CS+ CX Compiler Package

## Outline

When using the CS+ CX Compiler package, note the following point.

1. Mathematical library function atan (No.19)

* The number after the note is the note's identification number.

## 1. Mathematical Library Function atan (No.19)

### 1.1 Applicable Products

CX V1.10 to V1.31

### 1.2 Details

If the absolute value of the argument of the math library function atan is larger than $3.59539 \mathrm{e}+307$, the return value becomes invalid: $\pm 1.373400766945016$ is returned instead of an expected value of $\pm 1.570796326794897$.

### 1.3 Conditions

The return value becomes invalid when both of the following conditions (1) and (2) are met.
(1) The absolute value of argument of atan is larger than $3.59539 \mathrm{e}+307$.
(2) A library that uses the FPU(Note) is linked.

Note: The applicable library is libf64.lib, which is located directly under <Installation path>\CS+\CACXICXIV1.xx\liblibl850e2v3f.

* $\mathrm{V} 1 . \mathrm{xx}$ indicates the version number.

### 1.4 Examples

Below is an example of the error. The parts corresponding to the error conditions are shown in red.
[C source]

```
volatile double \(x, y\);
void func(void) \{
    \(x=3.59540 \mathrm{e}+307 ; \quad / /\) Condition (1)
    \(y=\operatorname{atan}(x) ;\)
    \}
```

Line 3:
Condition (1) is met because a value larger than $3.59539 \mathrm{e}+307$ is specified as the variable for the argument of atan.

## Line 4:

The atan's return value is 1.373400766945016 , which is invalid.

### 1.5 Workaround

As shown in the example below, check if the argument of atan meets condition (1) ${ }^{\text {(Note) }}$. If condition (1) is met, set $\pm 1.570796326794897$ as the return value instead of the return value of atan.
Note: The return value of the atan function that handles 8-byte floating-point type converges to $\pm \pi / 2$ when the absolute value of the argument exceeds approximately $10^{17}$. Therefore, $\pm 1 e+307$ is used as the decision value for the argument in the example below.
[C source]

```
volatile double \(x, y\);
void func(void) \{
    if \((x>1 e+307) \quad / /\) Check if \(x\) is larger than \(1 e+307\).
            \(y=1.570796326794897 ;\)
            else if \((x<-1 e+307) \quad / / \quad\) Check if \(x\) is smaller than \(-1 e+307\)
            \(y=-1.570796326794897 ;\)
            else
            \(y=\operatorname{atan}(x) ;\)
    \}
```

### 1.6 Schedule for Fixing the Problem

There is no schedule for fixing this problem.
