

## ISL71091SEHxx Family

Single Event Effects (SEE) Testing

AN1938  
Rev 0.00  
June 4, 2014

## Introduction

The intense proton and heavy ion environment encountered in space applications can cause a variety of single event effects in electronic circuitry, including Single Event Upset (SEU), Single Event Transient (SET), Single Event Functional Interrupt (SEFI), Single Event Burnout (SEB). SEE can lead to system-level performance issues including disruption, degradation and destruction. For predictable and reliable space system operation, individual electronic components should be characterized to determine their SEE response. This report discusses the results of SEE testing performed on the ISL71091SEHxx product family or precision references design for space applications.

## Product Description

The ISL71091SEHxx is a family of ultra low noise, high DC accuracy precision voltage reference products with an input range to 30V. Four output voltage variants are available, 3.30V (ISL71091SEH33), 2.048V (ISL71091SEH20), 4.096V (ISL71091SEH40), and 10.0V (ISL71091SEH10). The ISL71091SEHxx use the Intersil PR40 Advanced Bipolar technology to achieve sub  $4\mu\text{V}_{\text{P,P}}$  noise at 0.1Hz and achieve 0.25% accuracy over radiation. Its implementation in an advanced bonded wafer SOI process using deep trench isolation results in fully isolated structures and latch-up free performance, whether electrically or single event (SEL) caused.

## Product Documentation

For more information about the ISL71091SEHxx, refer to the following documentation.

## SEE Test Objectives

The ISL71091SEHxx was tested to determine its susceptibility to Single Event Burnout (SEB, destructive ion effects) and to characterize its Single Event Transient (SET) behavior over various Linear Energy Transfer (LET) levels.

## SEE Test Facility

Testing was performed at the Texas A&M University (TAMU) Cyclotron Institute heavy ion facility. This facility is coupled to a K500 super-conducting cyclotron, which is capable of generating a wide range of test particles with the various energy, flux and fluence levels needed for advanced radiation testing.

## SEE Test Set-up

SEE testing is carried out with the sample in an active configuration. A schematic of the ISL71091SEHxx SEE test fixture is shown in [Figure 1](#). The test circuit is configured to accept an input voltage from 4V to 30V and generate the nominal output voltage. The output current of the reference was adjusted using fixed load resistors on a test board.

Four ISL71091SEHxx test fixtures were mounted to a test jig, which could be moved with respect to the ion beam. The parts were assembled in dual in-line packages with the metal lid removed for beam exposure. Using 20-foot coaxial cables, the test jig was connected to a switch box in the control room, which contained all of the monitoring equipment. The switch box allowed any one of the four test circuits to be controlled and monitored remotely.

In later testing a single board with four devices mounted so that all four could be exposed to the ion beam at once. This allowed testing of four parts simultaneously.

Digital multimeters were used to monitor input voltage ( $V_{\text{IN}}$ ), output voltage ( $V_{\text{OUT}}$ ) and input current ( $I_{\text{IN}}$ ). LeCroy waveRunner 4-channel digital oscilloscopes were used to capture and store SET traces at  $V_{\text{OUT}}$  that exceeded the oscilloscope trigger level.

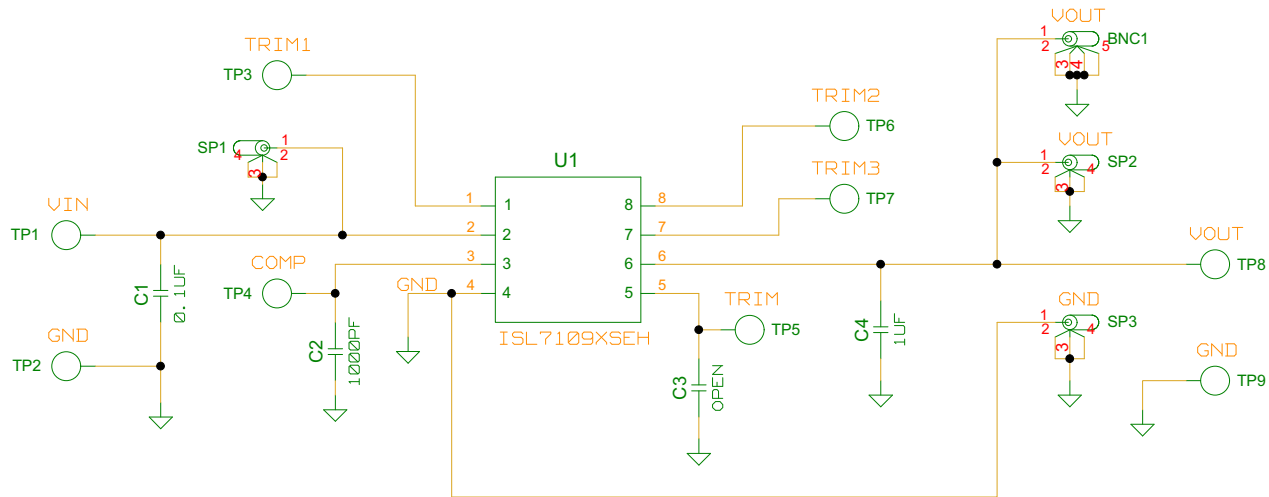

FIGURE 1. SCHEMATIC OF THE ISL71091SEHXX SEE TEST CIRCUIT

NOTE:

1. The output capacitor ( $C_{OUT}$ ),  $C_4$ , was varied between 0.1µF and 10µF and the compensation capacitor ( $C_{COMP}$ ),  $C_2$ , was varied between 1nF and 10nF.

### SEB Testing of ISL71091SEH33 (3.3V) Reference

For the SEB tests, conditions were selected to maximize the electrical and thermal stresses on the Device Under Test (DUT), thus insuring worst-case conditions. The input voltage ( $V_{IN}$ ), was initially set to 35V, and then increased in 1V increments. SEB testing was conducted with the ISL71091SEH33, hence the output voltage ( $V_{OUT}$ ) was 3.3V. Output current ( $I_{OUT}$ ) was set to either 5mA (sinking current) or 10mA (sourcing current), which are the limits of load regulation current for the parts. The output capacitance was tested at both 0.1µF and 10µF. Case temperature was maintained at +125°C by controlling the current flowing into a resistive heater bonded to the underside of

the DUT. This insured that the junction temperature of the DUT exceeded +125°C, which is the maximum junction temperature anticipated for high reliability applications. Four devices were irradiated with Au ions at a normal incident angle, resulting in an effective LET of 86.4 MeV·cm<sup>2</sup>/mg. Table 1 summarizes the results of SEB testing. The chart shows sample size and passing results for an input voltage level of 36V on each device.

From a silicon design perspective all the products in the ISL71091SEHxx product family are exactly the same in silicon. The output voltages are produced by the same circuitry and trimmed through a resistor ladder network. Therefore, the ISL71091SEH33 SEB results are applicable to the complete product family of ISL71091SEHxx parts.

NOTE:

- Samples were tested with increasing input voltage (V<sub>IN</sub>) until failure as determined by more than 1% change in either V<sub>OUT</sub> or I<sub>IN</sub>. The chart shows passing results for the input voltage levels of 35V and 36V and failures at 38V. Each irradiation was to 5x10<sup>6</sup> ions/cm<sup>2</sup> at a rate of 2.5x10<sup>4</sup> ions/(cm<sup>2</sup>s).

## SET Testing of ISL71091SEH33, 3.3V Reference

The first SET testing of the ISL71091SEHxx family was done on four samples of the ISL71091SEH33. Two parts had C<sub>OUT</sub> = 0.1μF and two parts had C<sub>OUT</sub> = 10μF. Irradiation was done at room temperature with LET of 8.5, 28, and 60 MeV·cm<sup>2</sup>/mg. Samples had V<sub>IN</sub> varied over 5.5V to 16.5V. V<sub>IN</sub> was limited to 16.5V due to the observed large SET at V<sub>IN</sub> = 30V which still represented in Figure 3 at V<sub>IN</sub> = 16.5V. Table 2 shows the SET summary giving the cross section for each input voltage and LET level. Figure 2 is the LET threshold plot representing Table 2.

TABLE 2. SET SUMMARY OF ISL71091SEH33 (3.3V) SAMPLES

8.5	13.2	1	0.1	191	5.0E+06	3.8E-05
8.5	5.5	1	0.1	158	5.0E+06	3.2E-05

NOTE:

- Trigger level for the output voltage was set to ±30mV and C<sub>COMP</sub> = 1nF.

FIGURE 2. ISL71091SEH33 LET THRESHOLD PLOT FOR ±30mV TRIGGER WINDOW WITH C<sub>OUT</sub> = 0.1μF AND I<sub>OUT</sub> = 1mA.

The data presented above only counts SET that exceed ±30mV. Closer inspection of SET reveals that there is a significant spread in the size and duration of the SET included in those counts. Most notably, at higher V<sub>IN</sub> and LET a set of very large and long SET appears. Figure 3 shows a sampling of these large SET for V<sub>IN</sub> = 16.5V and LET = 60. The largest from this particular run was over +300mV from nominal and lasted well over 1ms.

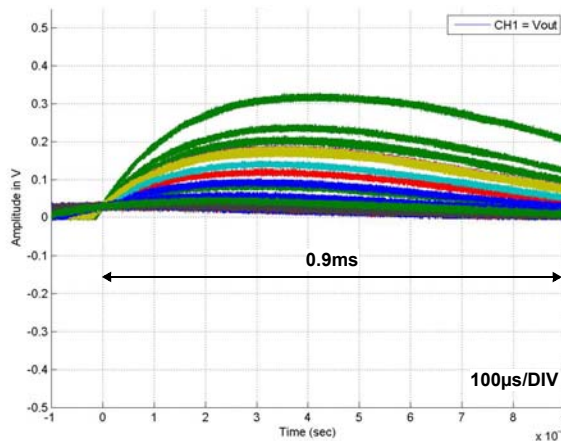

FIGURE 3. COMPOSITE (58) PLOT OF SELECTED LARGE AND LONG SET FOR ISL71091SEH33 AT LET = 60, V<sub>IN</sub> = 16.5V, I<sub>OUT</sub> = 1mA, C<sub>OUT</sub> = 10μF

Lowering the input voltage to V<sub>IN</sub> = 13.2V significantly suppressed the magnitude of the SET as can be noted in Figure 4. Thus the input voltage is a strong determiner of this large and long SET category.

FIGURE 4. COMPOSITE (5) PLOT OF SELECTED LARGE AND LONG SET FOR ISL71091SEH33 AT LET = 60,  $V_{IN} = 13.2V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 10\mu F$

It is also worth noting that reducing the output capacitor from  $10\mu F$  to  $0.1\mu F$  is effective in shortening the SET disturbance but is not effective in reducing the magnitudes. Comparing the magnitudes of Figure 5 with those of Figure 3 illustrates this point. In both figures, the peak prolonged SET is about  $+300mV$ , while in Figure 3 it persists over  $1ms$  whereas in Figure 5 the SET is limited to within  $200\mu s$ . Figures 3 through 7 indicate a strong dependence of SET magnitude on  $V_{IN}$  and a strong dependence of the SET duration on  $C_{OUT}$ . Just as a confirmation, Figure 6 compared to Figure 3 demonstrates the impact of both  $V_{IN}$  and  $C_{OUT}$ , although the peak magnitudes roughly double those of Figure 4. Finally, Figure 7 shows that the large and long SET are gone with a  $V_{IN} = 5.5V$  at LET = 28. Only sharp spike SET remain (both positive and negative), with magnitudes larger than the slow events at  $C_{OUT} = 10\mu F$ .

FIGURE 5. COMPOSITE (250) SET PLOT FOR ISL71091SEH33 AT LET = 60,  $V_{IN} = 16.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$

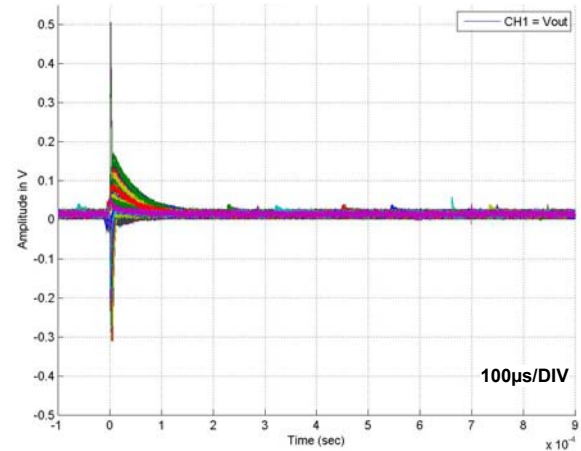

FIGURE 6. COMPOSITE (250) SET PLOT FOR ISL71091SEH33 AT LET = 60,  $V_{IN} = 13.2V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$

FIGURE 7. COMPOSITE (250) SET PLOT FOR ISL71091SEH33 AT LET = 28  $V_{IN} = 5.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$ ,  $C_{COMP} = 1nF$ .

## SET Testing of ISL71091SEH20, 2.048V Reference

Four of the ISL71091SEH20 2.048 references were run to test for SET. A summary of the conditions and the SET counts obtained is in [Table 3](#).

TABLE 3. SET SUMMARY OF ISL71091SEH20 (2.048V) SAMPLES

NOTE:

4. Trigger level for the output voltage set to ±20mV and I<sub>OUT</sub> = 1mA. Each irradiation was to 5x10<sup>6</sup> ion/cm<sup>2</sup>.

SET for the ISL71091SEH20 varied considerably with the selection of C<sub>OUT</sub> (either 0.1μF or 1μF) and the headroom voltage on V<sub>IN</sub>. Examples of the SET waveforms captured are shown in [Figures 8](#) through [12](#).

FIGURE 8. COMPOSITE (100) PLOT OF SET FOR ISL71091SEH20 AT LET = 60 V<sub>IN</sub> = 16.5V, I<sub>OUT</sub> = 1mA, C<sub>OUT</sub> = 0.1μF, C<sub>COMP</sub> = 1nF. TRIGGER AT ±20mV, WHILE SCOPE TRUNCATES SET TRACES AT ±400mV.

FIGURE 9. COMPOSITE PLOT OF 100 SET FOR ISL71091SEH20 AT LET = 60 V<sub>IN</sub> = 16.5V, I<sub>OUT</sub> = 1mA, C<sub>OUT</sub> = 1μF, C<sub>COMP</sub> = 1nF. TRIGGER AT ±20mV.

[Figures 8](#) and [9](#) show the SET resulting with V<sub>IN</sub> = 16.5V and LET = 60 MeV • cm<sup>2</sup>/mg. In the case of [Figure 8](#) (C<sub>OUT</sub> = 0.1μF) some SET exceeded 400mV deviation from the 2.048V regulation point, both positive and negative at I<sub>OUT</sub> = 1mA. In this case, the SET duration was about 30μs.

For [Figure 9](#) (C<sub>OUT</sub> = 1μF) the SET deviations were limited to about +250mV and -100mV at I<sub>OUT</sub> = 1mA. However, the durations are much longer with some overshoot (undershoot) evident beyond 80μs. A few SET in [Figure 9](#) are very long and extrapolate out to about 1ms, but this again is at V<sub>IN</sub> = 16.5V. These events represent a cross section of about 2x10<sup>-6</sup> cm<sup>2</sup>. These very long SET are consistent with what was seen on the ISL71091SEH33 (3.3V) reference. It is interesting to note that these long SET disappeared with a reduced V<sub>IN</sub> = 13.2V as exhibited in [Figure 10](#). [Figure 11](#) is also free of these long SET for V<sub>IN</sub> = 5.5V, and a moderate reduction in SET peak deviations is also seen. LET = 28 MeV • cm<sup>2</sup>/gm is insufficient to generate

these long SET even with  $V_{IN} = 16.5V$ , as shown in [Figure 12](#) as compared to [Figure 9](#).

**FIGURE 10. COMPOSITE (100) PLOT OF SET FOR ISL71091SEH20 AT LET = 60  $V_{IN} = 13.2V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 1nF$ . TRIGGER AT  $\pm 20mV$ .**

**FIGURE 11. COMPOSITE (100) PLOT OF SET FOR ISL71091SEH20 AT LET 60  $V_{IN} = 5.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 1nF$ . TRIGGER AT  $\pm 20mV$ .**

**FIGURE 12. COMPOSITE (100) PLOT OF SET FOR ISL71091SEH20 AT LET = 28  $V_{IN} = 16.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 1nF$ . TRIGGER AT  $\pm 20mV$ .**

**FIGURE 13. COMPOSITE PLOT OF 100 SET FOR ISL71091SEH20 AT LET = 60,  $V_{IN} = 5.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$ ,  $C_{COMP} = 1nF$ . TRIGGER AT  $\pm 20mV$  AND SCOPE TRUNCATING SET AT  $\pm 400mV$ .**

Even at  $V_{IN} = 5.5V$  the SET can exceed  $\pm 400mV$  with  $C_{OUT} = 0.1\mu F$ . Thus the SET performance is very much linked to both the selection of  $C_{OUT}$  and  $V_{IN}$ . Comparing [Figure 13](#) to [Figure 11](#) shows that the magnitude of the SET are reduced from greater than 400mV with  $C_{OUT} = 0.1\mu F$  ([Figure 13](#)) to less than 125mV ([Figure 11](#)), but the duration grows from under 20µs to about 200µs. Comparing [Figure 12](#) to [Figure 11](#) indicates that the magnitude of the SET does not diminish much with the reduction in ion LET from 60 to 28 MeV • cm<sup>2</sup>/mg.

## SET Testing of ISL71091SEH40, 4.096V Reference

Four samples of the ISL71091SEH40 (4.096V reference) were tested for SET as summarized in Table 4. Parts were tested at both maximum sink (-5mA) and source current (10mA) at LET 28 and 8.5 MeV • cm<sup>2</sup>/mg. SET captures were triggered at ±20mV deviation from DC.

There is a clear difference between DUT3 and DUT4 even though they had the same capacitance values. It was noted that the SET triggering on DUT3 were spikes of <10ns duration, (see Figure 20) so the difference was in registering these very short events. The oscilloscopes were swapped and the difference between DUT3 and DUT4 remained the same, so the difference was not the oscilloscope. Very likely the difference was due to a difference in the C<sub>OUT</sub> impedance as dominated by PC board parasitics, but that is speculation.

It is clear that the decrease in LET from 28 to 8.5 MeV • cm<sup>2</sup>/mg significantly reduced the number of SET reaching the ±20mV trigger threshold. Also, the selection of capacitor values had a strong influence on captures. At C<sub>OUT</sub> = 1µF and C<sub>COMP</sub> = 10nF SET reaching ±20mV were nearly eliminated for LET 8.5 MeV • cm<sup>2</sup>/mg. With C<sub>OUT</sub> = 10µF, no SET at all of ±20mV were recorded.

The SET counts for DUT1 runs 301 through 306 were very similar and the SET transients were of the form represented in Figure 14 which shows all the SET for run 303 and DUT1. A few large positive SET extended to a maximum of +520mV, and a single large negative SET reached 330mV. However, the vast majority of

SET captured was within ±100mV. The major SET deviation was over in about 20µs with the tail extending about 100µs. These characteristics held for the other 300 series runs on DUT1.

FIGURE 14. COMPOSITE PLOT OF 1021 SET FOR DUT1 RUN 303: C<sub>OUT</sub> = 0.1µF, C<sub>COMP</sub> = 1nF, I<sub>OUT</sub> = -5mA, V<sub>IN</sub> = 30V, LET = 28

A slightly different way to look at the SET is provided in Figure 15. It is clear in this view just how rare the larger SET's are. Virtually all the positive SET are between -175mV and +25mV; only a 6.75x10<sup>-6</sup> cross section represents larger positive events. There were 27 events above +250mV out of 1021 total captures. Negative SET are almost all smaller than 200mV.

FIGURE 15. SUMMARY OF RUN 301 DUT1 SET CROSS SECTIONS BY DEVIATION. THE COLUMNS REPRESENT THE CROSS SECTION OF SET WITH DEVIATIONS LARGER THAN THE BIN THE COLUMN IS IN.

DUT2, with  $C_{OUT} = 1\mu F$  and  $C_{COMP} = 10nF$ , exhibited different SET characteristics from DUT1 as shown in Figure 16. The count of SET exceeding  $\pm 20mV$  is reduced by a factor of 30, and those captured were bounded by  $+75mV$  and  $-50mV$  and decayed in  $100\mu s$ . Despite the higher SET counts for DUT2 on runs 301 and 302 the SET form was the same.

FIGURE 16. COMPOSITE PLOT OF 34 SET FOR DUT2 RUN 303:  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 10nF$ ,  $I_{OUT} = -5mA$ ,  $V_{IN} = 30V$ , LET = 28

Figure 17 shows the form of the SET shifted with a change in load current from  $-5mA$  to  $+10mA$ . In this case the negative SET extended down to  $-90mV$ , but the positive SET were essentially unchanged at about  $+75mV$ .

When the LET was dropped to  $8.5 MeV \cdot cm^2/mg$  the SET reaching  $\pm 20mV$  on DUT2 virtually vanished. Figure 18 shows the only two SET recorded on DUT2 for run 206 and these barely made the  $\pm 20mV$  trigger level.

FIGURE 17. COMPOSITE PLOT OF 33 SET FOR DUT2 RUN 306:  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 10nF$ ,  $I_{OUT} = 10mA$ ,  $V_{IN} = 30V$ , LET = 28

FIGURE 18. COMPOSITE PLOT OF THE 2 SET FOR DUT2 RUN 206:  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 10nF$ ,  $I_{OUT} = 10mA$ ,  $V_{IN} = 30V$ , LET = 8.5

Finally, the SET for DUT3 ( $C_{OUT} = 10\mu F$ ,  $C_{COMP} = 10nF$ ) at LET =  $28 MeV \cdot cm^2/mg$  are shown in Figure 19. It should be noted that the time scale in Figure 19 is marked  $1 \times 10^{-6}$  seconds where as the previous plots were in  $1 \times 10^{-5}$  seconds. The plots in Figure 19 do not reach the  $\pm 20mV$  triggering levels due to the plotting software routine (MATLAB), filtering out the triggering event, which was very short and sharp. An example of the direct oscilloscope capture for DUT3 in run 301 is shown in Figure 20. Here it can be seen that the event triggering the oscilloscope was only about  $10ns$  wide and negative.

**FIGURE 19. COMPOSITE PLOT OF THE 193 SET FOR DUT3 RUN 306:**  
 $C_{OUT} = 10\mu F$ ,  $C_{COMP} = 10nF$ ,  $I_{OUT} = 10mA$ ,  $V_{IN} = 30V$ ,  
 LET = 28

## SET Testing of ISL71091SEH10, 10.0V Reference

Four ISL71091SEH10 (10.0V) parts were initially SET tested as outlined in [Table 5](#).

**TABLE 5. SUMMARY OF SET TESTING OF ISL71091SEH10 SAMPLES**

LET	$C_{OUT}$ ( $\mu F$ )	$C_{COMP}$ (nF)	$V_{IN}$	PART A EVENTS ( $\pm 100mV$ )	PART B EVENTS ( $\pm 100mV$ )	NET CROSS SECTION ( $cm^2$ )
60	1	1	16.5	74	46	1.2E-05
60	0.1	1	16.5	419 (2962 <a href="#">Note 7</a> )	441 (989 <a href="#">Note 7</a> )	4.0E-04

8.5	1	1	16.5	0	0	–
8.5	0.1	1	16.5	1 (257 <a href="#">Note 7</a> )	2 (49 <a href="#">Note 7</a> )	3.1E-05
8.5	1	1	13.2	0	0	–
8.5	0.1	1	13.2	0 (234 <a href="#">Note 7</a> )	0 (124 <a href="#">Note 7</a> )	–

**NOTES:**

- The  $I_{OUT}$  for each part was 1mA and the fluency for each irradiation was  $5 \times 10^6$  ion/ $cm^2$ .
- Counts were captured with a  $\pm 20mV$  trigger.

The counts of  $\pm 100mV$  ( $\pm 1\%$ ) SET were highly sensitive to the value of  $C_{OUT}$ . [Figure 21](#) shows the plot of cross sections versus LET. The cross section at LET = 60 was reduced by almost an order of magnitude in going from  $C_{OUT} = 0.1\mu F$  to  $C_{OUT} = 1\mu F$ . The  $\pm 20mV$  (0.2%) SET were much more common but were not captured for all cases and are not converted to cross sections here.

[Figures 22](#) and [23](#) provide comparison of the SET forms for the two different output capacitors, 0.1 $\mu F$  and 1 $\mu F$ . The SET with the smaller  $C_{OUT}$  value reach the oscilloscope clipping limits of  $\pm 400mV$ , but the SET for the larger  $C_{OUT}$  are maintained within  $\pm 200mV$ . However, the duration grows from 20 $\mu s$  to 100 $\mu s$ . There does not appear to be significant overshoot/undershoot in the case of  $C_{OUT} = 1\mu F$  that appears in case of the 2.048V reference.

[Figure 24](#) shows that SET of significant magnitude ( $>300mV$ ) are induced by ions with LET of 8.5  $MeV \cdot cm^2/mg$ . However, with  $C_{OUT} = 1\mu F$  all SET were suppressed to below the  $\pm 100mV$  triggering threshold for LET < 60. It appears that  $C_{OUT} = 1\mu F$  is sufficient to hold all 10V output SET within  $\pm 100mV$  for LET  $\leq 28$   $MeV \cdot cm^2/mg$  and  $I_{OUT} = 1mA$ . Both positive and negative SET's are in evidence at the 1mA output current. At LET = 60, SET larger than 100mV do occur.

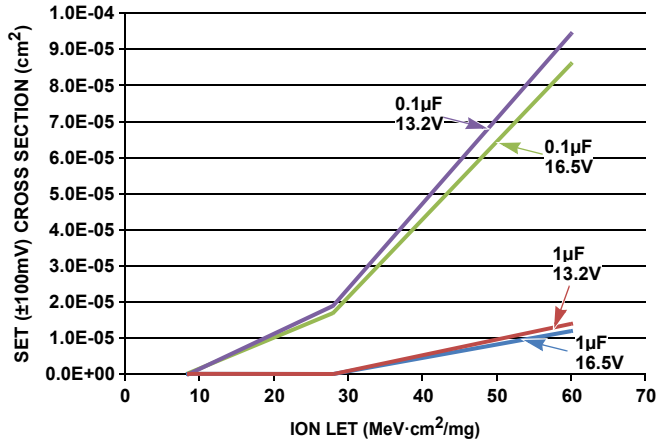

FIGURE 21. PLOT OF NOMINAL CROSS SECTION FOR THE VARIOUS CONDITIONS TESTED FOR THE ISL71091SEH10

FIGURE 22. COMPOSITE PLOT OF 100 SET FOR ISL71091SEH10 AT LET = 60,  $V_{IN} = 16.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$ ,  $C_{COMP} = 1nF$ . CAPTURE TRIGGER AT  $\pm 20mV$ , SCOPE TRUNCATED SET AT  $\pm 400mV$ .

FIGURE 23. COMPOSITE (74) PLOT OF SET FOR ISL71091SEH10 AT LET = 60,  $V_{IN} = 16.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 1\mu F$ ,  $C_{COMP} = 1nF$ . CAPTURE TRIGGER AT  $\pm 100mV$ .

FIGURE 24. COMPOSITE (49) PLOT OF SET FOR ISL71091SEH10 AT LET = 8.5,  $V_{IN} = 16.5V$ ,  $I_{OUT} = 1mA$ ,  $C_{OUT} = 0.1\mu F$ ,  $C_{COMP} = 1nF$ . CAPTURE TRIGGER AT  $\pm 20mV$

Further SET testing was done on four additional parts of the ISL71091SEH10 to look at the lower LET and the impact of the capacitor selection. A summary of this testing is shown in [Table 6](#).

TABLE 6. SUMMARY OF SECOND ROUND OF SET TESTING ON THE ISL71091SEH10

Run	LET	IOUT (mA)	VIN (V)	SET Counts ( $\pm 20\text{mV}$ ), $4\text{e}6 \text{ ion/cm}^2$			
				$C_{\text{OUT}} = 0.1\mu\text{F}$ $C_{\text{COMP}} = 1\text{nF}$	$C_{\text{OUT}} = 1\mu\text{F}$ $C_{\text{COMP}} = 10\text{nF}$	$C_{\text{OUT}} = 10\mu\text{F}$ $C_{\text{COMP}} = 10\text{nF}$	
				DUT 1	DUT 2	DUT 3	DUT 4
311	28	-5	6	1129	58	183	13
312			7.5	1103	67	196	34
313			30	<b>952 (Figure 25)</b>	<b>38 (Figure 27)</b>	<b>435 (Figure 28)</b>	62
314	10	10	6	1229	70	162	9
315			7.5	1379	73	211	28
316			30	1219	39	437	59
211	8.5	-5	6	176	1	0	0
212			7.5	162	0	0	0
213			30	<b>154 (Figure 26)</b>	1	0	0
214		10	6	179	0	0	0
215			7.5	161	0	0	0
216			30	194	0	0	0

NOTE:

8. Bold entries correspond to composite SET plot in [Figures 25](#) through [28](#).

Clearly the count of  $\pm 20\text{mV}$  SET is reduced considerably in going from  $C_{\text{OUT}} = 0.1\mu\text{F}$  and  $C_{\text{COMP}} = 1\text{nF}$  to  $C_{\text{OUT}} = 1\mu\text{F}$  and  $C_{\text{COMP}} = 10\text{nF}$ . The change going from  $C_{\text{OUT}} = 1\mu\text{F}$  to  $C_{\text{OUT}} = 10\mu\text{F}$  is less clear due to the discrepancy between DUT3 and DUT4. This difference mimics the difference between DUT3 and DUT4 of the 4.096V reference.

[Figure 25](#) displays the 952 events registered for run 313 on DUT1. The similarity of these SET with those observed for the 4.096V reference ([Figure 14](#)) is clear, even to the deviations of the SET.

Reducing the LET to  $8.5 \text{ MeV} \cdot \text{cm}^2/\text{mg}$  reduces the SET magnitudes as well as the  $\pm 20\text{mV}$  SET counts (952 to 154) as shown in [Figure 26](#). Clearly the LET determines the magnitude of the resulting SET. Although one SET reached  $+270\text{mV}$  and one reached  $-75\text{mV}$ , the rest of the SET were bounded by  $+100\text{mV}$  and  $-50\text{mV}$ .

The impact of changing  $C_{\text{OUT}}$  to  $1\mu\text{F}$  and  $C_{\text{COMP}}$  to  $10\text{nF}$  is apparent in [Figure 27](#) (run 313 DUT2). Not only has the SET count dropped from 952 to 38, but the extremes of the SET have dropped to  $+75\text{mV}$  and  $-60\text{mV}$ . This is virtually identical to the case of the 4.096V reference depicted in [Figure 16](#).

For the case of  $C_{\text{OUT}} = 10\mu\text{F}$  and  $C_{\text{COMP}} = 10\text{nF}$  the 10V reference again correlates with the 4.096V reference in that SET under 5mV register on the plotting diagrams.

FIGURE 25. COMPOSITE PLOT OF 952 SET FROM RUN 313 ON DUT1:  $C_{\text{OUT}} = 0.1\mu\text{F}$ ,  $C_{\text{COMP}} = 1\text{nF}$ ,  $I_{\text{OUT}} = 10\text{mA}$ ,  $V_{\text{IN}} = 30\text{V}$ , LET = 28

FIGURE 26. COMPOSITE PLOT OF 154 SET FROM RUN 213 DUT1:  
 $C_{OUT} = 0.1\mu\text{F}$ ,  $C_{COMP} = 1\text{nF}$ ,  $I_{OUT} = -5\text{mA}$ ,  $V_{IN} = 30\text{V}$ ,  
 $\text{LET} = 8.5$ .

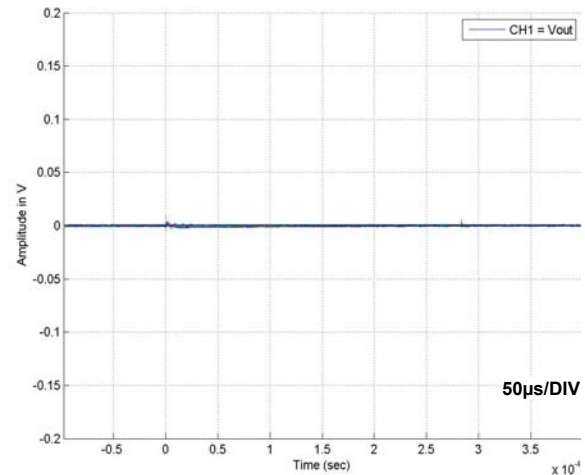

FIGURE 28. COMPOSITE PLOT OF 435 SET FROM RUN 313 DUT3:  
 $C_{OUT} = 10\mu\text{F}$ ,  $C_{COMP} = 10\text{nF}$ ,  $I_{OUT} = -5\text{mA}$ ,  $V_{IN} = 30\text{V}$ ,  
 $\text{LET} = 28$

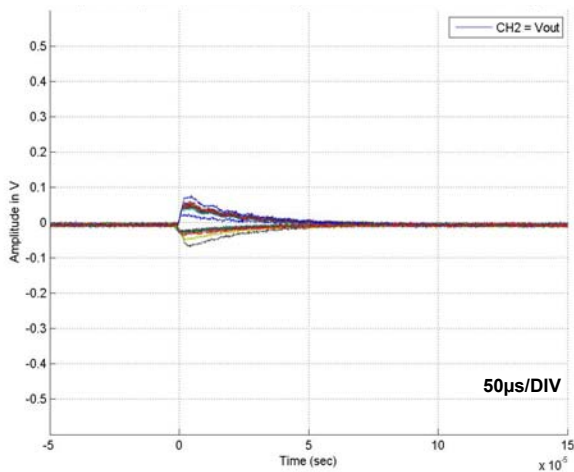

FIGURE 27. COMPOSITE PLOT OF 38 SET FROM RUN 313 DUT2:  
 $C_{OUT} = 1\mu\text{F}$ ,  $C_{COMP} = 10\text{nF}$ ,  $I_{OUT} = -5\text{mA}$ ,  $V_{IN} = 30\text{V}$ ,  
 $\text{LET} = 28$ .

## Conclusions

SEE testing of the ISL71091SEH precision reference product family has demonstrated that the devices are immune to SEB and SEL to an LET of  $86.4 \text{ MeV} \cdot \text{cm}^2/\text{mg}$  with an input voltage up to 36V and a load current of either -5mA or +10mA. This represents a supply voltage 20% over the recommended maximum operation of 30V and at the limits of the recommended output drive current capability. Although SEB/SEL (destructive ion testing) was only done on the 3.3V version (ISL71091SEH33) these results apply to all of the ISL71091SEHxx family since they share the same silicon design.

SET testing demonstrated that a larger  $C_{OUT}$  serves to suppress the SET deviation magnitude but brings some jeopardy. A  $C_{OUT} = 10\mu\text{F}$  was very effective in limiting SET at  $\text{LET} = 28 \text{ MeV} \cdot \text{cm}^2/\text{mg}$  as can be best seen in the results for the 4.096V and 10.0V references. However, at  $\text{LET} = 60 \text{ MeV} \cdot \text{cm}^2/\text{mg}$  and  $V_{IN} = 16.5\text{V}$  on the 3.3V and 2.048V references a large and long SET form appeared (Figures 3 and 9). This implies a compromise with capacitor selection and SET performance.

If large and short ( $\pm 500\text{mV}$  and  $25\mu\text{s}$ ) SET in response to relatively low LET ( $\leq 28 \text{ MeV} \cdot \text{cm}^2/\text{mg}$ ) can be tolerated, the minimal capacitance values of  $C_{OUT} = 0.1\mu\text{F}$  and  $C_{COMP} = 1\text{nF}$  can be used. However, if suppression of these common events is needed, going to  $C_{OUT} = 10\mu\text{F}$  and  $C_{COMP} = 10\text{nF}$  virtually eliminates the SET but opens up the potential for rarer events at higher LET and  $V_{IN} (>13.2\text{V})$ , which are large (several hundred millivolts) and long ( $\sim 1\text{ms}$ ).

There is not a clear “best” choice of capacitance values as every choice brings with it an SET consequence. The user is encouraged to carefully review the data presented in the report in considering and deciding upon the  $V_{IN}$ ,  $C_{OUT}$ , and  $C_{COMP}$  values to be used in an application.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.  
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.  
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.  
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.  
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.  
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
