

## ISL73007SEHEVAL1Z

The ISL73007SEHEVAL1Z evaluation board (shown in [Figure 3](#)) features the [ISL73007SEH](#) buck regulator. This IC is a small foot print radiation hardened POL designed for critical low power applications.

The ISL73007SEH is operational over 3V to 18V integrating both high-side and low-side power FETs and switches at a default 500kHz frequency. The switching frequency can also be programmed from 300kHz up to 1MHz using an external resistor. The ISL73007SEH uses constant-frequency peak current mode control architecture for fast loop transient response. The ISL73007SEH can use either its internal compensation at the 500kHz default switching frequency or an external Type II compensation at other frequencies to stabilize the loop as determined by specific design and performance requirements. When integrating both P-channel and N-channel power devices and with the option of internal compensation, a minimum of external components are required, thereby reducing the BOM count and complexity of the design.

The ISL73007SEHEVAL1Z demonstration board and this accompanying manual provide a quick and easy method to evaluate the ISL73007SEH part in both an internal or an external 500kHz configuration. See the [ISL73007SEH datasheet](#) for information about the operation, function, and performance of the device.

## Features

- Optimized for 12V to 3.3V conversion
- Jumper configurable to either the internal or external 500kHz switching frequency, slope and compensation configuration
- 3A output current

## Specifications

The ISL73007SEHEVAL1Z demonstration board is configurable by jumpers for either external or internal configuration of frequency, compensation or slope. The board allows for other conditions to be evaluated with user-modification of components and connections.

The electrical ratings of the ISL73007SEHEVAL1Z demonstration board are shown in [Table 1](#).

**Table 1. Electrical Ratings**

Parameter	Rating
PVIN Supply Voltage	10.8V - 18V
DC Output Voltage	3.3V
Operating Frequency	500kHz
Output Current	3A
Temperature	-55°C to +125°C

# 1. Functional Description

The ISL73007SEHEVAL1Z demonstration board is default configured for 12V to 3.3V conversion with a 3A maximum output current and contains the ISL73007SEH voltage regulator IC. Any of the external configurations for switching frequency, control loop and slope compensations can be chosen by jumpers JP4, JP5 and JP3 respectively. [Figure 1](#) shows the ISL73007SEHEVAL1Z demonstration board block diagram. Photographs of the ISL73007SEHEVAL1Z are shown in [Figure 3](#) and [Figure 4](#).

The ISL73007SEHEVAL1Z demonstration board provides test point access to critical pins of the IC device and convenient pads for connecting test equipment. For more information, see the schematic ([Figure 5](#)), PCB layers ([Figure 7](#) through [Figure 12](#)), and [Bill of Materials](#). Performance data taken using the ISL73007SEHEVAL1Z and basic lab equipment is shown in [Figure 13](#) through [Figure 24](#).

## 1.1 Operational Characteristics

The ISL73007SEHEVAL1Z only requires a single voltage supply > 10.8V connected to the PVIN pad to operate, outputting 3.3V on the VOUT pad with a 3A output current capability. Configured for a nominal PVIN voltage of 12V, the input operating voltage at which the IC turns on is set by the resistor divider ( $R_1$  and  $R_2$ ) on the ENABLE pin. **Note:** Do not exceed 5V on the ENABLE pin.

## 1.2 Setup and Configuration

The following equipment is recommended for testing the board:

- 12V power supply
- 100MHz oscilloscope

Complete the following steps to configure and use the board:

1. Configure the board as shown in [Figure 2](#).
2. Connect and turn on a 12V power supply to the PVIN pad.
3. Using the oscilloscope to look at VIN and VOUT waveforms and to also observe the behavior of the LX phase node located on pins 13 and 14 of the IC package. Proper probe grounding must be practiced when observing clean waveforms.
4. Output current loading can be externally added at the VOUT and GND pads for loaded output evaluations. A DVM(s) can be employed to monitor the input and output voltages and currents.

## 2. Board Design

Figure 3. ISL73007SEHEVAL1Z Evaluation Board (Top)

Figure 4. ISL73007SEHEVAL1Z Evaluation Board (Bottom)

## 2.1 Basic Layout

The ISL73007SEH is located in the center of the board and is labeled U1. Input power is to be connected across the PVIN and GND jacks. The output voltage appears across the VOUT and GND jacks.  $C_{IN}$  is provided by  $C_2$  and  $C_4$  (flip side). The output LC filter is comprised of the  $L_{OUT}$ ,  $L_1$  and  $C_{OUT}$  is provided by  $C_7$  and  $C_9$ . JP1 sets the EN threshold to enable the IC when PVIN is  $\sim 10.8V$ , otherwise ENABLE can be accessed by TP1. The transient generator circuit is towards the right of the board. Consult the schematic in (Figure 5) for details.

## 2.2 Layout Guidelines

PCB design is critical to reduce parasitic inductances with critical components being closely placed to the IC. The critical components in order would be the loop compensation RC, the slope resistor, and the low ESR ceramic input capacitors. Avoid placing any traces or components under the LX shapes to avoid noise coupling from the switching node.
