

## ISL73847SEHDEMO2Z

The ISL73847SEHDEMO2Z demonstration board demonstrates the performance of the **ISL73847SEH** dual-phase buck controller. The board is optimized for a 4.5V to 15V input operation to generate a 50A max, 1V output.

## Specifications

- Input voltage supply ( $V_{IN}$ ): 4.5V to 15V
- Preset output voltage ( $V_{OUT}$ ): 1V
- Preset switching frequency: 500kHz
- Maximum load current: 50A
- Preset droop regulation

## Features

- Power-Good LED indicator
- Integrated LDO (VCC)
- Droop regulation set by a single resistor

# 1. Functional Description

## 1.1 Operating Range

The ISL73847SEHDEMO2Z board requires one input supply ( $V_{IN}$ ) to operate properly. This supply powers the ISL73847SEH controller analog supply input, plus additional supporting circuitry and the onboard buck power supply input. You can set the  $V_{IN}$  supply from 4.5V to 15V. The buck regulator circuit is preset for a 1V output voltage and a switching frequency of 500kHz with a  $0.22\mu H$  output inductor and  $2.64mF$  output capacitance per phase with the option of being synchronized to an external clock using SYNC-I.

## 1.2 Before Starting

The board does not come with any connectors. To properly use the board, you must solder connectors to the  $V_{IN}$ , GND, and  $V_{OUT}$  solder pads.

## 1.3 Quick-Start Guide

1. Apply a 4.5V to 15V voltage to  $V_{IN}$  connectors, as shown in [Figure 2](#). To use 4w sense lines from a power supply or a voltmeter to monitor the input voltage, solder a jumper to TP1.
2. If required, a resistor or electronic load can be connected to the  $V_{OUT}$  connectors, as shown in [Figure 2](#). To use 4w sense lines from an electronic load, solder a jumper to TP2.

Figure 2. ISL73847SEHDEMO2Z Board Setup

## 1.4 Changing the Switching Frequency

The ISL73847SEHDEMO2Z is configured for a 500kHz switching frequency by a 94.2kΩ pull-down resistor ( $R_2$ ) on the FS pin. The demonstration board includes a 0.22μH inductor and an array of output bypass capacitors for a 2.64mF output capacitance per phase, which makes up the LC filter. If you need to select a different switching frequency, see [Figure 3](#) for choosing the appropriate  $R_2$  value on FS. For more information about the FS pin, refer to the [ISL73847SEH datasheet](#).

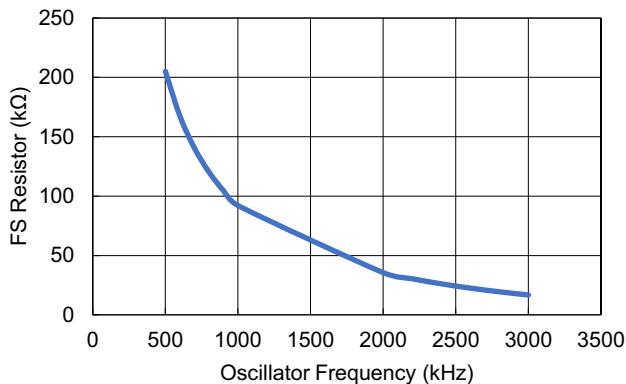

Figure 3.  $R_{FS}$  vs Frequency

## 1.5 Soft-Start Adjustment

The ISL73847SEHDEMO2Z is configured for a 2ms soft-start (SS) time by a 22nF bypass capacitor ( $C_2$ ) connected to the SS pin. The SS time can be adjusted from 2ms to 200ms by changing the  $C_2$  capacitor. If you must select a different soft-start time, use [Equation 1](#) to calculate the capacitance given the required soft-start time. For more information on SS, refer to the [ISL73847SEH datasheet](#).

$$(EQ. 1) \quad C_{SS} = \frac{t_{SS} \times 10^{-5}}{V_{REF}}$$

where:

- $C_{SS}$  is the soft-start capacitance in Farads
- $t_{SS}$  is the required soft-start time in seconds
- $V_{REF}$  is the reference voltage, which is nominally 0.6V

## 1.6 Droop Regulation

The ISL73847SEHDEMO2Z minimizes peak-to-peak transient response excursions by using a 604Ω resistor ( $R_1$ ) connected between the VREF and DROOP pins. If droop regulation is unnecessary, replace the 604Ω with a 0Ω resistor to short the VREF and DROOP pins together. For more information about the droop regulation, refer to the [ISL73847SEH datasheet](#).

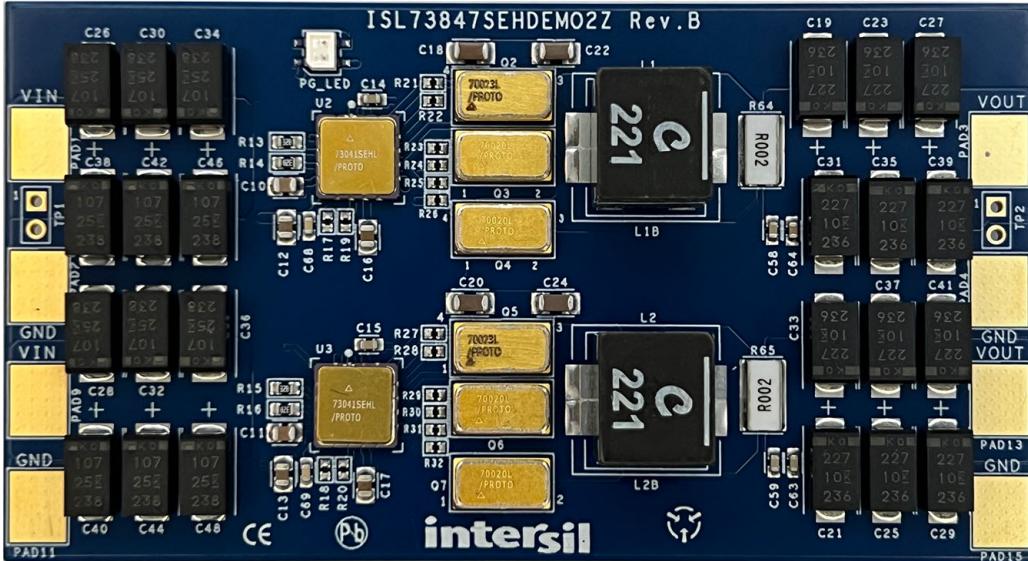

## 1.7 IMON

The ISL73847SEHDEMO2Z monitors the average current through the inductor as a voltage on the IMON pin. A 10kΩ pull-down resistor ( $R_{10}$ ) is connected to the IMON pin. A 100pF bypass capacitor is added in parallel to  $R_{10}$  to improve averaging. For more information about the IMON pin, refer to the [ISL73847SEH datasheet](#).

## 1.8 Enabling/Disabling

The ISL73847SEHDEMO2Z automatically enables when VDD reaches a certain voltage on power-up by a  $4.99\text{k}\Omega$  resistor ( $R_6$ ) connected between EN and VDD. For more information about enabling and disabling the controller, refer to the */ISL73847SEH datasheet*.
