

RL78 Family

CTSU Module Software Integration System

Introduction

This application note describes the CTSU Module.

Target Device

RL78/G23 Group

When using this application note with an MCU other than that specified here, adjust the contents to meet the specifications of your target MCU and fully evaluate before using the CTSU module.

1. Overview

The CTSU module is a CTSU2L driver for the Touch Module. The CTSU module is configured assuming access via the Touch middleware layer, but can also be accessed from the user application.

1.1 Functions

The CTSU module supports the following functions.

1.1.1 QE for Capacitive Touch Usage

The module provides various capacitive touch measurements based on configuration settings generated by QE for Capacitive Touch.

As a part of the configuration settings, the touch interface configuration displays the combination of terminals to be measured (referred to as TS) and the corresponding measurement mode. Multi-touch interface configurations are necessary when the development product has a combination of different measurement modes or when the active shield is used.

1.1.2 Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event Link Controller (ELCL).

As the measurement process is carried out by the CTSU2L peripheral, it does not use up main processor processing time.

The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The data transfer controller (DTC) can also be used for these processes.

When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed.

Start the measurement with API function `R_CTSU_ScanStart()`.

Obtain the measurement results with API function `R_CTSU_DataGet()`.

1.1.3 Sensor ICO Correction function

The CTSU2L peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor ICO MCU.

The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.

When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor ICO.

1.1.4 Initial Offset Adjustment

The CTSU2L peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic capacitance for it to fit within the sensor ICO dynamic range.

This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, `R_CTSU_ScanStart()` and `R_CTSU_DataGet()` must be repeated several times after startup. Because the `ctsu_element_cfg_t` member "so" is the starting point for adjustments, you can set the

appropriate value for “so” in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for “so” is a value adjusted by QE for Capacitive Touch.

This function can be turned off in the configuration settings.

1.1.5 Multi-frequency Measurements

The CTSU2L peripheral can measure in one of four drive frequencies to avoid synchronous noise.

With the default settings, the module takes measurements at three different frequencies. After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as “normalization.”

When this normalization is turned off in the config settings, the user can use the results of these three frequencies as noise filters. However, the three frequencies cannot be tied with the Touch module.

Figure 1 Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.

Drive frequency is calculated in the following equation:

$$(PCLKB \text{ frequency} / CLK / STCLK) \times SUMULTIn / 2 / SDPA \quad : \quad n = 0, 1, 2$$

The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

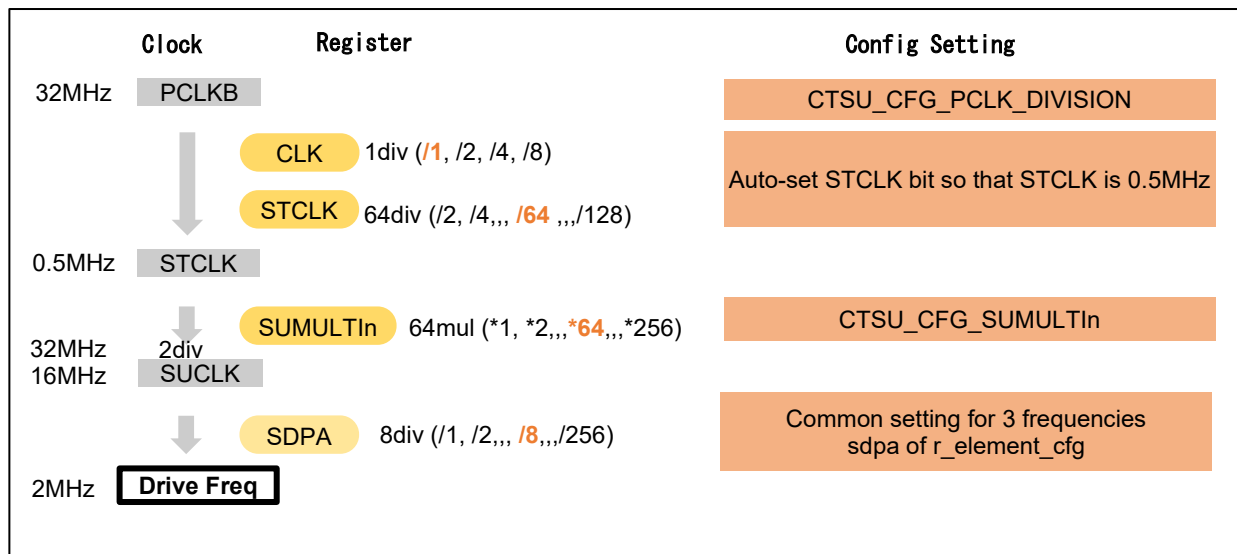

Figure 2 Drive Frequency Settings

1.1.6 Shield Function

The CTSU2L peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.

This module allows the user to set a shield for each touch interface configuration.

For example, for the electrode configuration shown in , the members of `ctsu_cfg_t` should be set as follows. Other members have been omitted for the example.

```
.txvsel    = CTSU_TXVSEL_INTERNAL_POWER,  
.txvsel2   = CTSU_TXVSEL_MODE,  
.md        = CTSU_MODE_SELF_MULTI_SCAN,  
.pose1     = CTSU_POSEL_SAME_PULSE,  
.ctsuchac0 = 0x0F,  
.ctsuchtrc0 = 0x08,
```

Figure 3 Example of Shield Electrode Structure

1.1.7 Measurement Error Message

When the CTSU2L peripheral detects an abnormal measurement, it sets the status register bit to 1.

In the measurement complete interrupt process, the module reads `ICOMP1`, `ICOMP0`, and `SENSOVF` of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to “member event” in the `ctsu_callback_args_t` callback function argument.

1.1.8 Moving Average

This function calculates the moving average of the measured results.

Set the number of times the moving average should be calculated in the config settings.

1.2 Measurement Mode

This module supports all three modes offered by the CTSU2L peripheral: self-capacitance, mutual capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

1.2.1 Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).

The CTSU2L peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8. Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].

In default settings, the measurement period for each TS is approximately 576us.

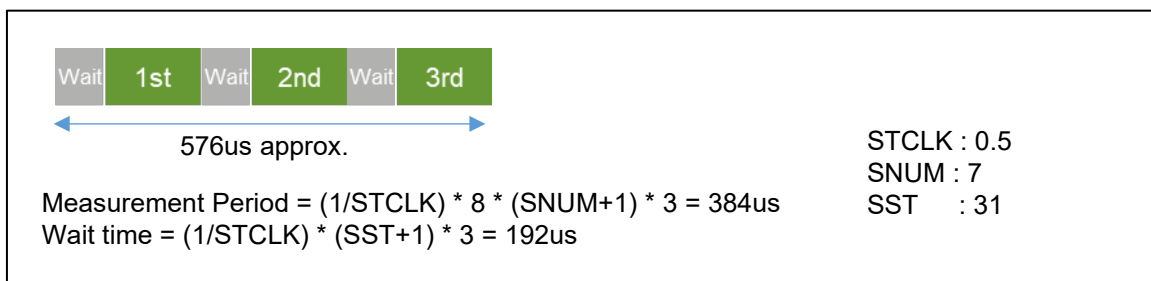

Figure 4 Self-capacitance Measurement Period

1.2.2 Mutual Capacitance Mode

The mutual capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.

The CTSU2L peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.

TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7

To measure the mutual capacitance generated between electrodes, the CTSU2L peripheral performs the measurement process on the same electrode twice. Therefore, the measurement period for one electrode under the default settings is approximately 1152us.

The mutual capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs the secondary measured result.

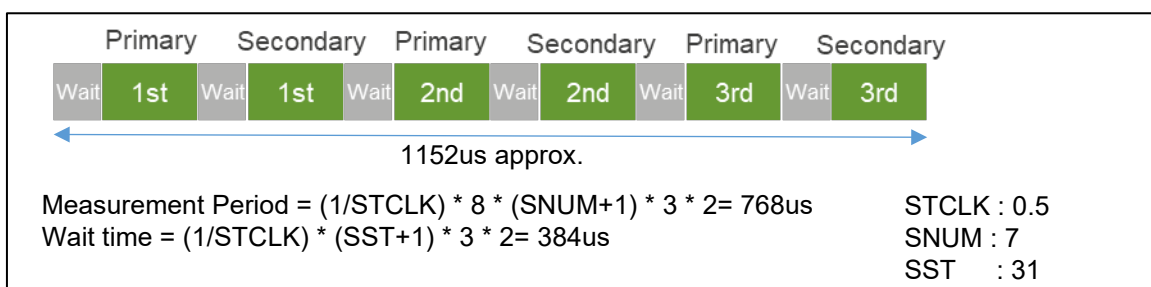

Figure 5 Mutual Capacitance Measurement Period

1.2.3 Current Measurement Mode

The current measurement mode is used to measure the minute current input to the TS terminal.

The order of measurement and data storage is the same as that of the self-capacitance mode.

As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

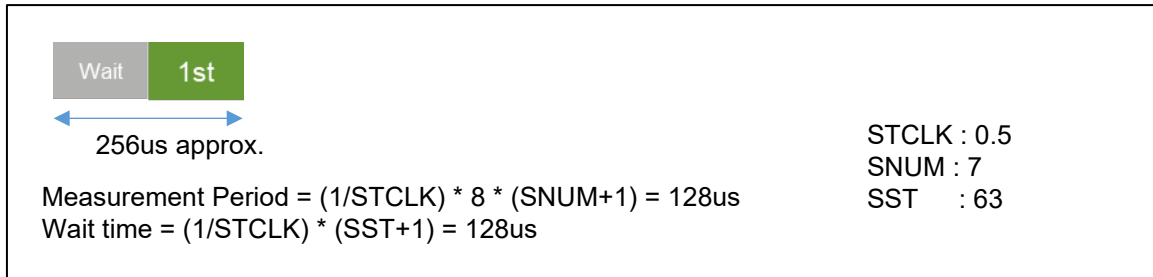

Figure 6 Current Measurement Period

1.2.4 Temperature Correction Mode

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure 7.

1. Measure the correction circuit. One set comprises twelve measurements.
2. Measure the current when TSCAP voltage is applied to the external resistor to create a correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

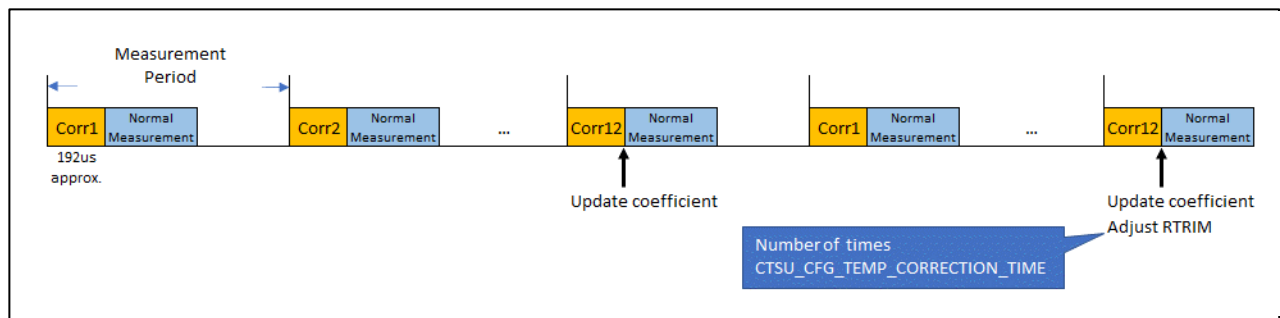

Figure 7 Temperature Correction Measurement Timing Chart

1.3 Measurement Timing

As explained in section 1.1.2, measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELCL).

The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode. See section 1.2 for details.

The execution timing of software triggers and external triggers differ slightly.

Since a software trigger sets the start flag after setting the touch interface configuration with R_CTSU_ScanStart (), there is a slight delay after the timer event occurrence. However, as the delay is

much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.

An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use `R_CTSU_ScanStart()` to set another touch interface configuration after one measurement is completed.

1.4 API Overview

The CTSU module includes the following functions.

Function	Description
<code>R_CTSU_Open()</code>	Initializes the specified touch interface configuration.
<code>R_CTSU_StartScan()</code>	Starts measurement of specified touch interface configuration.
<code>R_CTSU_DataGet()</code>	Gets measured values of specified touch interface configuration.
<code>R_CTSU_CallbackSet()</code>	Set callback function of specified touch interface configuration.
<code>R_CTSU_Close()</code>	Closes specified touch interface configuration.
<code>R_CTSU_VersionGet()</code>	Gets module version number.

2. API Information

Operations of this module has been confirmed under the following conditions.

2.1 Hardware Requirements

The MCU used in the development must support the following function.

- CTSU2L

2.2 Software Requirements

This driver depends on the following module:

- Board support package (r_bsp) v1.00 or newer

According to the configuration settings, the driver may also depend on the following modules:

- Code generator DTC v1.00 or newer

Finally, the driver assumes use of the following tool:

- QE for Capacitive Touch[RA, RL78] V1.3.0 or newer (capacitive touch sensor development support tool)

2.3 Supported Toolchains

Module operations have been confirmed on the following toolchains

- Renesas CC-RL Toolchain v1.09.00
- IAR Embedded Workbench for Renesas RL78 v4.20.1
- LLVM for RL78 10.0.0.202102

2.4 Restrictions

The module code is non-reentrant and protects simultaneous calls for multiple function.

2.5 Header File

All interface definitions to be called and used in the API are defined in “r_ctsu_api.h” .

Select “r_ctsu_config.h” as the configuration option in each build.

2.6 Integer Type

This driver uses ANSI C99. The types are defined instdint.h .

2.7 Compilation Settings

The following table provides the names and setting values for the configuration option settings used the CTSU module.

r_ctsu_config.h Configuration Options	
CTSU_CFG_PARAM_CHECKING_ENABLE *Default value: "BSP_CFG_PARAM_CHECKING_ENABLE"	Selects whether to include the parameter check process in the code. Selecting "0" allows the user to omit the parameter check process from the code to shorten the code size. "1": Omit parameter check process from code. "2": Include parameter check process in code. "BSP_CFG_PARAM_CHECKING_ENABLE": Selection depends on BSP setting.
CTSU_CFG_USE_DTC *Default value: "0"	Select "1" to use the DTC, rather than the main processor, to run the CTSU2L's CTSUWR interrupt and CTSURD interrupt processes. Note: If the DTC is used elsewhere in the application, it may compete with the use of this driver.
CTSU_CFG_INTCTSUWR_PRIORITY_LEVEL *Default value: "2"	Sets the CTSUWR interrupt priority level (also necessary when using the DTC). The priority level range is from 0 (high) to 3 (low).
CTSU_CFG_INTCTSURD_PRIORITY_LEVEL *Default value: "2"	Sets the CTSURD interrupt priority level (also necessary when using the DTC). The priority level range is from 0 (high) to 3 (low).
CTSU_CFG_INTCTSUFN_PRIORITY_LEVEL *Default value: 2	Sets the CTSUFN interrupt priority level. The priority level range is from 0 (high) to 3 (low).
CTSU_CFG_DTC_USE_SC	
The following configurations depend on the touch interface configuration and cannot be set using Smart Configurator. These configurations are set when using QE for Capacitive Touch. In this case, QE_TOUCH_CONFIGURATION is defined in the project. Although r_ctsu_config.h becomes invalid, qe_touch_define.h is defined instead.	
CTSU_CFG_NUM_SELF_ELEMENTS	Sets the total number of TS for self-capacitance, current measurement, and temperature correction.
CTSU_CFG_NUM_MUTUAL_ELEMENTS	Sets the total number of matrixes for mutual capacitance
CTSU_CFG_LOW_VOLTAGE_MODE	Enables/disables the low voltage mode. This value is set in the CTSUCRAL register's ATUNE0 bit.
CTSU_CFG_PCLK_DIVISION	Sets the PCLK frequency division rate. This value is set in the CTSUCRAL register's CLK bit.
CTSU_CFG_TSCAP_PORT	Sets the TSCAP port. Example: For P30, set 0x0300.
CTSU_CFG_VCC_MV	Sets the VCC (voltage). Example: for 5.00V, set 5000.
CTSU_CFG_NUM_SUMULTI	Sets the number of multi-frequency measurements.
CTSU_CFG_SUMULTI0	Sets the multiplication factor for the first frequency in a multi-frequency measurement. Recommended: 0x3F
CTSU_CFG_SUMULTI1	Sets the multiplication factor for the second frequency in a multi-frequency measurement. Recommended: 0x36
CTSU_CFG_SUMULTI2	Sets the multiplication factor for the third frequency in a multi-frequency measurement. Recommended: 0x48
CTSU_CFG_TEMP_CORRECTION_SUPPORT	Enables/disables temperature correction.
CTSU_CFG_TEMP_CORRECTION_TS	Sets the temperature correction terminal number.

CTSU_CFG_TEMP_CORRECTION_TIME	Sets the update interval for the correction coefficient of the temperature correction. Assuming 13 measurements per set in the temperature correction mode, indicate the number of sets per update.
CTSU_CFG_CALIB_RTRIM_SUPPORT	Enables/disables RTRIM correction for temperature correction. The ADC must be selected to operate with RTRIM correction enabled.

2.8 Code Size

ROM (code and constants) and RAM (global data) size are determined according to the configuration options as described in “section 2.7 Compilation Setting” during a build. The values shown are reference values when the compile option is the default for the CC-RL C compiler listed in “section 2.3 Supported Toolchains”. The code size varies according to the C compile version and compile options.

This is the value when one self-capacity button is set in the default setting of Smart Configurator. It also includes sample applications generated by the TOUCH module and QE for Capacitive Touch.

Table 1 Code Size

ROM and RAM Usage	
RAM	379 bytes
ROM	7268 bytes

2.9 Arguments

The following are the structures and enums used as arguments of the API functions. Many of the parameters used in the API functions are defined by the enums, which provides a way to check types and reduce errors.

These structures and enums are defined in `r_ctsu_api.h` along with the prototype declaration.

The following is the control structure for the touch interface configuration. This does not need to be set in the application. Using QE for Capacitive Touch allows the variables corresponding to the touch interface configuration to be output by `qe_touch_config.c`. Make sure to set `qe_touch_config.c` in the module's first API argument.

```
typedef struct st_ctsu_instance_ctrl
{
    uint32_t          open;                ///< Whether or not driver is open.
    ctsu_state_t     state;                ///< CTSU run state.
    ctsu_tuning_t    tuning;               ///< CTSU Initial offset tuning status.
    uint16_t         num_elements;        ///< Number of elements to scan
    uint16_t         wr_index;            ///< Word index into ctsuwr register array.
    uint16_t         rd_index;            ///< Word index into scan data buffer.
    uint8_t          * p_tuning_count;     ///< Pointer to tuning count of each element.
    int32_t          * p_tuning_diff;     ///< Pointer to difference from base value of each element.
    uint16_t         average;             ///< CTSU Moving average counter.
    uint16_t         num_moving_average;  ///< Copy from config by Open API.
    uint8_t          ctsucr1;             ///< Copy from config by Open API.
    ctsu_ctsuwr_t    * p_ctsuwr;         ///< CTSUWR write register value.
    ctsu_self_buf_t  * p_self_raw;        ///< Pointer to Self raw data.
    uint16_t         * p_self_data;       ///< pointer to Self moving average data.
    ctsu_mutual_buf_t * p_mutual_raw;     ///< pointer to Mutual raw data.
    uint16_t         * p_mutual_pri_data;  ///< pointer to Mutual primary moving average data
    uint16_t         * p_mutual_snd_data;  ///< pointer to Mutual secondary moving average data.
    ctsu_correction_info_t * p_correction_info; ///< pointer to correction info
    ctsu_range_t     range;               ///< According to atune12. (20uA:0, 40uA:1, 80uA:2, 160uA:3)
    uint8_t          ctsucr2;             ///< Copy from config by Open API.
    ctsu_cfg_t const * p_ctsu_cfg;        ///< Pointer to initial configurations.
    void const       * p_context;         ///< Placeholder for user data.
    void (* p_callback)(ctsu_callback_args_t * p_args); ///< Callback provided when a CTSUFN occurs.
} ctsu_instance_ctrl_t;
```

The following is the configuration setting structure for the touch interface configuration.

Using QE for Capacitive Touch allows the variables and initialization values corresponding to the touch interface configuration to be output by `qe_touch_config.c`. Make sure to set `qe_touch_config.c` in the second argument of `R_CTSU_Open()`.

```
typedef struct st_ctsu_cfg
{
    ctsu_cap_t          cap;           ///< CTSU Scan Start Trigger Select
    ctsu_txvsel_t      txvsel;        ///< CTSU Transmission Power Supply Select
    ctsu_txvsel2_t     txvsel2;       ///< CTSU Transmission Power Supply Select 2
    ctsu_atune12_t     atune12;       ///< CTSU Power Supply Capacity Adjustment
    ctsu_md_t          md;            ///< CTSU Measurement Mode Select
    ctsu_posel_t       posel;         ///< CTSU Non-Measured Channel Output Select
    uint8_t            ctsuchac0;     ///< TS00-TS07 enable mask
    uint8_t            ctsuchac1;     ///< TS08-TS15 enable mask
    uint8_t            ctsuchac2;     ///< TS16-TS23 enable mask
    uint8_t            ctsuchac3;     ///< TS24-TS31 enable mask
    uint8_t            ctsuchac4;     ///< TS32-TS39 enable mask
    uint8_t            ctsuchtrc0;    ///< TS00-TS07 mutual-tx mask
    uint8_t            ctsuchtrc1;    ///< TS08-TS15 mutual-tx mask
    uint8_t            ctsuchtrc2;    ///< TS16-TS23 mutual-tx mask
    uint8_t            ctsuchtrc3;    ///< TS24-TS31 mutual-tx mask
    uint8_t            ctsuchtrc4;    ///< TS32-TS39 mutual-tx mask
    ctsu_element_cfg_t const * p_elements; ///< Pointer to elements configuration array
    uint8_t            num_rx;        ///< Number of receive terminals
    uint8_t            num_tx;        ///< Number of transmit terminals
    uint16_t           num_moving_average; ///< Number of moving average for measurement data
    uint8_t            tuning_enable;  ///< Initial offset tuning flag
    void (* p_callback)(ctsu_callback_args_t * p_args); ///< Callback provided when CTSUFN ISR occurs.
    void const * p_context;           ///< User defined context passed into callback function.
    void const * p_extend;           ///< Pointer to extended configuration by instance of
} ctsu_cfg_t;
interface
{
    ctsu_cfg_t;
```

The following are the enums used for the above listed structures.

```
/** CTSU Events for callback function */
typedef enum e_ctsu_event
{
    CTSU_EVENT_SCAN_COMPLETE = 0x00,    ///< Normal end
    CTSU_EVENT_OVERFLOW      = 0x01,    ///< Sensor counter overflow (CTSUST.CTUSOVF set)
    CTSU_EVENT_ICOMP         = 0x02,    ///< Abnormal TSCAP voltage (CTSUERRS.CTSUICOMP set)

    uint8_t sdpa;                   ///< CTSU Base Clock Setting
} ctsu_element_cfg_t;

```

2.10 Return Values

The following provides return values for the API functions. The enum is defined in `r_ctsu_api.h`, along with the API function prototype declaration.

```

/* Return error codes */
typedef enum e_fsp_err
{
    FSP_SUCCESS,
    FSP_ERR_ASSERTION,           ///< A critical assertion has failed
    FSP_ERR_INVALID_ARGUMENT,    ///< Invalid input parameter
    FSP_ERR_NOT_OPEN,           ///< Requested channel is not configured or API not open
    FSP_ERR_ALREADY_OPEN,       ///< Requested channel is already open in a different configuration
    FSP_ERR_NOT_ENABLED,        ///< Requested operation is not enabled
    FSP_ERR_INVALID_STATE,      ///< API or command not valid in the current state
    FSP_ERR_CTSU_SCANNING,       ///< Scanning.
    FSP_ERR_CTSU_NOT_GET_DATA,   ///< Not processed previous scan data.
    FSP_ERR_CTSU_INCOMPLETE_TUNING, ///< Incomplete initial offset tuning.
} fsp_err_t;

```

3. API Functions

3.1 R_CTSU_Open

This function initializes the module and must be executed before using any of the other API functions. Please execute this function for each touch interface.

Format

```
fsp_err_t R_CTSU_Open (ctsu_ctrl_t * const p_ctrl,  
                      ctsu_cfg_t const * const p_cfg)
```

Parameters

p_ctrl Pointer to the control structure (normally generated by QE for Capacitive Touch)

p_cfg Pointer to the config structure (normally generated by QE for Capacitive Touch)

Return Values

```
FSP_SUCCESS                    /* Successfully completed */  
FSP_ERR_ASSERTION            /* Argument pointer not specified */  
FSP_ERR_ALREADY_OPEN        /* Open() is called without calling Close() */  
FSP_ERR_INVALID_ARGUMENT    /* Configuration parameters are invalid */
```

Properties

Prototype is declared in r_ctsu_api.h

Description

This function enables control structure initialization, register initialization, and interrupt setting according to the argument p_cfg.

Also, the correction coefficient generation process is executed while processing the first touch interface structure. The process takes approximately 120ms.

The DTC is initialized if CTSU_CFG_USE_DTC is enabled when the first touch interface configuration is processed.

Reentrant

This function is non-reentrant

Example

```
fsp_err_t err;

/* Initialize pins (function created by Smart Configurator) */
R_CTSU_PinSetInit();

/* Initialize the API. */
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);

/* Check for errors. */
if (err != FSP_SUCCESS)
{
    . . .
}
```

Special Notes:

The port must be initialized before calling this function. We recommend using the `R_CTSU_PinSetInit()` function generated by SmartConfigurator as the port initialization function

3.2 R_CTSU_ScanStart

This function starts measurement of the specified touch interface configuration.

Format

```
fsp_err_t R_CTSU_ScanStart (ctsu_ctrl_t * const p_ctrl)
```

Parameters

p_ctrl Pointer to the control structure (normally generated by QE for Capacitive Touch)

Return Values

```
FSP_SUCCESS                            /* Successfully completed */  
FSP_ERR_ASSERTION                    /* Argument pointer not specified */  
FSP_ERR_NOT_OPEN                    /* Called without calling Open() */  
FSP_ERR_CTSU_SCANNING               /* Now scanning */  
FSP_ERR_CTSU_NOT_GET_DATA          /* Did not obtain previous results */
```

Properties

Prototype is declared in r_ctsu_api.h.

Description

When a software trigger occurs, this function sets and starts the measurement based on the touch interface configuration. With an external trigger, the function sets the measurement and goes to the trigger wait state.

If CTSU_CFG_USE_DTC is enabled, the function also sets the DTC.

The resulting value is notified in the callback generated from the INTCTSUFN interrupt handler.

Reentrant

This function is non-reentrant.

Example

```
fsp_err_t err;  
  
/* Initiate a sensor scan by software trigger */  
err = R_CTSU_ScanStart(&g_ctsu_ctrl);  
  
/* Check for errors. */  
if (err != FSP_SUCCESS)  
{  
    . . .  
}
```

Special Notes:

None

3.3 R_CTSU_DataGet

This function reads all the values previously measured in the specified touch interface configuration.

Format

```
fsp_err_t R_CTSU_DataGet (ctsu_ctrl_t * const p_ctrl, uint16_t * p_data)
```

Parameters

p_ctrl Pointer to the control structure (normally generated by QE for Capacitive Touch)
p_data Pointer to the buffer that stores the measured value.

Return Values

FSP_SUCCESS /* CTSU initialization successfully completed */
FSP_ERR_ASSERTION /* Argument pointer not specified */
FSP_ERR_NOT_OPEN /* Called without calling Open() */
FSP_ERR_CTSU_SCANNING /* scanning */
FSP_ERR_CTSU_INCOMPLETE_TUNING /*Tuning initial offset */

Properties

Prototype is declared in r_ctsu_api.h.

Description

This function reads all previously measured values into the specified buffer. The required buffer size varies depending on the measurement mode. Prepare twice the number of TS for the self-capacitance and current measurement modes, and twice the number of matrixes for the mutual-capacitance mode. If normalization (majority frequency) is turned off, prepare multiple CTSU_CFG_NUM_SUMULTI terminals for each mode. The value measured in the temperature correction mode is not stored. When RTRIM adjustment is performed, the RTRIM value is stored. At this time, the ADC settings have been changed in this function, so perform the process to return to the ADC settings you are using. Otherwise, store 0xFFFF.

When initial offset adjustment is on, FSP_ERR_INCOMPLETE_TUNING is returned several times until the adjustment is complete. Measured values are not stored in the buffer at this time. For more details on initial offset adjustment, refer to section 1.1.5.

The measured value is the value resulting from the sensor ICO correction, normalization (when on), and moving average processes executed in this function.

Reentrant

This function is non-reentrant.

Example:

```
fsp_err_t err;
uint16_t buf[CTSU_CFG_NUM_SELF_ELEMENTS];

/* Get all sensor values */
err = R_CTSU_DataGet(&g_ctsu_ctrl, buf);
```

Special Notes:

None

3.4 R_CTSU_CallbackSet

This function sets the function specified for the measurement completion callback function.

Format

```
fsp_err_t R_CTSU_CallbackSet (ctsu_ctrl_t * const p_api_ctrl,
                             void (* p_callback)(ctsu_callback_args_t *),
                             void const * const p_context,
                             csu_callback_args_t * const p_callback_memory)
```

Parameters

p_api_ctrl Pointer to the control structure (normally generated by QE for Capacitive Touch)
 p_callback Pointer to callback function
 p_context Pointer to send to callback function
 p_callback_memory Set to NULL

Return Values

FSP_SUCCESS */* Successfully completed */*
 FSP_ERR_ASSERTION */* Argument pointer not specified */*
 FSP_ERR_NOT_OPEN */* Called without calling Open() */*

Properties

Prototype is declared in r_ctsu_api.h.

Description

This function sets the function specified for the measurement completion callback function. By default, the callback function is set to the function of member p_callback of csu_cfg_t, so use it when you want to change to another function during operation.

You can also set the context pointer. If not used, set p_context to NULL. Set p_callback_memory to NULL.

Reentrant

This function is non-reentrant.

Example:

```
fsp_err_t err;

/* Set callback function */
err = R_CTSU_CallbackSet(&ctsu_ctrl, csu_callback, NULL, NULL);
```

Special Notes:

None

3.5 R_CTSU_Close

This function closes the specified touch interface configuration.

Format

```
fsp_err_t R_CTSU_Close (ctsu_ctrl_t * const p_ctrl)
```

Parameters

p_ctrl Pointer to the control structure (normally generated by QE for Capacitive Touch)

Return Values

```
FSP_SUCCESS            /* Successfully completed */  
FSP_ERR_ASSERTION     /* Argument pointer not specified */  
FSP_ERR_NOT_OPEN      /* Called without calling Open() */
```

Properties

Prototype is declared in r_ctsu_api.h.

Description

This function closes the specified touch interface configuration.

Reentrant

This function is non-reentrant.

Example:

```
fsp_err_t err;  
  
/* Shut down peripheral and close driver */  
err = R_CTSU_Close(&g_ctsu_ctrl);
```

Special Notes:

None

3.6 R_CTSU_VersionGet

This function returns the version information of this module.

Format

```
fsp_err_t R_CTSU_VersionGet (fsp_version_t * const p_version)
```

Parameters

p_version Pointer that stores the obtained version information.

Return Values

FSP_SUCCESS */* Successfully completed */*

FSP_ERR_ASSERTION */* Argument pointer not specified */*

Properties

Prototype is declared in r_cts_u_api.h.

Description

This function returns the version information of this module, which is encoded as follows: the upper 2 bytes contain the API version number and the lower two bytes contain the code version number. For example, when the API version number is 1.10 and the CODE version number is 1.31, the version information is encoded as 0x010a011f.

Reentrant

This function is reentrant.

Example:

```
fsp_err_t err;
fsp_version_t fsp_version;

/* Get version of installed CTSU API. */
err = R_CTSU_GetVersion(&fsp_version);

/* Check to make sure version is new enough for this application's use. */
if (MIN_VERSION > fsp_version.api_version_major)
{
    /* This QE CTSU API version is not new enough and does not have XXX feature
       that is needed by this application. Alert user. */
    ...
}
```

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
