RENESAS

1.5V LOW-POWER WIDE-RANGE FREQUENCY CLOCK DRIVER

ICS98UAE877A

Description

The PLL clock buffer, ICS98UAE877A, is designed for a V_{DDQ} of 1.5V, an AV_{DD} of 1.5V and differential data input and output levels.

ICS98UAE877A is a zero delay buffer that distributes a differential clock input pair (CLK_INT, CLK_INC) to ten differential pair of clock outputs (CLKT[0:9], CLKC[0:9]) and one differential pair feedback clock outputs (FB_OUTT, FBOUTC). The clock outputs are controlled by the input clocks (CLK_INT, CLK_INC), the feedback clocks (FB_INT, FB_INC), the LVCMOS program pins (OE, OS) and the Analog Power input (AVDD). When OE is low, the outputs (except FB_OUTT/FB_OUTC) are disabled while the internal PLL continues to maintain its locked-in frequency. OS (Output Select) is a program pin that must be tied to GND or V_{DDQ}. When OS is high, OE will function as described above. When OS is low, OE has no effect on CLKT7/CLKC7 (they are free running in addition to FB_OUTT/FB_OUTC). When AV_{DD} is grounded, the PLL is turned off and bypassed for test purposes.

When both clock signals (CLK_INT, CLK_INC) are logic low, the device will enter a low power mode. An input logic detection circuit on the differential inputs, independent from the input buffers, will detect the logic low level and perform a low power state where all outputs, the feedback and the PLL are OFF. When the inputs transition from both being logic low to being differential signals, the PLL will be turned back on, the inputs and outputs will be enabled and the PLL will obtain phase lock between the feedback clock pair (FB_INT, FB_INC) and the input clock pair (CLK_INT, CLK_INC) within the specified stabilization time tSTAB.

The PLL in ICS98UAE877A clock driver uses the input clocks (CLK_INT, CLK_INC) and the feedback clocks (FB_INT, FB_INC) to provide high-performance, low-skew, low-jitter output differential clocks (CLKT[0:9], CLKC[0:9]). ICS98UAE877A is also able to track Spread Spectrum Clocking (SSC) for reduced EMI.

ICS98UAE877A is available in Commercial Temperature Range (0°C to 70°C) and Industrial Temperature Range (-40°C to +85°C). See Ordering Information for details

Features

- Low skew, low jitter PLL clock driver
- 1 to 10 differential clock distribution
- Feedback pins for input to output synchronization
- Spread Spectrum tolerant inputs
- Auto PD when input signal is at a certain logic state
- Available in 52-ball VFBGA and a 40-pin MLF

Applications

- DDR2 Memory Modules / Zero Delay Board Fan Out
- Provides complete DDR DIMM solution with IDT74SSTUAE32xxx family

Switching Characteristics

- Period jitter: 40ps (DDR2-400/533)
  30ps (DDR2-667)

- Half-period jitter: 60ps (DDR2-400/533)
  50ps (DDR2-667)

- Output-Output Skew 40ps (DDR2-400/533)
 30ps (DDR2-667)

- Cycle-Cycle Jitter 40ps

Block Diagram

NOTE:
1. The Logic Detect (LD) powers down the device when a logic LOW is applied to both CLK_INT and CLK_INC.

1.5V (nom)	X	X	H	H	Reserved				

1   Outputs are disabled to a LOW state meeting the I$_{ODL}$ limit.

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item	Rating
Supply Voltage, (AV$_{DD}$ and V$_{DDQ}$)	-0.5V to 2.5V
Logic Inputs	GND - 0.5V to V$_{DDQ}$ + 0.5V
Ambient Operating Temperature	-40° C to +85° C
Storage Temperature	-65 to +150° C

DC Electrical Characteristics Over Operating Range

Following Conditions Apply Unless Otherwise Specified:

Commercial: T_A = 0°C to +70°C, Industrial: T_A = -40°C to +85°C; Supply Voltage AV_{DD}/V_{DDQ} = 1.5V ± 0.075V.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Units
V_{OH}	Output HIGH Voltage	I_{OH} = -100µA	V_{DDQ} - 2			V
		I_{OH} = -6mA	1.1	1.45		
V_{OL}	Output LOW Voltage	I_{OL} = 100µA		0.25	0.1	V
		I_{OL} = 6mA			0.6	
V_{IK}	Input Clamp Voltage	I_{IN} = -18mA			-1.2	V
I_{IH}	Input HIGH Current	CLK_INT, CLK_INC; V_I = V_{DD} or GND			±250	µA
I_{IL}	Input LOW Current	OS, FB_INT, FB_INC; V_I = V_{DD} or GND			±10	µA
I_{ODL}	Output Disabled LOW Current	OE = L, V_{ODL} = 100mV	100			µA
$I_{DD}1.5$	Operating Supply Current	C_L = 0pF @ 410MHz			300	mA
I_{DDLD}		C_L = 0pF			500	µA
C_{IN}[1]	Input Capacitance	V_I = V_{DDQ} or GND	2		3	pF
C_{OUT}[1]	Output Capacitance	V_{OUT} = V_{DDQ} or GND	2		3	

1   Guaranteed by design, not 100% tested in production.

Recommended Operating Conditions

Following Conditions Apply Unless Otherwise Specified:

Commercial: T_A = 0°C to +70°C, Industrial: T_A = -40°C to +85°C; Supply Voltage AV_{DD}/V_{DDQ} = 1.5V ± 0.075V.

Symbol	Parameter[1]	Conditions	Min.	Typ.	Max.	Units
AV_{DD}, V_{DDQ}	Supply Voltage		1.425	1.5	1.575	V
V_{IL}	LOW - Level Input Voltage	CLK_INT, CLK_INC, FB_INT, FB_INC			0.35 x V_{DDQ}	V
		OE, OS				
V_{IH}	HIGH -Level Input Voltage	CLK_INT, CLK_INC, FB_INT, FB_INC	0.65 x V_{DDQ}			V
		OE, OS				
V_{IN}	DC Input Signal Voltage[2]		-0.3		V_{DDQ} + 0.3	V
V_{ID}	Differential Input Signal Voltage[3]	DC - CLK_INT, CLK_INC, FB_INT, FB_INC	0.35		V_{DDQ} + 0.4	V
		AC - CLK_INT, CLK_INC, FB_INT, FB_INC	0.6			
V_{OX}	Output Differential Cross-Voltage[4]		$V_{DDQ}/2$ - 0.1		$V_{DDQ}/2$ +0.1	V
V_{IX}	Input Differential Cross-Voltage[4]		$V_{DDQ}/2$ - 0.15	$V_{DDQ}/2$	$V_{DDQ}/2$ + 0.15	
I_{OH}	HIGH-Level Output Current				-6	mA
I_{OL}	LOW-Level Output Current				6	
T_A	Operating Free-Air Temperature		-40		+85	°C

1   Unused inputs must be held HIGH or LOW to prevent them from floating.

2   DC input signal voltage specifies the allowable DC execution of differential input.

3   Differential inputs signal voltages specifies the differential voltage [VTR-VCP] required for switching, where VTR is the true input level and VCP is the complementary input level.

4   Differential cross-point voltage is expected to track variations of V_{DDQ} and is the voltage at which the differential signal must be crossing.

Timing Requirements Over Recommended Operating Free-Air Temperature Range

Following Conditions Apply Unless Otherwise Specified:

Commercial: T_A = 0°C to +70°C, Industrial: T_A = -40°C to +85°C; Supply Voltage AV_{DD}/V_{DDQ} = 1.5V ± 0.075V.

Symbol	Parameter[1]	Conditions	Min.	Max.	Units
freq$_{OP}$	Max Clock Frequency[2]	1.5V ± 0.075V @ 25°C	95	410	MHz
freq$_{APP}$	Application Frequency Range[3]	1.5V ± 0.075V @ 25°C	160	410	MHz
d$_{TIN}$	Input Clock Duty Cycle		40	60	%
T$_{STAB}$	CLK Stabilization[4]			9	µs

1   The PLL must be able to handle spread spectrum induced skew.
2   Operating clock frequency indicates a range over which the PLL must be able to lock, but in which it is not required to meet the other timing parameters. (Used for low speed system debug.)
3   Application clock frequency indicates a range over which the PLL must meet all timing parameters.
4   Stabilization time is the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal, within the value specificied by the Static Phase Offset ($t\varnothing$), after power-up. During normal operation, the stabilization time is also the time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal when CLK and $\overline{CLK}$ go to a logic low state, enter the power-down mode and later return to active operation. CLK and $\overline{CLK}$ may be left floating after they have been driven low for one complete clock cycle.

Switching Characteristics Over Recommended Free Air Operating Range

Following Conditions Apply Unless Otherwise Specified:

Commercial: T_A = 0°C to +70°C, Industrial: T_A = -40°C to +85°C; Supply Voltage AV_{DD}/V_{DDQ} = 1.5V ± 0.075V
