## APPLICATION NOTE

SCIF (Clock Synchronous) Data Transfer Using DMAC

R01AN0274EJ0103 Rev.1.03 Mar. 1, 2012

### Introduction

This application note presents an overview of using the direct memory access controller (DMAC) and serial communication interface with FIFO (SCIF) of the SH7216 to perform clock synchronous data transfer.

Note that although the sample tasks and applications presented in this application note have been verified to work as intended, they should be checked in the actual operating environment before being put into actual use.

### **Target Device**

SH7216

### Contents

1.	Introduction	2
2.	Description of Sample Application	3
3.	Reference Documents	. 18
•••		

### 1. Introduction

### 1.1 Specifications

- DMAC channels 0 and 1, and SCIF channel 3, are used.
- The activation source for DMAC channel 0 is the SCIF transmit FIFO data empty interrupt (TXI).
- The activation source for DMAC channel 1 is the SCIF receive FIFO data full interrupt (RXI).
- SCIF channel 3 is set to clock synchronous mode and 8-bit fixed data length.
- The transmit data is a 32-byte character string that is allocated beforehand to the on-chip flash memory.
- The receive data is stored in the on-chip RAM.

### 1.2 Functions Used

- Serial communication interface with FIFO (SCIF), channel 3
- Direct memory access controller (DMAC), channels 0 and 1

### **1.3** Applicable Conditions

MCU	SH7216
Operating frequency	Internal clock: 200 MHz
	Bus clock: 50 MHz
	Peripheral clock: 50 MHz
Integrated development environment	Renesas Electronics High-performance Embedded Workshop, Ver. 4.06.00
C compiler	Renesas Electronics SuperH RISC Engine Family
	C/C++ Compiler Package, Ver. 9.03.00, Release 00
Compile options	High-performance Embedded Workshop default settings
	(-cpu=sh2afpu -pic=1 -object="\$(CONFIGDIR)¥\$(FILELEAF).obj"
	-debug -gbr=auto -chgincpath -errorpath -global_volatile=0
	-opt_range=all -infinite_loop=0 -del_vacant_loop=0
	-struct_alloc=1 -nologo)

### 2. Description of Sample Application

The sample application performs SCIF clock synchronous data transmission and reception, using the SCIF as the DMAC activation source.

### 2.1 Operation of Functions Used

### 2.1.1 Serial Communication Interface with FIFO (SCIF)

The SCIF supports two data transfer modes: asynchronous and clock synchronous. It incorporates 16-stage first-in firstout (FIFO) registers for transmission and reception, enabling efficient and high-speed continuous communication.

For details of the SCIF, see the Serial Communication Interface with FIFO

(SCIF) section in the SH7216 Group Hardware Manual.

Table 1 shows an outline of the SCIF, table 2 asynchronous communication, and table 3 clock synchronous communication.

Figure 1 is a block diagram of the SCIF.

Item	Description
Communication modes	Asynchronous serial communication, clock synchronous serial communication
	Support for full-duplex communication
Clock source	Baud rate generator (internal clock) or SCK pin (external clock)
Interrupts	Transmit FIFO data empty interrupt, break interrupt, receive FIFO data full
	interrupt, receive error interrupt
Other	Low-power mode setting
	Receive error count detection
	Timeout error detection (for reception in asynchronous mode)

#### Table 1 SCIF Outline

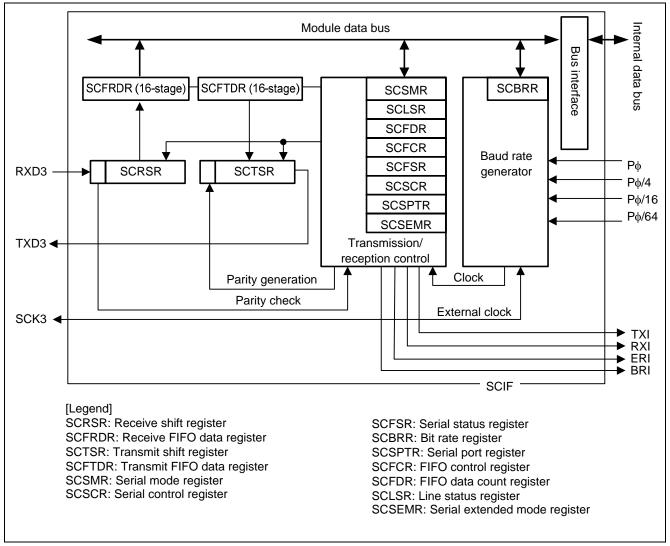

#### Table 2 Outline of Asynchronous Communication

Item	Description
Data length	7 or 8 bits
Stop bit length	1 or 2 bits
Parity	Even, odd, or no parity
Receive error detection	Parity error, framing error, overrun error
Break detection	A break is detected when a framing error is followed by a space 0 level (low level) lasting for one frame length or more. A break can also be detected by reading the RXD pin level directly from the serial port register when a framing error occurs.

#### Table 3 Outline of Clock Synchronous Communication

Item	Description
Data length	8 bits
Receive error detection	Overrun error

### 2.1.2 Direct Memory Access Controller (DMAC)

The DMAC of the SH7216 takes the place of the CPU to perform high-speed data transfers between external devices with DACK (transfer request acknowledge signal), external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral module.

The bus mode is selectable between cycle steal mode and burst mode.

For details of the DMAC, see the Direct Memory Access Controller (DMAC) section in the SH7216 Group Hardware Manual.

Table 4 shows an overview of the DMAC. Figure 2 shows an example of DMA transfer using cycle steal mode, and figure 3 shows an example of DMA transfer using burst mode. Figure 4 is a block diagram of the DMAC.

Item	Description		
Number of channels	8 channels: CH0 to CH7		
	External requests can be accepted on only four channels, CH0 to CH3.		
Address space	4 GB		
Transfer data length	Byte, word (2 bytes), longword (4 bytes), 16 bytes (longword $\times$ 4)		
Max. transfer count	16,777,216 (24-bit) transfers		
Addressing modes	Single address mode, dual address mode		
Transfer requests	External request, on-chip peripheral module request, auto request		
	(SCIF: 8 sources, I2C3: 2 sources, A/D converter: 1 source, MTU2: 5 sources,		
	CMT: 2 sources)		
Bus modes	Cycle steal mode (normal mode, intermittent mode), burst mode		
Priority	Channel priority fixed mode, round-robin mode		
Interrupt requests	Generation of interrupt request to CPU when data transfer half finished or at		
	end of data transfer		
External request detection	DREQ input low/high level detection, rising/falling edge detection		
Transfer request	Ability to set active level of DACK and TEND		
acknowledge signal/			
transfer end signal			

#### Table 4 DMAC Overview

In normal mode cycle steal operation, the DMAC releases bus mastership to another bus master each time transfer of a transfer unit (byte, word, longword, or 16-byte unit) completes. When the next transfer request occurs, the DMAC takes back bus mastership from another bus master, transfers another transfer unit, and again releases bus mastership to another master when the transfer completes. This process is repeated until the transfer end condition is satisfied. Normal mode cycle steal operation can be used for any transfer category, regardless of the transfer request source, transfer source, or transfer destination. DREQ Bus mastership passed temporarily to CPU Bus cycle CPU CPU CPU XDMACXDMAC CPU XDMACXDMACX CPU Read Read Write Write

releasing bus mas mode when DREC releases bus mas	In burst mode, once the DMAC obtains bus mastership it performs data transfer continuously, not releasing bus mastership until the transfer end condition is satisfied. However, in external request mode when DREQ level detection is enabled and DREQ is not at the active level, the DMAC releases bus mastership to another bus master after all DMAC transfers for which requests have been received have completed, even if the transfer end condition has not been satisfied.

### 2.2 Sample Program Operation

Table 5 lists the settings for the sample program. Figure 5 illustrates the operation of the program.

Table 5	Sample	Program	Settings
---------	--------	---------	----------

Function	ltem	Setting	
SCIF	Operating mode	Clock synchronous	
	Data length	8 bits	
	Clock source	P∲ clock (50 MHz)	
	Interrupts	Transmit FIFO data empty interrupt receive FIFO data full interrupt (RX	
	Baud rate	100,000 bps	
DMAC	Channel	CH0	CH1
	Transfer activation source	On-chip peripheral module request mode (TXI3 in SCIF_3)	On-chip peripheral module request mode (RXI3 in SCIF_3)
	Transfer data length	One byte	One byte
	Transfer count	32	32
	Transfer source address	Start address of character string in on-chip flash memory	SCIF3 receive FIFO data register (SCFRDR_3)
	Transfer destination address	SCIF3 transmit FIFO data register (SCFTDR_3)	Receive data storage area start address in on-chip RAM
	Addressing mode	Dual address mode	Dual address mode
	Bus mode	Cycle steal mode	Cycle steal mode
	Priority	Channel priority fixed mode	Channel priority fixed mode
	Interrupt request	DMAC stops when data transfer ends	DMAC stops when data transfer ends

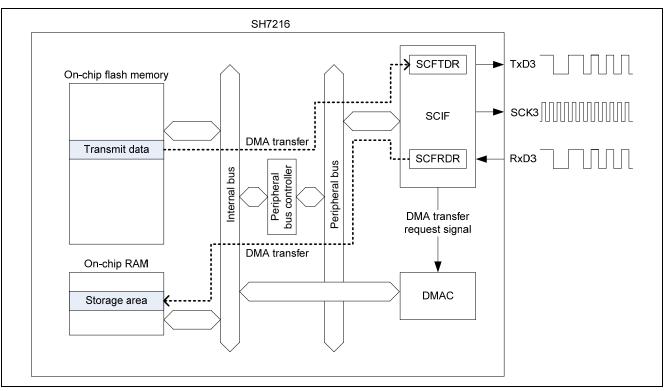

Figure 5 Illustration of Program Operation

### 2.3 Setting Procedure for Functions Used

The procedure for making initial settings for the functions used by the sample program is described below.

Figure 6 shows the processing sequence of the sample program, figure 7 shows the setting sequence for canceling module standby, figure 8 shows the setting sequence for the pin configuration controller, figure 9 shows the initialization sequence for DMAC channel 0, figure 10 shows the initialization sequence for DMAC channel 1, and figure 11 shows the SCIF initialization sequence.

Figure 12 shows the processing sequence of the SCIF transmit interrupt handler, figure 13 shows the processing sequence of the SCIF receive interrupt handler, and figure 14 shows the processing sequence of the receive error interrupt handler.

For details on the settings of each register, see the SH7216 Group Hardware Manual.

### 2.4 Register Settings for Sample Program

The register setting values used in the sample program are described below.

### 2.4.1 Clock Pulse Generator (CPG)

Table 6 lists the clock pulse generator settings.

#### Table 6 Clock Pulse Generator Settings

Register	Address	Setting value	Description	
Frequency control register (FRQCR)	H'FFFE0010	H'0303	STC[2:0] = B'011: ×1/8 (Βφ) IFC[2:0] = B'000: ×1/4 (Ιφ) PFC[2:0] = B'011: ×1/8 (Ρφ)	

### 2.4.2 Power-Down Mode

Table 7 lists the standby control register (STBCR) settings.

#### Table 7 Standby Control Register Settings

Register	Address	Setting value	Description
Standby control	H'FFFE0018	H'00	Clear MSTP8 to 0: DMAC operates (initial value)
register 2 (STBCR2)			Other bits: Initial values
Standby control	H'FFFE040C	H'E7	Clear MSTP44 to 0: SCIF3 operates
register 4 (STBCR4)			Other bits: Initial values

### 2.4.3 Interrupt Controller (INTC)

Table 8 lists the interrupt priority register (IPR) settings.

#### Table 8 Interrupt Priority Register Settings

Register	Address	Setting value	Description
Interrupt priority	H'FFFE0C00	H'FF00	Set DMAC0 interrupt level to 15 (bits 15 to 12).
register 06 (IPR06)			Set DMAC1 interrupt level to 15 (bits 11 to 8).
Interrupt priority register 14 (IPR14)	H'FFFE0C10	H'000F	Set SCIF3 interrupt level to 15 (bits 3 to 0).

### 2.4.4 Direct Memory Access Controller (DMAC)

Table 9 lists the register settings for DMAC (channel 0) and table 10 for DMAC (channel 1).

Table 9 DMAC (Channel 0) Reg	ister Settings
------------------------------	----------------

Register	Address	Setting value	Description
DMA source address register 0 (SAR_0)	H'FFFE1000	_	Set the start address of the character string in on- chip flash memory as the DMA transfer source address.
DMA destination address register 0 (DAR_0)	H'FFFE1004	H'FFFE980C	Set the SCIF3 transmit FIFO data register (SCFTDR_3) as the DMA transfer destination address.
DMA transfer count register 0 (DMATCR_0)	H'FFFE1008	H'00000020	Set the DMA transfer count to 32. (Set the single transfer size to one byte in CHCR_0.)
DMA channel control register 0 (CHCR_0)	H'FFFE100C	H'00001804 (initial setting value)	TC = 0: 1 transfer per transfer request RLD = 0: Reload function disabled (initial value) DM[1:0] = B'00: Fixed destination address SM[1:0] = B'01: Increment source address RS[3:0] = B'1000: DMA extension resource selector TB = 0: Cycle steal mode (initial value) TS[1:0] = B'00: Transfer unit set to one byte IE = 1: Interrupt requests enabled TE: Clear to 0 at DMA transfer end interrupt. DE: Before DMAC initial settings, clear to 0 to disable DMA transfers (initial value). After DMAC initial settings, set to 1 to enable DMA transfers. Clear to 0 to disable DMA transfers at DMA transfer end interrupt.
DMA operation register (DMAOR)	H'FFFE1200	_	DME: After DMAC initial settings, set to 1 to enable DMA transfers on all channels. Clear to 0 to disable DMA transfers on all channels at DMA transfer end interrupt.
DMA extension resource selector 0 (DMARS0)	H'FFFE1300	H'xx8D	Set SCIF3 (TXI3) as activation source for channel 0.

		j-	
Register	Address	Setting value	Description
DMA source address register 1 (SAR_1)	H'FFFE1010	H'FFFE9814	Set the SCIF3 receive FIFO data register (SCFRDR_3) as the DMA transfer destination address.
DMA destination address register 1 (DAR_1)	H'FFFE1014	_	Set the start address of the receive data storage area in on-chip RAM as the DMA transfer source address
DMA transfer count register 1 (DMATCR_1)	H'FFFE1018	H'00000020	Set the DMA transfer count to 32. (Set the single transfer size to one byte in CHCR_1.)
DMA channel control register 1 (CHCR_1)	H'FFFE101C	H'00004804 (initial setting value)	TC = 0: 1 transfer per transfer request RLD = 0: Reload function disabled (initial value) DM[1:0] = B'01: Increment destination address SM[1:0] = B'00: Fixed source address RS[3:0] = B'1000: DMA extension resource selector TB = 0: Cycle steal mode (initial value) TS[1:0] = B'00: Transfer unit set to one byte IE = 1: Interrupt requests enabled TE: Clear to 0 at DMA transfer end interrupt. DE: Before DMAC initial settings, clear to 0 to disable DMA transfers (initial value). After DMAC initial settings, set to 1 to enable DMA transfers. Clear to 0 to disable DMA transfers at DMA transfer end interrupt.
DMA operation register (DMAOR)	H'FFFE1200	_	DME: After DMAC initial settings, set to 1 to enable DMA transfers on all channels. Clear to 0 to disable DMA transfers on all channels at DMA transfer end interrupt.
DMA extension resource selector 0 (DMARS0)	H'FFFE1300	H'8Exx	Set SCIF3 (RXI3) as activation source for channel 1.

### Table 10 DMAC (Channel 1) Register Settings

### 2.4.5 Serial Communication Interface with FIFO (SCIF)

Table 11 lists the SCIF register settings.

#### Table 11 SCIF register settings

Register	Address	Setting value	Description
Serial control	H'FFFE9808	H'0000	Initial value
register 3 (SCSCR_3)			TIE = 0: Transmit FIFO data empty interrupt (TXI)
			requests disabled
			RIE = 0: Receive FIFO data full interrupt (RXI)
			requests and receive error interrupt (ERI) request requests disabled
			TE = 0: Transmit operation disabled
			RE = 0: Receive operation disabled
			When making settings (clock synchronous mode)
			CEK[1:0] = B'00: Internal clock/SCK pin
			synchronous clock output
		H'00F8	When transmit/receive enabled
			TIE = 1: Transmit FIFO data empty interrupt (TXI)
			requests enabled
			RIE = 1: Receive FIFO data full interrupt (RXI)
			requests and receive error interrupt (ERI)
			requests enabled
			TE = 1: Transmit operation enabled
			RE = 1: Receive operation enabled
		H'0038	When transmit/receive ends
			TIE = 0: Transmit FIFO data empty interrupt (TXI)
			requests disabled
			RIE = 1: Receive FIFO data full interrupt (RXI) requests disabled
FIFO control register 3	H'FFFE9818	H'0006	Initial settings
(SCFCR_3)		110000	RTRG = 0: Specified receive trigger count (1)
			TTRG = 0: Specified transmit trigger count (8)
			TFRST = 1: SCFTDR resets enabled
			RFRST = 1: SCFRDR resets enabled
			LOOP = 0: Loop back test disabled
		H'0030	Initial settings
			RTRG = 0: Specified receive trigger count (1)
			TTRG = 3: Specified transmit trigger count (16)
			TFRST = 0: SCFTDR resets disabled
			RFRST = 0: SCFRDR resets disabled
			LOOP = 0: Loop back test disabled
Serial status register 3	H'FFFE9810	H'0060	Initial settings
(SCFSR_3)			TDRE = 1: Transmit data register empty flag
			TEND = 1: Transmit end flag
Line status register 3	H'FFFE9824	H'0000	Initial settings
(SCLSR_3)		1.1100000	ORER = 0: Overrun error flag
Serial mode register 3	H'FFFE9800	H'0000	C/A = 1: Clock synchronous mode
(SCSMR_3)			CHR = 0: 8-bit data
Dit roto register 2			CKS[1:0] = B'00: P\u00f6 clock
Bit rate register 3 (SCBBR_3)	H'FFFE9804	D'124	Clock synchronous mode Bit rate: 100,000 (bps)

1.01	Jun. 25, 2010	_	Modifications to source project due to change in FRQCR setting method
1.02	Sep. 27, 2010	10	Figure 8 amended
1.03	Mar. 1, 2012		Addition of source projects for SH7239 and SH7231

### General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

- 1. Handling of Unused Pins
  - Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.
    - The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.
- 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

 The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

- 3. Prohibition of Access to Reserved Addresses Access to reserved addresses is prohibited.
  - The reserved addresses are provided for the possible future expansion of functions. Do not access
    these addresses; the correct operation of LSI is not guaranteed if they are accessed.
- 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
- 5. Differences between Products

Before changing from one product to another, i.e. to one with a different type number, confirm that the change will not lead to problems.

— The characteristics of MPU/MCU in the same group but having different type numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different type numbers, implement a system-evaluation test for each of the products.

	use of these circuits, software, or information.
5.	When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and
	regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to he development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is
	prohibited under any applicable domestic or foreign laws or regulations.
6.	Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics
_	assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7.	Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas
	Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for
	which it is not intended wilhout the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the
	use of any Renessa Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renessa Electronics.
	The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc. Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools;
	personal electronic equipment; and industrial robots.
	High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically
	designed for life support. Specific*: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical
	specific . All chain, aerospace equipment, submersione repeaters, nuclear reactor control systems, neurcal equipment or systems for the support (e.g. annotal me support evoces or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8.	fou should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage
	ange, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the
9.	use of Renesas Electronics products beyond such specified ranges. Nthough Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and
5.	malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the
	possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to
	edundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult,
10	please evaluate the safety of the final products or system manufactured by you.
10.	please evaluate the safety of the final products or system manufactured by you.
