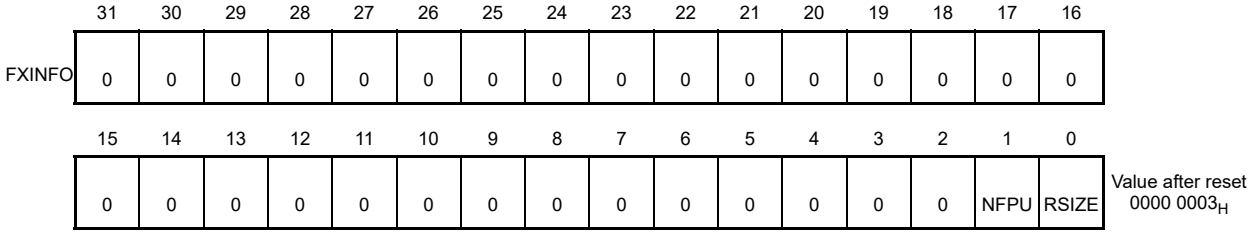

Table 3.59 FXINFO Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	NFPU	This bit indicates that 4-way SIMD arithmetic unit is provided.	R	1
0	RSIZE	This bit indicates that 32 128-bit vector registers are provided.	R	1

(4) FXCFG — Extended Floating-point Operation Configuration

This register reflects the contents of the FXSR register bits related to the operation settings.

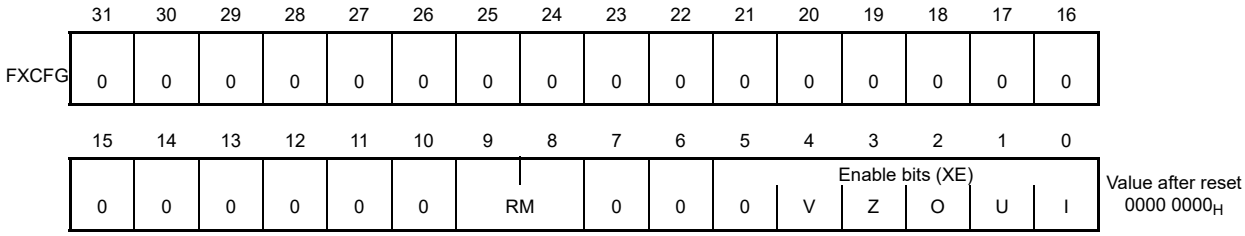

Table 3.60 FXCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 10	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
9, 8	RM	These are the rounding mode control bits. The RM bits define the rounding mode that the FXU uses for all extended floating-point instructions. Values written to these bits are reflected in FXSR.RM bits.	R/W	0
7 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	XE (V,Z,O,U,I)	These are the enable bits. For details, see **Section 3.2.3.4(1), Enable Bits (XE)**. Values written to these bits are reflected in FXSR.XE bits.	R/W	0

RM Bits		Mnemonic	Description
9	8		
0	0	RN	Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0.
0	1	RZ	Rounds the result toward 0. The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.
1	0	RP	Rounds the result toward +∞. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy.
1	1	RM	Rounds the result toward −∞. The result is nearest to a value equal to or less than the accurate result with infinite accuracy.

(5) FXXC — XC (Cause) Bits for Each operation way

This register holds the XC (cause) bits of extended floating-point operation exceptions for each operation way. Any attempts to write this register will not affect the value of the XC bits of the FXSR register.

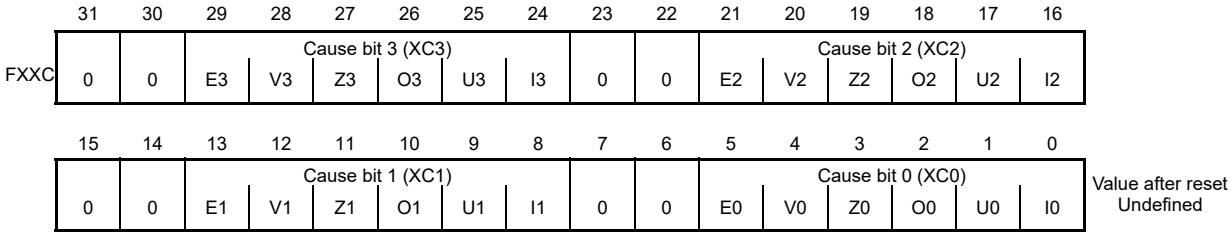

Table 3.61 FXXC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31, 30	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
29 to 24	XC3 (E3,V3,Z3,O3,U3,I3)	These bits hold the cause bits associated with operation way 3.	R/W	Undefined
23, 22	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
21 to 16	XC2 (E2,V2,Z2,O2,U2,I2)	These bits hold the cause bits associated with operation way 2.	R/W	Undefined
15, 14	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
13 to 8	XC1 (E1,V1,Z1,O1,U1,I1)	These bits hold the cause bits associated with operation way 1.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5 to 0	XC0 (E0,V0,Z0,O0,U0,I0)	These bits hold the cause bits associated with operation way 0.	R/W	Undefined

(6) FXXP — XP (Preservation) Bits for Each operation way

This register holds the XP (preservation) bits of extended floating-point operation exceptions for each operation way. Any attempts to write this register will not affect the value of the XP bits of the FXSR register.

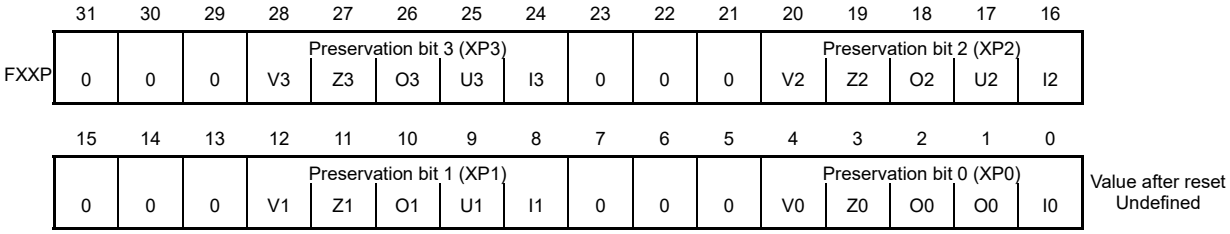

Table 3.62 FXXP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 29	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
28 to 24	XP3 (V3,Z3,O3,U3,I3)	These bits hold the preservation bits associated with operation way 3.	R/W	Undefined
23 to 21	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
20 to 16	XP2 (V2,Z2,O2,U2,I2)	These bits hold the preservation bits associated with operation way 2.	R/W	Undefined
15 to 13	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
12 to 8	XP1 (V1,Z1,O1,U1,I1)	These bits hold the preservation bits associated with operation way 1.	R/W	Undefined
7 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	XP0 (V0,Z0,O0,U0,I0)	These bits hold the preservation bits associated with operation way 0.	R/W	Undefined

3.2.3.6 MPU Function Registers

(a) MPU Function System Registers

MPU function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.63 MPU Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR2, 5	MPCFG	MPU configuration	SV
SR8, 5	MCA	Memory protection setting check address	SV
SR9, 5	MCS	Memory protection setting check size	SV
SR10, 5	MCC	Memory protection setting check command	SV
SR11, 5	MCR	Memory protection setting check result	SV
SR12, 5	MCI	Memory protection setting check SPID	SV
SR16, 5	MPIDX	Index of memory protection setting registers to be accessed	SV
SR17, 5	MPBK	MPU Bank Setting	SV
SR20, 5	MPLA	Protection area minimum address	SV
SR21, 5	MPUA	Protection area maximum address	SV
SR22, 5	MPAT	Protection area attribute	SV
SR24, 5	MPID0	SPID which can access protection area	SV
SR25, 5	MPID1	SPID which can access protection area	SV
SR26, 5	MPID2	SPID which can access protection area	SV
SR27, 5	MPID3	SPID which can access protection area	SV
SR28, 5	MPID4	SPID which can access protection area	SV
SR29, 5	MPID5	SPID which can access protection area	SV
SR30, 5	MPID6	SPID which can access protection area	SV
SR31, 5	MPID7	SPID which can access protection area	SV

(1) MPM — Memory Protection Operation Mode

The memory protection operation mode register is used to define the basic operation mode of the memory protection function.

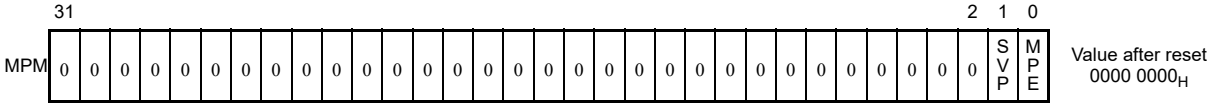

Table 3.64 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	SVP	In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: Enable all accesses in SV mode. 1: Restrict access according to the SX, SW, and SR bits in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable MPU function. 0: Disable 1: Enable	R/W	0

Note 1. When the SVP bit is set to 1 by an LDSR instruction, the setting is effective from the operand access by the subsequent instruction. On the other hand, since the instruction fetch access is executed independently from the setting of the SVP bit, it is not possible to identify the timing when the new setting is applied to the instruction fetch access. In this case, make settings of the protection area in advance so that the program which sets the SVP bit itself will not be blocked.

Note 2. If the SVP bit is set to 1, the MDP or MIP exception handler cannot be executed if it is not permitted to access to the necessary memory areas. Be sure to make settings of the protection area in advance so that the necessary memory areas can be accessed by the exception handler.

(2) MPCFG — MPU Configuration

This register holds the information about the configuration of the MPU.

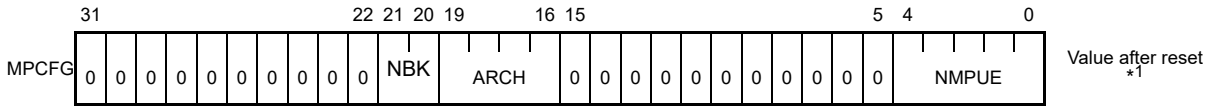

Table 3.65 MPCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 22	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
21, 20	NBK	Indicates the "number of banks - 1" of the MPU bank *2 equipped in this CPU. Since the MPU bank of this CPU is equipped with one bank, 0 is read.	R	*1
19 to 16	ARCH	These bits indicate the version of the MPU architecture specifications. A value of 2 is read for this CPU.	R	2
15 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	NMPUE	These bits indicate the number of MPU entries implemented in this CPU minus 1. A value of 31 is read since this CPU incorporates 32 MPU entries.	R	31

Note 1. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

Note 2. The number of MPU bank mounted on the MPU is equal or more than one. The MPU bank consists of MPU entries (MPAT, MPUA, MPLA) whose number is specified by NMPUE. If two banks are equipped, the number of MPU entries twice as large as the value indicated by the NMPUE are equipped. However, each MPU bank is used exclusively. Only the MPU bank indicated by the MPBK register is used for memory protection. Therefore, even if multiple banks are equipped, the maximum number of the MPU entries that can be used simultaneously for memory protection is up to the value indicated by the NMPUE.

(3) MCA — Memory Protection Setting Check Address

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

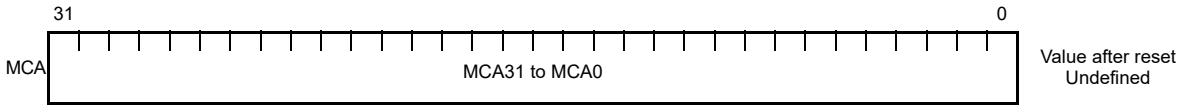

Table 3.66 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCA31 to MCA0	These bits are used to specify the starting address of the memory area which subjects to a memory protection setting check in bytes.	R/W	Undefined

(4) MCS — Memory Protection Setting Check Size

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

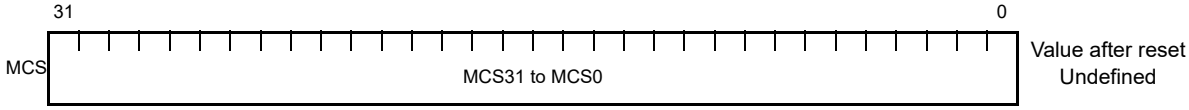

Table 3.67 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCS31 to MCS0	These bits are used to specify the size of the memory area in bytes which subjects to a memory protection setting check. Because the specified size is assumed to represent an unsigned integer, it is not possible to check an area in the direction in which the address value decreases relative to the MCA register value.	R/W	Undefined

(5) MCC — Memory Protection Setting Check Command

This command register is used to start a memory protection setting check.

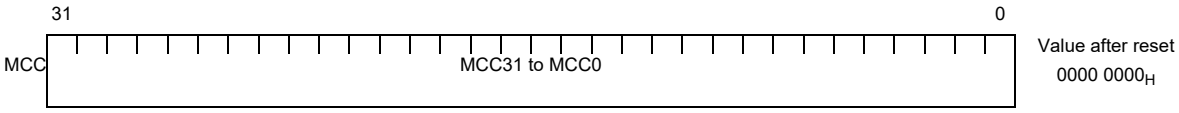

Table 3.68 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCC31 to MCC0	When any value is written to the MCC register, a memory protection setting check starts. By setting up the MCA / MCS register and then writing to the MCC register, results are stored in MCR. Because the check is started by any written value, a check can be started by using r0 as the source register without using any unnecessary registers. Note that, for the check, the results are applied according to each area setting regardless of the state of the PSW.UM bit. This checking applies for memory protection setting of a MPU bank that is specified by MPBK register. When the MCC register is read, value 0000 0000_H is always returned.	R/W	0

(6) MCR — Memory Protection Setting Check Result

This register is used to store the results of a memory protection setting check.

When the MCC register is written, the value of the MPIDn registers (n = 0 to 7), the WMPIDn bits (n = 0 to 7) (for write permission) and the RMPIDn bits (n = 0 to 7) (for execution and read permission) of each MPAT register are checked to verify that the SPID specified by the MCI register matches the SPID for which the access is permitted.

However, if the WG bit or RG bit of the MPAT register is set to 1, it is assumed that the SPID specified by the MCI register matches the SPID for which write or execution and read access is permitted regardless of the SPID matching result above.

If an SPID match is found, protection attributes of the protection area which includes the address area specified by the MCA and MCS registers are stored in the corresponding attribute bits of the MCR register. If multiple protection areas include the specified address area, and if an access is permitted by any of the protection areas, 1, which indicates the access is permitted, is stored in the corresponding attribute bits of the MCR register.

If no SPID match is found or no protection area including the specified address area exists, 0, which indicates the access is not permitted, is stored in each attribute bit of the MCR register.

CAUTION

If the specified area to be checked crosses 0000 0000_H or 7FFF $FFFF_H$, it is judged as an area setting error, and the MCR.OV bit is set to 1. This means that the MCR.OV bit must be read to confirm that the result is not invalid (OV = 0) before referencing the check result of each attribute bit. When the MCR.OV bit is set to 1, all attribute bits are cleared to 0 unless the MPM.SVP bit is 0. If the MPM.SVP bit is 0, the MCR.SXE, SWE and SRE bits are set to 1, even if the MCR.OV bit is set to 1. Even when no SPID match is found, the MCR.OV bit is set to 1 if the area setting is wrong.

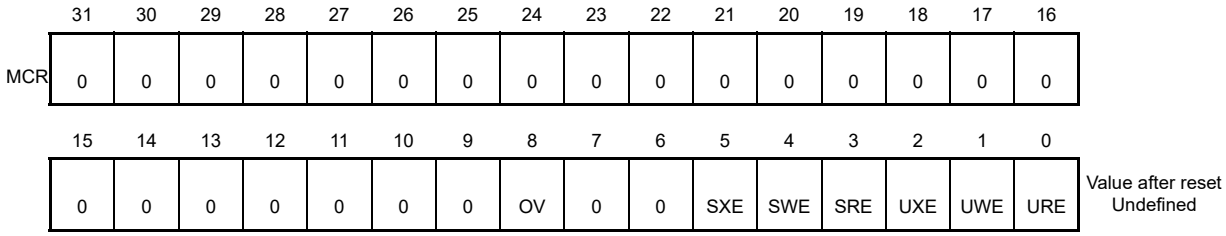

Table 3.69 MCR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	OV	If the specified area includes 0000 0000_H or 7FFF $FFFF_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SXE	If the specified area is contained within one protection area and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one protection area and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one protection area and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
2	UXE	If the specified area is contained within one protection area and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one protection area and writing from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one protection area and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(7) MCI — Memory Protection Setting Check SPID

This register is used to specify the SPID for which a memory protection settings check is to be performed.

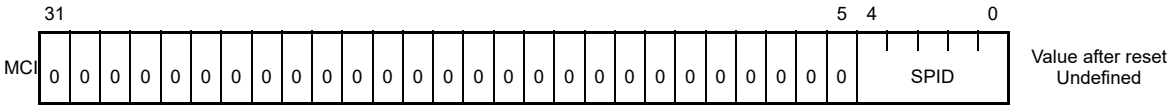

Table 3.70 MCI Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	SPID	These bits specify the SPID for which a memory protection settings check is to be performed.	R/W	Undefined

(8) MPIDX — Index of Memory Protection Setting Registers to be Accessed

This register is used to specify the index of memory protection setting registers to be accessed.

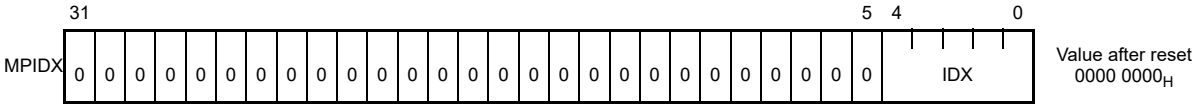

Table 3.71 MPIDX Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	IDX	These bits specify the MPU entries index of the MPLA, MPUA, and MPAT registers to be accessed by the LDSR or STSR instruction. The result of changing the value of this register is reflected in the instruction immediately following. Values from 0 to the maximum entry number indicated in the MPCFG.NMPUE can be specified for the IDX. If you specify a value exceeding the maximum entry number for the IDX, and the MPLA, MPUA, or MPAT register is accessed by the LDSR or STSR instruction, it is handled as an undefined register.	R/W	0

(9) MPBK — MPU Bank Setting

The MPBK register selects the MPU bank.

This register is not updated if the SVLOCK.SVL bit is set to 1.

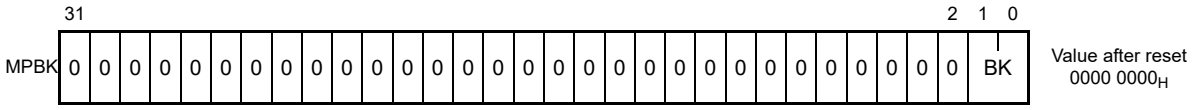

Table 3.72 MPBK Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1, 0	BK	These bits specify the MPU bank to be used for memory protection. 0: MPU bank 0 Other than above: Setting prohibited The MPU bank specified in the BK field is subject to memory protection, memory protection setting check function, the LDM.MP instruction, the STM.MP instruction. Each register of the MPU bank not specified in the BK field has no effect on the MPU function. And it is impossible to operate such registers with the LDSR and STSR instructions. It is impossible to set the value exceeding the MPCFG.NBK in the BK field. If an attempt is made to write such a value, the value is ignored and the original value is kept.	R/W	0

(10) MPLA — Protection Area Minimum Address

This register indicates the minimum address of a protection area. The value written into this register with the LDSR instruction is set as the minimum address of area n (n = 0 to MPCFG.NMPUE) specified in the MPIDX register. The value read from this register with the STSR instruction is the minimum address of area n specified in the MPIDX register. It is impossible to manipulate the minimum address of area n without using the MPIDX register and this register.

If the value more than MPCFG.NMPUE is specified in the MPIDX register, the register is handled as an undefined register.

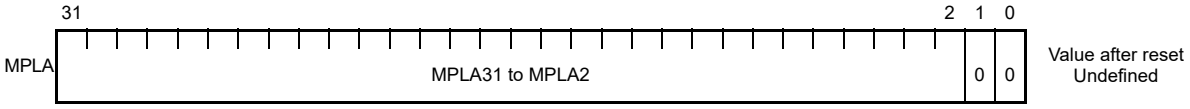

Table 3.73 MPLA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	MPLA31 to MPLA2	These bits specify the minimum address of area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register. The specified minimum address is included in the range of area matching.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(11) MPUA — Protection Area Maximum Address

This register indicates the maximum address of a protection area. The value written into this register with the LDSR instruction is set as the maximum address of area n (n = 0 to MPCFG.NMPUE) specified in the MPIDX register. The value read from this register with the STSR instruction is the maximum address of area n specified in the MPIDX register. It is impossible to manipulate the maximum address of area n without using the MPIDX register and this register.

If the value more than MPCFG.NMPUE is specified in the MPIDX register, the register is handled as an undefined register.

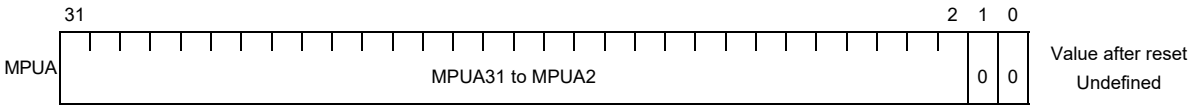

Table 3.74 MPUA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	MPUA31 to MPUA2	These bits specify the maximum address of area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register. The specified maximum address is included in the range of area matching. Bits 1 and 0 of the maximum address are handled as 1.	R/W	Undefined
1, 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(12) MPAT — Protection Area Attribute

This register indicates the attribute of a protection area. The value written into this register with the LDSR instruction is set as the protection attribute of area n (n = 0 to MPCFG.NMPUE) specified in the MPIDX register. The value read from this register with the STSR instruction is the protection attribute of area n specified by the MPIDX register. It is impossible to manipulate the attribute of area n without using the MPIDX register and this register.

If the value more than MPCFG.NMPUE is specified in the MPIDX register, the register is handled as an undefined register.

For details on how to set these bits, see **Section 3.2.5.1 (2), Protection Area Settings**.

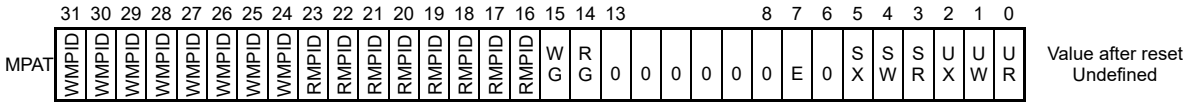

Table 3.75 MPAT Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 24	WMPID7 to 0	This bit indicates the write permission for the SPID specified in the MPIDn (n = 0 to 7) register. 0: Writing by the SPID specified by the MPIDn register is disabled. 1: Writing by the SPID specified by the MPIDn register is enabled.	R/W	Undefined
23 to 16	RMPID7 to 0	This bit indicates the execution and read permissions for the SPID specified in the MPIDn (n = 0 to 7) register. 0: Execution and reading by the SPID specified by the MPIDn register is disabled. 1: Execution and reading by the SPID specified by the MPIDn register is enabled.	R/W	Undefined
15	WG	This bit indicates the write permission for any SPID. 0: Writing is enabled by the settings of the MPIDn register and WMPIDn bit (n = 0 to 7). 1: Writing by any SPID is enabled regardless of the settings of the MPIDn register and WMPIDn bit (n = 0 to 7).	R/W	Undefined
14	RG	This bit indicates the execution and read permissions for any SPID. 0: Execution and reading is enabled by the settings of the MPIDn register and RMPIDn bit (n = 0 to 7). 1: Execution and reading by any SPID is enabled regardless of the settings of the MPIDn register and RMPIDn bit (n = 0 to 7).	R/W	Undefined
13 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	E	This bit indicates whether area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5	SX	This bit indicates the execution permission in the supervisor mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates the write permission in the supervisor mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates the read permission in the supervisor mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register.*1, *2 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Table 3.75 MPAT Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
2	UX	This bit indicates the execution permission in the user mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates the write permission in the user mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates the read permission in the user mode for area n (n = 0 to MPCFG.NMPUE) specified by the MPIDX register.*2 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, the MDP or MIP exception handler might not be executed depending on the settings. Be sure to make settings of the protection area in advance so that the necessary memory areas can be accessed by the exception handler.

Note 2. For the CALLT, SWITCH, and SYSCALL instructions and interrupts in table reference method, an MDP exception occurs if reading the address where the table is stored is not permitted. Permission for the SYSCAL instruction and interrupts in table reference method are judged after the operation mode of the CPU is transitioned to the supervisor mode. Therefore, when the MPM.SVP bit is set (1), the SR bit need to be set (1) as well.

(13) MPIDn —SPID which can Access Protection Area

This register specifies the SPID which can access protection area. The accessibility for the specified SPID is determined in conjunction with the WMPIDn and RMPIDn bits (n = 0 to 7) which are specified via the MPAT register.

This CPU has 8 MPID registers.

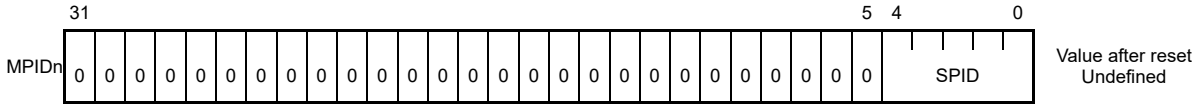

Table 3.76 MPIDn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
4 to 0	SPID	These bits specify the SPID which can access protection area.	R/W	Undefined

3.2.3.7 Cache Operation Function Registers

(a) Cache Control Function System Registers

Cache control function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.77 Cache Control Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR16, 4	ICTAGL	Instruction cache tag Lo access	SV
SR17, 4	ICTAGH	Instruction cache tag Hi access	SV
SR18, 4	ICDATL	Instruction cache data Lo access	SV
SR19, 4	ICDATH	Instruction cache data Hi access	SV
SR24, 4	ICCTRL	Instruction cache control	SV
SR26, 4	ICCFG	Instruction cache configuration	SV
SR28, 4	ICERR	Instruction cache error	SV

(1) ICTAGL — Instruction Cache Tag Lo Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the tag RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the tag RAM for the instruction cache are stored.

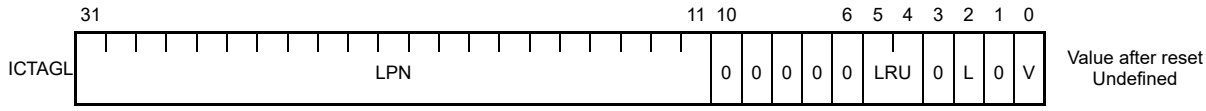

Table 3.78 ICTAGL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 11	LPN	These bits hold address bits 27 to 11. Bits 31 to 28 must always be set to 0. Bits 27 to 11 are held if the cache size is 8 Kbytes. Bits 27 to 12 are held and bit 11 is always set to 0 if the cache size is 16 Kbytes.*1 Bits 27 to 13 are held and bit 12 and 11 are always set to 0 if the cache size is 32 Kbytes.*2	R/W	Undefined
10 to 6	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
5, 4	LRU	These bits indicate LRU information of specified cache line. LRU information cannot be freely changed to any value by the CIST instruction.	R/W	Undefined
3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	L	This bit holds the lock information.*3 0: The cache line is not locked. 1: The cache line is locked.	R/W	Undefined
1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	V	This bit holds valid/invalid information of specified cache line.*3 0: The cache line is disabled. 1: The cache line is enabled.	R/W	Undefined

Note 1. Bit 11 cannot be written with any value by an LDSR instruction if the cache size is 16 Kbytes. It is always set to 0.

Note 2. Bit 12 and 11 can not be changed by an LDSR instruction if the cache size is 32Kbytes. It is always set to 0.

Note 3. If a tag RAM is set by a CIST instruction, the settings of other bits are valid only when the V bit is enabled. When the V bit is disabled, the cache line is always judged as a cache miss regardless of the value in the LPN bit. Also, when the V bit is disabled, even if the cache line is locked by the setting of the L bit, the cache line becomes the target to be replaced.

(2) ICTAGH — Instruction Cache Tag Hi Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the ECC for the tag RAM and the Data RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the ECC for the tag RAM and the Data RAM for the instruction cache are stored.

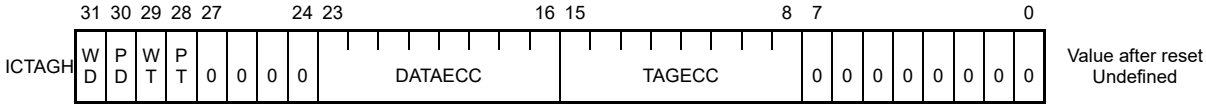

Table 3.79 ICTAGH Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	WD	This bit specifies whether the data RAM of the cache is updated during execution of the CIST instruction. 0: Data RAM of the cache is not updated. 1: Data RAM of the cache is updated.	R/W	0
30	PD	This bit specifies the data to be written to the ECC of the data RAM when the WD bit is set to 1 and the CIST instruction is executed. 0: ECC automatically generated from the write data is written to the ECC of the data RAM. 1: Values in the DATAECC field are written to the ECC of the data RAM.	R/W	0
29	WT	This bit specifies whether the tag RAM of the cache is updated during execution of the CIST instruction. When this bit is set to 1, the V bit and L bit of the cache line are also updated. 0: Tag RAM of the cache is not updated. 1: Tag RAM of the cache is updated.	R/W	0
28	PT	This bit specifies the data to be written to the ECC of the tag RAM when the WT bit is set to 1 and the CIST instruction is executed. 0: ECC automatically generated from the write data is written to the ECC of the tag RAM. 1: Values in the TAGECC field are written to the ECC of the tag RAM.	R/W	0
27 to 24	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
23 to 16	DATAECC	These bits hold ECC for data RAM.	R/W	Undefined
15 to 8	TAGECC	These bits hold ECC for tag RAM. Bit 15 is fixed to 0.	R/W	Undefined
7 to 0	—	(Reserved for future expansion. Be sure to set to 0.)	R	0

(3) ICDATL — Instruction Cache Data Lo Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the data RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the data RAM for the instruction cache are stored.

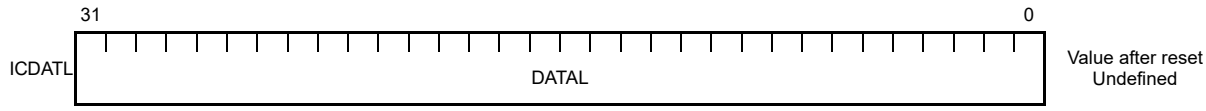

Table 3.80 ICDATL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	DATAL	These bits hold the lower-order 32 bits of the 64-bit instruction data*1 in the block in the specified cache line. The bits to be held is specified by offset of the index.*2 Offset of index = 00: Bits 31 to 0*3 Offset of index = 01: Bits 95 to 64*3 Offset of index = 10: Bits 159 to 128*3 Offset of index = 11: Bits 223 to 192*3	R/W	Undefined

Note 1. Data alignment of the instruction data in the block in the cache line is different from the data alignment of memory. For details, see **Section 3.2.5.2 (10), Configuration of Instruction Cache**.

Note 2. For details on how to specify Offset, see **Section 3.2.5.2 (6), Cache Index Specification Method**.

Note 3. For details on the bit position, see **Figure 3.31** in **Section 3.2.5.2 (10), Configuration of Instruction Cache**.

(4) ICDATH — Instruction Cache Data Hi Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the data RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the data RAM for the instruction cache are stored.

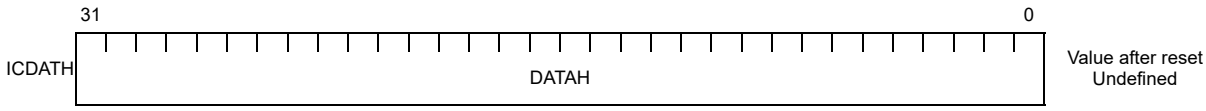

Table 3.81 ICDATH Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	DATAH	These bits hold the upper-order 32 bits of the 64-bit instruction data*1 in the block in the specified cache line. The bits to be held is specified by offset of the index.*2 Offset of index = 00: Bits 63 to 32*3 Offset of index = 01: Bits 127 to 96*3 Offset of index = 10: Bits 191 to 160*3 Offset of index = 11: Bits 255 to 224*3	R/W	Undefined

Note 1. Data alignment of the instruction data in the block in the cache line is different from the data alignment of memory. For details, see **Section 3.2.5.2 (10), Configuration of Instruction Cache**.

Note 2. For details on how to specify Offset, see **Section 3.2.5.2 (6), Cache Index Specification Method**.

Note 3. For details on the bit position, see **Figure 3.31** in **Section 3.2.5.2 (10), Configuration of Instruction Cache**.

(5) ICCTRL — Instruction Cache Control

This register is used to control the instruction cache.

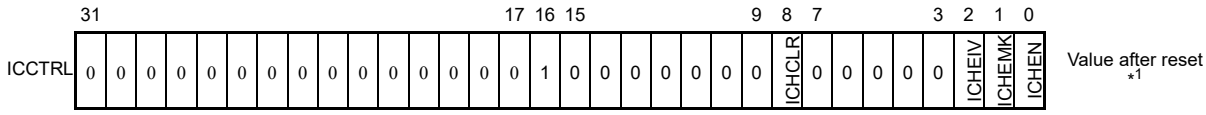

Table 3.82 ICCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 17	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
16	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
15 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	ICHCLR	When this bit is set to 1, the entire instruction cache is cleared. This clears the V and L bits (to 0) and initializes the LRU information. This bit is always read as 0.	R/W	0
7 to 3	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
2	ICHEIV	When this bit is set to 1, the instruction cache is automatically set as invalid (the ICHEN bit is cleared to 0) whenever a cache error*2 occurs.	R/W	0
1	ICHEMK	When this bit is set to 1, it masks notification of cache error exceptions for the CPU after a cache error*2 has occurred.	R/W	1
0	ICHEN	This bit indicates valid/invalid status of instruction cache. 0: Instruction cache is invalid 1: Instruction cache is valid	R/W	*1

Note 1. The value after reset is determined by the hardware specifications. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

Note 2. For details on the cache error, see **Section 3.2.5.2 (10), Configuration of Instruction Cache**.

(6) ICCFG — Instruction Cache Configuration

This register indicates the instruction cache configuration.

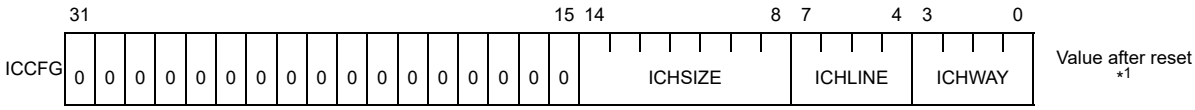

Table 3.83 ICCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 15	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
14 to 8	ICHSIZE	These bits indicate the size (in Kbytes) of the instruction cache. 000 1000: 8 Kbytes 001 0000: 16 Kbytes 010 0000: 32 Kbytes Other than above: Setting prohibited	R	*1
7 to 4	ICHLINE	These bits indicate the number of lines for each way in the instruction cache. 0010: 64 lines 0100: 128 lines 1000: 256 lines Other than above: Setting prohibited	R	*1
3 to 0	ICHWAY	These bits indicate the number of ways in the instruction cache. 0100: 4 ways Other than above: Setting prohibited	R	*1

Note 1. The value after reset is determined by the hardware specifications. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

(7) ICERR — Instruction Cache Error

This register is used to store cache error information for the instruction cache.

After the ICHERR bit is set to 1, any subsequent cache error information that is generated is not stored until this setting is explicitly cleared to 0. However, information on error status (ESAFE, ESMH, ESPBSE, ESTE1, ESTE2, ESDC, and ESDE) is accumulated.

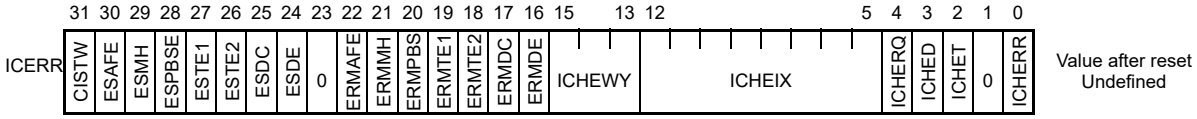

Table 3.84 ICERR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	CISTW	This bit is set to indicate that the destination way specified for a CISTI instruction was in error. Although the entry information is overwritten so that writing is completed, the V bit will be cleared the next time the cache line is read (i.e. reading will be judged to have missed the cache). However, setting of this bit is not accompanied by an exception for the CPU.	R/W	Undefined
30	ESAFE	Error status: Address feedback error	R/W	Undefined
29	ESMH	Error status: Multi hit	R/W	Undefined
28	ESPBSE	Error status: WAY error	R/W	Undefined
27	ESTE1	Error status: Tag RAM 1-bit error	R/W	Undefined
26	ESTE2	Error status: Tag RAM 2-bits error	R/W	Undefined
25	ESDC	Error status: Data RAM 1-bit error	R/W	Undefined
24	ESDE	Error status: Data RAM 2-bits error	R/W	Undefined
23	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
22	ERMAFE	Error exception notification mask: Address feedback error*3	R/W	0
21	ERMMH	Error exception notification mask: Multi hit*3	R/W	0
20	ERMPBSE	Error exception notification mask: WAY error*3	R/W	0
19	ERMTE1	Error exception notification mask: Tag RAM 1-bit error*3	R/W	0
18	ERMTE2	Error exception notification mask: Tag RAM 2-bits error*3	R/W	0
17	ERMDC	Error exception notification mask: Data RAM 1-bit error*3	R/W	0
16	ERMDE	Error exception notification mask: Data RAM 2-bits error*3	R/W	0
15 to 13	ICHEWY	These bits hold the way number where a cache error occurred. Bit 15 is always set to 0.	R/W	Undefined
12 to 5	ICHEIX	These bits hold the cache index where a cache error occurred. Bits 10 to 5 are held and bits 12 and 11 are fixed to 0 for a cache size of 8 Kbytes.*1 Bits 11 to 5 are held and bit 12 is fixed to 0 for a cache size of 16 Kbytes.*2 Bits 12 to 5 are held for cache size of 32 Kbytes.	R/W	Undefined
4	ICHERQ	When this bit is set to 1, this bit indicates that cache error exception notification is in progress. However, if cache error exception notification has been masked, the CPU is not notified even when 1 has been set to this bit.	R/W	0
3	ICHED	This bit indicates that an error has occurred in data RAM.	R/W	0
2	ICHET	This bit indicates that an error has occurred in tag RAM.	R/W	0
1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	ICHERR	This bit is set to 1 when a cache error has occurred.	R/W	0

Note 1. Bits 12 and 11 cannot be written with any value by an LDSR instruction if the cache size is 8 Kbytes. They are always set to 0.

Note 2. Bit 12 cannot be written with any value by an LDSR instruction if the cache size is 16 Kbytes. It is always set to 0.

Note 3. While the error exception notification mask bit for each error cause is cleared (to 0), if the corresponding error occurs, the ICHERR, ICHERQ, ICHED/ICHET, ICHEIX, and ICHEWY bits are updated and the corresponding error status bit is set (to 1). While the error exception notification mask bit is set (to 1), if the corresponding error occurs, only the corresponding error status bit is set (to 1).

3.2.3.8 Count Function Registers

(a) Count Function System Registers

Count function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.85 Count Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission	
			Read	Write
SR0, 11	TSCOUNTL	Timestamp count L register	UM	SV
SR1, 11	TSCOUNTH	Timestamp count H register	UM	SV
SR2, 11	TSCTRL	Timestamp count control register	SV	
SR8, 11	PMUMCTRL	Performance counter User mode control register	SV	
SR0, 14	PMCTRL0	Performance count control 0 register	SV*1	
SR1, 14	PMCTRL1	Performance count control 1 register	SV*1	
SR2, 14	PMCTRL2	Performance count control 2 register	SV*1	
SR3, 14	PMCTRL3	Performance count control 3 register	SV*1	
SR4, 14	PMCTRL4	Performance count control 4 register	SV*1	
SR5, 14	PMCTRL5	Performance count control 5 register	SV*1	
SR6, 14	PMCTRL6	Performance count control 6 register	SV*1	
SR7, 14	PMCTRL7	Performance count control 7 register	SV*1	
SR16, 14	PMCOUNT0	Performance count 0 register	SV*1	
SR17, 14	PMCOUNT1	Performance count 1 register	SV*1	
SR18, 14	PMCOUNT2	Performance count 2 register	SV*1	
SR19, 14	PMCOUNT3	Performance count 3 register	SV*1	
SR20, 14	PMCOUNT4	Performance count 4 register	SV*1	
SR21, 14	PMCOUNT5	Performance count 5 register	SV*1	
SR22, 14	PMCOUNT6	Performance count 6 register	SV*1	
SR23, 14	PMCOUNT7	Performance count 7 register	SV*1	
SR0, 15	PMSUBCND0	Performance count subcondition 0 register	SV*1	
SR1, 15	PMSUBCND1	Performance count subcondition 1 register	SV*1	
SR2, 15	PMSUBCND2	Performance count subcondition 2 register	SV*1	
SR3, 15	PMSUBCND3	Performance count subcondition 3 register	SV*1	
SR4, 15	PMSUBCND4	Performance count subcondition 4 register	SV*1	
SR5, 15	PMSUBCND5	Performance count subcondition 5 register	SV*1	
SR6, 15	PMSUBCND6	Performance count subcondition 6 register	SV*1	
SR7, 15	PMSUBCND7	Performance count subcondition 7 register	SV*1	

Note 1. Accessing in user mode becomes possible by configuring the PMUMCTRL register.

(1) TSCOUNTL — Timestamp Count L

This register, together with the timestamp count H register, implements a 64-bit counter. This register serves as the lower-order 32 bits of the 64-bit counter.

This register can be read only in user mode. A PIE exception will occur if an attempt is made to write this register in user mode. This register can be read and written in supervisor mode.

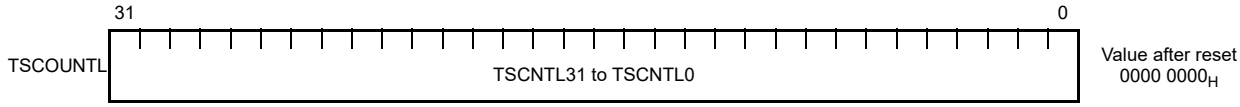

Table 3.86 TSCOUNTL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	TSCNTL31 to TSCNTL0	These bits account for the lower-order 32 bits of the 64-bit counter. If counting is enabled by the TSCTRL register, the value of this register is incremented by 1 on every clock cycle. When this register counts up from FFFF FFFF$_H$, the TSCOUNTH register is incremented by 1 as a carryover and this register wraps around to 0000 0000$_H$. This register is accessible at an arbitrary timing regardless of whether counting is enabled or disabled. In addition, it is possible to start counting at an arbitrary count by loading that value in this register before starting to count.	R/W*1	0

Note 1. To use this register for making up an accurate 64-bit counter, see **Section 3.2.2.12, Timestamp Counter**.

(2) TSCOUNTH — Timestamp Count H

This register, together with the timestamp count L register, implements a 64-bit counter. This register serves as the higher-order 32 bits of the 64-bit counter.

This register can be read only in user mode. A PIE exception will occur if an attempt is made to write this register in user mode. This register can be read and written in supervisor mode.

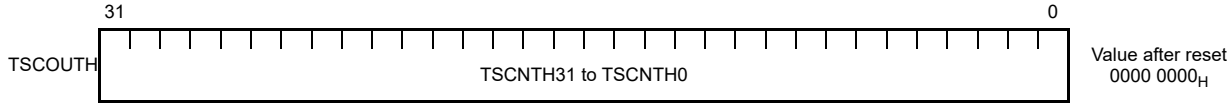

Table 3.87 TSCOUNTH Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	TSCNTH31 to TSCNTH0	These bits account for the higher-order 32 bits of the 64-bit counter. If counting is enabled by the TSCTRL register, the value of this register is incremented by 1 when the TSCOUNTL register counts up and generates a carryover. If a carryover occurs in the TSCOUNTL register when this register holds a value of FFFF FFFF$_H$, the TSCTRL.OVF bit is set to 1 and this register wraps around to 0000 0000$_H$. This register is accessible at an arbitrary timing regardless of whether counting is enabled or disabled. In addition, it is possible to start counting at an arbitrary count by loading that value in this register before starting to count.	R/W*1	0

Note 1. To use this register for making up an accurate 64-bit counter, see **Section 3.2.2.12, Timestamp Counter**.

(3) TSCTRL — Timestamp Count Control

This register is used to control the 64-bit timestamp counter which is implemented by combining the TSCOUNTH and TSCOUNTL registers.

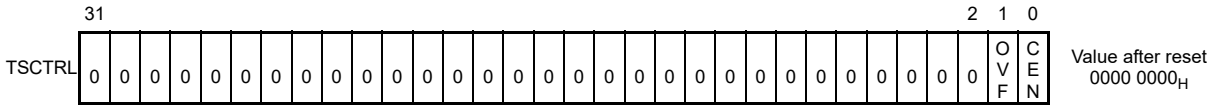

Table 3.88 TSCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	OVF	This bit serves as the overflow flag. This bit is set to 1 when an overflow occurs in the TSCOUNTH register as the result of its count operation. This bit is not automatically cleared to 0. To reset the overflow state, write a 0 into this bit. Since this bit can be written with a 1, it can be an overflow condition regardless of the count operation. Although it does not affect the counter operation, care must be taken not to take that condition for an overflow.	R/W	0
0	CEN	This bit enables or disables the count operation of the 64-bit timestamp counter which is implemented by combining the TSCOUNTH and TSCOUNTL registers. 0: Disables count operation. 1: Enables count operation. If this bit is written with a 1 when it is set to 0, the counter starts counting immediately. If this bit is written with a 0 when it is set to 1, the counter stops counting immediately. If this bit is 0, the values of the TSCOUNTH and TSCOUNTL registers are preserved. There is no factor that will automatically change the value of this bit.	R/W	0

(4) PMUMCTRL — Performance Counter User Mode Control

This register specifies the accessibility to system registers of the performance measurement function in user mode. The accessibility of the system registers is specified for each of the corresponding channels of the performance measurement function.

When the access in user mode is disabled, any attempt to access one of these system registers generates a PIE exception. When the access in user mode is enabled, the system registers can be read and written.

The performance measurement function itself runs in user mode regardless of the settings of this register. Even when all channels are disabled by this register for accesses in user mode, it is possible to measure the performance in user mode if the settings are done in supervisor mode.

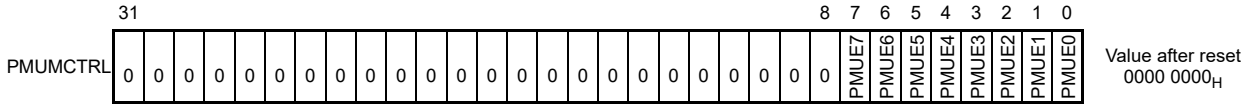

Table 3.89 PMUMCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 8	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
7	PMUE7	This bit specifies the accessibility of the PMCTRL7, PMCOUNT7 and PMSUBCND7 registers in user mode. 0: Disables accesses to PMCTRL7/PMCOUNT7/PMSUBCND7 in user mode. 1: Enables accesses to PMCTRL7/PMCOUNT7/PMSUBCND7 in user mode.	R/W	0
6	PMUE6	This bit specifies the accessibility of the PMCTRL6, PMCOUNT6 and PMSUBCND6 registers in user mode. 0: Disables accesses to PMCTRL6/PMCOUNT6/PMSUBCND6 in user mode. 1: Enables accesses to PMCTRL6/PMCOUNT6/PMSUBCND6 in user mode.	R/W	0
5	PMUE5	This bit specifies the accessibility of the PMCTRL5, PMCOUNT5 and PMSUBCND5 registers in user mode. 0: Disables accesses to PMCTRL5/PMCOUNT5/PMSUBCND5 in user mode. 1: Enables accesses to PMCTRL5/PMCOUNT5/PMSUBCND5 in user mode.	R/W	0
4	PMUE4	This bit specifies the accessibility of the PMCTRL4, PMCOUNT4 and PMSUBCND4 registers in user mode. 0: Disables accesses to PMCTRL4/PMCOUNT4/PMSUBCND4 in user mode. 1: Enables accesses to PMCTRL4/PMCOUNT4/PMSUBCND4 in user mode.	R/W	0
3	PMUE3	This bit specifies the accessibility of the PMCTRL3, PMCOUNT3 and PMSUBCND3 registers in user mode. 0: Disables accesses to PMCTRL3/PMCOUNT3/PMSUBCND3 in user mode. 1: Enables accesses to PMCTRL3/PMCOUNT3/PMSUBCND3 in user mode.	R/W	0

Table 3.89 PMUMCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
2	PMUE2	This bit specifies the accessibility of the PMCTRL2, PMCOUNT2 and PMSUBCND2 registers in user mode. 0: Disables accesses to PMCTRL2/PMCOUNT2/PMSUBCND2 in user mode. 1: Enables accesses to PMCTRL2/PMCOUNT2/PMSUBCND2 in user mode.	R/W	0
1	PMUE1	This bit specifies the accessibility of the PMCTRL1, PMCOUNT1 and PMSUBCND1 registers in user mode. 0: Disables accesses to PMCTRL1/PMCOUNT1/PMSUBCND1 in user mode. 1: Enables accesses to PMCTRL1/PMCOUNT1/PMSUBCND1 in user mode.	R/W	0
0	PMUE0	This bit specifies the accessibility of the PMCTRL0, PMCOUNT0 and PMSUBCND0 registers in user mode. 0: Disables accesses to PMCTRL0/PMCOUNT0/PMSUBCND0 in user mode. 1: Enables accesses to PMCTRL0/PMCOUNT0/PMSUBCND0 in user mode.	R/W	0

(5) PMCTRLn — Performance Count Control

This register controls the counting operation of the PMCOUNTn register. This CPU has 8 channels (n = 0 to 7) of performance count control registers.

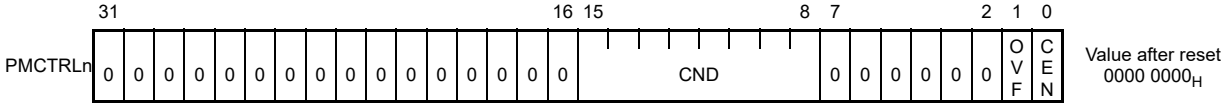

Table 3.90 PMCTRLn Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
15 to 8	CND	These bits specify the number of the event of which occurrences is to be counted. The PMCOUNTn register is not updated if the CEN bit is set (to 1) specifying an invalid event number.	R/W	0

Number	Details of Event	Speculative Operation*1
00_H	Number of all clock cycles*2	None
10_H	Number of executions of all instructions*3	None
18_H	Number of instructions that cause branch*4	None
19_H	Number of executions of conditional branch instructions (Bcond/Loop)*5	None
$1A_H$	Number of branch prediction misses of conditional branch instructions (Bcond/Loop)*5	None
20_H	Number of EIINTn acceptances*6	None
21_H	Number of FEINT acceptances	None
22_H	Number of terminating type exception acceptances*6 (including EIINTn and FEINT)	None
23_H	Number of resumable and pending type exception acceptances	None
28_H	Number of clock cycles during no interrupt is processed (period during which the ISPR register holds 0000_H*7)	None
29_H	Number of clock cycles during no interrupt is processed and interrupts are disabled (period during which the ISPR register holds 0000_H*7 and PSW.ID = 1)	None
30_H	Number of instruction fetch requests*8	Yes
31_H	Number of instruction cache hits*9	Yes
40_H	Number of stall cycles during which instructions are not issued to the instruction execution unit*10	Yes
50_H	Number of instruction fetch requests to Flash ROM*11	Yes
51_H	Number of data read requests to Flash ROM*12	Yes

Table 3.90 PMCTRLn Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
7 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	OVF	This bit serves as the overflow flag. This bit is set to 1 when an overflow occurs in the PMCOUNTn register as the result of its count operation. This bit is not automatically cleared to 0. To reset the overflow state, write a 0 into this bit. Since this bit can be written with a 1, it can be an overflow condition regardless of the count operation. Although it does not affect the counter operation, care must be taken not to take that condition for an overflow.	R/W	0
0	CEN	This bit enables or disables the count operation of the PMCOUNTn register. 0: Disables count operation. 1: Enables count operation. If this bit is written with a 1 when it is set to 0, the counter starts counting immediately. If this bit is written with a 0 when it is set to 1, the counter stops counting immediately. If this bit is 0, the values of the PMCOUNTn register is preserved. There is no factor that will automatically change the value of this bit.	R/W	0

Note 1. For the events for which speculative operation column is “Yes”, events whose execution results are cancelled are also counted.

Note 2. All clock cycles from the start of counting until the end, including the period during which no instruction is executed, are counted.

Note 3. The LDSR instruction which starts counting is not included but the LDSR instruction which stops counting is included in this number.

Note 4. Applicable instructions are JR, JMP, Bcond (only if condition is met), JARL, LOOP (only if condition is met), CALLT, DISPOSE, SWITCH, SYSCALL, CTRET, EIRET and FERET instructions. Other instructions with branch processing are not counted. Bcond and LOOP instructions are not counted if condition is not met.

Note 5. It is possible to obtain the branch prediction miss rate (hit rate) by measuring the numbers of executions of conditional branch instructions and branch prediction misses. Note that the unconditional branch (BR) of the Bcond instruction is counted in “Number of executions of conditional branch instructions” (CND = 19_H), but it is not counted in “Number of branch prediction misses of conditional branch instructions” (CND = $1A_H$).

Note 6. In EIINTn with table reference method, an exception which is detected during reading of the table or automatically saving the context to the register bank is not included in this number.

Note 7. Since this event presumes that the ISPR register is automatically updated on the acceptance of and returning from interrupt, it cannot be measured correctly if it is used with the INTCFG.ISPC bit set to 1.

Note 8. This CPU acquires the instruction code in 64-bit units. Every 64-bit acquisition is counted as a request for a single instruction fetching. Note that this is not the number of instructions. Instruction fetching by the CACHE instruction and PREF instruction is not counted.

Note 9. In this CPU, a cache hit indicates the number of requests for a single instruction fetching but not the number of instructions. Cache operation by the CACHE instruction is not counted.

Note 10. Instruction issue stall occurs when issuing of an instruction (starting execution of an instruction) is stalled if the CPU satisfies any of the following conditions.

- At execution of an STSR instruction that reads the PSW register, issue of the instruction is stalled until completion of all preceding instructions.
- At execution of a SYNCP, SYNCM, or SYNCI instruction, issue of the instruction is stalled until waiting conditions for the instruction are cleared. For details on the waiting conditions, see **Section 3.2.7.1, Synchronization Processing**.
- At execution of an LDSR instruction or STSR instruction that manipulates the cache control function system registers, issue of the instruction is stalled until completion of all preceding CACHE instructions.
- At execution of an LDSR instruction or STSR instruction that manipulates the FPU system registers, issue of the instruction is stalled until completion of all preceding FPU instructions.
- At execution of an LDSR instruction or STSR instruction that manipulates the FXU system registers, issue of the instruction is stalled until completion of all preceding FXU instructions.

- If an LDSR instruction updates the system register which guarantees reflection of its update to the subsequent instruction, issue of the instruction is stalled until the update of the system register is completed. For details, see **Section 3.2.7.3, Hazard Management after System Register Update**.
- If execution of an STSR instruction is started after execution of an LDSR instruction is started, issue of the STSR instruction is stalled until completion of the LDSR instruction. (This applies even if the system register numbers of the LDSR and STSR instructions do not match).
- When a HALT instruction is executed, issue of the subsequent instruction is stalled until conditions for releasing the halt state are generated.
- When a SNOOZE instruction is executed, issue of the subsequent instruction is stalled until conditions for releasing the snooze state are generated.
- When any of the following instructions that includes branching is executed, issue of the subsequent instruction is stalled until completion of the branching and cancellation of execution of the subsequent instruction.
  SYSCALL, CALLT, EIRET, FERET, CTRET, TRAP, FETRAP, SYNCI
- When any of the following exceptions is detected, issue of the subsequent instruction is stalled until acknowledgement of the exception is completed and cancellation of execution of the subsequent instruction.
  MIP, SYSERR (resumable), RIE, UCPOP, PIE

Note 11. Actual Flash ROM access requests are counted. If an instruction fetch request hits the instruction cache, it is not counted. Instruction fetch requests to Flash ROM by the CACHE and PREF instructions are counted. Instruction pre-fetching to Flash ROM is also counted.

Note 12. Actual Flash ROM access requests are counted. If a data read request hits the ROM data buffer, it is not counted. Pre-fetching to Flash ROM is counted. Note that the number of data read requests to Flash ROM is different from the number of Flash ROM accesses by instructions.

Note 13. Since the number of instruction fetch request (30H) and the number of instruction cache hits (31H) include the speculative instruction fetching, the number of hits divided by the number of requests may not be the accurate instruction cache hit rate of this CPU. The instruction cache hit rate of this CPU can be calculated by the number of instruction fetch requests and the number of instruction fetch requests to Flash ROM (50H). In this case, the number of instruction fetch request reduced by the number of instruction fetch requests to Flash ROM will be the number of instruction cache hits. However, even in this case, the number of instruction cache hits includes the speculative instruction fetching. Pre-fetching by the PREF instruction is counted as the number of instruction fetch requests, though accessing non-cacheable area is not counted as the number of instruction fetch requests to Flash ROM.

(6) PMCOUNTn — Performance Count

This register counts the number of occurrences of various events, which are specified by the PMCTRLn register. This CPU has 8 channels (n = 0 to 7) of performance count registers.

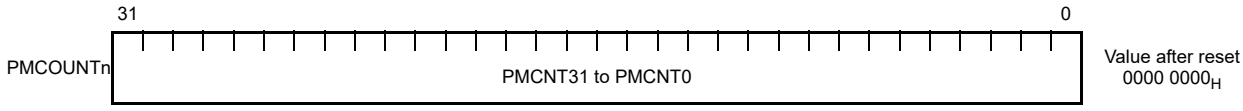

Table 3.91 PMCOUNTn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	PMCNT31 to PMCNT0	These bits form a 32-bit counter register. The counter counts the number of occurrences of the event that is specified by the PMCTRLn.CND bit. When this register counts up from FFFF FFFF$_H$, the PMCTRLn.OVF bit is set to 1 and the register wraps around to 0000 0000$_H$. This register is accessible at an arbitrary timing regardless of whether counting is enabled or disabled. In addition, it is possible to start counting at an arbitrary count by loading that value in this register before starting to count.	R/W	0

(7) PMSUBCNDn — Performance Count Sub condition

The PMSUBCNDn register specifies the subcondition of the count execution according to the setting of the PMCTRLn.CND. In the PMSUBCNDn register, 8 channels (n = 0 to 7) are equipped.

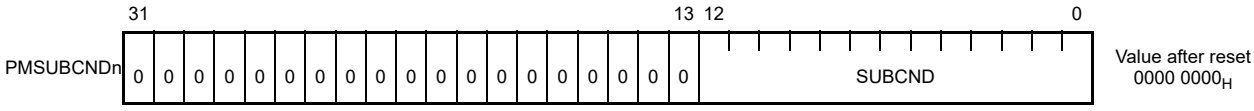

Table 3.92 PMSUBCNDn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 13	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
12 to 0	SUBCND	How the value of the SUBCND field is used depends on the setting of the PMCTRLn.CND. If the value of the PMCTRLn.CND is other than the following, the value of the SUBCND field does not affect the operation of the performance counter. **Value of the PMCTRLn.CND** / **Operation of the performance counter** 20_H / The channel number of the interrupt (EIINTn) for which the acceptance count is counted can be limited. The operation is specified by the value of bit 12. 0: The channel number to be counted is not limited. 1: The channel number to be counted is limited. If the bit 12 is set (1), only when the channel number n of the accepted interrupt (EIINTn) matches*1 the value specified by bits 11 to 0, the performance counter is counted up. 21_H / The channel number of interrupt (FEINTm) for which the number of accepted times is counted can be limited. The operation is specified by the value of bit 4. 0: The channel number to be counted is not limited. 1: The channel number to be counted is limited. If the bit 4 is set (1), only when the channel number m of the accepted interrupt (FEINTm) matches*2 the value specified by bits 3 to 0, the performance counter is counted up. The values of bits 12 to 5 do not affect the operation of the performance counter.	R/W	0

Note 1. If the total number of the channel numbers of interrupt (EIINTn) can be expressed in binary number of 11 bits or less, 0 is added to the upper side of the channel number compared with bits 11 to 0 of the SUBCND. For example, if the total number of channel numbers of interrupt (EIINTn) is 1024 (channel number is 0 to 1023), bit 12 and bit 11 of the SUBCND are set (1), bits 10 to 0 of the SUBCND are cleared (0), if it is limited to counting with the channel number 1024, the channel number always becomes inconsistent, the interrupt (EIINTn) acceptance is not counted the number of times.

Note 2. Set only the mounted channel number to this bit.

3.2.3.9 Hardware Function Registers

(a) Hardware Function System Registers

Hardware function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.93 Hardware Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR 0, 12	LSTEST0	Lock-step function self-diagnosis register 0	SV
SR1, 12	LSTEST1	Lock-step function self-diagnosis register 1	SV
SR2, 12	LSCFG	Lock-step function configuration	SV
SR5, 12	IFCR	Instruction fetch control register	SV
SR8, 12	BRPCTRL0	Branch prediction function control register	SV
SR12, 13	L1RCFG	L1RAM configuration	SV
SR24, 13	RDBCR	ROM data buffer control register	SV

(1) LSTEST0 — Lock-step Function Self-diagnosis Register 0

This register is for the self-diagnosis of the lock-step function. It can be used for the self-diagnosis of the lock-step function in combination with the LSTEST1 register. For details of the lock-step function and its availability, see **Section 44, Functional Safety**.

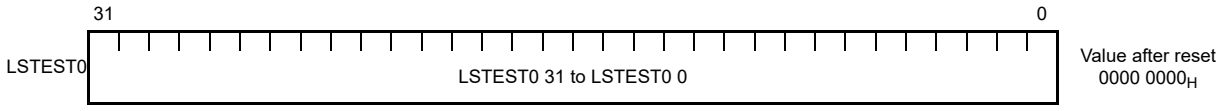

Table 3.94 LSTEST0 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	LSTEST0 31 to LSTEST0 0	[Write] Write any value to bits of the LSTEST0 register. [Read] Value in LSTEST0 is read by the master CPU of the lock-stepped CPU. Value in LSTEST1 is read by the checker CPU of the lock-stepped CPU.	R/W	0

(2) LSTEST1 — Lock-step Function Self-diagnosis Register 1

This register is for the self-diagnosis of the lock-step function. It can be used for the self-diagnosis of the lock-step function in combination with the LSTEST0 register. For details of the lock-step function and its availability, see **Section 44, Functional Safety**.

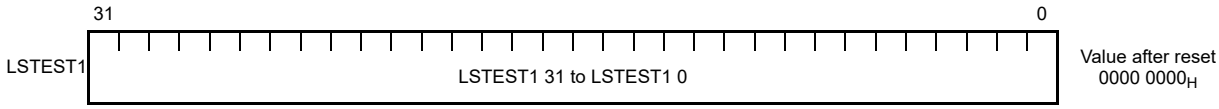

Table 3.95 LSTEST1 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	LSTEST1 31 to LSTEST1 0	[Write] Write any value to bits of the LSTEST1 register. [Read] Value in LSTEST1 is read by the master CPU of the lock-stepped CPU. Value in LSTEST0 is read by the checker CPU of the lock-stepped CPU.	R/W	0

(3) LSCFG — Configuration of Lock Step function

This register indicates the configuration of the Lock Step function.

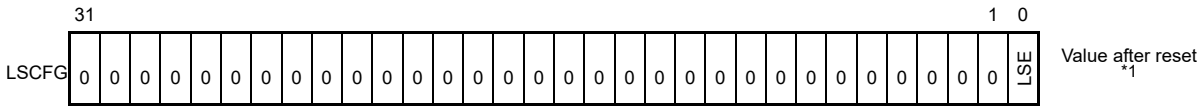

Table 3.96 LSCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	LSE	This bit indicates the availability of the Lock Step function. 0: The Lock Step function is not available. 1: The Lock Step function is available.	R	*1

Note 1. For details, see **Section 3.9.7, Product information of initial value for G4MH register**.

Note: For details of the Lock Step function, see **Section 44, Functional Safety**.

(4) IFCR — Instruction Fetch Control Register

This register controls the instruction fetching function.

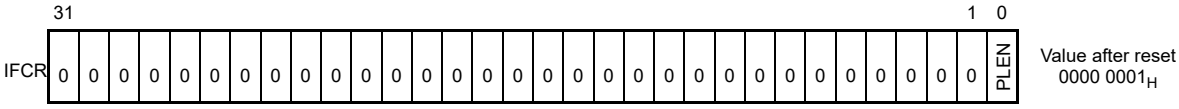

Table 3.97 IFCR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
0	PLEN	This bit specifies whether the instruction fetch preload function is enabled or disabled. 0: Disabled 1: Enabled*1	R/W*2	1

Note 1. Instruction fetch preload is executed only when the instruction cache is enabled and the fetching is to the cacheable area.

Note 2. Instruction fetch access and a system register access are independent from each other. Therefore, the settings of this register can be changed even the preload function is running. In this case, the preload function currently running normally completes with the old settings and the new settings are applied from the next operations of the preload function. If you want to suppress preloading before, during, and after changing of the register settings, we recommend execution of instructions by which the register settings are changed in the non-cacheable area.

(5) BRPCTRL0 — Branch Prediction Function Control Register

This register controls the branch prediction function.

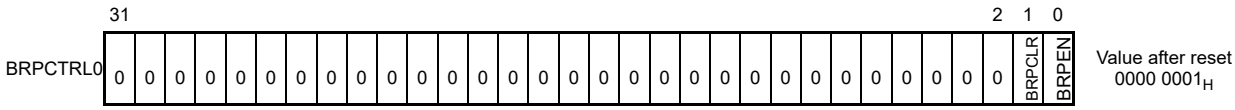

Table 3.98 BRPCTRL0 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	BRPCLR	Setting this bit to 1 clears the buffers related to branch prediction function. This bit is always read as 0.	R/W*2	0
0	BRPEN	This bit specifies whether the branch prediction function*1 is enabled or disabled. 0: Disabled 1: Enabled	R/W*2	1

Note 1. When this function is enabled, the address of the branch destination of the branch instruction is predicted based on the prediction function incorporated in the product, and instructions are fetched from the predicted address. If this function is disabled, branch prediction is not performed and instructions are fetched from the next instruction address. Branch prediction is performed only when the instruction cache is enabled and fetching is to the cacheable area.

Note 2. Branch prediction and a system register access are independent from each other. Therefore, the settings of this register can be changed even the branch prediction function is running. In this case, the branch prediction function currently running normally completes with the old settings and the new settings are applied from the next operations of the branch prediction function. If you want to suppress branch prediction before, during, and after changing of the register settings, we recommend execution of instructions by which the register settings are changed in the non-cacheable area.

(6) L1RCFG — Configuration of L1RAM

This register indicates the configuration of the L1RAM.

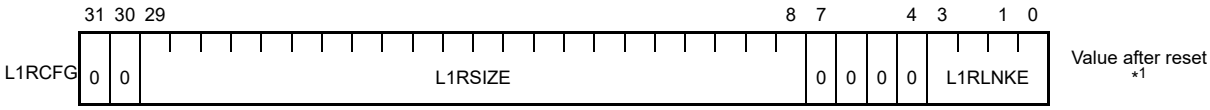

Table 3.99 L1RCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31, 30	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
29 to 8	L1RSIZE	This field indicates the L1RAM capacity (Kbytes). (For example: 000020_H: 32 Kbytes)	R	*1
7 to 4	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
3 to 0	L1RLNKE	This field indicates the number of entries of links available in L1RAM. (For example: 0010_B: 2 entries)	R	*1

Note 1. See **Section 3.9.7, Product information of initial value for G4MH register**.

(7) RDBCR — ROM Data Buffer Control Register

This register controls the ROM data buffer.

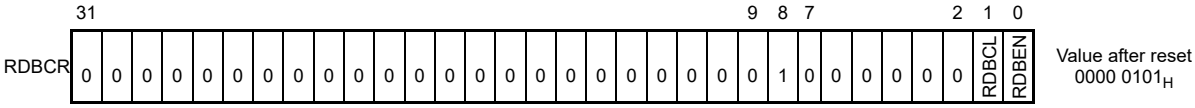

Table 3.100 RDBCR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
8	—	(Reserved for future expansion. Be sure to set to 1.)	R	1
7 to 2	—	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	RDBCLR	Setting this bit (to 1) clears the ROM data buffer and initializes the LRU information in the ROM data buffer. If this bit is set (to 1) during load processing or when a bus request issued by the prefetch function is present, the load data is not registered in the ROM data buffer. This bit is always read as 0.	R/W*1	0
0	RDBEN	This bit specifies whether the ROM data buffer is enabled or disabled. 0: ROM data buffer is disabled. 1: ROM data buffer is enabled.	R/W*1	1

Note 1. Any change in the value of this register is processed independently of any load instructions that use the ROM data buffer. To have the change in the value of this register exactly reflected, it is recommended that this register be manipulated after all load operations are completed.

3.2.3.10 Virtualization Support Function System Registers

Virtualization support function system registers are the system registers that are used for controlling the virtualization support function. For details, see the *RH850G4MH Virtualization User's Manual: Hardware*.

Table 3.101 List of Virtualization Support Function System Registers

Register No. (regID, selID)	Symbol	Function	Access Permission
SR16, 1	HVCFG	Setting virtualization support function	SV*1

Note 1. HVCFG register is used when Virtualization support function is enable. When Virtualization support function is disable, access to this register is prohibited. For details about Virtualization support function, see the *RH850G4MH Virtualization User's Manual: Hardware*.

3.2.4 Exceptions and Interrupts

An exception is a particular event that forces branching of operation from the current program to another program.

The program at the branch destination of a given exception is called an “exception handler”.

CAUTION

This CPU handles interrupts as types of exception.

3.2.4.1 Outline of Exceptions

This section describes the elements that assign properties to exceptions, and shows how exceptions work.

(1) Exception Cause List

This CPU supports the following exceptions.

Table 3.102 Exception Cause List

Exception	Name	Source	Type*1	Saved Resource	Return/ Restoration	Exception Cause Code*2	Priority Order*3		Acknowledgment Condition (PSW)		Update (PSW)				
							Priority Level	Priority	ID	NP	UM	ID	NP	EP	EBV
RESET	Reset	Reset input	Terminating	—	—	None	1	—	x	x	0	1	0	0	0
MDP	Memory protection exception (access privilege)	Memory protection violation due to an interrupt using the table reference method	Terminating	FE	Yes	95_H	2*7	—	x	x	0	1	1	1	s
FENMI	FENMI interrupt	Interrupt input terminal	Terminating	FE	No	$E0_H$	4	1	x	x	0	1	1	0	s
FEINT	FEINT interrupt	Interrupt input terminal	Terminating	FE	Yes	$F0_H$-FF_H	4	2	x	0	0	1	1	0	s
SYSERR	System error	Error due to context saving to the register bank	Terminating	FE	No	$1C_H$	4	3	x	x	0	1	1	1	s
EIINT0-2047	User interrupt	Interrupt input terminal	Terminating	EI	Yes	1000_H-$17FF_H$*5	5	*10	0	0	0	*9	s	0	s
MIP	Memory protection exception (execution privilege)	Memory protection violation due to instruction fetching	Resumable	FE	Yes	90_H	7	1	x	x	0	1	1	1	s
SYSERR	System error	Error due to instruction fetching	Resumable	FE	No	10_H-$1F_H$*4	7	2	x	x	0	1	1	1	s
UCPOP	Coprocessor unusable exception	Execution of a coprocessor instruction/access permission violation	Resumable	FE	Yes	80_H-82_H*6	7	3	x	x	0	1	1	1	s
RIE	Reserved instruction exception	Execution of a reserved instruction	Resumable	FE	Yes	60_H	7	4	x	x	0	1	1	1	s
PIE	Privilege instruction exception	Execution of a privileged instruction/access permission violation	Resumable	FE	Yes	$A0_H$	7	5	x	x	0	1	1	1	s
SYSERR	System error	Error prior to context restoration from the register bank	Resumable	FE	No	$1D_H$	7	6	x	x	0	1	1	1	s
MAE	Misalignment exception	Misaligned access occurrence	Resumable	FE	Yes	$C0_H$	8	1	x	x	0	1	1	1	s
MDP	Memory protection exception (access privilege)	Memory protection violation due to operand access	Resumable	FE	Yes	91_H	8	2	x	x	0	1	1	1	s
FPE	FPU exception (precise)	Execution of an FPU instruction	Resumable	EI	Yes	71_H	8	3	x	x	0	1	s	1	s
FXE	FXU exception (precise)	Execution of an FXU instruction	Resumable	EI	Yes	75_H	8	4	x	x	0	1	s	1	s
SYSCALL	System call	Execution of the SYSCALL instruction	Pending	EI	Yes	8000_H-$80FF_H$	9	*8	x	x	0	1	s	1	s
FETRAP	FE level trap	Execution of the FETRAP instruction	Pending	FE	Yes	31_H-$3F_H$	9		x	x	0	1	1	1	s
TRAP0	EI level trap 0	Execution of the TRAP instruction	Pending	EI	Yes	40_H-$4F_H$	9		x	x	0	1	s	1	s
TRAP1	EI level trap 1	Execution of the TRAP instruction	Pending	EI	Yes	50_H-$5F_H$	9		x	x	0	1	s	1	s

Note: s: Retained, x: Not an acknowledgment condition

Note 1. For details, see **Section 3.2.4.1 (3), Types of Exceptions**.

Note 2. Represents lower-order 16 bits of the exception cause code. The higher-order 16 bits of the exception cause code are loaded with a detail code which is defined for each exception. The code is 0000_H unless it is specifically described in the individual functional descriptions.

Note 3. The acknowledgment priority for exceptions is checked by the priority level, and then priority. A smaller value has a higher priority. For details, see **Section 3.2.4.1 (4), Exception Acknowledgment Conditions and Priority Order**.

Note 4. For details, see **Section 3.2.4.1 (2), Overview of Exception Causes**.

Note 5. 1000_H-$17FF_H$ (channels 0 to 2047) are selected according to the channel.

Note 6. 80_H-82_H correspond to the coprocessor use permissions (CU0-CU2), respectively.

Note 7. The case in which an MDP exception occurs during the processing (table read or automatic context saving onto the register bank) which is performed after a table reference method interrupt (EIINTn) is selected as the result of priority determination. The occurrence of this type of exceptions takes precedence over that of the terminating-type exceptions except the reset. For details, see **Section 3.2.4.1 (2), Overview of Exception Causes**.

Note 8. Occurs in an exclusive manner as it is caused by the execution of an instruction. There is no priority difference within the same priority level.

Note 9. There are cases in which the PSW.ID bit is set to 0 on interrupts of table reference method in which the register bank is used. For details, see **Section 3.2.4.5 (2), Automatic Context Saving**.

Note 10. The priority of EIINT0-EIINT2047 varies depending on settings of the interrupt controller. For details, see **Section 3.2.4.1 (5), Interrupt Exception Priority and Priority Masking**.

(2) Overview of Exception Causes

The following is an overview of the exception causes handled by the CPU.

(a) RESET

RESET is generated when inputting a reset signal. For details, see **Section 3.2.8, Reset**.

(b) FENMI, FEINT, and EIINT

These are interrupts generated by interrupt signals from the interrupt controller to activate a certain program. For details about the interrupt functions, see **Section 3.2.3.3, Interrupt Function Registers** and the specifications of the interrupt controller incorporated in your product.

(c) SYSERR

This is a system error exception.

An error occurring during automatic context saving using the register bank function is notified as a terminating-type SYSERR exception. In this case, as with the case of acknowledging an interrupt, the PC of the instruction that is interrupted when the exception occurred is loaded in the FEPC and the PSW at that time in the FEPSW, respectively. An error occurring during the restoration of the context with the RESBANK instruction is notified as a resumable-type SYSERR exception. In this case, the PC of the RESBANK instruction is loaded in the FEPC and the PSW at that time in the FEPSW, respectively.

An error that occurs at an instruction fetch access is notified as a resumable-type SYSERR exception. In this case, the PC of the instruction to be fetched is loaded in the FEPC and the PSW at that time in the FEPSW, respectively.

Table 3.103 lists the exception cause codes that are loaded in the lower-order 16 bits of the FEIC register when SYSERR exceptions occur. The higher-order 16 bits of the exception cause code are padded with 0s.

Table 3.103 Lower-order 16 Bits of the Exception Cause Codes Associated with the SYSERR Exception

Exception Cause Code	Cause
11_H	A response error occurred in a bus slave at the time of instruction fetching.*1
13_H	An error within the scope of safety functions, such as an ECC error or parity error, occurred at the time of instruction fetching.*1,*2
$1C_H$	An error occurred when automatically saving context to the register bank.
$1D_H$	An error occurred at the time of context restoration from the register bank (during the execution of the RESBANK instruction).

Note 1. For details, see **Section 3.9.8, Product information of SYSERR factor**.

Note 2. When an ECC or parity error is found in fetching from the instruction cache, it is handled as a cache miss so a SYSERR exception does not occur.

All the causes that generate a SYSERR exception for this CPU are listed in **Table 3.103**. An error that is detected externally to the CPU does not generate a SYSERR exception.

(d) FPE

These are exceptions that occur when a floating-point instruction is being executed. For details, see **Section 3.2.6.1, Floating-Point Operation**.

(e) FXE

These are exceptions that occur when an extended floating-point instruction is being executed. For details, see **Section 3.2.6.2, Extended Floating-Point Operation**.

(f) MIP and MDP

These are exceptions that occur when the MPU detects a violation. Detecting an exception is performed when the address at which the instruction will access the memory is calculated. For details, see **Section 3.2.5.1, Memory Protection Unit (MPU)**.

There are cases in which an MDP exception is detected during a table read or automatic context saving onto the register bank when a table reference method interrupt (EIINTn) is selected as the result of determining the priority level of the terminating-type exception. In such a case, the execution of the instruction is interrupted and an MDP exception (terminating-type) is generated as with an ordinary interrupt. In this case, the PC of the instruction that is interrupted is saved in the FEPC and the PSW that is established before the interrupt is accepted is saved in the FEPSW, respectively. For the table reference method, see **Section 3.2.4.4, Exception Handler Address**.

(g) RIE

This is a reserved instruction exception. This exception occurs when an attempt is made to execute the opcode of an instruction other than an instruction whose operation is defined. The operation is the same as the RIE instruction. For details of reserved instruction and RIE instruction, see the *RH850G4MH User's Manual: Software*.

(h) PIE

This is a privilege instruction exception. This exception occurs when an attempt is made to execute an instruction that does not have the required privilege. For details, see **Section 3.2.2.1 (3), CPU Operating Mode and Privileges**, **Section 3.2.2.2, Instruction Execution**, and **Section 3.2.2.5(3)(a), LDSR and STSR**.

(i) UCPOP

This is an exception that occurs when an attempt is made to execute a coprocessor instruction when the coprocessor in question is not usable. For details, see **Section 3.2.2.4, Coprocessors**.

(j) MAE

This is an exception that occurs when the result of address calculation is a misaligned address. For details, see **Section 3.2.2.6 (3), Data Alignment**.

(k) TRAP, FETRAP, and SYSCALL

These are exceptions that occur according to the result of instruction execution. For details, see the *RH850G4MH User's Manual: Software*.

(3) Types of Exceptions

This CPU divides exceptions into the following three types according how they are executed.

- Terminating exceptions
- Resumable exceptions
- Pending exceptions

(a) Terminating Exceptions

In the case of an exception of this type, the exception is acknowledged by interrupting the current instruction before its operation is executed. These exceptions include interrupts, etc.

In the case of interrupts, their occurrence is not dependent upon the result of executing the current instruction, that is, generation is not related to that instruction. When an interrupt occurs, the PSW.EP bit is cleared to 0, unlike other exceptions. Consequently, termination of the exception handler routine is reported to the external interrupt controller when the return instruction is executed. Be sure to execute a return instruction from an interrupt while the PSW.EP bit is cleared to 0.

CAUTIONS

1. **The PSW.EP bit is cleared to 0 only when an interrupt (EIINTn, FEINT, or FENMI) is acknowledged. It is set to 1 when any other exception occurs.**
   If a return instruction from the exception handler routine that has been started by an interrupt is executed while the PSW.EP bit is set to 1, the resources on the external interrupt controller might not be released, causing malfunctioning.
2. **A terminating exception may be accepted during the execution of an instruction that performs multiple memory accesses. In this case, although the execution of the instruction is terminated, the result of memory accesses that have been already completed are not canceled. For example, memory is updated by the PREPARE instruction and the general-purpose registers are updated by the DISPOSE instruction. However, it is guaranteed that the PC and SP retain the original values required to re-execute the instruction. For details, see the *RH850G4MH User's Manual: Software*. The relevant instructions are listed below.**
   – **PREPARE, DISPOSE, PUSHSP, POPSP, RESBANK, STM.MP, LDM.MP**
3. **For the instructions that perform load-access and branch, a terminating exception may be accepted after the load-access is completed. However, it is guaranteed that the PC and the system registers (such as CTPC) that are updated on completion of the instruction retain the original values required to re-execute the instruction. For details, see the *RH850G4MH User's Manual: Software*. The relevant instructions are listed below.**
   – **CALLT, SYSCALL, SWITCH**

(b) Resumable Exceptions

A resumable exception is the one that occurs during the operation of an instruction and that is accepted without the completion of that instruction. It is also called a precise exception because it is accepted precisely without the completion of the instruction that was being executed and without the execution of the subsequent instructions. The occurrence of this exception suppresses the update of the general-purpose and system registers. In addition, since the return PC of the exception points to the very instruction that caused the exception, it is possible to resume the execution at the point before the exception occurred.

The return PC of a resumable exception is the PC of the instruction which caused the exception (current PC).

(c) Pending Exceptions

This is an exception acknowledged after the execution of an instruction finishes as a result of executing the instruction operation. Pending exceptions include software exceptions. Because pending exceptions occur as a result of normal instruction execution, the processing resumes with the instruction following the instruction that caused the pending exceptions when processing control is returned. The original processing can be normally continued after the exception handling.

The return PC of a pending exception is the PC of the next instruction (next PC).

(4) Exception Acknowledgment Conditions and Priority Order

This CPU acknowledges only one exception at specific timing based on the exception acknowledgment conditions and priority order. The exception to be acknowledged is determined based on the exception acknowledgment conditions and priority order, as shown in **Figure 3.16** below.

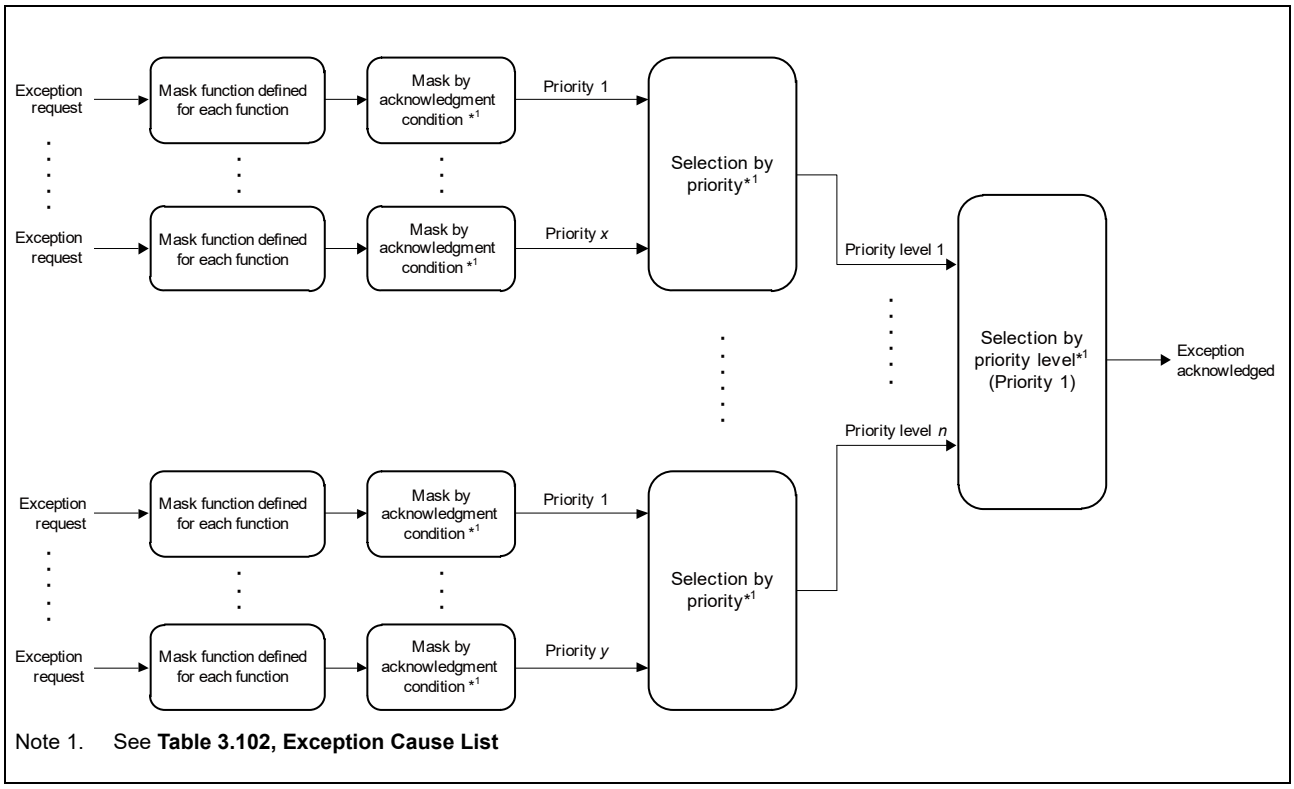

Figure 3.16 Exception Acknowledgment Conditions and Priority Order

In **Table 3.102**, an exception with “0” in the acknowledgment condition column can be acknowledged when the corresponding bit is “0”. This kind of exception is not accepted when the corresponding bit is “1”. When it changes to “0” and the acknowledgment conditions are met, acknowledgment of the exception becomes possible. If no value is specified for a bit, it is not an acknowledgment condition. If multiple bits are specified as conditions, all the conditions must be met simultaneously.

Some exceptions are provided with dedicated mask functions that are unique to their functionality. The decision on the acceptability of the exceptions based on the individually defined mask function is made before the decision on the acknowledgement (acceptance) conditions listed in **Table 3.102**. For details, see the description of the cause of the individual exceptions.

If more than two exceptions satisfy the acknowledgment conditions simultaneously, one exception is selected according to the priority order. The priority order is determined in multiple stages; priority level, and then priority. A smaller number has a higher priority.

When this CPU accepts an exception, it returns an acceptance response to the requesting module.

If a terminating-type exception is not accepted, the request for that exception is not made pending by this CPU. To keep the exception request pending for acceptance, the module such as the interrupt controller that issued the terminating-type exception request to the CPU makes the exception request pending.

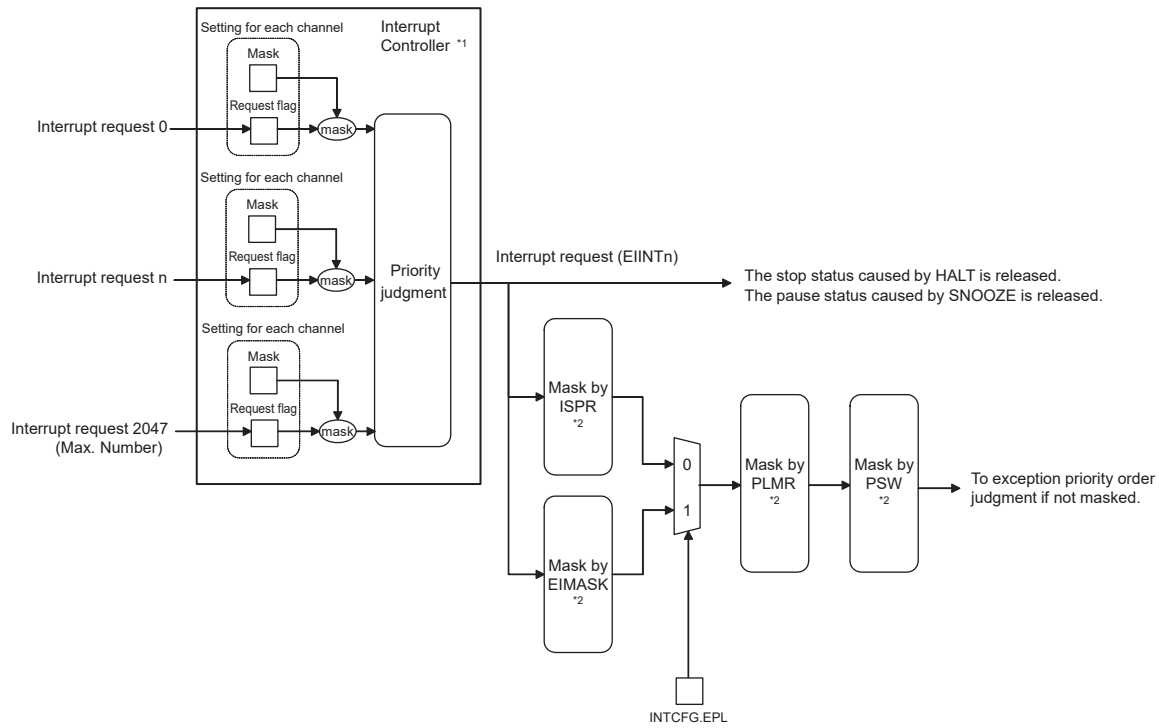
Any exceptions that occur at the same time as a reset are not accepted. For details, see **Section 3.2.4.2 (1), Special Operations**.

For details about acknowledgment conditions, priority level, and priority, see **Table 3.102**.

(5) Interrupt Exception Priority and Priority Masking

An interrupt (EIINTn) can be masked for each exception priority or interrupt priority by setting registers. This function allows the software implementation of an interrupt ceiling with a more flexible software structure and no maintenance.

Figure 3.17 shows an overview of the functions of interrupt exception priority and priority masking.



Note 1. For details about the interrupt controller, see **Section 6, Interrupts**.

Note 2. EIINTn which is masked by each masking function can be shown by each bit of IMSR or ICSR.PMEI.

Figure 3.17 Interrupt Exception Priority and Priority Masking

(a) Interrupt Priority

This CPU supports the following priority levels for interrupts (EIINTn):

When the interrupt priority level extension function is disabled (INTCFG.EPL is cleared to 0): Maximum 16 priority level

When the interrupt priority level extension function is enabled (INTCFG.EPL is set to 1): Maximum 64 priority level

For details on the procedure to set interrupt priority, see **Section 6, Interrupts**.

(i) When interrupts with priority level 16 to 63 occur in case the interrupt priority level expansion is disabled (INTCFG.EPL is cleared to 0)

The function for acknowledgment of interrupt (EIINTn) works limited. Interrupt can be masked by ISPR and PLMR. If either one of bit for ISPR is set to 1, all interrupts (EIINTn) whose priority is lower than or equal to 16 is masked. PLMR always judges acknowledgment based on the set value and interrupt priority level regardless of the setting of the interrupt priority level extension function. On the

other hand, the priority information of acknowledged interrupt (EIINTn) is not saved in ISPR and PSW.EIMASK.

As it's mentioned above, it's not recommended to use because the priority information is not handled by CPU even if the acknowledge of interrupt (EIINTn) is possible.

(ii) Constraints for interrupts with priority level 16 to 62

Regardless of whether the interrupt priority level extension function is enabled or disabled, the following constraints are valid for interrupts (EIINTn) with priority level 16 to 62.

- When the acknowledged interrupt (EIINTn) has a priority level between 16 and 62 and the exception handler address is generated by the direct vector address method, the offset address is $1F0_H$ that is the same as for interrupt with priority level 15. Therefore, the same exception handler address is used for all interrupts (EIINTn) whose priority level is lower than or equal to 15. Refer to **Section 3.2.4.4, Exception Handler Address** for more details.
- When the acknowledged interrupt (EIINTn) whose priority level between 16 and 62, the availability of register bank is specified by RBCR0.BE[15] that is the same as for interrupts whose priority level is 15. For all interrupts (EIINTn) whose priority level is lower than or equal to 15, the availability of the register bank cannot be specified by priority level. Refer to **Section 3.2.4.5 (2), Automatic Context Saving**.
- When the acknowledged interrupt (EIINTn) whose priority level is between 16 and 62, the value of PSW.ID bit is specified by RBCR1.NC[15] after being saved to the register bank, that is the same in the case of priority level 15. For all interrupts (EIINTn) whose priority level is lower than or equal to 15,the value of the PSW.ID bit after being saved to the register bank cannot be specified by priority level. Refer to **Section 3.2.4.5(2)(b), Suppressing the Update of the PSW.ID Bit**.

(iii) Constraint for interrupt with priority level 63

If the interrupt priority level extension function is disabled, the interrupt (EIINTn) with priority level 63 (lowest priority level) will always be masked by PLMR. If the interrupt priority level extension function is enabled, the interrupt (EIINTn) with priority level 63 (lowest priority level) will always be masked by PSW.EIMASK. As it's mentioned above, interrupt (EIINTn) with priority level 63 is not acknowledged regardless of whether the interrupt priority level extension function is enabled or disabled. But both stop status caused by the HALT instruction and temporary halt status caused by the SNOOZE instruction can be released by occurrence of interrupt with priority level 63.

(b) Interrupt Priority Mask

If interrupt priority level extension function is disabled (INTCFG.EPL is cleared to 0), interrupt (EIINTn) acknowledge is judged by ISPR and PLMR. If interrupt priority level extension function is enabled (INTCFG.EPL is set to 1), interrupt (EIINTn) acknowledge is judged by PSW.EIMASK and PLMR.

(i) ISPR

Interrupt acknowledge is judged by ISPR only when interrupt priority level extension function is disabled.

For the ISPR register, the bit corresponding to the priority is set to 1 when the hardware acknowledges an interrupt, and interrupts with the same or lower priority are masked. When the EIRET instruction

corresponding to the interrupt is executed, the corresponding bit of the ISPR register is cleared to 0 to clear the mask.

This automatic interrupt ceiling makes multiple interrupts servicing easy without using software control.

The function of the INTCFG register allows you to disable automatic update of the ISPR register upon acknowledgment of and return from an interrupt. To perform interrupt ceiling control by using software without using the function of the ISPR register, set the ISPC bit in the INTCFG register to 1, clear the ISPR register, and then control the ceiling value with software by using the PLMR register.

(ii) PSW.EIMASK

Interrupt acknowledge is judged by PSW.EIMASK only when interrupt priority level extension function is enabled.

PSW.EIMAK masks the interrupt (EIINTn) whose priority level is lower than or equal to the set value. When the CPU acknowledges an interrupt (EIINTn), its interrupt priority is stored. When EIRET or FERET instruction is executed, the value of EIPSW.EIMASK or FEPSW.EIMASK is stored. The settings of PSW.EIMASK can be changed by LDSR instruction.

(iii) PLMR

PLMR masks the interrupt (EIINTn) whose priority level is lower than or equal to the set value.

The PLMR register allows you to mask specific interrupt priorities with software. Use it to raise the priority level of the interrupt ceiling temporarily in a program. The mask setting specified by the ISPR register or PSW.EIMASK and the mask setting of PLMR might overlap, and an interrupt is masked if it is masked by any of them. Normally, use the PLMR register to raise the ceiling value from the ceiling value of the ISPR register or PSW.EIMASK.

Also, when you are using the PLMR register, you can check if any interrupt is masked with the PLMR register by using the ICSR register.

(6) Return and Restoration

When exception handling has been performed, it might affect the original program that was interrupted by the acknowledged exception. This effect is indicated from two perspectives: “Return” and “Restoration”.

- Return: Indicates whether or not the original program can be re-executed from where it was interrupted.
- Restoration: Indicates whether or not the processor statuses (status of processor resources such as general-purpose registers and system registers) can be restored as they were when the original program was interrupted.

An exception that cannot be returned or restored from (“No” in **Table 3.102**) might cause the return PC to be lost, making it impossible to return from the exception to the original processing by using a return instruction. An exception whose trigger cannot be selected is an unreturnable or unrestorable exception.

For an unrestorable exception, it is possible to return to the original program flow. However, because the state before the occurrence of the exception cannot be restored at that point, care must be taken in continuing subsequent program operation.

(7) Context Saving

To save the current program sequence when an exception occurs, appropriately save the following resources according to the function definitions. There are resources that are automatically saved by hardware and resources that need to be saved by software.

- Program counter (PC)
- Program status word (PSW)
- Exception cause code (EIIC, FEIC)
- Work system register (EIWR, FEWR)

The resource to use as the saving destination is determined according to the exception type. Saved resource determination is described below.

For exceptions that use the register bank function, specific resources are automatically saved. For details, see **Section 3.2.4.5, Register Bank Function**.

(a) Context Saving

Exceptions with certain acknowledgment conditions might not be acknowledged at the start of exception handling, based on the pending bits (PSW.ID and NP bits) that are automatically set when another exception is acknowledged.

To enable multiple exception processing which makes exceptions of the same level acceptable again, the return registers and certain information about the corresponding exception causes must be saved, such as to a stack. This information that must be saved is called the “context”.

In principle, it is necessary to make sure that no exceptions of the same level can occur before saving the context.

The working system registers that can be used in the work of saving contexts and those for which the values are saved to enable the handling of multiple exceptions as required are referred to as the basic context registers.

These basic context registers are provided for each exception level. For this reason, it is possible to precisely return from the current exception since its context will not be overwritten when an exception of a different level occurs before saving the current context.

Table 3.104 Basic Context Registers

Exception Level	Basic Context Registers
EI level	EIPC, EIPSW, EIIC, EIWR
FE level	FEPC, FEPSW, FEIC, FEWR

See **Section 3.2.2.3 (2), Exception Level**.

3.2.4.2 Operation when Acknowledging an Exception

Check whether each exception that is reported during instruction execution is acknowledged according to the priority. The procedure for exception-specific acknowledgment operation is shown below.

<1> Check whether the acknowledgment conditions are satisfied and whether exceptions are acknowledged according to their priority.

<2> Calculate the exception handler address according to the current PSW value*1

<3> For FE level exceptions, the following processing is performed.

- Saving the PC to FEPC
- Saving the PSW to FEPSW
- Storing the exception cause code in FEIC
- Updating the PSW*2
- Store the exception handler address calculated in (2) in the PC, and then pass control to the exception handler.

<4> For EI level exceptions, the following processing is performed.

- Saving the PC to EIPC
- Saving the PSW to EIPSW
- Storing the exception cause code in EIIC
- Updating the PSW*2
- Store the exception handler address calculated in (2) in the PC, and then pass control to the exception handler.
- When the exception is an interrupt that uses the register bank, save the context automatically*3.

Note 1. For details, see **Section 3.2.4.4, Exception Handler Address**.

Note 2. For the values to be updated, see **Table 3.102**.

Note 3. For details on register banks, see **Section 3.2.4.5, Register Bank Function**.

Figure 3.18 shows the steps <1> to <4>.

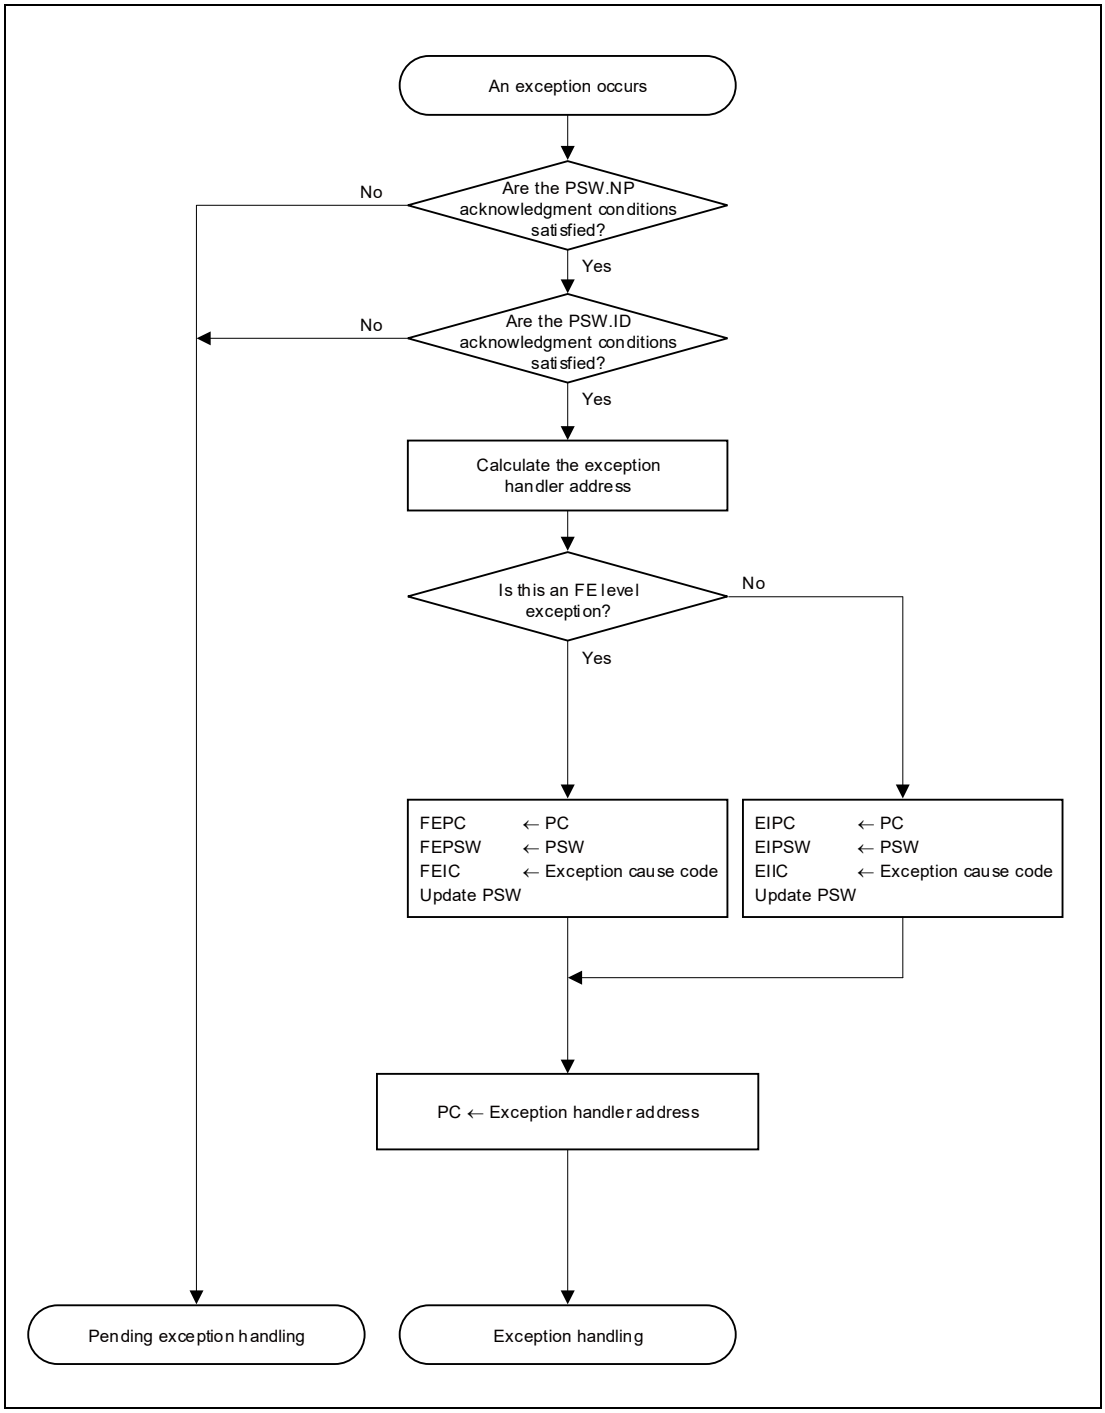


Figure 3.18 Operation When Acknowledging an Exception

(1) Special Operations

(a) EP Bit of PSW Register

If an interrupt is acknowledged, the PSW.EP bit is cleared to 0. If an exception other than an interrupt is acknowledged, the PSW.EP bit is set to 1.

The operation of the CPU when executing the EIRET and FERET instructions depends on the state of the EP bit. If the EP bit is cleared to 0, the CPU notifies the external interrupt controller of the termination of the exception processing routine. This function is necessary to properly control the request flag in the interrupt controller and other resources upon return from the interrupt. When the EP bit is cleared to 0, and the EIRET instruction is executed, the bit with the highest priority (0 is the highest) among the bits set to 1 in ISPR.ISP15 to ISPR.ISP0 is cleared to 0.

To return from an interrupt, be sure to execute the return instruction with the EP bit cleared to 0.

(b) Coprocessor Unusable Exception

For coprocessor unusable exceptions, the opcodes that cause the exception depend on the status of the CU bit of the PSW register.
When a coprocessor is not included in the product or it is not usable, if an attempt is made to execute a coprocessor instruction corresponding to the coprocessor, a coprocessor unusable exception (UCPOP) immediately occurs. If an LDSR or STSR instruction attempts to access a system register of the coprocessor, a coprocessor unusable exception (UCPOP) immediately occurs too.
For details, see **Section 3.2.2.4 (3), Coprocessor Unusable Exceptions**.

(c) Reserved Instruction Exception

If an opcode that is reserved for future function extension and for which no instruction is defined is executed, a reserved instruction exception (RIE) occurs.

The opcode that always generates a reserved instruction exception is defined as the RIE instruction.

(d) Reset

Reset is performed in the same way as exception handling, but it is not regarded as EI level exception or FE level exception. The reset operation is the same that of an exception without acknowledgment conditions, but the value of each register is changed to the value after reset. In addition, returning to the original program from the reset is not possible.

All exceptions that have occurred at the same time as CPU initialization are canceled and not acknowledged even after CPU initialization.

For details, see **Section 3.2.8, Reset**.

3.2.4.3 Return from Exception Handling

To return from exception handling, execute the return instruction (EIRET or FERET) corresponding to the relevant exception level.

When a context has been saved, such as to a stack, the context must be restored before executing the return instruction. When execution is returned from an unrestorable exception, the status before the exception occurs in the original program cannot be restored. Consequently, the execution result might differ from that when the exception does not occur.

The EIRET instruction is used to return from EI level exception handling and the FERET instruction is used to return from FE level exception handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes control to the return PC address.

<1> If the PSW.EP bit is set to 0, the CPU notifies the interrupt controller of the termination of the exception routine.

<2> When the EIRET instruction is executed while PSW.EP = 0 and INTCFG.ISPC = 0, the CPU updates the ISPR register.
When the FERET instruction is executed, the CPU does not update the ISPR register.

<3> When the EIRET instruction is executed, return PC and PSW are loaded from the EIPC and EIPSW registers.
When the FERET instruction is executed, return PC and PSW are loaded from the FEPC and FEPSW registers.

<4> Control is passed to the address indicated by the return PC that were loaded.

Figure 3.19 shows the flow for returning from exception handling using the EIRET or FERET instruction.

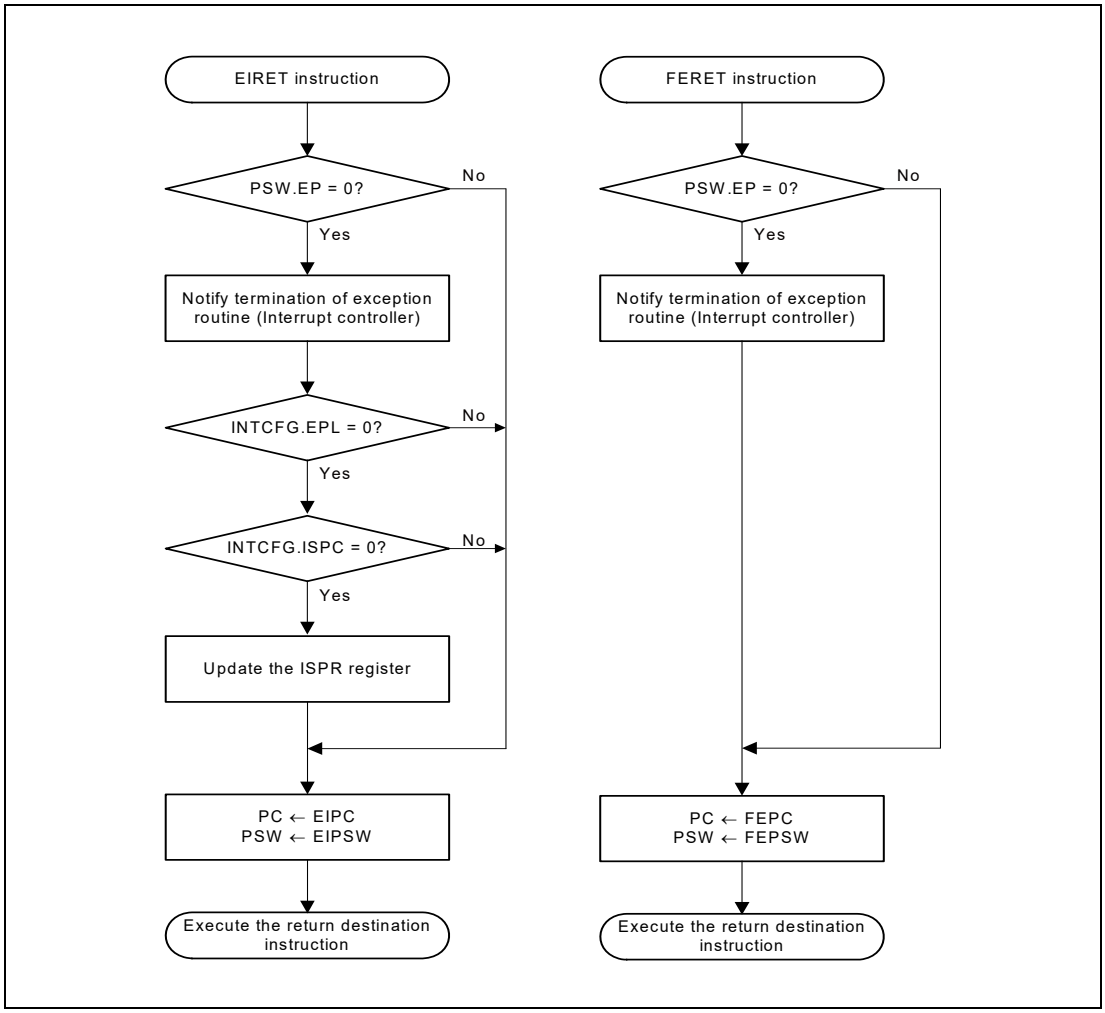

Figure 3.19 Return Instruction-Based Exception Return Flow

3.2.4.4 Exception Handler Address

For this CPU, the exception handler address used for execution during reset input, exception acknowledgment, or interrupt acknowledgment can be changed according to the settings.

(1) Resets, Exceptions, and Interrupts

The exception handler address for resets, exceptions and interrupts is determined by using the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, RBASE register, and EBASE register. For user interrupts, table reference method can be also specified. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

(a) Direct Vector Method

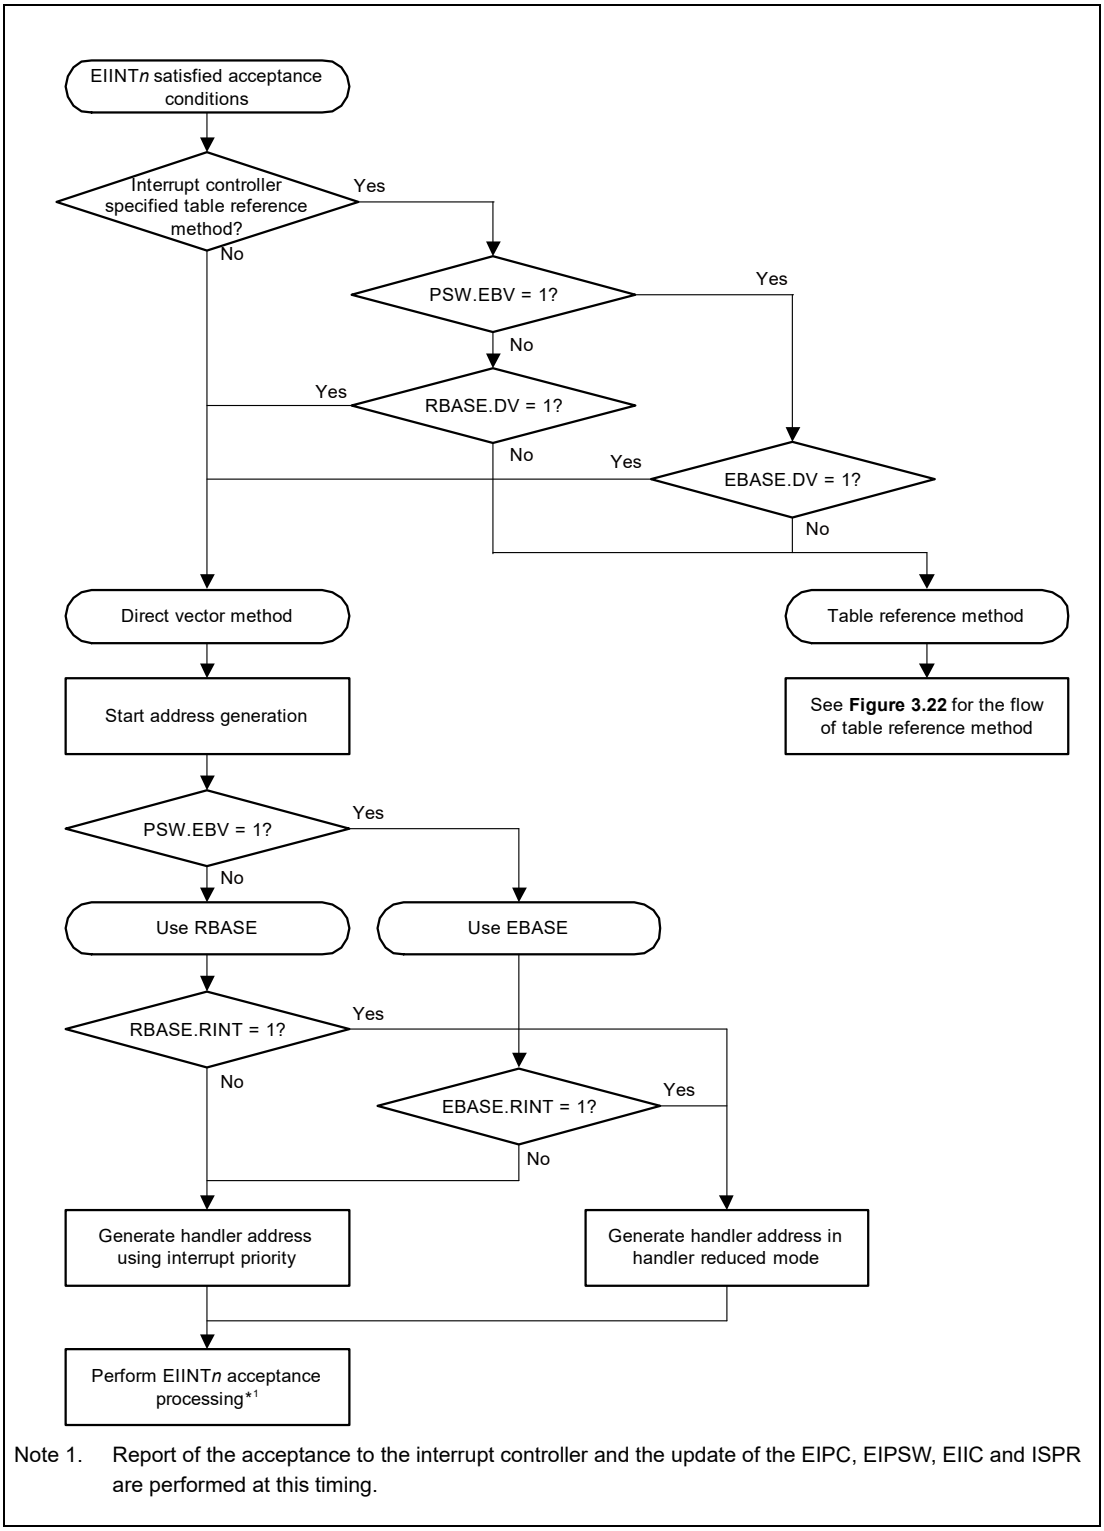
This CPU uses the result of adding the offset address shown in **Table 3.105** to the base address indicated by the RBASE or EBASE register as the exception handler address.

Whether to use the RBASE or EBASE register as the base address is selected according to the PSW.EBV bit. If the PSW.EBV bit is set to 1, the EBASE register value is used as the base address. If the bit is cleared to 0, the RBASE register value is used as the base address.

However, reset input always refers to the RBASE register.

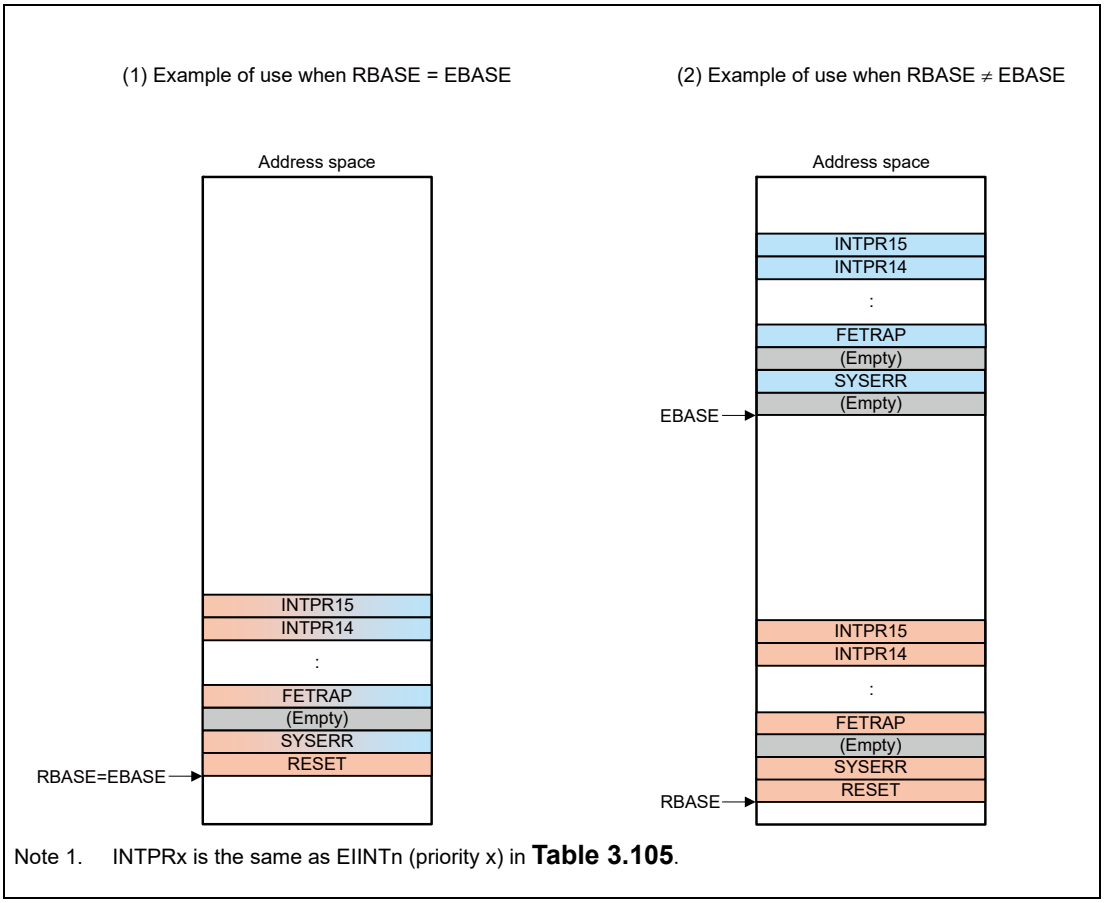
In addition, user interrupts (EIINTn) refer to the RINT bit of the selected base register, and reduce the offset address according to the value of the bit. If the RBASE.RINT bit or EBASE.RINT bit is set to 1, all user interrupts are handled using an offset address of 100_H. If the bit is cleared to 0, the offset address is determined according to **Table 3.105**.

Figure 3.20 shows the flow of generating a handler address for the direct vector method.



Note 1. Report of the acceptance to the interrupt controller and the update of the EIPC, EIPSW, EIIC and ISPR are performed at this timing.

Figure 3.20 Flow of Generating a Handler Address of the Direct Vector Method



Note 1. INTPRx is the same as EIINTn (priority x) in **Table 3.105**.

Figure 3.21 Direct Vector Method

The table below shows how base register is selected and offset address for each exception. The value of the PSW register used to determine the exception handler address is the value after being updated due to the acknowledgment of an exception.

Table 3.105 Selection of Base Register/Offset Address

	PSW.EBV = 0	PSW.EBV = 1	RINT = 0	RINT = 1
	Base Register		Offset Address	
RESET	RBASE	None[*1]	000_H	000_H
SYSERR		EBASE	010_H	010_H
(R.F.U.)			020_H	020_H
FETRAP			030_H	030_H
TRAP0			040_H	040_H
TRAP1			050_H	050_H
RIE			060_H	060_H
FPE/FXE			070_H	070_H
UCPOP			080_H	080_H
MIP/MDP			090_H	090_H
PIE			$0A0_H$	$0A0_H$
(R.F.U.)			$0B0_H$	$0B0_H$
MAE			$0C0_H$	$0C0_H$
(R.F.U.)			$0D0_H$	$0D0_H$
FENMI			$0E0_H$	$0E0_H$
FEINT			$0F0_H$	$0F0_H$
EIINTn (priority 0)			100_H	100_H
EIINTn (priority 1)			110_H	
EIINTn (priority 2)			120_H	
EIINTn (priority 3)			130_H	
EIINTn (priority 4)			140_H	
EIINTn (priority 5)			150_H	
EIINTn (priority 6)			160_H	
EIINTn (priority 7)			170_H	
EIINTn (priority 8)			180_H	
EIINTn (priority 9)			190_H	
EIINTn (priority 10)			$1A0_H$	
EIINTn (priority 11)			$1B0_H$	
EIINTn (priority 12)			$1C0_H$	
EIINTn (priority 13)			$1D0_H$	
EIINTn (priority 14)			$1E0_H$	
EIINTn (priority 15 or less[*2])			$1F0_H$	

Note 1. An exception generated to update EBV to 0.

Note 2. Interrupt (EIINTn) which priority level is less than equal 16 uses the same offset address with the interrupt (EIINTn) with priority level 15. Because the same interrupt handler is used, software process is necessary for recognition of interrupt factor. By this constraint, the increasing of memory area which is used for interrupt handler by direct vector method can be avoided even if interrupt priority level extension function is enabled.

The user interrupt offset address reduction function is used to reduce the memory size required by the exception handler for specific operating modes of the system. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

(b) Table Reference Method

In the direct vector method, there is one user-interrupt exception handler for each interrupt priority, and user-interrupts with the same priority branch to the same interrupt handler, but some users might want to use code areas that differ from the start time for each interrupt handler.

This CPU defines a table reference method to accommodate to such uses.

Figure 3.22 shows the flow of generating a handler address for the table reference method.

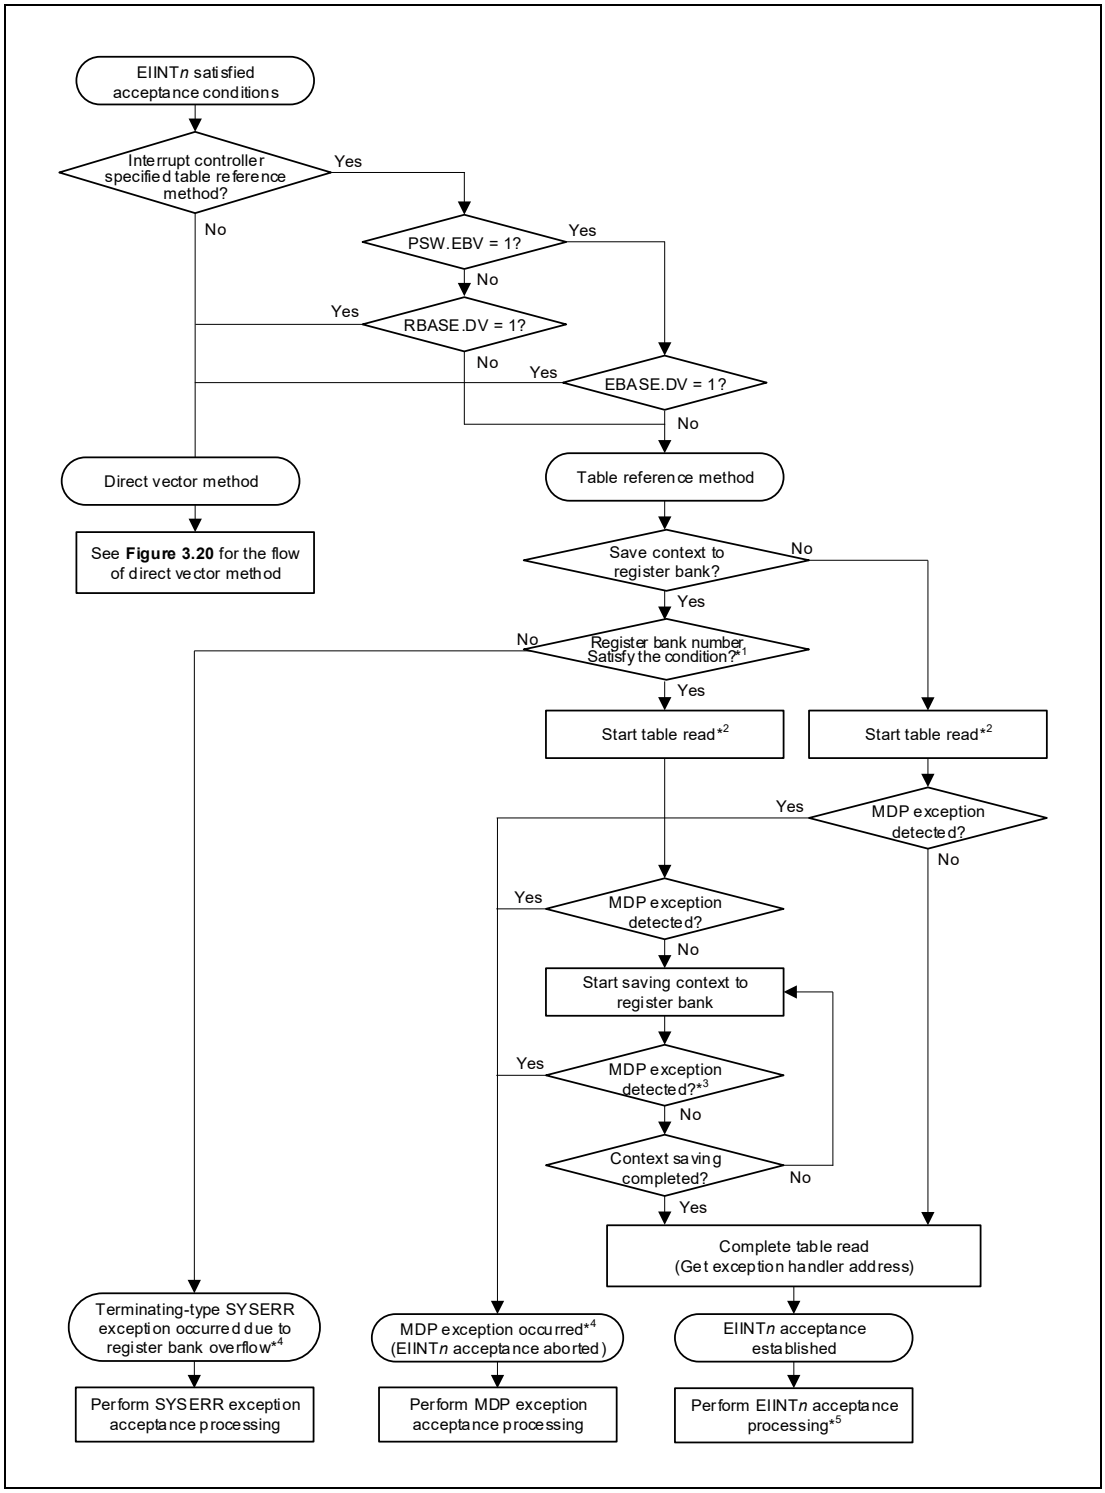


Figure 3.22 Flow of Generating a Handler Address of Table Reference Method (1/2)

Note 1. For automatic context saving onto the register bank, the operation condition judgment is necessary. For details, see **Figure 3.24**.

Note 2. This CPU updates the EIPC and EIPSW at this timing.

Note 3. Detection of an MDP exception is performed every time an individual context is saved. An MDP exception occurs when an MDP violation is detected when saving an individual context rather than after all context saving is completed.

Note 4. The PC of the instruction interrupted by the interrupt and the value of the PSW at that time are saved to the FEPC and the FEPSW respectively. These values are the same as the values saved to the EIPC and the EIPSW at the timing of Note 2. Therefore, when returning from the exception handler, it is possible to return exactly to the interrupted instruction. In addition, because no acceptance response has been reported to the interrupt controller, unless canceling the interrupt request in the exception handler, the interrupt request will remain held and interrupt acceptance processing will start again.

Note 5. Report of the acceptance to the interrupt controller and the update of the EIIC and ISPR are performed at this timing.

Figure 3.22 Flow of Generating a Handler Address of Table Reference Method (2/2)

<1> In any of the following cases, the exception handler address is determined by using the direct vector method.

- When the interrupt channel setting is not the table reference method
- When PSW.EBV = 0 and RBASE.DV = 1
- When PSW.EBV = 1 and EBASE.DV = 1

<2> In cases other than <1>, calculate the table read position.
Exception handler address read position = INTBP register + channel number × 4 bytes

<3> Read word data starting at the exception handler address read position calculated in <2>.

<4> Use the word data read in <3> as the exception handler address.

<5> The acceptance of the interrupt is established when the exception handler address has been got. In addition to the exception acceptance processing shown in **Figure 3.18**, the CPU returns an acceptance response to the interrupt controller and updates the ISPR.

CAUTIONS

1. **For details about the interrupt channel settings, see Section 6, Interrupts.**
2. **There are cases in which a memory protection exception (MDP) occurs while reading word data from the exception handler address read position depending on the memory protection settings. In such a case, the acceptance of the interrupt is temporarily cancelled. Since no acceptance response is returned to the interrupt controller, the interrupt request is held pending and is become acceptable again when execution is returned from the memory protection exception processing.**
3. **If a memory protection exception occurs during a word data read from the exception handler address read position, the PC of the instruction that is interrupted by the interrupt is saved in the FEPC. Since the acceptance of the interrupt is cancelled, the value of the PSW established when the interrupt occurred (which should have been saved in the EIPSW) is saved in the FEPSW.**

Exception handler address read positions corresponding to interrupt channels and the placement of the interrupt handler address table in memory are shown below.

Table 3.106 Exception Handler Address Read Position

Type	Exception Handler Address Read Position
EIINT interrupt channel 0	INTBP + 0 × 4
EIINT interrupt channel 1	INTBP + 1 × 4
:	:
EIINT interrupt channel 2046	INTBP + 2046 × 4
EIINT interrupt channel 2047	INTBP + 2047 × 4

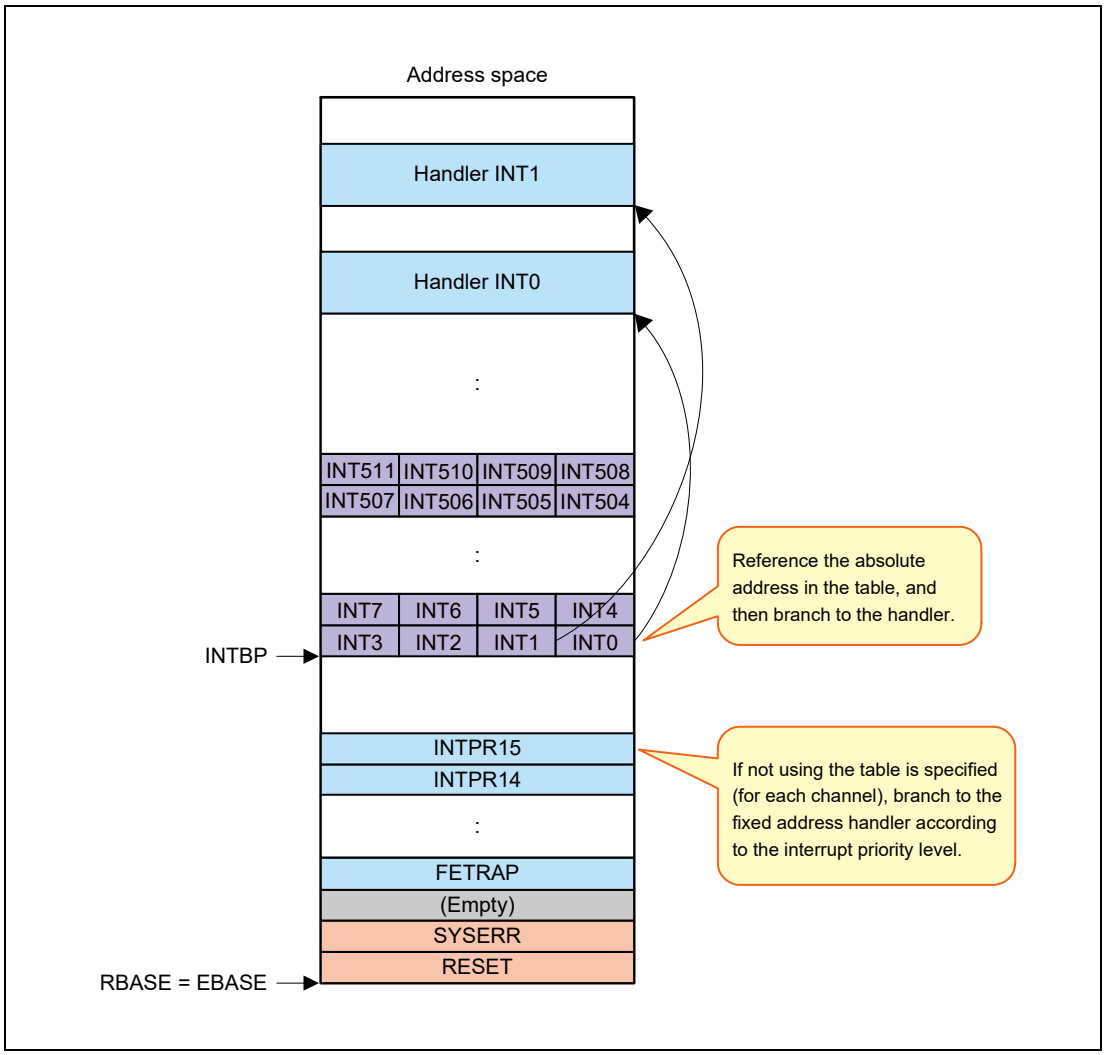

Figure 3.23 Placement of the Interrupt Handler Address Table in Memory

For details about the exception handler address selection method settings for each interrupt channel, see **Section 6, Interrupts**.

(2) System Calls

For system call exceptions, the referenced table entry is selected according to the value of the vector specified by the SYSCALL instruction and the value of the SCCFG.SIZE bit, and the exception handler address is calculated according to the contents of the table entry and the SCBP register value.

As an example, if table size n is specified by SCCFG.SIZE, the table entry is selected as shown below. Note that if the vector specified by the SYSCALL instruction (vector 8) is greater than table size n, the table entry referenced by vector n + 1 to 255 is table entry 0.

Table 3.107 System Calls

Vector	Exception Cause Code	Referenced Table Entry
0	$0000\ 8000_H$	Table entry 0
1	$0000\ 8001_H$	Table entry 1
2	$0000\ 8002_H$	Table entry 2
(Omitted)	:	:
n − 1	$0000\ 8000_H + (n - 1)_H$	Table entry n − 1
n	$0000\ 8000_H + n_H$	Table entry n
n + 1	$0000\ 8000_H + (n + 1)_H$	Table entry 0
(Omitted)	:	:
254	$0000\ 80FE_H$	Table entry 0
255	$0000\ 80FF_H$	Table entry 0

CAUTION

Because table entry 0 is selected if a vector that exceeds the table size specified by SCCFG.SIZE is specified, allocate the error processing routine at table entry 0.

3.2.4.5 Register Bank Function

This CPU provides the register bank function that automatically saves the context when it accepts an interrupts (EIINTn). Since the saving of the context proceeds in parallel with the interrupt acceptance processing, this function enables the CPU to make high-speed interrupt response.

(1) Outline of the Register Bank Function

The register bank function that this CPU provides has the following features:

- Automatically saves the context upon acceptance of an interrupt (EIINTn) meeting some conditions (see **Section 3.2.4.5 (2), Automatic Context Saving**).
- The destination of the context saving is not dedicated memory but an area of ordinary memory installed in this CPU (specified by the RBIP register).
- The context to be saved can be selected from two groups (specified by the RBCR0.MD bit).
- Supports a maximum of 64 levels of multiple interrupts (the RBNR.BN bits indicate the number of accepted interrupts).
- The context is restored from the register bank by executing the RESBANK instruction (no automatic restoration function).

(2) Automatic Context Saving

Automatic context saving is carried out when the following conditions are satisfied for an interrupt request (EIINTn) notified:

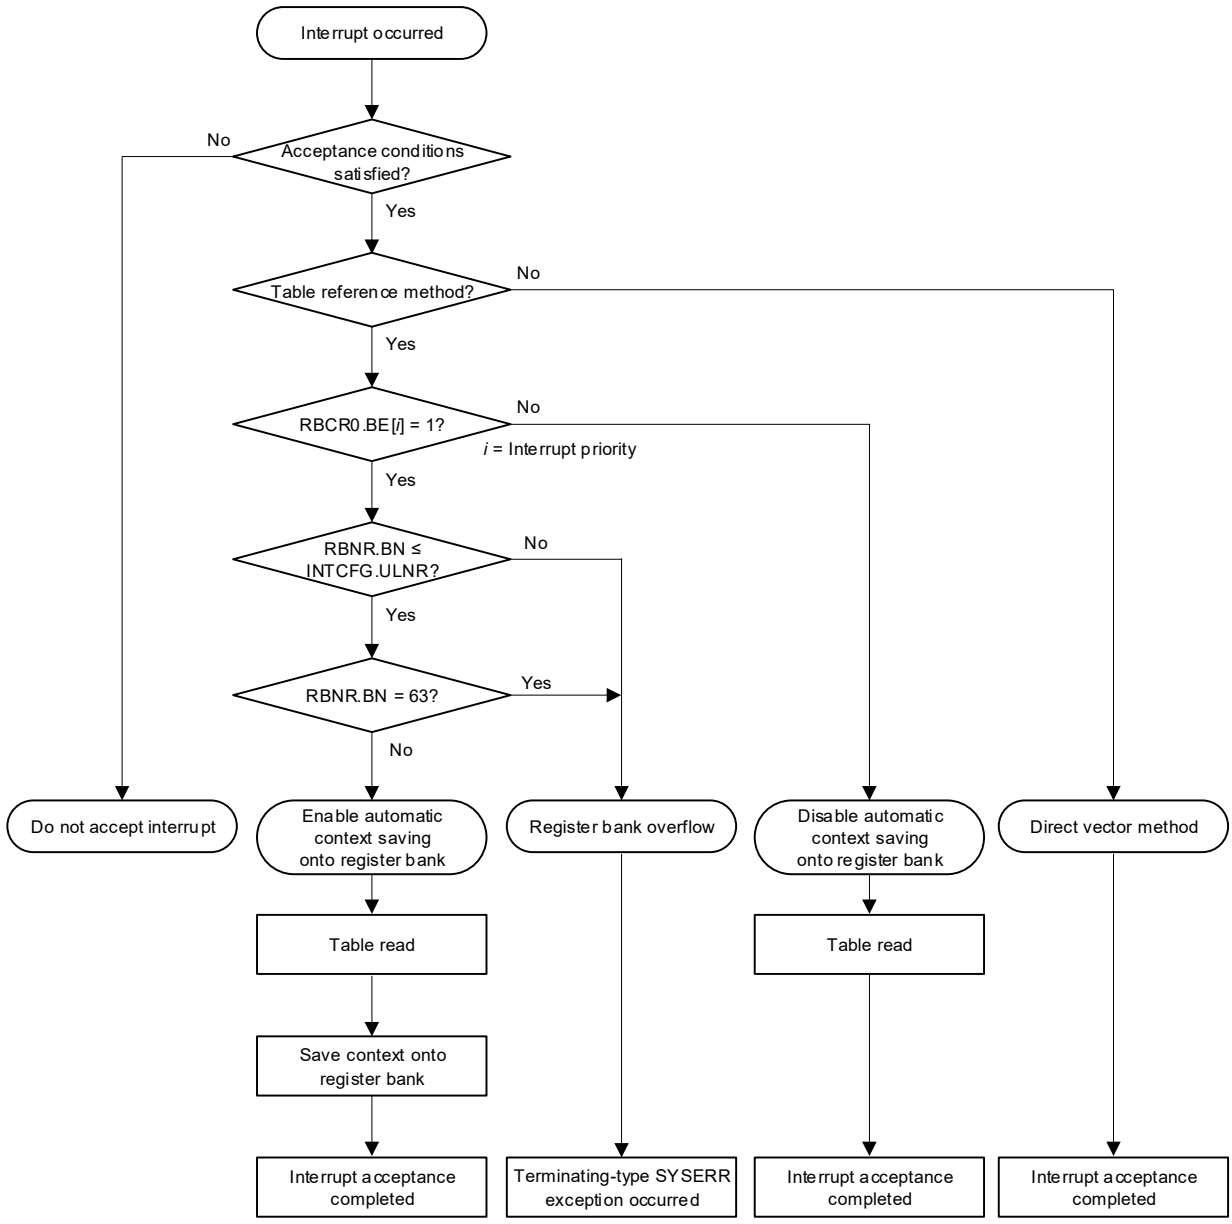
- Table reference method is specified for the interrupt request*1.
- The use of the register bank is specified by the RBCR0.BE[*i*] bit which is associated with the priority (*i*) of the interrupt request *2(the automatic context saving onto the register bank is enabled).
- The RBNR.BN bits have a value no greater than the value of INTCFG.ULNR*3 (check the number of the register banks in use).

Note 1. See **Section 6, Interrupts** for the procedure to specify the table reference method.
Note 2. Availability of context auto saving for all interrupt (EIINTn) which priority level is less than equal 16 is specified by RBCR0.BE[15].
Note 3. If the value of RBNR.BN is bigger than INTCFG.ULNR or the value of RBNR.BN is 63, the context auto saving is not done. In this case, SYSERR exception that exception factor code (lower 16 bits) is $1C_H$ occurs.

Automatic context saving is not carried out if the table reference method is not specified for the interrupt request (EIINTn) or the use of the register bank is not specified by the RBCR0.BE[*i*] bit associated with the interrupt priority (*i*).

In addition, no automatic context saving is carried out if the value of the RBNR.BN bits are greater than INTCFG.ULNR, or if the value of RBNR.BN is 63. In such a case, it is assumed that an unexpected interrupt acceptance processing is being performed and a terminating-type SYSERR exception is notified for error processing.

Figure 3.24 shows the flow of checking the conditions for automatic context saving.



Note 1. For details of operations other than the condition judgement, see **Figure 3.20** and **Figure 3.22**.

Figure 3.24 Flow of Checking the Conditions for Automatic Context Saving

(a) Automatic Context Saving

Shown below is the processing of automatic context saving onto the register bank.

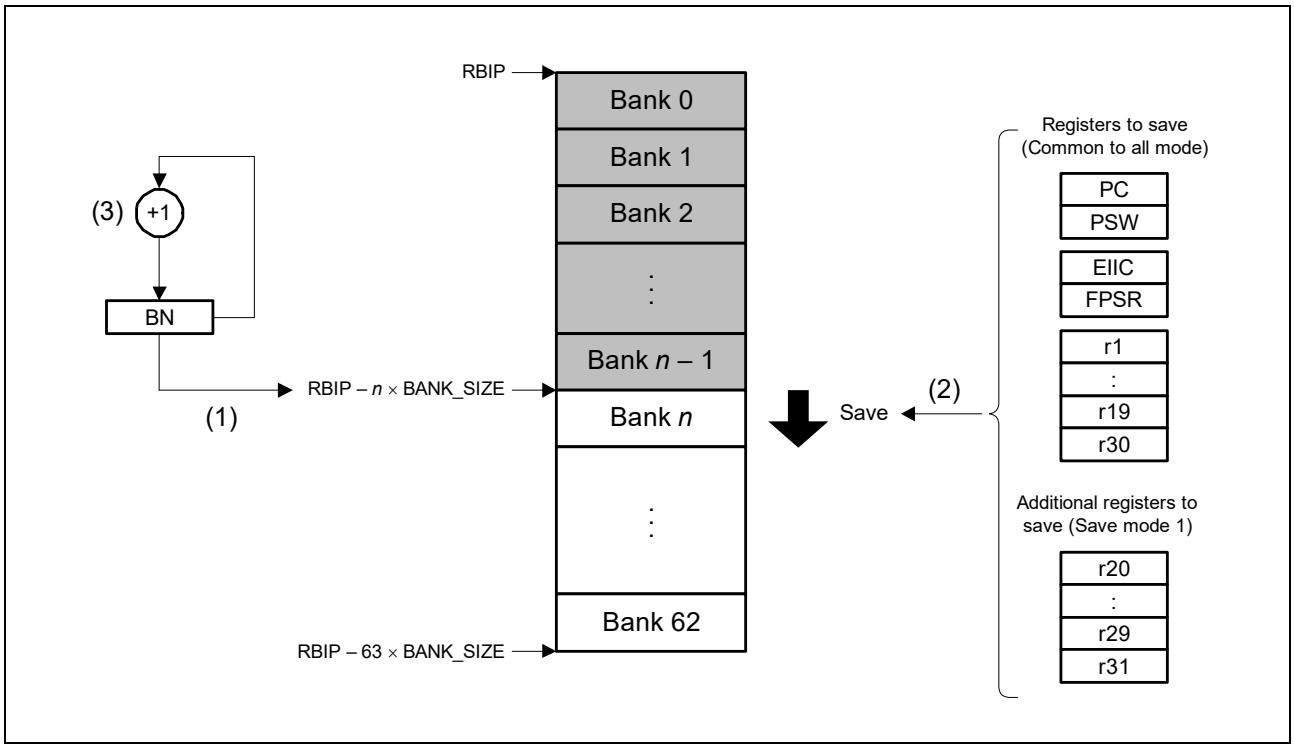


Figure 3.25 Processing of Automatic Context Saving

1. Calculate the start address of register bank n on which the context is to be saved based on the value of the register bank initial pointer (RBIP) and the value (*n*) of the BN bits of the register bank number register (RBNR) established upon acceptance of the interrupt. The size (BANK_SIZE) of the register bank differs depending on the save mode that is selected.
   Start address:
   RBIP – *n* × BANK_SIZE
   BANK_SIZE:
   Save mode 0: 60_H
   Save mode 1: 90_H
2. Save the target registers onto the register bank n specified by the RBNR.BN bits according to the save mode specified by the RBCR0.MD bit*1. **Table 3.108** shows a list of the registers to save, their addresses, and save order.
3. Increment the value of the RBNR.BN bits by 1. This terminates the register bank saving processing*2 and initiates the execution of the interrupt handler*3.

Note 1. MDP exceptions (terminating-type) might be caused by memory accesses made during the register bank saving processing. The other types of interrupts and exceptions cannot be accepted.

Note 2. The saving of the registers into the memory area specified as the register bank does not have always been completed. To ensure the completion of register saving, this CPU can employ a procedure similar to the one with the ordinary store instruction. For details, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

Note 3. Exceptions of higher priorities can be accepted after the saving onto the register bank is finished.

Table 3.108 List of Registers to Save, Addresses, Save Order, and Restore Order

Addresses RBIP − n × BANK_SIZE	Save mode 0 (MD = 0)	Save mode 1 (MD = 1)	Save Order *1, *2	Restore Order *1, *3
−04H	PC	PC	1	24 / 35
−08H	PSW	PSW	2	23 / 34
−0CH	EIIC	EIIC	3	22 / 33
−10H	FPSR	FPSR	4	21 / 32
−14H	r1	r1	5	20 / 31
−18H	r2	r2	6	19 / 30
−1CH	r3	r3	7	18 / 29
−20H	r4	r4	8	17 / 28
−24H	r5	r5	9	16 / 27
−28H	r6	r6	10	15 / 26
−2CH	r7	r7	11	14 / 25
−30H	r8	r8	12	13 / 24
−34H	r9	r9	13	12 / 23
−38H	r10	r10	14	11 / 22
−3CH	r11	r11	15	10 / 21
−40H	r12	r12	16	9 / 20
−44H	r13	r13	17	8 / 19
−48H	r14	r14	18	7 / 18
−4CH	r15	r15	19	6 / 17
−50H	r16	r16	20	5 / 16
−54H	r17	r17	21	4 / 15
−58H	r18	r18	22	3 / 14
−5CH	r19	r19	23	2 / 13
−60H	r30	r20	24	1 / 12
−64H	*4	r21	25	11
−68H		r22	26	10
−6C H		r23	27	9
−70H		r24	28	8
−74H		r25	29	7
−78H		r26	30	6
−7CH		r27	31	5
−80H		r28	32	4
−84H		r29	33	3
−88H		r30	34	2
−8CH		r31	35	1
−90H		*5		
−94H		*6		

Note 1. Register saving and restoration start sequentially at sequence number 1.

Note 2. The target registers to be saved in save mode 0 (RBCR0.MD = 0) are the registers up to r30 with a save sequence number of 24.

Note 3. The restoration sequence numbers shown on the left side are for save mode 0 and those shown on the right side are for save mode 1.

Note 4. In save mode 0, the next bank (n + 1) starts from this address.

Note 5. In save mode 1, no register is saved in this address. This address is not used.

Note 6. In save mode 1, the next bank (n + 1) starts from this address.

(b) Suppressing the Update of the PSW.ID Bit

When an interrupt (EIINTn) is accepted in the normal state, the PSW.ID bit is set to 1 and interrupts of the same EI level cannot be accepted unless the acceptance of interrupts is enabled explicitly with the EI instruction.

For interrupts that make use of the register bank (satisfying the automatic context saving conditions), on the other hand, by clearing the RBCR1.NC[*i*] bit associated with the interrupt priority (*i*) to 0, the PSW.ID bit keeps its value 0 without being set to 1 when an interrupt is accepted. This makes it possible to accept interrupts of higher priorities without software intervention after the end of automatic context saving. Since necessary registers are automatically saved, the CPU can return to the original interrupt processing precisely.

NOTE

The PSW.ID bit of all interrupt (EIINTn) which priority level is less than equal 16 after interrupt acknowledgment is defined by RBCR1.NC[15].

(3) Context Restoration

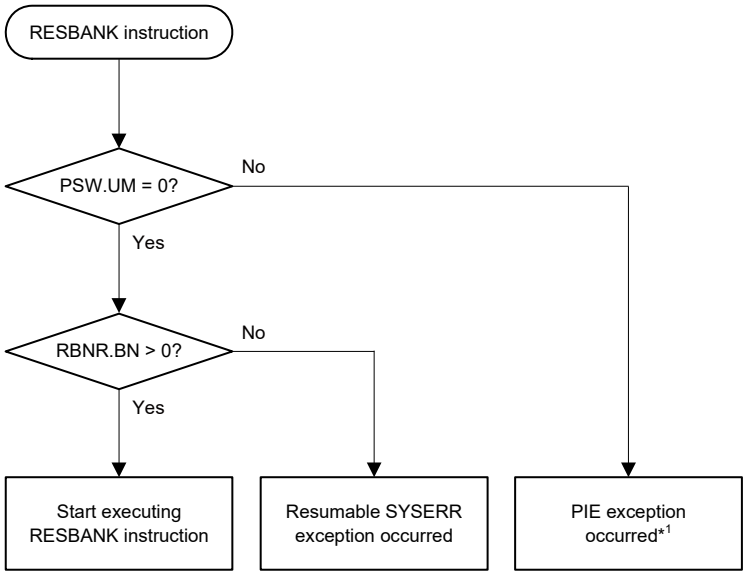
The context automatically saved onto the register bank need to be restored before returning from the interrupt processing to the original program. Although the context saving onto the register bank is automatically done, its restoration needs to be accomplished explicitly by software executing the RESBANK instruction.

(a) Conditions for Executing the RESBANK Instruction

The RESBANK instruction must be executed to restore the context from the register bank. The RESBANK instruction is a supervisor-privileged instruction. A PIE exception will occur if it is executed in user mode.

A resumable-type SYSERR exception will occur if the RESBANK instruction is executed when the value of the RBNR.BN bits are 0. A 0 in the RBNR.BN bits means that no context has automatically been saved onto the register bank. Accordingly, an invalid value will be restored if the RESBANK instruction is executed in such case.

The above-mentioned operating conditions are summarized in **Figure 3.26**.



Note 1. The process for detecting MIP and other exceptions that are not caused directly by the RESBANK instruction is omitted.

Figure 3.26 Flow of Checking the Conditions for Executing the RESBANK Instruction

(b) Context Restoration

The figure below shows the processing of the RESBANK instruction for restoring the context from the register bank.

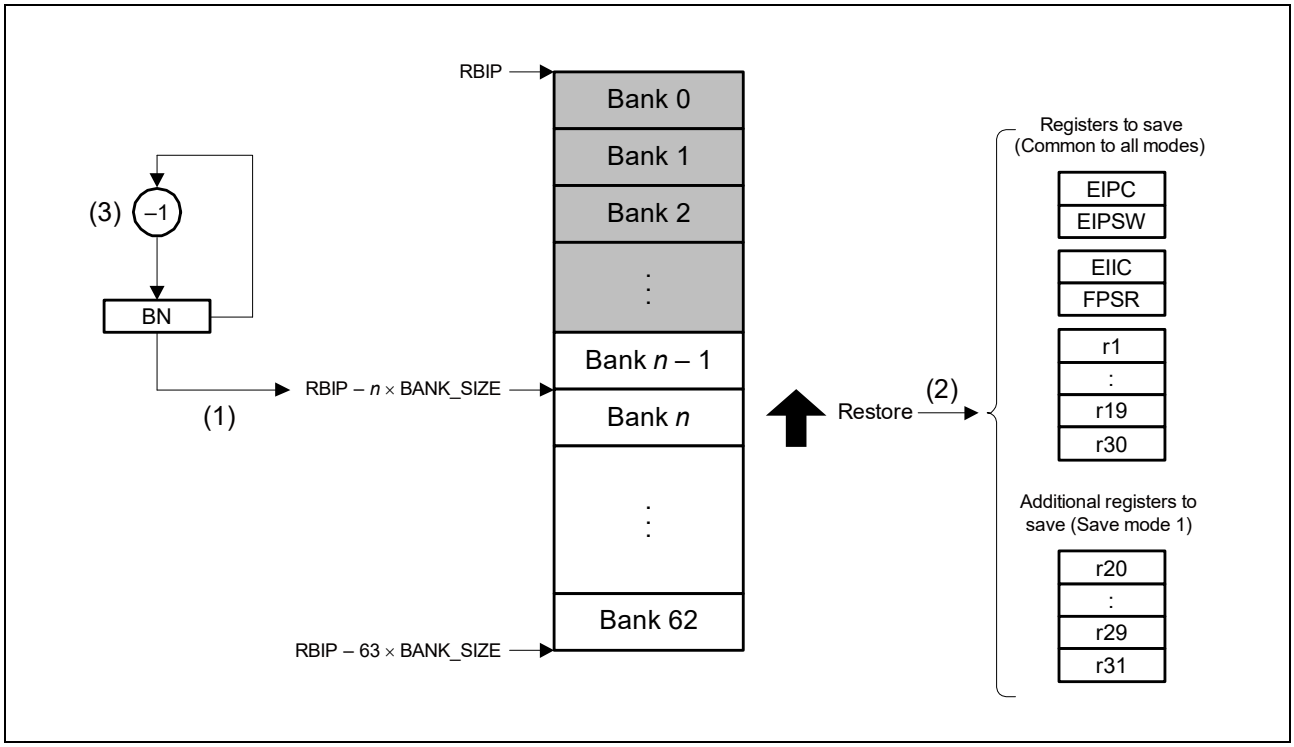


Figure 3.27 Processing of Context Restoration

1. Calculate the start address of register bank n-1 from which the context is to be restored based on the value of the register bank initial pointer (RBIP) and the value (n) of the BN bits of the register bank number register (RBNR) established upon acceptance of the interrupt. Unlike in the case of saving the context, the start address to be referenced when restoring the context is the lower-limit side of the register bank addresses. The size (BANK_SIZE) of the register bank differs depending on the save mode that is selected.
   Start address:
   RBIP – n × BANK_SIZE
   BANK_SIZE:
   Save mode 0: 60_H
   Save mode 1: 90_H
2. Restore the context from the register bank n-1 in the target registers according to the save mode specified by the RBCR0.MD bit*1. **Table 3.108** shows a list of the registers to restore, their addresses, and restore order.
3. Decrement the value of the RBNR.BN bits by 1*2. This terminates the register bank restoration processing and completes the execution of the RESBANK instruction*3.

Note 1. The CPU can accept terminating-type exceptions while restoring the context from the register bank. MDP exceptions (resumable-type) might be caused by memory accesses made during the register bank restoration processing.

Note 2. When the CPU accepts an exception before the value of RBNR.BN is updated, it stops the execution of the RESBANK instruction even if the restoration of all registers is not yet

completed. In this case, though there are some registers of which restoration has been completed, the CPU cannot know what registers have been restored. Since the return PC of the exception is the PC of this RESBANK instruction, the CPU can re-execute precisely the RESBANK instruction if none of the resources related to the RESBANK instruction are altered during the exception processing.

Note 3. After the RESBANK instruction is executed, execute the EIRET instruction to return from the interrupt handler.

3.2.4.6 List of Memory Access Exceptions

Table 3.109 shows a list of instructions and exceptions that make memory accesses and the exceptions that can be detected. Exceptions identified by the symbol ✓ can be detected during the memory accesses that are made during the processing of the listed instructions and exceptions. Exceptions identified by the symbol × are not detected.

Table 3.109 List of Memory Access Exceptions

Instruction/Exception	MAE	MDP	Instruction/Exception	MAE	MDP
SLD.B	×	✓	PREPARE	×	✓
SLD.BU	×	✓	DISPOSE	×	✓
SLD.H	✓	✓	PUSHSP	×	✓
SLD.HU	✓	✓	POPSP	×	✓
SLD.W	✓	✓	STM.MP	×	✓
SST.B	×	✓	LDM.MP	×	✓
SST.H	✓	✓	SWITCH	×	✓
SST.W	✓	✓	CALLT	×	✓
LD.B	×	✓	SYSCALL	×	✓
LD.BU	×	✓	LDV.W	✓	✓
LD.H	✓	✓	LDV.DW	✓	✓
LD.HU	✓	✓	LDV.QW	✓	✓
LD.W	✓	✓	STV.W	✓	✓
LD.DW	✓	✓	STV.DW	✓	✓
ST.B	×	✓	STV.QW	✓	✓
ST.H	✓	✓	LDVZ.H4	✓	✓
ST.W	✓	✓	STVZ.H4	✓	✓
ST.DW	✓	✓	CACHE (CHBII)	×	✓
LDL.BU	×	✓	CACHE (CIBII)	×	×
LDL.HU	✓	✓	CACHE (CFALI)	×	✓
LDL.W	✓	✓	CACHE (CISTI)	×	×
STC.B	×	✓	CACHE (CILDI)	×	×
STC.H	✓	✓	CACHE (other commands)	×	×
STC.W	✓	✓	PREF (PREFI)	×	×*1
CAXI	✓	✓	PREF (other commands)	×	×
SET1	×	✓	Table reference type EIINTn	×	✓*2
CLR1	×	✓	Register bank saving processing	×	✓*2
NOT1	×	✓	RESBANK	×	✓
TST1	×	✓			

Note 1. When a violation is detected during the execution of the PREF instruction, no MDP exception is generated but the memory access is suppressed. Read access is not performed.

Note 2. Both of table read accesses due to table reference method interrupts and write accesses for automatically saving the context onto the register bank occur independently of the execution of an instruction. This CPU handles any MDP exception that is caused by these accesses as a terminating-type exception. The exception cause code of this MDP exception differs from that of resumable-type MDP exceptions. For details see **Table 3.102**.

3.2.5 Memory Management

This CPU provides the following functions for managing memory.

- Memory protection unit (MPU)
- Instruction cache

3.2.5.1 Memory Protection Unit (MPU)

Memory protection functions are provided in an MPU (memory protection unit) to maintain a smooth system by detecting and preventing unauthorized use of system resources by unreliable programs, runaway events, etc.

(1) Features

(a) Memory Access Control

Multiple protection areas can be assigned to the address space. Consequently, unauthorized program execution or data manipulation by user programs can be detected and prevented. The upper and lower limit addresses of each area can be specified so that the address space can be used precisely and efficiently.

(b) Access Management for Each CPU Operation Mode

In this CPU, several status bits are used to control access to resources, and these bits are used in combination to perform protection that is appropriate, according to each program's level of reliability.

(c) Protection with the System Protection Identifier (SPID)

This CPU can use the system protection identifier (SPID) to check for area matching. The usage and limitations on settings of the SPID register depend on the system specifications of the product in which this CPU is mounted. Reflecting such system specifications in the control of memory access can enable the efficient management of access.

(2) Protection Area Settings

(a) Protection Area Attribute Settings

Set the respective protection areas appropriately. For details about registers, see **Section 3.2.3, Register Set**.

E bit

This sets the target protection area setup as enabled or disabled. When disabled, all settings are disabled. Make sure valid setting values have been stored for other protection area settings (MPUA, MPLA, and MPAT) at the time when this bit is set to 1.

UX, UR, and UW bits

These bits indicate the access privileges for the target protection area during user mode. A 1 in these bits indicates the presence of the corresponding access privilege.

SX, SR, and SW bits

These bits indicate the access privileges for the target protection area during supervisor mode. These bits, in addition to the E bit, are valid only when the MPM.SVP bit has been set to 1. If the MPM.SVP

bit has been cleared to 0, even when the E bit is set to 1, protection is not performed while in supervisor mode, regardless of the values of the SX, SR, and SW bits, and the entire address space becomes access-enabled.

WG and WMPIDn bits and MPIDn registers (n = 0 to 7)

These bits indicate how to reference the system protection identifier (SPID) during the check for the permission to write to a protection area.

When the WG bit is set (to 1), the access permission for all write accesses is judged only by the settings of the UW or SW bit regardless of the value of the SPID that is set.

When the WG bit is cleared (to 0), if the value of the SPID register matches any of the values specified in the MPIDn registers and if the WMPIDn bit corresponding to the matching MPIDn register is set (to 1), the access permission is judged according to the settings of the UW or SW bit. If the value of the SPID register matches none of the values specified in the MPIDn registers or if the WMPIDn bit corresponding to the matching MPIDn register is cleared (to 0), the access permission is judged to be “write-disabled” regardless of the settings of the UW or SW bit.

In addition, when the values of multiple MPIDn registers match the value of the SPID register, writing is possible if any of the corresponding WMPIDn bit is set (to 1).

RG bit, RMPIDn bit, and MPIDn registers (n = 0 to 7)

These bits indicate how to reference the system protection identifier (SPID) during the check for the permission to read from a protection area.

When the RG bit is set (to 1), the access permission for all read accesses is judged only by the settings of the UX and UR bits or the SX and SR bits regardless of the value of the SPID that is set. When the RG bit is cleared (to 0), if the value of the SPID register matches any of the values specified in the MPIDn registers and if the RMPIDn bit corresponding to the matching MPIDn register is set (to 1), the access permission is judged according to the settings of the UX and UR bits or the SX and SR bits. If the value of the SPID register matches none of the values specified in the MPIDn registers or if the RMPIDn bit corresponding to the matching MPIDn register is cleared (to 0), the access permission is judged to be “read-disabled” regardless of the settings of the UX and UR bits or the SX and SR bits.

In addition, when the values of multiple MPIDn registers match the value of the SPID register, reading is possible if any of the corresponding RMPIDn bit is set (to 1).

(3) Caution Points for Protection Area Setup

(a) Crossing Protection Area Boundaries

When the specified protection areas overlap, the access control settings for the overlapping parts are set to “allow most”.

In other words, when multiple protection areas have been specified, if access is enabled for either of the protection areas, access is judged to be enabled.

(b) Invalid Protection Area Settings

Protection area settings are invalid in the following case.

When value set to lower-limit address is larger than value set to upper-limit address

CAUTION

Addresses are handled as unsigned integers (0_H to FFFF $FFFF_H$).

For example, the following settings alone cannot make the target area accessible (MPAT is omitted):

MPLA0 = FFFF $FF80_H$, MPUA0 = 0000 $00FC_H$

This setting should be divided into the following two protection area settings.

MPLA0 = FFFF $FF80_H$, MPUA0 = FFFF $FFFC_H$

MPLA1 = 0000 0000_H, MPUA1 = 0000 $00FC_H$

MPLA0 refers to the MPLA register for the protection area 0. The same holds true for the other registers.

(c) Lower- and Upper-Limit Addresses Referenced during Protection Violation Checks

Table 3.110 lists the lower-limit addresses that are compared with MPLA and the upper-limit addresses that are compared with MPUA during the protection violation check.

Table 3.110 Lower- and Upper-limit Addresses Referenced during the Protection Violation Check

Instruction/Event	Access size	Lower-Limit Address	Upper-Limit Address
SLD, SST, LD, ST, LDL, STC, LDV, STV	Byte	Address calculated according to the addressing specified in the instruction	Same as lower-limit address
	Half word		Lower-limit address + 1
	Word		Lower-limit address + 3
	Double word*1		Lower-limit address + 7
	Quad word*1		Lower-limit address + 15
CAXI	Word	Value of reg1	Lower-limit address + 3
SET1, NOT1, CLR1, TST1	Byte	Address calculated according to the addressing specified in the instruction	Same as lower-limit address
PREPARE, DISPOSE, PUSHSP, POPSP, STM, LDM	Word*2	Address calculated from the value of the SP and the number of accesses	Lower-limit address + 3
SWITCH, CALLT	Half word	Address calculated according to the addressing specified in the instruction	Lower-limit address + 1
SYSCALL	Word	Address calculated according to the default addressing	Lower-limit address + 3
CACHE (CHBII, CFALI), PREF	Cache line size*3	reg1 value rounded by cache line size	Lower-limit address + Cache line size – 1
Table reference EIINTn	Word	Address from which the exception handler address is read when table reference method is selected	Lower-limit address + 3
Automatic context saving onto a register bank	Word*2	Address calculated from the values of the RBIP and the RBNR.BN bit	Lower-limit address + 3
RESBANK	Word*2	Address calculated from the values of the RBIP and the RBNR.BN bit	Lower-limit address + 3
Memory protection configuration check function	Value of MCS	Value of MCA	Value of MCA + MCS – 1
Instruction fetch	Instruction fetch size*4	PC rounded by the instruction fetch size	Lower-limit address + Instruction fetch size – 1

Note 1. Since the minimum protection area unit is word-size, there are cases in which the lower- or upper-limit address specified for a double or quad word access does not fall within the address range designated by a single protection area setting. If either one of the lower- and upper-limit addresses does not fall within the specified address range, a protection violation is detected and an MDP exception is generated. See **Section 3.2.5.1(3)(d), Memory Access Spanning Contiguous Protection Areas,** for the operation for two contiguous protection area settings.

Note 2. The instruction accesses contiguous multi-byte area, however, memory accesses for a single register are carried out on word-size basis. Memory protection is effected on each of these word-size accesses. For this reason, there are cases in which a data protection violation is detected when some of word-size memory access are executed and there still are memory accesses that are yet to be executed. In these cases, an MDP exception occurs during the processing of the instruction, and the instruction is aborted. Memory or registers are updated by the completed processing of the instruction.

Note 3. For the cache line size, see **Section 3.9.9, Product Information of Cache Structure**.

Note 4. For the instruction fetch size, see **Section 3.9.10, Product Information of Fetch Size**.

(d) Memory Access Spanning Contiguous Protection Areas

With respect to the memory protection against an operand access, it is necessary that the associated memory access is encompassed entirely in a single access enabled area. No accesses that span over two or more areas are allowed even when the access enabled areas are allocated in contiguous spaces. In this CPU, since the minimum protection area unit is word-size and misaligned accesses cannot be executed, memory accesses spanning over areas can occur during double word size memory accesses (LD.DW, ST.DW, LDV.DW, and STV.DW) or quad-word memory access (LDV.QW, STV.QW).

On the other hand, the memory accesses associated with the instructions PREPARE, DISPOSE, PUSHSP, POPSP, STM.MP, LDM.MP, and RESBANK and the memory accesses associated with the automatic context saving onto a register bank may span over two or more access enabled areas since they are handled as repetitions of two or more word size accesses.

With respect to the memory protection against an instruction fetch, if a fetch access spans over protection areas, the instruction codes that are fetched are given the result of judging the memory protection which is made with the word size as a delimiter. Since only a specific part of the instruction codes that are fetched is required to execute the instruction, even if an instruction fetch which spans over enabled and disabled areas is made, the instruction code in the enabled area can be executed. If the instruction code in the disabled area is used, an MIP exception will occur.

Since the instruction codes are allocated on a half word basis, for an instruction whose instruction length is the word size or longer, there are cases in which the instruction itself spans over protection areas. In such a case, the instruction may be executed if both areas are enabled. If one area is disabled, however, the instruction cannot be executed even if the other area is enabled.

Table 3.111 below shows the examples of operand accesses which span over protection areas. **Table 3.112** below shows the examples of instruction fetches which span over protection areas. In the following examples, the LD.DW, DISPOSE instructions and the instruction fetch start to access address 0000 00FC$_H$ and proceed in the direction of increasing addresses. The PREPARE instruction starts to access address 0000 0100$_H$ and proceeds in the direction of decreasing addresses. The memory protection setting check function checks the area that begins from 0000 00FC$_H$ and goes beyond the boundary of the protection area. In the examples, following two protection areas are set.

Protection area setting 0: MPLA0 = 0000 0000$_H$, MPUA0 = 0000 00FC$_H$
Protection area setting 1: MPLA1 = 0000 0100$_H$, MPUA1 = 0000 01FC$_H$

Table 3.111 Examples of Operand Memory Accesses Spanning Over Contiguous Protection Areas

Protection Setting		Operation			
Setting 0	Setting 1	LD.DW, etc.	PREPARE, etc. (save context)	DISPOSE, etc. (restore context)	Memory Protection Setting Check
Disabled	Disabled	MDP	MDP	MDP	Prohibited (0)*5
Disabled	Enabled	MDP	MDP*1	MDP*3	Prohibited (0)*5
Enabled	Disabled	MDP	MDP*2	MDP*4	Prohibited (0)*5
Enabled	Enabled	MDP	Access executed	Access executed	Prohibited (0)*5

Note 1. Accesses made to addresses in the protection area setting 1 are enabled and update the memory. When an access is made to an address in the protection area setting 0, an MDP exception occurs and the execution of the instruction is aborted. The MEA register holds the address at which the first data protection violation is detected.

Note 2. Since the address at which accessing is to start is disabled, an MDP exception occurs without the execution of any memory access.

Note 3. Since the address at which accessing is to start is disabled, an MDP exception occurs without the execution of any memory access.

Note 4. Accesses made to addresses in the protection area setting 0 are enabled and update the registers. When an access is made to an address in the protection area setting 1, an MDP exception occurs and the execution of the instruction is aborted. The MEA register holds the address at which the first data protection violation is detected.

Note 5. The memory protection setting check function sets “Prohibited (0)” to the corresponding bits of the MCR register unless the target area falls within a single protection area.

Table 3.112 Examples of Instruction Fetch Memory Accesses Spanning Over Contiguous Protection Areas

Protection Setting		Operation			
Setting 0	Setting 1	Execute Instructions Covered by Only Setting 0	Execute Instructions Covered by Only Setting 1	Execute Instructions Spanning Over Settings 0 and 1	Manipulate Instruction Cache with CACHE Instruction/Prefetching by the PREF Instruction
Disabled	Disabled	MIP	MIP	MIP	MDP*1/Disabled*2
Disabled	Enabled	MIP	Instruction executed	MIP	MDP*1/Disabled*2
Enabled	Disabled	Instruction executed	MIP	MIP	MDP*1/Disabled*2
Enabled	Enabled	Instruction executed	Instruction executed	Instruction executed	MDP*1/Disabled*2

Note 1. An MDP exception occurs when a memory protection violation is detected for the CACHE instruction which manipulates the instruction cache using the address specification method.

Note 2. An MDP exception does not occur, and prefetching is disabled when a PREF instruction leads to a violation of memory protection.

(e) Memory Access which Spans Over Address 0000 0000_H

Table 3.113 summarizes the operations that are performed when a memory access which spans over addresses FFFF $FFFF_H$ to 0000 0000_H is made with the protection setting such that all the address spaces are enabled by the following single protection area setting:

Protection area setting 0: MPLA0 = 0000 0000_H, MPUA0 = FFFF $FFFC_H$

Table 3.113 Operations of Memory Access That Span Over Address 0000 0000_H

Instruction/Event	Operation
LD.DW, ST.DW	MDP exception
PREPARE, DISPOSE, PUSHSP, POPSP, RESBANK, Automatic context saving onto a register bank	Access executed

For instructions and events other than those mentioned above, no memory access which spans over address 0000 0000_H is generated by a single instruction or event.

(4) Access Control

In this CPU, accesses are controlled appropriately according to the settings described in **Section 3.2.5.1 (2), Protection Area Settings**. In any of the cases listed below, the CPU ensures logical integrity by limiting actual access, detecting violations before instruction execution is completed, and setting up exceptions.

- When about to execute an instruction at an address outside the executable area
- When about to execute an instruction that reads from an address outside the read-accessible area
- When about to execute an instruction that writes to an address outside the write-accessible area

The specifics of access control are as follows.

- The result of the access which is judged as prohibited is not reflected in memory or I/O devices.
- The result of the access which is judged as enabled is reflected in memory or I/O devices.

CAUTIONS

1. Even when access is enabled, there might be cases where access is blocked by another function that prohibits it.

2. In some cases, access judged to be prohibited may be executed for a memory. The cases are as listed below.

- **Reading local RAM**
- **Reading of code flash memory by instruction prefetching of the instruction cache**

Since execution of the instructions that read from the local RAM or execute the prefetched instruction is inhibited by an exception, such access does not affect the execution of instructions. However, when a debugger is monitoring access to the local RAM or code flash memory, it may observe access judged to be prohibited.

(5) Violations and Exceptions

In this CPU, violations are detected during instruction fetch access or operand access according to the protection area settings, and an exception is generated.

- Execution protection violation (during instruction fetch access)
- Data protection violation (during operand access)

(a) Execution Protection Violation (MIP Exception)

This violation is detected when an instruction is executed. An execution protection violation is detected when attempting to execute an instruction that has been placed in a non-executable area.

When an execution protection violation is detected, an MIP exception always occurs.

(b) Data Protection Violation (MDP Exception)

This violation is detected during operand access. A data protection violation is detected when a memory access instruction, etc. attempts to access data from an access-prohibited area.

When a data protection violation is detected, an MDP exception always occurs.

(c) Exception Cause Code and Exception Address

When an execution protection violation or data protection violation has been detected, the exception cause code is determined as shown in **Table 3.114**. The determined exception cause code is set to the FEIC register.

The MEA register is used to store either the PC of the instruction that detected the execution protection violation or the access address used when the data protection violation occurred. The MEA register is shared by MIP and MDP exceptions since these exceptions do not occur simultaneously. Also, when a data protection violation occurs, the information of the instruction or event that caused the violation is stored in the MEI register.

Table 3.114 Exception Cause Code of Memory Protection Violation

Exception	Operation Mode When Violation Occurred	Bit Number and Bit Name										
		31-25	24	23	22	21	20	19	18	17	16	15-0
		—	MS	BL	RMW	SX	SW	SR	UX	UW	UR	—
MIP	User mode	0	0	0	0	0	0	0	1	0	0	90_H
	Supervisor mode	0	0	0	0	1	0	0	0	0	0	90_H
MDP	User mode	0	*5	*4	*3	0	0	0	0	*2	*1	91_H
	Supervisor mode	0				0	*2	*1	0	0	0	91_H*6

Note: UR: A violation is detected during a read operation in user mode (PSW.UM = 1).
UW: A violation is detected during a write operation in user mode (PSW.UM = 1).
UX: A violation is detected during instruction execution in user mode (PSW.UM = 1).
SR: A violation is detected during a read operation in supervisor mode (PSW.UM = 0).
SW: A violation is detected during a write operation in supervisor mode (PSW.UM = 0).
SX: A violation is detected during instruction execution in supervisor mode (PSW.UM = 0).
RMW: Set to 1 when the instruction causing the violation contains a read-modify-write operation (SET1, NOT1, CLR1,or CAXI).
BL: Set to 1 when the instruction causing the violation performs a block transfer (PREPARE, DISPOSE, PUSHSP, or POPSP).
MS: Set to 1 when the instruction causing the violation performs a misaligned access.

Note 1. When a read violation is caused by an instruction that includes a read operation, either the SR or UR bit is set to 1.

Note 2. When a write violation is caused by an instruction that includes a write operation, either the SW or UW bit is set to 1.

Note 3. This bit is set to 1 when a violation is caused by the SET1, NOT1, CLR1, or CAXI instruction.

Note 4. This bit is set to 1 when a violation is caused by the PREPARE, DISPOSE, PUSHSP, or POPSP instruction.

Note 5. This bit is set to 1 when the instruction causing the violation performs a misaligned access.

Note 6. These bits are loaded with 95_H for a data protection violation that is detected during a table read initiated by table reference EIINTn or automatic context saving onto a register bank. These are executed only in supervisor mode.

(6) Memory Protection Setting Check Function

For the programs, such as OS, that provide services, this CPU provides a memory protection setting check function to enable implementation of a service protection function that checks in advance whether or not the address area to be used for the requested operations is within an area that is accessible by the source that requested the service. By using this function, when verifying the validity of the user-supplied parameters for a system service, the OS can complete the verification in a shorter time than by repeating reading and checking the area settings by software.

(a) Check Details

The memory protection setting check function checks what access permission settings are made for the specified address area according to the protection area settings that are stored in the MPU.

If the address area specified by the MCA and MCS registers is contained within one protection area (specified by a pair of the MPLA and MPUA registers) and the instruction execution (instruction fetch)/write access/read access for the SPID specified by the MCI register is permitted in supervisor mode/user mode, the corresponding bit in the MCR register is set (to 1).

If the specified address area is not contained within one protection area or an access for the specified SPID is not permitted in an operation mode, the corresponding bit in the MCR register is cleared (to 0).

This check operation is realized by executing the same memory protection judgement procedure that is applied to the operand access or instruction fetch access to the specified address area and SPID. Therefore, when the checked address area is accessed by a load instruction, store instruction or instruction fetch, the access is judged as permitted or a memory protection exception occurs according to the check result.

CAUTIONS

1. **For the memory protection setting check function to judge the access as permitted, it is necessary that the specified address area is contained within one protection area. For example, when two contiguous protection areas are set as access permitted (see Section 3.2.5.1(3)(d), Memory Access Spanning Contiguous Protection Areas), the memory protection setting check result for the address area spanning over the contiguous protection areas becomes “access prohibited (0)”. Therefore, if there are such memory protection settings, there may be a difference between the actual access result by PREPARE instruction, instruction fetch, etc. and the result of memory protection setting check function.**
2. **The memory protection check function makes the same judgement as the memory protection judgement that is applied to the actual memory accesses. For example, if the MPM.MPE bit is cleared (to 0), all check results are always set to “access permitted (1)”. If the MPM.SVP bit is cleared (to 0), the bits MCR.SXE, SWE, and SRE are always set to “access permitted (1)”. Or if the MPM.MPE bit is set (to 1) (MPM.SVP is assumed to be cleared) and the MPAT.E bit of all protection area settings is cleared (to 0), the MCR.UXE, UWE, and URE bits are always set to “access prohibited (0)”.**

(b) Checking Procedure

Set the base address (lower limit) of the target address area to the MCA register, the size of the target area to the MCS register, and the system protection identifier (SPID) of the source requesting the service to the MCI register, then use the LDSR instruction (r0 specification is recommended) to access the MCC register and execute a check. The results can be read from the MCR register by the STSR instruction.

CAUTION

If the specified area to be checked crosses 0000 0000$_H$ or 7FFF FFFF$_H$, it is judged as an area setting error, and the MCR.OV bit is set to 1. This means that the MCR.OV bit must be checked before accessing the check results. Do not use the check result until it is confirmed that the result is not invalid (OV = 0).

(c) Sample Code

It is assumed that the memory protection setting check function will be used for the following operations.

```
_service_protection:
        …
        MOV         ADDRESS, r10        // Store the start address of the area to be checked to r10
        MOV         SIZE, r11           // Store the size of the area to be checked to r11
        MOV         SPID, r12           // Store the system protection identifier to r12
        DI
        LDSR        r10, sr8, 5         // Set the address to MCA
        LDSR        r11, sr9, 5         // Set the size to MCS
        LDSR        r12, sr12, 5        // Set the system protection identifier to MCI
        LDSR        r0, sr10, 5         // Start checking with MCC
        STSR        sr11, r13, 5        // Get the results from MCR
        EI
        ANDI        0x0100, r13, r0
        BNZ         _overflow           // Processing of invalid input when OV = 1
        BR          _result_check       // Otherwise, result is checked
```

(d) Method of Calculating Address Areas

The address area to be checked is treated as follows and compared with the memory protection setting.

Lower-limit address of the area: MCA setting
Upper-limit address of the area: Value calculated from MCA + (MCS – 1)

In addition, when MCS is set to 0000 0000$_H$, the value of "MCS – 1" is treated as FFFF FFFF$_H$. Moreover, if the result of calculating an upper address exceeds FFFF FFFF$_H$, it will be calculated as a 33-bit value, but the most significant bit, which represents an overflow, is discarded.

When MCA is 0000 0000$_H$ and MCS is 0000 0000$_H$, the upper-limit address is FFFF FFFF$_H$.
When MCA is FFFF FFFF$_H$ and MCS is 0000 0002$_H$, the upper-limit address is 0000 0001$_H$.

(e) Checking Results of the Memory Protection Setting Checking Function

Table 3.115 lists the results of the memory protection setting checking function for various settings.

Table 3.115 List of Checking Results of Memory Protection Setting Checking Function

MPM Setting		Check Setting (MCA, MCS, MCI)		Operation in the Various Types of Protected Area					Final Result of Checking (in the MCR)*2		
				Protection Setting			Result of Checking for One Protected Area*1				
MPE	SVP	Address	MCI, MPIDn	E	Address	xMPIDn*3	SXE, SWE, SRE	UXE, UWE, URE	OV	SXE, SWE, SRE	UXE, UWE, URE
0	—	—	—	—	—	—	—	—	0	All bits are set to 1	All bits are set to 1
1	0	Spanning 0000 0000_H	—	—	—	—	—	—	1	All bits are set to 1	All bits are set to 0
		Spanning 7FFF $FFFF_H$	—	—	—	—	—	—	1	All bits are set to 1	All bits are set to 0
		Other than above	*4	*4	*4	*4	All bits are set to 1	*4	0	All bits are set to 1	*4
	1	Spanning 0000 0000_H	—	—	—	—	—	—	1	All bits are set to 0	All bits are set to 0
		Spanning 7FFF $FFFF_H$	—	—	—	—	—	—	1	All bits are set to 0	All bits are set to 0
		Other than above	Mismatch	—	—	—	All bits are set to 0	All bits are set to 0	0	All bits are set to 0	All bits are set to 0
			Match	0	—	—	All bits are set to 0	All bits are set to 0	0	Results for each of the areas	Results for each of the areas
				1	Not included	—	All bits are set to 0	All bits are set to 0	0	Results for each of the areas	Results for each of the areas
					—	Disabled	All bits are set to 0	All bits are set to 0	0	Results for each of the areas	Results for each of the areas
					Included	Enabled	Results corresponding to the setting	Results corresponding to the setting	0	Results for each of the areas	Results for each of the areas

Note 1. For the MPM and other settings, this indicates the result produced by a single protection-setting area, but it cannot be directly monitored.

Note 2. The values to be stored in each bit of the MCR are the overall results for all areas covered by the given protection setting. “Results for each of the areas” will be enabled if the result of checking for even one area is enabled. However, for the value of the OV bit or all bits being set to 1 or 0, the result is as defined regardless of the result of each protection setting area.

Note 3. This indicates the result of enabling when the WG or RG bit is set (to 1), or the collective results of enabling or disabling by the individual WMPIDn and RMPIDn bits.

Note 4. When the MPM.MPE bit is set (to 1) and the MPM.SVP bit is cleared (0), access to all memory in supervisor mode is enabled. On the other hand, the judgment in user mode is different. The results obtained in accord with the settings for checking and protection are stored in the same way as the results when both the MPM.MPE and MPM.SVP bits are set (to 1).

3.2.5.2 Cache

This section describes the function to control the cache memory that is installed in this CPU.

In normal operation, the cache memory is used implicitly in instruction fetching by the CPU. However, if the setting is to be changed or the state of the cache memory is directly manipulated by the CACHE instruction, consistency with the normal operation of CPU must be maintained. In many cases, the hardware makes adjustments so that inconsistencies between the normal operation of the CPU and the manipulation of the cache do not arise. However, to make sure that the results of cache manipulation are the intended state, take care that the manipulation does not affect the implicit operation.

For a detailed description of the cache memory that is installed in the individual products, see **Section 3.9.9, Product Information of Cache Structure**.

(1) Features

A 16-KB and parity-based way select (PBS) 4-way set associative instruction cache is placed between the CPU and the code flash. The instruction cache and the code flash are connected to each other via a 256-bit dedicated bus to minimize penalties caused by a cache miss. A data buffer is also mounted between the CPU and the code flash to achieve high-speed data access. The 256-MB area from 0000 0000_H to 0FFF $FFFF_H$ in the address space is intended for the instruction cache and data buffer.

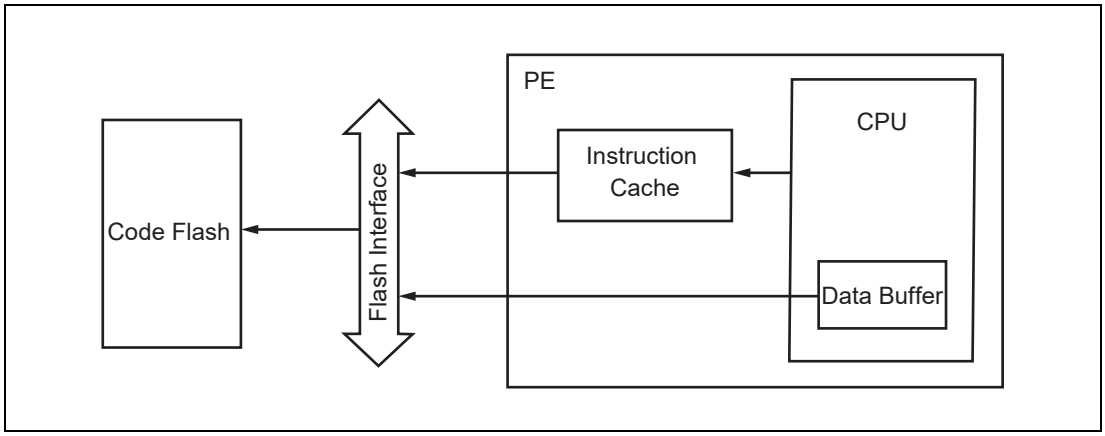

Figure 3.28 Instruction Cache and Data Buffer

(2) Cache Operation Registers

Figure 3.29 shows the system registers for cache operation. The supervisor privilege is required for the operation.

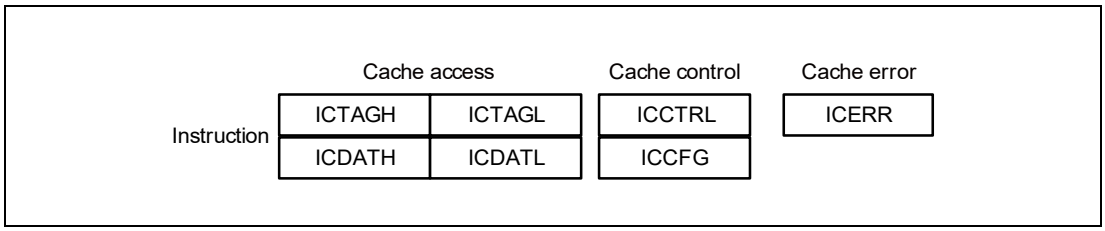

Figure 3.29 Cache Operation Registers

(3) Change Cache Use Mode

(a) Change Use Mode of Instruction Cache

The instruction cache use mode can be changed by using the ICCTRL.ICHEN bit. To enable an instruction cache, set the ICHEN bit to 1.

To disable the instruction cache, clear the ICHEN bit to 0.

Completion of the LDSR instruction that sets ICHEN might not coincide with completion of the instruction cache setting change. As in the following sample code, by executing the SYNCI instruction after the LDSR instruction, it is ensured that the change of the instruction cache setting takes effect after the SYNCI instruction.

```
LDSR r10, sr24, 4    // Change the instruction cache settings (ICCTRL)(setting value is stored in
                        r10)
SYNCI                // Wait for completion of the LDSR instruction, then refetch the subsequent
                        instructions.
```

(4) Cache Operations Using CACHE Instruction

The CACHE instruction manipulates the specified data in the cache memory.

Such data manipulation by the CACHE instruction starts after updating of the cache memory by all preceding memory access has been completed. Consequently, the result of preceding memory access is guaranteed to be the target for operations using the CACHE instruction. Additionally, a suitable synchronization operation is needed following execution of the CACHE instruction to ensure that the results are reflected in subsequent instructions.

The CACHE instruction can manipulate the cache memory even when the cache is disabled.

(a) Specification Method for Target of CACHE Instruction

There are basically two ways to specify the target for operations.

Directly specify the address to be accessed:
In this CPU, this is called the address specification method. In this case, the cache line containing the specified address is subject to operation.

Directly specify the cache memory's way number and line number:
In this CPU, this is called the index specification method. In this case, no hit judgment for the cache is performed, and the operation is performed on the specified cache index. For details about the cache index specification method, see **Section 3.2.5.2 (6), Cache Index Specification Method**.

(b) Operations Performed using the CACHE Instruction

The operations performed on the cache memory are divided into the following. For details about each operation, see the *RH850G4MH User's Manual: Software*.

Cache Hit Block Invalidate / Cache Indexed Block Invalidate (CHBI / CIBI)

This disables the specified cache line. When using the address specification method, the cache line is disabled only when there is a hit. When using the index method, specified cache line is disabled. If the specified cache line is locked, it is unlocked. This operation can be used in cases such as when the entire memory cache is initialized by software.

Disabling a cache line refers to the process of clearing the cache information corresponding to the ICTAGL.V and ICTAGL.L bits (to 0).

Cache Fetch and Lock (CFAL)

This stores the data at the specified address to the cache memory. At this time, the cache line where the data is stored is locked. This prevents the cache line from being replaced. If the target cache line has already been stored in the cache memory, it is simply locked. If the target cache line has already been stored in the cache memory and is locked, this operation does nothing.

This operation can be used to improve execution efficiency by reducing variations in instruction execution time that occur due to cache misses in the specified memory area.

Cache lines are locked only when they are enabled. Although enabling and locking of a cache line are carried out simultaneously during the execution of the CFAL instruction, no cache line is locked when only locking is configured using the CIST instruction. For details, see **Section 3.2.3.7 (1), ICTAGL — Instruction Cache Tag Lo Access**.

CAUTION

In the instruction cache supported by this CPU, if all the cache lines at the same index in the target way group are locked, the cache lines are not replaced. Care must be taken with respect to the cache lock specifications and the number of cache ways when monopolizing the cache memory efficiently using this operation. For the way group, see Section 3.2.5.2 (10), Configuration of Instruction Cache.
For details, see Section 3.9.9, Product Information of Cache Structure.

Cache Indexed Load / Cache Indexed Store (CILD / CIST)

This operation is used to directly access the cache memory. Values can be written and read, via a system register, at a position in the cache memory specified by using an index. Because cache data and cache tags can be accessed directly, this operation can be used for purposes such as software debugging.

(5) Cache Operation by the PREF Instruction

The PREF instruction is provided to realize efficient cache access by advising the CPU that an address is likely to be used in the near future. Getting the CPU to prefetch data into the cache memory before using the data can reduce the read wait time caused by a cache miss.

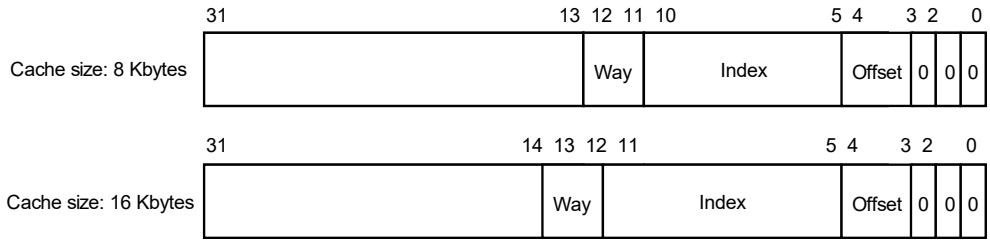
Assuming support by compilers and other tools, the PREF instruction can be executed regardless of the CPU operating mode. Execution of the PREF instruction does not cause an exception generated by the MPU, and has no effect on logical operations, just like the NOP instruction.

CAUTION

Because a data read request by the PREF instruction is rather speculative, it might not be executed depending on the system conditions. No cache fill is performed if all the cache lines at the same index in the target way group are locked. If an area outside the cacheable area is specified, the read itself is not carried out.

(6) Cache Index Specification Method

For a cache instruction that uses the index specification method, explicitly specify the cache memory subject to operation in the format shown in **Figure 3.30**, instead of specifying an address. The bit positions of each field depend on the size of the cache memory incorporated in the CPU core. Information about the incorporated cache memory and size can be read from the ICCFG register.



Note: Way: Specify the way within the cache.
Index: Specify the cache index.
Offset: Specify the offset within the cache line.

Note: Always set 0 to the bits other than the WAY, Index and Offset bits.

Figure 3.30 Cache Index Specification Method

NOTE

The Offset field indicates the byte position within the cache line. This setting is not required (i.e., ignored) in normal index specification operations. For a CILD/CIST operation, it is used to specify a position within the cache line because the ICDATH/ICDATL register is shorter than the cache line length.

(7) Execution Privilege of the CACHE/PREF Instruction

Because the CACHE instruction directly manipulates the contents of the cache memory, privileges are specified according to the type of operation. When the CACHE instruction is executed without the privilege required for the CACHE operation, a privilege instruction exception (PIE) occurs.

On the other hand, the PREF instruction provides information for speculative execution, so it can be executed in any mode.

The privileges required by the different operations performed by the CACHE instruction are shown below.

(a) Operations allowed with the user authority

Among address specification method operations, operations without a cache lock (CHBI) can be executed in any operation mode.

(b) Operations requiring the supervisor authority

Among address specification method operations, operations with a cache lock (CFAL) require the supervisor privilege.

In addition, index specification method operations also require the supervisor privilege.

(8) Memory Protection for the CACHE and PREF Instructions

The memory protection judgment for the CACHE and PREF instructions proceeds in accord with the operating mode when the instruction is executed. These instructions are handled as read access. When memory protection is enabled and the MPAT.SR or UR bit is set (to 1), the instruction can be executed according to the operating mode.

The CACHE instructions using the address specification mode are subject to the memory protection provided by the MPU. If a protection violation is detected, the cache operation is not executed and an MDP exception occurs.

On the other hand, since the CACHE instructions using the index specification method specify the position of data in the instruction cache but not the memory address, they are not subject to the memory protection. No matter what value is specified for the index, an MDP exception does not occur.

If a protection violation for a PREF instruction is detected, the prefetching is not performed and an MDP exception does not occur.

For both CACHE and PREF instructions, if operation is undefined for the specified opcode, cache operation and memory access are not performed at all, so they are not subject to the memory protection.

Table 3.116 shows the correspondence between operations and access permissions.

Table 3.116 Relationship between Cache Operations and Permissions

Instruction	Address/Index	Instruction Execution Privilege	Access Permission
CHBII	Address	UM	Read
CIBII	Index	SV	—
CFALI	Address	SV	Read
CISTI	Index	SV	—
CILDI	Index	SV	—
PREF	Address	UM	Read

(9) Example of Using the CACHE Instruction to Manipulate Cache Memory

This section gives an example of cache memory manipulation by the CACHE instruction, with setting up self-modifying code as the intention.

In the following example, an instruction code is generated in memory that is being cached in the instruction cache, and the instruction cache is disabled. Regarding whether memory that supports such cache memory manipulation is present, see **Section 3.9.9, Product Information of Cache Structure**.

```
ST.W r20, 0[r10]          //  Write the target data to memory
SYNCM                     //  Wait for the completion of memory writing
CACHE 0x00, [r10]         //  CHBII: Disable caching of the target area by the instruction cache
SYNCI                     //  Wait for the completion of instruction cache manipulation
JMP [r12]                 //  Brach to the target area and execute the updated instruction code
```

(10) Configuration of Instruction Cache

This section describes the configuration of instruction cache mounted for this CPU. For more information, see **Section 3.9.9, Product Information of Cache Structure**.

This CPU supports an instruction cache in the following configuration.

- Four ways
- 256-bit cache line size (unit of filling)
- 256-Mbyte target area for caching
- ECC protection
- Cache error notification

(a) Four ways

Since the instruction cache mounted for this CPU is configured with four ways, the capacity of each way is one-quarter of the capacity of the whole cache.

The four ways are divided into two way groups; way 0 and way 1 belong to way group A, and way 2 and way 3 belong to way group B. As for the access address, if the parity of the bits to be stored in the tag is 0, way group A is used, whereas way group B is used if the parity is 1.

Table 3.117 shows the addresses to generate parity for each cache capacity.

Table 3.117 Parity generation target address

Cache capacity	Parity generation target address
8 KB	Bit 24 to 11
16 KB	Bit 24 to 12
32 KB	Bit 24 to 13

When storing data in a new cache line, the LRU (least recently used) method determines the destination way for storage from within the given way group.

(b) Cache line size

The cache line size (unit of filling) is the amount of data that is stored in one line of the cache, and is 256 bits in the instruction cache for this CPU.

(c) Allocation of cache data

Data from memory are allocated to the cache memory in the way shown in **Figure 3.31**.

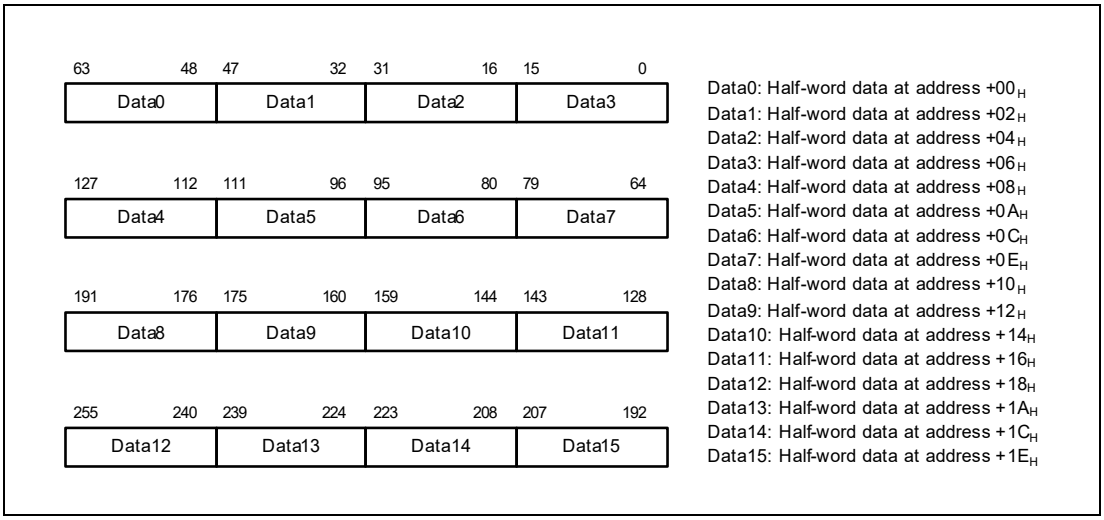


Figure 3.31 Allocation of Data to the Cache

(d) Cacheable area

The cacheable area for the instruction cache of this CPU is the 256 Mbytes from 0000 0000_H to 0FFF $FFFF_H$. Although instructions can be fetched from locations beyond the above area, they are never stored in the instruction cache in that case.

(e) ECC protection

The data RAM and the tag RAM of the instruction cache for this CPU are protected by ECCs. Upon detection of an ECC error in either area of RAM, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

For details on the ECC protection, refer to **Section 44, Functional Safety**.

(f) Cache error notification

The instruction cache for this CPU detects the following five types of errors. A cache error is detected at the time of read operation by the instruction fetching or the CACHE instruction using the address specification method. In addition to the read operation, an address-feedback error is also detected at the time of write operation by cache fill. This CPU provides external notification of these errors. For the operation in cases of these errors occurring, refer to **Section 44, Functional Safety** and **Section 3.9.12, Error Notifications**.

- ECC error of data RAM
- ECC error of tag RAM
- Multi-hit error
- Way error
- Address-feedback error

A multi-hit error is detected when access to an address hits two ways in a way group at the same time. Upon detection of a multi-hit error, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

A way error is detected when the parity in a way group does not match the parity of data stored in the tag RAM. Upon detection of a way error, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

An address-feedback error is detected when the address for access to the RAM does not match the feedback address. When the error is detected at the time of cache reading, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds. When the error is detected at the time of cache writing, the target line is disabled, and the CPU provides external notification of the occurrence of the error.

(11) Data Buffer Function

The four-line buffer with 256 bits per line is mounted as a data buffer. 256-bit data read from the code flash is stored in the data buffer in 256-bit units. When the data buffer hit occurs, the data is read out from the data buffer, so the code flash is not accessed again.

3.2.6 Coprocessor

3.2.6.1 Floating-Point Operation

The floating-point unit (FPU) operates as the CPU coprocessor, and executes floating-point instructions.

Either single-precision (32-bit) or double-precision (64-bit) data can be used. In addition, the conversion between a floating point type and an integer type is possible.

The FPU of this CPU conforms to ANSI/IEEE standard 754-2008 (IEEE Standard for Floating-Point Arithmetic).

(1) Configuration of Floating-Point Operation Function

(a) Not implemented

If the floating-point operation function is not implemented, all the floating-point instructions cannot be used. If an attempt is made to execute such an instruction, a coprocessor unusable exception occurs. In addition, all the floating-point system registers become inaccessible, and if an attempt is made to access any of the registers using LDSR/STSR instruction, a coprocessor unusable exception occurs.

(b) Implementing only single precision

If only the floating-point operation function with single precision is implemented, only floating-point instructions classified as single precision*1 can be used. If an attempt is made to execute a floating-point instruction classified as double precision*2, a coprocessor unusable exception occurs. All the floating-point system registers supply the function described in **Section 3.2.3.4, FPU Function Registers**.

Note 1. The single-precision floating-point instruction is the instruction described as (Single) in the description of each instruction in the *RH850G4MH User's Manual: Software*.

Note 2. The double-precision floating-point instruction is the instruction described as (Double) in the description of each instruction in the *RH850G4MH User's Manual: Software*.

(c) Implementing single precision and double precision

All the floating-point instructions can be used when floating-point instructions of single precision and double precision are implemented. All the floating-point system registers supply the functions described in **Section 3.2.3.4, FPU Function Registers**.

(2) Data Types

(a) Floating-point format

The FPU supports 32-bit (single precision) and 64-bit (double precision) IEEE754 floating-point operations.

The single-precision floating-point format consists of a 24-bit signed fraction (s + f) and an 8-bit exponent (e), as shown in **Figure 3.32**.

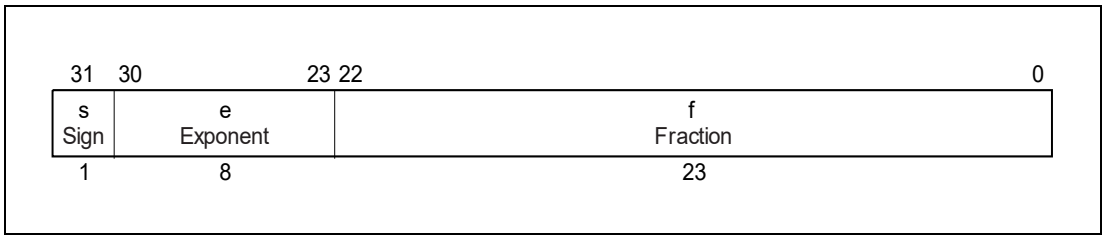

Figure 3.32 Single-Precision Floating-Point Format

The double-precision floating-point format consists of a 53-bit signed fraction (s + f) and an 11-bit exponent (e), as shown in **Figure 3.33**.

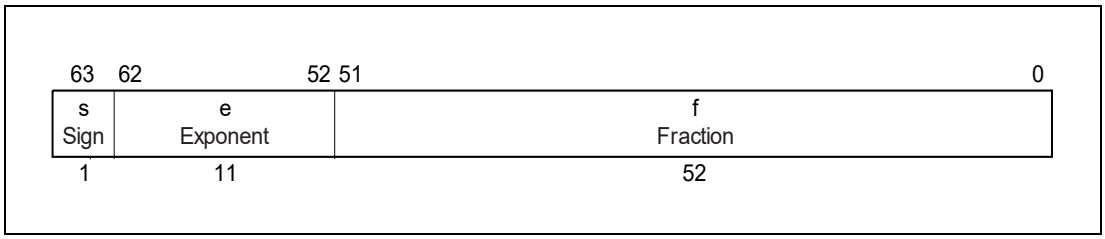

Figure 3.33 Double-precision Floating-Point Format

A numerical value in the floating-point format includes the following three areas.

- Sign bit s
- Exponent: e = E + bias value
- Fraction: $f = .b_1b_2...b_{P-1}$ (value lower than the first decimal place)

The bias value for the single-precision format is 127. For double-precision format, the bias value is 1023.

The range of the exponent value E when unbiased covers all integers from Emin to Emax, along with two reserved values, Emin –1 (±0 or subnormal number), and Emax +1 (±∞ or NaN: not-a-number). A numeric value other than 0 is represented in one format, depending on the single-precision and double-precision formats.

The numeric value (v) represented in this format can be calculated by the expression shown in **Table 3.118**.

Table 3.118 Calculation Expression of Floating-Point Value

Type	Calculation Expression	
NaN (not-a-number)	If E = Emax + 1 and f ≠ 0	then v = NaN regardless of s
±∞ (infinite number)	If E = Emax + 1 and f = 0	then v = $(-1)^s\infty$
Normalized number	If Emin ≤ E ≤ Emax	then v = $(-1)^s2^E$ (1.f)
Subnormal number	If E = Emin – 1 and f ≠ 0	then v = $(-1)^s2^{Emin}$ (0.f)
±0 (zero)	If E = Emin – 1 and f = 0	then v = $(-1)^s0$

- NaN (not-a-number)
  IEEE754 defines a floating-point value called NaN (not-a-number). Because this value is not a numerical value, it does not have any “greater than” or “less than” relationships to other values. If v is NaN in all of the floating-point formats, it might be either SignalingNaN (S-NaN) or QuietNaN (Q-NaN), depending on the value of the most significant bit of “f”. If the most significant bit of “f” is set, v is QuietNaN; if the most significant bit is cleared, it is SignalingNaN.

Table 3.119 shows the value of each parameter defined in floating-point formats.

Table 3.119 Floating-Point Formats and Parameter Values

Parameter	Format	
	Single Precision	Double Precision
Emax	+127	+1023
Emin	–126	–1022
Bias value of exponent	+127	+1023
Length of exponent (number of bits)	8	11
Integer bits	Cannot be seen	Cannot be seen
Length of fraction (number of bits)	23	52
Length of format (number of bits)	32	64

Table 3.120 shows the minimum and maximum values that can be represented in floating-point formats.

Table 3.120 Floating-Point Minimum and Maximum Values

Type	Value
Minimum value of single-precision floating point	1.40129846e – 45
Minimum value of single-precision floating point (normal)	1.17549435e – 38
Maximum value of single-precision floating point	3.40282347e + 38
Minimum value of double-precision floating point	4.9406564584124654e – 324
Minimum value of double-precision floating point (normal)	2.2250738585072014e – 308
Maximum value of double-precision floating point	1.7976931348623157e + 308

(b) Fixed-point formats

The value of a fixed point is held in the format of 2's complement. **Figure 3.34** shows a 32-bit fixed-point format and **Figure 3.35** shows a 64-bit fixed-point format. No signed bits exist in the unsigned fixed-point format, and all bits represent the integer value.

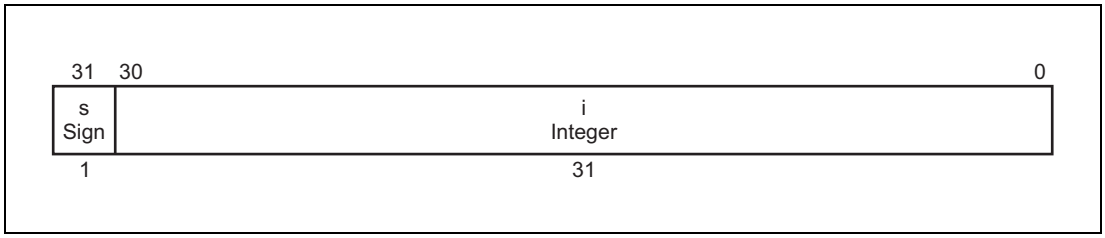

Figure 3.34 32-bit Fixed-Point Format

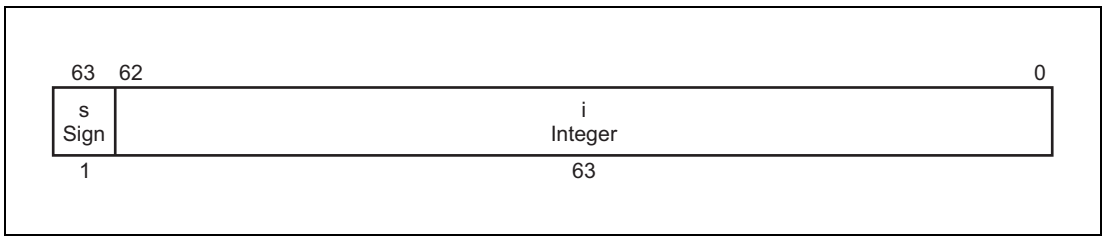

Figure 3.35 64-bit Fixed-Point Format

(c) Expanded floating-point format

This CPU supports the 16-bit (half-precision) IEEE754 floating-point format as a floating-point format for storing data. The half-precision floating-point format is used to decrease the amount of data; it is not supported for arithmetic operations. Instructions are available for converting single-precision floating-point format data into half-precision floating-point data and vice-versa. The half-precision floating-point format consists of an 11-bit signed fraction (s + f) and a 5-bit exponent (e), as shown in **Figure 3.36**.

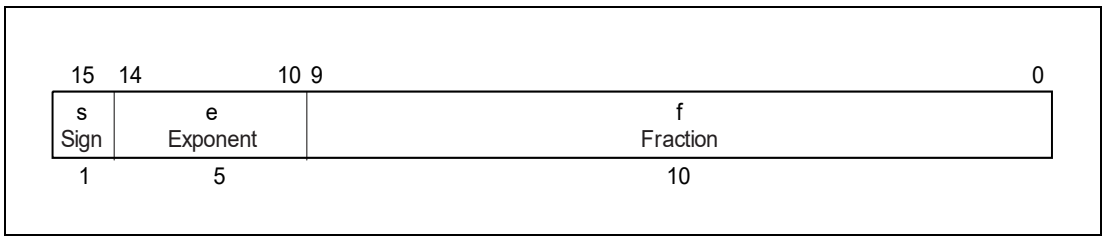

Figure 3.36 Half-Precision Floating-Point Format

Like other floating-point formats, the numeric values represented in this format can be calculated by using the expressions shown in **Table 3.118**. The values of the parameters defined by the half-precision floating-point format are shown in **Table 3.121**.

Table 3.121 Half-Precision Floating-Point Format and Parameter Values

Parameter	Half Precision
Emax	+15
Emin	–14
Bias value of exponent	+15
Length of exponent (number of bits)	5
Integer bits	Cannot be seen
Length of fraction (number of bits)	10
Length of format (number of bits)	16

Table 3.122 shows the minimum and maximum values that can be represented in the half-precision floating-point format.

Table 3.122 Half-Precision Floating-Point Minimum and Maximum Values

Type	Value
Minimum value of half-precision floating point	5.96046e – 8
Maximum value of half-precision floating point (normal)	6.10352e – 5
Maximum value of half-precision floating point	65504

(3) Register Set

For details about the register set, see **Section 3.2.3.4, FPU Function Registers**.

(4) Floating-Point Instructions

Floating-point instructions are divided into single-precision instructions (single) and double-precision instructions (double).

For details about the floating-point instructions, see the *RH850G4MH User's Manual: Software*.

(5) Floating-Point Operation Exceptions

This section describes how the FPU processes floating-point operation exceptions.

(a) Types of exceptions

When floating-point operations or processing of operation results cannot be done using the ordinary method, a floating-point operation exception occurs.

One of the following two operations is performed when a floating-point operation exception has occurred.

- When exceptions are enabled
  The cause bit is set in the floating-point configuration/status register (FPSR), and processing (by software) is passed to the exception handler routine.
- When exceptions are prohibited
  The preservation bit is set in the floating-point configuration/status register (FPSR), an appropriate value (initial value) is stored in the FPU destination register, then execution is continued.

The FPU uses cause bits, enable bits, and preservation bits (status flags) to support the following five types of IEEE754-defined exception causes.

- Inexact operation (I)
- Overflow (O)
- Underflow (U)
- Division by zero (Z)
- Invalid operation (V)

The sixth type of exception cause is unimplemented operation (E), which causes an exception when a floating-point operation cannot be executed. This exception requires processing by software. An unimplemented operation exception (E) occurs when exceptions are always enabled, rather than by using properties, enable bits, or preservation bits.

Figure 3.37 shows the FPSR register bits that are used to support exceptions.

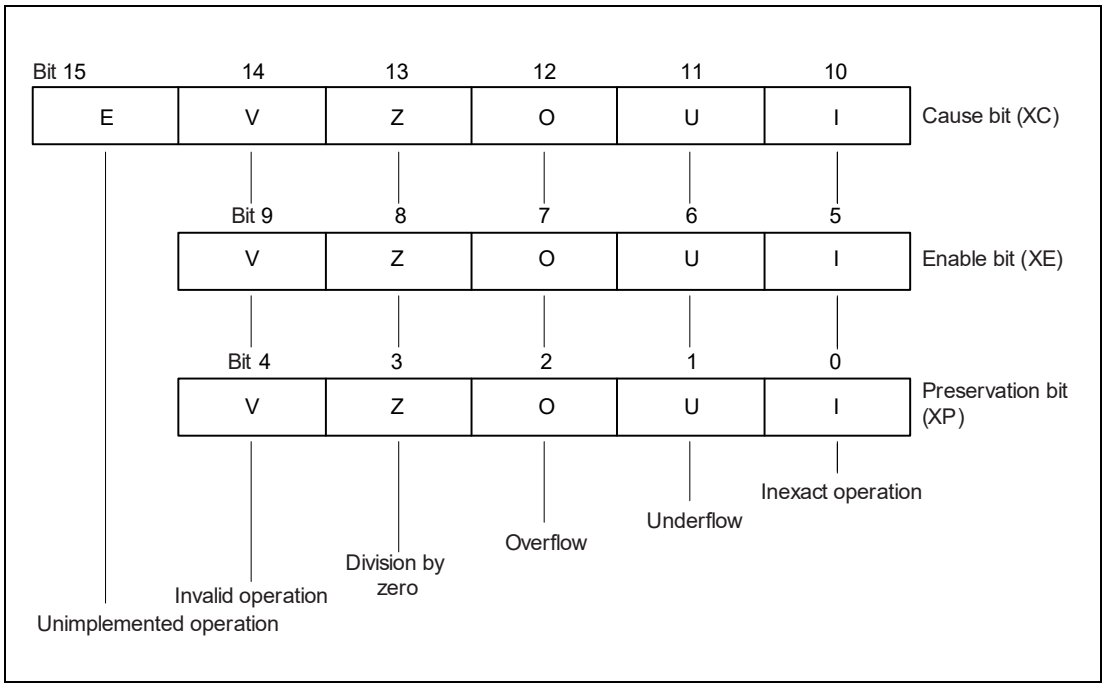

Figure 3.37 Cause, Enable, and Preservation Bits of FPSR Register

The five exceptions (V, Z, O, U, and I) defined by IEEE754 are enabled when the corresponding enable bits are set. When an exception occurs, if the corresponding enable bit has been set, the FPU sets the corresponding cause bit. If the exception can be acknowledged, processing is passed to the exception handler routine. If exceptions are prohibited, the exception corresponding preservation bit is set, and processing is not passed to the exception handler routine.

(b) Exception handling

When a floating-point operation exception occurs, the cause bits of the FPSR register indicate the cause of the floating-point operation exception.

Status flag

A corresponding preservation bit is available for each IEEE754-defined exception. The preservation bit is set when the corresponding exception is prohibited but the exception condition has been detected. The preservation bit is set or reset whenever new values are written to the FPSR register by the LDSR instruction.

If an exception is prohibited by an enable bit, predetermined processing is performed by the FPU. This processing provides an initial value as the result, rather than a floating-point operation result. This initial value is determined according to the type of exception. For an overflow exception or underflow exception, the initial value also differs depending on the current rounding mode. **Table 3.123** shows the initial values provided for each of the FPU IEEE754-defined exceptions.

Table 3.123 FPU Initial Values for IEEE754-Defined Exceptions

Area	Description	Rounding Mode	Initial Value
V	Invalid operation	—	Quiet not-a-number (Q-NaN)
Z	Division by zero	—	Correctly signed ∞
O	Overflow	RN	∞ with sign of intermediate result
		RZ	Maximum normalized number with sign of intermediate result
		RP	Negative overflow: Maximum negative normalized number Positive overflow: +∞
		RM	Positive overflow: Maximum positive normalized number Negative overflow: –∞
U	Underflow*1	RN*2	0 with sign of intermediate result
		RZ	0 with sign of intermediate result
		RP	Positive underflow: Minimum positive normalized number Negative underflow: 0
		RM	Negative underflow: Minimum negative normalized number Positive underflow: 0
I	Inexact operation	—	Rounded result

Note 1. If the FPSR.FS bit is cleared, an unimplemented operation exception (E) will occur if an underflow occurs in the rounded result; an underflow exception (U) will not occur. If the FS bit of the FPSR register is set, the flushed result is used as the initial value.

Note 2. If the rounding mode is RN and the FN bit of the FPSR register is set, flushing will occur in the direction of higher accuracy. For details, see **Section 3.2.6.1 (9), Flush to Nearest.**

(6) Exception Details

The following describes the conditions under which each of the FPU exceptions occurs and the FPU responses.

(a) Inexact exception (I)

In the following cases, the FPU detects an inexact exception.

- When the precision of the rounded result is dropped
- When the rounded result overflows while overflow exceptions are prohibited
- When the rounded result underflows while underflow exceptions are prohibited
- When the operand that is a subnormal number is flushed, neither an invalid operation exception (V) nor a division by zero exception (Z) is detected, and the other operands are not Q-NaN

CAUTION

If the FS bit of the FPSR register is cleared and the operation result underflows, an unimplemented operation exception (E) occurs. In such cases, the underflow exception is not detected, so the inexact exception is not detected either.

If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and an inexact exception occurs.

If exception is not enabled

If no other exception occurs, the rounded result or the result that underflows or overflows is stored in the destination register.

(b) Invalid operation exception (V)

An invalid operation exception occurs when either or both of the operands are invalid.

Arithmetic operation with S-NaN included in operands. The conditional move instruction (CMOV), absolute value (ABS), and arithmetic negation (NEG) are not handled as arithmetic operations, but minimum value (MIN) and maximum value (MAX) are handled as arithmetic operations.

- Multiplication: $\pm 0 \times \pm\infty$ or $\pm\infty \times \pm 0$
- Fused-multiply-add: $(\pm 0 \times \pm\infty) + c$ or $(\pm\infty \times \pm 0) + c$. But only if c is not Q-NaN.
- Addition/subtraction or multiply-add operation*1:
  Addition of infinite values with different signs or subtraction of infinite values with the same sign
- Division: $\pm 0 \div \pm 0$ or $\pm\infty \div \pm\infty$
- Square root: When operand is less than 0
- Conversion to integer when source is outside of integer range.
- Comparison: With condition codes 8 to 15, if the operand is unordered (see the table "Definitions of Condition Code Bits and Their Logical Inversions" in the *RH850G4MH User's Manual: Software*).

Note 1. When the multiplication result is infinite or when adding or subtracting between infinities.

If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and an invalid operation exception occurs.

If exception is not enabled

If no other exception occurs, and the destination is a floating-point format, Q-NaN is stored in the destination register. If the destination has an integer format, see the operation result description of each instruction for the value to be stored in the destination register.

(c) Division by zero exception (Z)

A division by zero exception occurs when a divisor is 0 and a dividend is a finite number other than 0.

If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and a division by zero exception occurs.

If exception is not enabled

If no other exception occurs, a correctly signed infinite number ($\pm\infty$) is stored in the destination register.

(d) Overflow exception (O)

An overflow exception is detected if the exponent range is infinite and if the result of the rounded floating point is greater than maximum finite number in the destination format.

If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an overflow exception occurs.

If exception is not enabled

If no other exception occurs, the initial value that is determined by the rounding mode and the sign of the intermediate result is stored in the destination register (see **Table 3.123, FPU Initial Values for IEEE754-Defined Exceptions**).

(e) Underflow exception (U)

If the operation result is -2^{Emin} to $+2^{Emin}$ (but not zero), an underflow exception is detected.

Although IEEE754 defines several methods for detecting an underflow, the same method should be used to detect underflows, regardless of the processing to be performed.

The following two methods can be used to detect an underflow for binary floating point numbers.

- The result calculated after rounding and using an infinite exponent range is not zero and is within $\pm 2^{Emin}$.
- The result calculated before rounding and using an infinite exponent range and precision is not zero and is within $\pm 2^{Emin}$.

In this CPU, an underflow is detected before rounding. Or the rounded result is one of the following, an inexact result is detected.

- When a given result differs from the result calculated when the exponent range and precision are infinite

In this CPU, the behavior when an inexact result is detected differs as follows depending on whether underflow exceptions are enabled or disabled:

If exception is enabled

When the FS bit of the FPSR register has been set, if underflow exceptions are enabled, an underflow exception (U) occurs. When the FS bit of the FPSR register has been set, if underflow exceptions are not enabled but inexact exceptions are enabled, an inexact exception (I) occurs.

If exception is not enabled

If the FS bit of the FPSR register has been set, the initial value determined according to the rounding mode and intermediate result value is stored in the destination register (see **Table 3.123, FPU Initial Values for IEEE754-Defined Exceptions**).

CAUTION

If the FS bit of the FPSR register has not been set, an unimplemented operation exception (E) occurs regardless of whether or not exceptions are enabled. Because an unimplemented operation exception (E) must occur, an underflow exception (U) does not occur.

(f) Unimplemented operation exception (E)

The E bit is set and an unimplemented operation exception (E) occurs when an abnormal operand or abnormal result that cannot be correctly processed by hardware has been detected. The operand and destination register contents do not change.

If the FS bit of the FPSR register has been set, an unimplemented operation exception (E) will not occur.

If the FS bit of the FPSR register has been cleared, an unimplemented operation exception (E) will occur under the following conditions (except for CMOVF.D, CMOVF.S, CMPF.D, CMPF.S, CVTF.HS, ABSF.D, ABSF.S, MAXF.D, MAXF.S, MINF.D, MINF.S, NEGF.D, and NEGF.S instructions).

- When the operand is a subnormal number
- When the operation result is a subnormal number, or an underflow has occurred

CAUTION

If the FS bit of the FPSR register is set to 1, an unimplemented operation exception (E) will not occur under any circumstances.

(7) Saving and Returning Status

When a floating-point operation exception occurs, the PC and PSW are saved to the EIPC and EIPSW registers respectively, and the exception cause code is saved to the EIIC register.

The exception cause code of the floating-point operation exception is 71_H.

When an EI level exception is acknowledged while processing a floating-point operation exception, an EIPC register override occurs, which prevents the returning to the instruction that caused the floating-point operation exception to occur. When acknowledgment of EI level exceptions is required, the contents of the EIPC, EIPSW, and EIIC registers must be saved, such as to a stack.

When a floating-point instruction is used in a floating-point operation exception handler routine, the FPSR and FPEPC registers will be overridden if another floating-point operation exception occurs. In such cases, the FPSR and FPEPC registers should be saved at the start of the floating-point operation exception handler processing, and should be returned at the end of the handler processing.

The cause bits of the FPSR register hold the results from only one enabled exception. In any case, the previous results are held until the next enabled exception occurs.

(8) Flushing Subnormal Numbers

This CPU can process subnormal numbers—very small numbers that are lower than the minimum normalized number—in one of the following two ways:

- Normalize the operand or operation result and continue executing arithmetic processing
- Generate an unimplemented operation exception (E) and execute exception handling

Executing software-based exception handling will obtain a more accurate result, but the amount of time required to obtain the result will vary depending on the input value. In control systems that require a real-time performance, therefore, this is usually unacceptable. In this case, it is important to obtain the result within a certain amount time rather than focus on accuracy.

(a) Normalize the subnormal numbers and continue executing arithmetic processing

By setting the FS bit of the FPSR register to 1, this CPU can normalize the operand or operation result to a specific value and continue executing arithmetic processing if a subnormal number is input as the operand or obtained as the operation result. At this time, extremely small differences in values might not appear in the operation result.

For the operand and operation result, the values to which subnormal numbers are flushed when the FS bit is set (1) are shown in **Table 3.124** and **Table 3.125** below.

Table 3.124 Rounding Mode and Flush Value of Input Operand

Sign of Subnormal Operand	Rounding Mode and Value to Which Input Operand Is Flushed			
	RN	RZ	RP	RM
+	+0			
–	–0			

Table 3.125 Rounding Mode and Flush Value of Operation Result

Sign of Subnormal Operand Result	Rounding Mode and Value to Which Operation Result Is Flushed			
	RN[*1]	RZ	RP	RM
+	+0	+0	$+2^{Emin}$	+0
–	–0	–0	–0	-2^{Emin}

Note 1. If the rounding mode is RN and the FN bit of the FPSR register is set, flushing will occur in the direction of higher accuracy. For details, see **Section 3.2.6.1 (9), Flush to Nearest**.

Whether an input operand that is a subnormal number has been flushed or not can be checked by referencing the IF bit of the FPSR register. Whether an operation result that is a subnormal number has been flushed or not can be checked by referencing the U bit of the FPSR register.

CAUTIONS

1. **In control systems that require a real-time performance, it is recommended to always set the FS bit of the FPSR register to 1.**
2. **If the FS bit of the FPSR register is set to 1, an unimplemented operation exception (E) will not occur under any circumstances.**
3. **Whether the operation result is a subnormal number is judged by using the value before rounding.**
4. **The IF bit of the FPSR register also accumulates and indicates information about flushing instructions that have caused a floating-point operation exception.**

(b) Generate an unimplemented operation exception (E) and execute exception handling

By clearing the FS bit of the FPSR register to 0, an unimplemented operation exception (E) will occur if a subnormal number is input as the operand or obtained as the operation result. When an unimplemented operation exception occurs, software-based progressive underflow processing is performed in the floating-point operation exception handling routine, enabling a more accurate result to be obtained. In this case, however, a real-time processing performance might not be realized due to the software processing load.

(c) Instructions that can handle subnormal numbers

The following instructions can be executed without causing an unimplemented operation exception (E) even if an operand that is a subnormal number is input while the FS bit of the FPSR register is 0.

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS)

(d) Instructions that are not affected by flushing subnormal numbers

For the following instructions, flushing does not occur even an operand that is a subnormal number is input while the FS bit of the FPSR register is 1.

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS)

(9) Flush to Nearest

This CPU provides flush-to-nearest mode, a feature for flushing to the nearest number with higher accuracy when a flushing operation results subnormal number. Flush-to-nearest mode is enabled when the rounding mode is RN and the FN bit of the FPSR register is set (1). When this mode is used, the FPU determines the value to which to flush the subnormal number based on the number of the operation result and not just the sign. This feature has no effect in rounding modes other than RN or on the result of flushing an input operand.

Table 3.126 Rounding Mode and Value to Which Operation Result is Flushed

Value of Subnormal Operation Result	Rounding Mode and Value to Which Operation Result Is Flushed				
	RN		RZ	RP	RM
	FN = 1	FN = 0			
$+2^{Emin-1} \leq$ Operation result $< +2^{Emin}$	$+2^{Emin}$	+0	+0	$+2^{Emin}$	+0
$+0 <$ Operation result $< +2^{Emin-1}$	+0				
$-2^{Emin-1} <$ Operation result < -0	−0	−0	−0	−0	-2^{Emin}
$-2^{Emin} <$ Operation result $\leq -2^{Emin-1}$	-2^{Emin}				

CAUTION

Whether the operation result is a subnormal number is judged by using the value before rounding.

(10) Limitation on the Floating-Point Operation Result

There is a limitation on the floating-point operation result of this CPU.

(a) Operation instruction result when the input data is NaN (not-a-number)

When the input data is NaN (not-a-number), the operation instruction result will be as shown in **Table 3.127**.

Table 3.127 Operation Result when Input data is NaN

Input Data*3	Single-precision Operation Result	Double-precision Operation Result
SNaN and QNaN mixed	7FFF FFFF$_H$	7FFFFFFF FFFFFFFF$_H$
Only SNaN	7FFF FFFF$_H$	7FFFFFFF FFFFFFFF$_H$
Only QNaN	*1	*1
SNaN and real number	7FFF FFFF$_H$	7FFFFFFF FFFFFFFF$_H$
QNaN and real number	*1, *4	*1, *4
Other than above*2	7FFF FFFF$_H$	7FFFFFFF FFFFFFFF$_H$

Note 1. If the input data contains QNaN, QNaN in the input data is selected as the operation result by the priority of reg2, reg1, and reg3.

Note 2. In this case, input data contains real numbers only, and the operation result is invalid.

Note 3. When the operand of an ABSF.S, ABSF.D, NEGF.S, or NEGF.D instruction is NaN, the result of the operation will be the value obtained by the operation on the sign bit alone.

Note 4. When one of the operands of an MAXF.S, MAXF.D, MINF.S, and MINF.D instruction is QNaN, the result of the operation will be whichever operand is a real number.

(b) Results of conversion instructions when the operand is NaN (not-a-number)

When the operand is NaN (not-a-number), the results of conversion are as shown in **Table 3.128**.

Table 3.128 Results of Conversion when the Operand is NaN (not-a-number)

Input Data	Output Format	Results of Conversion
Half-precision SNaN	Single precision	7FFF FFFF$_H$
Half-precision QNaN	Single precision	The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the output value are 0.
Single-precision SNaN	Word (signed)	8000 0000$_H$
	Word (unsigned)	0000 0000$_H$
	Long (signed)	8000 0000_0000 0000$_H$
	Long (unsigned)	0000 0000_0000 0000$_H$
	Half precision	7FFF$_H$
	Double precision	7FFF FFFF_FFFF FFFF$_H$
Single-precision QNaN	Word (signed)	8000 0000$_H$
	Word (unsigned)	0000 0000$_H$
	Long (signed)	8000 0000_0000 0000$_H$
	Long (unsigned)	0000 0000_0000 0000$_H$
	Half precision	The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the operand are truncated.
	Double precision	The QNaN value with the same sign. Bits 28 to 0 in the fractional part of the output value are 0.
Double-precision SNaN	Word (signed)	8000 0000$_H$
	Word (unsigned)	0000 0000$_H$
	Long (signed)	8000 0000_0000 0000$_H$
	Long (unsigned)	0000 0000_0000 0000$_H$
	Single precision	7FFF FFFF$_H$
Double-precision QNaN	Word (signed)	8000 0000$_H$
	Word (unsigned)	0000 0000$_H$
	Long (signed)	8000 0000_0000 0000$_H$
	Long (unsigned)	0000 0000_0000 0000$_H$
	Single precision	The QNaN value with the same sign. Bits 28 to 0 in the fractional part of the operand are truncated.

(c) When 0 comparison is performed by MAXF and MINF

When both reg1 and reg2 are either +0 or –0, the operation will be as follows.

MINF.S, MINF.D: The value of reg1 is stored in reg3.

MAXF.S, MAXF.D: The value of reg2 is stored in reg3.

(d) In the case of the precision instruction (RECIPF)

The operation results of RECIPF.S and RECIPF.D are the same as the operation results of 1/x by DIVF.S and DIVF.D.

3.2.6.2 Extended Floating-Point Operation

The extended floating-point operation unit (FXU) operates as a coprocessor of the CPU, and executes an extended floating-point operation instruction.

The execution of one extended floating-point operation instruction allows the execution of four single-precision floating-point (vector data) operations. This is an operation generally referred to as an SIMD (Single Instruction Multiple Data) operation.

Also, conversion is possible between a floating-point type and an integer type. In extended floating-point operation by this CPU, the floating-point is handled according to the ANSI/IEEE standard 754-2008 “IEEE Standard for Floating-point Arithmetic”.

The FXU consists of an extended floating-point operation block and vector registers where vector data is stored. There are 32 vector registers and the data width is 128 bits.

An extended floating-point operation instruction is executed by the extended floating-point operation block. The extended floating-point operation block performs 32-bit x 4 vector data operation on 128-bit vector registers. This is an operation method generally referred to as SIMD execution.

(1) Configuration of Extended Floating-Point Operation Function

(a) Not implemented

If the extended floating-point operation function is not implemented, any extended floating-point operation instruction cannot be used, and any attempt to execute an extended floating-point operation instruction will result in a coprocessor unusable exception. Also, any extended floating-point system register cannot be accessed, and any attempt to manipulate an extended floating-point system register by means of the LDSR/STSR instruction will result in a coprocessor unusable exception.

(b) Implemented

If the extended floating-point operation function is implemented, any extended floating-point operation instruction can be used. Also, all vector registers and extended floating-point system registers provide the functions described in **Section 3.2.3.5, FXU Function Registers.**

(2) Data Types

The FXU supports the single-precision floating-point formats specified by IEEE 754. For details of the single-precision floating-point formats, see **Section 3.2.6.1 (2), Data Types**.

The FXU does not support the double-precision floating-point formats.

(3) Register Set

For details of the register set, see **Section 3.2.3.5, FXU Function Registers**.

(4) Extended Floating-Point Operation Instructions

Extended floating-point operation instructions consist of extended floating-point vector operation instructions and extended floating-point vector manipulation instructions. For details of the extended floating-point operation instructions, see the *RH850G4MH User’s Manual: Software*.

(5) Extended Floating-Point Operation Exceptions

This section describes how the FXU handles extended floating-point operation exceptions.

(a) Types of Exceptions

When it becomes impossible to perform floating-point operation or handle operation results on any operation way during the execution of an extended floating-point operation instruction, an extended floating-point operation exception occurs.

One of the following two operations is performed when an extended floating-point operation exception has occurred.

- When exceptions are enabled
  The exception cause of each operation way is set in the FXXC register, and the logical OR of the extended floating-point operation exception that has occurred on each operation way is saved into the cause bits of the extended floating-point configuration/status register FXSR.
  Control (software control) is transferred to the exception handler routine.
- When exceptions are disabled
  The exception cause of each operation way is set in the FXXP register, and the logical OR of the extended floating-point operation exception that has occurred on each operation way is saved into the preservation bits of the extended floating-point configuration/status register FXSR.
  An appropriate value (initial value) is stored in the destination register for an instruction that has caused an exception, and execution is continued.

The FXU uses cause bits, enable bits, and preservation bits (status flags) to support the following five types of IEEE754-defined exception causes.

- Inexact operation (I)
- Overflow (O)
- Underflow (U)
- Division by zero (Z)
- Invalid operation (V)

The sixth type of exception cause is unimplemented operation (E), which causes an exception when an extended floating-point operation cannot be executed. This exception requires processing by software. An unimplemented operation exception (E) occurs when exceptions are always enabled, rather than by using properties, enable bits, or preservation bits.

Figure 3.38 shows the relationship among the enable bits and the cause bits of the FXSR register and the cause bits of the FXXC register; these bits are used to support exceptions. **Figure 3.39** shows the relationship among the enable bits and the preservation bits of the FXSR register and the preservation bits of the FXXP register.

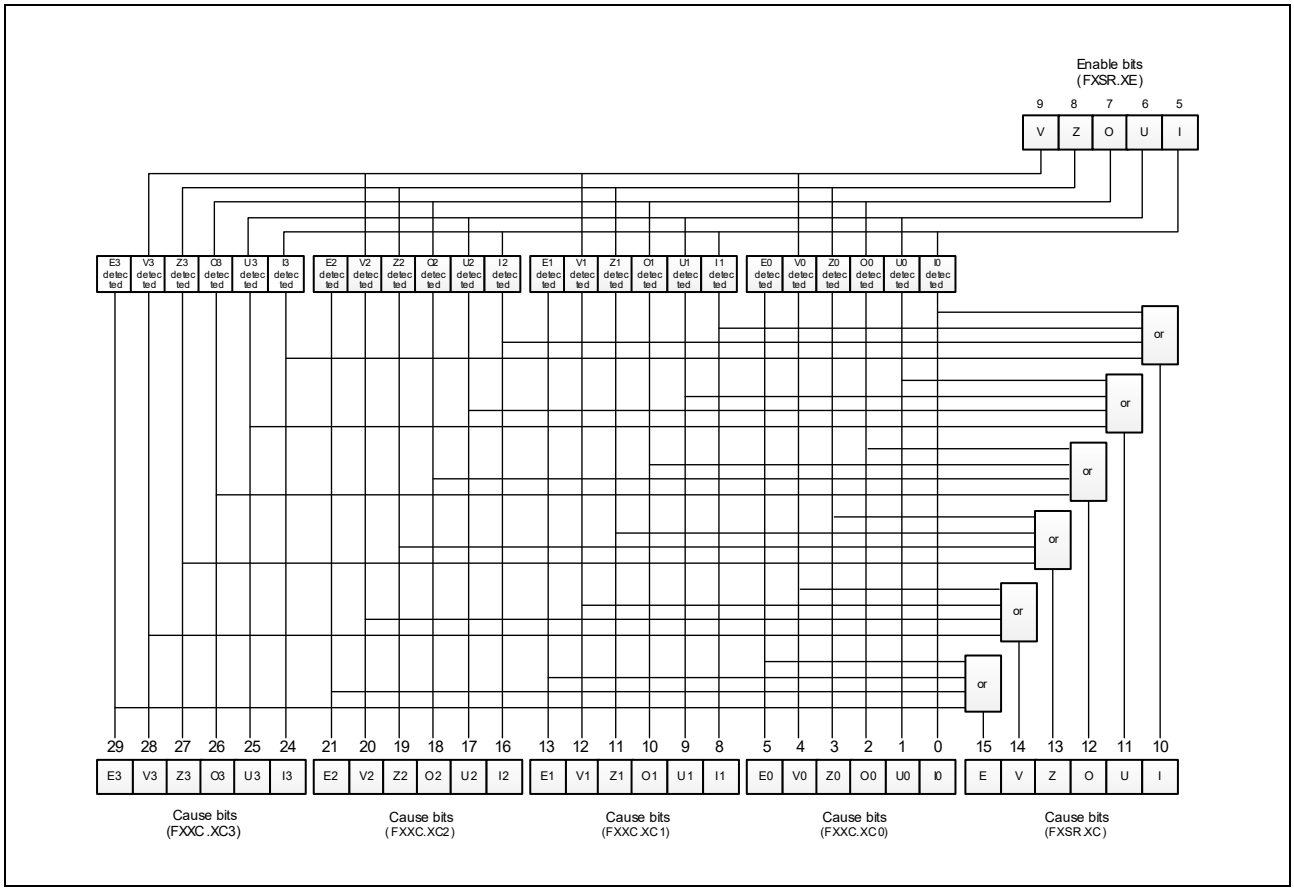

Figure 3.38 Relationship among the Cause and Enable Bits of the FXXC and FXSR Registers

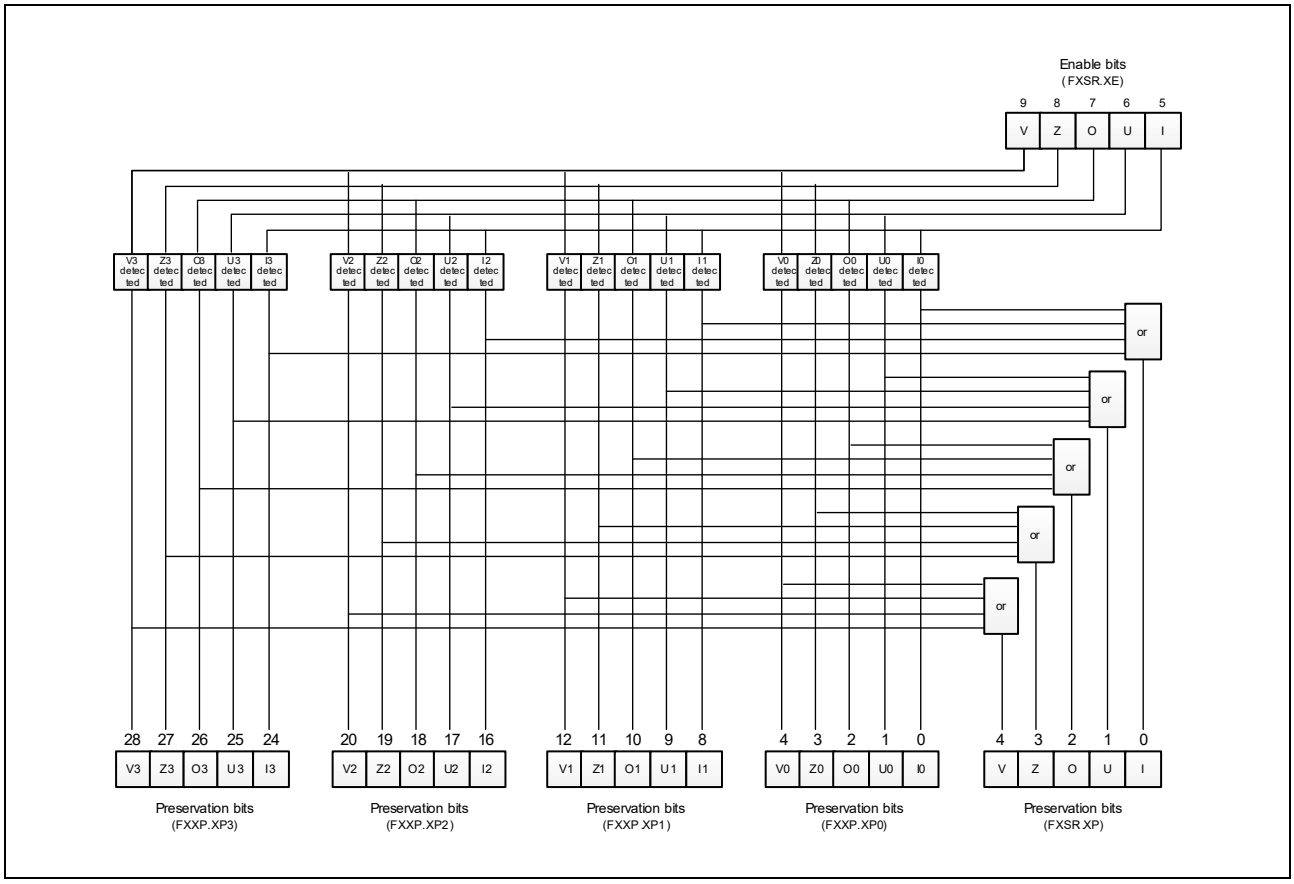

Figure 3.39 Relationship among the Preservation and Enable Bits of the FXXP and FXSR Registers

The five exceptions (V, Z, O, U, and I) defined by IEEE754 are enabled when the corresponding enable bits are set. All operation ways share the enable bits of the FXSR register, but detection of an exception is performed for each operation way. Therefore, different exceptions may be detected on multiple operation ways. In this case, one extended floating-point operation exception occurs.

If an exception has been detected on an operation way with its corresponding enable bit set, the FXU sets the cause bit of the operation way in the FXXC register. Also, it obtains the logical OR of the cause bits of all operation ways and sets the corresponding cause bits in the FXSR register. If the exception can be acknowledged, control is transferred to the exception handler routine.

If exceptions are prohibited, the preservation bit of that operation way in the FXXP register is set. Also, the logical OR of the preservation bits of all operation ways is obtained to set the corresponding preservation bits in the FXSR register. In this case, control is not transferred to the exception handler routine.

(b) Exception handling

When an extended floating-point operation exception occurs, the cause bits of the FXSR register indicate the cause of the extended floating-point operation exception.

Status flag

A corresponding preservation bit is available for each IEEE754-defined exception. The preservation bit is set when the corresponding exception is prohibited and the exception condition has been detected. The preservation bit is set or reset whenever new values are written to the FXSR register by the LDSR instruction.

If an exception is prohibited by an enable bit, predetermined processing is performed by the FXU. This processing provides an initial value as the result, rather than a floating-point operation result. This initial value is determined according to the type of exception. For an overflow exception or underflow exception, the initial value also differs depending on the current rounding mode. **Table 3.129** shows the initial values provided for each of the IEEE754-defined exceptions.

Note that initial values are stored only for operation ways where an exception has been detected. If different exceptions have been detected on multiple operation ways, the initial value corresponding to each exception is stored in the destination of each operation way.

Table 3.129 FXU Initial Values for IEEE754 Defined Exceptions

Area	Description	Rounding Mode	Initial Value
V	Invalid operation	—	Quiet not-a-number (Q-NaN)
Z	Division by zero	—	Correctly signed ∞
O	Overflow	RN	∞ with sign of intermediate result
		RZ	Maximum normalized number with sign of intermediate result
		RP	Negative overflow: Maximum negative normalized number Positive overflow: +∞
		RM	Positive overflow: Maximum positive normalized number Negative overflow: –∞
U	Underflow*1	RN*2	0 with sign of intermediate result
		RZ	0 with sign of intermediate result
		RP	Positive underflow: Minimum positive normalized number Negative underflow: 0
		RM	Negative underflow: Minimum negative normalized number Positive underflow: 0
I	Inexact operation	—	Rounded result

Note 1. If the FXSR.FS bit is cleared, an underflow in the rounded result will cause an unimplemented operation exception (E); therefore, in this case, an underflow exception (U) will not occur. If the FXSR.FS bit is set, the flushed result is used as the initial value.

Note 2. If the rounding mode is RN and FXSR.FN is set, flushing will occur in the direction of higher accuracy. For details, see **Section 3.2.6.1 (9), Flush to Nearest**.

(6) Exception Details

The following describes the conditions under which each extended floating-point operation exception occurs and how the FXU handles it.

(a) Inexact operation exception (I)

If any of the following conditions is detected on any operation way, the FXU detects an inexact operation exception.

- When the precision of the rounded result is dropped
- When the rounded result overflows while overflow exceptions are prohibited
- When the rounded result underflows while underflow exceptions are prohibited
- When the operand that is a subnormal number is flushed, neither an invalid operation exception (V) nor a division by zero exception (Z) is detected, and the other operands are not Q-NaN

CAUTION

If the FXSR.FS bit is cleared and the operation result underflows, an unimplemented operation exception (E) occurs. In such cases, the underflow exception is not detected, so the inexact operation exception is not detected either.

If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an inexact operation exception occurs.

If exception is not enabled

If no other exception occurs, the rounded result or the result that underflows or overflows is stored in the destination register.

(b) Invalid operation exception (V)

If either or both of the operands are invalid on any operation way, an invalid operation exception is detected.

- Arithmetic operation with S-NaN included in operands. The conditional move instruction (CMOV), absolute value (ABS), and arithmetic negation (NEG) are not handled as arithmetic operations, but minimum value (MIN) and maximum value (MAX) are handled as arithmetic operations.
- Multiplication: $\pm 0 \times \pm\infty$ or $\pm\infty \times \pm 0$
- Multiply-add operation: $(\pm 0 \times \pm\infty) + c$ or $(\pm\infty \times \pm 0) + c$. But only if c is not Q-NaN.
- Addition/subtraction or multiply-add operation*1:
  Addition of infinite values with different signs or subtraction of infinite values with the same sign.
- Division: $\pm 0 \div \pm 0$ or $\pm\infty \div \pm\infty$
- Square root: When operand is less than 0.
- Conversion to integer when source is outside of integer range.
- Comparison: With condition codes 8 to 15, if the operand is unordered (see the table "Comparison Condition" for the CMPF.S4 instruction in *the RH850G4MH User's Manual: Software*).

Note 1. When the multiplication result is infinite and when adding or subtracting between infinities.

If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an invalid operation exception occurs.

If exception is not enabled

If no other exception occurs, and the destination is a floating-point format, Q-NaN is stored in the destination register. If the destination has an integer format, see the operation result description of each instruction for the value to be stored in the destination register.

(c) Division by zero exception (Z)

A division by zero exception is detected if, on any operation way, a divisor is 0 and a dividend is a finite number other than 0.

If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and a division by zero exception occurs.

If exception is not enabled

If no other exception occurs, a correctly signed infinite number (±∞) is stored in the destination register.

(d) Overflow exception (O)

An overflow exception is detected if, on any operation way, the exponent range is infinite and if the result of the rounded floating-point is greater than maximum finite number in the destination format.

If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an overflow exception occurs.

If exception is not enabled

If no other exception occurs, the initial value that is determined by the rounding mode and the sign of the intermediate result is stored in the destination register (see **Table 3.129, FXU Initial Values for IEEE754 Defined Exceptions**).

(e) Underflow exception (U)

If, on any operation way, the operation result is -2^{Emin} to $+2^{Emin}$ (but not zero), an underflow exception is detected.

Although IEEE754 defines several methods for detecting an underflow, the same method should be used to detect underflows, regardless of the processing to be performed.

The following two methods can be used to detect an underflow for binary floating-point numbers.

- The result calculated after rounding and using an infinite exponent range is not zero and is within $\pm 2^{Emin}$

- The result calculated before rounding and using an infinite exponent range and precision is not zero and is within $\pm 2^{Emin}$.

In this CPU, an underflow is detected before rounding.

Also, if the rounded result is one of the following, an inexact result is detected.

- When a given result differs from the result calculated when the exponent range and precision are infinite

In this CPU, the behavior when an inexact result is detected differs as follows depending on whether underflow exceptions are enabled or disabled.

If exception is enabled

When the FXSR.FS bit has been set, if underflow exceptions are enabled, an underflow exception (U) occurs. When the FXSR.FS bit has been set, if underflow exceptions are not enabled but inexact operation exceptions are enabled, an inexact operation exception (I) occurs.

If exception is not enabled

If the FXSR.FS bit has been set, the initial value determined according to the rounding mode and intermediate result value is stored in the destination register (see **Table 3.129, FXU Initial Values for IEEE754 Defined Exceptions**).

CAUTION

If the FXSR.FS bit has not been set, an unimplemented operation exception (E) always occurs regardless of whether or not exceptions are enabled. Therefore, an underflow exception (U) does not occur.

(f) Unimplemented operation exception (E)

The E bit is set and an unimplemented operation exception (E) occurs when, on any operation way, an abnormal operand or abnormal result that cannot be correctly processed by hardware has been detected. The operand and destination register contents do not change.

If the FXSR.FS bit has been set, an unimplemented operation exception (E) will not occur.

If the FXSR.FS bit has been cleared, an unimplemented operation exception (E) will occur under the following conditions (except for ABSF. S4, CMOVF. W4, CMPF.S4, CVTF.HS4, MAXF.S4, MAXRF.S4, MINF.S4, MINRF.S4, and NEGF.S4 instructions).

- When the operand is a subnormal number
- When the operation result is a subnormal number, or an underflow has occurred

CAUTION

If the FXSR.FS bit is set to 1, an unimplemented operation exception (E) will not occur under any circumstances.

(7) Saving and Restoring Status

When an extended floating-point operation exception occurs, the PC and PSW are saved to the EIPC and EIPSW registers respectively, and the exception cause code is saved to the EIIC register.

The exception cause code of the extended floating-point operation exception is 75_H.

When an EI level exception is acknowledged while processing an extended floating-point operation exception, an EIPC register override occurs, which prevents the returning to the instruction that caused the extended floating-point operation exception to occur. Therefore, when acknowledgment of EI level exceptions is required, the contents of the EIPC, EIPSW, and EIIC registers must be saved in advance into a stack or the like.

When an extended floating-point operation instruction is used in an extended floating-point operation exception handler routine, the FXSR and FXXC registers will be overridden if another floating-point operation exception occurs. In such cases, the FXSR and FXXC registers should be saved at the start of the extended floating-point operation exception handler processing, and should be restored at the end of the handler processing.

The cause bits of the FXSR register hold the results from only one enabled exception. In any case, the previous results are held until the next enabled exception occurs.

(8) Flushing Subnormal Numbers

This CPU can process subnormal numbers—very small numbers that are lower than the minimum normalized number—in one of the following two ways:

- Normalize the operand or operation result and continue executing arithmetic processing
- Generate an unimplemented operation exception (E) and execute exception handling

Executing software-based exception handling will obtain a more accurate result, but the amount of time required to obtain the result will vary depending on the input value. In control systems that require a real-time performance, therefore, this is usually unacceptable. In this case, it is important to obtain the result within a certain amount of time rather than focus on accuracy.

(a) Normalize the subnormal numbers and continue executing arithmetic processing

By setting the FS bit of the FXSR register to 1, this CPU can normalize the operand or operation result to a specific value and continue executing arithmetic processing even if a subnormal number is input as the operand or obtained as the operation result. At this time, extremely small differences in values might not appear in the operation result.

For the operand and operation result, the values to which subnormal numbers are flushed when the FS bit is set to 1 are shown in **Table 3.130** and **Table 3.131** below.

Table 3.130 Rounding Mode and Flush Value of Input Operand

Sign of Subnormal Operand	Rounding Mode and Value to Which Input Operand is Flushed			
	RN	RZ	RP	RM
+	+0			
–	–0			

Table 3.131 Rounding Mode and Flush Value of Operation Result

Sign of Subnormal Operation Result	Rounding Mode and Value to Which Operation Result is Flushed			
	RN*1	RZ	RP	RM
+	+0	+0	$+2^{Emin}$	+0
–	–0	–0	–0	-2^{Emin}

Note 1. If the rounding mode is RN and FXSR.FN is set, flushing will occur in the direction of higher accuracy. For details, see **Section 3.2.6.1(9), Flush to Nearest.**

Whether an input operand that is a subnormal number has been flushed or not can be checked by referencing the IF bit of the FXSR register. Whether an operation result that is a subnormal number has been flushed or not can be checked by referencing the U bit of the FXSR register.

CAUTIONS

1. **In control systems that require a real-time performance, it is recommended to always set the FS bit of the FXSR register to 1.**
2. **If the FS bit of the FXSR register is set to 1, an unimplemented operation exception will not occur under any circumstances.**
3. **Whether the operation result is a subnormal number is judged by using the value before rounding.**
4. **The IF bit of the FXSR register also accumulates and indicates information about flushing instructions that have caused an extended floating-point operation exception.**

(b) Generate an unimplemented operation exception (E) and execute exception handling

Clearing the FS bit of the FXSR register to 0 will cause an unimplemented operation exception (E) if a subnormal number is input as the operand or obtained as the operation result. When an unimplemented operation exception occurs, software-based progressive underflow processing is performed in the floating-point operation exception handling routine, enabling a more accurate result to be obtained. In this case, however, a real-time processing performance might not be ensured depending on the software processing load.

(c) Instructions that can handle subnormal numbers

The following instructions can be executed without causing an unimplemented operation exception (E) even if an operand that is a subnormal number is input while the FS bit of the FXSR register is 0.

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS4)

(d) Instructions that are not affected by flushing subnormal numbers

For the following instructions, flushing does not occur even if an operand that is a subnormal number is input while the FS bit of the FXSR register is 1.

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS4)

(9) Flush to Nearest

This CPU provides flush-to-nearest mode, a feature for flushing to the nearest number with higher accuracy when a flushing operation results subnormal number. Flush-to-nearest mode is enabled when the rounding mode is RN and FXSR.FN is set to 1. When this mode is used, the FXU determines the value to which to flush the subnormal number based on the number of the operation result and not just the sign. This feature has no effect in rounding modes other than RN or on the result of flushing an input operand.

Table 3.132 Rounding Mode and Value to Which Operation Result is Flushed

Value of Subnormal Operation Result	Rounding Mode and Value to Which Operation Result is Flushed				
	RN		RZ	RP	RM
	FN = 1	FN = 0			
$+2^{Emin-1} \leq$ Operation result $< +2^{Emin}$	$+2^{Emin}$	+0	+0	$+2^{Emin}$	+0
$+0 <$ Operation result $< +2^{Emin-1}$	+0				
$-2^{Emin-1} <$ Operation result < -0	−0	−0	−0	−0	-2^{Emin}
$-2^{Emin} <$ Operation result $\leq -2^{Emin-1}$	-2^{Emin}				

CAUTION

Whether the operation result is a subnormal number is judged by using the value before rounding.

(10) Limitation on the Extended Floating-Point Operation Result

There is a limitation on the extended floating-point operation result of this CPU.

(a) Operation instruction result when the input data is NaN (not-a-number)

When the input data is NaN (not-a-number), the operation instruction result will be as shown in **Table 3.133**.

Table 3.133 Operation Result when Input data is NaN

Input Data*3	Operation Result
SNaN and QNaN mixed	$7FFF\ FFFF_H$
Only SNaN	$7FFF\ FFFF_H$
Only QNaN	*1,*4
SNaN and real number	$7FFF\ FFFF_H$
QNaN and real number	*1,*4
Other than above*2	$7FFF\ FFFF_H$

Note 1. If the input data contains QNaN, QNaN in the input data is selected as the operation result by the priority of wreg2, wreg1, and wreg3.

Note 2. In this case, input data contains real numbers only, and the operation result is invalid.

Note 3. When the operand of an ABSF.S4 or NEGF.S4 instruction is NaN, the result of the operation will be the value obtained by the operation on the sign bit alone.

Note 4. When one of the operands of an MAXF.S4, MAXRF.S4, MINF.S4, and MINRF.S4 instruction is QNaN, the result of the operation will be whichever operand is a real number.

(b) Results of conversion instructions when the input data is NaN (not-a-number)

When the input data is NaN (not-a-number), the results of conversion are as shown in **Table 3.134**.

Table 3.134 Results of Conversion when the Input Data is NaN (not-a-number)

Input Data	Output Format	Results of Conversion
Half-precision SNaN	Single precision	7FFF $FFFF_H$
Half-precision QNaN	Single precision	The QNaN value with the same sign. Bits 12 to 0 in the mantissa part of the output value are 0.
Single-precision SNaN	Word (signed)	8000 0000_H
	Word (unsigned)	0000 0000_H
	Half precision	$7FFF_H$
Single-precision QNaN	Word (signed)	8000 0000_H
	Word (unsigned)	0000 0000_H
	Half precision	The QNaN value with the same sign. Bits 12 to 0 in the mantissa part of the input data are truncated.

(c) When 0 comparison is performed by MAXF and MINF

When wreg1 and wreg2 elements are either +0 or –0, the operation will be as follows.

MINF.S4: The values of each element of wreg1 are stored in each element of wreg3.

MAXF.S4: The values of each element of wreg2 are stored in each element of wreg3.

MINRF.S4: The values of even elements of wreg1 and wreg2 are stored in each element of wreg3.

MAXRF.S4: The values of odd elements of wreg1 and wreg2 are stored in each element of wreg3.

(d) In the case of the precision instruction (RECIPF)

The operation results of RECIPF.S4 are the same as the operation results of 1/x by DIVF.S4.

3.2.7 Hazard Control

This CPU may require hazard management in software in order to accurately refer to the operation result of memory and system registers in subsequent instructions.

- Special instruction for synchronous processing
- Execution completion guarantee of store instruction
- Hazard control after updating system register

3.2.7.1 Synchronization Processing

In order to increase the processing performance, this CPU executes subsequent instructions without waiting for completion of the processing of preceding instructions, as long as there is no dependence relationship between a preceding instruction and a subsequent instruction. For example, when a store instruction is to update the value of a control register of a peripheral device which operates more slowly than the CPU, even when updating of the register is not completed while the bus system is still handling processing to store the value, the execution of a subsequent instruction will proceed. For this reason, if a subsequent instruction should certainly be made to wait for completion of processing of a preceding instruction by software, procedures for synchronization processing are required.

Moreover, when a single CPU is executing multiple load and store instructions, the results of execution are guaranteed to be in the order of the instructions of the program. However, in order to guarantee the order of data accesses among multiple bus masters outside a mutual exclusion control section, synchronization processing should be performed before the subsequent data access. For details of synchronization processing, refer to **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** and **Section 3.9.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation**

This CPU provides four instructions dedicated for synchronization processing. In addition, since a wait for the result of preceding load processing depends on general-purpose registers and handled automatically by hardware, no synchronization processing is required by software.

(1) SYNCP

The SYNCP instruction is a special instruction for pipeline synchronization processing, which makes pipelines wait for the result of executing a preceding instruction is reflected before starting to execute a subsequent instruction. Though the SYNCP instruction causes a wait for the results of executing all preceding load processing (up to storing of the loaded values in general-purpose registers), it does not cause waiting for the results of executing store processing (updating of the destination memory locations for storage and of memory-mapped control registers). For how to be sure that the results of executing store processing are reflected for subsequent instructions, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

(2) SYNCM

The SYNCM instruction is a special instruction for memory-access synchronization processing, and causes a wait for the results of executing all preceding load processing (up to storage of the loaded values in general-purpose registers) and for the results of executing all preceding store processing (updating of the destination memory locations for storage and memory-mapped control registers). However, for those bus systems and peripheral devices for which storage is speculatively completed

(resulting in delays in the completion of writing to the memory and control registers), the SYNCM instruction does not guarantee completion of the execution of store instructions. For how to be sure that the results of executing store processing are reflected for subsequent instructions in such cases, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

(3) SYNCI

The SYNCI instruction is a special instruction for the synchronization of instruction fetching. It causes subsequent instructions that have already been fetched into the pipeline but not executed to be discarded, and restarts instruction fetching from the earliest of the discarded instructions to have been fetched. This instruction is used when the result of a preceding instruction must be reflected in processing by subsequently fetched instructions. Though the SYNCI instruction causes a wait for the results of executing all preceding load processing (up to storing of the loaded values in general-purpose registers), it does not cause waiting for the results of executing store processing (updating of the destination memory locations for storage and of memory-mapped control registers). If a cache instruction has been issued, this instruction also causes a wait for the completion of the instruction cache operation.

The SYNCI instruction should be executed after changes to the CPU operating mode or reflection of changes to the memory protection settings if this will be required in subsequent instruction fetching. For details, see **Section 3.2.7.3 (1), Updating the Settings Related to Instruction Fetching**.

When reflecting the results of executing store instructions in subsequent instruction fetching is required, due to changes to self-modifying code or switching between areas of the code-flash memory, execute a dummy read before the SYNCI instruction. This causes a wait for the results of executing store instructions, resulting in these being reflected in subsequent instruction fetching. For details, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

(4) SYNCE

The SYNCE instruction of this CPU does not perform processing related to synchronization.

(5) Synchronization Processing summary

The effects of the four synchronization processing instructions are summarized in **Table 3.135**.

Table 3.135 Effects of Synchronization Processing Instructions

Synchronization Processing Instruction	Guaranteed Synchronization Processing				
	Instruction Fetching		Instruction Execution		
	Subsequent Instructions	Cache Operations*1	Load Instructions	Store Instructions	Instructions for Other Operations
SYNCP	—	—	Execution completed*3	—	Execution completed
SYNCM	—	—	Execution completed*3	Execution completed*4	Execution completed
SYNCI	Re-fetching*2	Execution completed	Execution completed*3	—	Execution completed
SYNCE	—	—	—	—	—

Note 1. This indicates the execution of cache instructions. The LDSR instruction to update the function registers for cache operations is included among the instructions for other operations.

Note 2. This CPU speculatively fetches instructions, so even if the next instruction from the SYNCI instruction has already been fetched, it is fetched again.

Note 3. This indicates the processing up to the storing of loaded data in general-purpose registers

Note 4. This indicates the processing up to updating of the destination memory locations and memory-mapped control registers for storage. However, updating may not be guaranteed. This depends on the specification of the destination for writing. For details, see **Section 3.2.7.2, Guaranteeing the Completion of Store Instruction**.

3.2.7.2 Guaranteeing the Completion of Store Instruction

Instructions for storage may appear to be completed faster than those for loading given the same address. However, the data for storage may not actually have been stored when the instruction has been completed. For example, in the synchronization of multiple cores or the manipulation of peripheral devices, processing related to the stored values should only proceed after storage in the target locations is confirmed. This should be checked by software after the execution of instructions for storage.

This CPU provides two approaches to waiting for the progress of storage at different stages.

(1) Using the SYNCM Instruction to Wait for the Completion of Storage

Executing the SYNCM instruction causes operations to wait until the results of preceding store instructions will be correctly read by subsequent reading. This guarantees confirmed execution when an instruction stored in the memory is to be executed or data are to be transferred to the other CPU core or by DMA via the memory.

In the following example, after waiting for the execution of the two store instructions that proceed the SYNCM instruction, the processing for which waiting was required proceeds in “Operations” below. Processing to branch to an address where an instruction code is stored, for notification of the other CPU, and so on, falls into the category of “Operations”.

```
ST.W      r21, 0[r1]          //    Store data 1
ST.W      r22, 4[r1]          //    Store data 2
SYNCM                         //    Wait for completion of the store instructions
Operation                     //    Processing after waiting for completion of the store instructions
```

However, the SYNCM instruction does not guarantee that the results of preceding store instructions will have already been reflected at the destinations. For example, when storing a value in a register of a peripheral device, the register of the peripheral device may not have been updated when waiting due to the SYNCM instruction has finished, and the resulting may be operation that is not as desired. In such cases, use dummy reading to cause the wait. This is described in **Section 3.2.7.2 (2), Using Dummy Reading to Wait for the Completion of Storage**.

In addition, since the SYNCM instruction requires hardware operations to wait in response to its execution, it is only effective in access to bus slaves where the CPU can recognize the progress of processing for storage. If a bus slave is capable of arbitrating requests from multiple bus masters, or is connected to the bus via a bus bridge, the CPU is unable to recognize the progress of storage, so using the SYNCM instruction to cause the wait may not be effective.

The bus slaves (address groups) that support using the SYNCM instruction to wait for the completion of storage in this CPU are listed in **Table 3.136**.

Table 3.136 Bus Slaves that Support Using the SYNCM Instruction to Wait for the Completion of Storage in This CPU

Bus Slaves	Description
L1RAM (given CPU)	Waiting for the updating of memory is also possible.*1
L1RAM (other CPU)	A configuration of two CPU cores can be assumed for this device. For configurations with three or more cores, refer to **Section 3.9.1.3, Product information of SYNCM**.
L2RAM	A configuration of two CPU cores with a single shared L2RAM can be assumed for this device. For configurations with three or more cores or having multiple L2RAMs, refer to **Section 3.9.1.3, Product information of SYNCM**.
INTC1	This is the dedicated interrupt controller for connection with the CPU.
Others	Depends on the specifications of the connected bus or slave. For details, refer to **Section 3.9.1.3, Product information of SYNCM**.

Note 1. For details, **Section 3.2.7.2 (2), Using Dummy Reading to Wait for the Completion of Storage**.

The instructions for which the SYNCM instruction causes a wait are all preceding instructions for storing and loading. Multiple instructions for storing and loading running at the same time raises the possibility of the wait being longer than is necessary.

One SYNCM instruction per store instruction is not required. Following consecutive storage in a specific bus slave in units of memory type, peripheral device, and so on, a single SYNCM instruction after the last store instruction leads to a wait for the completion of all preceding store instructions. In the above example, one SYNCM instruction is executed after the execution of two store instructions.

(2) Using Dummy Reading to Wait for the Completion of Storage

Executing a load instruction for the same address immediately after a store instruction can also be used to wait for the completion of a store instruction. This approach is unlike using the SYNCM instruction to cause waiting, since it involves actually waiting for the result of the store instruction to be reflected. On the other hand, this approach may require more cycles than using the SYNCM instruction.

Specifying r0 as the destination for storage of the value loaded by the dummy read enables discarding of the loaded values when they are unnecessary, without destroying the other register values. The following is an example of code for this.

```
ST.W       r21, 0[r1]          //    Store data 1
ST.W       r22, 4[r1]          //    Store data 2
LD.W       4[r1], r0           //    Load data from the target for access (dummy read).
SYNCP                          //    Wait for loading to be completed.
Operation                      //    Processing after waiting for completion of the store instructions
```

Unlike using the SYNCM instruction, this approach combines functions of the CPUs to cause the wait. Since it does not require dedicated hardware, it may be used with many bus slaves.

On the other hand, if a cache for temporarily storing data is present in the bus system along the path to the destination, a value to be stored will be read by a subsequent load instruction even if it has not yet reached its destination, so this method cannot guarantee the completion of store instructions in such cases. Also, depending on the specifications of peripheral devices, a predetermined time after a change to a setting by a store instruction may have to elapse before the desired value can be read. In addition to this approach, such cases require processing to wait for the predetermined time.

Though this CPU does not include such cache functions or peripheral functions with limits on the time to elapse before reading, the situation depends on the product. For details, refer to **Section 3.9.1.4, Product information of Waiting for the Completion of Storage**.

As with using the SYNCM instruction, in using dummy reading, following consecutive storage in a particular bus slave, only a single load instruction following the final store instruction is effective in waiting for the execution of all preceding store instructions to be complete.

Table 3.137 lists the bus slaves for which using dummy reading to wait is effective.

Table 3.137 Bus Slaves for which Using Dummy Reading to Wait is Effective

Bus Slaves	Description
L1RAM (other CPU)	
L2RAM	
INTC1	
Others	Depends on the specifications of the connected bus or slave. For details, refer to **Section 3.9.1.4, Product information of Waiting for the Completion of Storage**.

In the case of access to the L1RAM of a given CPU, for the sake of the efficiency of processing, execution of the load instruction may be completed before the memory is actually updated. On the other hand, it is possible to execute a SYNCM instruction to cause the wait for completion of the updating of memory. Therefore, use the SYNCM instruction to cause the wait for the completion of instructions for storage in the L1RAM of a given CPU.

When reflecting the results of executing store instructions in subsequent instruction fetching is required, due to changes to self-modifying code or switching between areas of the code-flash memory, execute a SYNCI instruction rather than a SYNCP instruction after the dummy read. This causes a wait for the results of executing store instructions, resulting in these being reflected in subsequent instruction fetching. The following shows an example of code for this.

```
ST.W        r21, 0[r1]              //    A change relating to instruction fetching
LD.W        0[r1], r0               //    Load data from the target for access (dummy read).
SYNCI                               //    Synchronization of the wait for the execution of loading and instruction
                                            fetching
Operation                           //    Processing after the change to instruction fetching operations
```

3.2.7.3 Hazard Management after System Register Update

If an LDSR instruction is executed to update the setting of a system register before an STSR instruction is executed to read the system register or before a CALLT instruction or the like, which uses the system register, is executed, then the new setting must be reflected in order to perform the desired operation.

This CPU guarantees that if an LDSR instruction is used to update system registers shown in **Table 3.138**, the new register setting will be applied when the subsequent instruction is executed. However, it does not guarantee that the new setting will be applied in instruction fetching. In this case, synchronization process is required. Also, the execution of an EI or DI instruction is treated in the same way as the update of PSW by an LDSR instruction; that is, it is guaranteed that the values updated by an EI or DI instruction is applied to the subsequent instruction.

Table 3.138 System Registers that Guarantee Reflection of their Updates by LDSR Instruction to the Subsequent Instruction

selID*1	System Register*2							
0	EIPC	EIPSW	FEPC	FEPSW	PSW	FPSR	FPEPC	FPST
	FPCC	FPCFG	EIIC	FEIC	CTPC	CTPSW	CTBP	SNZCFG
	EIWR	FEWR						
1	SPID	SPIDLIST	RBASE	EBASE	INTBP*3	MCTL	PID	SVLOCK
	SCCFG	SCBP						
2	PEID	BMID	MEA	MEI	ISPR*3	ICSR	INTCFG*3	PLMR*3
	RBCR0*4	RBCR1*4	RBNR*4	RBIP*4	IMSR			
5	MPM	MPCFG	MCA	MCS	MCC	MCR	MCI	MPIDX*5
10	FXSR*6	FXST*6	FXINFO*6	FXCFG*6	FXXC*6	FXXP*6		
12	LSCFG							
13	RDBCR	L1RCFG						

Note 1. In the representation of LDSR and STSR instructions, selection ID are represented as selID.

Note 2. This table includes a register whose value cannot be updated and a register that has a bit whose value cannot be updated.

Note 3. If these registers, which control the acceptance of interrupts, are updated, interrupts will be accepted with the new register settings if interrupt requests are present at the time of executing the subsequent instruction.

Note 4. If these registers, which control the register bank function, are updated, interrupts will be accepted with the new register settings if interrupt requests are present at the time of executing the subsequent instruction. However, when the RESBANK instruction is executed after updating the RBCR0.MD, a synchronization process is required.

Note 5. If an LDSR instruction is executed to update the MPLA, MPUA, or MPAT register immediately after another LDSR instruction is executed to update the MPIDX register, it is guaranteed that the new setting of MPIDX is reflected in the subsequent instructions. In order to read the MPLA, MPUA, or MPAT register by using a STSR instruction after the update of the MPIDX register, a synchronization process is required.

Note 6. FXU system register is not supported in RH850/U2A.

If the settings related to instruction fetch or a system register that is not shown in **Table 3.138** is updated, the new register setting can be reflected by performing any of the following synchronization processes immediately after the LDSR instruction. The appropriate synchronization process should be decided according to details of the new register setting and the subsequent operation.

For SYNCI or SYNCP instruction, that are used for synchronization process, see **Section 3.2.7.1, Synchronization Processing**.

(1) Updating the Settings Related to Instruction Fetching

To effectively supply instruction codes read from the memory to the instruction execution unit, operations of instruction fetching are independent from those of the instruction execution unit and are speculative. This means that the progress of reading the subsequent instruction code by instruction fetching is not known on completion of the system register update. In other words, the result from which instruction fetching is applied to the new setting of the system register is not known. Therefore, an explicit synchronization process is required for updates of the system registers which are related to instruction fetching. This process is also necessary for updates of the system registers listed in **Table 3.138** in order to ensure that the updates are reflected in instruction fetching.

The system registers related to instruction fetching are listed below:

CPU operating mode:	PSW.UM, PSW.CU1, PSW.CU0
Access protection:	SPID
Memory protection:	MPU function registers
Instruction cache:	Cache operation function registers
Instruction fetch:	Instruction fetch control registers

If the settings of the system registers listed above are updated, by executing the SYNCI, EIRET, or FERET instruction, the new settings are surely reflected when the subsequent instruction is fetched. Here, these instructions are called “Instruction fetch synchronization instructions”. For usage of the EIRET and FERET instructions, see **Section 3.2.7.3 (7), Use of EIRET and FERET Instructions in Synchronization Process**.

For fetching the instruction fetch synchronization instructions themselves, whether the updates of the system registers are reflected or not cannot be decided. In these cases, the following cares must be taken.

(a) Updating PSW.UM

When an LDSR instruction is used to update PSW, especially by setting PSW.UM (to 1), which in response enables memory protection function, be sure that fetching of the SYNCI instruction, which is used for synchronizing the instruction fetch, does not cause a memory protection violation. Also note that setting PSW.UM disables execution of some instructions and updating of some system registers.

On the other hand, when an EIRET or FERET instruction is executed, the value in EIPSW or FEPSW is transferred to PSW as the operation of the instruction. This means that fetching of the instruction takes place before updating of PSW.UM by the instruction itself. For these reasons, updating of PSW.UM by an EIRET or FERET instruction is recommended.

(b) Updating PSW.CU1 and PSW.CU0

After PSW.CU1 or PSW.CU0 is updated, if a FXU or FPU instruction is executed without synchronization process, a coprocessor unusable exception (UCPOP) may not be properly detected. To avoid this, execute a SYNCI instruction for synchronization after updating these bits. Unlike updating of PSW.UM, updating of PSW.CU1 or PSW.CU0 and detection of a coprocessor unusable exception can be surely synchronized by a SYNCI instruction.

For updating PSW.CU1 or PSW.CU0 and PSW.UM at the same time, use of an EIRET or FERET instruction described in **Section 3.2.7.3(1)(a), Updating PSW.UM** is recommended.

(c) Updating SPID

SPID is referenced by memory protection function and the bus system outside the CPU. If an ID without access permission to the memory resources or peripheral devices is set to SPID, instruction fetching does not take place correctly. Be sure to set an appropriate ID to SPID. To ensure that the bus system references any updates on SPID, it might be the case that the instruction cache need to be disabled once. For details, see **Section 44, Functional Safety**.

(d) Updating MPU Function Registers

Updating the settings of memory protection by manipulating the MPU function registers is detailed in **Section 3.2.7.3 (2), Updating the Memory Protection Settings of MPU**.

For reflecting the updated settings in fetching of the subsequent instruction, execute either of the SYNCI, EIRET, and FERET instructions. Note, however, that whether the instruction fetch synchronization instruction itself is fetched with the new protection settings or not is not known. In this case, the following operations are required.

i) Enable memory protection in user mode only and update the settings in supervisor mode.

ii) Update the settings of memory protection in the area where execution of instructions are allowed.

iii) Surely set execution of instructions for the memory area including those for instruction fetch synchronization instruction to be enabled

For updating PSW.UM with operation i) above, use of an EIRET or FERET instruction described in **Section 3.2.7.3(1)(a), Updating PSW.UM** is recommended.

(e) Updating Cache Operation Function Registers

Updating these registers by an instruction does not require certain synchronization process. However, if you want to make sure that the disabled state of the instruction cache is reflected in fetching of the subsequent instruction, execute an instruction fetch synchronization instruction after the update of the cache operation function registers.

(f) Updating Instruction Fetch Control Registers

Updating these registers by an instruction does not require certain synchronization process.

(2) Updating the Memory Protection Settings of MPU

The system registers of MPU that are shown in **Table 3.138** guarantee that their latest settings are reflected in the subsequent instruction, but this does not apply to other system registers (MPIDX, MPLA, MPUA, MPAT, and MPIDn (n = 0 to 7) that configure the settings of protection areas.

In order to read settings updated by an LDSR instruction by using the subsequent STSR instruction, the synchronization process described in **Section 3.2.7.3 (4), Updating Register Bank Function-Related System Registers** is required.

For reflecting the updated memory protection settings in the instruction fetch, see **Section 3.2.7.3 (1), Updating the Settings Related to Instruction Fetching**.

For reflecting the updated memory protection setting in the instruction that makes operand accesses, execute a SYNCI or SYNCP instruction after the update. This ensures that the new protection setting is reflected in the operand accesses by the subsequent instructions.

The EIRET and FERET instructions can be used instead of the SYNCI and SYNCP instructions. Especially, for the case of updating memory protection settings related to instruction fetch as well as making operand accesses, use of an EIRET or FERET instruction is recommended.

(3) Updating Interrupt-Related System Registers

As shown in **Table 3.138**, when the system registers related to interrupts (ISPR, INTCFG, PLMR) are updated, it is guaranteed that the updates are reflected when the subsequent instruction is executed.

However, when updating the setting of INTCFG to stop automatic update of ISPR, for example, if an interrupt is generated after INTCFG is updated and before an LDSR instruction that updates ISPR is executed, only the update in INTCFG is reflected in the interrupt handling. As the update of ISPR is not reflected, the desired interrupt handling cannot be performed.

To avoid this, when updating the system registers related to interrupts, it is recommended to disable interrupts by setting PSW.ID to 1.

We also recommend that updating of PSW.EBV and EBASE, which specify vector address of an interrupt handler, are executed while interrupts are disabled. For details, see **Section 3.2.7.3 (8), Updating PSW.EBV and EBASE**.

(4) Updating Register Bank Function-Related System Registers

As shown in **Table 3.138**, when the system registers related to the register bank function (RBCR0, RBCR1, RBNR, RBIP) are updated, it is guaranteed that the updates are reflected when the subsequent instruction is executed. For example, if an interrupt is generated after an LDSR instruction that updates RBIP is executed, the automatic context saving to the register bank is executed using the updated value of RBIP.

However, when updating the settings of RBCR0 and RBCR1, for example, if an interrupt is generated after RBCR0 is updated and before an LDSR instruction that updates RBCR1 is executed, only the update in RBCR0 is reflected in the automatic context saving to the register bank. As the update of RBCR1 is not reflected, the desired processing cannot be performed.

To avoid this, when updating the system registers related to the register bank function, it is recommended to disable interrupts by setting PSW.ID to 1.

For RBCR0 only, synchronization process by the SYNCI instruction is necessary to surely reflect the new setting of the register to the subsequent RESBANK instruction. The following shows an example of code for this.

```
DI                              //  Disable interrupt
LDSR       r20, 15, 2           //  Update RBCR0
SYNCI                           //  Synchronization of instruction fetching
RESBANK                         //  Execute RESBANK using updated RBCR0
```

(5) Reading a System Register by Using an STSR Instruction

After executing an LDSR instruction to update a system register, execute a SYNCP instruction before executing an STSR instruction for read operation. Since the SYNCP instruction waits until the execution of the preceding LDSR instruction is completed, it is ensured that the new register setting is read.

For the system registers shown in **Table 3.138**, the new register settings are read without synchronization process by SYNCP instruction.

(6) Referencing a System Register by the Subsequent Instruction

After executing an LDSR instruction to update a system register, execute a SYNCP instruction before executing an instruction to refer to the system register. Since the SYNCP instruction waits until the execution of the preceding LDSR instruction is completed, it is ensured that the new register setting is reflected.

(7) Use of EIRET and FERET Instructions in Synchronization Process

The EIRET and FERET instructions are defined as return instructions from the exception handler of their corresponding exception levels. These instructions can set any PC and PSW at the same time and therefore usable as instructions for synchronization process in this CPU.

To use an EIRET instruction for synchronization process, set appropriate values to EIPC and EIPSW and execute the instruction. To use an FERET instruction for synchronization process, set appropriate values to FEPC and FEPSW and execute the instruction.

Set values to EIPC and FEPC that is the PCs after these instructions are executed. Set values to EIPSW and FEPSW that is the PSW after these instructions are executed.

Note that these instructions are supervisor privileged instructions. That means, the state of PSW.UM can be changed only from 0 (clear) to 1 (set), supervisor mode to user mode.

For details on the EIRET and FERET instructions, see the *RH850G4MH User's Manual: Software*.

(8) Updating PSW.EBV and EBASE

EBASE is a register that indicates the vector address of the exception handler. This is enabled when PSW.EBV is set (to 1). The recommended updating procedure is as follows.

1. Set PSW.ID to 1
2. Clear PSW.EBV to 0 (updating at the same time with PSW.ID is possible)
3. Update EBASE
4. Set PSW.EBV to 1
5. Clear PSW.ID to 0 (updating at the same time with PSW.EBV is possible)

For updating PSW.UM in the procedure above as well, use of an EIRET or FERET instruction described in **Section 3.2.7.3(1)(a), Updating PSW.UM** is recommended.

3.2.8 Reset

3.2.8.1 Status of Registers After Reset

If a reset signal is input by a method defined by the hardware specifications, the program registers and system registers are placed in the status shown by the value after reset of each register in **Section 3.2.3, Register Set**, and program execution is started. Set the contents of each register to an appropriate value in the program.

The CPU executes a reset to start execution of a program from the reset address specified by **Section 3.2.4.4, Exception Handler Address**.

Note that because the PSW.ID bit is set to 1 immediately after a reset, conditional EI level exceptions will not be acknowledged. To acknowledge conditional EI level exceptions, clear the PSW.ID bit to 0.

3.2.9 Ensuring Coherency after Code Flash Programming

The CPU has an efficient instruction cache and data buffer for the code flash area.

Therefore, after using self-programming to program the code flash memory, clear the instruction cache and data buffer to ensure coherency. The instruction cache and data buffer can be cleared by using the ICCTRL register and the RDBCR register, respectively. The entire CPU's instruction cache and data buffer can also be cleared at the same time by using the TM_CC register. For details on the ICCTRL and RDBCR register, see **Section 3.2.3.7, Cache Operation Function Registers** and **Section 3.2.3.9, Hardware Function Registers**. For details on the TM_CC register, see **Section 3.2.9.1, Registers**.

3.2.9.1 Registers

(1) Register Base Address

The GCFU base address is listed in the following table. The GCFU register addresses are given as offsets from the base addresses.

Table 3.139 Register Base Address

Base Address Name	Base Address	Bus Group
<GCFU_base>	FFFB 1400_H	P-Bus Group 0

(2) Clock Supply

Clock supply by and to GCFU is listed in the following table.

Table 3.140 Clock Supply

Unit Name	Unit Clock Name	Clock Supply Name
GCFU	PCLK	CLK_HBUS

(3) List of Registers

Table 3.141 List of Registers

Module Name	Register Name	Symbol	Address	Access
GCFU	Cache Clear Operation Register	TM_CC	<GCFU_base> + 08_H	32

(4) TM_CC — Cache Clear Operation Register

The TM_CC register is used to issue requests for clearing of the unit (instruction cache or data buffer) that holds data from the code flash.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	ICCMK	DCCMK	—	ICCLR	DCCLR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W

Table 3.142 TM_CC Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	ICCMK	Instruction Cache Clear Mask Writing 1 to this bit masks cache clear requests upon updating of the memory mapping enable register GCFU.TM_ME and CFU.TM_ME. Cache clear requests by writing 1 to the GCFU.TM_CC.ICCLR bit are not masked. 0: Do not mask cache clear requests 1: Mask cache clear requests
3	DCCMK	Data Cache (Buffer) Clear Mask Writing 1 to this bit masks cache clear requests upon updating of the memory mapping enable register GCFU.TM_ME and CFU.TM_ME. Cache clear requests by writing 1 to the GCFU.TM_CC.DCCLR bit are not masked. 0: Do not mask cache clear requests 1: Mask cache clear requests
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ICCLR	Instruction Cache Clear Request Writing 1 to this bit issues an instruction cache clear request. Writing 0 is ignored. The read value is 1 when this bit is read before completion of the cache clear request, and 0 when it is read after completion of the cache clear request. **Note:** If 1 has been written to this bit and then 1 is written again before completion of the cache clear request, the second write is ignored. (The cache clear request is not executed by the second write.) If 1 has been written to this bit and then 0 is written before completion of the cache clear request, the cache clear request is not canceled. To execute cache clear requests continuously, be sure to check that execution of the preceding cache clear request has been completed (by reading this bit and checking that the readout value is 0) before executing the next cache clear request. 0: Indicates that a cache clear request is not currently being processed, or processing of a cache clear request has been completed (when read). 1: Issues a cache clear request (when written). Indicates that a cache clear request is currently being processed (when read).

Table 3.142 TM_CC Register Contents (2/2)

Bit Position	Bit Name	Function
0	DCCLR	Data Buffer Clear Request Writing 1 to this bit issues a data buffer clear request. Writing 0 is ignored. The read value is 1 when this bit is read before completion of the data buffer clear request, and 0 when it is read after completion of the data buffer clear request. **Note:** If 1 has been written to this bit and then 1 is written again before completion of the data buffer clear request, the second write is ignored. (The data buffer clear request is not executed by the second write.) If 1 has been written to this bit and then 0 is written before completion of the data buffer clear request, the data buffer clear request is not canceled. To execute data buffer clear requests continuously, be sure to check that execution of the preceding data buffer clear request has been completed (by reading this bit and checking that the readout value is 0) before executing the next data buffer clear request. 0: Indicates that a data buffer clear request is not currently being processed, or processing of a data buffer clear request has been completed (when read). 1: Issues a data buffer clear request (when written). Indicates that a data buffer clear request is currently being processed (when read).

3.3 Inter-CPU Overview

This subsection contains a Barrier-Synchronization (BARR), Inter-Processor Interrupt (IPIR) and Time Protection Timer (TPTM). The first part of this subsection describes this product's specific properties, such as the number of units, register base addresses, etc. The remainder of the subsection shows the functions and registers.

3.3.1 Features

3.3.1.1 Number of Units

Table 3.143 Number of Units

Product Name		RH850/U2A-EVA	RH850/U2A16	RH850/U2A8	RH850/U2A6
BARR	Number of units	1	1	1	1
	Name of unit	BARR			
IPIR	Number of units	1	1	1	1
	Number of channels for each CPU	4	4	4	4
	Name of unit	IPIR			
TPTM	Number of units	1	1	1	1
	Number of channels for each CPU	2 interval timers 1 free-run timer 2 Up timers	2 interval timers 1 free-run timer 2 Up timers	2 interval timers 1 free-run timer 2 Up timers	2 interval timers 1 free-run timer 2 Up timers
	Name of unit	TPTM			

3.3.1.2 Register Base Address

The base address of BARR, IPIR and TPTM are listed in the following table. BARR, IPIR and TPTM register addresses are given as offsets from these base addresses.

Table 3.144 Register Base Addresses

Base Address Name	Base Address	Bus Group
<BARR_base>	FFFB 8000$_H$	I-Bus Group1
<IPIR_base>	FFFB 9000$_H$	I-Bus Group0
<TPTM_base>	FFFB B000$_H$	I-Bus Group2

3.3.1.3 Clock Supplies

The clock supplies are listed in the following table .

Table 3.145 Clock Supplies

Unit Name	Unit Clock Name	Supply Clock Name
BARR	cpu_clk	CLK_CPU
IPIR	cpu_clk	CLK_CPU
TPTM	cpu_clk	CLK_CPU

3.3.1.4 Interrupt Requests

The interrupt requests are listed in the following table.

Table 3.146 Interrupt Requests (1/2)

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
INTIPIR0	ipir_int_ch0	IPIR CH0 interrupt	EIINT0	—	—
INTIPIR1	ipir_int_ch1	IPIR CH1 interrupt	EIINT1	—	—
INTIPIR2	ipir_int_ch2	IPIR CH2 interrupt	EIINT2	—	—
INTIPIR3	ipir_int_ch3	IPIR CH3 interrupt	EIINT3	—	—
FEINT or INTTPTM*1	TPTM_IRQ	TPTM interval interrupt	FEINT or EIINT31*1	—	—
INTTPTMU00	INTTPTMU00	TPTM up timer interrupt for PE0 with comparison value 0	EIINT209	—	Group3-26
INTTPTMU01	INTTPTMU01	TPTM up timer interrupt for PE0 with comparison value 1	EIINT210	—	Group3-27
INTTPTMU02	INTTPTMU02	TPTM up timer interrupt for PE0 with comparison value 2	EIINT211	—	—
INTTPTMU03	INTTPTMU03	TPTM up timer interrupt for PE0 with comparison value 3	EIINT212	—	—
INTTPTMU10	INTTPTMU10	TPTM up timer interrupt for PE1 with comparison value 0	EIINT213	—	Group3-28
INTTPTMU11	INTTPTMU11	TPTM up timer interrupt for PE1 with comparison value 1	EIINT214	—	Group3-29
INTTPTMU12	INTTPTMU12	TPTM up timer interrupt for PE1 with comparison value 2	EIINT215	—	—
INTTPTMU13	INTTPTMU13	TPTM up timer interrupt for PE1 with comparison value 3	EIINT216	—	—
INTTPTMU20	INTTPTMU20	TPTM up timer interrupt for PE2 with comparison value 0	EIINT217	—	Group3-30
INTTPTMU21	INTTPTMU21	TPTM up timer interrupt for PE2 with comparison value 1	EIINT218	—	Group3-31

Table 3.146 Interrupt Requests (2/2)

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
INTTPTMU22	INTTPTMU22	TPTM up timer interrupt for PE2 with comparison value 2	EIINT219	—	—
INTTPTMU23	INTTPTMU23	TPTM up timer interrupt for PE2 with comparison value 3	EIINT220	—	—
INTTPTMU30	INTTPTMU30	TPTM up timer interrupt for PE3 with comparison value 0	EIINT221	—	Group3-32
INTTPTMU31	INTTPTMU31	TPTM up timer interrupt for PE3 with comparison value 1	EIINT222	—	Group3-33
INTTPTMU32	INTTPTMU32	TPTM up timer interrupt for PE3 with comparison value 2	EIINT223	—	—
INTTPTMU33	INTTPTMU33	TPTM up timer interrupt for PE3 with comparison value 3	EIINT224	—	—

Note 1. This interrupt can be selected for use as FEINT or EIINT31. See **Section 6.3.15, TPTMSEL — TPTM Interrupt FE EI Select Register**.

3.3.1.5 Reset Sources

The reset sources are shown below. These modules are initialized by the following reset sources.

Table 3.147 Reset Sources

Unit Name	Register Name	Reset Condition					
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset
BARR	All registers	√	√	√	√	—	—
IPIR	All registers	√	√	√	√	—	—
TPTM	All registers	√	√	√	√	—	—

3.3.1.6 External Input/Output Signals

This module has no external input/output signals.

3.3.2 Processor Element Identifier

The PEID, the ID number of a processor element, can be read from the PEID register. Which CPU core performs a specific program can be known by referring to the PEID. The following shows the PEIDs of this product.

For the PEID register, see **3.2.3.2, Basic System Registers**.

CPU Core	PEID
CPU0 (PE0)	000_B
CPU1 (PE1)	001_B
CPU2 (PE2)	010_B
CPU3 (PE3)	011_B

3.4 Inter-Processor Interrupt

3.4.1 Inter-Processor Interrupt Overview

Inter Processor Interrupt Register (IPIR) is a function that controls fast interrupt requests between PEs. Use of IPIR achieves faster processing of inter-PE interrupts than setting a request flag for the INTC2 interrupt channel by using software.

IPIR has the following features.

- Support of inter-PE interrupt function of 4 channels
- Level detection of interrupts. Edge detection is not supported.
- Accessible from all clusters and all PEs
- Identification of interrupt request source PE is possible.
- Unintended inter-PE interrupts can be prevented by masking interrupt requests.
- SET1, CLR1, and NOT1 can be executed as atomic operation instructions to IPIR.
- Support of address EDC function
- Support of data ECC function
- Support of guard function to prevent unauthorized access.
  - Read-modify-write operations using the LD instruction and the ST instruction are also possible, but not as atomic operations.

3.4.2 Inter-Processor Interrupts Registers

3.4.2.1 List of Registers

Table 3.148 List of Registers

Module Name	Register Name	Register Symbol	Address	Access Size	Access Protection	
					IBG	Other
IPIR	IPIRn*2 Inter-PE interrupt enable self-register*1	IPInENS	<IPIR_base> + 000_H + 020_H × n	8	IPIGPROT0_Rn	—
	IPIRn Inter-PE interrupt flag self-register*1	IPInFLGS	<IPIR_base> + 004_H + 020_H × n	8	IPIGPROT0_Rn	—
	IPIRn Inter-PE interrupt clear self-register*1	IPInFCLRS	<IPIR_base> + 008_H + 020_H × n	8	IPIGPROT0_Rn	—
	IPIRn Inter-PE interrupt request self-register*1	IPInREQS	<IPIR_base> + 010_H + 020_H × n	8	IPIGPROT0_Tn	—
	IPIRn Inter-PE interrupt request clear self-register*1	IPInRCLRS	<IPIR_base> + 014_H + 020_H × n	8	IPIGPROT0_Tn	—
	IPIRn Inter-PE interrupt enable register m*3	IPInENm	<IPIR_base> + 800_H + 020_H × n + 100_H × m	8	IPIGPROT0_4	—
	IPIRn Inter-PE interrupt flag register m*3	IPInFLGm	<IPIR_base> + 804_H + 020_H × n + 100_H × m	8	IPIGPROT0_4	—
	IPIRn Inter-PE interrupt clear register m*3	IPInFCLRm	<IPIR_base> + 808_H + 020_H × n + 100_H × m	8	IPIGPROT0_4	—
	IPIRn Inter-PE interrupt request register m*3	IPInREQm	<IPIR_base> + 810_H + 020_H × n + 100_H × m	8	IPIGPROT0_4	—
	IPIRn Inter-PE interrupt request clear register m*3	IPInRCLRm	<IPIR_base> + 814_H + 020_H × n + 100_H × m	8	IPIGPROT0_4	—

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses the IPI0REQS register, PE1 can also access the IPI0REQ1 register.

Note 2. n = 0 to 3. n is the channel number of IPIR.

Note 3. m = 0 to 3. m is the PEID.

3.4.2.2 Self Region

The self region contains the following five types of registers.

- IPInENS —IPIRn Inter-PE interrupt enable self-register
- IPInFLGS —IPIRn Inter-PE interrupt flag self-register
- IPInFCLRS —IPIRn Inter-PE interrupt clear self-register
- IPInREQS — IPIRn Inter-PE interrupt request self-register
- IPInRCLRS —IPIRn Inter-PE interrupt request clear self-register

The self-registers are virtual registers that do not physically exist. Access from each PE to self-registers is routed to the actual register corresponding to the access source PE. **Table 3.149** lists the access source PEs and routing destination registers. For the functions of each register bit, refer to the specifications of the routing destination register. When masters except PEx access the self registers, the register returns 0, write access is ignored and error response will be notified.

It is basically assumed that the IPIR registers are accessed from PEs via self region when PEs use the IPIR function. This allows PEs to use the same code because it is not necessary to specify different register addresses for each PE.

It is also possible to directly access registers by specifying the address of the actual register without using the self-registers. In this case, the purpose is assumed to be to check the status of registers for another PE, or to reference the individual registers by a debugging tool.

Table 3.149 Self Region Register Routing List

Self Register	Access Source PE			
	PE0	PE1	PE2	PE3
IPInENS	IPInEN0	IPInEN1	IPInEN2	IPInEN3
IPInFLGS	IPInFLG0	IPInFLG1	IPInFLG2	IPInFLG3
IPInFCLRS	IPInFCLR0	IPInFCLR1	IPInFCLR2	IPInFCLR3
IPInREQS	IPInREQ0	IPInREQ1	IPInREQ2	IPInREQ3
IPInRCLRS	IPInRCLR0	IPInRCLR1	IPInRCLR2	IPInRCLR3

3.4.2.3 IPInENm — IPIRn Inter-PE Interrupt Enable Register m

This register sets the transmitting PE allowed to issue inter-PE interrupt requests to PEm.

This register is used to enable inter-PE interrupt requests of PE (PEx) by the receiving PE (PEm) itself.

Access: This register can be read or written in 8-bit units.

Address: <IPIR_base> + 800_H + 020_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	EN[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.150 IPInENm Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	EN[3:0]	Inter-PE Interrupt Enable. Write 1 to the x-th bit to enable the issuance of inter-PE interrupt requests from PEx to PEm. Write 0 to the x-th bit to disable the issuance of inter-PE interrupt requests from PEx to PEm. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.4.2.4 IPInFLGm — IPIRn Inter-PE Interrupt Flag Register

This register indicates the transmitting PE that issued an inter-PE interrupt request to PEm.

This register is used to distinguish the requesting PE by PEm when PEm has received an inter-PE interrupt request.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <IPIR_base> + 804_H + 020_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FLG[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 3.151 IPInFLGm Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3 to 0	FLG[3:0]	Inter-PE Interrupt Request Flag. This register indicates the status of Inter-PE Interrupt request from other PEs. The x-th bit is automatically updated according to the IPInREQx[m] change while the value of the IPInENm[x] bit is 1. The x-th bit is not set if IPInENm[x] is 0, even if IPInREQx[m] is set. The x-th bit is also cleared when the IPInFCLRm[x] bit is set. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.4.2.5 IPInFCLRm — IPIRn Inter-PE Interrupt Clear Register m

This register clears inter-PE interrupt requests to PEm.

This register is used to clear the request flag (IPInFLGm) and the request (IPInREQx) after receiving the Inter-PE interrupt request from another PE.

Access: This register is write-only register that can be written in 8-bit units.

Address: <IPIR_base> + 808_H + 020_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FCLR[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 3.152 IPInFCLRm Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	FCLR[3:0]	Inter-PE Interrupt Request Flag Clear IPInFLGm[x] and IPInREQx[m] can be cleared by writing 1 to this bit. Writing 0 is ignored. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.4.2.6 IPInREQm — IPIRn Inter-PE Interrupt Request Register m

This register controls Inter-PE interrupt request from PEm to other PEs.

Access: This register can be read or written in 8-bit units.

Address: <IPIR_base> + 810_H + 020_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	REQ[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.153 IPInREQm Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	REQ[3:0]	When 1 is written to the x-th bit while the value of the IPInENx[m] bit is 1: The value of the x-th bit becomes 1. The high level is output to the inter-PE interrupt request for PEx, and IPInFLGx[m] is automatically set to 1. When 1 is written to the x-th bit while the value of the IPInENx[m] bit is 0: The value of the x-th bit becomes 1. There are no other operations. When 0 is written to the x-th bit: Writing 0 is ignored. When read: The register value is read out. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.4.2.7 IPInRCLRm — IPIRn Inter-PE Interrupt Request Clear Register m

This register clears inter-PE interrupt requests for other PEs by PEm.

This register is assumed to be used to clear inter-PE interrupt requests by the transmitting PE.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <IPIR_base> + 814_H + 020_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	RCLR[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	W	W	W	W

Table 3.154 IPInRCLRm Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When writing, write the value after reset.
3 to 0	RCLR[3:0]	Inter-PE Interrupt Request Clear Writing 1 to the x-th bit clears the IPInREQm[x] bit. If the value of the IPInENx[m] bit is 1, the IPInFLGx[m] bit is also cleared at the same time. The transmitting PE allowed to issue inter-PE interrupt requests by the IPInENm register can also cancel an inter-PE interrupt request by using this bit, but the receiving PE may in some cases accept the inter-PE interrupt request while the cancellation processing takes place. Writing 0 is ignored. This bit always returns 0 when read. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.4.3 Inter-Processor Interrupt Function

3.4.3.1 Initial Setting

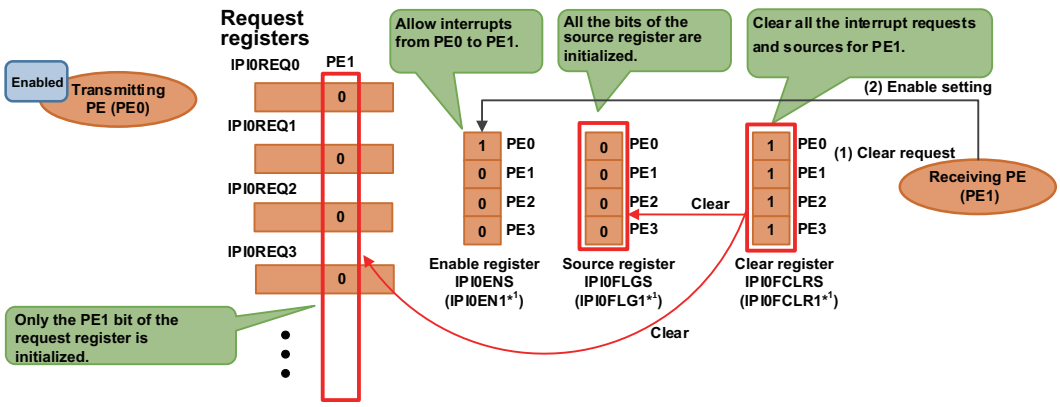
Initial setting of authorized PEs by the IPInENm register must be made before IPIR is used. An example of initial setting is given below.

(1) Initial Setting by Receiving PE

Figure 3.40 shows an example of the initial setting of IPIR channel 0 by PE1, which is a receiving PE.

First, if IPIR has already been used and the values of bits IPI0REQ0 to 3[1] and the value of the IPI0FLG1 register have changed from the initial values, PE1 writes $0F_H$ to the IPI0FCLRS (= IPI0FCLR1) register to clear bits IPI0REQ0 to 3[1] and the IPI0FLG1 register. If the values of bits IPI0REQ0 to 3[1] and the IPI0FLG1 register are the initial values, for example after hardware reset, this clearing operation is not required.

Next, PE1 writes 01_H to the IPI0ENS (= IPI0EN1) register to accept interrupt requests from PE0 to PE1. Like for the clear register, upon completion of setting of the enable register, PE1 can accept interrupt requests from PE0.



Note 1. Register actually accessed from PE1.

Figure 3.40 Example of Initial Setting of IPIR Channel 0 by Receiving PE (PE1)

(2) Initial Setting by Control PE

An example of initial setting from a PE other than a receiving PE is shown below. In this section, the PE that performs the initial setting is called the control PE for the sake of convenience. **Figure 3.41** shows an example of the initial setting of IPIR channel 0 by PE3, which is the control PE. In this figure, bits PE0 to 3 of each register are omitted.

First, if IPIR has already been used and the values of bits IPI0REQ0 to 3[1] and the value of the IPI0FLG1 register have changed from the initial values, PE3 writes $0F_H$ to the IPI0FCLR1 register to clear bits IPI0REQ0 to 3[1] and the IPI0FLG1 register. If the values of bits IPI0REQ0 to 3[1] and the IPI0FLG1 register are the initial values, for example after hardware reset, this clearing operation is not required.

Next, PE3 writes 01_H to the IPI0EN1 register to accept interrupt requests from PE0 to PE1. Like for the clear register, upon completion of setting of the enable register, PE1 can accept interrupt requests from PE0.

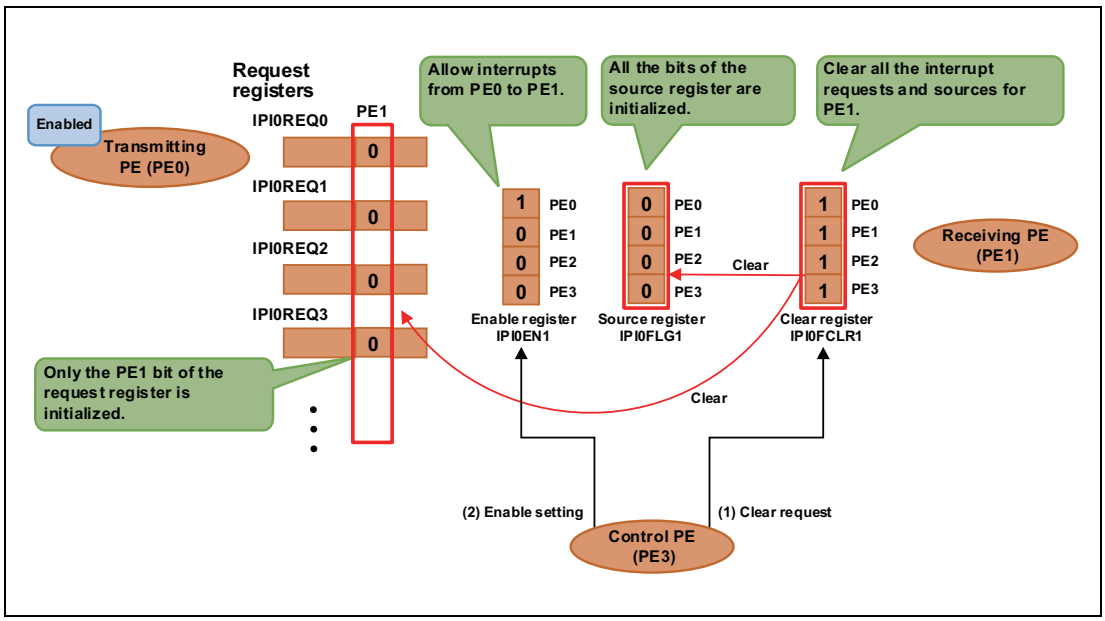


Figure 3.41 Example of Initial Configuration of IPIR Channel 0 by Control PE (PE3)

3.4.3.2 Inter-PE Interrupt Request

Figure 3.42 shows an example of the operation when PE0 sends an inter-PE interrupt request to PE1 using IPIR channel 0. In this figure, bits PE0 to 3 of each register are omitted. In this example, the initial setting is set to IPI0EN1 in advance to enable inter-PE interrupt requests from PE0. For an operation example of the initial setting, see **Section 3.4.3.1, Initial Setting**. The following describes an example of accessing the registers through the self-register.

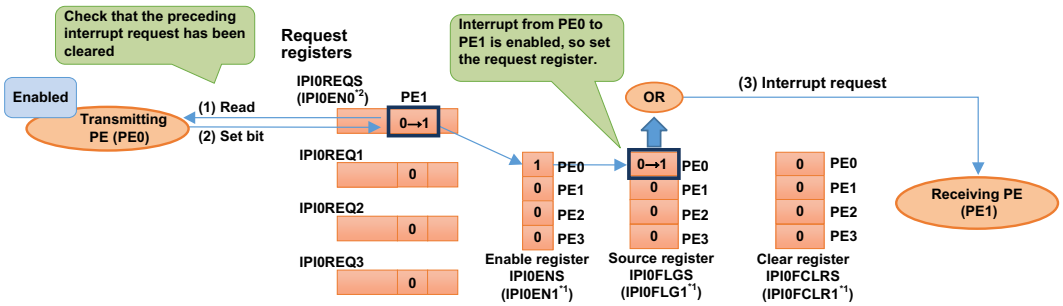
First, PE0, which is the transmitting PE, reads the IPI0REQS (= IPI0REQ0) register and checks that the value of the IPI0REQS[1] (= IPI0REQ0[1]) bit is 0_B. If the value of the IPI0REQS[1] (= IPI0REQ0[1]) bit is 1_B, this means that the previous inter-PE interrupt request from PE0 to PE1 has not been accepted by PE1, and thus a new inter-PE interrupt request cannot be issued. If it is confirmed that the value of the IPI0REQS[1] (= IPI0REQ0[1]) bit is 0_B and thus an inter-PE interrupt request from PE0 to PE1 is enabled, PE0 sets the IPI0REQS[1] (= IPI0REQ0[1]) bit to 1_B to issue an inter-PE interrupt request from PE1. Because inter-PE interrupts from PE0 to PE1 are enabled by the IPI0EN1 register, when PE0 sets the IPI0REQS[1] (= IPI0REQ0[1]) bit to 1_B, the IPI0FLG1[1] bit is automatically set to 1_B, and an inter-PE interrupt request signal is output to PE1 from IPIR.

Figure 3.43 shows an example of the operation when PE1 receives an inter-PE interrupt request from PE0 using IPIR channel 0. When PE1, which is the receiving PE, receives an inter-PE interrupt request signal, it reads the IPI0FLGS (= IPI0FLG1) register, and because the value of the IPI0FLGS[0] (= IPI0FLG1[0]) bit is 1B, it recognizes that the inter-PE interrupt request has been sent from PE0. But if the request side clears the request, the value of it is 0B. After verifying the source of the inter-PE interrupt, PE1 sets the IPI0FCLRS[0] (= IPI0FCLR1[0]) bit to 1B, and the processing transitions to the inter-PE interrupt processing. The IPI0REQS[1] (= IPI0REQ0[1]) bit and the IPI0FLGS (= IPI0FLG1) bit are automatically cleared when the IPI0FCLRS[0] (= IPI0FCLR1[0]) bit is set to 1B by PE1.

Figure 3.44 shows the operation flow from initial setting of IPIR by the receiving PE (PE1), to sending of an inter-PE interrupt request by the transmitting PE (PE0), and completion of reception of that inter-PE interrupt request by the receiving PE (PE1).

Note that if a new inter-PE interrupt request is generated to the same receiving PE before the source register is cleared by the receiving PE with the clear register, the bit corresponding to the new transmitting PE in the source register will be set to 1B, but the inter-PE interrupt request signal being retained high, the second and subsequent inter-PE interrupt requests will not be output. Therefore, the processing when multiple sources occur when the receiving PE has received an inter-PE interrupt request must be controlled by software.

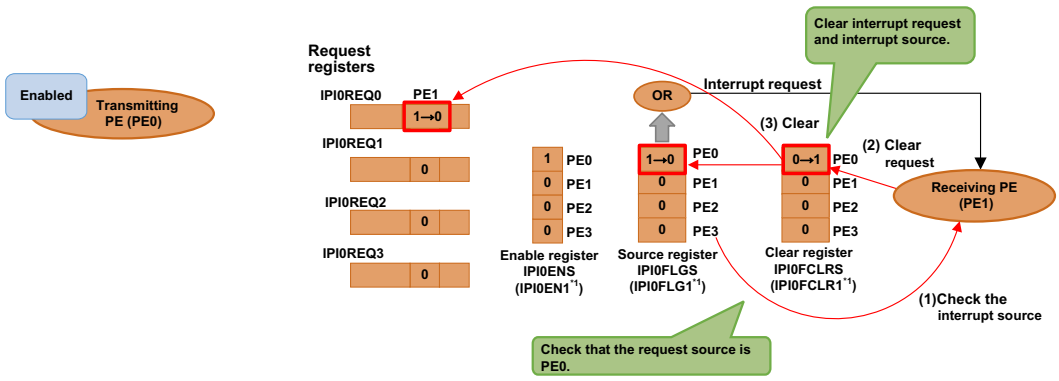
The transmitting PE can detect whether the preceding inter-PE interrupt request was successfully received by the receiving PE, by checking the value of the request register. To monitor the request register with a polling loop, it is recommended to curb the bus load by executing the snooze instruction within the polling loop in order to avoid the bus system occupation for extended periods of time.



Note 1. Register actually accessed from PE1.

Note 2. Register actually accessed from PE0.

Figure 3.42 Example of Inter-PE Interrupt Transmission Operation



Note 1. Register actually accessed from PE1.

(1) Sample Code

(a) Transmission Processing

Figure 3.45 shows a sample flowchart of the inter-PE interrupt request transmission processing using IPIR channel 0.

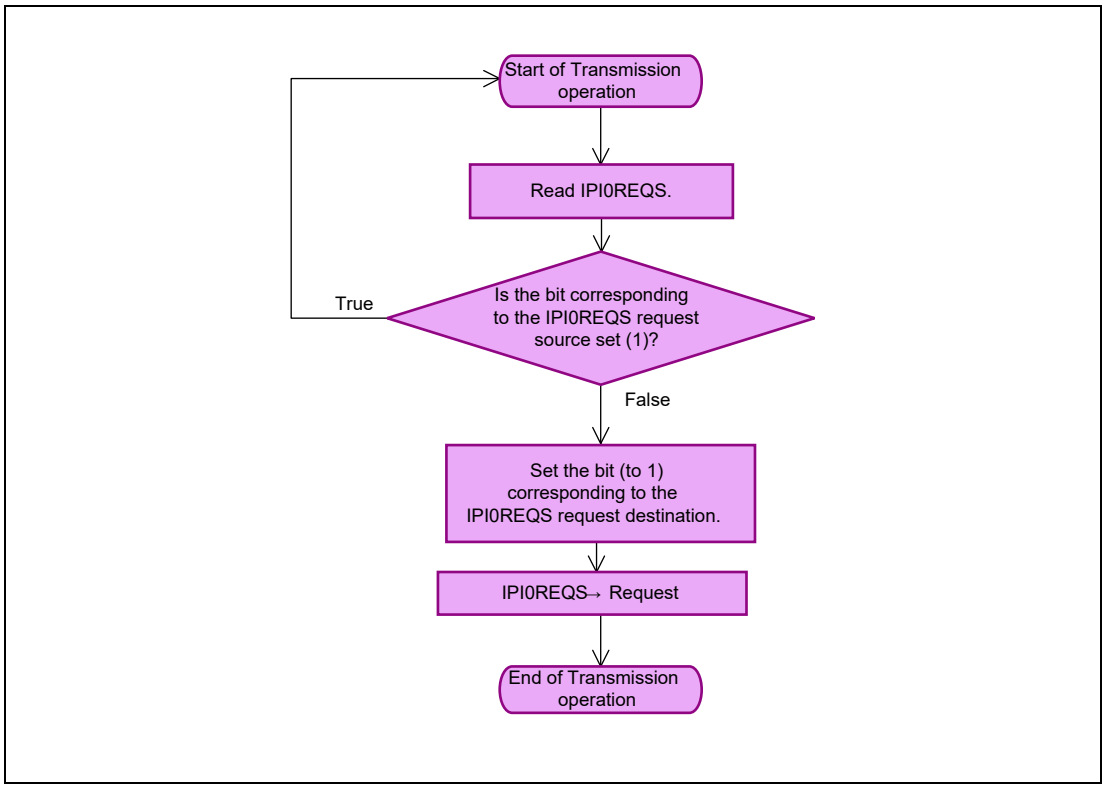

Figure 3.45 Flowchart of Inter-PE Interrupt Request Transmission Processing

(b) Reception Processing

Figure 3.46 shows a sample flowchart of the inter-PE interrupt request reception processing using IPIR channel 0. To prevent source flag loss, the source flag & source clear register configuration is used.

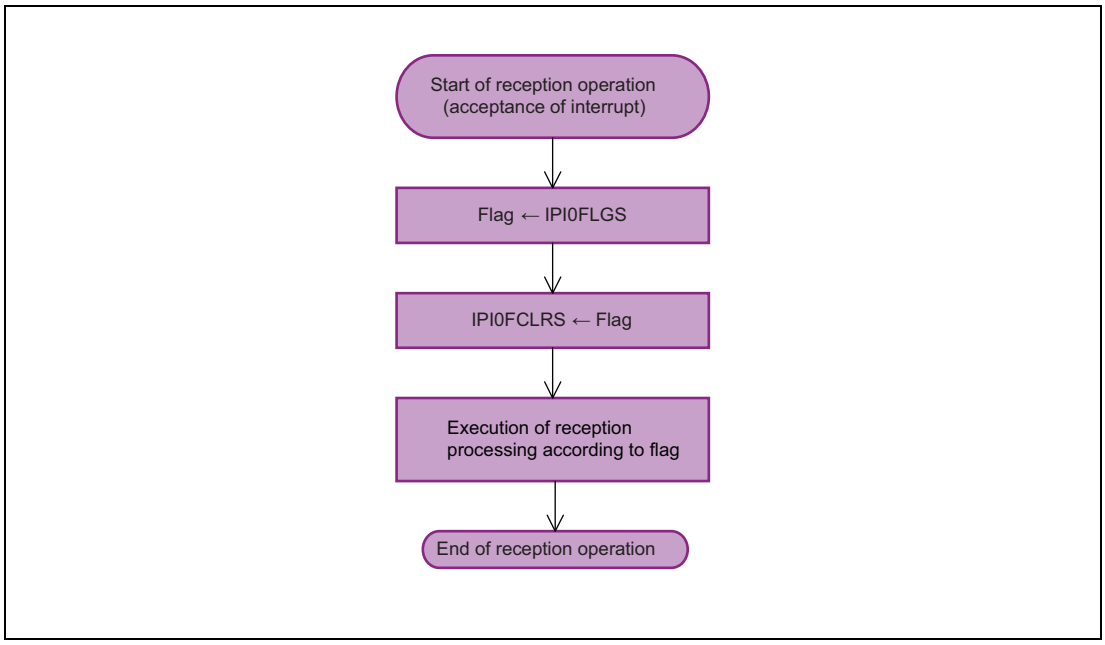

Figure 3.46 Flowchart of Inter-PE Interrupt Request Transmission Processing

3.4.3.3 Request Mask Function

Inter-PE interrupt requests disabled by the IPInENm register setting are ignored. **Figure 3.47** shows an example of the operation when an inter-PE interrupt is requested from a disabled PE. In this figure, bits PE0 to 3 of each register are omitted. In this example, the initial setting is set to IPI0EN1 in advance to prohibit inter-PE interrupt requests from PE2 to PE1. For an operation example of the initial setting, see **Section 3.4.3.1, Initial Setting**.

Even if PE2 sets IPI0REQS[1] (= IPI0REQ2[1]) to 1B to request PE1 to issue an inter-PE interrupt, inter-PE interrupts from PE2 to PE1 are prohibited, so the IPInFLG1[2] bit remains 0B and no interrupt request signal is output.

If the transmitting PE disabled by the IPInENm register setting unintentionally writes 1B to the IPI0REQm register, the IPI0REQm register can be cleared by using the IPInRCLRm register. For details, see **Section 3.4.3.5, Inter-PE Interrupt Request Clear Function**.

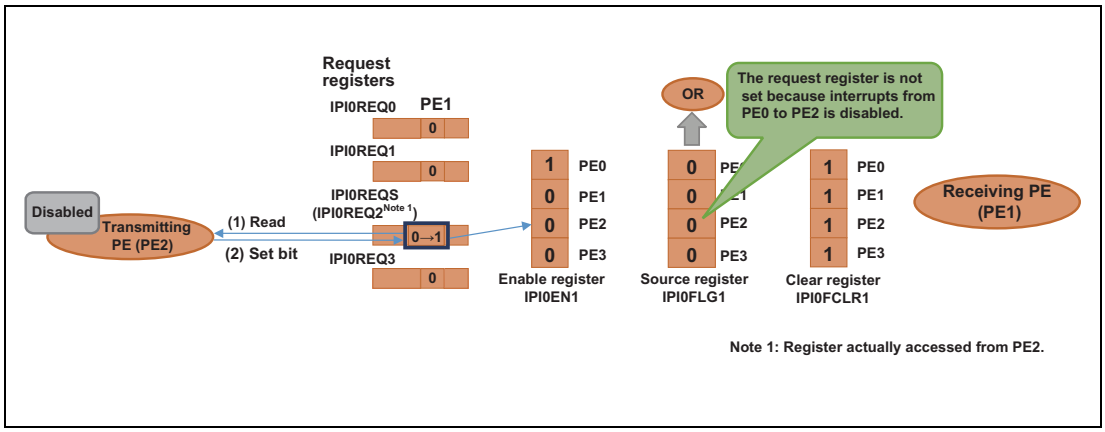

Figure 3.47 Request Mask Operation Example

3.4.3.4 Inter-PE Interrupt Requests of Multiple Systems

If the combination of the transmitting PE and receiving PE differs, multiple inter-PE interrupt requests can be output simultaneously on one channel of IPIR. For example it is possible to output inter-PE interrupt request A (PE0 to PE1) and inter-PE interrupt request B (PE1 to PE0) on channel 1 of IPIR simultaneously. Each register operates independently when the combination of the transmitting PE and receiving PE differs, so multiple inter-PE interrupt requests can be output simultaneously.

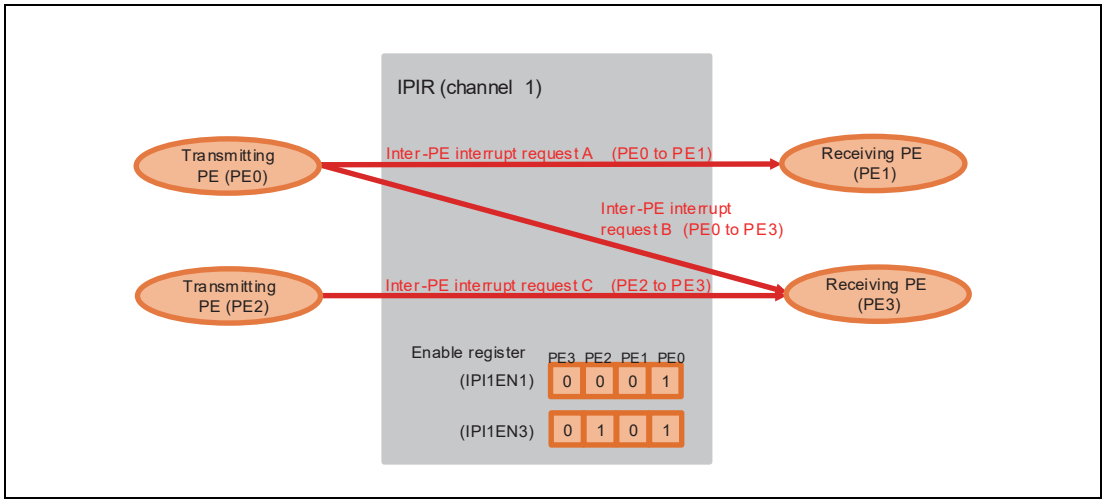

Figure 3.48 Example of Simultaneous Output of Inter-Processor Interrupt Requests

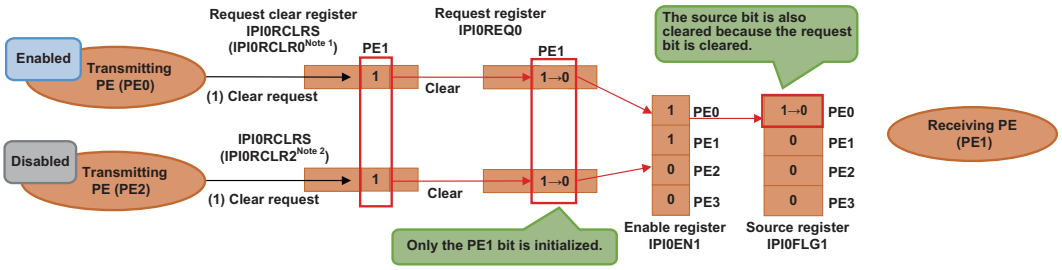
3.4.3.5 Inter-PE Interrupt Request Clear Function

The IPInREQm[x] bit can be cleared by setting the IPInRCLRm[x] bit to 1B, allowing you to cancel inter-PE interrupt requests from the transmitting PE. If inter-PE interrupt requests from the transmitting PE are enabled by the IPInENx[m] bit, the IPInFLGx[m] bit is also cleared at the same time as the IPInREQm[x] bit is cleared. However, the receiving PE may in some cases accept the inter-PE interrupt while the cancellation processing takes place.

Figure 3.49 shows an example of the operation to clear inter-PE interrupt requests from PE0 and PE2 to PE1. When PE0 writes 1B to the IPI0RCLRS[1] (= IPI0RCLR0[1]) bit, the IPI0REQ0[1] bit is cleared. Moreover, because inter-PE interrupt requests from PE0 to PE1 are enabled by the IPI0EN1 register setting, IPI0FLG1[0] is also cleared.

When PE2 writes 1B to the IPI0RCLRS[1] (= IPI0RCLR2[1]) bit, the IPI0REQ2[1] bit is cleared. Here, inter-PE interrupt requests from PE2 to PE1 are disabled by the IPI0EN1 register setting, so the IPI0RCLR2 register does not affect the value of the IPI0FLG1 register.



Note 1. Register actually accessed from PE0.

Note 2. Register actually accessed from PE2.

Figure 3.49 Example of Inter-PE Interrupt Request Clear Function Operation

3.4.4 Usage When Virtualization Enabled

3.4.4.1 Overview

In this section, VM means "Host or Guest".

IPIR is designed to support interruption from PE to PE. More exactly, it is from a source PE to INTC1 of destination PE. Bits of IPIR registers are prepared for each PE, not for each VM. When it is used for interruption from a VM to another, 2 more settings are required.

Destination VM is specified using EIBD register of INTC1. Source VM configuration is indirectly realized by guard function assigning different SPIDs to VMs. Then, registers for a PE of the channel can be written by just one VM of the PE. Read access from non-source VMs is not harmful in normal use. IPIR cannot tell source VM to destination VM. If it is necessary to know who sent an interrupt, send GPID in some method or avoid time-dependent channel assignment.

It is also possible to use IPIR for intra-PE interrupt, interrupt from a VM to another in the same PE.

3.4.4.2 Setting Example

Assumptions:

Considering 6 masters shown in **Figure 3.50**, **Table 3.155**.

Three interrupts are using channel n, from Guest 0 of PE0 (SPID = 8) to Guest 1 of PE0 (SPID = 16), from Guest 0 of PE1 (SPID = 9) to Guest 1 of PE0, from Guest 0 of PE0 to Guest 1 of PE1 (SPID =1 7).

Host of PE0 (SPID = 0) and Host of PE1 (SPID = 1) are error handling PEs.

Table 3.156 shows each register can be accessed by which VMs when guard registers are set as shown in **Table 3.155**. Access control is done using PEID and SPID. This is visualized in **Figure 3.51**. In the figure, a black arrow from a Master (green box) indicates write access. If it reached a register (blue box), the register can be written by the master. If not, the access is blocked by PEID matching (yellow box) or by SPID matching (red box).

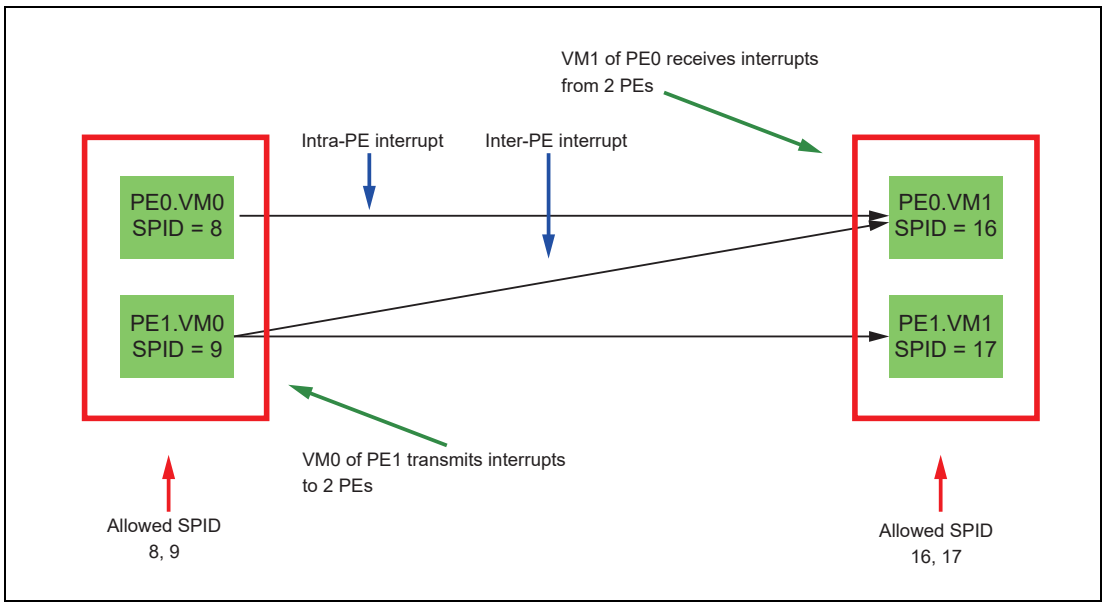


Figure 3.50 Example of Inter-VM Interrupt

Table 3.155 Setting Example of IPIR Registers

Register	Value	Description
IPInEN0	03_H	PE0 receives interrupts from PE0 and PE1.
IPInEN1	02_H	PE1 receives interrupts from PE1.
IPIGPROT0_Rn	$0000\ 0101_H$	Read access: Allowed Write access: Allowed if specified in IPIGPROT1_n
IPIGPROT1_Rn	$0003\ 0000_H$	Allowed SPID: 16, 17
IPIGPROT0_Tn	$0000\ 0101_H$	Read access: Allowed Write access: Allowed if specified in IPIGPROT1_n
IPIGPROT1_Tn	$0000\ 0300_H$	Allowed SPID: 8, 9
IPIGPROT0_4	$0000\ 0101_H$	Read access: Allowed Write access: Allowed if specified in IPIGPROT1_4
IPIGPROT1_4	$0000\ 0003_H$	Allowed SPID: 0, 1
EIBDn (INTC1 of PE0)	00008100_H	Channel n is bound to Guest 1
EIBDn (INTC1 of PE1)	00008101_H	Channel n is bound to Guest 1

Table 3.156 Summary of Access Control

		PE0			PE1		
		Host	Guest 0	Guest 1	Host	Guest 0	Guest 1

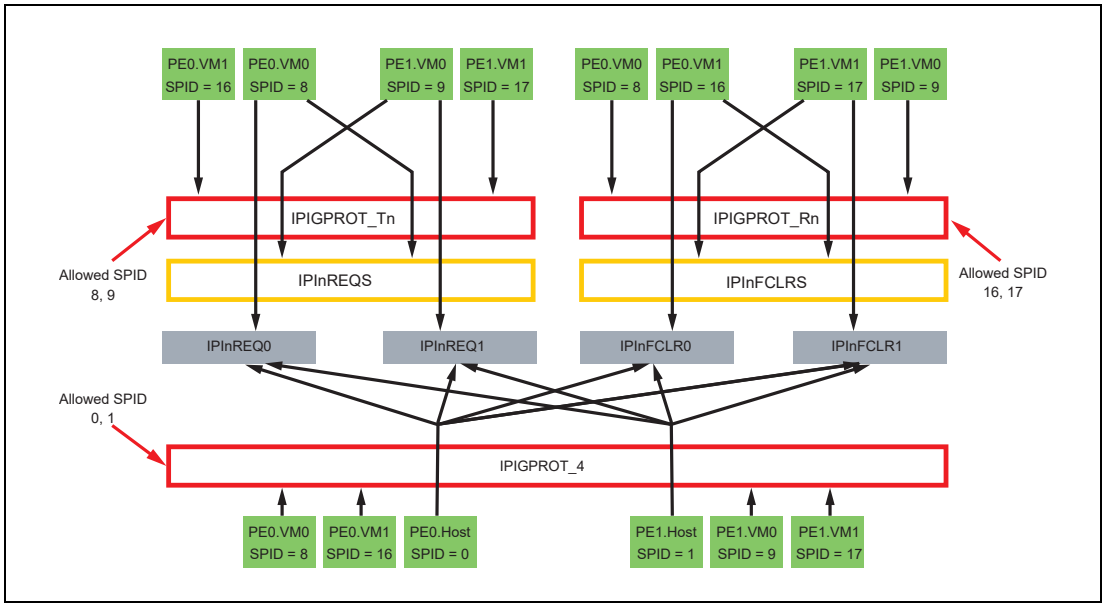

Figure 3.51 Example of per-VM Write Access Control

3.5 Mutual Exclusion

This CPU provides instructions that enable shared resources to be controlled mutually exclusively from multiple programs when the system is operating in a multi- processing environment.

CAUTION

Embedded CPUs in a single-processor configuration use a programming model in which data coherence is maintained by disabling the acknowledgment of maskable interrupts. This is a very easy and sure method of maintaining data coherence, but naturally in a multi-processor, multiple programs might be executing and attempting to use the data at the same time. In this case it is not possible to maintain data coherence simply by disabling maskable interrupt acknowledgment.

3.5.1 Mutual Exclusion Overview

The local RAM and cluster RAM are available as resources for exclusive control. As atomic operation instructions, the instructions of LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the local RAM and cluster RAM. These registers are also accessible by the LD and ST instructions but are not regarded as atomic operation.

3.5.2 Mutual Exclusion Function

3.5.2.1 Shared Data that does not Require Mutual Exclusion Processing

This CPU maintains data access coherence for the following types of data access even in a multi-processor environment.

- Access in which the data is aligned to the size that matches the data type (aligned access)
  - LD, ST, SLD, SST, LDL, STC, and bit manipulation instructions (TST1)
- Access by using a bit manipulation instruction (SET1, CLR1, or NOT1) (read-modify-write)
- Access by using the CAXI instruction (read-modify-write)

NOTE

Whether an instruction is atomically executed or not depends on the data format. Refer to **Section 3.2.2.6, Data Types**.

With some exceptions, mutual exclusion is achieved by using these types of data access. In other words, it is guaranteed that while one CPU is executing the instructions that perform the above data accesses, another CPU is not accessing the data. This is known as an instruction being executed atomically or an instruction guaranteeing the atomicity.

Note that the atomic execution of an instruction means that a data access bus transaction completes with no disruption; it does not necessarily mean that a series of transactions has been completed.

CAUTION

The extent to which coherency is guaranteed might be limited, depending on the hardware specifications. For example, for some memories, coherency might not be guaranteed even if aligned access is used. For details, see Section 3.5.1, Mutual Exclusion Overview and Section 3.9.3, Accesses to Registers by Bit-Manipulation Instructions.

3.5.2.2 Operation of the LDL and STC Instructions

The LDL and STC instructions can be used to obtain atomic read-modify-write operations for accurate processing in the updating of memory by multicore systems. The LDL and STC instructions operate as follows. For the operation of the LDL and STC instructions, refer to the *RH850G4MH User's Manual: Software*.

(1) Link

Only one link (LLbit) can be created per CPU. The link includes information on the address for which it was created, and control is applied according to whether an STC instruction succeeds or fails at this address and whether the link is lost. The link also includes the data size information when it the link is created and therefore any STC instruction which has a data size different from that of the LDL instruction that created a link always fails, and the link is deleted.

(2) Link generation

Each CPU is capable of generating a link to the local RAM and the cluster RAM.

Executing the LDL instruction on the target RAM for the operation leads to the link address being registered, the link flag being set, and a link being generated in response to reading by the instruction.

(a) The local RAM for the given processor

(b) The cluster RAM

Each CPU is capable of generating a link to either (a) or (b).

(3) Success in storing

After a link has been generated, storing will only proceed in response to executing an STC instruction corresponding to the generated link.

(4) Failure in storing

If a link is lost, storing does not proceed even when an STC instruction for the corresponding address is processed. Storing also does not proceed when an STC instruction that does not correspond to the link is processed.

(5) Condition for successful storing

If the following condition is met, the STC instruction is judged to be for the address corresponding to the link.

– The address and size for the LDL instruction that generated the link matches that for the STC instruction.

(6) Loss of the link

A link is lost when certain event or address conditions are satisfied. **Table 3.157** shows the link loss conditions. A link is lost if any of the conditions shown in this table satisfied.

Table 3.157 Link Loss Conditions

Event Condition	Remark
Store operation to a 32-byte-aligned address range that includes the address of the existing link*1	The following operations by both the CPU for which the link was generated and another bus master (e.g. CPU) correspond. • ST, SST, STC and STV instructions • SET1, NOT1, CLR1, and CAXI instructions • PREPARE, PUSHSP and STM.MP instructions
Execution of STC instruction for a location corresponding to the existing link within its own CPU	The corresponding link (for (1) or (2) above) will be lost whether the result of the instruction was success or fail.
Execution of LDL instruction for a location corresponding to the existing link within its own CPU	The link generated by a CPU in response to its preceding LDL instruction will be lost, and the link in response to the following LDL instruction is generated.
Execution of CLL instruction	
Exception acknowledgment	
Execution of EIRET instruction	
Execution of FERET instruction	
Bus access error of LDL	

Note 1. In the local RAM, if the store instruction except STC/CAXI instruction is executed, the Link is not always lost. Therefore use the program flow which does not need that these instruction cause the Link Loss. For example, in the sample code (7), after reading the Lock variable using the LDL instruction, by executing the STC instruction only if nobody has the Lock, the program flow does not need the Link Loss caused by the store instruction for the Lock Release.

(7) Sample Code

The sample code of a spinlock executed by using the LDL.W and STC.W instructions is shown below.

Lock Acquisition

```
                MOV             lock_adr, r20
Lock:           LDL.W           [r20], r21
                CMP             r0, r21
                BNZ             Lock_wait
                MOV             1, r21
                STC.W           r21, [r20]
                CMP             r0, r21
                BNZ             Lock_success
Lock_wait:      SNOOZE
                BR              Lock
Lock_success:
```

Lock Release

```
                ST.W            r0, 0[r20]
```

3.5.2.3 Performing Mutual Exclusion by Using the SET1 Instruction

The SET1 instruction can be used to perform mutual exclusion over multiple data arrays. By executing the SET1 instruction on the same bit in the memory and then checking the PSW.Z flag, which indicates the execution result, it can be determined whether lock acquisition succeeded or failed.

CAUTIONS

1. **Depending on the hardware specifications, the system performance might drop if exclusive control is executed frequently by using the SET1 instruction, because this causes the bus to be occupied for a long time. It is therefore recommended to execute exclusive control by using the LDL/STC instructions as much as possible.**
2. **When performing mutual exclusion by using the SET1 instruction, to prevent the problem of excessive bus occupancy described in Caution 1 above, execute the SNOOZE instruction before attempting to acquire a lock again after lock acquisition has failed, and adjust the lock acquisition loop execution interval.**

(1) Sample Code

The sample code of a spinlock executed by using the SET1 instruction is shown below.

Lock Acquisition

```
                MOV             lock_adr, r20
Lock:           SET1            0, 0[r20]
                BZ              Lock_success
                SNOOZE
                BR              Lock
Lock_success:
```

Lock Release

```
                CLR1            0, 0[r20]
```

3.5.2.4 Performing Mutual Exclusion by Using the CAXI Instruction

The CAXI instruction can be used to perform mutual exclusion over multiple data arrays. By executing the CAXI instruction on the same word in the memory and then checking the destination register, it can be determined whether lock acquisition succeeded or failed.

CAUTIONS

1. **Depending on the hardware specifications, the system performance might drop if exclusive control is executed frequently by using the CAXI instruction, because this causes the bus to be occupied for a long time. It is therefore recommended to execute exclusive control by using the LDL/STC instructions as much as possible.**
2. **When performing mutual exclusion by using the CAXI instruction, to prevent the problem of excessive bus occupancy described in Caution 1 above, execute the SNOOZE instruction before attempting to acquire a lock again after lock acquisition has failed, and adjust the lock acquisition loop execution interval.**

(1) Sample Code

The sample code of a spinlock executed by using the CAXI instruction is shown below.

Lock Acquisition

```
                MOV             lock_adr, r20
Lock:           MOV             1, r21
                CAXI            [r20], r0, r21
                BZ              Lock_success
                SNOOZE
                BR              Lock
Lock_success:
```

Lock Release

```
                ST.W            r0, 0[r20]
```

3.6 Barrier-Synchronization

3.6.1 Barrier-Synchronization Overview

When parallel processing is performed using a multicore processor, it may be necessary to make the cores wait until the data required for the next processing is ready, at which point the processing can proceed to the next processing. Typically, control that sets up a barrier that prevents the next process from starting before all the applicable cores complete the predetermined processing is called barrier synchronization. It is possible to implement barrier synchronization just using software, but this may degrade system processing performance due to the concentration of barrier arrival notifications from the various cores and memory access from the various cores for verification purposes.

Barrier synchronization registers enable easy barrier synchronization by detecting whether all the applicable cores have completed the required processing through the reception of completion notifications from the various PEs, while also providing a barrier synchronization support function that automatically clears completion notifications from the various PEs in preparation for the next barrier synchronization. This function makes it possible to reduce the number of memory accesses for barrier synchronization, thereby minimizing the negative impact of barrier synchronization on processing performance. This function can also be used for barrier synchronization between PEs forming a cluster. The barrier synchronization register has the following features.

- The 16-ch barrier synchronization registers are provided.
- Barrier synchronization can be implemented using the same code for all the cores.
- Accessible from all clusters and all PEs within the system
- Support of address EDC function
- Support of data ECC function
- Support of guard function to prevent unauthorized access.

3.6.2 Barrier-Synchronization Registers

3.6.2.1 List of Registers

Table 3.158 List of Registers

Module Name	Register Name	Register Symbol	Address	Access Size	Access Protection	
					IBG	Other
BARR	Barrier-Synchronization n*2 initialization register	BRnINIT	<BARR_base> + 000_H + 010_H × n	8	BRGPROT0_n	—
	Barrier-Synchronization n*2 barrier participating PE setting register	BRnEN	<BARR_base> + 004_H + 010_H × n	8	BRGPROT0_n	—
	Barrier-Synchronization n*2 barrier check register self*1	BRnCHKS	<BARR_base> + 100_H + 010_H × n	8	BRGPROT0_n	—
	Barrier-Synchronization n*2 barrier Synchronization completion register self*1	BRnSYNCS	<BARR_base> + 104_H + 010_H × n	8	BRGPROT0_n	—
	Barrier-Synchronization n*2 barrier check register m*3	BRnCHKm	<BARR_base> + 800_H + 010_H × n + 100 H × m	8	BRGPROT0_16	—
	Barrier-Synchronization n*2 barrier synchronization completion register m*3	BRnSYNCm	<BARR_base> + 804_H + 010_H × n + 100_H × m	8	BRGPROT0_16	—

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses BR0CHKS register, PE1 can access BR0CHK1 register.

Note 2. n = 0 to 15. n is the Barrier-Synchronization channel number.

Note 3. m = 0 to 3. m is the value of PEID.

3.6.2.2 Self Region

The self region contains the following two types of registers.

- BRnCHKS —Barrier-Synchronization n - barrier check self-register
- BRnSYNCS— Barrier-Synchronization n – barrier synchronization completion self-register

The self registers are virtual registers that do not physically exist. Access from each PE to self registers is routed to the actual register corresponding to the access source PE. **Table 3.159** lists the access source PEs and routing destination registers. For the functions of each register bit, refer to the specifications of the routing destination register. When masters except PEx access the self registers, the register returns 0, write access is ignored and error response will be notified.

It is basically assumed that the barrier synchronization registers are accessed from PEs via self region when PEs use the barrier synchronization function. This allows PEs to use same code because it is not necessary to specify different register address for each PE.

It is also possible to directly access registers by specifying the address of the actual register without using the self register. In this case, the purpose is assumed to check the status of registers for another PE, or referencing of individual registers by a debugging tool.

Table 3.159 Self Region Register Routing List

Self Register	Access Source PE			
	PE0	PE1	PE2	PE3
BRnCHKS	BRnCHK0	BRnCHK1	BRnCHK2	BRnCHK3
BRnSYNCS	BRnSYNC0	BRnSYNC1	BRnSYNC2	BRnSYNC3

3.6.2.3 BRnINIT — Barrier-Synchronization n Initialization Register

This register initializes the Barrier-Synchronization channel n (n = 0 to 15). This register clears the BRnCHKm register and BRnSYNCm register of channel n.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <BARR_base> + 000_H + 010_H × n

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	BRINIT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 3.160 BRnINIT Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	BRINIT	Barrier-Synchronization n initialize Writing 1 to this bit clears registers BRnCHK0 to 3 and registers BRnSYNC0 to 3 of the same channel. This bit always returns 0 when read.

3.6.2.4 BRnEN — Barrier-Synchronization n Barrier Participating PE setting Register

This register enables Barrier-Synchronization Participation in channel n for PEs.

Access: This register can be read or written in 8-bit units.

Address: <BARR_base> + 004_H + 010_H × n

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	BREN[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.161 BRnEN Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	BREN[3:0]	Barrier-Synchronization Participation enable for channel n Writing 1 to the x-th bit enables the barrier synchronization support function for PEx. Writing 0 to the x-th bit disables the barrier synchronization support function for PEx. Bit 0: PE0 Bit 1: PE1 : Bit 3: PE3

3.6.2.5 BRnCHKm — Barrier-Synchronization n Barrier Check Register m

This register is used for PEm to notify that PEm has arrived at the barrier of channel n. The PE that has arrived at the barrier is to write the BRCHK bit of this register.

Access: This register can be read or written in 8-bit units.

Address: <BARR_base> + 800_H + 010_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	BRCHK
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 3.162 BRnCHKm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BRCHK	Barrier Check Bit of channel n This bit can be updated by both software and hardware. Software: When the BRnCHKm register is written, the value of this bit becoming 1 regardless of the writing value. This bit can be set even if the BRnEN.BRENm bit is 0, but it does not affect the barrier -synchronization of channel n. Hardware: This bit is cleared by the hardware when the barrier-synchronization is established at the condition that all the BRnCHKm.BRCHK bits of participating PEs, which are enabled by the BRnEN register, are set. At the same time, the BRnSYNCm.BRSYNC bits of all participating PEs are set. This bit is cleared by writing 1 to the BRnINIT.BRINIT bit.

NOTE

If all bits of the BRnEN register are 0 (no PE participates the barrier synchronization), BRCHK bit cannot be set.

3.6.2.6 BRnSYNCm — Barrier-Synchronization n Barrier Synchronization Completion Register m

This register indicates that all the PEs that participate in the barrier of channel n have arrived at the barrier of channel n.

Access: This register can be read or written in 8-bit units.

Address: <BARR_base> + 804_H + 010_H × n + 100_H × m

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	BRSYNC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 3.163 BRnSYNCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BRSYNC	Barrier synchronization completion This bit can be updated by both software and hardware. Software: When the BRnSYNCm register is written, this bit is updated with the write data. Hardware: If the BRnEN.BRENm bit is 1, this bit is automatically set when the barrier-synchronization is established at the condition that all the BRnCHKm.BRCHK bits of participating PEs, which are enabled by the BRnEN register, are set. If the BRnEN.BRENm bit is 0, this bit is not updated by the hardware. This bit is cleared by writing 1 to the BRnINIT.BRINIT bit.

3.6.3 Barrier-Synchronization Function

3.6.3.1 Initial Setting

Before the barrier synchronization register is used, initial settings must be made in the BRnEN register. **Figure 3.52** shows an example of the initial setting of synchronization register channel 0 by PE0.

First, to clear the setting of the previous operation, the BR0EN register is cleared by write operation. After clearing of the BR0EN register, write 07_H to the BR0EN register to participate PE0, PE1 and PE2 in barrier synchronization. Lastly, PE0 writes 1_B to the BR0INIT register to clear registers BR0CHK0 to 3 and registers BR0SYNC0 to 3. Upon completion of setting of the participating PE setting register and initialization, barrier synchronization using the barrier synchronization register is possible.

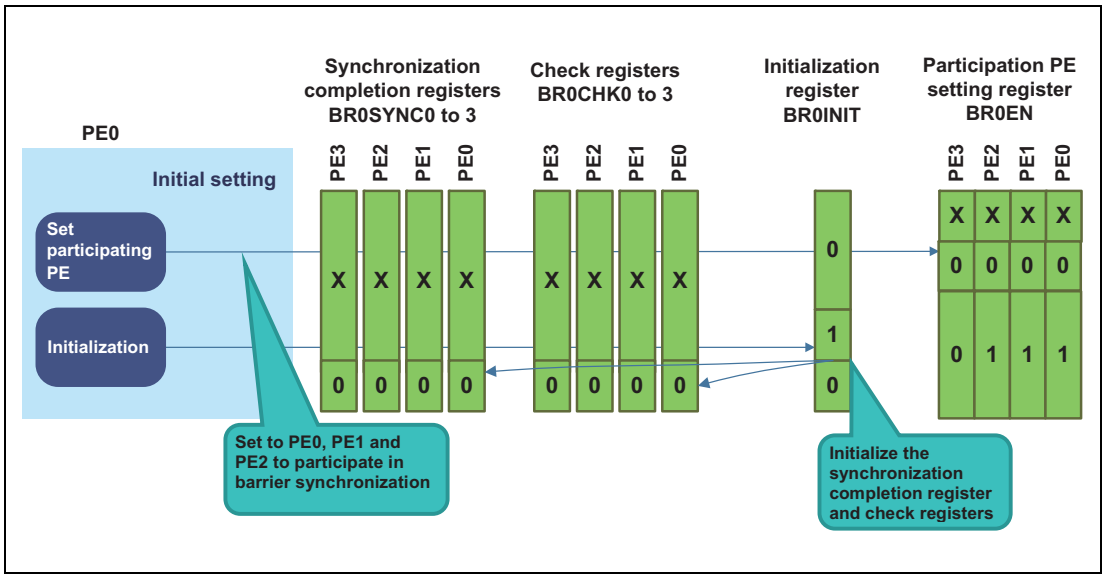

Figure 3.52 Example of Initial Setting of Barrier Synchronization Register

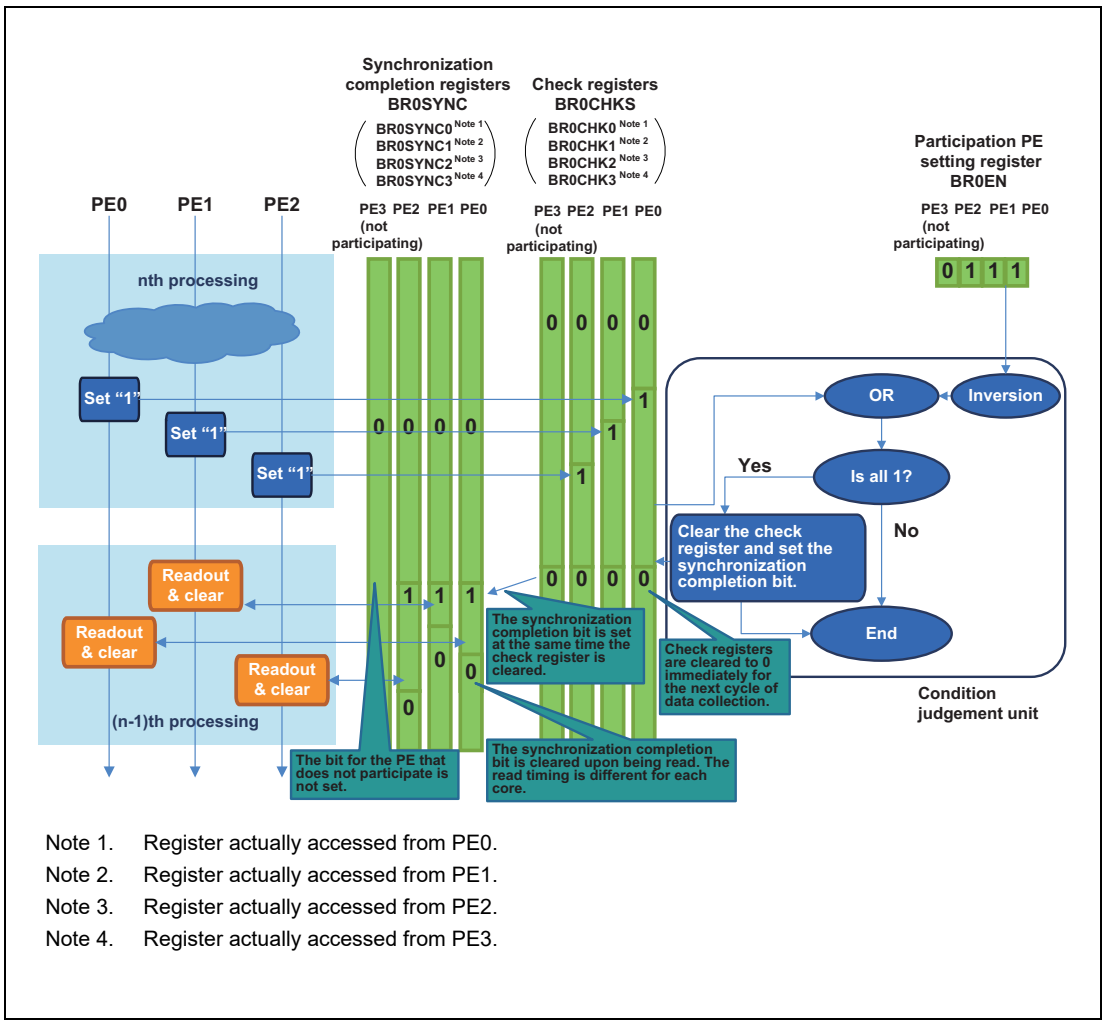
3.6.3.2 Barrier Synchronization

Figure 3.53 shows an example of the operation executing barrier synchronization of PE0, PE1, and PE2 using barrier synchronization register channel 0. In this example, PE0, PE1, and PE2 are set by the BR0EN register in advance to participate in barrier synchronization by the initial setting processing described in **Section 3.6.3.1, Initial Setting**.

When PE0, PE1, and PE2, which are set to participate in barrier synchronization by the BR0EN register, arrive at the barrier, they each write data to the BR0CHKS register, setting it to 1B. Note that the BR0CHKS register is set to 1B when it is written to, regardless of the write value. Each of the PEs, upon arriving at the barrier, polls the BR0SYNCS register and waits for all the other PEs participating in barrier synchronization to arrive at the barrier. When all the PEs participating in barrier synchronization arrive at the barrier and the values of registers BR0CHK0 to 2 have all become 1B, registers BR0CHK0 to 3 are automatically cleared, and 1B is automatically set to registers BR0SYNC0 to 2 (= BR0SYNCS). When a PE that arrives at the barrier detects that the BR0SYNCS register has been set to 1B, it considers that all the PEs participating in barrier synchronization have arrived at the barrier, and it clears the respective BR0SYNCS registers to 0B to allow transition to the next processing. When the values of registers BR0CHK0 to 2 have all become 1B, registers BR0CHK0 to 3 are automatically cleared, so each PE is able to move on to the next cycle as soon as the BR0SYNCS register is cleared.



Note 1. Register actually accessed from PE0.
Note 2. Register actually accessed from PE1.
Note 3. Register actually accessed from PE2.
Note 4. Register actually accessed from PE3.

Figure 3.53 Example of Operation of Barrier Synchronization Using Barrier Synchronization Register

3.6.4 Usage When Virtualization Enabled

3.6.4.1 Overview

Barrier-Sync is designed to support synchronization of VMs running at the same time. Virtualization is realized by time-sharing in this architecture. Therefore, Barrier-Sync cannot be used to synchronize multiple VMs in the same PE.

Bits of Barrier-Sync registers are prepared for each PE, not for each VM. If a PE is allowed to participate in a channel of synchronization, Barrier-Sync cannot distinguish a participating VM from non-participating VMs. To avoid this, use guard function and assign different SPIDs to VMs. Then, registers for a PE of the channel can be written by just one VM. Read access from non-participating VMs is not harmful in normal use.

3.6.4.2 Setting Example

Assumptions:

Considering 6 masters shown in **Table 3.164**, **Table 3.165** and **Figure 3.54**.

Synchronizing Guest 0 of PE0 (SPID=8) and Guest 1 of PE1 (SPID=17) using channel n.

Host of PE0 (SPID=0) and Host of PE1 (SPID=1) are error handling PEs

Table 3.165 shows each register can be accessed by which VMs when guard registers are set as shown **Table 3.164**. Access control is done using PEID and SPID. This is visualized in **Figure 3.54**. In the figure, a black arrow from a Master indicates write access. If it reached a register (BRnINIT, BRnCHK0, BRnCHK1), the register can be written by the master. If not, the access is blocked by PEID matching (BRnCHKS) or by SPID matching (BRGPROT_16, BRGPROT_n).

Table 3.164 Setting Example of Barrier-Sync Registers

Register	Value	Description
BRnEN	03_H	PE0 and PE1 are participating in channel n.
BRRGPROT0_n	$0000\ 0101_H$	Read access: Allowed Write access: Allowed if specified in BRRGPROT1_n
BRRGPROT1_n	$0002\ 0103_H$	Allowed SPID: 0, 1, 8, 17
BRRGPROT0_16	$0000\ 0101_H$	Read access: Allowed Write access: Allowed if specified in BRRGPROT1_16
BRRGPROT1_16	$0000\ 0003_H$	Allowed SPID: 0, 1

Table 3.165 Summary of Access Control

Register	Access	PE0			PE1		
		Host	Guest 0	Guest 1	Host	Guest 0	Guest 1
		SPID = 0	SPID = 8	SPID = 16	SPID = 1	SPID = 9	SPID = 17
BRnINIT, BRnEN	Direct	Allowed	Allowed	Not allowed (SPID)	Allowed	Not allowed (SPID)	Allowed
BRnCHK0, BRnSYNC0	Via Self Registers	Allowed	Allowed	Not allowed (SPID)	Not allowed (PEID)	Not allowed (PEID)	Not allowed (PEID)
	Direct	Allowed	Not allowed (SPID)	Not allowed (SPID)	Allowed	Not allowed (SPID)	Not allowed (SPID)
BRnCHK1, BRnSYNC1	Via Self Registers	Not allowed (PEID)	Not allowed (PEID)	Not allowed (PEID)	Allowed	Not allowed (SPID)	Allowed
	Direct	Allowed	Not allowed (SPID)	Not allowed (SPID)	Allowed	Not allowed (SPID)	Not allowed (SPID)

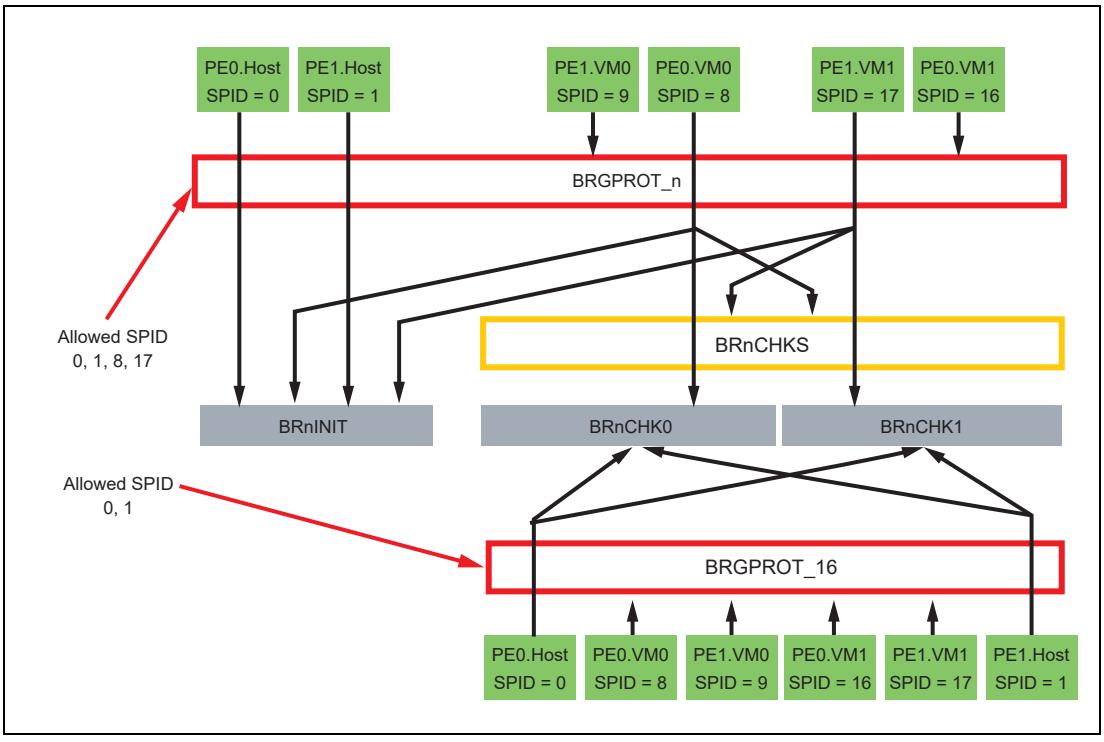


Figure 3.54 Example of per-VM Write Access Control

3.7 TPTM

3.7.1 TPTM Overview

Time Protection Timer (TPTM) is sets of CPU dedicated timers used to achieve high performance and functionality of timing protection. One timer set is assigned to each CPU respectively. One timer set is composed of 2 Interval timers, 1 Free-run timer and 2 Up timers.

Each timer set of TPTM has the following features.

- Interval timer × 2ch (down counter)
- Free-run timer × 1ch (up counter)
- Up timer × 2ch (up counter)
- Start, Stop and Restart of counter for the interval timers, the free-run timer and the up timers.
- Divided counter of the timers can be configured for the interval timers, the free-run timer, up timer respectively.
- Simultaneous count control for the interval timers belonging to the same PE.
- Simultaneous count control for the up timers belonging to the same PE using registers prepared for each PE.
- Globally simultaneous count control registers are prepared. A PE can control all up counters including ones owned by other PEs.
- Underflow interrupt for the interval timers.
- Comparison value matching interrupts for the up timers.
- Address EDC for the access of registers.
- Data ECC for the access of registers.
- Support of guard function to prevent unauthorized access.
- Each timer set has 3 control signals to stop timers while in debug mode. One is for interval timers and the free-run timer, another is for up timer 0, the other is for up timer 1.

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses TPTMSIRUN register, PE1 can access the TPTM1IRUN register.

Note 2. n = 0 to 3. n is the PEID number.

3.7.2.2 Self Region

The self region contains the following registers. The self region can be accessed by only particular CPU.

The self-registers are virtual registers that do not physically exist. Access from each PE to self-registers is routed to the actual register corresponding to the access source PE. **Table 3.167** lists the access source PEs and routing destination registers. For the functions of each register bit, refer to the specifications of the routing destination register. When masters except PEx access the self registers, the register returns 0, write access is ignored and error response will be notified.

It is basically assumed that the TPTM registers are accessed from PEs via self region. This allows PEs to use same code because it is not necessary to specify different register address for each PE.

It is also possible to directly access registers by specifying the address of the actual register without using the self register. In this case, the purpose is assumed to check the status of registers for another PE, or referencing of individual registers by a debugging tool.

- TPTMSIRUN— Counter Start Register of Interval Timer
- TPTMSIRRUN —Counter Restart Register of Interval Timer
- TPTMSISTP— Counter Stop Register of Interval Timer
- TPTMSISTR— Counter Status Register of Interval Timer
- TPTMSIIEN— Interrupt Enable Register of Interval Timer
- TPTMSIUSTR—Underflow Status Register of Interval Timer
- TPTMSIDIV— Divider Register of Interval Timer
- TPTMSFRUN— Counter Start Register of Free-run Timer
- TPTMSFRRUN —Counter Restart Register of Free-run Timer
- TPTMSFSTP— Counter Stop Register of Free-run Timer
- TPTMSFSTR— Counter Status Register of Interval Timer
- TPTMSFDIV— Divider Register of Free-run Timer
- TPTMSURUN—Counter Start Register of Up Timer
- TPTMSURRUN—Counter Restart Register of Up Timer
- TPTMSUSTP—Counter Stop Register of Up Timer
- TPTMSUSTR—Counter Status Register of Up Timer
- TPTMSUIEN—Interrupt Enable Register of Up Timer
- TPTMSUDIV—Divider Register of Up Timer
- TPTMSUTRG—Trigger Select Register of Up Timer
- TPTMSICNT0— Counter Channel 0 Register of Interval Timer
- TPTMSILD0— Load Channel 0 Register of Interval Timer
- TPTMSICNT1— Counter Channel 1 Register of Interval Timer
- TPTMSILD1— Load Channel 1 Register of Interval Timer
- TPTMSFCNT— Counter Register of Free-run Timer

- TPTMSUCNTm— Counter Channel m Register of Up Timer (m = 0 to 1)
- TPTMSUCMPmi— Compare Value i of 0 Register of Up Timer m (m = 0 to 1, i = 0 to 3)

3.7.2.3 TPTMnIRUN — Counter Start Register of Interval Timer for PEn

This register controls start of interval timer for each channel.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 100_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 3.168 TPTMnIRUN Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	IRUN1	Start command bit of interval timer channel 1 0: No action 1: Start counter When writing 1 to the bit, the value of TPTMnILD1 is loaded in TPTMnICNT1. This bit is always read as 0.
0	IRUN0	Start command bit of interval timer channel 0 0: No action 1: Start counter When writing 1 to the bit, the value of TPTMnILD0 is loaded in TPTMnICNT0. This bit is always read as 0.

3.7.2.4 TPTMnIRRUN — Counter Restart Register of Interval Timer for PEn

This register controls restart of interval timer for each channel.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 104_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 3.169 TPTMnIRRUN Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	IRRUN1	Restart command bit of interval timer channel 1 0: No action 1: Restart counter When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT1. This bit is always read as 0.
0	IRRUN0	Restart command bit of interval timer channel 0 0: No action 1: Restart counter When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT0. This bit is always read as 0.

3.7.2.5 TPTMnISTP — Counter Stop Register of Interval Timer for PEn

This register controls stop of interval timer for each channel

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 108_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ISTP1	ISTP0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 3.170 TPTMnISTP Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	ISTP1	Stop command bit of interval timer channel 1 0: No action 1: Stop counter When writing 1 to the bit, the counter is stopped at the value of TPTMnICNT1. This bit is always read as 0.
0	ISTP0	Stop command bit of interval timer channel 0 0: No action 1: Stop counter When writing 1 to the bit, the counter is stopped at the value of TPTMnICNT0. This bit is always read as 0.

3.7.2.6 TPTMnISTR — Counter Status Register of Interval Timer for PEn

This register indicates the interval timer status for each channel.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + $10C_H$ + 100_H × n

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ISTR1	ISTR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 3.171 TPTMnISTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	ISTR1	Status bit of interval timer channel 1 0: Counter is stopped. 1: Counter is running.
0	ISTR0	Status bit of interval timer channel 0 0: Counter is stopped. 1: Counter is running.

3.7.2.7 TPTMnIIEN — Interrupt Enable Register of Interval Timer for PEn

This register controls enabling/disabling of interrupt request by TPTM_IRQ[n].

When underflow occurs in interval timer channel m in TPTMn, TPTMnIUSTR.IUSTRm bit is set whether IIENm bit is set or not. If IIENm bit is set, TPTM_IRQ[n] is asserted.

Note that TPTM_IRQ[n] will be asserted immediately after IIENm bit is set if TPTMnIUSTR.IUSTRm holds 1.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 110_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IIEN1	IIEN0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 3.172 TPTMnIIEN Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	IIEN1	Interrupt enable bit of interval timer channel 1 0: Disable. 1: Enable.
0	IIEN0	Interrupt enable bit of interval timer channel 0 0: Disable. 1: Enable.

3.7.2.8 TPTMnIUSTR — Underflow Status Register of Interval Timer for PEn

This register indicates the status of underflow occurrence of interval timers in TPTMn.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 114_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IUSTR1	IUSTR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 3.173 TPTMnIUSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	IUSTR1	Underflow flag bit of interval timer channel 1 0: Underflow did not occur. 1: Underflow occurred. When writing 0 to the bit, IUSTR1 is cleared. Writing 1 to the bit is ignored.
0	IUSTR0	Underflow flag bit of interval timer channel 0 0: Underflow did not occur. 1: Underflow occurred. When writing 0 to the bit, IUSTR0 is cleared. Writing 1 to the bit is ignored.

NOTE

To clear a single bit, it is recommended to use CLR1 instruction.

3.7.2.9 TPTMnIDIV — Divider Register of Interval Timer for PEn

This register specifies dividing ratio of interval timer counting clock for each channel.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 118_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	IDIV[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.174 TPTMnIDIV Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	IDIV[7:0]	Clock dividing setting of interval timer for all channels Counter clock ratio is specified by the following expression. count_clock = cpu_clk / (IDIV[7:0] + 1)

CAUTIONS

1. **To avoid unintended timer behavior, the TPTMnIDIV register should be written while all channels of TPTMnICNTm are in stop state.**
2. **It is prohibited to access this register by bit-manipulation instruction.**

3.7.2.10 TPTMnFRUN — Counter Start Register of Free-run Timer for PEn

This register controls start of free-run timer.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 120_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRUN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.175 TPTMnFRUN Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	FRUN	Start command bit of free-run timer 0: No action 1: Start counter When writing 1 to the bit during the counter stopping, the value of 0000 0000_H is loaded in TPTMnFCNT and the counter is started. When writing 1 to the bit during the counter working, the value of 0000 0000_H is loaded in TPTMnFCNT and the counter is re-started. This bit is always read as 0.

3.7.2.11 TPTMnFRRUN — Counter Restart Register of Free-run Timer for PEn

This register controls restart of free-run timer.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 124_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FRRUN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.176 TPTMnFRRUN Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	FRRUN	Restart command bit of free-run timer 0: No action 1: Restart counter When writing 1 to the bit, the counter is restarted from current value of TPTMnFCNT. This bit is always read as 0.

3.7.2.12 TPTMnFSTP — Counter Stop Register of Free-run Timer for PEn

This register controls stop of free-run timer.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 128_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSTP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.177 TPTMnFSTP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	FSTP	Stop command bit of free-run timer 0: No action 1: Stop counter When writing 1 to the bit, the counter is stopped at the value of TPTMnFCNT. This bit is always read as 0.

3.7.2.13 TPTMnFSTR — Counter Status Register of Free-run Timer for PEn

This register indicates the free-run timer status.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + $12C_H$ + 100_H × n

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSTR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 3.178 TPTMnFSTR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	FSTR	Status bit of Free- run timer 0: Counter is stopped. 1: Counter is running.

3.7.2.14 TPTMnFDIV — Divider Register of Free-run Timer for PEn

This register specifies dividing ratio of free-run timer counting clock.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 130_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	FDIV[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.179 TPTMnFDIV Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	FDIV[7:0]	Clock dividing setting of free-run timer Counter clock ratio is specified by the following expression. count_clock = cpu_clk / (FDIV[7:0] + 1)

CAUTIONS

1. **To avoid unintended timer behavior, the TPTMnFDIV register should be written while TPTMnFCNT is in stop state.**
2. **It is prohibited to access this register by bit-manipulation instruction.**

3.7.2.15 TPTMnURUN — Counter Start Register of Up Timer for PEn

This register controls start of up timer for each channel.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 140_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	URUN1	URUN0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 3.180 TPTMnURUN Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	URUN1	Start command bit of up timer channel 1 0: No action 1: Start counter When writing 1 to the bit, the value of 0000 0000_H is loaded onto TPTMnUCNT1. This bit is always read as 0.
0	URUN0	Start command bit of up timer channel 0 0: No action 1: Start counter When writing 1 to the bit, the value of 0000 0000_H is loaded onto TPTMnUCNT0. This bit is always read as 0.

3.7.2.16 TPTMnURRUN — Counter Restart Register of Up Timer for PEn

This register controls restart of up timer for each channel.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 144_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 3.181 TPTMnURRUN Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	URRUN1	Restart command bit of up timer channel 1 0: No action 1: Restart counter When writing 1 to the bit, the counter is restarted from current value of TPTMnUCNT1. This bit is always read as 0.
0	URRUN0	Restart command bit of up timer channel 0 0: No action 1: Start counter When writing 1 to the bit, the counter is restarted from current value of TPTMnUCNT0. This bit is always read as 0.

3.7.2.17 TPTMnUSTP — Counter Stop Register of Up Timer for PEn

This register controls stop of up timer for each channel.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 148_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	USTP1	USTP0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 3.182 TPTMnUSTP Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	USTP1	Stop command bit of up timer channel 1 0: No action 1: Stop counter When writing 1 to the bit, the counter is stop at the value of TPTMnUCNT1. This bit is always read as 0.
0	USTP0	Stop command bit of up timer channel 0 0: No action 1: Stop counter When writing 1 to the bit, the counter is stop at the value of TPTMnUCNT0. This bit is always read as 0.

3.7.2.18 TPTMnUSTR — Counter Status Register of Up Timer for PEn

This register indicates the up timer status for each channel.

Access: This register is a read-only register that can be read in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + $14C_H$ + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	USTR1	USTR0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 3.183 TPTMnUSTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	USTR1	Status bit of up timer channel 1 0: Counter is stopped (initial). 1: Counter is running.
0	USTR0	Status bit of up timer channel 0 0: Counter is stopped (initial). 1: Counter is running.

3.7.2.19 TPTMnUIEN — Interrupt Enable Register of Up Timer for PEn

This register controls enabling/disabling of interrupt requests, INTTPTMUni.

When TPTMnUIEN.UmIENi is set, INTTPTMUni is asserted if TPTMnUCNTm and TPTMnUCNTmi match. There is no status register for INTTPTMUni because they are pulse interrupt (m = 0 to 1, i = 0 to 3).

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 150_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	U1IEN3	U1IEN2	U1IEN1	U1IEN0	—	—	—	—	U0IEN3	U0IEN2	U0IEN1	U0IEN0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 3.184 TPTMnUIEN Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	U1IEN3	Interrupt enable bit of up timer channel 1, compare value 3 0: Disabled (initial). 1: Enabled.
10	U1IEN2	Interrupt enable bit of up timer channel 1, compare value 2 0: Disabled (initial). 1: Enabled.
9	U1IEN1	Interrupt enable bit of up timer channel 1, compare value 1 0: Disabled (initial). 1: Enabled.
8	U1IEN0	Interrupt enable bit of up timer channel 1, compare value 0 0: Disabled (initial). 1: Enabled.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	U0IEN3	Interrupt enable bit of up timer channel 0, compare value 3 0: Disabled (initial). 1: Enabled.
2	U0IEN2	Interrupt enable bit of up timer channel 0, compare value 2 0: Disabled (initial). 1: Enabled.
1	U0IEN1	Interrupt enable bit of up timer channel 0, compare value 1 0: Disabled (initial). 1: Enabled.
0	U0IEN0	Interrupt enable bit of up timer channel 0, compare value 0 0: Disabled (initial). 1: Enabled.

3.7.2.20 TPTMnUDIV — Divider Register of Up Timer for PEn

This register specifies dividing ratio of up timer counting clock for each channel.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 158_H + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	UDIV[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.185 TPTMnUDIV Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	UDIV[7:0]	Clock dividing setting of up timer for all channels Counter clock ratio is specified by the following expression. count_clock = cpu_clk / (UDIV[7:0] + 1)

CAUTIONS

1. To avoid unintended timer behavior, the TPTMnUDIV register should be written while all channels of TPTMnUCNTm are in stop state.
2. It is prohibited to access this register by bit-manipulation instruction.

3.7.2.21 TPTMnUTRG — Trigger Select Register of Up Timer for PEn

This register specifies the trigger of up timer for each channel.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + $15C_H$ + 100_H × n

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GTRGEN1	—	—	—	—	—	—	GTRGCH1	GTRGEN0	—	—	—	—	—	—	GTRGCH0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W

Table 3.186 TPTMnUTRG Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	GTRGEN1	Up timer 1 global trigger enable 0: Up counter 1 is controlled by TPTMnURUN, TPTMnURRUN, TPTMnUSTP 1: Up counter 1 is controlled by simultaneous control registers (TPTMGgURUN, TPTMGgURRUN, TPTMGgUSTP)
14 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GTRGCH1	This bit is configured to specify the registers by which up counter 1 is controlled. When TPTMnUTRG.GTRGEN1 = 1 and TPTMnUTRG.GTRGCH1 = g (g = 0 to 1), up counter 1 is controlled by TPTMGgURUN, TPTMGgURRUN, TPTMGgUSTP.
7	GTRGEN0	Up timer 0 global trigger enable 0: Up counter 0 is controlled by TPTMnURUN, TPTMnURRUN, TPTMnUSTP 1: Up counter 1 is controlled by simultaneous control registers (TPTMGgURUN, TPTMGgURRUN, TPTMGgUSTP)
6 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	GTRGCH0	This bit is configured to specify the registers by which up counter 0 is controlled. When TPTMnUTRG.GTRGEN0 = 1 and TPTMnUTRG.GTRGCH0 = g (g = 0 to 1), up counter 0 is controlled by TPTMGgURUN, TPTMGgURRUN, TPTMGgUSTP.

3.7.2.22 TPTMnICNTm — Counter Channel m Register of Interval Timer for PEn

This register is the counter itself of interval timer channel m (m = 0 to 1).

Access: This register can be read or written in 32-bit units.

Address: <TPTM_base> + 180_H + 100_H × n + 8_H × m

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ICNT[31:16]															
Value after reset	Undefined															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ICNT[15:0]															
Value after reset	Undefined															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.187 TPTMnICNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	ICNT[31:0]	Counter value of interval timer channel m for PEn When writing 1_B to TPTMnIRUN.IRUNm, the value of TPTMnILDm is loaded in this register and this register starts to count down from this value. Also, when an underflow of this register occurs, the value of TPTMnILDm is reloaded in this register and this register continues to count down from this value.

CAUTION

To avoid unintended timer behavior, the TPTMnICNTm register should be written while in stop state.

3.7.2.23 TPTMnILDm — Load Channel m Register of Interval Timer for PEn

This register specifies the loading value for interval timer channel m (m = 0 to 1).

Access: This register can be read or written in 32-bit units.

Address: <TPTM_base> + 184_H + 100_H × n + 8_H × m

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ILD[31:16]															
Value after reset	Undefined															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.188 TPTMnILDm Register Contents

Bit Position	Bit Name	Function
31 to 0	ILD[31:0]	Load data value of interval timer channel m for PEn At the timing of writing 1 to TPTMnIRUNm, the value of this register is loaded in TPTMnICNTm. Also, when an underflow of TPTMnICNTm occurs, the value of this register is reloaded in TPTMnICNTm.

CAUTION

To avoid unintended timer behavior, the TPTMnILDm register should be written while TPTMnCNTm of corresponding channel is in stop state.

3.7.2.24 TPTMnFCNT — Counter Register of Free-run Timer for PEn

This register is the counter itself of free-run timer.

Access: This register can be read or written in 32-bit units.

Address: <TPTM_base> + $1A0_H$ + 100_H × n

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	FCNT[31:16]															
Value after reset	Undefined

Table 3.189 TPTMnFCNT Register Contents

Bit Position	Bit Name	Function
31 to 0	FCNT[31:0]	Counter value of free-run timer for PEn When writing 1_B to TPTMnFRUN.FRUN, the value of 0000_0000_H is loaded in this register and this register starts to count up from this value. Also, when an overflow of this register occurs, the value of 0000_0000_H is reloaded in this register and this register continues to count up from this value.

CAUTION

To avoid unintended timer behavior, the TPTMnFCNT register should be written while in stop state.

3.7.2.25 TPTMnUCNTm — Counter Register of Up Timer for PEn

This register is the counter itself of up timer channel m (m = 0 to 1).

Access: This register can be read or written in 32-bit units.

Address: <TPTM_base> + $1C0_H$ + 100_H × n + 20_H x m

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UCNT[31:16]

Table 3.190 TPTMnUCNTm Register Contents

Bit Position	Bit Name	Function
31 to 0	UCNT[31:0]	Counter value of up timer for PEn When writing 1_B to TPTMnURUN.URUNm, the value of 0000 0000_H is loaded in this register and this register starts to count up from this value. Also, when an overflow of this register occurs, the value of 0000 0000_H is reloaded in this register and this register continues to count up from this value.

CAUTION

To avoid unintended timer behavior, the TPTMnUCNTm register should be written while in stop state.

3.7.2.26 TPTMnUCMPmi — Compare Value i Register of Up Timer m for PEn

This register specifies the i-th value compared with the value of up timer channel m (m = 0 to 1, i = 0 to 3).

Access: This register can be read or written in 32-bit units.

Address: <TPTM_base> + $1C4_H$ + 100_H × n + 20_H x m + 4_H x i

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	UCMP[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.191 TPTMnUCMPmi Register Contents

Bit Position	Bit Name	Function
31 to 0	UCMP[31:0]	Value compared with up counter If TPTMnUIEN.UmIENi = 1 and TPTMnUCNTm is equal to TPTMnUCMPmi, INTTPTMni is asserted.

CAUTION

To avoid unintended timer behavior, the TPTMnUCMPmi register should be written while in stop state.

When the TPTMnUCMPmi register is updated while the up timer is running, it must be avoided that TPTMnUCNTm exceeds TPTMnUCMPmi during the write process to TPTMnUCMPmi as the interrupt (INTTPTMUni) of the up timer might be lost.

3.7.2.27 TPTMGgURUN — Counter Start Register of Up Timer for Global Control Channel g

This register starts Up timers.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 940_H + 100_H x g (g = 0 to 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.192 TPTMGgURUN Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	URUN	Start command bit of up timers 0: No action 1: Start up timer m of PEn if TPTMnUTRG.GTRGENm is 1 and TPTMnUTRG.GTRGCHm = g. If not, no action. When writing 1 to the bit, the value of 0000 0000_H is loaded onto TPTMnUCNTm. This bit is always read as 0.

3.7.2.28 TPTMGgURRUN — Counter Restart Register of Up Timer for Global Control Channel g

This register restarts Up timers.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 944_H + 100_H x g (g = 0 to 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	URRUN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.193 TPTMGgURRUN Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	URRUN	Restart command bit of up timers 0: No action 1: Restart up timer m of PEn if TPTMnUTRG.GTRGENm is 1 and TPTMnUTRG.GTRGCHm = g. If not, no action. When writing 1 to the bit, the counter is restarted from current value of TPTMnUCNTm. This bit is always read as 0.

3.7.2.29 TPTMGgUSTP — Counter Stop Register of Up Timer for Global Control Channel g

This register stops Up timers.

Access: This register is a write-only register that can be written in 32-bit, 16-bit or 8-bit units.

Address: <TPTM_base> + 948_H + 100_H x g (g = 0 to 1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 3.194 TPTMGgUSTP Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	USTP	Stop command bit of up timers 0: No action 1: Stop up timer n of PEn if TPTMnUTRG.GTRGENm is 1 and TPTMnUTRG.GTRGCHm = g. If not, no action. When writing 1 to the bit, the counter is stop at the value of TPTMnUCNTm. This bit is always read as 0.

3.7.3 TPTM Function

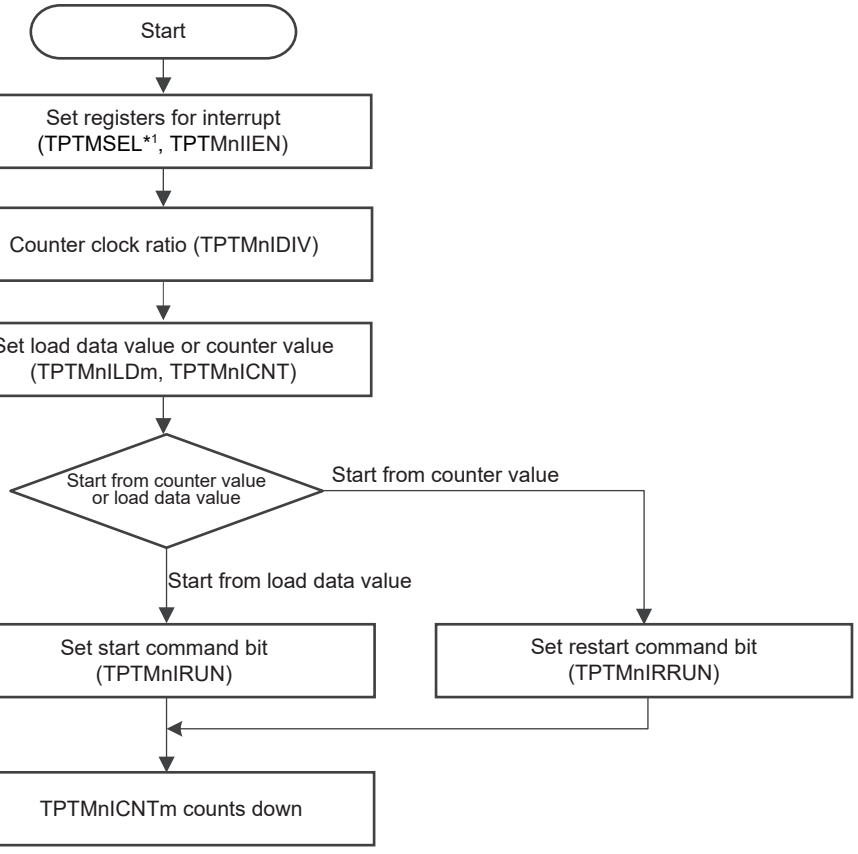
CAUTION

If interruption is used as EI level instead of FE level, set the TPTMSEL register before TPTM starts. It is prohibited to change the setting value of the TPTMSEL register after TPTM start.

3.7.3.1 Interval Timer Operation

(1) Normal Operation

The normal operation flow is shown in **Figure 3.55**.



Note 1. see **Section 6.3.15, TPTMSEL — TPTM Interrupt FE EI Select Register**.

Figure 3.55 Flow of Normal Operation

It shows the timing chart of normal operation of interval timer in case that counter clock ratio is a 1/2 period of CPU_CLK and load data value is 0000 0004_H in **Figure 3.56**.

TPTMnICNTm starts countdown at the next cycle of setting TPTMnIRUN.IRUNm bit.

If TPTMnIRUN.IRUNm bit is set while the counter is running, the TPTMnICNTm value is updated by the TPTMnILDm value and continues countdown.

When the TPTMnICNTm turns zero, TPTMnUSTR.USTRm is set and, if TPTMnIIEN.IIENm bit is set, TPTM_IRQ[n] is asserted.

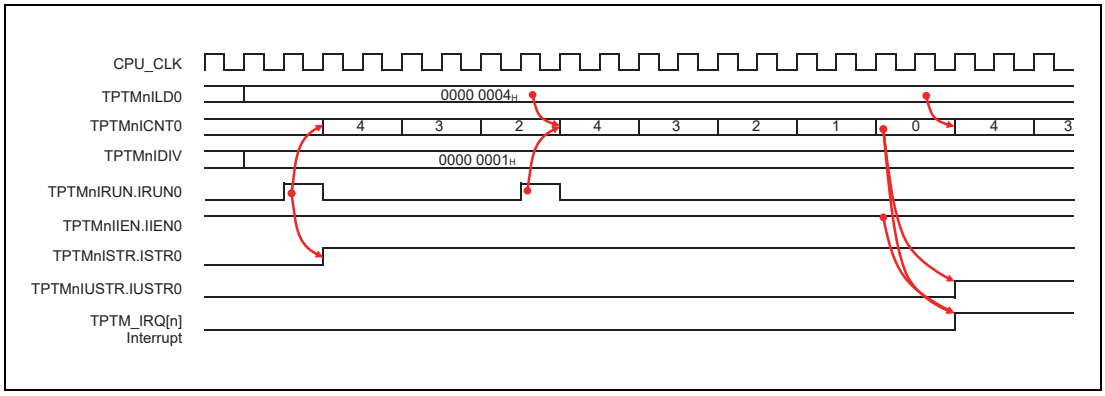


Figure 3.56 Normal Operation (TPTMnIDIV = 0000 0001$_H$, TPTMnILD = 0000 0004$_H$)

(2) Operation during a Restart

The flow of operation during a restart is shown in **Figure 3.57**.

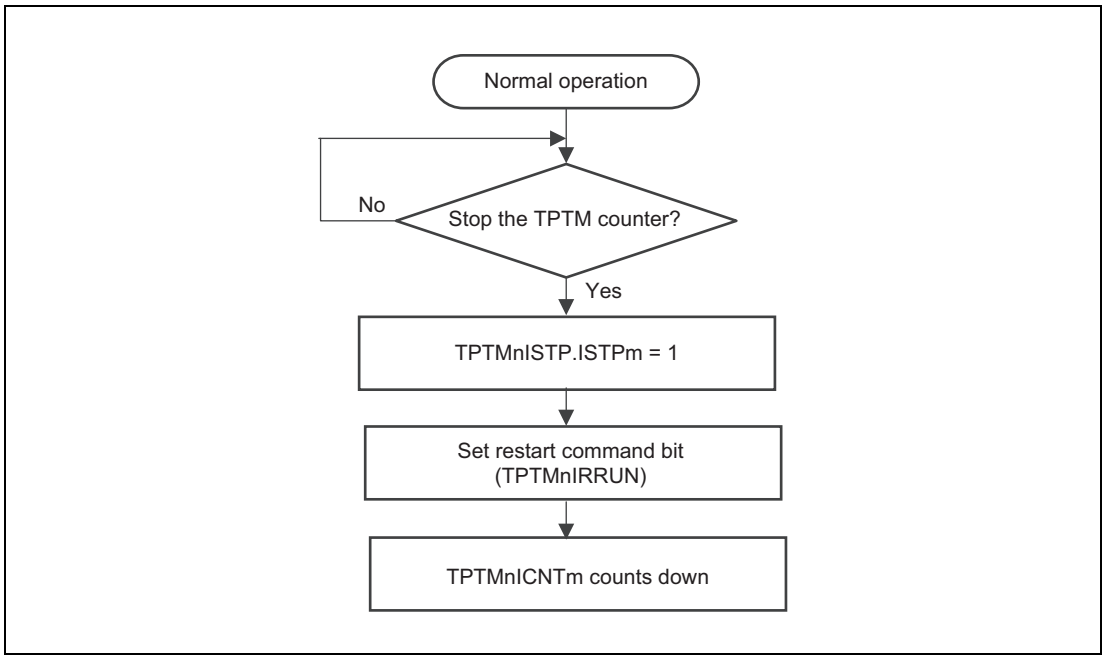

Figure 3.57 Flow of Operation during a Restart

TPTMnICNTm starts countdown at the next cycle after setting TPTMnIRUN.

TPTMnICNTm stops countdown at the next cycle after setting TPTMnISTP during countdown.

TPTMnICNTm restarts countdown from the current counter value at the next cycle after setting TPTMnIRRUN during countdown stop.

The timing chart of interval timer operation at the time of restart when the counter clock ratio is 1/2 period of CPU_CLK and load data value is 0000 0004$_H$ is shown in **Figure 3.58**.

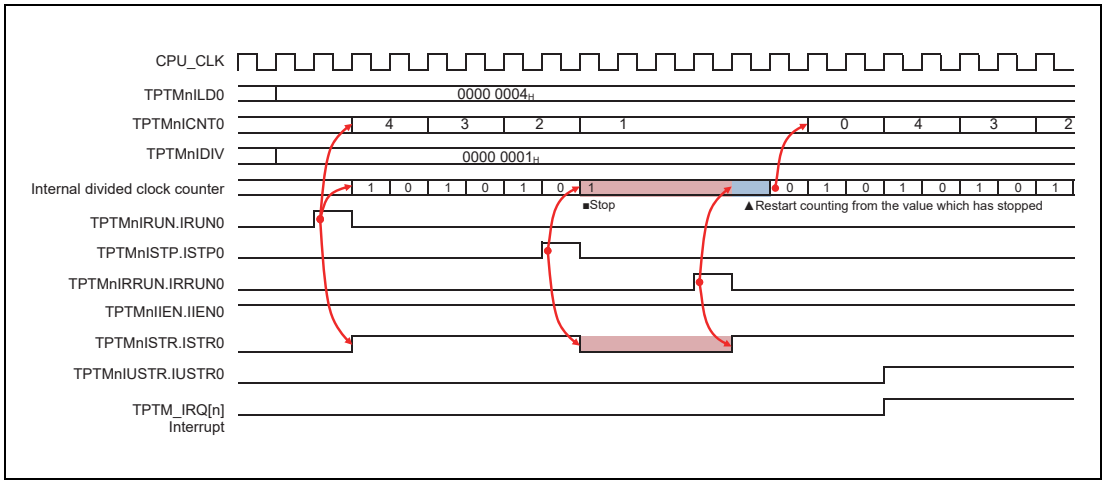

Figure 3.58 Operation during a Restart (TPTMnIDIV = 0000 0001$_H$, TPTMnILD = 0000 0004$_H$)

(3) Operation during an Underflow

If the interval counter is still running even when the TPTMnCNTm is 0000 0000$_H$, counter under flow will occur and TPTMnIUSTR.IUSTRm bit will be set at the next cycle.

When TPTMnIIEN.IIENm is 1$_B$, an interrupt is enabled, TPTMnIUSTR.IUSTRm is set and TPTM_IRQ is asserted at the next cycle after TPTMnCNTm becomes 0000 0000$_H$.

When CPU has finished interrupt processing of TPTM, it needs to clear TPTMnIUSTR.IUSTRm.

Cycles of TPTMn Interrupt

The cycles of TPTMn Interrupt are as follows.

- TPTMn Interrupt generation cycle = TPTMnCNTm × Counter-Clock cycle*

  *Counter-Clock cycle = CPU_CLK × (TPTMnIDIV+1)

When TPTMnIIEN.IIENm is 0, an interrupt is disabled, TPTMnIUSTR.IUSTRm is set but TPTM_IRQ is not asserted at the next cycle after TPTMnCNTm becomes 0000 0000$_H$. In this case, TPTM_IRQ is asserted if TPTMnIIEN.IIENm is set before TPTMnIUSTR.IUSTRm is cleared.

3.7.3.2 Free-run Timer Operation

Free-run timer operation is same as interval timer basically, except following features. The explanation for common feature is omitted.

- Counter direction is up-counter. TPTMnFCNT value is incremented by every TPTMnFDIV period.
- No load value register. TPTMnFCNT always starts 0000 0000$_H$ by setting TPTMnFRUN.FRUN bit.
- No interrupt assertion for the counter overflow.
- Number of channels: 1 channel

3.7.3.3 Up Timer Operation

Up timer operation is same as interval timer basically, except following features. The explanation for common feature is omitted.

- Counter direction is up-counter. TPTMnUCNTm value is incremented by every TPTMnUDIV period.
- No load value register. TPTMnUCNT always starts 0000 0000_H by setting TPTMnURUN.URUNm bit.
- Edge interrupt asserted based on counter value comparison. INTTPTMUni is asserted either when TPTMnUCNT0 = TPTMnUCMP0i or when TPTMnUCNT1 = TPTMnUCMP1i.
- Number of channels: 2 channels

3.8 Inter-VM Communication (IVC)

Data communication between Virtual Machines (VMs) is accomplished through shared memory blocks. This hardware supports function to establish a single owner for this shared memory block without Virtual Machine Monitor (VMM)*1 management at any time. This function is called Inter-VM communication (IVC).

Note 1. Virtual Machine Monitor (VMM) or hypervisor means Software that manages virtual machines.

3.8.1 Features

IVC supports function below

- Access control is based on CRAM guard function (CRG).
- Only two VMs can exchange data with the shared memory block.
- Only either VM is permitted to write the memory block. The write accessible VM is called “owner”. Write access permission is called “ownership”.
- Two VMs can exchange the ownership to write the shared memory block.
- The current owner can block the ownership request by another VM. In this case, it is possible that current owner can change the ownership.

3.8.2 Registers

IVC function is based on CRAM guard function. In this section, Registers related to IVC function are described. Refer to **Section 44, Functional Safety** to see about the detail of CRAM guard function register.

3.8.2.1 Register Base Address

Table 3.195 Register Base Address

Base Address Name	Base Address	Peripheral Group
<GUARD_CRAMCRG0_base>	FFC6 D000$_H$	P-Bus Group 0
<GUARD_CRAMCRG1_base>*1	FFC6 D200$_H$	P-Bus Group 0
<GUARD_CRAMCRG2_base>*2	FFC6 D400$_H$	P-Bus Group 0
<GUARD_CRAMCRG3_base>	FFC6 D600$_H$	P-Bus Group 0
<GUARD_CRAMCRG01_base>	FFC6 E800$_H$	P-Bus Group 0
<GUARD_CRAMCRG11_base>*1	FFC6 EA00$_H$	P-Bus Group 0
<GUARD_CRAMCRG21_base>*2	FFC6 EC00$_H$	P-Bus Group 0
<GUARD_CRAMCRG31_base>	FFC6 EE00$_H$	P-Bus Group 0

Note 1. This base address is not available in RH850/U2A8 and RH850/U2A6.
Note 2. This base address is not available in RH850/U2A6.

3.8.2.2 List of Register

Table 3.196 List of Registers

Module Name	Register Name	Register Symbol	Address	Access Size	Access Protection	
					IBG	Other
CRAMCRGn *5	Channel protection control register	CRGPROTm (m = 0 to 7)	<GUARD_CRAMCRGn_base> + 10_H + m * 20_H	8, 16, 32	*1	CRGKCPROT
	Inter-VM Communication Access Permission Register	CRGIVCSPIDm (m = 0 to 7)	<GUARD_CRAMCRGn_base> + 20_H + m * 20_H	8, 16, 32	*1	*2
CRAMCRGn1 *5	Inter-VM Communication Ownership Request Register	CRGIVCREQm (m = 0 to 7)	<GUARD_CRAMCRGn1_base> + 00_H + m * 20_H	32	—	*3
	Inter-VM Communication Ownership Request Lock Register	CRGIVCLOCKm (m = 0 to 7)	<GUARD_CRAMCRGn1_base> + 04_H + m * 20_H	32	—	*4
	Inter-VM Communication Current Ownership Register	CRGIVCOWNRm (m = 0 to 7)	<GUARD_CRAMCRGn1_base> + 08_H + m * 20_H	32	—	—

Note 1. n=0: PBG00#3
n=1: PBG00#4
n=2: PBG00#5
n=3: PBG00#6

Note 2. It is possible to write to this register when CRGKCPROT.KCE=1 and CRGPROTm.OW=0.

Note 3. Write operation that matches to conditions below is valid when CRGSPIDm.OW=1
When CRGIVCLOCKm.LK=0, master with SPID that is assigned to CRGIVCSPIDm register
When CRGIVCLOCKm.LK=1, master that has the ownership of IVC function

Note 4. It is possible to write to this register when either condition below matches CRGKCPROT.KCE=1.
Write access from the current owner VM, when CRGPROTm.OW=1.

Note 5. n is the cluster number.
RH850/U2A-EVA, RH850/U2A16: n = 0, 1, 2, 3
RH850/U2A8: n = 0, 2, 3
RH850/U2A6: n = 0, 3

3.8.2.3 CRGPROTm — CRAM Guard Control Register

Specifies the access to be protected for CRAM. Access prohibited by any of the identifiers is protected as unauthorized access. This register is used to specify the settings for those other than SPID. This register also is used to enable or disable the function of IVC.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base> + 10_H + m × 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OW
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

	—	—	—	—	—	—	—	GEN	—	DBG	—	UM	—	—	WG	RG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R	R	R/W	R/W

Table 3.197 CRGPROTm Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	OW	Enable Inter-VM Communication function. It enable to control CRGSPIDm register setting, even if CRGKCPROT.KCE is set to 0. 0: Disable Inter-VM Communication function. It is possible to write to CRGSPIDm register when CRGKCPROT.KCE is set to 1. 1: Enable Inter-VM Communication function. Only VMs with an SPID set in CRGIVCSPIDm register can control CRGSPIDm register setting by access to CRGIVCREQm and CRGIVCLOCKm registers, even if CRGKCPROT.KCE is set to 0.
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	GEN	Enables/disables guard setting. For more details, see **Section 44.5.5, CRG**
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	DBG	R/W enable setting for debug master. For more details, see **Section 44.5.5, CRG**
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	UM	R/W disable setting in user mode. For more details, see **Section 44.5.5, CRG**
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	WG	Write Global Enable. For more details, see **Section 44.5.5, CRG**
0	RG	Read Global Enable. For more details, see **Section 44.5.5, CRG**

3.8.2.4 CRGIVCSPIDm — Inter-VM Communication Access Permission Register

Defines which VMs are used for IVC function. SPID values, which are assigned to VMs for IVC function, are set to this register. VMs that are set to this register can control CRGSPIDm register setting by access to CRGIVCREQm and CRGIVCLOCKm registers. When KCE bit in CRGKCPROT register is 1 and OW bit in CRGPROTm register is 0, it is possible to write to this register. It is mandatory to set only 2bits, that are SPID bits of VM to control IVC function.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <GUARD_CRAMCRGn_base>+ 20_H + m × 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVCSPID[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVCSPID[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 3.198 CRGIVCSPIDm Register Contents

Bit Position	Bit Name	Function
31 to 0	IVCSPID	Setting of CRGSPIDm register access permission This register is a list of bits representing SPID value to be used for IVC. Each bit number shows SPID value assigned to VM. When CRGPROTm.OW is set to 1 and IVCSPID[n] is set to 1, VM that has SPID=n is permitted the write access to CRGIVCREQm and CRGIVCLOCKm registers for Inter VM communication. This register is writeable only when CPGKCPROT.KCE=1 and CRGPROTm.OW=0. [n]=0: Write access from VM with SPID=n to CRGSPIDREQm and CRGIVCLOCKm registers is not permitted. (n=0-31) [n]=1: Write access from VM with SPID=n to CRGSPIDREQm and CRGIVCLOCKm registers is permitted. (n=0-31)

Note 1. It is mandatory to set only two bits to control Inter-VM Communication.

3.8.2.5 CRGIVCREQm — Inter-VM Communication Ownership Request Register

Sets the trigger to issue the request of the ownership, when Inter-VM Communication is valid. Only access from VMs that are set to CRGIVCSPIDm register is accepted.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <GUARD_CRAMCRGn1_base> + 00_H + m × 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVCREQ[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVCREQ[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 3.199 CRGIVCREQm Register Contents

Bit Position	Bit Name	Function
31 to 0	IVCREQ	Issue the ownership request from VM. This register is write only register. Read data is always 0. When VM assigned to IVC function writes any data to this register, CRGSPIDm register can be updated from the current SPID value to another SPID value to be used for IVC function. Ownership request is issued when CRGPROTm.LK = 0. - Write access from either VM, when CRGIVCLOCKm.LK = 0. - Write access from the current owner. It does not depend on CRGIVCLOCKm.LK value.

3.8.2.6 CRGIVCLOCKm — Inter-VM Communication Ownership Request Lock Register

Locks the request from non-owner VM. This register is writable when KCE bit in CRGKCPROT register is 1 or the write access from the owner when CRGPROTm.OW is set to 1. This register is automatically cleared, when the current owner writes to CRGIVCREQm register.

Access: This register can be read or written in 32-bit units.

Address: <GUARD_CRAMCRGn1_base> + 04_H + m × 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3.200 CRGIVCLOCKm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	LK	Block the ownership request from VM that does not have the ownership. It is possible to write to this bit, when either condition below matches. - CRGKCPROTm.KCE = 1 - CRGPROTm.OW = 1 and the access from the owner VM It is possible to clear this register automatically, when the owner writes to CRGIVCREQm register to release the ownership. 0: Ownership request is accepted. 1: Ownership request is NOT accepted.

3.8.2.7 CRGIVCOWNRm — Inter-VM Communication Current Ownership Register

It is possible to read the status of the current owner. The value of this register is same with the value of CRGSPIDm register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <GUARD_CRAMCRGn1_base> + 08_H + m × 20_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	IVCOWN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IVCOWN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 3.201 CRGIVCOWNRm Register Contents

Bit Position	Bit Name	Function
31 to 0	IVCOWN	Current owner SPID for Inter-VM Communication This register is read-only register, and the value is same with that of CRGSPIDm register.

3.8.3 Function

Each VM is identified by SPID value. Inter-VM Communication controls shared memory (CRAM) access with SPID setting of CRAM guard function.

CRAM guard operation can be changed to support Inter-VM Communication, when OW bit in CRGPROTm is set to 1.

GRGIVCSPIDm register defines SPID values of VMs to be used for Inter-VM Communication. This register must be set to 1 for only 2 bits exactly because Inter-VM Communication supports only data exchange with 1-to-1 VMs. Therefore, it is necessary to be set by the trusted software like VMM.

It is necessary for CRGSPIDm register to set either SPID value to be used for IVC function.

Two VMs assigned to IVC function can control the condition of CRGSPIDm register with CRGIVCREQm and CRGIVCLOCKm registers without setting KCE bit in CRGKCPROT register to 1. By CRGIVCREQm register write access from VM for IVC function, CRGSPIDm value can be updated from the current SPID to another SPID. Setting 1 to LK bit in CRGIVCLOCKm, CRGSPIDm cannot be updated by request from non-owner VM.

3.8.3.1 Example of Operation

This section is described about the example of IVC operation.

- Condition
  - SPID value of VMs for IVC: VM0 (SPID=1) and VM1 (SPID=7)
  - VM0 has the ownership
- Necessary initial register setting to enable IVC function
  - CRGSPIDm.SPID[1] = 1 (CRGSPIDm = 00000002_H)
  - CRGIVCSPIDm[1] and CRGIVCSPIDm[7] are set to 1. (CRGIVCSPIDm=00000082_H)
  - CRGPROTm.OW = 1
  - Other CRAM guard setting (Address range, Guard function enable and so on)
- Case 1: VM0 writes to CRGIVCREQm register.
  - CRGSPIDm register value changes from 00000002_H to 00000080_H. (Ownership is changed)
- Case 2: VM1 writes to CRGIVCREQm register.
  - CRGSPIDm register value changes from 00000002_H to 00000080_H. (Ownership is changed)
- Case 3: VM0 writes to CRGIVCREQm register after VM0 set 1 to CRGIVCLOCKm register.
  - CRGSPIDm register value changes from 00000002_H to 00000080_H (Ownership is changed)
  - CRGIVCLOCKm register is automatically cleared.
- Case 4: VM1 writes to CRGIVCREQm register after VM0 set 1 to CRGIVCLOCKm register.
  - CRGSPIDm register value keeps 00000002_H. (Ownership is kept)
  - CRGIVCLOCKm register keeps 00000001_H.
- Case5: VM1 write to CRGIVCLOCKm register
  - CRGIVCLOCKm register keeps 00000000_H. Because VM1 is not an owner.

3.8.4 Software flow of IVC

Software flow is described for IVC.

3.8.4.1 Initial setting for IVC

Initial setting must be executed by the trusted software.

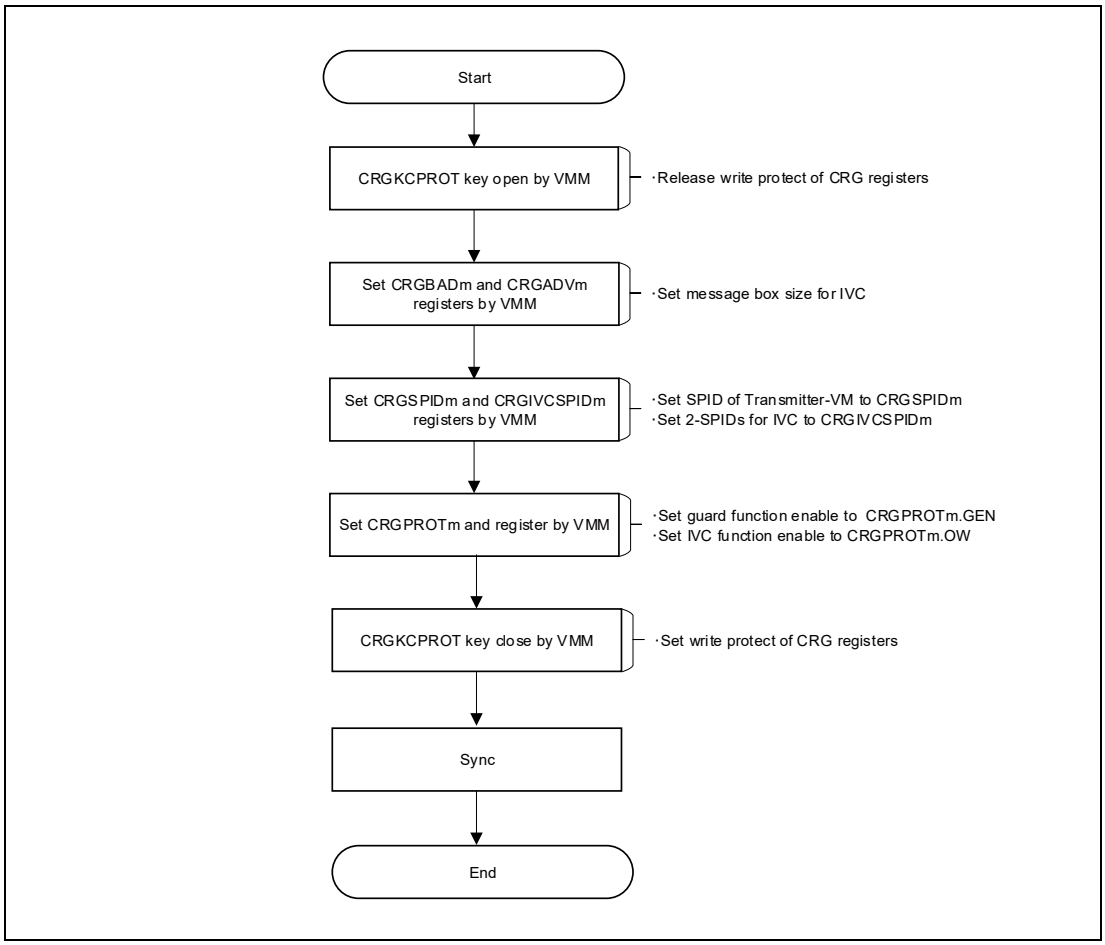

Figure 3.59 Initial Setting Flow for IVC

3.8.4.2 Data Transfer and Pass the Ownership

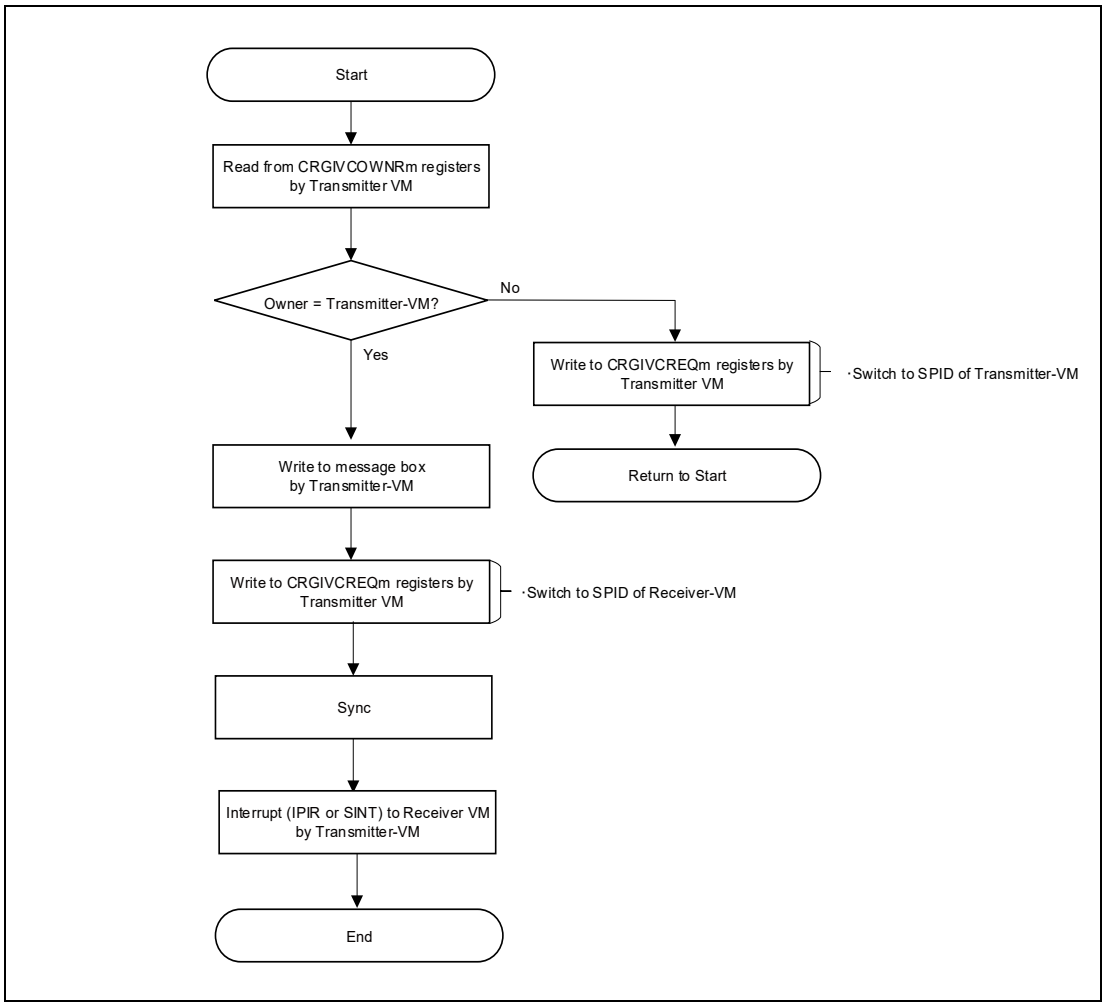

Figure 3.60 Data Transfer and Pass the Ownership Flow

3.8.4.3 Data Received

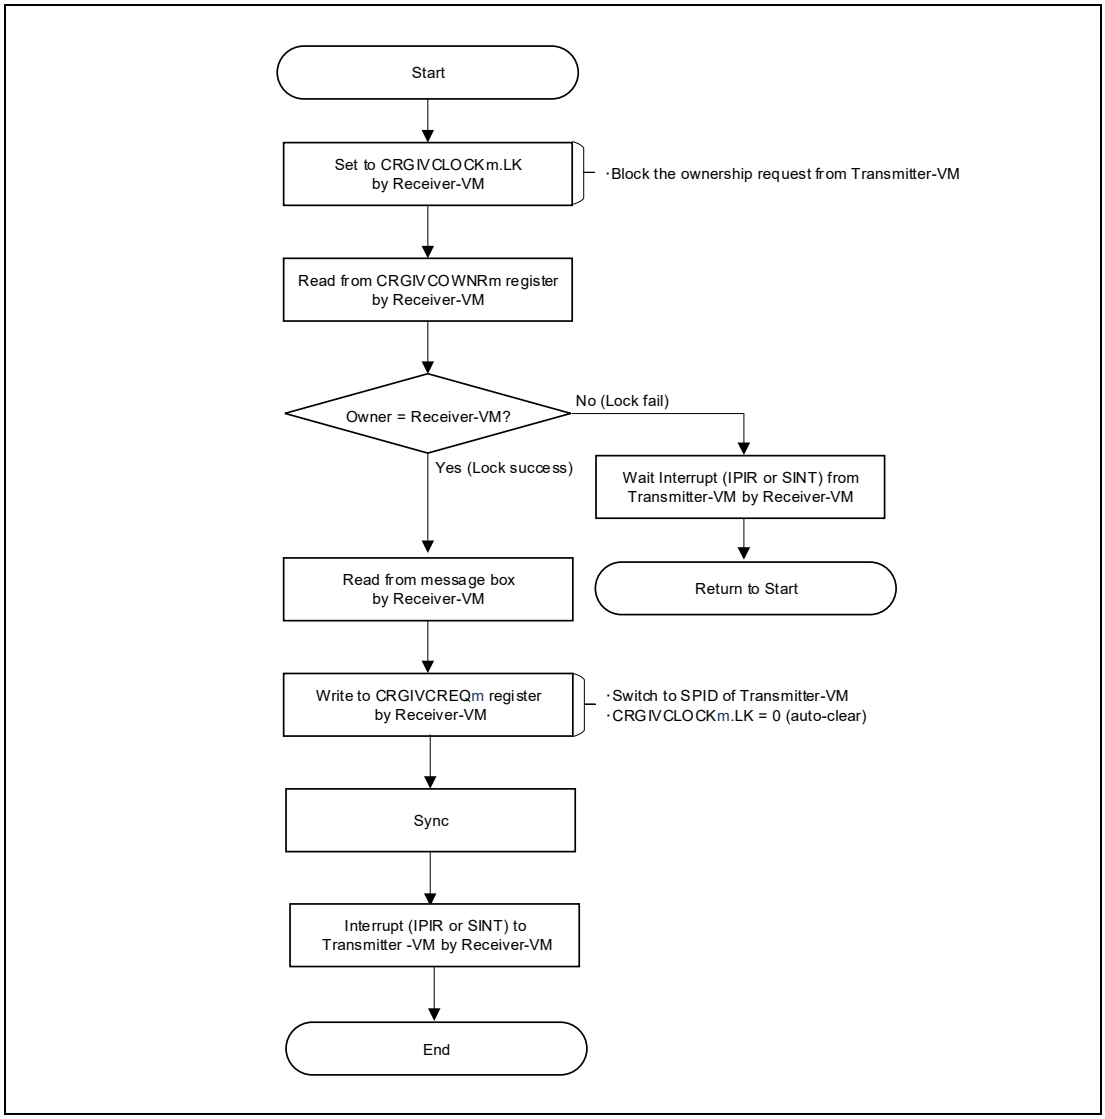

Figure 3.61 Data Received Flow

3.9 Usage Notes

3.9.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation

When a control register is updated by a store instruction, there is a time lag from execution of the store instruction by the CPU to actual updating of the control register. Therefore, appropriate processing for synchronization is required to ensure that control registers reflect updated values before execution of subsequent instructions. The processing for synchronization is shown below.

For details on the procedure regarding updating of the system registers by the LDSR instruction and synchronization with subsequent instructions, refer to **Section 3.2.7.3, Hazard Management after System Register Update**.

3.9.1.1 When Updated Results in the Control Registers or Memory are Reflected in the Implementation of a Subsequent Instruction:

Example 1: An interrupt may be enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

(1) Store instruction to update a control register (ST.W, etc.)

(2) Dummy reading of the above-mentioned control register (LD.W, etc.)*1

(3) SYNCP

(4) Subsequent instruction (EI, etc.)

Example 2: Implement the same processing even when the access required after waiting to secure the updating of a given control register (register A) is to another control register (register B). This includes the following cases: the interlinked operation of different peripheral modules and when releasing the interrupt mask in INTC after making peripheral module settings.

However, this processing is unnecessary if control registers A and B are in the same P-Bus Group.

For the correspondence between the P-Bus Groups and the peripheral modules/registers, see each section.

(1) Store instruction to update control register A (ST.W, etc.)

(2) Dummy reading of the above-mentioned control register (LD.W, etc.)*1

(3) SYNCP

(4) Store/Load instruction to access control register B (ST.W, LD.W, etc.)

The same processing is also required when access to control registers and memory within the scope of protection starts after waiting for the completion of settings for safety functions such as memory protection, ECC checking, and so on.

Moreover, the same processing is also required when guarantee the completion of store accesses to memory.

Note 1. Dummy reading of any register of the same P-Bus Group can be used instead.

3.9.1.2 When the Updated Results in the Control Registers and Memories are Reflected in the Instruction Fetch of a Subsequent Instruction:

1. If you wish to write an instruction to the RAM and then branch to the RAM to execute the written instruction, do this as follows.
   (1) Store instruction to update a memory (ST.W, etc.)
   (2) Dummy reading of the above-mentioned memory (LD.W, etc.)
   (3) SYNCI
   (4) Subsequent instruction (branch instruction, etc.)
2. When branching to a target memory after waiting for the completion of updating the control registers for memory protection and ECC, do this as follows.
   (1) Store instruction to update a control register (ST.W, etc.)
   (2) Dummy reading of the control register (LD.W, etc.)
   (3) SYNCI
   (4) Subsequent instruction (branch instruction, etc.)

3.9.1.3 Product information of SYNCM

The following table shows the correspondence between the module names given in **Table 3.136, Bus Slaves that Support Using the SYNCM Instruction to Wait for the Completion of Storage in This CPU** and the module names in this product information document.

Table 3.202 Module Name Correspondence in this Product Information Document

Module name in *Table 3.136*	Module name of this product information document
L1RAM (given CPU)	Local RAM (own core)
L1RAM (other CPU)	Local RAM (other core)
L2RAM	Cluster 0/1/2/3 RAM
INTC1	INTC1
Others	There is no module corresponding to "Others" in this product

3.9.1.4 Product information of Waiting for the Completion of Storage

Table 3.203 Bus Slaves for which Using Dummy Reading to Wait is Effective

Bus Slaves	Description
L1RAM (given CPU)	Local RAM (own core)
L1RAM (other CPU)	Local RAM (other core)
L2RAM	Cluster 0/1/2/3 RAM
INTC1	INTC1
Others	All peripheral module

3.9.2 Synchronization of Load Instruction Completion and Subsequent Instruction Generation

When a control register and memory is accessed by a load instruction, the order of data accesses does not guarantee the same order of program. Therefore, appropriate processing for synchronization is required to ensure the completion of a load instruction for the subsequent data access instructions. However, the synchronization processing is not necessary for accesses to some target data space. For details on target data space, refer to **Section 4.2.2, Data Space Accessible by CPUs**. The processing for load synchronization is shown below.

Example) It is necessary to wait for the completion of a load access to an address A before an access to other address B, proceed as follows in this case.

(1) Load instruction to refer Address A (LD.W, etc.*1)

(2) SYNCP

(3) Store/Load instruction to access Address B (ST.W, LD.W, etc.*1)

Note 1. Load instruction: LD.*, SLD.*, LDV.*, TST1, SET1, CLR1, NOT1, POPSP, RESBANK, DISPOSE, SWITCH, CALLT, SYSCALL, CAXI, LDL
Store instruction: ST.*, SST.*, STV.*, SET1, CLR1, NOT1, PUSHSP, PREPARE, CAXI, STC

3.9.3 Accesses to Registers by Bit-Manipulation Instructions

Processing of a bit-manipulation instruction takes the form of atomic reading, modification, and writing of an eight-bit unit. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. However, take care in the cases of registers that contain multiple flag bits, since the read-modify-write cycle may also clear flags other than those which were for clearing.

Write access to H-Bus group registers by using bit-manipulation instructions is not atomic. Access by other masters may interrupt the read-modify-write processing of these instructions.

3.9.4 Ensuring Coherency after Code Flash Programming

For PE0 and PE1, see **Section 3.2.9, Ensuring Coherency after Code Flash Programming**.

For ICUMHA, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

3.9.5 Overwriting Context when Acknowledging Multiple Exceptions

Exceptions may be acknowledged regardless of the states of the ID or NP bits of the PSW register. This depends on the type of exception. When multiple exceptions occur, the contents of the system registers which hold the context information are overwritten. Regarding the conditions for acknowledging exceptions from each source and the possibility of return and recovery, see **Section 3.2.4, Exceptions and Interrupts**.

3.9.6 Usage Notes on Prefetching

CPU executes speculative instruction fetching from locations after the current value of the program counter to maintain the throughput of instruction fetches. Reading from memory due to such prefetching may proceed even from locations to which instruction codes have not been assigned (Note 1. in **Figure 3.62**). Note the following and keep in mind that the CPU does not execute values read in such cases.

The following notes apply to instruction fetching from memory in general.

- Occurrence of ECC errors due to values in memory being undefined

This prefetching may lead to an ECC error in case of reading from the code flash memory after it has been erased or from the Local RAM or Cluster RAM before initialization. When instruction codes are assigned to memory, initialize said area with values as desired (Note 1. in **Figure 3.62**).

- Detection of illegal access by the Slave Guard (CRG, PEG, etc.)

The Slave Guard may detect such prefetching as illegal access. To prevent prefetching being detected as an illegal access, do not allow any region of overlap area with said areas (Note 1. in **Figure 3.62**) and areas to which access is prohibited by the Slave guard. Prefetch from an reading from an area protected by the MPU does not cause a memory protection exception.

- Access to Access Prohibited Area

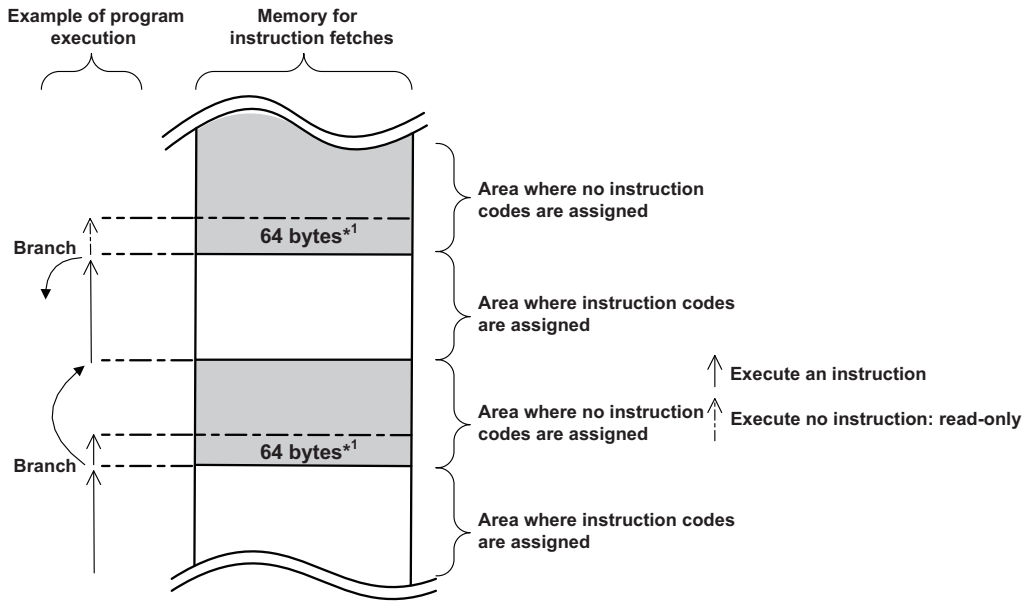
Prefetch can also cause access to unimplemented area.

This caution needs to be taken care also for RAM instruction fetch.

Assign instruction codes to memory without allowing any overlap between said area (Note 1. in **Figure 3.62**) and an access-prohibited area.

- Speculative read operation by Prefetch

Depending on the decode result of prefetch instruction, the CPU may issue speculative read request to Local RAM (own core), Local RAM (other core), Cluster RAM or Code Flash. The lockstep error described in **Section 44.4.5, Usage Note** may be occurred by speculative read request. If it is unnecessary as a result of branch instruction, the data is discarded.



Note 1. Area from final address of instruction code to final address + 64 bytes. Even if instruction codes are not placed in this area, requests for prefetching may lead to reading from memory at the time of branching

Figure 3.62 Areas that Require Attention Regarding Prefetching

3.9.7 Product information of initial value for G4MH register

The G4MH register's initial values of the product dependent are shown below.

Table 3.204 The initial value for G4MH register

Register No	Symbol	Initial value
SR0,1	SPID, HMSPID*7	*1
SR1,1	SPIDLIST, HMSPIDLIST*7	FFFF FFFF$_H$
SR2,1	RBASE	*2
SR6,1	PID	0784 0700$_H$*3
SR16,1	HVCFG	*4
SR0,2	PEID, HMPEID*7	*5
SR1,2	BMID	*6
SR24,4	ICCTRL	0001 0003$_H$
SR26,4	ICCFG	0000 1044$_H$
SR16,9	GMSPID*7	*1
SR17,9	GMSPIDLIST*7	FFFF FFFF$_H$
SR30,9	GMPEID*7	*5
SR12,13	L1RCFG	*11
SR2,12	LSCFG	*8
SR2,5	MPCFG	0002 001F$_H$*9
SR0,3	DBGEN*7	0000 01FF$_H$
SR28,3	DBCFG*10	0000 000B$_H$

Note 1. The initial values of SPID/GMSPID register are listed below.
CPU0: 0000 0000$_H$
CPU1: 0000 0001$_H$
CPU2: 0000 0002$_H$
CPU3: 0000 0003$_H$

Note 2. See **Section 4, Address Space** about RBASE register's bit to 31 from 9. Initial value of RBASE.DV bit is 0 and Initial value of RBASE.RINT bit is 0.

Note 3. Bit 23 relates to Virtualization features. See the *RH850G4MH Virtualization User's Manual: Hardware*.

Note 4. The initial value of HVCFG register is defined by Option Byte. See **Section 51, Flash Memory** for details.

Note 5. The initial values of PEID/GMPEID register are listed below.
CPU0: 0000 0000$_H$
CPU1: 0000 0001$_H$
CPU2: 0000 0002$_H$
CPU3: 0000 0003$_H$

Note 6. The initial values of BMID register are listed below.
CPU0: 0000 0000$_H$
CPU1: 0000 0001$_H$
CPU2: 0000 0002$_H$
CPU3: 0000 0003$_H$

Note 7. These registers relate to Virtualization features. For details, see the *RH850G4MH Virtualization User's Manual: Hardware*.

Note 8. The initial value of LSCFG are listed below.
CPU0: 0000 0001$_H$
CPU1, CPU2, CPU3: is defined by Option Byte. See **Section 51, Flash Memory** for details.

Note 9. MPCFG.NBK = 0 means that there is only one MPU bank mounted in this product.

Note 10. This register relates to Debug features. For details, see the *RH850/U2A-EVA Group User's Manual: Emulation*.

Note 11. The initial values of L1RCFG register are listed below.
U2A-EVA, U2A16 and U2A6: 0000 4004$_H$
U2A8: 0000 4002$_H$

3.9.8 Product information of SYSERR factor

The product-dependent SYSERR causes are shown below. Refer to **Section 3.2.4, Exceptions and Interrupts**.

Table 3.205 Production information of SYSERR factor

Exception Cause Code*1	Cause
11_H	When any of the following errors occurs in instruction fetch • ADDRESS ECC error in Local RAM, Cluster RAM and Code Flash • Guard error in PEG, CRG and security guard.*2 • Address Feedback error in LRAM and Cluster RAM • An unimplemented area is fetch accessed
13_H	When any of the following errors occurs in instruction fetch • Uncorrectable DATA ECC error in Local RAM, Cluster RAM and Code Flash (including cases where 1-bit correction is prohibited) • Address parity error in Code Flash.

Note 1. Refer to **Section 3.2.4, Exceptions and Interrupts** about another exception cause code (excluding 11_H and 13_H)

Note 2. Guard error caused by security setting. For details of Security guard, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

NOTE

If system register SR16, 13 is accessed by write operation, SYSERR exception whose codes are different from the code in **Table 3.103, Lower-order 16 Bits of the Exception Cause Codes Associated with the SYSERR Exception** may occur. Therefore, write access to SR16,13 is prohibited.

When an error occurs in instruction fetch at the time of cache miss or cache invalid, following ECM error sources may not be notified and following error information registers may not be updated.

< ECM error sources >

No.80: Code Flash - Address parity error

No.81: Code Flash - Data ECC 2-bit error

No.82: Code Flash - Data ECC 1-bit error

No.83: Code Flash - ECC overflow error

< Error information registers>

ECMmESSTR2 CF_SERSTR

CF_DERSTR CF_OVFSTR

CF_SERINF CF_nSEADR

CF_00DEADR

However, by executing the following sequence in the SYSERR exception handler, the above notification and the update can be performed. In that case, note that the access information will be recorded as load since it is not fetch access.

- Clear(0) RDBCR.RDBEN
- Read memory area from FEPC to FEPC+7 using LD.H instruction

3.9.9 Product Information of Cache Structure

The product-dependent cache structure are shown below.

Table 3.206 Product information of Cache Structure

Cache structure	RH850/U2A-EVA	RH850/U2A16	RH850/U2A8	RH850/U2A6
Total Size	16 KB	16 KB	16 KB	16 KB
Number of Way	4 ways	4 ways	4 ways	4 ways
Number of Line	128 lines	128 lines	128 lines	128 lines

3.9.10 Product Information of Fetch Size

These product's CPU(RH850G4MH2) fetch size is 64-Bit.

3.9.11 Register Initialization

The CPU in this product has general purpose registers and system registers which value after reset are undefined. In case of lockstep core, initial value of the master core and checker core after reset may be different. Therefore, these registers must be initialized at first. The registers which need the initialization are shown in **Table 3.207**.

For Usage of Lockstep Error, see **Section 44, Functional Safety**.

Table 3.207 Registers must be Initialized

Type	Registers
General purpose register	r1 to r31
Basic system register	EIPC, FEPC, CTPC, EIWR, FEWR, EBASE, INTBP, MEA, MEI, RBIP
FPU system register *1	FPSR, FPEPC, FPST, FPCC
MPU function register	MCA, MCS, MCR, MPLA*3, MPUA*3, MPAT*3, MPIDn, MCI
Cache operation function register	ICTAGL, ICTAGH, ICDATL, ICDATH, ICERR
Virtualization support function system register*2	HVSB
Guest Context Register*2	GMEIPC, GMFEPC, GMEBASE, GMINTBP, GMEIWR, GMFEWR, GMMEA, GMMEI.

Note 1. When FPU is valid, the undefined bits of these registers must be initialized to 0.

Note 2. When the virtualization support function is valid, the undefined bits of these registers must be initialized to 0. For details of those registers, see the *RH850G4MH Virtualization User's Manual: Hardware.*

Note 3. The registers of all the 32 MPU entries should be initialized. Set the index register MPIDX from 0 to 31, and initialize the corresponding MPLA, MPUA, MPAT registers.

3.9.12 Error Notifications

The error notifications of this module are listed in the following table.

Table 3.208 Error Notifications

Error Notification	Description	ECM error Number	Error Response to bus master
Multi-hit error (PE0)	Instruction cache Multi-hit error	—	√
Way error (PE0)	Instruction cache Way error	—	√
Multi-hit error (PE1)	Instruction cache Multi-hit error	—	√
Way error (PE1)	Instruction cache Way error	—	√
Multi-hit error (PE2)	Instruction cache Multi-hit error	—	√
Way error (PE2)	Instruction cache Way error	—	√
Multi-hit error (PE3)	Instruction cache Multi-hit error	—	√
Way error (PE3)	Instruction cache Way error	—	√
Data Access Error (PE0)*1	PE0 data access error	255	—
Data Access Error (PE1)*1	PE1 data access error	287	—
Data Access Error (PE2)*1	PE2 data access error	319	—
Data Access Error (PE3)*1	PE3 data access error	351	—

Note 1. This error is generated due to the error response caused by some error.
For details of the error response caused by some error, see the column for Error Response to bus master in Error Notifications Table shown in each section.

3.9.13 Target for LDL, STC and CAXI Instructions

LDL, STC and CAXI instructions target only local RAM and cluster RAM.

Section 4 Address Space

4.1 Overview

Table 4.1 and **Table 4.2** show the address space for each product.

For further details of Code Flash and Data Flash area, see **Section 51, Flash Memory**.

For details of ECC Test Area, see the *RH850/U2Ax Safety Application Note*.

Table 4.1 Address Space (Single Map Mode) (1/3)

Start Address	End Address	Area	Availability of Area √: Available, —: Not available					Access from		
			U2A-EVA (U2A16 mode)	U2A-EVA (U2A8 mode)	U2A16	U2A8	U2A6	CPU	DMA modules	H-Bus modules

1000 0000$_H$	FFFF FFFF$_H$	This address area does not change even in double map mode. See **Table 4.1**.								

Note 1. Non-overlay mirror area of 0000 0000$_H$ - 03FF FFFF$_H$

Note 2. Blank Check Area for 0000 0000$_H$ - 03FF FFFF$_H$ or 0800 0000$_H$ - 0BFF FFFF$_H$

: Fetch and data access available

: Data access available

: Access prohibited

4.2 Address Space Viewed from Each Bus Master

4.2.1 Space in which instructions can be fetched

1. Instructions of CPUs can be fetched from the code flash, local RAM and Cluster RAM.
2. The reset vector (RBASE initial value) of CPUs:
   - In User Boot Mode with CPU0, its head address is 0800 0000_H.
   - In User Boot Mode with CPUn (n:1-3), its head address is same as in Normal Operation Mode.
   - In Normal Operation Mode with CPUn (n:0-3), its head address can be set within Code Flash (User Area) by Reset Vector PEn (OPT_RBASEn).
     If Code Flash is in Double Map Mode, it can be selected within Valid area.
     (The size of User Area depends on the products. See **Section 51.3.1, Mapping of Code Flash Memory** for each variant. See also **Section 51.12, Configuration Setting Area (Option Bytes, Reset Vector)** for setting of OPT_RBASEn.)

NOTE

For assignment of instruction codes, see **Section 3.9.6, Usage Notes on Prefetching**.

4.2.2 Data Space Accessible by CPUs

See **Section 4.1, Overview** for the accessible spaces from CPUs.

NOTE

The data accesses inside the following target data space are operated in the same order as the program.

- Code Flash
- H-Bus area Group 0, 1, 2, 3
- Debug (CPU0, CPU1, CPU2, CPU3)
- Instrumentation RAM
- Cluster ERAM (Cluster 0, 1)
- Global Emulation RAM
- Cluster RAM (Cluster 0, 1, 2, 3)
- P-Bus area Group 0, 1, 2H/2L, 3, 4, 5, 6H/6L, 7, 8, 9
- I-Bus area Group 0, 1, 2
- CPU peripheral area (self, CPU0, CPU1, CPU2, CPU3)

The load accesses inside the following target data space may be operated before the completion of the preceding access (load or store). In order to guarantee the order of accesses, synchronization processing by software for the preceding access is necessary.

- Local RAM (self, CPU0, CPU1, CPU2, CPU3)

For the data accesses between different target spaces, the order of data accesses is not guaranteed as the program order.

In order to guarantee the order of accesses, synchronization processing by software for the preceding access is necessary.

For details of synchronization processing, refer to **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** and **Section 3.9.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation**.

4.2.3 Data Space Accessible by DMA modules

See **Section 4.1, Overview** for the accessible spaces from DMA modules.

4.2.4 Data Space Accessible by H-Bus modules

See **Section 4.1, Overview** for the accessible spaces from H-Bus modules.

NOTE

Only RHSIF can access to H-Bus slave modules. For other H-Bus master, this area poses as reserved area. [For U2A-EVA, U2A16 and U2A8 Only]

4.3 Error notification for an access to unmapped area

When any master accesses to “unmapped area” in which the significant resource is not assigned, error response via bus to the access master is signaled. See **Table 4.3** for error response to bus master. Regarding of the reaction for an error response of each area, see **Section 4.3.1** to **Section 4.3.9**.

Table 4.3 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
Unmapped Area Error	Unmapped area access error	—	√

4.3.1 Unmapped Code Flash area access error

Error response will be notified if accessed to the area represented as "Not available" in **Section 4.1, Overview**.

Table 4.4 and **Table 4.5** describe the area that notify error response for access.

For details of Code Flash and Data Flash area, see **Section 51, Flash Memory**.

Table 4.4 Error Notifications of Code Flash area (Single Map Mode) (1/2)

Start Address	End Address	Area	Error Response ER: Available, —: Not available

1000 0000$_H$	FFFF FFFF$_H$	This address area does not change even in double map mode. See **Table 4.1**.					

Note 1. The following errors also occur.
* ECC 2-bit error
* Address Parity Error depending on the address

Note 2. Same as 0000 0000$_H$ to 03FF FFFF$_H$

Note 3. For details of ECC Test Area, see the *RH850/U2Ax Safety Application Note*.

Note 4. See **Section 51, Flash Memory**.

4.3.2 Unmapped Cluster RAM area access error

Error response will be notified if accessed to the area represented as "Not available" in **Section 4.1, Overview**.

Table 4.6 Error Notifications of Cluster RAM area

Start Address	End Address	Area	Error Response ER: Available, —: Not available				
			U2A-EVA (U2A16 mode)	U2A-EVA (U2A8 mode)	U2A16	U2A8	U2A6

FE84 0000$_H$	FEFF FFFF$_H$	Reserved	ER	ER	ER	ER	ER

Note 1. CRG (Cluster RAM Guard) error will be occurred even without guard setting when access to this area.

4.3.3 Unmapped Local RAM area access error

Error response will be notified if accessed to the area represented as "Not available" in **Section 4.1, Overview**.

Error response will be notified if accessed to Local RAM (self) by DMA/DTS or H-Bus.

Availability of error notification depends on PEx_DISABLE setting in OPBT3, if accessed to Local RAM (CPUx). (x:1-3)

4.3.4 Unmapped CPU peripheral area access error

Error response will be notified if accessed to the area represented as "Not available" in **Section 4.1, Overview**.

Error response will be notified if accessed to CPU peripheral (self) by DMA/DTS or H-Bus.

Availability of error notification depends on PEx_DISABLE setting in OPBT3, if accessed to CPU peripheral area (CPUx). (x:1-3)

4.3.5 Details of P-Bus area

Error response will be notified if accessed to the area represented as "Unmapped area" and "Not available of other areas".

Table 4.7 List of P-Bus area access (1/27)

Note 1. The access does not output an error response.

Note 2. PBG(P-Bus Guard) error will be occurred according to setting of PBG00#1 when access to this area.

4.3.6 Details of H-Bus area

Error response will be notified if accessed to reserved area.

Table 4.8 List of H-Bus area access

Start Address	End Address	Area	Availability of Area √: Available, —: Not available					
			U2A-EVA (U2A16 mode)	U2A-EVA (U2A8 mode)	U2A16	U2A8	U2A6 (292 pins and 176 pins)	U2A6 (156 pins and 144 pins)

3C00 0000_H	3FFF $FFFF_H$	Reserved	—	—	—	—	—	—

Note 1. Only RHSIF can access to H-Bus slave modules. For other H-Bus master, this area poses as reserved area. [For U2A-EVA, U2A16 and U2A8 Only]

Note 2. The access does not output an error response.

4.3.7 Details of I-Bus area

Error response will be notified if accessed to reserved area.

When masters except PEx access the self registers of BARR, IPIR and TPTM, error response will be notified.

Table 4.9 List of I-Bus area access

Start Address	End Address	Area	Availability of Area √: Available, —: Not available				
			U2A-EVA (U2A16 mode)	U2A-EVA (U2A8 mode)	U2A16	U2A8	U2A6

FFFB $C000_H$	FFFB $FFFF_H$	Reserved	—	—	—	—	—

4.3.8 Debug area

Error response will be notified if accessed to F901 0000_H - F904 $FFFF_H$, FA00 0000_H - FA0F $FFFF_H$ by H-Bus.

Availability of error notification depends on PE_DISABLE setting in OPBT3 if accessed to F902 0000_H - F902 $FFFF_H$.

[For U2A-EVA(U2A16 mode)/U2A16]
Availability of error notification depends on PE_DISABLE setting in OPBT3 if accessed to F903 0000_H - F904 $FFFF_H$.

[For U2A-EVA(U2A16 mode)/U2A-EVA(U2A8 mode)]
Error response will be notified if accessed to FA10 0000_H - FB1F $FFFF_H$, FB40 0000_H - FB5F $FFFF_H$ by H-Bus.

[For U2A6]
Error response will be notified if accessed to FA10 0000_H - FB00 $1FFF_H$, FB02 0000_H - FB02 $1FFF_H$, FB04 0000_H - FB04 $1FFF_H$, FB06 0000_H - FB06 $1FFF_H$ by H-Bus.

4.3.9 Other area

Error response will be notified if accessed to $4000\ 0000_H$ - $F8FF\ FFFF_H$.

Section 5 Operating Modes

5.1 Features

This MCU has multiple operating modes, which can be selected with the five pins (FLMD0, FLMD1, FLMD2, MODE0 and $\overline{\text{TRST}}$) and the setting of STMSEL1, STMSEL0 in option byte. For details of STMSEL1, STMSEL0, see **Section 51, Flash Memory**. **Table 5.1** shows the list of the operating modes.

The values of FLMD0, FLMD1, FLMD2, MODE0 and $\overline{\text{TRST}}$ are latched at the rising edge of $\overline{\text{RESET}}$ to determine the operating mode, and part of the values of these pins should be kept during $\overline{\text{RESET}}$ = 1 except that the value of FLMD0 can be changed for selecting Flash Programming Interface in the Serial Programming Mode, for details of which pin should be kept refer to the **Table 5.1**. These pins are continually being monitored during operation to detect mode errors.

Table 5.1 Mode List

	Pins					OPBT					
	FLMD0	FLMD1	FLMD2	MODE0	$\overline{\text{TRST}}$	STMSEL1	STMSEL0	Operating Mode	Startup Area	Types of Debug Interface*1	Flash Programming Interface
User Mode	0	x	x	x	0	0	0	Normal Operating Mode	User Area*2	Nexus/LPD	—
	0	x	x	x	0	0	1	User Boot Mode 0	User Boot Area*3	Nexus/LPD	—
	0	x	x	x	0	1	x	Serial Programming Mode 0	Boot firmware	—	CSI
	0	x	x	x	1*5	x	0	Normal Operating Mode	User Area*2	Nexus/LPD	—
	0	x	x	x	1*5	x	1	User Boot Mode 0	User Boot Area*3	Nexus/LPD	—
	1	0	x	x	x	x	x	Serial Programming Mode 1	Boot firmware	—	2-wire UART/CSI*4
	1	1	0	x	x*5	x	x	User Boot Mode 1	User Boot Area*3	Nexus/LPD	—
	1	1	1	0	x	x	x	Boundary Scan Mode	—	BSCAN	—

Note 1. For the correspondence between the pin function and pin state in each debug interface. See **Section 2, Pin Functions**.

Note 2. Reset vector address can be set by option bytes. See **Section 51, Flash Memory**.

Note 3. The reset vector address of CPU0 is fixed to 0800 0000_H (head address in User Boot Area). The reset vector address of CPU 1 to 3 can be set by option bytes.

Note 4. For details of Flash Programming Interface is shown in **Section 51, Flash Memory**. CSI is the “Clocked Serial Interface”.

Note 5. CPU does not run after releasing the reset depending on option byte (CPUBTMSK_EN). BIST is not executed.

NOTE

To change operating mode shown below, restart from Power On Reset.

In the case of External Reset only, Power Control is not initialized and MCU does not restart properly.

- Serial Programming Mode 0 to User Boot Mode 1 and Boundary Scan Mode.
- Serial Programming Mode 1 to other than Serial Programming Mode 0/1.
- Other modes to Serial Programming Mode 0/1.

In addition to above mode change, restart from Power On Reset in the case of the following case as well.

- After first External Reset is released with $\overline{\text{TRST}}$ is 1 after power up, External Reset is asserted again with $\overline{\text{TRST}}$ is 0.

5.1.1 Normal Operation Mode

This mode is the basic mode for execution of application software. The On-chip debug functions can be used in this mode.

After reset release, instruction fetch is carried out from the user area. For reset vector of each CPU, see **Section 51, Flash Memory**.

The CPU will not autonomously run when $\overline{\text{TRST}}$ = 1. A debugger must be used to have the CPU run.

5.1.2 User Boot Mode 0/1

This mode is the same as Normal Operation Mode except the reset vector address of CPU0.

After reset release, instruction fetch of CPU0 is carried out from the user boot area.

Transition to chip standby modes is not supported in User Boot Mode 1.

5.1.3 Serial Programming Mode 0/1

A dedicated flash memory programmer can be used to handle the flash memory. After reset release, the MCU boots up from the On-chip boot program and starts connection in the specified protocol for flash programming. For details, see **Section 51, Flash Memory**.

CPUn (n! = 0) is disabled regardless of the option byte in this mode.

5.1.4 Boundary Scan Mode

This mode allows boundary scan tests compliant with IEEE Standard 1149.1.

CPU is disabled regardless of the option byte in this mode. For details, See **Section 53, Boundary Scan**.

5.2 Input Pins

Table 5.2 shows the pin information for mode setting. All mode terminals are taken in Mode Register. FLMD[2:1] and MODE0 can be used as GPIO.

Table 5.2 Pin information for mode setting

Pin Name	I/O	Function
FLMD0	Input	Operating mode select pin
FLMD1	Input	Operating mode select pin
FLMD2	Input	Operating mode select pin
MODE0	Input	Operating mode select pin
$\overline{\text{TRST}}$	Input	The shared of Nexus/JTAG Reset pin and operating mode select pin

5.3 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA / DTS requests.

The error notifications to ECM of this module are listed on the following table.

Table 5.3 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to Bus Master
Mode error during Normal Operation Mode/User Boot Mode	Unintended activation of Production Test Mode	24	—
Mode error during User Boot Mode	Unintended activation of Normal Operation Mode	25	—
Mode error during Normal Operation Mode	Unintended deactivation of Normal Operation Mode	26	—
Mode error during Normal Operation Mode/User Boot Mode	Unintended activation of Serial Programming Mode	27	—
Mode error during Normal Operation Mode	Unintended activation of User Boot Mode	28	—
Mode error during User Boot Mode	Unintended deactivation of User Boot Mode	29	—
Mode error during any mode	Mode check error	30	—
Unintended Debug Enable detection (PE0)	This error issued when CPU operating mode transits to debug mode without authentication from debugger	227	—
Unintended Debug Enable detection (PE1)	This error issued when CPU operating mode transits to debug mode without authentication from debugger	259	—
Unintended Debug Enable detection (PE2)	This error issued when CPU operating mode transits to debug mode without authentication from debugger	291	—
Unintended Debug Enable detection (PE3)	This error issued when CPU operating mode transits to debug mode without authentication from debugger	323	—

5.4 Register Description

5.4.1 List of Registers

The following table lists the operating modes registers.

Table 5.4 List of Registers

Register Name	Register Symbol	Address	Access Width	Value after reset	Access Protection	
					PBG	Other
Mode Register	MODE	FF98 4000_H	32	000X $00xx_H$	PBG20 #2	—

5.4.2 Reset of Registers

Register reset condition is shown in **Table 5.5**.

Table 5.5 Register Reset Condition

Register Symbol	Reset Condition						
	Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
MODE	—	√*1	—	—	—	—	—

Note 1. External Reset only

5.4.3 MODE — Mode Register

This register indicates the value of the mode pins and mode select option bytes latched when External Reset is released.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 4000$_H$

Value after reset: 000x 00xx$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STMSEL1	STMSEL0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	MODE0	FLMD2	FLMD1	FLMD0	TRST
Value after reset	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.6 MODE Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	STMSEL1	STMSEL1 This bit indicates the value of the Option byte STMSEL1 latched 0: Low-level 1: High-level
16	STMSEL0	STMSEL0 This bit indicates the value of the Option byte STMSEL0 latched 0: Low-level 1: High-level
15 to 5	Reserved	When read, the value after reset is returned.
4	MODE0	MODE0 This bit indicates the value of the Mode Pin MODE0 latched 0: Low-level 1: High-level
3	FLMD2	FLMD2 This bit indicates the value of the Mode Pin FLMD2 latched 0: Low-level 1: High-level
2	FLMD1	FLMD1 This bit indicates the value of the Mode Pin FLMD1 latched 0: Low-level 1: High-level
1	FLMD0	FLMD0 This bit indicates the value of the Mode Pin FLMD0 latched 0: Low-level 1: High-level
0	TRST	TRST This bit indicates the value of the Mode Pin $\overline{\text{TRST}}$ latched 0: Low-level 1: High-level

5.5 Mode Error

This MCU has the function to notify the ECM of errors when it detects an unintended activation of a different mode or unintended de-activation of the currently selected mode. The Mode pins, STMSEL0, and STMSEL1 bits are monitored to detect unintended changes. If these values change when they are not expected to change, then a mode check error will occur.
The unintended modes are as follows. For details, see **Section 45, Error Control Module (ECM)**.
Detectable unintended modes are shown in **Table 5.7**.

Table 5.7 The List of Detectable Mode Errors

User Intended Mode	Detectable Mode Error
Normal Operation Mode	Unintended deactivation of Normal Operation Mode.
	Unintended activation of User Boot Mode
	Unintended activation of Serial Programming Mode
	Unintended activation of Production Test Mode
User Boot Mode*1	Unintended deactivation of User Boot Mode.
	Unintended activation of Normal Operation Mode.
	Unintended activation of Serial Programming Mode
	Unintended activation of Production Test Mode
Other than On chip debug mode	Unintended Debug Enabled detection
Any mode	The detection of differences between latched value and coming level from Flash with STMSEL0, STMSEL1. It is called mode check error.

Note 1. User Boot Mode 1 is not included.

NOTE

Unintended activation or de-activation mode error can be detected only when the set of the external terminals and the set of STMSEL1, STMSEL0 are correspond with Normal Operation Mode or User Boot Mode 0 under the condition of $\overline{\text{TRST}}$ = 0.

Although it is possible to change FLMD0 after $\overline{\text{RESET}}$ is released, the mode error is also detected when FLMD0 is changed from “1” to “0”. (e.g. If FLMD0 is changed to 0 after $\overline{\text{RESET}}$ release with setting of Serial Programming Mode 1 and STMSEL1 = 0, “Unintended activation of Serial Programming Mode” is detected.)

Section 6 Interrupts

This section describes the interrupt units.

6.1 Features of Interrupt Units

6.1.1 Units and Channels

This microcontroller has the following number of interrupt units.

Table 6.1 Number of Units (INTC1)

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units per PE	1	1	1	1	1	1	1	1	1	1
Unit Name	INTC1									

Table 6.2 Number of Units (INTC2)

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1	1	1	1	1	1	1	1	1	1
Unit Name	INTC2									

Table 6.3 Number of Units (INTIF)

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units per PE	1	1	1	1	1	1	1	1	1	1
Unit Name	FEINC									

6.1.2 Register Base Address

The register base addresses of the interrupt units are listed in **Table 6.7**.

The address of each register in this section is specified as an offset from one of these base addresses.

Table 6.7 Register Base Address

Base Address Name	SELF/PE	Base Address	Bus Group
<INTC1_SELF_base>	INTC1 of SELF	FFFC 0000$_H$	—
<INTC1_PE0_base>	INTC1 of PE0	FFFC 4000$_H$	CPU Peripheral 0
<INTC1_PE1_base>	INTC1 of PE1	FFFC 8000$_H$	CPU Peripheral 1
<INTC1_PE2_base>	INTC1 of PE2	FFFC C000$_H$	CPU Peripheral 2
<INTC1_PE3_base>	INTC1 of PE3	FFFD 0000$_H$	CPU Peripheral 3
<INTC2_base>	—	FFF8 0000$_H$	P-Bus Group 0
<INTIF_base>	—	FF09 0000$_H$	P-Bus Group 9
<EINT_base>	—	FFC0 0000$_H$	P-Bus Group 6L
<FENC_base>	—	FF9A 3A00$_H$	P-Bus Group 2L
<FEINC_PE0_base>	FEINC of PE0	FF9A 3B00$_H$	P-Bus Group 2L
<FEINC_PE1_base>	FEINC of PE1	FF9A 3C00$_H$	P-Bus Group 2L
<FEINC_PE2_base>	FEINC of PE2	FF9A 3D00$_H$	P-Bus Group 2L
<FEINC_PE3_base>	FEINC of PE3	FF9A 3E00$_H$	P-Bus Group 2L

6.1.3 Clock Supply

Clock supplies for each interrupt unit are shown in the following table.

Table 6.8 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
INTC1	clk	CLK_CPU
INTC2	pe_clk	CLK_CPU
	bus_clk	CLK_HBUS
INTIF	pclk	CLK_HBUS
EINT	clk_lsb	CLK_LSB
FENC	pclk	CLKA_LPS
FEINC	pclk	CLKA_LPS

6.1.4 Reset Sources

The reset sources for initialization of the interrupt units are shown in **Table 6.9**.

Table 6.9 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
INTC1	All registers*1	√	√	√	√	√	—	—
INTC2	All registers*1	√	√	√	√	√	—	—
INTIF	All registers*1	√	√	√	√	√	—	—
EINT	All registers*1	√	√	√	√	√	—	—
FENC	All registers*1	√	√	√	√	—	—	—
FEINC	All registers*1	√	√	√	√	—	—	—

Note 1. See **Table 6.13**.

6.1.5 External Input/Output Signals

External input/output signals of the interrupt units are listed below.

Table 6.10 External Input/Output Signals (1/2)

Unit Signal Name	Direction	Outline	Alternative Port Pin Signal
INTP0	Input	External pin INTP0	JP0_0, P0_0, P2_6, P6_13, P4_0, P10_7, P20_14
INTP1	Input	External pin INTP1	JP0_1, P0_1, P4_10, P6_7, P10_10, P10_12
INTP2	Input	External pin INTP2	JP0_2, P0_2, P3_3, P3_8, P4_13
INTP3	Input	External pin INTP3	JP0_3, P0_3, P2_5, P4_5, P6_5
INTP4	Input	External pin INTP4	P0_4, P2_0, P2_2, P4_7, P17_2
INTP5	Input	External pin INTP5	P0_5, P2_4, P2_7, P2_10, P4_12
INTP6	Input	External pin INTP6	P0_6, P2_6, P2_12, P4_15, P20_5
INTP7	Input	External pin INTP7	P0_7, P2_8, P2_14, P3_5, P20_8
INTP8	Input	External pin INTP8	P0_1, P0_8, P1_1, P3_9, P10_5, P22_3
INTP9	Input	External pin INTP9	P0_4, P0_9, P1_3, P3_10, P24_5
INTP10	Input	External pin INTP10	P0_5, P0_10, P1_5, P3_11, P20_14, P24_7
INTP11	Input	External pin INTP11	P0_7, P0_11, P1_7, P3_12, P24_9
INTP12	Input	External pin INTP12	P0_10, P0_12, P1_9, P3_13, P24_11
INTP13	Input	External pin INTP13	P0_11, P1_0, P1_11, P3_14, P24_13
INTP14	Input	External pin INTP14	P1_1, P1_13, P3_15, P8_1, P17_4
INTP15	Input	External pin INTP15	P1_2, P1_15, P4_2, P8_3, P17_6
INTP16	Input	External pin INTP16	P1_3, P2_9, P3_2, P4_9, P10_5, P10_8, P20_2, P20_14, P22_0
INTP17	Input	External pin INTP17	P1_4, P2_4, P3_3, P4_4, P24_4
INTP18	Input	External pin INTP18	P1_5, P2_1, P3_2, P3_4, P21_4, P21_7
INTP19	Input	External pin INTP19	P1_6, P2_11, P3_5, P4_15, P6_0

Table 6.10 External Input/Output Signals (2/2)

Unit Signal Name	Direction	Outline	Alternative Port Pin Signal
INTP20	Input	External pin INTP20	P1_7, P3_7, P4_11, P6_2, P6_15
INTP21	Input	External pin INTP21	P1_8, P2_3, P3_8, P4_6, P6_3
INTP22	Input	External pin INTP22	P1_9, P2_6, P4_0, P6_0, P6_4
INTP23	Input	External pin INTP23	P1_10, P2_13, P3_4, P4_1, P6_6
INTP24	Input	External pin INTP24	P1_11, P4_1, P5_6, P6_8
INTP25	Input	External pin INTP25	P1_12, P4_15, P5_2, P6_2, P6_11
INTP26	Input	External pin INTP26	P1_13, P5_3, P6_4, P6_12, P6_14
INTP27	Input	External pin INTP27	P1_14, P3_7, P5_6, P6_9, P6_14
INTP28	Input	External pin INTP28	P0_0, P1_0, P1_15, P4_4
INTP29	Input	External pin INTP29	P0_2, P1_2, P4_5, P8_0
INTP30	Input	External pin INTP30	P0_3, P1_4, P4_6, P8_1
INTP31	Input	External pin INTP31	P0_6, P1_6, P4_7, P8_2
INTP32	Input	External pin INTP32	P0_8, P1_8, P4_8, P8_3
INTP33	Input	External pin INTP33	P0_9, P1_10, P4_9, P8_4
INTP34	Input	External pin INTP34	P1_12, P4_10, P8_0, P8_5
INTP35	Input	External pin INTP35	P1_14, P4_11, P8_2, P8_6
INTP36	Input	External pin INTP36	P3_0, P5_4, P8_4, P8_7
INTP37	Input	External pin INTP37	P3_9, P6_9, P8_6, P8_8
INTP38	Input	External pin INTP38	P3_0, P3_11, P8_8, P8_9
INTP39	Input	External pin INTP39	P3_1, P3_13, P6_11, P8_10
FEINT	Input	External pin NMI	JP0_5, P4_7

Note: For details of Alternative Port Pin Signal, see Appendix “E02_01_List_of_Pin_Assignment.xlsx” in **Section 2, Pin Functions**.

6.1.6 Edge Detection Configuration

The external interrupts INTPm and NMI can be configured to generate an interrupt request upon a rising or falling edge or upon both edges of the external pin.

For details, refer to **Section 2.7, Noise Filter & Edge/Level Detector** and **Section 2.7.3.2, FCLACTLm_<name> — Filter Control Register**.

6.2 Overview

6.2.1 Outline

Interrupt Controller (INTC) determines priority of interrupt sources and controls interrupt requests to the CPU. INTC has a register to set priority for each interrupt source. Interrupt requests are processed according to the priority configured via the register.

INTC features

- Interrupt sources
  - Non-Maskable interrupt (FENMI): 1 channel for each CPU.
  - FE level interrupt (FEINT): 1 channel for each CPU.
  - Low latency EI level interrupt (maskable) (EIINT0 to 31):
    • 32 channels for each CPU.
    • Inter-processor interrupts: 4 channels shared on channel 0-3.
    • Broadcast interrupts: 4 channels shared on channel 4-7.
  - Low speed interrupts (maskable) (EIINT32 to 767):
    • 736 channels shared by all CPUs.
- Interrupt priority levels
  - Up to 64 priority levels can be configured by interrupt control registers.
- Interrupt detection method
  - The detection method of FEINT and EIINT interrupts are individually set to edge detection or level detection.
- Register banks.
  - For details about register banks, see **Section 3.2.4.5, Register Bank Function**.

INTC consists of INTC1 and INTC2.

- INTC1
  - All CPUs have their own interrupt controllers. Each CPU accesses the INTC1 that corresponds to the CPU. INTC1 controls low-latency interrupts and has the following functions:
    • Priority setting
    • Interrupt mask setting
    • Interrupt binding: Destination mode of the CPU (Host/Guest, GPID)
- INTC2
  - INTC2 is a common interrupt controller that all the CPUs share. INTC2 controls low-speed interrupts and has the following functions:
    • Priority setting.
    • Interrupt mask setting.
    • Interrupt binding: Destination PE, Destination mode of the CPU (Host/Guest, GPID).
    • Broadcast interrupt setting.

Others

- INTIF

  - Peripheral interrupt / TPTM interrupt control function.
- EINT
  - Software interrupt control function
- FENC
  - FENMI control function
- FEINC
  - FEINT control function

6.2.2 Functional Overview

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions. Exceptions are described in detail in **Section 3.2.4, Exceptions and Interrupts**.

The following three exceptions are called interrupts, and are described in this section:

- FE level Non-Maskable Interrupt (FENMI) An FENMI interrupt is acknowledged even if another FE level interrupt, FEINT, has been generated.
  - An FENMI interrupt is acknowledged even if the CPU system register PSW.NP = 1.
  - Return from an FENMI interrupt is not possible and recovery is disabled when multiple interrupts occur.
- FE level maskable interrupt (FEINT)
  An FEINT interrupt can be acknowledged only if an FE level non-maskable interrupt, FENMI, has not been generated.
  - An FEINT can be acknowledged if the CPU system register PSW.NP = 0.
  - Return is enabled and recovery is enabled.
- EI level maskable interrupt (EIINT)
  An EIINT interrupt can be acknowledged if an FE level interrupt, FENMI or FEINT, has not been generated.
  - An EIINT can be acknowledged only if the CPU system registers PSW.NP = 0 and PSW.ID = 0, and when the following two conditions are satisfied:
    - The interrupt priority level is higher than the priority level of the acknowledgment status, which is set to the CPU system register ISPR.
    - The interrupt priority level is higher than the priority level, which is set to the CPU system register PLMR.
  - Return is enabled and recovery is enabled.
  - Interrupt masking can be specified for each interrupt channel.
  - One of 64 interrupt priority levels can be specified for each interrupt channel.

For details about the PSW register, see **Section 3.2.3.2, (5) PSW — Program Status Word**.

6.2.3 Interrupt Sources

6.2.3.1 FE Level Non-Maskable Interrupts

For details about the priority order, return PC, status registers and return instructions, see **3.2.4, Exceptions and Interrupts**.

Table 6.11 Non-Maskable Interrupt Requests

Interrupt	Interrupt Request		Unit	Priority Order	Detection Type	Exception Cause Code	Offset Address
Symbol	Name	Cause					
FENMI	NMI	Secure WDT overflow interrupt	SWDT	*1	Edge	$0E0_H$	$0E0_H$

Note 1. See **Table 3.102, Exception Cause List**.

6.2.3.2 FE Level Maskable Interrupts

For details about the priority order, return PC, status registers and return instructions, see **Section 3.2.4, Exceptions and Interrupts**.

Table 6.12 FE Level Interrupt Requests

Interrupt	Interrupt Request	Unit	Priority Order	Detection Type	Exception Cause Code	Offset Address
Symbol	Cause					
PE0						
FEINT	NMI pin	Port	*1	Level	$F0_H$	$F0_H$
	Interrupt from Time Protection Timer for PE0*2	Time Protection Timer				
	FE level interrupt from the ECM	ECM				
PE1						
FEINT	NMI pin	Port	*1	Level	$F0_H$	$F0_H$
	Interrupt from Time Protection Timer for PE1*2	Time Protection Timer				
	FE level interrupt from the ECM	ECM				
PE2						
FEINT	NMI pin	Port	*1	Level	$F0_H$	$F0_H$
	Interrupt from Time Protection Timer for PE2*2	Time Protection Timer				
	FE level interrupt from the ECM	ECM				
PE3						
FEINT	NMI pin	Port	*1	Level	$F0_H$	$F0_H$
	Interrupt from Time Protection Timer for PE3*2	Time Protection Timer				
	FE level interrupt from the ECM	ECM				

Note 1. See **Table 3.102, Exception Cause List**.

Note 2. This interrupt can be used as an EIINT. See **Section 6.3.15, TPTMSEL — TPTM Interrupt FE EI Select Register**.

6.2.3.3 EI Level Maskable Interrupts

For details about the priority order, return PC and return instructions, see **Section 3.2.4, Exceptions and Interrupts**.

For details about the control registers, see **Section 6.3.2, EIC0 to EIC767 — EI Level Interrupt Control Register 0 to 767**.

For details, refer to Appendix file “Interrupt_table.xlsx”.

6.2.4 Block Diagram

The block diagram of the interrupt units is shown in **Figure 6.1**.

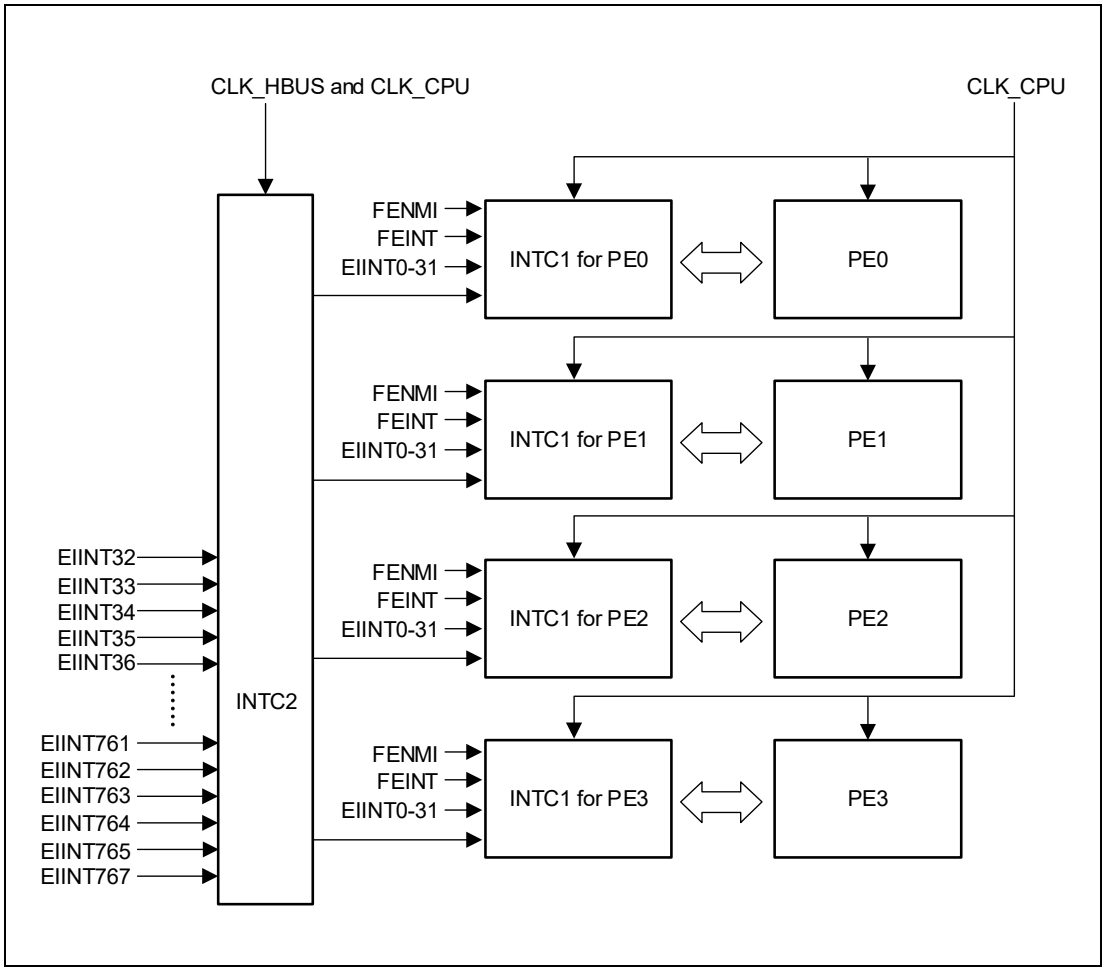

Figure 6.1 Block Diagram of Interrupt Units

6.3 Registers

6.3.1 List of Registers

Table 6.13 List of Register

Module Name	Register Name	Symbol	Address	Access	Access Protection	
					PEG/INTC2G/PBG	Other
INTC1	EI level Interrupt Control Register*1	EICn (n = 0 to 31)	<INTC1_PEx_base*2> + 0000_H + 02_H × n	8, 16	*3	—
	EI level Interrupt Mask Register*1	IMR0	<INTC1_PEx_base*2> + $00F0_H$	8, 16, 32	*3	—
	EI level Interrupt Bind Register*1	EIBDn (n = 0 to 31)	<INTC1_PEx_base*2> + 0100_H + 04_H × n	8, 16, 32	*3	—
	FE level Interrupt Bind Register	FIBD	<INTC1_PEx_base*2> + $01C0_H$	8, 16, 32	*3	—
	Extended EI level Interrupt Control Register	EEICn (n = 0 to 31)	<INTC1_PEx_base*2> + 0200_H + 04_H × n	8, 16, 32	*3	—
	BGEIINT Priority Level Setting Register	EIBG	<INTC1_PEx_base*2> + 0280_H	8, 16, 32	*3	—
	BGFEINT Channel Mask Setting Register	FIBG	<INTC1_PEx_base*2> + $02C0_H$	8, 16, 32	*3	—
	INTC1 Virtualization Configuration Register	IHVCFG	<INTC1_PEx_base*2> + $02F0_H$	8, 16, 32	*3	—
INTC2	EI level Interrupt Control Register*1	EICn (n = 32 to 767)	<INTC2_base> + 0000_H + 02_H × n	8, 16	INTC2GPROT_n	—
	EI Level Interrupt Mask Register*1	IMRn (n = 1 to 23)	<INTC2_base> + 1000_H + 04_H × n	8, 16, 32	INTC2GPROT_IMR	—
	INTC2 BGEIINT Priority Level Setting Register	I2EIBGm (m = 0 to 3)	<INTC2_base> + $1FE0_H$ + 04_H × m	8, 16, 32	INTC2GPROT_GR	—
	EI level Interrupt Bind Register*1	EIBDn (n = 32 to 767)	<INTC2_base> + 2000_H + 04_H × n	8, 16, 32	INTC2GPROT_GR	—
	Extended EI level Interrupt Control Register	EEICn (n = 32 to 767)	<INTC2_base> + 4000_H + 04_H × n	8, 16, 32	INTC2GPROT_n	—
INTIF	Peripheral Interrupt Status Register n	PINTn (n = 0 to 7)	<INTIF_base> + 00_H + 04_H × n	32	PBG90#4	—
	Peripheral Interrupt Status Clear Register n	PINTCLRn (n = 0 to 7)	<INTIF_base> + 20_H + 04_H × n	32	PBG90#4	—
	TPTM Interrupt FE EI Select Register	TPTMSEL	<INTIF_base> + 200_H	8, 16, 32	PBG90#4	—
EINT	Software Interrupt Register 0	SINTR0	<EINT_base>	8	PBG6L0#3	—
	Software Interrupt Register 1	SINTR1	<EINT_base> + 4_H	8	PBG6L0#3	—
	Software Interrupt Register 2	SINTR2	<EINT_base> + 8_H	8	PBG6L0#3	—
	Software Interrupt Register 3	SINTR3	<EINT_base> + C_H	8	PBG6L0#3	—
FENC	FENMI Status Register	FENMIF	<FENC_base>	32	PBG20#8	—
	FENMI Status Clear Register	FENMIC	<FENC_base> + 8_H	32	PBG20#8	—
FEINC	FEINT Status Register	FEINTF	<FEINC_PEx_base>	32	PBG20#8	—
	FEINT Event Mask Register	FEINTMSK	<FEINC_PEx_base> + 4_H	32	PBG20#8	—
	FEINT Status Clear Register	FEINTC	<FEINC_PEx_base> + 8_H	32	PBG20#8	—

Note 1. It is recommended to execute a DI instruction to avoid incorrect detection of interrupts when the settings of these registers are changed.

Note 2. PEx: PE0, PE1, PE2, PE3, SELF (x = 0 to 3)

Note 3. x = 0: GUARD_PE0CL0
x = 1: GUARD_PE1CL0
x = 2: GUARD_PE2CL1
x = 3: GUARD_PE3CL1

See **Section 44.5.4.3, List of Registers** for details of PEG.

The **Table 6.14** shows Access Authority of INTC1 registers.

Table 6.14 Access Authority of INTC1 registers

Symbol	Access Authority		Description
	IHVE = 1	IHVE = 0	
EICn (n = 0 to 31)	SV	UM	When IHVCFG.IHVE = 1 and the CPU is in Guest mode*1, EICn can be accessed only by the Guest*1 to which channel n is bound.
IMR0	SV	UM	When IHVCFG.IHVE = 1 and the CPU is in Guest mode*1, Bit n can be written by the Guest*1 to which channel n is bound.
EIBDn (n = 0 to 31)	HV*1	UM	When IHVCFG.IHVE = 0, some bits are treated as Reserved bit.
FIBD	HV*1	UM	When IHVCFG.IHVE = 0, some bits are treated as Reserved bit.
EEICn (n = 0 to 31)	SV	UM	When IHVCFG.IHVE = 1 and the CPU is in Guest mode*1, EEICn can be accessed only by the Guest*1 to which channel n is bound.
EIBG	HV*1	UM	When IHVCFG.IHVE = 0, this register is treated as Reserved register.
FIBG	HV*1	UM	When IHVCFG.IHVE = 0, this register is treated as Reserved register.
IHVCFG	HV*1	UM	—

Note: HV: Hypervisor
SV: Supervisor
UM: User mode

Note 1. For details of HV (Hypervisor), Guest mode, Guest, see the *RH850G4MH Virtualization User's Manual: Hardware*.

6.3.2 EIC0 to EIC767 — EI Level Interrupt Control Register 0 to 767

These registers define control of EI level interrupts. There is one register for each EI interrupt source. For a complete list of interrupt sources, see the Interrupt table. All bits except EIP[5:4] of EEICn are shared with EICn (n is from 0 to 767, similarly thereafter). Use EEICn register if channel n is set as non-broadcast channel (EIBDn.CST = 0) and channel n is bound to a PE in 64-priority mode (EIBDn.PEID=m and INTCFG.EPL of PEm = 1). EEICn and EICn must be used exclusively.

CAUTION

If the EIRFn bit is set to 0 immediately after a peripheral module generates the corresponding interrupt request upon detection of an edge (before an interrupt is acknowledged by the CPU), the request may be lost. If EIOVn bit is set to 0 immediately after a peripheral module generates a second interrupt request, the overflow flag (EIOVn bit) may be lost. If the EIRFn bit is set to 1 immediately after an interrupt is acknowledged by the CPU, a new interrupt request will be generated. This also applies to bit manipulation instructions (set1, clr1, not1) described in Section 3.9.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation. Executing a bit-manipulation instruction to a byte has no effect on the other byte. EIRFn or EIOVn can be unintendedly updated by bit manipulations to the other bits of the byte.

Access: This register can be read or written in 16-bit or 8-bit units.

Address: EIC0 to EIC31: <INTC1_PEx_base> + 0000_H + 02_H × n (n = 0 to 31, x = 0 to 3)
EIC32 to EIC767: <INTC2_base> + 0000_H + 02_H × n (n = 32 to 767)

Value after reset: $008F_H$ (edge detection), $808F_H$ (level detection)*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EICTn	—	—	EIRFn	—	—	—	—	EIMKn	EITBn	EIOVn	—	EIPn[3:0]			
Value after reset	0/1*1	0	0	0	0	0	0	0	1	0	0	0	1	1	1	1
R/W	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R	R/W*	R/W	R/W	R/W

Note 1. Interrupt detection by edge: 0_B
Interrupt detection by level: 1_B

Table 6.15 EIC0 to EIC767 Register Contents (1/2)

Bit Position	Bit Name	Function
15	EICTn	This bit indicates the type of interrupt detection. This bit is read only. 0: Detection by edge 1: Detection by level When writing in 8-bit or 16-bit units, write the value after a reset.
14, 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	EIRFn	Interrupt Request Flag Operation varies depending on the interrupt input interface. 0: No interrupt request (Initial value) 1: Interrupt request present • Edge detection This flag is automatically cleared to 0 when an interrupt request from its own channel is acknowledged by the CPU core. • Level detection This bit cannot be set or cleared by the software. This is a read-only bit.

Table 6.15 EIC0 to EIC767 Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	EIMKn	Interrupt Mask If this bit is set to 1, interrupt requests set by the interrupt request flag (EIRFn) are masked to inhibit interrupt requests from the channel to the CPU core. The presence of unprocessed interrupts is not reported and the PMEI bit in ICSR is not set for the channel for which this bit is set to 1. Even when interrupt processing is disabled by the setting of this bit, the input of an interrupt signal is not masked and the interrupt request flag is set. The state of this bit is also reflected in the Interrupt Mask Register (IMR). When the interrupt request from the channel is masked with EIMKn = 1, the EIRFn still reflects the interrupt request for the channel and can be polled in software. When the EIMKn bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the EIMKn bit is also reflected in the corresponding IMRm register. 0: Interrupt processing is enabled. 1: Interrupt processing is disabled. (Initial value)
6	EITBn	Interrupt Vector Method Select 0: Direct vector method 1: Table reference method
5	EIOVn	Interrupt Overflow 0: No interrupt overflow 1: EIINTn rose in edge-detection mode (mode_Eict[n] = 0) when EICn.EIRF = 1. This bit is independent of write access to EICn.EIRF. If EICn.EIRF=1, EICn.EIOVn=0, and 1 is written to EICn.EIRF by 8-bit access, EICn.EIOV is NOT set. EICn.EIOV bit can be unintendedly cleared even by bit manipulation instruction to the other bits in EICn[7:0]. To avoid this, use EEICn.
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	EIPn	These bits specify 16 interrupt priority levels (0: highest priority, 15: lowest priority). If two or more EI level interrupt requests are generated simultaneously, the source with a higher priority specified by these bits is selected and is sent to the CPU core. If the priorities specified by these bits are equal, the source with the lower default priority channel number is selected.

Note: n = 0 to 767
The values for the given channel numbers listed as reserved in the Interrupt table must not be set to anything other than their values after a reset.

NOTE

When a channel n is defined as broadcast interrupt (EIBDn.CST=1), EIMKn and EIRFn bits of the EICn register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask (EIMKn=1) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, EIC4 to EIC7 registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

6.3.3 IMR0 to IMR23 — EI Level Interrupt Mask Register 0 to 23

These registers are an aggregation of the EIMK bits from the EIC registers. Setting of the EIMK bit in the EIC register is reflected in this register. Also the setting of a bit in this register is reflected in the EIMK bit of the corresponding EIC register.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: IMR0: <INTC1_PEx_base> + $00F0_H$ (x = 0 to 3)
IMRn (n = 1 to 23): <INTC2_base> + 1000_H + 04_H × n

Value after reset: FFFF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EIMK (n × 32 + 31)	EIMK (n × 32 + 30)	EIMK (n × 32 + 29)	EIMK (n × 32 + 28)	EIMK (n × 32 + 27)	EIMK (n × 32 + 26)	EIMK (n × 32 + 25)	EIMK (n × 32 + 24)	EIMK (n × 32 + 23)	EIMK (n × 32 + 22)	EIMK (n × 32 + 21)	EIMK (n × 32 + 20)	EIMK (n × 32 + 19)	EIMK (n × 32 + 18)	EIMK (n × 32 + 17)	EIMK (n × 32 + 16)
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	EIMK (n × 32 + 15)	EIMK (n × 32 + 14)	EIMK (n × 32 + 13)	EIMK (n × 32 + 12)	EIMK (n × 32 + 11)	EIMK (n × 32 + 10)	EIMK (n × 32 + 9)	EIMK (n × 32 + 8)	EIMK (n × 32 + 7)	EIMK (n × 32 + 6)	EIMK (n × 32 + 5)	EIMK (n × 32 + 4)	EIMK (n × 32 + 3)	EIMK (n × 32 + 2)	EIMK (n × 32 + 1)	EIMK (n × 32 + 0)
Value after reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 6.16 IMR0 to IMR23 Register Contents

Bit Position	Bit Name	Function
31 to 0	EIMK (n × 32 + 31) to EIMK (n × 32 + 0)	These are interrupt mask bits for EI level maskable interrupt (INT) channels 0 to 767. 0: Interrupt processing enabled 1: Interrupt processing disabled

Note: n = 0 to 23
The value of EIMK bits listed as reserved for the given channel numbers in the Interrupt table must be set to 1.

NOTES

1. When writing to the EIMK bit by writing IMR1 to 23 registers, only access from the PE set in the EIBDn.PEID (n =32 to 767) register in the corresponding channel is possible. The EIMK bit is not updated when writing from a different PE.
2. When a channel is used as broadcast interrupt (EIBDn.CST=1), EIMK bit corresponding to the channel must be set to 0.
3. When virtualization is enabled, IMR1-23 write access control is the following table.

PEID	CPU mode	EIBD.GM	EIBD.GPID	Write control
Unmatch	-	-	-	Disable
Match	Host	-	-	Enable
Match	Guest	0	-	Disable
Match	Guest	1	Unmatch	Disable
Match	Guest	1	Match	Enable

6.3.4 EIBD0 to EIBD31 — EI Level Interrupt Bind Register 0 to 31

These registers are provided for each EI level interrupt source to define binding between interrupt sources and PEs. For details on each of the interrupt sources, see the Interrupt table.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC1_PEx_base> + 0100_H + 04_H × n (n = 0 to 31, x = 0 to 3)

Value after reset: 0000 0000_H (PE0)
0000 0001_H (PE1)
0000 0002_H (PE2)
0000 0003_H (PE3)

Table 6.17 EIBD0 to EIBD31 Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	GM	0: Channel is bound to Host partition 1: Channel is bound to Guest partition This bit can be written only if IHVCFG.IHVE = 1.
14 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	GPID[2:0]	These bits specify the destination partition when EIBDn.GM = 1. These bits can be written only if IHVCFG.IHVE = 1.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PEID[2:0]	These bits specify the interrupt bind (request) destination. These bits are fixed in EIBD0 to EIBD31 and cannot be modified. 000: Interrupt is bound to PE0. 001: Interrupt is bound to PE1. 010: Interrupt is bound to PE2. 011: Interrupt is bound to PE3.

Note: The values for the given channel numbers listed as reserved in the Interrupt table must not be set to anything other than their values after a reset.

NOTE

Changing the corresponding EIBDn register during the processing of an EIINT request is prohibited.

Note: n = 0 to 31

6.3.5 EIBD32 to EIBD767 — EI Level Interrupt Bind Register 32 to 767

These registers are provided for each EI level interrupt source to define a binding between interrupt sources 32 to 767 and CPU cores. For a list of interrupt sources, see the Interrupt table.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC2_base> + 2000_H + 04_H × n (n = 32 to 767)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CST	—	—	—	—	—	BCP[1:0]		—	—	—	—	—	—	—	—

Table 6.18 EIBD32 to EIBD767 Register Contents

Bit Position	Bit Name	Function
31	CST	Broadcast interrupt enable. If this bit is set, channel n is used as broadcast channel. This bit can be enabled only if EICn.EICT = 0 (Edge detection).
30 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25 to 24	BCP[1:0]	When the CST bit is 1, these bits specify a broadcast interrupt port number setting. When the CST bit is 0, these bits do not specify anything.
23 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	GM	0: Channel is bound to Host partition 1: Channel is bound to Guest partition This bit can be written only if IHVCFG.IHVE = 1.
14 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	GPID[2:0]	These bits specify the destination partition when EIBDn.GM = 1. These bits can be written only if IHVCFG.IHVE = 1.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PEID[2:0]	These bits specify the interrupt bind (request) destination. 000: Interrupt is bound to PE0. 001: Interrupt is bound to PE1. 010: Interrupt is bound to PE2. 011: Interrupt is bound to PE3. Other than above: Setting prohibited To execute an interrupt of the corresponding source, be sure to set one of the above values.

Note: The values for the given channel numbers listed as reserved in the Interrupt table must not be set to anything other than their values after a reset.

NOTE

Changing the corresponding EIBDn (n = 32 to 767) register during the processing of an EIINT request is prohibited.

6.3.6 FIBD — FE Level Interrupt Bind Register

These registers are provided for each FE level interrupt source to make correspondence between each source and PE.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC1_PEx_base> + $01C0_H$ (x = 0 to 3)

Value after reset: $0000\ 0000_H$ (PE0)
$0000\ 0001_H$ (PE1)
$0000\ 0002_H$ (PE2)
$0000\ 0003_H$ (PE3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 6.19 FIBD Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	GM	0: Channel is bound to Host. 1: Channel is bound to a Guest. This bit can be written only if IHVCFG.IHVE = 1.
14 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	GPID[2:0]	These bits specify the destination partition when EIBDn.GM = 1. These bits can be written only if IHVCFG.IHVE = 1.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PEID[2:0]	These bits specify an interrupt bind (request) destination. m: Interrupts are bound to PEm (m = 0 to 3). These bits of PEm is fixed to m.

6.3.7 EEIC0 to EEIC767 — Extended EI Level Interrupt Control Register 0 to 767

This register defines control of EI level interrupts. There is one register for each EI interrupt source. All bits except EIP[5:4] of EEICn are shared with EICn. Use EEICn register if channel n is set as non-broadcast channel (EIBDn.CST = 0) and channel n is bound to a PE in 64-priority mode (EIBDn.PEID=m and INTCFG.EPL of PEm =is 1) in 64-priority mode. EEICn and EICn must be used exclusively.

CAUTION

If EIRFn bit is set to 0 immediately after a peripheral module generates the corresponding interrupt request upon detection of an edge (before an interrupt is accepted by the CPU), the request may be lost. If EIOVn bit is set to 0 immediately after a peripheral module generates a second interrupt request, the overflow flag (EIOVn bit) may be lost.

If EIRFn bit is set to 1 immediately after an interrupt is accepted by the CPU, a new interrupt request will be generated.

This also applies to bit manipulation instructions (set1, clr1, not1) described in Section 3.9.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation.

Executing a bit-manipulation instruction to a byte has no effect on the other byte. EIRFn or EIOVn can be unintendedly updated by bit manipulations to the other bits of the byte.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: EEICn (n = 0 to 31): <INTC1_PEx_base> + 0200_H + 04_H × n (x = 0 to 3)
EEICn (n = 32 to 767): <INTC2_base> + 4000_H + 04_H × n

Value after reset: Value after reset: 0080 $000F_H$ (edge detection), 8080 $000F_H$ (level detection)*1

Interrupt detection by level: 1_B

Table 6.20 EEIC0 to EEIC767 Register Contents

Bit Position	Bit Name	Function
31	EICTn	This bit indicates the type of an interrupt detection. This bit is read only. 0: Detection with an edge 1: Detection of the level Written value to this bit must be the value after reset.
30, 29	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
28	EIRFn	Interrupt Request Flag Operation varies with the interrupt input interface. 0: No interrupt request (Initial value) 1: Interrupt request present • Edge detection This flag is automatically cleared to 0 when an interrupt request of the channel is accepted by the CPU core. • Level detection This bit cannot be set or cleared by the software. This is a read-only bit.
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23	EIMKn	Interrupt Mask If this bit is set to 1, interrupt requests set in the interrupt request flag (EIRFn) are masked to inhibit interrupt requests from the channel to the CPU core. Notification of presence of unprocessed interrupts is not made and the PMEI bit in ICSR is not set from channels for which this bit is set to 1. Even when the interrupt request from the channel is masked with EIMKn = 1, the EIRFn still reflects the interrupt request for the channel and can be polled in software. When the EIMKn bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the EIMKn bit is also reflected in the corresponding IMRm register. 0: Interrupt processing is enabled. 1: Interrupt processing is disabled. (Initial value)
22	EITBn	Interrupt Vector Method Select 0: Direct branching method based on priority 1: Table referencing method
21 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15	EIOVn	Interrupt Overflow 0: No interrupt overflow 1: EIINTn rose in edge-detection mode (mode_Eict[n] = 0) when EEICn.EIRF = 1. This bit is independent of write access to EEICn.EIRF. If EEICn.EIRF=1, EEICn.EIOVn=0, and 1 is written to EEICn.EIRF by 8-bit access, EEICn.EIOV is NOT set.
14 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	EIP5n to EIP0n	These bits specify 64 interrupt priority levels (0: highest priority, 63: lowest priority). If two or more EI level interrupt requests are generated simultaneously, a source with higher priority specified by these bits is selected and is sent to the CPU core. If the priority specified by these bits is equal, a source of less-number channel is selected as fixed priority. Note that the interrupt (EIINTn) with priority level 63 is not acknowledged in any case. For details, see **Section 3.2.4.1, (5) Interrupt Exception Priority and Priority Masking**. Even in 16-priority mode, EIP[5:4] is used for interrupt arbitration. EEICn.EIP[5:4] must be 0 if the channel is bound to a PE running in 16-priority mode.

Note: n = 0 to 767
The values of bits listed as reserved for the given channel numbers in the interrupt table must be retained after a reset.

6.3.8 IHVCFG — INTC1 Virtualization Configuration Register

This register is prepared for each INTC1 to enable configuration of virtualization-related bits of INTC1 registers. This register does not affect INTC1s in other PEs.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC1_PEx_base> + $02F0_H$ (x = 0 to 3)

Value after reset: $0000\ 000x_H$ (PE0)
$0000\ 000x_H$ (PE1)
$0000\ 000x_H$ (PE2)
$0000\ 000x_H$ (PE3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Note 1. Initial value is defined by Option Byte. See **Section 51.12, Configuration Setting Area (Option Bytes, Reset Vector)**.

Table 6.21 IHVCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	IHVE*2	Configuration of virtualization-related bits of INTC1 registers is enabled if this bit is set. Refer to the description of each register to know which bits are under control of this bit. It is mandatory that the value of this is bit is the same as the value of HVCFG.HVE bit even though the values can be configured independently.

Note 2. When the value of this bit needs to be changed from the initial value, the change must be made before the settings of other functions are changed, at the beginning of the CPU initialization process after releasing reset. Do not change the value of this bit during user program operation.

6.3.9 EIBG — BGEIINT Priority Level Setting Register

This register is used to configure priority threshold of BGEIINT used in request arbitration.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC1_PEx_base> + 0280_H (x = 0 to 3)

Value after reset: $0000\ 0000_H$ (PE0)
$0000\ 0000_H$ (PE1)
$0000\ 0000_H$ (PE2)
$0000\ 0000_H$ (PE3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 6.22 EIBG Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	BGPR[5:0]	These bits are priority threshold of BGEIINT used in request arbitration. EEICn.EIP < EIBG.BGPR: request to background Guest is allowed. EEICn.EIP ≥ EIBG.BGPR: request to background Guest is NOT allowed. (the less-number priority is the higher priority) These bits can be written only if IHVCFG.IHVE = 1. Set the same value to both EIBG.BGPR of PEx and I2EIBGm.BGPR.

6.3.10 I2EIBG0 to I2EIBG3 — INTC2 BGEIINT Priority Level Setting Register

This register is used to configure priority threshold of BGEIINT used in request arbitration.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC2_base> + $1FE0_H + 04_H \times m$ (m = 0 to 3)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 6.23 I2EIBG0 to I2EIBG3 Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5 to 0	BGPR[5:0]	These bits are priority threshold of BGEIINT to PEm used in request arbitration if EIBDn.PEID = m. EEICn.EIP < I2EIBGm.BGPR: request to background Guest is allowed. EEICn.EIP ≥ I2EIBGm.BGPR: request to background Guest is NOT allowed. (the less-number priority is the higher priority) Set the same value to both EIBG.BGPR of PEx and I2EIBGm.BGPR.

6.3.11 FIBG — BGFEINT Channel Mask Setting Register

This register is used to enable each BGFEINT.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units.

Address: <INTC1_PEx_base> + $02C0_H$ (x = 0 to 3)

Value after reset: $0000\ 0000_H$ (PE0)
$0000\ 0000_H$ (PE1)
$0000\ 0000_H$ (PE2)
$0000\ 0000_H$ (PE3)

Table 6.24 FIBG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BGE	0: FEINT to background Guest is NOT allowed. 1: FEINT to background Guest is allowed. This bit can be written only if IHVCFG.IHVE = 1.

6.3.12 SINTR0 to SINTR3 — Software Interrupt Register

SINTR0 to SINTR3 are 8-bit registers used to control software interrupts 0 to 3 (SINT0 to SINT3).

Writing 01_H to these registers increments the value of the counter; writing 00_H decrements it. When the value of the counter for any of these registers is 1 or more, the corresponding interrupt from among software interrupts 0 to 3 (SINT0 to SINT3) is generated. When reading the value from any of these registers, the read value is the current value of the counter.

Access: This register can be read or written in 8-bit units.

Address: <EINT_base> + 4 * n (n = 0 to 3)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	SINTCn[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 6.25 SINTR0 to SINTR3 Register Contents

Bit Position	Bit Name	Function
7 to 0	SINTCn[7:0]	Software Interrupt Request This bit generates a software interrupt. [Reading operation] The number of SINTn interrupt request counts is read out. [Writing operation] Writing 01_H: Increments the counter.*1 Writing 00_H: Decrements the counter.*2

Note 1. When 01_H is written to the register while the value of the counter is FF_H, the counter is not incremented and its value remains FF_H.

Note 2. When 00_H is written to the register while the value of the counter is 00_H, the counter is not decremented and its value remains 00_H.

6.3.13 PINTn + x — Peripheral Interrupt Status Register

All 128 DTS interrupt flags are divided between 8 registers PINT0 to PINT7. Each register contains 32 interrupt flags. Only one bit in each register PINT0 to PINT7 can be set. If multiple DTS channels within the same PINTn register request an interrupt, only the bit of the lowest DTS channel in that register is set.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <INTIF_base> + 00_H + 04_H × (n + x)

Value after reset: 0000 0000_H

6.3.14 PINTCLRn + x — Peripheral Interrupt Status Clear Register

Writing a value from the interrupt read register (PINTn) to the corresponding interrupt clear register (PINTCLRn) will clear that interrupt.

Access: This register is a write-only register that can be written in 32-bit units.

Address: <INTIF_base> + 20_H + 04_H × (n + x)

Value after reset: 0000 0000_H

- **PINTCLR n + x (n = 0 to 3, x = 0)**

31 to 0	INTCTCLR	These bits clear the DTS ch (0 + 32 × n) to (31 + 32 × n) transfer count match interrupt status. These bits should be written with the value corresponding to the PINT(n + x) register inside an interrupt handler routine.

6.3.15 TPTMSEL — TPTM Interrupt FE EI Select Register

This register selects how TPTM interrupts are mapped in each CPU core.

Access: This register can be read or written in 32-bit, 16-bit or 8-bit units

Address: <INTIF_base> + 200_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 6.30 TPTMSEL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	TPTMSEL3	This bit selects whether the FEINT or the EIINT is the TPTM interrupt of PE3. 0: The TPTM interrupt of PE3 is connected to FEINT. 1: The TPTM interrupt of PE3 is connected to EIINT
2	TPTMSEL2	This bit selects whether the FEINT or the EIINT is the TPTM interrupt of PE2. 0: The TPTM interrupt of PE2 is connected to FEINT. 1: The TPTM interrupt of PE2 is connected to EIINT
1	TPTMSEL1	This bit selects whether the FEINT or the EIINT is the TPTM interrupt of PE1. 0: The TPTM interrupt of PE1 is connected to FEINT. 1: The TPTM interrupt of PE1 is connected to EIINT
0	TPTMSEL0	This bit selects whether the FEINT or the EIINT is the TPTM interrupt of PE0. 0: The TPTM interrupt of PE0 is connected to FEINT. 1: The TPTM interrupt of PE0 is connected to EIINT

NOTE

In U2A-EVA, TPTM underflow interrupt (EIINT31) can not be used. Therefore, setting other than default value ($0000\ 0000_H$) to TPTMSEL register is prohibited in U2A-EVA.

6.3.16 FENMIF — FENMI Status Register

This register contains information about which interrupt has generated the FE level non-maskable interrupt (FENMI).

Access: This register is a read-only register that can be read in 32-bit units.

Address: <FENC_base>

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 6.31 FENMIF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	SWDTNMIF	Secure WDT overflow interrupt flag 0: No Secure WDT overflow interrupt occurred. 1: Secure WDT overflow interrupt occurred.

6.3.17 FENMIC — FENMIC Status Clear Register

This register clears the FE level non-maskable interrupt flag.

Access: This register is a write-only register that can be written in 32-bit units

Address: <FENC_base> + 8_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 6.32 FENMIC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SWDTNMIC	Secure WDT overflow interrupt flag clear 0: — 1: Secure WDT overflow interrupt flag is cleared.

6.3.18 FEINTF — FEINT Status Register

This register contains information about which interrupt has generated the FE level maskable interrupt (FEINT).

Access: This register is a read-only register that can be read in 32-bit units.

Address: <FEINC_PEx_base> (x = 0 to 3)

Value after reset: 0000 0000_H (PE0)
0000 0000_H (PE1)
0000 0000_H (PE2)
0000 0000_H (PE3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 6.33 FEINTF Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2	ECMPExFEINTF	ECM PEx FEINT occurrence 0: No ECM PEx FEINT occurred. 1: ECM PEx FEINT occurred.
1	TPTMPExFEINTF	TPTM PEx FEINT occurrence 0: No TPTM PEx FEINT occurred. 1: TPTM PEx FEINT occurred.
0	NMIFEINTF	NMI pin FEINT occurrence 0: No NMI pin FEINT occurred. 1: NMI pin FEINT occurred.

6.3.19 FEINTMSK — FEINT Event Mask Register

This register masks the FE level maskable interrupt (FEINT).

Access: This register can be read or written in 32-bit units.

Address: <FEINC_PEx_base> + 4_H (x = 0 to 3)

Value after reset: 0000 0007_H (PE0)
0000 0007_H (PE1)
0000 0007_H (PE2)
0000 0007_H (PE3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 6.34 FEINTMSK Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ECMPExFEINTMSK	ECM PEx FEINT mask 0: Not masked ECM PEx FEINT. 1: Masked ECM PEx FEINT.
1	TPTMPExFEINTMSK	TPTM PEx FEINT mask 0: Not masked TPTM PEx FEINT. 1: Masked TPTM PEx FEINT.
0	NMIFEINTMSK	NMI pin FEINT mask 0: Not masked NMI pin FEINT. 1: Masked NMI pin FEINT.

6.3.20 FEINTC — FEINT Status Clear Register

This register clears the FE level maskable interrupt flags.

Access: This register is a write-only register that can be written in 32-bit units

Address: <FEINC_PEx_base> + 8_H (x = 0 to 3)

Value after reset: 0000 0000_H (PE0)
0000 0000_H (PE1)
0000 0000_H (PE2)
0000 0000_H (PE3)

Table 6.35 FEINTC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When writing, write the value after reset.
2	ECMFEINTC	ECM FEINT flag clear 0: — 1: NMI pin FEINT flag is cleared.
1	TPTMFEINTC	TPTM FEINT flag clear 0: — 1: NMI pin FEINT flag is cleared.
0	NMIFEINTC	NMI pin FEINT flag clear 0: — 1: NMI pin FEINT flag is cleared.

6.4 Interrupt Operation

6.4.1 Level Interrupts

For the operation of level interrupts, see **Section 6.5.1, Level Interrupt Processing Flow**.

6.4.2 Inter-Processor Interrupts

For the operation of Inter-Processor Interrupts, see **Section 3.4, Inter-Processor Interrupt**.

6.4.3 Broadcast Interrupts

INTC2 has a function for broadcast interrupts. With this function, the EIINTn request input is transferred to EIINT4-7 of each CPU's INTC1 as a broadcast notification 0-3 with no priority judgement.

The interrupt detection type of the EIINTn must be edge detection if the broadcast function is used. The broadcast function cannot be activated (EIBDn.CST cannot be set) if the interrupt detection type of the EIINTn is configured as level detection.

When EIBDn.CST is set, EIINTn is used as the broadcast interrupt source.

EIBDn.BCP[1:0] determines which port of the broadcast interrupt (EIINT4-7) is triggered. It is prohibited to assign more than one interrupt channel to the same broadcast interrupt (EIINT4-7).

For the operation of broadcast interrupts, see **Section 6.3.5, EIBD32 to EIBD767 — EI Level Interrupt Bind Register 32 to 767** and **Section 6.5.4, Broadcast Interrupt Processing Flow**.

6.4.4 Software Interrupts

For the operation of software interrupts, see **Section 6.3.12, SINTR0 to SINTR3 — Software Interrupt Register** and **Section 6.4.6, Priority Level Handling.**

6.4.5 DTS Interrupt Merge Function

Up to 128 transfer end interrupts and up to 128 transfer count match interrupts are aggregated into one type of interrupt in units of 32 interrupts. 128 bits from all DTS channels are combined into 8 registers PINT0 to PINT7. If multiple DTS channels within the same status register (PINT0 to PINT7) request an interrupt, only the bit of the lowest DTS channel in that register is set. For additional information see **Section 6.3.13, PINTn + x — Peripheral Interrupt Status Register** and **Section 6.3.14, PINTCLRn + x — Peripheral Interrupt Status Clear Register**.

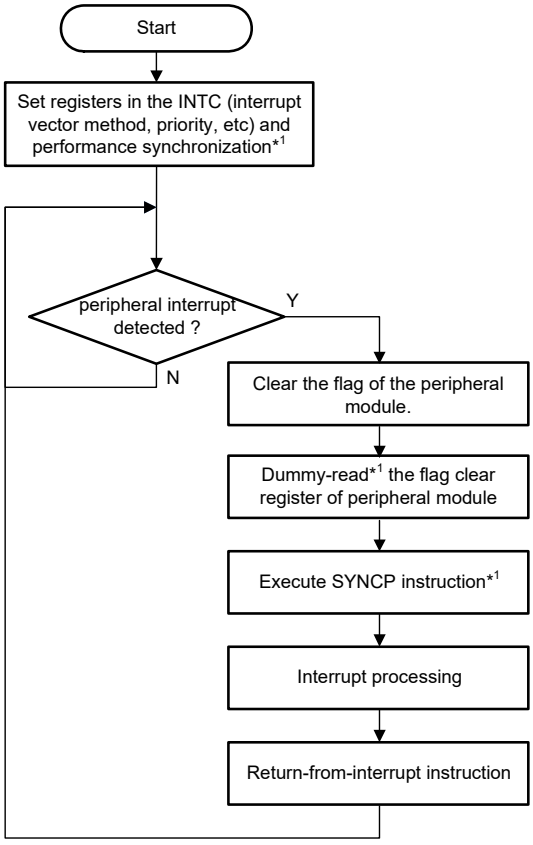
6.4.6 Priority Level Handling

There is no priority control for FENMI and FEINT because it has one channel.

EI-level maskable interrupt priority is determined within EIINT0-31 and EIINT32-767 in each PE. Priority is determined by 64 interrupt priority levels specified for each interrupt channel (EEICn.EIPn[5:0], EICn.EIPn[3:0]). In channels with same priority level, the channel with the lowest number is given priority over other channels.

6.5 Interrupt Processing Flow

6.5.1 Level Interrupt Processing Flow

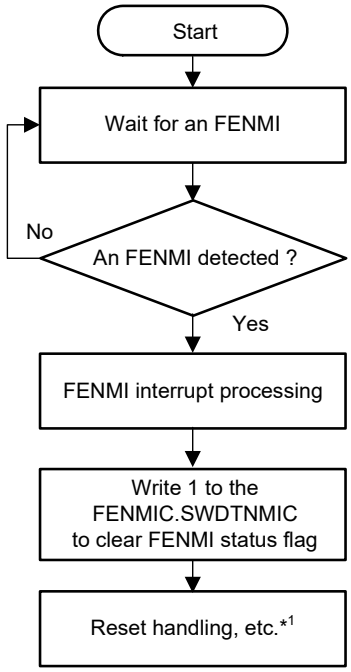


Note 1. See **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** for details about synchronization after setting registers.

Figure 6.2 Example of the Level Interrupt Processing Flow

6.5.2 FENMI Processing Flow

- After an FENMI has been detected from notification of secure WDT overflow, an interrupt request is sent to the INTC.
- FENMI interrupts are acknowledged as the highest priority even when another FE level interrupt has been generated. FENMI interrupts cannot be masked by PSW.NP in the CPU system register. Recovery or return from FENMI interrupt is not possible.

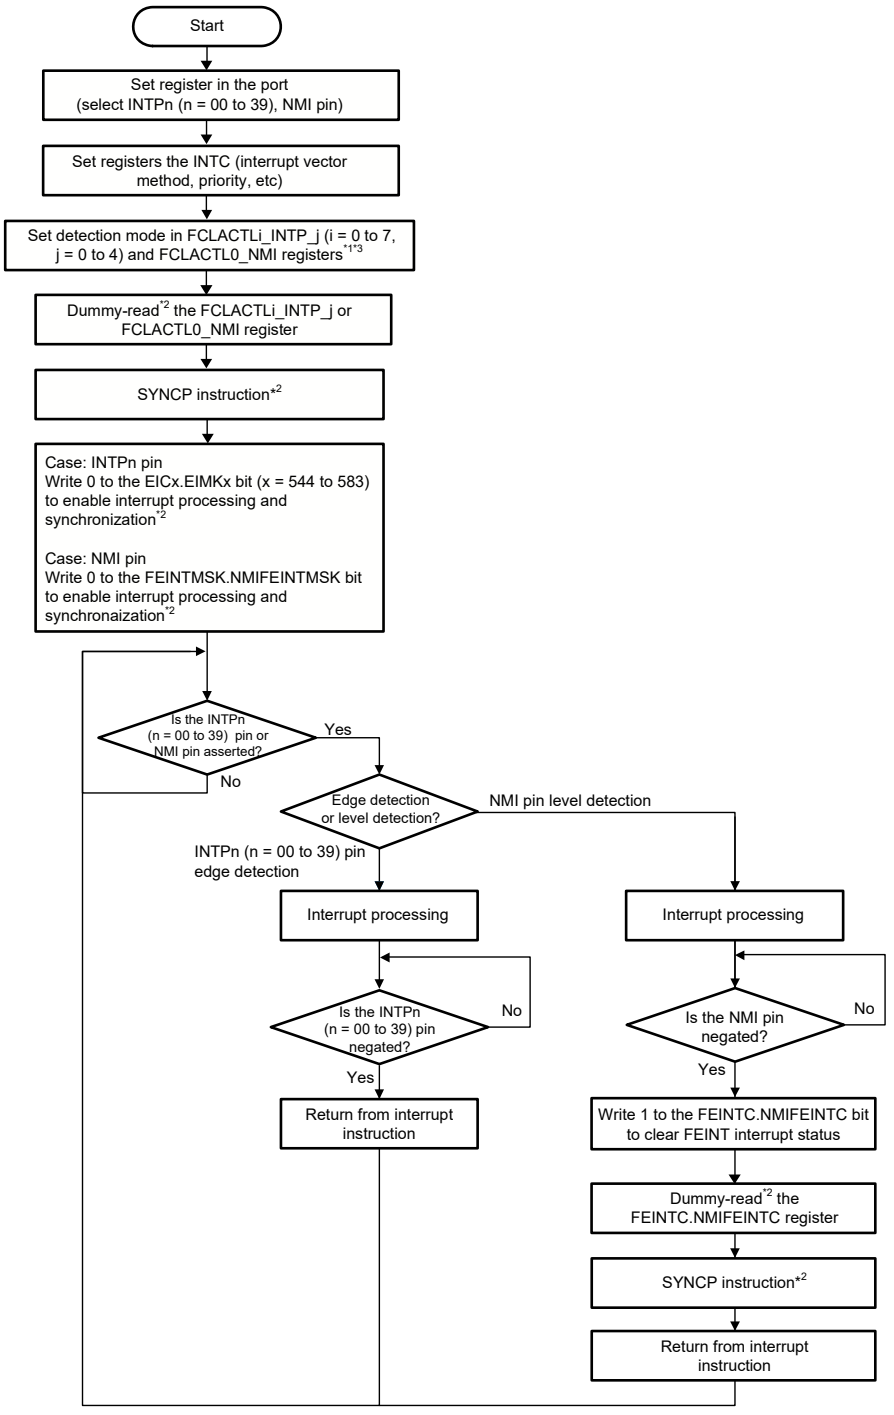


Note 1. The system registers (FEPC and FEPSW) are overwritten upon FENMI acknowledgment. For branching to user processing after FENMI acknowledgment, set the FEPC and FEPSW registers according to the needs of the application and execute an FERET instruction.

Figure 6.3 Example of the FENMI Processing Flow

6.5.3 External Interrupt Processing Flow

- Select the INTPn (n = 00 to 39) and FEINT(NMI) detection method (edge detection or level detection) by setting FCLACTLi_INTP_j (i = 0 to 7, j = 0 to 4) and FCLACTL0_NMI registers.
- After detection of INTPn (n = 00 to 39) and FEINT(NMI), an interrupt request is issued to the INTC.
- If level detection is selected, confirm that the INTPn (n = 00 to 39) and NMI pin is negated before returning from the interrupt service routine by an instruction.
- If edge detection is selected, clear the interrupt request before returning from an interrupt service routine by an instruction.



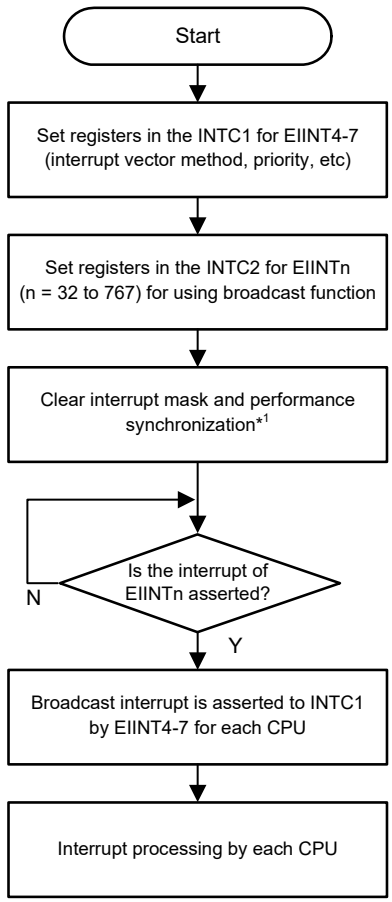
Note 1. See **Section 2.7, Noise Filter & Edge/Level Detector** and **Section 2.7.3.2, FCLACTLm_<name> — Filter Control Register**.

Note 2. See **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** for details about synchronization after setting registers.

Note 3. In order to avoid an unintended interrupt occurrence, use the following configuration sequence.
1. Configure the port registers.
2. Wait for the period of pulse rejection.
3. Configure the FCLACTLi_INPT_j and FCLACTL0_NMI registers.

Figure 6.4 Example of the External Interrupt Processing Flow

6.5.4 Broadcast Interrupt Processing Flow



Note 1. See **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** for details about synchronization after setting registers.

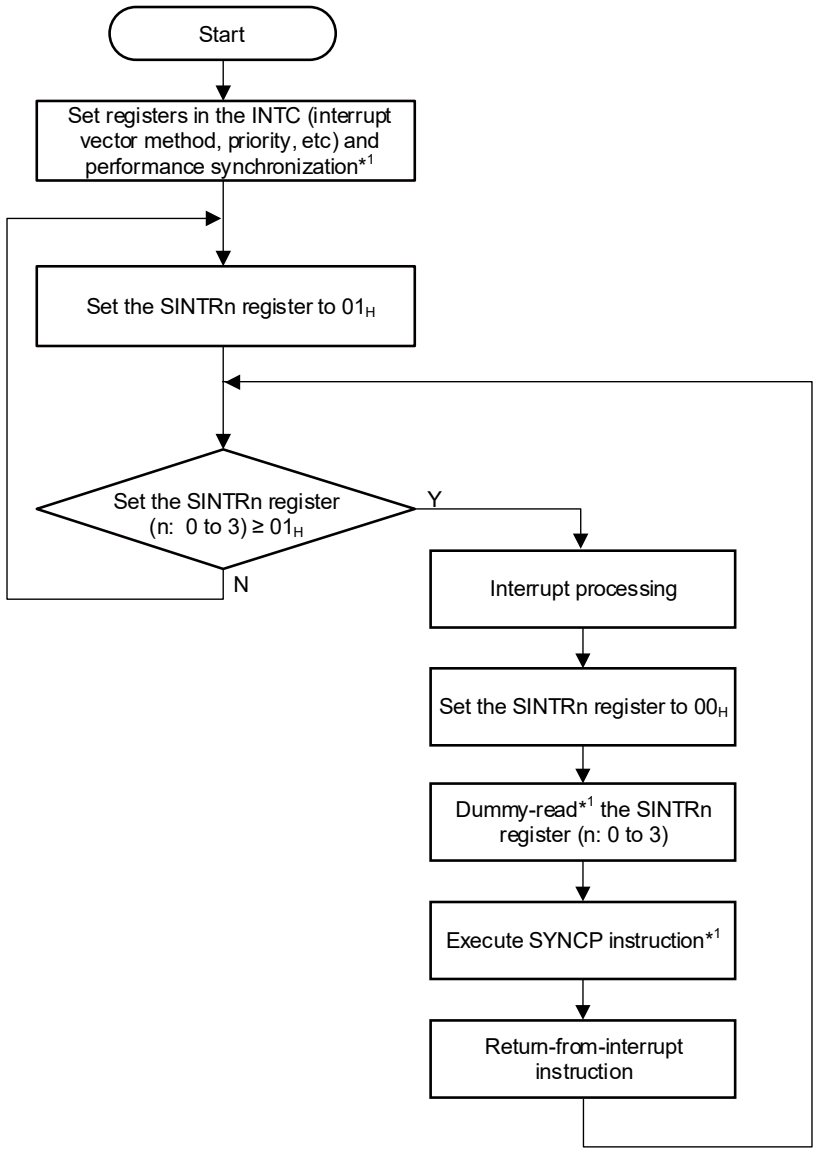
Figure 6.5 Example for the Broadcast Interrupt

NOTE

When using the broadcast function, the EIINTn (n = 32 to 767) interrupts are not generated individually upon the occurrence of each interrupt factor. Interrupts are generated in EIINT4-7 as broadcast interrupts.

6.5.5 Software Interrupt Processing Flow

- Software interrupt requests are controlled by writing 00_H or 01_H to the counter registers (SINTR0 to SINTR3).
- Writing 00_H leads to the counter's value being decremented by 1.
- Writing 01_H leads to the counter's value being incremented by 1.
- If the incremented counter value is 1 or above, an interrupt request for the INTC is generated.
- Before returning from interrupt service routine, decrement the SINTRn counter by 1. If SINTRn is 00_H after issuing the instruction to return from the interrupt, wait for the writing of 01_H to SINTRn.

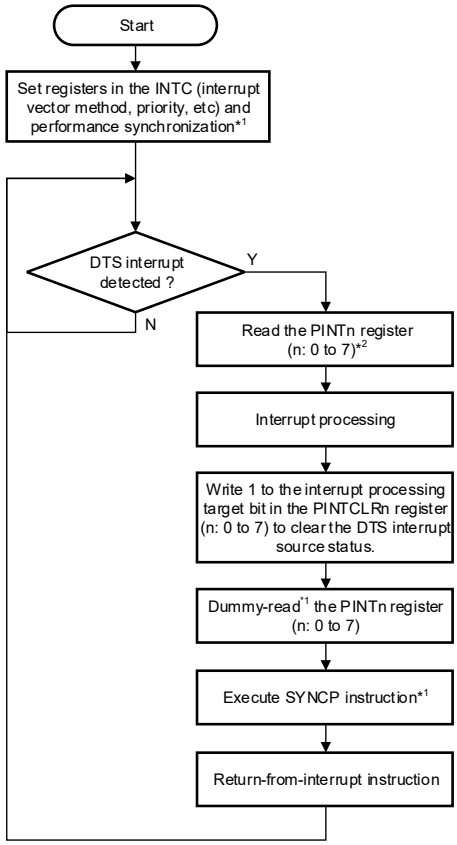


Note 1. See **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** for details about synchronization after setting registers.

Figure 6.6 Example of the Software Interrupt Processing Flow

6.5.6 DTS Interrupt Processing Flow

- When only one interrupt request is generated out of the bundled 32 interrupt sources
  - The bit corresponding to the interrupt request in the PINTn register is set to 1 and an interrupt request is output.
  - On completion of interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the interrupt request before issuing the return from interrupt instruction, then wait for the next one.
- When multiple interrupt sources are generated out of the bundled 32 interrupt sources
  - Only the bit of the DTS channel with the lowest number is set in the PINTn register and the request is generated.
  - On completion of interrupt processing (before returning from the interrupt service routine), write 1 to the corresponding bit in the interrupt clear register (PINTCLRn) to clear the interrupt request.
  - After clearing the interrupt request bit of the first DTS channel, the bit corresponding to the next lowest DTS channel requesting an interrupt is set and the interrupt request is output.
  - These steps are repeated until all interrupt sources bundled into the same 32-bits register are cleared.



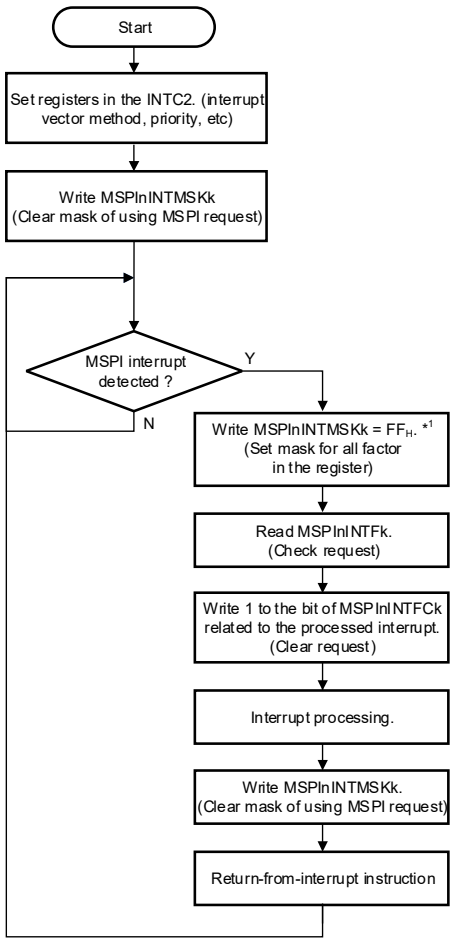
Note 1. See **Section 3.9.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation** for details about synchronization after setting registers.

Note 2. Use this data to clear the DTS interrupt status. It is necessary to set the data from the first read of the PINTn register after a DTS interrupt is detected.

Figure 6.7 Example of the DTS Interrupt Processing Flow

6.5.7 MSPI Interrupt Processing Flow

- Interrupt requests generated by MSPIn are combined into one request (Grouped Interrupt) and connected to one channel of INTC2.
  Among the Grouped Interrupt, the interrupt that has occurred can be confirmed in the MSPIn Interrupt Factor Register(MSPInINTFk).
  See **Section 19.1.4, Interrupt Requests and Error Notifications** for details.
- Some interrupt requests of MSPIn are independently connected to INTC2.
  For these interrupt requests, independent interrupt and Grouped Interrupts should be used exclusively.
- Even if multiple interrupts occur in MSPIn, there may be only one interrupt request to the CPU.
  When using INTMSPInTX, INTMSPInRX, INTMSPInFE, and INTMSPInERR, follow the flowchart in **Figure 6.8** for interrupt processing.



Note 1. Set only MSPInINTMSKk corresponding to the detected interrupt (INTMSPInTX, INTMSPInRX, INTMSPInFE, INTMSPInERR).

Figure 6.8 Example of the MSPI Interrupt Processing Flow

6.6 Interrupt Response Times

Table 6.36 Interrupt Response Times (Min)

Target	Interrupt Request Source		Number of Cycles for Processing			
	INTC Connection	Operating Clock	Synchronization	INTC2	INTC1	In PE0/PE1/PE2/PE3
PE0/PE1 PE2/PE3	Directly input to INTC1	CLK_CPU	1 × Iϕ	—	2 × Iϕ <1 × Iϕ>	See the description under “In PE0/PE1/PE2/PE3” below.
		CLK_LSB	2 × Pϕ + 1 × Sϕ

Section 7 sDMA Controller (sDMAC)

This section contains a generic description of the sDMA Controller (sDMAC).

The first part of this section describes this product specific properties, such as the number of units and register base addresses.

The remainder of the section describes the functions and registers of the sDMAC.

7.1 Features sDMAC for RH850/U2A-EVA

7.1.1 Number of Units

This microcontroller has the following number of sDMAC units.

Table 7.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	2	2	2	2	2	2	2	2	2	2
Number of Channels	16	16	16	16	16	16	16	16	16	16
Name	SDMACj (j = 0, 1)									

Table 7.2 Index

Index	Description
j	The individual units are identified by the index “j” (j = 0 to 1).
n	The individual channels are identified by the index “n” (n = 0 to 15).
m	The individual trigger group selection registers are identified by the index “m” (m = 0 to 15).

7.1.2 Register Base Addresses

sDMAC register addresses are given as offsets from the base addresses.

sDMAC base addresses are listed in the following table.

Table 7.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<SDMAC0_base>	FFF9 0000$_H$	P-Bus Group 0
<SDMAC1_base>	FFF9 8000$_H$	P-Bus Group 0
<DMATRGSEL_base>	FF09 0400$_H$	P-Bus Group 9

7.1.3 Clock Supply

The sDMAC clock supplies are shown in the following table.

Table 7.4 sDMAC Clock Supply

Unit Name	Clock Name in the Unit	Supply Clock Name	Description
SDMACj	SCLK	CLK_HBUS	System interconnect clock
	PCLK	CLK_HBUS	Register access clock
DMATRGSEL	PCLK	CLK_HBUS	Register access clock

7.1.4 Interrupts Requests and Error Notifications

sDMAC interrupt requests are listed in the following table.

Table 7.5 Interrupt Requests (1/2)

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number
INTSDMAC0CH0	SDMAC0.intreq_ch[0]	sDMAC0 channel 0 transfer end interrupt sDMAC0 channel 0 descriptor step end interrupt sDMAC0 channel 0 address error interrupt	47
INTSDMAC0CH1	SDMAC0.intreq_ch[1]	sDMAC0 channel 1 transfer end interrupt sDMAC0 channel 1 descriptor step end interrupt sDMAC0 channel 1 address error interrupt	48
INTSDMAC0CH2	SDMAC0.intreq_ch[2]	sDMAC0 channel 2 transfer end interrupt sDMAC0 channel 2 descriptor step end interrupt sDMAC0 channel 2 address error interrupt	49
INTSDMAC0CH3	SDMAC0.intreq_ch[3]	sDMAC0 channel 3 transfer end interrupt sDMAC0 channel 3 descriptor step end interrupt sDMAC0 channel 3 address error interrupt	50
INTSDMAC0CH4	SDMAC0.intreq_ch[4]	sDMAC0 channel 4 transfer end interrupt sDMAC0 channel 4 descriptor step end interrupt sDMAC0 channel 4 address error interrupt	51
INTSDMAC0CH5	SDMAC0.intreq_ch[5]	sDMAC0 channel 5 transfer end interrupt sDMAC0 channel 5 descriptor step end interrupt sDMAC0 channel 5 address error interrupt	52
INTSDMAC0CH6	SDMAC0.intreq_ch[6]	sDMAC0 channel 6 transfer end interrupt sDMAC0 channel 6 descriptor step end interrupt sDMAC0 channel 6 address error interrupt	53
INTSDMAC0CH7	SDMAC0.intreq_ch[7]	sDMAC0 channel 7 transfer end interrupt sDMAC0 channel 7 descriptor step end interrupt sDMAC0 channel 7 address error interrupt	54
INTSDMAC0CH8	SDMAC0.intreq_ch[8]	sDMAC0 channel 8 transfer end interrupt sDMAC0 channel 8 descriptor step end interrupt sDMAC0 channel 8 address error interrupt	55
INTSDMAC0CH9	SDMAC0.intreq_ch[9]	sDMAC0 channel 9 transfer end interrupt sDMAC0 channel 9 descriptor step end interrupt sDMAC0 channel 9 address error interrupt	56
INTSDMAC0CH10	SDMAC0.intreq_ch[10]	sDMAC0 channel 10 transfer end interrupt sDMAC0 channel 10 descriptor step end interrupt sDMAC0 channel 10 address error interrupt	57
INTSDMAC0CH11	SDMAC0.intreq_ch[11]	sDMAC0 channel 11 transfer end interrupt sDMAC0 channel 11 descriptor step end interrupt sDMAC0 channel 11 address error interrupt	58
INTSDMAC0CH12	SDMAC0.intreq_ch[12]	sDMAC0 channel 12 transfer end interrupt sDMAC0 channel 12 descriptor step end interrupt sDMAC0 channel 12 address error interrupt	59
INTSDMAC0CH13	SDMAC0.intreq_ch[13]	sDMAC0 channel 13 transfer end interrupt sDMAC0 channel 13 descriptor step end interrupt sDMAC0 channel 13 address error interrupt	60
INTSDMAC0CH14	SDMAC0.intreq_ch[14]	sDMAC0 channel 14 transfer end interrupt sDMAC0 channel 14 descriptor step end interrupt sDMAC0 channel 14 address error interrupt	61
INTSDMAC0CH15	SDMAC0.intreq_ch[15]	sDMAC0 channel 15 transfer end interrupt sDMAC0 channel 15 descriptor step end interrupt sDMAC0 channel 15 address error interrupt	62
INTSDMACERR	SDMAC0.intreq_aerr SDMAC1.intreq_aerr	sDMAC0 address error interrupt sDMAC1 address error interrupt	29

Table 7.5 Interrupt Requests (2/2)

Interrupt Symbol Name	Unit Interrupt Signal	Description	Interrupt Number
INTSDMAC1CH0	SDMAC1.intreq_ch[0]	sDMAC1 channel 0 transfer end interrupt sDMAC1 channel 0 descriptor step end interrupt sDMAC1 channel 0 address error interrupt	63
INTSDMAC1CH1	SDMAC1.intreq_ch[1]	sDMAC1 channel 1 transfer end interrupt sDMAC1 channel 1 descriptor step end interrupt sDMAC1 channel 1 address error interrupt	64
INTSDMAC1CH2	SDMAC1.intreq_ch[2]	sDMAC1 channel 2 transfer end interrupt sDMAC1 channel 2 descriptor step end interrupt sDMAC1 channel 2 address error interrupt	65
INTSDMAC1CH3	SDMAC1.intreq_ch[3]	sDMAC1 channel 3 transfer end interrupt sDMAC1 channel 3 descriptor step end interrupt sDMAC1 channel 3 address error interrupt	66
INTSDMAC1CH4	SDMAC1.intreq_ch[4]	sDMAC1 channel 4 transfer end interrupt sDMAC1 channel 4 descriptor step end interrupt sDMAC1 channel 4 address error interrupt	67
INTSDMAC1CH5	SDMAC1.intreq_ch[5]	sDMAC1 channel 5 transfer end interrupt sDMAC1 channel 5 descriptor step end interrupt sDMAC1 channel 5 address error interrupt	68
INTSDMAC1CH6	SDMAC1.intreq_ch[6]	sDMAC1 channel 6 transfer end interrupt sDMAC1 channel 6 descriptor step end interrupt sDMAC1 channel 6 address error interrupt	69
INTSDMAC1CH7	SDMAC1.intreq_ch[7]	sDMAC1 channel 7 transfer end interrupt sDMAC1 channel 7 descriptor step end interrupt sDMAC1 channel 7 address error interrupt	70
INTSDMAC1CH8	SDMAC1.intreq_ch[8]	sDMAC1 channel 8 transfer end interrupt sDMAC1 channel 8 descriptor step end interrupt sDMAC1 channel 8 address error interrupt	71
INTSDMAC1CH9	SDMAC1.intreq_ch[9]	sDMAC1 channel 9 transfer end interrupt sDMAC1 channel 9 descriptor step end interrupt sDMAC1 channel 9 address error interrupt	72
INTSDMAC1CH10	SDMAC1.intreq_ch[10]	sDMAC1 channel 10 transfer end interrupt sDMAC1 channel 10 descriptor step end interrupt sDMAC1 channel 10 address error interrupt	73
INTSDMAC1CH11	SDMAC1.intreq_ch[11]	sDMAC1 channel 11 transfer end interrupt sDMAC1 channel 11 descriptor step end interrupt sDMAC1 channel 11 address error interrupt	74
INTSDMAC1CH12	SDMAC1.intreq_ch[12]	sDMAC1 channel 12 transfer end interrupt sDMAC1 channel 12 descriptor step end interrupt sDMAC1 channel 12 address error interrupt	75
INTSDMAC1CH13	SDMAC1.intreq_ch[13]	sDMAC1 channel 13 transfer end interrupt sDMAC1 channel 13 descriptor step end interrupt sDMAC1 channel 13 address error interrupt	76
INTSDMAC1CH14	SDMAC1.intreq_ch[14]	sDMAC1 channel 14 transfer end interrupt sDMAC1 channel 14 descriptor step end interrupt sDMAC1 channel 14 address error interrupt	77
NTSDMAC1CH15	SDMAC1.intreq_ch[15]	sDMAC1 channel 15 transfer end interrupt sDMAC1 channel 15 descriptor step end interrupt sDMAC1 channel 15 address error interrupt	78

The error notifications of this module are listed in the following table.

Table 7.6 Error Notifications

Error Notification	Description	ECM error Number	Error Response to bus master
DTS/sDMAC Transfer Error	DMA address error*1 (by INTSDMACERR interrupt)	182	—

Note: This error is generated due to the error response caused by some error.
For details of the error response caused by some error, see the column for Error Response to bus master in Error Notifications Table shown in each section.

Note 1. For details about causes of address errors, see **Section 7.5, (1) Address Errors**.

7.1.5 sDMAC Transfer Requests

The sDMAC transfer request table lists all sDMAC transfer request factors that can be selected by the DMAjRS_n registers and groups that can be selected by the DMACSELj_m registers. For details of List of DMA Trigger Sources, refer to Appendix file "sDMAC_Transfer_request_Table.xlsx"

7.1.6 Reset Sources

sDMAC reset sources are listed in the following table. The sDMAC is initialized by these reset sources.

Table 7.7 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
SDMACj	All registers	√	√	√	√	√	—	—
DMATRGSEL	All registers	√	√	√	√	√	—	—

7.2 Overview

The sDMAC can be used in place of the CPU to perform high-speed data transfer between on-chip memories.

7.2.1 Functional Overview

The sDMAC has the following features.

- 16 channels
- 4-Gbyte physical address space
  - Source and destination addresses are 32 bits wide
- Physical bus data width: 64 bits
- Transfer data length: 1 byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes
- The maximum transfer size: 4,294,967,295 bytes (2^{32}-1 bytes)
- Parallel reads and writes (fly-by)
- Address mode: Dual address mode
- Transfer requests:
  Two request modes are available. Requests can be triggered by an auto request (a transfer request always occurs) or a peripheral hardware request.
- Bus mode:

  Each channel can be set to either normal speed mode or slow speed mode.
- Mode for arbitration between transfer channels

  The arbitration mode can be set to either fixed priority mode or round-robin mode.
- Interrupt requests:

  CPU interrupts from the sDMAC are triggered by three factors: termination of the descriptor step, termination of a data transfer and occurrence of an address error.
- Functions of the descriptor:

  A descriptor contains register settings (source address register, destination address register, transfer size register, transfer mode register and scatter gather registers) and can be chained to the next descriptor. The descriptor memory size is 4 KB. This descriptor memory is shared by all channels.
- Scatter-gather transfer:

  Inner and outer loops for transfers with inner and outer address increments are supported. Scattering at the destination interface and gathering at the source interface can be enabled independently and in parallel.
  - Inner and outer address increments are 32 bits wide
- The Data RAM and The Descriptor RAM are protected by ECC function. For details, see **Section 44, Functional Safety**.
- sDMAC has a data RAM as a pending transfer data buffer.
  The data RAM size is 2 KB and a DMA channel can use 64 bits × 16 lines for its own transactions.

7.2.2 Block Diagram

The following is a block diagram of sDMAC.

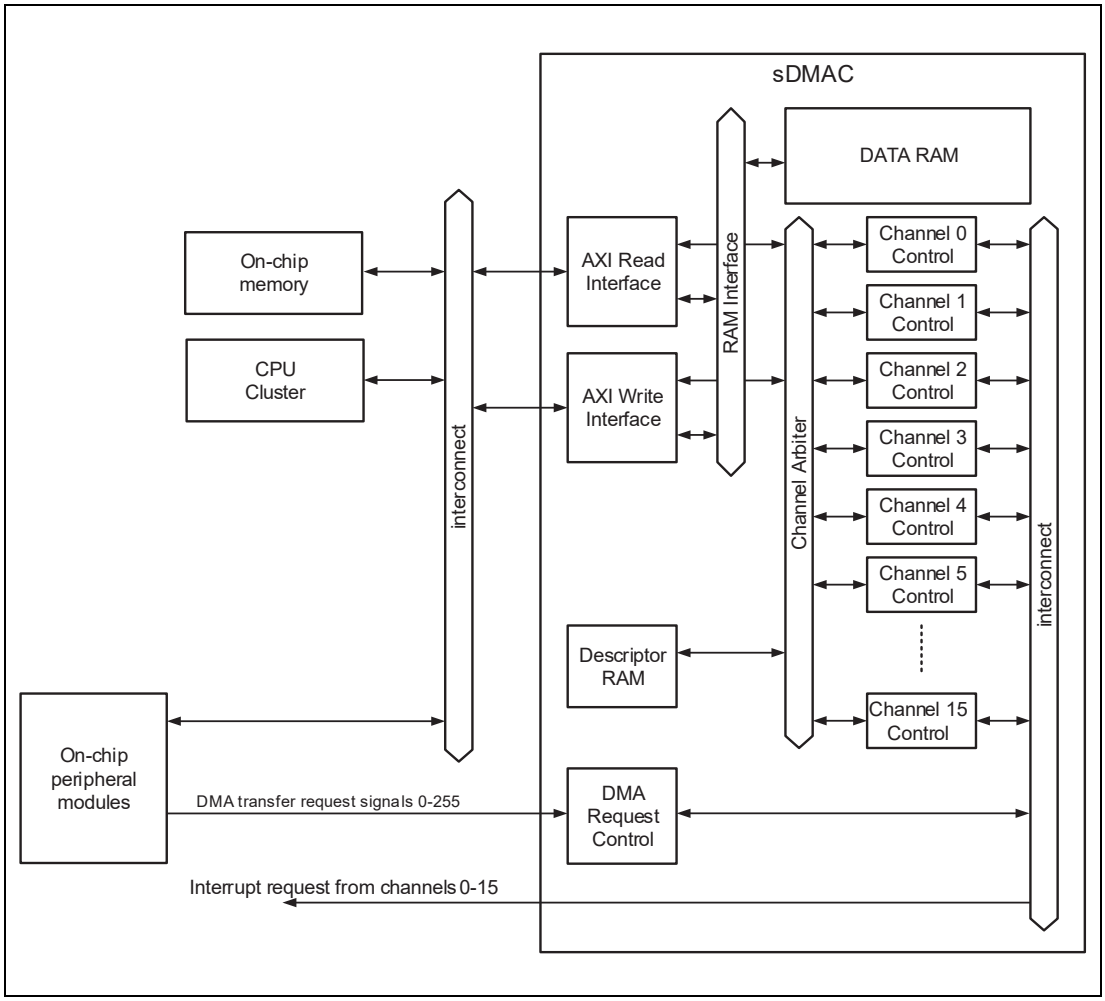

Figure 7.1 Block Diagram of sDMAC

The following block diagram shows sDMAC transfer request source selection by the DMACSELj_m registers.

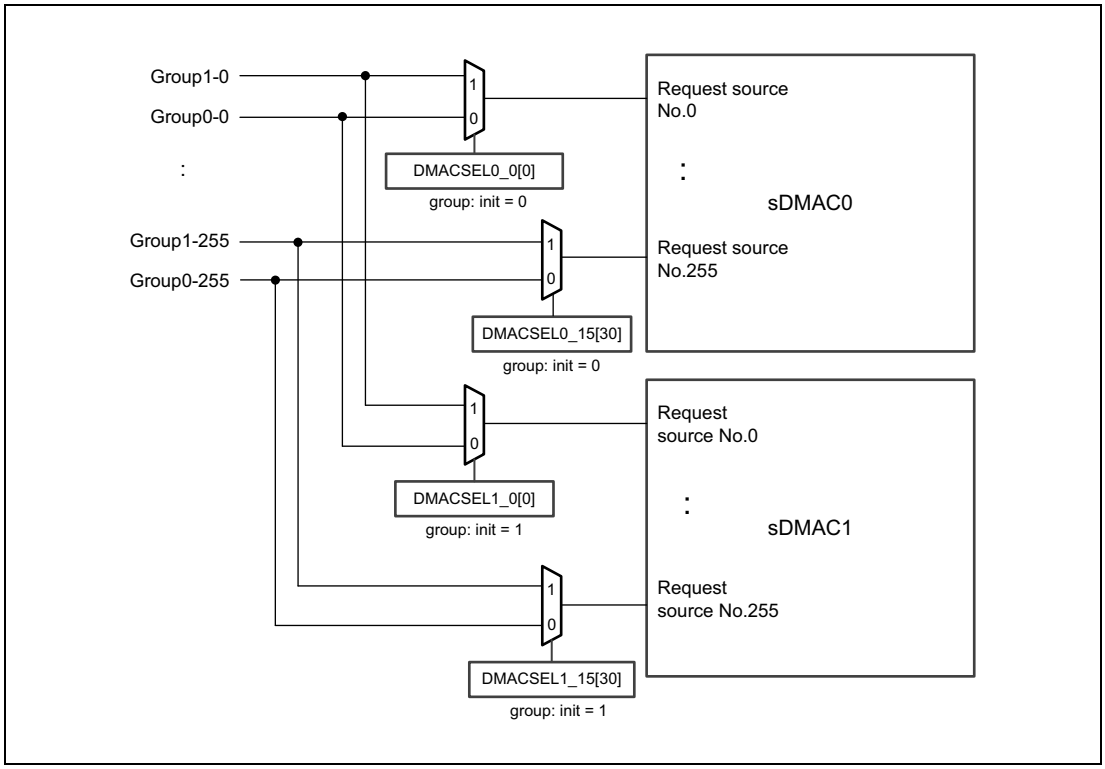

Figure 7.2 Block Diagram of sDMAC Transfer Request Selection

7.3 Registers of sDMAC

7.3.1 List of Registers

sDMAC registers are listed in the following table.

For details about <SDMACj_base>, see **Section 7.1.2, Register Base Addresses**.

Table 7.8 List of Registers (1/2)

Module Name	Register Name	Symbol	Address	Access	Access Protection	
					DMAj/PBG	Other
Global Registers						
SDMACj	DMA address error interrupt status register	DMAjESTA	<SDMACj_base> + 0010_H	32	DMAGPROT_GR	—
	DMA channel interrupt status register	DMAjISTA	<SDMACj_base> + 0020_H	32	DMAGPROT_GR	—
	DMA channel request priority register	DMAjCHPRI	<SDMACj_base> + 0040_H	32	DMAGPROT_GR	—
	DMA operation register	DMAjOR	<SDMACj_base> + 0060_H	16	DMAGPROT_GR	—
	DMA channel reset register	DMAjCHRST	<SDMACj_base> + 0080_H	32	DMAGPROT_GR	—
	DMA channel master setting register	DMAjCM_n	<SDMACj_base> + (n × 4_H) + 100_H	32	DMAGPROT_GR	—
Channel Registers						
SDMACj	DMA source address register	DMAjSAR_n	<SDMACj_base> + (n × 80_H) + 2000_H	32	DMAGPROT_n	—
	DMA destination address register	DMAjDAR_n	<SDMACj_base> + (n × 80_H) + 2004_H	32	DMAGPROT_n	—
	DMA transfer size register	DMAjTSR_n	<SDMACj_base> + (n × 80_H) + 2008_H	32	DMAGPROT_n	—
	DMA transfer size register B	DMAjTSRB_n	<SDMACj_base> + (n × 80_H) + $200C_H$	32	DMAGPROT_n	—
	DMA transfer mode register	DMAjTMR_n	<SDMACj_base> + (n × 80_H) + 2010_H	32	DMAGPROT_n	—
	DMA channel control register	DMAjCHCR_n	<SDMACj_base> + (n × 80_H) + 2014_H	16	DMAGPROT_n	—
	DMA channel suspend register	DMAjCHSTP_n	<SDMACj_base> + (n × 80_H) + 2016_H	16	DMAGPROT_n	—
	DMA channel status register	DMAjCHSTA_n	<SDMACj_base> + (n × 80_H) + 2018_H	32	DMAGPROT_n	—
	DMA channel flag clear register	DMAjCHFCR_n	<SDMACj_base> + (n × 80_H) + $201C_H$	32	DMAGPROT_n	—
	DMA gather inner address increment register	DMAjGIAI_n	<SDMACj_base> + (n × 80_H) + 2020_H	32	DMAGPROT_n	—
	DMA gather outer address increment register	DMAjGOAI_n	<SDMACj_base> + (n × 80_H) + 2024_H	32	DMAGPROT_n	—
	DMA scatter inner address increment register	DMAjSIAI_n	<SDMACj_base> + (n × 80_H) + 2028_H	32	DMAGPROT_n	—
	DMA scatter outer address increment register	DMAjSOAI_n	<SDMACj_base> + (n × 80_H) + $202C_H$	32	DMAGPROT_n	—
	DMA scatter gather status register	DMAjSGST_n	<SDMACj_base> + (n × 80_H) + 2038_H	32	DMAGPROT_n	—
	DMA scatter gather control register	DMAjSGCR_n	<SDMACj_base> + (n × 80_H) + $203C_H$	32	DMAGPROT_n	—

Table 7.8 List of Registers (2/2)

Module Name	Register Name	Symbol	Address	Access	Access Protection	
					DMAj/PBG	Other
SDMACj	DMA resource select register	DMAjRS_n	<SDMACj_base> + (n × 80_H) + 2040_H	32	DMAGPROT_n	—
	DMA buffer control registers	DMAjBUFCR_n	<SDMACj_base> + (n × 80_H) + 2048_H	32	DMAGPROT_n	—
	DMA descriptor pointer register	DMAjDPPTR_n	<SDMACj_base> + (n × 80_H) + 2050_H	32	DMAGPROT_n	—
	DMA descriptor control register	DMAjDPCR_n	<SDMACj_base> + (n × 80_H) + 2054_H	32	DMAGPROT_n	—
Descriptor memory						
SDMACj	Descriptor memory	Descriptor RAM	<SDMACj_base> + 4000_H to <SDMACj_base> + $4FFC_H$	32	DMAGPROT_DP	—
Transfer trigger selection						
DMATRGSEL	sDMACj transfer request group selection register m	DMACSELj_m	<DMATRGSEL_base> + (j × 40_H) + (m × 4_H)	8, 16, 32	PBG90#4	—

7.3.2 DMAjESTA — DMA Address Error Interrupt Status Register

DMAjESTA is a 32-bit read-only register that indicates the address error interrupt (INTSDMACERR) status of each channel. Causes of address errors are shown in **Section 7.5, (1) Address Errors**. Specification of the error notification routes is shown in **Section 7.4.2, DMA Interrupts**.

Access: DMAjESTA register is a read-only register that can be read in 32-bit units

Address: <SDMACj_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AEN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.9 DMAjESTA Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned
15 to 0	AEN[15:0]	Channel address error interrupt INTSDMACERR status These bits reflect the CAE bit status of the channels whose CAEE bit is set to 1. AEN[n]: 0: Channel n, address error does not occur 1: Channel n, address error occurs and generate address error interrupt INTSDMACERR

7.3.3 DMAjISTA — DMA Channel Interrupt Status Register

DMAjISTA is a 32-bit read-only register that indicates the interrupt signal status of each channel. Interrupt routes are shown in **Section 7.4.2, DMA Interrupts**.

Access: DMAjISTA register is a read-only register that can be read in 32-bit units

Address: <SDMACj_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	INT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.10 DMAjISTA Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	INT[15:0]	Channel interrupt status INT[n]: 0: Channel n interrupt does not occur 1: Channel n Interrupt occurs

7.3.4 DMAjCHPRI — DMA Channel Request Priority Register

DMAjCHPRI is a 32-bit read/write register that specifies the channel request priority count timing.

See **Section 7.4.3, (3) Channel Request Priority** for details.

Access: DMAjCHPRI register can be read or written in 32-bit units

Address: <SDMACj_base> + 0040_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PRICNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.11 DMAjCHPRI Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	PRICNT[15:0]	Channel Request Priority Count value This bit is used to control the timing of the channel request priority function.

7.3.5 DMAjOR — DMA Operation Register

DMAjOR is a 16-bit read/write register that controls master enable and specifies the priority level of all DMA channels.

Access: DMAjOR register can be read or written in 16-bit units

Address: <SDMACj_base> + 0060_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PR[1:0]		—	—	—	—	—	—	—	DME
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R	R/W

Table 7.12 DMAjOR Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	PR[1:0]	Priority Mode Select the priority level between channels when there are transfer requests for multiple channels simultaneously. 00: CH0 > CH1 > ... > CH14 > CH15 11: Round-robin mode Other than above: Setting prohibited
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DME	DMA Master Enable Enables or disables DMA transfers on all channels. If the DME bit and the DE bit in DMAjCHCR_n are set to 1, DMA transfer is enabled. At this time, the TE bits in DMAjCHSTA_n and the CAE bits in DMAjCHSTA_n must be all 0. If this bit is cleared during transfer, transfers on all channels are terminated. 0: Disable DMA transfers on all channels 1: Enable DMA transfers on all channels

7.3.6 DMAjCHRST — DMA Channel Reset Register

DMAjCHRST register is a 32-bit write-only register that initializes each channel.

When this register is set, the specified channel state is initialized completely and the following registers are initialized.

DMAjSAR_n, DMAjDAR_n, DMAjTSR_n, DMAjTSRB_n, DMAjTMR_n, DMAjCHCR_n, DMAjCHSTP_n, DMAjCHSTA_n, DMAjGIAI_n, DMAjGOAI_n, DMAjSIAI_n, DMAjSOAI_n, DMAjSGCR_n, DMAjRS_n, DMAjBUFCR_n, DMAjDPPTR_n, DMAjDPCR_n

Access: DMAjCHRST register is a write-only register that can be written in 32-bit units

Address: <SDMACj_base> + 0080_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CLR[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 7.13 DMAjCHRST Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing, write the value after reset.
15 to 0	CLR[15:0]	All registers in the channel can be cleared by writing to these bits. CLR[0] 0: Ignored 1: Channel 0 registers are cleared CLR[1] 0: Ignored 1: Channel 1 registers are cleared … CLR[15] 0: Ignored 1: Channel 15 registers are cleared Before writing to this register, confirm that channel BUSY is 0. These bits are always read as 0.

7.3.7 DMAjCM_n — DMA Channel Master Setting Register n

DMAjCM_n is a 32-bit read/write register that configures the DMA master information.

Access: DMAjCM_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 4_H) + 100_H

Value after reset: DMA0CM_n: 0000 $1C00_H$
DMA1CM_n: 0000 $1B00_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.14 DMAjCM_n Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	SPID[4:0]	Channel master SPID setting Specifies the SPID information of the master assigned to the channel. Value after reset of DMA0CM_n: $1C_H$ Value after reset of DMA1CM_n: $1B_H$
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel. 0: Supervisor mode 1: User mode

7.3.8 DMAjSAR_n — DMA Source Address Register n

DMAjSAR_n is a 32-bit read/write register that specifies the source address of DMA transfer. During DMA transfer, this register indicates the next source address.

The source address register must be specified based on a transaction size boundary which is set to STS bit in DMAjTMR_n register regardless of the source address mode which is set to SM bit in DMAjTMR_n register.

Access: DMAjSAR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7.3.9 DMAjDAR_n — DMA Destination Address Register n

DMAjDAR_n is a 32-bit read/write register that specifies the destination address of DMA transfer. During DMA transfer, this register indicates the next destination address.

When the selected destination address mode is “increment” (DM bit in DMAjTMR_n register is 01_B), the destination address can be specified on a byte boundary. Otherwise the destination address must be specified on the transaction size boundary (DTS bit in DMAjTMR_n register).

Access: DMAjDAR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2004_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DAR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

7.3.10 DMAjTSR_n — DMA Transfer Size Register n

DMAjTSR_n is a 32-bit read/write register that specifies the DMA transfer size. The total size of DMA transfer is 1 byte when the setting is 0000 0001_H and 4,294,967,295 bytes (2^{32}-1 bytes) when FFFF $FFFF_H$ is set. When the setting is 0000 0000_H, transfer does not occur, and TE is set immediately. During DMA transfer, DMAjTSR_n indicates the remaining transfer size.

In DMA transfer, the size of the read transfer and write transfer may differ. This is because the DMAC uses flyby DMA transfer via the data RAM. DMAjTSR_n indicates the read transfer size.

Access: DMAjTSR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSR[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

7.3.11 DMAjTSRB_n — DMA Transfer Size Register B n

DMAjTSRB_n is a 32-bit read-only register that indicates the DMA transfer size. During DMA transfer, this register indicates the remaining transfer size (in bytes). When DMAjTSR_n is written, the same value is set in this register.

In DMA transfer, the size of the read transfer and write transfer may differ. This is because the DMAC uses flyby DMA transfer via data RAM. DMAjTSRB_n indicates the write transfer size. DMAjTSR_n value is also set to DMAjTSRB_n register when DMAjTSR_n value is updated by Descriptor function.

Access: DMAjTSRB_n register is a read-only register that can be read in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + $200C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TSRW[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

7.3.12 DMAjTMR_n — DMA Transfer Mode Register n

DMAjTMR_n is a 32-bit read/write register that specifies the DMA transfer mode.

Access: DMAjTMR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2010_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	SLM[3:0]				PRI[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.15 DMAjTMR_n Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 20	SLM[3:0]	DMA Transfer Slow Speed mode Specifies the number of clock cycles (bus clock) between two DMA transfers. DMA transfer is executed once every number of clock cycles specified by SLM. 0000: Normal mode 1000: 256 clock cycles 1001: 512 clock cycles 1010: 1024 clock cycles : 1111: 32768 clock cycles Other than above: Setting prohibited
19 to 16	PRI[3:0]	Channel Request Priority Setting These bits set the priority of channel requests. Refer to **Section 7.4.3 (3), Channel Request Priority** about detail. PRI[3]: 0: Channel request priority is disabled. 1: Channel request priority is enabled. PRI[2:0] 111: Highest priority : 000: Lowest priority
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	TRS	Transfer request source Specifies which transfer request source will be sent to the DMAC. Before changing transfer request sources, the DMA enable bit (DE) should be set to 0. 0: Auto request 1: Hardware request

Table 7.15 DMAjTMR_n Register Contents (2/2)

Bit Position	Bit Name	Function
11, 10	DM[1:0]	Destination address mode Specify whether the DMA destination address is incremented or fixed, and the amount of increment. 00: Fixed destination address 01: Destination address is incremented based on destination transaction size (DTS) +1 in 1-byte unit transfers +2 in 2-byte unit transfers +4 in 4-byte unit transfers +8 in 8-byte unit transfers +16 in 16-byte unit transfers +32 in 32-byte unit transfers +64 in 64-byte unit transfers Other than above: Setting prohibited
9, 8	SM[1:0]	Source Address Mode Specify whether the DMA source address is incremented or fixed, and the amount of increment. 00: Fixed source address 01: Source address is incremented based on source transaction size (STS) +1 in 1-byte unit transfers +2 in 2-byte unit transfers +4 in 4-byte unit transfers +8 in 8-byte unit transfers +16 in 16-byte unit transfers +32 in 32-byte unit transfers +64 in 64-byte unit transfers Other than above: Setting prohibited
7 to 4	DTS[3:0]	DMA destination transaction size 0000: 1-byte unit transfer 0001: 2-byte unit transfer 0010: 4-byte unit transfer 0011: 8-byte unit transfer 0100: 16-byte unit transfer 0101: 32-byte unit transfer 0110: 64-byte unit transfer Other than above: Setting prohibited
3 to 0	STS[3:0]	DMA source transaction size 0000: 1-byte unit transfer 0001: 2-byte unit transfer 0010: 4-byte unit transfer 0011: 8-byte unit transfer 0100: 16-byte unit transfer 0101: 32-byte unit transfer 0110: 64-byte unit transfer Other than above: Setting prohibited

7.3.13 DMAjCHCR_n — DMA Channel Control Register n

DMAjCHCR_n is a 16-bit read/write register that controls DMA transfer.

Access: DMAjCHCR_n register can be read or written in 16-bit units

Address: <SDMACj_base> + (n × 80_H) + 2014_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	DPE	DPB	—	—	—	CAEE	CAIE	DSIE	IE	DE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 7.16 DMAjCHCR_n Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	DPE	Descriptor enable bit Specifies whether the descriptor is enabled. 0: Disabled Descriptor operation is disabled. 1: Enabled Descriptor operation is enabled. When the DMAjDPPTR_n.CF bit is set to 1, after reading the register setting from the descriptor memory, DMA transfer is continued. Clearing the DPE bit by setting the DMAjCHFCR_n.DPEC bit to 1 terminates the descriptor chain operation.
8	DPB	Descriptor start bit Specifies the configuration to be loaded at the beginning of the descriptor. After reading the descriptor, this bit is cleared. While DE = 1, DPB must not be set to 1. 0: Start the DMA transfer via a register setting. 1: Start DMA transfer after the channel configuration is copied from the descriptor memory. The configurations to copy from the Descriptor memory are specified in the DMAjDPCR_n register.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	CAEE	Channel address error interrupt INTSDMACERR enable Specifies whether a channel can generate an interrupt request upon the occurrence of an address error. When the CAEE bit and the DMAjCHSTA_n.CAE bit are set to 1, a channel (sDMAC_CH0 to sDMAC_CH15) will generate an interrupt request (INTSDMACERR) upon the occurrence of an address error. For details, see **Section 7.4.2, DMA Interrupts**. 0: Interrupt request disabled 1: Interrupt request enabled

Table 7.16 DMAjCHCR_n Register Contents (2/2)

Bit Position	Bit Name	Function
3	CAIE	Channel address error interrupt INTSDMACjCHn enable Specifies whether a channel can generate an interrupt request upon occurrence of an address error. When the CAIE bit and DMAjCHSTA_n.CAE bit are set to 1, a channel will generate an interrupt request (INTSDMACjCHn) upon the occurrence of an address error. For details, see **Section 7.4.2, DMA Interrupts**. 0: Interrupt request disabled 1: Interrupt request enabled
2	DSIE	Descriptor step end interrupt master enable Specifies whether a channel can generate an interrupt at the end of a descriptor step. When the DMAjDPPTR_n.DIE bit and DSIE bit are set to 1, a channel will generate an interrupt request (INTSDMACjCHn) upon completion of a descriptor step. For details, see **Section 7.4.2, DMA Interrupts**. 0: Interrupt request is disabled 1: Interrupt request is enabled
1	IE	Transfer end interrupt enable Specifies whether or not a channel can generate an interrupt at the end of DMA transfer. Setting this bit to 1 will allow a channel to generate an interrupt request (INTSDMACjCHn) when the DMAjCHSTA_n.TE bit is set to 1. For details, see **Section 7.4.2, DMA Interrupts**. 0: Interrupt request is disabled 1: Interrupt request is enabled
0	DE	DMA Enable Enables or disables DMA transfer for the corresponding channel. Clearing the DE bit to 0 by setting the DMAjCHFCR_n.DEC bit to 1 aborts DMA transfer. The DE bit is also cleared automatically when an ongoing DMA transfer is finished or an ECC error of the descriptor RAM occurs. See **Section 7.5, Usage Notes** for details about DMA transfer abort. 0: DMA transfer disabled 1: DMA transfer enabled

7.3.14 DMAjCHSTP_n — DMA Channel Suspend Register

DMAjCHSTP_n is a 16-bit read/write register that controls the suspend condition for DMA transfer.

Access: DMAjCHSTP_n register can be read or written in 16-bit units

Address: <SDMACj_base> + (n × 80_H) + 2016_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.17 DMAjCHSTP_n Register Contents

Bit Position	Bit Name	Function
15 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	STP	DMA transmission suspend When this bit is set to 1, packet requests suspend immediately. When this bit is set to 0 after transmission has been suspended, the transmission is resumed. 0: No operation 1: DMA transfer suspend

7.3.15 DMAjCHSTA_n — DMA Channel Status Register n

DMAjCHSTA_n register is a 32-bit read-only register that shows the DMA transfer status.

Access: DMAjCHSTA_n register is a read-only register that can be read in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2018_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	OVF	DRQ	—	—	—	—	—	—	—	—	CAE	DSE	TE	BUSY
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.18 DMAjCHSTA_n Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned.
13	OVF	Hardware transfer request overflow flag Indicates that a hardware trigger was asserted before a pending hardware transfer request has been acknowledged. To clear the OVF bit, write 1 to the DMAjCHFCR_n.OVFC bit. 0: No hardware transfer request overflow 1: Hardware transfer request overflow occurred
12	DRQ	Hardware request status If this bit is set, it means that a hardware transfer request exists or is retained. • This bit shows whether a hardware transfer request is retained. When the transfer specified by DMAjRS_n.TL bits is completed, this bit is automatically cleared. This bit can be cleared by writing 1 to the DMAjCHFCR_n.DRQC bit. This bit changes regardless of the value of the DMAjTMR_n.TRS bit when a hardware DMA transfer request is generated. 0: There is no hardware transfer request 1: There is a hardware transfer request
11 to 4	Reserved	When read, the value after reset is returned.
3	CAE	Address error flag Indicates that an address error interrupt occurred in the DMA transfer. The following conditions can set this bit: The transfer source or transfer destination is an invalid space. A GUARD error occurred upon access to a source or a destination address. Channel register setting is prohibited. See **Section 7.5, (1) Address Errors** for details about address errors. If this bit is set, DMA transfer is not enabled for the channel even if the DE bit is set to 1. To clear the CAE bit, write 1 to the DMAjCHFCR_n.CAEC bit. 0: Address error interrupt did not occur in the DMA transfer 1: Address error interrupt occurred in the DMA transfer

Table 7.18 DMAjCHSTA_n Register Contents (2/2)

Bit Position	Bit Name	Function
2	DSE	Descriptor step end flag When the DMAjCHCR_n.DSIE bit is set to 1 and the DMAjDPPTR_n.DIE bit is set to 1, the DSE bit is set to 1 at the end of DMA transfer. To clear the DSE bit, write 1 to the DMAjCHFCR_n.DSEC bit. 0: DMA transfer is in progress or has finished 1: The descriptor step has finished
1	TE	Transfer end flag The TE bit is set to 1 when data transfer ends (DMAjTSR_n becomes 0). When the descriptor is enabled, the TE bit is set to 1 at the end of all descriptor steps. The TE bit is not set to 1 in the following cases: - DMA transfer ends due to a DMA address error before DMAjTSR_n becomes 0. - DMA transfer is terminated by clearing the DE bit and DME bit in DMAjOR. To clear the TE bit, write 1 to the DMAjCHFCR_n.TEC bit. If the DMAjCHCR_n.DE bit is set to 1 while TE bit is set to 1, DMA transfer will not be enabled. 0: DMA transfer is in progress or DMA transfer has finished 1: DMA transfer ended at the specified count (TSR = 0)
0	BUSY	Channel Busy flag This bit indicates that the channel is busy. When transfer is started, the BUSY bit is set to 1. After the DMAjCHCR_n.DE bit is cleared or the DMAjCHSTP_n.STP bit is set, the BUSY bit is cleared after receiving the response of all packets. 0: Channel status is idle 1: Channel status is busy

7.3.16 DMAjCHFCR_n — DMA Channel Flag Clear Register n

DMAjCHFCR_n is a 32-bit write-only register that clears the DMA channel status flags.

Access: DMAjCHFCR_n register is a write-only register that can be written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + $201C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	OVFC	DRQC	—	—	DPEC	—	—	—	—	—	CAEC	DSEC	TEC	DEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	W	W	R	R	W	R	R	R	R	R	W	W	W	W

Table 7.19 DMAjCHFCR_n Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 14	Reserved	When writing, write the value after reset.
13	OVFC	Hardware transfer request overflow flag clear This bit is always read as 0. When the OVFC bit is set to 1, the DMAjCHSTA_n.OVF bit is cleared. 0: No operation 1: DMAjCHSTA_n.OVF bit is cleared.
12	DRQC	Hardware transfer request clear This bit is always read as 0. When the DRQC bit is set to 1, the DMAjCHSTA_n.DRQ bit is cleared. 0: No operation 1: DMAjCHSTA_n.DRQ bit is cleared.
11 to 10	Reserved	When writing, write the value after reset.
9	DPEC	Descriptor enable clear This bit is always read as 0. When the DPEC bit is set to 1, the DMAjCHCR_n.DPE bit is cleared. The DMAjCHCR_n.DPE bit is the enable condition of the descriptor operation. To abort DMA transfer at the end of a descriptor step, clear the DPE bit by using this bit. 0: No operation 1: DMAjCHCR_n.DPE bit is cleared
8 to 4	Reserved	When writing, write the value after reset.
3	CAEC	Address error flag clear This bit is always read as 0. When the CAEC bit is set to 1, the DMAjCHSTA_n.CAE bit is cleared. The DMAjCHSTA_n.CAE bit is the stop condition of DMA transfer. To end DMA transfer, clear the DMAjCHCR_n.DE bit before clearing the DMAjCHSTA_n.CAE bit. 0: No operation 1: DMAjCHSTA_n.CAE bit is cleared
2	DSEC	Descriptor step end flag clear This bit is always read as 0. When the DSEC bit is set to 1, the DMAjCHSTA_n.DSE bit is cleared. 0: No operation 1: DMAjCHSTA_n.DSE bit is cleared

Table 7.19 DMAjCHFCR_n Register Contents (2/2)

Bit Position	Bit Name	Function
1	TEC	Transfer end flag clear This bit is always read as 0. When the TEC bit is set to 1, the DMAjCHSTA_n.TE bit is cleared. The DMAjCHSTA_n.TE bit is the stop condition of DMA transfer. To end DMA transfer, clear the DMAjCHCR_n.DE bit before clearing the DMAjCHSTA_n.TE bit. 0: No operation 1: DMAjCHSTA_n.TE bit is cleared
0	DEC	DMA enable clear This bit is always read as 0. When the DEC bit is set to 1, the DMAjCHCR_n.DE bit is cleared. The DMAjCHCR_n.DE bit is the enable condition of DMA transfer. To abort DMA transfer, clear the DE bit by using this bit. See **Section 7.5, Usage Notes** for details about DMA transfer abort. 0: No operation 1: DMAjCHCR_n.DE bit is cleared

7.3.17 DMAjGIAI_n — DMA Gather Inner Address Increment Register n

DMAjGIAI_n is a 32-bit read/write register that specifies the source address increment for the inner loop of a gather transfer.

Access: DMAjGIAI_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2020_H

Value after reset: 0000 0000_H

NOTE

This register must be set to a multiple of DMA source transaction size which is set to STS bit in the DMAjTMR_n register.

7.3.18 DMAjGOAI_n — DMA Gather Outer Address Increment Register n

DMAjGOAI_n is a 32-bit read/write register that specifies the source address increment for the outer loop of a gather transfer.

Access: DMAjGOAI_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2024_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

NOTE

This register must be set to a multiple of DMA source transaction size which is set to STS bit in the DMAjTMR_n register.

7.3.19 DMAjSIAI_n — DMA Scatter Inner Address Increment Register n

DMAjSIAI_n is a 32-bit read/write register that specifies the destination address increment for the inner loop of a scatter transfer.

Access: DMAjSIAI_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2028_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7.3.20 DMAjSOAI_n — DMA Scatter Outer Address Increment Register n

DMAjSOAI_n is a 32-bit read/write register that specifies the destination address increment for the outer loop of a scatter transfer.

Access: DMAjSOAI_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + $202C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

7.3.21 DMAjSGST_n — DMA Scatter Gather Status Register n

DMAjSGST_n is a 32-bit read only register that indicates the count of inner scatter and gather loops. The detailed operation of scatter/gather is explained in **Section 7.4.5, Scatter Gather Transfer**.

Access: DMAjSGST_n register is a read-only register that can be read in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2038_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.20 DMAjSGST_n Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned.
29 to 16	SICNT[13:0]	Indicates the current repeat count of the scatter inner DMA loop.
15, 14	Reserved	When read, the value after reset is returned.
13 to 0	GICNT[13:0]	Indicates the current repeat count of the gather inner DMA loop.

7.3.22 DMAjSGCR_n — DMA Scatter Gather Control Register n

DMAjSGCR_n is a 32-bit read/write register that controls scattering on the source side and gathering on the destination side. The operation of scatter/gather is explained in detail in **Section 7.4.5, Scatter Gather Transfer**.

Access: DMAjSGCR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + ($n \times 80_H$) + $203C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

30	ZF	Zero fill 0: Zero fill is disabled 1: Zero fill is enabled
29 to 16	SIRPT[13:0]	Repeat count of the inner DMA loop if scattering is enabled 0: Zero repeats 1: One repeat : 16383: 16383 repeats
15	GEN	Gather enable on destination side 0: Gathering is disabled 1: Gathering is enabled
14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 0	GIRPT[13:0]	Repeat count of the inner DMA loop if gathering is enabled 0: Zero repeats 1: One repeat : 16383: 16383 repeats

7.3.23 DMAjRS_n — DMA Resource Select Register n

DMAjRS_n is a 32-bit read/write register that specifies the source and control settings for hardware transfer requests. The operation of hardware transfer requests is explained in detail in **Section 7.4.1, DMA Transfer Requests**.

Access: DMAjRS_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2040_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.22 DMAjRS_n Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	TC[15:0]	Transfer count per hardware request Specify the number of DMA transfers in hardware request mode. This bit is valid only when the DMAjRS_n.TL bit is set to 000 or 001. In this case, setting 0 is prohibited.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14 to 12	TL[2:0]	Transfer limit per hardware request Specifies the limit of transfers generated by a hardware request. 000: Transaction size indicated by DMAjTMR_n.STS * DMAjRS_n.TC (Setting prohibited when PLE = 1) 001: Transaction size indicated by DMAjTMR_n.DTS * DMAjRS_n.TC (Setting prohibited when PLE = 0) 010: Transfer size indicated by DMAjTSR_n.TSR 011: Until the DSE flag is asserted. (Transfer also ends when the TE flag is asserted.) 100: Until the TE flag is asserted Other than above: Setting prohibited
11	FPT	First pre-load trigger Specifies the trigger to start the first pre-load transfer. If transfer data is not prepared before DE is set, this bit should be set to 1. When the pre-load function is disabled (PLE = 0), this setting is ignored. 0: First pre-load start when DE is set to 1 1: First pre-load start when hardware request is asserted
10	PLE	Pre-load enable When the pre-load function is enabled, the DMAC loads transfer data from the source memory before a hardware request is asserted. 0: Disable 1: Enable

Table 7.22 DMAjRS_n Register Contents (2/2)

Bit Position	Bit Name	Function
9	DRQI	DMA request initialization when descriptor settings are loaded Specifies whether to initialize the DRQ bits when this register setting is loaded from the descriptor memory. When DRQI is set to 1, the remaining DRQ bits are cleared. The DRQ bits are also cleared when a different source (RS) is loaded. For details, see **Section 7.4.6 (4) (h), Example 8: Hardware Request Operation with Different Request Source Settings**. 0: DRQ initialize disabled 1: DRQ initialize enabled
8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	RS[7:0]	DMA request source See the DMA request resources of on-chip peripheral modules.

7.3.24 DMAjBUFCR_n — DMA Buffer Control Register n

DMAjBUFCR_n is a 32-bit read/write register that controls the upper limit of the data RAM buffer. This register specifies the upper limit of the RAM buffer available to a channel for data prefetching. This setting should not be changed unless it is necessary to limit the amount of prefetched data.

Access: DMAjBUFCR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2048_H

Value after reset: 0000 0080_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.23 DMAjBUFCR_n Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	ULB[7:0]	Upper limit of buffer This register controls the upper limit of a channel's data buffer. A power-of-two setting is recommended. Setting ULB to less than the transaction size (DMAjTMR_n.STS, DMAjTMR_n.DTS) is prohibited. The maximum value is 128 (bytes).

7.3.25 DMAjDPPTR_n — DMA Descriptor Pointer Register n

DMAjDPPTR_n is a 32-bit read/write register that specifies the address of the next register setting in the descriptor memory. The operation of descriptors is explained in detail in **Section 7.4.6, Descriptors**.

Access: DMAjDPPTR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + (n × 80_H) + 2050_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	PTR[11:2]										DIE	CF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.24 DMAjDPPTR_n Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 2	PTR[11:2]	Address pointer of Descriptor These bits indicate the address of the next register setting in the descriptor memory.
1	DIE	Descriptor interrupt enable When the DMAjCHCR_n.DSIE bit and this bit are set to 1 at the end of the current DMA transfer, the DSE bit in DMAjCHSTA_n set to 1 and the descriptor step end interrupt is issued. 0: Interrupt request is disabled 1: Interrupt request is enabled
0	CF	Continuation flag of descriptor 0: Disable Transfer is not continued. The TE bit in the DMAjCHCR_n register is set to 1 at the termination of the current DMA transfer. 1: Enable When DMA transfer with the current register settings is terminated and DMAjCHCR_n.DPE is set to 1, transfer continues to read the register settings from the DPTR address of the descriptor memory.

7.3.26 DMAjDPCR_n — DMA Descriptor Control Register n

DMAjDPCR_n is a 32-bit read/write register that specifies which channel settings will be updated with the contents of the descriptor memory. The operation of descriptors is explained in details in **Section 7.4.6, Descriptors**.

Access: DMAjDPCR_n register can be read or written in 32-bit units

Address: <SDMACj_base> + ($n \times 80_H$) + 2054_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.25 DMAjDPCR_n Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 0	UPF[10:0]	Update flag of Descriptor These bits specify the registers to be updated by a descriptor operation. The DMAjDPPTR_n register is always updated. UPF[0]: Enable/disable updating the DMAjSAR_n register UPF[1]: Enable/disable updating the DMAjDAR_n register UPF[2]: Enable/disable updating the DMAjTSR_n register UPF[3]: Enable/disable updating the DMAjTMR_n register UPF[4]: Enable/disable updating the DMAjGIAI_n register UPF[5]: Enable/disable updating the DMAjGOAI_n register UPF[6]: Enable/disable updating the DMAjSIAI_n register UPF[7]: Enable/disable updating the DMAjSOAI_n register UPF[8]: Enable/disable updating the DMAjSGCR_n register UPF[9]: Enable/disable updating the DMAjRS_n register UPF[10]: Enable/disable updating the DMAjBUFCR_n register

7.3.27 Descriptor RAM — Descriptor Memory

See **Section 7.4.6, Descriptors** for details about the descriptor memory.

7.3.28 DMACSELj_m — sDMACj Transfer Request Group Selection Register m (m = 0 to 15)

DMACSELj_m register specifies the sDMACj transfer request group for each channel.

Access: DMACSELj_m register can be read or written in 8-, 16-, or 32-bit units

Address: DMACSEL0_m: <DMATRGSEL_base> + (m × 4_H)
DMACSEL1_m: <DMATRGSEL_base> + (m × 4_H) + 40_H

Value after reset: DMACSEL0_m: 0000 0000_H
DMACSEL1_m: 5555 5555_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	SEL10	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 10
19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18	SEL9	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 9

Table 7.26 DMACSELj_m Register Contents (2/2)

Bit Position	Bit Name	Function
17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	SEL8	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 8
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	SEL7	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 7
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	SEL6	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 6
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	SEL5	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 5
9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SEL4	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 4
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	SEL3	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 3
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	SEL2	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 2
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	SEL1	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 1
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	SEL0	Selects the DMA transfer request group for sDMACj transfer request signal 16 x m + 0

The following table shows the DMACSELj_0 to DMACSELj_15 register contents.

Bit Name	Function
SELn	0_B: Select DMA transfer request group 0 1_B: Select DMA transfer request group 1

7.4 Operation

7.4.1 DMA Transfer Requests

The DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request source (TRS) bit in the DMA transfer mode register (DMAjTMR_n) determines whether a hardware DMA transfer request or a software DMA transfer request is used. How to set up DMA transfer requests is described in **Section 7.7, Setting up DMA Transfer**.

(1) Auto-Request Mode

When the TRS bit in the DMAjTMR_n register is set to 0, a software DMA transfer request can be generated. When the DE bit in DMAjCHCR_n and the DME bit in DMAjOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMAjCHSTA_n is 0.

(2) Hardware-Request Mode

When the TRS bit in the DMAjTMR_n register is set to 1, if DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

In the case of a hardware DMA transfer request for the DMAC, one out of 256 hardware DMA transfer sources is selected and assigned to each channel of the DMAC in the DMA request control module. This assignment is configured by the resource select (RS) bit in the DMAjRS_n register.

Examples of using hardware request mode are shown below.

(a) Example 1: Hardware Request Operation to Transfer Data from a Peripheral Module

Figure 7.3 and **Figure 7.4** show examples of a peripheral module requesting sDMAC transfer from peripheral memory to on-chip memory. When the hardware transfer request triggers a load data transfer (DMAjRS_n.PLE = 0), the DMAjRS_n.TL bit determines the load data transfer limit per hardware transfer request. Store data transfers are executed in auto request mode in this case.

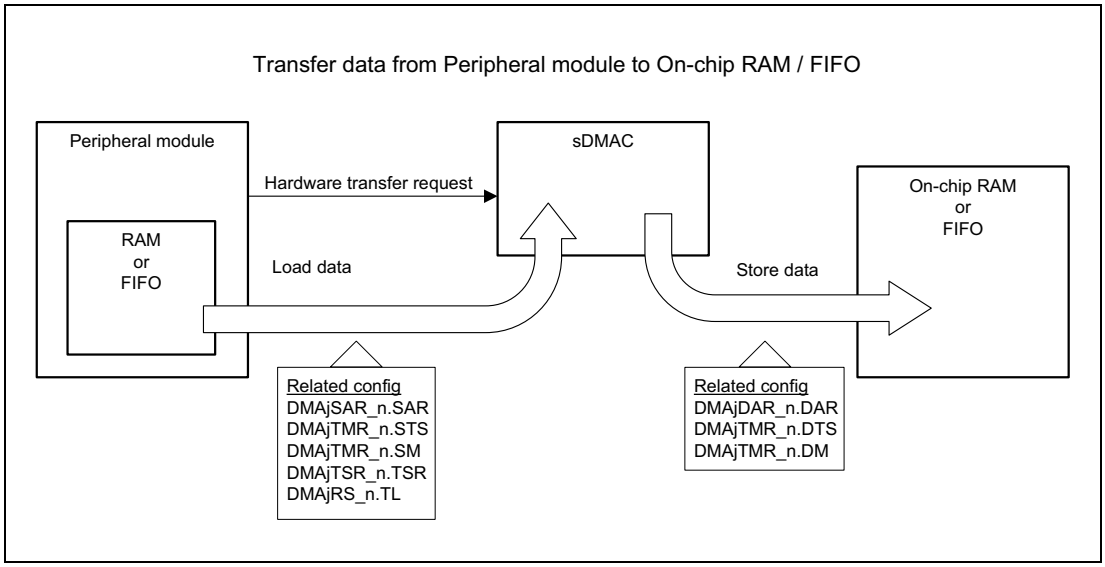

Figure 7.3 Transferring Data from Peripheral Module in Hardware-Request Mode

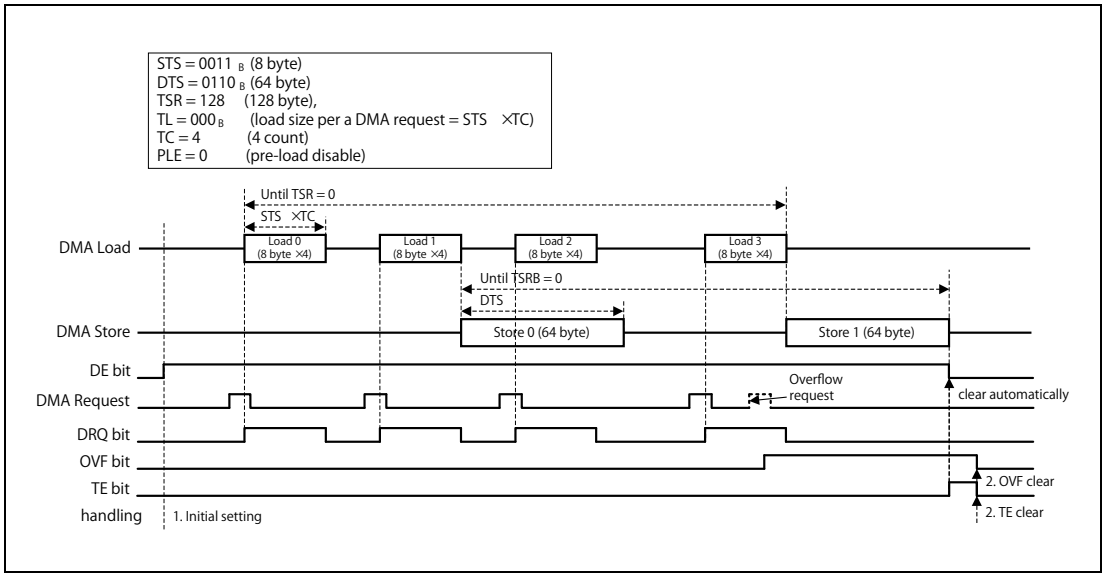

Figure 7.4 Timing Chart for Transferring Data from Peripheral Module

(b) Example 2: Hardware Request Operation to Transfer Data to a Peripheral Module

Figure 7.5, **Figure 7.6**, **Figure 7.7**, and **Figure 7.8** show examples of a peripheral module requesting sDMAC transfer from on-chip memory to peripheral module memory. When the pre-load function is enabled (DMAjRS_n.PLE = 1), a hardware transfer request triggers a store data transfer. The DMAjRS_n.TL bit determines the store data transfer limit per hardware transfer request. Load data transfers are executed in auto request mode in this case.

In case the pre-load transfer is triggered before the load data is prepared in the source memory, the pre-load limit can be controlled by setting the ULB bit in DMAjBUFCR_n register as shown in **Figure 7.8**.

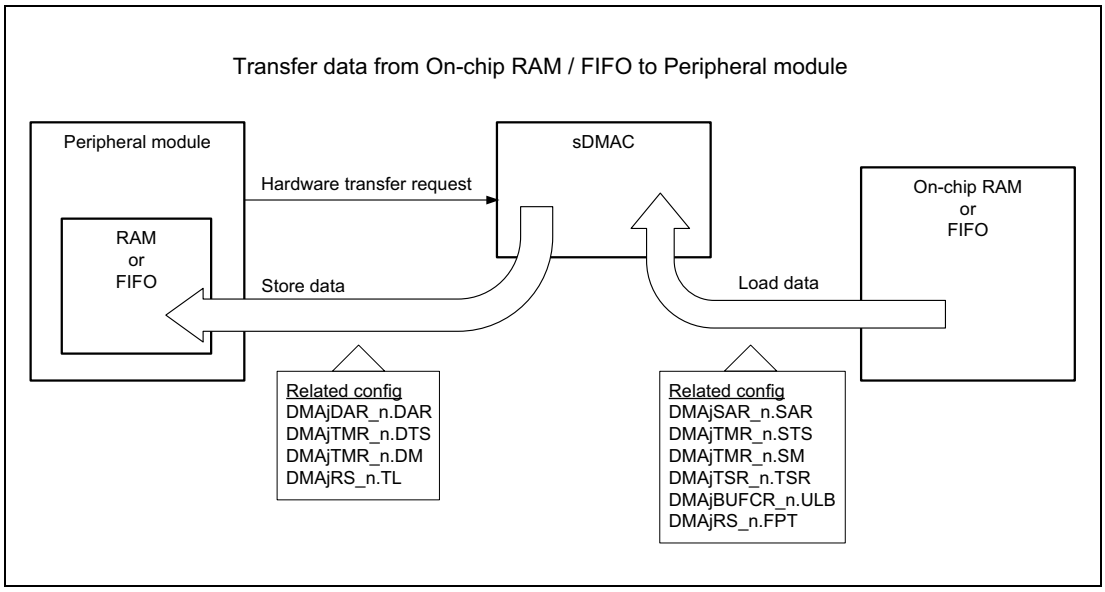

Figure 7.5 Transferring Data to a Peripheral Module in Hardware Request Mode

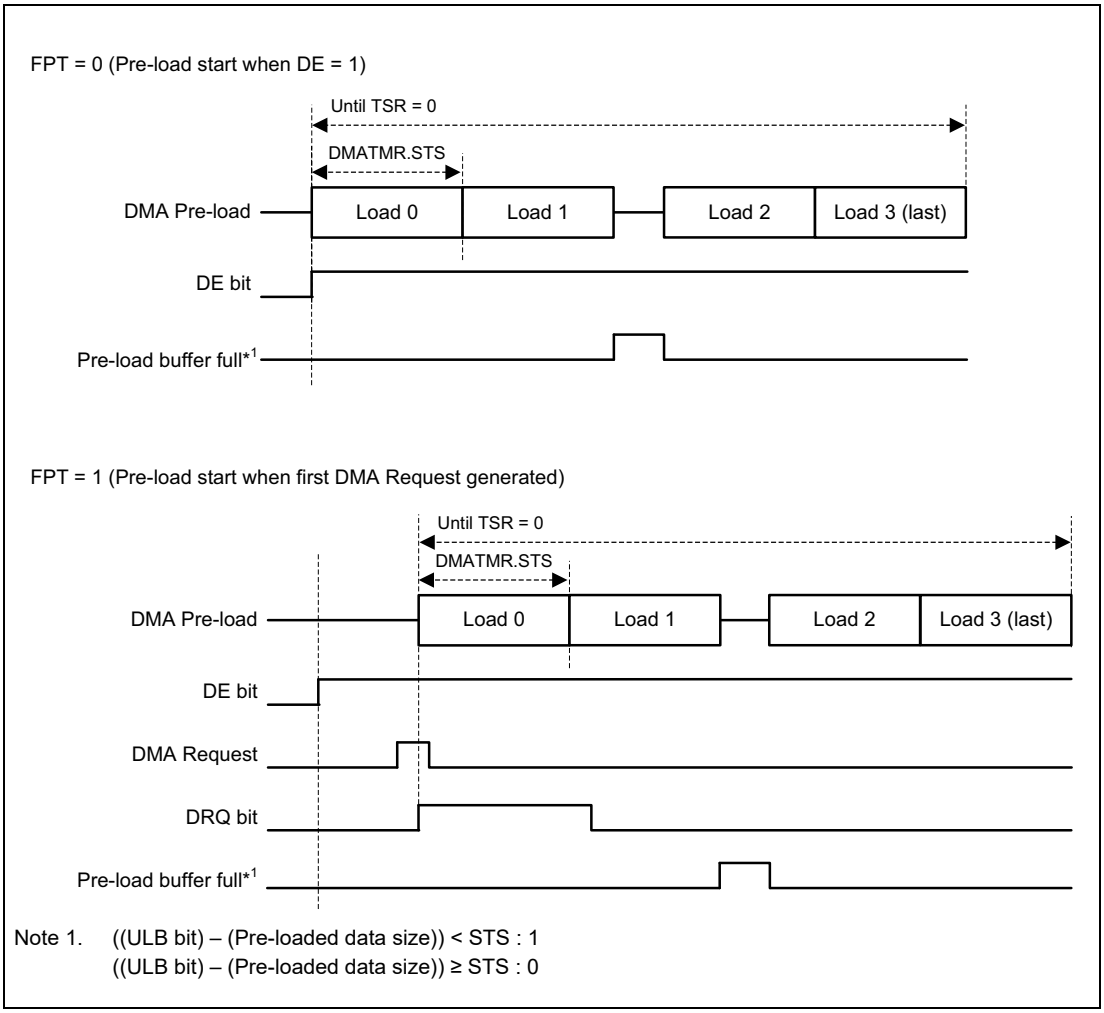

Note 1. ((ULB bit) – (Pre-loaded data size)) < STS : 1
((ULB bit) – (Pre-loaded data size)) ≥ STS : 0

Figure 7.6 Timing Chart for Pre-Load Function in Hardware Request Mode

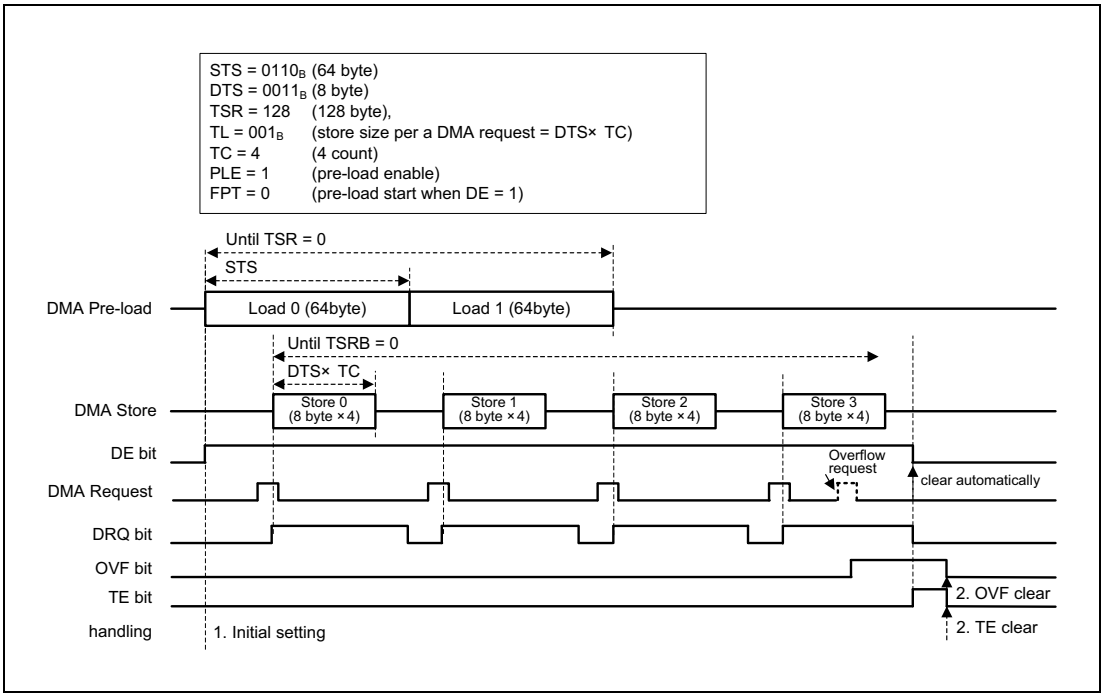

Figure 7.7 Timing Chart of Transferring Data to Peripheral Module

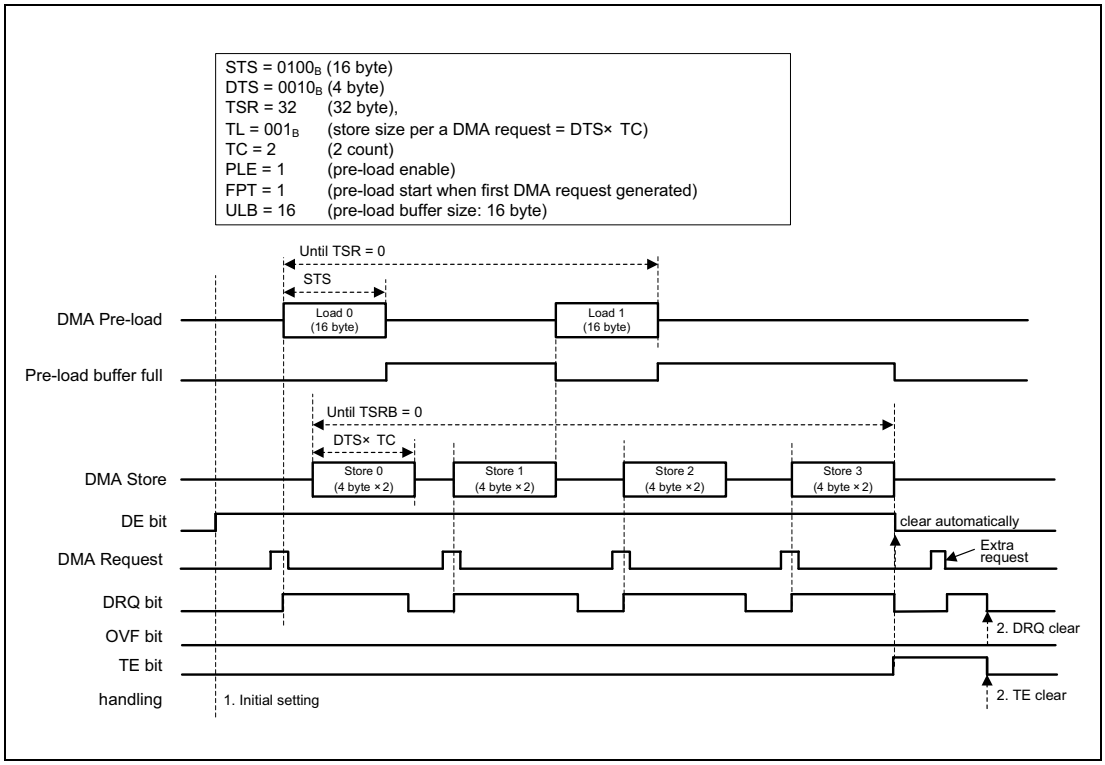

Figure 7.8 Timing Chart of Transferring Data with Buffer Control Operation

7.4.2 DMA Interrupts

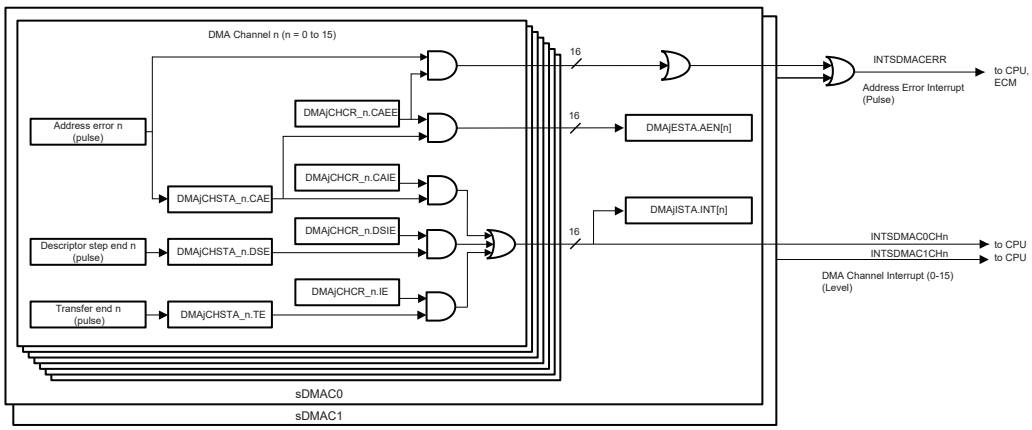
The routing of sDMAC interrupts is shown in **Figure 7.9**. sDMAC interrupts can be masked by the DMA channel registers.

A channel interrupt request is raised by sDMAC if any of these status bits is set (OR function):

- Transfer end (TE),
- Descriptor step end (DSE) ,
- Channel address error (CAE).

The address error is also notified to CPU by another path and interrupt INTSDMACERR can be generated.

The status of channel interrupt requests and address errors is indicated in global registers DMAjISTA and DMAjESTA.



Note: For details about causes of address errors, see **Section 7.5, (1) Address Errors**.

Figure 7.9 Interrupt Routing in sDMAC

7.4.3 Channel Priority

When sDMAC receives transfer requests from multiple channels, it transfers data according to a predetermined priority. One of two modes (fixed priority mode or round-robin mode) can be selected (DMAjOR.PR[1:0]).

(1) Fixed Priority Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... >CH14 > CH15

(2) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (1 to 64 byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer has just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... >CH14 > CH15 immediately after reset.

(3) Channel Request Priority

To increase the priority of the specified channel, use the PRI bits in the DMA transfer mode register (DMAjTMR_n). This function is given priority over the PR bits in the DMA operation register (DMAjOR). If a channel request is not accepted, the channel priority counter increases by the count set by the PRICNT bits in the DMA channel request priority register (DMAjCHPRI). The PRICNT bits in the DMA channel request priority register (DMAjCHPRI) are counted up by SCLK. When this priority counter reaches the maximum value (= 7), the highest priority request is accepted. However, if more than one channel has high priority, the requests are arbitrated according to the setting of the PR bits in DMAjOR.

Figure 7.10 shows the channel request priorities.

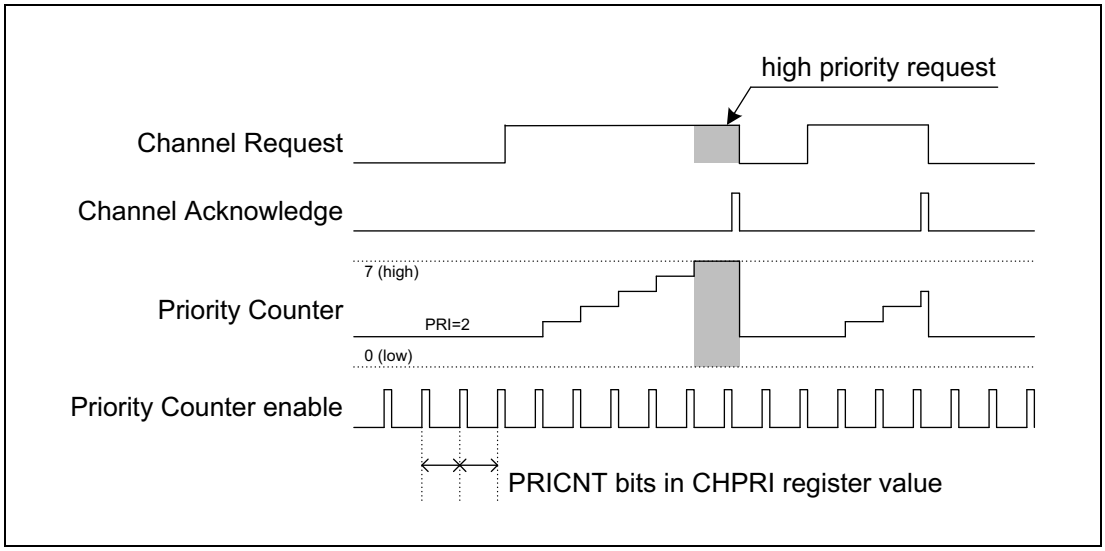


Figure 7.10 Channel Request Priorities

7.4.4 Slow Speed Mode

In slow speed mode, there is a configurable delay between consecutive DMA transfers. The delay (number of clock cycles) is specified by the SLM bit in the DMAjTMR_n register. Slow speed mode can be selected independently for each DMA channel. When one DMA channel operating in slow speed mode is waiting between DMA transfers, another DMA channel operating in slow speed mode can perform DMA transfer.

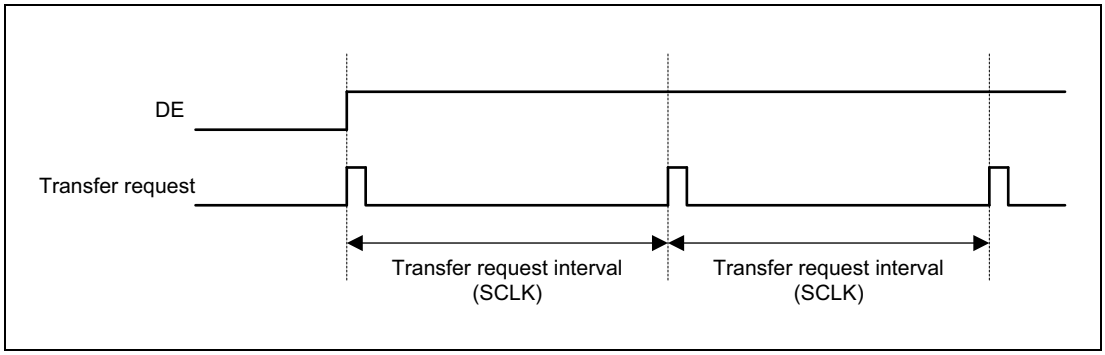

Figure 7.11 Slow Speed Mode

7.4.5 Scatter Gather Transfer

The DMAC supports gathering on the source side and scattering on the destination side.

The gather flow is shown in **Figure 7.12**. It is enabled if the GEN bit in DMAjSGCR_n for the given DMA channel is set to 1. The gather flow supports an inner and an outer loop. The number of iterations of the inner loop is specified by the GIRPT bit in DMAjSGCR_n register. The total of inner and outer loop transfers equals the number of TSR bytes. So the number of iterations of the outer loop is indirectly defined by the TSR register. The inner loop always transfers a data unit the size of an STS byte from the source to the data RAM and the SAR register is updated in the same way as transfers with gathering disabled. Additionally, the source address (SAR bits in DMAjSAR_n register) is increased by the inner address increment (GIAI bits in DMAjGIAI_n register). This procedure is repeated until the value of TSR bits in DMAjTSR_n or the value of GICNT bits in DMAjSGST_n register reaches zero, which concludes the inner loop. Before the inner loop is repeated, the source address (SAR bits in DMAjSAR_n register) is increased by the outer address increment (GOAI bits in DMAjGOAI_n register) and the GICNT bits in DMAjSGST_n register are restored with the value of GIRPT bits in DMAjSGCR_n register. The outer loop is repeated until the value of TSR bits in DMAjTSR_n register reaches zero. **Figure 7.14** shows an example with gathering and scattering enabled. If a transaction error occurs while the gather flow is active, the gather flow restarts at the beginning after the error condition is cleared.

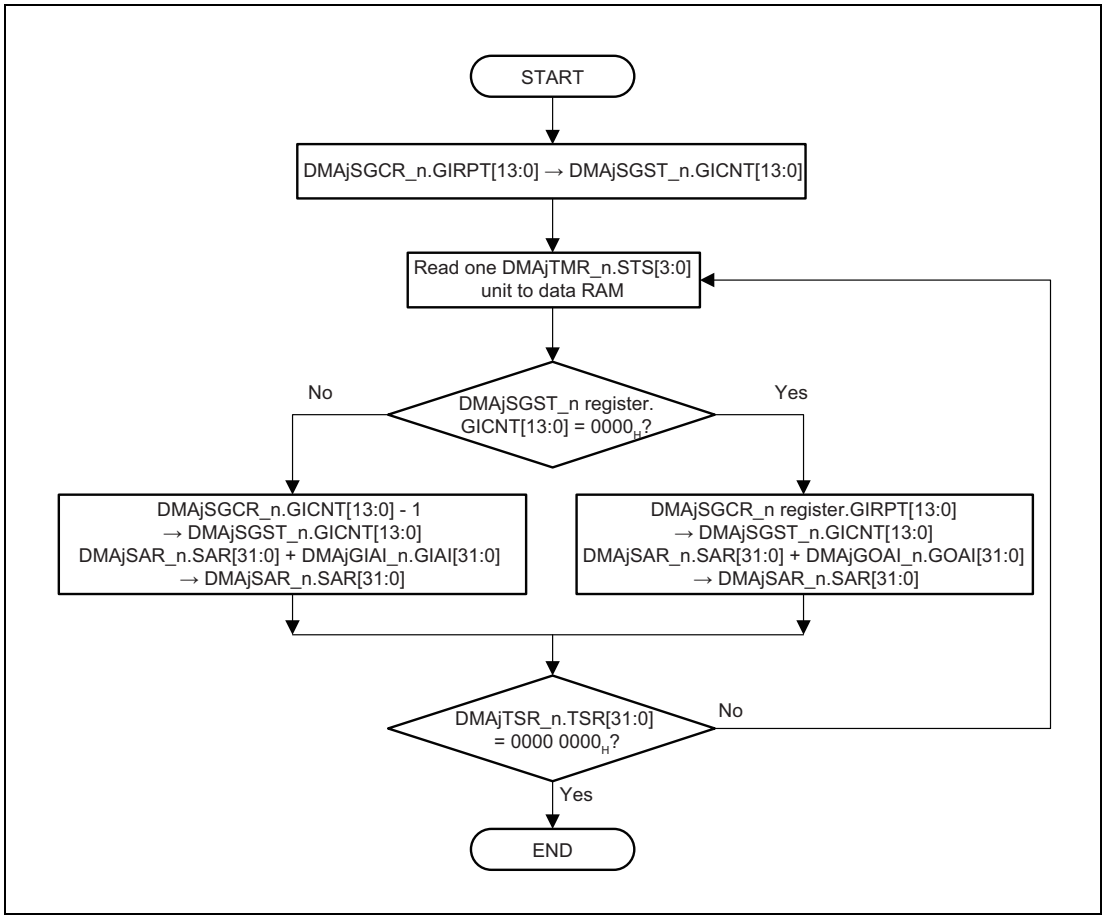

Figure 7.12 Gather Flow at Source Side If GEN = 1

The scatter flow is shown in **Figure 7.13**. It is enabled if the SEN bit in DMAjSGCR_n for the given DMA channel is set to 1. The scatter flow also supports an inner and outer loop. Additionally, zero filling is supported in the inner loop. The number of iterations of the inner loop is specified by the SIRPT register. The total of inner and outer loop transfers equals the number of TSRB bytes. So the number of iterations of the outer loop is indirectly defined by the TSRB register. The inner loop always transfers one data unit of size specified by DTS bits in DMAjTMR_n from the data RAM to the destination address and the DAR bits in DMAjDAR_n register is updated in the same way as for transfers with scattering disabled. If zero filling is disabled by setting ZF bit in DMAjSGCR_n = 0, the destination address (DAR bits in DMAjDAR_n register) is additionally increased by the inner address increment (SIAI bits in DMAjSIAI_n register), resulting in the destination address for the next data unit (the value of DAR bits in DMAjDAR_n register plus the value of SIAI bits in DMAjSIAI_n register). If zero filling is enabled by setting ZF bit in DMAjSGCR_n register = 1, value zero with data units specified by SIAI bits in DMAjSIAI_n register are written to the destination address and the DAR bits in DMAjDAR_n register is updated. This procedure also uses internal register ZFTSR to calculate the remaining zero fill transfer size. This procedure is repeated until the value of TSRW bits in DMAjTSRB_n register or the value of SICNT bits in DMAjSGST_n register reaches zero, which concludes the inner loop. Before the inner loop is repeated, the destination address (DAR bits in DMAjDAR_n register) is increased by the outer address increment (SOAI bits in DMAjSOAI_n register) if zero fill is disabled and the SICNT bits in DMAjSGST_n register is restored with the value of SIRPT bits in DMAjSGCR_n register. The outer loop is repeated until the value of TSRW bits in DMAjTSRB_n reaches zero. **Figure 7.14** shows an example with gathering and scattering enabled. If

a transaction error occurs while the scatter flow is active, the scatter flow restarts at the beginning after the error condition is cleared.

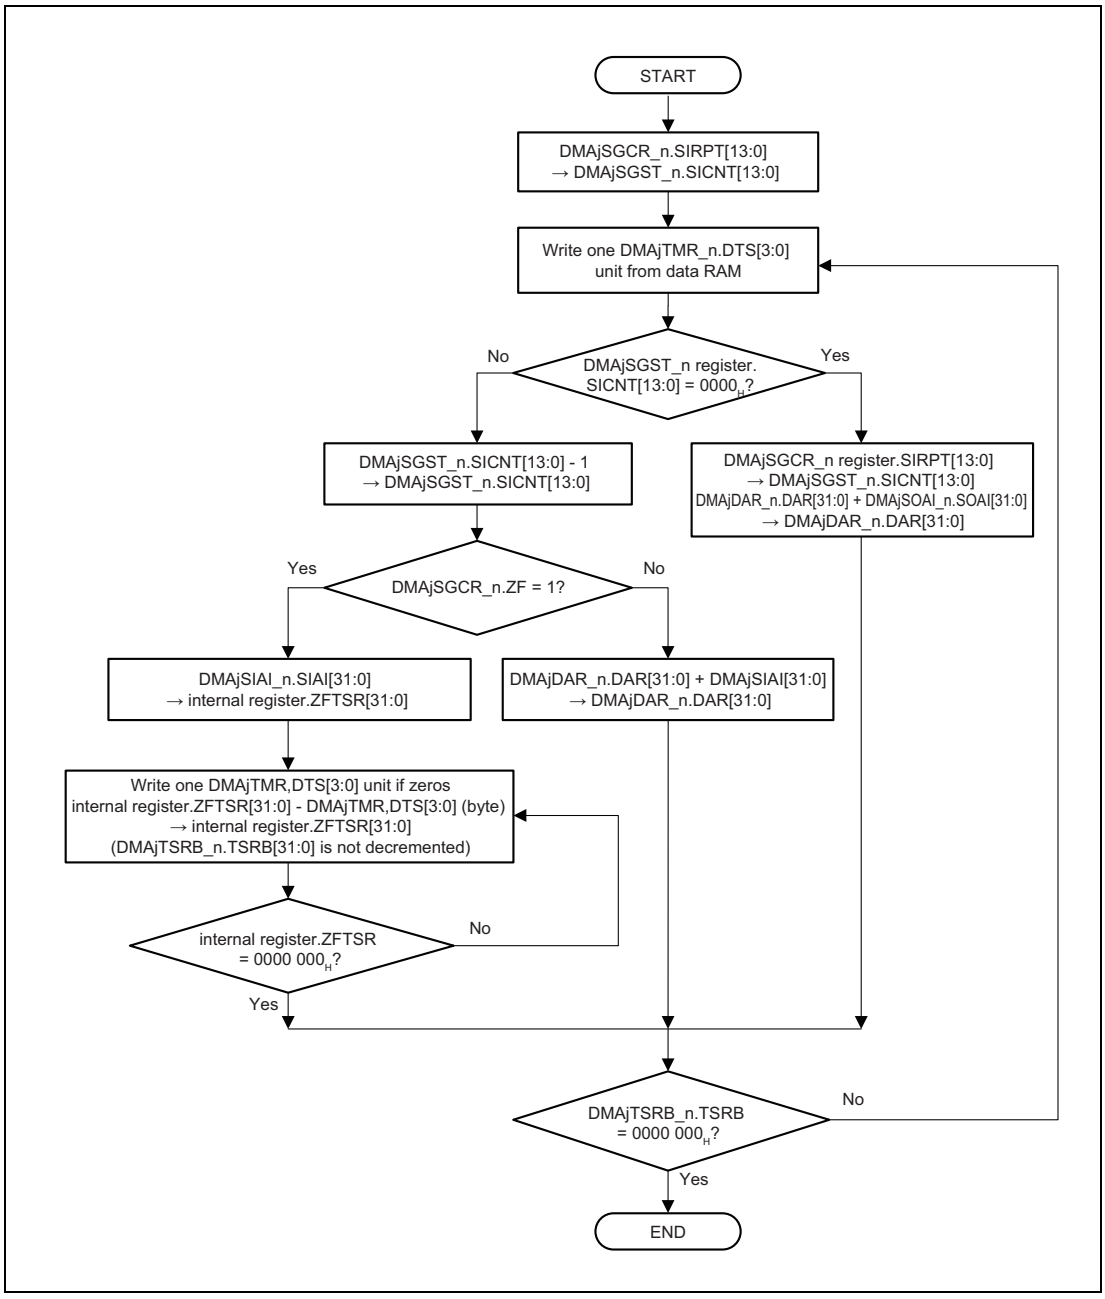

Figure 7.13 Scatter Flow at Destination Side If SEN = 1

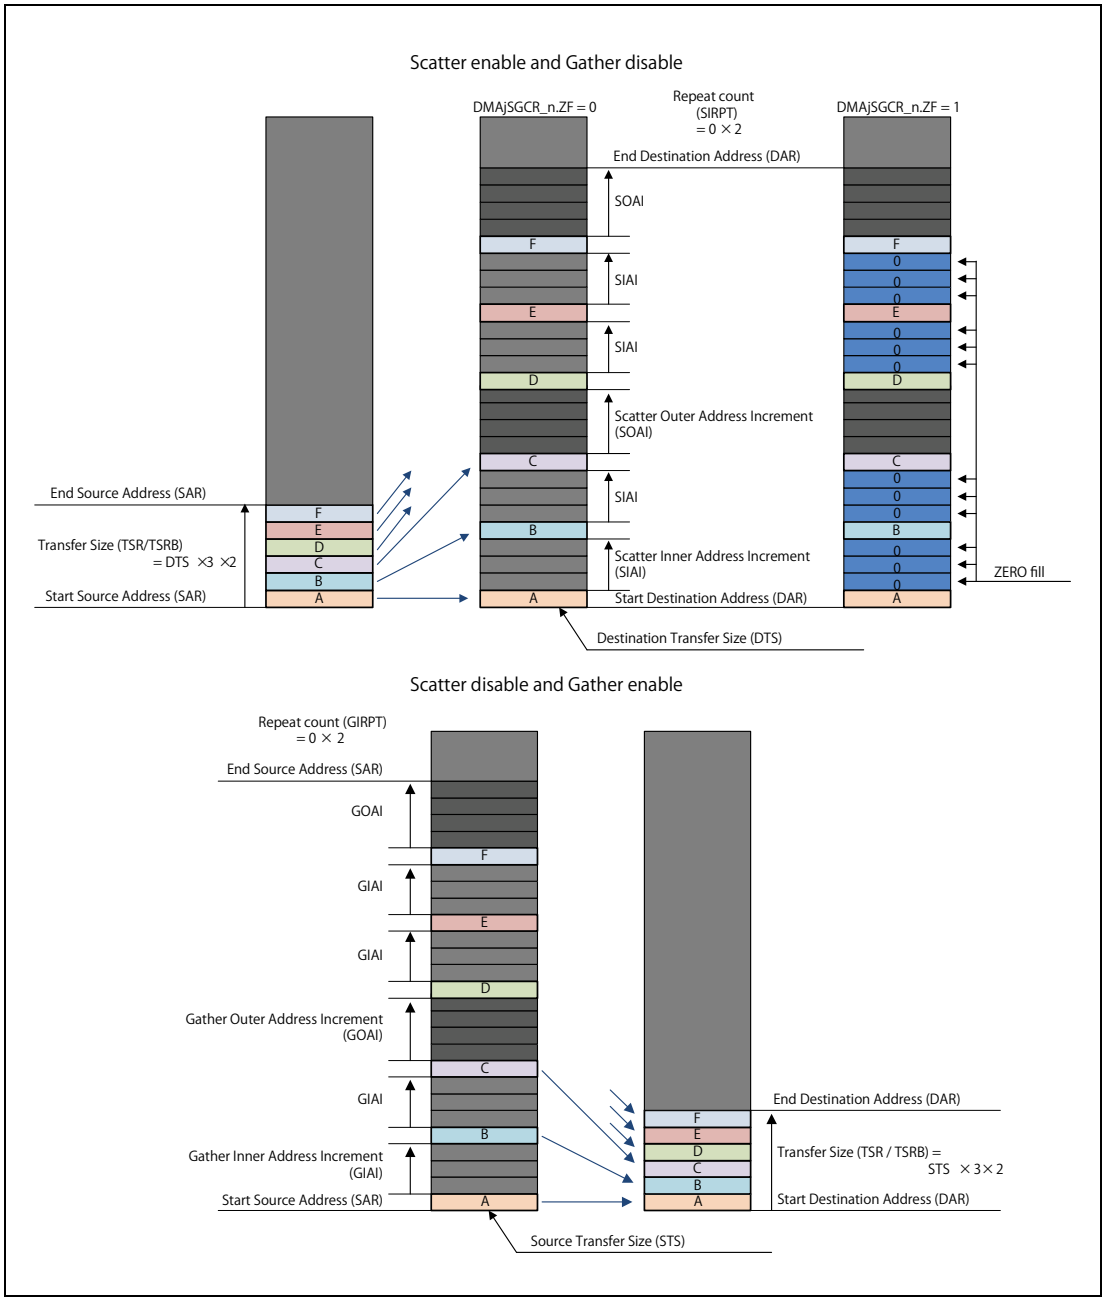

Figure 7.14 Examples That Show the Operation of Scatter and Gather Flows

The scatter gather features can be used to realize re-sorting. Transposing a column vector from a source memory address to a row vector at the destination memory address is realized by using gathering at the source side. The inner loop (GIRPT bits in DMAjSGCR_n register) is set to the number of samples in the vector. The data unit size (STS bits or DTS bits in DMAjTMR_n register) is set to the size of one vector element. The inner address offset (GIAI bits in DMAjGIAI_n register) is set to k*STS, where k is the width of the source matrix in the number of elements and STS is the value of STS bits in DMAjTMR_n register. The same principle can be used to transpose a row vector to a column vector. Here, scattering is used instead of gathering. Gathering and scattering can also be used to read every m-th source address and write it to every n-th destination address. Since gathering and scattering can be enabled independently, any combination is possible. At the destination side, zero filling can be used to set the words between the write addresses to zero.

Finally, the outer loop feature for both gathering and scattering allows the realization of inner and outer DMA loops.

7.4.6 Descriptors

A descriptor contains all the necessary register bits that describe a single transfer task on a channel. A channel can execute multiple descriptors in a chain by reloading the register settings from the descriptor memory. Descriptor operations are enabled by setting DPE bit to 1_B in DMAjCHCR_n. When the DMA transfer defined by the current register setting is finished, the next descriptor is loaded from the descriptor memory. The address of the descriptor to load is defined by the DMAjDPPTR_n.PTR bits. The new descriptor also updates the DMAjDPPTR_n register. This enables an arbitrary chain of descriptors.

Updating of the register list by descriptor operations is shown in **Table 7.27**.

The bit format in the descriptor memory matches the bit format in the corresponding DMA channel registers.

The DMAjSAR_n, DMAjDAR_n and DMAjTSR_n registers are updated during DMA transfer. If the DMAjSAR_n and DMAjDAR_n registers are not updated, the next DMA transfer is started from the final value of the previous DMA transfer. The DMAjTSR_n register is set to 0 after DMA transfer, so DMAjTSR_n register must be updated.

Table 7.27 Register List of Channels to Be Updated

No	Name	Abbreviation	Bit	DMADPCR.UPF bit
1	DMA source address register	DMAjSAR_n	All bits	UPF[0]
2	DMA destination address register	DMAjDAR_n	All bits	UPF[1]
3	DMA transfer size register	DMAjTSR_n	All bits	UPF[2]
4	DMA transfer mode register	DMAjTMR_n	All bits	UPF[3]
5	DMA gather inner address increment register	DMAjGIAI_n	All bits	UPF[4]
6	DMA gather outer address increment register	DMAjGOAI_n	All bits	UPF[5]
7	DMA scatter inner address increment register	DMAjSIAI_n	All bits	UPF[6]
8	DMA scatter outer address increment register	DMAjSOAI_n	All bits	UPF[7]
9	DMA scatter gather control register	DMAjSGCR_n	All bits	UPF[8]
10	DMA resource select register	DMAjRS_n	All bits	UPF[9]
11	DMA buffer control register	DMAjBUFCR_n	All bits	UPF[10]

Set as follows for each channel that should use the descriptor function:

- Specify the register to be updated in the UPF bits of the DMAjDPCR_n register.
- Set the DMA transfer setting in the descriptor memory.
- If DMA transfer should start when a configuration is copied from the descriptor memory to DMA channel registers
  - set the DMAjDPPTR_n.PTR bits to the first transfer configuration in the descriptor memory
  - set DMAjCHCR_n.DPB to 1

- If DMA transfer should start according to a register setting and continue with the descriptor function.
  - configure the channel registers
  - set the DMAjDPPTR_n.PTR bits to the address of the next transfer configuration in the descriptor memory
  - set DMAjDPPTR_n.CF to 1
  - set DMAjCHCR_n.DPB to 0

The descriptor memory is shared by all DMA channels. Therefore is it important to avoid overlaps of areas used by different DMA channels in common descriptor memory.

(1) Configuration of Descriptor Memory

A DMA transfer configuration can start from any address in the descriptor memory. Register configurations that are not updated should not be written.

Examples of configurations in descriptor memory are shown in the figure below.

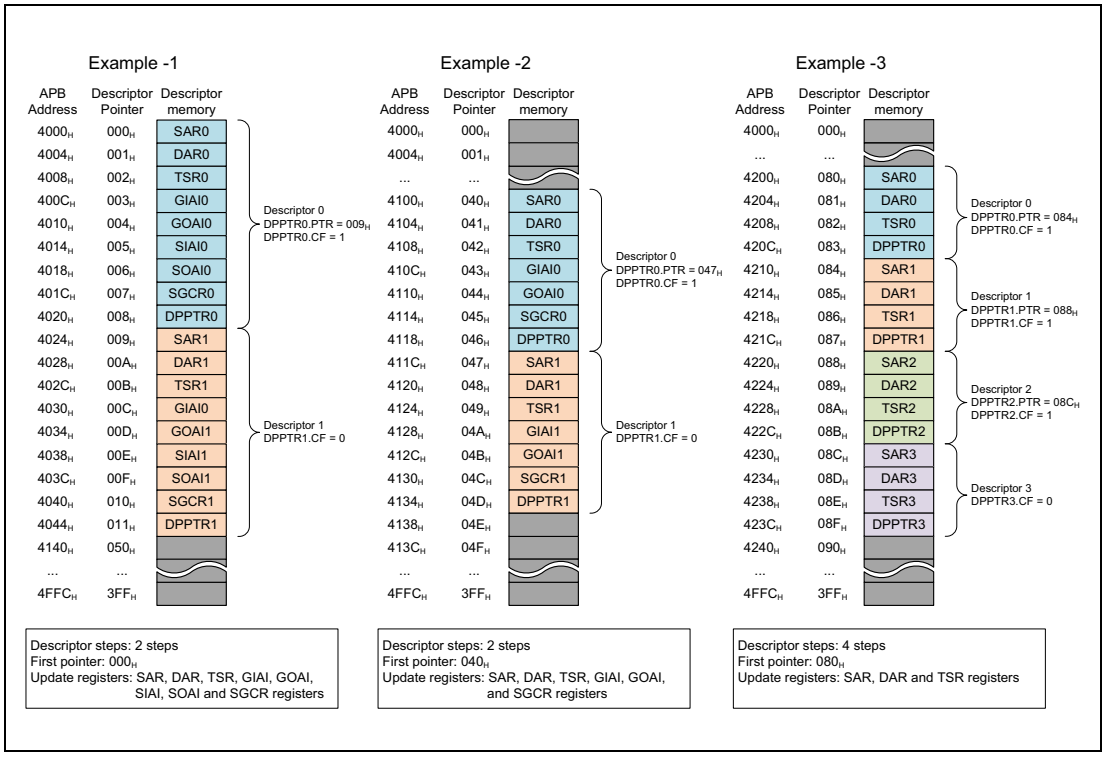

Figure 7.15 Built-in Descriptor Memory Configuration

(2) Flow of Setting Updating by Descriptor Operation

Updating a configuration by using the descriptor function is specified by the UPF bits in the DMAjDPCR_n register. If a register is updated by a descriptor operation, the PTR bit in DMAjDPPTR_n is incremented. Finally the DMAjDPPTR_n register is updated. Therefore, the DMAjDPPTR_n register setting must be always written into the descriptor memory.

This flow is automatically processed by hardware.

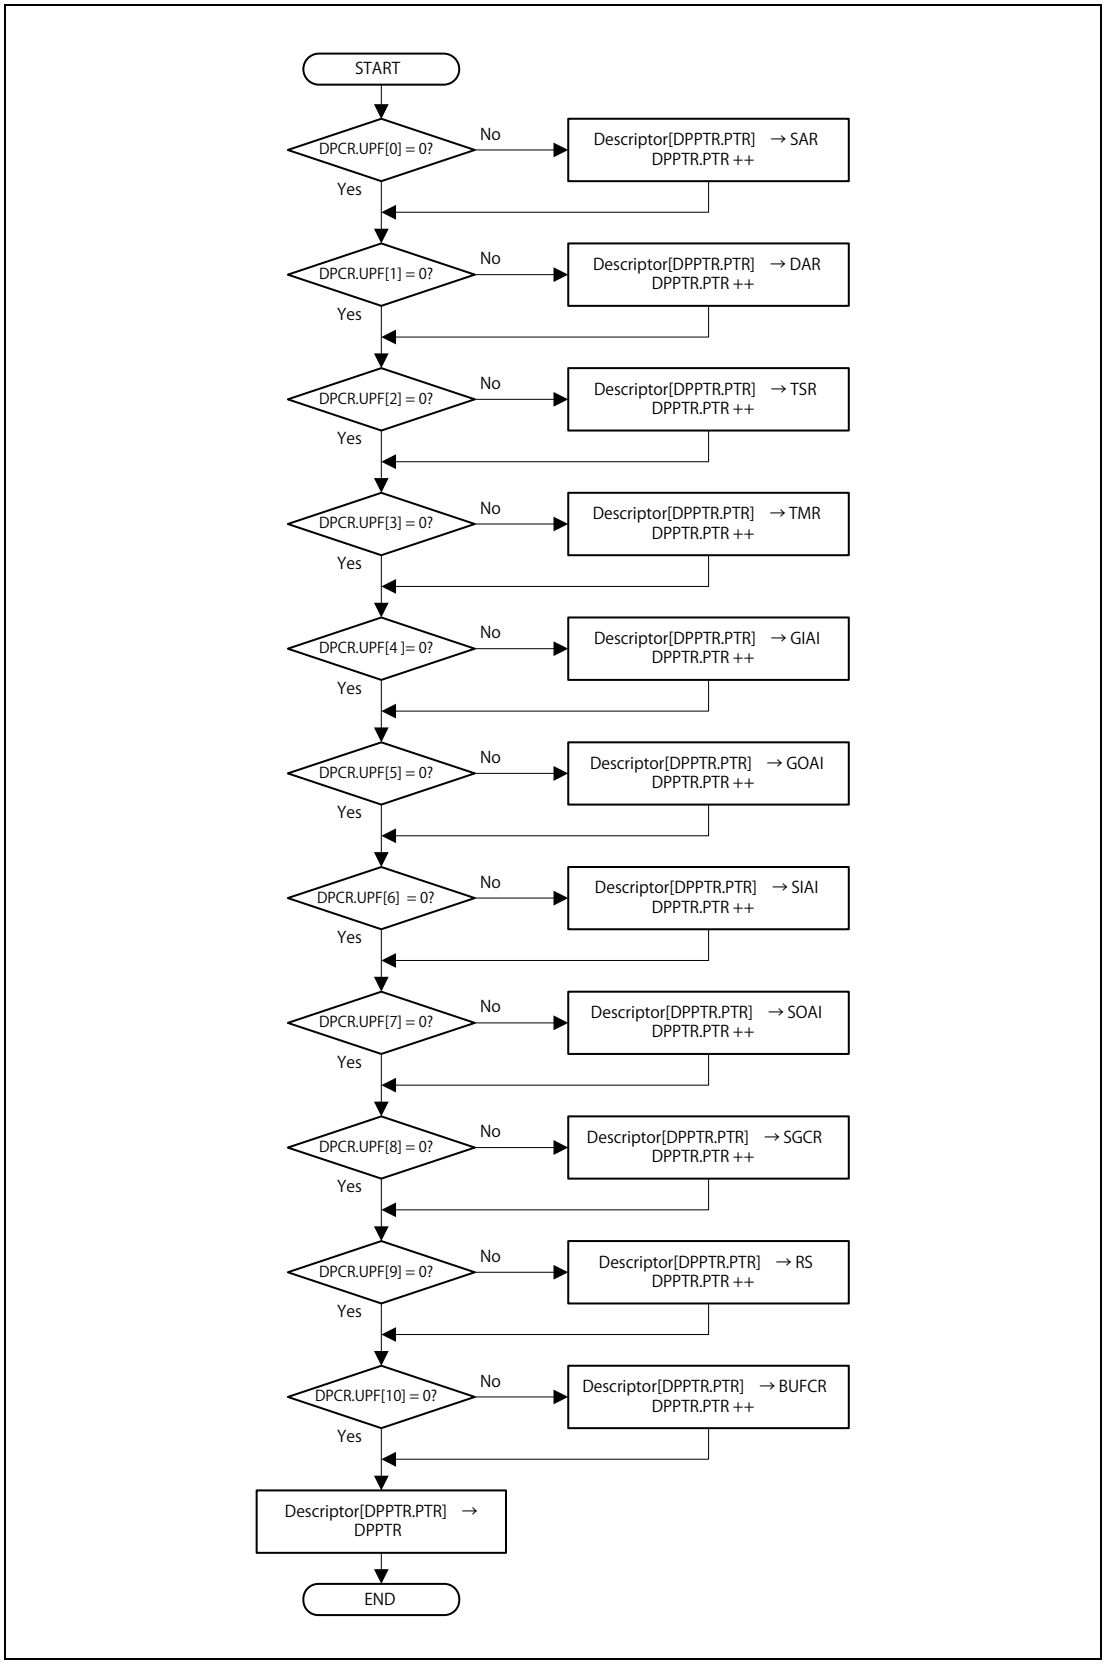

Figure 7.16 Flow of Setting Updating by Descriptor Operation

(3) Descriptor Operational Flow

Figure 7.17 shows the descriptor operational flow.

When the first transfer setting is written in the descriptor memory, the DPB bit in the DMAjCHCR_n register is set to 1. When a DSE interrupt is issued after a DMA transfer step is completed, the DSIE bit in the DMAjCHCR_n register and the DIE bit in DMAjDPPTR_n in the descriptor memory are set to 1. A DSE interrupt can be issued at the optional timing by using this setting. If the DSE bit in the DMAjCHSTA_n register is already set when the DMA transfer step completes, the next transfer setting is not read from the descriptor memory. There is a possibility that the next setting is not written in the descriptor memory because the first DSE interrupt has not been processed. The descriptor can be continued by clearing the first DSE interrupt. When the DPE bit in DMAjCHCR_n register is set to 0 or the CF bit in the DMAjDPPTR_n register in the descriptor memory is set to 0 after a DMA transfer step is complete, a TE interrupt is issued, and the descriptor ends.

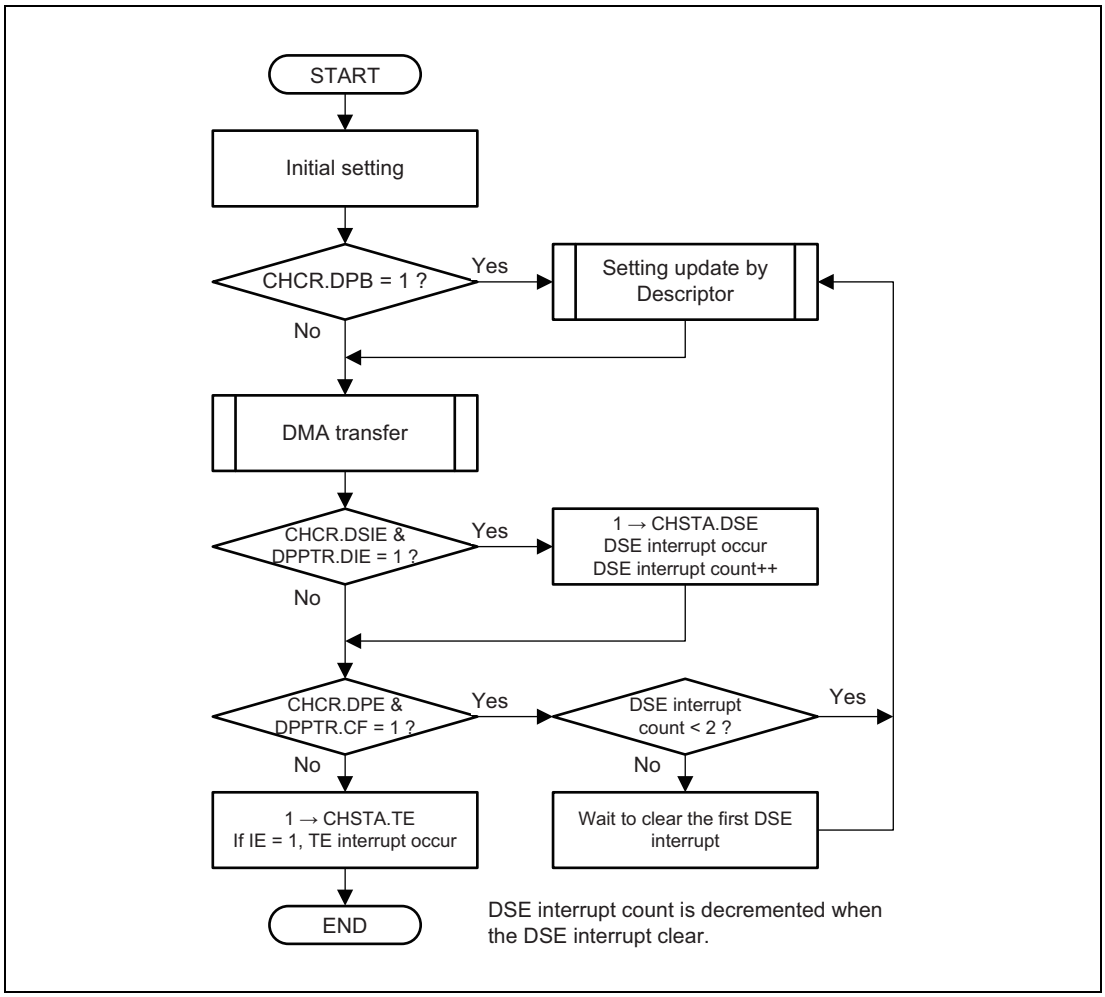

Figure 7.17 Descriptor Operational Flow

(4) Example of descriptor usage

Figure 7.18 to **Figure 7.25** show examples of using descriptors operations.

(a) Example 1: Normal Descriptor Operations

The DMAC transfers descriptors in the listed order and generates an interrupt after all of the transfers are complete.

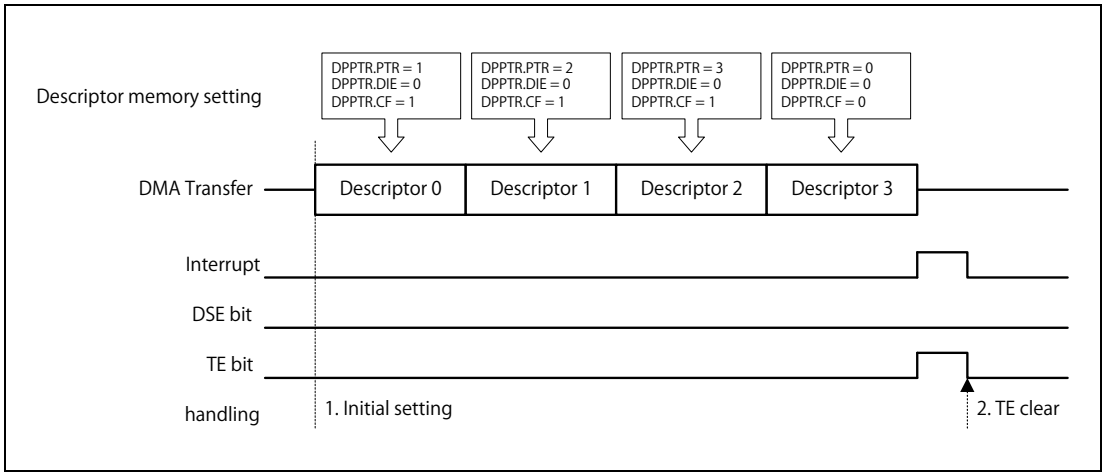

Figure 7.18 Normal Descriptor Operations (Example 1)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 3 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 0, PTR = Descriptor 2 pointer Descriptor[2].DPPTR CF = 1, DIE = 0, PTR = Descriptor 3 pointer Descriptor[3].DPPTR CF = 0, DIE = 0, PTR = Any value The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 1) DSE interrupt disable (CHCR.DSIE = 0) To start the transfer after reading descriptor memory (CHCR.DPB = 1)
2	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer (CHCR.DE = 0) Clear the transfer end flag (CHFCR.TEC = 1)

(b) Example 2: Specific Order Operations

The DMAC transfers descriptors in the specified order and generates an interrupt after all of the transfers are complete.

Descriptor 0 → Descriptor 1 → Descriptor 3 → Descriptor 2

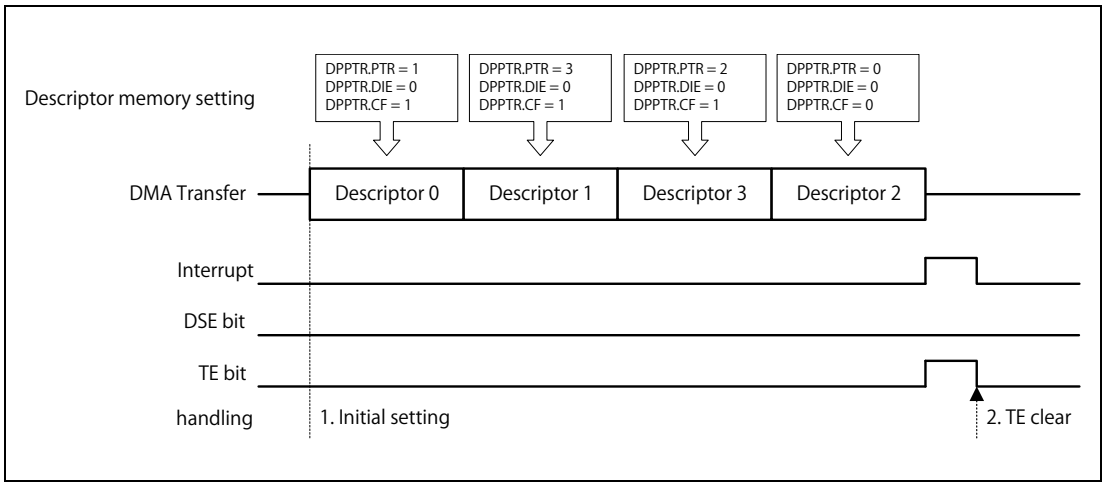

Figure 7.19 Specific Order Operation (Example 2)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 3 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 0, PTR = Descriptor 3 pointer Descriptor[2].DPPTR CF = 0, DIE = 0, PTR = Any value Descriptor[3].DPPTR CF = 1, DIE = 0, PTR = Descriptor 2 pointer The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 1) DSE interrupt disable (CHCR.DSIE = 0) After reading descriptor memory (CHCR.DPB = 1)
2	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer. (CHCR.DE = 0) Clear the transfer end flag. (CHFCR.TEC = 1)

(c) Example 3: Descriptor Step End Interrupt

The DMAC transfers the descriptors in order, and generates an interrupt after the specified descriptor is complete.

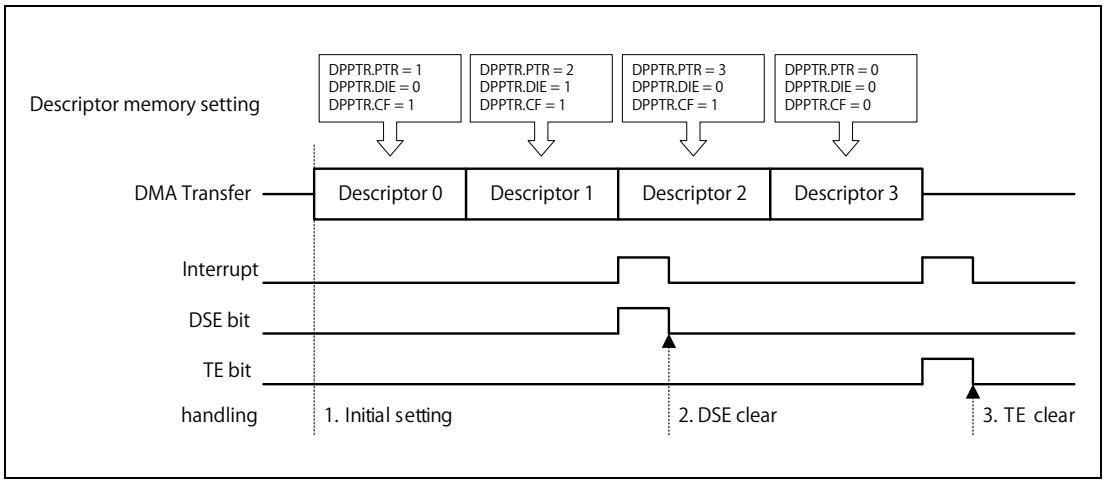

Figure 7.20 Descriptor Step End Interrupt (Example 3)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 3 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 2 pointer Descriptor[2].DPPTR CF = 1, DIE = 0, PTR = Descriptor 3 pointer Descriptor[3].DPPTR CF = 0, DIE = 0, PTR = Any value The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 1) DSE interrupt enable (CHCR.DSIE = 1) After reading descriptor memory (CHCR.DPB = 1)
2	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
3	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer (CHCR.DE = 0) Clear the transfer end flag (CHFCR.TEC = 1)

(d) Example 4: Double Buffer Operation

Example of double buffer operation using DSE interrupt.

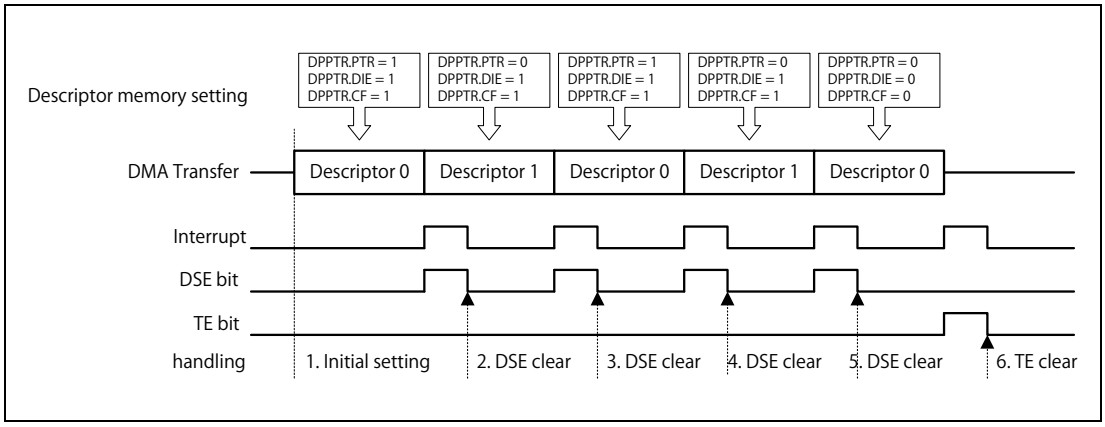

Figure 7.21 Double Buffer Operation (Example 4)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptor 0 to 1 is written in Descriptor Memory Descriptor[0].DPPTR CF = 1, DIE = 1, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 0 pointer The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 1) DSE interrupt enable (CHCR.DSIE = 1) After reading descriptor memory (CHCR.DPB = 1)
2, 3	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
4	DSE clear	Check the interrupt status (read CHSTA) Clear continuation flag. (Descriptor[0].DPPTR.CF = 0) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
5	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
6	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer. (CHCR.DE = 0) Clear the transfer end flag. (CHFCR.TEC = 1)

(e) Example 5: Double Buffer Operation with Interrupt Processing Delay

When the next DSE interrupt occurs without clearing the DSE interrupt and without reading the next setting from descriptor memory, transmission is suspended. When the DSE interrupt is cleared after writing the next setting to the descriptor memory, transmission resumes.

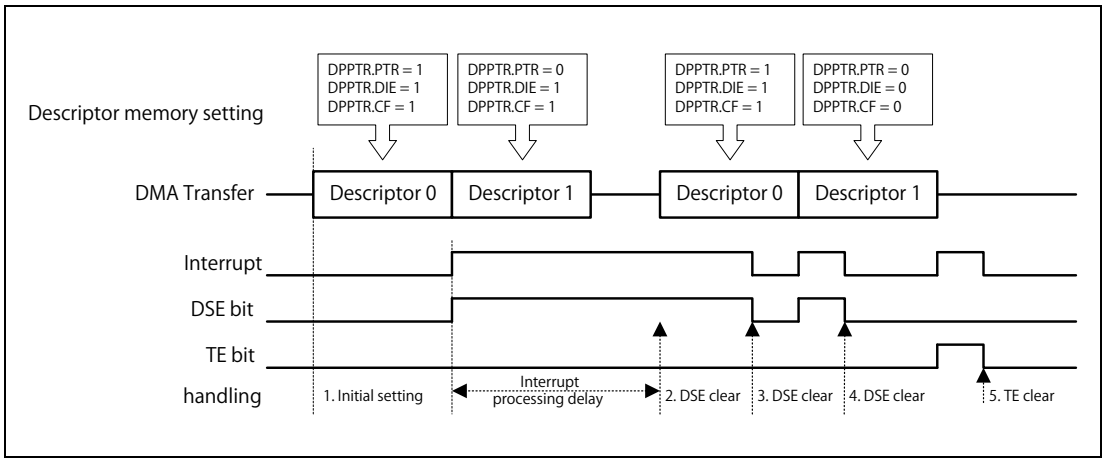

Figure 7.22 Double Buffer Operation with Interrupt Processing Delay (Example 5)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptor 0 to 1 is written in Descriptor Memory Descriptor[0].DPPTR CF = 1, DIE = 1, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 0 pointer The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 1) DSE interrupt enable (CHCR.DSIE = 1) After reading descriptor memory (CHCR.DPB = 1)
2	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
3	DSE clear	Check the interrupt status (read CHSTA) Clear continuation flag. (Descriptor[1].DPPTR.CF = 0) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
4	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
5	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer. (CHCR.DE = 0) Clear the transfer end flag. (CHFCR.TEC = 1)

(f) Example 6: Repeat Operation

The continuation flag remains set and DMA transfer is repeated.

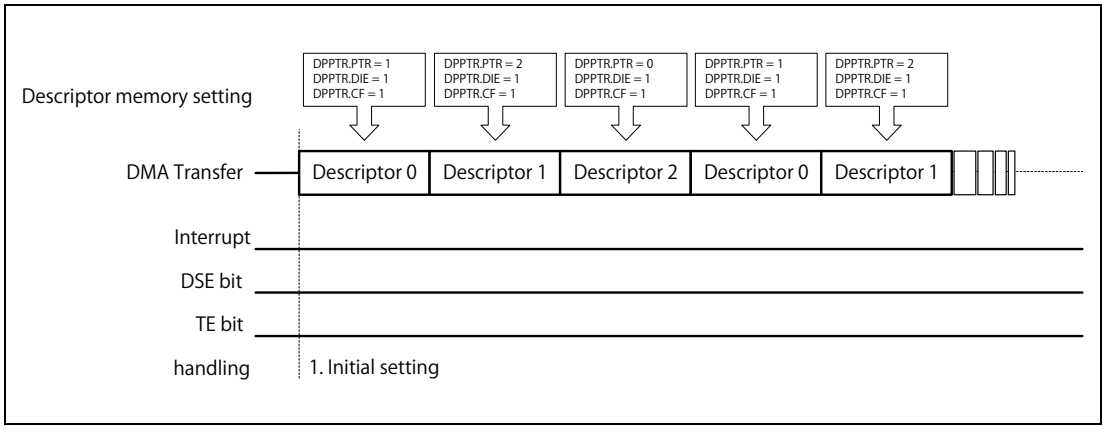

Figure 7.23 Repeat Operation (Example 6)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 2 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 1, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 2 pointer Descriptor[2].DPPTR CF = 1, DIE = 1, PTR = Descriptor 0 pointer The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 0) DSE interrupt disable (CHCR.DSIE = 0) After reading descriptor memory (CHCR.DPB = 1)

(g) Example 7: Hardware Request Operation

When hardware transfer request mode is set, the descriptor operation is executed by a hardware request.

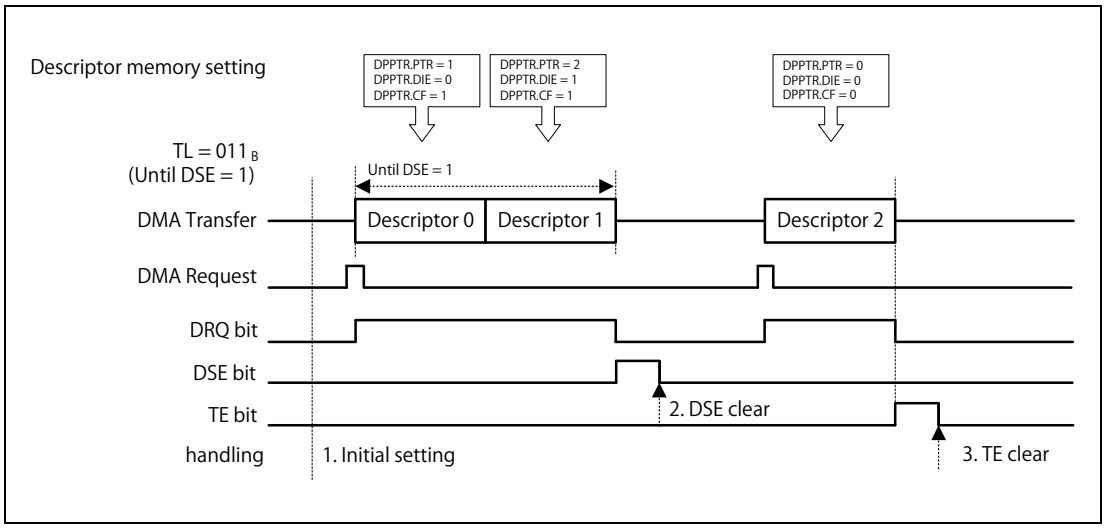

Figure 7.24 Hardware Request Operation (Example 7)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 3 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 2 pointer Descriptor[2].DPPTR CF = 0, DIE = 0, PTR = Any value The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Setting hardware transfer request in each Descriptor n (n = 0~2) Hardware request mode (Descriptor[n].DMAjTMR_n.TRS = 1) Transfer limit by DSE is asserted (Descriptor[n].DMAjRS_n.TL = 3'b011) Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 0) DSE interrupt disable (CHCR.DSIE = 0) After reading descriptor memory (CHCR.DPB = 1)
2	DSE clear	Check the interrupt status (read CHSTA) Clear Descriptor step end flag. (CHFCR.DSEC = 1)
3	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer. (CHCR.DE = 0) Clear the transfer end flag. (CHFCR.TEC = 1)

(h) Example 8: Hardware Request Operation with Different Request Source Settings

If a hardware request source setting is different in chained descriptors, the generated DMA request is automatically cleared when the descriptor memory setting is loaded.

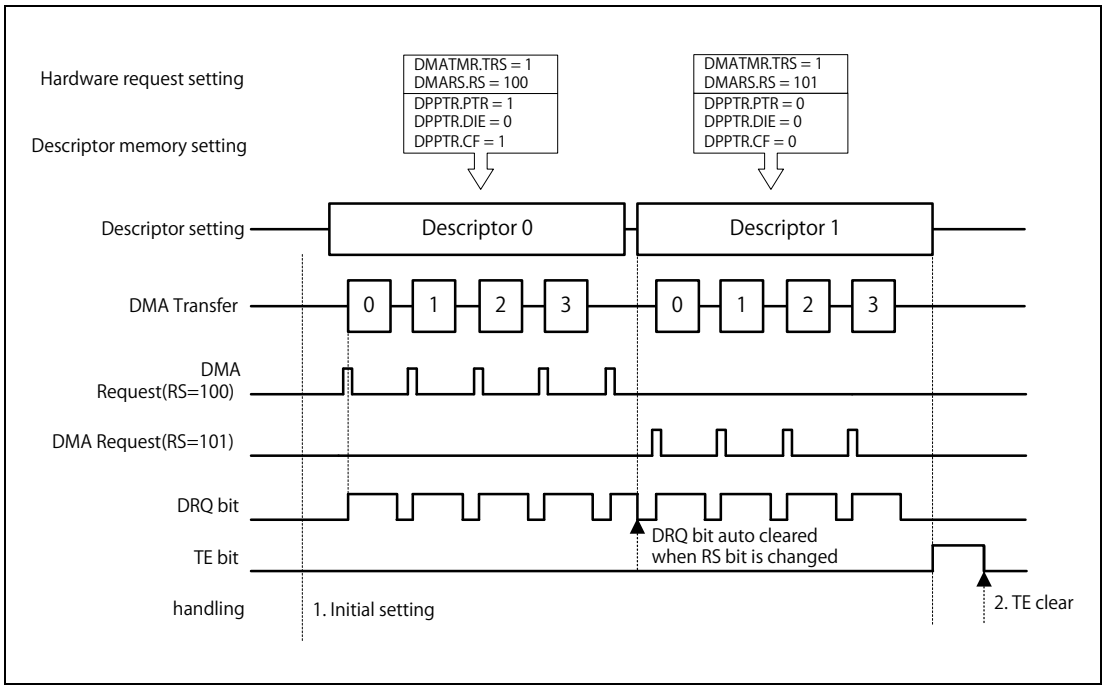

Figure 7.25 Hardware Request Operation with Different Request Source Settings (Example 8)

No	Handling	Detail
1	Initial setting	Specify the register to be updated. Write to the DPCR register. Descriptors 0 to 3 are written to the descriptor memory. Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer Descriptor[1].DPPTR CF = 0, DIE = 0, PTR = Any value The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 Setting hardware transfer request in each Descriptor Descriptor[0].DMAjTMR_n TRS = 1 Descriptor[0].DMAjRS_n RS = 100 (hardware request resource channel) Descriptor[1].DMAjTMR_n TRS = 1 Descriptor[1].DMAjRS_n RS = 101 (hardware request resource channel) Start the descriptor operation (write to CHCR) Descriptor enable (CHCR.DPE = 1) TE interrupt enable (CHCR.IE = 0) DSE interrupt disable (CHCR.DSIE = 0) After reading descriptor memory (CHCR.DPB = 1)
3	TE clear	Check the interrupt status (read CHSTA) Disable DMA transfer. (CHCR.DE = 0) Clear the transfer end flag. (CHFCR.TEC = 1)

(5) Stopping a Descriptor Operation

Three methods can be used to stop a descriptor operation.

Method 1: Descriptor updating is stopped after completion of the specific DMA transfer.
The specific CF bit in DMAjDPPTR_n in the descriptor memory is set to 0.
The TE interrupt is issued after the end of the specified DMA transfer.

Method 2: Descriptor updating is stopped after the current DMA transfer is complete.
The DPE bit in the DMAjCHCR_n register is set to 0 by writing 1 to the DPEC bit in the DMAjCHFCR_n register. The TE interrupt is issued after the end of the current DMA transfer even if the CF bit is set to 1.
It is not recommended to use the CF bit of the DMAjDPPTR_n register to stop DMA transfer. This bit is updated by the descriptor function.

Method 3: Immediate stop without completing the current DMA transfer.
See **Section 7.5, (2) DMA Transfer Abort** and **Section 7.5, (3) Suspend and Resume DMA Transfer**.

7.4.7 Transfer Flow

Write the transfer condition settings to the DMA source address register (DMAjSAR_n), DMA destination address register (DMAjDAR_n), DMA transfer size register (DMAjTSR_n), DMA transfer mode register (DMAjTMR_n), DMA Channel control register (DMAjCHCR_n), DMA resource select register (DMAjRS_n) and DMA operation register (DMAjOR). The DMAC transfers data in following order.

(1) Auto Request Mode

- A transfer request occurs and the DMAC confirms whether transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0). Transfer starts automatically.
- If a transfer request is generated, one transfer unit (specified by STS [3:0] or DTS[3:0]) will be transferred. DMAjTSR_n will be decremented by the transfer unit every time DMA transfer completes.
- When the specified number of transfers are complete (the value of DMAjTSR_n and DMAjTSRB_n is 0), transfer ends normally. At this time if the IE bit of DMAjCHSTA_n is set to 1, a TE interrupt will be issued to the CPU.
- Transfer is terminated if an address error occurs in DMA transfer. In addition, transfer is terminated even if the DE bit of DMAjCHCR_n or the DME bit of DMAjOR is set to 0.

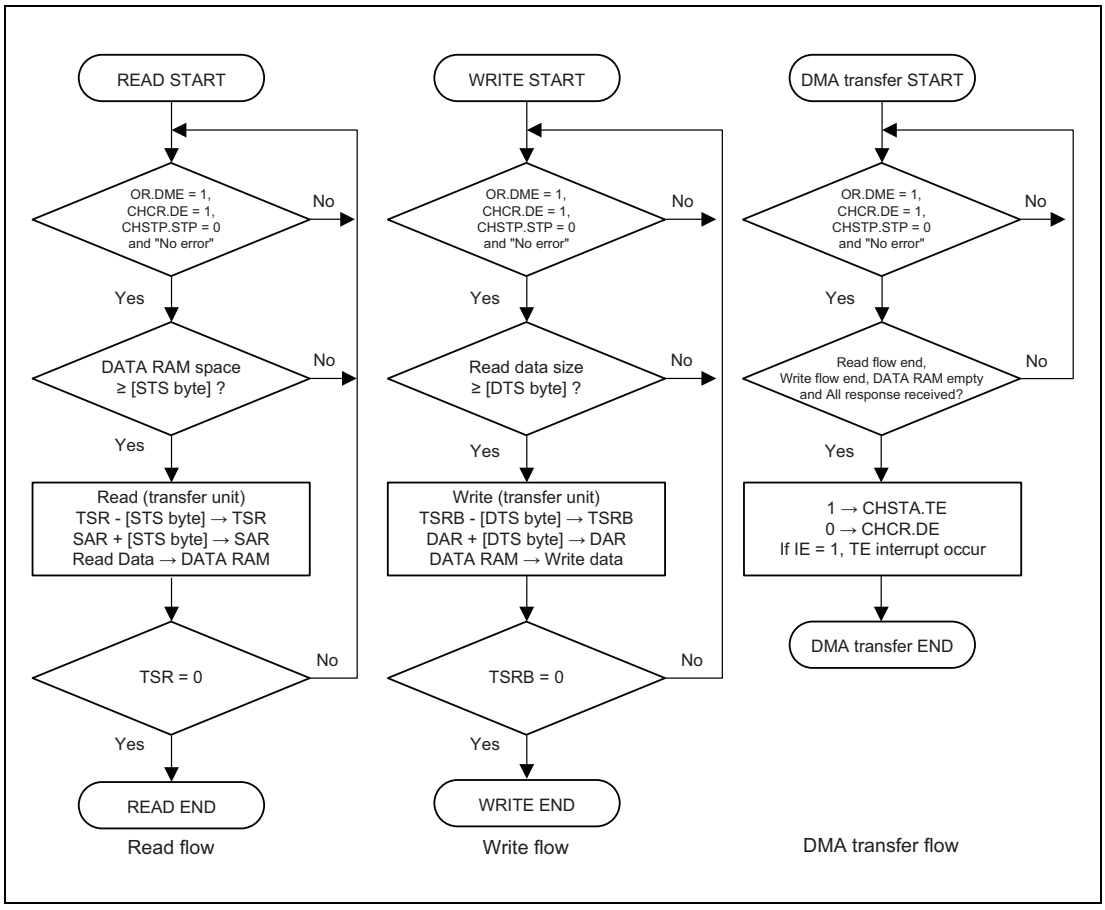

Figure 7.26 Transfer Flow in Auto Request Mode

(2) Hardware Request Mode

- **Figure 7.27** shows the flow in hardware request mode.
- A hardware request can be received when the DMAC confirms whether transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0).
- If PLE is set to 1 and FPT is set to 0, pre-loading data from the source memory to the data RAM of sDMAC starts automatically. DMAjTSR_n will be decremented by the transfer unit every time pre-load transfer completes. If FPT is set to 1, pre-loading occurs after the first hardware transfer request is generated and the internal status register (FPS) is set to 0.
- When a hardware transfer request is generated, one transfer unit (specified by TL[2:0]) will be transferred. DMAjTSRB_n will be decremented by the transfer unit every time transfer completes.
- When the specified number of transfers are complete (the value of DMAjTSR_n and DMAjTSRB_n is 0), transfer ends normally. At this time if the IE bit of DMAjCHSTA_n is set to 1, a TE interrupt will be issued to the CPU.
- Transfer is terminated if an address error occurs in DMA transfer. In addition, transfer is terminated even if the DE bit of DMAjCHCR_n or the DME bit of DMAjOR is set to 0.

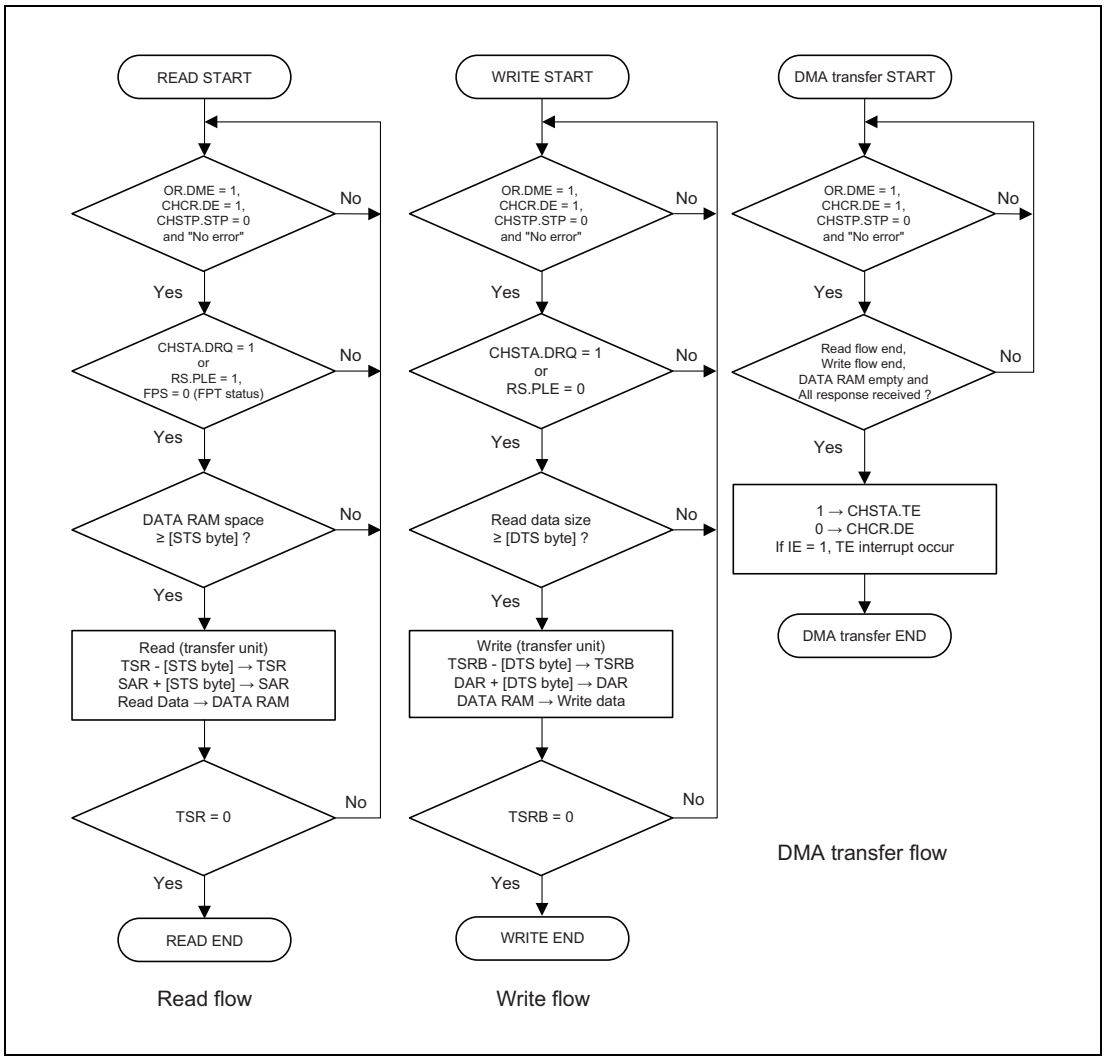

Figure 7.27 Transfer Flow in Hardware Request Mode

7.4.8 Performance

The DMA controller operates on a CLK_HBUS. Read and write transaction requests are issued in parallel on both system interconnect read and write interfaces to enable flyby transfers. Transaction requests are issued without waiting for a reply. So multiple outstanding requests can be in flight on the bus. This is used to hide latencies on the path from the DMA to the slave. The DMA supports 16 outstanding transactions per system interconnect interface (16 reads and 16 writes).

All channels operate in parallel. Arbitration on the read/write interfaces is performed as defined in the operation register DMAjOR. The bus data width is 64 bits (8 bytes). If the unit transfer size (STS/DTS) is larger than 8 bytes, the transaction requests multiple replies in sequence (also called “burst”). The maximum burst size is 8, resulting in a maximum transfer unit size of 64 bytes.

The maximum number of outstanding requests in each DMA channel changes depending on the unit transfer size (STS/DTS). Each DMA channel can use 128 bytes in data RAM as outstanding transfer data buffer. If the unit transfer size (STS/DTS) in a DMA channel is 16 bytes or more, the number of outstanding requests in the DMA channel is 8 or less and the maximum number of outstanding request is 16 or less. Each DMA channel can issue a new transaction request every three clock cycles at best. The frequency at which each DMA channel issues a new transaction request changes depending on the number of outstanding requests in the DMA channel or the number of channels using DMA transfer. If the unit transfer size (STS/DTS) in a DMA channel is 64 bytes, the number of outstanding requests in the DMA channel is 2. In this case, if DMA transfer is operated with one DMA channel and a transaction request is issued twice, a subsequent read transaction request is not issued before previous read and write transaction requests are processed, and the DMA channel cannot issue a new transaction request every three clock cycles.

To utilize the read and write data channels every cycle, two approaches can be used:

- Use three DMA channels. Each channel transfers one third of the required data. The DMAC issues a new request transaction every cycle on the read and write interfaces in parallel.
- Use one DMA channel with a STS/DTS value of 8 bytes. The read/write transaction requests are issued every three cycles.

Both approaches fully utilize the read and write data channels if the data RAM is sufficiently utilized.

7.5 Usage Notes

Pay attention to the following notes when using the DMAC.

(1) Address Errors

When a DMA address error occurs, set the register of the erroneous channel again after DMA transfer abort shown in **Section 7.5, (2) DMA Transfer Abort** and then start transfer. Address errors are caused by the factors indicated in **Table 7.28**.

Table 7.28 Address Error Factors

Factor	Description
DMA transfer error	The transfer source or transfer destination is invalid space.
	The transfer source or transfer destination is a GUARD error.
Prohibited setting error	DMA source transaction size setting is prohibited. (DMATMR.STS > 0110 : 64 bytes)
	DMA destination transaction size setting is prohibited. (DMATMR.DTS > 0110 : 64 bytes)
	DMA transfer count is zero in hardware request mode (DMARS.TC = 0 when DMARS.TL = 000, 001)

(2) DMA Transfer Abort

To abort DMA transfer, clear the DE bit in the DMA channel control register

(DMAjCHCR_n) by using the DEC bit in the DMA channel flag clear register (DMAjCHFCR_n) to disable DMA transfer. After that, the BUSY bit is cleared to 0. There is a possibility that a TE/DSE interrupt may occur to asynchronous timing after aborting transfer, so it is necessary to assume the following case and take appropriate measures:

- After DMA transfer is aborted, the TE/DSE bit is set to 1 and the BUSY bit is cleared. If the IE/DSIE bit is set to 1 at that time, the DMA interrupt is asserted.

Figure 7.28 shows a processing example when DMA transfer is aborted.

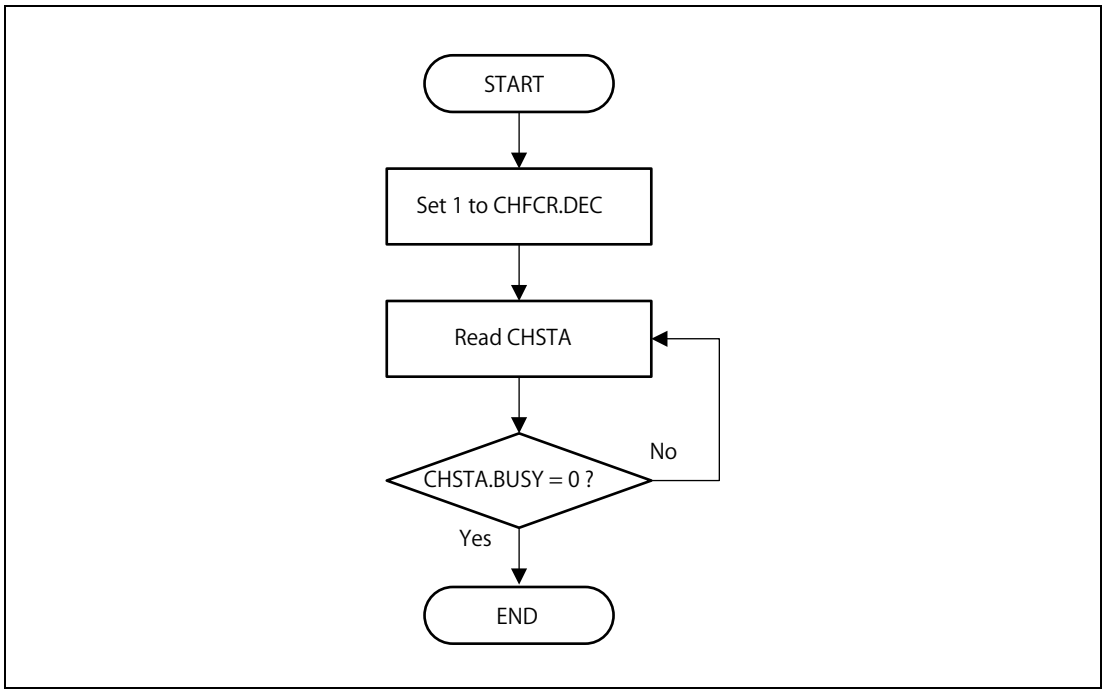

Figure 7.28 Example of DMA Transfer Abort Processing

(3) Suspend and Resume DMA Transfer

To suspend DMA transfer temporarily, write 1 to the STP bit in the DMA channel suspend register (DMAjCHSTP_n). After receiving the entire response packet, the BUSY bit is cleared to 0. To resume, set the STP bit to 0.

Figure 7.29 shows a processing example when suspending and resuming DMA transfer.

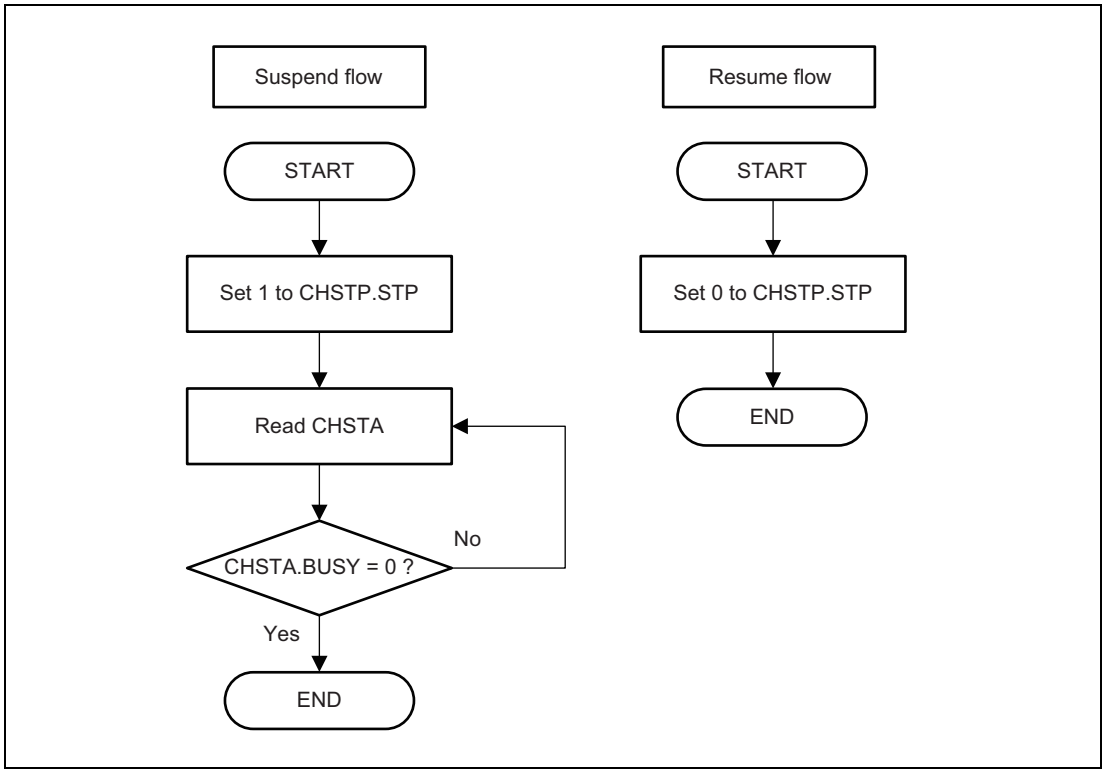

Figure 7.29 Example of DMA Transfer Suspend and Resume Processing

(4) Restriction and Impact on the Transfer Unit Size on Addresses and Offsets

The general recommendation is to set the destination address (DAR) and the scatter address increments (SIAI, SOAI) to a multiple of the related transfer unit size (DTS). If this recommendation is not followed, the byte transfers are used instead. This reduces the performance significantly.

In case of using the Gather Transfer function, the DMA Source Address Register (DMAjSAR_n), the DMA Gather Inner Address Increment Register (DMAjGIAI_n) and the DMA Gather Outer Address Increment Register (DMAjGOAI_n) must be set to multiples of DMA source transaction size which is set to STS bit in the DMAjTMR_n register.

7.6 Reliability Function

7.6.1 Overview

In this product, the DMAC is a resource used by multiple masters (CPU0 to CPU3). In order for the DMAC to support a multi-core configuration, the following reliability functions are offered.

- Register access protection function

  Refer to **Section 44, Functional Safety**.

- Master information inheritance function

7.6.2 Master Information Inheritance Function

In this product, DMA access inherits master information is set by DMAjCM_n register.

The master information that is output from the DMAC is as shown in **Table 7.29** for access guard.

Table 7.29 Master Information That Is Output from DMAC

Meaning	Value that is output from DMAC
UM	Same as the UM bit value in the channel master setting register
Secure	Non secure
SPID	Same as the SPID bit value in the channel master setting register

7.7 Setting up DMA Transfer

7.7.1 Overview of Setting up DMA Transfer

Table 7.30 Overview of Setting up DMA Transfer

No.	Description	Register		Necessity of the Setting
1	Transfer request group selection setting	DMACSELj_m	DMA transfer request group selection register m	Mandatory (if using hardware transfer request mode)
2	Overall DMA operation setting	DMAjCM_n	DMA channel master setting register	Mandatory
3	Channel setting	DMAjSAR_n	DMA source address register	Mandatory
4		DMAjDAR_n	DMA destination address register	Mandatory
5		DMAjTSR_n	DMA transfer size register	Mandatory
6		DMAjTMR_n	DMA transfer mode register	Mandatory
7		DMAjRS_n	DMA resource select register	Mandatory (if using hardware transfer request mode)
8	Status clear	DMAjCHFCR_n	DMA channel flag clear register	Mandatory
9	Channel operation enable	DMAjCHCR_n	DMA channel control register	Mandatory

NOTE

If a transfer request is used to change the transfer request group, it is necessary to set up the registers from the beginning without configuring an overall DMA operation setting.

7.7.2 Setting up the Transfer Request Group Selection

Set up the transfer request group selection before using the sDMAC. The following registers must be set up to configure a transfer request group.

- sDMACj Transfer Request Group Selection Register m (DMACSELj_m) (j = 0 to 1, m = 0 to 15)
  This register configures the transfer request group selection

7.7.3 Setting up the Overall DMA Operation

Set up the overall DMA operation before you start using DMA.

The following register must be set up to configure the overall DMA operation.

DMAC channel master setting register (DMAjCM_n)

This register configures the channel assignment. (For details, see **Section 7.6, Reliability Function**.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

7.7.4 Setting up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC channel.

To configure the DMA channel setting, the master allowed to access each channel needs to set up the channel registers.

Follow the procedure below to set up the DMAC channel setting and use the DMAC.

(1) Disabling the DMAC channel operation

If the channel operation enable bit (DE) in the DMA channel control register (DMAjCHCR_n) is set, channel setting up registers must not to be set up. Wait for the previous DMA transfer to finish or be aborted, and then disable the DMAC channel operation.

(2) Setting up the transfer information

When setting up the transfer information for the DMAC, the following registers need to be set up.

- DMA source address register (DMAjSAR_n)
- DMA destination address register (DMAjDAR_n)
- DMA transfer size register (DMAjTSR_n)
- DMA transfer mode register (DMAjTMR_n)

(3) Setting up the DMA transfer request

While setting the transfer information, you need to set the DMA transfer request select (TRS) bit in the DMA transfer mode register (DMAjTMR_n) to define whether a hardware or software DMA transfer request is used.
The hardware and software DMA transfer request cannot be used for the same channel at the same time. If the hardware DMA transfer request is used, select one source to be used as the hardware DMA transfer request out of the 256 available hardware DMA transfer sources using the resource selection (RS) bit in the DMA resource select register (DMAjRS_n).
The DMA channel may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DMACHSTA_n.DRQ) and overflow flag (DMACHSTA_n.OVF) by using the DMA channel flag clear register (DMAjCHFCR_n) before enabling channel operation.
If the software DMA transfer request is used, disable the hardware DMA transfer request select (TRS) bit in the DMA transfer mode register (DMAjTMR_n).

(4) Clearing the transfer status

The DMA channel status register (DMAjCHSTA_n) may retain the result of the previous DMA transfer. Clear the flags in the DMA transfer status register using the DMA channel flag clear register (DMAjCHFCR_n).

(5) Enabling the DMAC channel operation

Set the DMA channel operation enable bit (DE) in the DMA channel control register (DMAjCHCR_n) to enable the channel operation. After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

Section 8 DTS Controller

This section provides a generic description of the Data Transfer Service (DTS) controller. The first part of this section contains information about product properties such as number of units and register base addresses. The second part of this section describes functions and registers of DTS.

8.1 Features of DTS

8.1.1 Number of Units and Channels

This product has the following number of DTS units.

Table 8.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1	1	1	1	1	1	1	1	1	1
Number of Channels	128	128	128	128	128	128	128	128	128	128
Name	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT	DTSCNT

Table 8.2 Definition of Indexes

Index	Description
nnn	The channel number is identified by the index “nnn”. (nnn = 0 to 127)
m	The individual trigger group selection registers are identified by the index “m” (m = 0 to 15).

8.1.2 Register Base Addresses

The DTS base addresses are listed in **Table 8.3**.

The DTS register addresses are specified as offsets from the base addresses.

Table 8.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<DTS_base>	FFF8 8000_H	P-Bus Group 0
<DMATRGSEL_base>	FF09 0400_H	P-Bus Group 9

8.1.3 Clock Supplies

The DTS clock supplies are shown in the following table.

Table 8.4 Clock Supplies

Unit Name	Clock for the Unit	Supply Clock Name
DTSCNT	clk	CLK_HBUS
DMATRGSEL	PCLK	CLK_HBUS

8.1.4 Interrupt Requests and Error Notifications

The DTS interrupt requests are listed in the following table.

Table 8.5 Interrupt Requests

Interrupt symbol name	Unit Interrupt Signal	Description	Interrupt Number
INTDTS31TO0	INTDTS[31:0]	DTS ch31-0 transfer end	39
INTDTS63TO32	INTDTS[63:32]	DTS ch63-32 transfer end	40
INTDTS95TO64	INTDTS[95:64]	DTS ch95-64 transfer end	41
INTDTS127TO96	INTDTS[127:96]	DTS ch127-96 transfer end	42
INTDTSCT31TO0	INTDTSCT[31:0]	DTS ch31-0 transfer count match	43
INTDTSCT63TO32	INTDTSCT[63:32]	DTS ch63-32 transfer count match	44
INTDTSCT95TO64	INTDTSCT[95:64]	DTS ch95-64 transfer count match	45
INTDTSCT127TO96	INTDTSCT[127:96]	DTS ch127-96 transfer count match	46
INTDTSERR	DTSERR	DTS transfer error	30

The error notifications of this module are listed in the following table.

Table 8.6 Error Notifications

Error Notification	Description	ECM error Number	Error Response to bus master
DTS/sDMAC Transfer Error	DTS transfer error	182	—

Note: This error is generated due to the error response caused by some error.
For details of the error response caused by some error, see the column for Error Response to bus master in Error Notifications Table shown in each section.

8.1.5 DTS Transfer Requests

The DTS transfer request table lists all DTS transfer request factors for DTS. The DTS transfer request group for DTS can be selected by the DTSSELm register. For details of List of DTS Trigger Sources, refer to Appendix file “DTS_Transfer_request_Table.xlsx”.

8.1.6 Reset Sources

DTS reset sources are listed in the following table. DTS is initialized by the following reset sources.

Table 8.7 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
DTSCNT	All registers	√	√	√	√	√	—	—
DTSSEL	All registers	√	√	√	√	√	—	—

8.1.7 External Input/Output Signals

This module has no signals mapped to external input/output pins.

8.2 Overview

8.2.1 Functional Overview

The Data Transfer Service (DTS) is a DMA controller used to access data without going through the CPU.

DTS stores transfer information in a dedicated RAM (DTSRAM).

Table 8.8 shows the configuration of DTS.

Table 8.8 Configuration of DTS

Module Name	Number of Units	Number of Channels
DTSCNT	1	128 ch

Functions of DTSFSL are arbitration of incoming the DTS requests, triggering the DTS controller and monitoring ongoing DTS transfers. DTSFSL can handle 128 DTS transfer sources.

The address space that can be used for DTS transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DTS, refer to **Section 4, Address Space**.

The DTS is connected to System Bus directly. If a conflict occurs with another bus master in System Bus, the transfer is arbitrated by round-robin arbitration.

8.2.2 Definition of Terms

Table 8.9 shows the terms used in this section.

Table 8.9 List of Term Definitions

Term	Description
DTS transfer	A term for data transfer carried out by the DTS controller
DTS cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DTS cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DTS transfer source	A trigger for a DTS transfer request issued by an internal peripheral device
Hardware DTS transfer request	A DTS transfer request issued by a hardware DTS transfer source
Software DTS transfer request	A DTS transfer request issued by writing to a register via software
DTS transfer request	A trigger to start DTS transfer with DTS
Transfer information (TI)	The information required for DTS transfer, including the source address, destination address, transfer data size, and transfer count. The transfer information for DTS is referred to as TI.
DTSRAM	RAM used by DTS to store the transfer information
Single transfer	A DTS transfer consisting of one DTS cycle started by one DTS transfer request
Block transfer 1	A DTS transfer consisting of the number of DTS cycles specified by the transfer count in the transfer information, started by one DTS transfer request
Block transfer 2	A DTS transfer consisting of the number of DTS cycles specified by the address reload count in the transfer information, started by one DTS transfer request
Block transfer	A general term for both block transfer 1 and block transfer 2
Last transfer	The DTS cycle carried out when the transfer count in the transfer information is 1
Address reload transfer	The DTS cycle carried out when the address reload count in the transfer information is 1 if reload function 2 is used
Suspend	An action of pausing a DTS transfer during block transfer. The DTS transfers can be resumed after suspension.
Resume	An action of resuming a suspended DTS transfer
Transfer abort	An action of aborting a DTS transfer before it is finished. Aborted DTS transfers cannot be resumed.

8.3 Registers

8.3.1 List of Registers

Table 8.10 List of Registers

Module Name	Register Name	Symbol	Address	Access	Access Protection	
					DTS/PBG	Other
DTSCNT	DTS control register 1	DTSCTL1	<DTS_base> + 0010_H	32	DTSGPROT_GR	—
	DTS control register 2	DTSCTL2	<DTS_base> + 0014_H	32	DTSGPROT_GR	—
	DTS status register	DTSSTS	<DTS_base> + 0018_H	32	DTSGPROT_GR	—
	DTS error register	DTSER	<DTS_base> + 0024_H	32	DTSGPROT_GR	—
	DTS channel priority setting 0	DTSPR0	<DTS_base> + 0060_H	32	DTSGPROT_GR	—
	DTS channel priority setting 1	DTSPR1	<DTS_base> + 0064_H	32	DTSGPROT_GR	—
	DTS channel priority setting 2	DTSPR2	<DTS_base> + 0068_H	32	DTSGPROT_GR	—
	DTS channel priority setting 3	DTSPR3	<DTS_base> + $006C_H$	32	DTSGPROT_GR	—
	DTS channel priority setting 4	DTSPR4	<DTS_base> + 0070_H	32	DTSGPROT_GR	—
	DTS channel priority setting 5	DTSPR5	<DTS_base> + 0074_H	32	DTSGPROT_GR	—
	DTS channel priority setting 6	DTSPR6	<DTS_base> + 0078_H	32	DTSGPROT_GR	—
	DTS channel priority setting 7	DTSPR7	<DTS_base> + $007C_H$	32	DTSGPROT_GR	—
	DTS channel nnn channel master setting*1	DTSnnnCM	<DTS_base> + “0200_H + 4_H × [DTS channel number] (0200_H to $03FC_H$)	32	DTSGPROT_GR	—
	DTS source address	DTSAnnn	<DTS_base> + 1000_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS destination address	DTDAnnn	<DTS_base> + 1004_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS transfer count	DTTCnnn	<DTS_base> + 1008_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS transfer control	DTTCTnnn	<DTS_base> + $100C_H$ + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS reload source address	DTRSAnnn	<DTS_base> + 1010_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS reload destination address	DTRDAnnn	<DTS_base> + 1014_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS reload transfer count	DTRTCnnn	<DTS_base> + 1018_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTS transfer count compare	DTTCCnnn	<DTS_base> + $101C_H$ + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTSFSL operation setting	DTFSLnnn	<DTS_base> + 1020_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTSFSL transfer status	DTFSTnnn	<DTS_base> + 1024_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTSFSL transfer request set	DTFSSnnn	<DTS_base> + 1028_H + 40_H × [channel number]	32	DTSGPROT_nnn	—
	DTSFSL transfer status clear	DTFSCnnn	<DTS_base> + $102C_H$ + 40_H × [channel number]	32	DTSGPROT_nnn	—
DMATRGSEL	DTS Transfer Request group selection	DTSSELm	<DMATRGSEL_base> + 200_H + (m × 4_H)	8, 16, 32	PBG90#4	—

Note 1. The [channel number] in the offset address is a number from 0 to 127. The “nnn” in the register symbols is a 3-digit number from 000 to 127.

Note 2. m index

8.3.2 Description of Global Registers

8.3.2.1 DTSCTL1 — DTS Control Register 1

DTS Control Register 1 (DTSCTL1) is a 32-bit read/write register that controls the DTS global suspension setting.

Access: DTSCTL1 register can be read or written in 32-bit units

Address: <DTS_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSUST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.11 DTSCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DTSUST	DTS suspend This bit shows whether DTS transfers are suspended. If this bit is set to 1, a DTS suspend is requested. 0: DTS is not suspended 1: DTS is suspended or DTS suspension is requested

8.3.2.2 DTSCTL2 — DTS Control Register 2

DTS Control Register 2 (DTSCTL2) is a 32-bit write only register that controls DTS transfer abort.

Access: DTSCTL2 register is a write-only register that can be written in 32-bit units

Address: <DTS_base> + 0014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSTIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 8.12 DTSCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DTSTIT	DTS transfer abort request Setting this bit to 1 while DTS transfer is suspended aborts the suspended DTS transfer. Writing to this bit while DTS transfer is in progress is ignored. When the suspended DTS transfer is aborted, the DTSSTS.DTSACT bit is cleared. This bit is write only. When read, 0 is returned.

8.3.2.3 DTSSTS — DTS Status Register

The DTS Status Register (DTSSTS) is a 32-bit read only register that indicates the DTS status.

Access: DTSSTS register is a read-only register that can be read in 32-bit units

Address: <DTS_base> + 0018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTSCYC	DTSACH[6:0]							DTSACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.13 DTSSTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned.
8	DTSCYC	DTS cycle execution state This bit shows whether a DTS cycle is in progress in DTS. 0: DTS cycle is not in progress. 1: DTS cycle is in progress.
7 to 1	DTSACH[6:0]	DTS transfer channel If there is a channel in DTS executing a DTS transfer, the channel number is shown. If there is no channel in DTS executing a DTS transfer, the channel number of the last DTS transfer is shown.
0	DTSACT	DTS transfer status This bit shows whether there is a channel in DTS executing a DTS transfer. 0: There is no channel in DTS executing DTS transfer. 1: There is a channel in DTS executing DTS transfer. If DTS is in the suspended state while there is a channel executing DTS transfer, this bit remains 1. If a DTS transfer abort request is made using the DTSCTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0. When a DTS transfer error occurs and the DTS transfer is aborted, this bit is cleared.

8.3.2.4 DTSER — DTS Error Register

The DTS Error Register (DTSER) is 32-bit read only register that indicates the error status of DTS.

Access: DTSER is a read-only register that can be read in 32-bit units

Address: <DTS_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DTSERCH[6:0]							—	—	—	—	—	—	DTSERWR	DTSER
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.14 DTSER Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is returned.
14 to 8	DTSERCH[6:0]	DTS error channel These bits show the DTS channel number of the smallest channel number that has a DTS transfer error. These bits are read-only and cannot be cleared.
7 to 2	Reserved	When read, the value after reset is returned.
1	DTSERWR	DTS transfer error cycle This bit indicates that a DTS transfer error occurred on the channel indicated by DTSERCH[6:0] in the read cycle or the write cycle. These bits are read-only and cannot be cleared. 0: A DTS transfer error occurred in the read cycle. 1: A DTS transfer error occurred in the write cycle.
0	DTSER	DTS transfer error flag This bit shows whether a DTS transfer error is detected in DTS. 0: A DTS transfer error was not detected in all DTS channels. 1: A DTS transfer error was detected in one of the DTS channels.

8.3.2.5 DTSPRn — DTS Channel Priority Setting Register (n = 0 to 7)

The DTS Channel Priority Setting Register (DTSPRn) is a 32-bit read/write register that defines the priorities for each DTS channel. The priorities are configured from 0 to 3, with 0 being the highest.

- **DTSPR0**

Access: DTSPR0 register can be read or written in 32-bit units

Address: <DTS_base> + 0060_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DTS15PR[1:0]		DTS14PR[1:0]		DTS13PR[1:0]		DTS12PR[1:0]		DTS11PR[1:0]		DTS10PR[1:0]		DTS9PR[1:0]		DTS8PR[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 8.22 DTSPR7 Register Contents

Bit Position	Bit Name	Function
31 to 0	DTSnPR[1:0] (n=112 to 127)	DTS channel n priority setting These bits configure the priority level of each DTS channel used for DTS channel arbitration. 00 is the highest priority, and 11 is the lowest.

8.3.2.6 DTSnnnCM — DTS Channel Master Setting Register (nnn = 000 to 127)

The DTS Channel Master Setting Register (DTSnnnCM) is a 32-bit read/write register that defines the channel master configuration for each DTS channel. The contents of this register is used for the master information inheritance function. For more information about the function, see **Section 8.7, Reliability Function**.

This register is placed in the DTSRAM and the lower 16-bit field of this register is shared with the DTS transfer count compare register (DTTCCnnn), one of DTS channel register. If this register is written, DTTCCnnn register is updated as well.

Access: DTSnnnCM register can be read or written in 32-bit units

Address: <DTS_base> + "$0200_H + 4_H \times$ [DTS channel number] (0200_H to $03FC_H$)"

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CHAIN_RESTRICT	CHAIN_SPID[4:0]					CHAIN_UM	—	—	SPID[4:0]					UM	—
Value after reset	Undefined*1															
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC[15:0]															
Value after reset	Undefined*1															
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.23 DTSnnnCM Register Contents

Bit Position	Bit Name	Function
31	CHAIN_RESTRICT	Chain function restriction setting 0: The chain function is not restricted. A chain from any channel is possible. 1: The chain function is restricted. A chain is permitted only when SPID set by CHAIN_SPID4-0 is the same as DTSnnnCM.SPID4-0 of the current channel in the chain and UM set by CHAIN_UM is the same as DTSnnnCM.UM of the current channel in the chain.
30 to 26	CHAIN_SPID[4:0]	Chain permission SPID setting These bits specify the SPID information that permits the chain function.
25	CHAIN_UM	Chain permission UM setting This bit specifies the UM information that permits the chain function.
24 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 18	SPID[4:0]	Channel master SPID setting These bits specify the SPID information used by the master assigned to the channel.
17	UM	Channel master UM setting This bit specifies the UM information of the master assigned to the channel.
16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare In terms of contents, this field is the same as bits[15:0] in **(8), DTTCCnnn — DTS Transfer Count Compare Register**.

Note: DTS000CM to DTS127CM configure the channel master information of DTS channels 0 to 127 respectively. For information about the functions this register provides, see **Section 8.7, Reliability Function**.
The lowest 16 bits of this register are shared with the DTS Transfer Count Compare Register, one of DTS channel registers.
When writing to this register, the DTS Transfer Count Compare Register is updated as well.
Bits 24, 23 and 16 of this register are reserved, but these bits are readable and writable. It is recommended to write 0 to these bits and to ignore the value read from these bits.

8.3.3 Description of DTS Channel Registers

8.3.3.1 Transfer Information of DTS (TI)

(1) Structure of TI

The transfer information of DTS is called TI. One TI consists of 8 sets which are called TI-A, TI-B, TI-C, TI-D, TI-E, TI-F, TI-G, and TI-H. Each set consists of a 32-bit word. Eight sets of TI are assigned to each channel.

The following figure shows the structure of TI.

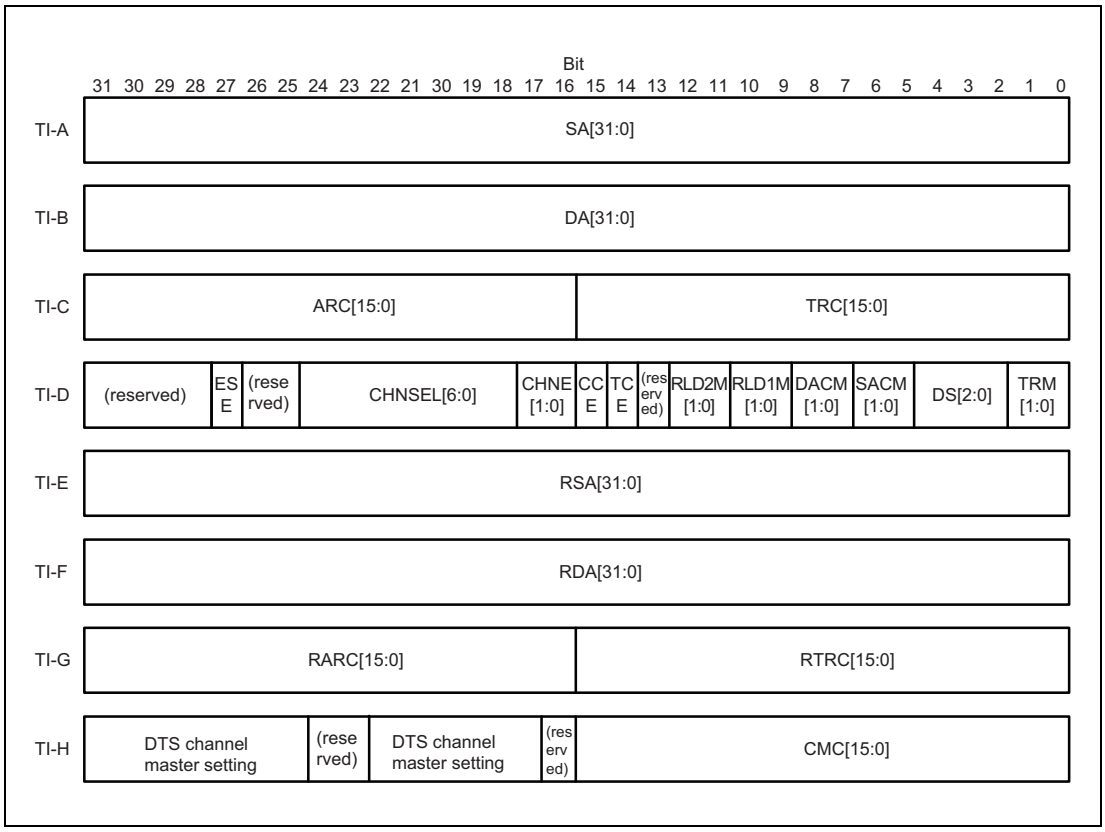

Figure 8.1 Structure of TI

(2) Organization of TI in DTSRAM

The user can indirectly access DTSRAM through the DTS channel registers for each channel and DTS channel master setting registers.

Therefore, direct access to TI structures in DTSRAM is usually not required.

As an exception, when an ECC error occurs while DTSRAM is being accessed, the address at which error occurred is stored in the DTSRAM 1st 1-bit Error Address Register (DR_00SEADR) or the DTSRAM 1st Fatal Error Address Register (DR_00DEADR). It is helpful to understand the address organization of TI in DTSRAM to distinguish which channel/TI has generated the error.

Figure 8.2 shows the address organization of TI in DTSRAM.

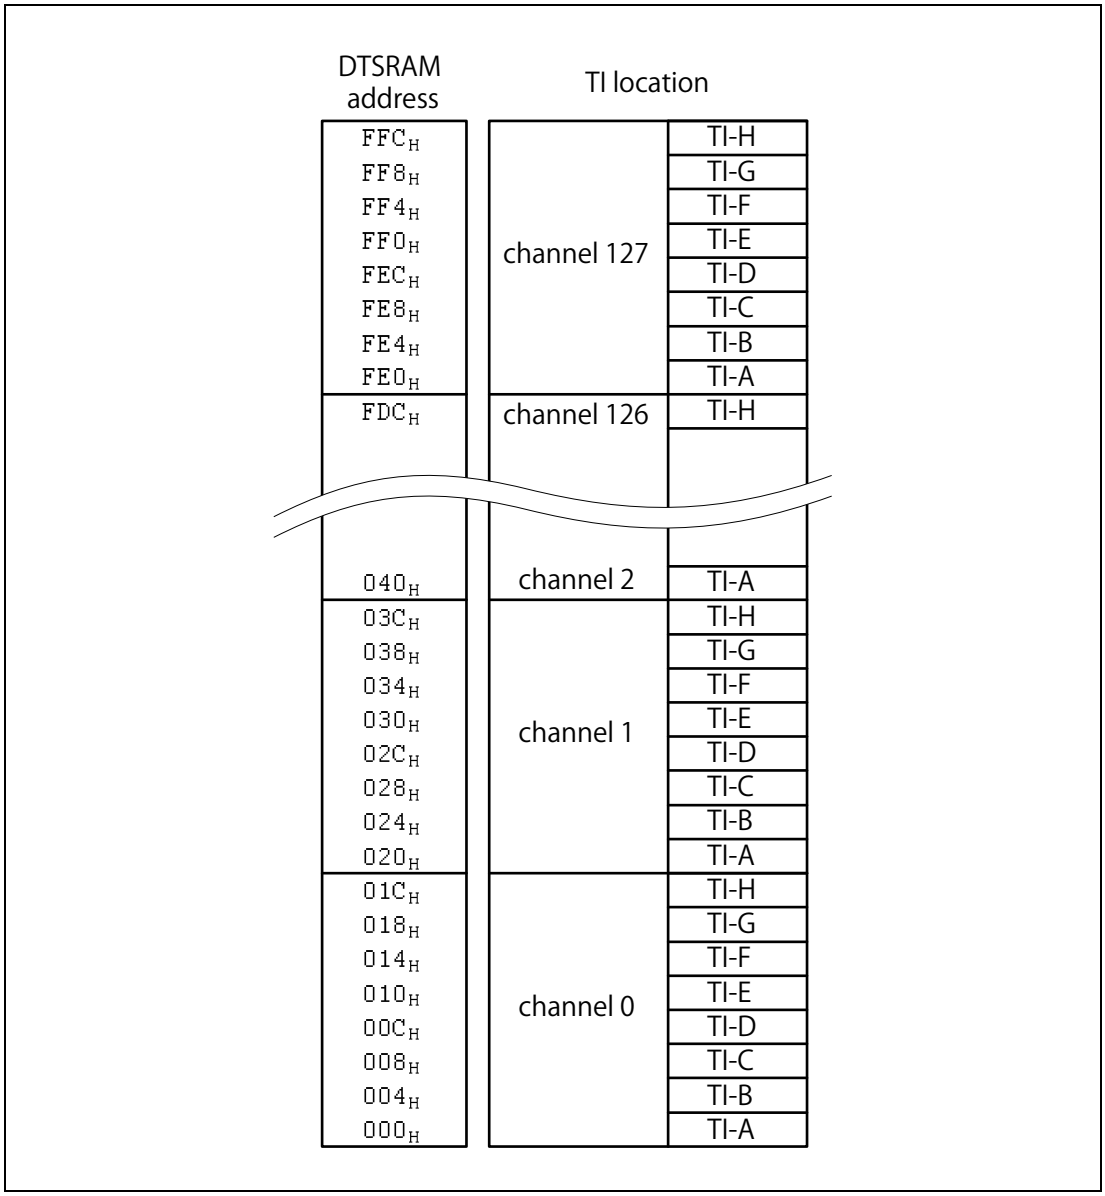

Figure 8.2 Organization of TI in DTSRAM

(3) How to Access TI

TI-A can be accessed through the DTS Source Address Register (DTSAnnn) for each channel.

TI-B can be accessed through the DTS Destination Address Register (DTDAnnn) for each channel.

TI-C can be accessed through the DTS Transfer Count Register (DTTCnnn) for each channel.

TI-D can be accessed through the DTS Transfer Control Register (DTTCTnnn) for each channel.

TI-E can be accessed through the DTS Reload Source Address register (DTRSAnnn) for each channel.

TI-F can be accessed through the DTS Reload Destination Address register (DTRDAnnn) for each channel.

TI-G can be accessed through the DTS Reload Transfer Count Register (DTRTCnnn) for each channel.

TI-H can be accessed through either the global Channel Master Setting Register (DTSnnnCM) or the channel specific Transfer Count Compare Register (DTTCCnnn).

(4) Cautions on Accessing TI

The value of the DTS Channel Master Setting Register and the value of the DTS Transfer Count Compare Register are both stored in TI-H.

Accessing the DTS Channel Master Setting Register (DTSnnnCM) is performed via a 32-bit access to the entire TI-H.

When writing to the DTS Channel Master Setting Register, the lower 16 bits (DTS transfer count compare or CMC) are also updated. When reading from the DTS Channel Master Setting Register, the lower 16 bits represent the CMC value.

When reading from the DTS Transfer Count Compare Register (DTTCCnnn), hardware performs a 32-bit read access from TI-H but only the lower 16 bits are used for the result of the register read. When writing to the DTS Transfer Count Compare Register (DTTCCnnn), hardware performs a read-modify-write access to TI-H.

Since the contents of TI after reset are undefined, writing to the DTS Transfer Count Compare Register (DTTCCnnn) before writing to the DTS Channel Master Setting Register can result in an ECC error due to the read part of the read-modify-write access.

Some bits of TI-H are reserved. It is recommended to write 0 to these bits and to ignore the value read from these bits.

After reset, the values of TI in DTSRAM are undefined. The first access to TI after reset should be a write access. Otherwise an ECC error will occur.

- DTS Source Address Register (DTSAnnn)
- DTS Destination Address Register (DTDAnnn)
- DTS Transfer Count Register (DTTCnnn)
- DTS Transfer Control Register (DTTCTnnn)
- DTS Reload Source Address Register (DTRSAnnn)
- DTS Reload Destination Address Register (DTRDAnnn)
- DTS Reload Transfer Count Register (DTRTCnnn)
- Channel Master Setting Registers (DTSnnnCM)

After reset a write access to the DTS Transfer Count Compare Register (DTTCCnnn) must follow a write access to the DTS Channel Master Setting Register (DTSnnnCM).

When accessing TI contents while a DTS transfer is in progress, the following implications should be considered.

- TI of the channel should not be updated by the CPU during the ongoing transfer. Otherwise a mismatch between the DTS transfer and the contents of TI may occur.
- If a TI access is requested from the CPU while a TI fetch or TI write back is being executed, the TI access is executed after the completion of the TI fetch or TI write back.
- If a TI fetch or TI write back is requested while a TI access request from the CPU is being processed, the TI fetch or TI write back is executed after the completion of the TI access.

8.3.3.2 Details of DTS Channel Registers

The “nnn” in the register symbols indicates the DTS channel number (nnn = 000 to 127).

(1) DTSAnnn — DTS Source Address Register

The DTS Source Address Register (DTSAnnn) is a 32-bit read/write register that specifies the DTS transfer source address of each channel.

Access: DTSAnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1000_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$ *1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA[31:16]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.24 DTSAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address These bits specify the DTS transfer source address. This register is updated at the timing of TI writeback and retains the DTS transfer source address for the next DTS transfer.

NOTE

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

Data Size	SA3	SA2	SA1	SA0
8 bits	0/1	0/1	0/1	0/1
16 bits	0/1	0/1	0/1	0
32 bits	0/1	0/1	0	0
64 bits	0/1	0	0	0
128 bits	0	0	0	0

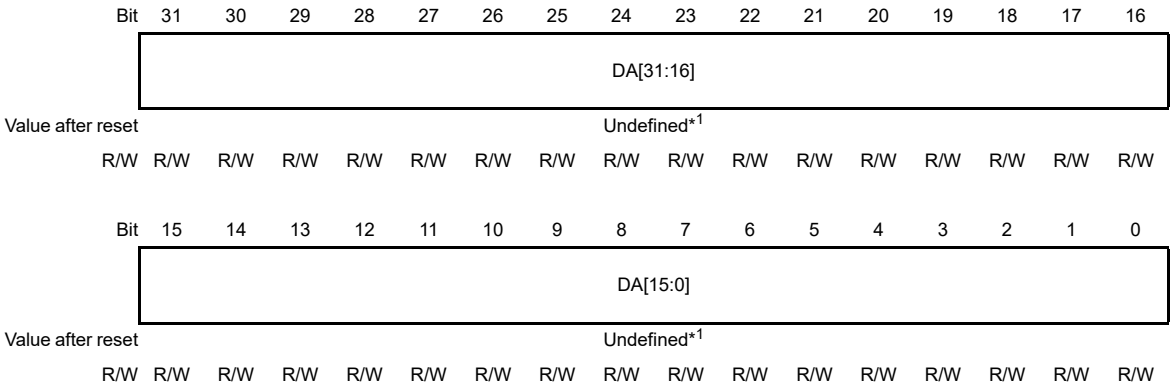
(2) DTDAnnn — DTS Destination Address Register

The DTS Destination Address Register (DTDAnnn) is a 32-bit read/write register that specifies the DTS transfer destination address of each channel.

Access: DTDAnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1004_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.



Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.25 DTDAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address These bits specify the DTS transfer destination address. This register is updated at the timing of TI writeback and retains the DTS transfer destination address for the next DTS transfer.

NOTES

1. If a DTS transfer error occurs in the read cycle of a DTS transfer, the write cycle is not executed, but the destination address is updated.
2. DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

Data Size	DA3	DA2	DA1	DA0
8 bits	0/1	0/1	0/1	0/1
16 bits	0/1	0/1	0/1	0
32 bits	0/1	0/1	0	0
64 bits	0/1	0	0	0
128 bits	0	0	0	0

(3) DTTCnnn — DTS Transfer Count Register

The DTS Transfer Count Register (DTTCnnn) is a 32-bit read/write register that specifies the DTS transfer count of each channel.

Access: DTTCnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1008_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.26 DTTCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count These bits specify the transfer count for the address reload function. The number is used for both reload function 2 and block transfer 2. When reload function 2 or block transfer 2 is used, ARC[15:0] are decremented by one for every DTS cycle and updated at the timing of TI writeback. When neither reload function 2 nor block transfer 2 is used, ARC[15:0] are not updated. If ARC[15:0] are 0000_H, address reload is not performed and ARC[15:0] are not updated.
15 to 0	TRC[15:0]	Transfer count These bits configure the transfer count. TRC[15:0] are decremented by one whenever a DTS cycle is executed. These bits are updated at the timing of TI writeback. If the reload function is not used, the value at completion (0000_H) is retained after the completion of the last transfer. If 0000_H is set, DTS transfer is not executed even if a DTS transfer request is accepted.

TRC[15:0]	Operation
0000_H	Transfer is disabled or complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

NOTE

If a transfer error occurs in the read cycle of DTS transfer, the write cycle is not executed, but the transfer count and address reload count are updated.

(4) DTTCTnnn — DTS Transfer Control Register

The DTS Transfer Control Register (DTTCTnnn) is a 32-bit read/write register that defines DTS transfer control configuration of the channel.

Access: DTTCTnnn register can be read or written in 32-bit units

Address: <DTS_base> + $100C_H$ + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	—	—	CHNSEL[6:0]							CHNE[1:0]	
Value after reset								Undefined*1								
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CCE	TCE	—	RLD2M[1:0]		RLD1M[1:0]		DACM[1:0]		SACM[1:0]		DS[2:0]			TRM[1:0]	
Value after reset								Undefined*1								
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.27 DTTCTnnn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value returned is undefined. The write value should be 0.
27	ESE	Setting of DTS error transfer disable This bit specifies whether to abort DTS transfer when a DTS transfer error occurs. If this bit is cleared to 0, DTS transfer continues when a DTS transfer error occurs. If this bit is set to 1, DTS transfer is aborted when a DTS transfer error occurs. 0: DTS transfer continues when a DTS transfer error occurs. 1: DTS transfer is aborted when a DTS transfer error occurs.
26 to 25	Reserved	When read, the value returned is undefined. The write value should be 0.
24 to 18	CHNSEL[6:0]	Next channel to chain These bits specify the next channel to chain. The next channel must be another channel in DTS. Setting the same channel for the next channel is not allowed. (Correct operation is not guaranteed in this case.)
17 to 16	CHNE[1:0]	Chain enable This bit selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DTS cycle at which the remaining transfer count is 1. 10: (Setting prohibited) 11: Always chain A chain request is generated at the completion of every DTS cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DTS cycle in which the Transfer Count Compare Register and remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.

Table 8.27 DTTCTnnn Register Contents (2/2)

Bit Position	Bit Name	Function
13	Reserved	When read, the value returned is undefined. The write value should be 0.
12, 11	RLD2M[1:0]	Reload function 2 setting These bits configure reload function 2. 00: Reload function 2 is disabled. 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DTS cycle in which the address reload count is 1. 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DTS cycle in which address reload count is 1. 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DTS cycle in which address reload count is 1.
10 to 9	RLD1M[1:0]	Reload function 1 setting These bits configure reload function 1. 00: Reload function 1 is disabled. 01: Reload function 1 is enabled. The source address and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1. (If reload function 2 is enabled, the address reload count is also reloaded.) 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1. (If reload function 2 is enabled, the address reload count is also reloaded.) 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1. (If reload function 2 is enabled, the address reload count is also reloaded.)
8 to 7	DACM[1:0]	Destination address count direction These bits specify the count direction of the destination address. 00: Increment 01: Decrement 10: Fixed 11: Prohibited (Operation not guaranteed)
6 to 5	SACM[1:0]	Source address count direction These bits specify the count direction of the source address. 00: Increment 01: Decrement 10: Fixed 11: Prohibited (Operation not guaranteed)
4 to 2	DS[2:0]	Transfer data size These bits specify the transfer data size. 000: 8 bits 001: 16 bits 010: 32 bits 011: 64 bits 100: 128 bits Other than the above: Prohibited (Operation not guaranteed)
1 to 0	TRM[1:0]	Transfer mode These bits specify the DTS transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Prohibited (Operation not guaranteed)

NOTES

1. If prohibited settings are used for some of the bits, the correct operation is not guaranteed.
2. Some bits in this register are unused, but these bits are readable and writable. It is recommended to write 0 to these bits and to ignore the value read from these bits.

(5) DTRSAnnn — DTS Reload Source Address Register

The DTS Reload Source Address Register (DTRSAnnn) is a 32-bit read/write register that specifies the DTS reload source address of each channel.

Access: DTRSAnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1010_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSA[31:16]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RSA[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.28 DTRSAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	RSA[31:0]	Reload source address These bits specify the source address to be reloaded when reload function 1 or reload function 2 is used.

NOTE

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

Data Size	RSA3	RSA2	RSA1	RSA0
8 bits	0/1	0/1	0/1	0/1
16 bits	0/1	0/1	0/1	0
32 bits	0/1	0/1	0	0
64 bits	0/1	0	0	0
128 bits	0	0	0	0

(6) DTRDAnnn — DTS Reload Destination Address Register

The DTS Reload Destination Address Register (DTRDAnnn) is a 32-bit read/write register that specifies the DTS reload destination address of each channel.

Access: DTRDAnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1014_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RDA[31:16]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDA[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.29 DTRDAnnn Register Contents

Bit Position	Bit Name	Function
31 to 0	RDA[31:0]	Reload destination address These bits specify the destination address to be reloaded when reload function 1 or reload function 2 is used.

NOTE

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

Data Size	RDA3	RDA2	RDA1	RDA0
8 bits	0/1	0/1	0/1	0/1
16 bits	0/1	0/1	0/1	0
32 bits	0/1	0/1	0	0
64 bits	0/1	0	0	0
128 bits	0	0	0	0

(7) DTRTCnnn — DTS Reload Transfer Count Register

The DTS Reload Transfer Count Register (DTRTCnnn) is a 32-bit read/write register that specifies the DTS reload transfer count of each channel.

Access: DTRTCnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1018_H + 40_H × [channel number]

Value after reset: 0000 0000_H*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RARC[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RTRC[15:0]															
Value after reset	Undefined*1															
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on the setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.30 DTRTCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	RARC[15:0]	Reload address reload count These bits specify the value to be reloaded to the address reload count when reload function 2 is used.
15 to 0	RTRC[15:0]	Reload transfer count These bits specify the value to be reloaded to the transfer count when reload function 1 is used.

RTRC[15:0]	Operation
0000_H	No DTS transfer
0001_H	1 transfer
:	:
$FFFF_H$	65535 transfers

(8) DTTCCnnn — DTS Transfer Count Compare Register

The DTS Transfer Count Compare Register (DTTCCnnn) is a 32-bit read/write register which configures the transfer count to be compared to transfer count register.

Access: DTTCCnnn register can be read or written in 32-bit units

Address: <DTS_base> + $101C_H$ + 40_H × [channel number]

Value after reset: $0000\ 0000_H$*1 RAM initialization is executed.
Undefined*1 RAM initialization is not executed.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC[15:0]															
Value after reset	Undefined*1															
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The value after reset is dependent on setting of RAM initialization. See **Section 9.5.6, RAM Initialization** for details.

Table 8.31 DTTCCnnn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value returned is undefined. The write value should be 0.
15 to 0	CMC[15:0]	Transfer count compare These bits configure the transfer count to be compared to the Transfer Count Register. If the transfer count match interrupt enable (DTTCTnnn.CCE) bit is 1, the transfer count match interrupt is generated at the completion of the DTS cycle in which remaining transfer count is the same as the value in this register. If CMC[15:0] is 0000_H, comparison with the transfer count is disabled. In this case, the transfer count match interrupt is not generated.

Note: This register must be accessed after the DTS channel master setting register is set up. If this register is accessed without setting up the DTS channel master setting register after reset, an ECC error may occur.

(9) DTFSLnnn — DTSFSL Operation Setting Register

The DTSFSL Operation Setting Register (DTFSLnnn) is a 32-bit read/write register that controls the DTS transfer request of each channel.

Access: DTFSLnnn register can be read or written in 32-bit units

Address: <DTS_base> + 1020_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	REQEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 8.32 DTFSLnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	REQEN	DTS transfer request enable This bit specifies whether a DTS transfer request of each channel is used as a candidate for DTS channel arbitration. 0: The DTS transfer request is not used as a candidate for DTS channel arbitration. 1: The DTS transfer request is used as a candidate for DTS channel arbitration. If this bit is 0, the request of the channel is not a candidate of DTS channel arbitration inside DTSFSL. DTS transfer request from the channel is not generated consequently, even if DTSFSL holds a request.

(10) DTFSTnnn — DTSFSL Transfer Status Register

The DTSFSL Transfer Status Register (DTFSTnnn) is a 32-bit read-only register that indicates the status of each channel.

Access: DTFSTnnn register is a read-only register that can be read in 32-bit units

Address: <DTS_base> + 1024_H + 40_H × [channel number]

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	—	ER	—	CC	TC	—	—	—	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 8.33 DTFSTnnn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned.
11	ERWR	DTS transfer error cycle When transfer error flag (ER) is set, this bit is also updated. This bit indicates whether a DTS transfer error has occurred in the read cycle or write cycle. If the ER bit is already set, this bit is not updated when another DTS transfer error occurs. This bit is also cleared when the ER bit is cleared. 0: A DTS transfer error occurred in the read cycle. 1: A DTS transfer error occurred in the write cycle
10 to 8	Reserved	When read, the value after reset is returned.
7	ER	Transfer error flag This bit is set when a DTS transfer error occurs. If this bit is 1 and the DTTCTnnn.ESE bit is set, a DTS transfer is not executed when a DTS transfer request occurs. This bit is cleared by writing 1 to the DTFSCnnn.ERC bit. 0: No DTS transfer error has occurred 1: A DTS transfer error has occurred
6	Reserved	When read, the value after reset is returned.
5	CC	Transfer count match flag This bit is set at the completion of the DTS transfer in which the remaining transfer count is the same as the value set in the transfer compare register. This bit is cleared by writing 1 to the DTFSCnnn.CCC bit. 0: No compare match with the Transfer Count Compare Register has occurred. 1: A compare match with the Transfer Count Compare Register has occurred.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and shows whether DTS transfer is complete. This bit is cleared by writing 1 to the DTFSCnnn.TCC bit. 0: DTS transfer is not complete 1: DTS transfer is complete
3 to 1	Reserved	When read, the value after reset is returned.

Table 8.33 DTFSTnnn Register Contents (2/2)

Bit Position	Bit Name	Function
0	DRQ	DTS transfer request flag This bit shows whether a DTS transfer request of this channel is being held. This bit is set when DTS transfer request is detected, or when the DTFSSnnn.DRQS bit is written by software. This bit is automatically cleared when DTS accepts a transfer request while DTSFSL is requesting DTS transfer for the channel in question. This bit also can be cleared by writing to the DTFSCnnn.DRQC bit. 0: A DTS transfer request was not detected. 1: A DTS transfer request was detected and is being held in DTSFSL.

(11) DTFSSnnn — DTSFSL Transfer Request Set Register

The DTSFSL Transfer Request Set Register (DTFSSnnn) is 32-bit write-only register that sets the DRQ bit in the DTFSTnnn register.

Access: DTFSSnnn register is a write-only register that can be written in 32-bit units

Address: <DTS_base> + 1028_H + 40_H × [channel number]

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 8.34 DTFSSnnn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DRQS	DTS transfer request set Writing 1 to this bit will generate a DTS transfer request. 0 is always read from this bit.

(12) DTFSCnnn — DTSFSL Transfer Status Clear Register

The DTSFSL Transfer Status Clear Register (DTFSCnnn) is 32-bit write-only register that clears the status flag bits in the DTFSTnnn register.

Access: DTFSCnnn register is a write-only register that can be written in 32-bit units

Address: <DTS_base> + $102C_H$ + 40_H × [channel number]

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	ERC	—	CCC	TCC	—	—	—	DRQC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	R	W	W	R	R	R	W

Table 8.35 DTFSCnnn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7	ERC	Transfer error flag (ER) clear The DTFSTnnn.ER bit can be cleared by writing 1 to this bit. 0 is always read from this bit.
6	Reserved	When writing, write the value after reset.
5	CCC	Transfer count match flag (CC) clear The DTFSTnnn.CC bit can be cleared by writing 1 to this bit. 0 is always read from this bit.
4	TCC	Transfer completion flag (TC) clear The DTFSTnnn.TC bit can be cleared by writing 1 to this bit. 0 is always read from this bit.
3 to 1	Reserved	When writing, write the value after reset.
0	DRQC	DTS transfer request clear The DTFSTnnn.DRQ bit can be cleared by writing 1 to this bit. 0 is always read from this bit.

8.3.4 Detail DTSSELm

8.3.4.1 DTSSELm — DTS Transfer Request Group Selection Register (m = 0 to 15)

DTSSELm register specifies the DTS transfer request group for each channel.

Access: DTSSELm register can be read or written in 8-, 16-, or 32-bit units

Address: <DMATRGSEL_base> + 200_H + (m × 4_H)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	SEL7[1:0]		—	—	SEL6[1:0]		—	—	SEL5[1:0]		—	—	SEL4[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SEL3[1:0]		—	—	SEL2[1:0]		—	—	SEL1[1:0]		—	—	SEL0[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 8.36 DTSSELm Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29, 28	SEL7[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 7.
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	SEL6[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 6.
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	SEL5[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 5.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	SEL4[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 4.
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	SEL3[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 3.
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	SEL2[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 2.
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5, 4	SEL1[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 1.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	SEL0[1:0]	These bits select the DTS transfer request group for DTS channel 8 x m + 0.

Bit Name	Function
SELn[1:0]	00_B: Select DTS transfer request group 0 01_B: Select DTS transfer request group 1 10_B: Select DTS transfer request group 2 11_B: Select DTS transfer request group 3

Figure 8.3 shows DTS transfer request group selection.

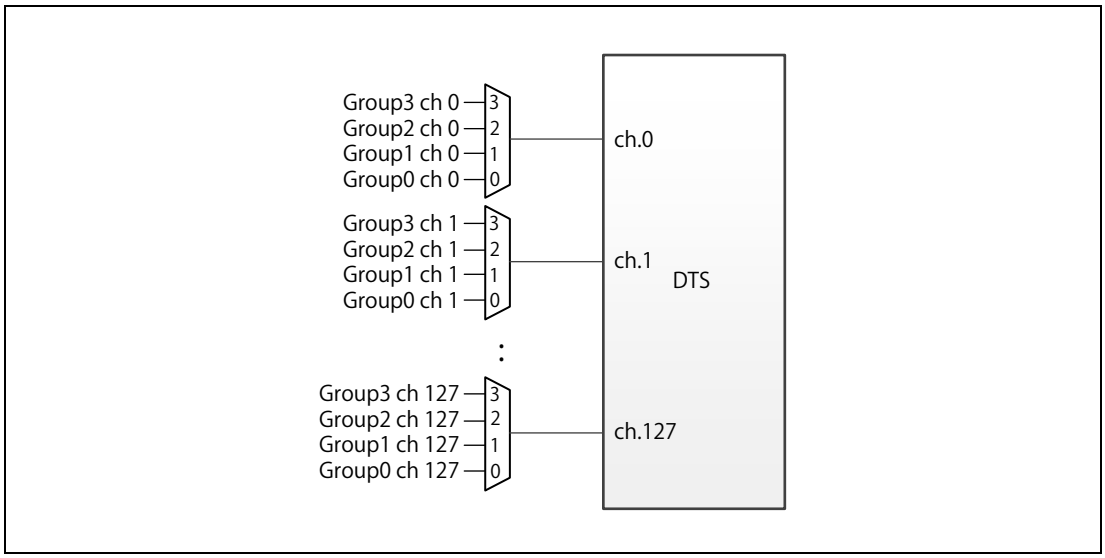


Figure 8.3 DTS Transfer Request Group Selection

8.4 Operation

8.4.1 Basic Operation of DTS Transfer

8.4.1.1 Transfer Mode

DTS has three transfer modes.

(1) Single Transfer

One DTS cycle is executed when a DTS transfer request is accepted.

(2) Block Transfer 1

The number of DTS cycles specified by the TRC bits in the DTS Transfer Count Register are executed when a DTS transfer request is accepted.

(3) Block Transfer 2

The number of DTS cycles specified by the ARC bits in the DTS Transfer Count Register are executed when a DTS transfer request is accepted. If the address reload count (ARC) is larger than the value of the transfer count (TRC), the number of DTS cycles is defined as the value of TRC.

8.4.1.2 Executing a DTS Cycle

DTS always executes the write cycle after the read cycle is complete. For example, if the transfer data size is 128 bits, the write cycle is executed after the read cycle for the 128-bit data is finished. The write cycle never starts before the read cycle is completed.

8.4.1.3 Updating Transfer Information

When a DTS cycle is executed, the DTS updates the transfer information as follows.

(1) Source Address and Destination Address

Transfer information (TI) will be updated as described in **Table 8.37** according to the settings of the DTS Transfer Control Register (DTTCTnnn) such as the source address count direction, the destination address count direction, and the transfer data size.

Table 8.37 Updating the Source Address and the Destination Address

Direction of Count	Transfer Data Size	Address after Update
Increment	8 bit	(address before update) + 0000 0001_H
	16 bit	(address before update) + 0000 0002_H
	32 bit	(address before update) + 0000 0004_H
	64 bit	(address before update) + 0000 0008_H
	128 bit	(address before update) + 0000 0010_H
Decrement	8 bit	(address before update) − 0000 0001_H
	16 bit	(address before update) − 0000 0002_H
	32 bit	(address before update) − 0000 0004_H
	64 bit	(address before update) − 0000 0008_H
	128 bit	(address before update) − 0000 0010_H
Fixed	—	Same as the address before update.

When the reload function is used, a specific update rule is applied other than the one described in **Table 8.37** for the last transfer and the address reload transfer. For details, see **Section 8.4.3, Reload Function**.

(2) Transfer Count/Address Reload Count

The transfer count is decremented by one for every DTS cycle.

The address reload count is decremented by one for every DTS cycle when reload function 2 or block transfer 2 is used. When neither reload function 2 nor block transfer 2 is used, it is not updated.

If the reload function is used, a specific update rule is applied for the last transfer and the address reload transfer.

For details, see **Section 8.4.3, Reload Function**.

(3) Other Transfer Information

Other transfer information is not updated during execution of a DTS cycle.

8.4.1.4 Last Transfer and Address Reload Transfer

The last transfer means the DTS cycle executed when the value in the Transfer Count Register, which shows the remaining number of transfers, is 1. The last transfer differs in operation compared to the other DTS cycles as follows.

- The transfer completion flag (DTFSTnnn.TC) is set when the last transfer is complete.
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When reload function 1 is enabled, reload function 1 is executed at the timing of the last transfer. For details, see **Section 8.4.3, Reload Function**.

Address reload transfer means the DTS cycle executed when reload function 2 is enabled and the address reload count is 1. Reload function 2 is executed after address reload transfer. For details, see **Section 8.4.3, Reload Function**.

8.4.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Output

DTS can output a transfer completion interrupt and a transfer count match interrupt to outside DTS.

(1) Transfer Completion Interrupt Output

When the transfer completion interrupt output enable bit (DTTCTn.TCE) is set in the Transfer Control Register, DTS requests a DTS transfer completion interrupt when the last transfer is complete.

(2) Transfer Count Match Interrupt Output

When the transfer count match interrupt enable bit (DTTCTn.CCE) is set in the Transfer Control Register, DTS requests a DTS transfer count match interrupt at the completion of the DTS cycle in which the Transfer Count Compare Register and the transfer count have the same value.

Figure 8.4 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

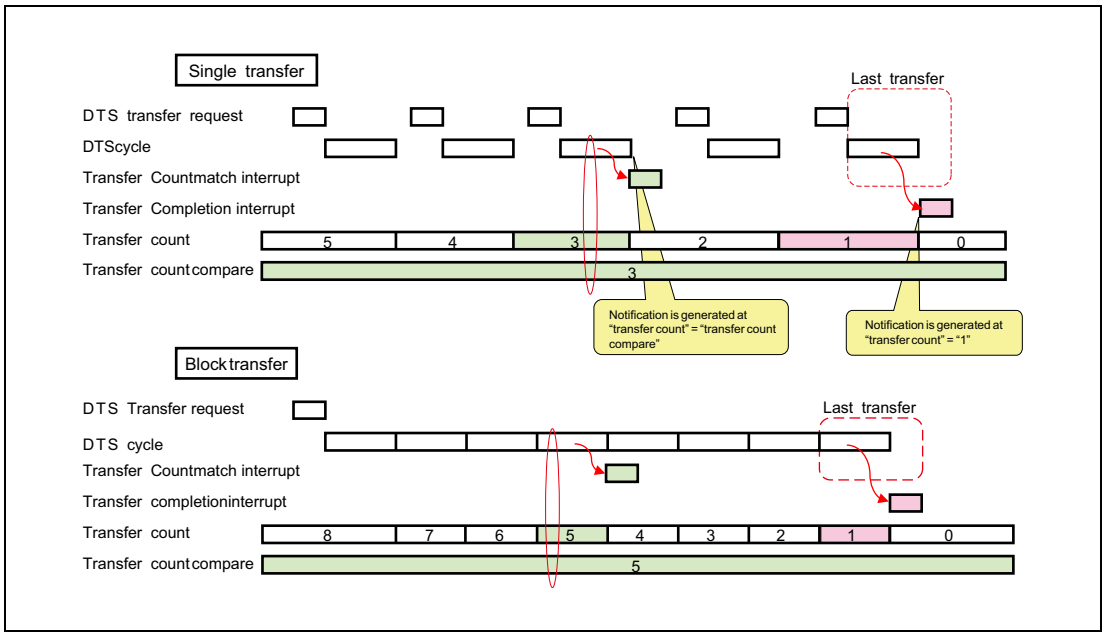

Figure 8.4 Transfer Completion Interrupt and Transfer Count Match Interrupt

8.4.1.6 Continuous Transfer

DTS does not have a configuration that supports continuous transfer.

DTS does not start DTS transfer when a DTS transfer request is generated while the transfer count is 0.

If the reload function 1 is used and the transfer count with the value other than 0 is reloaded to the transfer count bits (TRC[15:0]) in the DTS Transfer Count Register (DTTCnnn) when the last transfer is complete, the DTS can start the transfer after the next DTS transfer request is accepted.

8.4.2 Channel Priority Order

This subsection explains arbitration between multiple DTS channels.

8.4.2.1 DTS Channel Arbitration

If there are DTS transfer requests from multiple DTS channels, DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using the DTS channel priority setting registers.

If there are DTS transfer requests from multiple DTS channels, arbitration is executed as follows.

The channel with the higher priority level in the setting of the DTS channel priority setting register has priority.

If two channels have the same priority level specified in the DTS channel priority setting register, the channel with the smaller channel number has priority.

DTSFSL sends DTS a DTS transfer request for the channel selected by arbitration. DTS executes DTS transfer when it accepts the DTS transfer request.

DTS transfer does not allow arbitration between DTS channels in the middle of a block transfer. If a higher priority DTS transfer request is issued during a lower priority block transfer, the higher priority DTS transfer has to wait until the current block transfer is complete*1.

Note 1. Completion of block transfer means either the last transfer or the last transfer for block transfer 1 or the address reload transfer for block transfer 2 is finished.

When the DTS is executing the block transfer 1 or the block transfer 2, a DTS cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer is completed.

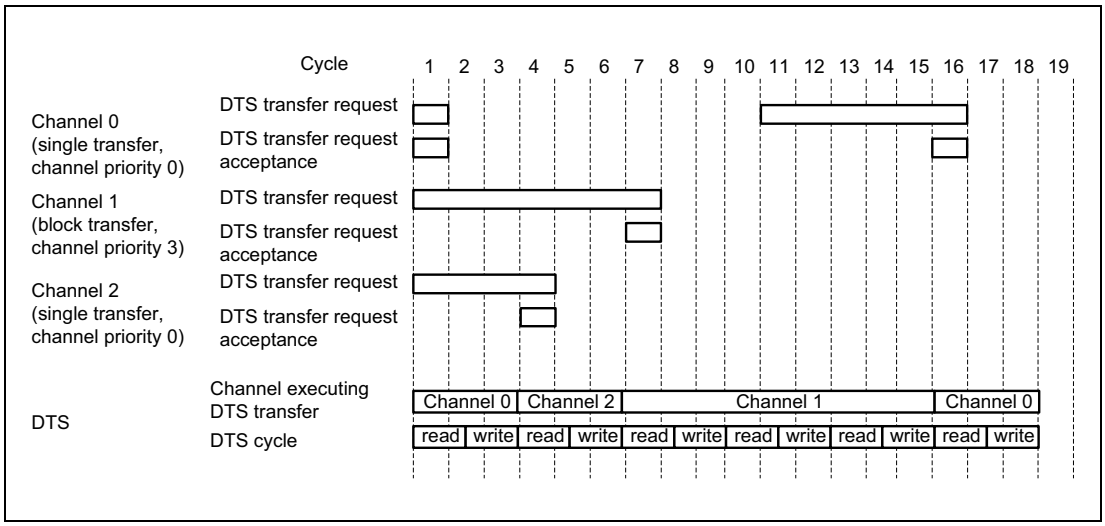

Figure 8.5 DTS Channel Arbitration

Cycle numbers shown in **Figure 8.5** are for explanation purposes only. They do not indicate the actual number of cycles necessary for executing DTS transfer.

In **Figure 8.5**, DTS transfer requests for channels 0, 1 and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1, which is 3. In addition, if two channels have the same priority, the channel with the smaller channel number has higher priority. Consequently, the priority order for arbitration is “channel 0 > channel 2 > channel 1”, and a DTS cycle for channel 0 starts because its priority is the highest. As a result of arbitration between channels 1 and 2 at cycle 4, a DTS cycle for channel 2 starts. A DTS cycle for channel 1 starts at Cycle 7, and continuous cycles follow until Cycle 15 because channel 1 uses block transfer. At Cycle 11, a DTS transfer request for channel 0 is generated. The DTS cycle for channel 1 is still ongoing and no arbitration is executed until the block transfer of channel 1 is complete.

At cycle 15, the block transfer of channel 1 is complete. At cycle 16, a DTS cycle for channel 0 starts.

8.4.3 Reload Function

8.4.3.1 Overview of the Reload Function

The reload function is the function which updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values at the time of specific transfer completion.

The reload function has two types of functions: reload function 1 and reload function 2.

8.4.3.2 Operation of Reload Function 1

When reload function 1 is enabled, the actions described in **Table 8.38** are executed at the timing of the last transfer according to the reload function 1 settings.

Table 8.38 Operation of Reload Function 1

Reload Function 1 Setting	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If reload function 2 is disabled: Not reloaded. If reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If reload function 2 is disabled: Not reloaded. If reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	If reload function 2 is disabled: Not reloaded. If reload function 2 is enabled: The reload address reload count is copied to this.

Figure 8.6 shows the operation of reload function 1.

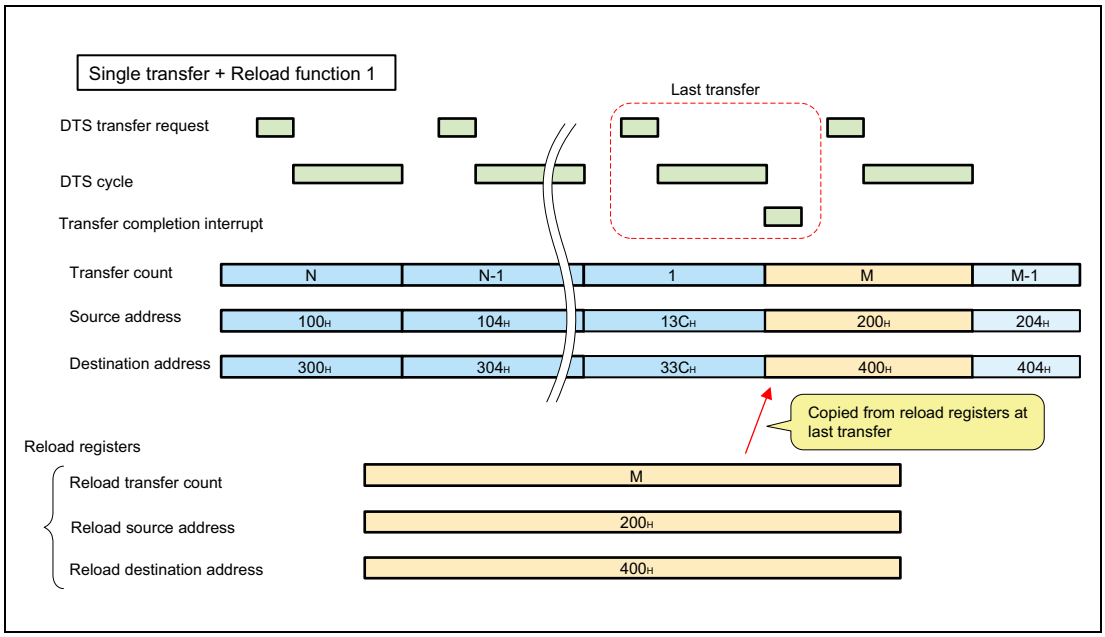

Figure 8.6 Operation of Reload Function 1

8.4.3.3 Reload Function 2

When reload function 2 is enabled, the actions described in **Table 8.39** are executed at the timing of address reload transfer according to the reload function 2 settings.

Table 8.39 Operation of Reload Function 2

Reload Function 2 Setting	Register	Action at Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 8.7 shows the operation of reload function 2.

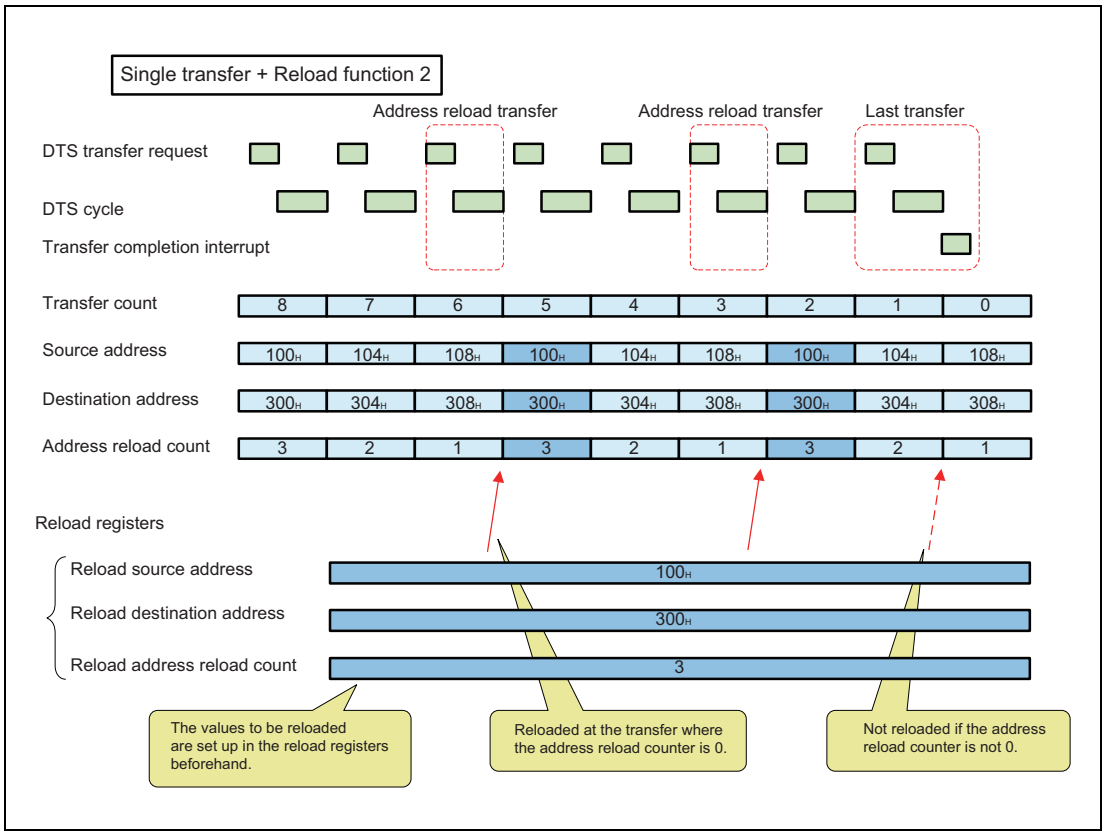

Figure 8.7 Operation of Reload Function 2

Figure 8.8 shows the operation when both reload function 1 and reload function 2 are used simultaneously.

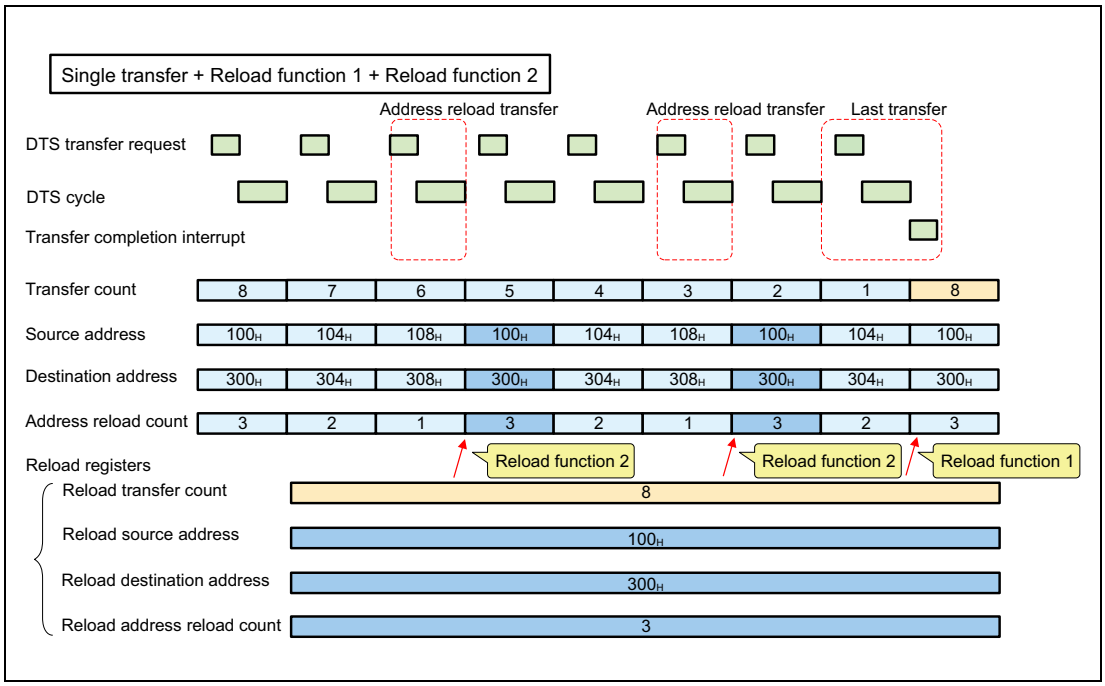

Figure 8.8 Operation When Combining Reload Function 1 and Reload Function 2

8.4.3.4 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information and reload transfer count information differs depending on the transfer mode.

In the single transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DTS cycle. Therefore, if the reload function is used for a single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

For a block transfer, TI is fetched only at the beginning of the block transfer. The TI is used for the reload function at the last transfer or the address reload transfer. Therefore, when using the reload function for a block transfer, the reload contents in the TI must be set up before the beginning of the block transfer. If the reload contents is updated during the block transfer, those new settings cannot be reflected to the TI nor the next transfer.

8.4.4 Chain Function

8.4.4.1 Overview

DTS provides a function called chain function. When using the chain function, the completion of the DTS cycle or the last transfer for one channel can trigger a DTS transfer request for another channel. The DTS transfer request initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DTS cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.9 shows the operation of the “always chain” option.

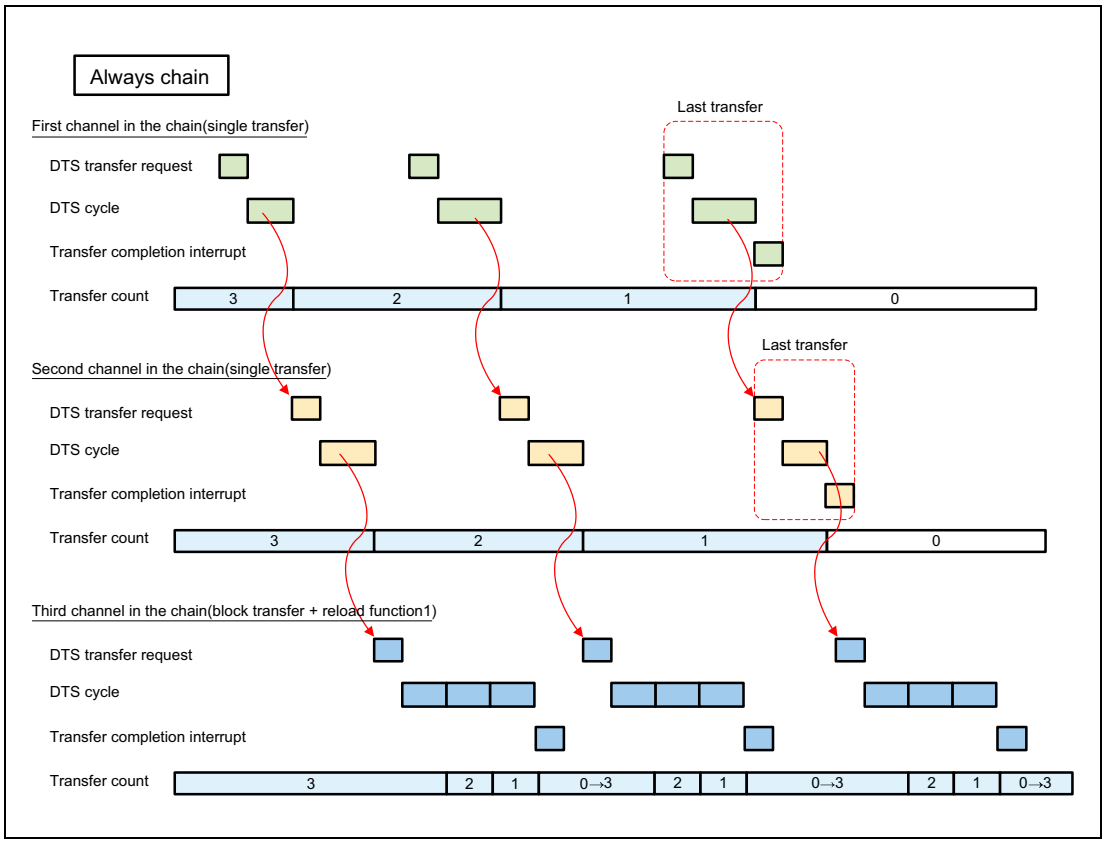

Figure 8.9 Operation of “Always Chain” Option

Figure 8.10 shows the operation of the “chain at the last transfer” option.

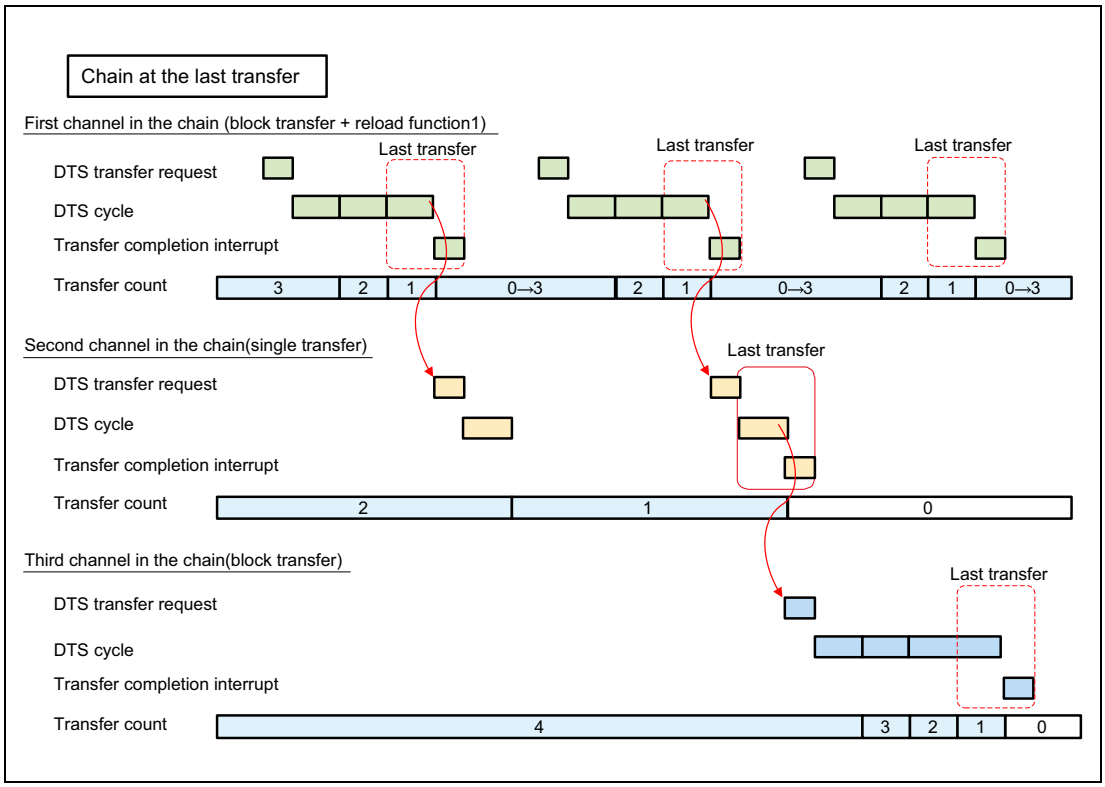

Figure 8.10 Operation of “Chain at the Last Transfer” Option

8.4.4.2 Setting Up the Chain Function

When using the chain function, it has to be enabled by the chain enable (DTTCTnnn.CHNE) and the next channel in the chain has to be specified in the chain selection (DTTCTnnn.CHNSEL) of the DTS Transfer Control Register.

If the reliability functions are required, the chain restriction (DTSnnnCM.CHAIN_RESTRICT, CHAIN_SPID[4:0], CHAIN_UM) also has to be specified in DTS Channel Master Setting Register.

For detailed information about reliability function, see **Section 8.7, Reliability Function** for details.

8.4.5 DTS Operation

8.4.5.1 Types of DTS Transfer Requests and Assigning DTS Transfer Requests

DTS starts DTS transfer by accepting a hardware DTS transfer request or software DTS transfer request.

A transfer request for DTS is retained in the transfer request pending bit of DTSFSL for each channel.

For DTSFSL, both a hardware DTS transfer request and a software DTS transfer request are retained in the same transfer request pending bit. When executing DTS transfer, DTS does not care whether the DTS transfer request is a hardware DTS transfer request or software DTS transfer request.

8.4.5.2 Generating and Accepting a DTS Transfer Request

DTS only supports edge detection for hardware DTS transfer requests.

When DTSFSL detects a hardware DTS transfer source*1 input, DTSFSL sets the transfer request pending bit and retains the hardware DTS transfer source as a DTS transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register is set, DTSFSL notifies DTS of the DTS transfer request.

Software can also generate a DTS transfer request by setting the transfer request pending bit (DTFSTnnn.DRQ) using the DTSFSL transfer request set register (DTFSSnnn).

DTSFSL can retain only one DTS transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DTS transfer source input for the same channel occurs, DTSFSL ignores the new hardware DTS transfer source input.

The transfer request pending bit is automatically cleared when DTS accepts the DTS transfer request. DTSFSL clears the transfer request pending bit automatically when DTS accepts the DTS transfer request regardless of the type of DTS transfer to be executed by DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer status clear register (DTFSCnnn). If the transfer request pending bit of a channel is cleared before DTS accepts the DTS transfer request, DTS transfer of the channel is not executed.

Note 1. For details, refer to Appendix file “DTS_Transfer_request_Table.xlsx”.

8.4.5.3 Executing DTS Transfer

When DTS accepts a DTS transfer request for a channel, DTS executes DTS transfer on the channel. If there are DTS transfer requests from multiple channels, DTSFSL arbitrates the DTS channels and selects the channel for the DTS transfer request.

While DTS is executing DTS transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DTS transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DTS transfer is complete or aborted because of a DTS transfer error or a register write and no channel is currently executing DTS transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

8.4.5.4 DTSRAM Access

DTS accesses the DTSRAM when DTS transfer starts and finishes.

The DTS action of reading transfer information from the DTSRAM when DTS transfer starts is called TI fetch.

The DTS action of updating the transfer information on the DTSRAM when DTS transfer finishes is called TI writeback.

A single transfer performs a TI fetch at the beginning of a DTS cycle and a TI writeback at the end of a DTS cycle.

A block transfer performs a TI fetch at the beginning of the first DTS cycle and a TI writeback at the end of the DTS cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of a single transfer, the transfer information in DTSRAM is updated during each DTS cycle. In the case of block transfer, the transfer information in DTSRAM is updated after completion of the block transfer. If software reads the transfer information from DTSRAM during execution of a block transfer, the information represents the beginning of the block transfer.

8.5 Suspension, Resume, and Transfer Abort, and Clearing a DTS Transfer Request

8.5.1 Suspend, Resume, and Transfer Abort of a DTS Transfer

A DTS transfer being executed by DTS can be suspended by setting the DTS suspend bit (DTSCTL1.DTSUST) in DTS control register 1. If a DTS cycle is in progress, the DTS transfer is suspended after the DTS cycle is finished. If the current DTS cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DTS transfer is suspended after a TI writeback and completion of the DTS cycle.

If the type of the current DTS cycle is other than the above, DTS transfer is suspended after the completion of the DTS cycle without a TI writeback. To resume DTS transfer after suspension, the DTS suspend bit in DTS control register 1 has to be cleared.

To abort DTS transfer by DTS, first suspend DTS as described above and then set the DTS transfer abort request bit (DTSCTL2.DTSTIT) in DTS control register 2. If a transfer is aborted, no TI writeback is executed. In addition, aborting a DTS transfer does not change the value of the DTS suspend bit (DTSCTL1.DTSUST). If it is desired to have the DTS accept another DTS transfer request after the abort, clear the DTS suspend bit.

Figure 8.11 shows an example of suspension, resume, and transfer abort of a DTS transfer.

In **Figure 8.11**, channels 0, 1, and 2 are executing block transfer. At time tick 1, a DTS transfer request for channel 1 is accepted and DTS transfer starts. At time tick 2, DTS transfer requests for channels 0 and 2 are generated. At time tick 3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DTS transfer request for channel 0 is accepted, and DTS transfer of channel 0 starts because channel 0 has a higher priority than channel 2. At time tick 4, the last transfer of channel 0 is complete, and DTS transfer of channel 2 starts. At time tick 5, DTS is put into the suspended state, and the DTS transfer of channel 2 is suspended. At time tick 6, DTS transfer requests for channels 0 and 1 are generated. At time tick 7, the suspended state for DTS is cleared, and the DTS transfer of channel 2, which was suspended in the middle of a block transfer, is resumed. If DTS transfer is suspended in the middle of a block transfer, no DTS channel arbitration is executed when it is resumed. At time tick 8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DTS transfer request for channel 0 is accepted and the DTS transfer starts because channel 0 has a higher priority than channel 2. At time tick 9, DTS is put into the suspended state, and at time tick 10, the suspended DTS transfer of channel 0 is aborted. When the suspended state of DTS is cleared at time tick 11, DTS transfer of channel 1 starts because there is no currently ongoing DTS transfer and channel 1 is the only channel with a DTS transfer request.

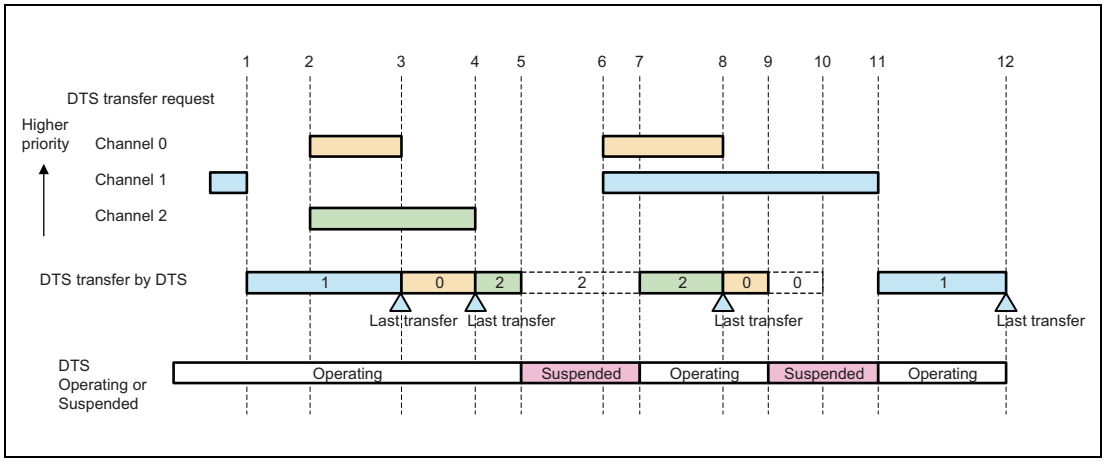

Figure 8.11 Example of Suspension, Resume, and Transfer Abort of a DTS Transfer

8.5.2 Masking and Clearing a Hardware DTS Transfer Request by DTSFSL

A DTS transfer request from a channel to DTS can be temporarily disabled (masked) by clearing the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register. In this case, the masked channel is excluded from DTSFSL arbitration.

A DTS transfer request held in DTSFSL can be cleared by setting the transfer request clear bit (DTFSCnnn.DRQC) in the DTSFSL transfer request clear register.

DTSFSL monitors hardware transfer source requests regardless of the state of DTS and the transfer request enable bit (DTFSLnnn.REQEN). DTSFSL sets a DTS transfer request for a channel when it detects a hardware transfer source request. When resuming or starting DTS transfer, a hardware DTS transfer request held in DTSFSL should be cleared as required.

8.5.3 List of Suspend, Resume, and Transfer Abort Functions

Table 8.40 List of Suspend, Resume, and Transfer Abort Functions

Function	How to Execute the Function	Operation	Possibility of DTS Transfer Abort
Suspension and resume of DTS	Setting and clearing DTSCTL1.DTSUST.	All channels of DTS transfer is suspended.	Possible (by setting DTSCTL2.DTSTIT during suspension)

8.6 Error Control

8.6.1 Types of Errors

DTS can generate the following types of errors:

- DTS Transfer Error
  This error is generated when an error is detected in the read cycle or write cycle in a DTS cycle or when an error is detected by checking the ECC in the read cycle.
  This error can be generated in all DTS channels during execution of DTS transfer.
- DTSRAM ECC Error
  This error is generated when an ECC error is detected in the DTSRAM read access by DTS.
  This error can be generated in the TI fetch during execution of DTS transfer for DTS or while software is accessing the DTS channel registers.
- DTSRAM Address Feedback Error
  This error is generated when an Address Feedback error is detected in the DTSRAM read or write access by DTS.
  This error can be generated in the TI fetch or TI writeback during execution of DTS transfer for DTS or while software is accessing the DTS channel registers. See **Section 44, Functional Safety** for details.

8.6.2 DTS Transfer Error

8.6.2.1 Operation of DTS When a DTS Transfer Error Occurs

When a DTS transfer error occurs in DTS, the transfer error flag (DTFSTnnn.ER) in the DTS transfer status register of the channel on which the DTS transfer error occurred is set. The transfer error cycle flag (DTSFSTnnn.ERWR) in the DTS transfer status register of the channel on which the DTS transfer error occurred shows whether the error occurred in the read cycle or the write cycle. The DTS Error register (DTSER) shows the smallest number of DTS channels on which the DTS transfer error occurred.

If a DTS transfer error occurs in a single transfer, a TI writeback is executed to finish the DTS cycle.

If a DTS transfer error occurs in the middle of a block transfer and DTS error transfer disable bit (DTTCTnnn.ESE) is set, the remaining DTS cycles in the block transfer are not executed, but a TI writeback is executed to finish the DTS cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If a DTS transfer error occurs in the middle of a block transfer and DTS error transfer disable bit (DTTCTnnn.ESE) is cleared, the block transfer continues regardless of the DTS transfer error.

If a DTS transfer error occurs during the read cycle of a DTS cycle, the write cycle is not executed. If a DTS transfer error occurs during the write cycle of a DTS cycle, the validity of the write is not guaranteed.

Regardless of whether a DTS transfer error occurs in the read cycle or write cycle of a DTS cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI writeback.

Even if the transfer error flag (DTFSTnnn.ER) in the DTS transfer status register of the channel is set, a TI fetch is executed when DTS accepts a DTS transfer request for the channel. If, as a result of the TI fetch, the DTS error transfer disable bit (DTTCTnnn.ESE) is found to be set, a DTS cycle and a TI writeback are not executed. If the DTS error transfer disable bit (DTTCTnnn.ESE) is cleared, DTS transfer is executed.

8.6.3 DTSRAM Error

There are three types of DTSRAM errors detected in DTSRAM read access: an ECC correctable error, an ECC uncorrectable error and an address feedback error. There is one type of DTSRAM error detected in DTSRAM write access: an address feedback error.

If an ECC correctable 1-bit error is detected during a TI fetch, error corrected data is used, and DTS transfer continues. If an ECC correctable 1-bit error is detected during DTS channel register access from software, error corrected data is returned as read data.

If an ECC uncorrectable error or an address feedback error is detected during a TI fetch, handling of the DTS transfer request is terminated without executing a DTS cycle and TI writeback. If an address feedback error is detected during a TI writeback, the validity of the TI writeback is not guaranteed. If an ECC uncorrectable error or address feedback error is detected during a DTS channel register read from software, a peripheral bus error is reported. If an address feedback error is detected during a DTS channel register write from software, a peripheral bus error is not reported, but the validity of the write access is not guaranteed. In addition to an ECC 2-bit error, an ECC 1- bit error is treated as uncorrectable if 1-bit error correction is disabled in ECC.

8.7 Reliability Function

8.7.1 Overview

In this product, DTS provides the following reliability functions to support multi-core configurations (multiple master PEs).

- Register access protection function

  See **Section 44, Functional Safety**.

- Master information inheritance function
- SPID setting restriction

  See **Section 44, Functional Safety**.

- Restriction on chain function

8.7.2 Master Information Inheritance Function

The master information inheritance function uses the contents of the channel master setting registers as the sideband information of the data transfer interface.

DTS outputs the sideband information of data transfer for the access guard.

Table 8.41 shows the sideband information that DTS outputs.

Table 8.41 Sideband Information That Is Output from DTS

Meaning	Value Output from DTS
UM	Same as the UM bit value in the channel master setting register
SEC	Non secure
SPID	Same as the SPID bit value in the channel master setting register,

8.7.3 Restriction on Chain Function

The channel configuration of the chain function can be restricted. When chain function restriction is enabled, only a pre-allowed channel in master information can be set as the next channel.

The chain function is not restricted if the CHAIN_RESTRICT bit of the DTS Channel Master Setting Register (DTSnnnCM) is cleared. In this case, DTS channel can specify any other channel to be included in the chain function.

The chain function is restricted if the CHAIN_RESTRICT bit of the DTS Channel Master Setting Register (DTSnnnCM) is set. In this case, only the channels in which CHAIN_SPID4-0 and CHAIN_UM match can be included into the chain function by DTS channel.

When a chain is executed, DTS compares the channel master settings of the previous and next channels to decide if the chain is permissible.

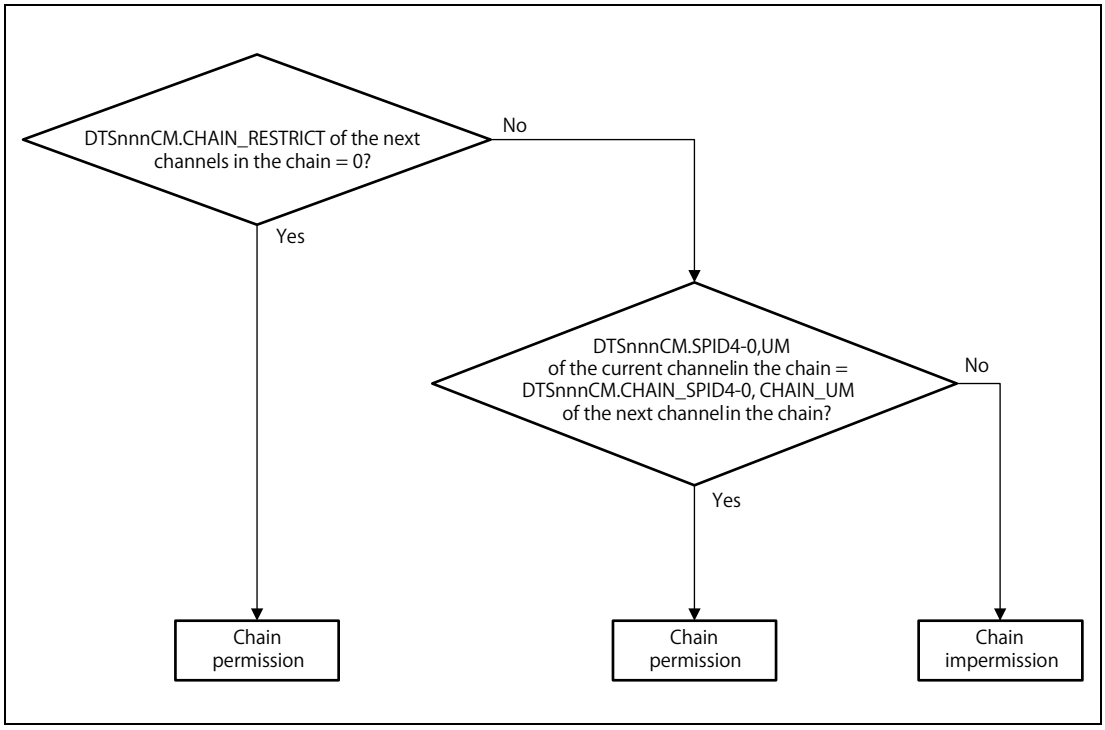

Figure 8.12 Chain Judgement Flow

8.8 Setting up DTS Transfer

8.8.1 Overview of Setting up DTS Transfer

Table 8.42 Overview of Setting up DTS Transfer (1/2)

Description	Register		Necessity of the Setting
Transfer request group selection setting	DTSSELm	DTS transfer request group selection	Mandatory (if using a hardware transfer request)
Overall DTS operation setting	DTSPRn	DTS channel priority setting	Mandatory (if DTS is used)
	DTSnnnCM	DTS channel master setting	Mandatory (if DTS is used)

Table 8.42 Overview of Setting up DTS Transfer (2/2)

Description	Register		Necessity of the Setting
Channel setting	DTSAnnn	DTS source address	Mandatory
	DTDAnnn	DTS destination address	Mandatory
	DTTCnnn	DTS transfer count	Mandatory
	DTTCTnnn	DTS transfer control	Mandatory
	DTRSAnnn	DTS reload source address	Mandatory if the reload function is used
	DTRDAnnn	DTS reload destination address	
	DTRTCnnn	DTS reload transfer count	
	DTTCCnnn	DTS transfer count compare	Mandatory if the transfer count match interrupt is used
Status clear	DTFSCnnn	DTSFSL transfer status clear	Recommended
Transfer request enable	DTFSLnnn	DTSFSL operation setting	Mandatory

8.8.2 Setting up the Transfer Request Group Selection

Set up the transfer request group selection before using DTS. The following registers must be set up to configure the transfer request group.

- DTS Transfer Request group selection Register (DTSSELm) (m = 0 to 15)
  This register configures the transfer request group selection.

8.8.3 Setting up the Overall DTS Operation

Set up the overall DTS operation before using DTS.

The following registers must be set up to configure the overall DTS operation.

- DTS channel priority setting registers (DTSPRn, n = 0 to 7)
  These registers configure the priority level of each DTS channel used for DTS channel arbitration.
- DTS channel master setting registers (DTSnnnCM)
  These registers configure channel assignment. (For details, see **Section 8.7, Reliability Function**.)

NOTE

It is important to properly configure the DTS channel master setting registers. Otherwise DTS transfer will not operate as expected.

It is recommended to clear following errors detected while setting up DTS:

- The DTSFSL Transfer Status Register (DTFSTnnn)

NOTE

Channel number information of the channel with error can be obtained by reading the DTS Error Register (DTSER).

8.8.4 Configuring the DTS Channel Settings

The DTS channel settings define the transfer information and transfer source for a DTS channel.

8.8.4.1 Configuring the DTS Channel Settings

The following procedure shows how to configure the DTS channel settings.

(1) Disable transfer requests by DTSFSL.

Clear the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register of the DTS channel being configured. This procedure is not mandatory but recommended in order to prevent DTS transfer requests during DTS channel configuration. It is also recommended to check the DTS status register (DTSSTS) and confirm that DTS transfer is not ongoing on the DTS channel being configured.

(2) Configure the transfer information (TI).

The following registers need to be set up to configure DTS channel transfer information.

- DTS Source Address Register (DTSAnnn)
- DTS Destination Address Register (DTDAnnn)
- DTS Transfer Count Register (DTTCnnn)
- DTS Transfer Control Register (DTTCTnnn)
- DTS Reload Source Address Register (DTRSAnnn)
- DTS Reload Destination Address Register (DTRDAnnn)
- DTS Reload Transfer Count Register (DTRTCnnn)
- DTS Transfer Count Compare Register (DTTCCnnn)

(3) Set the DTS transfer request.

DTS does not distinguish between hardware and software DTS transfer requests (no specific setting). Both hardware and software DTS transfer requests are retained in the same transfer request pending bit (DTFSTnnn.DRQ).

DTSFSL may retain a DTS transfer request that came before the transfer information is set up. If necessary, DTS transfer requests (DTFSTnnn.DRQ) retained in DTSFSL can be cleared by using the DTFSL transfer status clear register (DTFSCnnn).

(4) Enable transfer requests by DTSFSL.

Set the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register to enable DTS transfer requests for the DTS channel.

After the transfer request enable bit for DTSFSL is set, DTS can accept a DTS transfer request and start DTS transfer.

Section 9 Reset Controller

9.1 Features

The Reset Controller controls all factors that have an influence on the reset behavior of the device.

The device has several kinds of reset categories depending on the areas that are reset. Each reset category is triggered by one or multiple reset sources.

The relation between reset categories and their sources are shown in **Table 9.1**. The relation between reset categories and initialized area is shown in **Table 9.2**.

Table 9.1 Reset Categories and Reset Sources

No.	Reset Category	Source
1	Power On Reset*1	• POC Reset (POCRES)
		• Debugger Reset (by debugger)*2
2	System Reset 1	• External Reset
		• Primary VMON Reset (VCC/AWOVDD, ISOVDD, E0VCC)
		• Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]
3	System Reset 2	• Software System Reset (by SWSRESA, SWSRESA_ICUM)
		• ECM Reset (if RESC0 = 0)
		• WDTBA Reset
4	Application Reset	• Software Application Reset (by SWARESA, SWARESA_ICUM)
		• ECM Reset (if RESC0 = 1)
5	DeepSTOP Reset	• DeepSTOP Reset (by DeepSTOP mode trigger)
6	Module Reset	• Software Module Reset (by SWMRESA _<name>*3)
7	JTAG Reset	• JTAG Reset ($\overline{\text{TRST}}$)*2

Note 1. Power On Reset is asserted when SYSVCC supply voltage is under VPOC level and is released when SYSVCC supply is over VPOC level. About VPOC, refer to **Section 10, Power Supply Circuit**, **Section 55, Electrical Characteristics**.

Note 2. For details, refer to **Section 50, Debugging and Calibration**.

Note 3. In this section, <name> represents target module.

Note 1. It is reset by $\overline{\text{TSRT}}$. For details, refer to the **Section 50, Debugging and Calibration**.
Note 2. The execution of RAM initialization is configurable by a register setting.
Note 3. Debugger Reset is excluded.
Note 4. For details, refer to the **Section 45, Error Control Module (ECM)**.
Note 5. For details, refer to the **Section 11, Power Supply Voltage Monitor**.
Note 6. External Reset only.
Note 7. For details, refer to the **Section 13, Clock Controller**.
Note 8. For details, refer to the **Section 15, Standby Controller (STBC)**.
Note 9. The execution of RAM initialization depends on Flash Option Byte.
Note 10. RAM initialization of RS-CANFD and FLXA are executed when each module startup. RAM initialization of ETNB is not executed by each reset factor.

9.2 Input/Output Pins

I/O pins related to reset are shown in **Table 9.3**.

Table 9.3 I/O Pins

Pin function name	Direction	Description
$\overline{\text{RESET}}$	Input	Reset Input
$\overline{\text{TRST}}$	Input	Debug Reset Input
$\overline{\text{RESETOUT}}$	Output	Reset Output

9.3 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA/DTS requests.

This module has no error notifications to ECM.

9.4 Registers

9.4.1 List of Registers

The register list related to reset is shown in **Table 9.4, List of Registers for Isolated area (ISO area)**, **Table 9.5, List of Registers for Always-On area (AWO area)**.

Table 9.4 List of Registers for Isolated area (ISO area) (1/3)

9.4.3 STAC_DPRAM — RAM Initialization Mode Control Register for DPRAM

This register is used to control the RAM initialization execution of the DPRAM. In Application Reset, initialization of DPRAM is executed depending on this register.

For details of RAM initialization, refer to **Section 9.5.6, RAM Initialization**.

Access: This register can be read or written in 32-bit units.

Address: FF98 0800$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 9.8 STAC_DPRAM Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RZEROMD[1:0]	RAM Initialization Mode for DPRAM. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

9.4.4 STAC_DTSRAM — RAM Initialization Mode Control Register for DTSRAM

This register is used to control the RAM initialization execution of the DTSRAM. In Application Reset, initialization of DTSRAM is executed depending on this register.

For details of RAM initialization, refer to **Section 9.5.6, RAM Initialization**.

Access: This register can be read or written in 32-bit units.

Address: FF98 0810$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 9.9 STAC_DTSRAM Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RZEROMD[1:0]	RAM Initialization Mode for DTSRAM. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

9.4.5 STAC_GTM — RAM Initialization Mode Control Register for GTM

This register is used to control the RAM initialization execution of the GTM. In Application Reset and Module Reset, initialization of RAM for GTM is executed depending on this register.

For details of RAM initialization, refer to **Section 9.5.6, RAM Initialization**.

Access: This register can be read or written in 32-bit units.

Address: FF98 0830$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 9.10 STAC_GTM Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RZEROMD[1:0]	RAM Initialization Mode for GTM0. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

9.4.6 STAC_MSPI — RAM Initialization Mode Control Register for MSPI

This register is used to control the RAM Initialization execution of the MSPI. In Application Reset and Module Reset, initialization of RAM for MSPI is executed depending on this register.
For details of RAM initialization, refer to **Section 9.5.6, RAM Initialization**.

Access: This register can be read or written in 32-bit units.
Address: FF98 0850_H
Value after reset: 000x $xxxx_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	RZEROMD9[1:0]		RZEROMD8[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x	x

Table 9.11 STAC_MSPI Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19, 18	RZEROMD9[1:0]	RAM Initialization Mode for MSPI9. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
17, 16	RZEROMD8[1:0]	RAM Initialization Mode for MSPI8. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
15, 14	RZEROMD7[1:0]	RAM Initialization Mode for MSPI7. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
13, 12	RZEROMD6[1:0]	RAM Initialization Mode for MSPI6. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
11, 10	RZEROMD5[1:0]	RAM Initialization Mode for MSPI5. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
9, 8	RZEROMD4[1:0]	RAM Initialization Mode for MSPI4. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

Table 9.11 STAC_MSPI Register Contents (2/2)

Bit Position	Bit Name	Function
7, 6	RZEROMD3[1:0]	RAM Initialization Mode for MSPI3. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
5, 4	RZEROMD2[1:0]	RAM Initialization Mode for MSPI2. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
3, 2	RZEROMD1[1:0]	RAM Initialization Mode for MSPI1. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled
1, 0	RZEROMD0[1:0]	RAM Initialization Mode for MSPI0. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

9.4.7 STAC_MMCA — RAM Initialization Mode Control Register for MMCA

This register is used to control the RAM Initialization execution of the MMCA. In Application Reset and Module Reset, initialization of RAM for MMCA is executed depending on this register.

For details of RAM initialization, refer to **Section 9.5.6, RAM Initialization**.

Access: This register can be read or written in 32-bit units.

Address: FF98 0860$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 9.12 STAC_MMCA Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RZEROMD[1:0]	RAM Initialization Mode for MMCA. Initial value depends on Flash Option Byte. $x0_B$: Disabled 01_B : Prohibited 11_B : Enabled

9.4.8 SWMRESA_RSCFD— Software Module Reset Assertion Register for RS-CANFD

This register is used to generate a Module Reset for RS-CANFD.
This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.
Address: FF98 0900_H
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 9.13 SWMRESA_RSCFD Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SWMRESA_RSCFD_1	Software Module Reset Trigger for RSCFD1 (CAN8 to 15) , E7RC11, E7RC12, and E7RC13 0 : No function 1 : Generate Module Reset
0	SWMRESA_RSCFD_0	Software Module Reset Trigger for RSCFD0 (CAN0 to 7), E7RC01, E7RC02, and E7RC03 0 : No function 1 : Generate Module Reset

9.4.9 SWMRESS_RSCFD — Software Module Reset Status Register for RS-CANFD

This register is used to show the execution status of a Module Reset for RS-CANFD.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 0904$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 9.14 SWMRESS_RSCFD Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SWMRESS_RSCFD_1	Software Module Reset Status for RSCFD1 (CAN8 to 15), E7RC11, E7RC12, and E7RC13 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_RSCFD_0	Software Module Reset Status for RSCFD0 (CAN0 to 7), E7RC01, E7RC02, and E7RC03 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.10 SWMRESA_FLXA — Software Module Reset Assertion Register for FLXA

This register is used to generate a Module Reset for FLXA.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 0910_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 9.20 SWMRESS_ETNB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SWMRESS_ETNB_1	Software Module Reset Status for ETNB1, E7GE00, and E7GE01 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_ETNB_0	Software Module Reset Status for ETNB0, E7ME00, and E7ME01 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.16 SWMRESA_RSENT — Software Module Reset Assertion Register for RSENT

This register is used to generate a Module Reset for RSENT.
This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.
Address: FF98 0940_H
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 9.22 SWMRESS_RSENT Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7	SWMRESS_RSENT_7	Software Module Reset Status for RSENT7 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
6	SWMRESS_RSENT_6	Software Module Reset Status for RSENT6 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
5	SWMRESS_RSENT_5	Software Module Reset Status for RSENT5 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
4	SWMRESS_RSENT_4	Software Module Reset Status for RSENT4 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
3	SWMRESS_RSENT_3	Software Module Reset Status for RSENT3 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
2	SWMRESS_RSENT_2	Software Module Reset Status for RSENT2 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
1	SWMRESS_RSENT_1	Software Module Reset Status for RSENT1 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_RSENT_0	Software Module Reset Status for RSENT0 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.18 SWMRESA_MSPI — Software Module Reset Assertion Register for MSPI

This register is used to generate a Module Reset for MSPI.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 0950_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 9.27 SWMRESA_ADCJ_ISO Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SWMRESA_ADCJ_1	Software Module Reset Trigger for ADCJ1 0 : No function 1 : Generate Module Reset
0	SWMRESA_ADCJ_0	Software Module Reset Trigger for ADCJ0 and AVSEG 0 : No function 1 : Generate Module Reset

9.4.23 SWMRESS_ADCJ_ISO — Software Module Reset Status Register for ADCJ (ISO)

This register is used to show the execution status of a Module Reset for ADCJ (ISO).

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 0974$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 9.28 SWMRESS_ADCJ_ISO Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SWMRESS_ADCJ_1	Software Module Reset Status for ADCJ1 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_ADCJ_0	Software Module Reset Status for ADCJ0 and AVSEG 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.24 SWMRESA_CXPI — Software Module Reset Assertion Register for CXPI

This register is used to generate a Module Reset for CXPI.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 0980_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

3	SWMRESS_CXPI_3	Software Module Reset Status for CXP13 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
2	SWMRESS_CXPI_2	Software Module Reset Status for CXP12 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
1	SWMRESS_CXPI_1	Software Module Reset Status for CXP11 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_CXPI_0	Software Module Reset Status for CXP10 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.26 SWMRESA_MMCA — Software Module Reset Assertion Register for MMCA

This register is used to generate a Module Reset for MMCA.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 0990_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	SWMRESA_TPBA_1	Software Module Reset Trigger for TPBA1 0 : No function 1 : Generate Module Reset
0	SWMRESA_TPBA_0	Software Module Reset Trigger for TPBA0 0 : No function 1 : Generate Module Reset

9.4.51 SWMRESS_TPBA — Software Module Reset Status Register for TPBA

This register is used to show the execution status of a Module Reset for TPBA.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 0A54$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 9.56 SWMRESS_TPBA Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SWMRESS_TPBA_1	Software Module Reset Status for TPBA1 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_TPBA_0	Software Module Reset Status for TPBA0 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.52 SWMRESA_TSG3 — Software Module Reset Assertion Register for TSG3

This register is used to generate a Module Reset for TSG3.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 $0A60_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

4	SWMRESS_OSTM_4	Software Module Reset Status for OSTM4 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
3	SWMRESS_OSTM_3	Software Module Reset Status for OSTM3 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
2	SWMRESS_OSTM_2	Software Module Reset Status for OSTM2 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
1	SWMRESS_OSTM_1	Software Module Reset Status for OSTM1 0 : Reset execution is not being processed. 1 : Reset execution is being processed.
0	SWMRESS_OSTM_0	Software Module Reset Status for OSTM0 0 : Reset execution is not being processed. 1 : Reset execution is being processed.

9.4.56 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 $0C00_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

9.4.57 RESFDDC — Reset Factor Clear Register for Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]

This register clears the reset flags of the RESFDD register.
This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.
Address: FF98 $0C10_H$
Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 9.62 RESFDDC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	RESFDDC	Debugger Disconnection Reset Flag Clear 0: No function 1: Clear flag

9.4.58 RESKCPROT0 — Reset Controller Register Key Code Protection Register 0

The RESKCPROT register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 0F00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 9.63 RESKCPROT0 Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0.
0	KCE	Key Code Enable bit 0 : Disables write access of protected registers 1 : Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing protected registers.

Note 2. Write A5A5A501$_H$ to this register to enable writing protected registers.

9.4.59 BOOTCTRL — Boot Control Register

This register controls the Start-Up of each PE. At the time of reset (Power On Reset, System Reset 1/2, Application Reset, DeepSTOP Reset) release, Either PE0 or ICUHMA start according to the Flash Option Byte. For details of Flash Option, see the *RH850/U2A-EVA Group Security User's Manual: Hardware.*

After reset release, PE can be started selectively by asserting the corresponding bit of this register. For details of Startup Order, see **Section 9.5.7.1, CPU's Startup Order**.

Only 1-write is possible for these bits. 0-write is ignored.

Access: This register can be read or written in 32-bit units.

Address: FFFB_2000$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 9.64 BOOTCTRL Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	BC3	Boot Control 3 This bit triggers the start-up of the PE3. (When OPBT3.PE3_DISABLE = 1, PE3 is inactive regardless of the value of this bit.) 0 : Inactive 1 : Active
2	BC2	Boot Control 2 This bit triggers the start-up of the PE2. (When OPBT3.PE2_DISABLE = 1, PE2 is inactive regardless of the value of this bit.) 0 : Inactive 1 : Active
1	BC1	Boot Control 1 This bit triggers the start-up of the PE1. (When OPBT3.PE1_DISABLE = 1, PE1 is inactive regardless of the value of this bit.) 0 : Inactive 1 : Active
0	BC0	Boot Control 0 This bit triggers the start-up of the PE0. 0 : Inactive 1 : Active

9.4.60 SWSRESA — Software System Reset Assertion Register

This register is used to generate a System Reset 2.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 $840C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W

Table 9.65 SWSRESA Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SWSRESA	Software System Reset Trigger 0 : No function 1 : Generate a System Reset 2

9.4.61 SWARESA — Software Application Reset Assertion Register

This register is used to generate an Application Reset.

Do not writing to SWARESA during Cyclic RUN mode.

This register is always read as 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 8410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	SWARESA	Software Application Reset Trigger 0 : No function 1 : Generate an Application Reset

9.4.62 RESC — Reset Configuration Register

This register contains configuration settings for the behavior of the device during reset.

Access: This register can be read or written in 32-bit units.

Address: FF98 8414$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RESC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 9.67 RESC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	RESC0	ECM Reset Configuration in RUN mode*1 0 : ECM Reset Generates a System Reset 2 1 : ECM Reset Generates an Application Reset

Note 1. In other than RUN mode, ECM Reset Generates System Reset 2 regardless of the value of RESC0.

9.4.63 RESF — Reset Factor Register

This register indicates whether a Reset occurred since it was cleared last time.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 8500$_H$

Value after reset: 0000 X005$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. Value after Power On Reset

Table 9.68 RESF Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned.
17	ICUMARESF0	ICUMHA Software Application Reset Flag This flag is a status controlled by ICUMHA. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*. This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
16	ICUMSRESF0	ICUMHA Software System Reset Flag This flag is a status controlled by ICUMHA. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*. This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
15	DRESF0	DeepSTOP Reset Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
14	HWBISTF2	HW BIST (Field BIST2) Execution Flag*1 This flag will always be asserted after a preceding DeepSTOP Reset if the Field BIST2 is executed. In this case the corresponding DeepSTOP Reset Flag indication is asserted as well. 0 : Field BIST2 was not executed 1 : Field BIST2 was executed
13	HWBISTF1	HW BIST (Field BIST1) Execution Flag*1 This flag will always be asserted after a preceding DeepSTOP Reset if the Field BIST1 is executed. In this case the corresponding DeepSTOP Reset Flag indication is asserted as well. 0 : Field BIST1 was not executed 1 : Field BIST1 was executed
12	HWBISTF0	HW BIST (Field BIST0) Execution Flag*1 This flag will always be asserted after a preceding Power On or System Reset 1/2 if the Field BIST0 is executed. In this case the corresponding Power On or System Reset 1/2 Flag indication is asserted as well. 0 : Field BIST0 was not executed 1 : Field BIST0 was executed

Table 9.68 RESF Register Contents (2/2)

Bit Position	Bit Name	Function
11	Reserved	When read, the value after reset is returned.
10	ARESF2	ECM Application Reset Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
9	Reserved	When read, the value after reset is returned.
8	ARESF0	Software Application Reset Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
7	SRES2F3	WDTBA Reset Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
6	SRES2F2	ECM System Reset 2 Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
5	Reserved	When read, the value after reset is returned.
4	SRES2F0	Software System Reset Flag This flag is cleared to 0 by Power On Reset, Primary VMON Reset. 0 : No reset occurred 1 : Reset has occurred
3	SRES1F1	Primary VMON Reset Flag This flag is only cleared by a Power On Reset 0 : No reset occurred 1 : Reset has occurred
2	SRES1F0	External Reset Flag This flag is also set by a Power On Reset. 0 : No reset occurred 1 : Reset has occurred
1	Reserved	When read, the value after reset is returned.
0	PRESF0	Power On Reset Flag This flag is set by a Power On Reset. 0 : No reset occurred 1 : Reset has occurred

Note 1. HWBISTFn is also set in the condition of “BIST not executed” by setting $\overline{\text{TRST}}$ pin to High. For the condition of BIST execution, refer to **Table 44.475** and **Table 44.476** about the condition.

9.4.64 RESFDD — Reset Factor Register for Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]

This register indicates whether a Debugger Disconnection Reset occurred since it was cleared last time.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 8510$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

0	RESFDD	Debugger Disconnection Reset Flag This flag is cleared to 0 by Power On Reset. 0: No reset occurred 1: Reset has occurred

9.5 Operation

9.5.1 Reset Categories

(1) Power On Reset

The Power On Reset represents a Start-Up of the device during power up. This reset occurs when SYSVCC supply voltage is under a definite level and is released when SYSVCC supply voltage is over the definite level. In this case entire microcontroller is initialized.

VLVI, LS IntOSC, Mode latch are excluded from reset. Power On Reset sources are as follows.

- POC Reset: Power On Clear Reset
- Debugger Reset: Reset generated by a debugger command

(2) System Reset 1

System Reset 1 is identical to the Power On Reset with the following exceptions. The Reset Factor Register of the Reset Controller and the Error Source Status Register of the Error Control Module and a part of Voltage Monitor registers are excluded from this reset. The Operating mode controller is initialized only in case External Reset is a reset source of System Reset 1. System Reset 1 sources are as follows.

- External Reset
- Primary Voltage Monitor (VMON) Reset (VCC)
- Primary Voltage Monitor (VMON) Reset (Other: AWOVDD, ISOVDD, E0VCC)
- Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]

(3) System Reset 2

System Reset 2 is identical to the System Reset 1 with the following exceptions. A part of the Clock Controller registers is preserved. System Reset 2 sources are as follows.

- Software Reset by writing the associated register
- Error Control Module (ECM) Reset (The Reset Category is configured by the Reset Configuration Register)
- Watchdog Timer Reset (WDTBA) for Always-On area (AWO area)

(4) Application Reset

Application Reset is used for fast re-initialization of the application. This reset is basically identical to the System Reset 2 with the following exceptions.
The configuration data stored in the FLASH is not reloaded. Also, HW BIST is not executed too. Therefore, fast re-initialization is realized. Application Reset sources are as follows.

- Software Application Reset by writing the associated register
- Error Control Module (ECM) Reset (The Reset Category is configured by the Reset Configuration Register)

Application Reset is valid only in RUN mode.
ECM Reset is issued as System Reset 2 in Chip standby mode.

(5) DeepSTOP Reset

At the transition to DeepSTOP mode, initializes all the Isolated area (ISO area).

(6) Module Reset

Module Reset is used for re-initialization of dedicated device function like certain peripherals.

Table 9.71 Modules that participate in Module Reset (1/3)

Module Reset Assertion register	Bit	Module
SWMRESA_RSCFD	SWMRESA_RSCFD_1	RSCFD1, E7RC11, E7RC12, E7RC13
	SWMRESA_RSCFD_0	RSCFD0, E7RC01, E7RC02, E7RC03

	SWMRESA_OSTM_1	OSTM1
	SWMRESA_OSTM_0	OSTM0

Note 1. Register RSENTTSSEL is not initialized by Module Reset.
Note 2. Register MSPITGCTLn, MSPITGDMAALT and MSPITGDTSALT are not initialized by Module Reset.
Note 3. Register PSI5TSSEL is not initialized by Module Reset.

(7) JTAG Reset

Debug Reset is used for re-initialization of debug module. For details, refer to **Section 50, Debugging and Calibration**.

9.5.2 Reset Sources

(1) POC Reset

The Power On Reset identifies a Start-Up of the device during power up. The power up condition is detected by a Power On Clear circuit (POC). It permanently compares the power supply voltage SYSVCC with an internal reference voltage (Vpoc). If SYSVCC lowers below the internal reference voltage (SYSVCC < Vpoc), Power On Reset is generated. For details, refer to **Section 55, Electrical Characteristics**.

(2) Debugger Reset

MCU transits to the internal reset state when the MCU is connected with the debug tool and receives the reset command from the debugger. It can trigger a Power On Reset. For details, refer to **Section 50, Debugging and Calibration** and the user's manual of the debugger.

(3) External Reset

A dedicated Reset Input pin ($\overline{\text{RESET}}$) is available for initialization. The associated buffer has input hysteresis. The External Reset is active low.

In case of an open reset input, the device will be initialized via the internal pull-down of the Reset Input Buffer. This ensures that the device is always in a safe state.

In case Power-up and Power-down, $\overline{\text{RESET}}$ should be low. In case Power-up, $\overline{\text{RESET}}$ must be asserted until all power supply exceeds the threshold.

Until VCC, SYSVCC, AWOVDD, ISOVDD and E0VCC exceed the threshold, Internal reset is generated.

After Internal reset and $\overline{\text{RESET}}$ are released, HW BIST and RAM initialization are executed.

For details on the required $\overline{\text{RESET}}$ low period and the threshold of all power supply refer to **Section 55, Electrical Characteristics**.

In case of External Reset excluding power-up/down, the low pulse width of the $\overline{\text{RESET}}$ input must be greater than the value of noise-filter characteristic to activate the reset. For details on the required $\overline{\text{RESET}}$ low pulse width (tWRSL), refer to **Section 55, Electrical Characteristics**.

(4) Primary VMON Reset

The VMON Reset can be asserted when each supply voltage is outside the operating range. The VMON Reset operation is independent from External Reset.
Following power domains can be detected.

- AWOVDD
- ISOVDD
- VCC
- E0VCC.

For details, refer to **Section 11, Power Supply Voltage Monitor**.

(5) Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]

A System Reset 1 will be trigged in case the debugger is disconnected from a device. The disconnection is detected by a falling edge of $\overline{\text{TRST}}$ during Security is Unlock.

The detection can be disable by FLASH Option Byte located to Security Setting Area. Refer to **Section 47.8, Security Setting Area**.

(6) Software Reset

The device supports multiple software resets that can trigger the reset of dedicated Reset Domains:

- Software System Reset Assertion Register (SWSRESA) triggers a System Reset 2.
- Software Application Reset Assertion Register (SWARESA) triggers an Application Reset.
- Software Module Reset Assertion Register n (SWMRESA_*) triggers reset of each peripheral domain.
- Software System Reset Assertion Register (SWSRESA_ICUM) for ICUMHA triggers a System Reset 2. For details, refer to the *RH850/U2A-EVA Group Security User's Manual: Hardware*.
- Software Application Reset Assertion Register (SWARESA_ICUM) for ICUMHA triggers an Application Reset. For details, refer to the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Each software reset can be triggered when software writes to the associated Reset Assertion Register.

Each Reset Assertion Register is protected against unintended access by configuring the Key Code protection register. For details, see **Section 9.4.58, RESKCPROT0 — Reset Controller Register Key Code Protection Register 0** .

Before writing to module reset assertion register, verify that the corresponding peripheral module is in the idle state and other Module Reset is not being executed. (After writing to module reset assertion register, this register can automatically release the module reset.)

The procedure of Module reset execution is shown in **Figure 9.1**. For the procedure of checking idle state, see the section of corresponding peripheral module.

CAUTION

During the Module Reset, do not access that module.

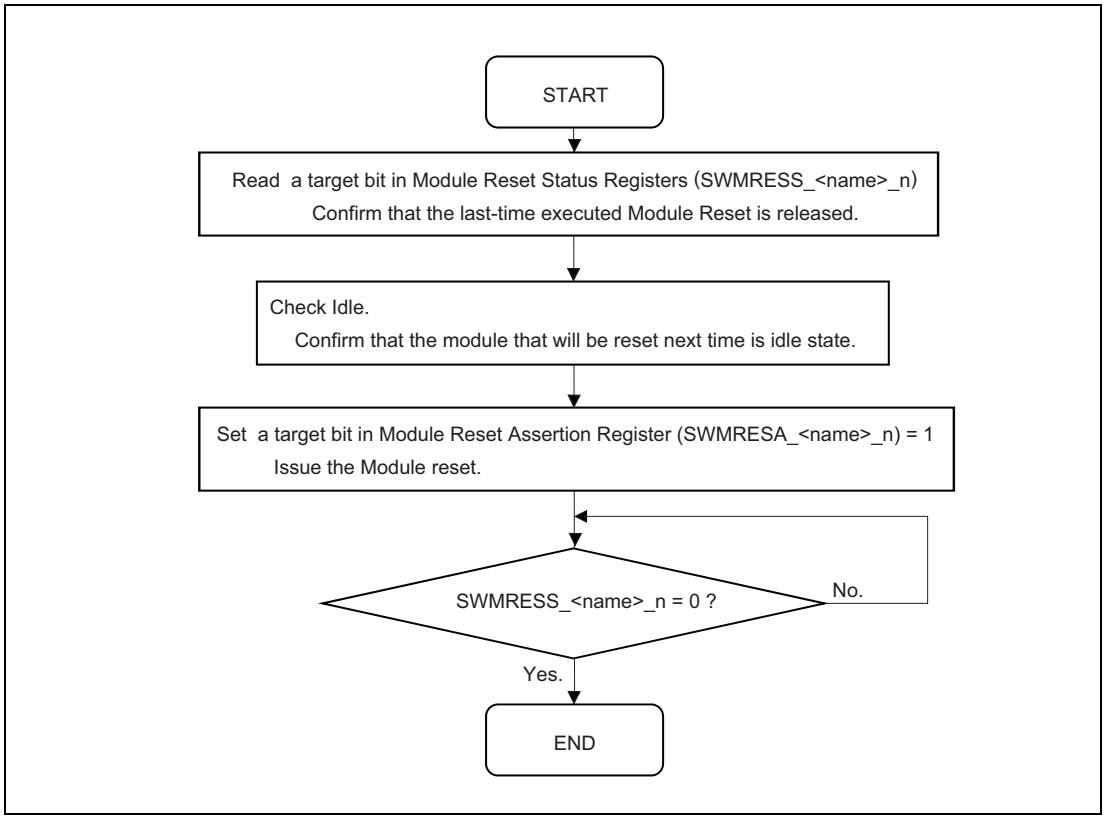

Figure 9.1 Flowchart of module Reset

(7) ECM Reset

All failures which are detectable by the Error Control Module (ECM) generate dedicated internal reset or interrupts (FENMI or EINT) instead. The failure signals and system behavior can be configured in the ECM (see **Section 45, Error Control Module (ECM)**). Optionally the device failures can be configured to be used as a Reset Source.

The ECM Reset can generate a System Reset 2 or an Application Reset. The behavior can be configured by the Reset Configuration Register.

(8) WDTBA Reset

The Window Watch Dog Timer (WDTBA) module can generate a WDTBA Reset.

(9) JTAG Reset (by $\overline{\text{TRST}}$)

A dedicated Reset Input pin ($\overline{\text{TRST}}$) is available for initialization of the debug function.

If $\overline{\text{TRST}}$ is open, the debug function will be always initialized via the internal pull-down of $\overline{\text{TRST}}$. For details on the filter characteristics, refer to **Section 55, Electrical Characteristics**. The Debug function is described in **Section 50, Debugging and Calibration**.

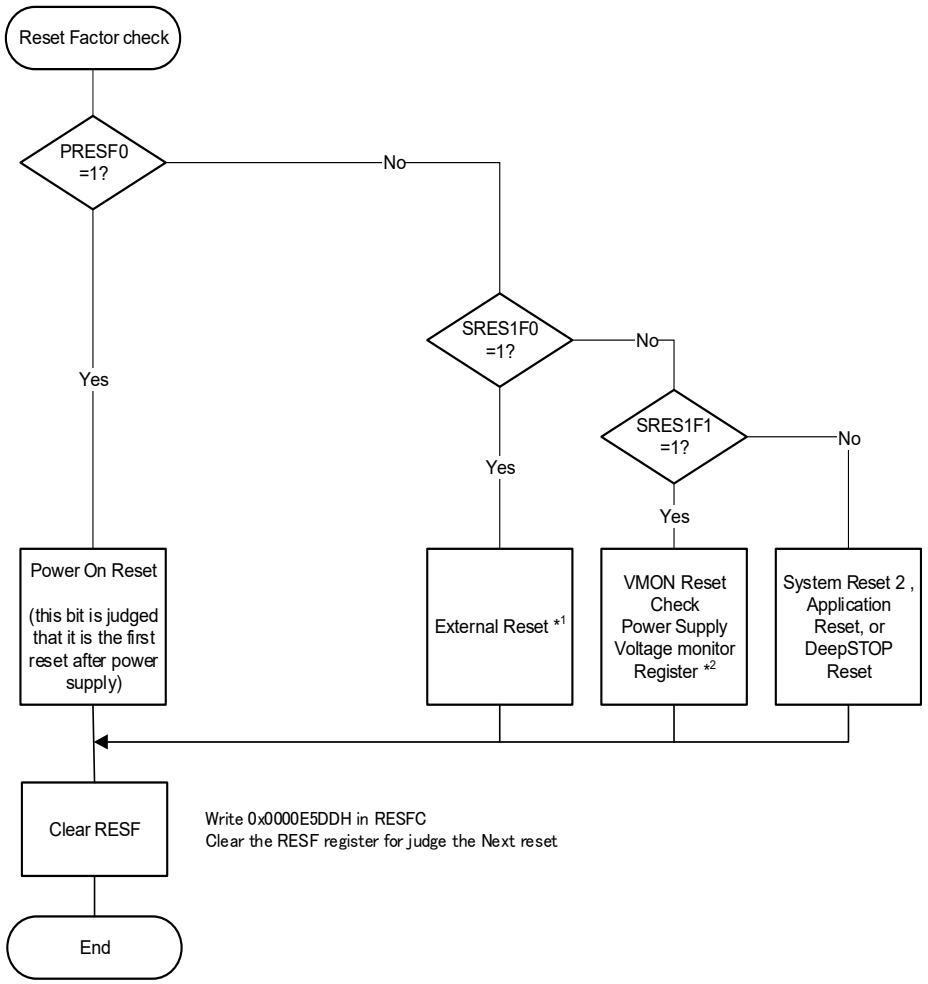
The Debug Reset is active low.

9.5.3 Reset Flags

Any reset root cause can be identified by SW in the Reset Factor Register (RESF) . Each reset source will be indicated by one bit when it occurs. The status can be read out after the reset has been executed.

For details, refer to the **Section 9.4.63, RESF — Reset Factor Register**.

The method for determining the reset factors is shown in **Figure 9.2**.



Note 1. SRES1F0 is a high priority flag. Do not use ARESF2 - 0 and SRES2F3 - 0 for judgment when SRES1F0 = 1 at the time of reset factor judgment.

Note 2. See **Section 11, Power Supply Voltage Monitor**.

Figure 9.2 Flowchart of Reset Factor Result

9.5.4 Read Configuration Data from FLASH

Reading configuration data from FLASH memory is executed by Power On Reset, System Reset 1, System Reset 2 and DeepSTOP Reset. If an ECC error is detected during FACI reset transfer, the ECC error is notified to ECM. The microcontroller will be kept in reset state and will not start up if the FACI reset transfer error is detected in Normal Operation Mode or User Boot Mode. For details, see **Section 51.17.1, FACI reset transfer**.

9.5.5 HW BIST

HW BIST is executed by Power On Reset, System Reset 1/2 and DeepSTOP Reset. In System Reset 2 and DeepSTOP Reset, HW BIST execution can be disabled depending on Field BIST0/1/2 (FBIST0/1/2) control register (BSEQ0CTL/BSEQ1CTL/ BSEQ2CTL). For details, see **Section 44.6, BIST**.

The HW BIST has three kinds of following.

- The Field BIST0 is executed before transition to RUN mode after Power On Reset and System Reset 1/2.
- The Field BIST1 is executed before returning to RUN mode from DeepSTOP mode.
- The Field BIST2 is executed before returning to Cyclic RUN mode from DeepSTOP mode.

For details, Refer to **Figure 15.1, Transition to Chip Standby Mode** in **Section 15, Standby Controller (STBC)**.

9.5.6 RAM Initialization

RAM can be initialized (to all0) after each reset occurs, depending on a Flash Option Byte or RAM Initialization Mode Control Register corresponding to each RAM. For details of target RAMs, see **Section 52, RAM**.

In Power On Reset and System reset 1/2, and DeepSTOP Reset, RAM initialization is executed according to Flash Option Byte value. For Flash Option Byte, see **Section 51, Flash Memory**.

In Application Reset and Module Reset, RAM initialization execution can be controlled by STAC register.

9.5.7 Start Up of Cores

9.5.7.1 CPU's Startup Order

Figure 9.3 shows CPU's startup order. Each CPU start in the following.

ICUMHA starts first if ICUMHA is enabled. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

(1) CPU0*1 starts after reset (Power On Reset, System Reset 1/2, Application Reset, DeepSTOP Reset).

(2) CPU0 execute Clock gear up*2.

(3) CPU0 starts each CPU by BOOTCTRL. Insert wait time (100 µs) between each CPU startup.

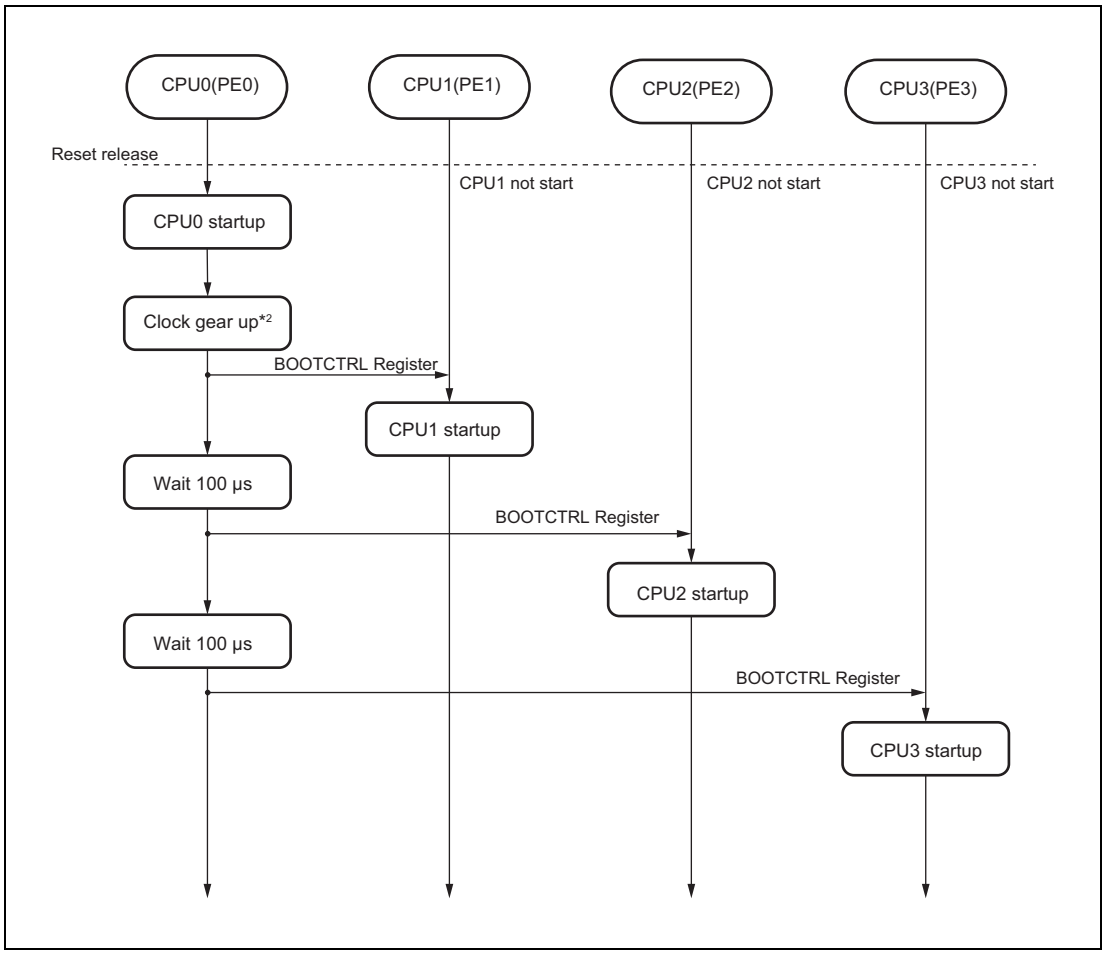


Figure 9.3 CPU's Startup Order in RUN Mode

Note 1. CPU0 activate setting is done by Flash Option Byte. For details, see the *RH850/U2A-EVA Group Security User's Manual: Hardware*.

Note 2. For details of gear up flow, see **Section 13.6.5, Sequence for Shifting the CPU System Clock Gear Up/ Down**.

9.5.8 Reset Mask function

In On-chip debug mode, reset factor can be masked. For details, see **Section 50, Debugging and Calibration**.
Masked reset sources are shown in **Table 9.72**.

Table 9.72 Masked reset sources

No.	Category	Source	Reset Masked
1	Power On Reset	POC Reset (POCRES)	—
		Debugger Reset (by debugger)	—
2	System Reset 1	External Reset	√
		Primary VMON Reset（VCC/ AWOVDD, ISOVDD, E0VCC）	—
		Debugger Disconnection Reset [For U2A16, U2A8 and U2A6 Only]	—
3	System Reset 2	Software System Reset (by SWSRESA, SWSRESA_ICUM)	√
		ECM Reset (if RESC0 = 0)	√
		WDTBA Reset	√
4	Application Reset	Software Application Reset (by SWARESA, SWARESA_ICUM)	√
		ECM Reset (if RESC0 = 1)	√
5	DeepSTOP Reset	DeepSTOP Reset (by DeepSTOP mode trigger)	—
6	Module Reset	Software Module Reset (by SWMRESA_<name>)	—
7	JTAG Reset	JTAG Reset ($\overline{\text{TRST}}$)	—

9.5.9 Reset Output ($\overline{\text{RESETOUT}}$)

When a reset source of Power On Reset, System Reset 1/2, and Application Reset is generated, a reset output signal ($\overline{\text{RESETOUT}}$) is output to the outside. Reset output is used to reset external devices at the same time as a reset is generated inside the microcontroller. For details, see **Section 2.4.4, RESETOUT Function**.

Section 10 Power Supply Circuit

This section describes the power supply and power domains of the RH850/U2A-EVA series.

10.1 Function

This section describes the external voltage connection and internal voltage distribution required to operate the microcontroller. The power supply circuit has a POC (Power On Clear) circuit for safe startup.

The internal circuits are separated into two independent power domains, the Always-On area (AWO) and the Isolated area (ISO).

The power supply of the Always-On area is always on in all operating modes and stand-by modes.

The power supply of the Isolated area can be turned off to reduce the overall power consumption depending on the type of stand-by mode.

For operation of the device, the following voltages are required:

- Power supply voltage SYSVCC for system logic and on-chip voltage regulators. The output voltage of the voltage regulators is supplied to the digital circuits in Always-On area power domain.
- Power supply voltage SVRDRVCC, SVRAVCC and SYSVCC for Switching Voltage Regulator (SVR).
- Power supply voltage ISOVDD for the digital circuits in ISO area power domain. The ISO area power domain is supplied by an external power supply.
- Power supply voltage EnVCC for the I/O ports.
- Power supply voltage AnVCC for the A/D converters and the separated I/O ports.
- Power supply voltage LVDVCC for the LVDS ports in Port Group 2.
- Power supply voltage E0VCC for the LVDS ports in Port Group 4.
- Power supply voltages EMUVCC and EMUVDD for the Aurora ports.
- Power supply voltage GETH0PVCC, GETH0BVCC and GETH0RVCC for SGMII.

10.2 Power Supply Pins

The table below lists all power supply pins and what they are used for.

10.2.1 External Pin List

Table 10.1 Power Supply Pins (1/2)

Power Supply	Power Supply Pins	Power Supply for
Power supply for internal circuits	SYSVCC	Power supply for System Logic, Internal voltage regulator and SVR power POC, VMON, VLVI Power supply terminal for PORTS
	VCC	Power supply for FLASH
	SVRAVCC (AD_VCC) SVRDRVCC (DRV_VCC)	Power supply for SVR
	VDD	Power supply terminal for ISOVDD
	VSS	Common Ground
	SVRAVSS (AD_VSS) SVRDRVSS (DRV_VSS)	Ground for SVR
	AWOVCL	External buffer capacitance of regulator
Power supply for I/O port	E0VCC	port group JP0_xx, Pxx_xx*2
	E1VCC	port group Pxx_xx*2
	E2VCC	port group Pxx_xx*2
	VSS	Common Ground
Power supply for A/D converters	A0VCC	Analog circuits of ADCJ, port group AP0_xx, AP1_xx
	A0VSS	
	A0VREFH	
	A1VCC	Analog circuits of ADCJ, port group AP2_xx, AP3_xx
	A1VSS	
	A1VREFH	
	A2VCC	Analog circuits of ADCJ, port group AP4_xx, AP5_xx
	A2VSS	
	A2VREFH	
Power supply for LVDS	LVDVCC	LVDS port in Port Group 2
	E0VCC	LVDS port in Port Group 4
	VSS	Common Ground
Power supply for SGMII	GETH0PVCC	Power supply for SGMII domain P3_8*2
	GETH0RVCC	
	GETH0BVCC	
	GETH0VCL (SGVCL)	
	VSS	Common Ground

Table 10.1 Power Supply Pins (2/2)

Power Supply	Power Supply Pins	Power Supply for
Power supply for EMU*1	EMUVCC	Debug circuits of EMU (Aurora)
	EMUVDD	
	VSS	
Power supply for Debug*1	DVCC	Debug circuits
	DVDD	
	VSS	Common Ground
Power supply for ERAM*1,*3	ERAMVCC	ERAM circuits of FLASH
	ERAMVDD	
	VSS	

Note 1. Only RH850/U2A-EVA support

Note 2. For the power supply of each pin, see the appendix "E02_01_List_of_Pin_Assignment.xlsx".

Note 3. RH850/U2A6 support ERAM and its power is supplied by VDD and VSS.

Note: See **Section 55, Electrical Characteristics** for the voltage range of each power supply.

10.3 Block Diagram of Power Domains

The figure below shows the overview of power supply circuit.

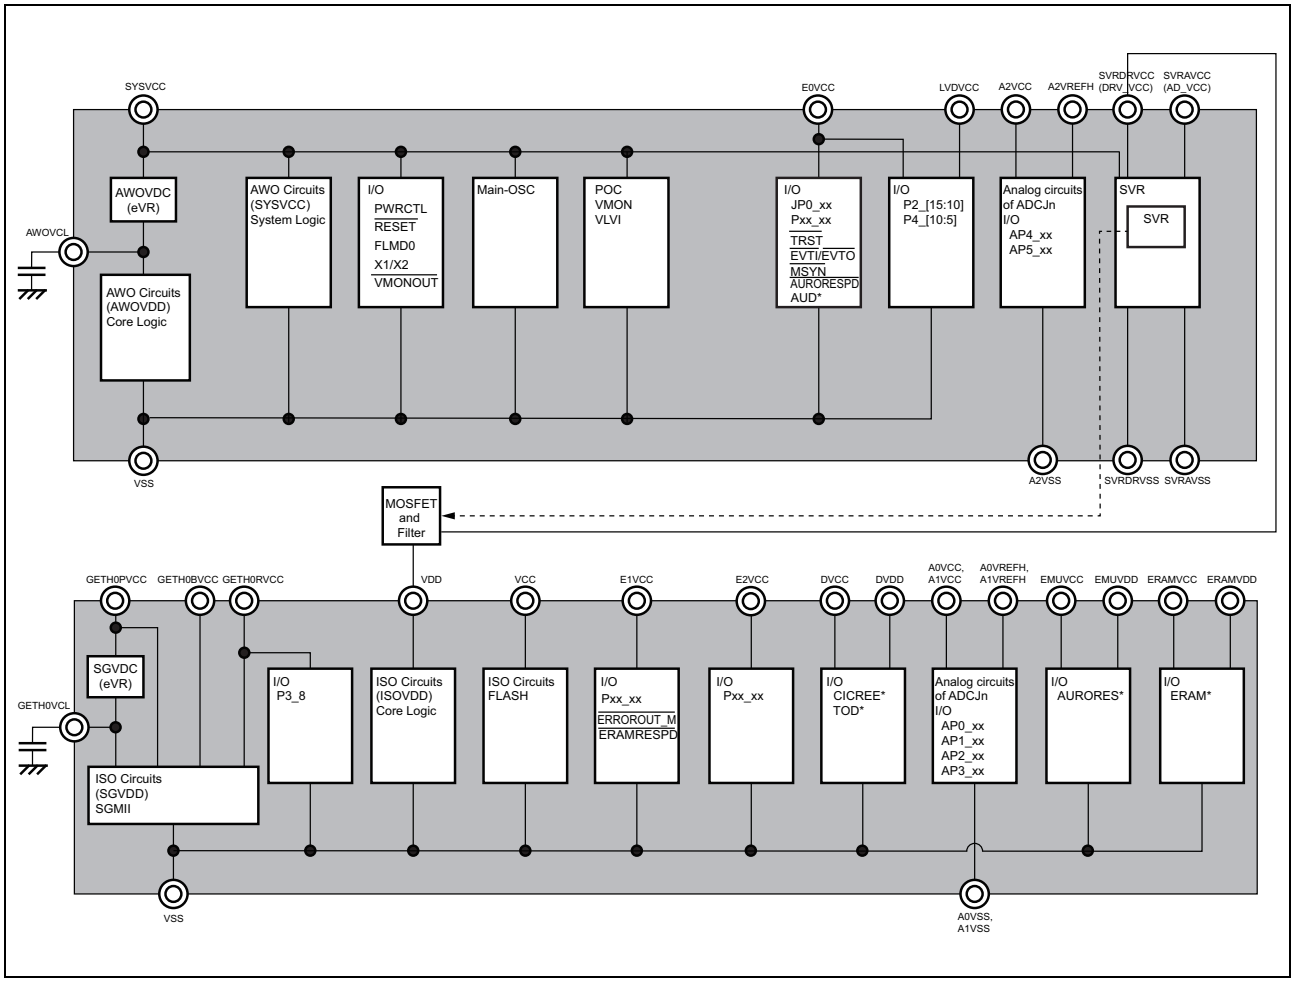

Figure 10.1 Overview of Power Supply Circuit (RH850/U2A-EVA BGA516)

10.4 Power Domains Arrangement

The table below lists the microcontroller functional modules for each power domain.

Table 10.2 Functional Modules and Power Domain

Power Domain	Functions
AWO area	• STBC, Reset controller • Retention RAM • CLMA0, CLMA1, CLMA2 • HV IntOSC, Main OSC, LS IntOSC, HS IntOSC • WDTBA, RTCA, TAUJ2, TAUJ3, ADCJ2 • SVR, LPS • POC, VMON, VLVI • AWO Port groups
ISO area	• CPU subsystem • Code Flash, Data Flash, Local RAM, Cluster RAM, Emulation RAM*1 • PLL, SGMII_PLL, HSIFPLL • CLMA3, CLMA4, CLMA5, CLMA6, CLMA7, CLMA8, CLMA9 • WDTB0, WDTB1, WDTB2, WDTB3 • RHSIF, TPBA, GTM • TAUD, TAUJ0, TAUJ1, OSTM, PWM-Diag, RS-CANFD, RLIN3, RIIC, LTSC • ADCJ0, ADCJ1, TAPA, TSG3, ENCA, SFMA, FLXA, ETNB, CXPI, RSENT, MMCA • SWDT, ICUM • PSI5, PSI5-S, SCI3 • MSPI, PIC, KCRC, OTS, ECM • ISO Port groups • DMON

Note 1. For U2A6 only

10.5 VDD Power Supply

10.5.1 Features

There are two ways to supply VDD power.

Power supply method without SVR. Refer to **Section 10.5.2, Without SVR**.

Power supply method using SVR. Refer to **Section 10.5.3, Using SVR**.

10.5.2 Without SVR

This section describes how to supply if you do not use SVR.

Connect the external power supply to VDD.

The supply voltage is supplied with the voltage specified by VDD.

Power is supplied from the VDD terminal to the ISO domain.

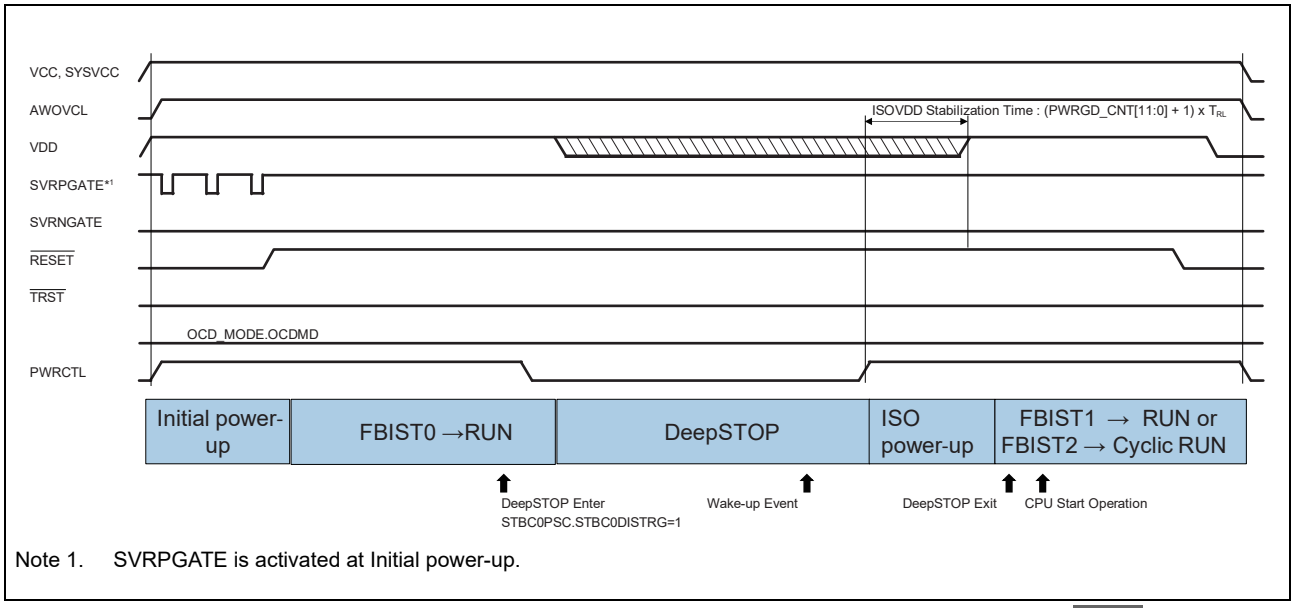
DeepSTOP mode allows the PWRCTL pin to control the VDD supply.

When the PWRCTL = L, external VDD supply to switch off.

When the PWRCTL = H, external VDD supply to switch on again.

DeepSTOP Reset will not be released until the VDD stabilizes when returning from DeepSTOP.

The waiting time for VDD stabilization can be set by PWRGD_CNT register.



Note 1. SVRPGATE is activated at Initial power-up.

Figure 10.11 External Power Supplies VDD when Non-Debug Mode ($\overline{TRST}$ = L, OCD_MODE.OCDMD = 0)

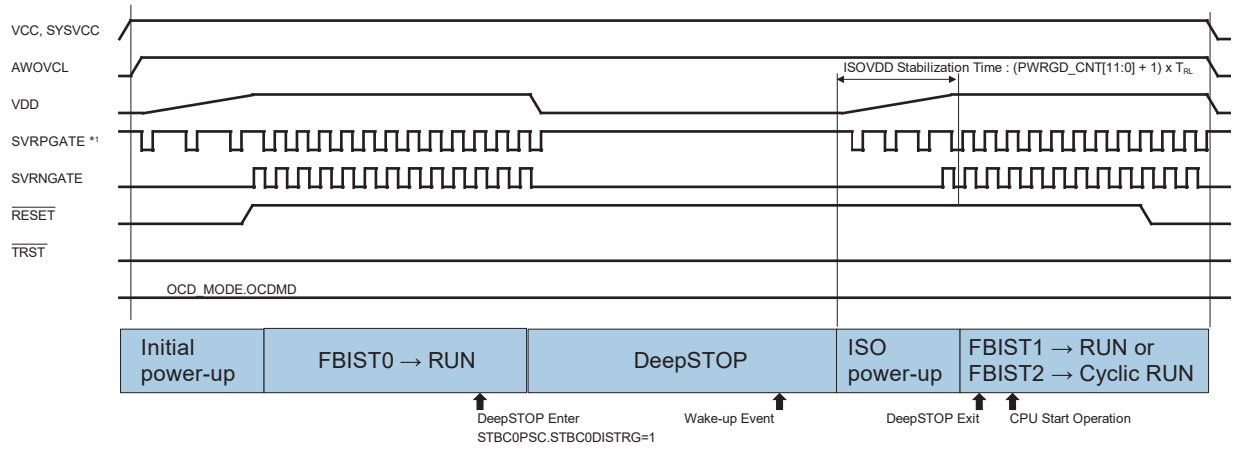
10.5.3 Using SVR

This section describes how to supply when using SVR.

SVR controls switching of external MOSFET.

Connect the output power from the external MOSFET to VDD.

Power is supplied from the VDD terminal to the ISO domain.



Note 1. SVRPGATE is activated at Initial power-up.

Figure 10.12 SVR Supplies VDD when Non-Debug Mode ($\overline{TRST}$ = L, OCD_MODE.OCDMD = 0)

For PWRGD_CNT refer to **Section 15.2.4.28, PWRGD_CNT — Power Good Counter Register**.

See the section below for more information

- **Section 11.2, Power On Clear**
- **Section 15.3.2, DeepSTOP Mode**
- **Section 9.5.1, Reset Categories**
- **Section 55, Electrical Characteristics**

10.6 SVR Controller

10.6.1 Features

SVR controller is Synchronous Rectification Step-Down Controller and can directly drive the MOSFET.

Connect output power of the MOSFET to the VDD, and power to the ISO area is supplied.

10.6.2 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA / DTS requests.

This module has no error notifications to ECM.

10.6.3 Input/Output Pins

This section describes the list of external pins for SVR converter.

Refer to the target specification of SVR for details of terminal characteristics.

10.6.3.1 External Supply pin

Table 10.3 External Supply pin

Port	I/O	Comment
SVRAVCC SYSVCC	—	3.3 V/5 V power supply for control blocks
SVRDRVCC	—	3.3 V/5 V power supply for gate driver
SVRAVSS SVRDRVSS	—	Ground for SVR

10.6.3.2 Gate driver pin

Table 10.4 Gate driver pin

Port	I/O	Comment
SVRPGATE	DO	Gate drive for the high-side PMOSFET
SVRNGATE	DO	Gate drive for the low-side NMOSFET

10.6.4 Setting Parameter

It is possible to set SVR parameters with the flash option byte.

Select combinations of Fsw, L, C, and MOSFET from data sheet and set them with the flash option byte.

A list of parameters is shown in the **Table 10.5**.

For details of flash option byte, see to **Section 51, Flash Memory**.

Table 10.5 SVR parameters list

	Control parameters of SVR	Comment
1	SVRENABLE	SVR enable setting
2	SVRAJDTP[2:0]	Adjusting dead time of High-side: OFF → Low-side: ON
3	SVRAJDTN[2:0]	Adjusting dead time of Low-side: OFF → High-side: ON
4	SVRAJPRDSR[3:0]	Adjusting slew rate (drive ability)
5	SVRADNSMP[7:0]	ADC sampling time setting
6	SVRADTHRESH[7:0]	ADC sampling start state setting
7	SVRADTHRESHE[7:0]	ADC conversion completion state setting
8	SVRFSWMODE[1:0]	Switching frequency setting
9	SVRKPVSCL[13:0]	Scaled KP value of VPID
10	SVRKIVSCL[13:0]	Scaled KI value of VPID
11	SVRKDVSCL[13:0]	Scaled KD value of VPID
12	SVRMAXDUTY[7:0]	Maximum on-duty setting
13	SVRMINSKIPDUTY[1:0]	Skip minimum pulse setting

10.6.5 Basic Function

This section describes the basic functions.

SVR is PMOS external digital control switching regulator. The functions and characteristics of SVR are as follows.

(1) SVR Enable setting

When SVR is used, set SVRENABLE of Option Byte to “1”. When SVR is not used, set SVRENABLE to “0”.

(2) Select the switching frequency

(3) Adjust pre-driver characteristics (slew rate, dead time can be adjusted)

It is possible to set SVR parameters with the flash option byte.

Select combinations of Fsw, L, C, PMOS and set them with the flash option byte.

(4) Starting mode with Soft Start and Power Supply mode with analog PFM and digital PWM

(a) Soft Start

This is the mode to raise the ISOVDD to the operation guaranteed voltage.

(b) PFM mode

This mode supplies constant ISOVDD regardless of SVR parameter.

(c) PWM mode

This is the mode in which ISOVDD is stably supplied using the parameters given to SVR.

10.7 Connection Example

10.7.1 Example of Power Supply Connection for RH850/U2A-EVA

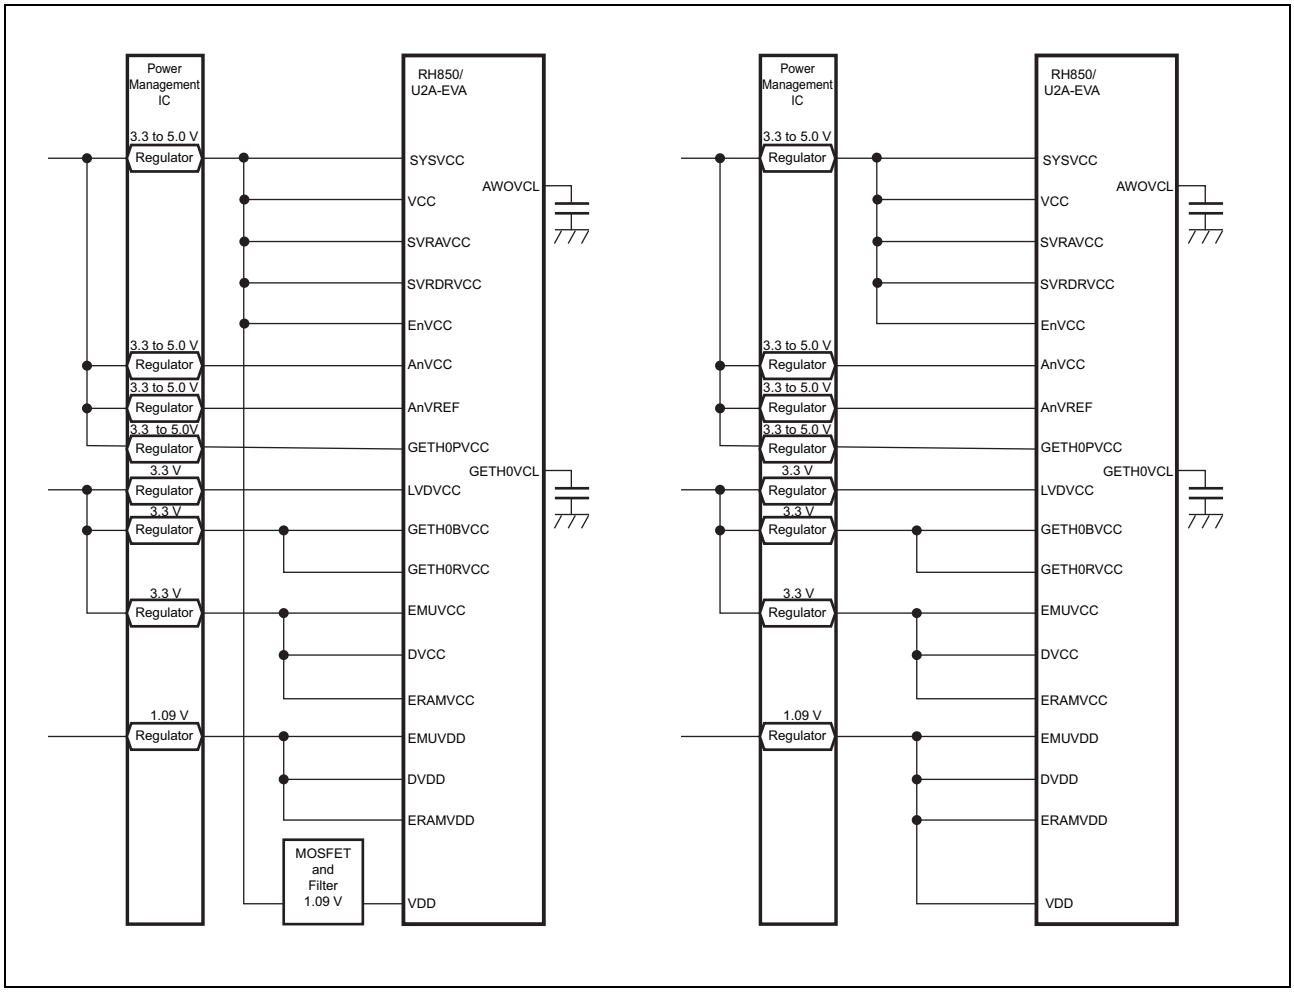


Figure 10.13 Example of Power Supply Connection for RH850/U2A-EVA

10.8 Power Up/Down Timing

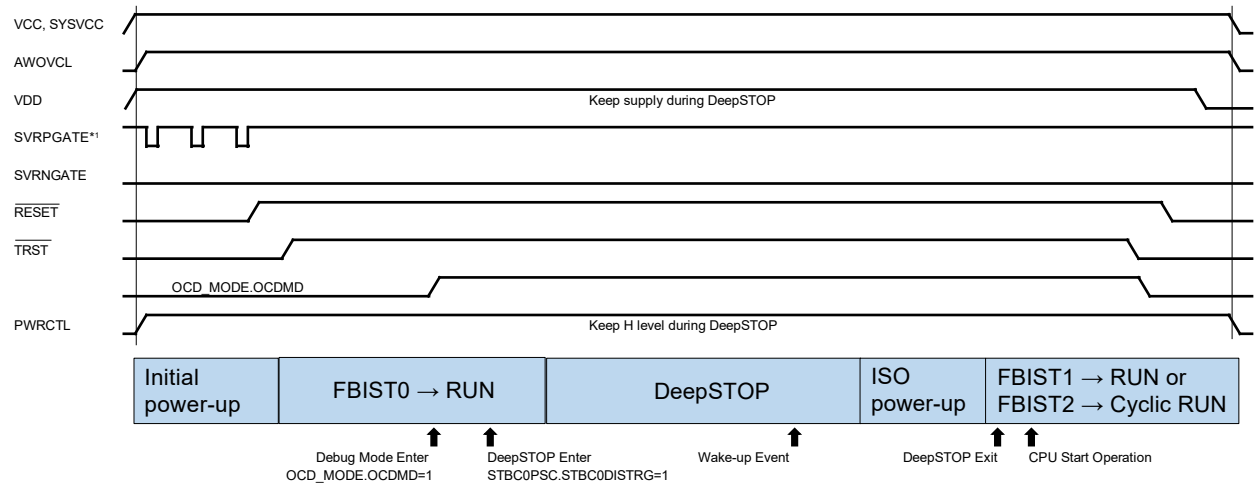
See details in **Section 55, Electrical Characteristics**.

10.9 Power Control in Debug Mode

In Debug mode, the power off control becomes invalid. Each power supply continues to be supplied even during DeepSTOP.

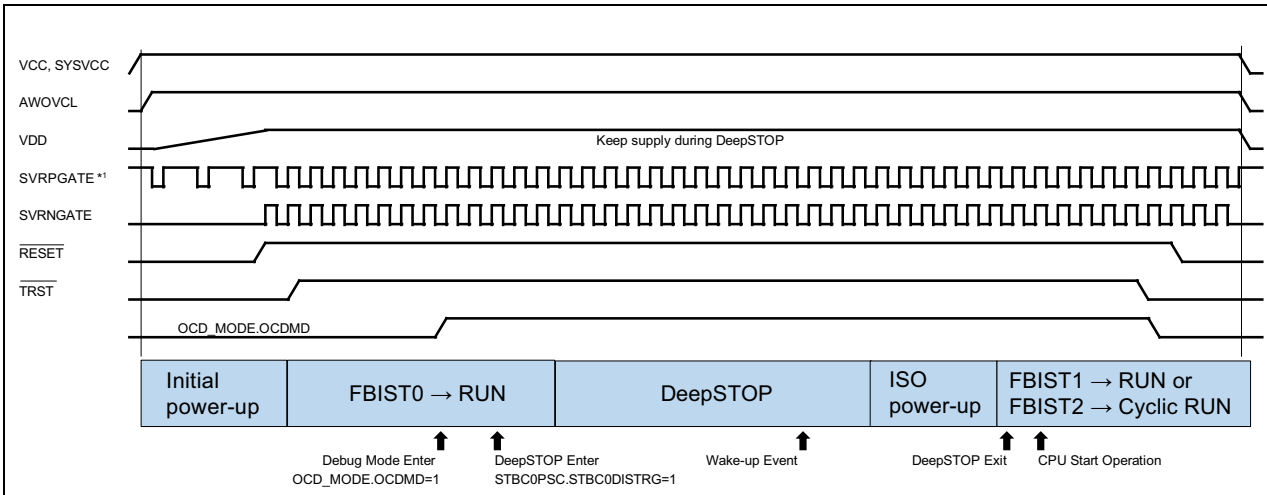
In the case of without SVR, PWRCTL signal keep to high level. For details, see **Figure 10.14, External Power Supplies VDD when Debug Mode (TRST = H, OCD_MODE.OCDMD = 1)**.

In the case of using SVR, SVR keeps operation and power supply from MOSFET continues. For details, see **Figure 10.15, SVR Supplies VDD when Debug Mode (TRST = H, OCD_MODE.OCDMD = 1)**.



Note 1. SVRPGATE is activated at Initial power-up.

Figure 10.14 External Power Supplies VDD when Debug Mode ($\overline{TRST}$ = H, OCD_MODE.OCDMD = 1)



Note 1. SVRPGATE is activated at Initial power-up.

Figure 10.15 SVR Supplies VDD when Debug Mode ($\overline{TRST}$ = H, OCD_MODE.OCDMD = 1)

10.10 SVR restriction

For products in **Table 10.6, Affected products**, as usage of SVR is restricted*1, using with external power supply is recommended.

For products in **Table 10.7, Not affected products**, either SVR (without restriction of below Note 1) or external power supply to VDD can be selected.

Note 1. In case of using SVR, when POCRES is issued, SYSVCC and SVRDRVCC should be raised up after VDD level is lower than 0.64 V.

Section 11 Power Supply Voltage Monitor

11.1 Overall Configuration

- The power supply voltage monitor continuously monitors multiple external and internal supply voltages in order to ensure that the device operates with a supply voltage within the specified range.
- If the power supply voltage drops below or rise above the reference voltage or comparison voltage, an internal reset signal is generated.
- The following lists the power supply voltage monitor functions.

Table 11.1 Power Supply Voltage Monitor Functions

Function Name	Monitor Voltage	Signal Generated when voltage drops or voltage rise
Power-On Clear (POC)	SYSVCC	Internal reset signal (POCRES)
Primary detection of Voltage Monitor (VMON)	AWOVDD ISOVDD VCC E0VCC	Internal reset signal (VMON Reset), Monitor signal ($\overline{\text{VMONOUT}}$)
Delay Monitor (DMON)	ISOVDD	
Secondary detection of Voltage Monitor (SAR-ADC)	AWOVDD ISOVDD VCC E0VCC	Connect INTC2
RAM Retention Voltage Indicator (VLVI)	SYSVCC	—

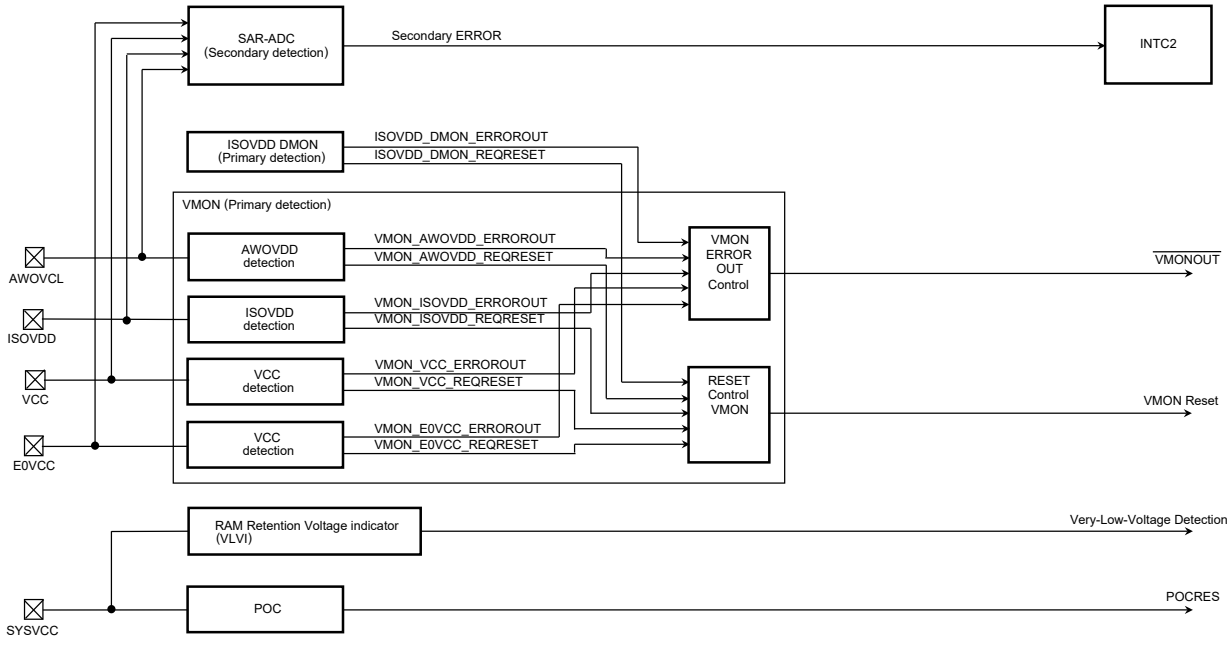
The block diagram of the power supply monitor is shown in **Figure 11.1**.

This MCU consist of POC, power supply voltage monitor (VMON, DMON and SAR-ADC) and VLVI.

Primary power supply voltage monitor can control on or off for the VMON Reset generated by high level/low level detection of ISOVDD, VCC, and E0VCC.

The detection of AWOVDD always generate a VMON Reset.

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage SYSVCC with the RAM retention voltage VVLVI.



Note: The device is kept in reset state under the control of $\overline{\text{RESET}}$, POC, or the configured voltage monitor VMON until reset status release. See **Section 55.2.13** and **Section 55.2.14** for the specification of the reset voltage levels.

Figure 11.1 Block Diagram of Power Supply Voltage Monitor (Overall)

11.2 Power On Clear

11.2.1 Features

The POC continuously monitors the external power supply voltage SYSVCC. This ensures that the microcontroller only operates at or above power-on-clear detection voltage (V_{POC}).

If SYSVCC falls below the POC detection voltage (SYSVCC < V_{POC}), Power On Reset is generated.

For details, see **Section 9.5.2, Reset Sources**.

11.2.2 Operation

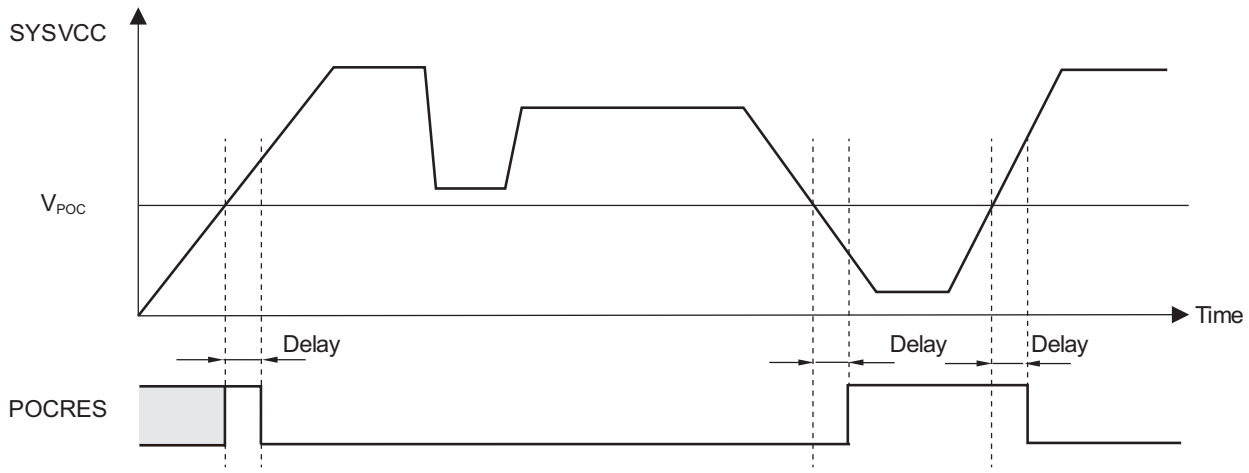
The power-on-clear circuit (POC) constantly compares the power supply voltage SYSVCC with the internal reference voltage V_{POC}. It ensures that the microcontroller only operates as long as the power supply exceeds a certain level.

If SYSVCC falls below the internal reference voltage (SYSVCC < V_{POC}), Power On Reset is generated and Power On Reset flag (PRESF0) is set.

For details, on the specification of the internal voltage reference level Power On Reset, see **Section 9.5.2, Reset Sources**.

The power-on-clear function holds the microcontroller in reset state as long as the power supply voltage does not exceed the threshold level V_{POC}.

The following figure illustrates the timing of a POCRES.



Note: Delay:
When the SYSVCC exceeds the V_{POC}, the POCRES is released after certain delay. When the SYSVCC falls below the V_{POC}, the Power On Reset flag POCRES is asserted after certain delay.
See **Section 55, Electrical Characteristics** for the delay time.

Figure 11.2 POC Reset Timing

11.3 Primary Detection of Voltage Monitor (VMON)

11.3.1 Features

- Violation occurrence of the operating voltage ranges is informed users of by:
  - Signal output pin ($\overline{\text{VMONOUT}}$).
  - Power supply voltage high and low-voltage flags.
  - VMON Reset.
- Diagnostic function:
  - VMON function is testable.
  - High and low-voltage error can be generated without influencing voltage itself.
  - VMON error test is done by changing reference voltage.
  - For diagnosis, the signal path to the $\overline{\text{VMONOUT}}$ pin can optionally be masked.

The primary detection of voltage monitor high-side (HDET) and low-side (LDET) voltage detectors, which detect if the monitored voltage is higher or lower than the specified voltage. See **Figure 11.3** and **Figure 11.4** for the detection level.

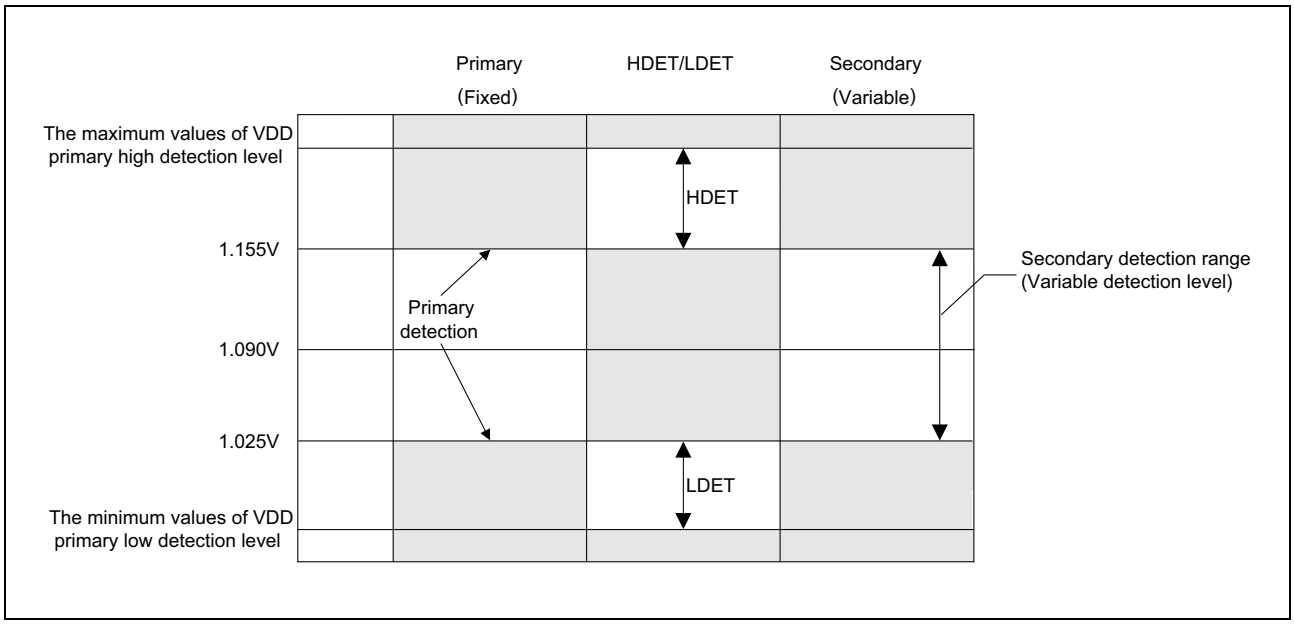


Figure 11.3 VMON Detection Level (ISOVDD/AWOVDD)

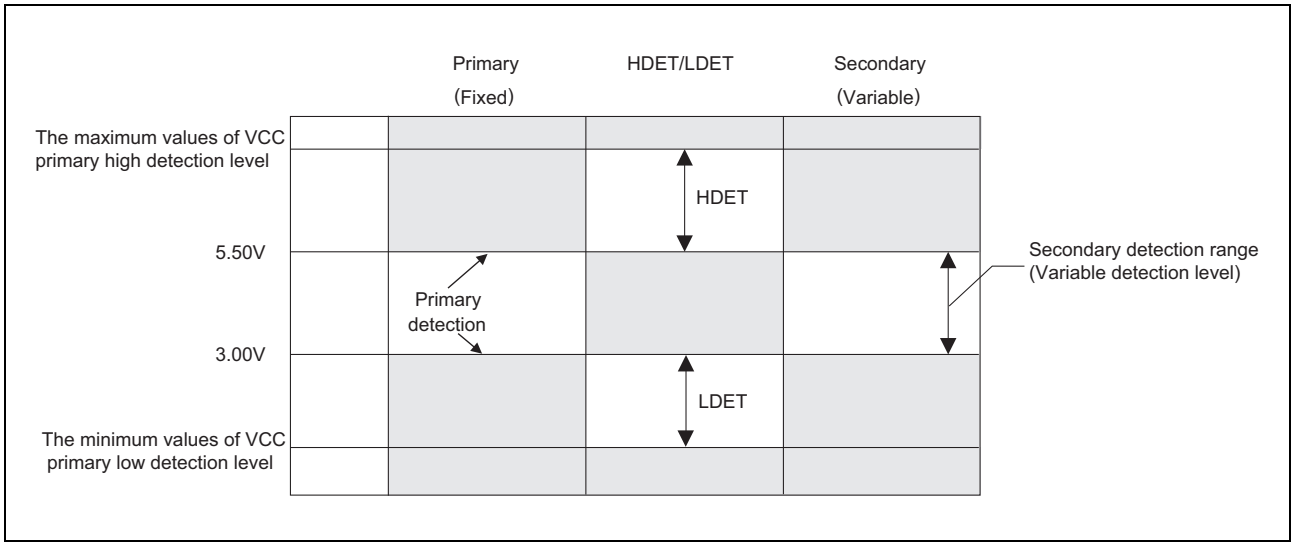

Figure 11.4 VMON Detection Level (E0VCC/VCC)

CAUTION

If system enters DeepSTOP mode, VMON function detection of ISOVDD part is masked.

See Section 11.3.6.12 of Table 11.16.

When not using VMON in DeepSTOP mode, VMON function of AWOVDD, VCC and E0VCC part are also masked and VMONOUT is kept to high.

11.3.2 Clock Supply

The clock supply to the VMON is shown in **Table 11.2**.

Table 11.2 Clock Supply

Module Name	Module Clock Name	Clock Name
VMON	Digital noise filter clock	CLK_HVIOSC
	Register access clock	CLK_LSB

11.3.3 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA / DTS requests.

This module has no error notifications to ECM.

11.3.4 External Input/Outputs

I/O pins related to reset are shown in **Table 11.3.**

Table 11.3 I/O pins

Module Name	Specification	Description
VMON	$\overline{\text{VMONOUT}}$	VMON error detection output

11.3.5 Overview

11.3.5.1 Block Diagram

Figure 11.5, **Figure 11.6**, **Figure 11.7** and **Figure 11.8** show the block diagram of the power supply voltage monitor.

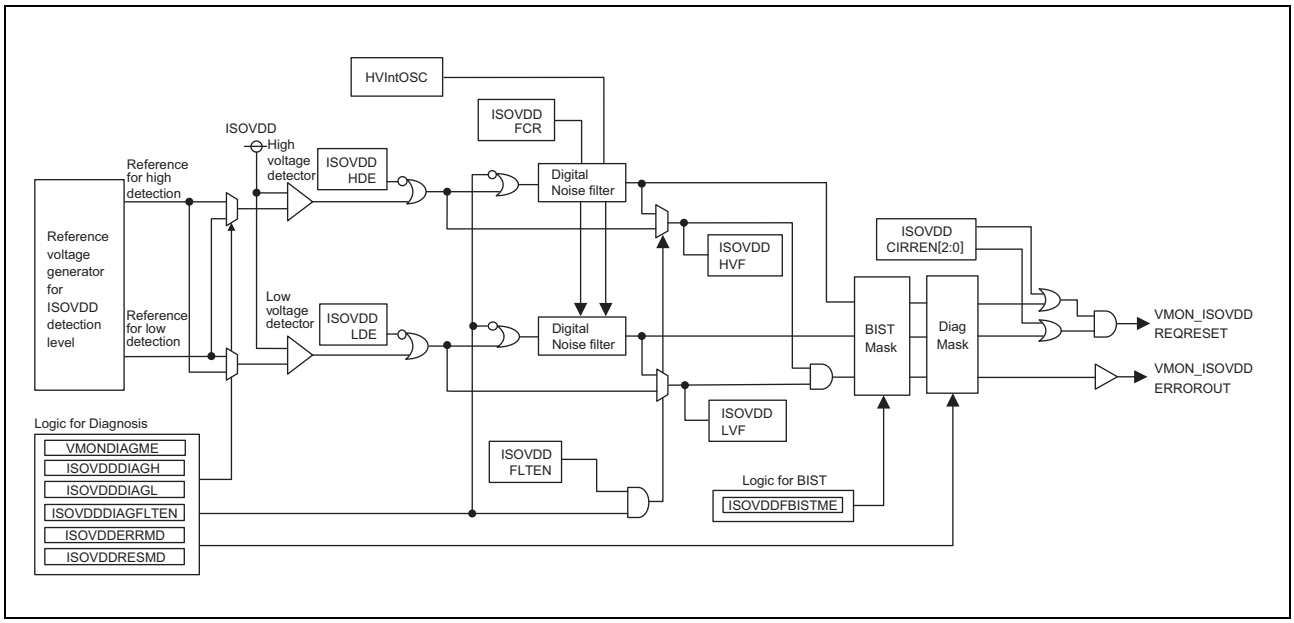

Figure 11.5 Block Diagram of the Power Supply Voltage Monitor (ISOVDD)

Note 1. VMON Reset is excluded.

Note 2. If VMON Reset which excepts AWOVDD detection during DeepSTOP transition, VMONDIAGME and VMONDIAGMEW may not be initialized even if DeepSTOP Reset occurs.
If System Reset 2 occurs during DeepSTOP transition, VMONDIAGME, VMONDIAGMEW, VMONDMASK, VMONDIAG, and VMONDIAGFE may not be initialized even if DeepSTOP Reset occurs.

Note 3. External Reset only.

Note 4. POC Reset only.

Note 5. Only External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection.

11.3.6.2 VMONF — VMON Factor Register

VMONF register indicates that an error is detected by VMON. Each flag of VMONF can be cleared individually by writing '1' to the corresponding bit in VMONFC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	E0VCCHVF	E0VCCLVF	VCCHVF	VCCLVF	ISOVDDHVF	ISOVDDLVF	AWOVDDHVF	AWOVDDLVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 11.6 VMONF Register Contents

Bit Position	Bit Name	Function
7	E0VCCHVF	E0VCC high voltage detection flag 0: No high E0VCC voltage violation detected 1: High E0VCC voltage violation occurred
6	E0VCCLVF	E0VCC low voltage detection flag 0: No low E0VCC voltage violation detected 1: Low E0VCC voltage violation occurred
5	VCCHVF	VCC high voltage detection flag 0: No high VCC voltage violation detected 1: High VCC voltage violation occurred
4	VCCLVF	VCC low voltage detection flag 0: No low VCC voltage violation detected 1: Low VCC voltage violation occurred
3	ISOVDDHVF	ISOVDD high voltage detection flag 0: No high ISOVDD voltage violation detected 1: High ISOVDD voltage violation occurred
2	ISOVDDLVF	ISOVDD low voltage detection flag 0: No low ISOVDD voltage violation detected 1: Low ISOVDD voltage violation occurred
1	AWOVDDHVF	AWOVDD high voltage detection flag 0: No high AWOVDD voltage violation detected 1: High AWOVDD voltage violation occurred
0	AWOVDDLVF	AWOVDD low voltage detection flag 0: No low AWOVDD voltage violation detected 1: Low AWOVDD voltage violation occurred

11.3.6.3 VMONFC — VMONF Clear Register

VMONFC is a register to clear the VMONF register. The read value of this register is always 00_H.

Access: This register is a write-only register that can be written in 8-bit units.

Address: FF98 3004_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	E0VCCHVFC	E0VCCLVFC	VCCHVFC	VCCLVFC	ISOVDDHVFC	ISOVDDLVFC	AWOVDDHVFC	AWOVDDLVFC

Table 11.7 VMONFC Register Contents

Bit Position	Bit Name	Function
7	E0VCCHVFC	Clear E0VCC high voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear E0VCCHVF
6	E0VCCLVFC	Clear E0VCC low voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear E0VCCLVF
5	VCCHVFC	Clear VCC high voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear VCCHVF
4	VCCLVFC	Clear VCC low voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear VCCLVF
3	ISOVDDHVFC	Clear ISOVDD high voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear ISOVDDHVF
2	ISOVDDLVFC	Clear ISOVDD low voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear ISOVDDLVF
1	AWOVDDHVFC	Clear AWOVDD high voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear AWOVDDHVF
0	AWOVDDLVFC	Clear AWOVDD low voltage detection flag 0: Writing 0 has no effect 1: Writing 1 will clear AWOVDDLVF

11.3.6.4 VMONDIAGME — VMON DIAG Monitor Enable Register

VMONDIAGME is a read only register to control VMON DIAG function.

This register reflects the settings written to the VMONDIAGMEW.

If VMON Reset which excepts AWOVDD detection or System Reset 2 occur during DeepSTOP transition, this register may not be initialized even if DeepSTOP Reset occurs.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3008$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VMONDIAGME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 11.8 VMONDIAGME Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	VMONDIAGME	Permit DIAG function 0: DIAG function of the Voltage Monitor can be enabled. 1: DIAG function of the Voltage Monitor cannot be enabled.

11.3.6.5 VMONDIAGMEW — VMONDIAGME Write Register

VMONDIAGMEW is a register to set values of VMONDIAGME. Writing is permitted only once after Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset were released. Subsequent write operation is ignored. The read value of this register is always 00_H.

If VMON Reset which excepts AWOVDD detection or System Reset 2 occur during DeepSTOP transition, this register may not be initialized even if DeepSTOP Reset occurs.

Access: This register is a write-only register that can be written in 8-bit units.

Address: FF98 $300C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VMONDIAGMEW
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 11.9 VMONDIAGMEW Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	VMONDIAGMEW	The data written in this bit is set to VMONDIAGME.

11.3.6.6 VMONDMASK — VMON Detection Output Diagnosis Mask Register

VMONDMASK is a register to mask $\overline{\text{VMONOUT}}$ and VMON Reset when VMONDIAGME = 0.

VMONDMASK setting is ignored if VMONDIAGME.VMONDIAGME = 1.

Writing to VMONDMASK is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

If System Reset 2 occur during DeepSTOP transition, this register may not be initialized even if DeepSTOP Reset occurs.

Access: This register can be read or written in 8-bit units

Address: FF98 3010_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	E0VCCRESMD	VCCRESMD	ISOVDDRESMD	AWOVDDRESMD	E0VCCERRMD	VCCERRMD	ISOVDDERRMD	AWOVDDERRMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.10 VMONDMASK Register Contents

Bit Position	Bit Name	Function
7	E0VCCRESMD	This bit masks VMON_E0VCC_REQ_RESET when VMONDIAGME.VMONDIAGME = 0. 0: VMON_E0VCC_REQ_RESET is not masked. 1: VMON_E0VCC_REQ_RESET is masked.
6	VCCRESMD	This bit masks VMON_VCC_REQ_RESET when VMONDIAGME.VMONDIAGME = 0. 0: VMON_VCC_REQ_RESET is not masked. 1: VMON_VCC_REQ_RESET is masked.
5	ISOVDDRESMD	This bit masks VMON_ISOVDD_REQ_RESET when VMONDIAGME.VMONDIAGME = 0. 0: VMON_ISOVDD_REQ_RESET is not masked. 1: VMON_ISOVDD_REQ_RESET is masked.
4	AWOVDDRESMD*1	This bit masks VMON_AWOVDD_REQ_RESET when VMONDIAGME.VMONDIAGME = 0. 0: VMON_AWOVDD_REQ_RESET is not masked. 1: VMON_AWOVDD_REQ_RESET is masked.
3	E0VCCERRMD	This bit masks VMON_E0VCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: VMON_E0VCC_ERROROUT is not masked. 1: VMON_E0VCC_ERROROUT is masked.
2	VCCERRMD	This bit masks VMON_VCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: VMON_VCC_ERROROUT is not masked. 1: VMON_VCC_ERROROUT is masked.
1	ISOVDDERRMD	This bit masks VMON_ISOVDD_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: VMON_ISOVDD_ERROROUT is not masked. 1: VMON_ISOVDD_ERROROUT is masked.
0	AWOVDDERRMD	This bit masks VMON_AWOVDD_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: VMON_AWOVDD_ERROROUT is not masked. 1: VMON_AWOVDD_ERROROUT is masked.

Note 1. Set AWO Reset to 1 during diagnosis.

CAUTION

In the case of Debugger Reset, External Reset, Debugger Disconnection Reset, or DeepSTOP Reset is inserted during VMON diagnosis, VMON Reset might occur or VMONOUT might become to L even if each bit (*RESMD and *ERRMD) of VMONDMASK register is set to 1.

11.3.6.7 VMONDIAG — VMONDIAG Mode Setting Register

VMONDIAG forces VMON comparators to output error. This register is valid only when VMONDIAGME = 0.

VMONDIAG's setting is ignored if VMONDIAGME.VMONDIAGME = 1.

Writing to VMONDIAG is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

If System Reset 2 occur during DeepSTOP transition, this register may not be initialized even if DeepSTOP Reset occurs.

Access: This register can be read or written in 8-bit units

Address: FF98 3014$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	E0VCCDIAGH	E0VCCDIAGL	VCCDIAGH	VCCDIAGL	ISOVDDDIAGH	ISOVDDDIAGL	AWOVDDDIAGH	AWOVDDDIAGL
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 11.11 VMONDIAG Register Contents (1/2)

Bit Position	Bit Name	Function
7	E0VCCDIAGH	This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: E0VCC for high voltage monitors normally. 1: E0VCC for high voltage will detect violation condition because detection level changes.
6	E0VCCDIAGL	This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: E0VCC for low voltage monitors normally. 1: E0VCC for low voltage will detect violation condition because detection level changes.
5	VCCDIAGH	This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: VCC for high voltage monitors normally. 1: VCC for high voltage will detect violation condition because detection level changes.
4	VCCDIAGL	This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: VCC for low voltage monitors normally. 1: VCC for low voltage will detect violation condition because detection level changes.
3	ISOVDDDIAGH	This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: ISOVDD for high voltage monitors normally. 1: ISOVDD for high voltage will detect violation condition because detection level changes.
2	ISOVDDDIAGL	This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: ISOVDD for low voltage monitors normally. 1: ISOVDD for low voltage will detect violation condition because detection level changes.

Table 11.11 VMONDIAG Register Contents (2/2)

Bit Position	Bit Name	Function
1	AWOVDDDIAGH	This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: AWOVDD for high voltage monitors normally. 1: AWOVDD for high voltage will detect violation condition because detection level changes.
0	AWOVDDDIAGL	This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME = 0. 0: AWOVDD for low voltage monitors normally. 1: AWOVDD for low voltage will detect violation condition because detection level changes.

11.3.6.8 VMONDIAGFE — VMON DIAG Filter Enable Register

VMONDIAGFE specifies whether output filter for $\overline{\text{VMONOUT}}$ is enabled.

This register is valid only when VMONDIAGME = 0. The setting of this register is ignored if

VMONDIAGME.VMONDIAGME = 1.

Writing to VMONDIAGFE is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

If System Reset 2 occur during DeepSTOP transition, this register may not be initialized even if DeepSTOP Reset occurs.

When each bit is set to 0, VMON Reset assertion which is controlled by the corresponding bit does not occur.

Access: This register can be read or written in 8-bit units

Address: FF98 3018$_H$

Value after reset: 0F$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	E0VCCDIAGFLTEN	VCCDIAGFLTEN	ISOVDDDIAGFLTEN	AWOVDDDIAGFLTEN

Table 11.12 VMONDIAGFE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	E0VCCDIAGFLTEN	Enable output filter for VMON_E0VCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: Disable output filter for VMON_E0VCC_ERROROUT 1: Enable output filter for VMON_E0VCC_ERROROUT
2	VCCDIAGFLTEN	Enable output filter for VMON_VCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: Disable output filter for VMON_VCC_ERROROUT 1: Enable output filter for VMON_VCC_ERROROUT
1	ISOVDDDIAGFLTEN	Enable output filter for VMON_ISOVDD_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: Disable output filter for VMON_ISOVDD_ERROROUT 1: Enable output filter for VMON_ISOVDD_ERROROUT
0	AWOVDDDIAGFLTEN	Enable output filter for VMON_AWOVDD_ERROROUT when VMONDIAGME.VMONDIAGME = 0. 0: Disable output filter for VMON_AWOVDD_ERROROUT 1: Enable output filter for VMON_AWOVDD_ERROROUT

11.3.6.9 VMONOUTF — VMONOUT Factor Register

VMONOUTF register indicates that an error is detected by VMON.

VMONOUTF can be cleared individually by writing “1” to the corresponding bit in VMONOUTFC.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 301C$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VMONOFLG
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 11.13 VMONOUTF Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	VMONOFLG	$\overline{\text{VMONOUT}}$ flag When $\overline{\text{VMONOUT}}$ pin has changed to low level, this flag is set to 1. 0: $\overline{\text{VMONOUT}}$ doesn’t have changed to low level. 1: $\overline{\text{VMONOUT}}$ has changed to low level.

11.3.6.10 VMONOUTFC — VMONOUTF Clear Register

VMONOUTFC is a register to clear the VMONOUTF register.

The read value of the register is always 00_H.

Access: This register is a write-only register that can be written in 8-bit units

Address: FF98 3020_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VMONOFLGC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 11.14 VMONOUTFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	VMONOFLGC	Clear $\overline{\text{VMONOUT}}$ flag 0: Writing 0 has no effect. 1: Writing 1 will clear VMONOFLG.

11.3.6.11 VMONMON — VMON Monitor Register

VMONMON register indicates the value of $\overline{\text{VMONOUT}}$ pin.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3024_H

Value after reset: $0x_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VMONOUT
Value after reset	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R

Table 11.15 VMONMON Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	VMONOUT	$\overline{\text{VMONOUT}}$ pin level 0: $\overline{\text{VMONOUT}}$ Output level is at low level. 1: $\overline{\text{VMONOUT}}$ Output level is at high level.

11.3.6.12 ISOVDDDE — ISOVDD Detection Enable Register

ISOVDDDE is register to control VMON Reset, mask of VMON signal and filter of VMON signal.

Bit 3, 1, 0 are set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Writing to ISOVDDDE is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

Access: This register can be read or written in 8-bit units

Address: FF98 3080_H

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	ISOVDDCIRREN[2:0]			ISOVDDFBISTME	ISOVDDFLTEN	—	ISOVDDHDE	ISOVDDLDE
Value after reset	0	0	0	0	x	0	x	x

Table 11.16 ISOVDDDE Register Contents

Bit Position	Bit Name	Function
7 to 5	ISOVDDCIRREN[2:0]	Permit VMON Reset by ISOVDD detection. ISOVDDCIRREN 2 to 0 101_B: VMON Reset by ISOVDD high voltage detection is permitted 110_B: VMON Reset by ISOVDD low voltage detection is permitted 111_B: VMON Reset by ISOVDD high/low voltage detection is permitted Other value: VMON Reset by ISOVDD detection is not permitted
4	ISOVDDFBISTME	When this bit is set to 0, VMON_ISOVDD_ERROROUT and VMON_ISOVDD_REQRESET is masked when field-BIST is carried out after VMON Reset. When this bit is set to 1, VMON_ISOVDD_ERROROUT and VMON_ISOVDD_REQRESET is not masked when field-BIST is carried out after VMON Reset. 0: During FBIST the VMON_ISOVDD_ERROROUT and VMON_ISOVDD_REQRESET can be masked 1: During FBIST the VMON_ISOVDD_ERROROUT and VMON_ISOVDD_REQRESET cannot be masked **NOTE:** VMON_ISOVDD_ERROROUT output and VMON_ISOVDD_REQRESET are always masked when field-BIST is carried out after Power On Reset, External Reset, or Debugger Disconnection Reset. VMON_ISOVDD_ERROROUT output and VMON_ISOVDD_REQRESET are always not masked when field-BIST is carried out after System Reset 2 or after DeepSTOP.
3	ISOVDDFLTEN	Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF. 0: Disable output filter for $\overline{\text{VMONOUT}}$ and VMONF. 1: Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	ISOVDDHDE	ISOVDD High voltage detection enable 0: Disable ISOVDD high voltage detection 1: Enable ISOVDD high voltage detection
0	ISOVDDLDE	ISOVDD Low voltage detection enable 0: Disable ISOVDD low voltage detection 1: Enable ISOVDD low voltage detection

CAUTION

If system enters DeepSTOP mode, VMON function of ISOVDD part is masked.

11.3.6.13 ISOVDDFCR — ISOVDD Monitor Filter Control Register

ISOVDDFCR is a register to adjust the filtering width of ISOVDD Monitor digital noise filter.

This register is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3084_H

Value after reset: $0x_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	ISOVDDFLTW[1:0]		ISOVDDCLKSEL[1:0]	
Value after reset	0	0	0	0	x	x	x	x
R/W	R	R	R	R	R	R	R	R

Table 11.17 ISOVDDFCR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3, 2	ISOVDDFLTW [1:0]	These bits select the minimum filtering width of digital noise filter. (The minimum filtering width is given by cycle-count of a clock selected by ISOVDDCLKSEL1, 0.) The following values are the Minimum Filtering Width (Cycle) 00_B: 20 cycle 01_B: 13 cycle 10_B: 8 cycle 11_B: 3 cycle
1, 0	ISOVDDCLKSEL[1:0]	These bits select a clock of the digital noise filter from the following clocks. The following values are the Clock of the Digital Filter 00_B: CLK_HVIOSC frequency/256 01_B: CLK_HVIOSC frequency/128 10_B: CLK_HVIOSC frequency/64 11_B: CLK_HVIOSC frequency/32 **CAUTION** A frequency of CLK_HVIOSC is typ. 16 MHz.

CAUTION

When using SVR Controller with Switching frequency = 868 kHz and using DeepSTOP Mode, set the filtering width to 50 µs or higher.

11.3.6.14 AWOVDDDE — AWOVDD Detection Enable Register

AWOVDDDE is register to control VMON Reset, mask of VMON signal and filter of VMON signal.

Bit 3 is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Writing to AWOVDDDE is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

Access: This register can be read or written in 8-bit units

Address: FF98 3088_H

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	AWOVDDFBISTME	AWOVDDFLTEN	—	—	—
Value after reset	0	0	0	0	x	0	0	0
R/W	R	R	R	R/W	R	R	R	R

Table 11.18 AWOVDDDE Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	AWOVDDFBISTME	When this bit is set to 0, VMON_AWOVDD_ERROROUT and VMON_AWOVDD_REQRESET is masked when field-BIST is carried out after VMON Reset. When this bit is set to 1, VMON_AWOVDD_ERROROUT and VMON_AWOVDD_REQRESET is not masked when field-BIST is carried out after VMON Reset. 0: During FBIST the VMON_AWOVDD_ERROROUT and VMON_AWOVDD_REQRESET can be masked 1: During FBIST the VMON_AWOVDD_ERROROUT and VMON_AWOVDD_REQRESET cannot be masked **NOTE:** VMON_AWOVDD_ERROROUT output and VMON_AWOVDD_REQRESET are always masked when field-BIST is carried out after Power On Reset, External Reset, or Debugger Disconnection Reset. VMON_AWOVDD_ERROROUT output and VMON_AWOVDD_REQRESET are always not masked when field-BIST is carried out after System Reset 2 or after DeepSTOP.
3	AWOVDDFLTEN	Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF. 0: Disable output filter for $\overline{\text{VMONOUT}}$ and VMONF. 1: Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF.
2 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

11.3.6.15 AWOVDDFCR — AWOVDD Monitor Filter Control Register

AWOVDDFCR is a register to adjust the filtering width of AWOVDD Monitor digital noise filter.

This register is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 308C$_H$

Value after reset: 0x$_H$

Bit	7	6	5	4	3	2	1	0

0	VCCLDE	VCC Low voltage detection enable 0: Disable VCC low voltage detection 1: Enable VCC low voltage detection

11.3.6.17 VCCFCR — VCC Monitor Filter Control Register

VCCFCR is a register to adjust the filtering width of VCC Monitor digital noise filter.

This register is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3104$_H$

Value after reset: 0x$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	VCCFLTW[1:0]		VCCCLKSEL[1:0]	
Value after reset	0	0	0	0	x	x	x	x
R/W	R	R	R	R	R	R	R	R

Table 11.21 VCCFCR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3, 2	VCCFLTW [1:0]	These bits select the minimum filtering width of digital noise filter. (The minimum filtering width is given by cycle-count of a clock selected by VCCCLKSEL1, 0.) The following values are the Minimum Filtering Width (Cycle) 00_B: 20 cycle 01_B: 13 cycle 10_B: 8 cycle 11_B: 3 cycle
1, 0	VCCCLKSEL [1:0]	These bits select a clock of the digital noise filter from the following clocks. The following values are the Clock of the Digital Filter 00_B: CLK_HVIOSC frequency/256 01_B: CLK_HVIOSC frequency/128 10_B: CLK_HVIOSC frequency/64 11_B: CLK_HVIOSC frequency/32 **CAUTION** A frequency of CLK_HVIOSC is typ. 16 MHz.

11.3.6.18 E0VCCDE — E0VCC Detection Enable Register

VCCDE is register to control VMON Reset, mask of VMON signal and filter of VMON signal.

Bit 3, 1, 0 are set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Writing to E0VCCDE is permitted during a period which starts from release of Power On Reset, External Reset, Debugger Disconnection Reset, VMON Reset which is AWOVDD detection, and DeepSTOP Reset to end of writing in VMONDIAGMEW.

Access: This register can be read or written in 8-bit units

Address: FF98 3180_H

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	E0VCCCIRREN[2:0]			—	E0VCCFLTEN	—	E0VCCHDE	E0VCCLDE
Value after reset	0	0	0	0	x	0	x	x
R/W	R/W	R/W	R/W	R	R	R	R	R

Table 11.22 E0VCCDE Register Contents

Bit Position	Bit Name	Function
7 to 5	E0VCCCIRREN [2:0]	Permit VMON Reset by E0VCC voltage detection. E0VCCCIRREN 2 to 0 101_B: VMON Reset by E0VCC high voltage detection is permitted 110_B: VMON Reset by E0VCC low voltage detection is permitted 111_B: VMON Reset by E0VCC high/low voltage detection is permitted Other value: VMON Reset by E0VCC detection is not permitted
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	E0VCCFLTEN	Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF 0 : Disable output filter for $\overline{\text{VMONOUT}}$ and VMONF 1 : Enable output filter for $\overline{\text{VMONOUT}}$ and VMONF
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	E0VCCHDE	E0VCC high voltage detection enable 0: Disable E0VCC high voltage detection 1: Enable E0VCC high voltage detection
0	E0VCCLDE	E0VCC Low voltage detection enable 0: Disable E0VCC low voltage detection 1: Enable E0VCC low voltage detection

11.3.6.19 E0VCCFCR — E0VCC Monitor Filter Control Register

E0VCCFCR is a register to adjust the filtering width of E0VCC Monitor digital noise filter.

This register is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3184$_H$

Value after reset: 0x$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	E0VCCFLTW[1:0]		E0VCCCLKSEL[1:0]	
Value after reset	0	0	0	0	x	x	x	x
R/W	R	R	R	R	R	R	R	R

Table 11.23 E0VCCFCR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned.
3, 2	E0VCCFLTW [1:0]	These bits select the minimum filtering width of digital noise filter. (The minimum filtering width is given by cycle-count of a clock selected by E0VCCCLKSEL1, 0) The following values are the Minimum Filtering Width (Cycle) 00_B: 20 cycle 01_B: 13 cycle 10_B: 8 cycle 11_B: 3 cycle
1, 0	E0VCCCLKSEL [1:0]	These bits select a clock of the digital noise filter from the following clocks. The following values are the Clock of the Digital Filter 00_B: CLK_HVIOSC frequency/256 01_B: CLK_HVIOSC frequency/128 10_B: CLK_HVIOSC frequency/64 11_B: CLK_HVIOSC frequency/32 **CAUTION** A frequency of CLK_HVIOSC is typ. 16 MHz.

11.3.6.20 VMONDSCR — VMON DeepSTOP Control Register

VMONDSCR is register to control VMON Reset, mask of VMON signal.

Bit 0 is set by flash option byte when Power On Reset, External Reset, or Debugger Disconnection Reset is released.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 31C0$_H$

Value after reset: 0X$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DSDETEN
Value after reset	0	0	0	0	0	0	0	x
R/W	R	R	R	R	R	R	R	R

Table 11.24 VMONDSCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	DSDETEN	VMON control during DeepSTOP 0: VMON disable (STOP) 1: VMON continue

11.3.6.21 VMONKCPROT — VMON Register Key Code Protection Register

The VMONKCPROT register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 3F00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 11.25 VMONKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0*1.
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writes to protected registers.
Write A5A5A501$_H$ to this register to enable writes to protected registers.

11.3.7 Operation

11.3.7.1 Basic Function

VMON watches AWOVDD, ISOVDD, VCC and E0VCC voltage.

VMON has high and low voltage detection circuit. If it detects voltage error, it records the error to VMONF register and notifies the error to the outside via $\overline{\text{VMONOUT}}$ pin. It also generates internal reset (VMON Reset) triggered by detection of voltage error. **Table 11.26** shows the symbol of primary high detection level, and primary low detection level for each power domain.

Table 11.26 Definition of Power domain detection Symbol name

Power domain	High detection level	Low detection level	High detect flag	Low detect flag
AWOVDD	$V_{AWOVDDMH}$	$V_{AWOVDDML}$	AWOVDDHVF	AWOVDDLVF
ISOVDD	$V_{ISOVDDMH}$	$V_{ISOVDDML}$	ISOVDDHVF	ISOVDDLVF
VCC	V_{VCCMH}	V_{VCCML}	VCCHVF	VCCLVF
E0VCC	$V_{E0VCCMH}$	$V_{E0VCCML}$	E0VCCHVF	E0VCCLVF

CAUTION

If system enters DeepSTOP mode, VMON function of ISOVDD area is masked.

(1) VMON detection flag

VMONF.ISOVDDHVF is set to “1” when ISOVDD becomes higher than high voltage detection level of VMON.

VMONF.ISOVDDLVF is set to “1” when ISOVDD becomes lower than low voltage detection level of VMON.

Table 11.26 shows the symbol of high detection flag, and low detection flag for each power domain.

These flags can be cleared to “0” by writing in the corresponding bit of VMONFC.

These flags are also cleared by Power On Reset (not cleared by other resets).

Figure 11.9 shows the operation example of VMONF.

(2) $\overline{\text{VMONOUT}}$ pin

While monitor voltage is higher than high voltage detection level or lower than low voltage detection level of VMON, $\overline{\text{VMONOUT}}$ pin outputs low.

If VMON does not detect voltage error $\overline{\text{VMONOUT}}$ pin outputs high.

To avoid unwanted operation of VMON circuit caused by instable power supply at power up, $\overline{\text{VMONOUT}}$ is fixed to low during Power On Reset period except when triggered by Debugger Reset.

$\overline{\text{VMONOUT}}$ outputs error detection result even during other reset period except Power On Reset.

Figure 11.9 shows the operation example of that is $\overline{\text{VMONOUT}}$ operated by ISOVDD.

Similarly, for other power supply, the operation timing of $\overline{\text{VMONOUT}}$ is the same as that for ISOVDD.

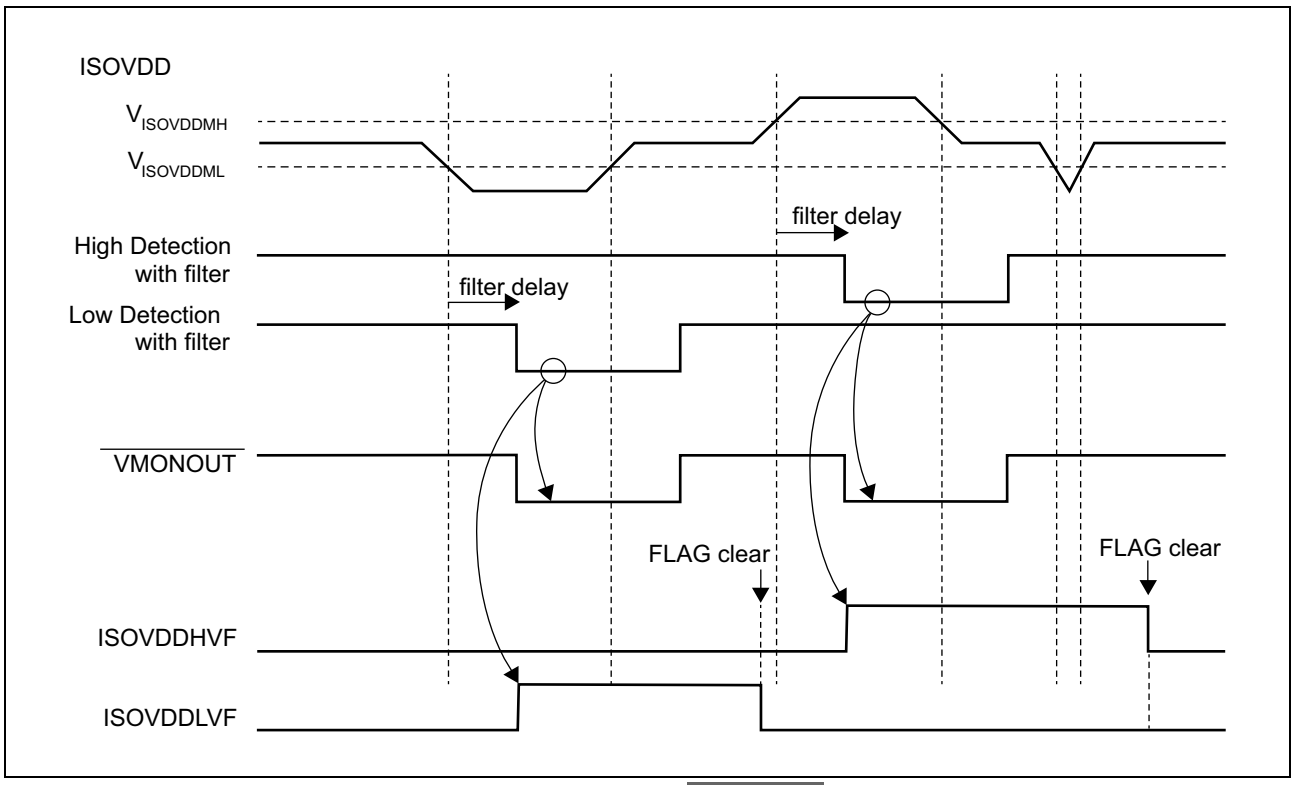

Figure 11.9 Example of VMONF and $\overline{\text{VMONOUT}}$ Operation (ISOVDD)

(3) VMON Reset

If ISOVDD voltage becomes higher than high voltage detection level of VMON when "101_B" or "111_B" were set to ISOVDDDE.ISOVDDCIRREN[2:0] in advance, VMON Reset occurs.

Similarly, if ISOVDD voltage becomes lower than low voltage detection level of VMON when "110_B" or "111_B" were set to ISOVDDDE.ISOVDDCIRREN[2:0] in advance, VMON Reset occurs.

If VCC voltage becomes higher than high voltage detection level of VMON when "101_B" or "111_B" were set to VCCDE.VCCCIRREN[2:0] in advance, VMON Reset occurs.

Similarly, if VCC voltage becomes lower than low voltage detection level of VMON when "110_B" or "111_B" were set to VCCDE.VCCCIRREN[2:0] in advance, VMON Reset occurs

If E0VCC voltage becomes higher than high voltage detection level of VMON when "101_B" or "111_B" were set to E0VCCDE.E0VCCCIRREN[2:0] in advance, VMON Reset occurs.

Similarly, if E0VCC voltage becomes lower than low voltage detection level of VMON when "110_B" or "111_B" were set to E0VCCDE.E0VCCCIRREN[2:0] in advance, VMON Reset occurs.

VMON Reset is released after the specified time has been passed since VMON detects the normal voltage.

NOTE

LDET and HDET of AWOVDD will always generate the VMON Reset at the time of low voltage detection, except for during the diagnosis.

Figure 11.10 shows the operation example of VMON Reset that is operated by ISOVDD.

Similarly, for other power supply, the operation timing of VMON Reset is the same as that for ISOVDD.

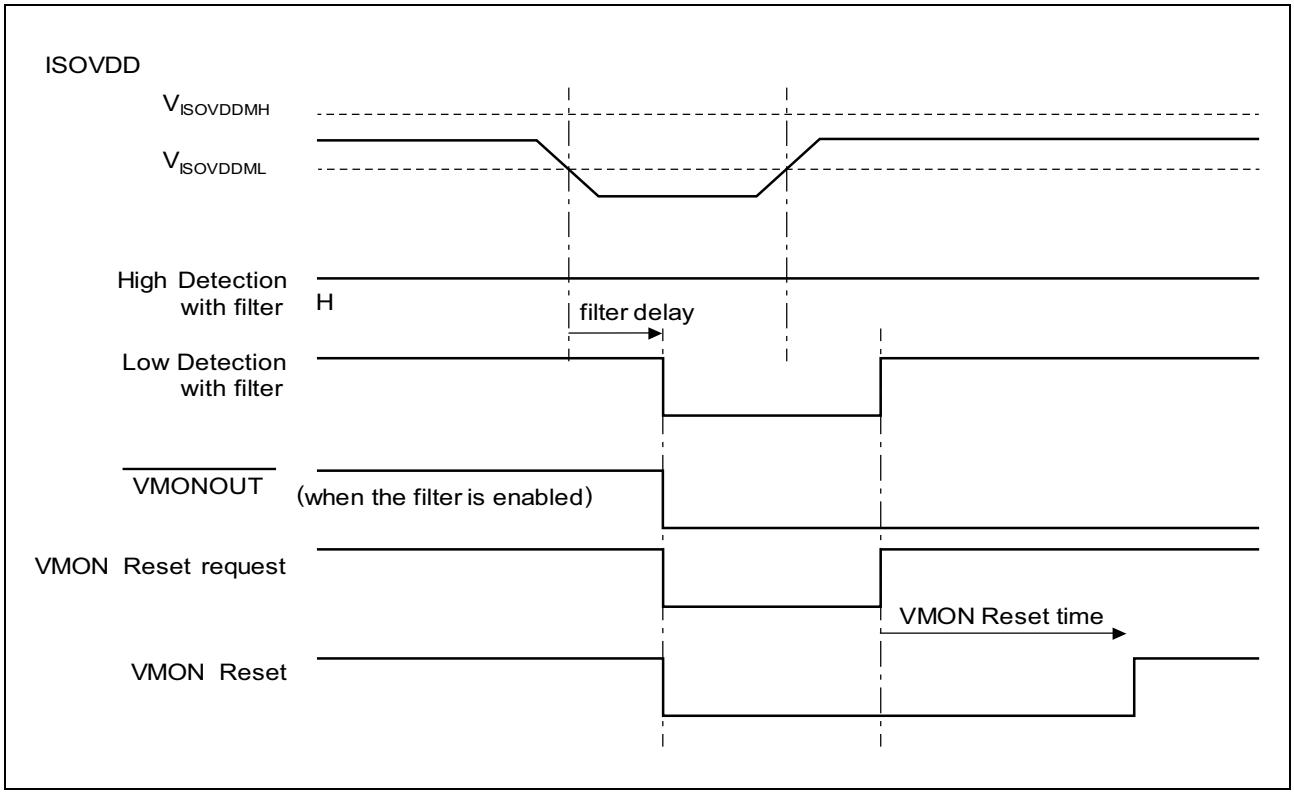

Figure 11.10 Example of VMON Reset Operation (ISOVDD)

(4) Digital Noise Filter

The output signal of the voltage detector passes through a digital noise filter to remove an unintended glitch. See "**Section 55, Electrical Characteristics**" for further information of the filters characteristics.

Digital noise filter clock and the cycle are controlled by setting of the following registers. (These registers are read only and set by flash option byte.)

- ISOVDDFCR
- AWOVDDFCR
- VCCFCR
- E0VCCFCR

The relation of filter enable is shown in **Figure 11.5**, **Figure 11.6**, **Figure 11.7** and **Figure 11.8**.

11.3.7.2 VMON function in BIST and Serial Programming Mode (Mask of $\overline{\text{VMONOUT}}$ pin and VMON Reset)

$\overline{\text{VMONOUT}}$ output and VMON Reset by detection of ISOVDD and AWOVDD voltage fluctuations are always masked during BIST after Power On Reset, External Reset, and Debugger Disconnection Reset.

It is possible to mask $\overline{\text{VMONOUT}}$ output and VMON Reset by setting ISOVDDDE.ISOVDDFBISTME and AWOVDDDE.AWOVDDFBISTME to “0” during BIST after VMON Reset. In this case, $\overline{\text{VMONOUT}}$ is fixed to high level and VMON Reset does not occur.

NOTE

$\overline{\text{VMONOUT}}$ output and VMON Reset by detection of ISOVDD and AWOVDD voltage fluctuations are not always masked during BIST after System Reset 2 and DeepSTOP Reset occur. $\overline{\text{VMONOUT}}$ output and VMON Reset by detection of VCC and E0VCC voltage fluctuations are always not masked during BIST.

In Serial Programming Mode, $\overline{\text{VMONOUT}}$ output is fixed to high even by detection of ISOVDD/AWOVDD/E0VCC/VCC voltage fluctuations during writing and erasing operations to the Flash memory.

11.3.7.3 Diagnosis Function

(1) Change of VMON detection level for the error injection

Table 11.27 List of Setting register

Condition	Detection target	Setting register
VMONDIAGME.VMONDIAGME is “0”	ISOVDD	VMONDIAG.ISOVDDDIAGH or VMONDIAG.ISOVDDDIAGL
VMONDIAGME.VMONDIAGME is “0”	AWOVDD	VMONDIAG.AWOVDDDIAGH or VMONDIAG.AWOVDDDIAGL
VMONDIAGME.VMONDIAGME is “0”	VCC	VMONDIAG.VCCDIAGH or VMONDIAG.VCCDIAGL
VMONDIAGME.VMONDIAGME is “0”	E0VCC	VMONDIAG.E0VCCDIAGH or VMONDIAG.E0VCCDIAGL

VMON error detection signal can be intentionally generated by setting these registers even when each power supply voltage is in the operating range.

NOTE

During diagnosis, Abnormal voltage can not be detected by VMON.

(2) Mask of $\overline{\text{VMONOUT}}$ and VMON Reset

Table 11.28 List of VMONOUT mask

Condition	Mask target
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.ISOVDDERRMD is set to “1”	VMON_ISOVDD_ERROROUT
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.AWOVDDERRMD is set to “1”	VMON_AWOVDD_ERROROUT
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.VCCERRMD is set to “1”	VMON_VCC_ERROROUT
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.E0VCCERRMD is set to “1”	VMON_E0VCC_ERROROUT

If above four settings are done, $\overline{\text{VMONOUT}}$ is dependent on the setting of DMON during diagnosis.

Table 11.29 List of VMON Reset mask

Condition	Mask target
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.ISOVDDRESMD is set to “1”	VMON_ISOVDD_REQ_RESET
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.AWOVDDRESMD is set to “1”	VMON_AWOVDD_REQ_RESET
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.VCCRESMD is set to “1”	VMON_VCC_REQ_RESET
VMONDIAGME.VMONDIAGME is “0” and VMONDMASK.E0VCCRESMD is set to “1”	VMON_E0VCC_REQ_RESET

(3) The flow of VMON diagnosis application

VMONDIAGME.VMONDIAGME is initialized to “0” by Power On Reset, External Reset, Debugger Disconnection Reset, and VMON Reset which is AWOVDD detection. So VMON diagnosis function is enabled at start-up after these resets.

The user’s application controls the diagnostic function by VMONDMASK, VMONDIAG and VMONDIAGFE.

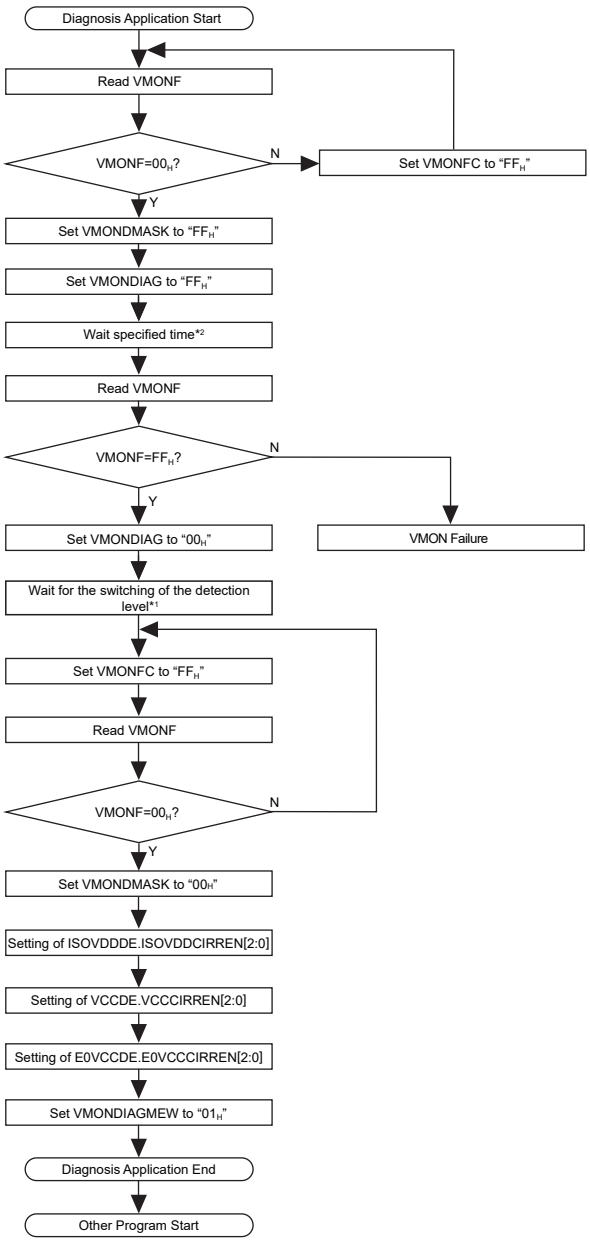
Figure 11.11 shows the example of the diagnosis application.

Figure 11.12 shows the example of the $\overline{\text{VMONOUT}}$ diagnosis application.

Figure 11.13 shows the example of the VMON Reset diagnosis application.

After diagnosis application was over, write “1” to VMONDIAGME.VMONDIAGME and disable VMON diagnosis function immediately.

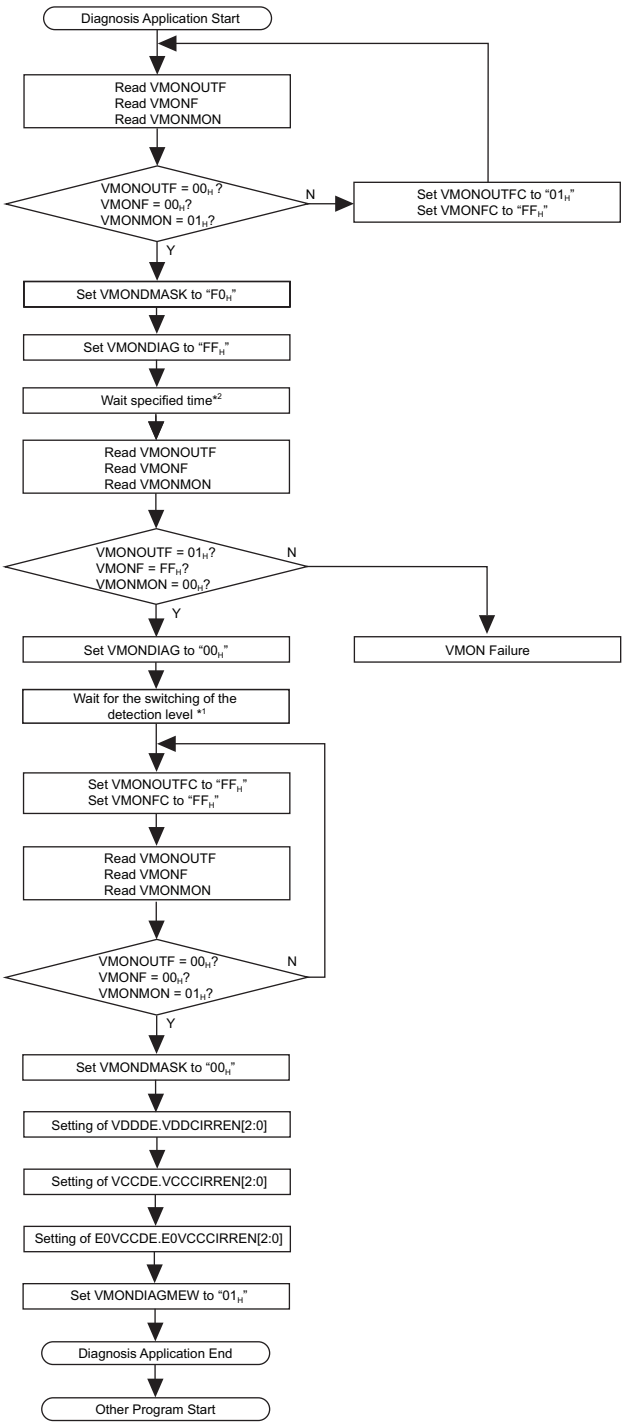
This function protects each flag against erroneous operation when each power supply is out of the operating range.



Note 1. The processing must produce waiting period of at least 30 µs.

Note 2. Wait more than the following time.
Wait time = 10 + 0.125 ×Dclk × (Wfil+1) [µs]
Dclk: Divided value. Value is selected by nnnFCR.nnnCLKSEL[1:0]
Wfil: Filtering Width. Value is set by nnnFCR.nnnFLTW[1:0]
nnn: ISOVDD/AWOVDD/VCC/E0VCC

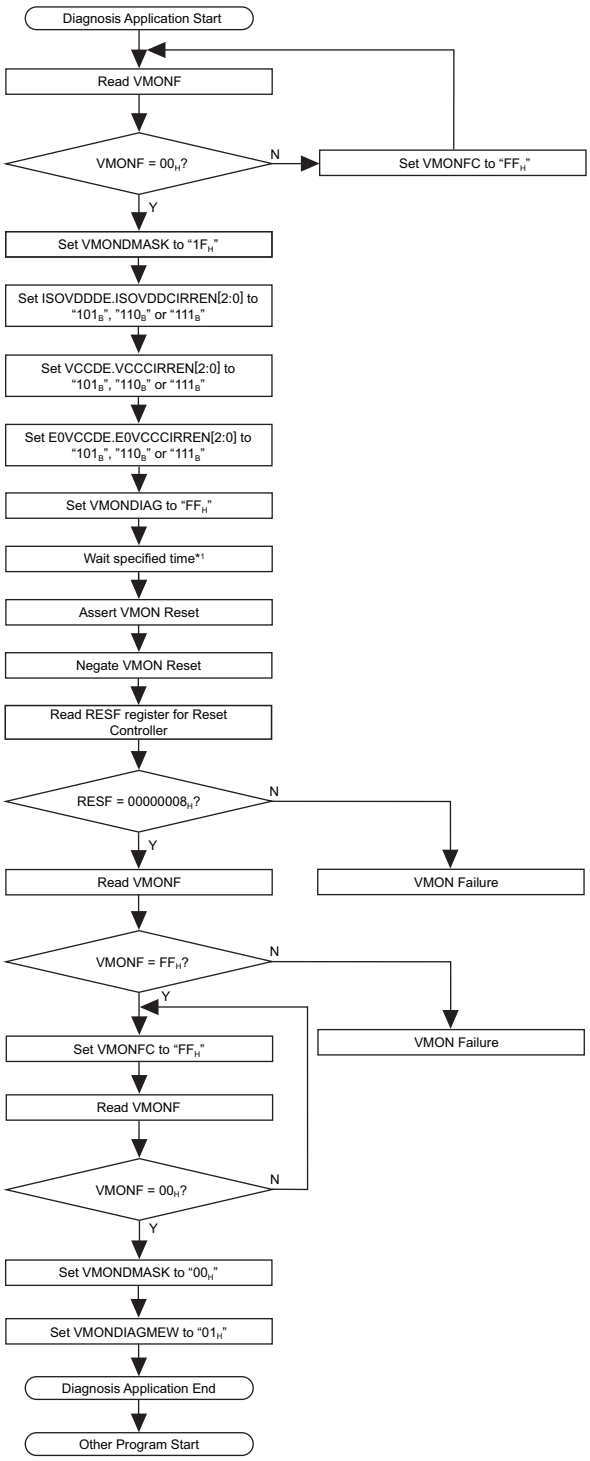
Figure 11.11 The Example of the Flowchart of VMON Diagnosis Application



Note 1. The processing must produce waiting period of at least 30µs.

Note 2. Wait more than the following time.
Wait time = 10 + 0.125 ×Dclk × (Wfil+1) [µs]
Dclk: Divided value. Value is selected by nnnFCR.nnnCLKSEL[1:0]
Wfil: Filtering Width. Value is set by nnnFCR.nnnFLTW[1:0]
nnn: ISOVDD/AWOVDD/VCC/E0VCC

Figure 11.12 The Example of the Flowchart of VMON Diagnosis Application (VMONOUT)



Note 1. Wait more than the following time.
Wait time = 10 + 0.125 ×Dclk × (Wfil+1) [µs]
Dclk: Divided value. Value is selected by nnnFCR.nnnCLKSEL[1:0]
Wfil: Filtering Width. Value is set by nnnFCR.nnnFLTW[1:0]
nnn: ISOVDD/AWOVDD/VCC/E0VCC

Figure 11.13 The Example of the Flowchart of VMON Diagnosis Application (VMON Reset)

(4) The flow of VMON re-diagnosis after DeepSTOP

The VMON detection of voltage monitor is used for monitoring the domains ISOVDD, AWOVDD, E0VCC and VCC.

When MCU return to RUN form DeepSTOP, VMON will be able to re-diagnosis.

11.3.7.4 Function in Standby

If system enters DeepSTOP mode, VMON function of ISOVDD detection was stopped.

The following shows the control of detections for per system mode.

Table 11.30 Function in Standby

State	ISOVDD Detection	AWOVDD Detection	VCC Detection	E0VCC Detection
DeepSTOP	— (Stopped)	DSDETEN	DSDETEN	DSDETEN
		DSDETEN = 0 Stopped	DSDETEN = 0 Stopped	DSDETEN = 0 Stopped
		DSDETEN = 1 Continue. Follow the values below AWOVDDFLTEN	DSDETEN = 1 Continue. Follow the values bellow VCCHDE VCCLDE VCCFLTEN	DSDETEN = 1 Continue. Follow the values below E0VCCHDE E0VCCLDE E0VCCFLTEN

In DeepSTOP mode, it is controlled by the value of DSDETEN to stop the detections or continue detections.

11.3.7.5 VMON function of mask

The following list shows the mask correspondence of the VMON function in the **Table 11.31**.

Table 11.31 VMON function of mask

Power Supply	VMON Function	Power On Reset	Serial Programming mode	Common Case	Field-BIST0	Field-BIST 1/2	Diagnosis	Deep STOP
ISOVDD	$\overline{\text{VMONOUT}}$	— (Always error)	Always masked	ISOVDDH/LDE	ISOVDDFBISTME	—	ISOVDDERRMD	Always masked
	VMON Reset	Always masked	—	ISOVDDH/LDE ISOVDDCIRREN	ISOVDDFBISTME	—	ISOVDDRESMD	Always masked
	VMON Flag	Always masked	—	ISOVDDH/LDE	—	—	—	Always masked
AWOVDD	$\overline{\text{VMONOUT}}$	— (Always error)	Always masked	—	AWOVDDFBISTME	—	AWOVDDERRMD	DSDETEN
	VMON Reset	Always masked	—	—	AWOVDDFBISTME	—	AWOVDDRESMD	DSDETEN
	VMON Flag	Always masked	—	—	—	—	—	DSDETEN
VCC	$\overline{\text{VMONOUT}}$	— (Always error)	Always masked	VCCH/LDE	—	—	VCCERRMD	DSDETEN
	VMON Reset	Always masked	—	VCCH/LDE VCCCIRREN	—	—	VCCRESMD	DSDETEN
	VMON Flag	Always masked	—	VCCH/LDE	—	—	—	DSDETEN
E0VCC	$\overline{\text{VMONOUT}}$	— (Always error)	Always masked	E0VCCH/LDE	—	—	E0VCCERRMD	DSDETEN
	VMON Reset	Always masked	—	E0VCCH/LDE E0VCCCIRREN	—	—	E0VCCRESMD	DSDETEN
	VMON Flag	Always masked	—	E0VCCH/LDE	—	—	—	DSDETEN

Note: —: Not masked, Other: how to mask (refer each register spec about polarity of setting)
Mask setting described in left side column is prior to that in right side column in the table.
(e.g. If $\overline{\text{VMONOUT}}$ function is masked by setting 0 to VCCH/LDE, DSDETEN is ignored in DeepSTOP)

11.3.8 Usage Notes

11.3.8.1 Flag Bit (VMONF)

Setting 1 to VMONF by error detection is prior to clearing VMONF by VMONFC.

These functions protect each flag against erroneous operation when each power supply is out of the operating range.

When Monitor voltages are recovered to the operating range, the MCU need to be initialized by External Reset or VMON Reset, or the MCU may still continue erroneous operation and then unintended clear of flag may occur.

11.3.8.2 AWOVDD Primary Low Detection

Because of internal circuit guard of this MCU, VMON Reset might occur in shorter time than the filter width when AWOVDD voltage is lower than the lowest level of VDD primary low detection range.

In that case, AWOVDDLVF will not be set by the AWOVDD primary low detection.

11.4 Delay Monitor (DMON)

11.4.1 Features

DMON can detect abnormalities in delay time of transistor devices by using an on-chip delay monitor while the microcontroller is working. It can only monitor the delay time on the ISOVDD domain. It detects an error if the monitored delay time is lower than a threshold according to the fabrication process conditions.

DMON assists the power supply voltage monitor (VMON) which detects the low level voltage of ISOVDD.

When DMON detects the delay error within the ranges of VMON detection, it notifies VMON about the error detection to operate VMON Reset normally.

When MainOSC error was detected in CLMA0, DMON possibility that output an error.

11.4.2 Clock Supply

The clock supply to the DMON is shown in the following table.

Table 11.32 Clock Supply

Module Name	Module Clock Name	Clock Name
DMON	MainOSC	CLK_MOSC
	Register access clock	CLK_LSB

11.4.3 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA / DTS requests.

This module has no error notifications to ECM.

11.4.4 External Input/Outputs

This module has no external input/output pins.

11.4.5 Overview

The On-Chip delay monitor measures the delay time related to the power supply voltage. It converts analog delay time into digital codes (DCODE) and outputs the DCODE into a comparator. The DCODE is compared with the threshold which is a fixed value. When the DCODE becomes lower than the threshold, an error output signal (DMON_ERROROUT) which and a reset request signal (DMON_REQRESET) are generated to notify the VMON.

11.4.5.1 Block Diagram

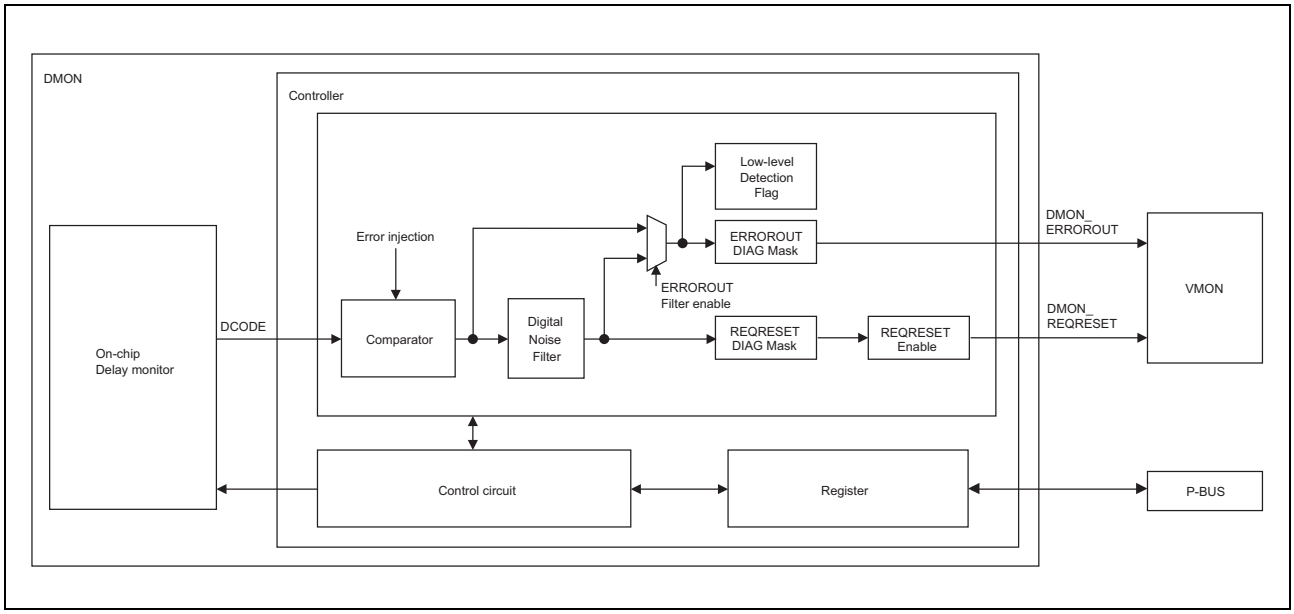


Figure 11.14 Block Diagram of the Delay Monitor

11.4.6 Registers

11.4.6.1 List of Registers

The register list related to DMON is shown in **Table 11.33**.

Table 11.33 List of Registers (DMON)

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
FF98 2800$_H$	DMONF	DMON Factor Register	32	0000 0000$_H$	PBG20 #2	
FF98 2804$_H$	DMONFC	DMONF Clear Register	32	0000 0000$_H$	PBG20 #2	DMONKCPROT0

Note 1. Only VMON Reset which is AWOVDD detection.

11.4.6.2 DMONF — DMON Factor Register

DMONF register indicates that an error is detected by DMON. Each flag of DMONF can be cleared individually by writing “1” to the corresponding bit in DMONFC.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 2800$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 11.35 DMONF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DMONLVF	Lower limit delay detection flag 0: No lower limit delay error detected 1: Lower limit delay error occurred

Note 1. DMONLVF is guaranteed only when VMON detection of ISOVDD does not occur.

11.4.6.3 DMONFC — DMONF Clear Register

DMONFC is a register to clear the DMONF register. The read value of this register is always $0000\ 0000_H$.

Access: This register is a write-only register that can be written in 32-bit units.

Address: $FF98\ 2804_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

0	DMONLVFC	Clear lower limit delay detection flag 0: Writing 0 has no effect 1: Writing 1 will clear DMONLVF

11.4.6.4 DMONDIAGME — DMON DIAG Monitor Enable Register

DMONDIAGME is a read only register to control DIAG function.

This register reflects the settings written to the DMONDIAGMEW.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 2808$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	DMONDIAGME	Permit DIAG function 0: DIAG function of the DMON can be enabled 1: DIAG function of the DMON cannot be enabled

11.4.6.5 DMONDIAGMEW — DMONDIAGME Write Register

DMONDIAGMEW is a register to set values of DMONDIAGME. Writing is permitted only once after Power On Reset, System Reset 1/2, DeepSTOP Reset or DMON Reset (RESDMON = 1) was released. Subsequent write operation is ignored. The read value of this register is always 0000 0000_H.

Access: This register is a write-only register that can be written in 32-bit units.

Address: FF98 $280C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 1	Reserved	When writing, write the value after reset.
0	DMONDIAGMEW	The data written in this bit is set to DMONDIAGME.DMONDIAGME.

11.4.6.6 DMONDMASK — DMON Detection Output Diagnosis Mask Register

DMONDMASK is a register to mask DMON_REQRESET and DMON_ERROROUT when DMONDIAGME.DMONDIAGME = 0. DMONDMASK setting is ignored if DMONDIAGME.DMONDIAGME = 1.

Access: This register can be read or written in 32-bit units.

Address: FF98 2810$_H$

Value after reset: 0000 0011$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 11.39 DMONDMASK Register Contents

Bit Position	Bit Name	Function
31 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DMONRESMD	This bit masks DMON_REQRESET when DMONDIAGME.DMONDIAGME = 0. 0: DMON_REQRESET is not masked. 1: DMON_REQRESET is masked.
3 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMONERRMD	This bit masks DMON_ERROROUT when DMONDIAGME.DMONDIAGME = 0. 0: DMON_ERROROUT is not masked. 1: DMON_ERROROUT is masked.

11.4.6.7 DMONDIAG — DMONDIAG Mode Setting Register

DMONDIAG register is used for controlling diagnostic function of DMON.

This register is valid only when DMONDIAGME.DMONDIAGME = 0. The setting of DMONDIAG is ignored if DMONDIAGME.DMONDIAGME = 1.

Access: This register can be read or written in 32-bit units.

Address: FF98 2814$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 11.40 DMONDIAG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMONDIAGL	This bit is used for error injection of diagnosis function when DMONDIAGME = 0. 0: Normal operation. 1: Execute error injection.

11.4.6.8 DMONDE — DMON Detection Enable Register

DMONDE is a register to control DMON detection, the mask of DMON signal and filter of DMON signal.

Writing in DMONDE is permitted during a period before writing in DMONDIAGMEW after Power On Reset, System Reset 1/2, DeepSTOP Reset or DMON Reset (RESDMON = 1) was released. Writing in this register is ignored, after writing in DMONDIAGMEW.

Access: This register can be read or written in 32-bit units.

Address: FF98 2818$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 11.41 DMONDE Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	DMONCIRREN1	Permit DMON_REQRESET notification. DMONCIRREN[1:0] 00_B, 01_B, 10_B: DMON_REQRESET is not permitted 11_B: DMON_REQRESET is permitted
6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	DMONCIRREN0	Refer to bit7 (DMONCIRREN1)
4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	DMONFLTEN	Enable output filter for DMON_ERROROUT and DMON Error Detection Flag 0: Disable output filter for DMON_ERROROUT and DMON Error Detection Flag 1: Enable output filter for DMON_ERROROUT and DMON Error Detection Flag
2, 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DMONLDE	DMON Low delay detection enable 0: Disable DMON lower limit delay detection 1: Enable DMON lower limit delay detection

CAUTION

Restrictions

- When ISOVDDDE.ISOVDDLDE = “0”, setting the DMONLDE to “1” is prohibited.
- When ISOVDDDE.ISOVDDCIRREN[2:0]! = “110_B” or “111_B”, setting the DMONCIRREN[1:0] to “11_B” is prohibited.

11.4.6.9 DMONFCR — DMON Filter Control Register

DMONFCR is a register to adjust the filtering width of DMON digital noise filter.

Writing in DMONFCR is permitted during a period before writing in DMONDIAGMEW after Power On Reset, System Reset 1/2, DeepSTOP Reset or DMON Reset (RESDMON = 1) was released. Writing in this register is ignored, after writing in DMONDIAGMEW.

Access: This register can be read or written in 32-bit units.

Address: FF98 281C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 11.42 DMONFCR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMONFLTW [2:0]	These bits select the minimum filtering width of digital noise filter. The minimum filtering width is given by number of sampling times 000_B: 1 sampling time 001_B: 2 sampling times 010_B: 4 sampling times 011_B: 8 sampling times 100_B: 16 sampling times 101_B: 32 sampling times 110_B: 64 sampling times 111_B: 128 sampling times **CAUTION** A sampling period is 5 µs (16 MHz), 4 µs (20/40 MHz), 3.33 µs (24 MHz).

11.4.6.10 DMONTEST — Delay Monitor Test Register

This register is used for the self-test of the Delay monitors.

Access: This register can be read or written in 32-bit units.

Address: FF98 2900$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 11.43 DMONTEST Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	RESDMON	DMON test reset signal control Asserting this bit re-initializes the Delay Monitor in order to continue normal operation. 0: Reset signal for DMON is released. 1: Reset signal for DMON is asserted.

11.4.6.11 DMONKCPROT0 — DMON Register 0 Key Code Protection Register

The DMONKCPROT0 register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 2F00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 11.45 DMONKCPROT2 Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0*1.
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writes to protected registers.
Write A5A5A501$_H$ to this register to enable writes to protected registers.

11.4.7 Operation

11.4.7.1 Basic Function

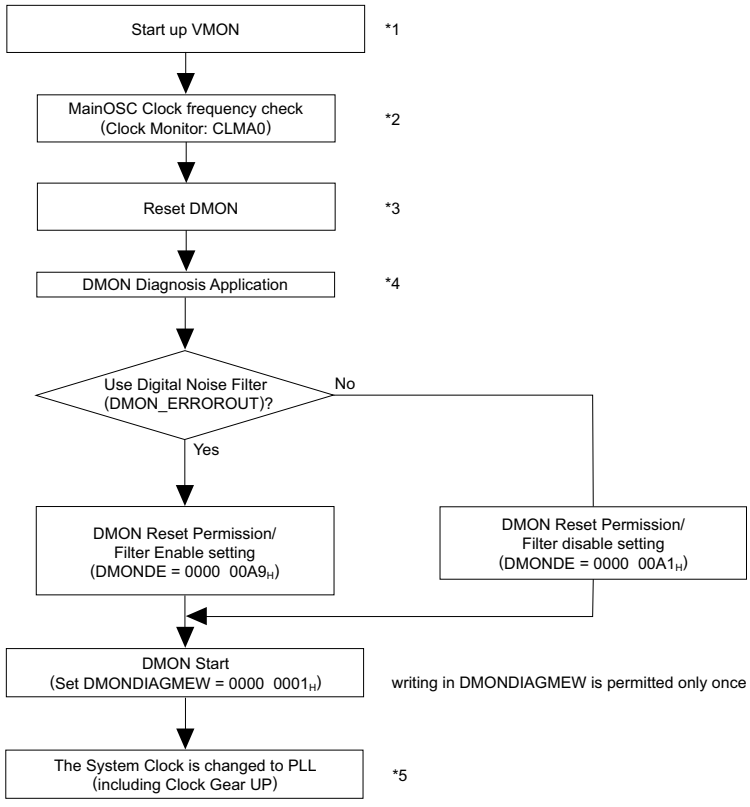
DMON monitors the delay time depending on ISOVDD supply voltage.

If it detects the delay error, it records the error to DMONF register. It also generates DMON_ERROROUT and DMON_REQRESET triggered by detection of the lower limit delay. It notifies the error to VMON.

Figure 11.15 shows the flowchart of starting up DMON. DMON begins to operate after VMON starts up and the Clock Monitor confirms that MainOSC clock is normally operating. The user must invoke DMON after starting up VMON, checking Clock Monitor whether MainOSC clock is normally operating, and resetting DMON. After DMON starts up, the system clock needs to be changed to PLL and the clock gear up is carried out.

The timing chart of DMON operation is shown in **Figure 11.16**.

When Power On Reset, System Reset 1/2, DeepSTOP Reset or DMON Reset (RESDMON = 1) is asserted, DMON is also initialized by these resets. After restart from the reset, the start-up sequence needs to be executed again.



Note 1. Refer to **Section 11.3**.

Note 2. Refer to **Section 14, Clock Monitor (CLMA)**.

Note 3. Refer to **Section 11.4.7.4**.

Note 4. Refer to **Section 11.4.7.2**.

Note 5. Refer to **Section 13, Clock Controller**.

Figure 11.15 Flowchart of the DMON Start-Up

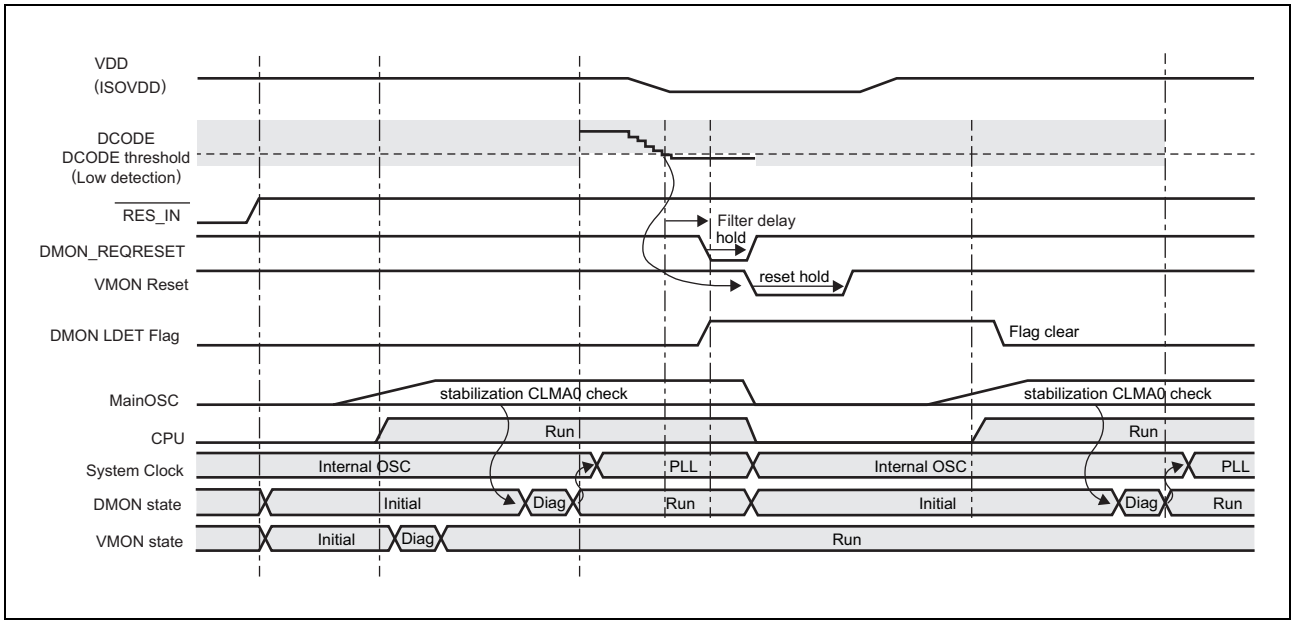


Figure 11.16 Timing Chart of the DMON Function

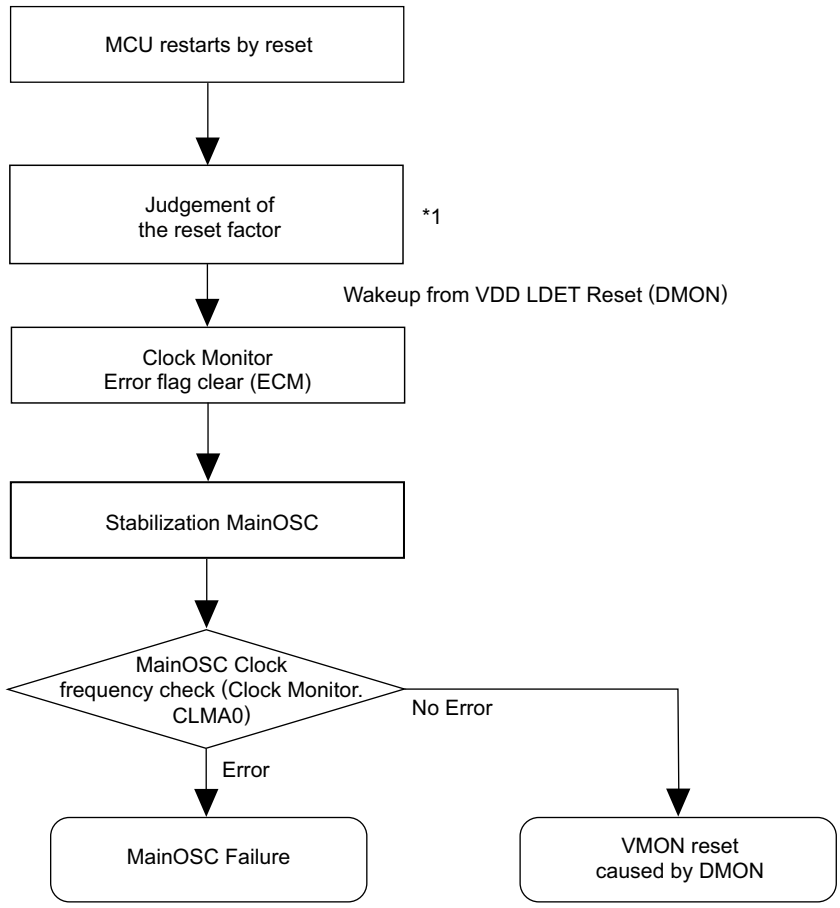
DMON generates the sampling period from MainOSC clock (CLK_MOSC). If the frequency of MainOSC is faster than the spec, the DCODE will become smaller than expected value due to shortening of sampling period. Therefore, there is a possibility that DMON detects the delay error before the error detection of clock monitor for MainOSC and the MCU is initialized by VMON Reset. If the user distinguishes between the failure of MainOSC and the reset factor caused by DMON error after the MCU restarts from VMON Reset, the user needs to confirm DMON error flag and check the frequency of MainOSC by clock monitor (CLMA0). **Figure 11.17** shows the example of flowchart to distinguish the factor.



Note 1. Refer to **Section 11.6.1**.

Figure 11.17 The Example of the Flowchart to Distinguish the Failure of Main OSC

(1) DMON Error Detection Flag

DMON sets “1” to DMONF.DMONLVF when the DCODE becomes lower than the low detection threshold level.

The flag can be cleared to “0” by writing in the corresponding bit of DMONFC.

The flag is also cleared by Power On Reset. **Figure 11.18** shows the operation example of DMONF.

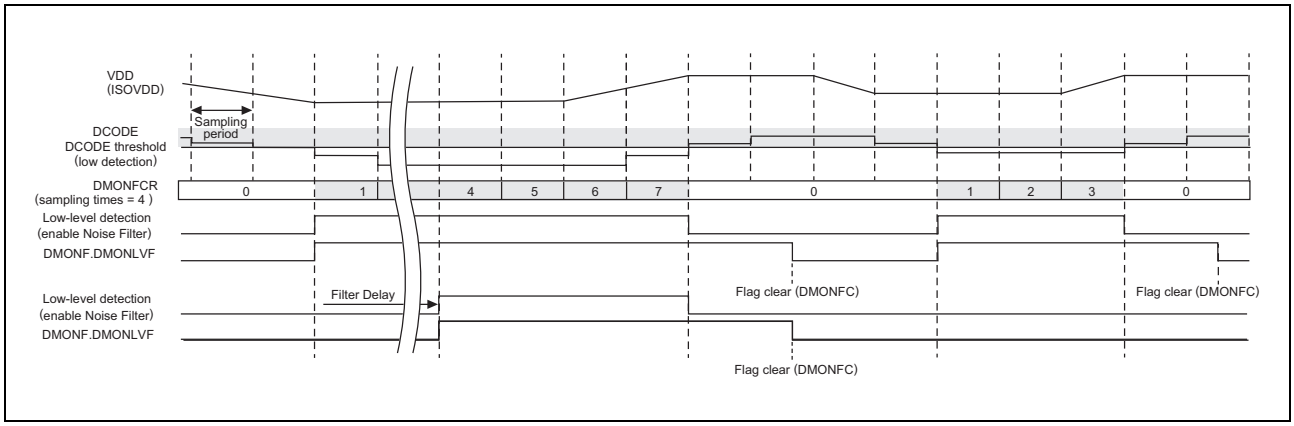


Figure 11.18 DMON Error Detection Flag

(2) DMON_REQRESET Output

If the DCODE value becomes lower than the DCODE threshold level when DMONDE.DMONCIRREN is set to "11_B", DMON notifies VMON that the DMON_REQRESET has occurred. After that, VMON Reset occurs and the MCU including DMON is initialized. DMON continues to hold the DMON_REQRESET state until DMON is initialized by VMON Reset. **Figure 11.19** shows the operation example of the DMON_REQRESET.

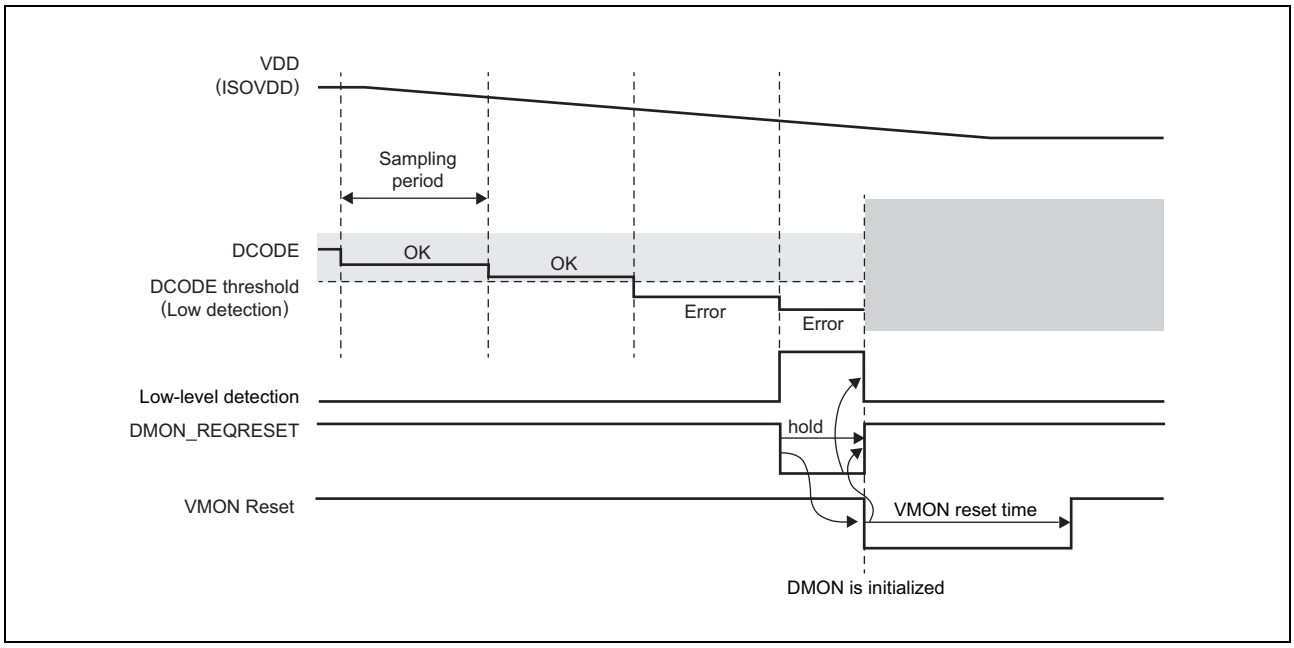

Figure 11.19 DMON_REQRESET Operation

(3) The Digital Noise Filter

The output signal of the DMON comparators passes through a digital noise filter to remove unintended glitches.

Whether to use filtered output or to bypass the filter is selectable by DMONDE.DMONFLTEN.

The Digital noise filter period can be changed by DMONFCR register.

11.4.7.2 Diagnosis Function

(1) Change of DMON detection level for the error injection

When DMONDIAGME.DMONDIAGME is set to “0”, Lower limit delay threshold level can be changed by DMONDIAG.DMONDIAGL.

DMON error detection signal can be intentionally generated by setting this register when VMON didn’t detect the voltage error and the clock monitor CLMA0 didn’t detect the frequency abnormalities.

(2) Mask of DMON_ERROROUT and DMON_REQRESET

When DMONDIAGME.DMONDIAGME is set to “0” and DMONDMASK.DMONERRMD is set to “1”, DMON_ERROROUT can be masked.

When DMONDIAGME.DMONDIAGME is set to “0” and DMONDMASK.DMONRESMD is set to “1”, DMON_REQRESET can be masked.

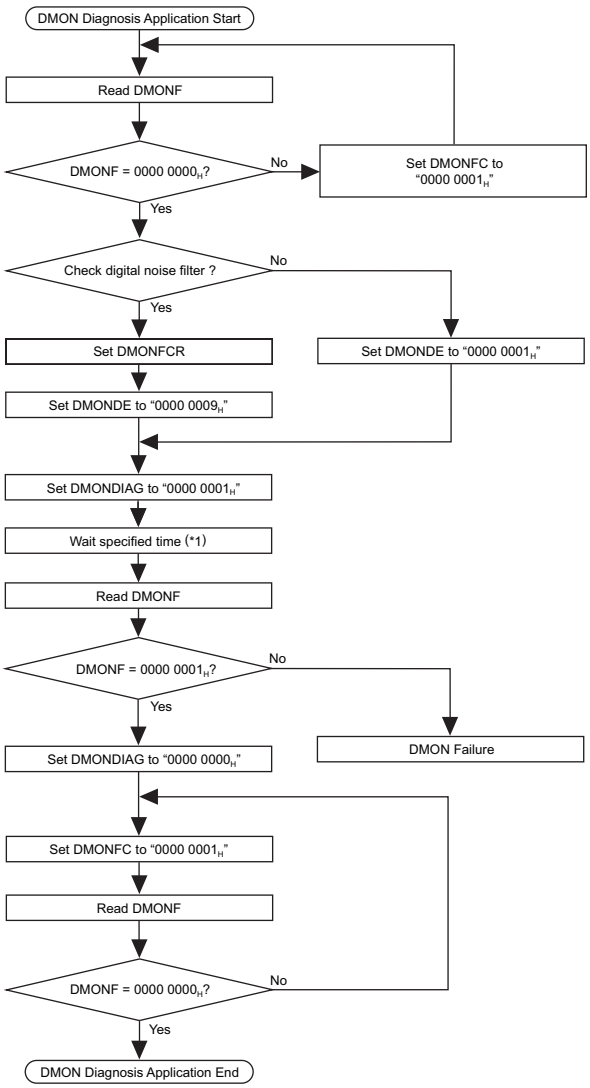
(3) The flow of DMON diagnosis application

DMONDIAGME.DMONDIAGME is initialized to “0” by Power On Reset, System Reset 1/2, DeepSTOP Reset or DMON Reset (RESDMON = 1). So DMON diagnosis function is enabled at start-up after these resets.

The user’s application controls the diagnostic function by DMONDMASK and DMONDIAG. **Figure 11.20** shows the example of the diagnosis application.

After diagnosis application was over, write “1” to DMONDIAGMEW.DMONDIAGMEW and disable DMON diagnosis function immediately.

This function protects each flag against erroneous operation when each power supply is out of the operating range.



Note 1. The diagnosis test wait time is changed by the filter setting. It is shown in **Table 11.46.**

Figure 11.20 The Example of the Flowchart of DMON Diagnosis Application

Table 11.46 The Wait Time of Diagnosis Test

DMONFCR.DMONFLTW	Wait time
000_B	3 sampling times
001_B	4 sampling times
010_B	6 sampling times
011_B	10 sampling times
100_B	18 sampling times
101_B	34 sampling times
110_B	66 sampling times
111_B	130 sampling times

CAUTION

A sampling period is 5 µs(16 MHz), 4 µs(20/40 MHz), 3.33 µs(24 MHz)

11.4.7.3 Function in Standby

It is necessary to stop the DMON operation before stopping the MainOSC by resetting DMON.DMON can be reset when DMONTEST.RESDMON is set to “1”.

11.4.7.4 Procedures to Reset DMON

DMONTEST.RESDMON can reset Delay Monitor.

[Procedure]

Example case:

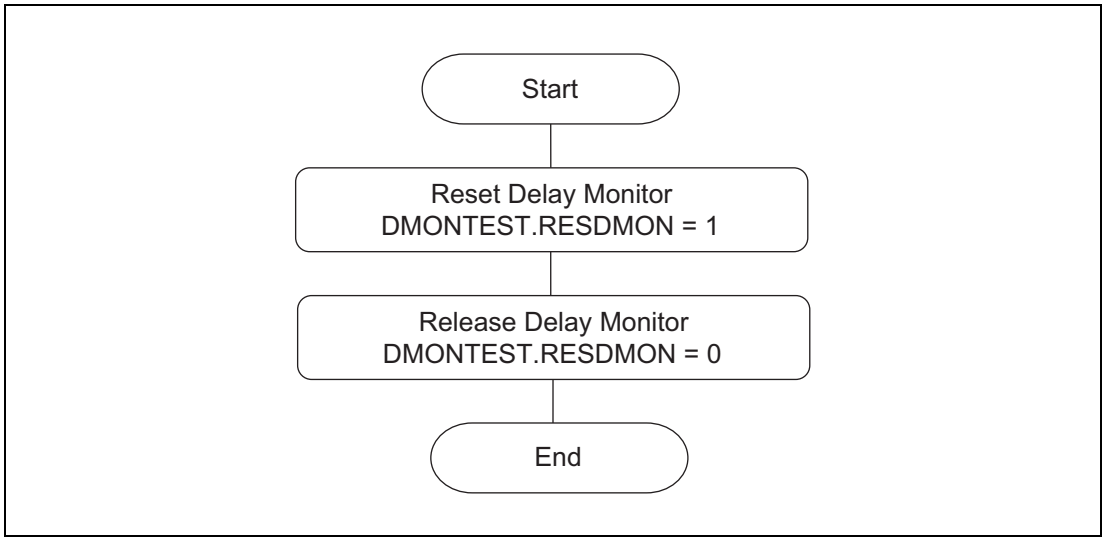


Figure 11.21 Flow Chart to Reset DMON

11.5 RAM Retention Voltage Indicator (Very Low Voltage Indicator, VLVI)

11.5.1 Features

The very-low-voltage detection circuit (VLVI) is used to detect the RAM retention voltage, and continuously compares the power supply voltage SYSVCC with the RAM retention voltage V_{VLVI}.

See **Section 55, Electrical Characteristics** for the specification of the RAM retention voltage level V_{VLVI}.

11.5.2 Clock Supply

The clock supply to the VLVI is shown in the following table.

Table 11.47 Clock Supply

Module Name	Module Clock Name	Supply Clock Name
VLVI	Register access clock	CLK_LSB

11.5.3 Interrupt Requests and Error Notifications

This module has no interrupt and sDMA / DTS requests.

This module has no error notifications to ECM.

11.5.4 External Input/Outputs

This module has no external input/output pins.

11.5.5 Registers

11.5.5.1 List of Registers

The register list related to VLVI is shown in **Table 11.48**.

Table 11.48 List of Registers (VLVI)

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other

VLVFC	√	√	—	—	—	—	—
VLVIKCPROT	√	√	√	—	√	—	—

11.5.5.2 VLVF — Very-Low-Voltage Detection Register

The very-low-voltage detection register (VLVF) shows the state of the RAM retention voltage detection.

This register is set upon detection of a voltage below the RAM retention voltage (V_{VLVI}).

If VLVF is set, the retention RAM content cannot be guaranteed.

Access: This register is a read-only register that can be read in 8-bit units.

Address: FF98 3300$_H$

Value after reset: 01$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VLVF
Value after reset	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R

Table 11.50 VLVF Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	VLVF	Very-Low-Voltage Detection Flag 0: Very-low-voltage is not detected. 1: Very-low-voltage is detected.

11.5.5.3 VLVFC— Very-Low-Voltage Detection Clear Register

This register clears the VLVF.VLVF bit.

Access: This register is a write-only register that can be written in 8-bit units.

Address: FF98 3308$_H$

Value after reset: 00$_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	VLVFC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 11.51 VLVFC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	VLVFC	Clear VLVF.VLVF bit. 0: Do not clear 1: Clear

11.5.5.4 VLVIKCPROT — VLVI Register Key Code Protection Register

The VLVIKCPROT register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units

Address: FF98 3F40$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 11.52 VLVIKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0 *1.
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writes to protected registers.
Write A5A5A501$_H$ to this register to enable writes to protected registers.

11.5.6 Operation

If the power supply voltage SYSVCC does not fall below V_{VLVI}, the content of the retention RAM (RRAM) is retained. See **Section 9.5.2, Reset Sources**.

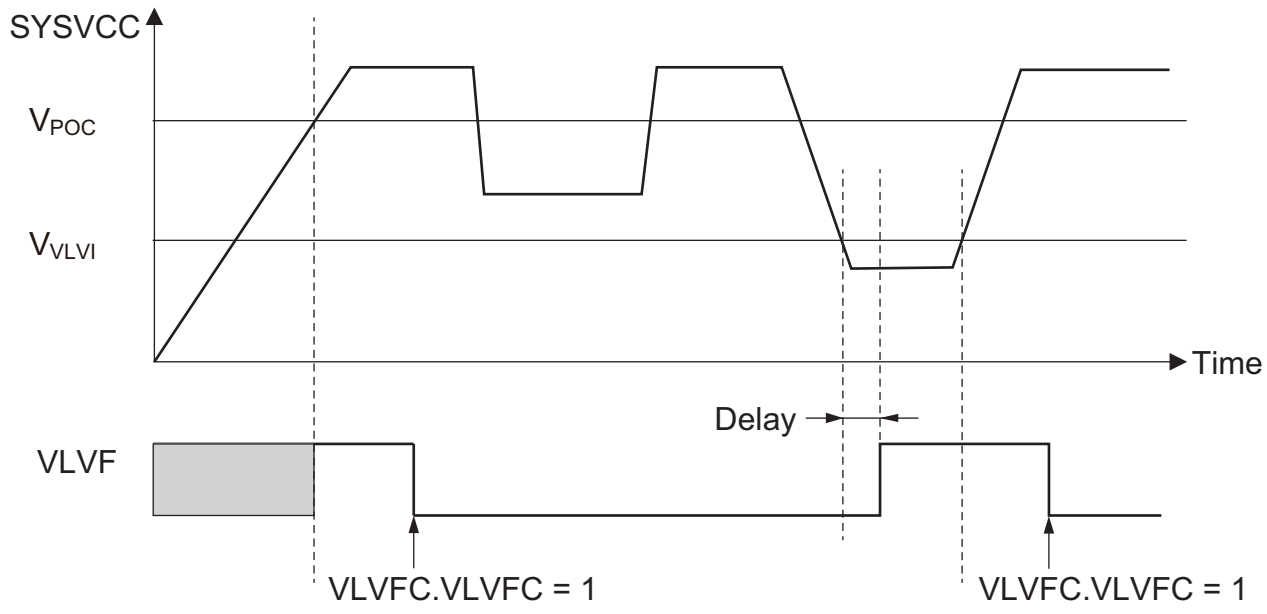
If SYSVCC falls below V_{VLVI}, the RRAM content cannot be guaranteed. Thus the entire RRAM must be restored before continuing operation.

If SYSVCC falls below the RAM retention voltage (SYSVCC < V_{VLVI}), the VLVF.VLVF bit is set.

After that, even if SYSVCC exceeds V_{VLVI}, the VLVF.VLVF bit is not cleared automatically. It is cleared by

- setting VLVFC.VLVFC bit to 1.

The following **Figure 11.22** illustrates the timing of VLVF.



Note: Delay:
When SYSVCC falls below V_{VLVI}, the VLVF bit is set to 1 after a certain delay.
See **Section 55, Electrical Characteristics** for delay time.

Figure 11.22 VLVF Operation Timing

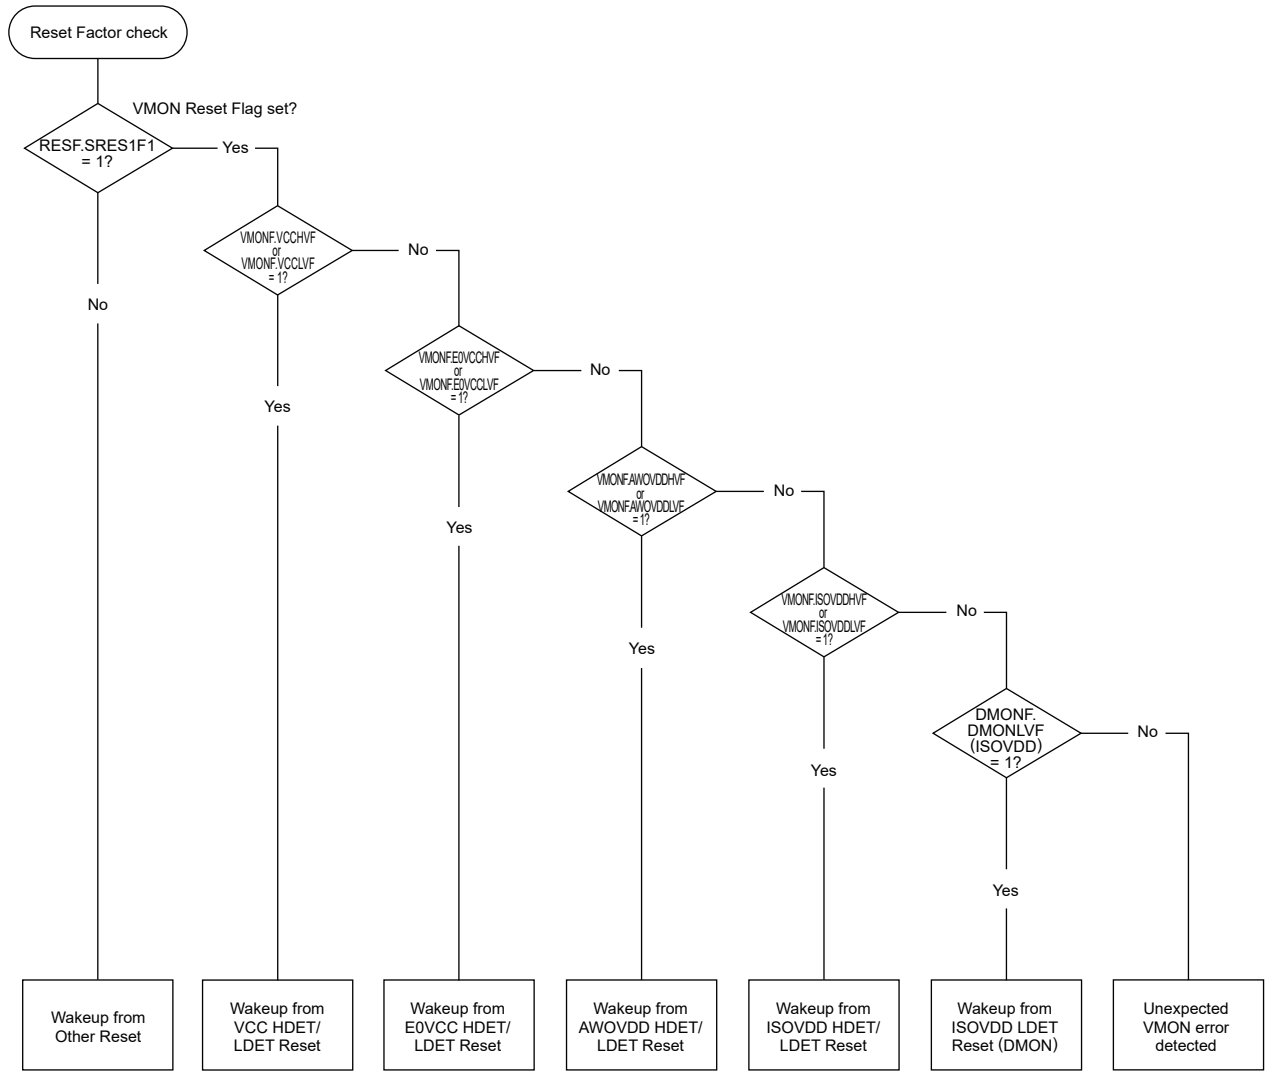
11.6 Usage Notes

11.6.1 Judgment Method of the Reset Factors for Voltage Monitor

If RESF.SRES1F1 bit is “1”, it can be known that wake-up from VMON Reset occurs.

Check the VMONF and DMONF for the detection power.

Judgment method of the reset factors is shown in **Figure 11.23**.



Note: If high voltage or low voltage of multiple power supplies is detected, the corresponding flag is set.

Figure 11.23 Flowchart of Reset Factor Result

12.1.3 Clock Supply

The clocks supplied to the temperature sensor are listed in the following table.

Table 12.3 Clock Supply

Unit Name	Unit Clock Name	Clock Name
OTS0	Operation clock	CLK_LSB
	Register access clock	CLK_LSB

12.1.4 Interrupt Requests and Error Notifications

The temperature sensor interrupt requests are listed in the following table.

Table 12.4 Interrupt Requests

Unit Interrupt Name	Unit Interrupt Signal Outline	Interrupt Number
INTOTSOTE	Temperature sensor error interrupt	657
INTOTSOTI	Temperature measurement end interrupt	658
INTOTSOTULI	Triggered if the state machine changes the state due to a temperature rise or drop in the guaranteed temperature range	659

The temperature sensor error notifications are listed in the following table.

Table 12.5 Error Notifications

Error Name	Description	Error number	Error response
Temperature sensor error	Abnormal temperature error (OTABE)	76	—

12.1.5 Reset Sources

The registers that constitute the temperature sensor are initialized by the reset sources listed below.

Table 12.6 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
OTS0	All registers	√	√	√	√	√	—	—

12.1.6 External Input/Output Pins

This module has no external input/output pin.

12.2 Overview

12.2.1 Functional Overview

The following describes the features of the temperature sensor.

- Temperature data register
  A temperature data register stores a temperature measurement value.
- Temperature measurement mode
  Single measurement mode: Used to measure temperature only once.
  Continuous measurement mode: Used to measure temperature continuously.
- Supporting temperature measurement end interrupt
  Each time temperature measurement ends, the temperature sensor can generate an interrupt request (INTOTSOTI) to be sent to the INTC.
- Supporting abnormal temperature error signal and temperature rise/drop interrupt
  Six temperature threshold values (high-temperature border AU > high-temperature border AL > high-temperature border BU > high-temperature border BL > low-temperature border AU > low-temperature border AL) should be set in advance. Furthermore, the temperature sensor has four temperature states (high temperature A, high temperature B, normal temperature, and low temperature A). The temperature state is updated at each temperature measurement according to six temperature threshold values. The following describes the conditions for generating an abnormal temperature error signal and a temperature rise/drop interrupt.
  - An abnormal temperature error signal (OTABE) is output at a transition from a state other than high temperature A to high temperature A or at a transition from a state other than low temperature A to low temperature A.
  - A temperature rise/drop interrupt (INTOTSOTULI) is output at a transition from high temperature A to high temperature B or normal temperature, or at a transition from high temperature B to normal temperature, that is, when the temperature drops.
  - A temperature rise/drop interrupt (INTOTSOTULI) is output at a transition from low temperature A to high temperature B or normal temperature, or at a transition from normal temperature to high temperature B, that is, when the temperature rises.

Temperature status can be monitored by reading the temperature status register.

- Diagnosis function
  When temperature is measured in continuous measurement mode, if the difference between the measured value and the previously measured value is larger than the specified temperature difference limit value, a temperature sensor error interrupt (INTOTSOTE) is output.
- Reducing errors by temperature correction
  Three temperature correction coefficients are stored during device manufacturing in coefficient registers A to C.

12.2.2 Block Diagram

Figure 12.1 shows a block diagram of the temperature sensor.

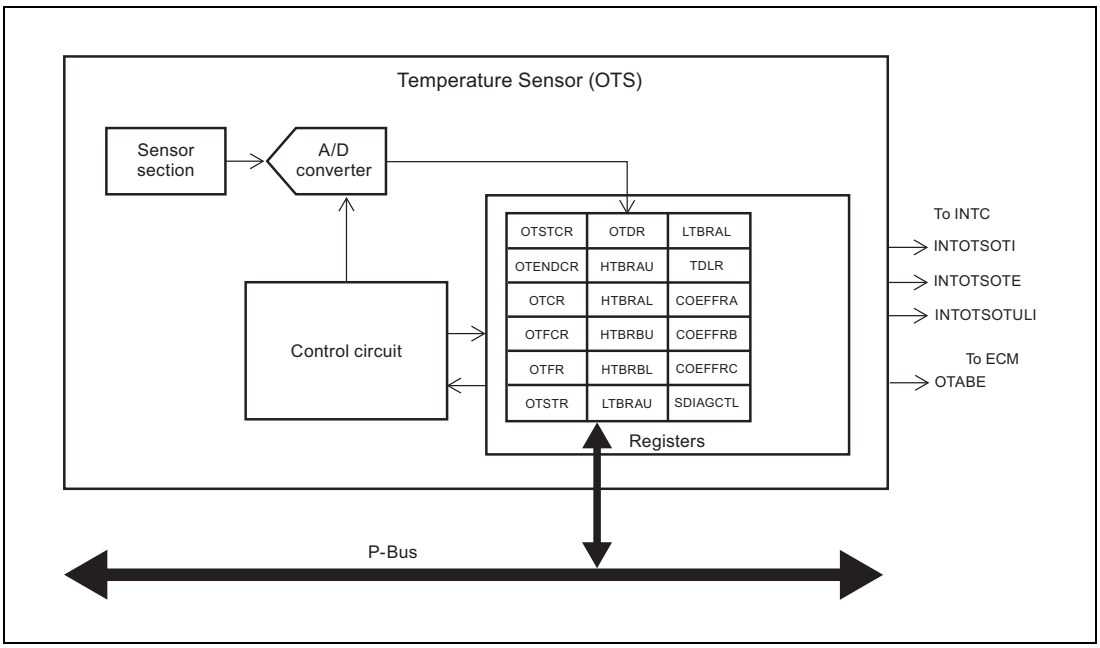

Figure 12.1 Temperature Sensor Block Diagram

12.3 Register

12.3.1 List of Registers

The following table lists the registers of the temperature sensor.

<OTS0_base> is defined in **Section 12.1.2, Register Base Addresses**.

Table 12.7 List of Registers

Unit Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
OTS0	Temperature measurement start control register	OTS0OTSTCR	<OTS0_base> +00_H	8	PBG6L0#2	—

12.3.2 OTS0OTSTCR — Temperature Measurement Start Control Register

OTS0OTSTCR is an 8-bit write-only control register to start the temperature sensor.

Access: This register can be written in 8-bit units.

Address: <OTS0_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OTST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 12.8 OTS0OTSTCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OTST	Temperature Measurement Start Condition for starting temperature measurement by OTST. Write 1 to OTST when OTACT = 0

12.3.3 OTS0OTENDCR — Temperature Measurement End Control Register

OTS0OTENDCR is an 8-bit write-only control register to terminate the temperature sensor.

Access: This register can be written in 8-bit units.

Address: <OTS0_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OTEND
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 12.9 OTS0OTENDCR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	OTEND	Temperature Measurement End Condition for terminating temperature measurement by OTEND. Write 1 to OTEND and then wait for 2 cycles of the OTS clock.

12.3.4 OTS0OTCR — Temperature Sensor Control Register

OTS0OTCR is an 8-bit readable/writable register to control the temperature sensor.

Access: This register can be read or written in 8-bit units.

Address: <OTS0_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	OTEE	OTULIE	OTABEE	SDE	OTMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 12.10 OTS0OTCR Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	OTEE	Temperature Sensor Error Enable 0: Disabled 1: Enabled When OTMD = 0 (single measurement mode) or SDE = 0 (diagnosis disabled), no temperature sensor error is generated regardless of the OTEE setting.
3	OTULIE	Temperature Rise/Drop Interrupt Enable 0: Disabled 1: Enabled
2	OTABEE	Temperature Alarm Error Enable 0: Disabled 1: Enabled
1	SDE	Diagnosis Enable 0: Disabled 1: Enabled When OTMD = 0 (single measurement mode), diagnosis is not performed regardless of the SDE setting.
0	OTMD	Temperature Measurement Mode 0: Single temperature measurement mode 1: Continuous temperature measurement mode

CAUTION

To prevent malfunction, set OTS0OTCR while the OTACT bit in OTS0OTFR is 0.

12.3.5 OTS0OTFCR — Temperature Sensor Flag Clear Register

OTS0OTFCR is an 8-bit write-only register to clear the OTS0OTFR register.

Access: This register can be written in 8-bit units.

Address: <OTS0_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDERC	—	OTFC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	W	R	W

Table 12.11 OTS0OTFCR Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When writing, write the value after reset.
2	SDERC	Diagnosis Error Clear Writing 0: Does not clear the diagnosis error. Writing 1: Clears the diagnosis error.
1	Reserved	When writing, write the value after reset.
0	OTFC	Temperature Measurement End Flag Clear Writing 0: Does not clear the temperature measurement end flag. Writing 1: Clears the temperature measurement end flag.

12.3.6 OTS0OTFR — Temperature Sensor Flag Register

OTS0OTFR is an 8-bit read-only register to indicate temperature sensor flags.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <OTS0_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	SDER	OTACT	OTF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 12.12 OTS0OTFR Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	When read, the value after reset is returned.
2	SDER	Diagnosis Error Setting condition A diagnosis error occurred. Clearing condition Write SDERC to 1 in OTS0OTFCR
1	OTACT	Temperature Sensor Status 0: The temperature sensor is in the idle state. 1: The temperature sensor is operating.
0	OTF	Temperature Measurement End Flag Setting condition A temperature measurement value is written to OTS0OTDR. Clearing condition Write OTFC to 1 in OTS0OTFCR. Reading of the OTS0OTDR register.

CAUTION

SDER is updated when a temperature measurement value is written to OTS0OTDR.

12.3.7 OTS0OTSTR — Temperature Status Register

OTS0OTSTR is an 8-bit read-only register to indicate temperature sensor status.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <OTS0_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TSTAT[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 12.13 OTS0OTSTR Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned.
1, 0	TSTAT[1:0]	Temperature Status 00: Normal temperature (value after reset) 01: High temperature B 10: High temperature A 11: Low temperature A When temperature is measured, temperature status is determined by the temperature measurement value and the status is reflected in TSTAT[1:0]. **Figure 12.2** shows the status transitions of TSTAT. **Table 12.14** shows the temperature alarm error and temperature rise/drop interrupt generating conditions.

CAUTION

The TSTAT[1:0] bits are updated when a temperature measurement value is written to OTS0OTDR.

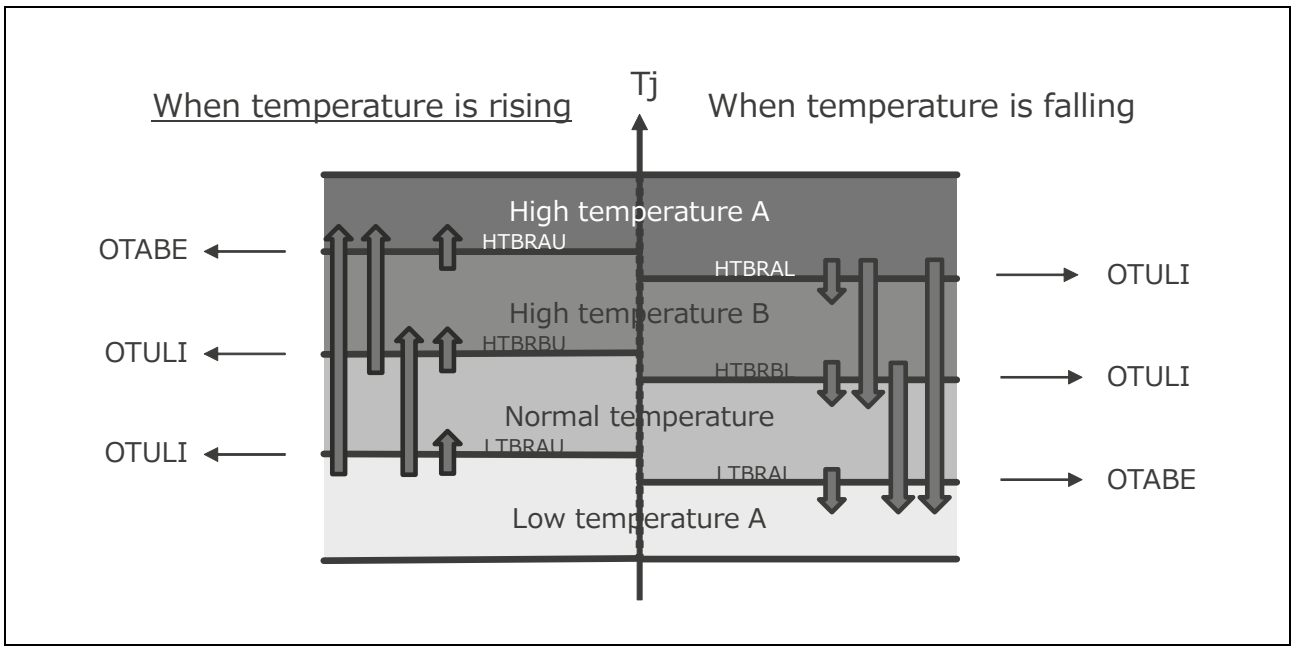

Figure 12.2 Temperature Status and Transition States

Table 12.14 Conditions for Generating Abnormal Temperature Error and Temperature Rise/Drop Interrupts

		After Status Transition			
		High temp. A	**High temp. B**	**Normal temp.**	**Low temp. A**
Before status transition	High temp. A	N/A	INTOTSOTULI	INTOTSOTULI	OTABE
	High temp. B	OTABE	N/A	INTOTSOTULI	OTABE
	Normal temp.	OTABE	INTOTSOTULI	N/A	OTABE
	Low temp. A	OTABE	INTOTSOTULI	INTOTSOTULI	N/A

[Legend]

OTABE: Occurrence of Abnormal temperature error

INTOTSOTULI: Occurrence of temperature rise or drop interrupt

N/A: Neither OTABE nor INTOTSOTULI occurs.

12.3.8 OTS0OTDR — Temperature Data Register

OTS0OTDR is a 16-bit read-only register that stores a temperature measurement value.

Access: This register is a read-only register that can be read in 16-bit units.

Address: <OTS0_base> + 18_H

Value after reset: 0000_H

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OTD*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

↑

Decimal point position

Note 1. OTD[15]: Sign bit (always 0)

Table 12.15 OTS0OTDR Register Contents

Bit Position	Bit Name	Function
15 to 0	OTD	Temperature Data Value These bits specify a value for temperature data. OTD[15] is always 0. The temperature can be calculated by the following formula. $T = AX^2 + BX + C$ – T[K]: Temperature value after correction – X: OTS0OTDR – A to C: Correction coefficients A to C Refer to **Section 12.3.12, OTS0COEFFRn — Coefficient n Register (n = A, B, C)**.

NOTE

When the CPU reads the register while the temperature sensor module is updating the register, the value before updating will be read. **Figure 12.3, Example of Temperature Measurement Operation (Single Measurement Mode)** shows the updating of this register.

12.3.9 OTS0HTBRmn — High-Temperature Border mn Register (m = A or B, n = U or L)

OTS0HTBRmn is a 16-bit readable/writable register to specify the temperature border of high temperature m.

Access: This register can be read or written in 16-bit units.

Address: OTS0HTBRAU: <OTS0_base> + $1C_H$, OTS0HTBRAL: <OTS0_base> + 20_H
OTS0HTBRBU: <OTS0_base> + 24_H, OTS0HTBRBL: <OTS0_base> + 28_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	HTBmn*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. HTBmn[15]: Sign bit (always 0)

Table 12.16 OTS0HTBRmn Register Contents

Bit Position	Bit Name	Function
15 to 0	HTBmn	High-Temperature Border mn These bits specify the high-temperature border mn. Specify it so that the following condition is met. OTS0HTBRAU > OTS0HTBRAL > OTS0HTBRBU > OTS0HTBRBL > OTS0LTBRAU > OTS0LTBRAL The HTBmn format is the same as the OTS0OTDR format. HTBmn[15] is always 0. For details, see **Section 12.3.7, OTS0OTSTR — Temperature Status Register**.

CAUTION

To prevent malfunction, set OTS0HTBRmn while the OTACT bit in OTS0OTFR is 0.

The new calculation of the border registers has to be done according to the reverse quadratic equation of the temperature register

$T = AX^2 + BX + C$

- [K]: Temperature value after correction
- X: OTS0OTDR
- A to C: Correction coefficients A to C

This leads to the formula:

$$X = \left(\frac{-B + \sqrt{B^2 - 4A \times (C - T)}}{2A} \right)$$

A, B, C = Correction coefficients A to C

(= decimalpoint - corrected raw value of CoeffRegisters (= raw value shifted right by 4)

T = Temperature [in K]

X = BorderRegister

Example:

- OTS0COEFFRA = 2106_H, OTS0COEFFRB = $2D87_H$, OTS0COEFFRC = 0040_H
- Temperature Border = 153°Celsius

→

- A = OTS0COEFFRA/(2^4) = 528.375
- B = OTS0COEFFRB/(2^4) = 728.4375
- C = OTS0COEFFRC/(2^4) = 4

$$X = \frac{-728.4 + \sqrt{728.4^2 - 4 \times 528.4 \times (4 - (153 + 273.15))}}{2 \times 528.4} = 0.43942$$

This value has to be decimal point corrected = multiplied with 2^{15}.

Calculated High Temperature Border Register:

OTS0HTBRmn = 0.43942×2^{15} = 14399

12.3.10 OTS0LTBRAn — Low-Temperature Border An Register (n = U or L)

OTS0LTBRAn is a 16-bit readable/writable register to specify the temperature border of low temperature A.

Access: This register can be read or written in 16-bit units.

Address: OTS0LTBRAU: <OTS0_base> + $2C_H$, OTS0LTBRAL: <OTS0_base> + 30_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LTBAn*1															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. LTBAn[15]: Sign bit (always 0)

Table 12.17 OTS0LTBRAn Register Contents

Bit Position	Bit Name	Function
15 to 0	LTBAn	Low-Temperature Border An These bits specify the low-temperature border An. Specify it so that the following condition is met. OTS0HTBRAU > OTS0HTBRAL > OTS0HTBRBU > OTS0HTBRBL > OTS0LTBRAU > OTS0LTBRAL The LTBAn format is the same as the OTS0OTDR format. LTBAn[15] is always 0. For details, see **Section 12.3.7, OTS0OTSTR — Temperature Status Register**.

CAUTION

To prevent malfunction, set OTS0LTBRAn while the OTACT bit in OTS0OTFR is 0.

12.3.11 OTS0TDLR — Temperature Difference Limiting Register

OTS0TDLR is a 16-bit readable/writable register to specify the temperature difference limit value for diagnosis.

Access: This register can be read or written in 16-bit units.

Address: <OTS0_base> + 34_H

Value after reset: $7FFF_H$

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. TDL[15]: Sign bit (always 0)

Table 12.18 OTS0TDLR Register Contents

Bit Position	Bit Name	Function
15 to 0	TDL	Temperature Difference Limit Value These bits specify a value for limiting the temperature difference between present temperature measurement value and previous temperature measurement value in continuous measurement mode. When the following condition is met, SDER (diagnosis error) is set to 1. OTS0TDLR < | present temperature measurement value – previous temperature measurement value | To calculate from the temperature, calculate back from the formula described in the OTS0COEFFRn register ($T[K] = AX^2 + BX + C$). For details, see **Section 12.3.12, OTS0COEFFRn — Coefficient n Register (n = A, B, C)**.The TDL format is the same as the OTS0OTDR format. TDL[15] is always 0. For details, see **12.3.7, OTS0OTSTR — Temperature Status Register**.

CAUTION

To prevent malfunction, set OTS0TDLR while the OTACT bit in OTS0OTFR is 0.

12.3.12 OTS0COEFFRn — Coefficient n Register (n = A, B, C)

OTS0COEFFRn is a 16-bit read-only register to store coefficients for correction calculation.

Coefficients are stored in OTS0COEFFRn during device manufacturing.

Access: This register is a read-only register that can be read in 16-bit units.

Address: OTS0COEFFRA: <OTS0_base> + 38_H, OTS0COEFFRB: <OTS0_base> + $3C_H$, OTS0COEFFRC: <OTS0_base> + 40_H

Value after reset: The initial value will be stored at delivery inspection for each devices

Signed fixed-point format

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. COEFF[15]: Sign bit

Table 12.19 OTS0COEFFRn Register Contents

Bit Position	Bit Name	Function
15 to 0	COEFF[15:0]	Coefficients Value for correction calculation These bits specify a value for coefficients Value.

- Reducing errors by temperature correction
  Three temperature correction coefficients are stored during device manufacturing in coefficient registers A to C.
  Errors in temperature measurement values can be reduced by making a correction by using the temperature correction calculation formula that uses the temperature correction coefficients. However, temperature corrections must be made by the CPU. By using this process, the Temperature Border setting can be improved.
- Correction calculation formula: $T[K] = AX^2 + BX + C$
  − T: Temperature value after correction
  − X: Temperature value before correction (OTS0OTDR)
  − A to C: Coefficients A to C (OTS0COEFFRn n = A, B, C)

  For example:
  $OTS0OTDR = 36DA_H$, $OTS0COEFFRA = 2106_H$, $OTS0COEFFRB = 2D87_H$, $OTS0COEFFC = 0040_H$

  $X = OTS0OTDR / (2^{15}) = 0.428528$

  $A = OTS0COEFFRA / (2^4) = 528.375$

  $B = OTS0COEFFRB / (2^4) = 728.4375$

  $C = OTS0COEFFRC / (2^4) = 4$

  $T[°C] = T[K] – 273.15 = AX^2 + BX + C – 273.15 = 140.035$ °C

12.3.13 OTS0SDIAGCTL — Self-Diagnosis Control Register

OTS0SDIAGCTL is an 8-bit readable/writable register to control the input of AD converter for self-diagnosis.

Access: This register can be read or written in 8-bit units.

Address: <OTS0_base> + $A0_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	ADCIN[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ADCIN[1:0]	AD Converter Input Control for Self-Diagnosis. 00: No pull-up/pull-down (normal operation) 01: Pull-down 10: Pull-up 11: Setting prohibited

12.4 Operation

12.4.1 Temperature Measurement Sequence

The temperature sensor is equipped with a Single measurement mode and a Continuous measurement mode.

The measurement start trigger and measurement end trigger of each mode is shown below.

Table 12.21 Measurement Start/End Trigger

Measurement Mode	Measurement Start Trigger	Measurement End Trigger
Single measurement mode OTS0OTCR.OTMD = 0	Write 1_B in OTS0OTSTCR.OTST.	1) Automatic stop after one temperature measurement ends 2) Write 1_B in OTS0OTENDCR.OTEND.*1*2
Continuous measurement mode OTS0OTCR.OTMD = 1	Write 1_B in OTS0OTSTCR.OTST.	Write 1_B in OTS0OTENDCR.OTEND

Note 1. If the temperature measurement has been stopped by the OTS0OTENDCR.OTEND, data during the measurement will be discarded.

Note 2. If the temperature measurement has been stopped by the OTS0OTENDCR.OTEND before the first measurement has been completed, the measurement operation will not output the measurement result at all.

The time until the temperature data is output requires 512 states (9.984 ms) of the OTS clock to convert the measured temperature to digital data.

There is a measurement stabilization period of 3 OTS clock states before the temperature is sampled after the measurement process is started by writing to the OTS0OTSSTCR.OTST bit.

In Single measurement mode, to update the temperature measurement result requires 515 OTS clock states, including the measurement preparation period, until the temperature measurement operation ends.

In Continuous measurement mode, 515 of the OTS clock states, including the 3-state measurement stabilization period, are required only for the first temperature measurement, the second and subsequent updates of the temperature measurement result require 512 states, and the measurement operation is repeated until 1 is written to OTENDCR.OTEND.

12.4.2 Examples of Temperature Measurement Operation

The following figure shows the temperature measurement operation in single measurement mode.

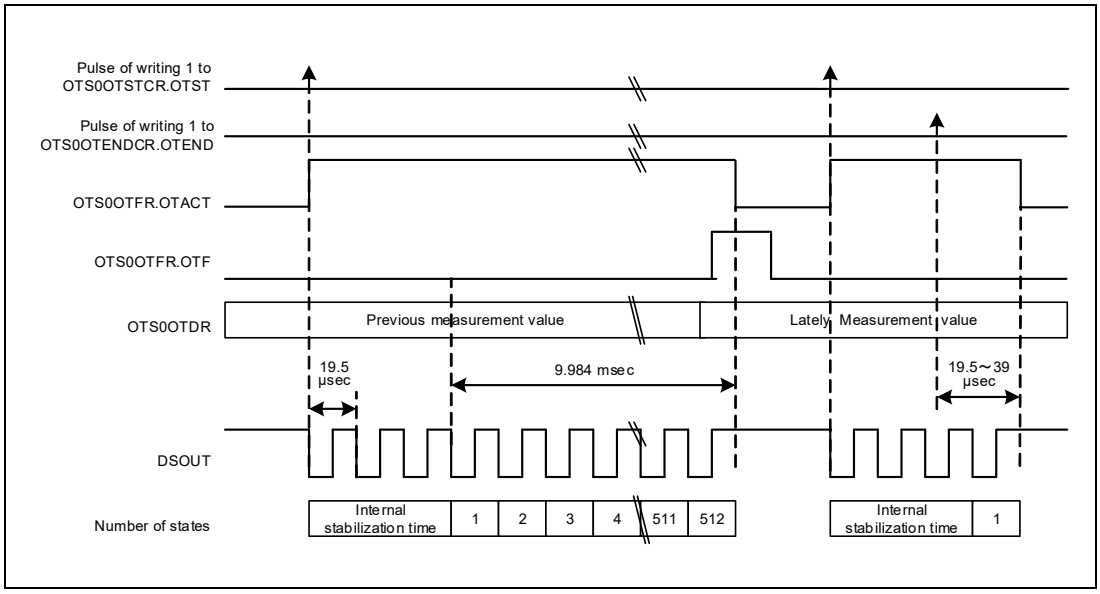

Figure 12.3 Example of Temperature Measurement Operation (Single Measurement Mode)

NOTE

If “1” is written to OTENDCR.OTEND at the time of internal cycle 511 or 512, request INTOTSOTI is issued and OTS0OTFR.OTF is set after updating the temperature measurement result as with the case of automatic stop after the temperature measurement.

DSOUT is the operation clock of the temperature sensor obtained by dividing CLK_LSB.

The period of DSOUT is 19.5 µs (When CLK_LSB 40 MHz)

The following figure shows temperature measurement operation in continuous measurement mode. There is no internal stabilization time in the second and subsequent temperature measurements.

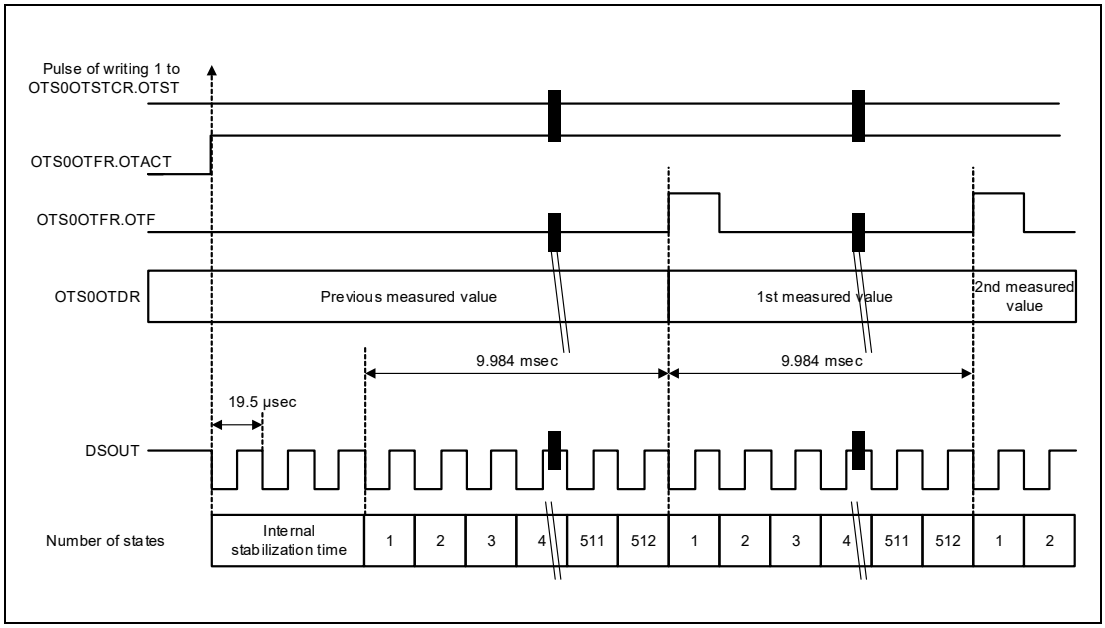

Figure 12.4 Example of Temperature Measurement Operation (Continuous Measurement Mode)

12.4.3 Temperature Measurement End Interrupt Request

The temperature sensor can generate a temperature measurement end interrupt request (INTOTSOTI) to be sent to the INTC. At this time, the OTS0OTFR.OTF is set.

The table below shows the assertion condition and negated conditions of INTOTSOTI and OTS0OTFR.OTF.

Table 12.22 Temperature Measurement End Conditions

Measurement End Notification Signal	Assert Conditions	Negated Conditions	Enable Control
Temperature measurement end interrupt (INTOTSOTI)	Each time temperature measurement ends	After the assertion, one cycle after the register access clock	No enable control bit.
Temperature measurement end flag (OTS0OTFR.OTF)	Each time temperature measurement ends	1) Reading of the OTS0OTDR register 2) Write 1_B in OTS0OTFCR.OTFC	No enable control bit.

For the OTS0OTFR.OTF bit, if the assertion conditions and negated conditions conflict, negated condition takes precedence.

If the temperature measurement has been stopped by the OTS0OTENDCR.OTEND, neither the INTOTSOTI nor the OTS0OTFR.OTF will occur.

However, after writing "1" to the OTS0OTENDCR.OTEND, when the measurement is within 2 OTS clock cycles of being completed, the measurement result is updated and the INTOTSOTI and OTS0OTFR.OTF are asserted.

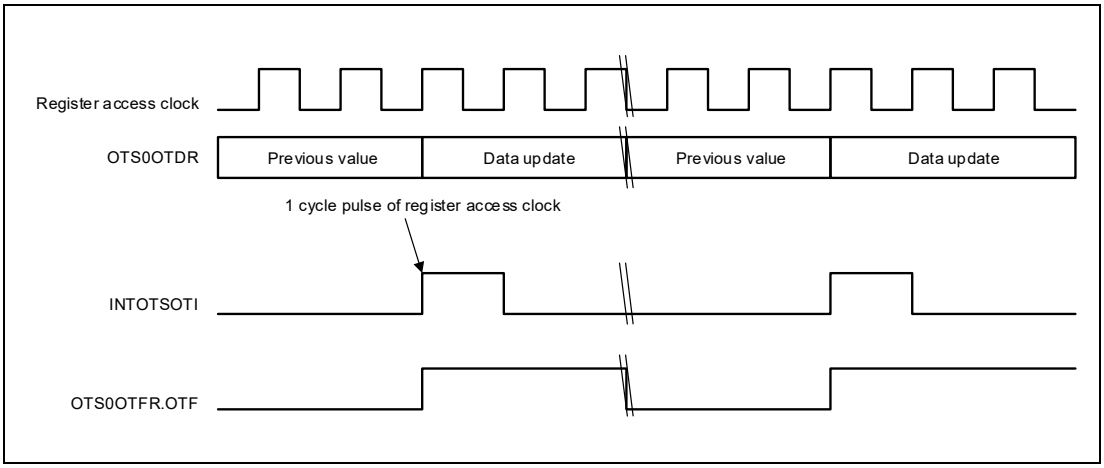

Figure 12.5 Example of Occurrence of a Temperature Measurement End Interrupt

12.4.4 Temperature Alarm Error and Temperature Rise /Drop Interrupt and Temperature Sensor Error Interrupt Requests

The temperature sensor can generate a temperature rise or drop interrupt request (INTOTSOTULI), a temperature sensor error interrupt request (INTOTSOTE) and an abnormal temperature error (OTABE) to be sent to ECM. Setting OTULIE in OTS0OTCR to 1 enables INTOTSOTULI. Setting OTULIE to 0 disables INTOTSOTULI. Setting OTEE in OTS0OTCR to 1 enables INTOTSOTE. Setting OTEE to 0 disables INTOTSOTE. Setting OTABEE in OTS0OTCR to 1 enables OTABE. Setting OTABEE to 0 disables OTABE.

The table below shows the assert conditions and negated conditions of INTOTSOTULI and OTABE.

Table 12.23 Temperature Sensor Interrupts

Temperature State Transition Notification Signal	Assert Conditions	Negated Conditions	Enable Control
Temperature rise or drop interrupt (INTOTSOTULI)	Temperature state transition from a state other than the high temperature B to high temperature B. Temperature state transition from a state other than the normal temperature to normal temperature.	After the assertion, one cycle after the register access clock	OTS0OTCR.OTULIE
Abnormal temperature error (OTABE)	Temperature state transition from a state other than the high temperature A to high temperature A. Temperature state transition from a state other than the low temperature A to low temperature A.	After the assertion, one cycle after the register access clock	OTS0OTCR.OTABEE
Temperature sensor error interrupt (INTOTSOTE)	After the OTDR register is updated, when the difference between the temperature measurements exceeds a set value TDL.	After the assertion, one cycle after the register access clock	OTS0OTCR.OTEE and OTS0OTCR.SDE
Diagnostic error flag (OTS0OTFR.SDER)	After the OTDR register is updated, when the difference between the temperature measurements exceeds a set value TDL.	Write 1B in OTS0OTFCR.SDERC	OTS0OTCR.SDE

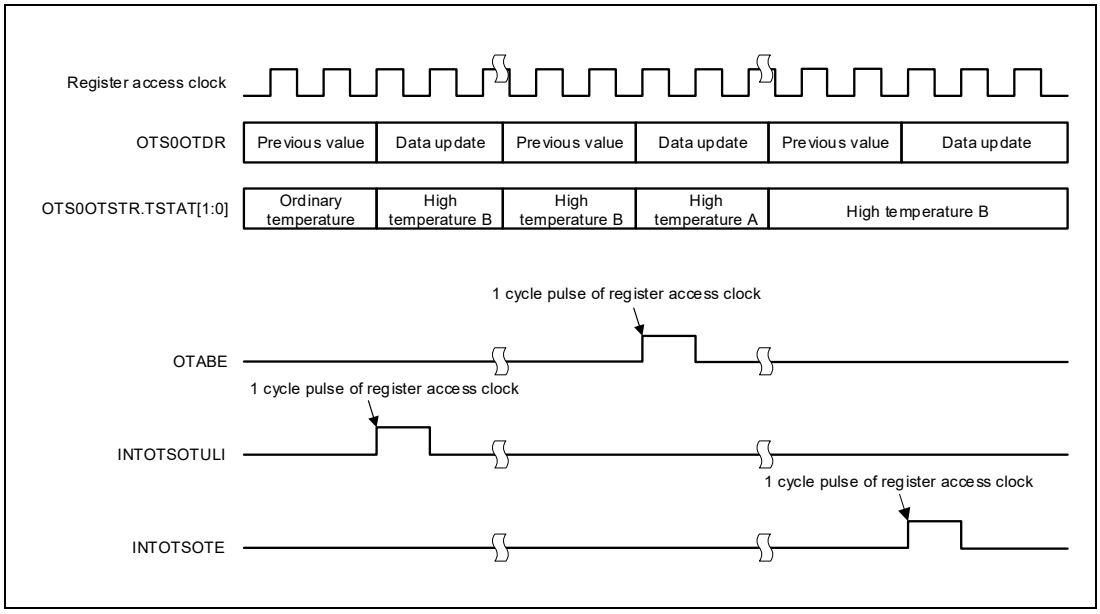

Figure 12.6 Example of Occurrence of a Temperature Alarm Error, a Temperature Rise/Drop Interrupt and a Temperature Sensor Error Interrupt

12.4.5 Self-Diagnosis Sequence

Self-diagnosis of the temperature sensor can be performed by the sequence shown in **Figure 12.7**.

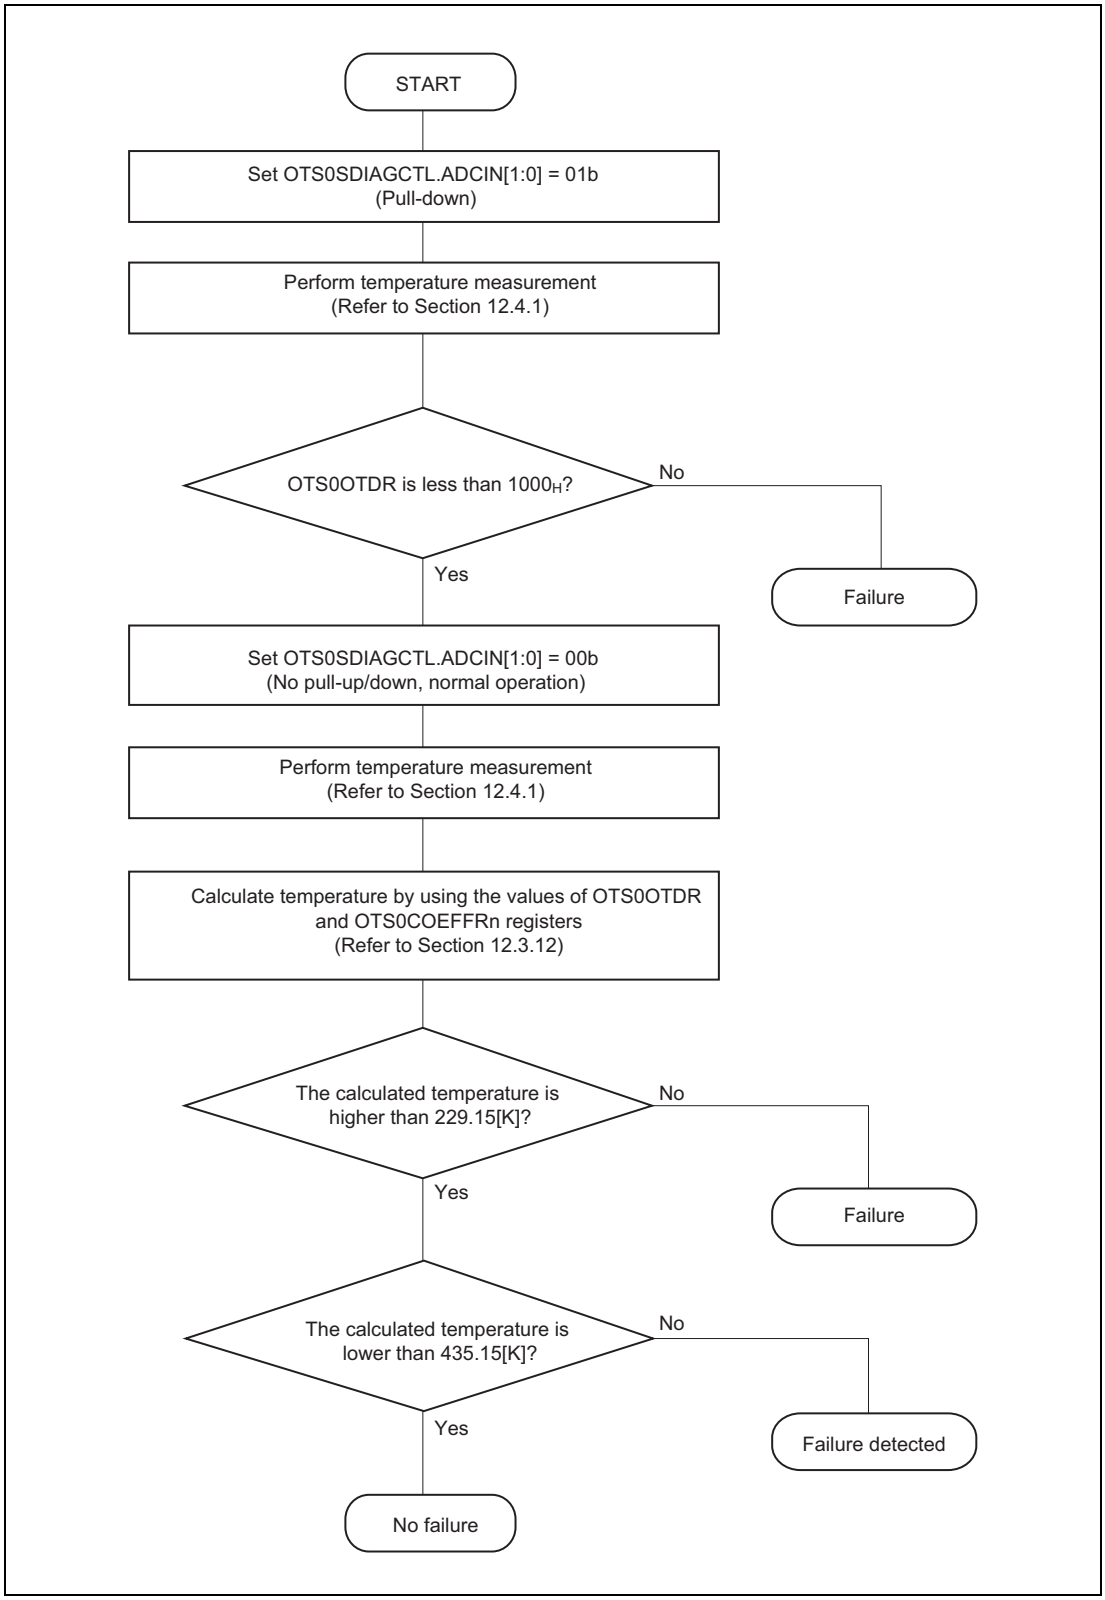

Figure 12.7 Self-Diagnosis Sequence

Section 13 Clock Controller

This section contains a generic description of the clock controller.

The first part in this section describes the specific features of the clock controller of the RH850/U2A-EVA microcontrollers. The ensuing sections describe the clock oscillation circuit, clock selectors, and clock output function that make up the clock controller.

13.1 Features of Clock Controller

The clock controller of the RH850/U2A-EVA microcontrollers has the following features.

- Five on-chip clock oscillators
  - Main Oscillator (Main OSC) with an oscillation frequency of 16, 20, 24, and 40 MHz
  - High Speed Internal Oscillator (HS IntOSC) with a nominal frequency of 200 MHz (Typ.)
  - Low Speed Internal Oscillator (LS IntOSC) with a nominal frequency of 240 kHz (Typ.)
  - High Voltage Internal Oscillator (HV IntOSC) with a nominal frequency of 16 MHz (Typ.)
  - Phase Locked Loop (PLL)

  The configuration of Main OSC, PLL, and HV IntOSC is variable by Option Byte OPBT10, OPBT11, and OPBT4.

  For details of Option Byte, see **Section 51, Flash Memory**, **Table 13.5, CPU System Clock Setting Table**, **Section 13.4.1, Main Oscillator (Main OSC)**, **Section 13.4.4, High Voltage Internal Oscillator (HV IntOSC)**, and **Section 13.4.5, Phase Locked Loop (PLL)**.
- Fine management of clock supply to peripheral modules
- On-chip clock monitor that detects clock anomalies when the Main Oscillator, High Speed Internal Oscillator, Low Speed Internal Oscillator, or PLL are in use. See **Section 14, Clock Monitor (CLMA)**.
- Clock output (FOUT)

13.1.1 External Input/Output Pins

Table 13.1 shows the pins related to the clock controller.

Table 13.1 Pins Related to the Clock Controller

Pin Function Name	Direction	Function
X1	Input	Main OSC crystal resonator/External clock input
X2	Output	Main OSC crystal resonator
EXTCLK0O	Output	Clock output 0 (FOUT)
EXTCLK1O	Output	Clock output 1 (FOUT)

13.2 Type of Clocks

Table 13.2 shows the List of Clock Sources, **Table 13.3** shows the List of Clocks.

Table 13.2 List of Clock Sources

Clock Name	Symbol	Clock Frequency (MHz)			Remarks
Main OSC clock	CLK_MOSC	16, 20, 24, 40			
HS IntOSC clock	CLK_HSIOSC	200			
LS IntOSC clock	CLK_LSIOSC	0.24			
HV IntOSC clock	CLK_HVIOSC	16			
PLL clock	CLK_PLL	800	640	480	Clock source: CLK_MOSC
	CLK_PLLO	800, 400	640, 320	480, 240	Clock source: CLK_PLL
Internal OSC clock	CLK_IOSC	200, 0.24			Clock source: CLK_HSIOSC or CLK_LSIOSC
System clock	CLK_SYS	800, 400	640, 320	480, 240	Clock source: CLK_PLLO
		200, 0.24			Clock source: CLK_IOSC

Table 13.3 List of Clocks

Clock Name	Symbol	Maximum Clock Frequency (MHz)			Remarks
CPU clock	CLK_CPU	400	320	240	The maximum clock frequency depends on the Option Byte CKDIVMD.
System Bus clock	CLK_SBUS	200	160	80	
H-BUS clock	CLK_HBUS	100	80	80	
Peripheral ultra high speed clock	CLK_UHSB	160	160	160	
Peripheral high speed clock	CLK_HSB	80	80	80	
Peripheral low speed clock	CLK_LSB	40	40	40	
RLIN3 comm. clock	CLK_RLIN	80			Refer to "**13.6.4, Clock Settings**" for clock source and divider.
RS-CANFD comm. clock	CLK_RCANOSC	40			
ADCJn (n = 0, 1) conv. clock	CLK_ADC	40			
MSPI comm. clock	CLK_MSPI	80			
ECM delay timer clock	CLK_ECMCNT	10			
WDTBn (n = 0 to 3), SWDTA, ICUM_WDTA0 count clock	CLK_WDT	10			
WDTBA count clock	CLKA_WDT	0.24			
TAUJn (n = 2, 3) operating clock	CLKA_TAUJ	80			
RTCA count clock	CLKA_RTCA	2.5			
ADCJ2 operating clock	CLKA_ADC	40			
Clock output 0 (FOUT)	EXTCLK0O	24			
Clock output 1 (FOUT)	EXTCLK1O	24			
LPS operating clock	CLKA_LPS	10			

Refer to **Table 13.4** about clock operation in chip standby mode.

Table 13.4 Clock Operation in Chip Standby Mode

Power Domain	Clock	STOP	DeepSTOP	Cyclic RUN	Cyclic STOP
AWO	CLK_MOSC	Operable*1	Operable*1	Operable	Operable*1
AWO	CLK_HSIOSC	Operable*1	Operable*1	Operable	Operable*1
AWO	CLK_LSIOSC	Operable	Operable	Operable	Operable
ISO	CLK_PLLO	Operable*1	Inoperable	Inoperable	Inoperable
AWO	CLK_IOSC	Operable	Operable	Operable	Operable
ISO	CLK_SYS	Operable	Inoperable	Operable	Operable
ISO	CLK_CPU	Inoperable	Inoperable	Operable	Inoperable
ISO	CLK_SBUS	Inoperable	Inoperable	Operable	Inoperable
ISO	CLK_HBUS	Inoperable	Inoperable	Operable	Inoperable
ISO	CLK_UHSB	Operable	Inoperable	Operable	Operable
ISO	CLK_HSB	Operable	Inoperable	Operable	Operable
ISO	CLK_LSB	Operable	Inoperable	Operable	Operable

AWO	EXTCLK1O	Operable	Operable	Operable	Operable
AWO	CLKA_LPS	Operable*2	Operable*2	Operable	Operable*2

Note 1. When the Stop Mask Register is set to 1, the oscillator continues operation in chip standby mode.

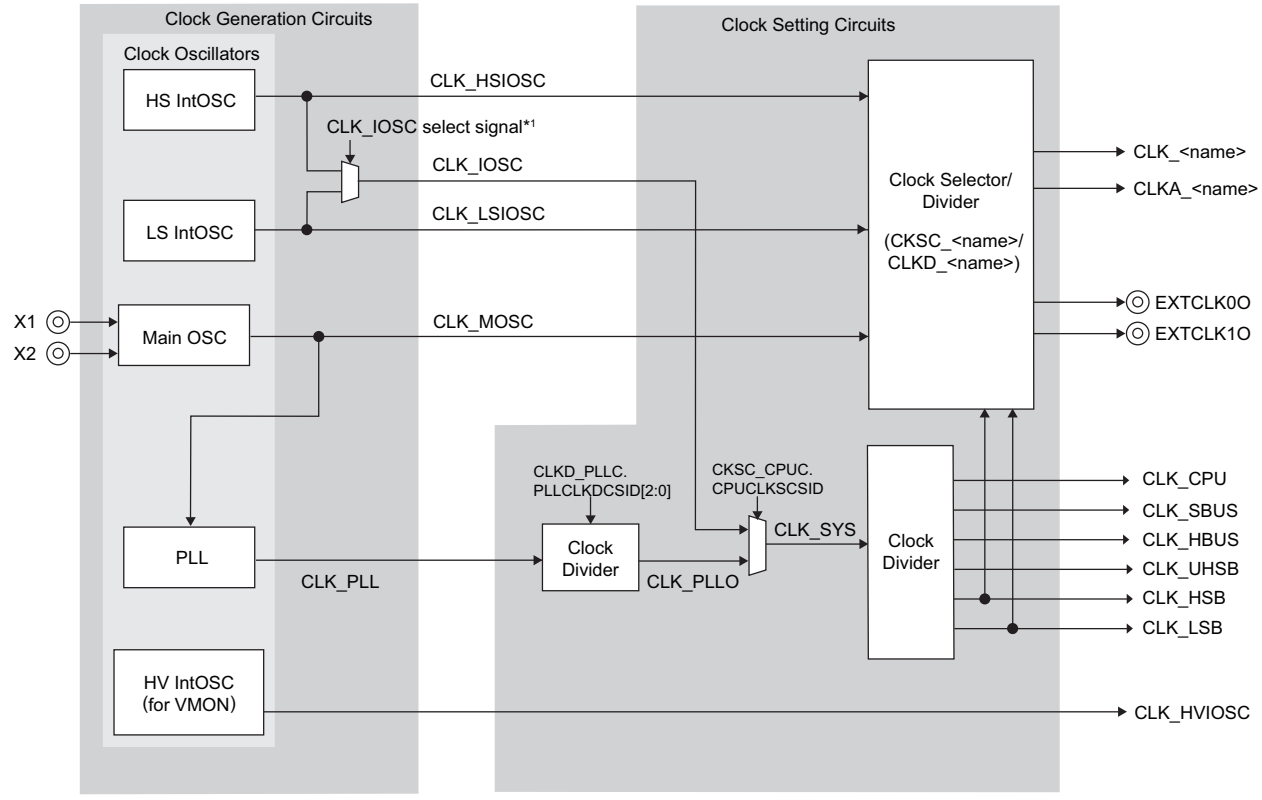
Note 2. When CLK_HSIOSC stops in chip standby mode , CLKA_LPS is CLK_LSIOSC. In other cases, CLKA_LPS is CLK_HSIOSC/20.

13.3 Configuration of Clock Controller

This section describes the configuration of the clock controller.

The clock controller is composed of clock generation circuits including clock oscillators, and clock setting circuits.

Figure 13.1 shows the configuration of the clock controller.



Note 1. For details, see **Section 13.3.1, Clock Generation Circuits, Internal OSC clock (CLK_IOSC)**.

Figure 13.1 Clock Controller Configuration

13.3.1 Clock Generation Circuits

Five clock oscillators are provided:

Four clock oscillators are located in the Always-On area (AWO area) and PLL is located in the Isolated area (ISO area).

Main Oscillator (Main OSC)

The Main OSC generates the clock CLK_MOSC, which runs at a frequency of 16, 20, 24, and 40 MHz. Generation of the clock CLK_MOSC requires the connection of an external resonator to X1 and X2. The clock CLK_MOSC is used as the reference clock for the PLL.

High Speed Internal Oscillator (HS IntOSC)

The HS IntOSC generates the clock CLK_HSIOSC, which runs at a frequency of 200 MHz (Typ.).

Low Speed Internal Oscillator (LS IntOSC)

The LS IntOSC generates the clock CLK_LSIOSC, which runs at a frequency of 240 kHz (Typ.). It starts operation at power up and cannot be stopped, hence it is always operating.

High Voltage Internal Oscillator (HV IntOSC)

The HV IntOSC generates the clock CLK_HVIOSC, which runs at a frequency of 16 MHz (Typ.).

Phase Locked Loop (PLL)

The PLL circuits generate high speed operation clock CLK_PLL for normal operation of the microcontroller.

Internal OSC clock (CLK_IOSC)

This clock is selected from CLK_LSIOSC and CLK_HSIOSC and used as startup clock for System clock (CLK_SYS).
The clock source of CLK_IOSC is CLK_HSIOSC except in the following case. In the following case, the clock source of CLK_IOSC is CLK_LSIOSC.

- CLK_HSIOSC stops in chip standby mode*1

Note 1. For the condition, see **Section 13.4.2, High Speed Internal Oscillator (HS IntOSC)**, HS IntOSC STOP Requests in Chip Standby Mode.

13.3.2 Clock Setting Circuits

The clocks generated by the clock oscillators are input to the clock selectors CKSC _<*name*> and the clock dividers CLKD_<*name*>.

The clocks for the CPU System and the peripheral modules are selected by dedicated clock selectors from clocks directly input from the oscillators, or in some cases from clocks that have been divided by clock dividers.

Note that not all available clocks generated by the clock oscillators are input to each clock selector or clock divider.

CPU System clock (CLK_CPU, CLK_SBUS, CLK_HBUS, CLK_UHSB, CLK_HSB, CLK_LSB)

The System clock (CLK_SYS) is selected from the PLL clock (CLK_PLLO) and the Internal OSC clock (CLK_IOSC) by the CKSC_CPUC register setting, and the CPU System clock (CLK_CPU, CLK_SBUS, CLK_HBUS, CLK_UHSB, CLK_HSB, CLK_LSB) is divided from the System clock (CLK_SYS).

For the CPU System clock setting table, see **Table 13.5**.

Table 13.5 CPU System Clock Setting Table

Clock Source	CLK_IOSC						CLK_PLLO					
	LS IntOSC			HS IntOSC			PLL					
Clock Setting	Register CKSC_CPUC.CPUCLKSCSID *2											
	1_B						0_B					
	Option Byte CKDIVMD *1											
	11_B	10_B	$0X_B$	11_B	10_B	$0X_B$	11_B		10_B		$0X_B$	
	—						Register CLKD_PLLC.PLLCLKDCSID[2:0] *3					
							001B	010B	001B	010B	001B	010B
CLK_CPU (MHz)	0.12	0.12	0.12	100	100	100	400	200	320	160	240	120
CLK_SBUS (MHz)	0.06	0.06	0.04	50	50	33.3	200	100	160	80	80	40
CLK_HBUS (MHz)	0.03	0.03	0.04	25	25	33.3	100	50	80	40	80	40
CLK_UHSB (MHz)	0.048	0.06	0.08	40	50	66.7	160	80	160	80	160	80
CLK_HSB (MHz)	0.024	0.03	0.04	20	25	33.3	80	40	80	40	80	40
CLK_LSB (MHz)	0.012	0.015	0.02	10	12.5	16.7	40	20	40	20	40	20

Note 1. For details, see **Section 51, Flash Memory**

Note 2. For details, see **Section 13.5.5.1, System Clock (CLK_SYS)**

Note 3. For details, see **Section 13.5.5.2, PLL Clock (CLK_PLLO)**

13.4 Clock Oscillators

13.4.1 Main Oscillator (Main OSC)

The Main Oscillator generates the clock CLK_MOSC. CLK_MOSC is also used as the PLL input clock. **Figure 13.2** shows the basic configuration and signals of the Main OSC.

The block diagram of Main OSC configuration and the sequence of Main OSC stabilization are shown in **Figure 13.3** and **Figure 13.4** respectively.

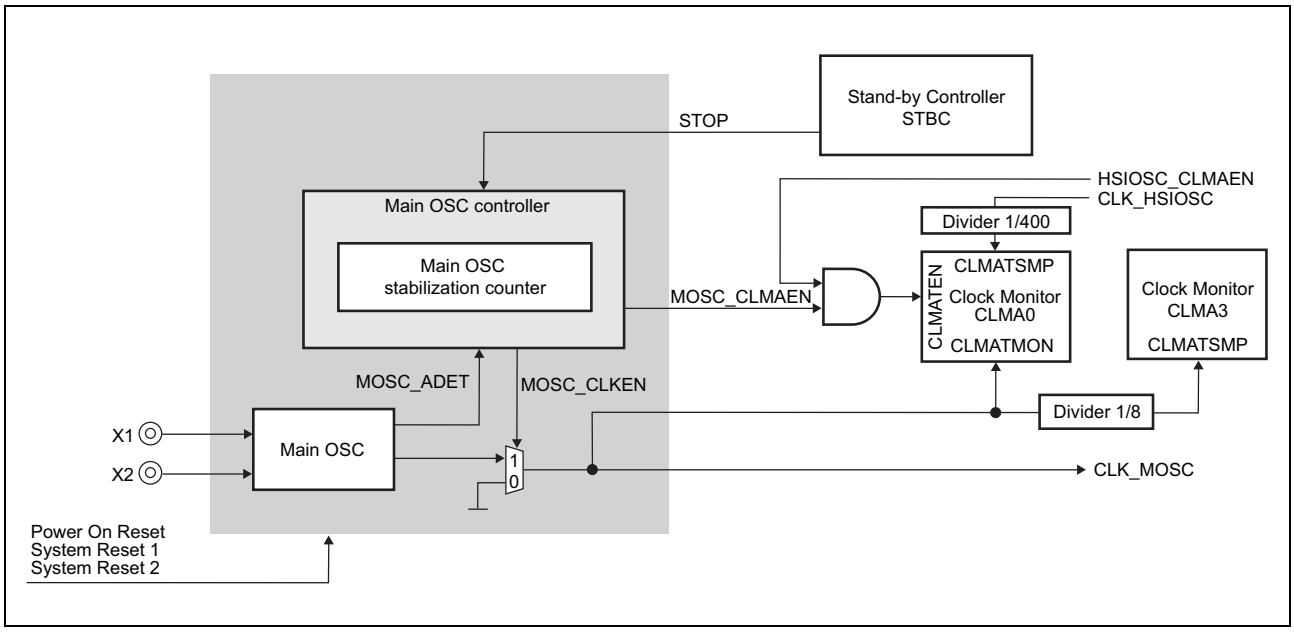


Figure 13.2 Main Oscillator (Main OSC)

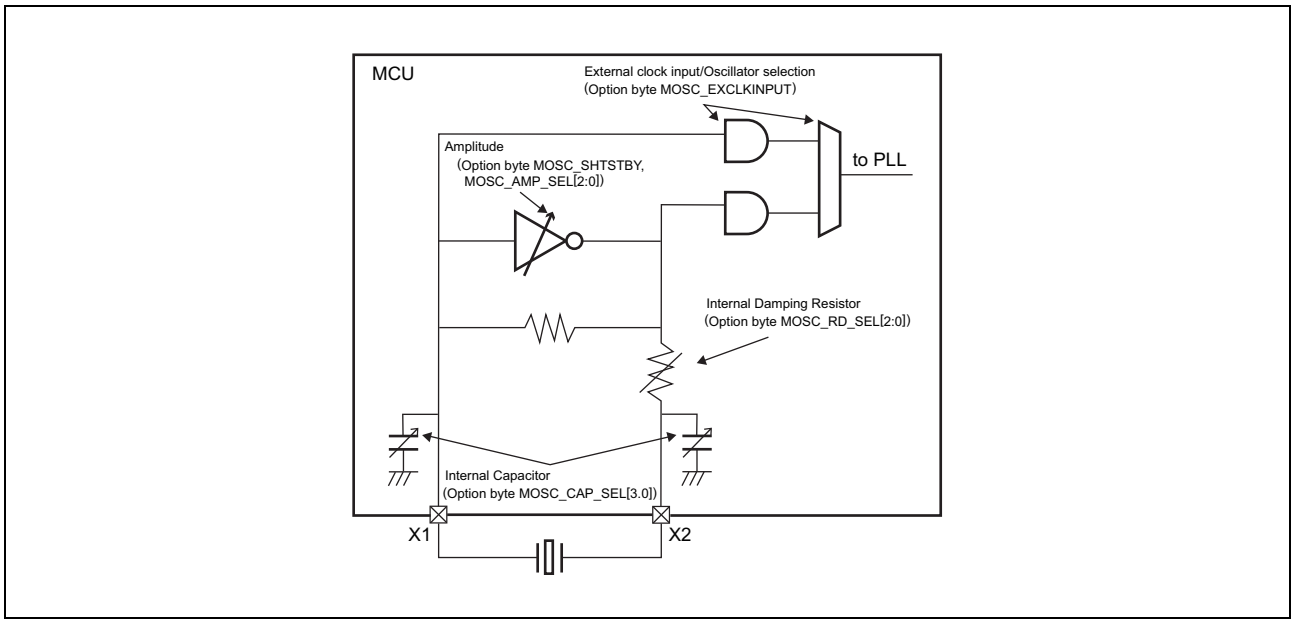

Figure 13.3 Block Diagram of Main OSC Configuration

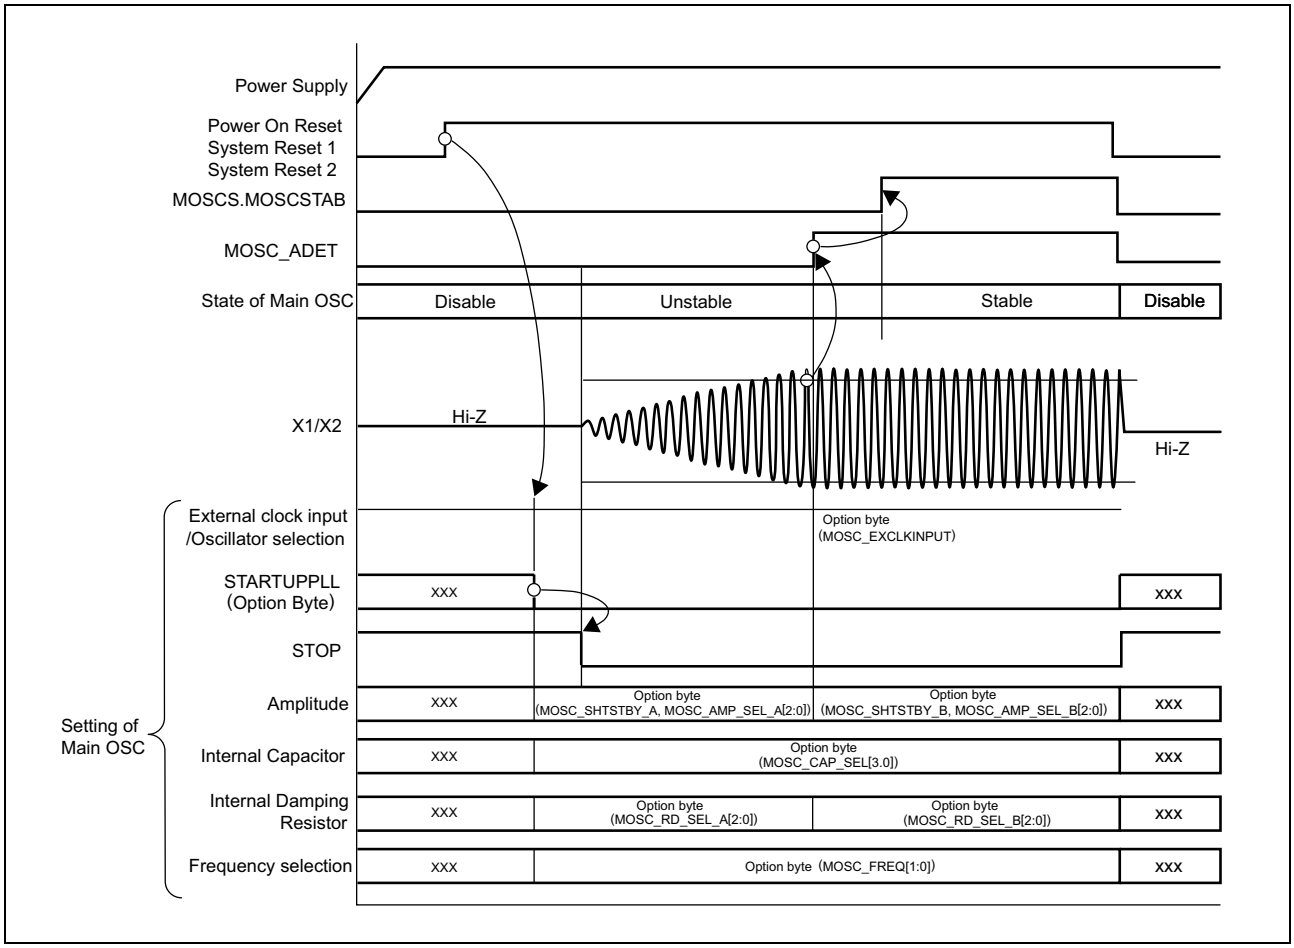

Figure 13.4 Sequence of Main OSC Stabilization

Main OSC

The Main OSC is initialized by Power On Reset and System Reset 1 and System Reset 2.

Whether to start or stop the Main OSC initial state after Reset release is determined by Option Byte STARTUPPLL.

After CPU Startup, it is controlled by the Main OSC Enable trigger bit (MOSCE.MOSCENTRG) or Main OSC Disable Trigger (MOSCE.MOSCDISTRG).

If DMON is enabled, the Main OSC shall not be set to disable.

Main OSC Stabilization

After the Main OSC starts oscillation, the X1/X2 signal amplitude are growing. When detecting enough signal amplitude level, the MOSC_ADET signal switches from 0 to 1 and the Main OSC stabilization counter starts counting the stabilization time. When the Main OSC stabilization counter reaches the predefined value, the Main OSC is assumed to be stable and the MOSC_CLKEN signal switches from 0 to 1 to enable the Main OSC clock CLK_MOSC.

As long as the Main OSC is not stable, the MOSC_CLKEN signal disables the Main OSC clock CLK_MOSC.

When the Main OSC is stopped by transition to chip standby mode (MOSCSTPM.MOSCSTPMSK = 0), MOSC_CLMAEN signal switches from 1 to 0 to disable the Clock Monitor CLMA0.

The stable and active state of the Main OSC is indicated by the Main OSC stable state bit (MOSCS.MOSCSTAB = 1).

For details of Option Byte, see **Section 51, Flash Memory**. SHTSTBY_A for start-up must be “1” and SHTSTBY_B for stable must be “0”.

Main OSC STOP Requests in Chip Standby Mode

The STOP signal from the Chip Standby Controller requests the Main OSC Controller to switch off the CLK_MOSC clock in chip standby modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

The stop request mask bit MOSCSTPM.MOSCSTPMSK controls whether the Main OSC is stopped during chip standby mode or continues operation:

- MOSCSTPM.MOSCSTPMSK = 0:
  The STOP request signal is not masked, so the Main OSC is stopped in chip standby mode.
  If the Main OSC is in operation before chip standby mode, it is automatically re-started after wake-up from chip standby mode, and the Main OSC stabilization counter counts the oscillation stabilization time.
- MOSCSTPM.MOSCSTPMSK = 1:
  The STOP request signal is masked, so the Main OSC continues to operate in chip standby mode.

Clock Monitor Control

The MOSC_CLMAEN signal and the HSIOSC_CLMAEN signal enable or disable supervision by the Clock Monitor CLMA0 when chip standby mode.

If CLMA0 is used in chip standby mode, set MOSCSTPM.MOSCSTPMSK and HSOSCSTPM.HSOSCSTPMSK to 1.

Main OSC Enable/Disable Trigger

The Main OSC can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger MOSCE.MOSCENTRG = 1 starts the Main OSC.
  Note that setting the enable trigger is only effective if the Main OSC is unstable, i.e. if MOSCS.MOSCSTAB = 0.
- Disable trigger MOSCE.MOSCDISTRG = 1 stops the Main OSC.
  Note that setting the disable trigger is only effective if the Main OSC is stable, i.e. if MOSCS.MOSCSTAB = 1.

Direct Clock Input to X1 (EXCLK Mode)

A clock waveform from an external clock source can be supplied to X1 pin. In this case, set the MOSC_EXCLKINPUT bit of OPBT10 register to 0 before clock input to X1 pin is supplied.
see **Section 51, Flash Memory**.

The behavior of CLK_MOSC is the same between EXCLK mode and OSC mode.
Enable trigger MOSCE.MOSCENTRG = 1 starts the Main OSC (CLK_MOSC).
Disable trigger MOSCE.MOSCDISTRG=1 stops the Main OSC (CLK_MOSC).
The STOP signal from the Chip Standby Controller requests the Main OSC Controller to switch off the CLK_MOSC clock in chip standby modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).

13.4.2 High Speed Internal Oscillator (HS IntOSC)

The High Speed Internal Oscillator generates the clock CLK_HSIOSC. CLK_HSIOSC has a nominal frequency of 200 MHz.

Figure 13.5 shows the basic configuration and signals of the HS IntOSC.

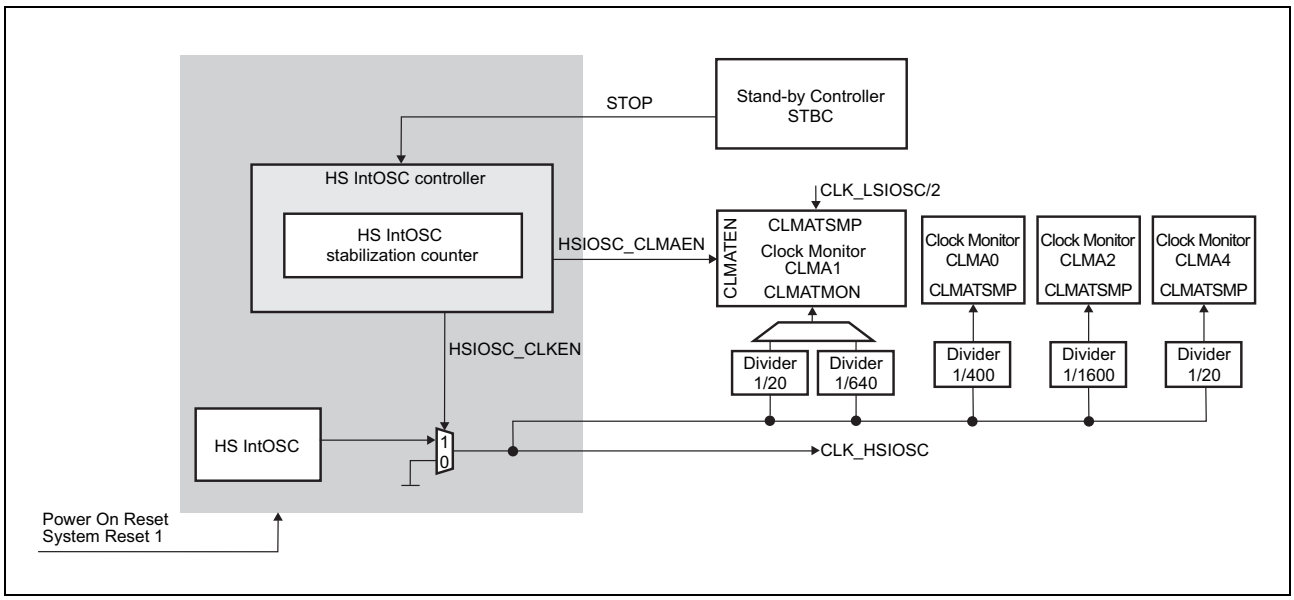

Figure 13.5 High Speed Internal Oscillator (HS IntOSC)

After Power On Reset or System Reset 1 release, the HS IntOSC starts operation.

HS IntOSC Stabilization

The HS IntOSC stabilization counter starts counting the stabilization time, after the HS IntOSC enabled. When the HS IntOSC stabilization counter reaches the predefined value, the HS IntOSC is assumed to be stable and the HSIOSC_CLKEN signal switches from 0 to 1 to enable the HS IntOSC clock CLK_HSIOSC.

As long as the HS IntOSC is not stable, the HSIOSC_CLKEN signal disables the HS IntOSC clock CLK_HSIOSC.

When the HS IntOSC is stopped by transition to chip standby mode (HSOSCSTPM.HSOSCSTPMSK = 0), HSIOSC_CLMAEN signal switches from 1 to 0 to disable the Clock Monitor CLMAn (n = 0, 1, 2).

The stable and active state of the HS IntOSC is indicated by the HS IntOSC clock stable state bit (HSOSCS.HSOSCSTAB = 1).

HS IntOSC STOP Requests in Chip Standby Mode

The STOP signal from the Chip Standby Controller requests the HS IntOSC Controller to switch off the CLK_HSIOSC clock in chip standby modes (STOP mode, DeepSTOP mode and Cyclic STOP mode).
The stop request mask bit HSOSCSTPM.HSOSCSTPMSK controls whether the HS IntOSC is stopped during chip standby mode or continues operation:

- HSOSCSTPM.HSOSCSTPMSK = 0:
  The STOP request signal is not masked, so the HS IntOSC is stopped during chip standby mode and automatically restarted after wake-up from chip standby mode.
  The STOP request is masked under the following conditions, even if HSOSCSTPM.HSOSCSTPMSK = 0. Therefore, the HS IntOSC will continue to operate even in chip standby mode.
  - If the low power sampler (LPS) is operating
- HSOSCSTPM.HSOSCSTPMSK = 1:
  The STOP request signal is masked, so the HS IntOSC continues to operate during chip standby mode.

Clock Monitor Control

The HSIOSC_CLMAEN signal enables or disables supervision by the Clock Monitor CLMAn (n = 0, 1, 2) when chip standby mode.

If CLMA1 is used in chip standby mode, set HSOSCSTPM.HSOSCSTPMSK to 1.

13.4.3 Low Speed Internal Oscillator (LS IntOSC)

The Low Speed Internal Oscillator generates the clock CLK_LSIOSC. CLK_LSIOSC has a nominal frequency of 240 kHz.

Figure 13.6 shows the basic configuration and signals of the LS IntOSC.

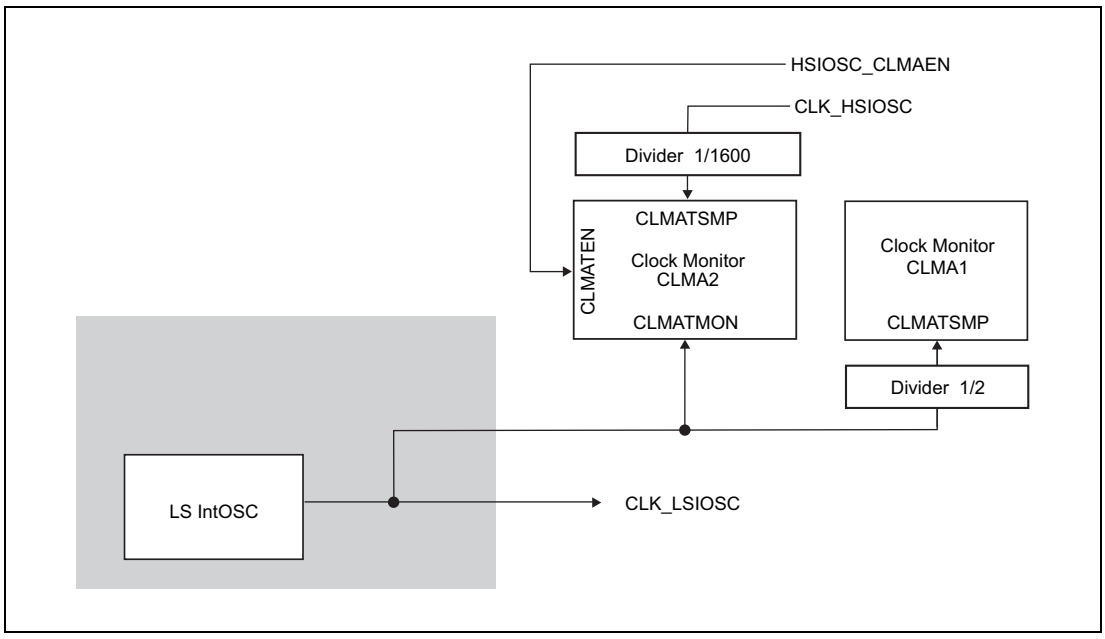

Figure 13.6 Low Speed Internal Oscillator (LS IntOSC)

After power supply the LS IntOSC starts operation. It cannot be stopped.

The LS IntOSC clock CLK_LSIOSC is used as the sampling clock for the Clock Monitor CLMA1.

Clock Monitor Control

The HSIOSC_CLMAEN signal enables or disables supervision by the Clock Monitor CLMA2 when chip standby mode.

If CLMA2 is used in chip standby mode, set HSOSCSTPM.HSOSCSTPMSK to 1.

13.4.4 High Voltage Internal Oscillator (HV IntOSC)

The High Voltage Internal Oscillator generates the clock CLK_HVIOSC. CLK_HVIOSC has a nominal frequency of 16 MHz.

Figure 13.7 shows the basic configuration and signals of the HV IntOSC.

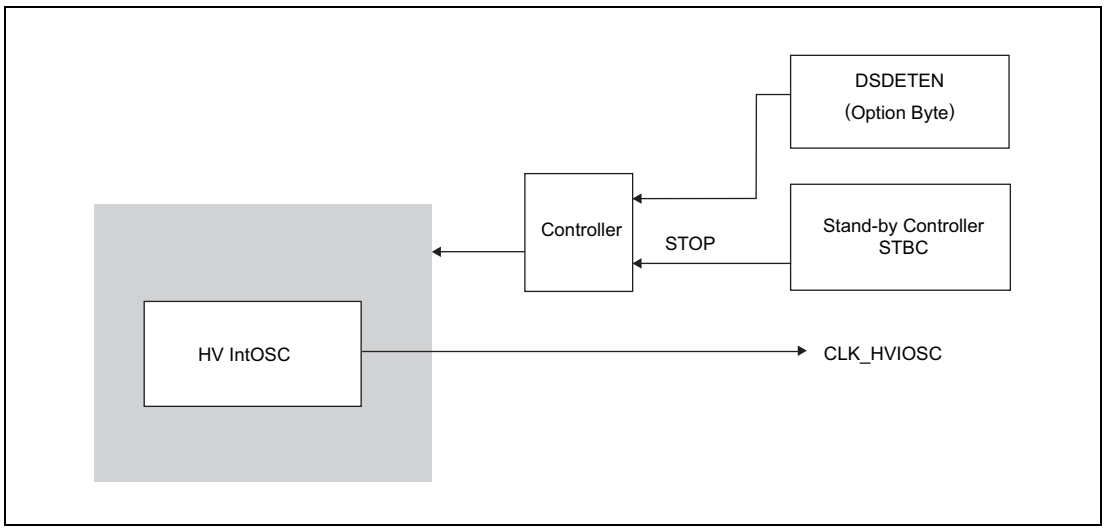

Figure 13.7 High Voltage Internal Oscillator (HV IntOSC)

After power supply the HV IntOSC starts operation.

HV IntOSC in Chip Standby Mode

The HV IntOSC is automatically disabled depends on Option Byte (DSDETEN) value when transitioning to DeepSTOP mode.
For details, see **Section 11.3.7.4, Function in Standby**.

13.4.5 Phase Locked Loop (PLL)

Main OSC is input to a phase-locked loop (PLL) clock oscillator as reference clock.
The PLL output clock CLK_PLL serve as the main operation clocks for the microcontroller.

Figure 13.8 shows the basic configuration and signals of the PLL.

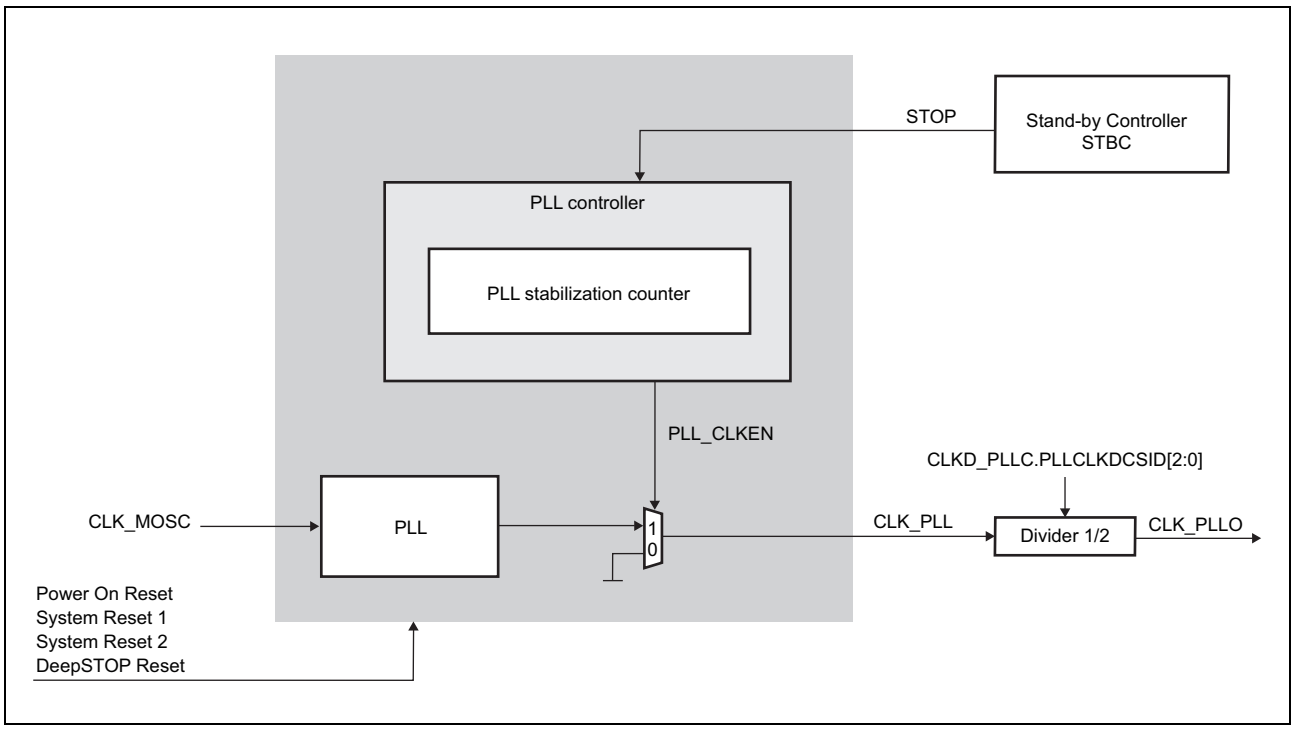

Figure 13.8 PLL

PLL Enable

The PLL is initialized by Power On Reset and System Reset 1 and System Reset 2 and DeepSTOP Reset.
Whether to start or stop the PLL initial state after Reset release is determined by Option Byte STARTUPPLL.

After CPU Startup, it is controlled by the PLL Enable trigger bit (PLLE.PLLENTRG) or PLL Disable Trigger (PLLE.PLLDISTRG).

PLL Stabilization

The PLL stabilization counter starts counting the stabilization time, after the PLL enabled.

When the PLL stabilization counter reaches the predefined value, the PLL is assumed to be stable and the PLL_CLKEN signal switches from 0 to 1 to enable the PLL clock CLK_PLL.

As long as the PLL is not stable, the PLL_CLKEN signal disables the PLL clock CLK_PLL.

The stable and active state of the PLL is indicated by the PLL clock stable state bit (PLLS.PLLCLKSTAB = 1).

PLL in Chip Standby Mode

When the chip standby mode transitions to DeepSTOP mode, the PLL is automatically disabled.

After restoring from DeepSTOP mode the PLL needs to be reconfigured.

When the chip standby mode transitions from STOP mode to RUN mode, the PLL automatically resumes.

In Cyclic RUN and Cyclic STOP mode, the PLL is not available. Do not enable the PLL by PLL Enable register.

PLL STOP Requests in Chip Standby Mode

The STOP signal from the Chip Standby Controller requests the PLL Controller to switch off the CLK_PLLO clock in chip standby modes (STOP mode, DeepSTOP mode and Cyclic STOP mode). The stop request mask bit PLLSTPM.PLLSTPMSK controls whether the PLL is stopped during chip standby mode or continues operation:

Table 13.6 PLL Stop Mask Setting

Main OSC		PLL		Behavior of the Main OSC and the PLL in chip standby mode
Status Register	Stop Mask Register	Status Register	Stop Mask Register	
MOSCSTAB	MOSCSTPMSK	PLLCLKSTAB	PLLSTPMSK	
1	0	1	0	The Main OSC and the PLL are stopped during chip standby mode.
			1	Setting prohibited.
		0	0 or 1	The Main OSC is stopped during chip standby mode. The PLL continues to stop.
	1	1	0	The Main OSC continues to operate during chip standby mode. The PLL is stopped during chip standby mode.
			1	The Main OSC and the PLL continues to operate during chip standby mode.
		0	0 or 1	The Main OSC continues to operate during chip standby mode. The PLL continues to stop.
0	0 or 1	0	0 or 1	The Main OSC and the PLL continues to stop.

PLL Enable/Disable Trigger

The PLL can be enabled and disabled by the enable and disable trigger control bits:

- Enable trigger PLLE.PLLENTRG = 1 starts the PLL
  Note that setting the enable trigger is only effective if the PLL is unstable, i.e. if PLLS.PLLCLKSTAB = 0.
- Disable trigger PLLE.PLLDISTRG = 1 stops the PLL
  Note that setting the disable trigger is only effective if the PLL is stable, i.e. if PLLS.PLLCLKSTAB = 1.

13.5 Registers

13.5.1 Register Protection

Write protection prevents inadvertent change of register content due to erroneous software execution.

Registers CLKKCPROT1 have to be written first in order to unlock protected registers and allow change of register content.

13.5.2 List of Registers

The registers of the clock controller are listed below.

Table 13.7 List of Clock Controller Registers for ISO area

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
FF98 0000$_H$	PLLE	PLL Enable Register	32	0000 0000$_H$	PBG20 #2	CLKKCPROT1
FF98 0004$_H$	PLLS	PLL Status Register	32	0000 000X$_H$	PBG20 #2	
FF98 000C$_H$	PLLSTPM	PLL Stop Mask Register	32	0000 0000$_H$	PBG20 #2	CLKKCPROT1
FF98 0100$_H$	CKSC_CPUC	CLK_CPU Selector Control Register	32	0000 0001$_H$	PBG20 #2	CLKKCPROT1

13.5.4 Clock Oscillator Registers

13.5.4.1 PLLE — PLL Enable Register

Access: This register is a write-only register that can be write in 32-bit units.

Address: FF98 0000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLDIS TRG	PLLEN TRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 13.11 PLLE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	PLLDISTRG*1	PLL Disable Trigger 0: No function 1: Stops PLL
0	PLLENTRG*2	PLL Enable Trigger 0: No function 1: Starts PLL

Note 1. Follow the procedure given below for stopping the PLL by using PLLDISTRG.
1. Confirm that the PLL is stable. See **Note 2.** about PLL is stable.
2. Select CLK_IOSC for clock source of CLK_SYS (CKSC_CPUS.CPUCLKSACT = 1).
3. Stop the PLL (PLLE.PLLDISTRG = 1).
4. Confirm that the PLL has been stopped (PLLS.PLLCLKEN = 0 & PLLS.PLLCLKSTAB = 0).

Note 2. Follow the procedure given below for starting the PLL by using PLLENTRG.
1. Confirm that the Main OSC is stable. See **Note 2.** of **Table 13.14** about Main OSC is stable.
2. Confirm that the PLL is stopped (PLLS.PLLCLKEN = 0 & PLLS.PLLCLKSTAB = 0).
3. Start the PLL (PLLE.PLLENTRG = 1).
4. Confirm that the PLL has been stable (PLLS.PLLCLKEN = 1 & PLLS.PLLCLKSTAB = 1).
5. Wait 1.4us or Read the PLLS.PLLCLKSTAB = 1 four times.

CAUTION

It is prohibited to write 1 to PLLDISTRG and PLLENTRG at the same time.

13.5.4.2 PLLS — PLL Status Register

This register provides stable status information about the PLL.

Access: This register can be read in 32-bit units.

Address: FF98 0004$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLCLKSTAB	PLLCLKEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0*2	x*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. Initial value depends on Option Byte (OPBT11.STARTUPPLL) except DeepSTOP Reset and serial programming mode.
Initial value when returning from DeepSTOP to RUN/Cyclic RUN is 0.
Initial value in serial programming mode is 0.

Note 2. In case the initial value of PLLCLKEN bit is 1, the reading value depends on the read timing and the stabilization time.

Table 13.12 PLLS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	PLLCLKSTAB	PLL clock stable state 0: PLL clock is unstable. 1: PLL clock is stable.*1
0	PLLCLKEN	PLL clock enable state 0: PLLE.PLLDISTRG is set to 1. 1: PLLE.PLLENTRG is set to 1.

Note 1. Follow the procedure given below for checking stable.
1. Confirm that the PLL has been stable (PLLS.PLLCLKEN = 1 & PLLS.PLLCLKSTAB = 1).
2. Wait 1.4 µs or Read the PLLS.PLLCLKSTAB = 1 four times.

CAUTION

PLLS.PLLSTAB is kept high even if setting PLLE.PLLDISTRG to 1 when PLL is selected for System clock source PLLS.PLLCLKEN is cleared to 0.

13.5.4.3 PLLSTPM — PLL Stop Mask Register

Access: This register can be read or written in 32-bit units.

Address: FF98 000C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.13 PLLSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	PLLSTPMSK	PLL Stop Request Mask 0: PLL stops operation in chip standby mode 1: PLL continues operation in chip standby mode

13.5.4.4 MOSCE — Main OSC Enable Register

This register is used to start and stop the Main OSC.

Access: This register is a write-only register that can be write in 32-bit units.

Address: FF98 8000$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCDISTRG	MOSCENTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	W	W

Table 13.14 MOSCE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	MOSCDISTRG *1	Main OSC Disable Trigger 0: No function 1: Stops Main OSC
0	MOSCENTRG*2	Main OSC Enable Trigger 0: No function 1: Starts Main OSC

Note 1. Follow the procedure given below for stopping the Main OSC by using MOSCDISTRG.
1. Confirm that the Main OSC is stable. See **Note 2.** about Main OSC is stable.
2. Select a clock source other than MOSC. Select Main OSC (CLK_MOSC) divided by 1 for CLK_RCANOSC.
3. Stop the Main OSC (MOSCE.MOSCDISTRG = 1).
4. Confirm that the Main OSC has been stopped (MOSCS.MOSCEN = 0 & MOSCS.MOSCSTAB = 0).

Note 2. Follow the procedure given below for starting the Main OSC by using MOSCENTRG.
1. Confirm that the Main OSC is stopped (MOSCS.MOSCEN = 0 & MOSCS.MOSCSTAB = 0).
2. Start the Main OSC (MOSCE.MOSCENTRG = 1).
3. Confirm that the Main OSC has been stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).
4. Wait 1.4us or Read the MOSCS.MOSCSTAB = 1 four times.

CAUTIONS

- **It is prohibited to write 1 to MOSCDISTRG and MOSCENTRG at the same time.**
- **Don't disable Main OSC while CLK_MOSC is selected for CLKA_ADC.**

13.5.4.5 MOSCS — Main OSC Status Register

This register provides stable status information about the Main OSC.

Access: This register can be read in 32-bit units.

Address: FF98 8004$_H$

Value after reset: 0000 000X$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCSTAB	MOSCEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0*2	x*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. Initial value depends on Option Byte (OPBT11.STARTUPPLL) except serial programming mode. Initial value in serial programming mode is 0.

Note 2. In case the initial value of MOSCEN bit is 1, the reading value depends on the read timing and the stabilization time.

Table 13.15 MOSCS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	MOSCSTAB	Main OSC stable state 0: Main OSC clock is unstable. 1: Main OSC clock is stable.*1
0	MOSCEN	Main OSC enable state 0: MOSCE.MOSCDISTRG is set to 1. 1: MOSCE.MOSCENTRG is set to 1.

Note 1. Follow the procedure given below for checking stable.
1. Confirm that the Main OSC has been stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).
2. Wait 1.4 µs or Read the MOSCS.MOSCSTAB = 1 four times.

CAUTION

MOSCS.MOSCSTAB is kept high even if setting MOSCE.MOSCDISTRG to 1 when PLL is operating MOSCS.MOSCEN is cleared to 0.

13.5.4.6 MOSCSTPM — Main OSC Stop Mask Register

Access: This register can be read or written in 32-bit units.

Address: FF98 800C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOSCSTPMSK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.16 MOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MOSCSTPMSK	Main OSC Stop Request Mask 0: Main OSC stops operation in chip standby mode. 1: Main OSC continues operation in chip standby mode.

13.5.4.7 HSOSCS — HS IntOSC Status Register

This register provides stable status information about the HS IntOSC.

Access: This register can be read in 32-bit units.

Address: FF98 8100_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HSOSC STAB	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0*1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The value becomes 1 before CPU reset is released.

Table 13.17 HSOSCS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	HSOSCSTAB	HS IntOSC clock stable State 0: HS IntOSC clock is unstable 1: HS IntOSC clock is stable
0	Reserved	When read, the value after reset is returned.

13.5.4.8 HSOSCSTPM — HS IntOSC Stop Mask Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8104_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.18 HSOSCSTPM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	HSOSCSTPMSK	HS IntOSC Stop Request Mask 0: HS IntOSC stops operation in chip standby mode 1: HS IntOSC continues operation in chip standby mode

13.5.5 Clock Selector/Divider Control Registers

13.5.5.1 System Clock (CLK_SYS)

(1) CKSC_CPUC — CLK_SYS Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0100_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.19 CKSC_CPUC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CPUCLKSCSID	Clock source control These bits select the ID of a clock source for CLK_SYS ID = 0: CLK_PLLO ID = 1: CLK_IOSC (default)

CAUTION

The clock source selected for the CLK_SYS should not be stopped by software.

(2) CKSC_CPUS — CLK_SYS Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0108$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCLKSACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.20 CKSC_CPUS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	CPUCLKSACT	Clock source status for CLK_SYS Indicates the ID of the selected clock source of the CLK_SYS. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CLK_PLLO ID = 1: CLK_IOSC refer to **Table 13.5**

13.5.5.2 PLL Clock (CLK_PLLO)

(1) CLKD_PLLC — CLK_PLLO Divider Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0120_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLCLKDCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 13.21 CLKD_PLLC Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	PLLCLKDCSID [2:0]	Clock Divider control These bits select the ID of a clock divider for CLK_PLLO 001_B: No division (default) 010_B: Divided by 2 Setting other than the above is prohibited.

CAUTIONS

1. **There is limitation that PLLCLKDCSID[2:0] = 010_B setting is only permitted when setting CPU System clock Gear Up/Down. For details of clock Gear Up/Down, see Section 13.6.5, Sequence for Shifting the CPU System Clock Gear Up/Down.**
2. **This register can be set during PLL is stable. See Note 2. of Table 13.14 about PLL is stable.**
   The setting during PLL is not stable is not guaranteed.
3. **This register can be set during CLKD_PLLS.PLLCLKDSYNC = 1 which indicates the divider is stable.**
   The behavior is not guaranteed if setup is performed while CLKD_PLLS.PLLCLKDSYNC = 0.

(2) CLKD_PLLS — CLK_PLLO Divider Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0128_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLLCLKDSYNC	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.22 CLKD_PLLS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	PLLCLKDSYNC	Divider clock synchronized 0: Clock output does not correspond to the actual divisor setting in PLLCLKDCSID 1: Clock output corresponds to the actual divisor setting in PLLCLKDCSID
0	Reserved	When read, the value after reset is returned.

13.5.5.3 RLIN Clock (CLK_RLIN)

(1) CKSC_RLINC — CLK_RLIN Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0140_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RLINSCSID[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 13.23 CKSC_RLINC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RLINSCSID[1:0]	Clock source control These bits select the ID of a clock source for CLK_RLIN*1 ID = 00_B: CLK_MOSC ID = 01_B: CLK_HSB (default) ID = 10_B: CLK_MOSC/4 ID = 11_B: CLK_MOSC/8

Note 1. When the module operates in chip standby mode, select a clock source other than CLK_HSB.

CAUTIONS

- **In the case of RLINSCSID[1:0] = 00_B or 10_B or 11_B,**
  The CKSC_RLINC register must be set so that the relationship between frequency (1) and (2) is retained within the range of "(1) ≥ (2) ×2 ".
  (1) Frequency [MHz] specified by the CLK_HSB.
  (2) Frequency [MHz] specified by the CLK_RLIN.
- **Write this register only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).**

(2) CKSC_RLINS — CLK_RLIN Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0148$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RLINSACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.24 CKSC_RLINS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1 , 0	RLINSACT[1:0]	Clock source status for CLK_RLIN Indicates the ID of the selected clock source of the CLK_RLIN. The value indicated by these bits shows the actual ID that is currently selected. ID = 00_B: CLK_MOSC ID = 01_B: CLK_HSB ID = 10_B: CLK_MOSC/4 ID = 11_B: CLK_MOSC/8

13.5.5.4 RS-CANFD Clock (CLK_RCANOSC)

(1) CKSC_RCANC — CLK_RCANOSC Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0150_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCANSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 13.25 CKSC_RCANC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	RCANSCSID [1:0]	Clock source control These bits select the ID of a clock source for CLK_RCANOSC ID = 00_B: Setting prohibited ID = 01_B: CLK_MOSC (default) ID = 10_B: CLK_MOSC/2 ID = 11_B: CLK_MOSC/4

CAUTION

Write this register only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).

(2) CKSC_RCANS — CLK_RCANOSC Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0158$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCANSACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.26 CKSC_RCANS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	RCANSACT[1:0]	Clock source status for CLK_RCANOSC Indicates the ID of the selected clock source of the CLK_RCANOSC. The value indicated by these bits shows the actual ID that is currently selected. ID = 01_B: CLK_MOSC ID = 10_B: CLK_MOSC/2 ID = 11_B: CLK_MOSC/4

13.5.5.5 ADCJn Clock (CLK_ADC)

(1) CKSC_ADCC — CLK_ADC Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0160_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADCSCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.27 CKSC_ADCC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ADCSCSID	Clock source control These bits select the ID of a clock source for CLK_ADC ID = 0_B: CLK_LSB ID = 1_B: CLK_LSB/2 (default)

(2) CKSC_ADCS — CLK_ADC Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0168_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ADCSACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.28 CKSC_ADCS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ADCSACT	Clock source status for CLK_ADC Indicates the ID of the selected clock source of the CLK_ADC. The value indicated by these bits shows the actual ID that is currently selected. ID = 0_B: CLK_LSB ID = 1_B: CLK_LSB/2

13.5.5.6 MSPI Clock (CLK_MSPI)

(1) CKSC_MSPIC — CLK_MSPI Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 0170_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSPISCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.29 CKSC_MSPIC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MSPISCSID	Clock source control These bits select the ID of a clock source for CLK_MSPI ID = 0: CLK_MOSC ID = 1: CLK_HSB (default)

CAUTION

Write this register only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).

(2) CKSC_MSPIS — CLK_MSPI Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 0178$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MSPIS ACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.30 CKSC_MSPIS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	MSPISACT	Clock source status for CLK_MSPI Indicates the ID of the selected clock source of the CLK_MSPI. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CLK_MOSC ID = 1: CLK_HSB

13.5.5.7 WDTBA Clock (CLKA_WDT)

(1) CKSC_AWDTC — CLKA_WDT Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8200_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.32 CKSC_AWDTS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	AWDTSACT	Clock source status for CLKA_WDT Indicates the ID of the selected clock source of the CLKA_WDT. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CLK_LSIOSC/1 ID = 1: CLK_LSIOSC/128

13.5.5.8 TAUJ Clock (CLKA_TAUJ)

(1) CKSC_ATAUJC— CLKA_TAUJ Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8210_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ATAUJSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 13.33 CKSC_ATAUJC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	ATAUJSCSID [1:0]	Clock source control These bits select the ID of a clock source for CLKA_TAUJ*1 ID = 00_B: CLK_LSIOSC ID = 01_B: CLK_HSIOSC/20 (default) ID = 10_B: CLK_MOSC ID = 11_B: CLK_HSB

Note 1. When the module operates in chip standby mode, select a clock source other than CLK_HSB.

CAUTION

Select CLK_MOSC only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).
Don't disable Main OSC while CLK_MOSC is selected for CLKA_TAUJ.

(2) CKSC_ATAUJS — CLKA_TAUJ Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8218$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.34 CKSC_ATAUJS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	ATAUJSACT[1:0]	Clock source status for CLKA_TAUJ Indicates the ID of the selected clock source of the CLKA_TAUJ. The value indicated by these bits shows the actual ID that is currently selected. ID = 00$_B$: CLK_LSIOSC ID = 01$_B$: CLK_HSIOSC/20 ID = 10$_B$: CLK_MOSC ID = 11$_B$: CLK_HSB

13.5.5.9 RTCA Clock (CLKA_RTCA)

(1) CKSC_ARTCAC — CLKA_RTCA Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8220_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.35 CKSC_ARTCAC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ARTCASCSID	Clock source control These bits select the ID of a clock source for CLKA_RTCA ID = 0: CLK_MOSC/16 ID = 1: CLK_LSIOSC (default)

CAUTION

Write this register only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).

(2) CKSC_ARTCAS — CLKA_RTCA Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8228$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARTCASACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.36 CKSC_ARTCAS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	ARTCASACT	Clock source status for CLKA_RTCA Indicates the ID of the selected clock source of the CLKA_RTCA. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CLK_MOSC/16 ID = 1: CLK_LSIOSC

13.5.5.10 ADCJ2 Clock (CLKA_ADC)

(1) CKSC_AADCC — CLKA_ADC Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8230$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCSCSID [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 13.37 CKSC_AADCC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	AADCSCSID [1:0]	Clock source control These bits select the ID of a clock source for CLKA_ADC*1 ID = 00_B: CLK_MOSC ID = 01_B: CLK_HSIOSC/20 (default) ID = 10_B: CLK_LSB ID = 11_B: Setting prohibited

Note 1. When the module operates in chip standby mode, select a clock source other than CLK_LSB.

CAUTION

Select CLK_MOSC only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).
Don't disable Main OSC while CLK_MOSC is selected for CLKA_ADC.
CLK_MOSC can be selected only when the frequency is 16 MHz, 20 MHz, or 24 MHz.

(2) CKSC_AADCS — CLKA_ADC Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8238$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCSACT[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.38 CKSC_AADCS Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1, 0	AADCSACT[1:0]	Clock source status for CLKA_ADC Indicates the ID of the selected clock source of the CLKA_ADC. The value indicated by these bits shows the actual ID that is currently selected. ID = 00_B: CLK_MOSC ID = 01_B: CLK_HSIOSC/20 ID = 10_B: CLK_LSB

(3) CLKD_AADCC — CLKA_ADC Divider Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8240$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCDCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.39 CLKD_AADCC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	AADCDCSID*1	Clock Divider control These bits select the ID of a clock divider for CLKA_ADC ID = 0: CKSC_AADCC selection/2 ID = 1: CKSC_AADCC selection/1 (default)

Note 1. Make sure the operation frequency of CLKA_ADC. For details, see **Section 55.4, A/D Converter Characteristics**.

(4) CLKD_AADCS — CLKA_ADC Divider Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8248$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AADCDACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.40 CLKD_AADCS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	AADCDACT	Clock divider status for CLKA_ADC Indicates the ID of the selected clock source of the CLKA_ADC. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CKSC_AADCC selection/2 ID = 1: CKSC_AADCC selection/1

13.5.5.11 FOUT0 Clock (EXTCLK0O)

(1) CKSC_FOUT0C — FOUT0 Clock Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8250_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	FOUT0SCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 13.41 CKSC_FOUT0C Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	FOUT0SCSID [2:0]	Source Clock Setting for EXTCLK0O*1 ID = 000_B: CLK_MOSC ID = 001_B: CLK_HSB (default) ID = 011_B: CLK_LSIOSC ID = 100_B: CLK_HSIOSC/20 ID = 110_B: CLK_MOSC ID = 111_B: CLK_MOSC Setting other than the above is prohibited.

Note 1. When the module operates in chip standby mode, select a clock source other than CLK_HSB.

CAUTION

Set this register when EXTCLK0O is stopped.

Select CLK_MOSC only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).

(2) CKSC_FOUT0S — FOUT0 Clock Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8258$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	FOUT0SACT[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 13.43 CLKD_FOUT0C Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	FOUT0DIV[9:0]	Clock Divider N 000_H: Clock output is stopped 001_H: N = 1 002_H: N = 2 : $3FE_H$: N = 1022 $3FF_H$: N = 1023

CAUTION

This register must not be written with a new value while the CLKD_FOUT0S.FOUT0SYNC is 0.

(4) CLKD_FOUT0S — FOUT0 Clock Divider Status Register

This register indicates the clock output status.

Access: This register can be read in 32-bit units.

Address: FF98 8268$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	FOUT1SCSID[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 13.45 CKSC_FOUT1C Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	FOUT1SCSID [2:0]	Source Clock Setting for EXTCLK1O*1 ID = 000_B: CLK_MOSC ID = 001_B: CLK_HSB (default) ID = 011_B: CLK_LSIOSC ID = 100_B: CLK_HSIOSC/20 ID = 110_B: CLK_MOSC ID = 111_B: CLK_MOSC Setting other than the above is prohibited.

Note 1. When the module operates in chip standby mode, select a clock source other than CLK_HSB.

CAUTION

Set this register when EXTCLK1O is stopped.

Select CLK_MOSC only when Main OSC is stable (MOSCS.MOSCEN = 1 & MOSCS.MOSCSTAB = 1).

(2) CKSC_FOUT1S — FOUT1 Clock Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8278$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.46 CKSC_FOUT1S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned.
2 to 0	FOUT1SACT[2:0]	Clock source status for FOUT1 Indicates the ID of the selected clock source of the FOUT1. The value indicated by these bits shows the actual ID that is currently selected. ID = 000_B: CLK_MOSC ID = 001_B: CLK_HSB ID = 011_B: CLK_LSIOSC ID = 100_B: CLK_HSIOSC/20 ID = 110_B: CLK_MOSC ID = 111_B: CLK_MOSC

(3) CLKD_FOUT1C — FOUT1 Clock Divider Control Register

This register defines the clock divisor.

Access: This register can be read or written in 32-bit units.

Address: FF98 8280$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 13.47 CLKD_FOUT1C Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9 to 0	FOUT1DIV[9:0]	Clock Divider N 000_H: Clock output is stopped 001_H: N = 1 002_H: N = 2 : $3FE_H$: N = 1022 $3FF_H$: N = 1023

CAUTION

This register must not be written with a new value while the CLKD_FOUT1S.FOUT1SYNC is 0.

(4) CLKD_FOUT1S — FOUT1 Clock Divider Status Register

This register indicates the clock output status.

Access: This register can be read in 32-bit units.

Address: FF98 8288$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 13.48 CLKD_FOUT1S Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	FOUT1CLKACT	Clock Divider Active 0: Frequency output is stopped. 1: Frequency output is ongoing.
0	FOUT1SYNC	Clock Divider Synchronized 0: The clock divider is in the process of synchronization. 1: The clock divider is stable (or stopped).

13.5.5.13 WDTBn Clock (CLK_WDT)

(1) CKSC_WDTC — CLK_WDT Selector Control Register

Access: This register can be read or written in 32-bit units.

Address: FF98 8300$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSCSID
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 13.49 CKSC_WDTC Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	WDTSCSID	Clock source control These bits select the ID of a clock source for CLK_WDT ID = 0: CLK_HSIOSC/20 ID = 1: CLK_HSIOSC/640 (default)

CAUTION

This register is not initialized by DeepSTOP Reset.

(2) CKSC_WDTS — CLK_WDT Selector Status Register

Access: This register can be read in 32-bit units.

Address: FF98 8308$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WDTSACT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 13.50 CKSC_WDTS Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned.
0	WDTSACT	Clock source status for CLK_WDT Indicates the ID of the selected clock source of the CLK_WDT. The value indicated by these bits shows the actual ID that is currently selected. ID = 0: CLK_HSIOSC/20 ID = 1: CLK_HSIOSC/640

CAUTION

This register is not initialized by DeepSTOP Reset.

13.5.6 Protection Register

(1) CLKKCPROT1 — Clock Controller Register Key Code Protection Register 1

The CLKKCPROT1 register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 0700$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 13.51 CLKKCPROT1 Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT[31:1]*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0.
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing to protected registers.
Write A5A5A501$_H$ to this register to enable writing to protected registers.

13.6 Operation

13.6.1 Clock Setting

13.6.1.1 Overview of Clock Selector/Divider Control Register

The clocks CLK_<*name*>, CLKA_<*name*> and EXTCLKnO (n = 0, 1) can be controlled by the following registers:

- Clock selector control registers
  These registers select the clock from the available source clocks.
  - CKSC_<*name*>C
  - CKSC_A<*name*>C
  - CKSC_FOUTnC (n = 0, 1)
- Clock divider control registers
  These registers specify the clock division ratio for the selected source clock.
  - CLKD_ <*name*> C
  - CLKD_A<*name*>C
  - CLKD_FOUTnC (n = 0, 1)
- Clock selector status registers/Clock divider status registers
  These registers return the currently active source clock selection and division status, respectively
  - CKSC_ <*name*>S/CLKD_ <*name*>S
  - CKSC_ A<*name*>S/CLKD_ A<*name*>S
  - CKSC_FOUTnS (n = 0, 1)/CLKD_FOUTnS (n = 0, 1)

NOTE

For details of the clocks with clock selector and divider, see **Table 13.52, List of Selectable Clocks**.

13.6.1.2 Setting Procedure for Clock

Procedure of setting up clock is described as below:

1. Clock selector setting
   - Select a source clock. (CKSC_ <*name*>C, CKSC_A<*name*>C, CKSC_FOUTnC (n = 0, 1))
   - Confirm completion of selection. (CKSC_ <*name*>S, CKSC_A<*name*>S, CKSC_FOUTnS (n = 0, 1))*1
2. Clock divider setting
   - Select a clock divider. (CLKD_ <*name*>C, CLKD_A<*name*>C, CLKD_FOUTnC (n = 0, 1))
   - Confirm completion of selection. (CLKD_ <*name*>S, CLKD_A<*name*>S, CLKD_FOUTnS (n = 0, 1))*2

Note 1. Continue processing after status register is updated with the new values written to control register.

Note 2. Continue processing after status register is updated with the new values written to control register (CLKD_AADCS = CLKD_AADCC).
Continue processing after status register indicates the synchronization with control register (CLKD_PLLS.PLLCLKDSYNC = 1, CLKD_FOUT0S.FOUT0SYNC = 1, CLKD_FOUT1S.FOUT1SYNC = 1).

CAUTION

The source clock to be selected must be operating before performing these settings. The behavior and performance are not guaranteed if setup is performed while the source clock is stopped.
Access to a peripheral module is prohibited while the clock is not supplied to the module.

13.6.2 Stopping the Clock in Chip Standby Mode

In chip standby modes (STOP mode, DeepSTOP mode, and Cyclic STOP mode), the peripheral clock which has the stop mask bit (MSR_<name>.STPMSK_<name>) can be configured to stop or continue in response to clock stop requests from the chip standby controller.

The clock stop mask bits are used to determine the operation status of the clock in chip standby mode: For details of chip standby mode, See **Section 15, Standby Controller (STBC)**.

The clocks CLK_CPU, CLK_SBUS and CLK_HBUS are stopped in STOP mode and Cyclic STOP mode. The clocks CLK_HSB, CLK_LSB for CLKA_<name> and EXTCLKnO (n = 0, 1) are stopped in DeepSTOP mode.

CAUTION

If the source clock of the peripheral clock stops during chip standby mode, MSR_<name>.STPMSK_<name> should be set to 0.

13.6.3 Stopping the Clock in Module Standby Mode

It is necessary to cancel the module standby mode in order to operate some peripheral modules.

For details of module standby mode, See **Section 15, Standby Controller (STBC)**.

13.6.4 Clock Settings

The following table shows a selectable source clock, a frequency division ratio, and a register to be used for each clock.

Table 13.52 List of Selectable Clocks (1/2)

Symbol	Clock Selector Control Register		Clock Divider Control Register		Maximum Frequency	Functional Module
CLK_CPU CLK_SBUS CLK_HBUS CLK_UHSB CLK_HSB CLK_LSB	CKSC_CPUC	CLK_PLLO	CLKD_PLLC	Refer to **Table 13.5**	400/320/240 MHz The maximum clock frequency depends on the Option Byte CKDIVMD.	CPU System
		CLK_IOSC				
CLK_RLIN	CKSC_RLINC	CLK_MOSC	—	**1/1**	80 MHz	RLIN3
		CLK_MOSC/4				
		CLK_MOSC/8				
		CLK_HSB				
CLK_RCANOSC	CKSC_RCANC	**CLK_MOSC**	—	**1/1**	40 MHz	RS-CANFD
		CLK_MOSC/2				
		CLK_MOSC/4				
CLK_ADC	CKSC_ADCC	CLK_LSB	—	**1/1**	40MHz	ADCJ0,1
		CLK_LSB/2				
CLK_MSPI	CKSC_MSPIC	CLK_MOSC	—	**1/1**	80 MHz	MSPI
		CLK_HSB				
CLK_ECMCNT	—	**CLK_HSIOSC/20**	—	**1/1**	10 MHz	ECM
CLK_WDT	CKSC_WDTC	CLK_HSIOSC/20	—	**1/1**	10 MHz	WDTB0,1,2,3 SWDTA ICUM_WDTA0
		CLK_HSIOSC/640				
CLKA_WDT	CKSC_AWDTC	CLK_LSIOSC	—	**1/1**	240 kHz	WDTBA
		CLK_LSIOSC/128				
CLKA_TAUJ	CKSC_ATAUJC	CLK_MOSC	—	**1/1**	80 MHz	TAUJ2 TAUJ3
		CLK_HSIOSC/20				
		CLK_LSIOSC				
		CLK_HSB				
CLKA_RTCA	CKSC_ARTCAC	CLK_MOSC/16	—	**1/1**	2.5 MHz	RTCA
		CLK_LSIOSC				
CLKA_ADC	CKSC_AADCC	CLK_MOSC	CLKD_AADCC	**1/1**	40 MHz	ADCJ2
		CLK_HSIOSC/20		1/2		
		CLK_LSB				
EXTCLK0O	CKSC_FOUT0C	CLK_MOSC	CLKD_FOUT0C	1/1 ~ 1/1023	24 MHz	FOUT0
		CLK_HSIOSC/20				
		CLK_LSIOSC				
		CLK_HSB		**stop**		

Table 13.52 List of Selectable Clocks (2/2)

Symbol	Clock Selector Control Register		Clock Divider Control Register		Maximum Frequency	Functional Module
EXTCLK1O	CKSC_FOUT1C	CLK_MOSC	CLKD_FOUT1C	1/1 ~ 1/1023	24 MHz	FOUT1
		CLK_HSIOSC/20				
		CLK_LSIOSC				
		CLK_HSB		**Stop**		
CLKA_LPS*1	—	**CLK_LSIOSC or CLK_HSIOSC/20**	—	1/1	10 MHz	LPS

Note: The items written in bold are the initial setting clocks for each register.

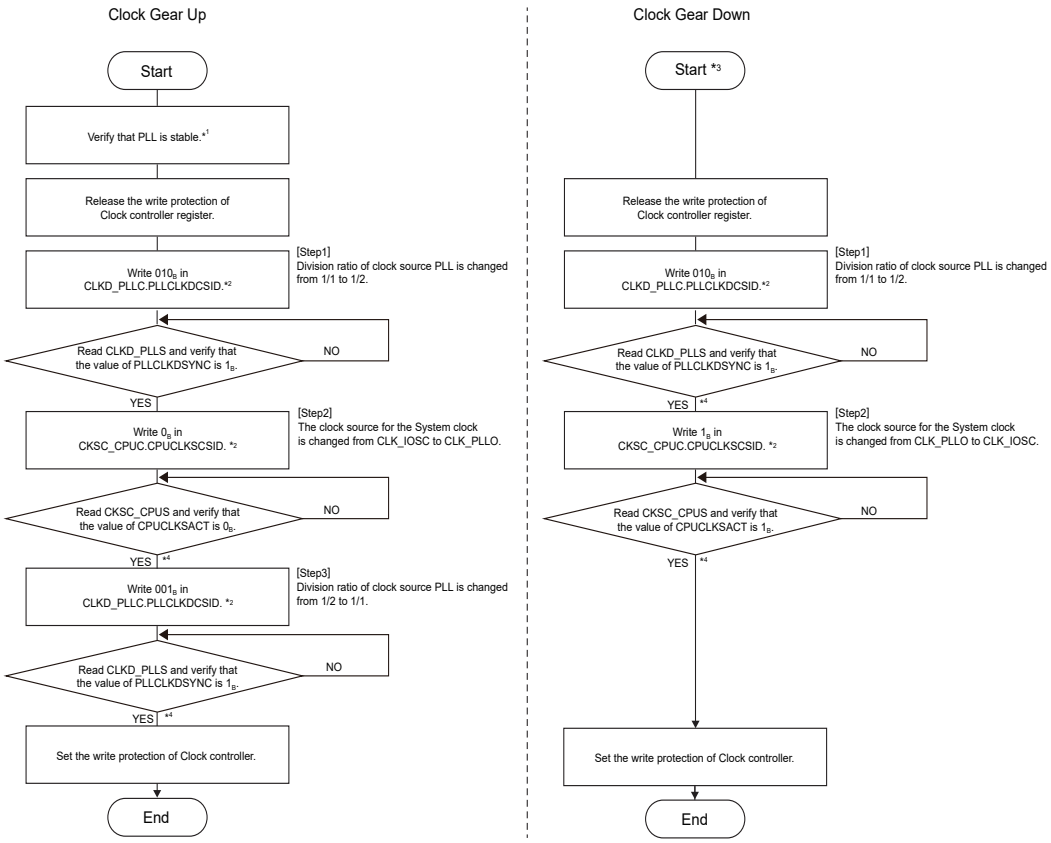
Note 1. When CLK_HSIOSC stops in chip standby mode , CLKA_LPS is CLK_LSIOSC. In other cases, CLKA_LPS is CLK_HSIOSC/20.

CAUTION

Refer to Section 13.6.2 and Section 13.6.3 and Stop Mask Register (MOSCSTPM, HSOSCSTPM, PLLSTPM) to stop the clocks.

13.6.5 Sequence for Shifting the CPU System Clock Gear Up/Down

CPU clock (CLK_CPU) is CLK_HSIOSC/2 when CPU startup.
Follow **Figure 13.9** below when shifting the CPU System clock .



Note: There are modules which can not operate when either CLK_IOSC or CLK_PLL/2 is selected to CLK_SYS.

Note 1. After release from the reset state, verify that PLL operation is stable before executing the sequence to shift the clock gear up. See **Section 13.5.4.2, PLLS — PLL Status Register**. For enabling PLL, see **Section 13.5.4.1, PLLE — PLL Enable Register**.

Note 2. The CKSC_CPUC and CLKD_PLLC registers are protected by the CLKKCPROT1 register. Execute the key code protection unlocking when setting these registers.

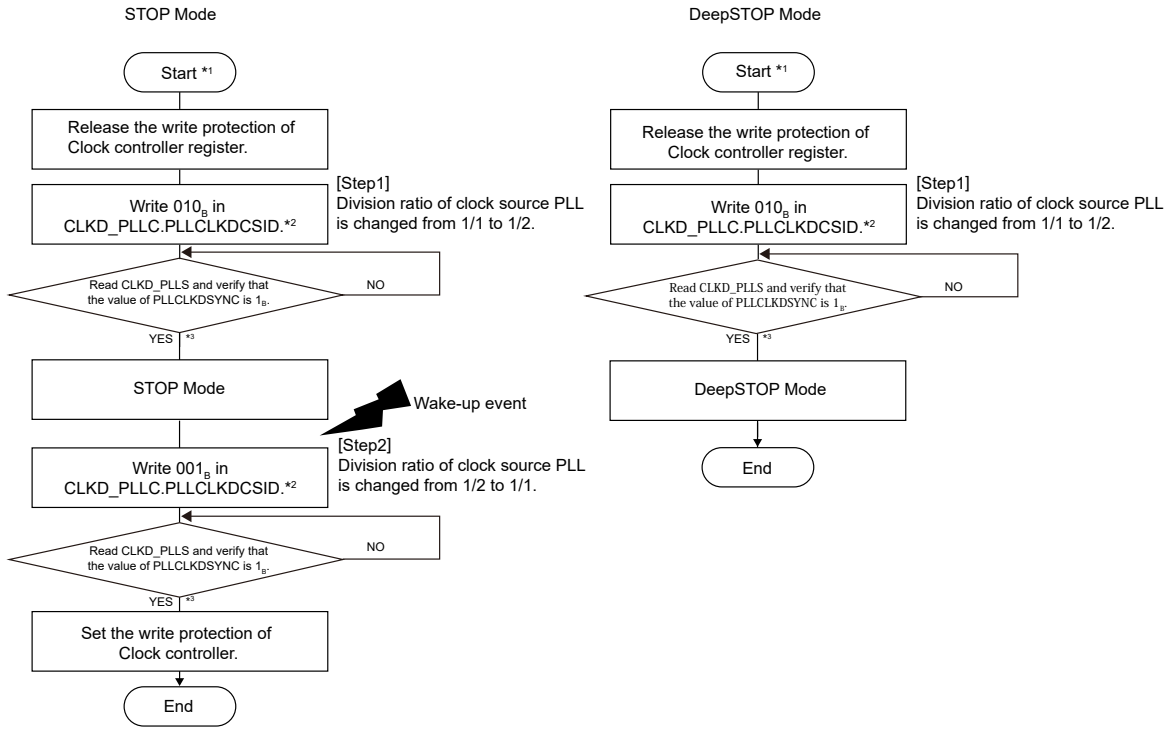
Note 3. CLK_PLLO is selected as the clock source for the System clock, and No division is selected as the division ratio of clock source PLL.

Note 4. Wait 100 µs after verifying

Figure 13.9 Shifting the CPU System Clock Gear Up/Down

13.6.6 CPU System Clock Setting in STOP/DeepSTOP Mode

Transition before STOP/DeepSTOP mode, follow the procedure below in case that CLK_PLLO is selected as the clock source for the System clock, and No division is selected as the division ratio of clock source PLL.



Note 1. CLK_PLLO is selected as the clock source for the System clock, and No division is selected as the division ratio of clock source PLL.

Note 2. The CKSC_CPUC and CLKD_PLLC registers are protected by the CLKKCPROT1 register. Execute the key code protection unlocking when setting these registers.

Note 3. Wait 100 µs after verifying

Figure 13.10 CPU System Clock Setting in STOP/DeepSTOP Mode

Section 14 Clock Monitor (CLMA)

The following sections describe clock monitor A (CLMA).

The first section describes the attributes specific to the RH850/U2A-EVA microcontrollers, including the number of channels, register base addresses, and input/output signal names.

The ensuing sections describe the functions relevant to all operations.

14.1 Features of RH850/U2A-EVA CLMA

14.1.1 Number of Channels

The RH850/U2A-EVA microcontrollers incorporate CLMA with the following number of channels.

Table 14.1 Number of Channels

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of channels	10 (n = 0 to 9)	10 (n = 0 to 9)	10 (n = 0 to 9)	10 (n = 0 to 9)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)	8 (n = 0 to 7)
Name	CLMAn									

14.1.2 Register Base Addresses

The CLMA base addresses are listed in the following table.

The CLMA register addresses are expressed as offsets from the base addresses.

Table 14.2 Register Base Addresses

Base Address Name	Base Address	Bus Group
<CLMAC_base>*1	FF98 9000$_H$	P-Bus Group 2L
<CLMA0_base>	FF98 9100$_H$	P-Bus Group 2L
<CLMA1_base>	FF98 9200$_H$	P-Bus Group 2L
<CLMA2_base>	FF98 9300$_H$	P-Bus Group 2L
<CLMA3_base>	FF98 1800$_H$	P-Bus Group 2L
<CLMA4_base>	FF98 1900$_H$	P-Bus Group 2L
<CLMA5_base>	FF98 1A00$_H$	P-Bus Group 2L
<CLMA6_base>	FF98 1B00$_H$	P-Bus Group 2L
<CLMA7_base>	FF98 1C00$_H$	P-Bus Group 2L
<CLMA8_base>	FF98 1D00$_H$	P-Bus Group 2L
<CLMA9_base>	FF98 1E00$_H$	P-Bus Group 2L

Note 1. Common registers CLMATEST, CLMATESTS.

14.1.3 Clock Supply

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.
Each clock frequency see **Section 13, Clock Controller**.

Table 14.3 Clock Supply

Channel Name	CLMATMON (monitored clock)	CLMATSMP (sampling clock)	PCLK (register access clock)
CLMA0	CLK_MOSC	CLK_HSIOSC/400	CLK_LSB
CLMA1	CLK_WDT (HS IntOSC 1/20, 1/640)	CLK_LSIOSC/2	CLK_LSB
CLMA2	CLK_LSIOSC	CLK_HSIOSC/1600	CLK_LSB
CLMA3	CLK_LSB	CLK_MOSC/8	CLK_LSB
CLMA4	CLK_LSB	CLK_HSIOSC/20	CLK_LSB
CLMA5	CLK_UHSB/2 (Target: GTM Main clock)	CLK_LSB/4	CLK_LSB
CLMA6	CLK_CPU/4 (Target: PE0 checker clock)	CLK_LSB/4	CLK_LSB
CLMA7	CLK_CPU/4 (Target: PE1 checker clock)	CLK_LSB/4	CLK_LSB
CLMA8	CLK_CPU/4 (Target: PE2 checker clock)	CLK_LSB/4	CLK_LSB
CLMA9	CLK_CPU/4 (Target: PE3 checker clock)	CLK_LSB/4	CLK_LSB

NOTE

- The PLL lock loss error status can be detected by CLMA3, because the PLL clock is monitored by these clock monitors.
  (When the PLL clock is selected as the system clock (CLK_SYS).)
- CLMA3 needs to execute a special flow after reset release. Refer to **Section 14.7.1, Notes on CLMA3 after Reset release** for details.
- When CLK_SYS source is PLL clock, CLMA3 can be used.
- When CLK_SYS source is CLK_IOSC, CLMA4 can be used.
- When DCLS of PEn (n = 1 to 3) is disabled by setting bits 19 to 17 in FLASH Option Byte 9, CLMAn (n = 7 to 9) can not be used.
  For details of FLASH Option Byte 9, see **Section 51.12.15, OPBT9 — Option Byte 9**.
- For procedures of clock change, refer to **Section 14.7.3, Notes on Procedures to Clock Change**.

14.1.4 Interrupt Requests and Error Notifications

This module has no interrupt requests.

The error notifications of this module are listed in the following table.

Table 14.4 Error Notifications

Error Notification	Description	ECM Error Number	Error Response to bus master
Clock monitor error for CLK_MOSC	CLMA0 over/under frequency error	48	—
Clock monitor error for CLK_WDT	CLMA1 over/under frequency error	49	—
Clock monitor error for CLK_LSIOSC	CLMA2 over/under frequency error	50	—
Clock monitor error for CLK_LSB	CLMA3 over/under frequency error	51	—
	CLMA4 over/under frequency error		
Clock monitor error for CLK_UHSB	CLMA5 over/under frequency error	52	—
Clock monitor error for CLK_CPU (PE0)	CLMA6 over/under frequency error	229	—
Clock monitor error for CLK_CPU (PE1)	CLMA7 over/under frequency error	261	—
Clock monitor error for CLK_CPU (PE2)	CLMA8 over/under frequency error	293	—
Clock monitor error for CLK_CPU (PE3)	CLMA9 over/under frequency error	325	—

14.1.5 Internal Input/Output Signals

Table 14.5 Internal Input/Output Signals

Clock monitor	Output to
CLMA0	ECM Error Input No.48
CLMA1	ECM Error Input No.49
CLMA2	ECM Error Input No.50
CLMA3	ECM Error Input No.51
CLMA4	ECM Error Input No.51
CLMA5	ECM Error Input No.52
CLMA6	ECM Error Input No.229
CLMA7	ECM Error Input No.261
CLMA8	ECM Error Input No.293
CLMA9	ECM Error Input No.325

Note: CLMA notifies ECM of high detection error and low detection error.

14.2 Overview

14.2.1 Block Diagram

The main components of the clock monitor are shown in **Figure 14.1**.

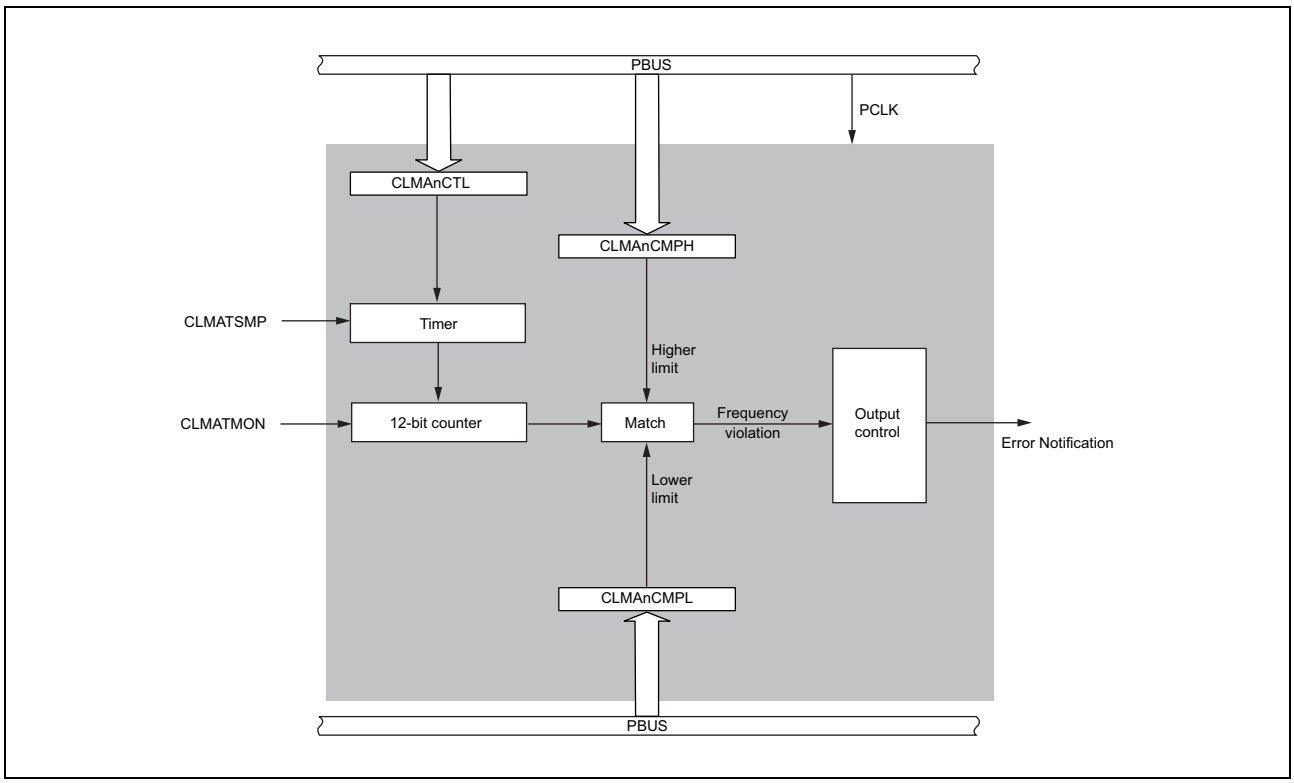


Figure 14.1 Block Diagram of Clock Monitor

14.2.2 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock.

It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range.

Upon detection of an abnormal clock, CLMAn sends the error notification to ECM.

The accuracy of each clock monitor is shown below.

Table 14.6 Accuracy of clock frequency used by Clock Monitor

Channel Name	CLMATMON (monitored clock)	CLMATSMP (sampling clock)
CLMA0	±0.1% *1	±5.0%
CLMA1	±5.0%	±10%
CLMA2	±10%	±5.0%
CLMA3	±0.1% *1	±0%
CLMA4	±0.1% *1*2	±0%
CLMA5	±0.1% *1	±0%
CLMA6	±0.1% *1	±0%
CLMA7	±0.1% *1	±0%
CLMA8	±0.1% *1	±0%
CLMA9	±0.1% *1	±0%

Note 1. Depends on the accuracy of the external parts.
Note 2. This is the value of “CLK_LSB = CLK_IOSC”.

14.3 Enabling CLMA

To enable CLMAn, CLMAnCTL which is a register to control CLMAn should be set 01_H. The control register CLMAnCTL is a write protection register to enable CLMAn. Refer to **Section 14.6.1** about procedure to enable CLMAn.

CLMA0 to CLMA2 are in the AWO area. When the monitored clock or sampling clock is stopped by transition to Chip Standby mode (MOSCSTPM.MOSCSTPMSK = 0, HSOSCSTPM.HSOSCSTPMSK = 0), the corresponding clock monitor is automatically stopped.

After returning from Chip Standby mode, and the monitored clock and sampling clock start oscillation again and become stable, the clock monitor also starts operation.

CLMA3 to CLMA9 are in the ISO area, and the software must stop these CLMAs before the system enters Chip Standby mode.

NOTE

- CLMAn can only be disabled by reset. Writing 0 to CLMAnCTL cannot disable CLMAn.
- The initial value of CLMAnCTL is 00_H. (00_H means CLMAn is disabled)

14.4 Functions

The Clock Monitor CLMAn is used to verify whether the frequency of a clock (CLMATMON) is within the specified range.

14.4.1 Detection of Abnormal Clock Frequencies

14.4.1.1 Detection Method

(1) CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the counter with the configured limits:
- CLMAnCMPL.CLMAnCMPL[11:0] defines the lower limit.
- CLMAnCMPH.CLMAnCMPH[11:0] defines the higher limit.

(2) When the frequency of CLMATMON is lower than the limit, the counter falls below CLMAnCMPL.CLMAnCMPL[11:0].

(3) When the frequency of CLMATMON is higher than the limit, the counter exceeds CLMAnCMPH.CLMAnCMPH[11:0].

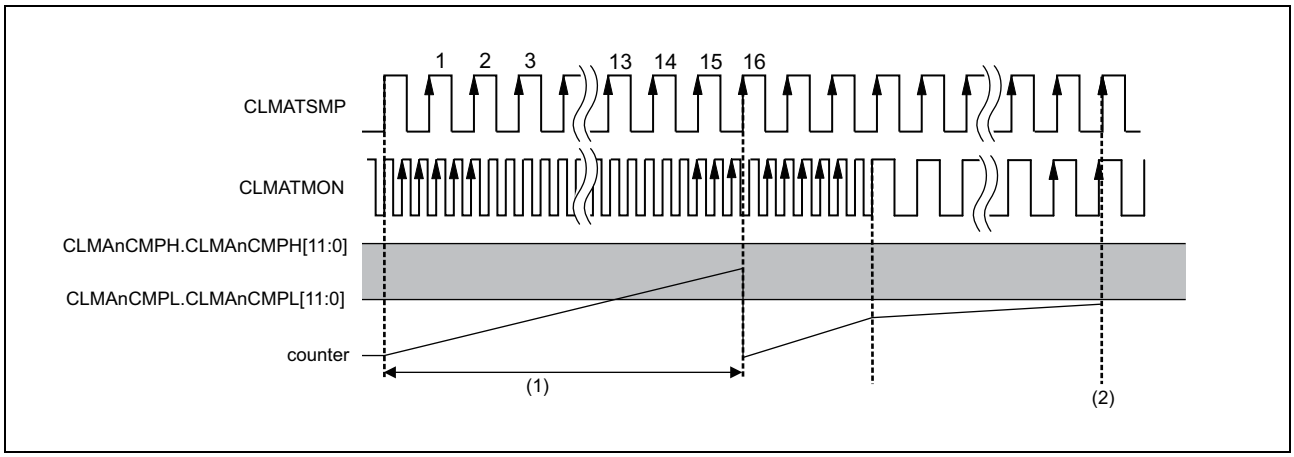

Figure 14.2 Example: $f_{CLMATMON}$ is Lower than the specified limit.

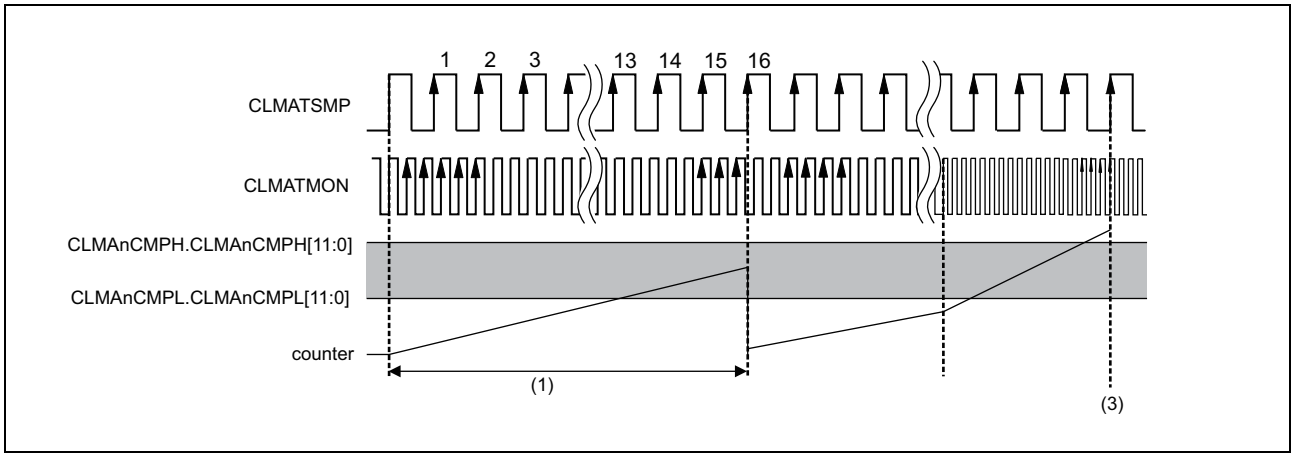

Figure 14.3 Example: $f_{CLMATMON}$ is Higher than the specified limit

NOTE

Even if the $f_{CLMATMON}$ exceeds or falls below the specified limits during a sample period, the counter might be within the valid range.
Abnormal $f_{CLMATMON}$ is detected after one sampling interval later.

14.4.1.2 Calculation of limits CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]

The compare registers CLMAnCMPL and CLMAnCMPH are configured with the minimum and maximum number of clock cycles of CLMATMON that are assumed to be valid within 16 cycles of the sampling clock CLMATSMP.

The expected number of clock cycles is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the limit values can be calculated by the following formulas:

$$\text{Lower limit} = N_{min} = \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Higher limit} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

Example

For $f_{CLMATSMP}$ = 240 kHz (±10%)/2 and $f_{CLMATMON}$ = 200 MHz (±5.0%) /640 the recommended limit values are the following:

$$N_{min} = (296.9/132) \times 16 - 1$$
$$= 34.98$$
$$CLMAnCMPL = 34 = 0022_H$$

$$N_{max} = (328.1/108) \times 16 + 1$$
$$= 49.61$$
$$CLMAnCMPH = 50 = 0032_H$$

Minimum limits

The following restrictions must be taken into account:

- $CLMAnCMPL \geq 0001_H$
- $CLMAnCMPH \geq CLMAnCMPL + 0003_H$

14.4.2 Error Notification

Once error is detected, i.e. frequency of monitored clock (CLMATMON) exceeds the higher limit or falls below the lower limit, CLMAn sends the error notification to ECM.

In addition, the error notification is not negated until CLMAn is reset.

14.4.3 Self-Test

This MCU implements a self-diagnosis function for the clock monitors. It allows isolating the clock monitor from the system and executing functional test patterns via software. Each clock monitor can be tested individually. For performing these tests, the clock monitor inputs can be controlled by dedicated control registers, while its outputs can be observed in status registers.

Two registers are implemented for the self-diagnosis of the Clock Monitor, the Clock Monitor Test Register (CLMATEST) and the Clock Monitor Test Status Register (CLMATESTS). Refer to the corresponding register descriptions for details.

14.5 Registers

14.5.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

Registers CLMAKCPROT have to be written first in order to unlock protected registers and allow change of register content.

14.5.2 List of Registers

The following table lists the CLMA registers.

<CLMAn_base> is defined in **Section 14.1.2, Register Base Addresses**.

Table 14.7 List of Registers

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
<CLMAC_base> + 00_H	CLMATEST	Clock Monitor Test Register	32	0000 0000_H	PBG20 #2	CLMAKCPROT
<CLMAC_base> + 04_H	CLMATESTS	Clock Monitor Test Status Register	32	0000 0000_H	PBG20 #2	
<CLMAn_base> + 00_H	CLMAnCTL	CLMAn Control Register	8	00_H	PBG20 #2	CLMAKCPROT
<CLMAn_base> + 08_H	CLMAnCMPL	CLMAn Comparison Register L	16	0001_H	PBG20 #2	
<CLMAn_base> + $0C_H$	CLMAnCMPH	CLMAn Comparison Register H	16	$03FF_H$	PBG20 #2	
FF98 2700_H	CLMAKCPROT	Clock Monitor Register Key Code Protection Register	32	0000 0000_H	PBG20 #2	

Note: (n = 0 to 9)

14.5.3 Reset of Registers

Table 14.8 Register reset conditions

Channel Name	Reset Category

14.5.4 CLMATEST – Clock Monitor Test Register

This register is used for the self-test of the clock monitors. Each Clock Monitor can be tested individually.

Access: This register can be read or written in 32-bit units.

Address: <CLMAC_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.10 CLMATEST Register contents (1/2)

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	CLMA9TESEN	CLMA9 self-test enable/disable 0: Test disabled. 1: Test enabled.
11	CLMA8TESEN	CLMA8 self-test enable/disable 0: Test disabled. 1: Test enabled.
10	CLMA7TESEN	CLMA7 self-test enable/disable 0: Test disabled. 1: Test enabled.
9	CLMA6TESEN	CLMA6 self-test enable/disable 0: Test disabled. 1: Test enabled.
8	CLMA5TESEN	CLMA5 self-test enable/disable 0: Test disabled. 1: Test enabled.
7	CLMA4TESEN	CLMA4 self-test enable/disable 0: Test disabled. 1: Test enabled.
6	CLMA3TESEN	CLMA3 self-test enable/disable 0: Test disabled. 1: Test enabled.
5	CLMA2TESEN	CLMA2 self-test enable/disable 0: Test disabled. 1: Test enabled.
4	CLMA1TESEN	CLMA1 self-test enable/disable 0: Test disabled. 1: Test enabled.
3	CLMA0TESEN	CLMA0 self-test enable/disable 0: Test disabled. 1: Test enabled.

Table 14.10 CLMATEST Register contents (2/2)

Bit Position	Bit Name	Function
2	ERRMSK *1	CLMA test error mask setting Asserting this bit prevents the detected error from being forwarded into the device. CLMA test reset signal mask setting 0: Error signal generation enabled 1: Error signal generation disabled (masked)
1	MONCLKMSK*1	Monitor clock mask setting Fixes the clock input to the CLMAn to low level. 0: Monitored clock enabled 1: Monitored clock disabled (masked)
0	RESCLM *1	CLMAn test reset signal control Asserting this bit re-initializes the Clock Monitor. 0: Reset signal for CLMAn is released. 1: Reset signal for CLMAn is asserted.

Note 1. These bits are valid for CLMAn which is in self-test mode by setting “1” to CLMAnTESEN.

14.5.5 CLMATESTS – Clock Monitor Test Status Register

This register is used for the self-test of the clock monitors. It monitors the error detection flags which are otherwise forwarded to the ECM module. Once error is detected, this register keeps the status until CLMAn is reset.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <CLMAC_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.11 CLMATESTS Register contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned.
9	CLMA9ERRS	CLMA9 error status 0: No error detected 1: Error detected
8	CLMA8ERRS	CLMA8 error status 0: No error detected 1: Error detected
7	CLMA7ERRS	CLMA7 error status 0: No error detected 1: Error detected
6	CLMA6ERRS	CLMA6 error status 0: No error detected 1: Error detected
5	CLMA5ERRS	CLMA5 error status 0: No error detected 1: Error detected
4	CLMA4ERRS	CLMA4 error status 0: No error detected 1: Error detected
3	CLMA3ERRS	CLMA3 error status 0: No error detected 1: Error detected
2	CLMA2ERRS	CLMA2 error status 0: No error detected 1: Error detected
1	CLMA1ERRS	CLMA1 error status 0: No error detected 1: Error detected
0	CLMA0ERRS	CLMA0 error status 0: No error detected 1: Error detected

14.5.6 CLMAnCTL – CLMAn Control Register

This register enables the clock monitor CLMAn.

Access: This register can be read or written in 8-bit units

Address: <CLMAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAnCLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 14.12 CLMAnCTL Register contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	CLMAnCLME*1	Enable or disables the clock monitor. 0: Disables CLMAn. 1: Enables CLMAn. This bit can only be cleared by a reset.

Note 1. (n = 0 to 9)

14.5.7 CLMAnCMPL – CLMAn Comparison Register L

This register specifies the lower limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL.CLMAnCLME = 0).

For details, see **Section 14.4.1.2, Calculation of limits CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + 08_H

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.13 CLMAnCMPL Register contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPL*1	Specifies the lower limit • The recommended value is $f_{CLMATMON\ (min)}$ / $f_{CLMATSMP\ (max)}$ × 16 - 1. • The minimum value is 0001_H.

Note 1. (n = 0 to 9)

14.5.8 CLMAnCMPH – CLMAn Comparison Register H

This register specifies the higher limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL.CLMAnCLME = 0).

For details, see **Section 14.4.1.2, Calculation of limits CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]**.

Access: This register can be read or written in 16-bit units.

Address: <CLMAn_base> + $0C_H$

Value after reset: $03FF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.14 CLMAnCMPH Register contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	CLMAnCMPH[*1]	Specifies the higher limit • The recommended value is $f_{CLMATMON\ (max)}$ / $f_{CLMATSMP\ (min)}$ × 16 + 1. • The minimum value is CLMAnCMPL + 0003_H.

Note 1. (n = 0 to 9)

14.5.9 CLMAKCPROT – Clock Monitor Register Key Code Protection Register

This register is used for protection against writing to the target registers due to program malfunction and the like. See **Table 14.7, List of Registers** for the target registers.

Access: This register can be read or written in 32-bit units.

Address: FF98 2700$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 14.15 CLMAKCPROT Register contents

Bit Position	Bit Name	Function
31 to 1	KCPROT*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0. *1
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing to protected registers.
Write A5A5A501$_H$ to this register to enable writing to protected registers.

14.6 Operation

14.6.1 Procedures to Enable CLMAn

[Procedure]

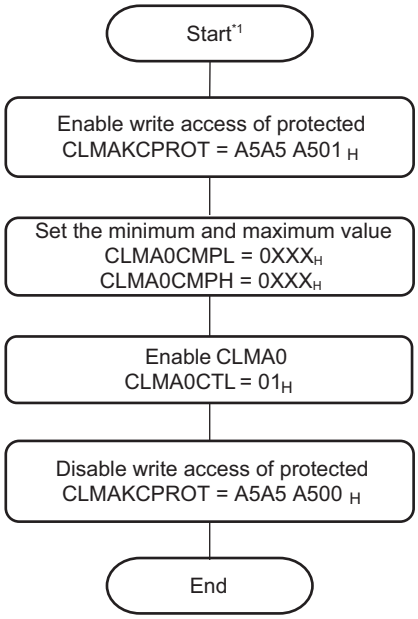
(1) Enable write access of protected registers with setting of CLMAKCPROT = A5A5 $A501_H$.

(2) Set the minimum and maximum number of clock cycles to CLMAnCMPL and CLMAnCMPH.

(3) Enable CLMAn by setting 01_H to CLMAnCTL.CLMAnCLME.

(4) Disable write access of protected registers with setting of CLMAKCPROT.KCE = A5A5 $A500_H$.

Example case: Enable CLMA0



Note 1. Initialize CLMA3 and clear the error status of ECM error source status register after reset release of CLMA3. See **Section 14.7.1, Notes on CLMA3 after Reset release** for details.

Figure 14.4 Flow Chart of the Enable CLMA0

CAUTION

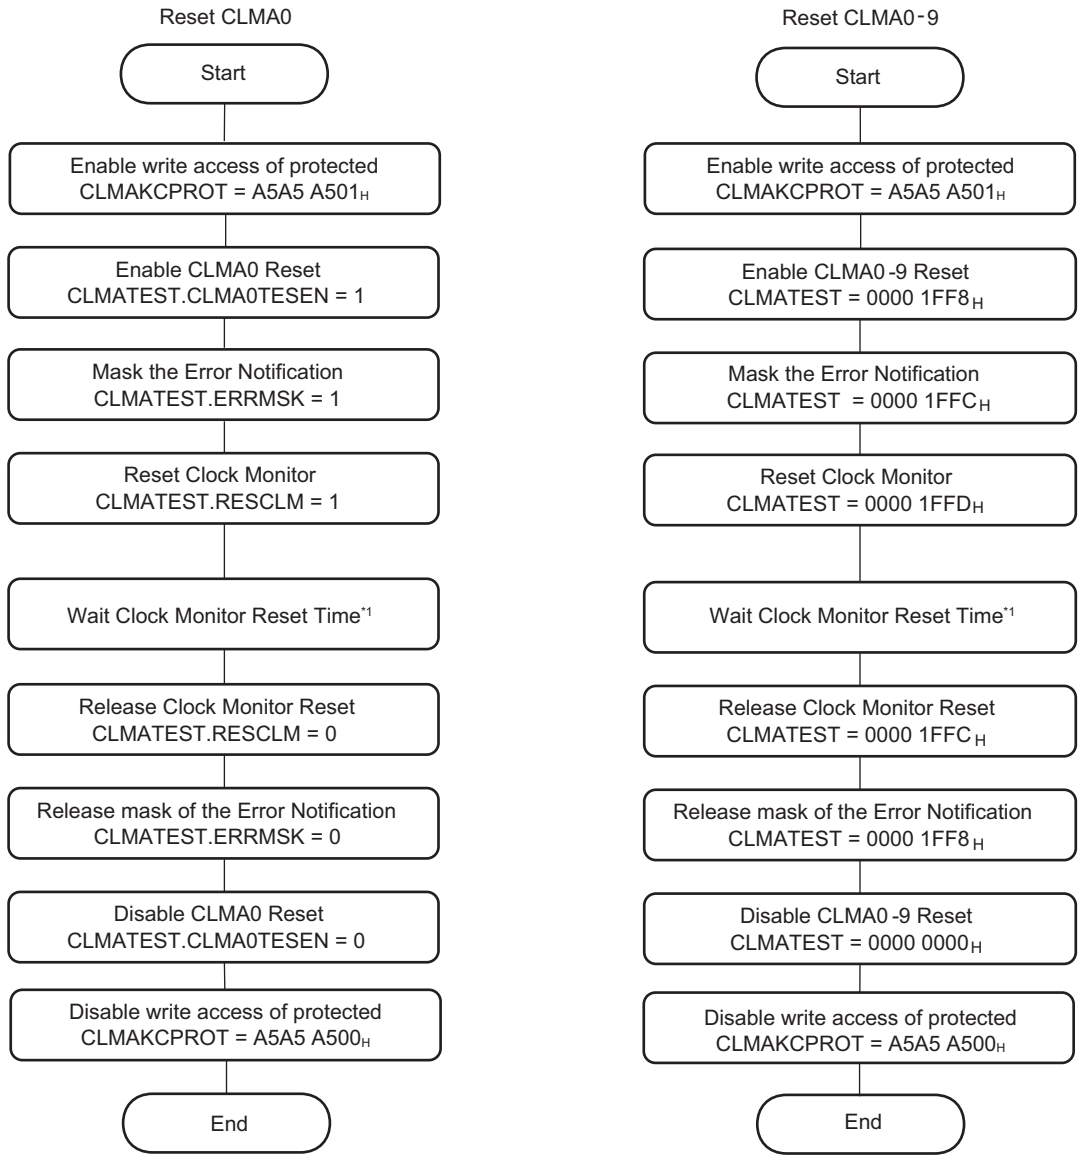
- **CLMA0 and CLMA3 operation must be started after users check stable state of Main OSC by referring to MOSCS.MOSCSTAB = 1.**
- **CLMA0, CLMA1, CLMA2 and CLMA4 operation must be started after users check stable state of HS IntOSC by referring to HSOSCS.HSOSCSTAB = 1.**
- **CLMAn (n = 3 to 9) operation must be started after users check that clock gear-up procedure has been finished. For details of clock gear-up sequence, see Section 13, Clock Controller.**

14.6.2 Procedures to Reset by CLMATEST.RESCLM

CLMATEST.RESCLM can also reset each clock monitor. Before changing clock frequency via register during operation. It is necessary to go through the procedure as below and to retry setting parameters for CLMAn.

[Procedure]

Example case: Reset CLMA0 or Reset CLMA0 to CLMA9

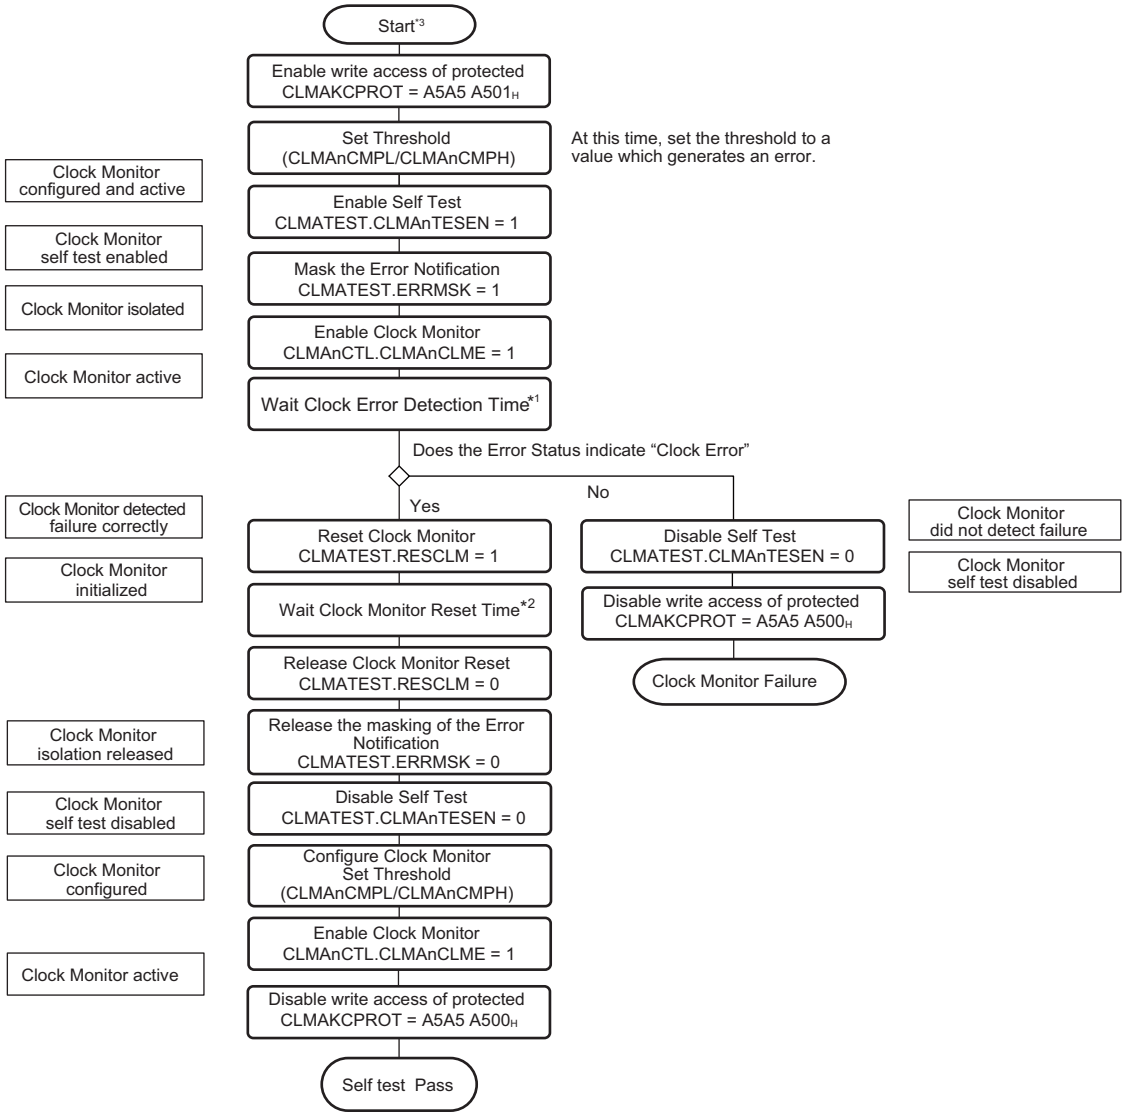


Note 1. CLMATEST.RESCLM must be kept asserted for at least 2 cycles at the corresponding sampling clock in order to make the CLMA initialized.

Figure 14.5 Flow Chart of the Reset by CLMATEST.RESCLM

14.6.3 Procedures to do Self-Test

Self-diagnosis of the clock monitor is available as described below. In the description, the clock monitor to be self-diagnosed is operating.



Note 1. After CLMAnCTL.CLMAnCLME bit is set to “1”, it requires more than or equal to 32 cycles at the sampling clock to detect the error status via CLMATESTS.

Note 2. CLMATEST.RESCLM must be kept asserted for at least 2 cycles at the corresponding sampling clock in order to make the CLMA initialized.

Note 3. Initialize CLMA3 and clear the error status of ECM error source status register after reset release of CLMA3. See **Section 14.7.1, Notes on CLMA3 after Reset release** for details.

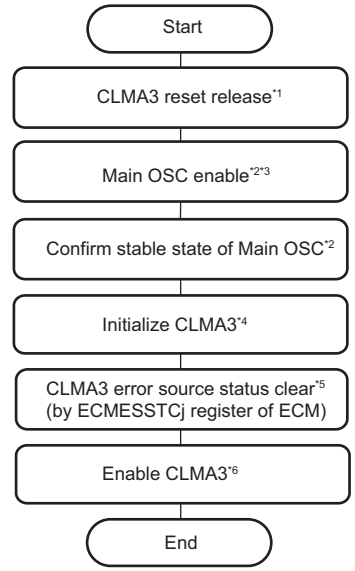
Figure 14.6 Flow Chart of the Self-Diagnosis

14.7 Usage Notes for CLMAn

14.7.1 Notes on CLMA3 after Reset release

After power-up or resume from power-down of MCU, the ECM error input of CLMA3 becomes undefined value and the ECM error source status register may be flagged.

So initialize CLMA3 and clear the error status of ECM error source status register after reset release of CLMA3. **Figure 14.7** shows the flow for clearing ECM error source status.

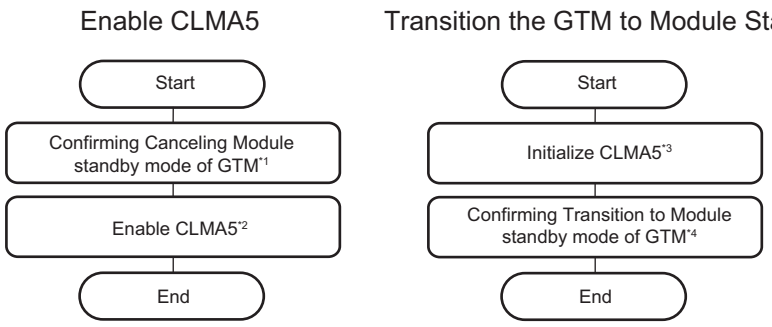


Note 1. See **Table 14.8** Register reset conditions for CLMA3 reset.
Note 2. See **Section 13.5.4.4, MOSCE — Main OSC Enable Register** for details.
Note 3. Setting is unnecessary if Main OSC is already enabled.
Note 4. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.
Note 5. See **Section 45.3.13, ECMESSTCj — ECM Error Source Status Clear Trigger Register j** for details.
Note 6. See **Section 14.6.1, Procedures to Enable CLMAn** and **Section 14.6.3, Procedures to do Self-Test** for details.

Figure 14.7 Flow Chart for clearing ECM error source status after CLMA3 reset release

14.7.2 Notes on CLMA5 in Module standby mode

Enable CLMA5 after confirming canceling module standby mode of GTM.
Stop the CLMA5 prior to transition the GTM to module standby.



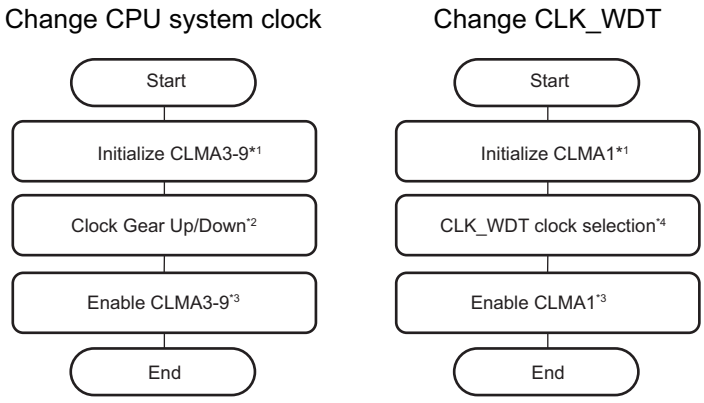
Note 1. See **Section 15.1.2.1, Canceling to Module Standby Mode** for details.
Note 2. See **Section 14.6.1, Procedures to Enable CLMAn** for details.
Note 3. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.
Note 4. See **Section 15.1.2.2, Transition to Module Standby Mode** for details.

Figure 14.8 Flow Chart of the CLMA5 in Module standby mode

14.7.3 Notes on Procedures to Clock Change

Initialize the clock monitor before the monitored clock or sampling clock is changed (including when the oscillator is stopped by software), and enable the clock monitor after the monitored clock and sampling clock are stable.

Clock change of the clock monitor is available as described below.



Note 1. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.
Note 2. See **Section 13.6.5, Sequence for Shifting the CPU System Clock Gear Up/Down** for details.
Note 3. See **Section 14.6.1, Procedures to Enable CLMAn** for details.
Note 4. See **Section 13.6.1.2, Setting Procedure for Clock** for details.

Figure 14.9 Flow Chart of the Clock Change

Section 15 Standby Controller (STBC)

This section describes the functions of the standby controller (STBC), the registers, and various chip standby modes.

15.1 Functions

15.1.1 Types of Chip Standby Mode

The RH850/U2A-EVA supports STOP mode and DeepSTOP mode for system-level low power status. In addition, the RH850/U2A-EVA supports cyclic operation (Cyclic RUN mode and Cyclic STOP mode) which supports low-power operation of limited functions. Transition between each mode is described in the **Section 15.1.1.4, Transition to Chip Standby Mode**.

- RUN mode
  RUN mode is a normal operation mode where the CPU is operating and all of other modules can operate. The CPU can enter “HALT” state by executing the “HALT” instruction to stop its operation in this mode.
- STOP mode
  STOP mode is a chip-level chip standby mode in which the clock supply to a certain clock can be stopped.
  STOP mode is entered by setting the STBC0STPT.STBC0STPTRG bit is set to 1.
  The clock supply to a certain clock can continue even in STOP mode by MSR_<name>*1.STPMSK_<name> bit setting. For details on the MSR_<name> register, see **Section 15.1.2.3, Behavior of Module Standby Mode during Chip Standby Mode**.
- DeepSTOP mode
  DeepSTOP mode is a chip-level chip standby mode to reduce power consumption further than STOP mode. In addition to the clock supply stop, the power supply to the Isolated area is switched off.
  DeepSTOP mode is entered by setting the STBC0PSC.STBC0DISTRG bit is set to 1.
- Cyclic RUN mode
  Cyclic RUN mode is a low-power operation mode in which limited modules can operate at low speed. In this mode, only the CPU0(PE0), the peripheral functions in the Always-On area, RLIN3, MSPI can operate. Data/Code flash memory and PLL are not available. The CPU1(PE1)/ CPU2(PE2)/CPU3(PE3) is also not available.
  The CPU0(PE0) executes the instructions in the retention RAM.
  In this mode, the CPU0(PE0) can issue the “HALT” instruction to enter HALT state.
  The mode transition to Cyclic RUN mode from DeepSTOP mode is triggered by Wake-Up Factor 1, and the mode transition to Cyclic RUN mode from Cyclic STOP mode is triggered by either Wake-Up Factor 0 or Wake-Up Factor 1.
  MSPI cannot be Wake-Up Factor because it does not have wake-up function.
- Cyclic STOP mode
  Cyclic STOP mode is a STOP mode in cyclic operation, and the CPU0(PE0) halts its operation.
  This mode is entered by setting the STBC0STPT.STBC0STPTRG bit to 1 in Cyclic RUN mode.

Note 1. In this section, <name> represents target module.

15.1.1.1 Wake-Up Control

(1) Wake-Up Factors for Chip Standby Modes

The standby controller can initiate return from chip standby mode by Wake-Up Factor 0 and Wake-Up Factor 1.

- Wake-Up Factor 0

  Wake-Up Factor 0 is trigger which can initiate return from STOP/DeepSTOP mode to RUN mode and can initiate return from Cyclic STOP mode to Cyclic RUN mode.

  When transition from Cyclic operation (Cyclic RUN mode and Cyclic STOP mode) to RUN mode, return to RUN mode via DeepSTOP mode.

  When the transition from Cyclic STOP to Cyclic RUN is made by Wake-Up Factor 0, if the transition to DeepSTOP by STBC0PSC.STBC0DISTRG is made without clearing Wake-Up Factor 0, the transition to RUN mode is made.

- Wake-Up Factor 1

  Wake-Up Factor 1 is trigger which can initiate return from DeepSTOP mode to Cyclic RUN mode and can initiate return from Cyclic STOP mode to Cyclic RUN mode.

(2) Setting of Wake-Up Factors

Wake-Up Factors for returning from chip standby modes are controlled by the following standby controller registers:

- Wake-Up Factor registers: WUF0_A0, WUF0_A1, WUF0_A2, WUF0_I0, WUF0_I1, WUF1_A0, WUF1_A1, WUF1_A2, WUF1_I0, WUF1_I1

  Upon occurrence of an effective Wake-Up Factor, the associated Wake-Up Factor flag is set to 1. By checking these registers and their flags, it is possible to identify the Wake-Up Factor.

- Wake-Up Factor mask registers: WUFMSK0_A0, WUFMSK0_A1, WUFMSK0_A2, WUFMSK0_I0, WUFMSK0_I1, WUFMSK1_A0, WUFMSK1_A1, WUFMSK1_A2, WUFMSK1_I0, WUFMSK1_I1

  Each bit of these registers is assigned to a certain Wake-Up Factor. Wake-up by this factor is enabled if its mask bit is set to 0. Wake-Up Factors assigned to both Wake-Up Factor 0 and 1 should not be enabled at the same time.

- Wake-Up Factor clear registers: WUFC0_A0, WUFC0_A1, WUFC0_A2, WUFC0_I0, WUFC0_I1, WUFC1_A0, WUFC1_A1, WUFC1_A2, WUFC1_I0, WUFC1_I1

  By setting the applicable bits in these registers to 1, the Wake-Up Factor bit (WUFy) in the Wake-Up Factor registers (WUF0_A0, WUF0_A1, WUF0_A2, WUF0_I0, WUF0_I1, WUF1_A0, WUF1_A1, WUF1_A2, WUF1_I0, WUF1_I1) can be cleared.

NOTE

The Wake-Up Factor flags in the Wake-Up Factor registers (WUF0_A0, WUF0_A1, WUF0_A2, WUF0_I0, WUF0_I1, WUF1_A0, WUF1_A1, WUF1_A2, WUF1_I0, WUF1_I1) only indicate the occurrence of Wake-Up Factor. These flags do not indicate a transition from chip standby mode to normal mode.

The assignment of the Wake-Up Factors to the control register bits and status register bits are shown in the following tables.

For details about the wake-up control and status registers, see below.

- **Section 15.2.4.35, WUF0_Ax/WUF1_Ax/WUF0_Ix/WUF1_Ix — Wake-Up Factor Registers**
- **Section 15.2.4.36, WUFMSK0_Ax/WUFMSK1_Ax/WUFMSK0_Ix/WUFMSK1_Ix — Wake-Up Factor Mask Registers**
- **Section 15.2.4.37, WUFC0_Ax/WUFC1_Ax/WUFC0_Ix/WUFC1_Ix — Wake-Up Factor Clear Registers**.

INTRLIN322	RLIN322	WUF0/1_I1[22]	WUFMSK0/1_I1[22]	WUFC0/1_I1[22]	√	—	√	—	√
INTRLIN323	RLIN323	WUF0/1_I1[23]	WUFMSK0/1_I1[23]	WUFC0/1_I1[23]	√	—	√	—	√

CAUTION

For the pins of the function used for the Wake-Up Factors from DeepSTOP, use the multiplexed functions of the ports assigned to the Always-On area or assigned to "Wake-up factors". See Section 2.2.1, Pin List and Function assignment.

15.1.1.2 On-Chip Debug Wake-Up

The On-Chip Debug Module (OCD) generates a wake-up event while the microcontroller runs the application program in the following cases:

- The debugger issues a stop request
- A breakpoint is hit

In either case all chip standby modes are terminated, provided the OCD debug event is enabled as a Wake-Up Factor via the WUFMSK0/1_A2 register.

CAUTION

If the OCD wake-up event is disabled, it is not possible to wake-up from chip standby modes via an On-chip debugger request.
The OCD wake-up event can be enabled as a Wake-Up Factor for all chip standby modes by setting WUFMSK0/1_A2[2] = 0.
When the hot plug-in function is used, make sure to enable the OCD wake-up event and return from chip standby mode by INTDCUTDI interrupt.

15.1.1.3 I/O Buffer Control

In DeepSTOP mode, the I/O buffers of port groups in the Isolated area transition to I/O buffer hold state.
For port groups in the Isolated area supporting I/O buffer hold state, see **Section 2.2.2, Pin Status**.

(1) I/O Buffer Hold State

During the I/O buffer hold state, the I/O buffer maintains the state before it enters this state. Therefore, no external or internal signal can change the state of the I/O buffer until the I/O buffer hold state is terminated.

After wake-up from DeepSTOP, the I/O buffers remain in I/O buffer hold state.
And releases I/O buffer hold state for each port group by setting the IOHOLDn register.
To release I/O buffer hold state, follow the steps shown below.

1. Re-configure the peripheral or port function.
2. Set IOHOLDn.IOHOLD_xxx = 0. (n = 0, 2)

CAUTION

The data from the I/O buffer can be used from when the common I/O buffer input is enabled in the above step 1. Follow the steps shown above even if the LVDS buffer is used.

The following table is a summary of the I/O buffer in the Isolated area during DeepSTOP mode and after wake-up.

Table 15.6 Buffer Operation during DeepSTOP Mode and after Wake-Up (I/O buffers in the Isolated area)

Chip Standby mode	Before DeepSTOP mode	During DeepSTOP mode	After Wake-Up*1
DeepSTOP mode	Normal operation	I/O buffer hold state*2	I/O buffer hold state*2

Note 1. Set the IOHOLDn.IOHOLD_xxx (n = 0, 2) bit to "0" to release the I/O buffer hold state.

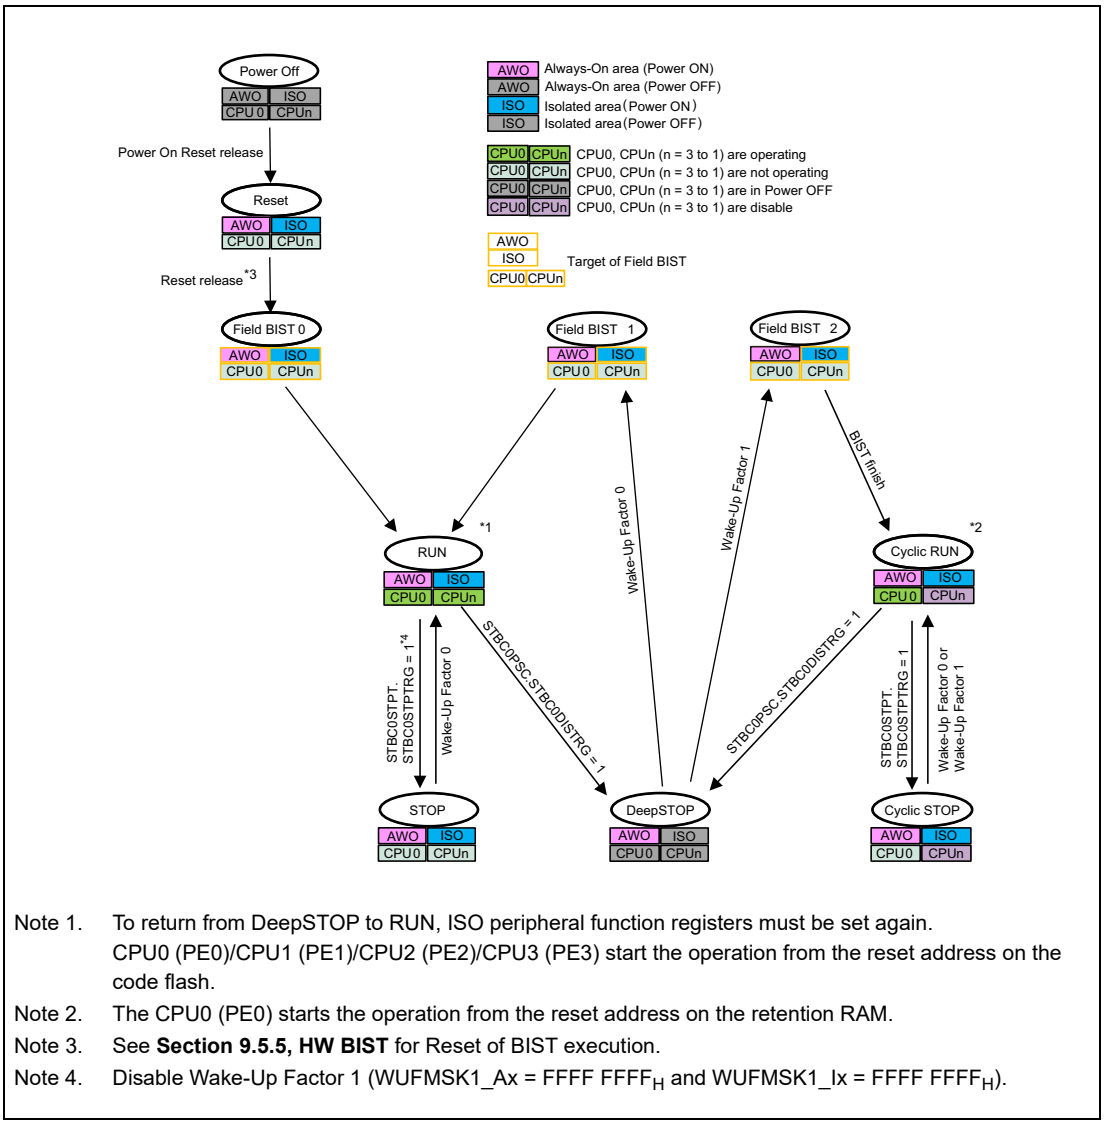
Note 2. I/O buffer hold sate is not supported when LVDS is used. The state is Hi-Z.

The port groups in the Always-On area don't support I/O buffer hold state. They continue operation and remain its state before entering DeepSTOP. In the case an alternative function of modules in Isolated area is assigned to the pin in the Always-On area, the state of the I/O buffer may change in the transition to the DeepSTOP due to initialization of the modules in the Isolated area by DeepSTOP Reset To avoid this behavior, it is recommended to change to function of modules in Always-On area (e. g. Port mode) before entering DeepSTOP.

15.1.1.4 Transition to Chip Standby Mode

The figure below shows transition between RUN mode and chip standby mode.

When Wake-Up Factor 0 and Wake-Up Factor 1 are set at the same time, Wake-Up Factor 0 takes precedence.



Note 1. To return from DeepSTOP to RUN, ISO peripheral function registers must be set again. CPU0 (PE0)/CPU1 (PE1)/CPU2 (PE2)/CPU3 (PE3) start the operation from the reset address on the code flash.

Note 2. The CPU0 (PE0) starts the operation from the reset address on the retention RAM.

Note 3. See **Section 9.5.5, HW BIST** for Reset of BIST execution.

Note 4. Disable Wake-Up Factor 1 (WUFMSK1_Ax = FFFF FFFF$_H$ and WUFMSK1_Ix = FFFF FFFF$_H$).

Figure 15.1 Transition to Chip Standby Mode

Table 15.7 CPU operating in each Chip Standby Mode

	CPU0(PE0)	CPU1(PE1)	CPU2(PE2)	CPU3(PE3)
RUN mode	Run	Run*1	Run*1	Run*1
STOP mode	Stop	Stop	Stop	Stop
DeepSTOP mode	Power off	Power off	Power off	Power off
Cyclic RUN mode	Run*2	Disable	Disable	Disable
Cyclic STOP mode	Stop	Disable	Disable	Disable

Note 1. After writing "1" to the bit of the BOOTCTRL register corresponding to each CPU, CPU start operating.

Note 2. The beginning address of Reset vector is Retention RAM (FE80 0000$_H$).

15.1.2 Types of Module Standby Mode

This function stops the clocks for peripheral modules by register setting in order to reduces power consumption.
Table 15.8, Modules that participate in Module Standby mode shows the modules that participate in the module standby modes.

After reset is released, all peripherals enter module standby modes.
Register access to the module in module standby mode is prohibited.

Example of the procedure of module standby mode is shown below.

15.1.2.1 Canceling to Module Standby Mode

1. Check the Software Module Reset Status Register of modules that participate in the module standby mode is 0 (SWMRESS_<name>. SWMRESS_<name>_n = 0).
2. Enable writing to protected registers (MSRKCPROT = $A5A5A501_H$).
3. Start all target clocks that cancels module standby mode (MSR_<name>.MS_<name>_n = 0).
4. Read the value of MSR_<name>.MS_<name>_n bit and check the value is 0.
5. Disable writing to protected registers (MSRKCPROT = $A5A5A500_H$).
6. Read the value of MSRKCPROT and check the value is 00000000_H.

CAUTION

ADCJ2 and TAUJ2/TAUJ3 need to wait for time before register setting after module standby cancel.
Read the register of the target module once for wait time.

Follow the steps shown below.

1. **Canceling module standby mode (Execute flow (2)(3)(4)(5)(6) above).**
2. **Read the register of ADCJ2 or TAUJ2/TAUJ3 once (Dummy read).**
3. **Register setting of ADCJ2 or TAUJ2/TAUJ3.**

15.1.2.2 Transition to Module Standby Mode

1. Check the modules that participate in the module standby mode have completed the operation and are in idle state and no other module or external pin may activate the module.
   For details of the way to confirm the idle state of the modules, see the section related to each module.
2. Check the Software Module Reset Status Register of modules that participate in the module standby mode is 0 (SWMRESS_<name>. SWMRESS_<name>_n = 0).
3. Stop all target clocks that participate in the module standby mode (MSR_<name>.MS_<name>_n = 1).

Table 15.8 Modules that participate in Module Standby mode (1/3)

Module Standby Register	Bit Name	Module Name
MSR_RSCFD	MS_RSCFD_1	RSCFD1, E7RC11, E7RC12, E7RC13

	MS_TAUJ_2	TAUJ2, SELB_TAUJ2I
MSR_WDTB_AWO	—*4	WDTBA

Note 1. Register RSENTTSSEL is always accessible regardless of the value of MSR_RSENT.

Note 2. Register MSPITGCTLn, MSPITGDMAALT, and MSPITGDTSALT are always accessible regardless of the value of MSR_MSPI.

Note 3. Register PSI5TSSEL is always accessible regardless of the value of MSR_PSI5.

Note 4. Module Standby Mode is not available. Only Chip Standby Mode is available.

15.1.2.3 Behavior of Module Standby Mode during Chip Standby Mode

Depending on the state of each bit (STPMSK_<name>,MS_<name>_n) of Module Standby Register.

Clock supply state in each mode of chip standby mode is shown in **Table 15.9**.

Table 15.9 Clock supply state in each mode at Chip Standby Mode

Module Standby Register		Chip Standby Mode	
MS_<name>_n	STPMSK_<name>*1	RUN, Cyclic RUN	STOP, DeepSTOP, Cyclic STOP
1	0	Stop	Stop
1	1	Stop	Stop
0	0	Supply	Stop
0	1	Supply	Supply

Note 1. If the source clock of the peripheral clock stops during chip standby mode, MSR_<name>.STPMSK_<name> should be set to 0.

For description of MS_<name>_n and STPMSK_<name>, refer to **Section 15.2.4, Details of Standby Controller Control Registers**.

Table 15.10, Clock operation propriety table of Module standby register target Module shows whether operation propriety to clock in each state.

Table 15.10 Clock operation propriety table of Module standby register target Module (1/2)

Note 1. ECM delay timer clock (CLK_ECMCNT) stops.

15.1.3 Clock Supply

The clock supply to the standby controller is shown in the following table.

Table 15.11 Clock Supply

Module Name	Module Clock Name	Supply Clock Name
Standby controller	Register access clock	CLK_LSB

15.2 Registers

15.2.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.

By releasing the protection of STBCKCPROT, MSRKCPROT, it can be written.

15.2.2 List of Registers

The following table lists the standby controller registers.

Table 15.12 List of Registers (1/2)

Address	Register Name	Description	Access Width	Value after reset	Access Protection	
					PBG	Other
FF98 1000$_H$	MSR_RSCFD	Module Standby Register for RS-CANFD	32	0000 0003$_H$	PBG20 #2	MSRKCPROT
FF98 1010$_H$	MSR_FLXA	Module Standby Register for FLXA	32	0000 0003$_H$	PBG20 #2	MSRKCPROT
FF98 1020$_H$	MSR_GTM	Module Standby Register for GTM	32	0000 0001$_H$	PBG20 #2	MSRKCPROT
FF98 1030$_H$	MSR_ETNB	Module Standby Register for ETNB	32	0000 0003$_H$	PBG20 #2	MSRKCPROT
FF98 1040$_H$	MSR_RSENT	Module Standby Register for RSENT	32	0000 00FF$_H$	PBG20 #2	MSRKCPROT
FF98 1050$_H$	MSR_MSPI	Module Standby Register for MSPI	32	0000 03FF$_H$	PBG20 #2	MSRKCPROT
FF98 1060$_H$	MSR_RLIN3	Module Standby Register for RLIN3	32	00FF FFFF$_H$	PBG20 #2	MSRKCPROT
FF98 1070$_H$	MSR_ADCJ_ISO	Module Standby Register for ADCJ0/ ADCJ1 (ISO area)	32	0000 0003$_H$	PBG20 #2	MSRKCPROT
FF98 1080$_H$	MSR_CXPI	Module Standby Register for CXPI	32	0000 000F$_H$	PBG20 #2	MSRKCPROT
FF98 1090$_H$	MSR_MMCA	Module Standby Register for MMCA	32	0000 0001$_H$	PBG20 #2	MSRKCPROT
FF98 10A0$_H$	MSR_ENCA	Module Standby Register for ENCA	32	0000 0003$_H$	PBG20 #2	MSRKCPROT
FF98 10B0$_H$	MSR_PSI5	Module Standby Register for PSI5	32	0000 000F$_H$	PBG20 #2	MSRKCPROT
FF98 10C0$_H$	MSR_PSI5S	Module Standby Register for PSI5-S	32	0000 0003$_H$	PBG20 #2	MSRKCPROT

Note 1. The reset is controlled bit by bit. The reset by Module Reset register bit (SWMRESA_<name>_n) initializes Module Standby register bit (MS_<name>_n).

Note 2. Only VMON Reset which is AWOVDD detection.

15.2.4 Details of Standby Controller Control Registers

15.2.4.1 MSR_RSCFD — Module Standby Register for RS-CANFD

This register is used to control the stop modes of the RS-CANFD.

Access: This register can be read or written in 32-bit units.

Address: FF98 1000_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STPMSK_RSCFD	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_RSCFD_1	MS_RSCFD_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.14 MSR_RSCFD Register Contents

Bit Position	Bit Name	Function
31	STPMSK_RSCFD	This bit controls the operation of RS-CANFD Clock in STOP mode with MS_RSCFD_n (n = 0, 1) = 0. 0 : The clocks are stopped in STOP mode. 1 : The clocks are supplied in STOP mode.
30 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_RSCFD_1	Setting this bit to 1 stops all clocks connected to RSCFD1 (CAN8 to CAN15), E7RC11, E7RC12, and E7RC13. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSCFD.SWMRESA_RSCFD_1 = 1, this bit is returned to the value after reset.
0	MS_RSCFD_0	Setting this bit to 1 stops all clocks connected to RSCFD0 (CAN0 to CAN7), E7RC01, E7RC02, and E7RC03. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSCFD.SWMRESA_RSCFD_0 = 1, this bit is returned to the value after reset.

15.2.4.2 MSR_FLXA — Module Standby Register for FLXA

This register is used to control the stop modes of the FLXA.

Access: This register can be read or written in 32-bit units.

Address: FF98 1010$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_FLXA_1	MS_FLXA_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.15 MSR_FLXA Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_FLXA_1	Setting this bit to 1 stops all clocks connected to FLXA1, E7FR10, E7FR11, and E7FR12. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_FLXA.SWMRESA_FLXA_1 = 1, this bit is returned to the value after reset.
0	MS_FLXA_0	Setting this bit to 1 stops all clocks connected to FLXA0, E7FR00, E7FR01, and E7FR02. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_FLXA.SWMRESA_FLXA_0 = 1, this bit is returned to the value after reset.

15.2.4.3 MSR_GTM — Module Standby Register for GTM

This register is used to control the stop modes of the GTM.

Access: This register can be read or written in 32-bit units.

Address: FF98 1020_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_GTM_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.16 MSR_GTM Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_GTM_0	Setting this bit to 1 stops all clocks connected to GTM0, GTM0_1, E7GT00, E7GT01, E7GT10, E7GT11, E7GT20, E7GT21, E7GT30, and E7GT31. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_GTM.SWMRESA_GTM_0 = 1, this bit is returned to the value after reset.

15.2.4.4 MSR_ETNB — Module Standby Register for ETNB

This register is used to control the stop modes of the ETNB.

Access: This register can be read or written in 32-bit units.

Address: FF98 1030_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_ETNB_1	MS_ETNB_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.17 MSR_ETNB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_ETNB_1	Setting this bit to 1 stops all clocks connected to ETNB1, E7GE00, and E7GE01. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ETNB.SWMRESA_ETNB_1 = 1, this bit is returned to the value after reset.
0	MS_ETNB_0	Setting this bit to 1 stops all clocks connected to ETNB0, E7ME00, and E7ME01. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ETNB.SWMRESA_ETNB_0 = 1, this bit is returned to the value after reset.

15.2.4.5 MSR_RSENT — Module Standby Register for RSENT

This register is used to control the stop modes of the RSENT.

Access: This register can be read or written in 32-bit units.

Address: FF98 1040$_H$

Value after reset: 0000 00FF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MS_RSENT_7	MS_RSENT_6	MS_RSENT_5	MS_RSENT_4	MS_RSENT_3	MS_RSENT_2	MS_RSENT_1	MS_RSENT_0
Value after reset	0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.18 MSR_RSENT Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7	MS_RSENT_7	Setting this bit to 1 stops all clocks connected to RSENT7. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_7 = 1, this bit is returned to the value after reset.
6	MS_RSENT_6	Setting this bit to 1 stops all clocks connected to RSENT6. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_6 = 1, this bit is returned to the value after reset.
5	MS_RSENT_5	Setting this bit to 1 stops all clocks connected to RSENT5. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_5 = 1, this bit is returned to the value after reset.
4	MS_RSENT_4	Setting this bit to 1 stops all clocks connected to RSENT4. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_4 = 1, this bit is returned to the value after reset.
3	MS_RSENT_3	Setting this bit to 1 stops all clocks connected to RSENT3. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_3 = 1, this bit is returned to the value after reset.

Table 15.18 MSR_RSENT Register Contents (2/2)

Bit Position	Bit Name	Function
2	MS_RSENT_2	Setting this bit to 1 stops all clocks connected to RSENT2. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_2 = 1, this bit is returned to the value after reset.
1	MS_RSENT_1	Setting this bit to 1 stops all clocks connected to RSENT1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_1 = 1, this bit is returned to the value after reset.
0	MS_RSENT_0	Setting this bit to 1 stops all clocks connected to RSENT0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RSENT.SWMRESA_RSENT_0 = 1, this bit is returned to the value after reset.

NOTE

Register RSENTTSSEL is always accessible regardless of the value of MSR_RSENT.

15.2.4.6 MSR_MSPI — Module Standby Register for MSPI

This register is used to control the stop modes of the MSPI.

Access: This register can be read or written in 32-bit units.

Address: FF98 1050$_H$

Value after reset: 0000 03FF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.19 MSR_MSPI Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	MS_MSPI_9	Setting this bit to 1 stops all clocks connected to MSPI9, MSPI9_INTF, and E7MS09. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_9 = 1, this bit is returned to the value after reset.
8	MS_MSPI_8	Setting this bit to 1 stops all clocks connected to MSPI8, MSPI8_INTF, and E7MS08. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_8 = 1, this bit is returned to the value after reset.
7	MS_MSPI_7	Setting this bit to 1 stops all clocks connected to MSPI7, MSPI7_INTF, and E7MS07. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_7 = 1, this bit is returned to the value after reset.
6	MS_MSPI_6	Setting this bit to 1 stops all clocks connected to MSPI6, MSPI6_INTF, and E7MS06. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_6 = 1, this bit is returned to the value after reset.
5	MS_MSPI_5	Setting this bit to 1 stops all clocks connected to MSPI5, MSPI5_INTF, and E7MS05. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_5 = 1, this bit is returned to the value after reset.

Table 15.19 MSR_MSPI Register Contents (2/2)

Bit Position	Bit Name	Function
4	MS_MSPI_4	Setting this bit to 1 stops all clocks connected to MSPI4, MSPI4_INTF, and E7MS04 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_4 = 1, this bit is returned to the value after reset.
3	MS_MSPI_3	Setting this bit to 1 stops all clocks connected to MSPI3, MSPI3_INTF, and E7MS03. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_3 = 1, this bit is returned to the value after reset.
2	MS_MSPI_2	Setting this bit to 1 stops all clocks connected to MSPI2, MSPI2_INTF, and E7MS02. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_2 = 1, this bit is returned to the value after reset.
1	MS_MSPI_1	Setting this bit to 1 stops all clocks connected to MSPI1, MSPI1_INTF, and E7MS01 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_1 = 1, this bit is returned to the value after reset.
0	MS_MSPI_0	Setting this bit to 1 stops all clocks connected to MSPI0, MSPI0_INTF, and E7MS00. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MSPI.SWMRESA_MSPI_0 = 1, this bit is returned to the value after reset.

NOTE

Register MSPITGCTLn, MSPITGDMAALT, and MSPITGDTSALT are always accessible regardless of the value of MSR_MSPI.

15.2.4.7 MSR_RLIN3 — Module Standby Register for RLIN3

This register is used to control the stop modes of the RLIN3.

Access: This register can be read or written in 32-bit units.

Address: FF98 1060$_H$

Value after reset: 00FF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.20 MSR_RLIN3 Register Contents (1/3)

Bit Position	Bit Name	Function
31	STPMSK_RLIN3	This bit controls the operation of RLIN3 Clock in STOP and Cyclic STOP mode with MS_RLIN3_n (n = 0 to 23) = 0. 0 : The clocks are stopped in STOP and Cyclic STOP mode. 1 : The clocks are supplied in STOP and Cyclic STOP mode.
30 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23	MS_RLIN3_23	Setting this bit to 1 stops all clocks connected to RLIN323. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_23 = 1, this bit is returned to the value after reset.
22	MS_RLIN3_22	Setting this bit to 1 stops all clocks connected to RLIN322. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_22 = 1, this bit is returned to the value after reset.
21	MS_RLIN3_21	Setting this bit to 1 stops all clocks connected to RLIN321. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_21 = 1, this bit is returned to the value after reset.
20	MS_RLIN3_20	Setting this bit to 1 stops all clocks connected to RLIN320. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_20 = 1, this bit is returned to the value after reset.
19	MS_RLIN3_19	Setting this bit to 1 stops all clocks connected to RLIN319. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_19 = 1, this bit is returned to the value after reset.

Table 15.20 MSR_RLIN3 Register Contents (2/3)

Bit Position	Bit Name	Function
18	MS_RLIN3_18	Setting this bit to 1 stops all clocks connected to RLIN318. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_18 = 1, this bit is returned to the value after reset.
17	MS_RLIN3_17	Setting this bit to 1 stops all clocks connected to RLIN317. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_17 = 1, this bit is returned to the value after reset.
16	MS_RLIN3_16	Setting this bit to 1 stops all clocks connected to RLIN316. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_16 = 1, this bit is returned to the value after reset.
15	MS_RLIN3_15	Setting this bit to 1 stops all clocks connected to RLIN315. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_15 = 1, this bit is returned to the value after reset.
14	MS_RLIN3_14	Setting this bit to 1 stops all clocks connected to RLIN314. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_14 = 1, this bit is returned to the value after reset.
13	MS_RLIN3_13	Setting this bit to 1 stops all clocks connected to RLIN313. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_13 = 1, this bit is returned to the value after reset.
12	MS_RLIN3_12	Setting this bit to 1 stops all clocks connected to RLIN312. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_12 = 1, this bit is returned to the value after reset.
11	MS_RLIN3_11	Setting this bit to 1 stops all clocks connected to RLIN311. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_11 = 1, this bit is returned to the value after reset.
10	MS_RLIN3_10	Setting this bit to 1 stops all clocks connected to RLIN310. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_10 = 1, this bit is returned to the value after reset.
9	MS_RLIN3_9	Setting this bit to 1 stops all clocks connected to RLIN39. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_9 = 1, this bit is returned to the value after reset.

Table 15.20 MSR_RLIN3 Register Contents (3/3)

Bit Position	Bit Name	Function
8	MS_RLIN3_8	Setting this bit to 1 stops all clocks connected to RLIN38. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_8 = 1, this bit is returned to the value after reset.
7	MS_RLIN3_7	Setting this bit to 1 stops all clocks connected to RLIN37. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_7 = 1, this bit is returned to the value after reset.
6	MS_RLIN3_6	Setting this bit to 1 stops all clocks connected to RLIN36. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_6 = 1, this bit is returned to the value after reset.
5	MS_RLIN3_5	Setting this bit to 1 stops all clocks connected to RLIN35. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_5 = 1, this bit is returned to the value after reset.
4	MS_RLIN3_4	Setting this bit to 1 stops all clocks connected to RLIN34. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_4 = 1, this bit is returned to the value after reset.
3	MS_RLIN3_3	Setting this bit to 1 stops all clocks connected to RLIN33. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_3 = 1, this bit is returned to the value after reset.
2	MS_RLIN3_2	Setting this bit to 1 stops all clocks connected to RLIN32. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_2 = 1, this bit is returned to the value after reset.
1	MS_RLIN3_1	Setting this bit to 1 stops all clocks connected to RLIN31. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_1 = 1, this bit is returned to the value after reset.
0	MS_RLIN3_0	Setting this bit to 1 stops all clocks connected to RLIN30. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RLIN3.SWMRESA_RLIN3_0 = 1, this bit is returned to the value after reset.

15.2.4.8 MSR_ADCJ_ISO — Module Standby Register for ADCJ0/ADCJ1 (ISO area)

This register is used to control the stop modes of the ADCJ0/ADCJ1 (ISO area).

Access: This register can be read or written in 32-bit units.

Address: FF98 1070_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_ADCJ_1	MS_ADCJ_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.21 MSR_ADCJ_ISO Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_ADCJ_1	Setting this bit to 1 stops all clocks connected to ADCJ1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ADCJ_ISO.SWMRESA_ADCJ_1 = 1, this bit is returned to the value after reset.
0	MS_ADCJ_0	Setting this bit to 1 stops all clocks connected to ADCJ0 and AVSEG. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ADCJ_ISO.SWMRESA_ADCJ_0 = 1, this bit is returned to the value after reset.

15.2.4.9 MSR_CXPI — Module Standby Register for CXPI

This register is used to control the stop modes of the CXPI.

Access: This register can be read or written in 32-bit units.

Address: FF98 1080_H

Value after reset: 0000 $000F_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 15.22 MSR_CXPI Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MS_CXPI_3	Setting this bit to 1 stops all clocks connected to CXP13. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_CXPI.SWMRESA_CXPI_3 = 1, this bit is returned to the value after reset.
2	MS_CXPI_2	Setting this bit to 1 stops all clocks connected to CXP12. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_CXPI.SWMRESA_CXPI_2 = 1, this bit is returned to the value after reset.
1	MS_CXPI_1	Setting this bit to 1 stops all clocks connected to CXP11. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_CXPI.SWMRESA_CXPI_1 = 1, this bit is returned to the value after reset.
0	MS_CXPI_0	Setting this bit to 1 stops all clocks connected to CXP10. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_CXPI.SWMRESA_CXPI_0 = 1, this bit is returned to the value after reset.

15.2.4.10 MSR_MMCA — Module Standby Register for MMCA

This register is used to control the stop modes of the MMCA.

Access: This register can be read or written in 32-bit units.

Address: FF98 1090_H

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.23 MSR_MMCA Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_MMCA_0	Setting this bit to 1 stops all clocks connected to MMCA0, E7MM00, and E7MM01. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_MMCA.SWMRESA_MMCA_0 = 1, this bit is returned to the value after reset.

15.2.4.11 MSR_ENCA — Module Standby Register for ENCA

This register is used to control the stop modes of the ENCA.

Access: This register can be read or written in 32-bit units.

Address: FF98 10A0$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_ENCA_1	MS_ENCA_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.24 MSR_ENCA Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_ENCA_1	Setting this bit to 1 stops all clocks connected to ENCA1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ENCA.SWMRESA_ENCA_1 = 1, this bit is returned to the value after reset.
0	MS_ENCA_0	Setting this bit to 1 stops all clocks connected to ENCA0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_ENCA.SWMRESA_ENCA_0 = 1, this bit is returned to the value after reset.

15.2.4.12 MSR_PSI5 — Module Standby Register for PSI5

This register is used to control the stop modes of the PSI5.

Access: This register can be read or written in 32-bit units.

Address: FF98 10B0$_H$

Value after reset: 0000 000F$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	MS_PSI5_3	MS_PSI5_2	MS_PSI5_1	MS_PSI5_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 15.25 MSR_PSI5 Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MS_PSI5_3	Setting this bit to 1 stops all clocks connected to PSI53. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5.SWMRESA_PSI5_3 = 1, this bit is returned to the value after reset.
2	MS_PSI5_2	Setting this bit to 1 stops all clocks connected to PSI52. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5.SWMRESA_PSI5_2 = 1, this bit is returned to the value after reset.
1	MS_PSI5_1	Setting this bit to 1 stops all clocks connected to PSI51. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5.SWMRESA_PSI5_1 = 1, this bit is returned to the value after reset.
0	MS_PSI5_0	Setting this bit to 1 stops all clocks connected to PSI50. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5.SWMRESA_PSI5_0 = 1, this bit is returned to the value after reset.

NOTE

Register PSI5TSSEL is always accessible regardless of the value of MSR_PSI5.

15.2.4.13 MSR_PSI5S — Module Standby Register for PSI5S

This register is used to control the stop modes of the PSI5S.

Access: This register can be read or written in 32-bit units.

Address: FF98 $10C0_H$

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_PSI5S_1	MS_PSI5S_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.26 MSR_PSI5S Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_PSI5S_1	Setting this bit to 1 stops all clocks connected to PSI5S1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5S.SWMRESA_PSI5S_1 = 1, this bit is returned to the value after reset.
0	MS_PSI5S_0	Setting this bit to 1 stops all clocks connected to PSI5S0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PSI5S.SWMRESA_PSI5S_0 = 1, this bit is returned to the value after reset.

15.2.4.14 MSR_PWMD — Module Standby Register for PWM-Diag

This register is used to control the stop modes of the PWM-Diag.

Access: This register can be read or written in 32-bit units.

Address: FF98 $10D0_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.27 MSR_PWMD Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_PWMD	Setting this bit to 1 stops all clocks connected to PWM-Diag (PWBA0, PWGC0-95, PWSD0, SLPW, and PWGCINTF). 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_PWMD.SWMRESA_PWMD = 1, this bit is returned to the value after reset.

15.2.4.15 MSR_RHSIF — Module Standby Register for RHSIF

This register is used to control the stop modes of the RHSIF.

Access: This register can be read or written in 32-bit units.

Address: FF98 $10E0_H$

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_RHSIF_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.28 MSR_RHSIF Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_RHSIF_0	Setting this bit to 1 stops communication clocks (Internal) connected to RHSIF0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RHSIF.SWMRESA_RHSIF_0 = 1, this bit is returned to the value after reset.

15.2.4.16 MSR_RIIC — Module Standby Register for RIIC

This register is used to control the stop modes of the RIIC.

Access: This register can be read or written in 32-bit units.

Address: FF98 $10F0_H$

Value after reset: $0000\ 0003_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 15.29 MSR_RIIC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_RIIC_1	Setting this bit to 1 stops all clocks connected to RIIC1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RIIC.SWMRESA_RIIC_1 = 1, this bit is returned to the value after reset.
0	MS_RIIC_0	Setting this bit to 1 stops all clocks connected to RIIC0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_RIIC.SWMRESA_RIIC_0 = 1, this bit is returned to the value after reset.

15.2.4.17 MSR_SCI3 — Module Standby Register for SCI3

This register is used to control the stop modes of the SCI3.

Access: This register can be read or written in 32-bit units.

Address: FF98 1100$_H$

Value after reset: 0000 0007$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 15.30 MSR_SCI3 Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	MS_SCI3_2	Setting this bit to 1 stops all clocks connected to SCI32. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_SCI3.SWMRESA_SCI3_2 = 1, this bit is returned to the value after reset.
1	MS_SCI3_1	Setting this bit to 1 stops all clocks connected to SCI31. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_SCI3.SWMRESA_SCI3_1 = 1, this bit is returned to the value after reset.
0	MS_SCI3_0	Setting this bit to 1 stops all clocks connected to SCI30. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_SCI3.SWMRESA_SCI3_0 = 1, this bit is returned to the value after reset.

15.2.4.18 MSR_TAPA — Module Standby Register for TAPA

This register is used to control the stop modes of the TAPA.

Access: This register can be read or written in 32-bit units.

Address: FF98 1120$_H$

Value after reset: 0000 000F$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 15.31 MSR_TAPA Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MS_TAPA_3	Setting this bit to 1 stops all clocks connected to TAPA3. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAPA.SWMRESA_TAPA_3 = 1, this bit is returned to the value after reset.
2	MS_TAPA_2	Setting this bit to 1 stops all clocks connected to TAPA2. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAPA.SWMRESA_TAPA_2 = 1, this bit is returned to the value after reset.
1	MS_TAPA_1	Setting this bit to 1 stops all clocks connected to TAPA1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAPA.SWMRESA_TAPA_1 = 1, this bit is returned to the value after reset.
0	MS_TAPA_0	Setting this bit to 1 stops all clocks connected to TAPA0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAPA.SWMRESA_TAPA_0 = 1, this bit is returned to the value after reset.

15.2.4.19 MSR_TAUD — Module Standby Register for TAUD

This register is used to control the stop modes of the TAUD.

Access: This register can be read or written in 32-bit units.

Address: FF98 1130_H

Value after reset: 0000 0007_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 15.32 MSR_TAUD Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	MS_TAUD_2	Setting this bit to 1 stops all clocks connected to TAUD2 and SELB_TAUD2I. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAUD.SWMRESA_TAUD_2 = 1, this bit is returned to the value after reset.
1	MS_TAUD_1	Setting this bit to 1 stops all clocks connected to TAUD1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAUD.SWMRESA_TAUD_1 = 1, this bit is returned to the value after reset.
0	MS_TAUD_0	Setting this bit to 1 stops all clocks connected to TAUD0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAUD.SWMRESA_TAUD_0 = 1, this bit is returned to the value after reset.

15.2.4.20 MSR_TAUJ_ISO — Module Standby Register for TAUJ0/TAUJ1 (ISO area)

This register is used to control the stop modes of the TAUJ0/TAUJ1 (ISO area).

Access: This register can be read or written in 32-bit units.

Address: FF98 1140$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 15.33 MSR_TAUJ_ISO Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_TAUJ_1	Setting this bit to 1 stops all clocks connected to TAUJ1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAUJ_ISO.SWMRESA_TAUJ_1 = 1, this bit is returned to the value after reset.
0	MS_TAUJ_0	Setting this bit to 1 stops all clocks connected to TAUJ0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TAUJ_ISO.SWMRESA_TAUJ_0 = 1, this bit is returned to the value after reset.

15.2.4.21 MSR_TPBA — Module Standby Register for TPBA

This register is used to control the stop modes of the TPBA.

Access: This register can be read or written in 32-bit units.

Address: FF98 1150_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.34 MSR_TPBA Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_TPBA_1	Setting this bit to 1 stops all clocks connected to TPBA1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TPBA.SWMRESA_TPBA_1 = 1, this bit is returned to the value after reset.
0	MS_TPBA_0	Setting this bit to 1 stops all clocks connected to TPBA0. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TPBA.SWMRESA_TPBA_0 = 1, this bit is returned to the value after reset.

15.2.4.22 MSR_TSG3 — Module Standby Register for TSG3

This register is used to control the stop modes of the TSG3.

Access: This register can be read or written in 32-bit units.

Address: FF98 1160_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_TSG3_1	MS_TSG3_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.35 MSR_TSG3 Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_TSG3_1	Setting this bit to 1 stops all clocks connected to TSG31. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TSG3.SWMRESA_TSG3_1 = 1, this bit is returned to the value after reset.
0	MS_TSG3_0	Setting this bit to 1 stops all clocks connected to TSG30. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_TSG3.SWMRESA_TSG3_0 = 1, this bit is returned to the value after reset.

15.2.4.23 MSR_OSTM — Module Standby Register for OSTM

This register is used to control the stop modes of the OSTM.

Access: This register can be read or written in 32-bit units.

Address: FF98 1180$_H$

Value after reset: 0000 03FF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	MS_OSTM_9	MS_OSTM_8	MS_OSTM_7	MS_OSTM6_	MS_OSTM_5	MS_OSTM_4	MS_OSTM_3	MS_OSTM_2	MS_OSTM_1	MS_OSTM_0
Value after reset	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.36 MSR_OSTM Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	MS_OSTM_9	Setting this bit to 1 stops all clocks connected to OSTM9 and IC0CKSEL9. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_9 = 1, this bit is returned to the value after reset.
8	MS_OSTM_8	Setting this bit to 1 stops all clocks connected to OSTM8 and IC0CKSEL8. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_8 = 1, this bit is returned to the value after reset.
7	MS_OSTM_7	Setting this bit to 1 stops all clocks connected to OSTM7. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_7 = 1, this bit is returned to the value after reset.
6	MS_OSTM_6	Setting this bit to 1 stops all clocks connected to OSTM6. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_6 = 1, this bit is returned to the value after reset.
5	MS_OSTM_5	Setting this bit to 1 stops all clocks connected to OSTM5. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_5 = 1, this bit is returned to the value after reset.
4	MS_OSTM_4	Setting this bit to 1 stops all clocks connected to OSTM4. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_4 = 1, this bit is returned to the value after reset.

Table 15.36 MSR_OSTM Register Contents (2/2)

Bit Position	Bit Name	Function
3	MS_OSTM_3	Setting this bit to 1 stops all clocks connected to OSTM3. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_3 = 1, this bit is returned to the value after reset.
2	MS_OSTM_2	Setting this bit to 1 stops all clocks connected to OSTM2. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_2 = 1, this bit is returned to the value after reset.
1	MS_OSTM_1	Setting this bit to 1 stops all clocks connected to OSTM1. 0 : The clocks are supplied. 1 : The clocks are stopped. When written to SWMRESA_OSTM.SWMRESA_OSTM_1 = 1, this bit is returned to the value after reset.
0	MS_OSTM_0	Setting this bit to 1 stops all clocks connected to OSTM0. 0 : The clocks are supplied. 1 : The clocks are stopped When written to SWMRESA_OSTM.SWMRESA_OSTM_0 = 1, this bit is returned to the value after reset.

15.2.4.24 STBCKCPROT — Standby controller Register Key Code Protection Register

STBCKCPROT register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 1700$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STBCKCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STBCKCPROT[15:1]															STBCKCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 15.37 STBCKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	STBCKCPROT* [1]	Enable or disable modification of the STBCKCE bit. The value written is not retained. These bits are always read as 0.
0	STBCKCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing to protected registers.
Write A5A5A501$_H$ to this register to enable writing to protected registers.

15.2.4.25 MSRKCPROT — Module Standby Register Key Code Protection Register

MSRKCPROT register is used for protection against writing operation to the registers which may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Access: This register can be read or written in 32-bit units.

Address: FF98 1710$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	KCPROT[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	KCPROT[15:1]															KCE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	R/W

Table 15.38 MSRKCPROT Register Contents

Bit Position	Bit Name	Function
31 to 1	KCPROT*1	Enable or disable modification of the KCE bit. The value written is not retained. These bits are always read as 0.
0	KCE	Key Code Enable bit 0: Disables write access of protected registers 1: Enables write access of protected registers

Note 1. Write A5A5A500$_H$ to this register to disable writing to protected registers.
Write A5A5A501$_H$ to this register to enable writing to protected registers.

15.2.4.26 STBC0PSC — Power Save Control Register

This register is used for transition to DeepSTOP mode.

Access: This register can be read or written in 32-bit units.

Address: FF98 8C00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STBC0 DISTRG	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R

Table 15.39 STBC0PSC Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	STBC0DISTRG*1	0 : No effect 1 : Transition to DeepSTOP mode This bit is cleared automatically after transition to the DeepSTOP mode.
0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Note 1. Before setting the STBC0PSC.STBC0DISTRG bit to 1, confirm Main OSC and PLL are in a stable state. Refer to **Section 13.5.4.1, PLLE — PLL Enable Register** for confirmation of the stable state of PLL. Refer to **Section 13.5.4.4, MOSCE — Main OSC Enable Register** for confirmation of the stable state of Main OSC.

15.2.4.27 STBC0STPT — Power Stop Trigger Register

This register is used for STOP mode or Cyclic STOP mode transition.

Access: This register can be read or written in 32-bit units.

Address: FF98 8C04$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	STBC0STPTRG
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.40 STBC0STPT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	STBC0STPTRG*1	0 : No effect. 1 : Transition to STOP / Cyclic STOP mode – In RUN mode: Transition to STOP mode – In Cyclic RUN mode: Transition to Cyclic STOP mode This bit is cleared automatically after transition to the STOP/Cyclic STOP mode.

Note 1. Before setting the STBC0STPT.STBC0STPTRG bit to 1, confirm Main OSC and PLL are in a stable state. Refer to **Section 13.5.4.1, PLLE — PLL Enable Register** for confirmation of the stable state of PLL. Refer to **Section 13.5.4.4, MOSCE — Main OSC Enable Register** for confirmation of the stable state of Main OSC.

15.2.4.28 PWRGD_CNT — Power Good Counter Register

This register determines a minimum waiting period for ISOVDD to be stable after PWRCTL is high level.

This register is used when returning from DeepSTOP mode.

Access: This register can be read or written in 32-bit units.

Address: FF98 8C08$_H$

Value after reset: 0000 0FFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 15.41 PWRGD_CNT Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	PWRGD_CNT*1	Power good counter value Wait time = (PWRGD_CNT[11:0] + 1) x 1/f_{RL}*1 f_{RL}: Low Speed Internal Oscillator (LS IntOSC) frequency.

Note 1. When using SVR, set the value according to the SVR guideline (Application Note) for this product. When not using SVR, set the wait time until the VDD input voltage becomes stable after the PWRCTL pin outputs a high level. See **Section 10.5, VDD Power Supply**.

15.2.4.29 IOHOLD0 — I/O Buffer Hold Control Register 0

This register specifies the hold state of the I/O buffer in DeepSTOP mode.

Access: This register can be read or written in 32-bit units.

Address: FF98 8D00$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.42 IOHOLD0 Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	IOHOLD_P24	This bit indicates the I/O hold state of each port group "P24". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
23	IOHOLD_P23	This bit indicates the I/O hold state of each port group "P23". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
22	IOHOLD_P22	This bit indicates the I/O hold state of each port group "P22". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
21	IOHOLD_P21	This bit indicates the I/O hold state of each port group "P21". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
20	IOHOLD_P20	This bit indicates the I/O hold state of each port group "P20". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
19	IOHOLD_P19	This bit indicates the I/O hold state of each port group "P19". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.

Table 15.42 IOHOLD0 Register Contents (2/3)

Bit Position	Bit Name	Function
18	IOHOLD_P18	This bit indicates the I/O hold state of each port group "P18". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
17	IOHOLD_P17	This bit indicates the I/O hold state of each port group "P17". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
16 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	IOHOLD_P12	This bit indicates the I/O hold state of each port group "P12". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
11	IOHOLD_P11	This bit indicates the I/O hold state of each port group "P11". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
10	IOHOLD_P10	This bit indicates the I/O hold state of each port group "P10". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
9	IOHOLD_P9	This bit indicates the I/O hold state of each port group "P9". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
8 to 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	IOHOLD_P5	This bit indicates the I/O hold state of each port group "P5". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
4	IOHOLD_P4	This bit indicates the I/O hold state of each port group "P4". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.

Table 15.42 IOHOLD0 Register Contents (3/3)

Bit Position	Bit Name	Function
3	IOHOLD_P3	This bit indicates the I/O hold state of each port group "P3". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
2	IOHOLD_P2	This bit indicates the I/O hold state of each port group "P2". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

15.2.4.30 IOHOLD2 — I/O Buffer Hold Control Register 2

This register specifies the hold state of the I/O buffer in DeepSTOP mode.

Access: This register can be read or written in 32-bit units.

Address: FF98 8D08$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	IOHOLD_AP3	IOHOLD_AP2	IOHOLD_AP1	IOHOLD_AP0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 15.43 IOHOLD2 Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	IOHOLD_AP3	This bit indicates the I/O hold state of each port group "AP3". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
2	IOHOLD_AP2	This bit indicates the I/O hold state of each port group "AP2". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
1	IOHOLD_AP1	This bit indicates the I/O hold state of each port group "AP1". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.
0	IOHOLD_AP0	This bit indicates the I/O hold state of each port group "AP0". 0 : I/O hold state is released 1 : I/O hold state This bit is automatically set to 1 at the transition to DeepSTOP mode. Setting this bit to 1 by software is ignored. To release the I/O hold state after the wake-up, set this bit to 0 by software.

15.2.4.31 MSR_ADCJ_AWO — Module Standby Register for ADCJ2 (AWO area)

This register is used to control the stop modes of the ADCJ2 (AWO area).

Access: This register can be read or written in 32-bit units.

Address: FF98 8E00$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STPMSK_ADCJ_AWO	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_ADCJ_2
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.44 MSR_ADCJ_AWO Register Contents

Bit Position	Bit Name	Function
31	STPMSK_ADCJ_AWO	This bit controls the operation of ADCJ2 Clock in STOP and DeepSTOP and Cyclic STOP mode with MS_ADCJ_2 = 0. 0 : The clocks are stopped in STOP and DeepSTOP and Cyclic STOP mode. 1 : The clocks are supplied in STOP and DeepSTOP and Cyclic STOP mode.
30 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_ADCJ_2	Setting this bit to 1 stops all clocks connected to ADCJ2 and ADCJ2SGTSELx. 0 : The clocks are supplied. 1 : The clocks are stopped.

NOTE

When operating LPS in Analog Input Mode

- Set the MS_ADCJ_2 = 0.
- Even though setting the STPMSK_ADCJ_AWO = 0, ADCJ2 Clock can operate only while LPS is operating (during A/D conversion) in chip standby mode.

15.2.4.32 MSR_RTCA — Module Standby Register for RTCA

This register is used to control the stop modes of the RTCA.

Access: This register can be read or written in 32-bit units.

Address: FF98 8E10$_H$

Value after reset: 0000 0001$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STPMSK_RTCA	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MS_RTCA_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 15.45 MSR_RTCA Register Contents

Bit Position	Bit Name	Function
31	STPMSK_RTCA	This bit controls the operation of RTCA Clock in STOP and DeepSTOP and Cyclic STOP mode with MS_RTCA_0 = 0. 0 : The clocks are stopped in STOP and DeepSTOP and Cyclic STOP mode. 1 : The clocks are supplied in STOP and DeepSTOP and Cyclic STOP mode.
30 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MS_RTCA_0	Setting this bit to 1 stops all clocks connected to RTCA0. 0 : The clocks are supplied. 1 : The clocks are stopped.

15.2.4.33 MSR_TAUJ_AWO — Module Standby Register for TAUJ2/TAUJ3 (AWO area)

This register is used to control the stop modes of the TAUJ2/TAUJ3 (AWO area).

Access: This register can be read or written in 32-bit units.

Address: FF98 8E20$_H$

Value after reset: 0000 0003$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 15.46 MSR_TAUJ_AWO Register Contents

Bit Position	Bit Name	Function
31	STPMSK_TAUJ_AWO	This bit controls the operation of TAUJ2/TAUJ3 Clock in STOP and DeepSTOP and Cyclic STOP mode with MS_TAUJ_n (n = 2, 3) = 0. 0 : The clocks are stopped in STOP and DeepSTOP and Cyclic STOP mode. 1 : The clocks are supplied in STOP and DeepSTOP and Cyclic STOP mode.
30 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MS_TAUJ_3	Setting this bit to 1 stops all clocks connected to TAUJ3 and SELB_TAUJ3I. 0 : The clocks are supplied. 1 : The clocks are stopped.
0	MS_TAUJ_2	Setting this bit to 1 stops all clocks connected to TAUJ2 and SELB_TAUJ2I. 0 : The clocks are supplied. 1 : The clocks are stopped.

15.2.4.34 MSR_WDTB_AWO — Module Standby Register for WDTB (AWO area)

This register is used to control the stop modes of the WDTB (AWO area).

Access: This register can be read or written in 32-bit units.

Address: FF98 8E30$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

4	WUFn4	Indicates the generation of a Wake-Up Factor. 0 : Wake-Up Factor is not generated 1 : Wake-Up Factor is generated

Table 15.48 WUF0_Ax/WUF1_Ax/WUF0_Ix/WUF1_Ix Register Contents (3/3)

Bit Position	Bit Name	Function
3	WUFn3	Indicates the generation of a Wake-Up Factor. 0 : Wake-Up Factor is not generated 1 : Wake-Up Factor is generated
2	WUFn2	Indicates the generation of a Wake-Up Factor. 0 : Wake-Up Factor is not generated 1 : Wake-Up Factor is generated
1	WUFn1	Indicates the generation of a Wake-Up Factor. 0 : Wake-Up Factor is not generated 1 : Wake-Up Factor is generated
0	WUFn0	Indicates the generation of a Wake-Up Factor. 0 : Wake-Up Factor is not generated 1 : Wake-Up Factor is generated

NOTE

While the WUFMSKnx (x = 0 to 31) bit in the Wake-Up Factor mask register is 1, WUFnx (x = 0 to 31) is not set to 1 at the generation of a Wake-Up Factor.

WUF0_Ax : WUF0_A0/WUF0_A1/WUF0_A2

WUF1_Ax : WUF1_A0/WUF1_A1/WUF1_A2

WUF0_Ix : WUF0_I0/WUF0_I1

WUF1_Ix : WUF1_I0/WUF1_I1

Wake-Up Factors

As for the assignment of Wake-Up Factors to the Wake-Up Factor register bits, see **Section 15.1.1, Types of Chip Standby Mode**.

The bit to which a Wake-Up Factor is not assigned is read as the value “0”.

15.2.4.36 WUFMSK0_Ax/WUFMSK1_Ax/WUFMSK0_Ix/WUFMSK1_Ix — Wake-Up Factor Mask Registers

These registers enable Wake-Up Factors.

Access: This register can be read or written in 32-bit units.

Address:
WUFMSK0_A0 : FF98 E004$_H$ WUFMSK0_A1 : FF98 E014$_H$
WUFMSK0_A2 : FF98 E024$_H$ WUFMSK1_A0 : FF98 E124$_H$
WUFMSK1_A1 : FF98 E134$_H$ WUFMSK1_A2 : FF98 E144$_H$
WUFMSK0_I0 : FF98 E204$_H$ WUFMSK0_I1 : FF98 E214$_H$
WUFMSK1_I0 : FF98 E324$_H$ WUFMSK1_I1 : FF98 E334$_H$

Value after reset:
WUFMSK0_A0 : FFFF FFFF$_H$ WUFMSK0_A1 : FFFF FFFF$_H$
WUFMSK0_A2 : FFFF FFFF$_H$ WUFMSK1_A0 : FFFF FFFF$_H$
WUFMSK1_A1 : FFFF FFFF$_H$ WUFMSK1_A2 : FFFF FFFF$_H$
WUFMSK0_I0 : FFFF FFFF$_H$ WUFMSK0_I1 : FFFF FFFF$_H$
WUFMSK1_I0 : FFFF FFFF$_H$ WUFMSK1_I1 : FFFF FFFF$_H$

Table 15.49 WUFMSK0_Ax/WUFMSK1_Ax/WUFMSK0_Ix/WUFMSK1_Ix Register Contents (3/3)

Bit Position	Bit Name	Function
4	WUFMSKn4	Enables/disables a Wake-Up Factor. 0 : Wake-Up Factor is enabled 1 : Wake-Up Factor is disabled
3	WUFMSKn3	Enables/disables a Wake-Up Factor. 0 : Wake-Up Factor is enabled 1 : Wake-Up Factor is disabled
2	WUFMSKn2	Enables/disables a Wake-Up Factor. 0 : Wake-Up Factor is enabled 1 : Wake-Up Factor is disabled
1	WUFMSKn1	Enables/disables a Wake-Up Factor. 0 : Wake-Up Factor is enabled 1 : Wake-Up Factor is disabled
0	WUFMSKn0	Enables/disables a Wake-Up Factor. 0 : Wake-Up Factor is enabled 1 : Wake-Up Factor is disabled

NOTE

While the WUFMSKnx (x = 0 to 31) bit is 1, WUFnx (x = 0 to 31) of the Wake-Up Factor register is not set to 1 at the generation of a Wake-Up Factor.

WUFMSK0_Ax : WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2

WUFMSK1_Ax : WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2

WUFMSK0_Ix : WUFMSK0_I0/WUFMSK0_I1

WUFMSK1_Ix : WUFMSK1_I0/WUFMSK1_I1

Wake-Up Factors

As for the assignment of Wake-Up Factors to the Wake-Up Factor register bits, see **Section 15.1.1, Types of Chip Standby Mode**.

When writing to these registers, write the value “1” to the bits to which Wake-Up Factors are not assigned.

15.2.4.37 WUFC0_Ax/WUFC1_Ax/WUFC0_Ix/WUFC1_Ix — Wake-Up Factor Clear Registers

These registers clear the WUFnx (x = 0 to 31) bits in the Wake-Up Factor registers.

Access: This register is a write-only register that can be write in 32-bit units.

Address:
WUFC0_A0 : FF98 E008$_H$ WUFC0_A1 : FF98 E018$_H$
WUFC0_A2 : FF98 E028$_H$ WUFC1_A0 : FF98 E128$_H$

Wake-Up Factors

As for the assignment of Wake-Up Factors to the Wake-Up Factor register bits, see **Section 15.1.1, Types of Chip Standby Mode**.

When writing to these registers, write the value “0” to the bits to which Wake-Up Factors are not assigned.

15.2.4.38 WUFMON — Wake-Up Factor Monitor Register

This register is used to monitor Wake-Up Factor Register.

Access: This register is a read-only register that can be read in 32-bit units.

Address: FF98 E1A0$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 15.51 WUFMON Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned.
25	MONWUF1_I1	When one of WUF1_I1 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF1_I1 register is cleared, this bit becomes 0. 0 : WUF1_I1 register is not active. 1 : WUF1_I1 register is active.
24	MONWUF1_I0	When one of WUF1_I0 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF1_I0 register is cleared, this bit becomes 0. 0 : WUF1_I0 register is not active. 1 : WUF1_I0 register is active.
23 to 19	Reserved	When read, the value after reset is returned.
18	MONWUF1_A2	When one of WUF1_A2 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF1_A2 register is cleared, this bit becomes 0. 0 : WUF1_A2 register is not active. 1 : WUF1_A2 register is active.
17	MONWUF1_A1	When one of WUF1_A1 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF1_A1 register is cleared, this bit becomes 0. 0 : WUF1_A1 register is not active. 1 : WUF1_A1 register is active.
16	MONWUF1_A0	When one of WUF1_A0 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF1_A0 register is cleared, this bit becomes 0. 0 : WUF1_A0 register is not active. 1 : WUF1_A0 register is active.
15 to 10	Reserved	When read, the value after reset is returned.
9	MONWUF0_I1	When one of WUF0_I1 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF0_I1 register is cleared, this bit becomes 0. 0 : WUF0_I1 register is not active. 1 : WUF0_I1 register is active.
8	MONWUF0_I0	When one of WUF0_I0 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF0_I0 register is cleared, this bit becomes 0. 0 : WUF0_I0 register is not active. 1 : WUF0_I0 register is active.
7 to 3	Reserved	When read, the value after reset is returned.

Table 15.51 WUFMON Register Contents (2/2)

Bit Position	Bit Name	Function
2	MONWUF0_A2	When one of WUF0_A2 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF0_A2 register is cleared, this bit becomes 0. 0 : WUF0_A2 register is not active. 1 : WUF0_A2 register is active.
1	MONWUF0_A1	When one of WUF0_A1 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF0_A1 register is cleared, this bit becomes 0. 0 : WUF0_A1 register is not active. 1 : WUF0_A1 register is active.
0	MONWUF0_A0	When one of WUF0_A0 registers [31: 0] becomes 1, this bit is set to 1. Also, when the WUF0_A0 register is cleared, this bit becomes 0. 0 : WUF0_A0 register is not active. 1 : WUF0_A0 register is active.

15.3 Chip Standby Mode Transition

This section explains the mode transition procedures.

CAUTION

Transition to chip standby mode should be performed by CPU0(PE0). When CPU0(PE0) shifts to chip standby mode, CPU1(PE1)/CPU2(PE2)/CPU3(PE3) will also shift to chip standby mode.

15.3.1 STOP Mode

In STOP mode, most of the clock supplies to the Always-On area and the Isolated area are stopped. The clock stop mask bit in module standby register control clock supply to related clocks in chip standby mode. Stop all of the peripheral functions before transition to STOP mode if the clock supply to the function will be stopped in STOP mode.

The transition procedure (example) to STOP mode is shown below.

Preparation for standby

- Stop DMON.
- Stop CLMA (3 to 9).
- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (EICn.EIRFn = 0).
  - Mask the interrupts for non-Wake-Up Factors (EICn.EIMKn = 1).
  - Release the masks of the interrupts for Wake-Up Factors (EICn.EIMKn = 0).
- Set the wake-up related registers.
  - Clear the Wake-Up Factor flags (the WUFC0_A0/WUFC0_A1/WUFC0_A2/WUFC0_I0/WUFC0_I1 registers).
  - Mask the non-Wake-Up Factor (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1 registers).
  - Release the masks of the Wake-Up Factors (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1 registers).

NOTE

Disable Wake-Up Factor 1 (WUFMSK1_Ax = FFFF FFFF$_H$ and WUFMSK1_Ix = FFFF FFFF$_H$).

- Set the clock stop mask bit in module standby register to select the clocks to be stopped and the ones to continue operating (using the MSR_<name>.STPMSK_<name> bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register

to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register, the HSOSCSTPMSK bit in the HSOSCSTPM register and the PLLSTPMSK bit in the PLLSTPM register).

Set a clock according to the method described in **Section 13.6.6, CPU System Clock Setting in STOP/DeepSTOP Mode**.

Start of Chip standby

Set the STBC0STPTRG bit in the STBC0STPT register to 1 to transition to STOP mode.

End of Chip standby

When a Wake-Up Factor is generated, the microcontroller returns from STOP mode.

Wake-up handling

The generation of the Wake-Up Factors can be determined by the Wake-Up Factor flags (WUF0_A0, WUF0_A1, WUF0_I0).

When an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

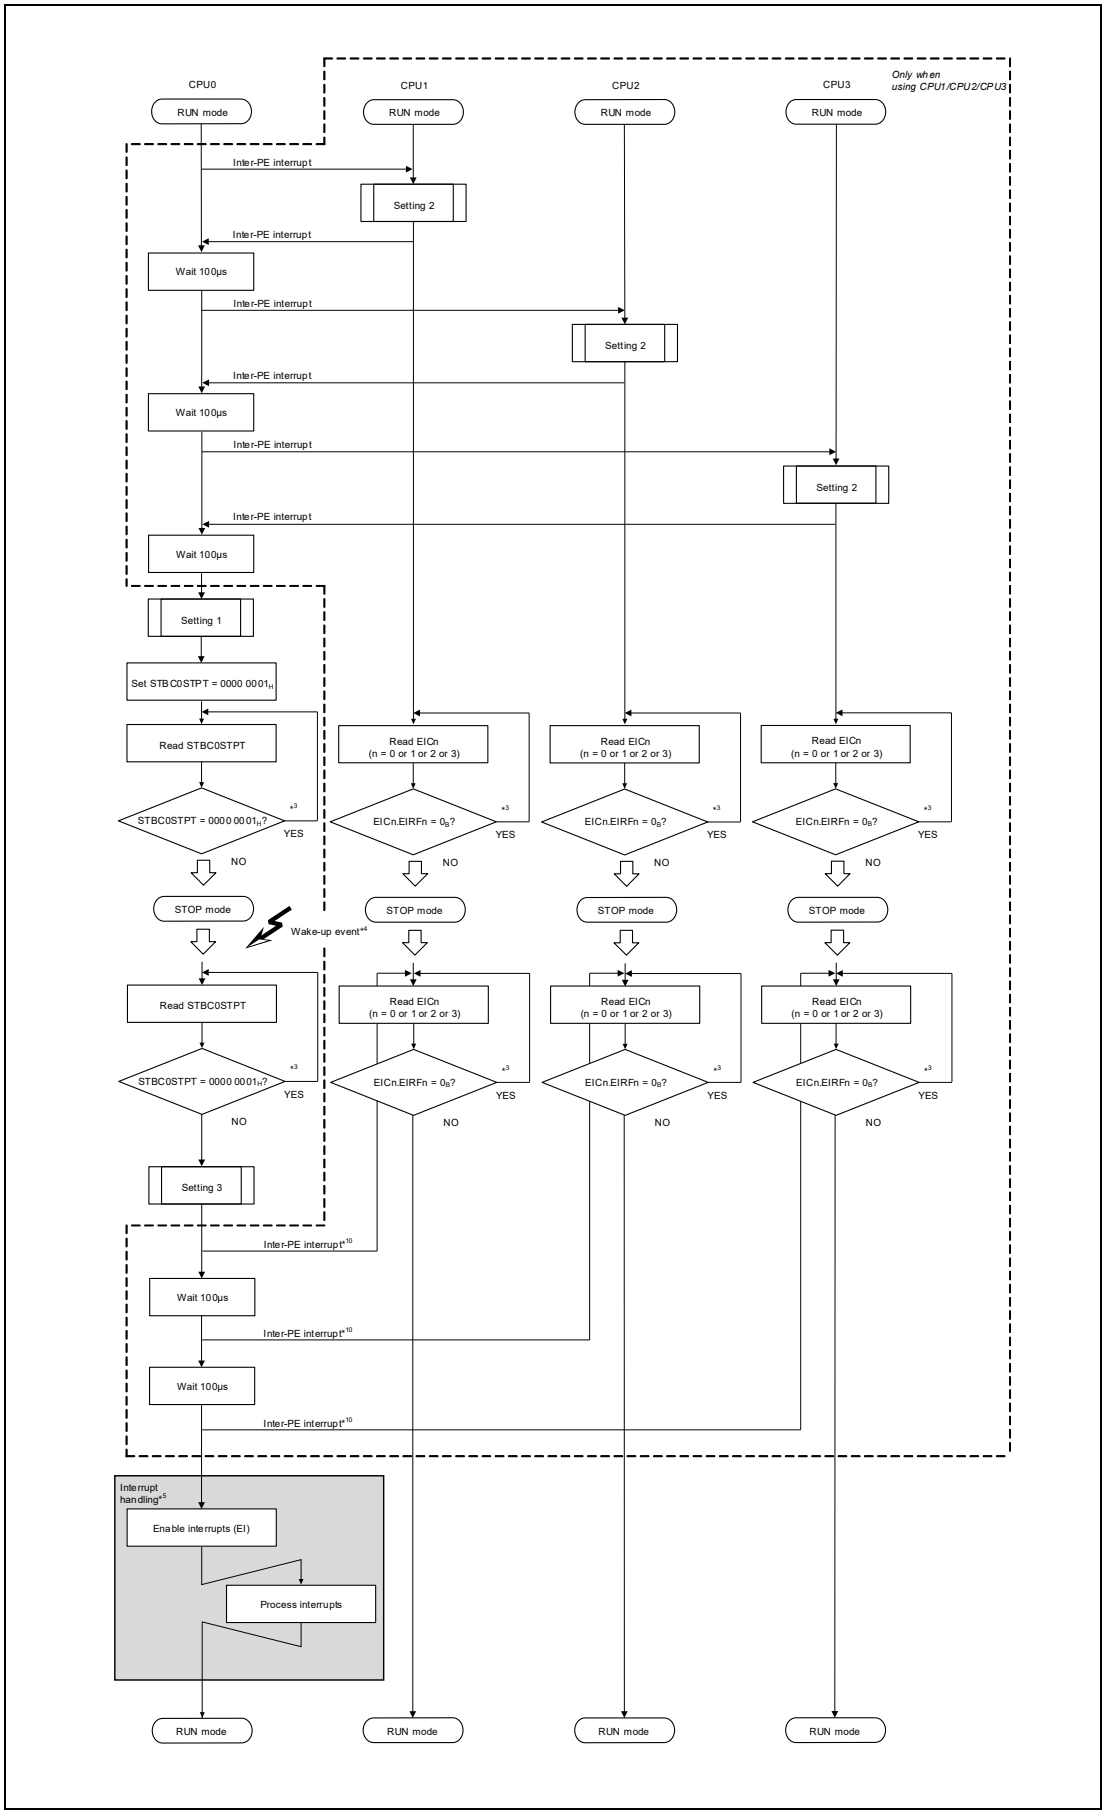

Figure 15.2 Example of STOP Mode Transition (1/2)

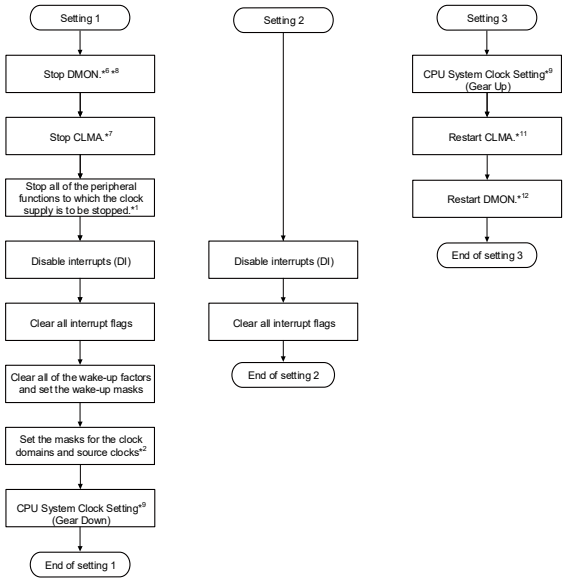

Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the STOP mode, the operation of the peripheral function may be incorrect. Before the transition to the STOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. Though the clock mask can be set before this flow is started, it must be set before $0000\ 0001_H$ is written to STBC0STPT.

Note 3. The clock supply to the CPU is stopped and the operation transitions to the STOP mode while checking that STBC0STPT = $0000\ 0001_H$ and EICn.EIRFn = 0_B. After returning from the STOP mode, the CPU starts the program from this loop.

Note 4. STBC0STPT is set to $0000\ 0000_H$ at the generation of a Wake-Up Factor. The generated Wake-Up Factor can be checked by the WUFxxx registers.

Note 5. This processing is optional. It is required when executing the interrupt handling after the wake-up.

Note 6. See **Section 11.4.7.4, Procedures to Reset DMON** for details.

Note 7. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.

Note 8. In case of stop Main OSC at chip standby mode, stop DMON.

Note 9. See **Section 13.6.6, CPU System Clock Setting in STOP/DeepSTOP Mode** for details.

Note 10. EICn.EIRFn can be set to 1_B by the Inter-PE interrupt. EICn.EIRFn should be cleared by software.

Note 11. See **Section 14.6.1, Procedures to Enable CLMAn** for details.

Note 12. See **Section 11.4.7.1, Basic Function** for details.

Figure 15.2 Example of STOP Mode Transition (2/2)

15.3.2 DeepSTOP Mode

In DeepSTOP mode, the clock supply to all areas and the power supply to the Isolated area are stopped. However, clock supply to peripheral functions in the Always-On area can be continued by setting the clock stop mask bit in module standby register.

The transition procedure (example) to DeepSTOP mode is shown below.

Preparation for standby

- Stop DMON.
- Stop CLMA (3 to 9).
- Stop all of the peripheral functions to which the clock supply is to be stopped.
- Disable the interrupt handling by issuing the CPU instruction “DI”.
- Set the interrupt control registers.
  - Clear the interrupt flag (EICn.EIRFn = 0).(n = 0 to 695)
  - Mask the interrupts for non-Wake-Up Factors (EICn.EIMKn = 1).(n = 0 to 695)
  - Release the masks of the interrupts for Wake-Up Factors (EICn.EIMKn = 0).(n = 0 to 695)
- Set the wake-up related registers.
  - Clear the Wake-Up Factor flags (the WUFC0_A0/WUFC0_A1/WUFC0_A2/WUFC0_I0/WUFC0_I1/ WUFC1_A0/WUFC1_A1/WUFC1_A2/WUFC1_I0/WUFC1_I1 registers).
  - Mask the non-Wake-Up Factor (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1/ WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 registers).
  - Release the masks of the Wake-Up Factors (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1/ WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 registers).

CAUTION

When a Wake-Up Factor is assigned to both Wake-Up Factor 0 registers and Wake-Up Factor 1 registers, it can be used only in one of them.

- Set the clock stop mask bit in module standby register to select the clocks to be stopped and the ones to continue operating (using the MSR_<name>.STPMSK_<name> bit).
- Specify whether to oscillate or stop each clock source. In addition, set the clock stop mask register to select the clock sources to be stopped and the ones to continue operating (using the MOSCSTPMSK bit in the MOSCSTPM register and the HSOSCSTPMSK bit in the HSOSCSTPM register).

Set a clock according to the method described in **Section 13.6.6, CPU System Clock Setting in STOP/DeepSTOP Mode**.

Start of standby

Set the STBC0DISTRG bit in the STBC0PSC register to 1 to transition to DeepSTOP mode.

End of standby

When a Wake-Up Factor is generated, the microcontroller returns from DeepSTOP mode.

Wake-up handling

- When returned from DeepSTOP mode due to Wake-Up Factor 0, the microcontroller starts the operation from the reset vector address.
  If one of the following interrupts has been generated before recovery from DeepSTOP mode to RUN mode, the microcontroller restarts operation from the exception handler address:
  - FENMI: FENMI handler address ($E0_H$)
  - FEINT: FEINT handler address ($F0_H$)

  Note that the General-purpose registers and local RAM are undefined value after return from DeepSTOP mode.
- When returned from DeepSTOP mode due to Wake-Up Factor 1, the device switches to CyclicRUN mode, the CPU0 (PE0) starts the operation from the reset address on the retention RAM. For details, refer to **Section 15.3.3, Cyclic RUN Mode**.
- The generation of the Wake-Up Factors can be determined by the Wake-Up Factor flags (WUF0_A0, WUF0_A1, WUF1_A0, WUF1_A1).
- The ports in the Isolated area maintain the I/O buffer hold state.
  Release the I/O buffer hold state by executing the following steps:
  1. Re-configure the peripheral functions and port functions.
  2. Set IOHOLDn.IOHOLD_xxx = 0 (n = 0, 2).
- To execute an interrupt of the Wake-Up Factor after the wake-up, evaluate the information of Wake-Up Factor flag by software and set the interrupt request flag in the interrupt control register. Then, when an interrupt is enabled by the CPU instruction “EI”, the generated wake-up interrupt will be executed.

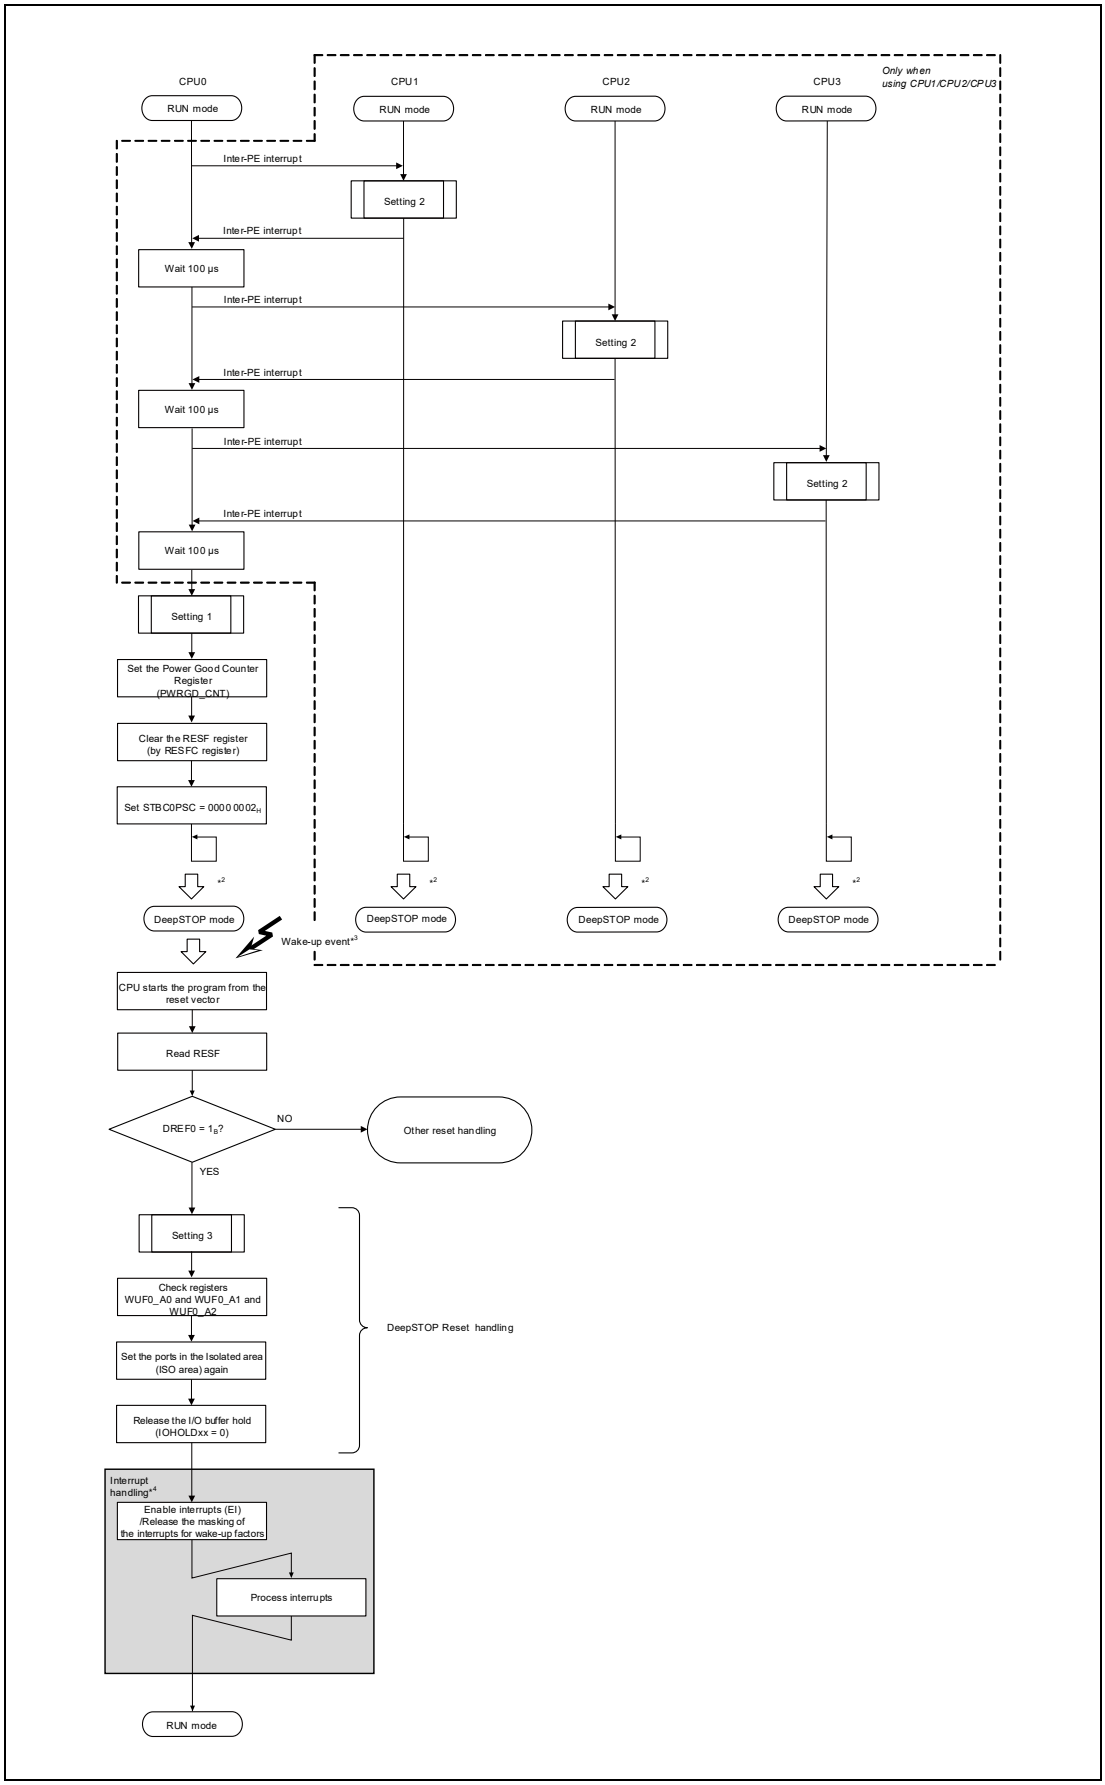

Figure 15.3 Example of DeepSTOP Mode Transition (1/2)

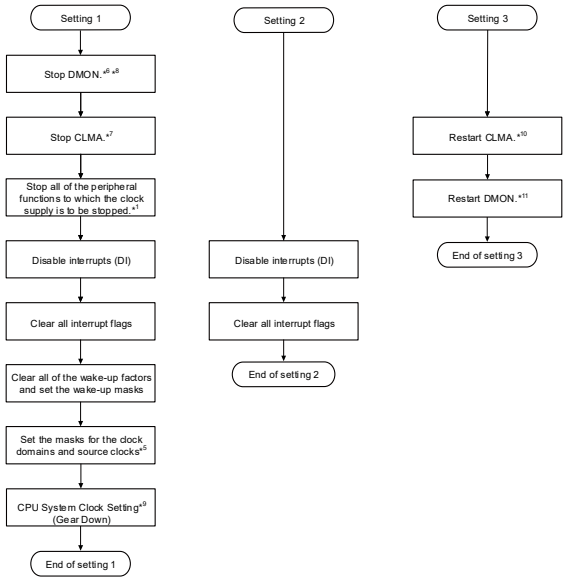


Note 1. When the operation of the peripheral function is stopped during operating due to the transition to the DeepSTOP mode, the operation of the peripheral function may be incorrect. Before the transition to the DeepSTOP mode, stop all of the peripheral functions to which the clock supply is to be stopped.

Note 2. After setting STBC0PSC = 0000 0002_H, wait for the transition to the DeepSTOP mode by the unconditional loop.

Note 3. The CPU starts the program from the reset vector after the generation of a Wake-Up Factor. The return from the DeepSTOP mode by a reset can be checked by the RESF register. In addition, the generated Wake-Up Factor can be checked by the WUF0_A0 and WUF0_A1 and WUF0_A2 registers.

Note 4. This processing is optional. It is required when executing the interrupt handling after the wake-up. To execute an interrupt of the wake-up factor after the wake-up, evaluate the information of wake-up factor flag by software and set the interrupt request flag in the interrupt control register. After that, the interrupt should be enabled.

Note 5. Though the clock mask can be set before this flow is started, it must be set before 0000 0002_H is written to STBC0PSC.

Note 6. See **Section 11.4.7.4, Procedures to Reset DMON** for details.

Note 7. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.

Note 8. In case of stop Main OSC at chip standby mode, stop DMON.

Note 9. See **Section 13.6.6, CPU System Clock Setting in STOP/DeepSTOP Mode** for details.

Note 10. See **Section 14.6.1, Procedures to Enable CLMAn** for details.

Note 11. See **Section 11.4.7.1, Basic Function** for details.

Figure 15.3 Example of DeepSTOP Mode Transition (2/2)

15.3.3 Cyclic RUN Mode

In Cyclic RUN mode, CPU0(PE0), the peripheral functions in the Always-On area (AWO area), RLIN3, and MSPI are available. In this mode, PLL and Flash Memory are not available.The CPU1(PE1)/CPU2(PE2)/CPU3(PE3) is also not available. The transition procedure (example) to Cyclic RUN mode is shown below.

Preparation for Cyclic RUN

Stop DMON and CLMA (3 to 9). Allocate the program for Cyclic RUN to the retention RAM. The reset vector base address (RBASE) in Cyclic RUN operation is set to the first address of the retention RAM (FE80 0000_H). Note that neither the code flash memory nor the data flash memory is available in Cyclic RUN mode.

The instruction to transition to DeepSTOP mode should be arranged in the interrupt exception handler or a polling routine of interrupt request which is used as the source of returning to the RUN mode.

CAUTION

Do not change the PSW.EBV bit from its value after reset in Cyclic RUN mode (Do not set the PSW.EBV bit to 1 in Cyclic RUN mode).

- Set the wake-up related registers.
  - Clear the Wake-Up Factor flags (the WUFC1_A0/WUFC1_A1/WUFC1_A2/WUFC1_I0/WUFC1_I1 register).
  - Mask the non-Wake-Up Factor (the WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 register).
  - Release the masks of the Wake-Up Factors (the WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 register).
- Transition to DeepSTOP mode. For details on the transition to DeepSTOP mode, see **Section 15.3.2, DeepSTOP Mode.**

Start of Cyclic RUN

The operation transitions to Cyclic RUN mode from DeepSTOP mode at the generation of Wake-Up Factor 1.

The operation transitions to Cyclic RUN mode from Cyclic STOP mode at the generation of Wake-Up Factors 0 and 1.

The microcontroller starts operation from the reset vector address of Cyclic RUN mode (the first address of the retention RAM (FE80 0000_H). If one of the following interrupts has been generated during recovery from DeepSTOP mode to Cyclic RUN mode, the microcontroller restart operation from the exception handler address:

- FENMI: FENMI handler address in Cyclic RUN mode (FE80 0000_H + $E0_H$).
- FEINT: FEINT handler address in Cyclic RUN mode (FE80 0000_H + $F0_H$).

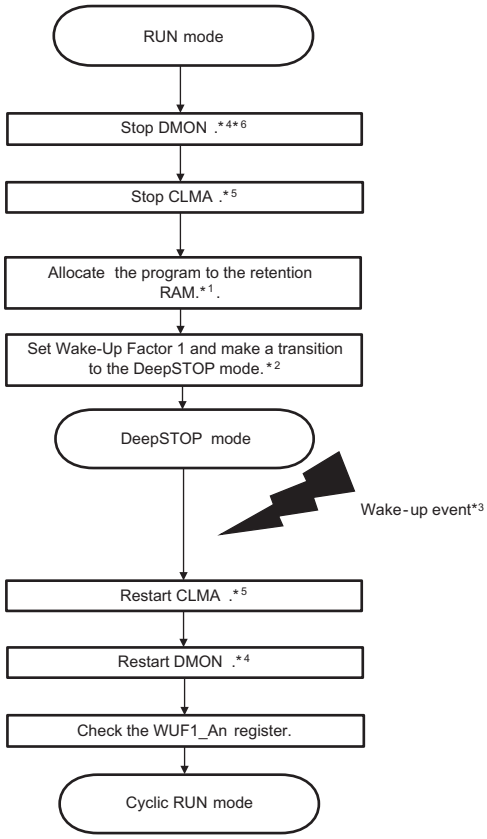
Note that the General-purpose registers and local RAM are undefined value after the transition to Cyclic RUN mode from DeepSTOP mode.

End of Cyclic RUN

The Cyclic RUN mode ends at the transition to the Cyclic STOP mode by setting the STBC0STPT.STBC0STPTRG bit to 1, or at the transition to the DeepSTOP mode by setting the STBC0PSC.STBC0DISTRG bit to 1.

Wake-up handling

The generation of the Wake-Up Factors can be determined by the Wake-Up Factor flags (WUF1_A0/ WUF1_A1/WUF1_A2/WUF1_I0/WUF1_I1) .



Note 1. When the mode transitions from the Cyclic RUN mode to the RUN mode by a Wake-Up Factor, the transition to the DeepSTOP mode should be made in the processing of the interrupt vector for the Wake-Up Factor. In that case, allocate the interrupt processing program to the retention RAM as well.

Note 2. Before the transition to the DeepSTOP mode, clear the flag for Wake-Up Factor 1 in the WUFC1_Ax register and set Wake-Up Factor 1 that is to be used in the WUFMSK1_A0/ WUFMSK1_I0 register. Other parts of the procedure for transition to DeepSTOP mode are the same as the normal procedure.

Note 3. The CPU starts the program from the top address (FE80 0000_H) of the retention RAM after the generation of a Wake-Up Factor. The generated Wake-Up Factor can be checked by the WUF1_A0/ WUF1_A1/WUF1_A2/WUF1_I0/WUF1_I1 register.

Note 4. See **Section 11.4.7.4, Procedures to Reset DMON** for details.

Note 5. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.

Note 6. In case of stop Main OSC at chip standby mode, DMON stops.

Figure 15.4 Example of Cyclic RUN Mode Transition

15.3.4 Cyclic STOP Mode

In Cyclic STOP mode, the peripheral functions in the Always-On area (AWO area), and RLIN3 are available. The transition procedure (example) to Cyclic STOP mode is shown below.

Preparation for Cyclic STOP

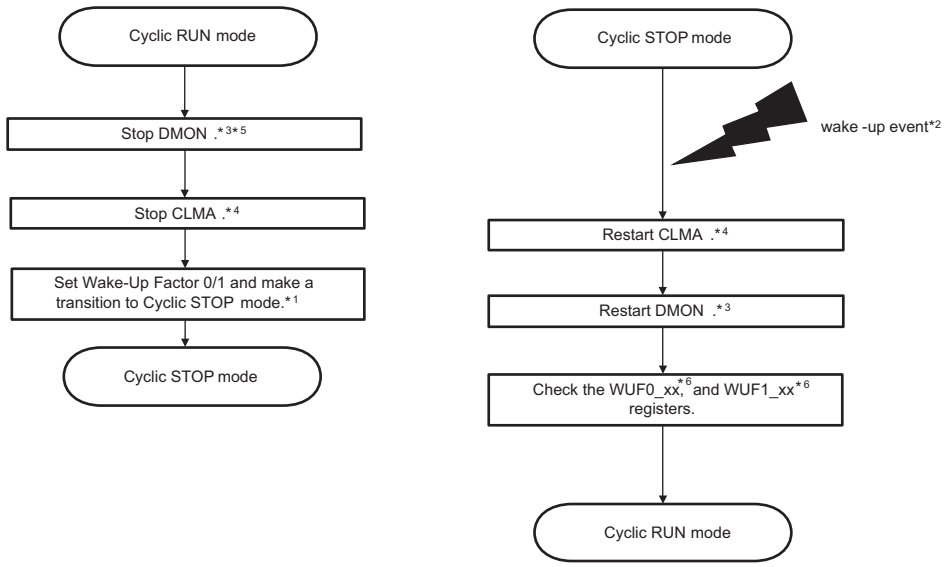
- Stop DMON.
- Stop CLMA (3 to 9).
- Transition to Cyclic RUN mode.
- Set the wake-up related registers.
  - Clear the Wake-Up Factor flags
    (the WUFC0_A0/WUFC0_A1/WUFC0_A2/WUFC0_I0/WUFC0_I1/
    WUFC1_A0/WUFC1_A1/WUFC1_A2/WUFC1_I0/WUFC1_I1 register).
  - Mask the non-Wake-Up Factor
    (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1/
    WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 register).
  - Release the masks of the Wake-Up Factors
    (the WUFMSK0_A0/WUFMSK0_A1/WUFMSK0_A2/WUFMSK0_I0/WUFMSK0_I1/
    WUFMSK1_A0/WUFMSK1_A1/WUFMSK1_A2/WUFMSK1_I0/WUFMSK1_I1 register).

Start of Cyclic STOP

Set the STBC0STPT.STBC0STPTRG bit to 1 to transition to Cyclic STOP mode.

End of Cyclic STOP

The operation transitions to Cyclic RUN mode at the generation of Wake-Up Factor 0 or 1.



Note 1. Set Wake-Up Factors 0 and 1 to be used for transitioning to RUN mode and Cyclic RUN mode, respectively. When the mode transitions to RUN mode by Wake-Up Factor 0, the transition processing to DeepSTOP mode should be added in Cyclic RUN mode.

Note 2. When a Wake-Up Factor is generated in Cyclic STOP mode, the mode transitions to Cyclic RUN mode and the operation starts immediately after the processing shifted to Cyclic STOP mode. The generated Wake-Up Factors can be checked by the WUF0_A0/WUF0_A1/WUF0_A2/WUF0_I0/WUF0_I1/ WUF1_A0/WUF1_A1/WUF1_A2/WUF1_I0/WUF1_I1 registers.

Note 3. See **Section 11.4.7.4, Procedures to Reset DMON** for details.

Note 4. See **Section 14.6.2, Procedures to Reset by CLMATEST.RESCLM** for details.

Note 5. In case of stop Main OSC at chip standby mode, stop DMON.

Note 6. "xx" is A0 , A1, A2 , I0 , I1.

Figure 15.5 Example of Cyclic STOP Mode Transition

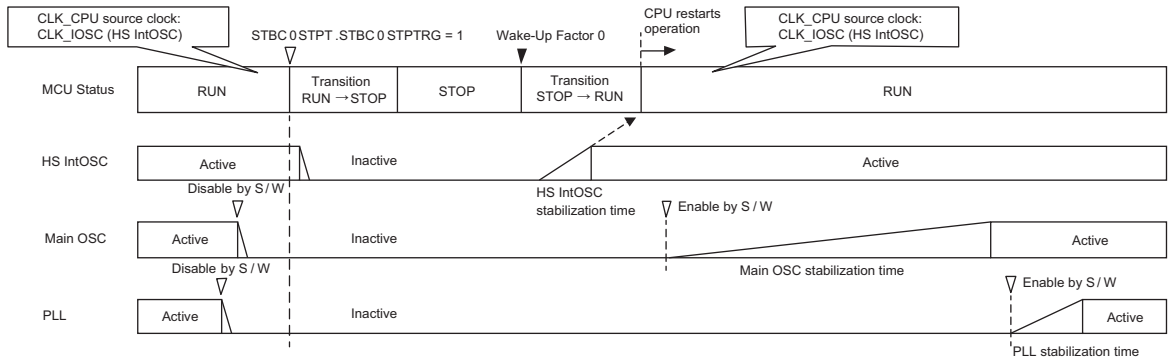
15.4 Clock Oscillator Behavior During Chip Standby Mode Transition

The following figures explain clock oscillator behavior during chip standby mode transition. The clock oscillators restart operation automatically if they are used before entering standby.

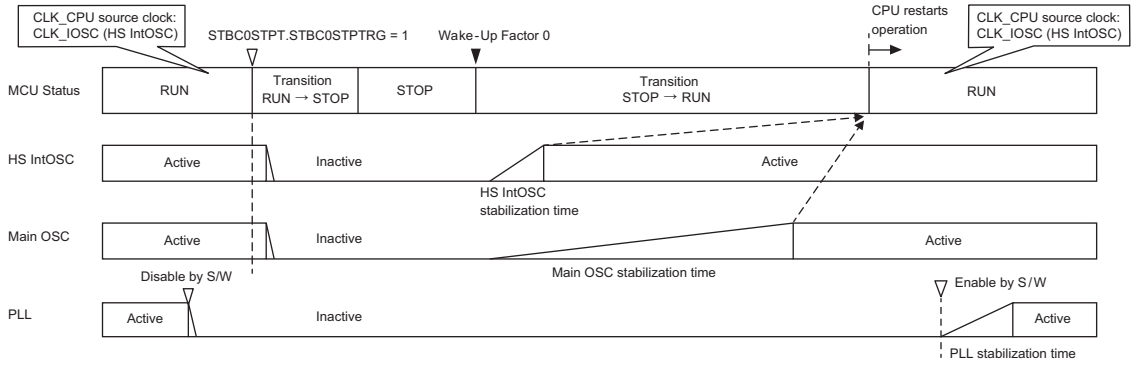
- If Main OSC and PLL are enabled before entering STOP mode, they restart oscillation automatically during wake-up from STOP mode, and CPU restarts operation after oscillations of these clock sources become stable.
- If Main OSC is enabled before entering DeepSTOP mode, it restarts oscillation automatically during wake-up from DeepSTOP mode, and CPU restarts operation after oscillation of Main OSC becomes stable. PLL is not restarted automatically even if it is enabled before entering DeepSTOP mode.
- If Main OSC is enabled before entering Cyclic STOP mode, it restarts oscillation automatically during wake-up from Cyclic STOP mode. CPU restarts operation after oscillation of Main OSC becomes stable.

Note that behavior of HS IntOSC, Main OSC and PLL in the following figures is in the case they stop oscillation during chip standby mode. HS IntOSC, Main OSC and PLL continue oscillation during chip standby mode if their stop mask register is set to 1 (HSOSCSTPMSK bit of HSOSCSTPM register, MOSCSTPM bit of MOSCSTPMSK register and PLLSTPMSK bit of PLLSTPM register respectively).

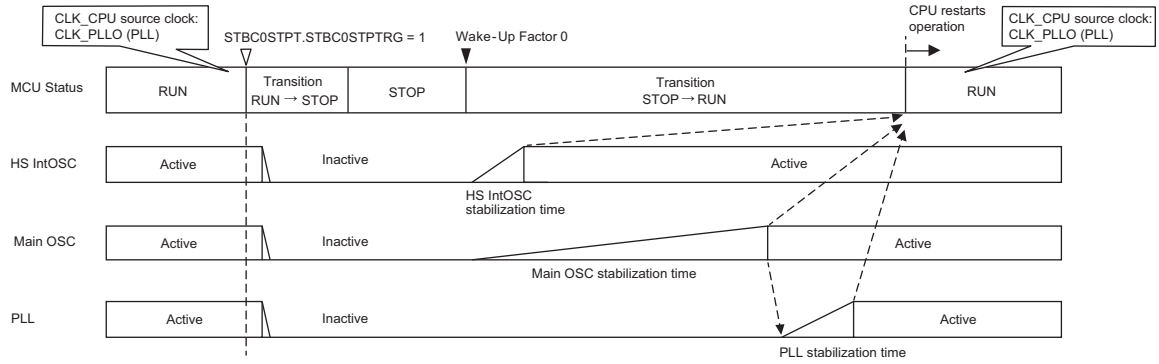
For details on the stop mask register, see **Section 13, Clock Controller**.



(a) PLL and Main OSC are disabled before entering STOP mode.
Restart Main OSC and PLL by software after wake-up.
CLK_CPU source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

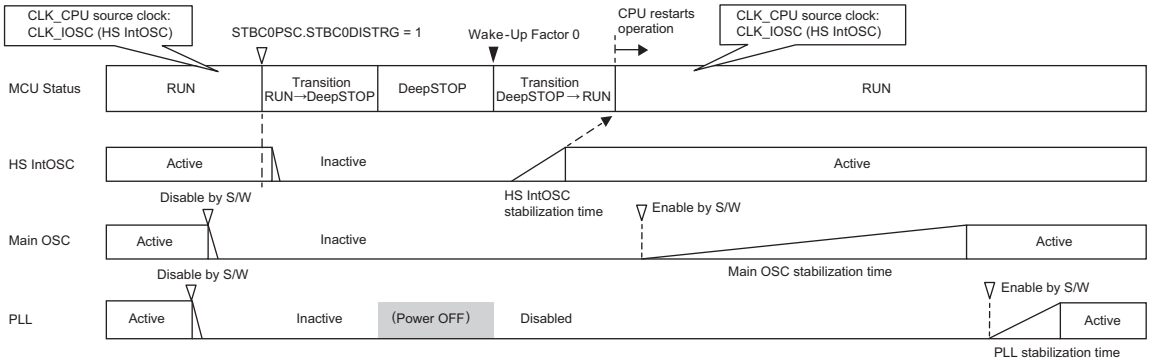


(b) PLL is disabled, and Main OSC is enabled before entering STOP mode.
Main OSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CLK_CPU source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

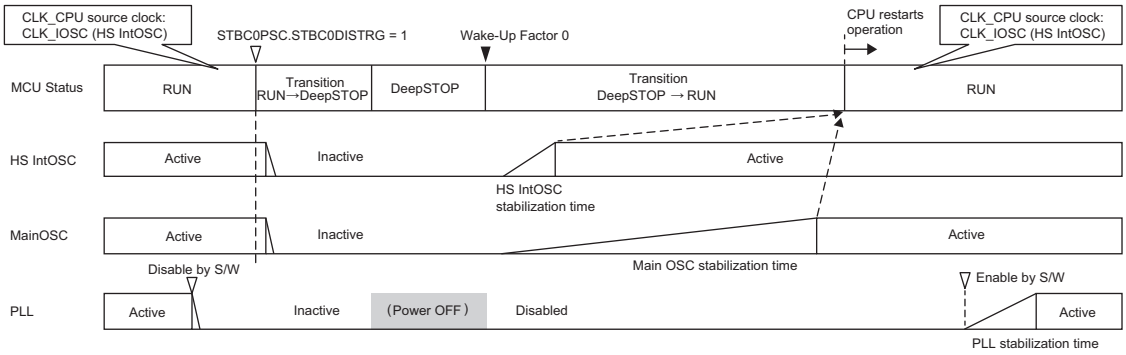


(c) PLL and Main OSC are enabled before entering STOP mode.
PLL and Main OSC are restarted automatically during transition to RUN mode, and become stable CPU restarts operation.
CLK_CPU source clock after wake-up from STOP mode is the same source clock before entering STOP mode.

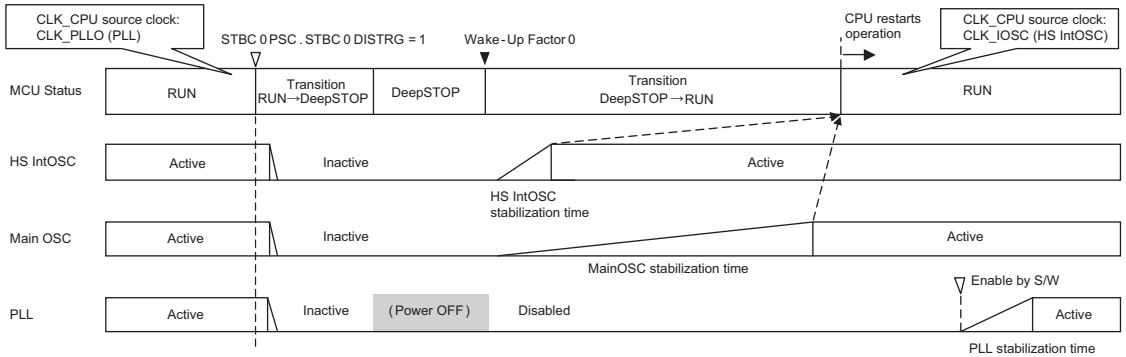
Figure 15.6 Clock oscillators behavior in Chip Standby Mode transition (RUN → STOP → RUN)



(a) PLL and Main OSC are disabled before entering DeepSTOP mode.
Restart Main OSC and PLL by software after wake-up.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).

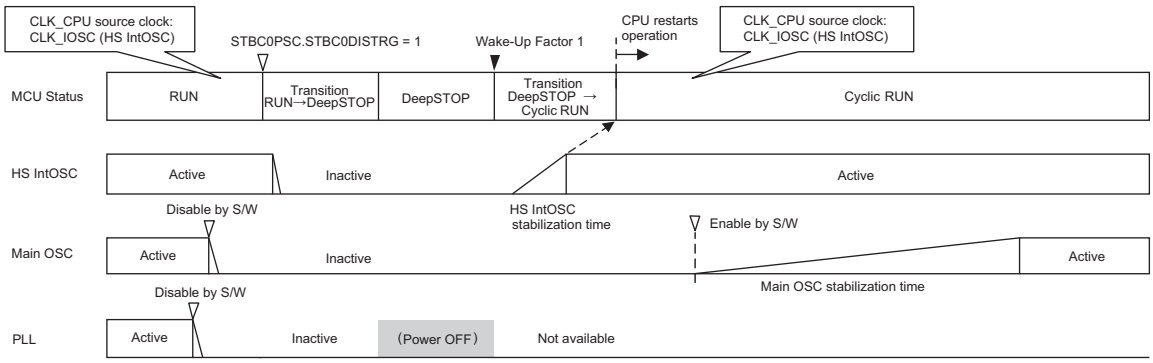


(b) PLL is disabled, and Main OSC is enabled before entering DeepSTOP mode.
Main OSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).

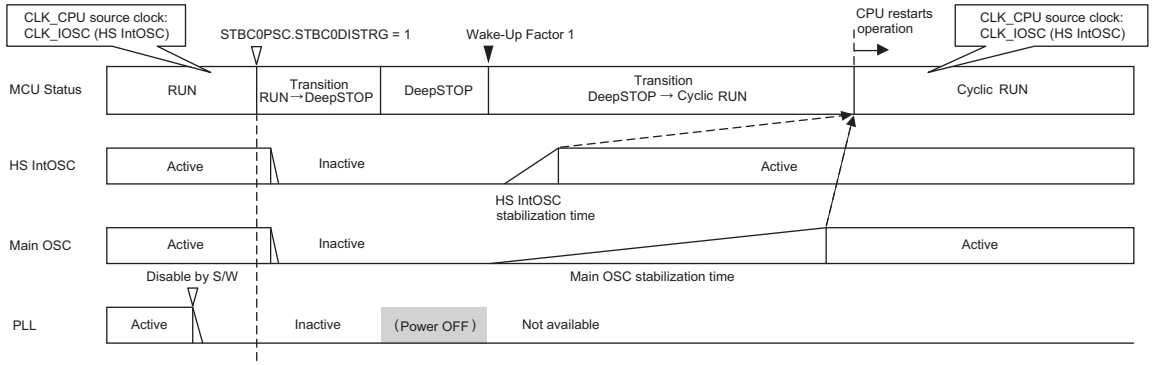


(c) PLL and Main OSC are enabled before entering DeepSTOP mode.
Main OSC is restarted automatically during transition to RUN mode, and becomes stable before CPU restarts operation.
Restart PLL by software after wake-up.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).

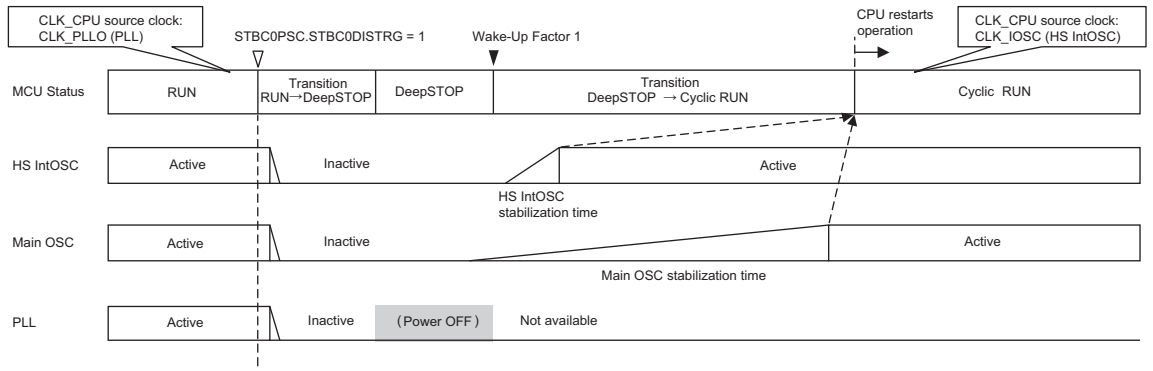
Figure 15.7 Clock oscillators behavior in Chip Standby Mode transition (RUN → DeepSTOP → RUN)



(a) PLL and Main OSC are disabled before entering DeepSTOP mode.
Restart Main OSC by software after wake-up. PLL is not available in Cyclic RUN mode.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).



(b) PLL is disabled, and Main OSC is enabled before entering DeepSTOP mode.
Main OSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).



(c) PLL and Main OSC are enabled before entering DeepSTOP mode.
Main OSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation. PLL is not available in Cyclic RUN mode.
CLK_CPU source clock after wake-up from DeepSTOP mode is CLK_IOSC (HS IntOSC).

Figure 15.8 Clock oscillators behavior in Chip Standby Mode transition (RUN → DeepSTOP → Cyclic RUN)

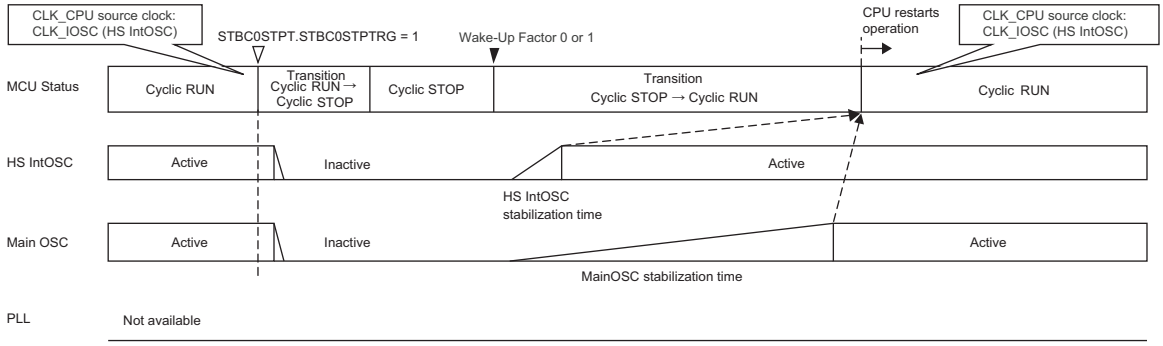
Restart Main OSC by software after wake-up.
CLK_CPU source clock after wake-up from Cyclic STOP mode is the same source clock before entering Cyclic STOP mode.



(b) Main OSC is enabled before entering Cyclic STOP mode.
Main OSC is restarted automatically during transition to Cyclic RUN mode, and becomes stable before CPU starts operation.
CLK_CPU source clock after wake-up from Cyclic STOP mode is the same source clock before entering Cyclic STOP mode.

Figure 15.11 Clock oscillators behavior in Chip Standby Mode transition (Cyclic RUN → Cyclic STOP → Cyclic RUN)

15.5 Cautions when Using Chip Standby Modes

15.5.1 Cautions Concerning Transitioning to DeepSTOP Mode When Using a Debugger

When using a debugger, executing a program that causes the mode to transition to DeepSTOP mode immediately after the program is started may cause improper communication between the OCD emulator and microcontroller because the microcontroller will enter DeepSTOP mode before the preparations for communication between the OCD emulator and microcontroller are completed.

The communication preparation period depends on the OCD emulator's host PC environment and the operating frequency of the microcontroller, so when performing debugging that causes the program to enter DeepSTOP mode immediately after the program starts, insert a wait between reset release and the DeepSTOP execution instruction so that the debugger starts normally.

In DeepSTOP mode, the debugging controller stops. For return from DeepSTOP mode by the debugger, see **Section 15.1.1.2, On-Chip Debug Wake-Up**.

Section 16 Low-Power Sampler (LPS)

This section contains a generic description of the low-power sampler (LPS).

The first part of this section describes the features specific RH850/U2A such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the LPS.

16.1 Features LPS for RH850/U2A

16.1.1 Number of Units

This microcontroller has the following number of LPS units.

Table 16.1 Number of Units

Product Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
Number of Units	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	0	1 (n = 0)
Name	LPSn									

Table 16.2 Unit Configurations and Channels

Unit Name LPSn	Number of Channels per Unit	Function	Channel Name	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
LPS0	1	Digital port input m for port polling	DPINm	24 ch	24 ch	15 ch	5 ch	15 ch	5 ch	5 ch	5 ch	0 ch	5 ch
		Analog input m for A/D converter	ADCJ2Im	20 ch	20 ch	20 ch	5 ch	20 ch	5 ch	5 ch	5 ch	0 ch	0 ch

Table 16.3 Indices

Index	Description
n	Throughout this section, the individual LPS units are identified by the index “n” (n = 0).
m	Throughout this section, the number of digital port input channels for LPS port polling is indicated by the index “m” (m = 0 to 23) and the number of analog input channels for A/D converter is indicated by the index “m” (m = 0 to 19)
k	The external multiplexer select output signal is indicated by the index “k”.
x	LPS sequence start trigger input signal is indicated by the index “x”.
y	Throughout this section, the individual TAUJ units are identified by the index “y”.

NOTE

Descriptions of functions and registers in this section are based on the maximum configurations. Adjust the indices in the text to the proper value for each product. When writing a value to a register that will result in writing to bits outside the range of the index for the product you are using, write the value after reset to these bits.

The following table shows the values indicated by the indices of each product.

Table 16.4 Indices of Products

Index	Indices of Each Product									
	RH850/ U2A-EVA (516 pins)	RH850/ U2A16 (516 pins)	RH850/ U2A16 (373 pins)	RH850/ U2A16 (292 pins)	RH850/ U2A8 (373 pins)	RH850/ U2A8 (292 pins)	RH850/ U2A6 (292 pins)	RH850/ U2A6 (176 pins)	RH850/ U2A6 (156 pins)	RH850/ U2A6 (144 pins)
m	0 to 23*1 0 to 19*2	0 to 23*1 0 to 19*2	0 to 14*1 0 to 19*2	0 to 2, 11 to 12*1 0 to 4*2	0 to 14*1 0 to 19*2	0 to 2, 11 to 12*1 0 to 4*2	0 to 2, 11 to 12*1 0 to 4*2	0 to 2, 11 to 12*1 0 to 4*2	—	0 to 2, 11 to 12*1 —*2
k	0 to 2	0 to 2	0 to 2	0 to 2	0 to 2	0 to 2	0 to 2	0 to 2	—	0 to 2
x	0 to 3	0 to 3	0 to 3	0 to 3	0 to 3	0 to 3	0 to 3	0 to 3	—	0 to 3
y	2, 3	2, 3	2, 3	2, 3	2, 3	2, 3	2, 3	2, 3	—	2, 3

Note 1. Digital port input m for port polling

Note 2. Analog input m for A/D converter

16.1.2 Register Base Address

The LPS base address is shown in the following table.

LPS register addresses are given as an offset from the base address.

Table 16.5 Register Base Addresses

Base Address Name	Base Address	Bus Group
<LPS0_base>	FF9A 4000$_H$	P-Bus Group 2L

16.1.3 Clock Supply

The LPS clock supply is shown in the following table.

If the operation request signal for the low-power sampler (LPS) is at the active level, the clock for CLKA_ADC for which the HS IntOSC is selected also operates.

Table 16.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
LPSn	Register access clock	CLK_LSB, CLKA_LPS
	Operating clock	CLKA_LPS

16.1.4 Interrupt Requests and Error Notifications

The LPS interrupt requests are listed in the following table.

Table 16.7 Interrupt and DMA/DTS Requests

Unit Interrupt Signal	Description	Interrupt Number	sDMA Trigger Number	DTS Trigger Number
LPS0				
INTCWEND	Port polling end interrupt (LPS)	693	—	—
INTDPE	Digital port error interrupt (LPS)	694	—	—
INTADCJ2I0*1	ADCJ2 SG0 end interrupt	239	Group0-14	Group0-12
INTADCJ2I1*1	ADCJ2 SG1 end interrupt	240	Group0-15	Group0-13
INTADCJ2I2*1	ADCJ2 SG2 end interrupt	241	Group0-16	Group0-14
INTADCJ2I3*1	ADCJ2 SG3 end interrupt	242	Group0-17	Group0-15
INTADCJ2I4*1	ADCJ2 SG4 end interrupt	243	Group0-18	Group0-16

Note 1. These signals are output from ADCJ2.

This module has no error notifications.

16.1.5 Reset Sources

The LPS reset sources are shown in the following table. The LPS is initialized by the reset source.

Table 16.8 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
LPS0	All registers	√	√	√	√	—	—	—

16.1.6 External Input/Output Signals

External input/output signals of LPS are listed below.

Table 16.9 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
LPS0		
DPO	Port output signal for digital input	DPO
DPSELk	External multiplexer select output signal for digital port	SELDPk
DPINm	Digital port input signal	DPINm
APO	Port output signal for analog input	APO
ADCJ2SELk*1	External analog multiplexer (MPX) output pin	ADCJ2SELk
ADCJ2Im*1	ADCJ input channel signal	ADCJ2Im

Note 1. These signals are input/output of ADCJ2. For details, see **Section 43.1.6, External Input/Output Signals**.

16.1.7 Internal Input/Output Signals

Internal input/output signals for connecting the LPS and STBC or the LPS and TAUJ are listed below.

Table 16.10 Internal Input/Output Signals

Unit Signal Name	Description	Connected to
WUTRG0	LPS wake-up source trigger 0 output signal	STBC
WUTRG1	LPS wake-up source trigger 1 output signal	STBC
INTTAUJylx	LPS sequence start trigger x input signal	TAUJy

16.2 Overview

16.2.1 Functional Overview

To monitor the external input without consuming CPU resources, the low-power sampler (LPS) can check the digital input ports and analog input ports without using the CPU. The figure below shows a connection example between the main components of the LPS and the external circuit.

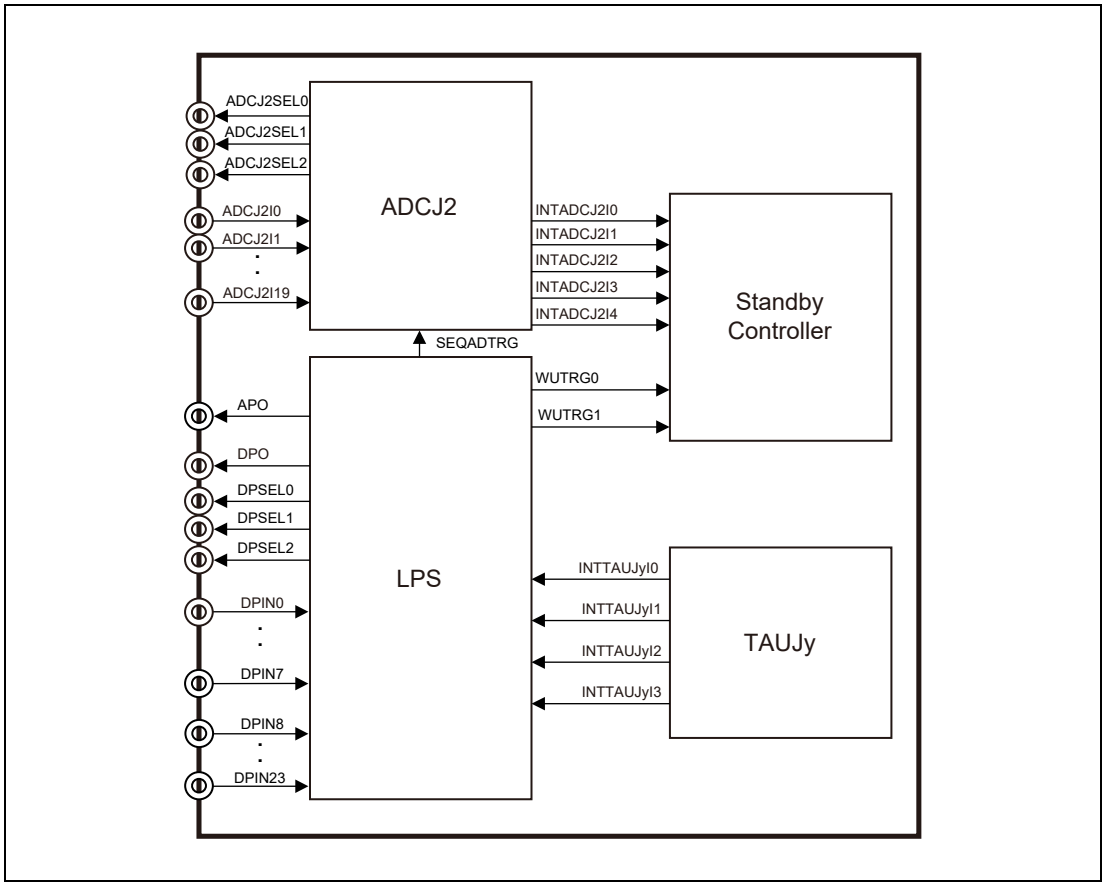


Figure 16.1 Block Diagram of the LPS

16.3 Registers

16.3.1 List of Registers

LPS registers are listed in the following table.

For details about <LPS0_base>, see **Section 16.1.2, Register Base Address**.

Table 16.11 List of Registers

Module Name	Register Name	Symbol	Address	Access Protection	
				PBG	Other
LPS0	LPS control register	SCTLR	<LPS0_base > + 00_H	PBG20 #7	
	Event flag register	EVFR	<LPS0_base > + 04_H	PBG20 #7	
	DPIN select register 0	DPSELR0	<LPS0_base > + 08_H	PBG20 #7	
	DPIN select register M	DPSELRM	<LPS0_base > + $0C_H$	PBG20 #7	
	DPIN select register H	DPSELRH	<LPS0_base > + 10_H	PBG20 #7	
	DPIN data set register 0	DPDSR0	<LPS0_base > + 14_H	PBG20 #7	
	DPIN data set register M	DPDSRM	<LPS0_base > + 18_H	PBG20 #7	
	DPIN data set register H	DPDSRH	<LPS0_base > + $1C_H$	PBG20 #7	
	DPIN data input monitor register 0	DPDIMR0	<LPS0_base > + 20_H	PBG20 #7	
	DPIN data input monitor register 1	DPDIMR1	<LPS0_base > + 24_H	PBG20 #7	
	DPIN data input monitor register 2	DPDIMR2	<LPS0_base > + 28_H	PBG20 #7	
	DPIN data input monitor register 3	DPDIMR3	<LPS0_base > + $2C_H$	PBG20 #7	
	DPIN data input monitor register 4	DPDIMR4	<LPS0_base > + 30_H	PBG20 #7	
	DPIN data input monitor register 5	DPDIMR5	<LPS0_base > + 34_H	PBG20 #7	
	DPIN data input monitor register 6	DPDIMR6	<LPS0_base > + 38_H	PBG20 #7	
	DPIN data input monitor register 7	DPDIMR7	<LPS0_base > + $3C_H$	PBG20 #7	
	Count value register	CNTVAL	<LPS0_base > + 40_H	PBG20 #7	
	LPS operation status register	SOSTR	<LPS0_base > + 44_H	PBG20 #7	

16.3.2 SCTLR — LPS Control Register

This register is used to configure the LPS.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 00_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	TJIS2	NUMDP 2	NUMDP 1	NUMDP 0	TJIS1	TJIS0	ADEN	DPEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 16.12 SCTLR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6 to 4	NUMDP[2:0]	These bits specify the number of times the port is read in digital input mode. If two or more times are specified, the external multiplexer is controlled by the DPSEL[2:0] pins. The bits for which comparison is enabled in the DPSELR0, DPSELRM, and DPSELRH registers are compared regardless of the repeat number setting, and WUTRG will be generated according to the results. **NUMDP[2:0] / Number of Times the Port Is Read** 000_B One time 001_B Two times 010_B Three times 011_B Four times 100_B Five times 101_B Six times 110_B Seven times 111_B Eight times These bits should be set before the TAUJy and sequence operations are started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)
7, 3, 2	TJIS[2:0]	Sequence Start Trigger Select 000: INTTAUJ2I0 001: INTTAUJ2I1 010: INTTAUJ2I2 011: INTTAUJ2I3 100: INTTAUJ3I0 101: INTTAUJ3I1 110: INTTAUJ3I2 111: INTTAUJ3I3 These bits should be set before the sequence operation is started (when the SCTLR.DPEN bit = 0, the SCTLR.ADEN bit = 0, and the SOSTR.SOF bit = 0). (When changing the SCTLR.DPEN bit and the SCTLR.ADEN bit, write the same value to these bits.)

Table 16.12 SCTLR Register Contents (2/2)

Bit Position	Bit Name	Function
1	ADEN	0: Analog input mode is disabled 1: Analog input mode is enabled
0	DPEN	0: Digital input mode is disabled 1: Digital input mode is enabled

16.3.3 EVFR — Event Flag Register

This register indicates the result of comparing the data sequentially captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers.

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DINEVF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 16.13 EVFR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	DINEVF	This bit indicates the result of comparing the data captured at the digital input pins and stored in the DPDIMR7 to DPDIMR0 registers with the comparison target data in the DPDSRH/DPDSRM/DPDSR0 registers. Read: 0: The result of comparison is a match. 1: The result of comparison is a mismatch. Write: 0: Clear the bit. 1: Prohibited. This bit is set to 1 when a mismatch is detected even in one bit. Only 0 can be written to clear this bit.

16.3.4 DPSELR0 — DPIN Select Register 0

This register specifies the compare target bits in the DPDSR0 and DPDIMR0 registers.

Write to the DPSELR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	D0EN_23	D0EN_22	D0EN_21	D0EN_20	D0EN_19	D0EN_18	D0EN_17	D0EN_16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	D0EN_15	D0EN_14	D0EN_13	D0EN_12	D0EN_11	D0EN_10	D0EN_9	D0EN_8	D0EN_7	D0EN_6	D0EN_5	D0EN_4	D0EN_3	D0EN_2	D0EN_1	D0EN_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.14 DPSELR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0EN_n (n = 23 to 0)	These bits enable or disable comparing each bit of the first data captured at the digital input pins and stored in the DPDIMR0 register with the comparison target data in the DPDSR0 register. 0: Disables comparison. 1: Enables comparison.

16.3.5 DPSELRM — DPIN Select Register M

This register specifies the compare target bits in the DPDSRM and DPDIMRm (m = 4 to 1) registers.

Write to the DPSELRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPSELRM can be read or written in 32-bit units.
DPSELRML and DPSELRMH can be read or written in 16-bit units.
DPSELR1, DPSELR2, DPSELR3, and DPSELR4 can be read or written in 8-bit units.

Address: DPSELRM: <LPS0_base> + $0C_H$
DPSELRML: <LPS0_base> + $0C_H$, DPSELRMH: <LPS0_base> + $0E_H$
DPSELR1: <LPS0_base> + $0C_H$, DPSELR2: <LPS0_base> + $0D_H$, DPSELR3: <LPS0_base> + $0E_H$,
DPSELR4: <LPS0_base> + $0F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.15 DPSELRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fifth data captured at the digital input pins and stored in the DPDIMR4 register with the comparison target data in the DPDSR4 register. 0: Disables comparison. 1: Enables comparison.
23 to 16	D3EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the fourth data captured at the digital input pins and stored in the DPDIMR3 register with the comparison target data in the DPDSR3 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D2EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the third data captured at the digital input pins and stored in the DPDIMR2 register with the comparison target data in the DPDSR2 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D1EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the second data captured at the digital input pins and stored in the DPDIMR1 register with the comparison target data in the DPDSR1 register. 0: Disables comparison. 1: Enables comparison.

16.3.6 DPSELRH — DPIN Select Register H

This register specifies the compare target bits in the DPDSRH and DPDIMRm (m = 7 to 5) registers.

Write to the DPSELRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPSELRH can be read or written in 32-bit units.
DPSELRHL and DPSELRHH can be read or written in 16-bit units.
DPSELR5, DPSELR6, and DPSELR7 can be read or written in 8-bit units.

Address: DPSELRH: <LPS0_base> + 10_H
DPSELRHL: <LPS0_base> + 10_H, DPSELRHH: <LPS0_base> + 12_H
DPSELR5: <LPS0_base> + 10_H, DPSELR6: <LPS0_base> + 11_H, DPSELR7: <LPS0_base> + 12_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.16 DPSELRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the eighth data captured at the digital input pins and stored in the DPDIMR7 register with the compare target data in the DPDSR7 register. 0: Disables comparison. 1: Enables comparison.
15 to 8	D6EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the seventh data captured at the digital input pins and stored in the DPDIMR6 register with the compare target data in the DPDSR6 register. 0: Disables comparison. 1: Enables comparison.
7 to 0	D5EN_n (n = 7 to 0)	These bits enable or disable comparing each bit of the sixth data captured at the digital input pins and stored in the DPDIMR5 register with the compare target data in the DPDSR5 register. 0: Disables comparison. 1: Enables comparison.

16.3.7 DPDSR0 — DPIN Data Set Register 0

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR0 register.

Write to the DPDSR0 register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 32-bit units.

Address: <LPS0_base> + 14_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.17 DPDSR0 Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 0	D0_n (n = 23 to 0)	Data to be compared with the first digital port input (DPINm)

16.3.8 DPDSRM — DPIN Data Set Register M

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR4 to DPDIMR1 registers.

Write to the DPDSRM register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPDSRM can be read or written in 32-bit units.
DPDSRML and DPDSRMH can be read or written in 16-bit units.
DPDSR1, DPDSR2, DPDSR3, and DPDSR4 can be read or written in 8-bit units.

Address: DPDSRM: <LPS0_base> + 18_H
DPDSRML: <LPS0_base> + 18_H, DPDSRMH: <LPS0_base> + $1A_H$
DPDSR1: <LPS0_base> + 18_H, DPDSR2: <LPS0_base> + 19_H, DPDSR3: <LPS0_base> + $1A_H$,
DPDSR4: <LPS0_base> + $1B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	D2_7	D2_6	D2_5	D2_4	D2_3	D2_2	D2_1	D2_0	D1_7	D1_6	D1_5	D1_4	D1_3	D1_2	D1_1	D1_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.18 DPDSRM Register Contents

Bit Position	Bit Name	Function
31 to 24	D4_n (n = 7 to 0)	Data to be compared with the fifth digital port input (DPINm)
23 to 16	D3_n (n = 7 to 0)	Data to be compared with the fourth digital port input (DPINm)
15 to 8	D2_n (n = 7 to 0)	Data to be compared with the third digital port input (DPINm)
7 to 0	D1_n (n = 7 to 0)	Data to be compared with the second digital port input (DPINm)

16.3.9 DPDSRH — DPIN Data Set Register H

This register specifies the data to be compared with the data captured at a digital input pin and stored in the DPDIMR7 to DPDIMR5 registers.

Write to the DPDSRH register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: DPDSRH can be read or written in 32-bit units.
DPDSRHL and DPDSRHH can be read or written in 16-bit units.
DPDSR5, DPDSR6, and DPDSR7 can be read or written in 8-bit units.

Address: DPDSRH: <LPS0_base> + $1C_H$
DPDSRHL: <LPS0_base> + $1C_H$, DPDSRHH: <LPS0_base> + $1E_H$
DPDSR5: <LPS0_base> + $1C_H$, DPDSR6: <LPS0_base> + $1D_H$, DPDSR7: <LPS0_base> + $1E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 16.19 DPDSRH Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	D7_n (n = 7 to 0)	Data to be compared with the eighth digital port input (DPINm)
15 to 8	D6_n (n = 7 to 0)	Data to be compared with the seventh digital port input (DPINm)
7 to 0	D5_n (n = 7 to 0)	Data to be compared with the sixth digital port input (DPINm)

16.3.10 DPDIMR0 — DPIN Data Input Monitor Register 0

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 23)) in digital input mode. DPDIMR0 stores the data acquired for the first time.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <LPS0_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

23 to 0	D0M_n (n = 23 to 0)	The first digital port input (DPINm) data

16.3.11 DPDIMR1 — DPIN Data Input Monitor Register 1

This register stores the data which the LPS acquired from the digital port input (DPINm (m = 0 to 7)) in multiplexer mode or MIX mode. DPDIMR1 stores the data acquired for the second time.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <LPS0_base> + 24_H

Value after reset: 00_H

7 to 0	D7M_n (n = 7 to 0)	The eighth digital port input (DPINm) data

16.3.18 CNTVAL — Count Value Register

This register specifies the stabilization time of the external circuits (digital signal source and analog signal source).

- In digital mode
  The time from when the DPO output is set to 1 to the time when the port input is acquired for the first time
- In analog mode
  The time from when the APO output is set to 1 to the time when the LPS outputs the A/D conversion trigger to the ADCJ2

Write to the CNTVAL register before the sequence operation is started (when the SOSTR.SOF bit = 0).

Access: This register can be read or written in 16-bit units.

Address: <LPS0_base> + 40_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CNT17	CNT16	CNT15	CNT14	CNT13	CNT12	CNT11	CNT10	CNT07	CNT06	CNT05	CNT04	CNT03	CNT02	CNT01	CNT00

Table 16.28 CNTVAL Register Contents

Bit Position	Bit Name	Function
15 to 8	CNT1n (n = 7 to 0)	These bits set the stabilization time of the external circuit (analog signal source). Stabilization time = (1/(f_{RH}/20)) × 16 × CNT1n (set value)
7 to 0	CNT0n (n = 7 to 0)	These bits set the stabilization time of the external circuit (digital signal source). Stabilization time = (1/(f_{RH}/20)) × 16 × CNT0n (set value)

16.3.19 SOSTR — LPS Operation Status Register

This register indicates the operating state of the LPS.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <LPS0_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SOF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 16.29 SOSTR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	SOF	LPS Operation Status Flag 0: Initial state before the occurrence of the start trigger 1: LPS operation is in progress (after the start trigger occurs) If the start trigger occurs while the SOF bit is set to 1 (during the LPS operation), the start trigger is canceled.

NOTE

When DPEN or ADEN is set to 0 for stop of the LPS, SOF bit is set to 0 after the bit becomes 1 once by hardware.

16.4 Digital Input Mode

With the digital input port DPINm and the externally connected multiplexer, up to 80 input ports can be monitored as shown in **Table 16.30, Combination of Monitored Ports**.

Port DPSELk is used to switch the external multiplexer. The DPSELk output is switched for the number of times specified in the SCTLR register.

TAUJy is used to set the timing to check the value input to the port.

Table 16.30 Combination of Monitored Ports

Combination (Number of Ports x Number of Checks)	Ports Used	Total Number
Direct mode When input ports are checked simultaneously without using the external multiplexer Up to 24 ports × 1	DPIN23 to DPIN0	Up to 24
Multiplexer mode When input ports are checked by using a small number of pins and the external multiplexer Up to 8 ports × 8	DPIN7 to DPIN0 DPSEL2 to DPSEL0	Up to 64
MIX mode When input ports are checked using a combination of the above two modes Up to 24 ports x 1 + Up to 8 ports x 7	DPIN23 to DPIN0*1 DPSEL2 to DPSEL0	Up to 80

Note 1. DPIN23 to DPIN8 are checked only for the first time.

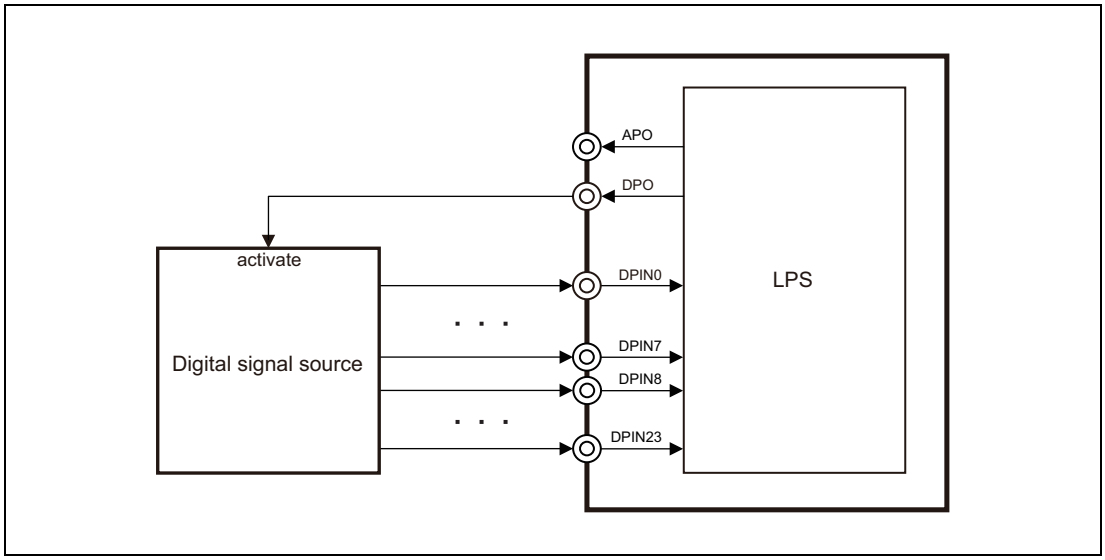

Figure 16.2 Direct Mode Connection Example

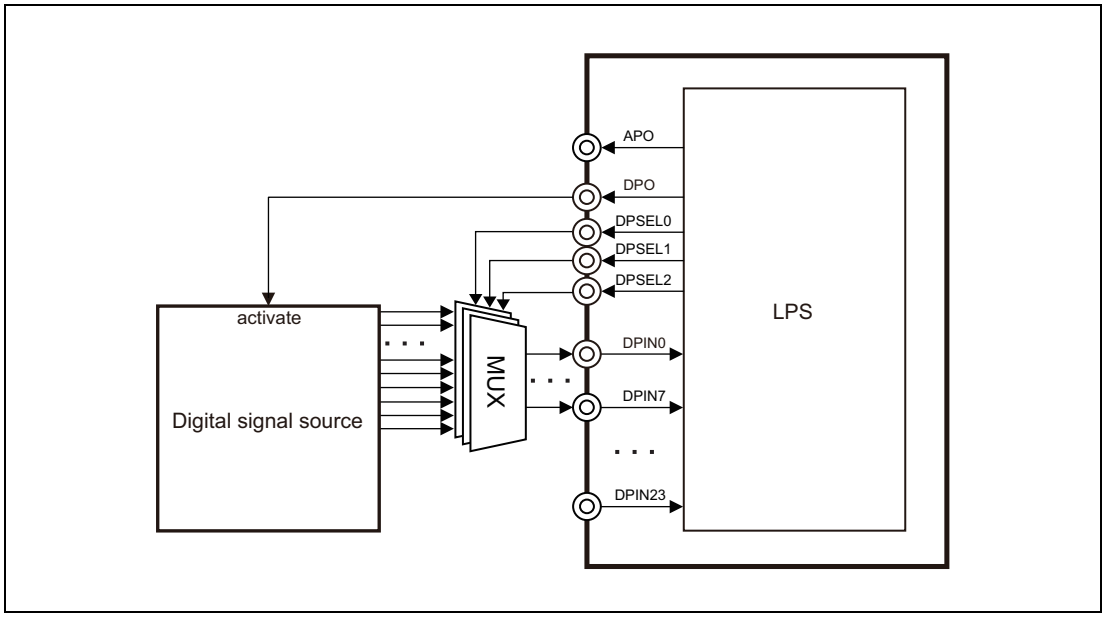

Figure 16.3 Multiplexer Mode Connection Example

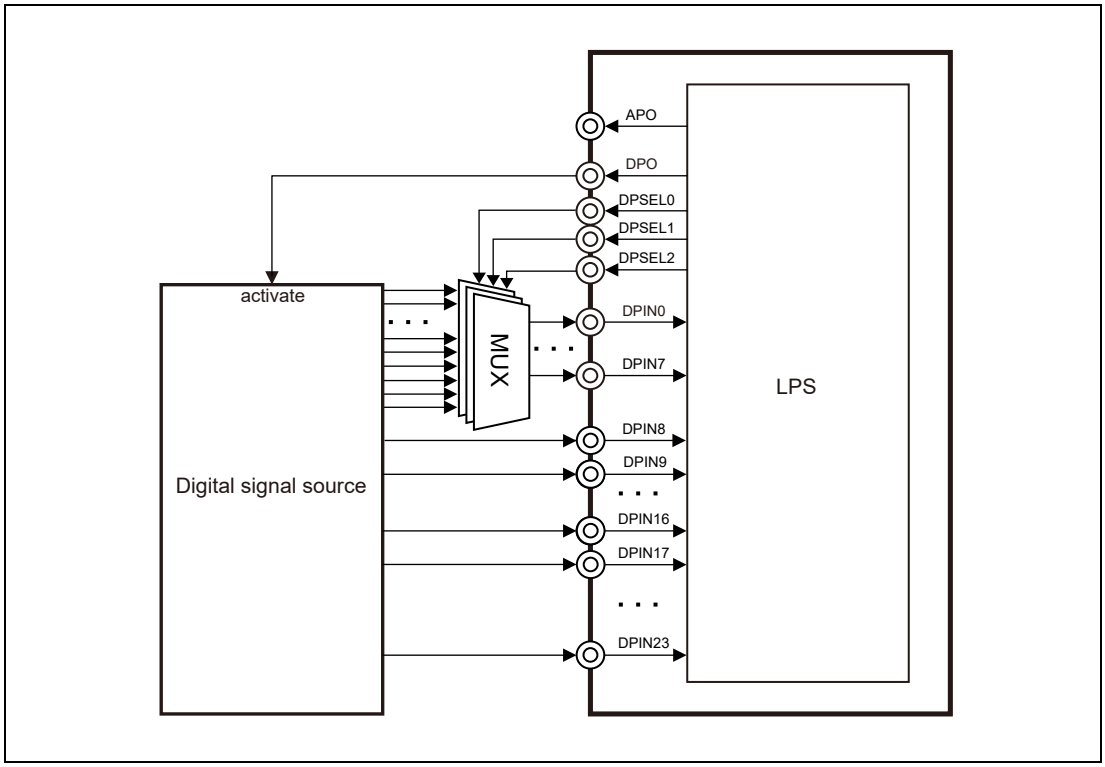

Figure 16.4 MIX Mode Connection Example

Preparation

- Set NUMDP[2:0] and TJIS[2:0] bits in the SCTLR register to specify the number of times the port is to be read, and the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the digital signal source by using the lower 8 bits in the CNTVAL register.
- Set expected values in the DPDSR0, DPDSRM and DPDSRH registers.
- Set the ports to be checked in the DPSELR0, DPSELRM, and DPSELRH registers.

Start

- Start the TAUJy.
- Set the SCTLR.DPEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in standby mode, it can only resume operation while the sequencer is running.

Upon completion of checking all ports that have been set, the INTCWEND interrupt occurs. In addition, if the input value of the port is different from the expected value set by the DPDSR0, DPDSRM, or DPDSRH register, the wake-up factor WUTRG0 occurs. The following figures show an example of the operation in digital input mode.

Stop

To stop the LPS operation in Digital Input Mode (by changing the SCTLR.DPEN bit setting from 1 to 0), follow the procedure shown below. In this example, the P6_4 pin is used as DPO.

1. Set the port register to specify low level output on the pin (P6.P6_4 = 0).
2. Change the setting for the P6_4 pin from the alternative port mode to the port mode (PMC6.PMC6_4 = 0).
3. Set SCTLR.DPEN = 0.

NOTE

The above procedure applies when the P6_4 pin is used as DPO. If the P6_12 pin is used as DPO, specify the P6_12 pin settings in the same way.

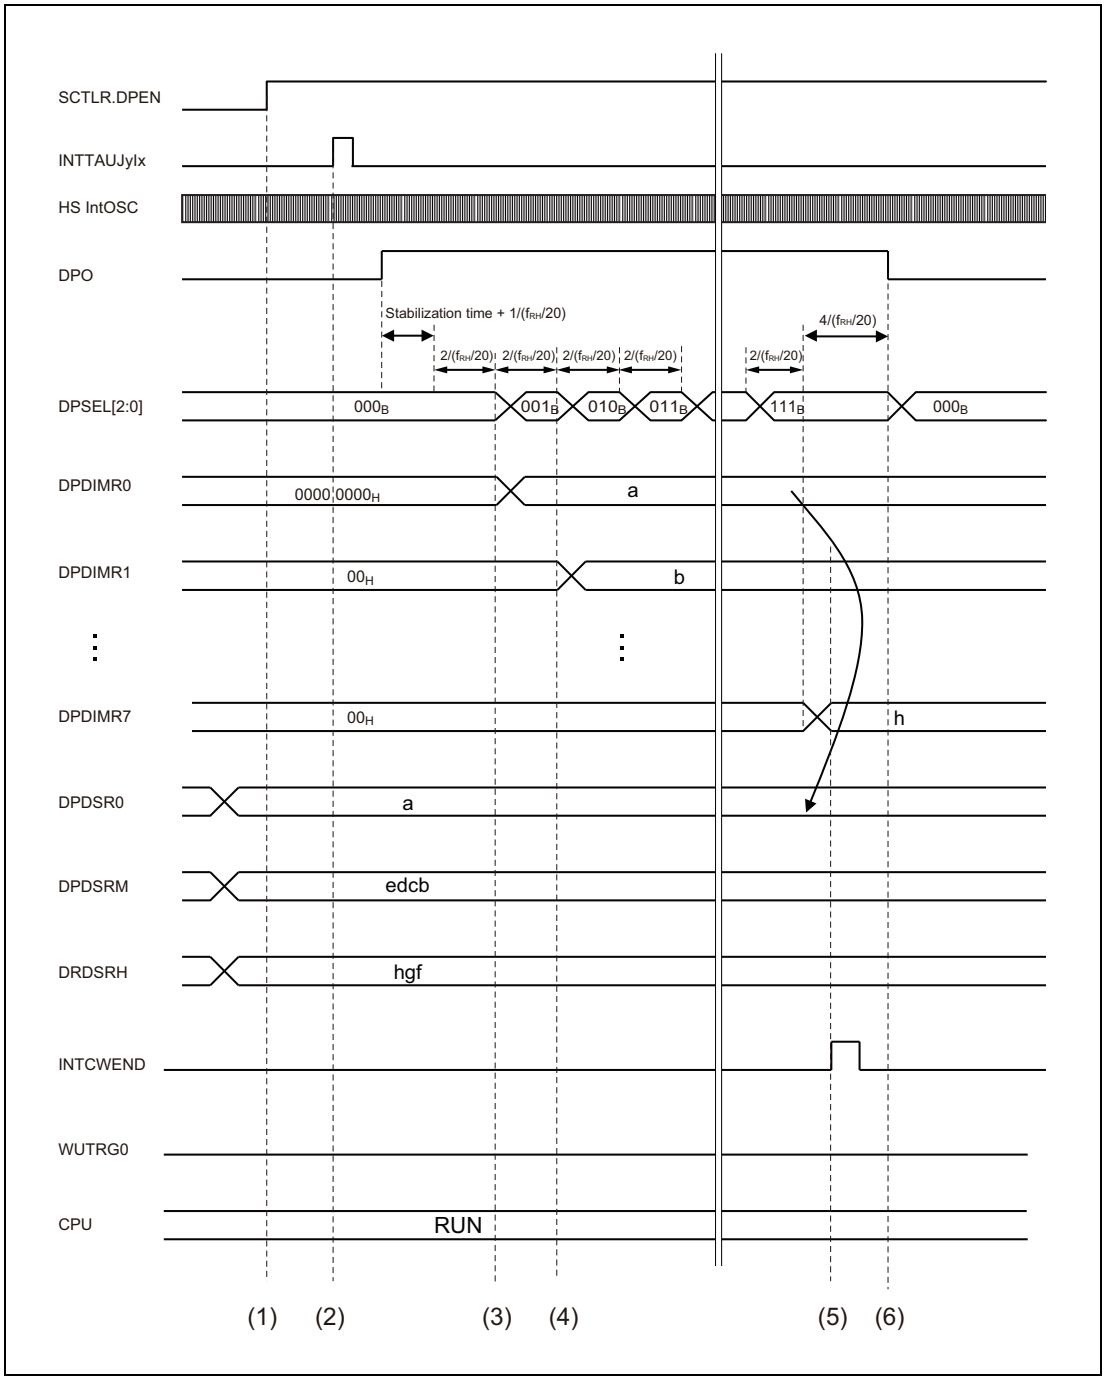

Figure 16.5 Operation of Digital Input Mode (8 Ports × 8) when the Input Value is not Changed (RUN Mode)

(1) Set the SCTLR.DPEN bit to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the sequencer outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(3) After the completion of the signal source stabilization, the LPS stores the DPIN[7:0] input value to the DPDIMR0 register and increments the DPSEL[2:0] pins to switch the external multiplexer.

(4) After the switching of the DPSEL[2:0] pins, the LPS stores the values in the DPDIMRn registers in order from DPDIMR1 and continues to increment the DPSEL[2:0] pins.

(5) After the value is stored up to the DPDIMR7 register, the INTCWEND interrupt is generated and the value is compared with the expected value set in the DPDSR0, DPDSRM, and DPDSRH registers.

(6) When the value is not different from the expected value, the wake-up factor WUTRG0 is not generated. The LPS stops the DPO output and returns to the waiting state for the trigger.

High level width of DPO pin is calculated by the following formula. For the Stabilization time, see **Section 16.3.18, CNTVAL — Count Value Register**.

High level width of DPO pin

= Stabilization time + $(1/(f_{RH}/20)) \times 1 + (1/(f_{RH}/20)) \times 2 \times$ (SCTLR.NUMDP (set value) + 1) + $(1/(f_{RH}/20)) \times 4$

= Stabilization time + $(1/(f_{RH}/20)) \times$ (2 × SCTLR.NUMDP (set value) + 7)

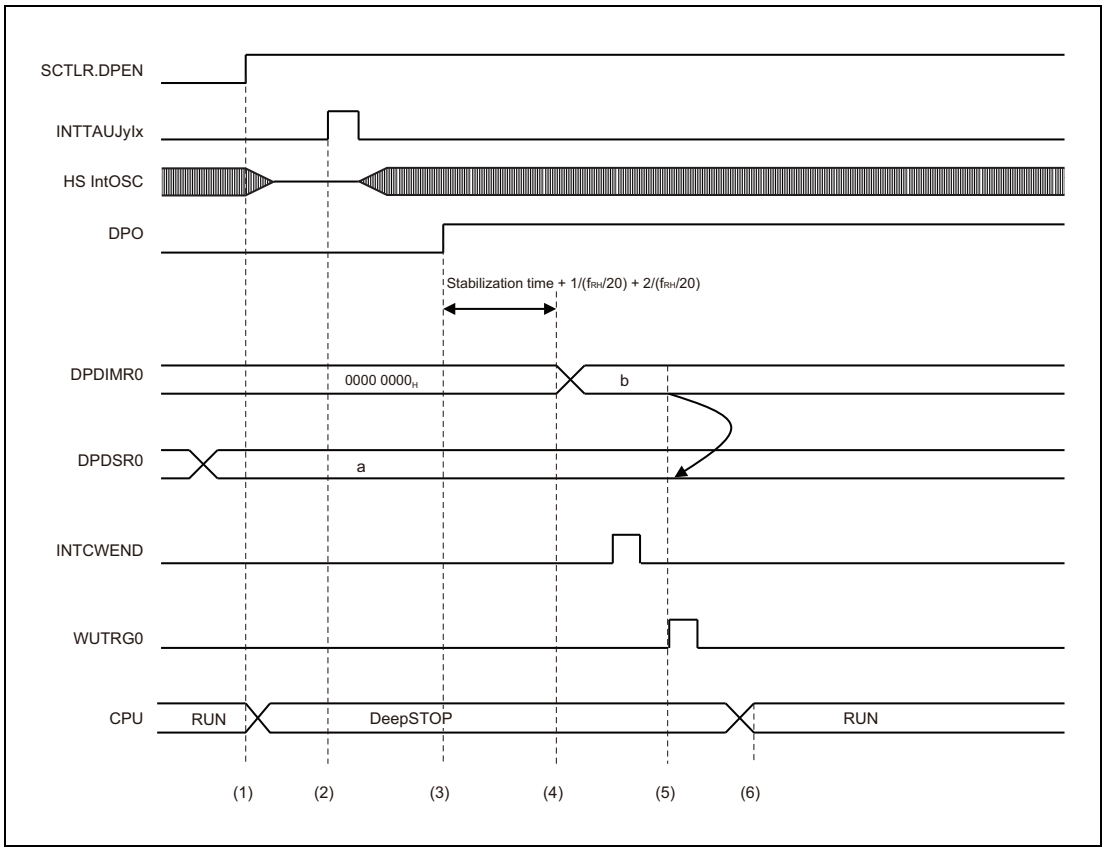

Figure 16.6 Operation of Digital Input Mode (24 Ports × 1) when the Input Value is Changed (DeepSTOP Mode)

(1) Set the STBC0PSC.STBC0DISTRG bit to 1 to transition to the DeepSTOP mode, while the SCTLR.DPEN bit is set to 1 by software to enable the digital input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(3) After the completion of the HS IntOSC stabilization time, the LPS outputs the high level from the DPO pin and waits for the time specified by CNTVAL.CNT0n to secure the stabilization of the external digital signal source.

(4) After the completion of the signal source stabilization, the LPS stores the DPIN[23:0] input value to the DPDIMR0 register and the INTCWEND interrupt is generated.

(5) The value stored in the DPDIMR0 register is compared with the expected value set in the DPDSR0 register. When the value is different from the expected value, the wake-up factor WUTRG0 is generated.

(6) The CPU returns to RUN mode at the generation of WUTRG0. The DPO pin is driven high until the EVFR.DINEVF bit is cleared to 0 by software.

16.4.1 Digital Port Error Interrupt

A level sensitive interrupt indicating a data comparison mismatch is generated. This interrupt is generated not only in standby mode but also in RUN mode. The set and clear conditions are shown below.

Table 16.31 Digital Port Error Interrupt

Unit Interrupt Signal	Set Condition	Clear Condition
INTDPE	When EVFR.DINEVF is set to 1 by hardware	When EVFR.DINEVF is cleared to 0 by software

16.5 Analog Input Mode

The analog input port ADCJ2Im (m = 0 to 19) can be monitored.

TAUJy is used to set the timing to check the value input to the port.

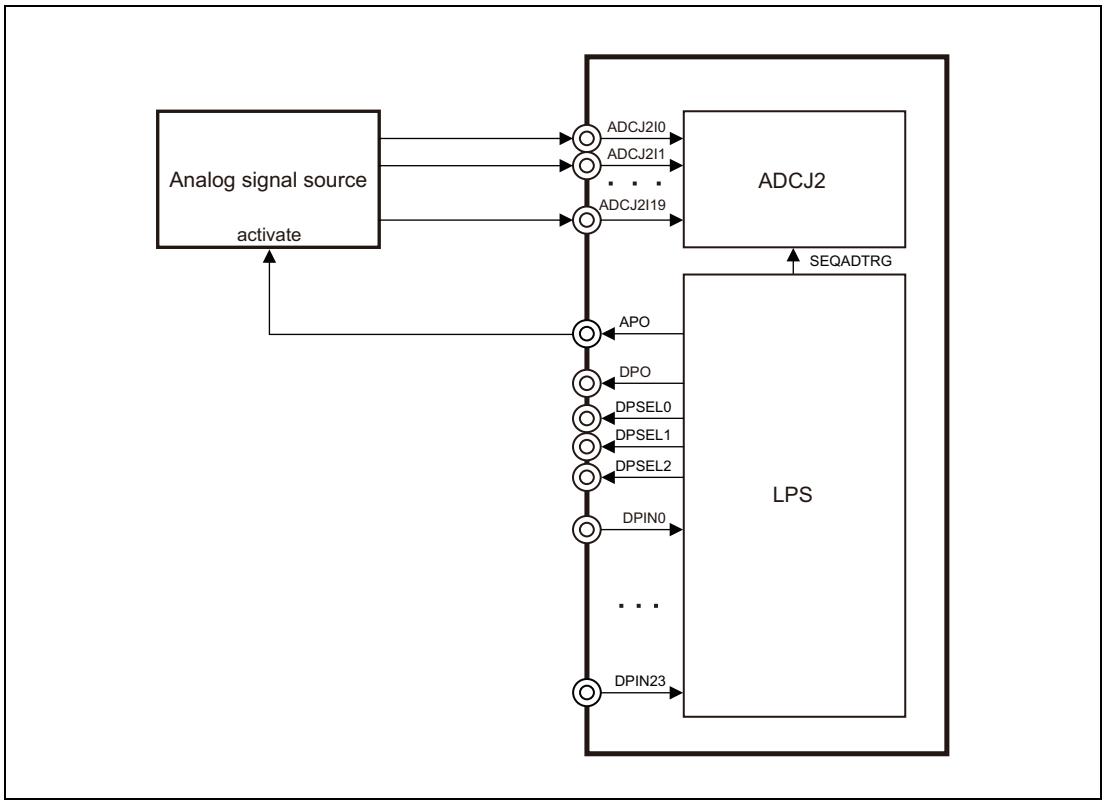

Figure 16.7 Analog Input Mode Connection Example 1

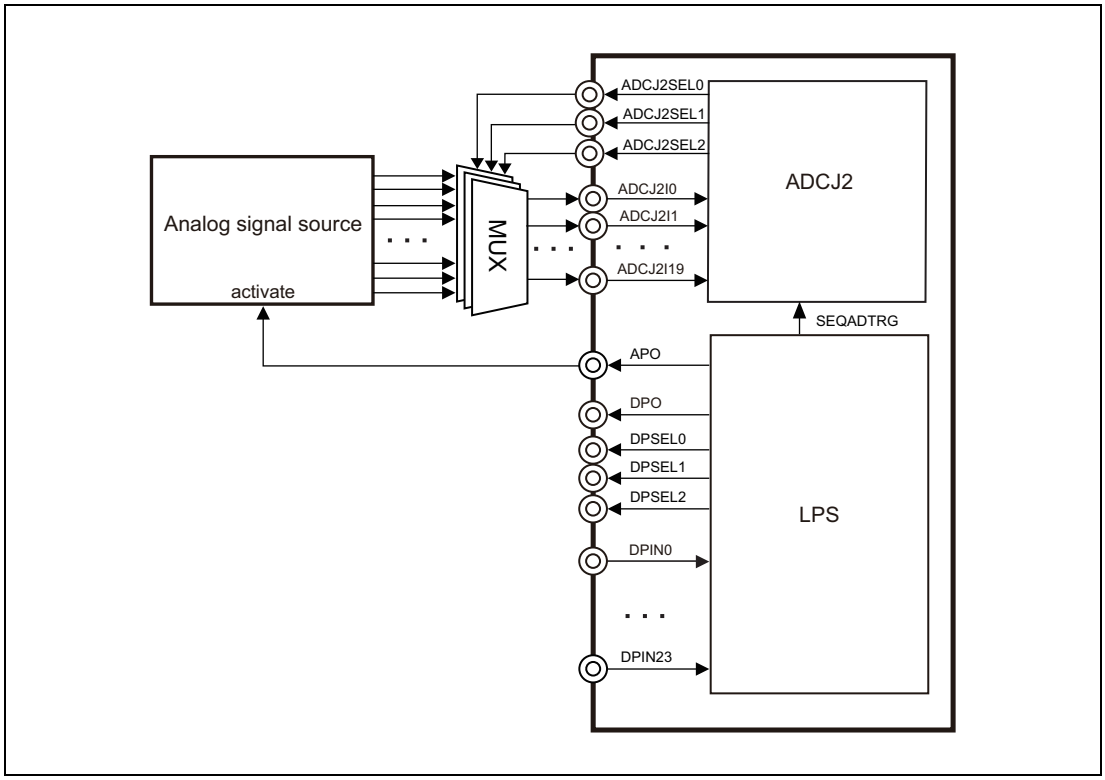

Figure 16.8 Analog Input Mode Connection Example 2

Preparation

- Set TJIS[2:0] bits in the SCTLR register to specify the TAUJy interrupt to be used as sequence start trigger.
- Set TAUJy to interval timer mode.
- Set the wait time of the analog signal source by using the upper 8 bits in the CNTVAL register.
- Set the ADCJ2.

CAUTIONS

1. **When the LPS is in use, the A/D conversion completion interrupt (INTADCJ2Ix) should be output after the conversion of all channels of the LPS has been completed. The setting is as follows.**
   - **Set the ADIE bit in virtual channel register j (ADCJ2VCRj) to 0 (a scan group x end interrupt (INTADCJ2Ix) is not generated when A/D conversion for virtual channel j ends in SGx.).**
   - **Set the ADIE bit in the scan group x control register (ADCJ2SGCRx) to 1 (INTADCJ2Ix is output when the scan for SGx ends).**
2. **Over the period from the generation of the LPS sequence start trigger set by the SCLTR.TJIS[2:0] bits to the completion of A/D conversion for all channels of LPS, do not forcibly end A/D conversion by using the ADCJ2ADHALTR bit.**
3. **When the LPS is in use, do not use the following modes.**

- **Continuous scan mode**
  (the setting ADCJ2SGCRx.SCANMD = 1 is prohibited)
- **Multicycle scan mode with 2 or more cycles**
  (the settings except ADCJ2SGMCYCRx.MCYC = 00_H are prohibited)

Start

- Start the TAUJy.
- Set the SCTLR.ADEN bit to 1.

After the operation starts, ports are checked at the interval set in TAUJy. The operation continues regardless of whether the mode is RUN mode or power save mode. If the HS IntOSC is stopped in standby mode, it can only resume operation while the sequencer is running.

To detect whether the analog input value differs from the expected value, use the A/D error interrupt request (INTADCJ2ERR) of the A/D converter.

In addition, if the analog input value is different from the expected value, the wake-up factor WUTRG1 occurs.

For details on the A/D error interrupt request (INTADCJ2ERR), see **Section 43.4.19.2, A/D Error Interrupt Request (INT_ADE)***1. The following figures show an example of the operation in analog input mode.

Note 1. In **Section 43, Analog to Digital Converter (ADCJ)**, the name of the A/D error interrupt request is described as “INT_ADE”.

Stop

To stop the LPS operation in Analog Input Mode (by changing the SCTLR.ADEN bit setting from 1 to 0), follow the procedure shown below. Note that the P6_8 pin is used as APO.

1. Set the port register to specify low level output on the pin (P6.P6_8 = 0).
2. Change the setting for the P6_8 pin from the alternative port mode to the port mode (PMC6.PMC6_8 = 0).
3. Set SCTLR.ADEN = 0.

NOTE

The above procedure applies when the P6_8 pin is used as APO. If the P6_13 pin is used as APO, specify the P6_13 pin settings in the same way.

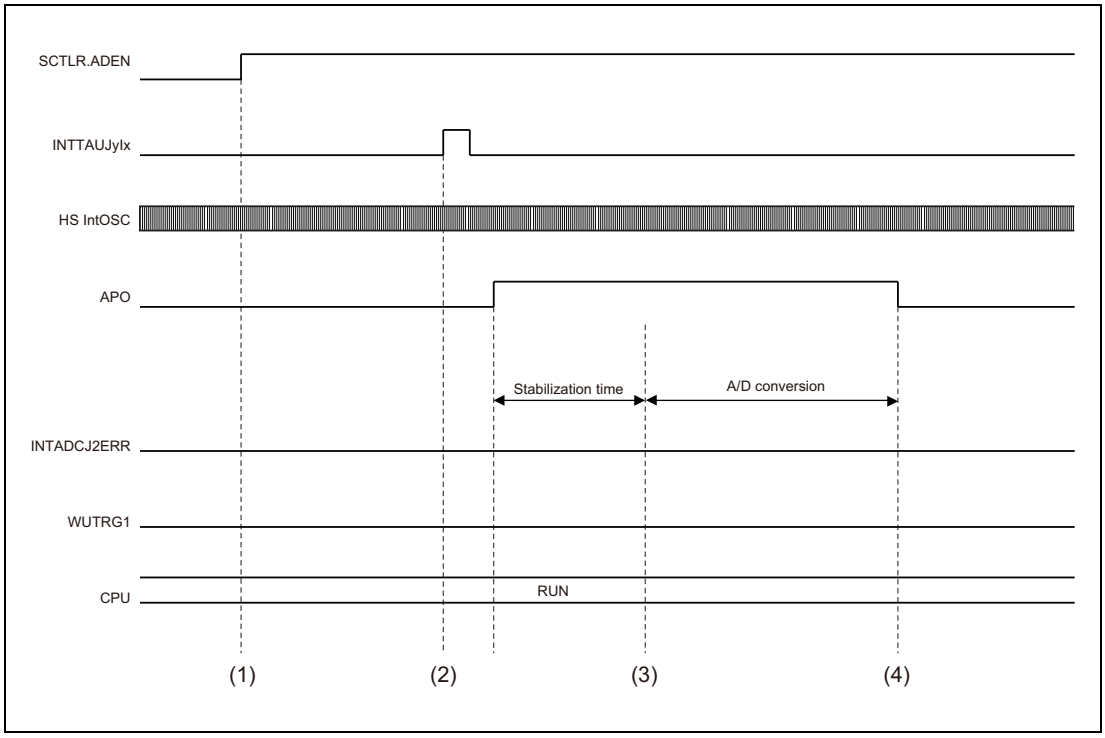

Figure 16.9 Operation of Analog Input Mode when the Conversion Result is within the Expected Range (RUN Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(3) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCJ2Im (m = 0 to 19), set in the A/D converter scan group, is started.

(4) When the INTADCJ2ERR interrupt is not generated as a result of A/D conversion, the LPS halts the A/D converter and resets the APO pin.

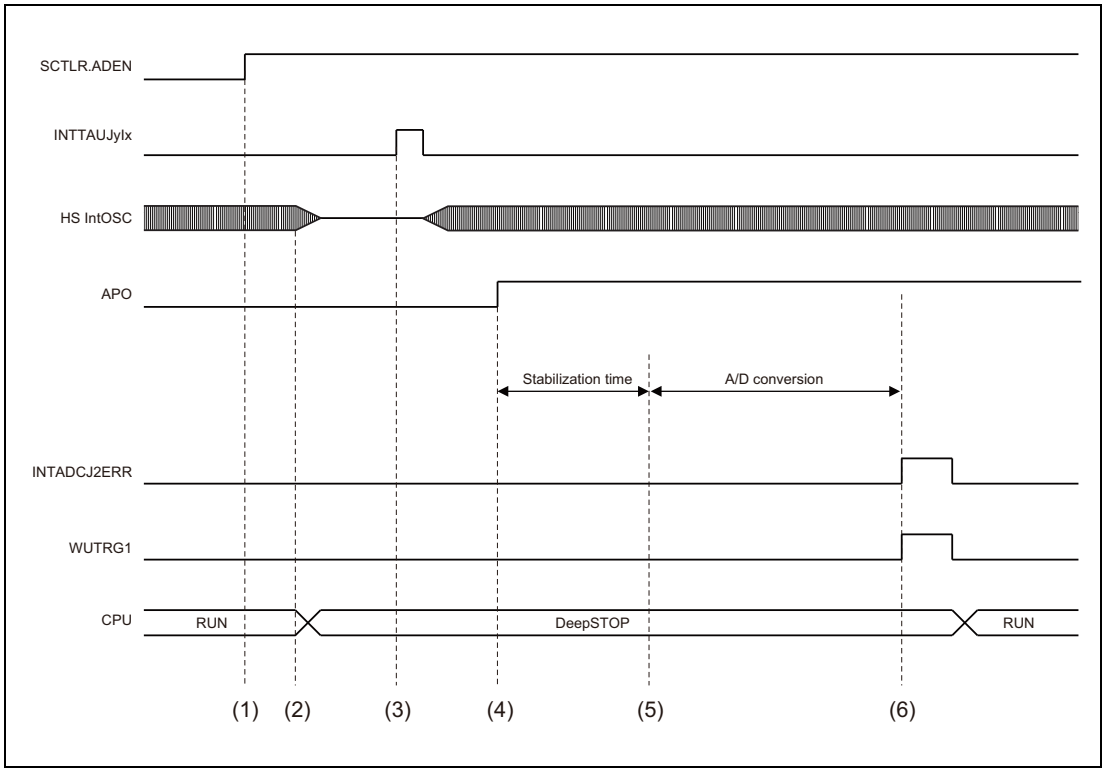

Figure 16.10 Operation of Analog Input Mode when the Conversion Result is not within the Expected Range (DeepSTOP Mode)

(1) Set the conversion trigger, scan group, and expected range of the A/D converter by software. Then, set the SCTLR.ADEN bit to 1 to enable the analog input mode of the LPS.

(2) Set the STBC0PSC.STBC0DISTRG bit to 1 by software to transition to the DeepSTOP mode.

(3) When the INTTAUJyIx interrupt specified by the SCTLR.TJIS bit is generated, the LPS enables the HS IntOSC to start the oscillation.

(4) After the completion of the HS IntOSC stabilization, the LPS outputs the high level from the APO pin at the same time it enables the A/D converter, and waits for the time specified by CNTVAL.CNT1n to secure the stabilization of the external analog signal source.

(5) After the completion of the signal source stabilization, the LPS triggers the start of conversion to the A/D converter and then the A/D conversion of ADCJ2Im (m = 0 to 19), set in the A/D converter scan group, is started.

(6) When the INTADCJ2ERR interrupt is generated as a result of A/D conversion, the wake-up factor WUTRG1 is generated and the CPU returns to RUN mode. The APO pin is driven high until the upper limit/lower limit error flag of the A/D converter is cleared to 0 by software.

NOTE

WUTRG1 is generated when the first ADCJ2 SG interrupt occurred after ADCJ2SGULCRx.UE or ADCJ2SGULCRx.LE is set.

Section 17 Serial Flash Memory Interface A (SFMA)

This section contains a generic description of the Serial Flash Memory Interface A (SFMA).

The first section describes all properties specific to the RH850/U2A-EVA, such as units, register base addresses, input/output signal names, etc.

The remainder of the section describes the function and registers of the SFMA.

17.1 Features SFMA of RH850/U2A-EVA

17.1.1 Number of Units and Channels

This microcontroller has the following number of SFMA units.

Table 17.1 Number of Channels

Product Name	RH850/U2A-EVA (516 pins)	RH850/U2A16 (516 pins)	RH850/U2A16 (373 pins)	RH850/U2A16 (292 pins)	RH850/U2A8 (373 pins)	RH850/U2A8 (292 pins)	RH850/U2A6 (292 pins)	RH850/U2A6 (176 pins)	RH850/U2A6 (156 pins)	RH850/U2A6 (144 pins)
Number of channels	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	—	—
Name	SFMAn									

Table 17.2 Index

Index	Description
n	Throughout this section, the individual SFMA units are identified by the index “n” (n = 0); for example, SFMAnCMNCR is the SFMAn common control register.

17.1.2 Register Base Address

SFMAn base address is listed in the following table.

SFMAn register addresses are given as offsets from the base address.

Table 17.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<SFMA0_base>	$1004\ 0000_H$	H-Bus Group 3

Note: Throughout this section, <SFMAn_base> is also same with <SFMA0_base> with index n = 0.

17.1.3 Clock Supply

The SFMAn clock supply is shown in the following table.

Table 17.4 Clock Supplies

Unit Name	Unit Clock Name	Supply Clock Name	Description
SFMAn	Bϕ	CLK_HSB	SFMAn clock
	Register access clock	CLK_HSB	SFMAn clock

17.1.4 Reset Sources

SFMAn reset sources are listed in the following table. SFMAn is initialized by these reset sources.

Table 17.5 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
SFMAn	All registers	√	√	√	√	√	√	—

17.1.5 External Input/Output Signals

External input/output signals of SFMAn are listed below.

Table 17.6 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
SFMA0		
SPBCLK	Clock output	SFMA0CLK
SPBSSL	Slave select signal output	SFMA0SSL
SPBMO/SPBIO0	Master transmit data/data 0	SFMA0IO0
SPBMI/SPBIO1	Master input data/data 1	SFMA0IO1
SPBIO2	Data 2	SFMA0IO2
SPBIO3	Data 3	SFMA0IO3

17.1.6 Interrupts and Error Notifications

SFMAn has no interrupts and DMA/DTS requests.

SFMAn has no error notifications.

17.2 Overview

17.2.1 Functional Overview

The Serial Flash Memory Interface outputs control signals to the serial flash memory connected to the SPI multi I/O bus space, thus enabling direct connection of the serial flash memory.

This module allows the connected serial flash memory to be accessed by directly reading the SPI multi I/O bus space, or using SPI operating mode to transmit and receive data.

- Serial Flash Memory Interface

  One serial flash memory device can be connected.

  A data bus size of 1 bit, 2 bits, or 4 bits can be selected.

- External Address Space Read Mode

  A maximum of 4-Gbyte address space is supported.

  The SPBSSL pin can be automatically controlled through access address monitoring.

  Efficient data reception due to built-in read cache (64-bit line × 16 entries).

- SPI Operating Mode

  Desired read/write access to serial flash memory is possible.

- Bit rate

  SPBCLK is generated by frequency division of Bϕ by the internal baud rate generator.

  SPBCLK frequency division ratio can be set from 2 to 4080.

- SPBSSL Pin Control

  Delay from SPBSSL signal assertion to SPBCLK operation (clock delay) can be set.
  Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

  Delay from SPBCLK stop to SPBSSL output negation (SPBSSL negation delay) can be set.
  Range: 1.5 to 8.5 SPBCLK cycles (set in SPBCLK-cycle units)

  SPBSSL output assertion wait before next access (next access delay) can be set.
  Range: 1 to 8 SPBCLK cycles (set in SPBCLK-cycle units)

  SPBSSL polarity can be changed.

17.3 Registers

17.3.1 List of Registers

SFMA registers are listed in the following table.

For details about <SFMAn_base>, see **Section 17.1.2, Register Base Address**.

Table 17.7 List of Registers

Module Name	Register Name	Symbol	Address size	Access size	Access Protection	
					HBG	Other
SFMAn	SFMAn Common control register	SFMAnCMNCR	<SFMAn_base> + 00_H	32	HBG96	—
SFMAn	SFMAn SSL delay register	SFMAnSSLDR	<SFMAn_base> + 04_H	32	HBG96	—
SFMAn	SFMAn Bit rate register	SFMAnSPBCR	<SFMAn_base> + 08_H	32	HBG96	—
SFMAn	SFMAn Data read control register	SFMAnDRCR	<SFMAn_base> + $0C_H$	32	HBG96	—
SFMAn	SFMAn Data read command setting register	SFMAnDRCMR	<SFMAn_base> + 10_H	32	HBG96	—
SFMAn	SFMAn Data read extended address setting register	SFMAnDREAR	<SFMAn_base> + 14_H	32	HBG96	—
SFMAn	SFMAn Data read option setting register	SFMAnDROPR	<SFMAn_base> + 18_H	32	HBG96	—
SFMAn	SFMAn Data read enable setting register	SFMAnDRENR	<SFMAn_base> + $1C_H$	32	HBG96	—
SFMAn	SFMAn SPI mode control register	SFMAnSMCR	<SFMAn_base> + 20_H	32	HBG96	—
SFMAn	SFMAn SPI mode command setting register	SFMAnSMCMR	<SFMAn_base> + 24_H	32	HBG96	—
SFMAn	SFMAn SPI mode address setting register	SFMAnSMADR	<SFMAn_base> + 28_H	32	HBG96	—
SFMAn	SFMAn SPI mode option setting register	SFMAnSMOPR	<SFMAn_base> + $2C_H$	32	HBG96	—
SFMAn	SFMAn SPI mode enable setting register	SFMAnSMENR	<SFMAn_base> + 30_H	32	HBG96	—
SFMAn	SFMAn SPI mode read data register	SFMAnSMRDR	<SFMAn_base> + 38_H	8, 16,32	HBG96	—
SFMAn	SFMAn SPI mode write data register	SFMAnSMWDR	<SFMAn_base> + 40_H	8, 16,32	HBG96	—
SFMAn	SFMAn Common status register	SFMAnCMNSR	<SFMAn_base> + 48_H	32	HBG96	—
SFMAn	SFMAn Data read dummy cycle setting register	SFMAnDRDMCR	<SFMAn_base> + 58_H	32	HBG96	—
SFMAn	SFMAn SPI mode dummy cycle setting register	SFMAnSMDMCR	<SFMAn_base> + 60_H	32	HBG96	—

17.3.2 SFMAnCMNCR — SFMAn Common Control Register

SFMAnCMNCR is a 32-bit register that controls the SPI multi-I/O bus controller. The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 00_H

Value after reset: $01AA\ 4000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MD	—	—	—	—	—	—	—	MOIIO3[1:0]		MOIIO2[1:0]		MOIIO1[1:0]		MOIIO0[1:0]	
Value after reset	0	0	0	0	0	0	0	1	1	0	1	0	1	0	1	0

Table 17.8 SFMAnCMNCR Register Contents (1/2)

Bit Position	Bit Name	Function
31	MD	Operating Mode Switch Switches the operating modes. 0: External address space read mode 1: SPI operating mode
30 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23, 22	MOIIO3[1:0]	SPBSSL Output Idle Value Fix SPBIO3 Fixes the output value of SPBIO3 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
21, 20	MOIIO2[1:0]	SPBSSL Output Idle Value Fix SPBIO2 Fixes the output value of SPBIO2 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
19, 18	MOIIO1[1:0]	SPBSSL Output Idle Value Fix SPBIO1 Fixes the output value of SPBIO1 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
17, 16	MOIIO0[1:0]	SPBSSL Output Idle Value Fix SPBIO0 Fixes the output value of SPBIO0 in SPBSSL negation period. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z

Table 17.8 SFMAnCMNCR Register Contents (2/2)

Bit Position	Bit Name	Function
15, 14	IO3FV[1:0]	SPBIO3 Fixed Value for 1-bit/2-bit Size Fixes the output value of SPBIO3 pin for 1-bit/2-bit size. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
13, 12	IO2FV[1:0]	SPBIO2 Fixed Value for 1-bit/2-bit Size Fixes the output value of SPBIO2 pin for 1-bit/2-bit size. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
11, 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	IO0FV[1:0]	SPBIO0 Fixed Value for 1-bit Size Input Fixes the output value of SPBIO0 pin for 1-bit size input. 00: Output value 0 01: Output value 1 10: Output value is kept at a preceding value. 11: Output value Hi-Z
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	CPHAT	Output Shift Sets the SPBCLK edge of the output data. CPHAT and CPHAR should be set according to the table in the description of CPHAR. 0: Data transmission at even edge 1: Data transmission at odd edge
5	CPHAR	Input Latch Sets the SPBCLK edge of the reception data. CPHAT and CPHAR should be set according to the following table. 0: Data reception at odd edge 1: Data reception at even edge
4	SSLP	SPBSSL Signal Polarity Sets the polarity of SPBSSL signal. 0: Active low SPBSSL signal 1: Active high SPBSSL signal
3	CPOL	SPBSSL Negation Period SPBCLK Output Direction Sets the SPBCLK output direction during SPBSSL negation period. 0: SPBCLK output is 0 during SPBSSL negation period. 1: SPBCLK output is 1 during SPBSSL negation period.
2 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CPHAT	CPHAR	
0	0	Setting enabled
0	1	Setting enabled
1	0	Setting prohibited
1	1	Setting enabled

17.3.3 SFMAnSSLDR — SFMAn SSL Delay Register

SFMAnSSLDR is a 32-bit register that adjusts the timing between the SPBSSL signal and the SPBCLK signal.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 04_H

Value after reset: $0007\ 0707_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	SPNDL[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLNDL[2:0]			—	—	—	—	—	SCKDL[2:0]		
Value after reset	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Table 17.9 SFMAnSSLDR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
18 to 16	SPNDL[2:0]	Next Access Delay Sets the period from transfer end to next transfer start (next access). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10 to 8	SLNDL[2:0]	SPBSSL Negation Delay Sets the period from the time the last SPBCLK edge is sent of a transfer to SPBSSL pin negation (SPBSSL negation delay). 000: 1.5 SPBCLK cycles 001: 2.5 SPBCLK cycles 010: 3.5 SPBCLK cycles 011: 4.5 SPBCLK cycles 100: 5.5 SPBCLK cycles 101: 6.5 SPBCLK cycles 110: 7.5 SPBCLK cycles 111: 8.5 SPBCLK cycles
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.9 SFMAnSSLDR Register Contents (2/2)

Bit Position	Bit Name	Function
2 to 0	SCKDL[2:0]	Clock Delay Sets the period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). 000: 1 SPBCLK cycle 001: 2 SPBCLK cycles 010: 3 SPBCLK cycles 011: 4 SPBCLK cycles 100: 5 SPBCLK cycles 101: 6 SPBCLK cycles 110: 7 SPBCLK cycles 111: 8 SPBCLK cycles

17.3.4 SFMAnSPBCR — SFMAn Bit Rate Register

SFMAnSPBCR is a 32-bit register that sets the bit rate.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 08_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPBR[7:0]								—	—	—	—	—	—	BRDV[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 17.10 SFMAnSPBCR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
15 to 8	SPBR[7:0]	Bit Rate Sets the bit rate. The bit rate is determined by a combination of these bits with the BRDV[1:0] bits. Setting SPBR[7:0] to 0 is prohibited. SPBR[7:0] needs to be changed to non-zero value before SPI communication starts.
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	BRDV[1:0]	Bit Rate Frequency Division Sets the bit rate. The bit rate is determined by a combination of these bits with the SPBR[7:0] bits. The SPBR value is used to set the base bit rate. The BRDV value is used to select a division ratio of the base bit rate from among no division, 2, 4, and 8. 00: Base bit rate 01: Base bit rate divided by 2 10: Base bit rate divided by 4 11: Base bit rate divided by 8

Bit Rate

SPBR[7:0] and BRDV[1:0] are used for setting the bit rate.
The following formula is used to calculate the bit rate when SPBR[7:0] ≠ 0.

$$\text{Bit rate} = B\phi / (2 \times n \times 2^N)$$

n: SPBR[7:0] setting (1, …, 255)

N: BRDV[1:0] setting (0 to 3)

17.3.5 SFMAnDRCR — SFMAn Data Read Control Register

SFMAnDRCR is a 32-bit register that sets the operation in external address space read mode.

The bits except the SSLN bit should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	SSLN	—	—	—	—	RBURST[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RCF	RBE	—	—	—	—	—	—	—	SSLE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	R/W	R	R	R	R	R	R	R	R/W

Table 17.11 SFMAnDRCR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	SSLN	SPBSSL Negation Asserted SPBSSL can be negated by writing 1 to this bit when both the RBE and SSLE bits are 1. This bit is always read as 0. **NOTE:** To start next access after SPBSSL negation using this bit, read SSLF in SFMAnCMNSR = 0 to confirm that the SPBSSL has been negated.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	RBURST[3:0]	Read Data Burst Length Sets the burst length (data unit count) when reading. This bit is enabled when the RBE bit is set to 1. 0000: 1 data unit 0001: 2 continuous data units : 1110: 15 continuous data units 1111: 16 continuous data units One data unit is 64 bits long.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	RCF	Read cache Flush When 1 is written to this bit, all the entries in the read cache are cleared. This bit is always read as 0. **NOTE:** After flushing the read cache by writing 1 to the RCF bit, read the SFMAnDRCR before proceeding to read from the external address space.
8	RBE	Read Burst Turns burst ON or OFF when reading. 0: Data is read according to the access size. 1: Read cache is enabled, and as many data units as the burst count specified in RBURST[3:0] bits is read.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.11 SFMAnDRCR Register Contents (2/2)

Bit Position	Bit Name	Function
0	SSLE	SPBSSL Negation Sets the conditions for SPBSSL negation during read burst. SPBSSL is negated for each access during normal read. 0: SPBSSL is negated after transfer of data set in burst length. 1: SPBSSL is negated when the accessed address is not continuous with the previously transferred address.

17.3.6 SFMAnDRCMR — SFMAn Data Read Command Setting Register

SFMAnDRCMR is a 32-bit register that sets the commands issued in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 10_H

Value after reset: $0003\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	OCMD[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.12 SFMAnDRCMR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

17.3.7 SFMAnDREAR — SFMAn Data Read Extended Address Setting Register

SFMAnDREAR is a 32-bit register that sets the address when the serial flash address is output in 32-bit mode.

The settings of this register should be changed when the TEND flag in CMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 14_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	EAV[5:0]						—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.13 SFMAnDREAR Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 17	EAV[5:0]	32-Bit Extended Upper Address Fixed Value Sets the serial flash address [31:26] fixed values to EAV[5:0]. This setting is valid when the ADE[3] bit in SFMAnDRENR is 1.
16 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

17.3.8 SFMAnDROPR — SFMAn Data Read Option Setting Register

SFMAnDROPR is a 32-bit register that sets the option data in external address space read mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 18_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPD3[7:0]								OPD2[7:0]

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPD1[7:0]								OPD0[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.14 SFMAnDROPR Register Contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

17.3.9 SFMAnDRENR — SFMAn Data Read Enable Setting Register

SFMAnDRENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and read data in external address space read mode and enables outputting them other than read data.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + $1C_H$

Value after reset: $0000\ 4700_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.15 SFMAnDRENR Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	CDB[1:0]	Command Bit Size Sets the command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
29, 28	OCDB[1:0]	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	ADB[1:0]	Address Bit Size Sets the address size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	OPDB[1:0]	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 17.15 SFMAnDRENR Register Contents (2/2)

Bit Position	Bit Name	Function
17, 16	DRDB[1:0]	Data Read Bit Size Sets the data read size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15	DME	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. **NOTE:** A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Be sure to use the following settings; otherwise, the operation is not guaranteed. 0000: Output disabled 0111: Address[23:0] 1111: Address[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

17.3.10 SFMAnSMCR — SFMAn SPI Mode Control Register

SFMAnSMCR is a 32-bit register that sets the operation in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	SSLKP	—	—	—	—	—	SPIRE	SPIWE	SPIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R/W	R/W	W

Table 17.16 SFMAnSMCR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8	SSLKP	SPBSSL Signal Level Determines the SPBSSL status after the end of transfer. 0: SPBSSL signal is negated at the end of transfer. 1: SPBSSL signal level is maintained from the end of transfer to the start of next access.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	SPIRE	Data Read Enable Enables reading in SPI operating mode. 0: Data reading disabled 1: Data reading enabled **NOTE:** When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
1	SPIWE	Data Write Enable Enables writing in SPI operating mode. 0: Data writing disabled 1: Data writing enabled **NOTE:** When the transfer data bit size is set to 2 bits or 4 bits with the SPIDB[1:0] bits, the SPIRE and SPIWE bits should not be set to 1 at the same time.
0	SPIE	SPI Data Transfer Enable Data is transferred by setting this bit to 1. This bit is enabled only when the TEND bit in SFMAnCMNSR is set to 1. The operation cannot be guaranteed when this bit is set to 1 with the TEND bit set to 0. This bit is always read as 0. **NOTE:** When the SPBSSL pin is de-asserted, the command, optional command, address, and option data that are output enabled are output even if the SPIRE and SPIWE bits are set to 0. When the SPBSSL pin is asserted, follow the notes described in **Section 17.5.2, Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode**.

17.3.11 SFMAnSMCMR — SFMAn SPI Mode Command Setting Register

SFMAnSMCMR is a 32-bit register that sets the commands issued in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	CMD[7:0]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.17 SFMAnSMCMR Register Contents

Bit Position	Bit Name	Function
31 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	CMD[7:0]	Command Sets the command.
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	OCMD[7:0]	Optional Command Sets the optional command.

17.3.12 SFMAnSMADR — SFMAn SPI Mode Address Setting Register

SFMAnSMADR is a 32-bit register that sets the addresses in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 28_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR[31:24]								ADR[23:16]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADR[15:0]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.18 SFMAnSMADR Register Contents

Bit Position	Bit Name	Function
31 to 24	ADR[31:24]	Address Sets the value of bits 31 to 24 when the serial flash address is output in 32-bit units. This setting is valid when ADE[3] in SFMAnSMENR is 1.
23 to 0	ADR[23:0]	Address Sets the address.

17.3.13 SFMAnSMOPR — SFMAn SPI Mode Option Setting Register

SFMAnSMOPR is a 32-bit register that sets the option data in SPI operating mode.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + $2C_H$

Value after reset: $0000\ 0000_H$

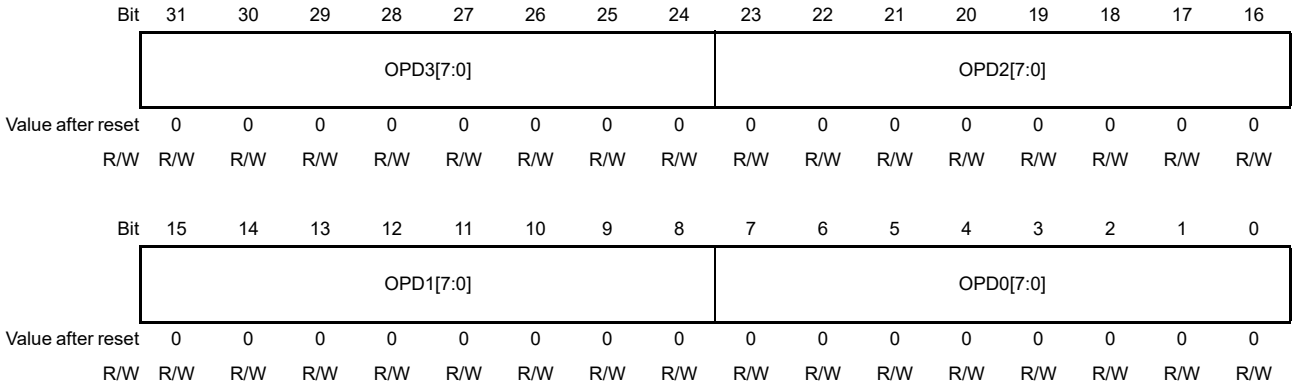

Table 17.19 SFMAnSMOPR Register Contents

Bit Position	Bit Name	Function
31 to 24	OPD3[7:0]	Option Data 3 Sets the option data 3.
23 to 16	OPD2[7:0]	Option Data 2 Sets the option data 2.
15 to 8	OPD1[7:0]	Option Data 1 Sets the option data 1.
7 to 0	OPD0[7:0]	Option Data 0 Sets the option data 0.

Note: OPD3, OPD2, OPD1, and OPD0 are output in this order.

17.3.14 SFMAnSMENR — SFMAn SPI Mode Enable Setting Register

SFMAnSMENR is a 32-bit register that sets the bit size of the command, optional command, address, option data, and transfer data in SPI operating mode and enables their output. SFMAnSMENR also enables dummy cycle insertion. Disabling all of the command, optional command, address, option data, dummy cycle, and transfer data is prohibited. At least one of them except dummy cycle must be enabled.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 30_H

Value after reset: 0000 4000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.20 SFMAnSMENR Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	CDB[1:0]	Command Bit Size Sets the command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
29, 28	OCDB[1:0]	Optional Command Bit Size Sets the optional command size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	ADB[1:0]	Address Bit Size Sets the address size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
23, 22	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
21, 20	OPDB[1:0]	Option Data Bit Size Sets the option data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited

Table 17.20 SFMAnSMENR Register Contents (2/2)

Bit Position	Bit Name	Function
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	SPIDB[1:0]	Transfer Data Bit Size Sets the transfer data size in bit units. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15	DME	Dummy Cycle Enable Enables insertion of the dummy cycle before the read data. **NOTE:** Dummy cycle insertion is prohibited for write in SPI operating mode including the case in which a transfer ends with a dummy cycle. **NOTE:** A setting is prohibited for a transfer starting with a dummy cycle. 0: Dummy cycle insertion disabled 1: Dummy cycle insertion enabled
14	CDE	Command Enable Sets the command to be output. 0: Command output disabled 1: Command output enabled
13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12	OCDE	Optional Command Enable Sets the optional command to be output. 0: Optional command output disabled 1: Optional command output enabled
11 to 8	ADE[3:0]	Address Enable Sets the address to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 0100: ADR[23:16] 0110: ADR[23:8] 0111: ADR[23:0] 1111: ADR[31:0] Other than above: Setting prohibited
7 to 4	OPDE[3:0]	Option Data Enable Sets the option data to be output. Use only the settings given below. Otherwise, the operation cannot be guaranteed. 0000: Output disabled 1000: OPD3 1100: OPD3, OPD2 1110: OPD3, OPD2, OPD1 1111: OPD3, OPD2, OPD1, OPD0 Other than above: Setting prohibited
3 to 0	SPIDE[3:0]	Transfer Data Enable Sets valid transfer data. The following settings must be used. Otherwise, the operation is not guaranteed. 0000: Not transferred 1000: 8 bits transferred (enables data at address 0 of the SPI mode read/write data register) 1100: 16 bits transferred (enables data at addresses 0 and 1 of the SPI mode read/write data register) 1111: 32 bits transferred (enables data at addresses 0 to 3 of the SPI mode read/write data register) Other than above: Setting prohibited

17.3.15 SFMAnSMRDR — SFMAn SPI Mode Read Data Register

SFMAnSMRDR is a 32-bit register that stores the read data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMAnSMENR). Be sure to access from address 0.

The settings of this register should be read when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: SFMAnSMRDR is a read-only register that can be read in 32-bit units.
SFMAnSMRDRL, SFMAnSMRDRH are read-only registers that can be read in 16-bit units.
SFMAnSMRDRLL, SFMAnSMRDRLH, SFMAnSMRDRHL, SFMAnSMRDRHH are read-only registers that can be read in 8-bit units.

Address: SFMAnSMRDR: <SFMAn_base> + 38_H
SFMAnSMRDRL: <SFMAn_base> + 38_H
SFMAnSMRDRLL: <SFMAn_base> + 38_H
SFMAnSMRDRLH: <SFMAn_base> + 39_H
SFMAnSMRDRH: <SFMAn_base> + $3A_H$
SFMAnSMRDRHL: <SFMAn_base> + $3A_H$
SFMAnSMRDRHH: <SFMAn_base> + $3B_H$

Value after reset: XXXX $XXXX_H$

Table 17.21 SFMAnSMRDR Register Contents

Bit Position	Bit Name	Function
31 to 0	RDATA[31:0]	Read Data Holds the data read in SPI operating mode.

Note: The contents of this register are modified upon completion of reception in SPI operating mode. Be sure to read data when reception in SPI operating mode is completed.

17.3.16 SFMAnSMWDR — SFMAn SPI Mode Write Data Register

SFMAnSMWDR is a 32-bit register that sets the write data in SPI operating mode.

Access to this register should be performed in the same size as the transfer size specified in the SPIDE[3:0] bits in the SPI mode enable setting register (SFMAnSMENR). Be sure to access from address 0.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: SFMAnSMWDR can be read or written in 32-bit units.
SFMAnSMWDRL, SFMAnSMWDRH can be read or written in 16-bit units.
SFMAnSMWDRLL, SFMAnSMWDRLH, SFMAnSMWDRHL, SFMAnSMWDRHH can be read or written in 8-bit units.

Address: SFMAnSMWDR: <SFMAn_base> + 40_H
SFMAnSMWDRL: <SFMAn_base> + 40_H
SFMAnSMWDRLL: <SFMAn_base> + 40_H

Bit Position	Bit Name	Function
31 to 0	WDATA[31:0]	Write Data Holds the data to be written in SPI operating mode.

17.3.17 SFMAnCMNSR — SFMAn Common Status Register

SFMAnCMNSR is a 32-bit register that holds flags indicating the operating state.

The settings of this register are reflected both in external address space read mode and SPI operating mode.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <SFMAn_base> + 48_H

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.23 SFMAnCMNSR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is returned.
1	SSLF	SPBSSL Pin Monitor 0: SPBSSL pin is negated 1: SPBSSL pin is asserted
0	TEND	Transfer End Flag Indicates whether the data transfer has ended. 0: Indicates that data transfer is in progress 1: Indicates that data transfer has ended

17.3.18 SFMAnDRDMCR — SFMAn Data Read Dummy Cycle Setting Register

SFMAnDRDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in external address space read mode.

The settings of this register are enabled when the DME bit in the data read enable setting register (SFMAnDRENR) is 1.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 58_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMDB[1:0]

Table 17.24 SFMAnDRDMCR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMAnCMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the data read enable setting register (SFMAnDRENR) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

17.3.19 SFMAnSMDMCR — SFMAn SPI Mode Dummy Cycle Setting Register

SFMAnSMDMCR is a 32-bit register that sets the size and number of dummy cycles to be inserted in SPI operating mode.

The settings of this register are enabled when the DME bit in the SPI mode enable setting register (SFMAnSMENR) is 1.

The settings of this register should be changed when the TEND flag in SFMAnCMNSR is 1; otherwise, the operation cannot be guaranteed.

Access: This register can be read or written in 32-bit units.

Address: <SFMAn_base> + 60_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMDB[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

	—	—	—	—	—	—	—	—	—	—	—	—	—	DMCYC[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 17.25 SFMAnSMDMCR Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17, 16	DMDB[1:0]	Dummy Cycle Bit Size Sets the dummy cycle size in bit units. The setting of these bits is combined with the setting of the IO0FV, IO2FV, and IO3FV bits in the common control register (SFMAnCMNCR) to determine the state of the unused pins during the dummy cycles. The state of the used pins is Hi-Z. 00: 1 bit 01: 2 bits 10: 4 bits 11: Setting prohibited
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 0	DMCYC[2:0]	Number of Dummy Cycles Sets the number of dummy cycles to be inserted when the DME bit in the SPI mode enable setting register (SFMAnSMENR) is 1. 000: 1 cycle 001: 2 cycles 010: 3 cycles 011: 4 cycles 100: 5 cycles 101: 6 cycles 110: 7 cycles 111: 8 cycles

17.4 Operation

17.4.1 System Configuration

With this module, one serial flash memory can be directly connected (data size of 1, 2, and 4 bits).

The example of system configuration is shown in **Figure 17.2**.

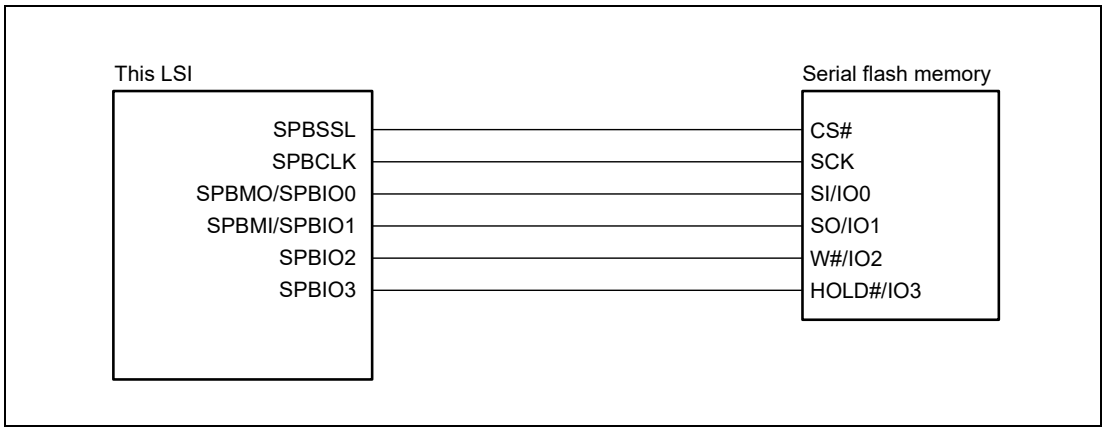

Figure 17.2 System Configuration Example with 4-Bit Data Size

17.4.2 Address Map

In external address space read mode, the serial flash connected is assigned in the SPI multi-I/O bus space. In combination with SFMAnDREAR, a maximum of 4 Gbytes can be accessed.

Table 17.26 Address Map

Internal Address	Max. Access Area
3800 0000_H to 3BFF $FFFF_H$	4 Gbytes

17.4.3 32-bit Serial Flash Addresses

Since the SPI multi-I/O bus space is 64 Mbytes, only a part of the 32-bit serial flash address area can be directly accessed. Here, the fixed value set in the pertinent register is used as the upper bit value of a 32-bit address.

To output serial flash addresses in 32 bits, set the ADE[3] bit in SFMAnDRENR to 1, and set the serial flash address[31:26] to the value of EAV[5:0] in SFMAnDREAR as a fixed value.

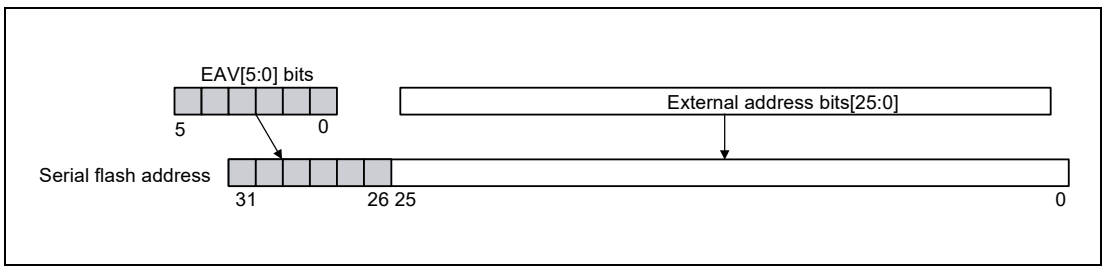

Figure 17.3 32-Bit Address Setting

17.4.4 Operating Modes

This module has two operating modes: external address space read mode and SPI operating mode.

In external address space read mode, a read access to the SPI multi-I/O bus space is converted into SPI communication and data is received. After data acquisition, data is returned to the bus master that is the issuing source. For details, see **Section 17.4.5, External Address Space Read Mode**.

In SPI operating mode, arbitrary SPI communication is carried out using register settings. For details, see **Section 17.4.8, SPI Operating Mode**.

17.4.5 External Address Space Read Mode

A read access to the SPI multi-I/O bus space can be converted into SPI communication in external address space read mode. Further, the commands, optional commands, option data, and dummy cycle issued for reading can be modified using registers.

In external address space read mode, either normal read operation or burst read operation can be selected. The transfer format is determined based on the common control register (SFMAnCMNCR), SSL delay register (SFMAnSSLDR), bit rate setting register (SFMAnSPBCR), data read control register (SFMAnDRCR), data read command setting register (SFMAnDRCMR), data read extended address setting register (SFMAnDREAR), data read option setting register (SFMAnDROPR), data read enable setting register (SFMAnDRENR), and data read dummy cycle setting register (SFMAnDRDMCR).

17.4.5.1 Normal Read Operation

When the RBE bit in SFMAnDRCR is set to 0, normal read operation is performed.

In the normal read operation, the data of 8 bits, 16 bits, and 32 bits are read for respectively a byte, a half-word, and a word read access. After reading, the SPBSSL pin is negated.

The normal read operation timing is shown in **Figure 17.4**.

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay), t2 is the time period from transmission of the last SPBCLK edge of a transfer to SPBSSL pin negation (SPBSSL negation delay), and t3 is the time period from one transfer end to the next transfer start (next access). For details of t1, t2, and t3, see **Section 17.4.9, Transfer Format**.

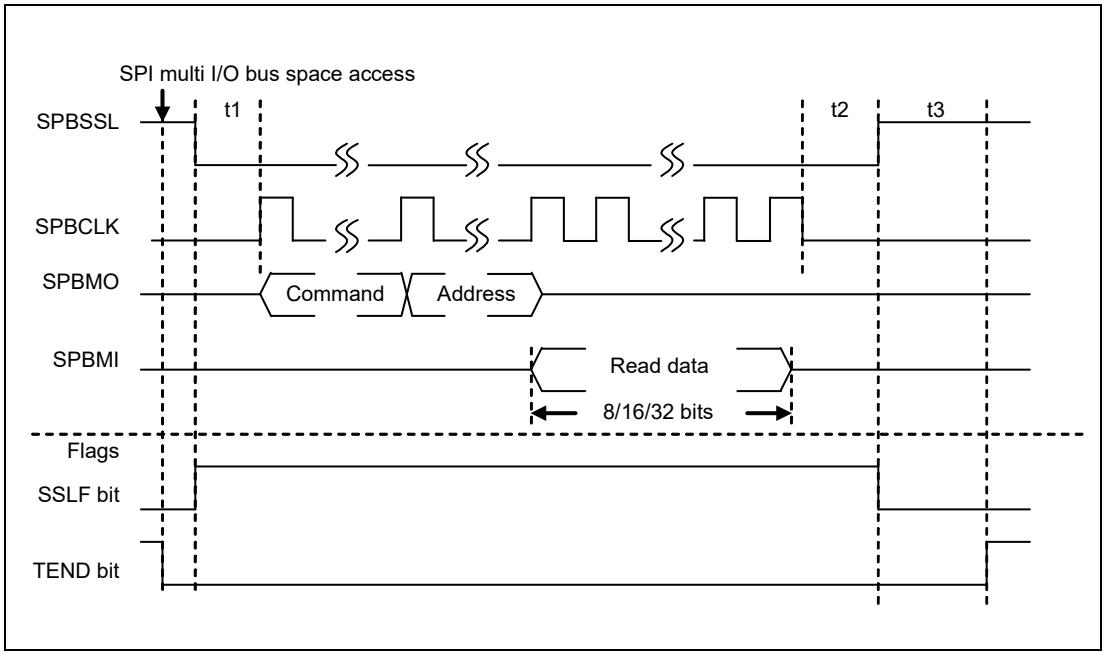

Figure 17.4 Normal Read Operation Timing

17.4.5.2 Burst Read Operation

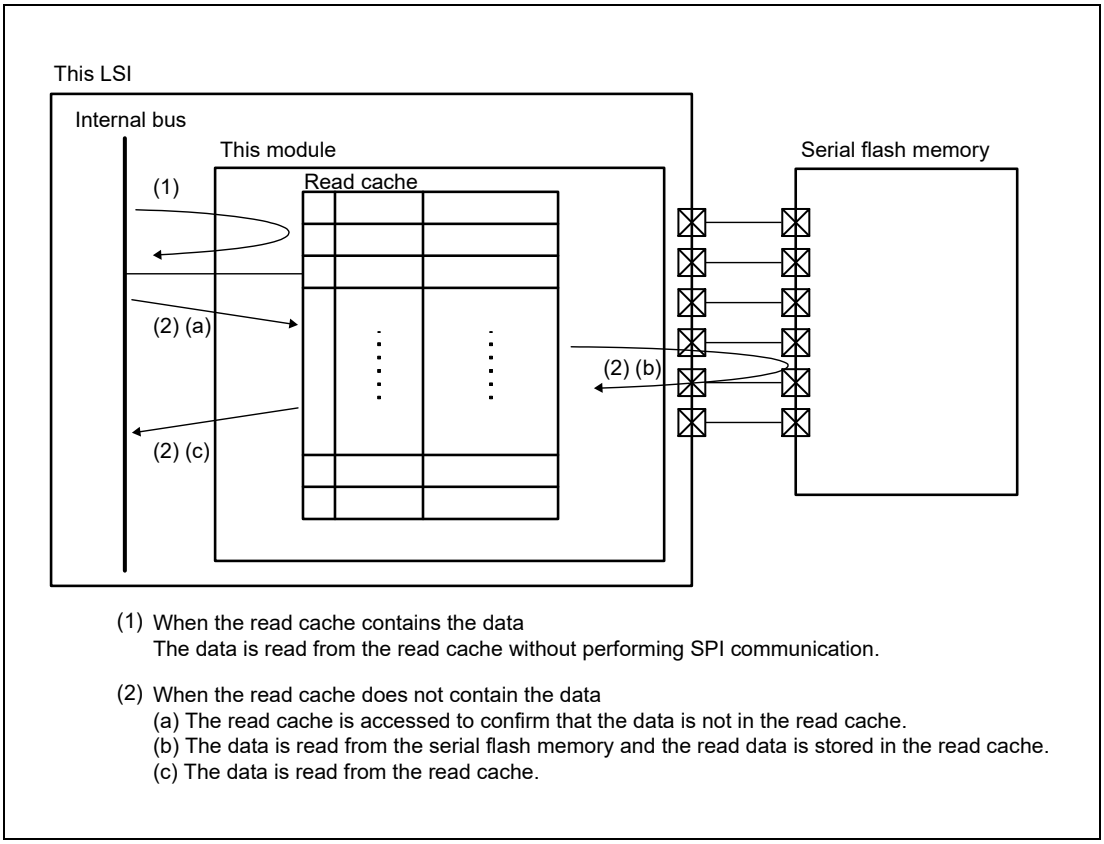
When the RBE bit in SFMAnDRCR is set to 1, burst read operation is performed.

Read cache is enabled in the burst read operation. For read cache operation, see **Section 17.4.7, Read Cache**.

For reading bytes, words, or longwords, the read cache is first referred to for the data. When the read cache contains the data, the data is read from the read cache without accessing the serial flash memory. When the read cache does not contain the data, burst read operation is performed in the serial flash memory and the read data is stored in the read cache. The data transfer length at that time is 64 bits × RBURST[3:0] bits and the data is always read from the 64-bit boundary.

The SPBSSL pin status after data transfer can be selected by using the SSLE bit in SFMAnDRCR. When the SSLE bit is set to 0, the SPBSSL pin is negated after data transfer. For an operation performed when the SSLE bit is set to 1, see **Section 17.4.5.3, Burst Read Operation with Automatic SPBSSL Negation**, just below.

A pattern diagram of this operation and a burst read operation timing diagram when SSLE bit is set to 0 are shown in **Figure 17.5** and **Figure 17.6**.



(1) When the read cache contains the data
The data is read from the read cache without performing SPI communication.

(2) When the read cache does not contain the data
(a) The read cache is accessed to confirm that the data is not in the read cache.
(b) The data is read from the serial flash memory and the read data is stored in the read cache.
(c) The data is read from the read cache.

Figure 17.5 Burst Read Operation

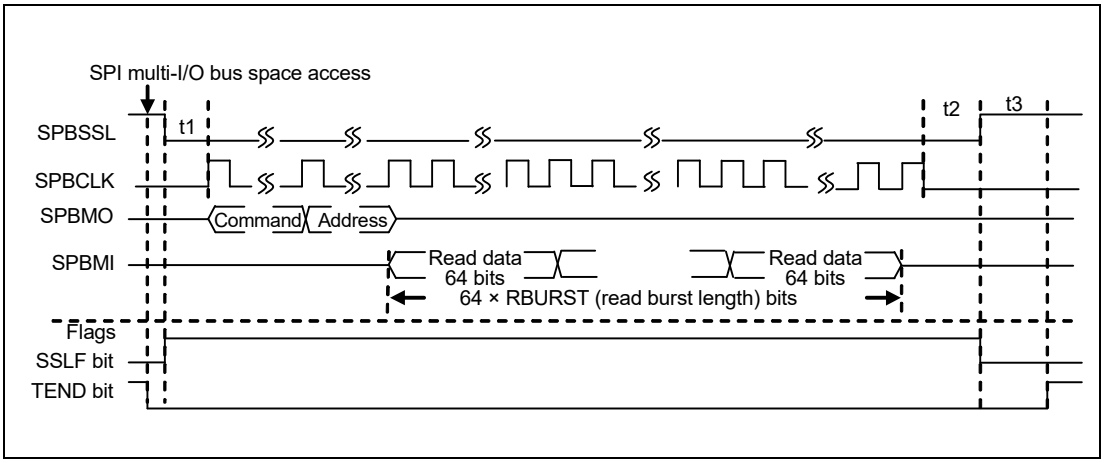


Figure 17.6 Burst Read Operation Timing (SSLE Bit = 0)

17.4.5.3 Burst Read Operation with Automatic SPBSSL Negation

When SSLE bit in SFMAnDRCR is set to 1, this module does not negate the SPBSSL pin after the burst read transfer. When accessing the next time, if the address is continuous with the previous read address, the burst read operation is performed without issuing the command, optional command, address, option data, or dummy cycle. If the address is not continuous with the previous read address, the SPBSSL pin is once negated and the burst read operation is performed after issuing the command, optional command, address, option data, or dummy cycle.

Burst read timing diagrams for continuous address and non-continuous address are shown in **Figure 17.7** and **Figure 17.8**.

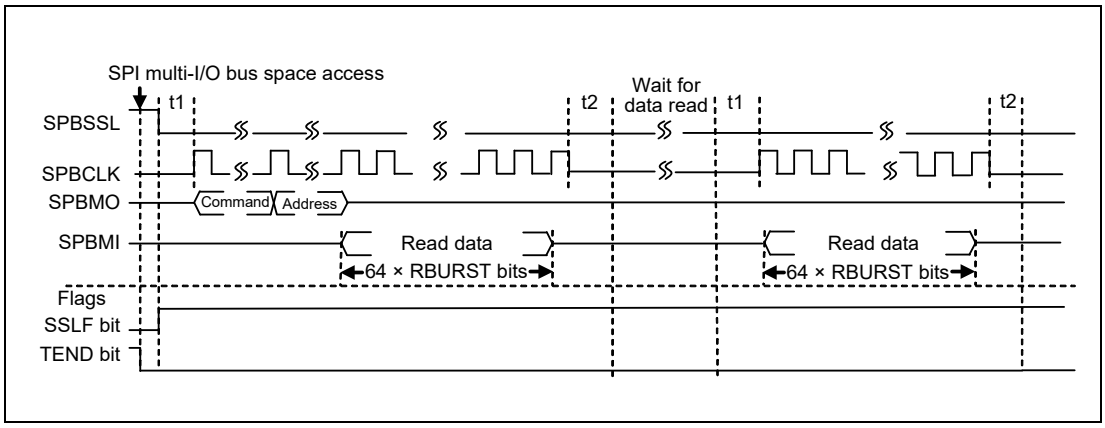

Figure 17.7 Burst Read Timing for Continuous Address (SSLE Bit = 1)

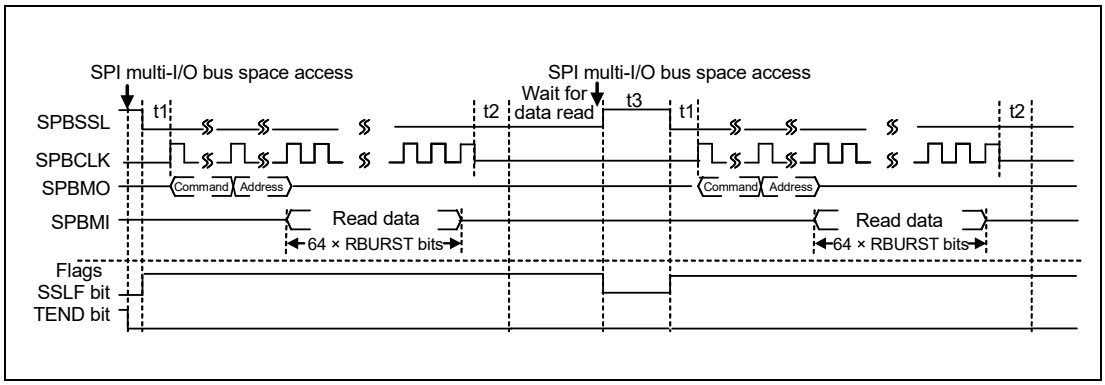

Figure 17.8 Burst Read Timing for Non-Continuous Address (SSLE Bit = 1)

For the next access after negation of the SPBSSL with the SSLN bit in SFMAnDRCR with this operation, read SSLF = 0 in SFMAnCMNSR to confirm that the SPBSSL has been negated.

17.4.6 Initial Setting Flow

An example of an initial setting flow in external address space read mode is shown in **Figure 17.9**.

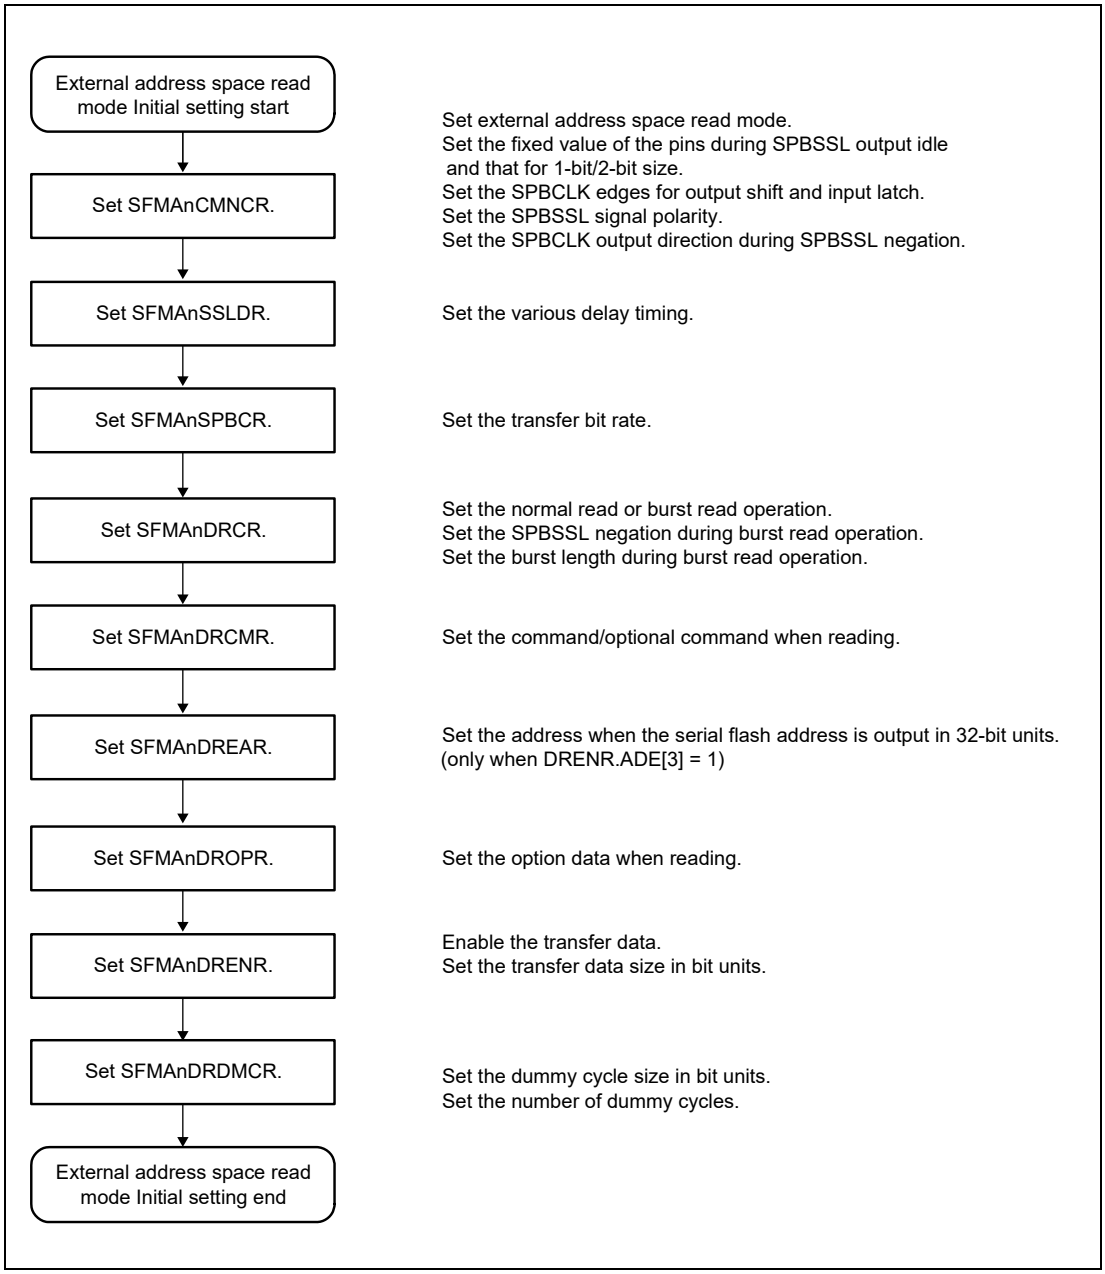

Figure 17.9 Example of Initial Setting Flow in External Address Space Read Mode

17.4.7 Read Cache

This module has a simple built-in read cache. The read cache can be used during external address space read mode and burst read operation. The read cache is configured with a line size of 64 bits and 16 entries.

Read cache configuration is shown in **Figure 17.10**.

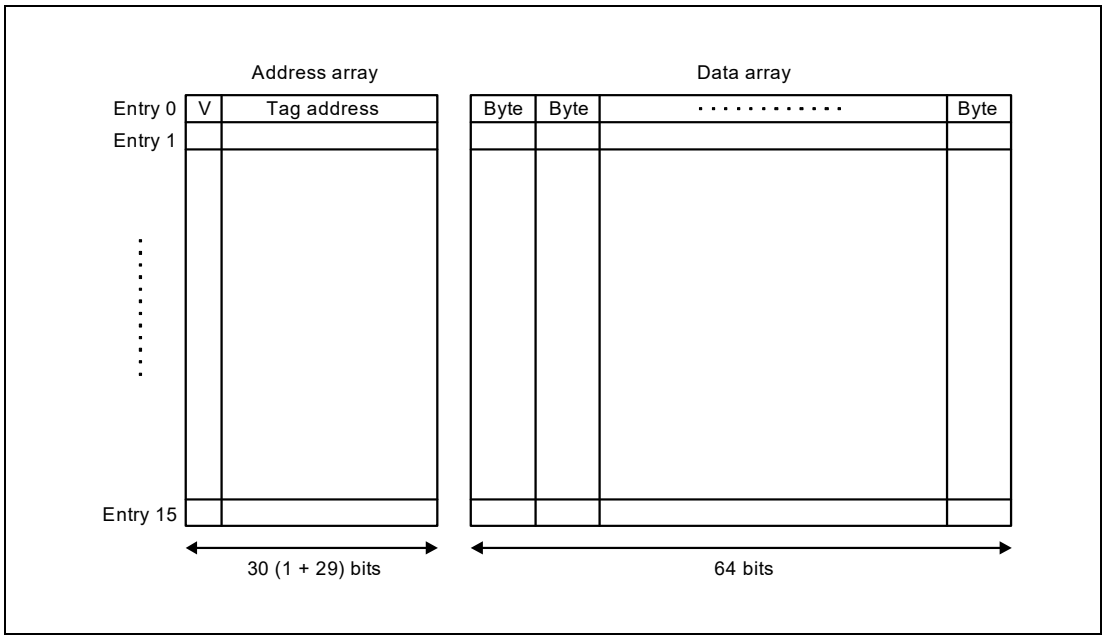

Figure 17.10 Read Cache Configuration

17.4.7.1 Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, the data is valid and when V bit is 0, the data is invalid.

The tag address bits hold the address used for the serial flash memory. Address bits 31 to 3 are used for the tag address.

Address bits 23 to 3 are enabled when address output is 24 bits.
Address bits 31 to 3 are enabled when address output is 32 bits.

17.4.7.2 Data Array

It retains the 64-bit read data. Registration in the read cache is performed in line units.

17.4.7.3 Read Operation

In case of read-hit, data is read from the read cache. In case of read-miss, after the 64 × RBURST (read burst length) data is read from the serial flash memory and the read cache is updated, the data is returned to the bus master.

17.4.7.4 Data Replacement

The write pointer is used to update data. In case of read-miss, the RBURST (read burst length) portion data is replaced starting at the entry specified by the write pointer. In other words, the data is replaced in the storage order of the data. Whether data is referred to or not will not affect the replacement order of data.

17.4.8 SPI Operating Mode

This module can carry out an arbitrary SPI operation by using the register settings.

The transfer format is determined based on the common control register (SFMAnCMNCR), SSL delay register (SFMAnSSLDR), bit rate setting register (SFMAnSPBCR), SPI mode control register (SFMAnSMCR), SPI mode command setting register (SFMAnSMCMR), SPI mode address setting register (SFMAnSMADR), SPI mode option setting register (SFMAnSMOPR), and SPI mode enable setting register (SFMAnSMENR), SPI mode read data register (SFMAnSMRDR), SPI mode write data register (SFMAnSMWDR), and SPI mode dummy cycle setting register (SFMAnSMDMCR).

SPI operating mode can be used for reading the status of the serial flash memory and writing to the serial flash memory.

In this mode, one transfer refers to the operation from when the SPIE bit in SFMAnSMCR is set to 1 when the TEND bit in SFMAnCMNSR is set to 1.

17.4.8.1 Transfer Start

The transfer of data is started in the set transfer format by setting the SPIE bit in SFMAnSMCR to 1. When write operation is enabled, the SPI mode write data register is transmitted to the serial flash memory. When read operation is enabled, data read from the serial flash memory is stored into the SPI mode read data register.

The SPI operation timing is shown in **Figure 17.11**.

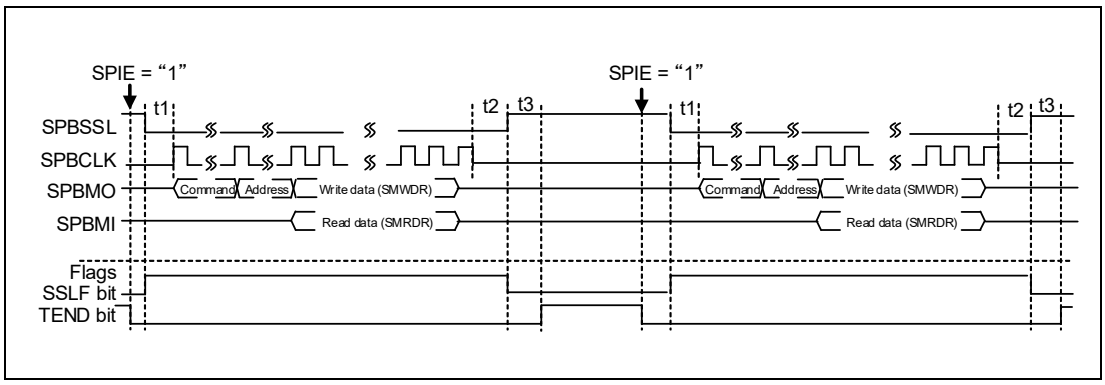

Figure 17.11 SPI Operation Timing

17.4.8.2 Read/Write Enable

- Read operation: Data can be read by setting the SPIRE bit in SFMAnSMCR to 1. The read data is stored into SFMAnSMRDR.
- Write operation: Data can be written by setting the SPIWE bit in SFMAnSMCR to 1. The data stored in SFMAnSMWDR is output.

When the data size is set to 1 bit using the SPIDB[1:0] bits in SFMAnSMENR, data can be transmitted and received by setting the SPIRE and SPIWE bits to 1. However, when the data size is set to 2 or 4 bits by using the SPIDB[1:0] bits, only one of the SPIRE and SPIWE bits should be enabled. The operation is not guaranteed if both the bits are enabled.

17.4.8.3 Retention of SPBSSL Pin Assertion

By setting the SSLKP bit in SFMAnSMCR to 1, assertion of the SPBSSL pin can be continued till the next transfer. With this function, the transfer can be carried out continuously with the SPBSSL kept in the asserted state.

The data transfer timing using the SSLKP bit is shown in **Figure 17.12**.

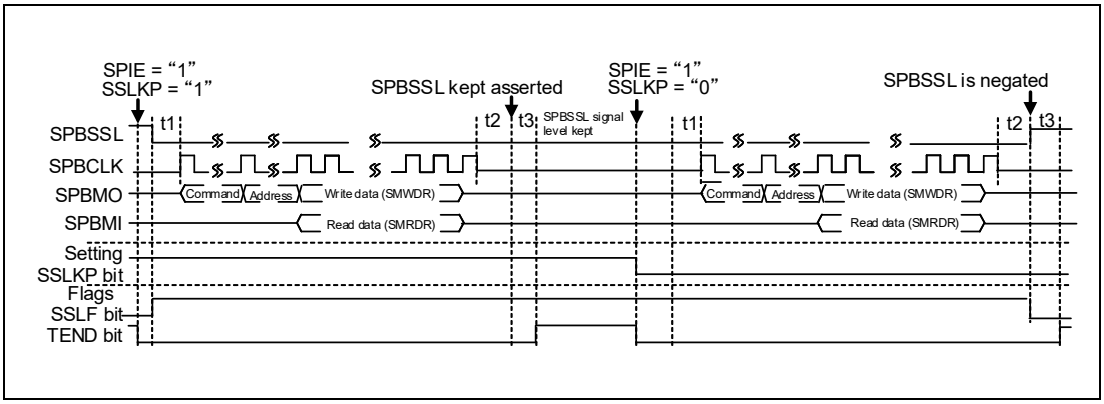

Figure 17.12 Data Transfer Timing using the SSLKP Bit

17.4.8.4 Initial Setting Flow

An example of an initial setting flow in SPI operating mode is shown in **Figure 17.13**.

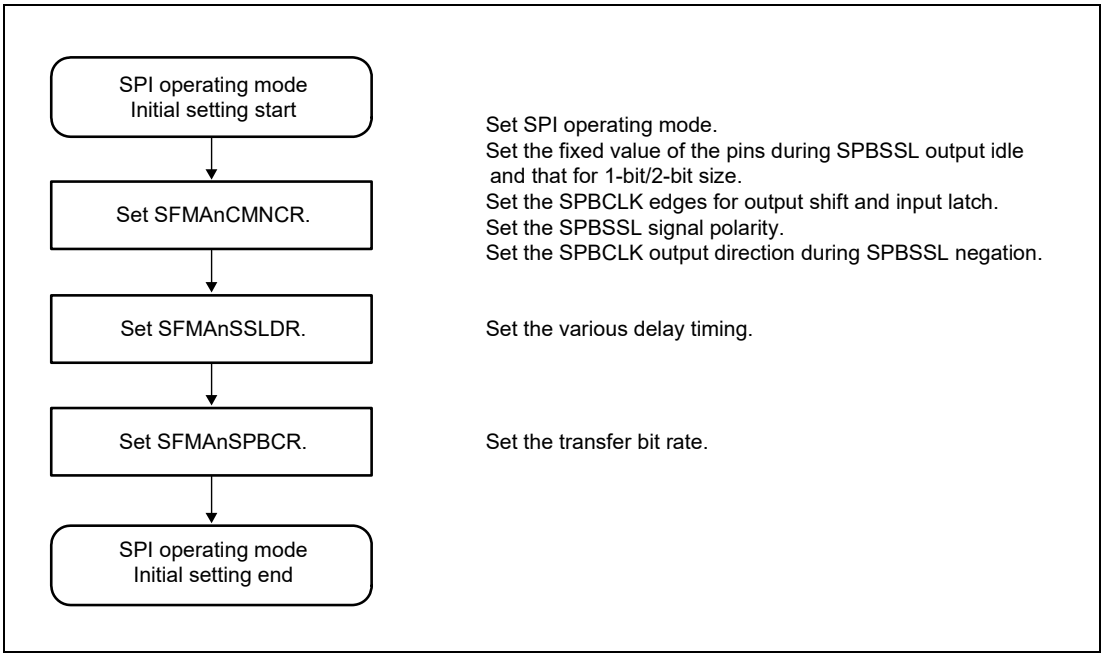

Figure 17.13 Example of Initial Setting Flow in SPI Operating Mode

17.4.8.5 Data Transfer Setting Flow

An example of a data transfer setting flow in SPI operating mode is shown in **Figure 17.14**.

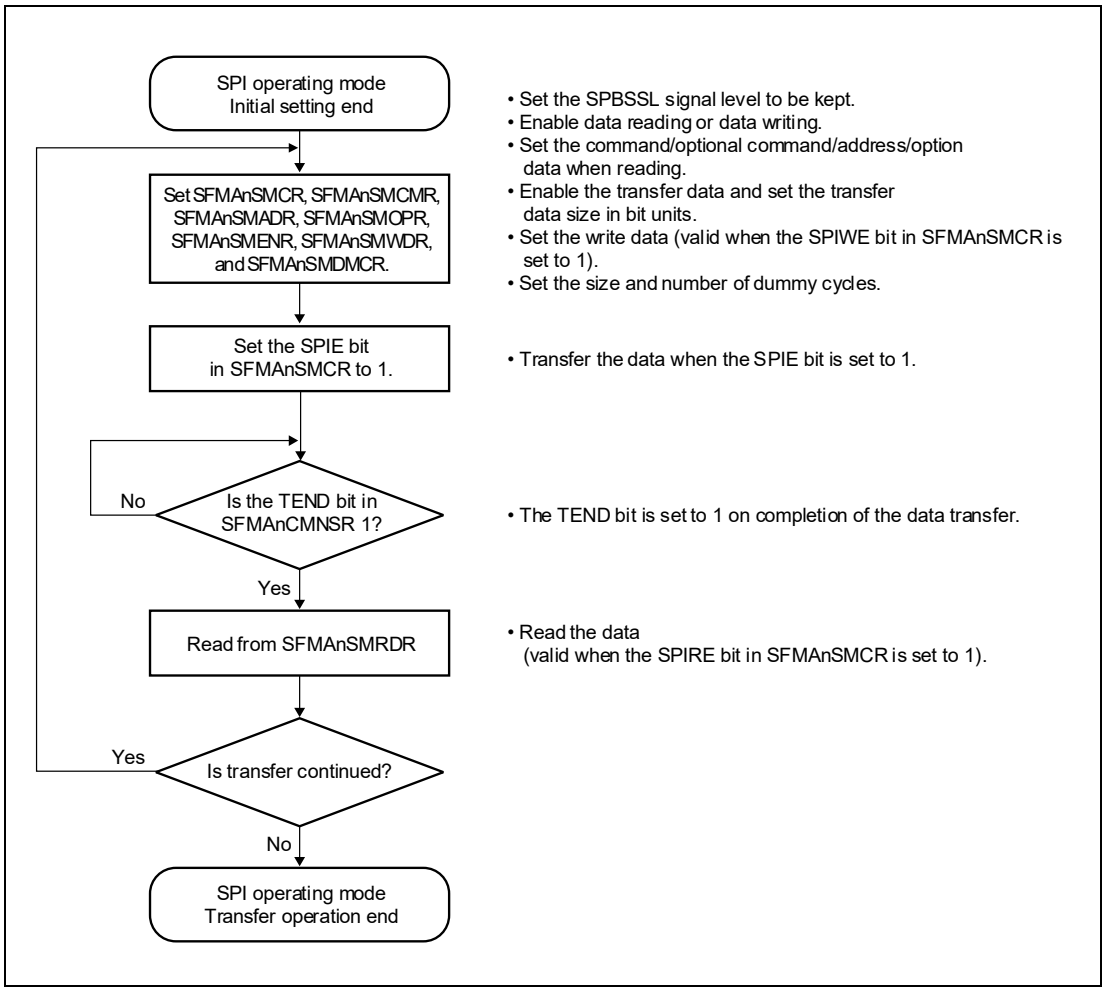

Figure 17.14 Example of a Data Transfer Setting Flow in SPI Operating Mode

17.4.9 Transfer Format

17.4.9.1 SPBSSL Pin Enable Polarity Control

The enable polarity of the SPBSSL pin can be changed with the SSLP bit in SFMAnCMNCR.

17.4.9.2 SPBCLK Output

The SPBCLK output direction during SPBSSL negation can be set with the CPOL bit in SFMAnCMNCR.

17.4.9.3 Data Transmission and Reception Timing

Data is transmitted and received at either the odd or even edges. The data transmission timing can be set to the odd or even edge with the CPHAT bit in SFMAnCMNCR. Similarly, the data reception timing can be set to the odd or even edge with the CPHAR bit in SFMAnCMNCR.

17.4.9.4 Delay Settings

t1 is the time period from SPBSSL pin assertion to SPBCLK oscillation (clock delay). It can be set with the SCKDL[2:0] bits in SFMAnSSLDR. t2 is the time period till the SPBSSL signal negation after the SPBCLK oscillation is stopped (SPBSSL negation delay). It can be set with the SLNDL[2:0] bits in SFMAnSSLDR. t3 is the time period required to prevent SPBSSL signal assertion for the next transfer after the end of the previous transfer (next access delay). It can be set with the SPNDL[2:0] bits in SFMAnSSLDR.

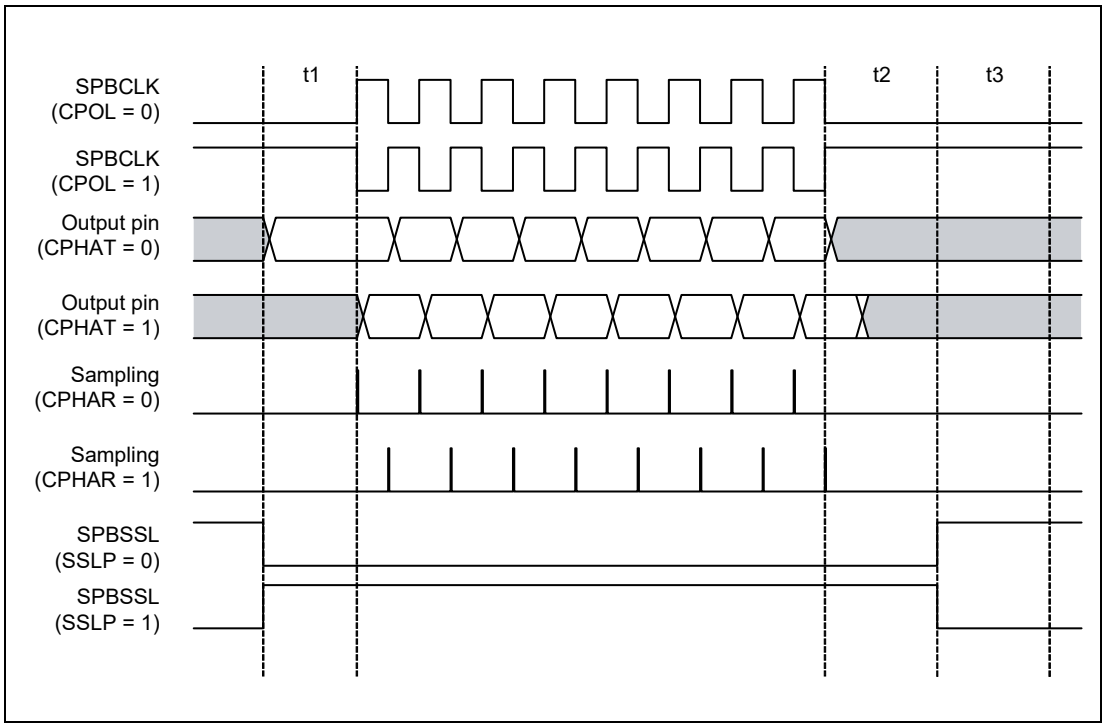

Figure 17.15 Transfer Format

17.4.10 Data Format

This module can input and output data in the order of command, optional command, address, option data, dummy cycle and data.

17.4.10.1 Data Registers

Table 17.27 shows the input and output data.

Table 17.27 Data Registers

Data	External Address Space Read Operation	SPI Operation
Command (8 bits)	CMD[7:0] bits in SFMAnDRCMR	CMD[7:0] bits in SFMAnSMCMR
Optional command (8 bits)	OCMD[7:0] bits in SFMAnDRCMR	OCMD[7:0] bits in SFMAnSMCMR
Address (32/24 bits)	32 bits: SFMAnDREAR.EAV[5:0] + lower [25:0] bits of the read address. 24 bits: Lower [23:0] bits of the read address	32 bits: ADR[31:0] bits in SFMAnSMADR 24 bits: ADR[23:0] bits in SFMAnSMADR
Option data (8 bits × 4)	SFMAnDROPR	SFMAnSMOPR
Dummy cycle (1 to 8 cycles)	SFMAnDRDMCR	SFMAnSMDMCR (only when read)
Transfer data	Normal read: 8, 16, and 32 bits Burst read: 64 × RBURST bits	Read: SFMAnSMRDR Write: SFMAnSMWDR

17.4.10.2 Data Enable

In external address space read mode, transfer enable or disable of the command, optional command, address, option data, and dummy cycle can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], and DME bits in SFMAnDRENR, respectively. The size and number of dummy cycles can be controlled with the data read dummy cycle setting register (SFMAnDRDMCR).

Similarly, in SPI operating mode, enable or disable of the command, optional command, address, option data, dummy cycle, and transfer data can be controlled with the CDE, OCDE, ADE[3:0], OPDE[3:0], DME, and SPIDE[3:0] bits in SFMAnSMENR, respectively. However, disabling all the above parameters is prohibited in SPI operating mode. At least one of them except dummy cycle must be enabled. The size and number of dummy cycles can be controlled with the SPI mode dummy cycle setting register (SFMAnSMDMCR).

For the address and option data in external address space read mode; and the address, option data, and transfer data in SPI operating mode, the enable bit setting allowed is determined according to the transfer data size. For the allowed setting combinations of the enable bits and transfer data size, refer to the description of the pertinent registers.

If data is disabled, that data is skipped, and input and output of the next data is carried out. The command, optional command, address, and option data are always output. During dummy cycles, the state of the used pins is Hi-Z. In external address space read mode, data is always input; and in SPI operating mode, input and output of data is determined based on the settings of the SPIRE and SPIWE bits in SFMAnSMCR.

There are some restrictions on dummy cycle insertion; refer to the description of the DME bits in SFMAnDRENR and SFMAnSMENR for details.

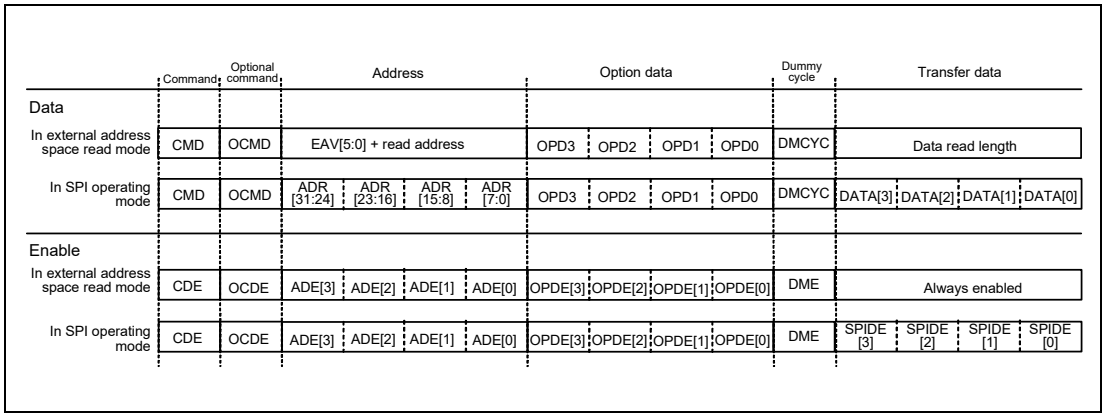

Figure 17.16 Data and Enable

17.4.10.3 Bit Size

In external address space read mode, the size of the command, optional command, address, option data, and the read data in bit units is respectively controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and DRDB[1:0] bits in SFMAnDRENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMAnDRDMCR.

Similarly, in SPI operating mode, the size of the command, optional command, address, option data, and read write data in bit units is controlled with the CDB[1:0], OCDB[1:0], ADB[1:0], OPDB[1:0], and SPIDB[1:0] bits in SFMAnSMENR. The size of the dummy cycle in bit units is also controlled with the DMDB[1:0] bits in SFMAnSMDMCR.

(1) 1-bit Size

When the size is set to 1 bit, SPBMI pin will be the input pin and SPBMO pin will be the output pin. SPBIO2 and SPBIO3 pins are not used.

Figure 17.17 shows the transfer format example.

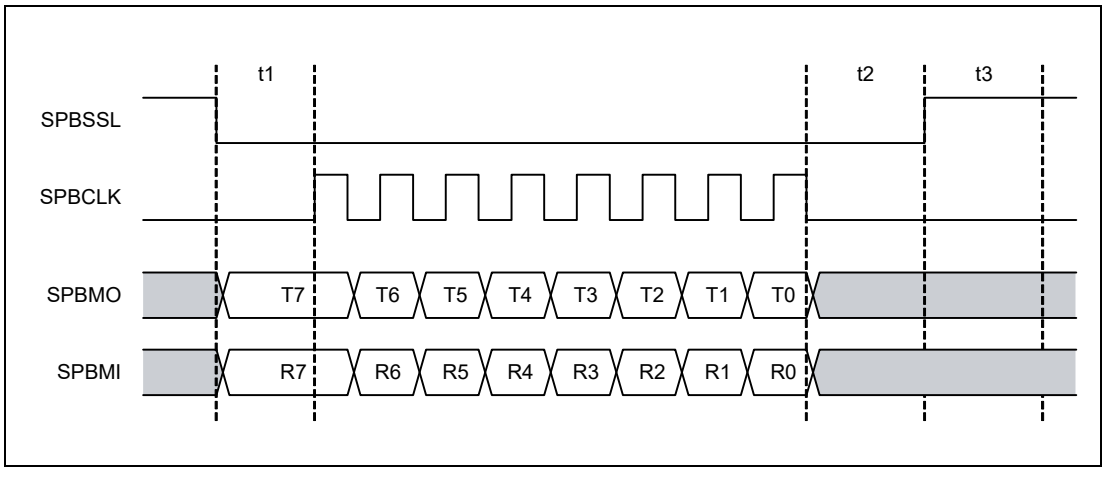

Figure 17.17 Transfer Format Example with 1-Bit Data Size

(2) 2-bit Size

When the size is set to 2 bits, SPBIO0 and SPBIO1 pins will be either the input pins or the output pins. SPBIO2 and SPBIO3 pins are not used.

Figure 17.18 shows the transfer format example.

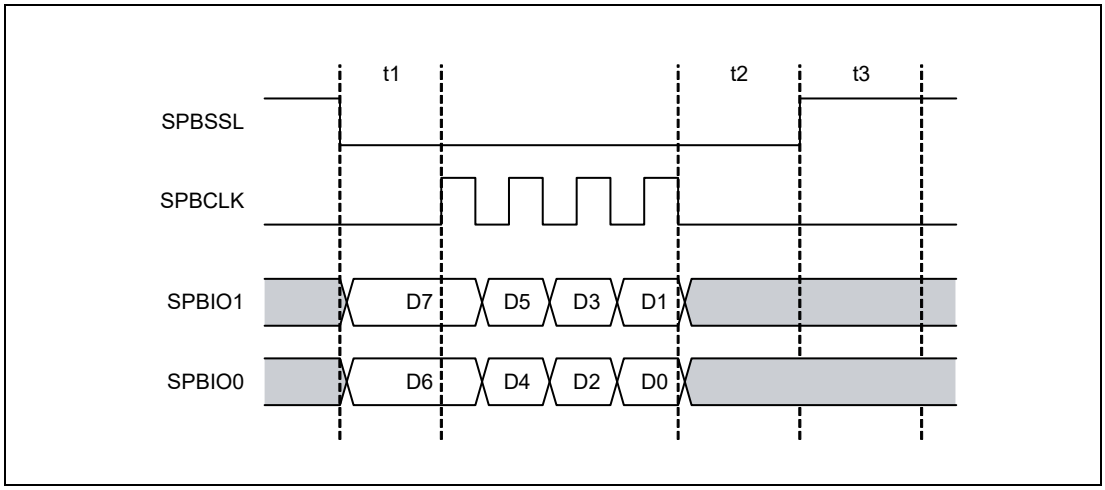

Figure 17.18 Transfer Format Example with 2-Bit Data Size

(3) 4-bit Size

When the size is set to 4 bits, SPBIO0, SPBIO1, SPBIO2, and SPBIO3 pins will be either the input pins or the output pins.

Figure 17.19 shows the transfer format example.

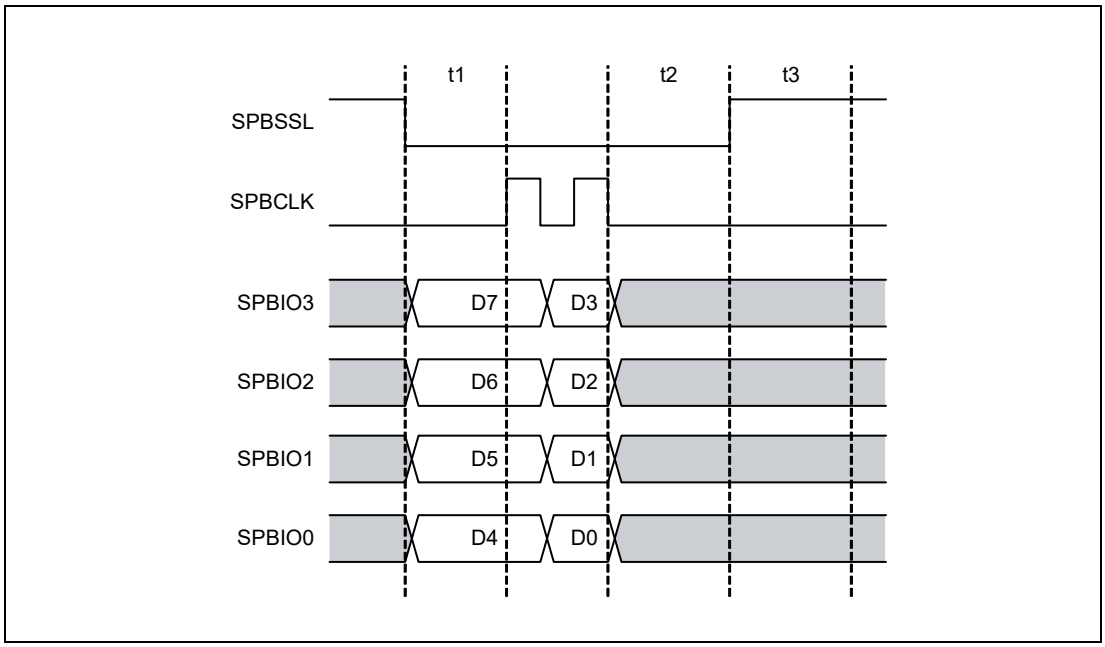

Figure 17.19 Transfer Format Example with 4-Bit Data Size

17.4.11 Data Pin Control

With this module, the status of pins can be automatically changed based on the data size to be used and the read/write settings. The pin status during the SPBSSL negation can be set with the MOIIO3, MOIIO2, MOIIO1, and MOIIO0 bits in SFMAnCMNCR. The SPBSSL and SPBCLK pins are always output pins. The status of respective pins is specified in **Table 17.28** to **Table 17.31**.

Table 17.28 Pin Status (1)

Pin	SPBSSL Negation	SPBSSL Assertion		
		Command, Optional Command, Address, Option Data		
		1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	MOIIO0 bit value	Output	Output	Output
SPBMI/SPBIO1	MOIIO1 bit value	Hi-Z	Output	Output
SPBIO2	MOIIO2 bit value	IO2FV bit value	IO2FV bit value	Output
SPBIO3	MOIIO3 bit value	IO3FV bit value	IO3FV bit value	Output

Table 17.29 Pin Status (2)

Pin	Transfer Data					
	External Address Space Read Operation			SPI Operation		
				SPIRE Bit = 1, SPIWE Bit = 0		
	1-bit Size	2-bit Size	4-bit Size	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Input	Input	IO0FV bit value	Input	Input
SPBMI/SPBIO1	Input	Input	Input	Input	Input	Input
SPBIO2	IO2FV bit value	IO2FV bit value	Input	IO2FV bit value	IO2FV bit value	Input
SPBIO3	IO3FV bit value	IO3FV bit value	Input	IO3FV bit value	IO3FV bit value	Input

Table 17.30 Pin Status (3)

Pin	Transfer Data					
	SPI Operation					
	SPIRE Bit = 0, SPIWE Bit = 1			SPIRE Bit = 1, SPIWE Bit = 1		
	1-bit Size	2-bit Size	4-bit Size	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	Output	Output	Output	Output	Setting prohibited	Setting prohibited
SPBMI/SPBIO1	Hi-Z	Output	Output	Input	Setting prohibited	Setting prohibited

SPBIO3	IO3FV bit value	IO3FV bit value	Output	IO3FV bit value	Setting prohibited	Setting prohibited

Table 17.31 Pin Status (4)

Pin	Dummy Cycle		
	1-bit Size	2-bit Size	4-bit Size
SPBMO/SPBIO0	IO0FV bit value	Hi-Z	Hi-Z
SPBMI/SPBIO1	Hi-Z	Hi-Z	Hi-Z
SPBIO2	IO2FV bit value	IO2FV bit value	Hi-Z
SPBIO3	IO3FV bit value	IO3FV bit value	Hi-Z

17.4.12 SPBSSL Pin Control

Negation conditions of the SPBSSL pin are as follows.

17.4.12.1 External Address Space Read Mode

(1) Normal read operation (RBE bit in SFMAnDRCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(2) Burst read without automatic SPBSSL negation (RBE bit in SFMAnDRCR = 1, SSLE bit in SFMAnDRCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(3) Burst read with automatic SPBSSL negation (RBE bit in SFMAnDRCR = 1, SSLE bit in SFMAnDRCR = 1)

- SPBSSL negated after t2 cycle when the read address is not continuous with the previously read address
- SPBSSL negated after the SSLN bit in SFMAnDRCR is set to 1

17.4.12.2 SPI Operating Mode

(1) SPBSSL pin assertion not retained (SSLKP bit in SFMAnSMCR = 0)
SPBSSL negated after completing the data transfer and t2 cycle.

(2) SPBSSL pin assertion retained (SSLKP bit in SFMAnSMCR = 1)
SPBSSL not negated.
When to be negated, data should be transferred after setting the SSLKP bit to 0.

17.4.13 Flags

This module has two flag bits SSLF and TEND in SFMAnCMNSR. These bits are read-only bits.

17.4.13.1 SSLF Bit

This bit indicates the SPBSSL pin status. The status is 1 when the SPBSSL is asserted, and the status is 0 when the SPBSSL is negated.

17.4.13.2 TEND Bit

This bit indicates whether transfer of data is in progress or the transfer of data has ended.

During t1 time period, data transfer, t2 time period, t3 time period, and waiting for read access by burst read and SPBSSL automatic negation, the TEND bit is read as 0 to indicate that the transfer of data is in progress.

When other than the above, the TEND bit is read as 1 to indicate that transfer of data has ended.

17.4.13.3 Register Re-writing Timing

The status of the TEND bit determines the rewritable registers.

The registers which can be written to, except the SSLN bit in SFMAnDRCR, should be modified when TEND = 1. Read SFMAnSMRDR when TEND = 1. SFMAnCMNSR can always be read.

17.5 Usage Notes

17.5.1 Notes on Transfer to Read Data in SPI Operating Mode

In SPI operating mode, take note of the following points for caution when setting the SPI mode enable setting register (SFMAnSMENR) to enable transfer only for reading data.

"Transfer only for reading data" indicates transfer to read data while the CDE, OCDE, ADE[3:0], and OPDE[3:0] bits in SFMAnSMENR are all 0.

17.5.1.1 Transfer to Read Data While the Signal on the SPBSSL Pin is de-asserted

Set the SFMAnSMENR.SPIDE[3:0] bits to 1100 or 1111 when transfer only for reading data is to proceed.

Transfer will not proceed normally if the setting of the SFMAnSMENR.SPIDE[3:0] bits is 1000.

17.5.1.2 Transfer to Read Data While the Signal on the SPBSSL Pin is Asserted

When transfer only for reading data is to proceed, set the SFMAnSMENR.SPIDE[3:0] bits to 1100 or 1111, or end the immediately preceding transfer with reading data.

When the immediately preceding transfer is of a command, optional command, address, or option data, or is transfer for writing data, the subsequent transfer only for reading data will not proceed normally if the setting of the SFMAnSMENR.SPIDE[3:0] bits is 1000.

17.5.2 Notes on Starting Transfer from the SPBSSL Retained State in SPI Operating Mode

Be sure to set the SPIWE bit in the SFMAnSMCR register to 1 when the transfer of a command, optional command, address, or option data is started while the SPBSSL pin is being asserted in SPI operating mode.

Section 18 Multi Media Card Interface A (MMCA)

This section contains a generic description of Multi Media Card Interface A (MMCA).

The first section describes all properties specific to the RH850/U2A-EVA, such as units, register base addresses, input/output signal names, etc.

The remainder of the section describes the functions and registers of the MMCA.

18.1 Features MMCA for RH850/U2A-EVA

18.1.1 Number of Units and Channels

This microcontroller has the following number of MMCA units.

Table 18.1 Number of Units

Product Name	RH850/U2A-EVA (516 pins)	RH850/U2A16 (516 pins)	RH850/U2A16 (373 pins)	RH850/U2A16 (292 pins)	RH850/U2A8 (373 pins)	RH850/U2A8 (292 pins)	RH850/U2A6 (292 pins)	RH850/U2A6 (176 pins)	RH850/U2A6 (156 pins)	RH850/U2A6 (144 pins)
Number of Units	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	1 (n = 0)	—	—
Name	MMCAn									

Table 18.2 Index

Index	Description
n	Throughout this section, the individual MMCA units are identified by the index “n” (n = 0); for example, MMCAnCE_CMD_SET is the MMCAn command setting register.

18.1.2 Register Base Addresses

MMCAn base address is listed in the following table.

MMCAn register addresses are given as an offset from the base address.

Table 18.3 Register Base Addresses

Base Address Name	Base Address	Bus Group
<MMCAn_base>	FFD5 5000_H	P-Bus Group 3

18.1.3 Clock Supply

The MMCAn clock supply is shown in the following table.

Table 18.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name	Description
MMCAn	MMCA module clock	CLK_HSB	MMCA module clock
	Register access clock	CLK_HSB	Bus clock

18.1.4 Interrupt Requests and Error Notifications

The MMCAn interrupts are listed in the following table.

Table 18.5 Interrupt and DMA/DTS Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number	DTS Trigger Number
MMCAn				
INTMMCA0	MMCA interrupt	696	—	—
DMAMMCA0	MMCA DMA request	—	Group0-191	Group1-45

This module has no error notifications.

18.1.5 Reset Sources

MMCAn reset sources are listed in the following table. MMCAn is initialized by these reset sources.

Table 18.6 Reset Sources

Unit Name	Register Name	Reset Condition						
		Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
MMCAn	All registers	√	√	√	√	√	√	—

18.1.6 External Input/Output Signals

External input/output signals of MMCAn are listed below.

Table 18.7 External Input/Output Signals

Unit Signal Name	Description	Alternative Port Pin Signal
MMCAn		
MMCA0CLK	MMCA Clock	MMCA0CLK
MMCA0CMD	MMCA Command / Response	MMCA0CMD
MMCA0DAT[7:0]	MMCA Data[7:0]	MMCA0DAT[7:0]

18.2 Overview

18.2.1 Functional Overview

- Compliant with JEDEC STANDARD JESD84-A441 (neither DDR mode nor 1.8-V operation is supported).
- Supports 1-/4-/8-bit MMC bus widths.
- Supports the backward-compatible mode.
- High-speed mode is supported.
- Supports the single data rate.
- MMC Clock frequency = MMCA module clock frequency/2^k (k = 1 to 10).
- Supports block transfer.
  Stream transfer is not supported.
- Supports boot operation.
  The alternative boot operation is not supported.
- MMC clock frequency settings are adjustable in the boot mode.
- Supports high priority interrupts (HPI).
  HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.
- Supports background operation.
- Interrupt requests: normal operation and error/timeout.
- DMA transfer requests: DMA or DTS can be used to read and write to the MMC interface buffer.

18.3 Registers

18.3.1 List of Registers

MMCA registers are listed in the following table.

For details on <MMCAn_base>, see **Section 18.1.2, Register Base Addresses**.

Table 18.8 List of Registers

Module	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
MMCAn	MMCAn Command Setting Register	MMCAnCE_CMD_SET	<MMCAn_base> + 00_H	32	PBG32#0	—
	MMCAn Argument Register	MMCAnCE_ARG	<MMCAn_base> + 08_H	32	PBG32#0	—
	MMCAn Argument Register for Automatically-Issued CMD12	MMCAnCE_ARG_CMD12	<MMCAn_base> + $0C_H$	32	PBG32#0	—
	MMCAn Command Control Register	MMCAnCE_CMD_CTRL	<MMCAn_base> + 10_H	32	PBG32#0	—
	MMCAn Transfer Block Setting Register	MMCAnCE_BLOCK_SET	<MMCAn_base> + 14_H	32	PBG32#0	—
	MMCAn Clock Control Register	MMCAnCE_CLK_CTRL	<MMCAn_base> + 18_H	32	PBG32#0	—
	MMCAn Buffer Access Configuration Register	MMCAnCE_BUF_ACC	<MMCAn_base> + $1C_H$	32	PBG32#0	—
	MMCAn Response Register 3	MMCAnCE_RESP3	<MMCAn_base> + 20_H	32	PBG32#0	—
	MMCAn Response Register 2	MMCAnCE_RESP2	<MMCAn_base> + 24_H	32	PBG32#0	—
	MMCAn Response Register 1	MMCAnCE_RESP1	<MMCAn_base> + 28_H	32	PBG32#0	—
	MMCAn Response Register 0	MMCAnCE_RESP0	<MMCAn_base> + $2C_H$	32	PBG32#0	—
	MMCAn Response Register for Automatically-Issued CMD12	MMCAnCE_RESP_CMD12	<MMCAn_base> + 30_H	32	PBG32#0	—
	MMCAn Data Register	MMCAnCE_DATA	<MMCAn_base> + 34_H	32	PBG32#0	—
	MMCAn Boot Operation Setting Register	MMCAnCE_BOOT	<MMCAn_base> + $3C_H$	32	PBG32#0	—
	MMCAn Interrupt Flag Register	MMCAnCE_INT	<MMCAn_base> + 40_H	32	PBG32#0	—
	MMCAn Interrupt Enable Register	MMCAnCE_INT_EN	<MMCAn_base> + 44_H	32	PBG32#0	—
	MMCAn Status Register 1	MMCAnCE_HOST_STS1	<MMCAn_base> + 48_H	32	PBG32#0	—
	MMCAn Status Register 2	MMCAnCE_HOST_STS2	<MMCAn_base> + $4C_H$	32	PBG32#0	—
	MMCAn Software Reset Register	MMCAnCE_SWRESA	<MMCAn_base> + $7C_H$	32	PBG32#0	—

18.3.2 MMCAnCE_CMD_SET — MMCAn Command Setting Register

MMCAnCE_CMD_SET sets a command sequence. For the setting values of MMCAnCE_CMD_SET, see **Section 18.4.4.13, Setting Values of MMCAnCE_CMD_SET**. The command sequence starts when the settings have been made in bits 31 to 16. Note that writing to MMCAnCE_CMD_SET is disabled while a command sequence is proceeding (the CMDSEQ bit in MMCAnCE_HOST_STS1 is 1).

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.9 MMCAnCE_CMD_SET Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30	BOOT	Boot Operations 0: Command sequence other than for boot operations 1: Command sequence for boot operations
29 to 24	CMD[5:0]	Command Index Set a command index ([45:40]).
23, 22	RTYP[1:0]	Response Type 00: No response 01: 6-byte response (R1, R1b, R3, R4, R5) 10: 17-byte response (R2) 11: Setting prohibited
21	RBSY	Response Busy Select Selects whether "busy" is involved in response reception. 0: No response busy 1: Response busy involved (R1b)
20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19	WDAT	Presence/Absence of Data 0: No data 1: With data
18	DWEN	Read/Write (valid when “with data” is selected) 0: Read from card 1: Write to card
17	CMLTE	Single/Multi Block Transfer Select (valid when “with data” is selected) 0: Single-block transfer 1: Multi-block transfer

Table 18.9 MMCAnCE_CMD_SET Register Contents (2/2)

Bit Position	Bit Name	Function
16	CMD12EN	Automatic CMD12 Issuance (valid when multi-block transfer is selected) *1 0: Disables automatic CMD12 issuance 1: Enables automatic CMD12 issuance For details of automatic CMD12 issuance, see **Section 18.4.3.4, Automatic CMD12 Issuance**. Note : Set the transfer block size to 512 bytes. Set the RBSY bit to 0.
15, 14	RIDXC[1:0]	Response Index Check Specify the items to be checked in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. 00: Checks the response index (check whether matched with a command index) 01: Checks the check bits (check whether all the bits are set to 1) 10: No checking 11: Setting prohibited
13, 12	RCRC7C[1:0]	Response CRC7 Check Specify the items to be checked in bits [7:1] of a 6-byte response or of a 17-byte response. 00: Checks CRC7 (set the response type to 01). 01: Checks the check bits (check whether all the bits are set to 1) (set the response type to 01). 10: Checks internal CRC7 (R2 only) (set the response type to 10). 11: No checking
11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	CRC16C	CRC16 Check in Reception (valid when “with data” and “read” are selected) 0: Checks CRC16 in reception. 1: Does not check CRC16 in reception (used when CMD14).
9	BOOTACK	Receive Boot Acknowledge (valid in boot mode) 0: Boot acknowledge is not received. 1: Boot acknowledge is received.
8	CRCSTE	CRC Status Reception (valid when “with data” and “write” are selected) 0: Receives CRC status. 1: Does not receive CRC status (used when CMD19).
7	TBIT	Transmission Bit Setting 0: Sets the transmission bit ([46]) to 1. 1: Sets the transmission bit ([46]) to 0.
6	OPDM	Open-Drain Output Mode 0: Normal output 1: Open-drain output This setting is only applied to the MMCAnCMD line.
5, 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	SBIT	Read Data Start Bit Detection Setting (valid when “with data” and “read” are selected) 0: Detects a start bit when the valid MMCAnDAT signals specified by the DATW bits are all 0. 1: Detects a start bit when MMCAnDAT[0] is 0.
2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1, 0	DATW[1:0]	Data Bus Width Setting (valid when “with data” is selected) 00: 1 bit 01: 4 bits 10: 8 bits 11: Setting prohibited

Note 1. It is recommended to use the pre-defined multi-block transfer by setting this bit to 0 for a higher data transfer rate.

18.3.3 MMCAnCE_ARG — MMCAn Argument Register

MMCAnCE_ARG sets the argument for the command to be transmitted. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 08_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARG[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ARG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.10 MMCAnCE_ARG Register Contents

Bit Position	Bit Name	Function
31 to 0	ARG[31:0]	Set bits [39:8] of the command. Note : Set the argument of automatically-issued CMD12 by MMCAnCE_ARG_CMD12.

18.3.4 MMCAnCE_ARG_CMD12 — MMCAn Argument Register for Automatically-Issued CMD12

MMCAnCE_ARG_CMD12 is used to set the argument for the automatically-issued CMD12. This register is valid when issuing CMD12 automatically in multi-block transfer. For automatic issuance of CMD12, see **Section 18.4.3.4, Automatic CMD12 Issuance**. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	C12ARG[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	C12ARG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.11 MMCAnCE_ARG_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	C12ARG[31:0]	Set bits [39:8] of the automatically-issued CMD12.

18.3.5 MMCAnCE_CMD_CTRL — MMCAn Command Control Register

MMCAnCE_CMD_CTRL is used to terminate a command sequence forcibly.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 10_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BREAK
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 18.12 MMCAnCE_CMD_CTRL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	BREAK	Forcible Termination of Command Sequence Writing 1 to this bit while it is 0 and then writing 0 to it discontinues the current command sequence. After this bit is set as described above, check if the value of the CMDSEQ bit in MMCAnCE_HOST_STS1 has become 0. If this is the case, execute software reset. Note : A software reset initializes the value of this register, so the setting in this register needs to be remade.

18.3.6 MMCAnCE_BLOCK_SET — MMCAn Transfer Block Setting Register

MMCAnCE_BLOCK_SET specifies the size of the block and the number of blocks for the data to be transferred. Set this register before starting a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 14_H

Value after reset: 0000 0200_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BLKCNT[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BLKSIZ[15:0]															
Value after reset	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.13 MMCAnCE_BLOCK_SET Register Contents

Bit Position	Bit Name	Function
31 to 16	BLKCNT[15:0]	Number of Blocks for Transfer Note : This setting is valid for multi-block transfer.
15 to 0	BLKSIZ[15:0]	Transfer Block Size Note : Transfer block size should be set as follows. Single-block transfer: 1 to 512 bytes Multi-block transfer: 512 bytes

18.3.7 MMCAnCE_CLK_CTRL — MMCAn Clock Control Register

MMCAnCE_CLK_CTRL controls the MMC clock and sets timeout values. Do not change the setting of this register while a command sequence is in progress.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 18_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MMCBUSBSY	—	—	—	—	—	—	CLKEN	—	—	—	—	CLKDIV[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	SRSPTO[1:0]		SRBSYTO[3:0]				SRWDTO[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 18.14 MMCAnCE_CLK_CTRL Register Contents (1/2)

Bit Position	Bit Name	Function
31	MMCBUSBSY	MMC Clock Output control / Division setting prohibition 0: MMC bus is not busy (During the command sequence + 10 cycle) 1: MMC bus is busy (During the command sequence + 10 cycle) When a command sequence is started with MMCAnCE_CMD_SET register setting, MMCBUSBSY bit is set to 1 at the same time as CMDSEQ bit is set to 1. After CMDSEQ bit is set to 0 at the command sequence end, MMCBUSBSY bit becomes 0 after 10 cycle of MMCAnCLK. Note: When MMC bus is busy, do not set CLKEN bit and the CLKDIV bit of the MMCAnCE_CLK_CTRL register.
30 to 25	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
24	CLKEN	MMC Clock Output Control 0: Does not output the MMC clock (fixed to low level). 1: Outputs the MMC clock.
23 to 20	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
19 to 16	CLKDIV[3:0]	MMC Clock Frequency Setting 0000: MMCA module clock/2^1 0001: MMCA module clock/2^2 : 0111: MMCA module clock/2^8 1000: MMCA module clock/2^9 1001: MMCA module clock/2^{10} 1010 to 1111: Setting prohibited For details of MMC clock frequency settings in boot operations, see **Section 18.4.3.5, MMC Clock Frequency in Boot Operations** and **Section 18.3.12, MMCAnCE_BOOT — MMCAn Boot Operation Setting Register**.
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13, 12	SRSPTO[1:0]	Response Timeout Setting 00: 64 MMC clock cycles 01: 128 MMC clock cycles 10: 256 MMC clock cycles 11: Setting prohibited

Table 18.14 MMCAnCE_CLK_CTRL Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 8	SRBSYTO[3:0]	Response Busy Timeout Setting 0000: MMC clock cycles × 2^{14} 0001: MMC clock cycles × 2^{15} 0010: MMC clock cycles × 2^{16} 0011: MMC clock cycles × 2^{17} 0100: MMC clock cycles × 2^{18} 0101: MMC clock cycles × 2^{19} 0110: MMC clock cycles × 2^{20} 0111: MMC clock cycles × 2^{21} 1000: MMC clock cycles × 2^{22} 1001: MMC clock cycles × 2^{23} 1010: MMC clock cycles × 2^{24} 1011: MMC clock cycles × 2^{25} 1100: MMC clock cycles × 2^{26} 1101: MMC clock cycles × 2^{27} 1110: MMC clock cycles × 2^{28} 1111: MMC clock cycles × 2^{29}
7 to 4	SRWDTO[3:0]	Write Data/Read Data Timeout Setting 0000: MMC clock cycles × 2^{14} 0001: MMC clock cycles × 2^{15} 0010: MMC clock cycles × 2^{16} 0011: MMC clock cycles × 2^{17} 0100: MMC clock cycles × 2^{18} 0101: MMC clock cycles × 2^{19} 0110: MMC clock cycles × 2^{20} 0111: MMC clock cycles × 2^{21} 1000: MMC clock cycles × 2^{22} 1001: MMC clock cycles × 2^{23} 1010: MMC clock cycles × 2^{24} 1011: MMC clock cycles × 2^{25} 1100: MMC clock cycles × 2^{26} 1101: MMC clock cycles × 2^{27} 1110: MMC clock cycles × 2^{28} 1111: MMC clock cycles × 2^{29}
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.8 MMCAnCE_BUF_ACC — MMCAn Buffer Access Configuration Register

MMCAnCE_BUF_ACC configures the method of accessing data registers and mode of DMA transfer. Do not set this register again during a command sequence. For explanation of the buffers, see **Section 18.4.3.3, Buffer Structure and Buffer Access**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $1C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	DMATYP	DMAWEN	DMAREN	—	—	—	—	—	—	—	ATYP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.15 MMCAnCE_BUF_ACC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	DMATYP	DMA Transfer setting When DMAWEN or DMAREN is set to 1, set to 1.
25	DMAWEN	Buffer Write DMA Transfer Request Enable 0: Disables DMA transfer request for buffer writing. 1: Enables DMA transfer request for buffer writing.
24	DMAREN	Buffer Read DMA Transfer Request Enable 0: Disables DMA transfer request for buffer reading. 1: Enables DMA transfer request for buffer reading.
23 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	ATYP	Buffer access selection 0: When not swapped byte-wise. 1: When swapped byte-wise. Note : For buffer access, refer to **18.4.3.3, Buffer Structure and Buffer Access**.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.9 MMCAnCE_RESP3 to MMCAnCE_RESP0 — MMCAn Response Registers 3 to 0

MMCAnCE_RESP3 to MMCAnCE_RESP0 are the registers in which the response that has been received is stored. For the formats of response values, see **Section 18.4.3.1, Command/Response Formats**.

Access: This register is a read-only register that can be read in 32-bit units.

Address: MMCAnCE_RESP3: <MMCAn_base> + 20_H
MMCAnCE_RESP2: <MMCAn_base> + 24_H
MMCAnCE_RESP1: <MMCAn_base> + 28_H
MMCAnCE_RESP0: <MMCAn_base> + $2C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMCAnCE_RESP3

Table 18.16 MMCAnCE_RESP3 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[127:96]	Bits [127:96] of a 17-byte response are stored.

MMCAnCE_RESP2

Table 18.17 MMCAnCE_RESP2 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[95:64]	Bits [95:64] of a 17-byte response are stored.

MMCAnCE_RESP1

Table 18.18 MMCAnCE_RESP1 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[63:32]	Bits [63:32] of a 17-byte response are stored.

MMCAnCE_RESP0

Table 18.19 MMCAnCE_RESP0 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP[31:0]	Bits [39:8] of a 6-byte response or bits [31:0] of a 17-byte response are stored. Note : The response to an automatically issued CMD12 is stored in the MMCAnCE_RESP_CMD12 register.

18.3.10 MMCAnCE_RESP_CMD12 — MMCAn Response Register for Automatically-Issued CMD12

MMCAnCE_RESP_CMD12 is a register in which the response to the automatically-issued CMD12 is stored.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MMCAn_base> + 30_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RSP12[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.20 MMCAnCE_RESP_CMD12 Register Contents

Bit Position	Bit Name	Function
31 to 0	RSP12[31:0]	Bits [39:8] of the response to automatically-issued CMD12 are stored.

18.3.11 MMCAnCE_DATA — MMCAn Data Register

MMCAnCE_DATA is used to access the buffers of this module. For the write/read data formats, see **18.4.3.2, Data Block Format**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 34_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 0	DATA[31:0]	Buffer write/read data [31:0]

18.3.12 MMCAnCE_BOOT — MMCAn Boot Operation Setting Register

MMCAnCE_BOOT controls the MMC clock and sets timeout values in boot mode. Do not set this register again during a command sequence.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $3C_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.22 MMCAnCE_BOOT Register Contents

Bit Position	Bit Name	Function
31 to 28	BTCLKDIV[3:0]	MMC Clock Frequency Setting in Boot Mode 0000: MMCA module clock/2^1 0001: MMCA module clock/2^2 0010: MMCA module clock/2^3 0011: MMCA module clock/2^4 0100 to 1111: Settings prohibited Set these bits to a value lower than that in the CLKDIV bits of MMCAnCE_CLK_CTRL. For MMC clock frequency in boot mode, see **Section 18.4.3.5, MMC Clock Frequency in Boot Operations**.
27 to 24	SBTACKTO[3:0]	Boot Acknowledge Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
23 to 20	S1STBTDATTO [3:0]	1st Boot Data Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
19 to 16	SBTDATTO[3:0]	Interval Between Boot Data Timeout Setting 0000: 2^{14} × MMC clock cycles 0001: 2^{15} × MMC clock cycles : 1110: 2^{28} × MMC clock cycles 1111: 2^{29} × MMC clock cycles
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.3.13 MMCAnCE_INT — MMCAn Interrupt Flag Register

MMCAnCE_INT indicates various statuses during execution of a command sequence. Each bit is set when its setting condition has been met. To clear flag(s), write 0 only to the bit(s) to be cleared and write 1 to the other bits. For the handling of this module in the case of an error or timeout, see **Section 18.4.3.8, Handling of This Module in the Case of Error/Timeout**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 40_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	CMD12DRE	CMD12RBE	CMD12CRE	DTRANE	BUFRE	BUFWEN	BUFREN	—	—	RBSYE	CRSPE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R	R	R/W*1	R/W*1

	CMDVIO	BUFVIO	—	—	WDATERR	RDATERR	RIDXERR	RSPERR	—	—	—	CRCSTO	WDATTO	RDATTO	RBSYTO	RSPTO
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. Writing 0 initializes the bit. Writing 1 is ignored.

Table 18.23 MMCAnCE_INT Register Contents (1/5)

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	CMD12DRE	Automatic CMD12 Issuance & Buffer Read Complete [Setting condition] Response busy for automatically-issued CMD12 and buffer reading have been completed. [Clearing condition] Writing a 0 to this bit. **Note:** When CMD12DRE has been set, CMD12RBE, CMD12CRE, and BUFRE have also been set. So, these bits should be cleared as well.
25	CMD12RBE	Automatic CMD12 Issuance Response Busy Complete [Setting condition] Reception of the response and response busy for an automatically-issued CMD12 have been completed. [Clearing condition] Writing a 0 to this bit. **Note:** When CMD12RBE has been set, CMD12CRE has also been set. So, this bit should be cleared as well. When CMD12RBE is set during a multi-block write, DTRANE is also set. So clear the bit as well.
24	CMD12CRE	Automatic CMD12 Response Complete [Setting condition] The response to an automatically-issued CMD12 has been received. [Clearing condition] Writing a 0 to this bit.

Table 18.23 MMCAnCE_INT Register Contents (2/5)

Bit Position	Bit Name	Function
23	DTRANE	Data Transmission Complete [Setting conditions] Transmission of all blocks of data has been completed. – When configured to receive CRC status: Completion of busy (data busy) after reception of CRC status – When configured not to receive CRC status: Completion of data transmission [Clearing condition] Writing a 0 to this bit.
22	BUFRE	Buffer Read Complete [Setting conditions] – Other than in boot operations All blocks of data have been received and the data have been read from the buffer. – In boot operations All blocks of data have been received and the data have been read from the buffer, MMCAnCMD has been modified from 0 to 1, and 48 MMC clock cycles have elapsed. [Clearing condition] Writing a 0 to this bit.
21	BUFWEN	Buffer Write Ready [Setting conditions] The buffer has become empty and ready for writing. [Clearing condition] Writing a 0 to this bit. **Note:** When writing data to MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be written. Note that this bit is not set when DMA transfer request for buffer writing is enabled.
20	BUFREN	Buffer Read Ready [Setting conditions] Transfer block size of data have been stored in the buffer and it has become ready for reading. [Clearing condition] Writing a 0 to this bit. **Note:** When reading data from MMCAnCE_DATA by the CPU, this bit should be cleared first and the data corresponding to the block size set in MMCAnCE_BLOCK_SET should be read. Note that this bit is not set when DMA transfer request for buffer reading is enabled.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	RBSYE	Response Busy Complete [Setting condition] Reception of a response and response busy have been completed. [Clearing condition] Writing a 0 to this bit. **Note:** When RBSYE has been set, CRSPE has also been set. So, this bit should be cleared as well. Completion of reception of the response and response busy for automatically-issued CMD12 is reflected in CMD12RBE.

Table 18.23 MMCAnCE_INT Register Contents (3/5)

Bit Position	Bit Name	Function
16	CRSPE	Command/Response Complete [Setting conditions] – Other than in boot operations When configured not to receive response: A command has been transmitted. When configured to receive 6- or 17-byte response: A response has been received. – In boot operations When reception of boot acknowledge has been selected: The boot acknowledge pattern has been received. [Clearing condition] Writing a 0 to this bit. Note : Completion of reception of the response to automatically-issued CMD12 is reflected in CMD12CRE.
15	CMDVIO	Command Issuance Error [Setting conditions] Illegal setting has been made in MMCAnCE_CMD_SET or MMCAnCE_BLOCK_SET. – During execution of a command sequence: Writing to CMD[5:0] in MMCAnCE_CMD_SET. (The command sequence is not stopped automatically.) – At the start of command sequence: - Writing to CMD[5:0] in MMCAnCE_CMD_SET when the registers have been set for one of the following writing a combinations of selection. - No response + response busy - No response + with data + not during boot operations - No data + automatic CMD12 issuance - With data + single-block transfer + automatic CMD12 issuance - With data + response busy + automatic CMD12 issuance - With data + transfer block size = 0 - With data + transfer block size ≥ 513 - With data + multi-block transfer + number of blocks for transfer = 0 - Boot operations + no data - Boot operations + write - Boot operations + response busy - Boot operations + automatic CMD12 issuance - Boot acknowledge reception + not during boot operations [Clearing condition] Writing a 0 to this bit.
14	BUFVIO	Buffer Access Error [Setting conditions] Illegal buffer access has been attempted. – MMCAnCE_ DATA has been accessed exceeding the block size set in BLKSIZ[15:0] in MMCAnCE_BLOCK_SET. – While data is being read from the card: MMCAnCE_DATA has been accessed with BUFREN not set (when DMA is used, with no DMA transfer request asserted for buffer reading). – While data is being written to the card: MMCAnCE_DATA has been accessed with BUFWEN not set (when DMA is used, with no DMA transfer request asserted for buffer writing). [Clearing condition] Writing a 0 to this bit. Note : When BUFVIO has been set, the command sequence is not stopped automatically. If an error occurs, this bit will be set.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 18.23 MMCAnCE_INT Register Contents (4/5)

Bit Position	Bit Name	Function
11	WDATERR	Write Data Error [Setting conditions] Error is found in the data that has been written. – Error is in the status of the CRC status. – Error is in the end bits of the CRC status. [Clearing condition] Writing a 0 to this bit. Note : When WDATERR has been set, the command sequence is stopped automatically.
10	RDATERR	Read Data Error [Setting conditions] Error is found in the read data. – Error is in CRC16 of the read data. – Error is in the end bits of the read data. [Clearing condition] Writing a 0 to this bit. Note : When RDATERR has been set, the command sequence is stopped automatically.
9	RIDXERR	Response Index Error [Setting conditions] Error has been found in the index value of the response. – When an error has been found in bits [45:40] of a 6-byte response (including automatically-issued CMD12) or bits [133:128] of a 17-byte response. (The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.) [Clearing condition] Writing a 0 to this bit. Note : When RIDXERR has been set, the command sequence is stopped automatically.
8	RSPERR	Response Error [Setting conditions] Error has been found in the response values of the response. – Transmission bit in the response is 1. – Error is in the end bits of the response. – When an error has been found in bits [7:1] of a 6-byte response (including automatically-issued CMD12) or a 17-byte response. (The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.) – Error in the boot acknowledge pattern. – Error in the end bits of the boot acknowledge. [Clearing condition] Writing a 0 to this bit. Note : When RSPERR has been set, the command sequence is stopped automatically.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	CRCSTO	CRC Status Timeout [Setting condition] CRC status could not be received. [Clearing condition] Writing a 0 to this bit. Note : The command sequence is not stopped even if CRCSTO is set.

Table 18.23 MMCAnCE_INT Register Contents (5/5)

Bit Position	Bit Name	Function
3	WDATTO	Write Data Timeout [Setting condition] The busy status remains unchanged after the period set by SRWDTO in MMCAnCE_CLK_CTRL after the CRC status was received. [Clearing condition] Writing a 0 to this bit. Note : The command sequence is not stopped even if WDATTO is set.
2	RDATTO	Read Data Timeout [Setting conditions] – Other than in boot operations - Read data could not be received within the period set by SRWDTO in MMCAnCE_CLK_CTRL after the read command was transmitted. - Read data could not be received within the period set by SRWDTO in MMCAnCE_CLK_CTRL after the read data was received. – In boot operations - The first read data could not be received within the period set by S1STBTDATTO in MMCAnCE_BOOT. - Read data could not be received within the period set by SBTDATTO in MMCAnCE_BOOT after the read data was received. [Clearing condition] Writing a 0 to this bit. Note : The command sequence is not stopped even if RDATTO is set.
1	RBSYTO	Response Busy Timeout [Setting condition] The busy status remains unchanged after the period set by SRBSYTO in MMCAnCE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. [Clearing condition] Writing a 0 to this bit. Note : The command sequence is not stopped even if RBSYTO is set.
0	RSPTO	Response Timeout [Setting conditions] – Other than in boot operations Response could not be received within the period set by SRSPTO in MMCAnCE_CLK_CTRL after the command (including automatically-issued CMD12) was transmitted. – In boot operations When reception of boot acknowledge has been selected: The boot acknowledge could not be received within the period set by SBTACKTO in MMCAnCE_BOOT. [Clearing condition] Writing a 0 to this bit. Note : The command sequence is not stopped even if RSPTO is set.

18.3.14 MMCAnCE_INT_EN — MMCAn Interrupt Enable Register

MMCAnCE_INT_EN controls output of the MMCAnCE_INT-related interrupt signals. For details on interrupt requests, see **Section 18.4.1, Interrupt Requests**.

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + 44_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.24 MMCAnCE_INT_EN Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
26	MCMD12DRE	CMD12DRE Interrupt Enable 0: Disables interrupt output by the CMD12DRE flag. 1: Enables interrupt output by the CMD12DRE flag.
25	MCMD12RBE	CMD12RBE Interrupt Enable 0: Disables interrupt output by the CMD12RBE flag. 1: Enables interrupt output by the CMD12RBE flag.
24	MCMD12CRE	CMD12CRE Interrupt Enable 0: Disables interrupt output by the CMD12CRE flag. 1: Enables interrupt output by the CMD12CRE flag.
23	MDTRANE	DTRANE Interrupt Enable 0: Disables interrupt output by the DTRANE flag. 1: Enables interrupt output by the DTRANE flag.
22	MBUFRE	BUFRE Interrupt Enable 0: Disables interrupt output by the BUFRE flag. 1: Enables interrupt output by the BUFRE flag.
21	MBUFWEN	BUFWEN Interrupt Enable 0: Disables interrupt output by the BUFWEN flag. 1: Enables interrupt output by the BUFWEN flag.
20	MBUFREN	BUFREN Interrupt Enable 0: Disables interrupt output by the BUFREN flag. 1: Enables interrupt output by the BUFREN flag.
19, 18	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
17	MRBSYE	RBSYE Interrupt Enable 0: Disables interrupt output by the RBSYE flag. 1: Enables interrupt output by the RBSYE flag.
16	MCRSPE	CRSPE Interrupt Enable 0: Disables interrupt output by the CRSPE flag. 1: Enables interrupt output by the CRSPE flag.
15	MCMDVIO	CMDVIO Interrupt Enable 0: Disables interrupt output by the CMDVIO flag. 1: Enables interrupt output by the CMDVIO flag.

Table 18.24 MMCAnCE_INT_EN Register Contents (2/2)

Bit Position	Bit Name	Function
14	MBUFVIO	BUFVIO Interrupt Enable 0: Disables interrupt output by the BUFVIO flag. 1: Enables interrupt output by the BUFVIO flag.
13, 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	MWDATERR	WDATERR Interrupt Enable 0: Disables interrupt output by the WDATERR flag. 1: Enables interrupt output by the WDATERR flag.
10	MRDATERR	RDATERR Interrupt Enable 0: Disables interrupt output by the RDATERR flag. 1: Enables interrupt output by the RDATERR flag.
9	MRIDXERR	RIDXERR Interrupt Enable 0: Disables interrupt output by the RIDXERR flag. 1: Enables interrupt output by the RIDXERR flag.
8	MRSPERR	RSPERR Interrupt Enable 0: Disables interrupt output by the RSPERR flag. 1: Enables interrupt output by the RSPERR flag.
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	MCRCSTO	CRCSTO Interrupt Enable 0: Disables interrupt output by the CRCSTO flag. 1: Enables interrupt output by the CRCSTO flag.
3	MWDATTO	WDATTO Interrupt Enable 0: Disables interrupt output by the WDATTO flag. 1: Enables interrupt output by the WDATTO flag.
2	MRDATTO	RDATTO Interrupt Enable 0: Disables interrupt output by the RDATTO flag. 1: Enables interrupt output by the RDATTO flag.
1	MRBSYTO	RBSYTO Interrupt Enable 0: Disables interrupt output by the RBSYTO flag. 1: Enables interrupt output by the RBSYTO flag.
0	MRSPTO	RSPTO Interrupt Enable 0: Disables interrupt output by the RSPTO flag. 1: Enables interrupt output by the RSPTO flag.

18.3.15 MMCAnCE_HOST_STS1 — MMCAn Status Register 1

MMCAnCE_HOST_STS1 indicates the number of blocks that have been transferred, the states of the MMCAnCMD line and MMCAnDAT lines, the index of the response that has been received, and whether a command sequence is in progress.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MMCAn_base> + 48_H

Value after reset: X0XX 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CMDSEQ	CMDSIG	RSPIDX[5:0]						DATSIG[7:0]							
Value after reset	0	—	0	0	0	0	0	0	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RCVBLK[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.25 MMCAnCE_HOST_STS1 Register Contents

Bit Position	Bit Name	Function
31	CMDSEQ	Command Sequence in Progress 0: Command sequence is in the initial state. 1: Command sequence is being executed.
30	CMDSIG	MMCAnCMD State Indicates the state on the MMCAnCMD line.
29 to 24	RSPIDX[5:0]	Response Index Indicate bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response.
23 to 16	DATSIG[7:0]	MMCAnDAT[7:0] State Indicate the state on the MMCAnDAT[7:0] lines. **Note:** When a communication error or a timeout error occurs, MMCAnDAT[0] may remain 0.
15 to 0	RCVBLK[15:0]	Number of Transferred Blocks Indicate the number of blocks that have been transferred. When the DWEN bit in MMCAnCE_CMD_SET is 0: Number of blocks read from the card When the DWEN bit in MMCAnCE_CMD_SET is 1: Number of blocks written to the card

18.3.16 MMCAnCE_HOST_STS2 — MMCAn Status Register 2

MMCAnCE_HOST_STS2 indicates timeout and error statuses.

Access: This register is a read-only register that can be read in 32-bit units.

Address: <MMCAn_base> + $4C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.26 MMCAnCE_HOST_STS2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	CRCSTE	CRC Status Error This bit is set to 1 when an error is found in the CRC status value.
30	CRC16E	Read Data CRC16 Error This bit is set to 1 when an error is found in CRC16 in the read data.
29	AC12CRCE	Automatic CMD12 Response CRC7 Error This bit is set to 1 when an error is found in bits [7:1] of the response to the automatically-issued CMD12. Note : The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
28	RSPCRC7E	Command Response CRC7 Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [7:1] of a 6-byte response or a 17-byte response. Note : The items to be checked are set by RCRC7C in MMCAnCE_CMD_SET.
27	CRCSTEBE	CRC Status End Bit Error This bit is set to 1 when an error is found in the end bits in CRC status.
26	RDATEBE	Read Data End Bit Error This bit is set to 1 when an error is found in the end bits in read data.
25	AC12REBE	Automatic CMD12 Response End Bit Error This bit is set to 1 when an error is found in the end bits of the response to the automatically-issued CMD12.
24	RSPEBE	Command Response End Bit Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in the end bits of the response.
23	AC12IDXE	Automatic CMD12 Response Index Error This bit is set to 1 when an error is found in bits [45:40] of the response to the automatically-issued CMD12. Note : The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.
22	RSPIDXE	Command Response Index Error (other than automatically-issued CMD12) This bit is set to 1 when an error is found in bits [45:40] of a 6-byte response or bits [133:128] of a 17-byte response. Note : The items to be checked are set by RIDXC in MMCAnCE_CMD_SET.
21	BTACKPATE	Boot Acknowledge Pattern Error This bit is set to 1 when an error is found in the boot acknowledge pattern.
20	BTACKEBE	Boot Acknowledge End Bit Error This bit is set to 1 when an error is found in the end bits of the boot-acknowledge.
19	Reserved	When read, the value after reset is returned.

Table 18.26 MMCAnCE_HOST_STS2 Register Contents (2/2)

Bit Position	Bit Name	Function
18 to 16	CRCST[2:0]	CRC Status/Boot Acknowledge Pattern Indication This bit indicates the value for CRC status that was received or the pattern value from the boot acknowledge.
15	Reserved	When read, the value after reset is returned.
14	STRDATTO	Read Data Timeout (valid other than in boot operations) This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read command was transmitted. This bit is set to 1 if read data is not received within the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after a read data was received.
13	DATBSYTO	Data Busy Timeout This bit is set to 1 if busy status remains unchanged after the period set by the SRWDTO bits in MMCAnCE_CLK_CTRL after the CRC status was received.
12	CRCSTTO	CRC Status Timeout This bit is set to 1 if CRC status could not be received.
11	AC12BSYTO	Automatic CMD12 Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
10	RSPBSYTO	Response Busy Timeout This bit is set to 1 if busy state remains unchanged after the period set by the SRBSYTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
9	AC12RSPTO	Automatic CMD12 Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after the automatically-issued CMD12 was transmitted.
8	STRSPTO	Response Timeout This bit is set to 1 if the response is not received within the period set by the SRSPTO bits in MMCAnCE_CLK_CTRL after a command (other than automatically-issued CMD12) was transmitted.
7	BTACKTO	Boot Acknowledge Timeout In boot operations, this bit is set to 1 if boot acknowledge is not received within the period set by the SBTACKTO bits in MMCAnCE_BOOT.
6	1STBTDATTO	1st Boot Data Timeout In boot operations, this bit is set to 1 if the 1st read data is not received within the period set by the S1STBTDATTO bits in MMCAnCE_BOOT.
5	BTDATTO	Interval between Boot Data Timeout In boot operations, this bit is set to 1 if read data is not received within the period set by the SBTDATTO bits in MMCAnCE_BOOT after a read data was received.
4 to 0	Reserved	When read, the value after reset is returned.

18.3.17 MMCAnCE_SWRESA — MMCAn Software Reset Register

MMCAnCE_SWRESA controls software reset of this module

Access: This register can be read or written in 32-bit units.

Address: <MMCAn_base> + $7C_H$

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SWRST	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.27 MMCAnCE_SWRESA Register Contents

Bit Position	Bit Name	Function
31	SWRST	Software Reset 0: Software reset cleared (normal operation). 1: Executes software reset. When this bit is set to 1, the values of all registers are initialized. (SWRST is not initialized.)
30 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

18.4 Operations

18.4.1 Interrupt Requests

The table below shows the specification of the interrupt requests. This module generates two types of interrupt requests: normal operation and error/timeout. When a bit in the flag register is set to 1 and also the corresponding bit in the interrupt enable register is set to 1 (enabled), an interrupt request is asserted.

Table 18.28 Specification of Interrupt Requests

Flag Register	Bit	Enable Register	Bit	Interrupt Request
MMCAnCE_INT	CMD12DRE	MMCAnCE_INT_EN	MCMD12DRE	Normal operation interrupt
	CMD12RBE		MCMD12RBE	
	CMD12CRE		MCMD12CRE	
	DTRANE		MDTRANE	
	BUFRE		MBUFRE	
	BUFWEN		MBUFWEN	
	BUFREN		MBUFREN	
	RBSYE		MRBSYE	
	CRSPE		MCRSPE	
	CMDVIO		MCMDVIO	Error/timeout interrupt
	BUFVIO		MBUFVIO	
	WDATERR		MWDATERR	
	RDATERR		MRDATERR	
	RIDXERR		MRIDXERR	
	RSPERR		MRSPERR	
	CRCSTO		MCRCSTO	
	WDATTO		MWDATTO	
	RDATTO		MRDATTO	
	RBSYTO		MRBSYTO	
	RSPTO		MRSPTO	

18.4.2 DMA Specifications

This module has two types of DMA transfer requests: for buffer reading and for buffer writing.

The method of DMA transfer is configured by MMCAnCE_BUF_ACC.

18.4.2.1 DMA for Buffer Writing

The DMA transfer request is asserted for buffer writing when the buffer has become empty while the DMAWEN bit in MMCAnCE_BUF_ACC is set to 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in MMCAnCE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in MMCAnCE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFWEN bit in MMCAnCE_INT will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or the command sequence is forcibly terminated by setting the BREAK bit in the MMCAnCE_CMD_CTRL register, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

18.4.2.2 DMA for Buffer Reading

The DMA transfer request is asserted for buffer reading when the buffer stores data of the block size specified in MMCAnCE_BLOCK_SET while the DMAREN bit in MMCAnCE_BUF_ACC is set to 1.

The DMA transfer request stays asserted for the amount of data specified by BLKSIZ (the block size set in MMCAnCE_BLOCK_SET) × BLKCNT (the number of blocks for transfer set in MMCAnCE_BLOCK_SET), and negated after the last block has been transferred. Note that the BUFREN bit in MMCAnCE_INT will not be asserted during DMA transfer.

If an error has occurred during DMA transfer or the command sequence is forcibly terminated by setting the BREAK bit in the MMCAnCE_CMD_CTRL register, the command sequence is stopped automatically, which causes the DMA transfer request to be negated.

18.4.3 Operations

18.4.3.1 Command/Response Formats

The figure below shows the format of the command to be transferred. The command index that is set in the CMD[5:0] bits in MMCAnCE_CMD_SET and the argument set in the ARG[31:0] bits in MMCAnCE_ARG are reflected in the command.

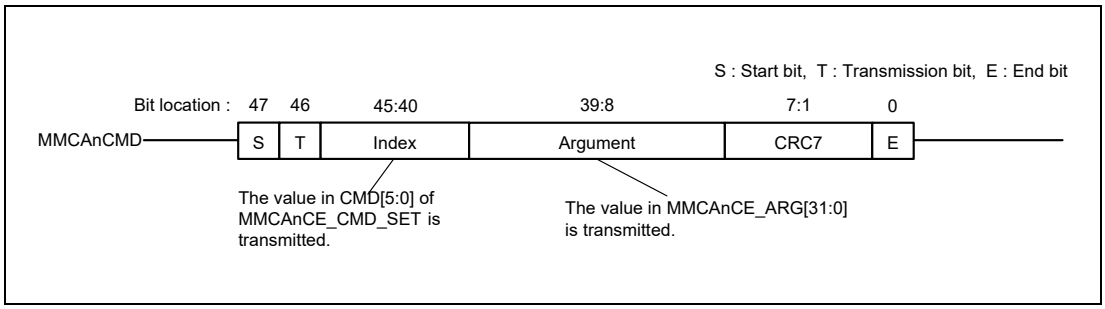

Figure 18.2 Command Format

Figure 18.3 and **Figure 18.4** show the formats when a 6-byte response and 17-byte response (R2) are received, respectively. The received response is stored in MMCAnCE_RESP0 or MMCAnCE_RESP3 to MMCAnCE_RESP0. The items to be checked are set by the RIDXC bits and the RCRC7C bits in MMCAnCE_CMD_SET.

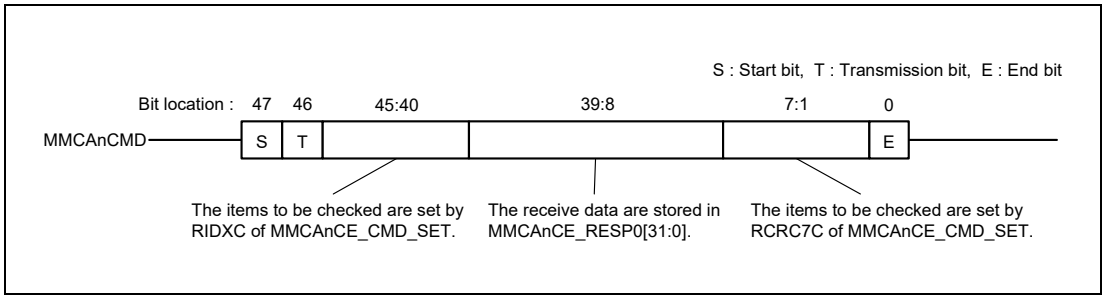

Figure 18.3 Format of 6-Byte Response

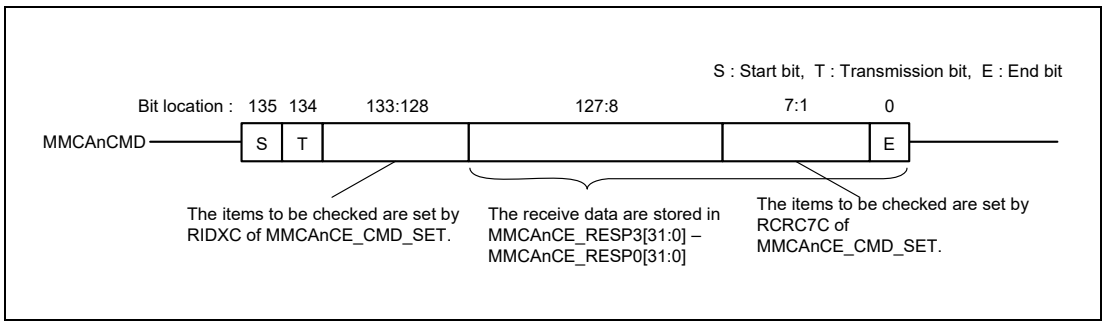

Figure 18.4 Format of 17-Byte Response (R2)

18.4.3.2 Data Block Format

The figure below shows the format of data blocks. For D0 to D3 in the figure, see **Section 18.4.3.3, Buffer Structure and Buffer Access**. When data are written to the card, the data stored in the buffer are transmitted. When data are read from the card, the received data are stored in the buffer.

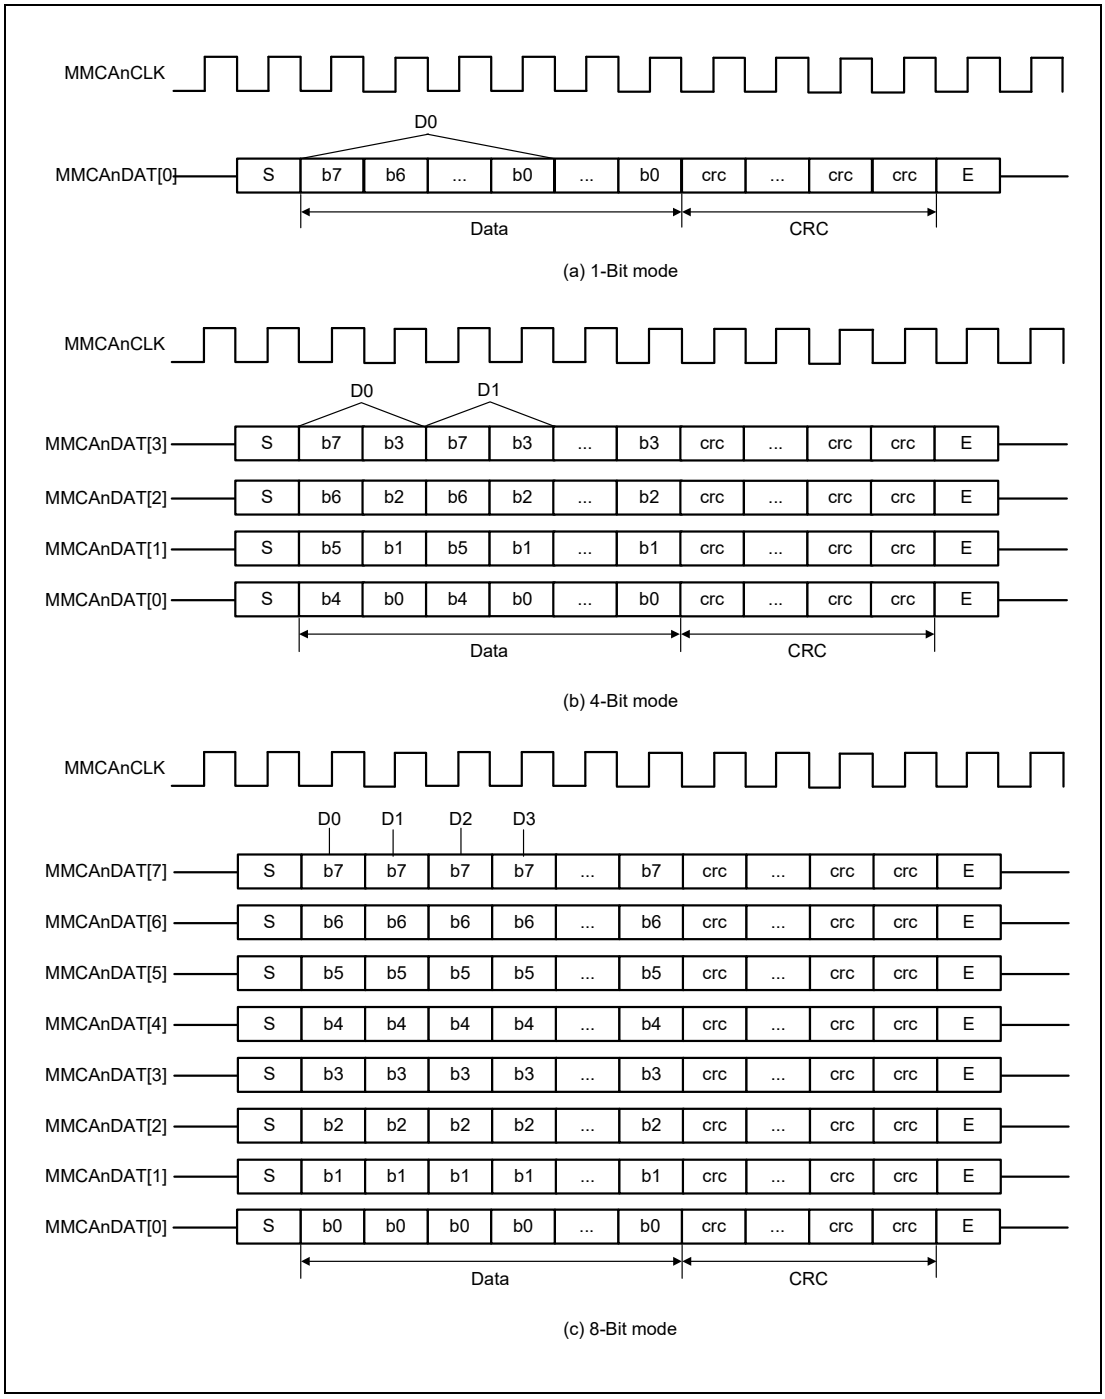

Figure 18.5 Data Block Format

18.4.3.3 Buffer Structure and Buffer Access

As shown in **Figure 18.6**, this module has two 512-byte RAM units for double buffering. If a block of data (512 bytes) stored in one buffer is transmitted during multi-block writing, the next block of data can be transmitted as soon as the other buffer is full. If a block of received data (512 bytes) is stored in one buffer during multi-block reading, the next block of received data can be stored in the other buffer once it is empty.

If neither buffer is empty during multi-block reading, the MMC clock is stopped, which in turn temporarily stops reception. Once either of the buffers becomes empty, supply of the MMC clock signal is re-started and data reception is resumed.

The buffers are accessed by MMCAnCE_DATA. If the transfer block size is set to 4 × n + 1 or 4 × n + 3, access should be made for 4 × (n + 1) bytes in 32-bit access. (n = 0, 1, 2, …, 127).

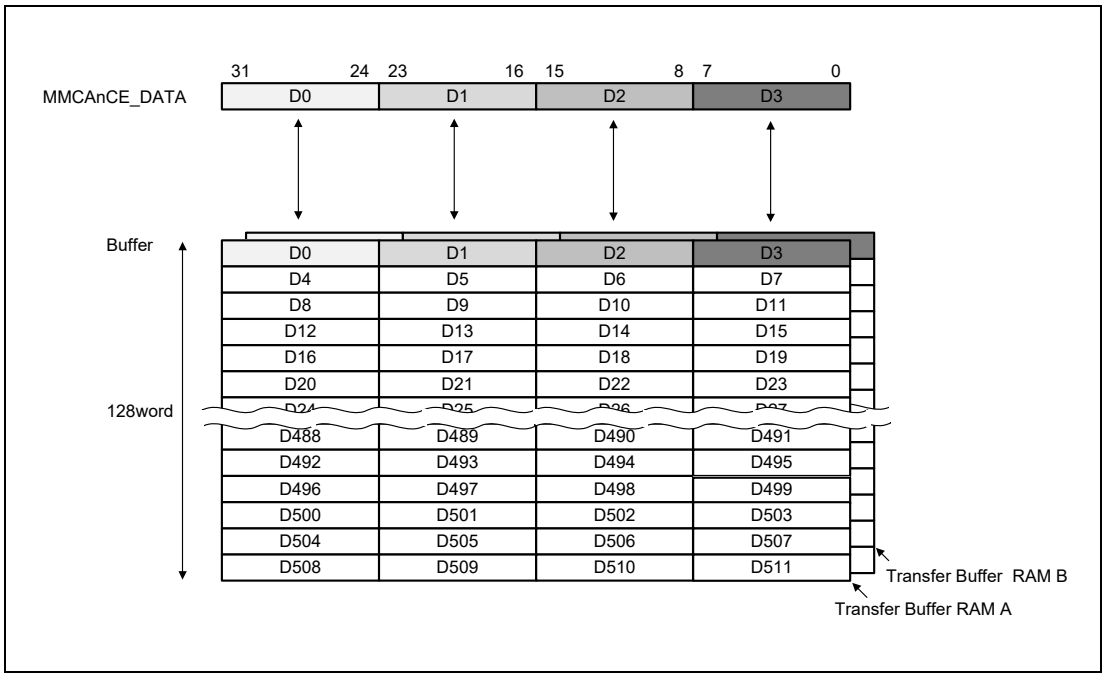

Figure 18.6 Double Buffer Structure

This module has the buffer access select function that allows byte-wise swapping of data when the buffer is accessed by writing to or reading from MMCAnCE_DATA. This function is enabled by the setting of MMCAnCE_BUF_ACC. The figure below shows the specification of 32-bit access.

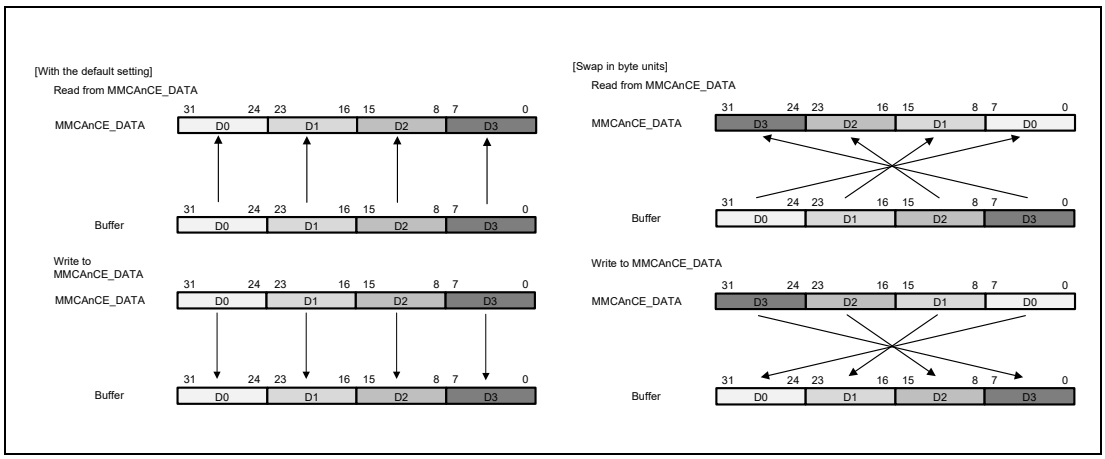

Figure 18.7 Specification of Byte-Swapping

18.4.3.4 Automatic CMD12 Issuance

This module has a function that automatically issues CMD12 when multi-block transfer is performed with the CMD12EN bit in MMCAnCE_CMD_SET set to 1.

The figure below shows the timing of automatic CMD12 issuance in multi-block read. CMD12 is issued so that the end bit of the command is sent two bits before the end bit of the data during reception of the last block.

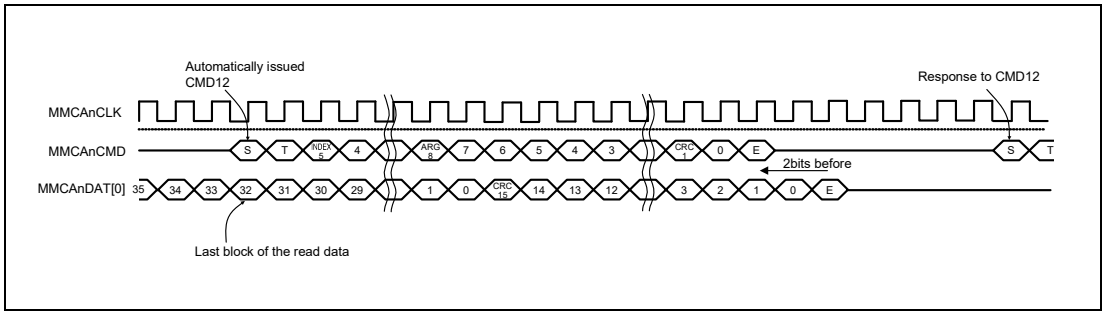

Figure 18.8 Timing of Automatically-Issued CMD12 in Multi-Block Read (1-Bit Mode)

The figure below shows the timing of automatic CMD12 issuance in multi-block write. CMD12 is issued after the data busy after transmission of the last block has ended.

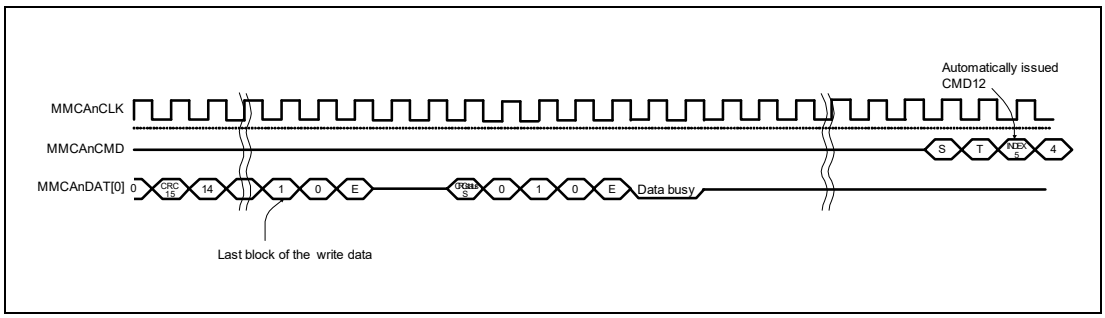

Figure 18.9 Timing of Automatically-Issued CMD12 in Multi-Block Write (1-Bit Mode)

The argument for the automatically-issued CMD12 is set in MMCAnCE_ARG_CMD12. Bits [39:8] of the response to the CMD12 is stored in MMCAnCE_RESP_CMD12. “Busy” is involved in response reception.

18.4.3.5 MMC Clock Frequency in Boot Operations

The figure below shows the timing for changing the MMC clock frequency in boot operations. In boot operations, the MMC clock frequency can be switched to the value corresponding to the setting of the BTCLKDIV bits of MMCAnCE_BOOT 74 MMC clock cycles after MMCAnCMD is modified from 1 to 0. Alternatively, it can be switched to the value corresponding to the setting of the CLKDIV bits of MMCAnCE_CLK_CTRL 48 MMC clock cycles after MMCAnCMD is modified from 0 to 1.

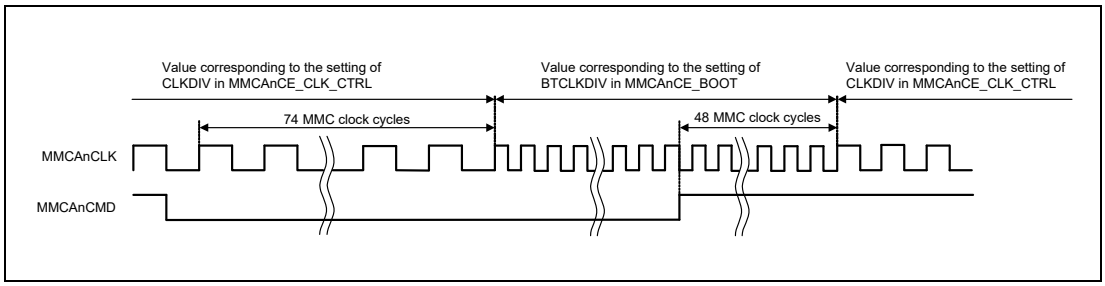

Figure 18.10 MMC Clock Frequency in Boot Operations

18.4.3.6 High Priority Interrupt (HPI)

The HPI should be processed according to the following procedure. Refer to **Section 18.3, Registers**, and **Section 18.4.4, Example of Setting**.

(a) To execute the HPI during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAnCE_HOST_STS1 becomes 0.
- Issue CMD12 (R1) to cause a device state transition from rcv to prg. If the device is already in the prg state here, the device does not output a response.
- Issue CMD13 (R1).
- Issue the HPI command.*1

(b) To execute the HPI in the response busy state not during a write to the device

- Terminate the command sequence forcibly.
- Wait until the CMDSEQ bit in MMCAnCE_HOST_STS1 turns 0.
- Issue CMD13 (R1).
- Issue the HPI command.*1

HPIs in the sequence of CMD6, CMD24, CMD25 (pre-defined), and CMD38 are supported.

Note 1. CMD12 (R1b) or CMD13 (R1b) differs depending on the e-MMC connected.

18.4.3.7 Background Operation

The background operation should be processed according to the following procedure. Refer to **Section 18.3, Registers**, and **Section 18.4.4, Example of Setting**.

To execute background operation, issue CMD6 (R1) to write to the BKOPS_START byte in the EXT_CSD register of the device.

To confirm that background operation has been completed, issue CMD6 (R1) and then CMD13 (R1) to check the device state, or poll the MMCAnDAT[0]. If the device state is tran after issuing CMD13 (R1) or MMCAnDAT[0] is high, background operation has been completed.

To suspend background operation, use the HPI (see **Section 18.4.3.6, High Priority Interrupt (HPI)**).

18.4.3.8 Handling of This Module in the Case of Error/Timeout

This module may not be stopped when an error has occurred. If an error has occurred and the CMDSEQ bit in MMCAnCE_HOST_STS1 is still indicating that the command sequence is in progress, terminate the sequence forcibly and execute software reset. Note that the data for transmission or received data that had been stored in the buffers at the time of error occurrence are not guaranteed.

This module is not stopped when a timeout has occurred. Before issuing the next command after the timeout has occurred, terminate the sequence forcibly and execute software reset.

18.4.4 Example of Setting

This section shows the procedures for executing typical command sequences.

18.4.4.1 Legends

The figure below shows the legends for the symbols used in the figures in the following subsections.

18.5 Detection and Correction of Errors in MMCA RAM

For details of this ECC function, see **Section 44.3.10, ECC for Peripheral RAM**.

Section 19 Multichannel Serial Peripheral Interface (MSPI)

This section contains a generic description of the Multi-channel Serial Peripheral Interface(MSPI).

19.1 Features of MSPI for RH850/U2A-EVA

19.1.1 Number of Units and Channels

This microcontroller has the following number of MSPI units.

Table 19.1 Number of Units

Product Name	RH850/U2A-EVA (516 pins)	RH850/U2A16 (516 pins)	RH850/U2A16 (373 pins)	RH850/U2A16 (292 pins)	RH850/U2A8 (373 pins)	RH850/U2A8 (292 pins)	RH850/U2A6 (292 pins)	RH850/U2A6 (176 pins)	RH850/U2A6 (156 pins)	RH850/U2A6 (144 pins)
Number of Units	10 (n = 0 to 9)	10 (n = 0 to 9)	9 (n = 0 to 8)	6 (n = 0 to 5)	9 (n = 0 to 8)	6 (n = 0 to 5)	6 (n = 0 to 5)	6 (n = 0 to 5)	6 (n = 0 to 5)	4 (n = 0 to 3
Name	MSPIn									

Table 19.2 Indices

Index	Description
n	Throughout this section, the individual MSPI units are identified by the index “n” (n = 0 to 9) For example, MSPI0CTL0 is the control register 0 for unit 0.
m	MSPIn has a maximum of 8 channels. Throughout this section, the individual channels are identified by the index “m” (m = 0 to 7). For example, MSPInCFG00 is the configuration register 0 for channel 0.
x	MSPIn has a maximum of 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a non-specified chip select signal.
k	Sets of registers where each has the same function are identified by the index “k” (k = 0 to 3). For example, the MSPInINTFk register (k = 0 to 3)

Table 19.3 Number of Transfer Control Channels and Chip Select Index

Unit Name	Number of Transfer Control Channels	Chip Select Index
MSPI0	8	CSx (x = 0 to 7)
MSPI1	8	CSx (x = 0 to 7)
MSPI2	8	CSx (x = 0 to 7)
MSPI3	8	CSx (x = 0 to 7)
MSPI4	8	CSx (x = 0 to 7)
MSPI5	4	CSx (x = 0 to 3)
MSPI6	4	CSx (x = 0 to 3)
MSPI7	4	CSx (x = 0 to 3)
MSPI8	4	CSx (x = 0 to 3)
MSPI9	4	CSx (x = 0 to 3)

19.1.2 Register Base Addresses

MSPIn register addresses are given as offsets from the base addresses.

MSPIn base addresses are listed in the following table.

Table 19.4 Register Base Addresses

Base Address Name	Base Address	Bus Group
MSPI0_base	FFC7 6000$_H$	P-Bus Group 4
MSPI1_base	FFC7 E000$_H$	P-Bus Group 5
MSPI2_base	FFD8 0000$_H$	P-Bus Group 4
MSPI3_base	FFCC 0000$_H$	P-Bus Group 5
MSPI4_base	FFD8 2000$_H$	P-Bus Group 4
MSPI5_base	FFCC 4000$_H$	P-Bus Group 5
MSPI6_base	FFD8 4000$_H$	P-Bus Group 4
MSPI7_base	FFCC 8000$_H$	P-Bus Group 5
MSPI8_base	FFD8 6000$_H$	P-Bus Group 4
MSPI9_base	FFCC C000$_H$	P-Bus Group 5
MSPI0_INTF_base	FFC7 5740$_H$	P-Bus Group 4
MSPI1_INTF_base	FFC7 C840$_H$	P-Bus Group 5
MSPI2_INTF_base	FFC7 5840$_H$	P-Bus Group 4
MSPI3_INTF_base	FFC7 CA40$_H$	P-Bus Group 5
MSPI4_INTF_base	FFC7 5940$_H$	P-Bus Group 4
MSPI5_INTF_base	FFC7 CC40$_H$	P-Bus Group 5
MSPI6_INTF_base	FFC7 5A40$_H$	P-Bus Group 4
MSPI7_INTF_base	FFC7 CE40$_H$	P-Bus Group 5
MSPI8_INTF_base	FFC7 5B40$_H$	P-Bus Group 4
MSPI9_INTF_base	FFC7 D040$_H$	P-Bus Group 5
MSPITG_base	FFC7 5D00$_H$	P-Bus Group 4

19.1.3 Clock Supply

The MSPI clock supplies are shown in the following **Table 19.5**.

Table 19.5 MSPI Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
MSPIn	PCLK	CLK_HSB
	MSPInCLK(MSPI communication clock)	CLK_MSPI

19.1.4 Interrupt Requests and Error Notifications

MSPIn interrupt requests are listed in the following table.

Table 19.6 Interrupt Requests (1/6)

Unit Interrupt Name	Description	Interrupt Number
MSPI0		
INTMSPI0TX0	Transmit status interrupt for channel 0	244, 250
INTMSPI0TX1	Transmit status interrupt for channel 1	246, 250
INTMSPI0TX2	Transmit status interrupt for channel 2	248, 250
INTMSPI0TX3	Transmit status interrupt for channel 3	250
INTMSPI0TX4	Transmit status interrupt for channel 4	250
INTMSPI0TX5	Transmit status interrupt for channel 5	250
INTMSPI0TX6	Transmit status interrupt for channel 6	250
INTMSPI0TX7	Transmit status interrupt for channel 7	250
INTMSPI0RX0	Receive status interrupt for channel 0	245, 251
INTMSPI0RX1	Receive status interrupt for channel 1	247, 251
INTMSPI0RX2	Receive status interrupt for channel 2	249, 251
INTMSPI0RX3	Receive status interrupt for channel 3	251
INTMSPI0RX4	Receive status interrupt for channel 4	251
INTMSPI0RX5	Receive status interrupt for channel 5	251
INTMSPI0RX6	Receive status interrupt for channel 6	251
INTMSPI0RX7	Receive status interrupt for channel 7	251
INTMSPI0FE0	Frame count end interrupt for channel 0	252
INTMSPI0FE1	Frame count end interrupt for channel 1	252
INTMSPI0FE2	Frame count end interrupt for channel 2	252
INTMSPI0FE3	Frame count end interrupt for channel 3	252
INTMSPI0FE4	Frame count end interrupt for channel 4	252
INTMSPI0FE5	Frame count end interrupt for channel 5	252
INTMSPI0FE6	Frame count end interrupt for channel 6	252
INTMSPI0FE7	Frame count end interrupt for channel 7	252
INTMSPI0ERR0	Error interrupt for channel 0	253
INTMSPI0ERR1	Error interrupt for channel 1	253
INTMSPI0ERR2	Error interrupt for channel 2	253
INTMSPI0ERR3	Error interrupt for channel 3	253
INTMSPI0ERR4	Error interrupt for channel 4	253
INTMSPI0ERR5	Error interrupt for channel 5	253
INTMSPI0ERR6	Error interrupt for channel 6	253
INTMSPI0ERR7	Error interrupt for channel 7	253

Table 19.6 Interrupt Requests (2/6)

Unit Interrupt Name	Description	Interrupt Number
MSPI1		
INTMSPI1TX0	Transmit status interrupt for channel 0	254, 260
INTMSPI1TX1	Transmit status interrupt for channel 1	256, 260
INTMSPI1TX2	Transmit status interrupt for channel 2	258, 260
INTMSPI1TX3	Transmit status interrupt for channel 3	260
INTMSPI1TX4	Transmit status interrupt for channel 4	260
INTMSPI1TX5	Transmit status interrupt for channel 5	260
INTMSPI1TX6	Transmit status interrupt for channel 6	260
INTMSPI1TX7	Transmit status interrupt for channel 7	260
INTMSPI1RX0	Receive status interrupt for channel 0	255, 261
INTMSPI1RX1	Receive status interrupt for channel 1	257, 261
INTMSPI1RX2	Receive status interrupt for channel 2	259, 261
INTMSPI1RX3	Receive status interrupt for channel 3	261
INTMSPI1RX4	Receive status interrupt for channel 4	261
INTMSPI1RX5	Receive status interrupt for channel 5	261
INTMSPI1RX6	Receive status interrupt for channel 6	261
INTMSPI1RX7	Receive status interrupt for channel 7	261
INTMSPI1FE0	Frame count end interrupt for channel 0	262
INTMSPI1FE1	Frame count end interrupt for channel 1	262
INTMSPI1FE2	Frame count end interrupt for channel 2	262
INTMSPI1FE3	Frame count end interrupt for channel 3	262
INTMSPI1FE4	Frame count end interrupt for channel 4	262
INTMSPI1FE5	Frame count end interrupt for channel 5	262
INTMSPI1FE6	Frame count end interrupt for channel 6	262
INTMSPI1FE7	Frame count end interrupt for channel 7	262
INTMSPI1ERR0	Error interrupt for channel 0	263
INTMSPI1ERR1	Error interrupt for channel 1	263
INTMSPI1ERR2	Error interrupt for channel 2	263
INTMSPI1ERR3	Error interrupt for channel 3	263
INTMSPI1ERR4	Error interrupt for channel 4	263
INTMSPI1ERR5	Error interrupt for channel 5	263
INTMSPI1ERR6	Error interrupt for channel 6	263
INTMSPI1ERR7	Error interrupt for channel 7	263
MSPI2		
INTMSPI2TX0	Transmit status interrupt for channel 0	264
INTMSPI2TX1	Transmit status interrupt for channel 1	264
INTMSPI2TX2	Transmit status interrupt for channel 2	264
INTMSPI2TX3	Transmit status interrupt for channel 3	264
INTMSPI2TX4	Transmit status interrupt for channel 4	264
INTMSPI2TX5	Transmit status interrupt for channel 5	264
INTMSPI2TX6	Transmit status interrupt for channel 6	264
INTMSPI2TX7	Transmit status interrupt for channel 7	264
INTMSPI2RX0	Receive status interrupt for channel 0	265
INTMSPI2RX1	Receive status interrupt for channel 1	265

Table 19.6 Interrupt Requests (3/6)

Unit Interrupt Name	Description	Interrupt Number
INTMSPI2RX2	Receive status interrupt for channel 2	265
INTMSPI2RX3	Receive status interrupt for channel 3	265
INTMSPI2RX4	Receive status interrupt for channel 4	265
INTMSPI2RX5	Receive status interrupt for channel 5	265
INTMSPI2RX6	Receive status interrupt for channel 6	265
INTMSPI2RX7	Receive status interrupt for channel 7	265
INTMSPI2FE0	Frame count end interrupt for channel 0	266
INTMSPI2FE1	Frame count end interrupt for channel 1	266
INTMSPI2FE2	Frame count end interrupt for channel 2	266
INTMSPI2FE3	Frame count end interrupt for channel 3	266
INTMSPI2FE4	Frame count end interrupt for channel 4	266
INTMSPI2FE5	Frame count end interrupt for channel 5	266
INTMSPI2FE6	Frame count end interrupt for channel 6	266
INTMSPI2FE7	Frame count end interrupt for channel 7	266
INTMSPI2ERR0	Error interrupt for channel 0	267
INTMSPI2ERR1	Error interrupt for channel 1	267
INTMSPI2ERR2	Error interrupt for channel 2	267
INTMSPI2ERR3	Error interrupt for channel 3	267
INTMSPI2ERR4	Error interrupt for channel 4	267
INTMSPI2ERR5	Error interrupt for channel 5	267
INTMSPI2ERR6	Error interrupt for channel 6	267
INTMSPI2ERR7	Error interrupt for channel 7	267
MSPI3		
INTMSPI3TX0	Transmit status interrupt for channel 0	268
INTMSPI3TX1	Transmit status interrupt for channel 1	268
INTMSPI3TX2	Transmit status interrupt for channel 2	268
INTMSPI3TX3	Transmit status interrupt for channel 3	268
INTMSPI3TX4	Transmit status interrupt for channel 4	268
INTMSPI3TX5	Transmit status interrupt for channel 5	268
INTMSPI3TX6	Transmit status interrupt for channel 6	268
INTMSPI3TX7	Transmit status interrupt for channel 7	268
INTMSPI3RX0	Receive status interrupt for channel 0	269
INTMSPI3RX1	Receive status interrupt for channel 1	269
INTMSPI3RX2	Receive status interrupt for channel 2	269
INTMSPI3RX3	Receive status interrupt for channel 3	269
INTMSPI3RX4	Receive status interrupt for channel 4	269
INTMSPI3RX5	Receive status interrupt for channel 5	269
INTMSPI3RX6	Receive status interrupt for channel 6	269
INTMSPI3RX7	Receive status interrupt for channel 7	269
INTMSPI3FE0	Frame count end interrupt for channel 0	270
INTMSPI3FE1	Frame count end interrupt for channel 1	270
INTMSPI3FE2	Frame count end interrupt for channel 2	270
INTMSPI3FE3	Frame count end interrupt for channel 3	270
INTMSPI3FE4	Frame count end interrupt for channel 4	270

Table 19.6 Interrupt Requests (4/6)

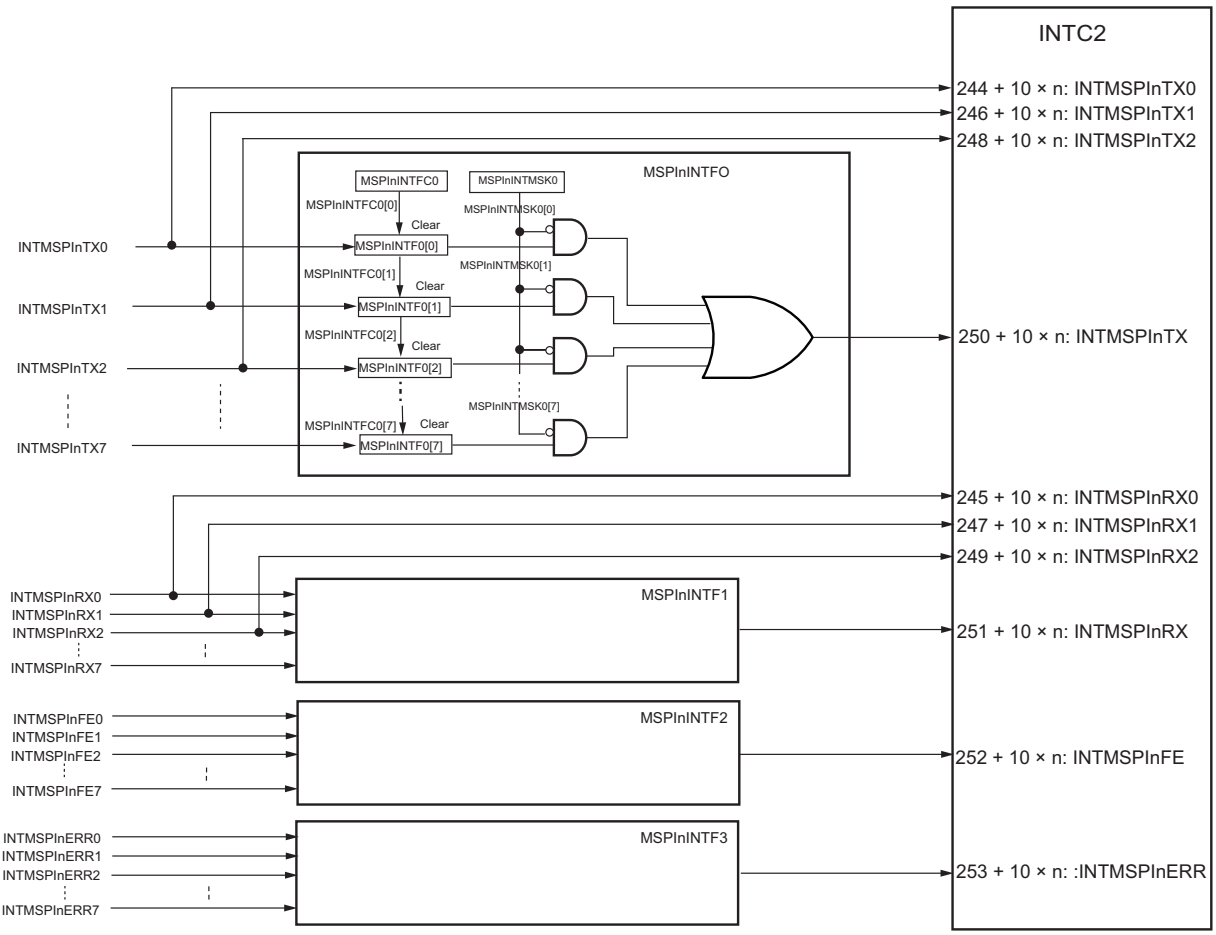
Unit Interrupt Name	Description	Interrupt Number
INTMSPI3FE5	Frame count end interrupt for channel 5	270
INTMSPI3FE6	Frame count end interrupt for channel 6	270
INTMSPI3FE7	Frame count end interrupt for channel 7	270
INTMSPI3ERR0	Error interrupt for channel 0	271
INTMSPI3ERR1	Error interrupt for channel 1	271
INTMSPI3ERR2	Error interrupt for channel 2	271
INTMSPI3ERR3	Error interrupt for channel 3	271
INTMSPI3ERR4	Error interrupt for channel 4	271
INTMSPI3ERR5	Error interrupt for channel 5	271
INTMSPI3ERR6	Error interrupt for channel 6	271
INTMSPI3ERR7	Error interrupt for channel 7	271
MSPI4		
INTMSPI4TX0	Transmit status interrupt for channel 0	272
INTMSPI4TX1	Transmit status interrupt for channel 1	272
INTMSPI4TX2	Transmit status interrupt for channel 2	272
INTMSPI4TX3	Transmit status interrupt for channel 3	272
INTMSPI4TX4	Transmit status interrupt for channel 4	272
INTMSPI4TX5	Transmit status interrupt for channel 5	272
INTMSPI4TX6	Transmit status interrupt for channel 6	272
INTMSPI4TX7	Transmit status interrupt for channel 7	272
INTMSPI4RX0	Receive status interrupt for channel 0	273
INTMSPI4RX1	Receive status interrupt for channel 1	273
INTMSPI4RX2	Receive status interrupt for channel 2	273
INTMSPI4RX3	Receive status interrupt for channel 3	273
INTMSPI4RX4	Receive status interrupt for channel 4	273
INTMSPI4RX5	Receive status interrupt for channel 5	273
INTMSPI4RX6	Receive status interrupt for channel 6	273
INTMSPI4RX7	Receive status interrupt for channel 7	273
INTMSPI4FE0	Frame count end interrupt for channel 0	274
INTMSPI4FE1	Frame count end interrupt for channel 1	274
INTMSPI4FE2	Frame count end interrupt for channel 2	274
INTMSPI4FE3	Frame count end interrupt for channel 3	274
INTMSPI4FE4	Frame count end interrupt for channel 4	274
INTMSPI4FE5	Frame count end interrupt for channel 5	274
INTMSPI4FE6	Frame count end interrupt for channel 6	274
INTMSPI4FE7	Frame count end interrupt for channel 7	274
INTMSPI4ERR0	Error interrupt for channel 0	275
INTMSPI4ERR1	Error interrupt for channel 1	275
INTMSPI4ERR2	Error interrupt for channel 2	275
INTMSPI4ERR3	Error interrupt for channel 3	275
INTMSPI4ERR4	Error interrupt for channel 4	275
INTMSPI4ERR5	Error interrupt for channel 5	275
INTMSPI4ERR6	Error interrupt for channel 6	275
INTMSPI4ERR7	Error interrupt for channel 7	275

Table 19.6 Interrupt Requests (5/6)

Unit Interrupt Name	Description	Interrupt Number
MSPI5		
INTMSPI5TX0	Transmit status interrupt for channel 0	276
INTMSPI5TX1	Transmit status interrupt for channel 1	276
INTMSPI5TX2	Transmit status interrupt for channel 2	276
INTMSPI5TX3	Transmit status interrupt for channel 3	276
INTMSPI5RX0	Receive status interrupt for channel 0	277
INTMSPI5RX1	Receive status interrupt for channel 1	277
INTMSPI5RX2	Receive status interrupt for channel 2	277
INTMSPI5RX3	Receive status interrupt for channel 3	277
INTMSPI5FE0	Frame count end interrupt for channel 0	278
INTMSPI5FE1	Frame count end interrupt for channel 1	278
INTMSPI5FE2	Frame count end interrupt for channel 2	278
INTMSPI5FE3	Frame count end interrupt for channel 3	278
INTMSPI5ERR0	Error interrupt for channel 0	279
INTMSPI5ERR1	Error interrupt for channel 1	279
INTMSPI5ERR2	Error interrupt for channel 2	279
INTMSPI5ERR3	Error interrupt for channel 3	279
MSPI6		
INTMSPI6TX0	Transmit status interrupt for channel 0	280
INTMSPI6TX1	Transmit status interrupt for channel 1	280
INTMSPI6TX2	Transmit status interrupt for channel 2	280
INTMSPI6TX3	Transmit status interrupt for channel 3	280
INTMSPI6RX0	Receive status interrupt for channel 0	281
INTMSPI6RX1	Receive status interrupt for channel 1	281
INTMSPI6RX2	Receive status interrupt for channel 2	281
INTMSPI6RX3	Receive status interrupt for channel 3	281
INTMSPI6FE0	Frame count end interrupt for channel 0	282
INTMSPI6FE1	Frame count end interrupt for channel 1	282
INTMSPI6FE2	Frame count end interrupt for channel 2	282
INTMSPI6FE3	Frame count end interrupt for channel 3	282
INTMSPI6ERR0	Error interrupt for channel 0	283
INTMSPI6ERR1	Error interrupt for channel 1	283
INTMSPI6ERR2	Error interrupt for channel 2	283
INTMSPI6ERR3	Error interrupt for channel 3	283
MSPI7		
INTMSPI7TX0	Transmit status interrupt for channel 0	284
INTMSPI7TX1	Transmit status interrupt for channel 1	284
INTMSPI7TX2	Transmit status interrupt for channel 2	284
INTMSPI7TX3	Transmit status interrupt for channel 3	284
INTMSPI7RX0	Receive status interrupt for channel 0	285
INTMSPI7RX1	Receive status interrupt for channel 1	285
INTMSPI7RX2	Receive status interrupt for channel 2	285
INTMSPI7RX3	Receive status interrupt for channel 3	285
INTMSPI7FE0	Frame count end interrupt for channel 0	286

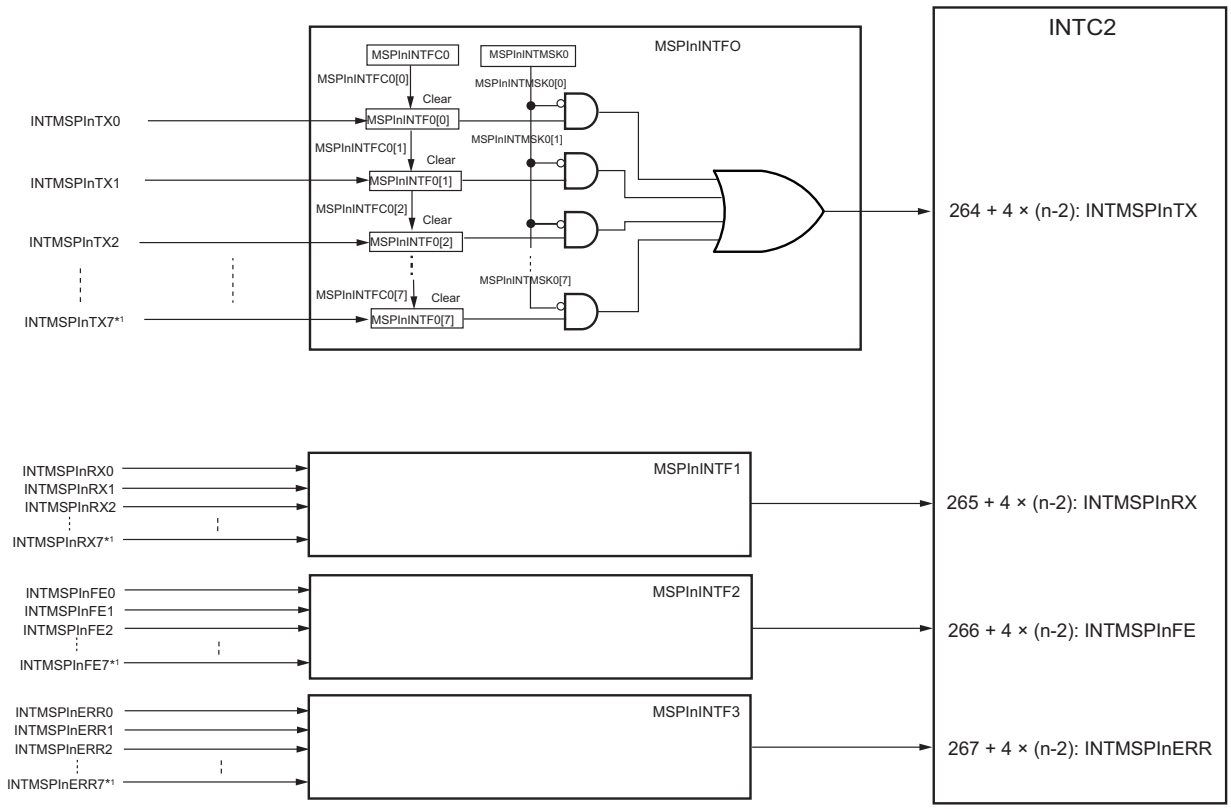
Table 19.6 Interrupt Requests (6/6)

Unit Interrupt Name	Description	Interrupt Number
INTMSPI7FE1	Frame count end interrupt for channel 1	286
INTMSPI7FE2	Frame count end interrupt for channel 2	286
INTMSPI7FE3	Frame count end interrupt for channel 3	286
INTMSPI7ERR0	Error interrupt for channel 0	287
INTMSPI7ERR1	Error interrupt for channel 1	287
INTMSPI7ERR2	Error interrupt for channel 2	287
INTMSPI7ERR3	Error interrupt for channel 3	287
MSPI8		
INTMSPI8TX0	Transmit status interrupt for channel 0	288
INTMSPI8TX1	Transmit status interrupt for channel 1	288
INTMSPI8TX2	Transmit status interrupt for channel 2	288
INTMSPI8TX3	Transmit status interrupt for channel 3	288
INTMSPI8RX0	Receive status interrupt for channel 0	289
INTMSPI8RX1	Receive status interrupt for channel 1	289
INTMSPI8RX2	Receive status interrupt for channel 2	289
INTMSPI8RX3	Receive status interrupt for channel 3	289
INTMSPI8FE0	Frame count end interrupt for channel 0	290
INTMSPI8FE1	Frame count end interrupt for channel 1	290
INTMSPI8FE2	Frame count end interrupt for channel 2	290
INTMSPI8FE3	Frame count end interrupt for channel 3	290
INTMSPI8ERR0	Error interrupt for channel 0	291
INTMSPI8ERR1	Error interrupt for channel 1	291
INTMSPI8ERR2	Error interrupt for channel 2	291
INTMSPI8ERR3	Error interrupt for channel 3	291
MSPI9		
INTMSPI9TX0	Transmit status interrupt for channel 0	292
INTMSPI9TX1	Transmit status interrupt for channel 1	292
INTMSPI9TX2	Transmit status interrupt for channel 2	292
INTMSPI9TX3	Transmit status interrupt for channel 3	292
INTMSPI9RX0	Receive status interrupt for channel 0	293
INTMSPI9RX1	Receive status interrupt for channel 1	293
INTMSPI9RX2	Receive status interrupt for channel 2	293
INTMSPI9RX3	Receive status interrupt for channel 3	293
INTMSPI9FE0	Frame count end interrupt for channel 0	294
INTMSPI9FE1	Frame count end interrupt for channel 1	294
INTMSPI9FE2	Frame count end interrupt for channel 2	294
INTMSPI9FE3	Frame count end interrupt for channel 3	294
INTMSPI9ERR0	Error interrupt for channel 0	295
INTMSPI9ERR1	Error interrupt for channel 1	295
INTMSPI9ERR2	Error interrupt for channel 2	295
INTMSPI9ERR3	Error interrupt for channel 3	295



Note: The number of interrupt signals is same as the number of channels of MSPIn. Refer **Section 19.1.1, Number of Units and Channels** for more details.

Figure 19.1 MSPI0-1 Interrupt Connection Image



Note: The number of interrupt signals is same as the number of channels of MSPIn. Refer **Section 19.1.1, Number of Units and Channels** for more details.

Figure 19.2 MSPI2-9 Interrupt Connection Image

This module has no error notification.

19.1.5 DMA/DTS Trigger

DMA/DTS trigger generator unit multiplexes INTMSPInTXm/INTMSPInRXm/INTMSPInFEm interrupt signals from all MSPI units and generates 30 DMA trigger signals (DMAMSPI0-29) and 64 DTS trigger signals (DTSMSPI0-63)The DMA/DTS trigger signals are listed in the following tables.

Table 19.7 sDMA Trigger number

DMA Trigger Signal	sDMA Trigger Number
DMAMSPI0	Group 0-109

19.1.6 Reset Sources

MSPI reset sources are listed in the following table. MSPI is initialized by these reset sources.

Table 19.9 Reset Sources

MSPIn	Reset Category						
Register Name	Power On Reset	System Reset 1	System Reset 2	Application Reset	DeepSTOP Reset	Module Reset	JTAG Reset
MSPIn registers*1	√	√	√	√*2	√	√*2	—
DMA/DTS Trigger Generator Registers	√	√	√	√	√	—	—

Note 1. All registers except DMA/DTS Trigger Registers.

Note 2. The execution of RAM initialization is configurable by a register setting.

19.1.7 External Input/Output Signals

External input/output signals of MSPIn are listed below.

Table 19.10 External Input/Output Signals (1/2)

Unit Signal Name	Description	Alternative port pin signal
MSPI0		
MSPI0SCK	Serial clock signal in Single end mode	MSPI0SC
	Serial clock signal in LVDS mode	MSPI0_SCKN MSPI0_SCKP
MSPI0SOUT	Output serial data signal in Single end mode	MSPI0SO
	Output serial data signal in LVDS mode	MSPI0_SON MSPI0_SOP
MSPI0SIN	Input serial data signal in Single end mode	MSPI0SI
	Input serial data signal in LVDS mode	MSPI0_SIN MSPI0_SIP
MSPI0CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI0SSI}}$
MSPI0DCSI	Data Consistency Check signal	MSPI0DCS
MSPI0CS[7:0]	Serial Peripheral Chip Select Output Signal	MSPI0CSS[7:0]
MSPI1		
MSPI1SCK	Serial clock signal in Single end mode	MSPI1SC
	Serial clock signal in LVDS mode	MSPI1_SCKN MSPI1_SCKP
MSPI1SOUT	Output serial data signal in Single end mode	MSPI1SO
	Output serial data signal in LVDS mode	MSPI1_SON MSPI1_SOP
MSPI1SIN	Input serial data signal in Single end mode	MSPI1SI
	Input serial data signal in LVDS mode	MSPI1_SIN MSPI1_SIP
MSPI1CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI1SSI}}$
MSPI1DCSI	Data Consistency Check signal	MSPI1DCS
MSPI1CS[7:0]	Serial Peripheral Chip Select Output Signal	MSPI1CSS[7:0]
MSPI2		
MSPI2SCK	Serial clock signal	MSPI2SC
MSPI2SOUT	Output serial data signal	MSPI2SO
MSPI2SIN	Input serial data signal	MSPI2SI
MSPI2CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI2SSI}}$
MSPI2SDCSI	Data Consistency Check signal	MSPI2DCS
MSPI2CS[7:0]	Serial Peripheral Chip Select Output Signal	MSPI2CSS[7:0]
MSPI3		
MSPI3SCK	Serial clock signal	MSPI3SC
MSPI3SOUT	Output serial data signal	MSPI3SO
MSPI3SIN	Input serial data signal	MSPI3SI
MSPI3CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI3SSI}}$
MSPI3DCSI	Data Consistency Check signal	MSPI3DCS
MSPI3CS[7:0]	Serial Peripheral Chip Select Output Signal	MSPI3CSS[7:0]
MSPI4		
MSPI4SCK	Serial clock signal	MSPI4SC

Table 19.10 External Input/Output Signals (2/2)

Unit Signal Name	Description	Alternative port pin signal
MSPI4SOUT	Output serial data signal	MSPI4SO
MSPI4SIN	Input serial data signal	MSPI4SI
MSPI4CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI4SSI}}$
MSPI4DCSI	Data Consistency Check signal	MSPI4DCS
MSPI4CS[7:0]	Serial Peripheral Chip Select Output signal	MSPI4CSS[7:0]
MSPI5		
MSPI5SCK	Serial clock signal	MSPI5SC
MSPI5SOUT	Output serial data signal	MSPI5SO
MSPI5SIN	Input serial data signal	MSPI5SI
MSPI5CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI5SSI}}$
MSPI5DCSI	Data Consistency Check signal	MSPI5DCS
MSPI5CS[3:0]	Serial Peripheral Chip Select Output signal	MSPI5CSS[3:0]
MSPI6		
MSPI6SCK	Serial clock signal	MSPI6SC
MSPI6SOUT	Output serial data signal	MSPI6SO
MSPI6SIN	Input serial data signal	MSPI6SI
MSPI6CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI6SSI}}$
MSPI6DCSI	Data Consistency Check signal	MSPI6DCS
MSPI6CS[3:0]	Serial Peripheral Chip Select Output signal	MSPI6CSS[3:0]
MSPI7		
MSPI7SCK	Serial clock signal	MSPI7SC
MSPI7SOUT	Output serial data signal	MSPI7SO
MSPI7SIN	Input serial data signal	MSPI7SI
MSPI7CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI7SSI}}$
MSPI7DCSI	Data Consistency Check signal	MSPI7DCS
MSPI7CS[3:0]	Serial Peripheral Chip Select Output signal	MSPI7CSS[3:0]
MSPI8		
MSPI8SCK	Serial clock signal	MSPI8SC
MSPI8SOUT	Output serial data signal	MSPI8SO
MSPI8SIN	Input serial data signal	MSPI8SI
MSPI8CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI8SSI}}$
MSPI8DCSI	Data Consistency Check signal	MSPI8DCS
MSPI8CS[3:0]	Serial Peripheral Chip Select Output signal	MSPI8CSS[3:0]
MSPI9		
MSPI9SCK	Serial clock signal	MSPI9SC
MSPI9SOUT	Output serial data signal	MSPI9SO
MSPI9SIN	Input serial data signal	MSPI9SI
MSPI9CSI	Serial Peripheral Chip Select Input Signal	$\overline{\text{MSPI9SSI}}$
MSPI9DCSI	Data Consistency Check signal	MSPI9DCS
MSPI9CS[3:0]	Serial Peripheral Chip Select Output signal	MSPI9CSS[3:0]

19.1.8 Data Consistency Check

The following table lists the port pins on which MSPInSOUT (MSPInSO) pin functions are multiplexed and data consistency checking.

Refer to **Section 19.6.8.2, Data Consistency Check** details on data consistency checking.

Table 19.11 Port Pins for Data Consistency Checking

Unit Signal Name	Port Pin Name	Alternative Function
MSPI0		
MSPI0SO	P2_13	AF3
	P4_5	AF2
	P6_9	AF3
MSPI1		
MSPI1SO	P5_2	AF3
	P6_7	AF4
	P10_2	AF3
MSPI2		
MSPI2SO	P2_5	AF4
	P4_6	AF4
	P10_10	AF3
MSPI3		
MSPI3SO	P5_4	AF2
	P22_0	AF4
	P24_13	AF2
MSPI4		
MSPI4SO	P21_2	AF4
	P23_2	AF1
MSPI5		
MSPI5SO	P12_2	AF1
	P24_6	AF2
MSPI6		
MSPI6SO	P9_2	AF1
	P11_2	AF1
MSPI7		
MSPI7SO	P11_10	AF1
	P19_2	AF1
MSPI8		
MSPI8SO	P0_2	AF5
	P18_3	AF1
MSPI9		
MSPI9SO	P1_2	AF5
	P18_10	AF1

CAUTION

This function is not supported with LVDS mode.

19.1.9 Combination of Pin and Port

MSPI uses multiple pins for one unit and the pins should be used in groups as given in the following table.

Table 19.12 Combination of Pin and Port table (1/2)

	Group	MSPIn SCK	MSPIn SIN	MSPIn SO	MSPIn DCSI	MSPIn SSI	MSPIn CSS0	MSPIn CSS1	MSPIn CSS2	MSPIn CSS3	MSPIn CSS4	MSPIn CSS5	MSPIn CSS6	MSPIn CSS7
MSPI0	1	P4_6	P4_7	P4_5	P4_5	P4_4	P2_3 P2_14 P4_4	P3_4 P4_1 P20_6	P4_13 P20_7	P2_8 P6_3 P10_10	P2_9 P4_15 P6_2	P3_4 P10_13 P20_0	P3_5 P10_14 P20_1	P2_14 P6_11 P17_1
	2	P6_8	P6_7	P6_9	P6_9	P4_4	P2_3 P2_14 P4_4	P3_4 P4_1 P20_6	P4_13 P20_7	P2_8 P6_3 P10_10	P2_9 P4_15 P6_2	P3_4 P10_3 P20_0	P3_5 P10_14 P20_1	P2_14 P6_11 P17_1

Note: Refer to **Table 2.3, Pin Function Name Definition** for available Port for each Product.
Refer to **Figure 2.9, Port setting flow example (Alternative mode with IP control)** for Port setting for MSPInSO and MSPInDCS.
Refer to **Figure 2.10, Port setting flow example (Alternative mode without IP control)** for Port setting for other pins.

19.2 Overview

19.2.1 Functional Overview

Multichannel Serial Peripheral Interface (MSPI) has the function as the following:

- Three-wire serial synchronous data transfer
- Master mode and slave mode selectable
- Multiple slaves configuration thanks to up to eight configurable chip select output signals
- Maximum transmission speed in master/slave mode:
  - In LVDS mode: up to 40 MHz (MSPI0-1)
  - In Single end mode: up to 20 MHz (MSPI0-5), up to 10 MHz (MSPI6-9)

CAUTIONS

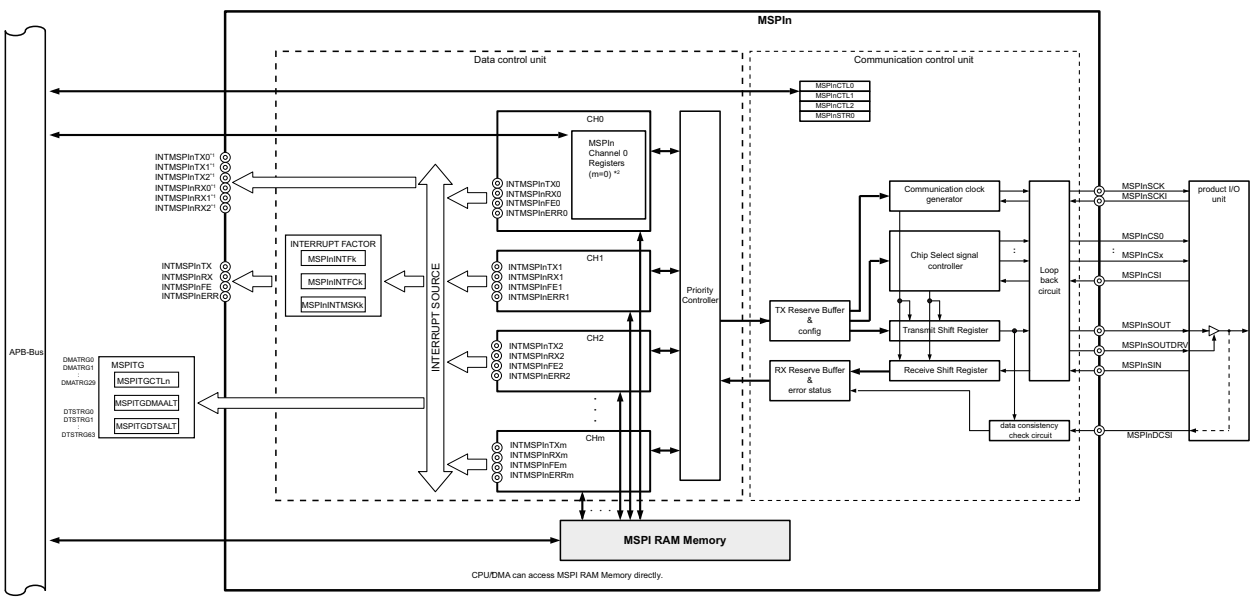
1. **Actual timings will depend on the characteristics of master & slave.**
2. **MSPI0 does not support LVDS mode in U2A6.**

- Phase of clock and data selectable for each channel
- Data transfer with MSB or LSB first selectable for each channel
- Transfer control channel: Up to 8 for each unit
- Transfer data length selectable from 2 to 128 incremented in 1-bit units for channel
- Three selectable transfer modes:
  - Transmit-only mode
  - Receive-only mode
  - Transmit/receive mode
- Error detection
  - Parity error
  - Data consistency error
  - Over-write error
  - Over-read error
  - Overrun error
- Support of JOB concept for AUTOSAR
- JOB enable control bit for AUTOSAR is provided
- LBM (Loop Back Mode) function for self-test
- Enforced chip select idle setting
- Support Safe-SPI ver1.00 only in master mode
- MSPI has four different interrupt requests.

  - Communication status
  - Reception status
  - Communication error
  - Job completion
- MSPI has three DMA requests.
  - Communication status
  - Reception status
  - Job completion
- Receive sample point
  - The sample point for the RX can be shifted to the next SCK edge

19.2.2 Block Diagram

The following block diagram shows the main components of the MSPI.



Note 1. These interrupts are only for MSPI0 and MSPI1. For more details, refer to **Figure 19.1, MSPI0-1 Interrupt Connection Image**.

Note 2. Refer to **Table 19.17, List of Channel m Registers**.

Figure 19.3 Block Diagram of MSPI

19.3 Interrupt Sources

MSPIn can generate the following interrupt requests:

- INTMSPInTXm (transmit status interrupt)
- INTMSPInRXm (receive status interrupt)
- INTMSPInFEm (frame count end interrupt)
- INTMSPInERRm (error interrupt)

m = 0 to 7

Table 19.13 Interrupt Generation

Mode	Interrupt	Cause of Interrupt
Direct memory mode	INTMSPInTXm	TX data empty *1
	INTMSPInRXm	RX data received *2
	INTMSPInFEm	Last frame end
	INTMSPInERRm	Error detected
Fixed buffer memory mode	INTMSPInTXm	Not output
	INTMSPInRXm	Not output
	INTMSPInFEm	Last frame end
	INTMSPInERRm	Error detected
Fixed FIFO memory mode	INTMSPInTXm	Half of FIFO buffer empty. *1
	INTMSPInRXm	Half of FIFO buffer full. *2
	INTMSPInFEm	Last frame end
	INTMSPInERRm	Error detected

Note 1. Only if data transmission is enabled (MSPInCFGm0.MSPInTXE=1).
Note 2. Only if data reception is enabled (MSPInCFGm0.MSPInRXEm=1.

19.4 DMA/DTS Trigger Generation

DMA/DTS trigger generator unit multiplexes INTMSPInTXm/INTMSPInRXm/INTMSPInFEm interrupt signals from all MSPI units and generates 30 DMA trigger signals (DMAMSPI0-29) and 64 DTS trigger signals (DTSMSPI0-63).

Two DMA trigger signals (Trigger 1/Trigger 2) and two DTS trigger signals (Trigger 1/Trigger 2) are assigned to each unit/channel, and the source interrupt signals for each trigger signal are selected by register settings. For more detailed information, refer to **Section 19.5.3, DMA/DTS Trigger Generator Registers**.

Each DMA/DTS trigger signal is shared by multiplex channels. In addition, a part of DMA/DTS trigger signals is shared by two MSPI units (Ex: MSPI0 and MSPI9 shared DMAMSPI4 Trigger 1 and DMAMSPI5 Trigger 2).

The assignments and the sharing are shown in the following table.

Table 19.14 DMA/DTS Trigger signals (1/2)

Unit	Channel	DMA Trigger Signal				DTS Trigger Signal			
		Trigger 1	Trigger 2	Trigger 1 (alternative)	Trigger 2 (alternative)	Trigger 1	Trigger 2	Trigger 1 (alternative)	Trigger 2 (alternative)
MSPI0	0	DMAMSPI0	DMAMSPI1	-	-	DTSMSPI0	DTSMSPI1	-	-
	1	DMAMSPI2	DMAMSPI3	-	-	DTSMSPI2	DTSMSPI3	-	-
	2	DMAMSPI4*1	DMAMSPI5*1	DMAMSPI0	DMAMSPI1	DTSMSPI4	DTSMSPI5	-	-
	3	DMAMSPI6*2	DMAMSPI7*2	DMAMSPI2	DMAMSPI3	DTSMSPI6	DTSMSPI7	-	-
	4	DMAMSPI0	DMAMSPI1	-	-	DTSMSPI8	DTSMSPI9	-	-
	5	DMAMSPI2	DMAMSPI3	-	-	DTSMSPI10	DTSMSPI11	-	-
	6	DMAMSPI4*1	DMAMSPI5*1	DMAMSPI0	DMAMSPI1	DTSMSPI12*7	DTSMSPI13*7	DTSMSPI8	DTSMSPI9
	7	DMAMSPI6*2	DMAMSPI7*2	DMAMSPI2	DMAMSPI3	DTSMSPI14*7	DTSMSPI15*7	DTSMSPI10	DTSMSPI11

Some examples of DMA trigger generation setting are shown in the following. (DTS trigger generation setting can also be done in a similar way.)

(1) [Example 1] MSPI0-Ch0: Use DMAMSPI0 for INTMSPI0TX0

As shown in **Table 19.14, DMA/DTS Trigger signals**, MSPI0-Ch0 has two DMA trigger signals, DMAMSPI0(Trigger 1) and DMAMSPI1(Trigger 2).

Set as follows to use DMAMSPI0(Trigger 1) for INTMSPI0TX0.

Setting	Explanation
MSPITGCTL0 = 0000 0002_H	• DMA trigger is enabled (DTS trigger is disabled) for MSPI0-Ch0 when MSPITGCTL0.TRGSEL0 = 0. • INTMSPI0TX0 interrupt signal is selected as source of Trigger 1 for MSPI0-Ch0 when MSPITGCTL0.SRCSEL0 = 001.
MSPITGDMAALT = Don't care	MSPI0-Ch0 can not use alternative trigger signals, and does not need MSPITGDMAALT register to be set. DMAMSPI0 is always used as DMA Trigger 1 for MSPI0-Ch0.

(2) [Example 2] MSPI0-Ch2: Use DMAMSPI1 or DMAMSPI5 for INTMSPI0RX2

As shown in **Table 19.14, DMA/DTS Trigger signals**, MSPI0-Ch2 has two DMA trigger signals, DMAMSPI4(Trigger 1) and DMAMSPI5(Trigger 2), or two alternative DMA trigger signals, DMAMSPI0(Trigger 1) and DMAMSPI1(Trigger 2).

Set as follows when using the alternative DMA trigger signal DMAMSPI1(Trigger 2) for INTMSPI0RX2.

Setting	Explanation
MSPITGCTL0 = 0000 $0A00_H$	• DMA trigger is enabled (DTS trigger is disabled) for MSPI0-Ch2 when MSPITGCTL0.TRGSEL2 = 0. • INTMSPI0RX2 interrupt signal is selected as source of Trigger 2 for MSPI0-Ch2 when MSPITGCTL0.SRCSEL2 = 101.
MSPITGDMAALT = 0000 0001_H	MSPI0-Ch2 can use alternative DMA trigger signals, and needs MSPITGDMAALT register to be set. DMAMSPI1 is used as DMA Trigger 2 for MSPI0-Ch2 when MSPITGDMAALT.DMAAS02 = 1.

On the other hand, set as follows when using the usual DMA trigger signal DMAMSPI5(Trigger 2) for INTMSPI0RX2.

Setting	Explanation
MSPITGCTL0 = 0000 $0A00_H$	• DMA trigger is enabled (DTS trigger is disabled) for MSPI0-Ch2 when MSPITGCTL0.TRGSEL2 = 0. • INTMSPI0RX2 interrupt signal is selected as source of Trigger 2 for MSPI0-Ch2 when MSPITGCTL0.SRCSEL2 = 101.
MSPITGDMAALT = 0000 0000_H	MSPI0-Ch2 can use alternative DMA trigger signals, and needs MSPITGDMAALT register to be set. DMAMSPI5 is used as DMA Trigger 2 for MSPI0-Ch2 when MSPITGDMAALT.DMAAS02 = 0.

(3) [Example 3] MSPI9-Ch0 use DMAMSPI4 for INTMSPI9TX0 and DMAMSPI5 for INTMSPI9RX0

As shown in **Table 19.14, DMA/DTS Trigger signals**, MSPI9-Ch0 has two DMA trigger signals, DMAMSPI4(Trigger 1) and DMAMSPI5(Trigger 2).

Set as follows to use DMAMSPI4(Trigger 1) for INTMSPI9TX0, and DMAMSPI5 for INTMSPI9RX0.

Setting	Explanation
MSPITGCTL9 = 0000 000E$_H$	• DMA trigger is enabled (DTS trigger is disabled) for MSPI9-Ch0 when MSPITGCTL9.TRGSEL0 = 0. • INTMSPI9TX0/INTMSPI9RX0 interrupt signal is selected as source of Trigger 1/2 for MSPI9-Ch0 when MSPITGCTL9.SRCSEL0 = 111.
MSPITGDMAALT = Don't care	MSPI9-Ch0 can not use alternative trigger signals, and does not need MSPITGDMAALT register to be set. DMAMSPI4/DMAMSPI5 is always used as DMA Trigger 1/2 for MSPI9-Ch0.

(4) [Example 4] Combination of settings for multiple units/channels

The assignments of DMA trigger signals and the source interrupt signals for each units/channels in this example are shown in the following table.

Table 19.15 Description of Example 4

Unit	Channel	Trigger 1		Trigger 2		Trigger 1 (alternative)		Trigger 2 (alternative)	
		DMA Trigger Signal	Source Signal	DMA Trigger Signal	Source Signal	DMA Trigger Signal	Source Signal	DMA Trigger Signal	Source Signal
MSPI0	0	DMAMSPI0	INTMSPI0TX0	DMAMSPI1	-	-	-	-	-
	1	DMAMSPI2	INTMSPI0TX1	DMAMSPI3	-	-	-	-	-
	2	DMAMSPI4	-	DMAMSPI5	-	DMAMSPI0	-	DMAMSPI1	INTMSPI0RX2
	3	DMAMSPI6	-	DMAMSPI7	-	DMAMSPI2	-	DMAMSPI3	INTMSPI0RX3
MSPI8	0	DMAMSPI6	INTMSPI8TX0	DMAMSPI7	-	-	-	-	-
	1	DMAMSPI6	-	DMAMSPI7	INTMSPI8TX1	-	-	-	-
MSPI9	0	DMAMSPI4	INTMSPI9TX0	DMAMSPI5	INTMSPI9RX0	-	-	-	-

The following assignments are necessary for each unit/channel.

- MSPI0-Ch0: Use DMAMSPI0 for INTMSPI0TX0
- MSPI0-Ch1: Use DMAMSPI2 for INTMSPI0TX1
- MSPI0-Ch2: Use DMAMSPI1 for INTMSPI0RX2
- MSPI0-Ch3: Use DMAMSPI3 for INTMSPI0RX3
- MSPI8-Ch0: Use DMAMSPI6 for INTMSPI8TX0
- MSPI8-Ch1: Use DMAMSPI7 for INTMSPI8TX1
- MSPI9-Ch0: Use DMAMSPI4/DMAMSPI5 for INTMSPI9TX0/INTMSPI9RX0

Set as follows for these assignments.

Setting	Explanation
MSPITGCTL0 = 0000 $AA22_H$	• DMA trigger is enabled (DTS trigger is disabled) for MSPI0-Ch0/1/2/3 when MSPITGCTL0.TRGSEL0/1/2/3 = 0. • INTMSPI0TX0 interrupt signal is selected as source of Trigger 1 for MSPI0-Ch0 when MSPITGCTL0.SRCSEL0 = 001. • INTMSPI0TX1 interrupt signal is selected as source of Trigger 1 for MSPI0-Ch1 when MSPITGCTL0.SRCSEL1 = 001. • INTMSPI0RX2 interrupt signal is selected as source of Trigger 2 for MSPI0-Ch2 when MSPITGCTL0.SRCSEL2 = 101. • INTMSPI0RX3 interrupt signal is selected as source of Trigger 2 for MSPI0-Ch3 when MSPITGCTL0.SRCSEL3 = 101.
MSPITGCTL8 = 0000 0082_H	• DMA trigger is enabled (DTS trigger is disabled) for MSPI8-Ch0/1 when MSPITGCTL8.TRGSEL0/1 = 0. • INTMSPI8TX0 interrupt signal is selected as source of Trigger 1 for MSPI8-Ch0 when MSPITGCTL8.SRCSEL0 = 001. • INTMSPI8TX1 interrupt signal is selected as source of Trigger 2 for MSPI8-Ch1 when MSPITGCTL8.SRCSEL1 = 100.
MSPITGCTL9 = 0000 $000E_H$	• DMA trigger is enabled (DTS trigger is disabled) for MSPI9-Ch0 when MSPITGCTL9.TRGSEL0 = 0. • INTMSPI9TX0/INTMSPI9RX0 interrupt signal is selected as source of Trigger 1/2 for MSPI9-Ch0 when MSPITGCTL9.SRCSEL0 = 111.
MSPITGDMAALT = 0000 0003_H	• MSPI0-Ch2 can use alternative DMA trigger signals, and needs MSPITGDMAALT register to be set. DMAMSPI1 is used as DMA Trigger 2 for MSPI0-Ch2 when MSPITGDMAALT.DMAAS02 = 1. • MSPI0-Ch3 can use alternative DMA trigger signals, and needs MSPITGDMAALT register to be set. DMAMSPI3 is used as DMA Trigger 2 for MSPI0-Ch3 when MSPITGDMAALT.DMAAS03 = 1.

19.5 Registers of MSPI

19.5.1 List of Registers

MSPI registers are listed in the following table.

Table 19.16 List of Common Registers

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
MSPIn	MSPIn Control Register 0	MSPInCTL0	<MSPIn_base> + 0000_H	8	*1	—
	MSPIn Control Register 1	MSPInCTL1	<MSPIn_base> + 0004_H	8,16,32	*1	—
	MSPIn Control Register 2	MSPInCTL2	<MSPIn_base> + 0008_H	8	*1	—
	MSPIn Status Register 0	MSPInSTR0	<MSPIn_base> + 0010_H	8	*1	—
MSPInINTF	MSPIn Interrupt Factor Register	MSPInINTFk	<MSPIn_INTF_base> + k x 30_H + 00_H	32	*1	—
	MSPIn Interrupt Mask Register	MSPInINTMSKk	<MSPIn_INTF_base> + k x 30_H + 04_H	32	*1	—
	MSPIn Interrupt Factor Clear Register	MSPInINTFCk	<MSPIn_INTF_base> + k x 30_H + 08_H	32	*1	—

Note 1. n = 0: PBG40#3, n = 1: PBG52#6, n = 2: PBG40#4, n = 3: PBG52#7, n = 4: PBG40#5, n = 5: PBG52#8, n = 6: PBG40#6, n = 7: PBG52#9, n = 8: PBG40#7, n = 9: PBG52#10

Table 19.17 List of Channel m Registers (1/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other
MSPIn	MSPIn channel Configuration Register m0	MSPInCFGm0	<MSPIn_base> + 00_H + 80_H x (m+1)	8,16,32	*1	—
	MSPIn channel Configuration Register m1	MSPInCFGm1	<MSPIn_base> + 04_H + 80_H x (m+1)	8,16,32	*1	—
	MSPIn channel Configuration Register m2	MSPInCFGm2	<MSPIn_base> + 08_H + 80_H x (m+1)	8,16	*1	—
	MSPIn channel Configuration Register m3	MSPInCFGm3	<MSPIn_base> + $0C_H$ + 80_H x (m+1)	8,16	*1	—
	MSPIn channel Configuration Register m4	MSPInCFGm4	<MSPIn_base> + 10_H + 80_H x (m+1)	8,16,32	*1	—
	MSPIn SCK Delay Time Setting Register m	MSPInSEUPm	<MSPIn_base> + 18_H + 80_H x (m+1)	8,16	*1	—
	MSPIn CS Negation Delay Time Setting Register m	MSPInHOLDm	<MSPIn_base> + $1C_H$ + 80_H x (m+1)	8,16	*1	—
	MSPIn CS Next Frame Delay Time Setting Register m	MSPInIDLEm	<MSPIn_base> + 20_H + 80_H x (m+1)	8,16	*1	—
	MSPIn Inter Data Time Setting Register m	MSPInINDAm	<MSPIn_base> + 24_H + 80_H x (m+1)	8,16	*1	—
	MSPI RAM Start Address Setting Register m	MSPInRASTADm	<MSPIn_base> + 28_H + 80_H x (m+1)	8,16	*1	—
	MSPIn Communication Frame Count Setting Register m	MSPInCFSETm	<MSPIn_base> + $2C_H$ + 80_H x (m+1)	8,16	*1	—
	MSPIn Communication Transmit Data Register m	MSPInSSTXm	<MSPIn_base> + 30_H + 80_H x (m+1)	8,16,32	*1	—

Table 19.17 List of Channel m Registers (2/2)

Module Name	Register Name	Symbol	Address	Access Size	Access Protection	
					PBG	Other

	<MSPIn_base> + 1000_H to <MSPIn_base> + $11FF_H$	U2A6

19.5.2 MSPIn Registers

19.5.2.1 MSPInCTL0 — MSPIn Control Register 0

This register is used to control the enable/disable of the MSPI function.

Access: This register can be read or written in 8-bit units.

Address: <MSPIn_base> + 0000_H

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	MSPInEN
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Table 19.20 MSPInCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	MSPInEN	This bit enables or disables the MSPI Function. 0: Disables the MSPIn function. 1: Enables the MSPIn function.

CAUTION

Four or more PCLK clock cycles plus four or more MSPInCLK clock cycles are necessary if MSPInEN has been cleared and then if MSPInEN has set again.

19.5.2.2 MSPInCTL1 — MSPIn Control Register 1

This register is used to control the MSPI function.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 0004_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSPIn MSSEL	—	MSPIn CSIE	MSPIn SAMP	MSPIn CKR	—	MSPIn SOLS[1:0]		—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MSPInCSP[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W	R/W	R/W	R/W

Note 1. Writable only for MSPI0 to 4

Table 19.21 MSPInCTL1 Register Contents

Bit Position	Bit Name	Function
31	MSPInMSSEL	This bit selects Master/Slave Mode 0: Master mode 1: Slave mode **Note:** Setting MSPInMSSEL before setting Port Alternative function for MSPI operation.
30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	MSPInCSIE	This bit enables or disables the slave select signal(MSPInCSI) in slave mode. 0:Input CS signal(MSPInCSI) is ignored in slave mode. 1:Input CS signal(MSPInCSI) is recognized in slave mode.
28	MSPInSAMP	This bit controls the internal sampling timing for receive data in master mode. 0: The sampling timing of Master receive is standard sampling point of SPI protocol. 1: The sampling timing of Master receive is next edge sampling point of SPI protocol.
27	MSPInCKR	This bit selects MSPIn Clock default level 0:The default level of MSPInSCK is low. 1:The default level of MSPInSCK is high.
26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	MSPInSOLS [1:0]	These bits select the MSPInSOUT function in Master mode. 00: Set MSPInSOUT to low after macro enable, and holds the level after each transfer. 01: Set MSPInSOUT to low after macro enable and low during idle time. 10: Set MSPInSOUT to high after macro enable, and holds the level after each transfer 11: Set MSPInSOUT to high after macro enable and high during idle time.
23 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	MSPInCSP [7:0]	These bits control the polarity of MSPInCS. 0: The MSPInCS signal is active low. 1: The MSPInCS signal is active high.

CAUTIONS

1. This register should be written when MSPInCTL0.MSPInEN = 0.
2. In the master mode(MSPInMSSEL=0), MSPInCSIE must be set to 0.
3. In the transmission only setting, MSPInSAMP must be set to 0.
4. In the slave mode(MSPInMSSEL=1), MSPInSAMP must be set to 0.
5. In the slave mode(MSPInMSSEL=1), MSPInSOLS[1:0] must be set to 00.
6. In the slave mode(MSPInMSSEL=1), MSPInCSP[7:0] must be set to 00_H.
7. In the master mode (MSPInMSSEL=0), MSPInSAMP must be set to 1 for 20 MHz/40 MHz mode.

19.5.2.3 MSPInCTL2 — MSPI Control Register 2

This register is used to enable or disable the data consistency check and the loop-back mode.

Access: This register can be read or written in 8-bit units.

Address: <MSPIn_base> + 0008_H

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MSPInDCS	MSPInLBM
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Table 19.22 MSPInCTL2 Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	MSPInDCS	This bit enables or disables the data consistency check. 0: Disables the data consistency check. 1: Enables the data consistency check.
0	MSPInLBM	This bit enables or disables the loop-back mode. 0: Disables the loop-back mode. 1: Enables the loop-back mode.

CAUTIONS

1. This register can be written only if MSPInCTL0.MSPInEN = 0.
2. In slave mode (MSPInMSSEL=1), MSPInLBM must be set to 0.

19.5.2.4 MSPInSTR0 — MSPIn Status Register 0

This register indicates MSPI communication status.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <MSPIn_base> + 0010_H

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	MSPInCNUMF[2:0]			—	—	—	MSPInCSF
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Table 19.23 MSPInSTR0 Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned.
6 to 4	MSPInCNUMF [2:0]	These bits indicate the number of the communicating channel. 0: The communicating channel is channel 0 (or communication stops). 1: The communicating channel is channel 1. 2: The communicating channel is channel 2. 3: The communicating channel is channel 3. 4: The communicating channel is channel 4. 5: The communicating channel is channel 5 6: The communicating channel is channel 6. 7: The communicating channel is channel 7.
3 to 1	Reserved	When read, the value after reset is returned.
0	MSPInCSF	This bit indicates the communication status of master mode. (When MSPInCSF is 0, all channels stop, and MSPI does not communicate.) • Set condition When 1 is written to MSPInCSTSm.MSPInCHENSm • Clear condition – Master Mode: When communication is completed and MSPInCHENm of ALL channels are cleared and insertion of hold time is completed. – Slave mode: When communication is completed and MSPInCHEN0 is cleared.

19.5.2.5 MSPInCSTRm — MSPIn Channel Status Register m (m = 0 to 7)

This register indicates the status of the MSPIn channel.

Access: This register is a read-only register that can be read in 8-, 16-bit units.

Address: <MSPIn_base> + 58_H + 80_H x (m+1)

Value after reset: 0000_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInFIRXNm[7:0]								—	—	MSPIn TXRQFm	MSPIn RXRQFm	—	—	MSPIn ACTFm	MSPIn CHENm
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.24 MSPInCSTRm Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 8	MSPInFIRXNm [7:0]	These bits indicate the number of received data not being read in fixed FIFO memory mode. (These bits are fixed to 00_H in Direct memory mode or Fixed Buffer memory mode.) 0: The number of received data not read is 0. 1: The number of received data not read is 1. 2: The number of received data not read is 2. : 32: The number of received data not read is 32. These bits are used in the fixed FIFO memory mode when communication is stopped using the clear trigger (MSPInCSTCm.MSPInCHENCm). In the case of 1 frame 8 bits, if there is one unread data, this register indicates 1. In the case of 1 frame 32 bits, if there is one unread data, this register indicates 1. In the case of 1 frame 128 bits, if there is one unread data, this register indicates 4.
7, 6	Reserved	When read, the value after reset is returned.
5	MSPInTXRQFm	This bit indicates a transmission data write request in Direct memory mode or Fixed FIFO memory mode. (This bit is fixed to 0 in Fixed Buffer memory mode.) 0: There is no request to write transmission data. 1: There is a request to write transmission data.
4	MSPInRXRQFm	This bit indicates a reception data read request in Direct memory mode or Fixed FIFO memory mode. (This bit is fixed to 0 in Fixed Buffer memory mode.) 0: There is no request to read reception data. 1: There is a request to read reception data.
3, 2	Reserved	When read, the value after reset is returned.
1	MSPInACTFm	This bit indicates whether the channel is active or inactive. 0: Channel m is inactive. 1: Channel m is active. • Set condition 1. If 1 is written to MSPInCSTSm.MSPInACTFSm when MSPInCHENm is 1. 2. When 1 is written to MSPInCSTSm.MSPInACTFSm and MSPInCSTSm.MSPInCHENSm simultaneously. 3. If trigger selected by MSPInCFGm4.MSPInHWTSm[5:0] is input, when MSPInCHENm is 1. • Clear condition 1. If MSPInCFGm0.MSPInFCCE is 0 and the transmission of the last frame is finished. 2. When 1 is written to MSPInCSTCm.MSPInCHENCm. 3. Write MSPInCTL0.MSPInEN to 0. (MSPInEN 1→0)

Table 19.24 MSPInCSTRm Register Contents (2/2)

Bit Position	Bit Name	Function
0	MSPInCHENm	This bit indicates whether the channel is disabled or enabled. When 1 is written to MSPInCSTSm.MSPInCHENSm, this bit is set to 1 And when the channel is frame count end, this bit is cleared to 0 by HW. 0: Channel m is disabled. 1: Channel m is enabled. • Set condition 1. When 1 is written to MSPInCSTSm.MSPInCHENSm. • Clear condition 1. If MSPInCFGm0.MSPInFCCE is 0 and the transmission of the last frame is finished. 2. When 1 is written to MSPInCSTCm.MSPInCHENCm. 3. When 0 is written to MSPInCTL0.MSPInEN to 0. (MSPInEN 1→0)

19.5.2.6 MSPInCSTSm — MSPIn Channel Status Set Register m (m = 0 to 7)

This register is used to set the MSPInCSTRm register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <MSPIn_base> + 34_H + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MSPIn ACTFSm	MSPIn CHENSm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	W	W

Table 19.25 MSPInCSTSm Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When writing, write the value after reset.
1	MSPInACTFSm	This bit sets the channel active flag (MSPInCSTRm.MSPInACTFm). 0: No function. 1: Sets MSPInCSTRm.MSPInACTFm to 1.
0	MSPInCHENSm	This bit sets the channel enable flag (MSPInCSTRm.MSPInCHENm). 0: No function. 1: Sets MSPInCSTRm.MSPInCHENm to 1.

19.5.2.7 MSPInCSTCm — MSPIn Channel Status Clear Register m (m = 0 to 7)

This register is used to clear the MSPInCSTRm register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <MSPIn_base> + 38_H + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	MSPIn CHENCm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	W

Table 19.26 MSPInCSTCm Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	MSPInCHENCm	This bit clears the channel enable flag. (This bit is the stop trigger of channel operation.) 0: No function. 1: Clears MSPInCSTRm.MSPInCHENm to 0.

19.5.2.8 MSPInCFGm0 — MSPIn channel Configuration Register m0 (m = 0 to 7)

This register is used to configure the channel operation.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 00_H + 80_H x (m+1)

Value after reset: 0070 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	MSPIn TXEm	MSPIn RXEm	—	—	MSPIn MDm[1:0]		—	MSPInPRIOm[2:0]			—	—	—	MSPIn LOCKm
Value after reset:	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	MSPIn FCCEm	—	—	—	—	—	—	—	—	MSPIn IEREm	MSPIn IFEEm	MSPIn IRXEm	MSPIn ITXEm
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 19.27 MSPInCFGm0 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
29	MSPInTXEm	This bit enables transmission. 0: Transmission disabled. 1: Transmission enabled.
28	MSPInRXEm	This bit enables reception. 0: Reception disabled. 1: Reception enabled.
27, 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25, 24	MSPInMDm[1:0]	This bits selects channel mode 00: Direct memory mode 01: Fixed buffer memory mode 10: Fixed FIFO memory mode 11: Setting prohibited
23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 20	MSPInPRIOm [2:0]	This bits select channel priority. 000: Channel priority level 1(Highest priority) 001: Channel priority level 2 010: Channel priority level 3 : 111: Channel priority level 8(Lowest priority)
19 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	MSPInLOCKm	This bit enables channel lock operation. 0: Disables the channel m lock operation. 1: Enables the channel m lock operation.
15 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 19.27 MSPInCFGm0 Register Contents (2/2)

Bit Position	Bit Name	Function
12	MSPInFCCEm	This bit selects the operation of channel frame count end in the direct memory mode. 0:When a last frame ends, MSPInCHENm is cleared and the channel operation ends. 1:When a last frame ends, MSPInCHENm is not cleared and the channel operation continues.
11 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	MSPInIEREm	This bit enables or disables the output of INTMSPInERRm interrupt. 0: Disables the interrupt output. 1: Enables the interrupt output.
2	MSPInIFEEm	This bit enables or disables the output of INTMSPInFEm interrupt. 0: Disables the interrupt output. 1: Enables the interrupt output.
1	MSPInIRXEm	This bit enables or disables the output of INTMSPInRXm interrupt. 0: Disables the interrupt output. 1: Enables the interrupt output.
0	MSPInITXEm	This bit enables or disables the output of INTMSPInTXm interrupt. 0: Disables the interrupt output. 1: Enables the interrupt output.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInPRIOm to 111 in the slave mode.**
3. **Set MSPInLOCKm to 0 in the slave mode.**
4. **Set MSPInFCCEm to 0 in the fixed buffer memory mode and fixed FIFO memory mode.**
5. **Set MSPInFCCEm to 0 in mode reception only setting of the direct memory mode.**
6. **When MSPInFCCEm is 1, set MSPInIFEEm to 0.**

19.5.2.9 MSPInCFGm1 — MSPIn channel Configuration Register m1 (m = 0 to 7)

This register is used to configure the channel operation.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 04_H + 80_H x (m+1)

Value after reset: 0100 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	MSPIn CPOLm	MSPIn CPHAm	—	—	—	MSPIn DIRm	—	MSPIn ICLSm	MSPIn FIDLm	MSPIn CSRIm
Value after reset:	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MSPIn SAFCMm	—	MSPIn SAFSm	MSPIn SAFEm	—	—	MSPInPSm[1:0]		—	—	—	MSPIn DECHKm
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Table 19.28 MSPInCFGm1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
25	MSPInCPOLm	This bit selects the MSPInSCK polarity. 0: MSPInSCK is low during idle time 1: MSPInSCK is high during idle time
24	MSPInCPHAm	This bit selects the MSPInSCK phase. 0: Shifting bits out for transmission takes place on even-numbered edges, and sampling for reception takes place on odd-numbered edges. 1: Shifting bits out for transmission takes place on odd-numbered edges, and sampling for reception takes place on even-numbered edges.
23 to 21	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
20	MSPInDIRm	This bit selects the communication direction. 0: Data is transmitted/received with MSB first. 1: Data is transmitted/received with LSB first.
19	Reserved.	When read, the value after reset is returned. When writing, write the value after reset.
18	MSPInICLSm	This bit controls the MSPInCS level for idle time in the Direct memory mode 0: MSPInCS level is inactive for idle time 1: MSPInCS level holds active level for idle time.
17	MSPInFIDLm	This bit controls whether to insert an idle period after each end of a frame. 0: The idle time is not inserted each end of a frame. 1: The idle time is forcibly inserted after each end of a frame.
16	MSPInCSRIm	This bit controls whether to insert an idle period after the last frame end. 0: Holds MSPInCS at the active level. 1: MSPInCS returns to the inactive level.
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	MSPInSAFCMm	This bit masks the CRC error of the first frame in Safe-SPI protocol function. 0: Does not mask the CRC error of the first frame. 1: Masks the CRC error of the first frame.
10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

1: parity check</td></tr>
</table>

CAUTIONS

1. This register should be written when MSPInCSTRm.MSPInCHENm = 0.
2. Set MSPInCPOLm to 0 in the slave mode.
   Set MSPInICLSm to 0 in the slave mode.
   Set MSPInICLSm to 0 in the fixed buffer memory mode and fixed FIFO memory mode.
   Set MSPInICLSm to 0 in the direct memory mode, in case only data reception is configured.
3. Set MSPInFIDLm to 0 in the slave mode.
4. Set MSPInCSRIm to 0 in the slave mode.
5. Set MSPInSAFEm to 0 in the slave mode.

19.5.2.10 MSPInCFGm2 — MSPIn channel Configuration Register m2 (m = 0 to 7)

This register is used to configure the channel operation.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + 08_H + 80_H x (m+1)

Value after reset: 0020_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MSPInFLENm[7:0]

Table 19.29 MSPInCFGm2 Register Contents

Bit Position	Bit Name	Function
15 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	MSPInFLENm [7:0]	These bits select frame length. 00_H: This setting is prohibited 01_H: This setting is prohibited 02_H: 2 bits 03_H: 3 bits 04_H: 4 bits 05_H: 5 bits 06_H: 6 bits 07_H: 7 bits 08_H: 8 bits : $1E_H$: 30 bits $1F_H$: 31 bits 20_H: 32 bits(default) : 80_H: 128 bits Settings other than above are prohibited.

CAUTION

This register should be written when MSPInCSTRm.MSPInCHENm = 0.

19.5.2.11 MSPInCFGm3 — MSPIn channel Configuration Register m3 (m = 0 to 7)

This register is used to configure the channel operation.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + $0C_H$ + 80_H x (m+1)

Value after reset: 0001_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 19.30 MSPInCFGm3 Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9, 8	MSPInPRCSm [1:0]	These bits select communications clock frequency division in the master mode 00: MSPInCLK 01: MSPInCLK/4 10: MSPInCLK/16 11: MSPInCLK/64
7 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4 to 0	MSPInCDIVm [4:0]	These bits select communications clock frequency division selection in master mode 00000: Setting prohibited 00001: MSPInCLK/2 00010: MSPInCLK/4 00011: MSPInCLK/6 00100: MSPInCLK/8 00101: MSPInCLK/10 00110: MSPInCLK/12 00111: MSPInCLK/14 01000: MSPInCLK/16 : 11101: MSPInCLK/58 11110: MSPInCLK/60 11111: MSPInCLK/62 $MSPInSCK \quad baud\ rate = \frac{MSPInCLK}{4^{MSPInPRCSm} \times MSPInCDIVm \times 2}$

CAUTIONS

1. **This register can be written only if MSPInCSTRm.MSPInCHENm = 0.**
2. **In the slave mode(MSPInMSSEL=1), MSPInCFGm3 must be set to 0001_H(default value).**

NOTE

Use by “PCLK/2 ≥ MSPInSCK”.

19.5.2.12 MSPInCFGm4 — MSPIn channel Configuration Register m4 (m = 0 to 7)

This register is used to configure the channel operation.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 10_H + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

010101	GTM	MCS0 Interrupt for channel (MCS0_IRQ0)
010110	GTM	MCS0 Interrupt for channel (MCS0_IRQ1)
010111	GTM	MCS0 Interrupt for channel (MCS0_IRQ2)
011000	GTM	MCS0 Interrupt for channel (MCS0_IRQ3)
011001	GTM	MCS0 Interrupt for channel (MCS0_IRQ4)
011010	GTM	MCS0 Interrupt for channel (MCS0_IRQ5)
011011	GTM	MCS0 Interrupt for channel (MCS0_IRQ6)
011100	GTM	MCS0 Interrupt for channel (MCS0_IRQ7)
011101	GTM	MCS2 Interrupt for channel (MCS2_IRQ0)
011110	GTM	MCS2 Interrupt for channel (MCS2_IRQ1)
011111	GTM	MCS2 Interrupt for channel (MCS2_IRQ2)
100000	GTM	MCS2 Interrupt for channel (MCS2_IRQ3)
100001 to 110000	—	Setting is prohibited
110001	TSG	TSG30 valley interrupt (INTTSG30IVLY)
110010	TSG	TSG30 peak interrupt (INTTSG30IPEK)
110011	TSG	TSG30 compare match interrupt 12 (INTTSG30I12)
110100	TSG	TSG30 compare match interrupt 11 (INTTSG30I11)
110101	TSG	TSG31 valley interrupt (INTTSG31IVLY)
110110	TSG	TSG31 peak interrupt (INTTSG31IPEK)
110111	TSG	TSG31 compare match interrupt 12 (INTTSG31I12)
111000	TSG	TSG31 compare match interrupt 11 (INTTSG31I11)
Other than above	—	Setting is prohibited

CAUTIONS

1. **When setting all except for 000000_B to 111000_B for MSPInHWTSm[5:0], a trigger becomes invalid.**
2. **U2A-EVA does not support the MCS0 and MCS2 interrupt as MSPI HW trigger.**

19.5.2.13 MSPInRASTADm — MSPI RAM Start Address Setting Register (m = 0 to 7)

This register is used to set start address of MSPI RAM in the fixed FIFO memory mode and fixed buffer memory mode.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + 28_H + 80_H x (m+1)

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	MSPInRASTAD[8:2]							—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Table 19.33 MSPInRASTADm Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
8 to 2	MSPInRASTAD [8:2]	These bits set start Address of MSPI RAM in Fixed FIFO memory mode or fixed buffer memory mode.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInRASTADm[8:2] to 0000_H in direct memory mode.**

19.5.2.14 MSPInSEUPm — MSPInSCK Setup Time Setting Register m (m = 0 to 7)

This register is used to control the operation of the set delay time from MSPInCS assertion to MSPInSCK operation start.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + 18_H + 80_H x (m+1)

Value after reset: 0001_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MSPInSEUPm [11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.34 MSPInSEUPm Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	MSPInSEUPm [11:0]	These bits set the delay between MSPInCS assertion and MSPInSCK operation start. 000_H: Prohibited 001_H to FFF_H : MSPInSCK delay time = MSPInSEUPm [11:0] × MSPInCLK.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInSEUPm to 0001_H in the slave mode.**

NOTE

When using the MSPI at master mode with the setting MSPInCFGm1.MSPInCPHAm = 0, set the period from CS active to the first edge of SCK to 1/2 or more of the communication rate by MSPInSEUPm.

19.5.2.15 MSPInHOLDm — Hold Time Setting Register m (m = 0 to 7)

This register is used to control the operation of the MSPInCS negation delay time.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + $1C_H$ + 80_H x (m+1)

Value after reset: 0001_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MSPInHOLDm [11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.35 MSPInHOLDm (m = 0 to 7) Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	MSPInHOLDm [11:0]	These bits set the delay time between MSPInSCK operation stop and MSPInCS negation delay time. 000_H: Prohibited 001_H to FFF_H: MSPInCS negation delay time = MSPInHOLDm [11:0] × MSPInCLK

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInHOLDm to 0001_H in Slave mode.**

19.5.2.16 MSPInIDLEm — Idle Time Setting Register m (m = 0 to 7)

This register is used to control the operation of the MSPInCS next frame delay time.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + 20_H + 80_H x (m+1)

Value after reset: 0001_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MSPInIDLEm [11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.36 MSPInIDLEm(m = 0 to 7) Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	MSPInIDLEm [11:0]	These bits set the delay between MSPInCS negation and MSPInCS assertion between two frames. 000_H: Prohibited 001_H to FFF_H: MSPInCS[7:0] next frame time = MSPInIDLEm [11:0] × MSPInCLK.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInIDLEm to 0001_H in slave mode.**

19.5.2.17 MSPInINDAm — Inter-Data Time Setting Register m (m = 0 to 7)

This register is used to control the operation of the inter-data time.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + 24_H + 80_H x (m+1)

Value after reset: 0000_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	MSPInINDAm [11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.37 MSPInINDAm (m = 0 to 7) Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11 to 0	MSPInINDAm [11:0]	These bits set the delay between MSPInSCK operation stop and MSPInSCK operation start between two frames with same MSPInCS configuration. 000_H-FFF_H : MSPInCS[7:0] next frame time = MSPInINDAm [11:0] × MSPInCLK.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0.**
2. **Set MSPInINDAm to 0000_H in slave mode.**

19.5.2.18 MSPInCFSETm — MSPIn Communication Frame Count Setting Register m (m = 0 to 7)

This register is used to set the number of frame count.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + $2C_H$ + 80_H x (m+1)

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInCFSETm[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.38 MSPInCFSETm Register Contents

Bit Position	Bit Name	Function
15 to 0	MSPInCFSETm [15:0]	These bits set the number of frame count. 0000_H: Setting prohibited 0001_H: The frame count number is 1 0002_H: The frame count number is 2 : $FFFE_H$: The frame count number is 65534 $FFFF_H$: The frame count number is 65535

CAUTION

This register should be written when MSPInCSTRm.MSPInCHENm = 0

19.5.2.19 MSPInSSELm —MSPInCS signal Selection Register m (m = 0 to 7)

This register is used to control the operation of the chip select activation and JOB function of Direct memory mode.

Access: This register can be read or written in 8-, 16-bit units.

Address: <MSPIn_base> + $3C_H$ + 80_H x (m+1)

Value after reset: 0000_H

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInJOBENm	—	—	—	—	—	—	—	MSPInCSRm [7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W	R/W	R/W	R/W

Note 1. Writable only for MSPI0 to 4

Table 19.39 MSPInSSELm Register Contents

Bit Position	Bit Name	Function
15	MSPInJOBENm	This bit activates the Job function for the next transfer. 0: Job ends with this frame. After this frame the channel with a higher priority can transfer data. 1: Job continuous after this frame. This and the next frame of channel m cannot be interrupted.
14 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	MSPInCSRm [7:0]	These bits set whether to activate or deactivate the MSPInCS[7:0]. 0: Deactivates MSPInCS[7:0] 1: Activates MSPInCS[7:0] for the communication.

CAUTIONS

1. **This register should be written when MSPInCSTRm.MSPInCHENm = 0 in the fixed buffer memory mode or fixed FIFO memory mode.**
2. **This register should be written when MSPInCSTRm.MSPInCHENm = 0 in reception only setting of the direct memory mode.**
3. **Set MSPInJOBENm to 0 in the fixed buffer memory mode, fixed FIFO memory mode, or slave mode.**
4. **Set MSPInSSELm to 0000_H in the slave mode.**

19.5.2.20 MSPInTXDAm0 — MSPIn Communication Transmit Data Register m0 (m = 0 to 7)

This register is used to write the transmit data.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 40_H + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSPInTXDAm0[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInTXDAm0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 19.40 MSPInTXDAm0 Register Contents

Bit Position	Bit Name	Function
31 to 0	MSPInTXDAm0 [31:0]	These bits hold the transmit data (transmit data bits 31 to 0).

CAUTION

In the Fixed FIFO mode, it is necessary to access this register according to the frame length.

Frame length 2 to 8: Writing in units of 8 bits.

Frame length 9 to 16: Writing in units of 16 bits.

Frame length 32 to 128: Writing in units of 32 bits.

19.5.2.21 MSPInFRERSTm — MSPIn Frame Error Status Register m(m = 0 to 7)

This register indicates the error of status in communication frame.

This register is used to monitor communication error in each communication frame in the Direct memory mode.

This register is updated when the receive data is stored in the MSPInRXDAm0 register, and can be used to confirm the error occurrence status for each communication frame.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <MSPIn_base> + $4C_H$ + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSPIn DCEFSTm	—	—	MSPIn CEFSTm	MSPIn PEFSTm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Table 19.41 MSPInFRERSTm Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is returned.
4	MSPInDCEFSTm	This bit indicates whether a transmission data consistency error was detected in communication frame. 0: No consistency error was detected on the associated transmission data in communication frame 1: A consistency error was detected on the associated transmission data in communication frame.
3, 2	Reserved	When read, the value after reset is returned.
1	MSPInCEFSTm	This bit indicates whether a reception data CRC error was detected in communication frame. 0: No CRC error was detected on the associated reception data in communication frame. 1: A CRC error was detected on the associated reception data in communication frame.
0	MSPInPEFSTm	This bit indicates whether a reception data parity error was detected in communication frame. 0: No parity error was detected on the associated reception data in communication frame. 1: A parity error was detected on the associated reception data in communication frame.

19.5.2.22 MSPInFRERSTCm — MSPIn Frame Error Status Clear Register m(m = 0 to 7)

This register is used to clear the MSPInFRERSTm register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <MSPIn_base> + 64_H + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	—	—	—	MSPIn DCEFSCm	—	—	MSPIn CEFSCm	MSPIn PEFSCm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	W	R	R	W	W

Table 19.42 MSPInFRERSTCm Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When writing, write the value after reset.
4	MSPInDCEFSCm	This bit clears the status flag of data consistency error. 0: No function. 1: Clears MSPInFRERSTm.MSPInDCEFSTm to 0.
3, 2	Reserved	When writing, write the value after reset.
1	MSPInCEFSCm	This bit clears the status flag of CRC error. 0: No function. 1: Clears MSPInFRERSTm.MSPInCEFSTm to 0.
0	MSPInPEFSCm	This bit clears the status flag of Parity error. 0: No function. 1: Clears MSPInFRERSTm.MSPInPEFSTm to 0.

19.5.2.23 MSPInRXDAm0 — MSPIn Communication Receive Data Register m0 (m = 0 to 7)

This register is used to control the receive data.

Access: This register is a read-only register that can be read in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 50_H + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSPInRXDAm0[31:16]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInRXDAm0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.43 MSPInRXDAm0 Register Contents

Bit Position	Bit Name	Function
31 to 0	MSPInRXDAm0 [31:0]	These bits store the received data (received data bits 31 to 0).

CAUTION

In the Fixed FIFO mode, it is necessary to access this register according to the frame length.

Frame length 2 to 8: Reading in units of 8 bits.

Frame length 9 to 16: Reading in units of 16 bits.

Frame length 32 to 128: Reading in units of 32 bits.

19.5.2.24 MSPInSSTXm — MSPIn SSL Selection and Communication Transmit Data Register m (m = 0 to 7)

This register is used to write the 16bit transmit data, chip select activation and JOB information with one access.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 30_H + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MSPInJOBENm	—	—	—	—	—	—	—	MSPInCSRm[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInTXDAm0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Writable only for MSPI0 to 4

Table 19.44 MSPInSSTXm Register Contents

Bit Position	Bit Name	Function
31	MSPInJOBENm	This bit activates the Job function for the next transfer. 0: Job ends with this frame. After this frame the channel with a higher priority can transfer data. 1: Job continuous after this frame. This and the next frame of channel m cannot be interrupted. This bit is the mirror bit of MSPInSSELm.MSPInJOBENm.
30 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	MSPInCSRm [7:0]	These bits set whether to activate or deactivate the MSPInCS[7:0]. 0: Deactivates MSPInCS[7:0]. 1: Activates MSPInCS[7:0] for the communication. These bits are the mirror bits of MSPInSSELm.MSPInCSRm[7:0].
15 to 0	MSPInTXDAm0 [15:0]	These bits hold the transmission data (transmission data bits 15 to 0). These bits are the mirror bits of MSPInTXDAm0[15:0].

CAUTION

This register is used to write MSPInJOBENm, MSPInCSRm[7:0], and MSPInTXDAm0[15:0] at the same time when communicating in direct memory mode with a frame length of 16 bits or less.

19.5.2.25 MSPInFSRXm — MSPIn Frame Error Status and Communication Receive Data Register m (m = 0 to 7)

This register is used to read the receive data and error status of communication frame.

This register reading will be affect same as MSPInRXDAm0 reading. (Clearing MSPInRXRQFm)

Access: This register is a read-only register that can be read in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + 60_H + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	MSPIn DEFSTm	—	—	MSPIn CEFSTm	MSPIn PEFSTm
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInRXDAm0[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.45 MSPInFSRXm Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is returned.
20	MSPInDEFSTm	This bit indicates whether a transmission data consistency error was detected in communication frame. 0: No consistency error was detected on the associated transmission data in communication frame 1: A consistency error was detected on the associated transmission data in communication frame. This bit is the mirror bit of MSPInFRERSTm.MSPInDCEFSTm.
19 to 18	Reserved	When read, the value after reset is returned.
17	MSPInCEFSTm	This bit indicates whether a reception data CRC error was detected in communication frame. 0: No CRC error was detected on the associated reception data in communication frame. 1: A CRC error was detected on the associated reception data in communication frame. This bit is the mirror bit of MSPInFRERSTm.MSPInCEFSTm.
16	MSPInPEFSTm	This bit indicates whether a reception data parity error was detected in communication frame. 0: No parity error was detected on the associated reception data in communication frame. 1: A parity error was detected on the associated reception data in communication frame. This bit is the mirror bit of MSPInFRERSTm.MSPInPEFSTm.
15 to 0	MSPInRXDAm0 [15:0]	These bits hold the receive data (receive data bit 15 to 0). These bits are the mirror bits of MSPInRXDAm0[15:0].

19.5.2.26 MSPInCESTm — MSPIn Channel Error Status Register m (m = 0 to 7)

This register indicates the channel error status of MSPIn.

Access: This register is a read-only register that can be read in 8-bit units.

Address: <MSPIn_base> + 68_H + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	MSPIn OVREEm	MSPIn OVWREm	MSPIn OVRUEm	MSPIn DCEm	—	—	MSPIn CEm	MSPIn PEm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Table 19.46 MSPInCESTm Register Contents

Bit Position	Bit Name	Function
7	MSPInOVREEm	This bit indicates whether an over-read error was detected in Fixed FIFO memory mode. 0: No over-read Error was detected. 1: An over-read error was detected.
6	MSPInOVWREm	This bit indicates whether an over-write error was detected in Fixed FIFO memory mode. 0: No over-write error was detected. 1: An over-write error was detected.
5	MSPInOVRUEm	This bit indicates whether an over-run error was detected in Direct memory mode or Fixed FIFO memory mode. 0: No overrun error was detected. 1: An overrun error was detected.
4	MSPInDCEm	This bit indicates whether a transmission data consistency error was detected. 0: No consistency error was detected on the associated transmission data. 1: A consistency error was detected on the associated transmission data.
3, 2	Reserved	When read, the value after reset is returned.
1	MSPInCEm	Indicates whether a reception data CRC error was detected in communication frame. 0: No CRC error was detected on the associated reception data in communication frame. 1: A CRC error was detected on the associated reception data in communication frame.
0	MSPInPEm	Indicates whether a reception data parity error was detected in communication frame. 0: No parity error was detected on the associated reception data in communication frame. 1: A parity error was detected on the associated reception data in communication frame.

19.5.2.27 MSPInCESTCm — MSPIn Channel Status Clear Register m (m = 0 to 7)

This register is used to clear the Error flag of MSPInCESTm register.

Access: This register is a write-only register that can be written in 8-bit units.

Address: <MSPIn_base> + $6C_H$ + 80_H x (m+1)

Value after reset: 00_H

Bit:	7	6	5	4	3	2	1	0
	MSPIn OVREECm	MSPIn OVWRECm	MSPIn OVRUECm	MSPIn DCECm	—	—	MSPIn CECm	MSPIn PECm
Value after reset:	0	0	0	0	0	0	0	0
R/W:	W	W	W	W	R	R	W	W

Table 19.47 MSPInCESTCm Register Contents

Bit Position	Bit Name	Function
7	MSPInOVREECm	This bit clears the status flag of over-read error. 0: No function. 1: Clear MSPInCESTm. MSPInOVREEm to 0.
6	MSPInOVWRECm	This bit clears the status flag of over-write error. 0: No function. 1: Clear MSPInCESTm.MSPInOVWREm to 0.
5	MSPInOVRUECm	This bit clears the status flag of overrun error. 0: No function. 1: Clear MSPInCESTm.MSPInOVRUEm to 0.
4	MSPInDCECm	This bit clears the status flag of data consistency error. 0: No function. 1: Clear MSPInCESTm.MSPInDCEm to 0.
3, 2	Reserved	When writing, write the value after reset.
1	MSPInCECm	This bit clears the status flag of CRC error. 0: No function. 1: Clear MSPInCESTm.MSPInCEm to 0.
0	MSPInPECm	This bit clears the status flag of reception data parity error. 0: No function. 1: Clear MSPInCESTm.MSPInPEm to 0.

19.5.2.28 MSPInCFCNTm — MSPIn Channel Frame Count Register m (m = 0 to 7)

This register is used to confirm the remaining frame count number.

Access: This register is a read-only register that can be read in 8-, 16-, or 32-bit units.

Address: <MSPIn_base> + $5C_H$ + 80_H x (m+1)

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSPInCFCNTm[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.48 MSPInCFCNTm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is returned.
15 to 0	MSPInCFCNTm [15:0]	These bits indicate the remaining frame count number.

19.5.2.29 MSPInINTFk — MSPIn Interrupt Factor Register (k = 0 to 3)

These registers contain information about which MSPIn interrupt (INTMSPInTXm, INTMSPInRXm, INTMSPInFEm, INTMSPInERRm) has been generated without depending on MSPInINTMSK setting.

Regarding block diagram image, see **Figure 19.1, MSPI0-1 Interrupt Connection Image** and **Figure 19.2, MSPI2-9 Interrupt Connection Image**.

Access: These registers are read-only register that can be read in 32-bit units.

Address: <MSPIn_INTF_base> + k × 30_H + 00_H

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MSPInINTFk[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 19.49 MSPInINTFk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned.
7 to 0	MSPInINTFk [7:0]	MSPIn interrupts occurrence 0: No interrupt occurred 1: interrupt has occurred The bits correspond to the following interrupts. MSPInINTF0[7:0] : INTMSPInTX MSPInINTF1[7:0] : INTMSPInRX MSPInINTF2[7:0] : INTMSPInFE MSPInINTF3[7:0] : INTMSPInERR The number of bits of MSPInINTFk is same as the number of channels of MSPIn. Refer to **Table 19.3, Number of Transfer Control Channels and Chip Select Index**.

19.5.2.30 MSPInINTMSKk — MSPIn Interrupt Mask Register (k = 0 to 3)

These registers mask MSPIn interrupts output to INTC2 by each channels.

Access: These registers can be read or written in 32-bit units.

Address: <MSPIn_INTF_base> + k × 30_H + 04_H

Value after reset: 0000 $00FF_H$ (MSPI0-4), 0000 $000F_H$ (MSPI5-9)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MSPInINTMSKk[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0/1*1	0/1*1	0/1*1	0/1*1	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R/W*2	R/W*2	R/W*2	R/W*2	R/W	R/W	R/W	R/W

Note 1. MSPI0-4: 1_B
MSPI5-9: 0_B

Note 2. Writable only for MSPI0-4

Table 19.50 MSPInINTMSKk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
7 to 0	MSPInINTMSKk [7:0]	MSPIn interrupts output to INTC2 mask 0: Not masked 1: Masked The bits correspond to the following interrupts. MSPInINTMSK0[7:0] : INTMSPInTX MSPInINTMSK1[7:0] : INTMSPInRX MSPInINTMSK2[7:0] : INTMSPInFE MSPInINTMSK3[7:0] : INTMSPInERR The number of bits of MSPInINTMSKk is same as the number of channels of MSPIn. Refer to **Table 19.3, Number of Transfer Control Channels and Chip Select Index**.

19.5.2.31 MSPInINTFCk — MSPIn Interrupt Factor Clear (k = 0 to 3)

These registers clear MSPIn interrupt factor register (MSPInINTFk) to INTC2 by each channels.

Access: These registers are write-only register that can be written in 32-bit units.

Address: <MSPIn_INTF_base> + k × 30_H + 08_H

Value after reset: 0000 0000_H

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	MSPInINTFCk[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	W*1	W*1	W*1	W*1	W	W	W	W

Note 1. Writable only for MSPI0-4

Table 19.51 MSPInINTFCk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	MSPInINTFCk [7:0]	MSPInINTFCk flag clear 0: — 1: Clear The bits correspond to the following interrupts. MSPInINTFC0[7:0] : INTMSPInTX MSPInINTFC1[7:0] : INTMSPInRX MSPInINTFC2[7:0] : INTMSPInFE MSPInINTFC3[7:0] : INTMSPInERR The number of bits of MSPInINTFCk is same as the number of channels of MSPIn. Refer to **Table 19.3, Number of Transfer Control Channels and Chip Select Index**.

19.5.3 DMA/DTS Trigger Generator Registers

19.5.3.1 MSPITGCTLn — MSPI Trigger Control Register for MSPIn (n = 0 to 9)

This register is used to control DMA/DTS trigger generation

For details about DMA/DTS trigger generation, see **Section 19.4, DMA/DTS Trigger Generation**.

Access: This register can be read or written in 8-, 16-, or 32-bit units.

Address: <MSPITG_base> + n × 04_H

Value after reset: $0000\ 0000_H$

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SRCSEL7[2:0]			TRGSEL7	SRCSEL6[2:0]			TRGSEL6	SRCSEL5[2:0]			TRGSEL5	SRCSEL4[2:0]			TRGSEL4
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SRCSEL3[2:0]			TRGSEL3	SRCSEL2[2:0]			TRGSEL2	SRCSEL1[2:0]			TRGSEL1	SRCSEL0[2:0]			TRGSEL0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. Writable only for MSPITGCTL0-4 registers

Table 19.52 MSPITGCTLn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 29	SRCSEL7[2:0]	Trigger Source Select For Channel 7 000: Trigger 1=None, Trigger 2=None 001: Trigger 1=INTMSPInTX7, Trigger 2=None 010: Trigger 1=INTMSPInRX7, Trigger 2=None 011: Trigger 1=INTMSPInFE7 Trigger 2=None 100: Trigger 1=None, Trigger 2=INTMSPInTX7 101: Trigger 1=None, Trigger 2=INTMSPInRX7 110: Trigger 1=None, Trigger 2=INTMSPInFE7 111: Trigger 1=INTMSPInTX7, Trigger 2=INTMSPInRX7 These bits are valid for MSPITGCTL0-4 registers only
