Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Table of Contents

Chapter 1 Introduction	10
1.1 Overview	10
1.2 Using this Manual	10
1.3 Documentation Standard	10
1.4 Introduction to FSP	10
1.4.1 Purpose	11
1.4.2 Quality	11
1.4.3 Ease of Use	11
1.4.4 Scalability	11
1.4.5 Build Time Configurations	11
1.4.6 e2 studio IDE	11
Chapter 2 Starting Development	12
2.1 Starting Development Introduction	12
2.2 e2 studio User Guide	13
2.2.1 What is e2 studio?	13
2.2.2 e2 studio Prerequisites	15
2.2.2.1 Obtaining an RA MCU Kit	15
2.2.2.2 PC Requirements	15
2.2.2.3 Installing e2 studio, platform installer and the FSP package	15
2.2.2.4 Choosing a Toolchain	15
2.2.2.5 Licensing	16
2.2.3 What is a Project?	16
2.2.4 Creating a Project	18
2.2.4.1 Creating a New Project	18
2.2.4.2 Selecting a Board and Toolchain	19
2.2.4.3 Selecting Flat or Arm® TrustZone® Project	20
2.2.4.4 Selecting a Project Template	21
2.2.5 Configuring a Project	24
2.2.5.1 Summary Tab	24
2.2.5.2 Configuring the BSP	25
2.2.5.3 Configuring Clocks	25
2.2.5.4 Configuring Pins	26
2.2.5.5 Configuring Interrupts from the Stacks Tab	28
2.2.5.6 Viewing Event Links	31
2.2.6 Adding Threads and Drivers	31
2.2.6.1 Adding and Configuring HAL Drivers	32
2.2.6.2 Adding Drivers to a Thread and Configuring the Drivers	34
2.2.6.3 Configuring Threads	37
2.2.7 Reviewing and Adding Components	38
2.2.8 Writing the Application	39
2.2.8.1 Coding Features	39
2.2.8.2 HAL Modules in FSP: A Practical Description	45
2.2.8.3 RTOS-Independent Applications	46
2.2.8.4 RTOS Applications	47
2.2.8.5 Additional Resources for Application Development	49
2.2.9 Debugging the Project	50
2.2.10 Modifying Toolchain Settings	50
2.2.11 Creating RA project with ARM Compiler 6 in e2 studio	51
2.2.12 Importing an Existing Project into e2 studio	54
2.3 Tutorial: Your First RA MCU Project - Blinky	58
2.3.1 Tutorial Blinky	58

2.3.2 What Does Blinky Do?	59
2.3.3 Prerequisites	59
2.3.4 Create a New Project for Blinky	59
2.3.4.1 Details about the Blinky Configuration	62
2.3.4.2 Configuring the Blinky Clocks	63
2.3.4.3 Configuring the Blinky Pins	63
2.3.4.4 Configuring the Parameters for Blinky Components	63
2.3.4.5 Where is main()?	63
2.3.4.6 Blinky Example Code	63
2.3.5 Build the Blinky Project	63
2.3.6 Debug the Blinky Project	64
2.3.6.1 Debug prerequisites	64
2.3.6.2 Debug steps	65
2.3.6.3 Details about the Debug Process	66
2.3.7 Run the Blinky Project	67
2.4 Tutorial: Using HAL Drivers - Programming the WDT	67
2.4.1 Application WDT	67
2.4.2 Creating a WDT Application Using the RA MCU FSP and e2 studio	67
2.4.2.1 Using the FSP and e2 studio	67
2.4.2.2 The WDT Application	67
2.4.2.3 WDT Application flow	68
2.4.3 Creating the Project with e2 studio	68
2.4.4 Configuring the Project with e2 studio	71
2.4.4.1 BSP Tab	72
2.4.4.2 Clocks Tab	72
2.4.4.3 Interrupts Tab	73
2.4.4.4 Event Links Tab	73
2.4.4.5 Pins Tab	73
2.4.4.6 Stacks Tab	73
2.4.4.7 Components Tab	76
2.4.5 WDT Generated Project Files	77
2.4.5.1 WDT hal_data.h	79
2.4.5.2 WDT hal_data.c	80
2.4.5.3 WDT main.c	81
2.4.5.4 WDT hal_entry.c	81
2.4.6 Building and Testing the Project	84
2.5 Primer: ARM® TrustZone® Project Development	85
2.5.1 Renesas Implementation of ARM® TrustZone® Technology	86
2.5.1.1 Calling from Non-Secure to Secure	87
2.5.1.2 Calling from Secure to Non-Secure	87
2.5.2 Workflow	87
2.5.2.1 Secure Project	87
2.5.2.2 Non-Secure Project	88
2.5.2.3 Flat Project	88
2.5.3 RA Project Generator (PG)	88
2.5.3.1 Secure Project Set Up	90
2.5.3.2 RTOS Support in TZ Project	90
2.5.3.3 Peripheral Security Attribution	91
2.5.3.4 Non-Secure	92
2.5.3.5 Flat Project Type	92
2.5.3.6 Secure Connection to Non-Secure Project	92
2.5.3.7 Debug Configurations	93
2.5.4 Secure Projects	93
2.5.4.1 Secure Clock	94
2.5.4.2 Setting Drivers as NSC	94

2.5.4.3 Guard Functions	94
2.5.5 Non-Secure projects	95
2.5.5.1 Clock Set Up	95
2.5.5.2 Selecting NSC Drivers	96
2.5.5.3 Locked Resources	96
2.5.5.4 Locked Channels	97
2.5.6 IDAU registers	97
2.5.6.1 SCI Boot Mode	99
2.5.6.2 DLM States	99
2.5.7 Debug	101
2.5.7.1 Non-Secure Debug	101
2.5.8 Debugger support	102
2.5.9 Third-Party IDEs	102
2.5.10 Renesas Flash Programmer (RFP)	103
2.5.11 Glossary	104
2.5.11.1 Configurator Icon Glossary	105
2.6 RA SC User Guide for MDK and IAR	105
2.6.1 What is RA SC?	105
2.6.2 Using RA Smart Configurator with Keil MDK	105
2.6.2.1 Prerequisites	105
2.6.2.2 Create new RA project	106
2.6.2.3 Modify existing RA project	107
2.6.2.4 Build and Debug RA project	107
2.6.2.5 Notes and Restrictions	108
2.6.3 Using RA Smart Configurator with IAR EWARM	109
2.6.3.1 Prerequisites	109
2.6.3.2 Create new RA project	109
2.6.3.3 Notes and Restrictions	110
Chapter 3 FSP Architecture	112
3.1 FSP Architecture Overview	112
3.1.1 C99 Use	112
3.1.2 Doxygen	112
3.1.3 Weak Symbols	112
3.1.4 Memory Allocation	112
3.1.5 FSP Terms	112
3.2 FSP Modules	114
3.3 FSP Stacks	115
3.4 FSP Interfaces	116
3.4.1 FSP Interface Enumerations	116
3.4.2 FSP Interface Callback Functions	116
3.4.3 FSP Interface Data Structures	119
3.4.3.1 FSP Interface Configuration Structure	119
3.4.3.2 FSP Interface API Structure	119
3.4.3.3 FSP Interface Instance Structure	122
3.5 FSP Instances	123
3.5.1 FSP Instance Control Structure	123
3.5.2 FSP Interface Extensions	123
3.5.2.1 FSP Extended Configuration Structure	124
3.5.3 FSP Instance API	124
3.6 FSP API Standards	124
3.6.1 FSP Function Names	124
3.6.2 Use of const in API parameters	124
3.6.3 FSP Version Information	125
3.7 FSP Build Time Configurations	125

3.8 FSP File Structure	125
3.9 FSP TrustZone Support	126
3.9.1 FSP TrustZone Projects	126
3.9.2 Non-Secure Callable Guard Functions	126
3.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules	126
3.9.4 Additional TrustZone Information	126
3.10 FSP Architecture in Practice	127
3.10.1 FSP Connecting Layers	127
3.10.2 Using FSP Modules in an Application	127
3.10.2.1 Create a Module Instance in the RA Configuration Editor	127
3.10.2.2 Use the Instance API in the Application	127
Chapter 4 API Reference	129
4.1 BSP	129
4.1.1 Common Error Codes	131
4.1.2 MCU Board Support Package	142
4.1.2.1 RA2A1	177
4.1.2.2 RA2E1	182
4.1.2.3 RA2E2	187
4.1.2.4 RA2L1	192
4.1.2.5 RA4E1	199
4.1.2.6 RA4M1	205
4.1.2.7 RA4M2	210
4.1.2.8 RA4M3	217
4.1.2.9 RA4W1	223
4.1.2.10 RA6E1	228
4.1.2.11 RA6M1	235
4.1.2.12 RA6M2	241
4.1.2.13 RA6M3	246
4.1.2.14 RA6M4	251
4.1.2.15 RA6M5	258
4.1.2.16 RA6T1	265
4.1.2.17 RA6T2	271
4.1.3 BSP I/O access	278
4.2 Modules	292
4.2.1 High-Speed Analog Comparator (r_acmphs)	305
4.2.2 Low-Power Analog Comparator (r_acmplp)	312
4.2.3 Analog to Digital Converter (r_adc)	320
4.2.4 Analog to Digital Converter (r_adc_b)	355
4.2.5 Asynchronous General Purpose Timer (r_agt)	389
4.2.6 Bluetooth Low Energy Library of Balance Configuration (r_ble)	415
4.2.7 Bluetooth Low Energy Library of Compact Configuration (r_ble)	417
4.2.8 Bluetooth Low Energy Library of Extended Configuration (r_ble)	420
4.2.9 Clock Frequency Accuracy Measurement Circuit (r_cac)	422
4.2.10 Controller Area Network (r_can)	429
4.2.11 Controller Area Network - Flexible Data (r_canfd)	465
4.2.12 Consumer Electronics Control (r_cec)	492
4.2.13 Clock Generation Circuit (r_cgc)	503
4.2.14 Cyclic Redundancy Check (CRC) Calculator (r_crc)	524
4.2.15 Capacitive Touch Sensing Unit (r_ctsu)	530
4.2.16 Digital to Analog Converter (r_dac)	563
4.2.17 Digital to Analog Converter (r_dac8)	569
4.2.18 Direct Memory Access Controller (r_dmac)	575
4.2.19 Data Operation Circuit (r_doc)	588
4.2.20 D/AVE 2D Port Interface (r_drw)	594

4.2.21 Data Transfer Controller (r_dtc)	596
4.2.22 Event Link Controller (r_elc)	609
4.2.23 Ethernet (r_ether)	616
4.2.24 Ethernet PHY (r_ether_phy)	637
4.2.25 High-Performance Flash Driver (r_flash_hp)	644
4.2.26 Low-Power Flash Driver (r_flash_lp)	663
4.2.27 Graphics LCD Controller (r_glcdc)	680
4.2.28 General PWM Timer (r_gpt)	723
4.2.29 General PWM Timer Three-Phase Motor Control Driver (r_gpt_three_phase)	766
4.2.30 I3C Bus Interface (r_i3c)	775
4.2.31 Interrupt Controller Unit (r_icu)	814
4.2.32 I2C Master on IIC/I3C (r_iic_b_master)	821
4.2.33 I2C Slave on IIC/I3C (r_iic_b_slave)	834
4.2.34 I2C Master on IIC (r_iic_master)	845
4.2.35 I2C Slave on IIC (r_iic_slave)	858
4.2.36 I/O Ports (r_ioport)	869
4.2.37 Independent Watchdog Timer (r_iwdt)	892
4.2.38 JPEG Codec (r_jpeg)	902
4.2.39 Key Interrupt (r_kint)	929
4.2.40 Low Power Modes (r_lpm)	933
4.2.41 Low Voltage Detection (r_lvd)	942
4.2.42 Operational Amplifier (r_opamp)	950
4.2.43 Octa Serial Peripheral Interface for Flash and RAM devices (r_ospi)	968
4.2.44 Parallel Data Capture (r_pdc)	994
4.2.45 Port Output Enable for GPT (r_poeg)	1001
4.2.46 Precision Time Protocol (r_ptp)	1009
4.2.47 Quad Serial Peripheral Interface Flash (r_qspi)	1030
4.2.48 Realtime Clock (r_rtc)	1049
4.2.49 Secure Crypto Engine (r_sce_protected)	1060
4.2.50 Serial Communications Interface (SCI) I2C (r_sci_b_i2c)	1214
4.2.51 Serial Communications Interface (SCI) SPI (r_sci_b_spi)	1227
4.2.52 Serial Communications Interface (SCI) UART (r_sci_b_uart)	1238
4.2.53 Serial Communications Interface (SCI) I2C (r_sci_i2c)	1256
4.2.54 Serial Communications Interface (SCI) SPI (r_sci_spi)	1268
4.2.55 Serial Communications Interface (SCI) UART (r_sci_uart)	1280
4.2.56 Sigma Delta Analog to Digital Converter (r_sdadc)	1298
4.2.57 SD/MMC Host Interface (r_sdhi)	1319
4.2.58 Segment LCD Controller (r_slcdc)	1335
4.2.59 Serial Peripheral Interface (r_spi)	1343
4.2.60 Serial Peripheral Interface (r_spi_b)	1361
4.2.61 Serial Sound Interface (r_ssi)	1378
4.2.62 USB (r_usb_basic)	1393
4.2.63 USB Composite Class (r_usb_composite)	1423
4.2.64 USB Host Communications Device Class Driver (r_usb_hcdc)	1433
4.2.65 USB Host Human Interface Device Class Driver (r_usb_hhid)	1442
4.2.66 USB Host Mass Storage Class Driver (r_usb_hmsc)	1451
4.2.67 USB Host Vendor Class (r_usb_hvnd)	1461
4.2.68 USB Peripheral Communications Device Class (r_usb_pcdc)	1475
4.2.69 USB Peripheral Human Interface Device Class (r_usb_phid)	1482
4.2.70 USB Peripheral Mass Storage Class (r_usb_pmsc)	1498
4.2.71 USB Peripheral Vendor Class (r_usb_pvnd)	1504
4.2.72 Watchdog Timer (r_wdt)	1516
4.2.73 ADPCM Decoder (rm_adpcm_decoder)	1528
4.2.74 Audio Playback with PWM (rm_audio_playback_pwm)	1532

4.2.75 AWS PKCS11 PAL (rm_aws_pkcs11_pal)	1543
4.2.76 AWS PKCS11 PAL LITTLEFS (rm_aws_pkcs11_pal_littlefs)	1544
4.2.77 Bluetooth Low Energy Abstraction (rm_ble_abs)	1545
4.2.78 Bluetooth Low Energy Abstraction with RYZ012 (rm_ble_abs_spp)	1580
4.2.79 SD/MMC Block Media Implementation (rm_block_media_sdmmc)	1588
4.2.80 SPI Block Media Implementation (rm_block_media_spi)	1595
4.2.81 USB HMSC Block Media Implementation (rm_block_media_usb)	1605
4.2.82 User Block Media Implementation (rm_block_media_user)	1612
4.2.83 I2C Communicatons Middleware (rm_comms_i2c)	1614
4.2.84 SEGGER emWin Port (rm_emwin_port)	1621
4.2.85 Azure RTOS FileX Block Media I/O Driver (rm_filex_block_media)	1629
4.2.86 Azure RTOS FileX LevelX I/O Driver (rm_filex_levelx_nor)	1646
4.2.87 FreeRTOS+FAT Port (rm_freertos_plus_fat)	1660
4.2.88 FreeRTOS Plus TCP (rm_freertos_plus_tcp)	1673
4.2.89 FreeRTOS Port (rm_freertos_port)	1680
4.2.90 RTOS Context Management (rm_tz_context)	1709
4.2.91 FS2012 Sensor Middleware (rm_fs2012)	1710
4.2.92 Azure RTOS GUIX Port (rm_guix_port)	1716
4.2.93 HS300X Sensor Middleware (rm_hs300x)	1723
4.2.94 Azure RTOS LevelX NOR SPI Driver (rm_levelx_nor_spi)	1735
4.2.95 LittleFS Flash Port (rm_littlefs_flash)	1748
4.2.96 MCUboot Port (rm_mcuboot_port)	1755
4.2.97 Motor 120 Control Hall (motor_120_control_hall)	1766
4.2.98 Motor 120 Control Sensorless (motor_120_control_sensorless)	1780
4.2.99 Motor 120 Degree (rm_motor_120_degree)	1798
4.2.100 Motor 120 degree driver (rm_motor_120_driver)	1810
4.2.101 Motor Current (rm_motor_current)	1823
4.2.102 Motor Driver (rm_motor_driver)	1834
4.2.103 Motor encoder vector control (rm_motor_encoder)	1841
4.2.104 Motor Angle and Speed Estimation (rm_motor_estimate)	1853
4.2.105 Motor Position (rm_motor_position)	1862
4.2.106 Motor Angle and Speed Calculation with an Encoder (rm_motor_sense_encoder)	1872
4.2.107 Motor Sensorless Vector Control (rm_motor_sensorless)	1882
4.2.108 Motor Speed (rm_motor_speed)	1893
4.2.109 Azure RTOS NetX Secure Crypto Hardware Acceleration (rm_netx_secure_crypto)	1904
4.2.110 Azure RTOS NetX Duo Ether Driver (rm_netxdue_ether)	1942
4.2.111 Azure RTOS NetX Duo WiFi Driver (rm_netxdue_wifi)	1945
4.2.112 Crypto Middleware (rm_psa_crypto)	1951
4.2.113 Azure RTOS ThreadX Port (rm_threadx_port)	1994
4.2.114 Intel TinyCrypt (rm_tinycrypt_port)	2003
4.2.115 Capacitive Touch Middleware (rm_touch)	2014
4.2.116 USBX Porting Layer (rm_usbx_port)	2033
4.2.117 Virtual EEPROM (rm_vee_flash)	2074
4.2.118 AWS Device Provisioning	2088
4.2.119 AWS HTTPS	2092
4.2.120 AWS MQTT	2097
4.2.121 Wifi Middleware (rm_wifi_onchip_silex)	2100
4.2.122 AWS Secure Sockets	2114
4.2.123 ZMOD4XXX Sensor Middleware (rm_zmod4xxx)	2120
4.3 Interfaces	2155
4.3.1 ADC Interface	2162
4.3.2 BLE Interface	2180
4.3.2.1 GAP	2186
4.3.2.2 GATT_COMMON	2353
4.3.2.3 GATT_SERVER	2354

4.3.2.4 GATT_CLIENT	2390
4.3.2.5 L2CAP	2441
4.3.2.6 VS	2458
4.3.3 CAC Interface	2488
4.3.4 CAN Interface	2497
4.3.5 CEC Interface	2507
4.3.6 CGC Interface	2516
4.3.7 Comparator Interface	2530
4.3.8 CRC Interface	2538
4.3.9 CTSU Interface	2545
4.3.10 DAC Interface	2559
4.3.11 Display Interface	2564
4.3.12 DOC Interface	2581
4.3.13 ELC Interface	2588
4.3.14 Ethernet Interface	2592
4.3.15 Ethernet PHY Interface	2602
4.3.16 External IRQ Interface	2607
4.3.17 Flash Interface	2614
4.3.18 I2C Master Interface	2629
4.3.19 I2C Slave Interface	2638
4.3.20 I2S Interface	2647
4.3.21 I3C Interface	2659
4.3.22 I/O Port Interface	2676
4.3.23 JPEG Codec Interface	2689
4.3.24 Key Matrix Interface	2703
4.3.25 Low Power Modes Interface	2708
4.3.26 Low Voltage Detection Interface	2721
4.3.27 OPAMP Interface	2731
4.3.28 PDC Interface	2737
4.3.29 POEG Interface	2744
4.3.30 PTP Interface	2752
4.3.31 RTC Interface	2777
4.3.32 SD/MMC Interface	2788
4.3.33 SLCDC Interface	2805
4.3.34 SPI Interface	2816
4.3.35 SPI Flash Interface	2829
4.3.36 Three-Phase Interface	2843
4.3.37 Timer Interface	2849
4.3.38 Transfer Interface	2862
4.3.39 UART Interface	2874
4.3.40 USB Interface	2885
4.3.41 USB HCDC Interface	2914
4.3.42 USB HHID Interface	2919
4.3.43 USB HMSC Interface	2921
4.3.44 USB PCDC Interface	2927
4.3.45 USB PHID Interface	2929
4.3.46 USB PMSC Interface	2929
4.3.47 WDT Interface	2930
4.3.48 ADPCM Decoder Interface	2940
4.3.49 AUDIO PLAYBACK Interface	2943
4.3.50 BLE ABS Interface	2948
4.3.51 Block Media Interface	2984

Chapter 1 Introduction

1.1 Overview

This manual describes how to use the Renesas Flexible Software Package (FSP) for writing applications for the RA microcontroller series.

1.2 Using this Manual

This manual provides a wide variety of information, so it can be helpful to know where to start. Here is a short description of each main section and how they can be used.

[Starting Development](#) - Provides a step by step guide on how to use e2 studio and FSP to develop a project for RA MCUs. This is a good place to start to get up to speed quickly and efficiently.

[FSP Architecture](#) - Provides useful background material on key FSP concepts such as Modules, Stacks, and API standards. Reference this section to extend or refresh your knowledge of FSP concepts.

[API Reference](#) - Provides detailed information on each module and interface including features, API functions, configuration settings, usage notes, function prototypes and code examples. Board Support Package (BSP) related API functions are also included.

Note

Much of the information in the API Reference section is available from within the e2 studio tool via the [Developer Assistance](#) feature. The information here can be referenced for additional details on API features.

1.3 Documentation Standard

Each [Modules](#) section user guide outlines the following:

- **Features:** A bullet list of high level features provided by the module.
- **Configuration:** A description of module specific configurations available in the RA Configuration editor.
- **Usage Notes:** Module specific documentation and limitations.
- **Examples:** Example code provided to help the user get started.
- **API Reference:** Usage notes for each API in the module, including the function prototype and hyperlinks to the interface documentation for parameter definitions.

Each [Interfaces](#) section user guide outlines the following:

- **Detailed Description:** A short description and summary of the interface functionality.
- **Data Structures:** A list and definition of each data structure used by the interface including the structure of the pointers that define the API and are shared by all modules that implement the interface.
- **Typedefs:** A list and description of the typedefs used by the interface.
- **Enumerations:** A list and description of the enumerations used by the interface.

1.4 Introduction to FSP

1.4.1 Purpose

The Renesas Flexible Software Package (FSP) is an optimized software package designed to provide easy to use, scalable, high quality software for embedded system design. The primary goal is to provide lightweight, efficient drivers that meet common use cases in embedded systems.

1.4.2 Quality

FSP code quality is enforced by peer reviews, automated requirements-based testing, and automated static analysis.

1.4.3 Ease of Use

FSP provides uniform and intuitive APIs that are well documented. Each module is supported with detailed user documentation including example code.

1.4.4 Scalability

FSP modules can be used on any MCU in the RA family, provided the MCU has any peripherals required by the module.

1.4.5 Build Time Configurations

FSP modules also have build time configurations that can be used to optimize the size of the module for the feature set required by the application.

1.4.6 e2 studio IDE

FSP provides a host of efficiency enhancing tools for developing projects targeting the Renesas RA series of MCU devices. The e2 studio IDE provides a familiar development cockpit from which the key steps of project creation, module selection and configuration, code development, code generation, and debugging are all managed.

Chapter 2 Starting Development

2.1 Starting Development Introduction

The wealth of resources available to learn about and use e2 studio and FSP can be overwhelming on first inspection, so this section provides a Starting Development Guide with a list of the most important initial steps. Following these highly recommended first 11 steps will bring you up to speed on the development environment in record time. Even experienced developers can benefit from the use of this guide, to learn the terminology that might be unfamiliar or different from previous environments.

1. Read the section [What is e2 studio?](#), up to but not including [e2 studio Prerequisites](#). This will provide a description of the various windows and views to use e2 studio to create a project, add modules and threads, configure module properties, add code, and debug a project. It also describes how to use key coding 'accelerators' like Developer Assist (to drag and drop parameter populated API function calls right into your code), a context aware Autocomplete (to easily find and select from suggested enumerations, functions, types, and many other coding elements), and many other similar productivity enhancers.
2. Read the [FSP Architecture](#), [FSP Modules](#) and [FSP Stacks](#) sections. These provide the basic background on how FSP modules and stacks are used to construct your application. Understanding their definitions and the theory behind how they combine will make it easier to develop with FSP.
3. Read a few [Modules](#) sections to see how to use API function calls, structures, enumerations, types and callbacks. These module guides provide the information you will use to implement your project code.
4. After you have a Kit and you have downloaded and installed e2 studio and FSP, you can build and debug a simple project to test your installation, tool flow, and the kit. (If you do not have a Kit or have not yet installed the development software, use the links included in the [e2 studio Prerequisites](#) for more information.) The simple [Tutorial: Your First RA MCU Project - Blinky](#) will Blink an LED on and off. Follow the instructions for importing and running this project in section [Create a New Project for Blinky](#). It will use some of the key steps for managing projects within e2 studio and is a good way to learn the basics.
5. Once you have successfully run Blinky you have a good starting point for using FSP for more complex projects. The Using HAL Drivers Tutorial, available at [Tutorial: Using HAL Drivers - Programming the WDT](#), shows how to create a project from scratch, using FSP API functions. Do this next.
6. Several Hands-on Quick FSP Labs are available that cover key development topics with short 15-minute Do it Yourself (DIY) activities targeting the EK-RA6M3. Topics covered include code development accelerators like Developer Assistance, Autocomplete, Help, Visual Expressions and using Example Projects. The complete list of available Quick FSP Labs can be found here: <https://en-support.renesas.com/knowledgeBase/category/31087/subcategory/31090>. Doing a couple of these labs provides further details on using FSP, and is also good practice. Running these labs is highly recommended.
7. The balance of the [FSP Architecture](#) sections (that is, those not called out in step 2 above) contain additional reference material that may be helpful in the future. Scan them so you know what they contain, in case you need them.
8. The balance of the e2 studio User Guide, starting with the [What is a Project?](#) section up to, but not including, [Writing the Application](#) section, provides a detailed description of each of

the key steps, windows, and entries used to create, manage, configure, build and debug a project. Much of this may be familiar after running through the tutorials and Quick Labs. However, it is important to have a good grasp of what each of the configuration tabs are used for as that is where the bulk of the project preparation work takes place prior to writing code. Skim over this section as it may help with any questions in the future.

9. Read the [Writing the Application](#) section to get a short introduction to the steps used when creating application code with FSP. It covers both RTOS-independent and RTOS-dependent applications. It also includes a short description for several of the code accelerators you should be familiar with by now. Using additional Quick FSP Labs is a good way to become familiar with the application development process and links to them are included in the appropriate places in this section. You can find the complete list of available Quick FSP Labs here: <https://en-support.renesas.com/knowledgeBase/19308277>.
10. Scan the [Debugging the Project](#) section to see the steps required to download and start a debug session.
11. Explore the additional material available on the following web pages and bookmark the resources that look most valuable to you:
 - a. RA Landing Page: <https://www.renesas.com/ra>
 - b. FSP Landing Page: <https://www.renesas.com/fsp>
 - c. Example Projects on GitHub: <https://github.com/renesas/ra-fsp-examples>

2.2 e2 studio User Guide

2.2.1 What is e2 studio?

Renesas e2 studio is a development tool encompassing code development, build, and debug. e2 studio is based on the open-source Eclipse IDE and the associated C/C++ Development Tooling (CDT).

When developing for RA MCUs, e2 studio hosts the Renesas Flexible Software Package (FSP). FSP provides a wide range of time saving tools to simplify the selection, configuration, and management of modules and threads, to easily implement complex applications. The time saving tools available in e2 studio and FSP include the following:

- A Graphical User Interface (GUI) (see [Adding Threads and Drivers](#)) with numerous wizards for configuring and auto-generating code
- A context sensitive Autocomplete (see [Tutorial: Using HAL Drivers - Programming the WDT](#)) feature that provides intelligent options for completing a programming element
- A [Developer Assistance](#) tool for selection of and drag and drop placement of API functions directly in application code
- A [Welcome Window](#) with links to example projects, application notes and a variety of other self-help support resources
- An [Information Icon](#) from each module is provided in the graphic configuration viewer that links to specific design resources, including code 'cheat sheets' that provide useful starting points for common application implementations.

Figure 1: e2 studio Splash Screen

e2 studio organizes project work based on Perspectives, Views, Windows, Panes, and Pages (sometimes called Tabs). A window is a section of the e2 studio GUI that presents information on a key topic. Windows often use tabs to select sub-topics. For example, an editor window might have a tab available for each open file, so it is easy to switch back and forth between them. A window Pane is a section of a window. Within a window, multiple Panes can be opened and viewed simultaneously, as opposed to a tabbed window, where only individual content is displayed. A memory-display Window, for example, might have multiple Panes that allow the data to be displayed in different formats, simultaneously. A Perspective is a collection of Views and Windows typical for a specific stage of development. The default perspectives are a C/C++ Perspective, an FSP Configuration Perspective and a Debug Perspective. These provide specific Views, Windows, Tabs, and Panes tailored for the common tasks needed during the specific development stage.

Figure 2: Default Perspective

In addition to managing project development, selecting modules, configuring them and simplifying code development, e2 studio also hosts the engine for automatically generating code based on module selections and configurations. The engine continually checks for dependencies and automatically adds any needed lower level modules to the module stack. It also identifies any lower level modules that require configuration (for example, an interrupt that needs to have a priority assigned). It also provides a guide for selecting between multiple choices or options to make it easy to complete a fully functional module stack.

The Generate Project Content function takes the selected and configured modules and automatically generates the complete and correct configuration code. The code is added to the folders visible in the **Project Explorer** window in e2 studio. The configuration.xml file in the project folder holds all the generated configuration settings. This file can be opened in the GUI-based RA Configuration editor to make further edits and changes. Once a project has been generated, you can go back and reconfigure any of the modules and settings if required using this editor.

Figure 3: Project Explorer Window showing generated folders and configuration.xml file

2.2.2 e2 studio Prerequisites

2.2.2.1 Obtaining an RA MCU Kit

To develop applications with FSP, start with one of the Renesas RA MCU Evaluation Kits. The Renesas RA MCU Evaluation Kits are designed to seamlessly integrate with the e2 studio.

Ordering information, Quick Start Guides, User Manuals, and other related documents for all RA MCU Evaluation Kits are available at <https://www.renesas.com/ra>.

2.2.2.2 PC Requirements

The following are the minimum PC requirements to use e2 studio:

- Windows 10 with Intel i5 or i7, or AMD A10-7850K or FX
- Memory: 8-GB DDR3 or DDR4 DRAM (16-GB DDR4/2400-MHz RAM is preferred)
- Minimum 250-GB hard disk

2.2.2.3 Installing e2 studio, platform installer and the FSP package

Detailed installation instructions for the e2 studio and the FSP are available on the Renesas website <https://www.renesas.com/fsp>. Review the release notes for e2 studio to ensure that the e2 studio version supports the selected FSP version. The starting version of the installer includes all features of the RA MCUs.

2.2.2.4 Choosing a Toolchain

e2 studio can work with several toolchains and toolchain versions such as the GNU Arm compiler and Arm AC6. A version of the GNU Arm compiler is included in the e2 studio installer and has been verified to run with the FSP version.

2.2.2.5 Licensing

FSP licensing includes full source code, limited to Renesas hardware only.

2.2.3 What is a Project?

In e2 studio, all FSP applications are organized in RA MCU projects. Setting up an RA MCU project involves:

1. Creating a Project
2. Configuring a Project

These steps are described in detail in the next two sections. When you have existing projects already, after you launch e2 studio and select a workspace, all projects previously saved in the selected workspace are loaded and displayed in the **Project Explorer** window. Each project has an associated configuration file named `configuration.xml`, which is located in the project's root directory.

Figure 4: e2 studio Project Configuration file

Double-click on the `configuration.xml` file to open the RA MCU Project Editor. To edit the project configuration, make sure that the **FSP Configuration** perspective is selected in the upper right hand corner of the e2 studio window. Once selected, you can use the editor to view or modify the configuration settings associated with this project.

Figure 5: e2 studio FSP Configuration Perspective

Note

Whenever the RA project configuration (that is, the `configuration.xml` file) is saved, a verbose RA Project Report file (`ra_cfg.txt`) with all the project settings is generated. The format allows differences to be easily viewed using a text comparison tool. The generated file is located in the project root directory.

Figure 6: RA Project Report

The RA Project Editor has a number of tabs. The configuration steps and options for individual tabs are discussed in the following sections.

Note

The tabs available in the RA Project Editor depend on the e2 studio version and the layout may vary slightly, however the functionality should be easy to follow..

Figure 7: RA Project Editor tabs

- Click on the YouTube icon to visit the Renesas FSP playlist on YouTube
- Click on the Support icon to visit RA support pages at Renesas.com
- Click on the user manual (owl) icon to open the RA software package User's Manual

2.2.4 Creating a Project

During project creation, you specify the type of project, give it a project name and location, and configure the project settings for version, target board, whether an RTOS is included, the toolchain version, and the beginning template. This section includes easy-to-follow step-by-step instructions for all of the project creation tasks. Once you have created the project, you can move to configuring the project hardware (clocks, pins, interrupts) and the parameters of all the modules that are part of your application.

2.2.4.1 Creating a New Project

For RA MCU applications, generate a new project using the following steps:

1. Click on **File > New > RA C/C++ Project**.

Figure 8: New RA MCU Project

Then click on the type of template for the type of project you are creating.

Figure 9: New Project Templates

2. Select a project name and location.

Figure 10: RA MCU Project Generator (Screen 1)

3. Click **Next**.

2.2.4.2 Selecting a Board and Toolchain

In the **Project Configuration** window select the hardware and software environment:

1. Select the **FSP version**.
2. Select the **Board** for your application. You can select an existing RA MCU Evaluation Kit or select **Custom User Board** for any of the RA MCU devices with your own BSP definition.
3. Select the **Device**. The **Device** is automatically populated based on the **Board** selection. Only change the **Device** when using the **Custom User Board (Any Device)** board selection.
4. To add threads, select **RTOS**, or **No RTOS** if an RTOS is not being used.
5. The **Toolchain** selection defaults to **GCC Arm Embedded**.
6. Select the **Toolchain version**. This should default to the installed toolchain version.
7. Select the **Debugger**. The J-Link Arm Debugger is preselected.

8. Click **Next**.

Figure 11: RA MCU Project Generator (Screen 2)

Note

Click on the **Help** icon (?) for user guides, RA contents, and other documents.

2.2.4.3 Selecting Flat or Arm® TrustZone® Project

If you selected a device or tool based on an Arm® Cortex®-M33, you next select whether to use Arm® TrustZone® in your project. For normal, non-TrustZone projects, select "Flat".

Figure 12: Flat, Secure, or Non-Secure Project

For more information on Arm® TrustZone®, see [Primer: ARM® TrustZone® Project Development](#).

2.2.4.4 Selecting a Project Template

In the next window, select the build artifact and RTOS.

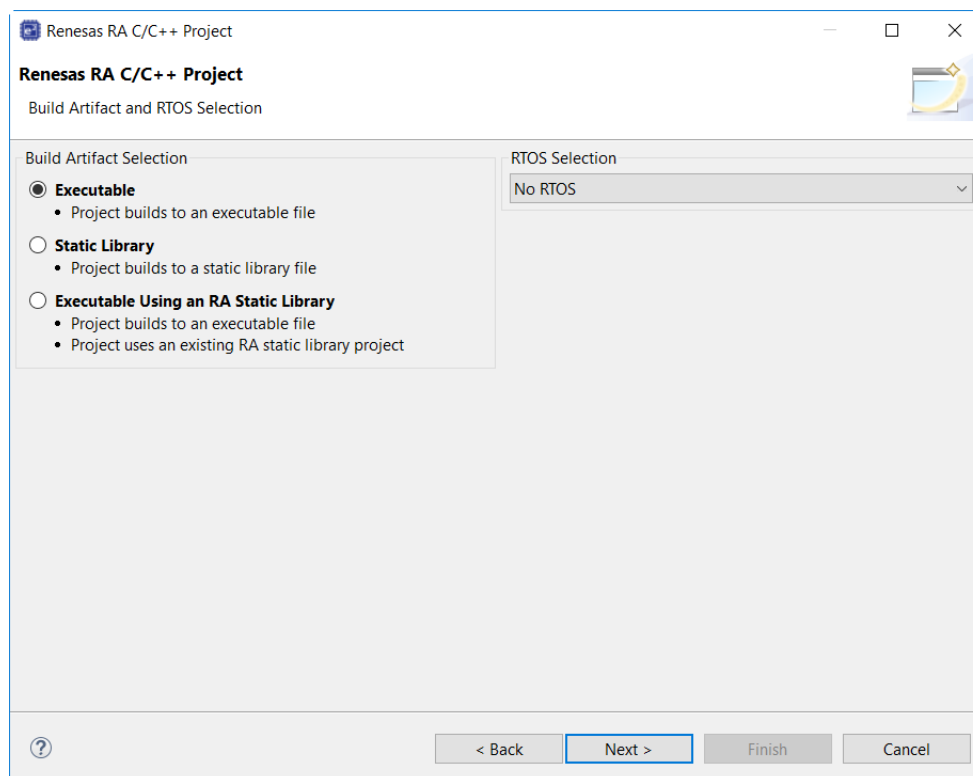

Figure 13: RA MCU Project Generator (Screen 3)

In the next window, select a project template from the list of available templates. By default, this screen shows the templates that are included in your current RA MCU pack. Once you have selected the appropriate template, click **Finish**.

Note

*If you want to develop your own application, select the basic template for your board, **Bare Metal - Minimal**.*

Figure 14: RA MCU Project Generator (Screen 4)

When the project is created, e2 studio displays a summary of the current project configuration in the RA MCU Project Editor.

Figure 15: RA MCU Project Editor and available editor tabs

On the bottom of the RA MCU Project Editor view, you can find the tabs for configuring multiple aspects of your project:

- With the **Summary** tab, you can see all they key characteristics of the project: board, device, toolchain, and more.
- With the **BSP** tab, you can change board specific parameters from the initial project selection.
- With the **Clocks** tab, you can configure the MCU clock settings for your project.
- With the **Pins** tab, you can configure the electrical characteristics and functions of each port pin.
- With the **Interrupts** tab, you can add new user events/interrupts.
- With the **Event Links** tab, you can configure events used by the Event Link Controller.
- With the **Stacks** tab, you can add and configure FSP modules. For each module selected in this tab, the **Properties** window provides access to the configuration parameters, interrupt priorities, and pin selections.
- The **Components** tab provides an overview of the selected modules. Although you can also add drivers for specific FSP releases and application sample code here, this tab is normally only used for reference.

The functions and use of each of these tabs is explained in detail in the next section.

2.2.5 Configuring a Project

Each of the configurable elements in an FSP project can be edited using the appropriate tab in the RA Configuration editor window. Importantly, the initial configuration of the MCU after reset and before any user code is executed is set by the configuration settings in the **BSP**, **Clocks** and **Pins** tabs. When you select a project template during project creation, e2 studio configures default values that are appropriate for the associated board. You can change those default values as needed. The following sections detail the process of configuring each of the project elements for each of the associated tabs.

2.2.5.1 Summary Tab

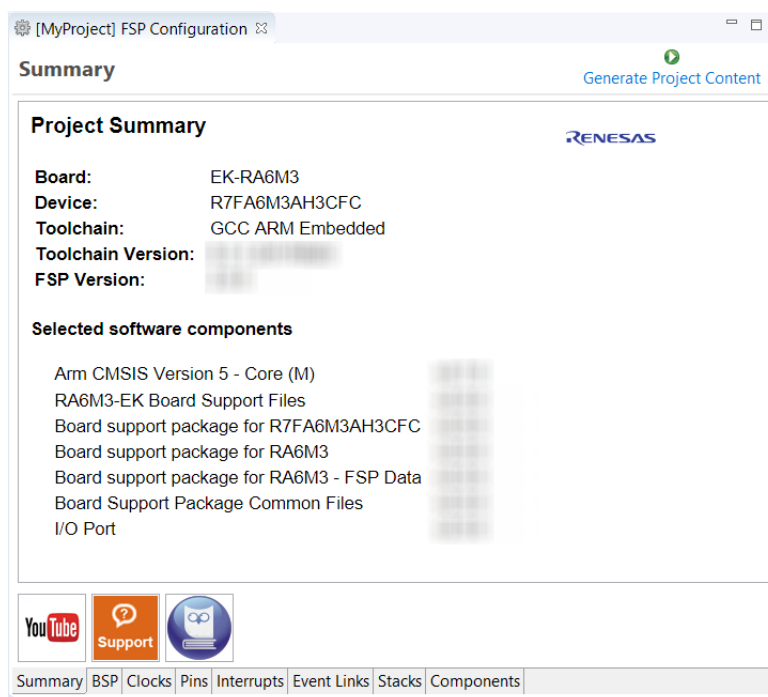

Figure 16: Configuration Summary tab

The **Summary** tab, seen in the above figure, identifies all the key elements and components of a project. It shows the target board, the device, toolchain and FSP version. Additionally, it provides a list of all the selected software components and modules used by the project. This is a more convenient summary view when compared to the **Components** tab.

The summary tab also includes handy icons with links to the Renesas YouTube channel, the Renesas support page and to the RA FSP User Manual that was downloaded during the installation process.

2.2.5.2 Configuring the BSP

The **BSP** tab shows the currently selected board (if any) and device. The Properties view is located in the lower left of the Project Configurations view as shown below.

Note

*If the Properties view is not visible, click **Window > Show View > Properties** in the top menu bar.*

Figure 17: Configuration BSP tab

The **Properties** view shows the configurable options available for the BSP. These can be changed as required. The BSP is the FSP layer above the MCU hardware. e2 studio checks the entry fields to flag invalid entries. For example, only valid numeric values can be entered for the stack size.

When you click the **Generate Project Content** button, the BSP configuration contents are written to `ra_cfg/fsp_cfg/bsp/bsp_cfg.h`

This file is created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

2.2.5.3 Configuring Clocks

The **Clocks** tab presents a graphical view of the MCU's clock tree, allowing the various clock dividers and sources to be modified. If a clock setting is invalid, the offending clock value is highlighted in red. It is still possible to generate code with this setting, but correct operation cannot be guaranteed. In the figure below, the USB clock UCLK has been changed so the resulting clock frequency is 60 MHz

instead of the required 48 MHz. This parameter is colored red.

Figure 18: Configuration Clocks tab

When you click the **Generate Project Content** button, the clock configuration contents are written to: `ra_gen/bsp_clock_cfg.h`

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

2.2.5.4 Configuring Pins

The **Pins** tab provides flexible configuration of the MCU's pins. As many pins are able to provide multiple functions, they can be configured on a peripheral basis. For example, selecting a serial channel via the SCI peripheral offers multiple options for the location of the receive and transmit pins for that module and channel. Once a pin is configured, it is shown as green in the **Package** view.

Note

If the **Package** view window is not open in e2 studio, select **Window > Show View > Pin Configurator > Package** from the top menu bar to open it.

The **Pins** tab simplifies the configuration of large packages with highly multiplexed pins by highlighting errors and presenting the options for each pin or for each peripheral. If you selected a project template for a specific board such as the EK-RA6M3, some peripherals connected on the board are preselected.

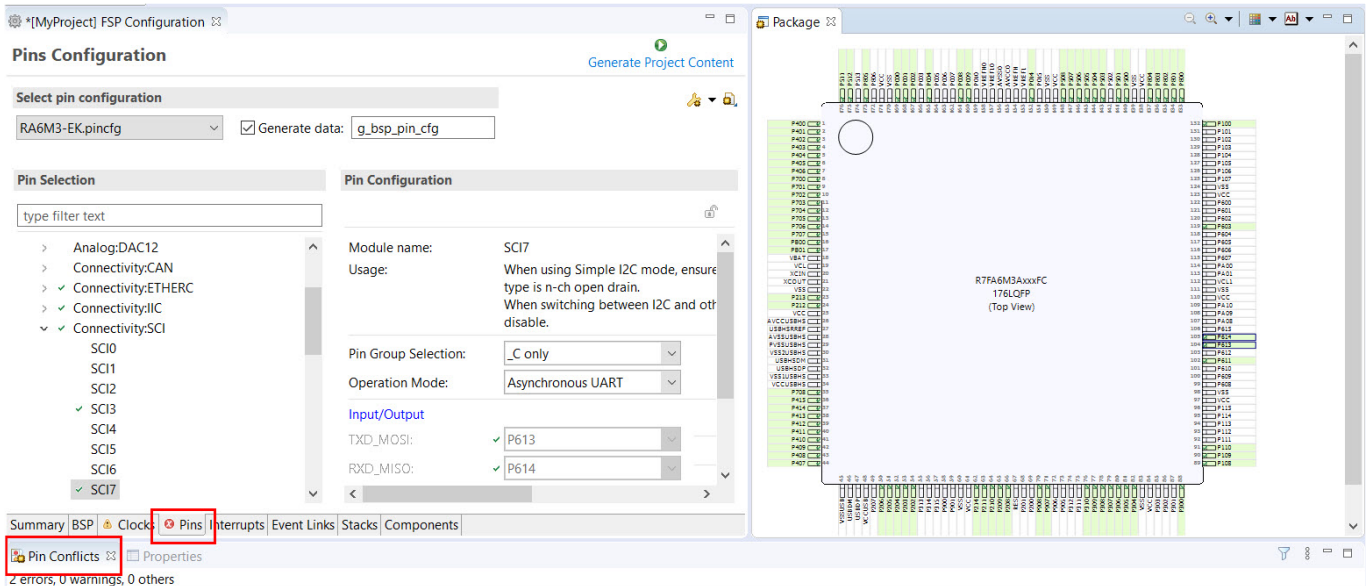

Figure 19: Pins Configuration

The pin configurator includes a built-in conflict checker, so if the same pin is allocated to another peripheral or I/O function the pin will be shown as red in the package view and also with white cross in a red square in the **Pin Selection** pane and **Pin Configuration** pane in the main **Pins** tab. The **Pin Conflicts** view provides a list of conflicts, so conflicts can be quickly identified and fixed.

In the example shown below, port P611 is already used by the CAC, and the attempt to connect this port to the Serial Communications Interface (SCI) results in a dangling connection error. To fix this error, select another port from the pin drop-down list or disable the CAC in the **Pin Selection** pane on the left side of the tab.

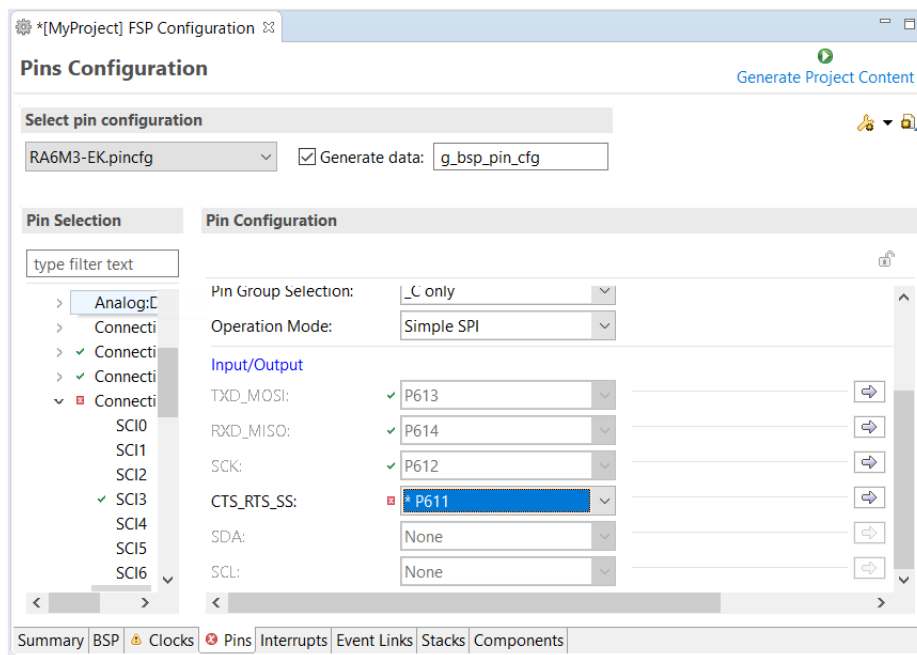

Figure 20: e2 studio Pin configurator

The pin configurator also shows a package view and the selected electrical or functional characteristics of each pin.

Figure 21: e2 studio Pin configurator package view

When you click the **Generate Project Content** button, the pin configuration contents are written to: `ra_gen\bsp_pin_cfg.h`

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

To make it easy to share pinning information for your project, e2 studio exports your pin configuration settings to a csv format and copies the csv file to `ra_gen/<MCU package>.csv`.

2.2.5.5 Configuring Interrupts from the Stacks Tab

You can use the **Properties** view in the **Stacks** tab to enable interrupts by setting the interrupt priority. Select the driver in the **Stacks** pane to view and edit its properties.

Figure 22: Configuring Interrupts in the Stacks tab

Creating Interrupts from the Interrupts Tab

On the **Interrupts** tab, the user can bypass a peripheral interrupt set by the FSP by setting a user-defined ISR. This can be done by adding a new event via the **New User Event** button.

Figure 23: Configuring interrupt in Interrupt Tab

Figure 24: Adding user-defined event

Enter the name of ISR for the new user event.

Figure 25: User-defined event ISR

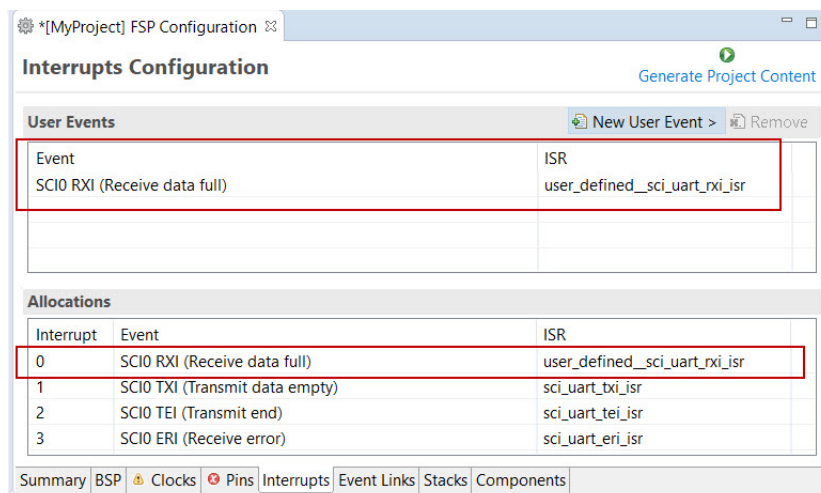

Figure 26: Using a user-defined event

2.2.5.6 Viewing Event Links

The Event Links tab can be used to view the Event Link Controller events. The events are sorted by peripheral to make it easy to find and verify them.

Figure 27: Viewing Event Links

Like the Interrupts tab, user-defined event sources and destinations (producers and consumers) can be defined by clicking the relevant **New User Event** button. Once a consumer is linked to a producer the link will appear in the **Allocations** section at the bottom.

Note

When selecting an ELC event to receive for a module (or when manually defining an event link), only the events that are made available by the modules configured in the project will be shown.

2.2.6 Adding Threads and Drivers

Every RTOS-based RA Project includes at least one RTOS Thread and a stack of FSP modules running

in that thread. The **Stacks** tab is a graphical user interface which helps you to add the right modules to a thread and configure the properties of both the threads and the modules associated with each thread. Once you have configured the thread, e2 studio automatically generates the code reflecting your configuration choices.

For any driver, or, more generally, any module that you add to a thread, e2 studio automatically resolves all dependencies with other modules and creates the appropriate stack. This stack is displayed in the Stacks pane, which e2 studio populates with the selected modules and module options for the selected thread.

The default view of the **Stacks** tab includes a Common Thread called **HAL/Common**. This thread includes the driver for I/O control (IOPORT). The default stack is shown in the **HAL/Common Stacks** pane. The default modules added to the HAL/Common driver are special in that the FSP only requires a single instance of each, which e2 studio then includes in every user-defined thread by default.

In applications that do not use an RTOS or run outside of the RTOS, the HAL/Common thread becomes the default location where you can add additional drivers to your application.

For a detailed description on how to add and configure modules and stacks, see the following sections:

- [Adding and Configuring HAL Drivers](#)
- [Adding Drivers to a Thread and Configuring the Drivers](#)

Once you have added a module either to HAL/Common or to a new thread, you can access the driver's configuration options in the **Properties** view. If you added thread objects, you can access the objects configuration options in the **Properties** view in the same way.

You can find details about how to configure threads here: [Configuring Threads](#)

Note

Driver and module selections and configuration options are defined in the FSP pack and can therefore change when the FSP version changes.

2.2.6.1 Adding and Configuring HAL Drivers

For applications that run outside or without the RTOS, you can add additional HAL drivers to your application using the HAL/Common thread. To add drivers, follow these steps:

1. Click on the HAL/Common icon in the **Stacks** pane. The Modules pane changes to **HAL/Common Stacks**.

Figure 28: e2 studio Project configurator - Adding drivers

2. Click **New Stack** to see a drop-down list of HAL level drivers available in the FSP.
3. Select a driver from the menu **New Stack > Driver**.

Figure 29: Select a driver

4. Select the driver module in the **HAL/Common Modules** pane and configure the driver properties in the **Properties** view.

e2 studio adds the following files when you click the **Generate Project Content** button:

- The selected driver module and its files to the ra/fsp directory
- The main() function and configuration structures and header files for your application as shown in the table below.

File	Contents	Overwritten by Generate Project Content?
------	----------	--

ra_gen/main.c	Contains main() calling generated and user code. When called, the BSP already has Initialized the MCU.	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

The configuration header files for all included modules are created or overwritten in this folder:
ra_cfg/fsp_cfg

2.2.6.2 Adding Drivers to a Thread and Configuring the Drivers

For an application that uses the RTOS, you can add one or more threads, and for each thread at least one module that runs in the thread. You can select modules from the Driver dropdown menu. To add modules to a thread, follow these steps:

1. In the **Threads** pane, click **New Thread** to add a Thread.

Figure 30: Adding a new RTOS Thread on the Stacks tab

2. In the **Properties** view, click on the **Name** and **Symbol** entries and enter a distinctive name and symbol for the new thread.

Note

e2 studio updates the name of the thread stacks pane to **My Thread Stacks**.

3. In the **My Thread Stacks** pane, click on **New Stack** to see a list of modules and drivers. HAL-level drivers can be added here.

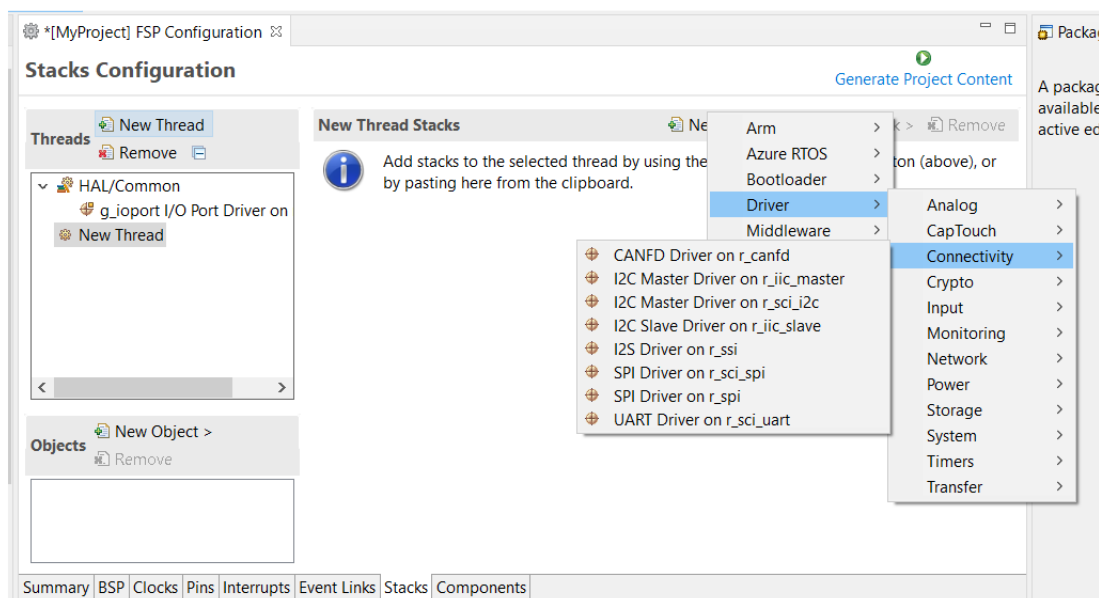

Figure 31: Adding Modules and Drivers to a thread

4. Select a module or driver from the list.
5. Click on the added driver and configure the driver as required by the application by updating the configuration parameters in the **Properties** view. To see the selected module or driver and be able to edit its properties, make sure the Thread containing the driver is highlighted in the **Threads** pane.

Figure 32: Configuring Module or Driver properties

6. If needed, add another thread by clicking **New Thread** in the **Threads** pane.

When you press the **Generate Project Content** button for the example above, e2 studio creates the files as shown in the following table:

File	Contents	Overwritten by Generate Project Content?
ra_gen/main.c	Contains main() calling generated and user code. When called the BSP will have initialized the MCU.	Yes
ra_gen/my_thread.c	Generated thread "my_thread" and configuration structures for modules added to this thread.	Yes
ra_gen/my_thread.h	Header file for thread "my_thread"	Yes
ra_gen/hal_data.c	Configuration structures for HAL Driver only modules.	Yes
ra_gen/hal_data.h	Header file for HAL Driver only modules.	Yes
src/hal_entry.c	User entry point for HAL Driver only code. Add your code here.	No

src/my_thread_entry.c	User entry point for thread "my_thread". Add your code here.	No
-----------------------	--	----

The configuration header files for all included modules and drivers are created or overwritten in the following folders: ra_cfg/fsp_cfg/<header files>

2.2.6.3 Configuring Threads

If the application uses an RTOS, the **Stacks** tab can be used to simplify the creation of RTOS threads, semaphores, mutexes, and event flags.

The components of each thread can be configured from the **Properties** view as shown below.

Figure 33: New Thread Properties

The **Properties** view contains settings common for all Threads (**Common**) and settings for this particular thread (**Thread**).

For this thread instance, the thread's name and properties (such as priority level or stack size) can be easily configured. e2 studio checks that the entries in the property field are valid. For example, it will verify that the field **Priority**, which requires an integer value, only contains numeric values between 0 and 9.

To add RTOS resources to a Thread, select a thread and click on **New Object** in the Thread Objects pane. The pane takes on the name of the selected thread, in this case **My Thread Objects**.

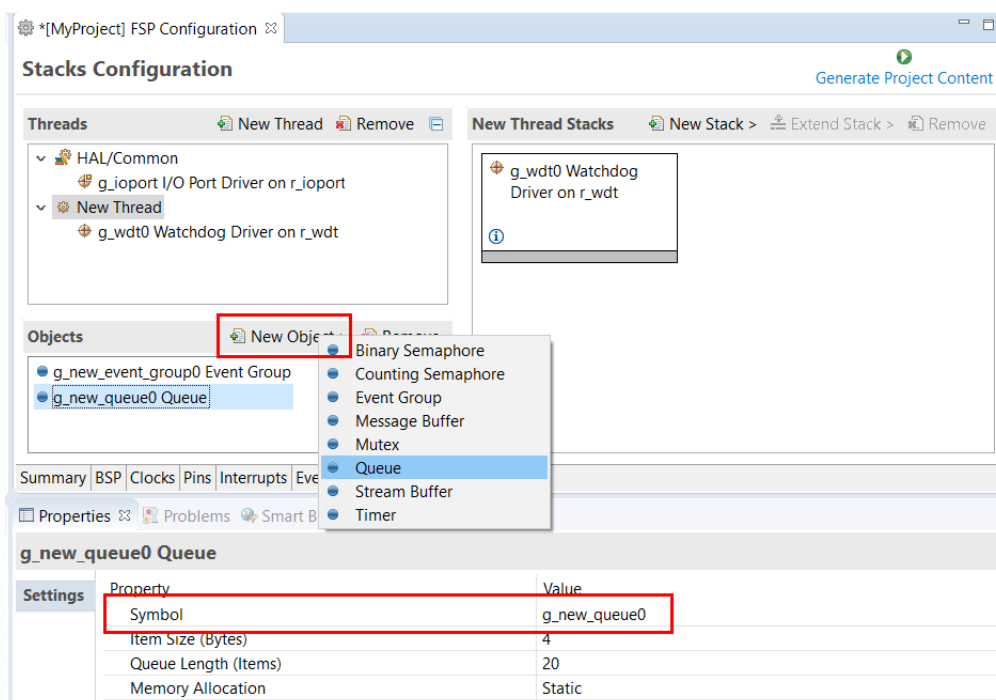

Figure 34: Configuring Thread Object Properties

Make sure to give each thread object a unique name and symbol by updating the **Name** and **Symbol** entries in the **Properties** view.

2.2.7 Reviewing and Adding Components

The **Components** tab enables the individual modules required by the application to be included or excluded. Modules common to all RA MCU projects are preselected (for example: **BSP > BSP > Board-specific BSP** and **HAL Drivers > all > r_cgc**). All modules that are necessary for the modules selected in the **Stacks** tab are included automatically. You can include or exclude additional modules by ticking the box next to the required component.

Figure 35: Components Tab

Clicking the **Generate Project Content** button copies the .c and .h files for each selected component into the following folders:

- ra/fsp/inc/api
- ra/fsp/inc/instances
- ra/fsp/src/bsp
- ra/fsp/src/<Driver_Name>

e2 studio also creates configuration files in the ra_cfg/fsp_cfg folder with configuration options set in the **Stacks** tab.

2.2.8 Writing the Application

Once you have added Modules and drivers and set their configuration parameters in the **Stacks** tab, you can add the application code that calls the Modules and drivers.

Note

To check your configuration, build the project once without errors before adding any of your own application code.

2.2.8.1 Coding Features

e2 studio provides several efficiency improving features that help write code. Review these features prior to digging into the code development step-by-step sections that follow.

Autocomplete

Autocomplete is a context aware coding accelerator that suggests possible completions for partially

typed-in code elements. If you can 'guess' the first part of a macro, for example, the Autocomplete function can suggest options for completing the rest of the macro.

In the following example, a macro related to a BSP_IO setting needs to be found. After typing BSP_IO_ in a source code file, pressing Ctrl + Space opens the Autocomplete list. This list shows a selection of context aware options for completing the macro. Scroll through the window to find the desired macro (in this case BSP_IO_LEVEL_HIGH) and click on it to add it to your code.

Figure 36: Autocomplete example

Other code elements can use autocomplete too. Some of the more common uses for Autocomplete include Enumerations, Types, and API functions - but try it in any situation you think the tool may have enough context to determine what you might be looking for.

For a hands-on experience using Autocomplete use the Quick FSP Labs for [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Welcome Window

The e2 studio Welcome window displays useful information and common links to assist in development. Check out these resources to see what is available. They are updated with each release, so check back to see what has been added after a new release.

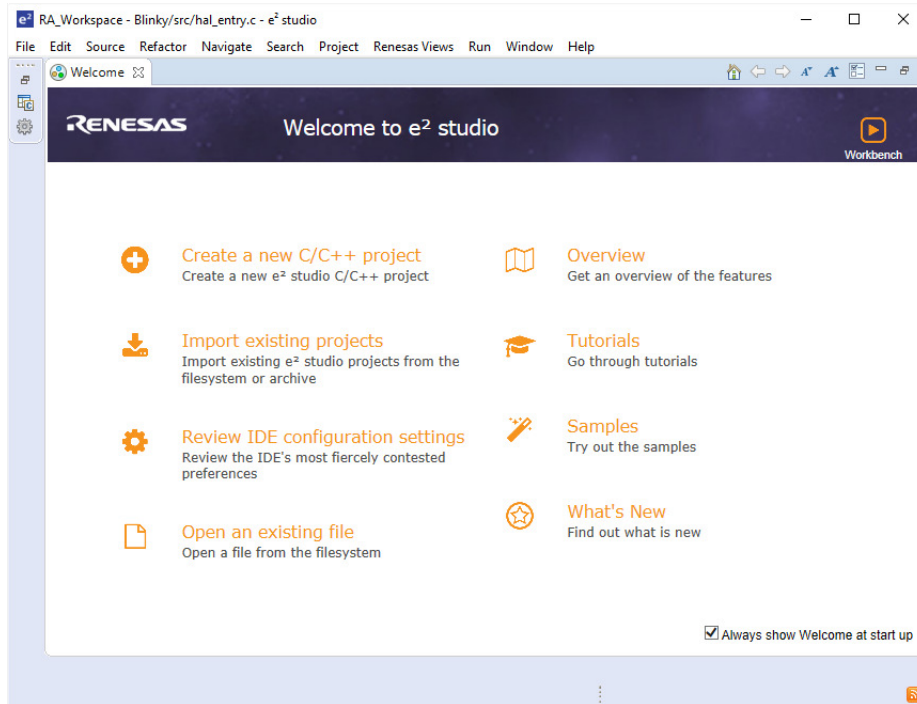

Figure 37: Welcome window

Cheat Sheets

Cheat sheets are macro driven illustrations of some common tasks. They show, step-by-step, what commands and menus are used. These will be populated with more examples on each release. Cheat Sheets are available from the **Help** menu.

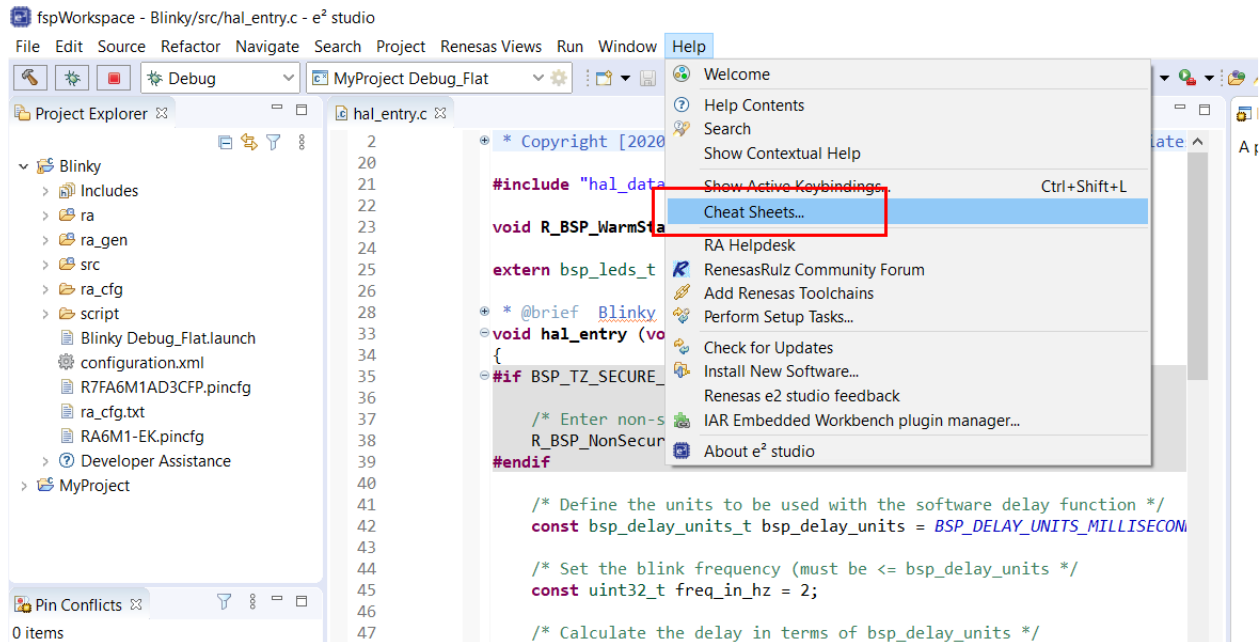

Figure 38: Cheat Sheets

Developer Assistance

FSP Developer Assistance provides developers with module and Application Programming Interface (API) reference documentation in e2 studio. After configuring the threads and software stacks for an FSP project with the RA Configuration editor, Developer Assistance quickly helps you get started writing C/C++ application code for the project using the configured stack modules.

1. Expand the project explorer to view Developer Assistance

Figure 39: Developer Assistance

2. Expand a stack module to show its APIs

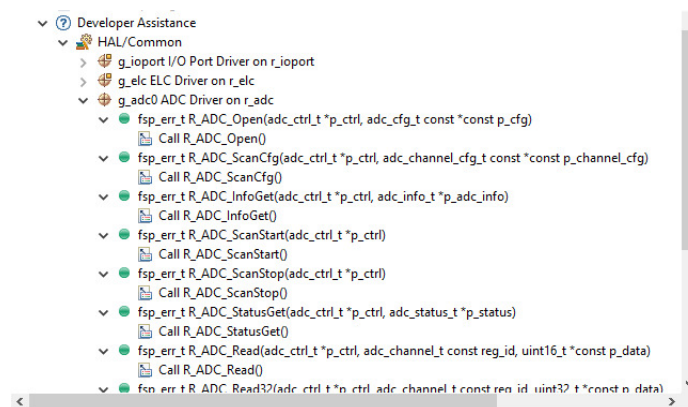

Figure 40: Developer Assistance APIs

3. Dragging and dropping an API from Developer Assistance to a source file helps to write source

code quickly.

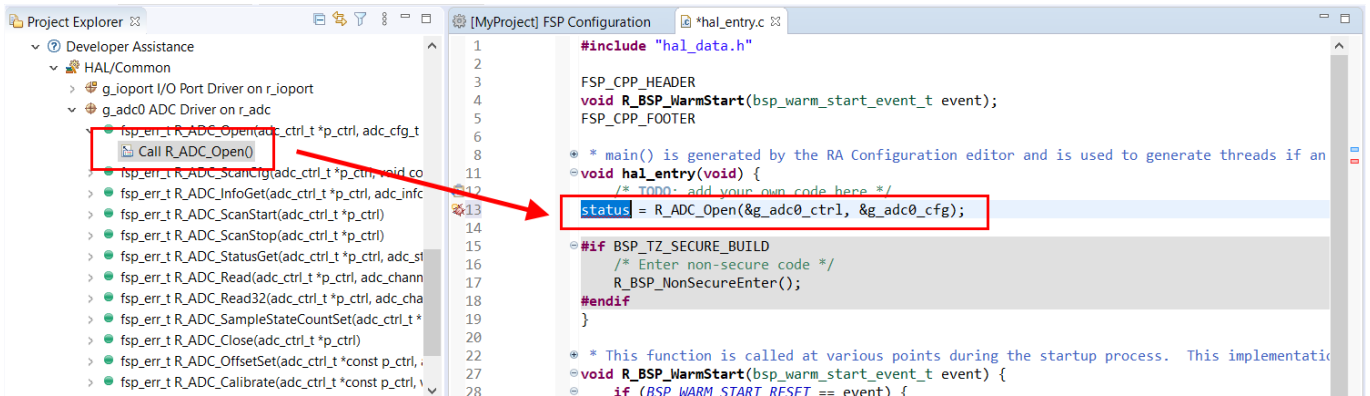

Figure 41: Dragging and Dropping an API in Developer Assistance

For a hands-on experience using Developer Assistance use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

Information Icon

Information icons are available on each module in the thread stack. Clicking on these icons opens a module folder on GitHub that contains additional information on the module. An example information icon is shown below:

Figure 42: Information icon

IDE Help

A good source of additional information for many FSP topics is the Help system. To get to the Help system, click on **Help** and then select **Help Contents** as seen below.

Figure 43: Opening the Help System

Once the Help system is open, select the **RA Contents** entry in the left side Guide-bar. Expand it to see the main RA Topics.

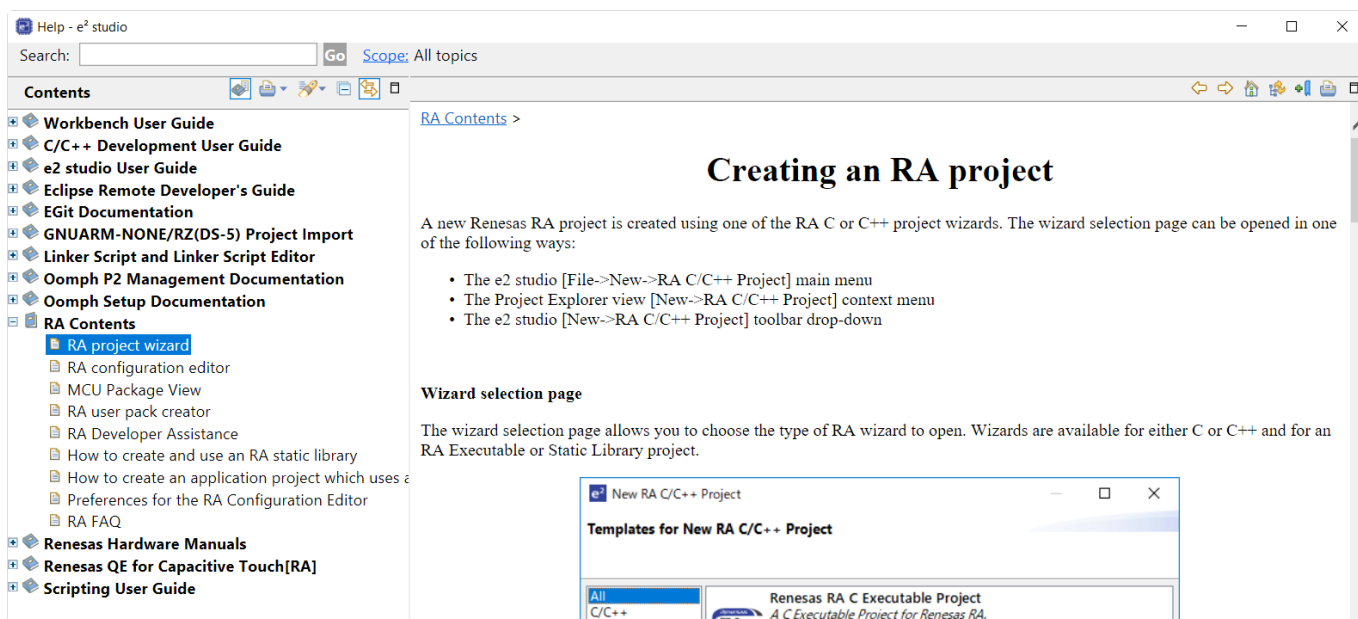

Figure 44: RA Content Help

You can also search for help topics by using the Search bar. Below is an example searching for Visual Expressions, a helpful feature in the e2 studio debugger.

Figure 45: e2 studio Help from the Search Bar

For a hands-on experience using the Help system use the Quick FSP Labs for [An Introduction to Developer Assistance](#), [Creating Blinky from Scratch](#) and [Creating an RTC Blinky from Scratch](#). These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

2.2.8.2 HAL Modules in FSP: A Practical Description

The [FSP Architecture](#) section describes FSP stacks, modules and interfaces in significant detail, providing an understanding of the theory behind them. The following sections provides a quick and practical introduction on how to use API functions when writing code and where in the API reference sections you can find useful API related information.

Introduction to HAL Modules

In FSP, HAL module drivers provide convenient API functions that access RA processor peripheral features. Module properties are defined in the RA GUI configurator, eliminating the tedious and error prone process of setting peripheral control registers. When configuration is complete, the generator automatically creates the code needed to implement the associated API functions. API functions are the main way a developer interacts with the target processor and peripherals.

HAL Driver API Function Call Formats

HAL driver API functions all have a similar format. They all start with "R_" to indicate they are HAL related functions. Next comes the module name followed by the function and any parameters. This format is illustrated below:

```
R_<module>_<function>( <parameters> );
```

Here are some examples:

```

status = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
status = R_GPT_Start(&g_timer0_ctrl);
status = R_GPT_PeriodSet(&g_timer0_ctrl, period);
status = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
status = R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);

```

HAL Driver API Call Reference Information

Each HAL module has a useful API Reference section that includes key details on each function. The function prototype is presented first, showing the return type (usually `fsp_status_t` for HAL functions) and the function parameters. A short description and any warnings or notes follow the function definition. In some cases, a code snippet is included to illustrate use of the function. Finally, all possible return values are provided to assist in debugging and error management.

◆ R_GPT_PeriodSet()

```

fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const p_ctrl,
                          uint32_t const   period_counts
                          )

```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements [timer_api_t::periodSet](#).

Warning
If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```

/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 * - If the PCLKD frequency has not changed since reset, the source clock
 *   frequency is
 *   BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 * - Use the R_GPT_InfoGet function (it accounts for the divider).
 * - Calculate the current PCLKD frequency using R_FSP_SystemClockHzGet
 *   (FSP_PRIV_CLOCK_PCLKD) and right shift
 *   by timer_cfg_t::source_div.
 * This example uses the 3rd option (R_FSP_SystemClockHzGet).
 */
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
    g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
 * calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
 * used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
    GPT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
handle_error(err);

```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Figure 46: Module Api Reference Section Example

2.2.8.3 RTOS-Independent Applications

To write application code:

1. Add all drivers and modules in the **Stacks** tab and resolve all dependencies flagged by e2 studio such as missing interrupts or drivers.
2. Configure the drivers in the **Properties** view.
3. In the Project Configuration view, click the **Generate Project Content** button.
4. In the **Project Explorer** view, double-click on the src/hal_entry.c file to edit the source file.

**Note**

All configuration structures necessary for the driver to be called in the application are initialized in `ra_gen/hal_data.c`.

Warning

Do not modify the files in the directory `ra_gen`. These files are overwritten every time you push the **Generate Project Content** button.

5. Add your application code here:

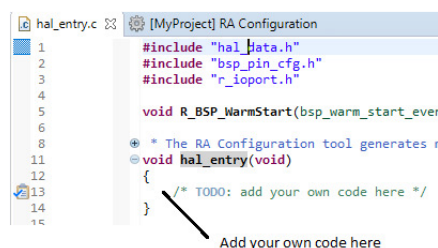

Figure 47: Adding user code to hal_entry.c

6. Build the project without errors by clicking on **Project > Build Project**.

The following tutorial shows how execute the steps above and add application code: [Tutorial: Using HAL Drivers - Programming the WDT](#).

The WDT example is a HAL level application which does not use an RTOS. The user guides for each module also include basic application code that you can add to `hal_entry.c`.

2.2.8.4 RTOS Applications

To write RTOS-aware application code using RTOS, follow these steps:

1. Add a thread using the **Stacks** tab.
2. Provide a unique name for the thread in the **Properties** view for this thread.

3. Configure all drivers and resources for this thread and resolve all dependencies flagged by e2 studio such as missing interrupts or drivers.
 4. Configure the thread objects.
 5. Provide unique names for each thread object in the **Properties** view for each object.
 6. Add more threads if needed and repeat steps 1 to 5.
 7. In the **RA Project Editor**, click the **Generate Project Content** button.
8. In the **Project Explorer** view, double-click on the src/my_thread_1_entry.c file to edit the source file.

Figure 48: Generated files for an RTOS application

Note

All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/my_thread_1.c and my_thread_2.c

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

9. Add your application code here:

Figure 49: Adding user code to my_thread_1.entry

10. Repeat steps 1 to 9 for the next thread.

11. Build your project without errors by clicking on **Project > Build Project**.

2.2.8.5 Additional Resources for Application Development

Example Projects

A wide variety of Example Projects for FSP and RA MCUs is available on the GitHub site here: <https://github.com/renesas/ra-fsp-examples>. Example projects are organized by target kit so it is easy to find all the examples for your kit of choice.

Figure 50: FSP Example Projects Organized by Kit

Projects are available as both downloadable zip files and as project source files. Typically, there is a project for each module. New example projects are being added periodically, so check back if a particular module isn't yet available.

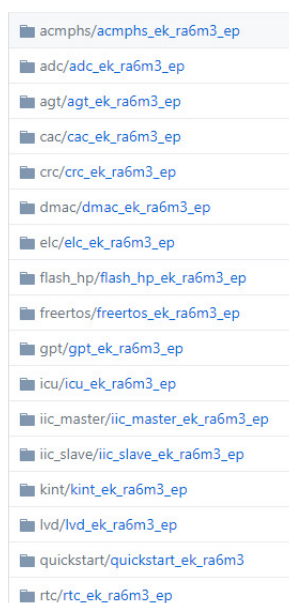

Figure 51: A Selection of Example Projects Available on GitHub

Quick Labs

A variety of Hands-on Do It Yourself labs are available on the Renesas RA and FSP Knowledge Base. Quick FSP Labs target the EK-RA6M3 kit and typically require only 15 minutes to complete. Each lab covers a couple related development tools and techniques like Autocomplete, Developer Assistance,

console I/O over RTT, and Visual Expressions, that can speed up the development process. A list of all available Quick Labs can be found here: <https://en-support.renesas.com/knowledgeBase/19450948>

2.2.9 Debugging the Project

Once your project builds without errors, you can use the Debugger to download your application to the board and execute it.

To debug an application follow these steps:

1. On the drop-down list next to the debug icon, select **Debug Configurations**.

2. In the **Debug Configurations** view, click on your project listed as **MyProject Debug**.

3. Connect the board to your PC via either a standalone Segger J-Link debugger, a Segger J-Link On-Board (included on all RA EKs), or an E2 or E2 Lite and click **Debug**.

Note

For details on using J-Link and connecting the board to the PC, see the Quick Start Guide included in the RA MCU Kit.

2.2.10 Modifying Toolchain Settings

There are instances where it may be necessary to make changes to the toolchain being used (for example, to change optimization level of the compiler or add a library to the linker). Such modifications can be made from within e2 studio through the menu **Project > Properties > Settings** when the project is selected. The following screenshot shows the settings dialog for the GNU Arm toolchain. This dialog will look slightly different depending upon the toolchain being used.

Figure 52: e2 studio Project toolchain settings

The scope for the settings is project scope which means that the settings are valid only for the project being modified.

The settings for the linker which control the location of the various memory sections are contained in a script file specific for the device being used. This script file is included in the project when it is created and is found in the script folder (for example, /script/a6m3.ld).

2.2.11 Creating RA project with ARM Compiler 6 in e2 studio

e2 studio does not include the ARM Compiler 6 (AC6) toolchain by default. Follow the steps below to integrate AC6 into e2 studio and create an AC6 RA project.

Note

It is assumed that the user is already familiar with RA project creation in e2 studio. e2 studio does not include ARM Compiler 6 (AC6) toolchain by default.

Steps 1 through 8 describe the process for integrating ARM Compiler 6 into e2 studio.

1. Download, install, and configure license for the AC6 toolchain (<https://developer.arm.com/tools-and-software/embedded/arm-compiler/downloads/version-6>).
2. Launch e2 studio.
3. Go to **Window > Preferences > Toolchains**.

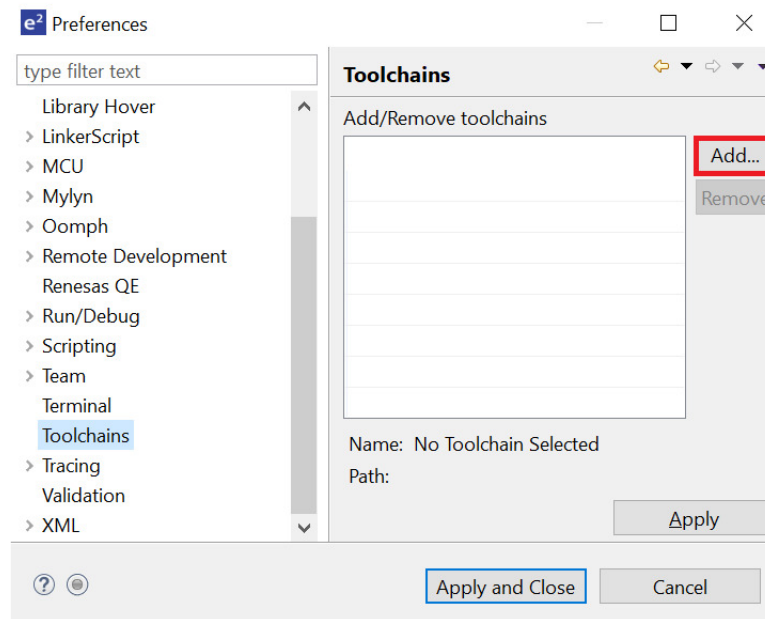

4. Click **Add**.

Figure 53: Add Toolchain

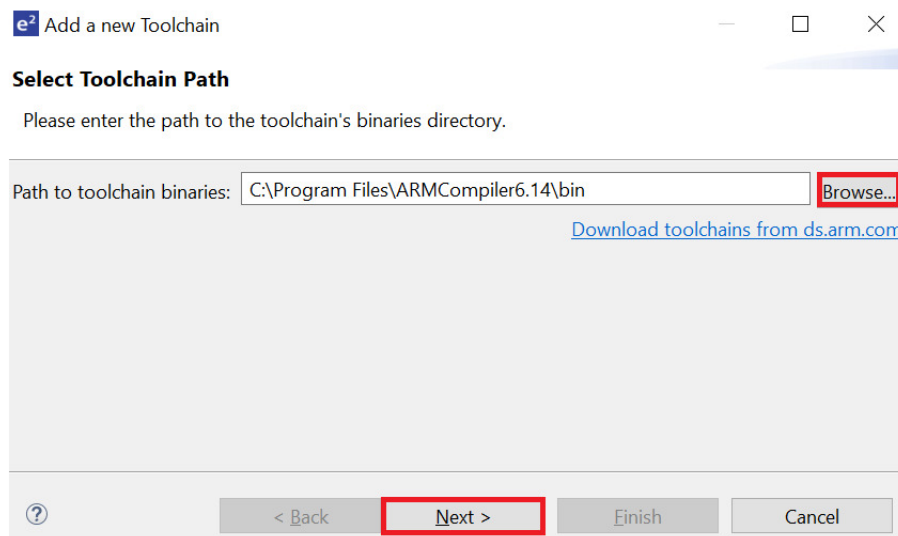

5. Browse to the path where AC6 toolchain is installed and select the \bin folder. Click **Next**.

Figure 54: Browse to AC6 Compiler

6. Toolchain information is displayed. Click **Finish**.

Figure 55: Toolchain Information

7. Click **Apply and Close**.

Figure 56: Apply and Close

8. Click **Restart Eclipse** when prompted.

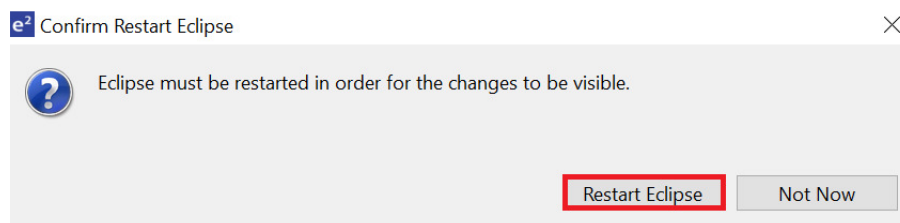

Figure 57: Restart Eclipse

9. When creating a new RA C/C++ project, select **ARM Compiler 6** included in the Toolchains section.

Figure 58: Select Arm Compiler

2.2.12 Importing an Existing Project into e2 studio

1. Start by opening e2 studio.
2. Open an existing Workspace to import the project and skip to step d. If the workspace doesn't exist, proceed with the following steps:
 - a. At the end of e2 studio startup, you will see the Workspace Launcher Dialog box as shown in the following figure.

Figure 59: Workspace Launcher dialog

- b. Enter a new workspace name in the Workspace Launcher Dialog as shown in the following figure. e2 studio creates a new workspace with this name.

Figure 60: Workspace Launcher dialog - Select Workspace

- c. Click **Launch**.
- d. When the workspace is opened, you may see the Welcome Window. Click on the **Workbench** arrow button to proceed past the Welcome Screen as seen in the following figure.

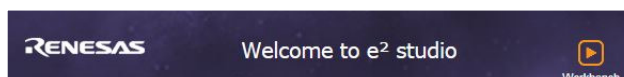

Figure 61: Workbench arrow button

3. You are now in the workspace that you want to import the project into. Click the **File** menu in the menu bar, as shown in the following figure.

Figure 62: Menu and tool bar

4. Click **Import** on the **File** menu or in the menu bar, as shown in the following figure.

Figure 63: File drop-down menu

5. In the **Import** dialog box, as shown in the following figure, choose the **General** option, then **Existing Projects into Workspace**, to import the project into the current workspace.

Figure 64: Project Import dialog with "Existing Projects into Workspace" option selected

6. Click **Next**.
7. To import the project, use either **Select archive file** or **Select root directory**.
 - a. Click **Select archive file** as shown in the following figure.

Figure 65: Import Existing Project dialog 1 - Select archive file

b. Click **Select root directory** as shown in the following figure.

Figure 66: Import Existing Project dialog 1 - Select root directory

8. Click **Browse**.
9. For **Select archive file**, browse to the folder where the zip file for the project you want to import is located. For **Select root directory**, browse to the project folder that you want to import.
10. Select the file for import. In our example, it is CAN_HAL_MG_AP.zip or CAN_HAL_MG_AP.
11. Click **Open**.
12. Select the project to import from the list of **Projects**, as shown in the following figure.

Figure 67: Import Existing Project dialog 2

13. Click **Finish** to import the project.

2.3 Tutorial: Your First RA MCU Project - Blinky

2.3.1 Tutorial Blinky

The goal of this tutorial is to quickly get acquainted with the Flexible Platform by moving through the

steps of creating a simple application using e2 studio and running that application on an RA MCU board.

2.3.2 What Does Blinky Do?

The application used in this tutorial is Blinky, traditionally the first program run in a new embedded development environment.

Blinky is the "Hello World" of microcontrollers. If the LED blinks you know that:

- The toolchain is setup correctly and builds a working executable image for your chip.
- The debugger has installed with working drivers and is properly connected to the board.
- The board is powered up and its jumper and switch settings are probably correct.
- The microcontroller is alive, the clocks are running, and the memory is initialized.

The Blinky example application used in this tutorial is designed to run the same way on all boards offered by Renesas that hold the RA microcontroller. The code in Blinky is completely board independent. It does the work by calling into the BSP (board support package) for the particular board it is running on. This works because:

- Every board has at least one LED connected to a GPIO pin.
- That one LED is always labelled LED1 on the silk screen.
- Every BSP supports an API that returns a list of LEDs on a board, and their port and pin assignments.

2.3.3 Prerequisites

To follow this tutorial, you need:

- Windows based PC
- e2 studio
- Flexible Software Package
- An RA MCU board kit

2.3.4 Create a New Project for Blinky

The creation and configuration of an RA MCU project is the first step in the creation of an application. The base RA MCU pack includes a pre-written Blinky example application that is simple and works on all Renesas RA MCU boards.

Follow these steps to create an RA MCU project:

1. In e2 studio, click **File > New > C/C++ Project** and select **Renesas RA** and **Renesas RA C/C++ Project**.
2. Assign a name to this new project. Blinky is a good name to use for this tutorial.
3. Click **Next**. The **Project Configuration** window shows your selection.

Figure 68: e2 studio Project Configuration window (part 1)

4. Select the board support package by selecting the name of your board from the **Device Selection** drop-down list and click **Next**.

Figure 69: e2 studio Project Configuration window (part 2)

5. Select the build artifact and RTOS.

Figure 70: e2 studio Project Configuration window (part 3)

6. Select the Blinky template for your board and click **Finish**.

Figure 71: e2 studio Project Configuration window (part 4)

Once the project has been created, the name of the project will show up in the **Project Explorer** window of e2 studio. Now click the **Generate Project Content** button in the top right corner of the **Project Configuration** window to generate your board specific files.

Figure 72: e2 studio Project Configuration tab

Your new project is now created, configured, and ready to build.

2.3.4.1 Details about the Blinky Configuration

The **Generate Project Content** button creates configuration header files, copies source files from templates, and generally configures the project based on the state of the **Project Configuration** screen.

For example, if you check a box next to a module in the **Components** tab and click the **Generate Project Content** button, all the files necessary for the inclusion of that module into the project will be copied or created. If that same check box is then unchecked those files will be deleted.

2.3.4.2 Configuring the Blinky Clocks

By selecting the Blinky template, the clocks are configured by e2 studio for the Blinky application. The clock configuration tab (see [Configuring Clocks](#)) shows the Blinky clock configuration. The Blinky clock configuration is stored in the BSP clock configuration file (see [BSP Clock Configuration](#)).

2.3.4.3 Configuring the Blinky Pins

By selecting the Blinky template, the GPIO pins used to toggle the LED1 are configured by e2 studio for the Blinky application. The pin configuration tab shows the pin configuration for the Blinky application (see [Configuring Pins](#)). The Blinky pin configuration is stored in the BSP configuration file (see [BSP Pin Configuration](#)).

2.3.4.4 Configuring the Parameters for Blinky Components

The Blinky project automatically selects the following HAL components in the Components tab:

- r_ioport

To see the configuration parameters for any of the components, check the **Properties** tab in the HAL window for the respective driver (see [Adding and Configuring HAL Drivers](#)).

2.3.4.5 Where is main()?

The main function is located in < project >/ra_gen/main.c. It is one of the files that are generated during the project creation stage and only contains a call to hal_entry(). For more information on generated files, see [Adding and Configuring HAL Drivers](#).

2.3.4.6 Blinky Example Code

The blinky application is stored in the hal_entry.c file. This file is generated by e2 studio when you select the Blinky Project template and is located in the project's src/ folder.

The application performs the following steps:

1. Get the LED information for the selected board by bsp_leds_t structure.
2. Define the output level HIGH for the GPIO pins controlling the LEDs for the selected board.
3. Get the selected system clock speed and scale down the clock, so the LED toggling can be observed.
4. Toggle the LED by writing to the GPIO pin with R_BSP_PinWrite((bsp_io_port_pin_t) pin, pin_level);

2.3.5 Build the Blinky Project

Highlight the new project in the **Project Explorer** window by clicking on it and build it.

There are three ways to build a project:

Refer to your board's user manual to learn how to connect the JTAG debugger to e2 studio.

2.3.6.2 Debug steps

To debug the Blinky application, follow these steps:

1. Configure the debugger for your project by clicking **Run > Debugger Configurations ...**

Figure 75: e2 studio Debug icon

or by selecting the drop-down menu next to the bug icon and selecting **Debugger Configurations ...**

Figure 76: e2 studio Debugger Configurations selection option

2. Select your debugger configuration in the window. If it is not visible then it must be created by clicking the **New** icon in the top left corner of the window. Once selected, the **Debug Configuration** window displays the Debug configuration for your Blinky project.

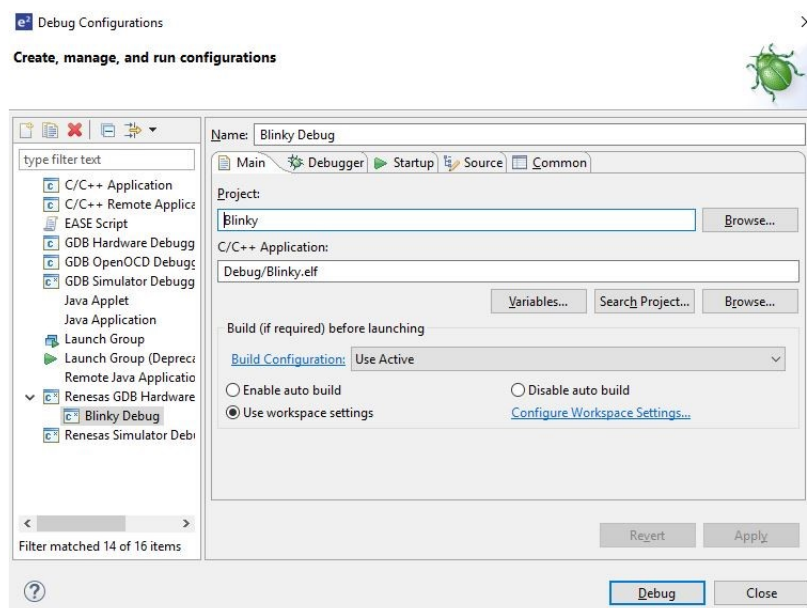

Figure 77: e2 studio Debugger Configurations window with Blinky project

3. Click **Debug** to begin debugging the application.

4. Extracting RA Debug.

2.3.6.3 Details about the Debug Process

In debug mode, e2 studio executes the following tasks:

1. Downloading the application image to the microcontroller and programming the image to the internal flash memory.
2. Setting a breakpoint at main().
3. Setting the stack pointer register to the stack.
4. Loading the program counter register with the address of the reset vector.
5. Displaying the startup code where the program counter points to.

Figure 78: e2 studio Debugger memory window

2.3.7 Run the Blinky Project

While in Debug mode, click **Run > Resume** or click on the **Play** icon twice.

Figure 79: e2 studio Debugger Play icon

The LEDs on the board marked LED1, LED2, and LED3 should now be blinking.

2.4 Tutorial: Using HAL Drivers - Programming the WDT

2.4.1 Application WDT

This tutorial illustrates the creation of a simple application that uses the Watchdog Timer module to monitor program operation. The tutorial shows each step in the development process and in particular identifies the auto-generated files and project structure created when using FSP and its GUI based configurator. The level of detail provided here is more than is normally needed during development but can be helpful in explaining how FSP works behind the scenes to simplify your work.

This application makes use of the following FSP modules:

- [MCU Board Support Package](#)
- [Watchdog Timer \(r_wdt\)](#)
- [I/O Ports \(r_ioport\)](#)

2.4.2 Creating a WDT Application Using the RA MCU FSP and e2 studio

2.4.2.1 Using the FSP and e2 studio

The Flexible Software Package (FSP) from Renesas provides a complete driver library for developing RA MCU applications. The FSP provides Hardware Abstraction Layer (HAL) drivers, Board Support Package (BSP) drivers for the developer to use to create applications. The FSP is integrated into Renesas e2 studio based on eclipse providing build (editor, compiler and linker) and debug phases with an extended GNU Debug (GDB) interface.

2.4.2.2 The WDT Application

The flowchart for the WDT application is shown below.

Figure 80: WDT Application flow diagram

2.4.2.3 WDT Application flow

The main sections of the WDT application are:

1. The BSP initializes the clocks, pins and other elements of the MCU readying the application to run.
2. main() calls hal_entry(). The function hal_entry() is created by the FSP with a placeholder for user code. The code for the WDT is added to this function.
3. Initialize the WDT, but do not start it.
4. Start the WDT by refreshing it.
5. In the first loop the red LED flashes 30 times and refreshes the watchdog each time the LED state is changed.
6. In the second loop, the green LED flashes, but the program DOES NOT refresh the watchdog. After the watchdog timeout period the device will reset which can be observed by the red LED flashing again as the sequence repeats.

2.4.3 Creating the Project with e2 studio

Start e2 studio and choose a workspace folder in the Workspace Launcher. Configure a new RA MCU project as follows.

1. Select **File > New > RA C/C++ Project**. Then select the template for the project.

Figure 81: Creating a new project

2. In the e2 studio Project **Configuration (RA Project)** window enter a project name, for example, WDT_Application. In addition, select the toolchain. If you want to choose new locations for the project unselect **Use default location**. Click **Next**.

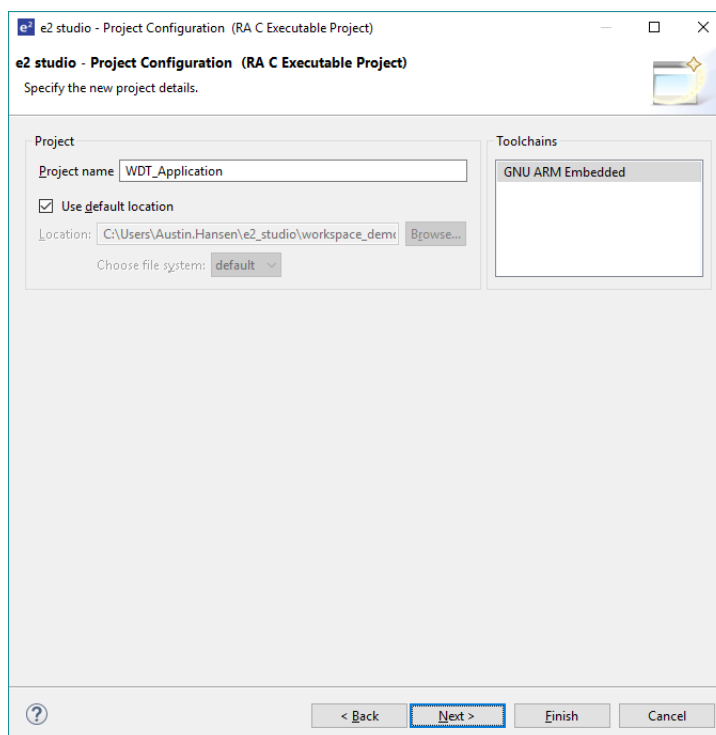

Figure 82: Project configuration (part 1)

3. This application runs on the EK-RA6M3 board. So, for the **Board** select **EK-RA6M3**.

This will automatically populate the **Device** drop-down with the correct device used on this board. Select the **Toolchain** version. Select **J-Link ARM** as the **Debugger**. Click **Next** to configure the project.

Figure 83: Project configuration (part 2)

The project template is now selected. As no RTOS is required select **Bare Metal - Blinky**.

Figure 84: Project configuration (part 3)

4. Click **Finish**.

e2 studio creates the project and opens the **Project Explorer** and **Project Configuration Settings** views with the **Summary** page showing a summary of the project configuration.

2.4.4 Configuring the Project with e2 studio

e2 studio simplifies and accelerates the project configuration process by providing a GUI interface for selecting the options to configure the project.

e2 studio offers a selection of perspectives presenting different windows to the user depending on the operation in progress. The default perspectives are **C/C++**, **FSP Configuration** and **Debug**. The perspective can be changed by selecting a new one from the buttons at the top right.

Figure 85: Selecting a perspective

The **C/C++** perspective provides a layout selected for code editing. The **FSP Configuration** perspective provides elements for configuring a RA MCU project, and the **Debug** perspective provides a view suited for debugging.

1. In order to configure the project settings ensure the **FSP Configuration** perspective is selected.

2. Ensure the **Project Configuration [WDT Application]** is open. It is already open if the Summary information is visible. To open the Project Configuration now or at any time make sure the **RA Configuration** perspective is selected and double-click on the configuration.xml file in the Project Explorer pane on the right side of e2 studio.

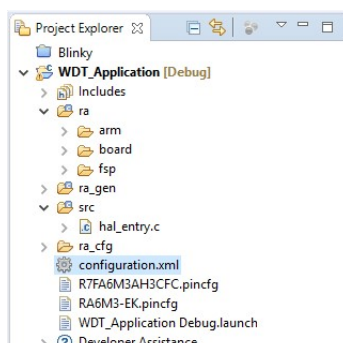

Figure 86: RA MCU Project Configuration Settings

At the base of the Project Configuration view there are several tabs for configuring the project. A project may require changes to some or all of these tabs. The tabs are shown below.

Figure 87: Project Configuration Tabs

2.4.4.1 BSP Tab

The **BSP** tab allows the Board Support Package (BSP) options to be modified from their defaults. For this particular WDT project no changes are required. However, if you want to use the WDT in auto-start mode, you can configure the settings of the OFS0 (Option Function Select Register 0) register in the **BSP** tab. See the RA Hardware User's Manual for details on the WDT autostart mode.

2.4.4.2 Clocks Tab

The **Clocks** tab presents a graphical view of the clock tree of the device. The drop-down boxes in the GUI enables configuration of the various clocks. The WDT uses PCLKB. The default output frequency for this clock is 60 MHz. Ensure this clock is outputting this value.

Figure 88: Clock configuration

2.4.4.3 Interrupts Tab

The **Interrupts** tab is used to add new user events or interrupts. No new interrupts or events are needed by the application, so no edits in this tab are required.

2.4.4.4 Event Links Tab

The **Event Links** tab is used to configure events used by the Event Link Controller (ELC). This project doesn't use the ELC, so no edits in this tab are required.

2.4.4.5 Pins Tab

The **Pins** tab provides a graphical tool for configuring the functionality of the pins of the device. For the WDT project no pin configuration is required. Although the project uses two LEDs connected to pins on the device, these pins are pre-configured as output GPIO pins by the BSP.

2.4.4.6 Stacks Tab

You can add any driver to the project using the **Stacks** tab. The HAL driver IO port pins are added automatically by e2 studio when the project is configured. The WDT application uses no RTOS Resources, so you only need to add the HAL WDT driver.

Figure 89: Stacks tab

1. Click on the **HAL/Common Panel** in the Threads Window as indicated in the figure above.

The Stacks Panel becomes a **HAL/Common Stacks** panel and is populated with the modules preselected by e2 studio.

2. Click on **New Stack** to find a pop-up window with the available HAL level drivers.
3. Select **WATCHDOG Driver on r_wdt**.

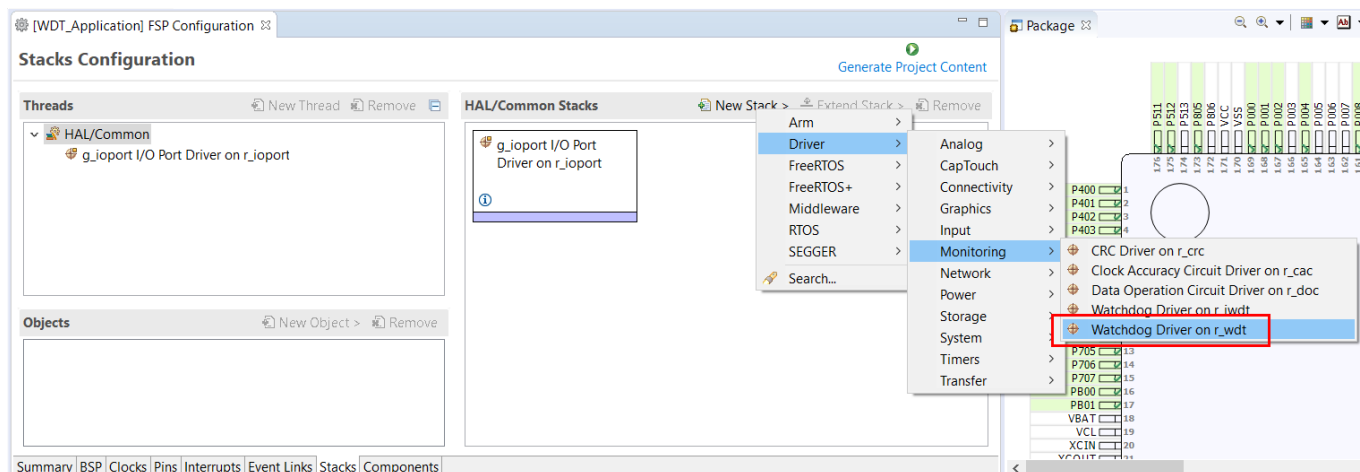

Figure 90: Module Selection

The selected HAL WDT driver is added to the **HAL/Common Stacks** Panel and the **Property** Window shows all configuration options for the selected module. The **Property** tab for the WDT should be visible at the bottom left of the screen. If it is not visible, check that the **FSP Configuration** perspective is selected.

The screenshot shows the 'Stacks Configuration' window. The 'Summary' tab is highlighted with a red box. Below the tabs, the 'g_wdt0 Watchdog Driver on r_wdt' stack is selected, and its properties are displayed in a table.

Settings	Property	Value
API Info	Property	
	▼ Common	
	Parameter Checking	Default (BSP)
	Register Start NMI Support	Disabled
	▼ Module g_wdt0 Watchdog Driver on r_wdt	
	Name	g_wdt0
	Timeout	16,384 Cycles
	Clock Division Ratio	PCLK/8192
	Window Start Position	100% (Window Position Not Specified)
	Window End Position	0% (Window Position Not Specified)
	Reset Control	Reset Output
Stop Control	WDT Count Disabled in Low Power Mode	
NMI Callback	NULL	

Figure 91: Module Properties

All parameters can be left with their default values.

The screenshot shows the 'Properties' window for the 'g_wdt0 Watchdog Driver on r_wdt'. The 'Settings' tab is selected, and the property table is displayed.

Settings	Property	Value
	Property	
	▼ Common	
	Parameter Checking	Default (BSP)
	Register Start NMI Support	Disabled
	▼ Module g_wdt0 Watchdog Driver on r_wdt	
	Name	g_wdt0
	Timeout	16,384 Cycles
	Clock Division Ratio	PCLK/8192
	Window Start Position	100% (Window Position Not Specified)
	Window End Position	0% (Window Position Not Specified)
	Reset Control	Reset Output
Stop Control	WDT Count Disabled in Low Power Mode	
NMI Callback	NULL	

Figure 92: g_wdt WATCHDOG Driver on WDT properties

With PCLKB running at 60 MHz the WDT will reset the device 2.23 seconds after the last refresh.

$$\text{WDT clock} = 60 \text{ MHz} / 8192 = 7.32 \text{ kHz}$$

$$\text{Cycle time} = 1 / 7.324 \text{ kHz} = 136.53 \text{ us}$$

Timeout = $136.53 \text{ us} \times 16384 = 2.23 \text{ seconds}$

Save the **Project Configuration** file and click the **Generate Project Content** button in the top right corner of the **Project Configuration** pane.

Figure 93: Generate Project Content button

e2 studio generates the project files.

2.4.4.7 Components Tab

The components tab is included for reference to see which modules are included in the project. Modules are selected automatically in the Components view after they are added in the Stacks Tab.

For the WDT project ensure that the following modules are selected:

1. HAL_Drivers -> r_ioport
2. HAL_Drivers -> r_wdt

Figure 94: Component Selection

Note

The list of modules displayed in the Components tab depends on the installed FSP version.

2.4.5 WDT Generated Project Files

Clicking the Generate Project Content button performs the following tasks.

- r_wdt folder and WDT driver contents created at:

ra/fsp/src

- r_wdt_api.h created in:

ra/fsp/inc/api

- r_wdt.h created in:

ra/fsp/inc/instances

The above files are the standard files for the WDT HAL module. They contain no specific project contents. They are the driver files for the WDT. Further information on the contents of these files can be found in the documentation for the WDT HAL module.

Configuration information for the WDT HAL module in the WDT project is found in:

ra_cfg/fsp_cfg/r_wdt_cfg.h

The above file's contents are based upon the **Common** settings in the **g_wdt WATCHDOG Driver on WDT Properties** pane.

Figure 95: r_wdt_cfg.h contents

Warning

Do not edit any of these files as they are recreated every time the Generate Project Content button is clicked and so any changes will be overwritten.

The r_ioport folder is not created at ra/fsp/src as this module is required by the BSP and so already exists. It is included in the WDT project in order to include the correct header file in ra_gen/hal_data.c—see later in this document for further details. For the same reason the other IOPORT header files— ra/fsp/inc/api/r_ioport_api.h and ra/fsp/inc/instances/r_ioport.h—are not created as they already exist.

In addition to generating the HAL driver files for the WDT and IOPORT files e2 studio also generates files containing configuration data for the WDT and a file where user code can safely be added. These files are shown below.

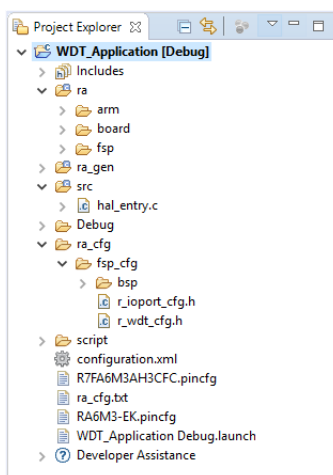

Figure 96: WDT project files

2.4.5.1 WDT hal_data.h

The contents of hal_data.h are shown below.

```
/* generated HAL header file - do not edit */  
#ifndef HAL_DATA_H_  
#define HAL_DATA_H_  
#include <stdint.h>  
#include "bsp_api.h"  
#include "common_data.h"  
#include "r_wdt.h"  
#include "r_wdt_api.h"  
#ifdef __cplusplus  
extern "C"  
{  
#endif  
extern const wdt_instance_t g_wdt0;  
#ifndef NULL  
void NULL(wdt_callback_args_t * p_args);  
#endif  
extern wdt_instance_ctrl_t g_wdt0_ctrl;  
extern const wdt_cfg_t g_wdt0_cfg;  
void hal_entry(void);  
void g_hal_init(void);
```

```
#ifndef __cplusplus
} /* extern "C" */
#endif
#endif /* HAL_DATA_H_ */
```

hal_data.h contains the header files required by the generated project. In addition this file includes external references to the **g_wdt0** instance structure which contains pointers to the configuration, control, api structures used for WDT HAL driver.

Warning

This file is regenerated each time Generate Project Content is clicked and must not be edited.

2.4.5.2 WDT hal_data.c

The contents of hal_data.c are shown below.

```
/* generated HAL source file - do not edit */
#include "hal_data.h"
wdt_instance_ctrl_t g_wdt0_ctrl;
const wdt_cfg_t g_wdt0_cfg =
{
    .timeout          = WDT_TIMEOUT_16384,
    .clock_division  = WDT_CLOCK_DIVISION_8192,
    .window_start    = WDT_WINDOW_START_100,
    .window_end      = WDT_WINDOW_END_0,
    .reset_control   = WDT_RESET_CONTROL_RESET,
    .stop_control    = WDT_STOP_CONTROL_ENABLE,
    .p_callback      = NULL,
};
/* Instance structure to use this module. */
const wdt_instance_t g_wdt0 =
{.p_ctrl = &g_wdt0_ctrl, .p_cfg = &g_wdt0_cfg, .p_api = &g_wdt_on_wdt};
void g_hal_init (void)
{
    g_common_init();
}
```

hal_data.c contains g_wdt0_ctrl which is the control structure for this instance of the WDT HAL driver. This structure should not be initialized as this is done by the driver when it is opened.

The contents of g_wdt0_cfg are populated in this file using the **Watchdog Driver on g_wdt0** pane in the Project Configuration **Stacks** tab. If the contents of this structure do not reflect the settings made in the IDE, ensure the **Project Configuration** settings are saved before clicking the **Generate Project Content** button.

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

2.4.5.3 WDT main.c

Contains main() called by the BSP start-up code. main() calls hal_entry() which contains user developed code (see next file). Here are the contents of main.c.

```
/* generated main source file - do not edit*/
#include "hal_data.h"

int main (void)
{
    hal_entry();
    return 0;
}
```

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

2.4.5.4 WDT hal_entry.c

This file contains the function hal_entry() called from main(). User developed code should be placed in this file and function.

For the WDT project edit the contents of this file to contain the code below. This code implements the flowchart in overview section of this document.

```
#include "hal_data.h"
#include "bsp_pin_cfg.h"
#include "r_ioport.h"

#define RED_LED_NO_OF_FLASHES 30
#define RED_LED_PIN BSP_IO_PORT_01_PIN_00
#define GREEN_LED_PIN BSP_IO_PORT_04_PIN_00
#define RED_LED_DELAY_MS 125
```

```
#define GREEN_LED_DELAY_MS 250
volatile uint32_t delay_counter;
volatile uint16_t loop_counter;
void R_BSP_WarmStart(bsp_warm_start_event_t event);
/*****
*****/
void hal_entry (void)
{
    /* Allow the WDT to run when the debugger is connected */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* Open the WDT */
    R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Start the WDT by refreshing it */
    R_WDT_Refresh(&g_wdt0_ctrl);

    /* Flash the red LED and feed the WDT for a few seconds */
    for (loop_counter = 0; loop_counter < RED_LED_NO_OF_FLASHES; loop_counter++)
    {
        /* Turn red LED on */
        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_LOW);

        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);

        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);

        R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_HIGH);

        /* Delay */
        R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);

        /* Refresh WDT */
        R_WDT_Refresh(&g_wdt0_ctrl);
    }

    /* Flash green LED but STOP feeding the WDT. WDT should reset the
    * device */
    while (1)
    {
        /* Turn green LED on */
```

```
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_LOW);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
/* Turn green off */
R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_HIGH);
/* Delay */
R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
}
}
/*****
*****/
void R_BSP_WarmStart (bsp_warm_start_event_t event)
{
    if (BSP_WARM_START_RESET == event)
    {
#if BSP_FEATURE_FLASH_LP_VERSION != 0
        /* Enable reading from data flash. */
        R_FACI_LP->DFLCTL = 1U;

        /* Would normally have to wait for tDSTOP(6us) for data flash recovery. Placing the
        enable here, before clock and
        * C runtime initialization, should negate the need for a delay since the
        initialization will typically take more than 6us. */
#endif
    }

    if (BSP_WARM_START_POST_C == event)
    {
        /* C runtime environment and system clocks are setup. */
        /* Configure pins. */
        R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    }
}
```

The WDT HAL driver API functions are defined in `r_wdt.h`. The WDT HAL driver is opened through the open API call using the instance structure defined in `r_wdt_api.h`:

```
/* Open the WDT */  
R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

The first passed parameter is the pointer to the control structure `g_wdt0_ctrl` instantiated in `hal_data.c`. The second parameter is the pointer to the configuration data `g_wdto_cfg` instantiated in the same `hal_data.c` file.

The WDT is started and refreshed through the API call:

```
/* Start the WDT by refreshing it */  
R_WDT_Refresh(&g_wdt0_ctrl);
```

Again the first (and only in this case) parameter passed to this API is the pointer to the control structure of this instance of the driver.

2.4.6 Building and Testing the Project

Build the project in e2 studio by clicking **Build > Build Project** or by clicking the build icon. The project should build without errors.

To debug the project

1. Connect the USB cable between the target board debug port and host PC.
2. In the **Project Explorer** pane on the left side of e2 studio, right-click on the WDT project **WDT_Application** and select **Debug As > Debug Configurations**.
3. Under **Renesas GDB Hardware Debugging** select **WDT_Application Debug** as shown below.

Figure 97: Debug configuration

- Click the **Debug** button. Click Yes to the debug perspective if asked.

- The code should run the `Reset_Handler()` function.
- Resume execution via **Run > Resume**. Execution will stop in `main()` at the call to `hal_entry()`.
- Resume execution again.

The red LED should start flashing. After 30 flashes the green LED will start flashing and the red LED will stop flashing.

While the green LED is flashing the WDT will underflow and reset the device resulting in the red LED to flash again as the sequence repeats.

- Stop the debugger in e2 studio via **Run > Terminate**.
- Click the reset button on the target board. The LEDs begin flashing.

2.5 Primer: ARM® TrustZone® Project Development

This section will introduce the user to the tools supporting ARM® TrustZone® configuration for the RA Family of microcontrollers. It is intended to be read by development engineers implementing RA ARM® TrustZone® projects for the first time. It will introduce basic concepts followed by workflow

and tooling functions designed to simplify and accelerate their first ARM® TrustZone® development. A background knowledge of e² studio and RA device hardware is expected.

Target Device

RA Cortex®-M33 or Cortex®-M23 devices with ARM® TrustZone® security extension.

2.5.1 Renesas Implementation of ARM® TrustZone® Technology

For brevity, ARM® TrustZone® will be abbreviated to TZ in this document.

The following section is supplied for reference only. For full details of TZ implementation, refer to Arm documentation (<https://developer.arm.com/ip-products/security-ip/trustzone>) and the RA6M4 device manual.

Arm TZ technology divides the MCU and therefore the application into Secure and Non-Secure partitions. Secure applications can access both Secure and Non-Secure memory and resources. Non-Secure code can access Non-Secure memory and resources as well as Secure resources through a set of so-called veneers located in the Non-Secure Callable (NSC) region. This ensures a single access point for Secure code when called from the Non-Secure partition. The MCU starts up in the Secure partition by default. The security state of the CPU can be either Secure or Non-Secure.

The MCU code flash, data flash, and SRAM are divided into Secure (S) and Non-Secure (NS) regions. Code flash and SRAM include a further region known as Non-Secure Callable (NSC). These memory security attributes are set into the non-volatile memory via SCI or USB boot mode commands when the device lifecycle is Secure Software Debug (SSD) state. The memory security attributes are loaded into the Implementation Defined Attribution Unit (IDAU) peripheral and the memory controller before application execution and cannot be updated by application code.

Figure 98: Secure and Non-Secure Regions

Note: All external memory accesses are considered to be Non-Secure.

Code Flash and SRAM can be divided into Secure, Non-Secure, and Non-Secure Callable. All secure memory accesses from the Non-Secure region MUST go through the Non-Secure Callable gateway and target a specific Secure Gateway (SG) assembler instruction. This forces access to Secure APIs at a fixed location and prevents calls to sub-functions and so on. Failing to target an SG instruction will generate a TZ exception.

TZ enabled compilers will manage generation of the NSC veneer automatically using CMSE extensions.

2.5.1.1 Calling from Non-Secure to Secure

A new instruction SG (Secure Gateway) has been added to the Armv8-M architecture. This MUST be the destination instruction for any branch within the Non-Secure Callable region. If an attempt is made to branch to any other instruction from the Non-Secure partition, a TZ exception will be thrown.

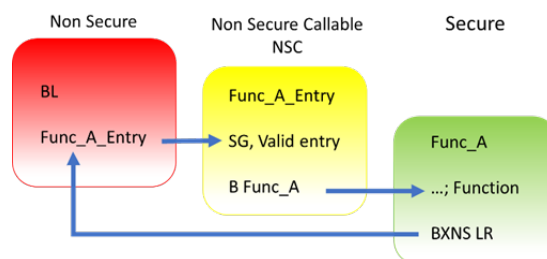

Figure 99: Calling from Non-Secure to Secure Functions

2.5.1.2 Calling from Secure to Non-Secure

Secure code uses B(L)XNS instructions to make direct calls to Non-Secure functions. While this is certainly possible, it can create a security vulnerability in the application. It is also challenging for the Secure application to determine the address of the non-secure function during build phase. From the RA Tools and FSP point view, calling directly from Secure to Non-Secure via FSP API is not supported.

Preference is for the Secure code to initialise as necessary from reset, then pass control to the Non-Secure partition. It will manage any data transfers and so forth via FSP call-backs as security checks. For example, secure data can be copied to Non-Secure RAM.

Figure 100: Calling from Secure to Non-Secure Functions

2.5.2 Workflow

ARM® TrustZone® MCU development normally consists of two projects within a workspace, Secure and Non-Secure. General project workflows are described in the following sections. The Renesas project generator also supports development with "Flat project" model with no ARM® TrustZone® awareness.

2.5.2.1 Secure Project

1. Start a new Secure project in e² studio.
2. Select and configure pins and drivers/stacks that need to be initialized and used in Secure

- mode. This should be kept to a minimum to reduce the security attack surface.
3. Expose top of stacks as Non-Secure Callable (NSC) **if** they need to be accessed from Non-Secure partition. Again, this should be kept to a minimum.
 4. Generate project content and write Secure code such as key handling and opening drives as needed.
 5. Modify/remove any unnecessary "Guard" functions as needed to control access via NSC.
 6. Build project.
 7. A Non-Secure project will be needed before debugging. If necessary, prepare a "dummy" Non-Secure project or replace `R_BSP_NonSecureEnter();` with `while(1);` in `hal_entry.c`.

2.5.2.2 Non-Secure Project

1. Start a new Non-Secure project.
2. If you have access to the Secure project, choose this option. However, if you only have access to a device with pre-programmed Secure code (commonly referred to as provisioned device) choose "Secure Bundle".
3. Select and configure pins and drivers/stacks that need to be initialized and used in Non-Secure mode.
4. Note that you can add NSC drivers and stacks as needed.
5. Generate project content and write Non-Secure code as needed
6. Access NSC drivers and Stacks via Guard functions.
7. Build and debug project.

2.5.2.3 Flat Project

A flat project does not technically use ARM® TrustZone® as the developer has made a decision to place the entire application in Secure partition from restart.

Notes:

- Any code placed in external memory (such as OSPI or QSPI) will be Non-Secure.
- The Ethernet EDMAC is designed to be a Non-Secure bus master so associated Ethernet RAM buffers will be placed in Non-Secure RAM. The tooling will automatically manage this.

The workflow is as follows:

1. Start a new Flat project.
2. Select and configure pins and drivers/stacks as needed.
3. Generate project content and write code as needed.
4. Build and debug project.

2.5.3 RA Project Generator (PG)

The RA project generators have been created to help users through setting up new TZ enabled projects. User will be prompted for project settings such as Project Type (Secure, Non-Secure, or Flat), compiler, RTOS and debugger. Care is needed when setting up a TZ project to ensure that the connection between Secure and Non-Secure partitions are managed correctly.

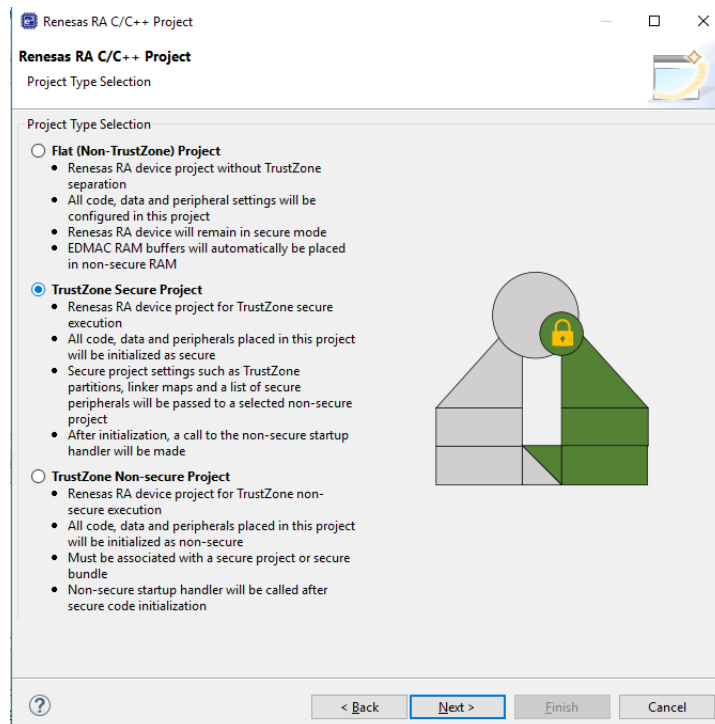

Figure 101: Secure Project (following Arm notation as green)

Figure 102: Non-Secure Project (following Arm notation as red)

Figure 103: Flat Project

2.5.3.1 Secure Project Set Up

All code, data, and peripherals in this project will be configured as Secure using the device Peripheral Security Attribution (PSA) registers. Although it is very application specific, we recommend keeping the Secure project code as small as possible to reduce the attack surface. For example, secure key handling may be the only application code in the secure project.

Necessary values to set up the TZ memory partition (IDAU registers) will be automatically calculated after the project is built to ensure they match the code and data size, keeping the attack surface as small as possible.

Typically, ANSI C start up code (clearing of RAM, variable initialisation, etc) , clock, and secure peripheral initialisation will occur in this project.

At the end of the Secure code, a call will be made to `R_BSP_NonSecureEnter()`; to pass control to the Non-Secure partition.

Non-Secure Callable (NSC) "Guard" functions are added to the project and expose selected modules to Non-Secure projects. User can add application-specific access checks as needed in these functions.

Output of this project type will be an elf file that must be either pre-programmed (provisioned) into a device or referenced by a Non-Secure project (via Secure bundle *.SBD) to build a final image.

This project type will NOT typically be debugged in isolation and will normally require a Non-Secure project such as a call to a `R_BSP_NonSecureEnter()` to be made. This can be replaced with `while(1);` if needed.

2.5.3.2 RTOS Support in TZ Project

Although the RTOS kernel and user tasks will reside in the Non-Secure partition, the Secure partition needs to allocate stack space and so on. It is essential when starting a new RTOS project that the TrustZone Secure RTOS-Minimal template is selected. This will add the Arm TrustZone Context RA Port as below.

Figure 104: Secure RTOS-Minimal Template

2.5.3.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-Secure. Peripherals are divided into two types.

Type-1 peripherals have one security attribute. Access to all registers is controlled by one security attribute. The Type-1 peripheral security attribute is set in the PSARx (x = B to E) register by the secure application.

Type-2 peripherals have the security attribute for each register or for each bit. Access to each register or bit field is controlled according to these security attributes. The Type-2 peripheral security attribute is set in the Security Attribution register in each module by the Secure application. For more information about the Security Attribution register, see sections in the Appropriate MCU's User's Manual for each peripheral.

Table 1. Secure and Non-Secure Peripherals

Type	Peripheral
Type 1	SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT
Type 2	System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports
Always Non-Secure	CS Area Controller, QSPI, OSPI, ETHERC, EDMAC

FSP will initialise the arbitration registers during Secure project BSP start up. User code may also be written to set or clear further arbitration. However care must be taken not to undermine FSP.

2.5.3.4 Non-Secure

All code, data, and peripherals in this project will be configured as Non-Secure. This project type must be associated with a Secure project to enable access to secure code, peripherals, linker scripts and others.

2.5.3.5 Flat Project Type

All code, data, and peripherals are configured in a Secure single partition except for the EDMAC RAM buffers that will remain in the Non-Secure partition. Effectively, TZ is disabled.

2.5.3.6 Secure Connection to Non-Secure Project

When starting a new Non-Secure Project, the user will be prompted for either a Secure Project or Secure Bundle. In each case, details of the linker settings, Non-Secure Callable functions, and Secure peripherals will be read to enable the Non-Secure project setup.

Should the Secure project or bundle be rebuilt, the Non-Secure editor will detect this and prompt user to regenerate the Non-Secure project configuration.

Figure 105: Secure Project or Bundle Selection

Secure Project (Combined)

A Secure project must reside in the same Workspace as the Non-Secure project and will typically be used when a design engineer has access to both the Secure and Non-Secure project sources. This is sometimes known as "Combined model".

A Secure .elf file will be referenced and included in the debug configuration for download to the target device. The development engineer will have visibility of Secure and Non-Secure project source code and configuration.

Secure Bundle (Split)

A Secure Bundle will ONLY include linker memory ranges, symbol references, and details of locked Secure peripheral configuration settings but no access to Secure source code (API header files will be included as necessary).

The Secure bundle file (*.SBD) must be supplied to the Non-Secure developer by the Secure project developer.

The development engineer will typically not have access to the Secure project or .elf file which MUST be pre-programmed or provisioned into the target MCU.

The DLM state of target device should then be switched to NSECSD (see section 6.2) before the device is provided to the non-secure developer.

This is often referred to as "Split model" where a basic security set up is developed by a Secure team and then passed to the Non-Secure team in the same facility or at a third party. The Non-Secure team has no access to the Secure source code and cannot directly access Secure peripherals, data, or APIs.

2.5.3.7 Debug Configurations

After each project type has been selected, a suitable debug configuration will be generated.

Non-Secure with Secure Project (Combined)

Both Secure and Non-Secure .elf files will be downloaded.

A debug configuration called <project name>_SSD will be generated.

Non-Secure with Secure Bundle (Split)

Only a Non-Secure elf will be downloaded. This configuration must be used with a pre-provisioned device (Secure project pre-programmed into MCU Flash).

A debug configuration called <project name>_NSECSD will be generated.

Flat Debug

A single .elf file will be downloaded.

A debug configuration called <project name>_FLAT will be generated.

2.5.4 Secure Projects

As mentioned, Secure code will be called immediately after device reset and run ANSI C start up, clock, interrupt vector table, and secure peripheral initialization before starting user code. All

selected peripheral configuration settings will be automatically initialised as Secure.

2.5.4.1 Secure Clock

Device clock settings are the possible exception in that they will be initialised in the Secure project (to enable faster start up from reset) but can be set as Secure or Non-Secure as user application may need to change settings during execution (for low-power mode and so on). The Secure and Non-Secure FSP BSPs can both change the clock settings.

However, clock settings can be locked as Secure should the developer choose to do so.

Figure 106: Secure Clock Setting

2.5.4.2 Setting Drivers as NSC

Some driver and middleware stacks in the Secure project may need to be accessed by the Non-Secure partition. To enable generation of NSC veneers, set "Non-Secure Callable" from the right-click context menu for the selected modules in the Configurator.

Note: It is only possible to "expose" top of stacks as NSC.

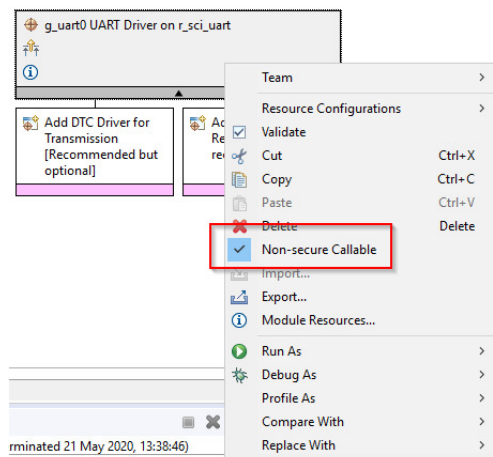

Figure 107: Generate NSC Veneers

The top of the stack will be marked with a new icon and tool tip to signify NSC access.

2.5.4.3 Guard Functions

Access to NSC drivers from a Non-Secure project is possible through the Guard APIs. FSP will automatically generate Guard functions for all the top of stack/driver APIs added to the project as Non-Secure Callable.

User can choose to add further levels of access control or delete guard function if they wish to only expose a limited range of APIs to a Non-Secure developer.

```
BSP_CMSE_NONSECURE_ENTRY fsp_err_t g_uart0_open_guard(  
    uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg) {  
    /* TODO: add your own security checks here */  
    FSP_PARAMETER_NOT_USED(p_api_ctrl);  
    FSP_PARAMETER_NOT_USED(p_cfg);  
    return R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);  
}
```

For example, an SCI channel may be opened and configured for a desired baud rate by the Secure developer, but only enable the Write API to the Non-Secure developer. In which case, all but `g_uart0_write_guard()` could be deleted. CTRL structures are not required as they will be added on the Secure side.

For example, the call from the Non-Secure partition would be as follows:

```
err = g_uart0_open_guard(0,0);
```

2.5.5 Non-Secure projects

Configuration of the project can continue as for other RA devices, but certain resources will be locked if they have been previously set up as Secure.

The Non-Secure project will be called from the Secure project via `R_BSP_NonSecureEnter()`;

2.5.5.1 Clock Set Up

You may recall that clocks can be set as Secure or Non-Secure. If they are set as Secure, settings will only be available to view, and user will not be able to change them. The Override button will be greyed. This is useful to preserve CGC sync with secure project by not overriding unless necessary. If it is NOT set as Secure, user can choose to override the initial Secure settings

Figure 108: Clock Setting as Non-Secure

Figure 109: Clock Setting as Secure

2.5.5.2 Selecting NSC Drivers

Drivers declared as NSC in a Secure project can be selected and added to Non-Secure project and will be decorated as before.

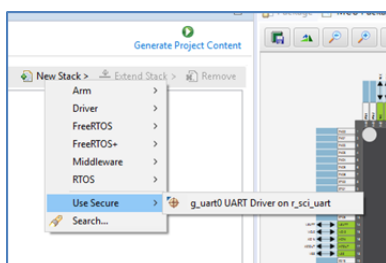

Figure 110: Selecting NSC Drivers

2.5.5.3 Locked Resources

When a NSC Secure driver is added to a Non-Secure project, the configuration settings are locked and are available for information only. A padlock is added for indication.

Figure 111: Locked Resources

2.5.5.4 Locked Channels

In a peripheral with multiple channels, for example, DMA, if a Non-Secure developer tries to select a channel that has already been defined as Secure, the following error message type will be displayed.

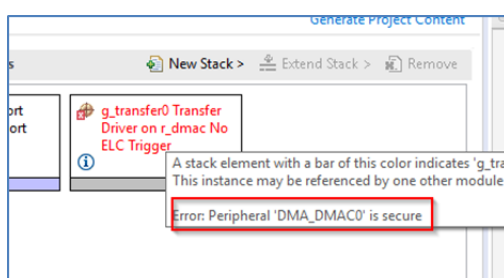

Figure 112: Error Message when Selecting a Secure Channel

2.5.6 IDAU registers

Renesas RA TZ-enabled devices include a set of registers known as Implementation Defined Attribution Unit (IDAU) that are used to set up partitions between Secure, Non-Secure Callable, and Non-Secure regions. The IDAU registers can only be programmed during MCU **boot mode** and NOT through the debug interfaces. Because of this, special debugger firmware has been developed to manage bringing the device up in SCI boot mode to set up the IDAU registers (automatically drives MD pin) and then switch back to debug mode as needed.

Note: Please be aware of the extra signal connection (MD pin) needed on the debug interface connector. The Renesas Evaluation Kit (EK) for your selected device is a good reference.

Pin No.	SWD	JTAG	Serial Programming using SCI
1	VCC	VCC	VCC
2	P108/SWDIO	P108/TMS	NC
4	P300/SWCLK Wired OR with MD	P300/TCK Wired OR with MD	P201/MD
6	P109/SWO/TXD9	P109/TDO/TXD9	P109/TXD9
8	P110/RXD9	P110/TDI/RXD9	P110/RXD9
9	GNDdetect	GNDdetect	GNDdetect
10	nRESET	nRESET	nRESET
12	P214/TRACECLK	P214/TRACECLK	NC
14	P211/TRACEDATA[0]	P211/TRACEDATA[0]	NC
16	P210/TRACEDATA[1]	P210/TRACEDATA[1]	NC
18	P209/TRACEDATA[2]	P209/TRACEDATA[2]	NC
20	P208/TRACEDATA[3]	P208/TRACEDATA[3]	NC
3, 5, 15,17, 19	GND	GND	GND
7	NC	NC	NC
11, 13	NC	NC	NC

The e² studio build phase automatically extracts the IDAU partition register settings from the Secure.elf file and programs them into the device during debug connection, which can be observed in the console.

This is an important phase of TZ development as the Secure partitions should be set as small as possible to ensure that the security attack surface is as small as possible.

However, should the developer wish to make these partitions larger to accommodate, for example during field firmware updates, const or data arrays should be placed in the Secure project as needed.

Figure 115: Example of MD Mode Pin Connection to Debugger Connector (from EK schematic)

2.5.6.2 DLM States

Device lifecycle defines the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. The following illustration shows the lifecycle definitions and capability in each lifecycle.

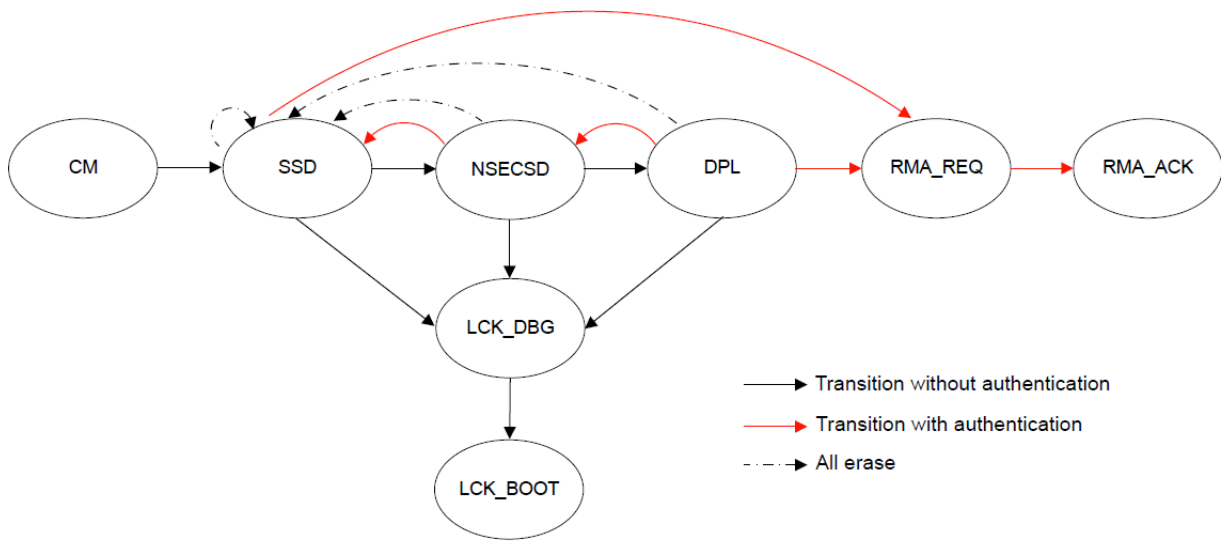

Figure 116: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_DBG, LCK_BOOT, RMA_REQ is only managed by Renesas Flash Programmer (RFP) and NOT within e² studio.

Lifecycle	Definition	Debug level	Serial programming	Test mode
CM	“Chip Manufacturing” The state when the customer received the device.	DBG2	Available, cannot access code/data flash	Not available
SSD	“Secure Software Development” The secure part of application is being developed.	DBG2	Available can program/erase/read all code/data flash area	Not available
NSECSD	“Non-SECure Software Development” The non-secure part of application is being developed.	DBG1	Available can program/erase/read all code/data flash area	Not available
DPL	“DePloyed” The device is in-field.	DBG0	Available cannot access code/data flash area	Not available
LCK_DBG	“LoCKed DeBuG” The debug interface is permanently disabled.	DBG0	Available cannot access code/data flash area	Not available
LCK_BOOT	“LoCKed BOOT interface” The debug interface and the serial programming interface are permanently disabled.	DBG0	Not available	Not available
RMA_REQ	“Return Material Authorization REQuest” Request for RMA. The customer must send the device to Renesas in this state.	DBG0	Available cannot access code/data flash area	Not available
RMA_ACK	“Return Material Authorization ACKnowledged” Failure analysis in Renesas	DBG2	Available cannot access code/data flash area	Available

Figure 117: Lifecycle Stages and Debug Levels

There are three debug access levels. The debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals

- DBG1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

Transitions for one state to another can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

2.5.7 Debug

By default, the device will be in SSD mode and so allow access to Secure and Non-Secure partitions. In this mode both Secure and Non-Secure .elf files will be downloaded.

The current debugger status is displayed in the lower left corner and includes the DLM state (SSD or NSECSD) and current partition (Secure, Non-Secure, or Non-Secure Callable) when the debugger is stopped, for example.

Figure 118: Current Debugger Status

2.5.7.1 Non-Secure Debug

Once the device is transitioned to NSECSD mode, only Non-Secure Flash, RAM and Peripherals can be accessed. In this mode, a Secure .elf must be pre-programmed (provisioned) into the device, and only a Non-Secure .elf file will be downloaded.

When in NSECSD mode access to Secure elements will be blocked and data displayed as ????????.

In NSECSD mode, it is not possible to set breakpoints on Secure code or data.

It is not possible to step into Secure code; the debugger will perform a step-over of any Secure function calls. Should the user press the Suspend button during execution, the debugger will stop at the next Non-Secure code access.

Assuming Secure memory region finishes at 32K (0x8000) in NSECSD debug mode (colour coding added for indication only), memory will be displayed as shown in the following figure.

Figure 119: Memory Display in NSECSD Debug Mode

Disassembly will be displayed as shown in the following figure.

```

Disassembly 0x8000

Figure 120: Disassembly Display in NSECSD Debug Mode

2.5.8 Debugger support

Renesas E2, E2 Lite, and SEGGER J-Link are supported in e² studio for TZ projects.

Debugger Support for TZ Projects

Feature	E2 Lite	E2	J-Link	J-Link OB	ULINK	IAR i-Jet
JTAG	Yes	Yes	Yes	No	Yes	Yes
SWD	Yes	Yes	Yes	Yes	Yes	Yes
ETB trace	Yes	Yes	Yes	Yes	Yes	Yes
ETM trace	No	Yes	Yes	No	Yes	Yes
TZ partition programming	Yes	Yes	Yes	Yes	No	No
Non secure debug	Yes	Yes	Yes	Yes	Yes	Yes
e ² studio	Yes	Yes	Yes	Yes	No	TBC
IAR EW Arm	Under consideration	Under consideration	Yes	Yes	No	Yes
Keil MDK	Under consideration	Under consideration	Yes	Yes	Yes	No

2.5.9 Third-Party IDEs

Third-party IDEs such as IAR Systems EWARM and Keil MDK (uVision) are supported by the RA Smart Configurator (RA SC).

In general, RA SC offers the same configurator functionality as e² studio documented above. Project

generators are available to initialise workspaces in the target IDEs as well as setting up debug configurations and so forth. However, there are some limitations that need to be noted especially with regards to IDAU TZ partition register programming. See the specific RA SC documentation for usage details.

2.5.10 Renesas Flash Programmer (RFP)

Updated versions of Renesas Flash Programmer (RFP) are available to support setting of partitions, DLM state and Authentication keys.

RFP can be downloaded free of charge on the Renesas web site.

A new mode has been added to Program Flash Options as shown in the following graphics.

Figure 121: RFP Program Flash Options

Options to set partition boundaries are shown in the following figure.

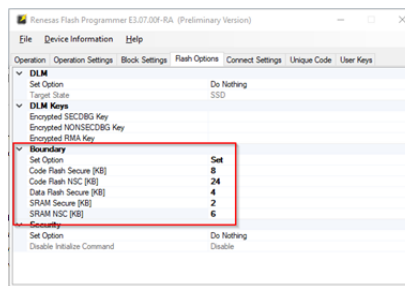

Figure 122: RFP Partition Boundaries

Options to set DLM state, Authentication keys, and Security settings are shown in the following figure.

Figure 123: RFP DLM State, Authentication Keys, and Security Settings

Great care is needed here as some DLM states can ****permanently**** turn off debug and boot mode on the devices. Equally programming a security access authentication key can lead to permanently locked devices if the key is lost.

2.5.11 Glossary

IDAU

Implementation Defined Attribute Unit. Used to program TZ partitions in SCI book mode.

NSECSD

Non-Secure Software Development mode

SSD

Secure Software Development mode

NSC

Non-Secure Callable. Special Secure memory region used for Veneer to allow access to Secure APIs from Non-Secure code.

Provisioned

Device with Secure code pre-programmed and DLM state set to **NSECSD**

Flat project

All code, data and peripherals are configured as secure with the exception of the EDMAC RAM buffer which are placed in Non-Secure RAM due to the configuration of the internal bus masters.

Veneer

Code that resides in Non-Secure Callable region

Combined model

Development engineer has access to both Secure and Non-Secure project and source code

Split model

Development Engineer has access to only the Non-Secure partition. No visibility of Secure source code. Secure code will be provisioned into device.

2.5.11.1 Configurator Icon Glossary

Figure 124: Configurator Icons

2.6 RA SC User Guide for MDK and IAR

2.6.1 What is RA SC?

The Renesas RA Smart Configurator (RA SC) is a desktop application designed to configure device hardware such as clock set up and pin assignment as well as initialization of FSP software components for a Renesas RA microcontroller project when using a 3rd-party IDE and toolchain.

The RA Smart Configurator can currently be used with

1. Keil MDK and the Arm compiler toolchain.
2. IAR EWARM with IAR toolchain for Arm

Projects can be configured and the project content generated in the same way as in e2 studio. Please refer to [Configuring a Project](#) section for more details.

2.6.2 Using RA Smart Configurator with Keil MDK

2.6.2.1 Prerequisites

- Keil MDK and Arm compiler are installed and licensed. Please refer to the RASC Release notes for the version to be installed.
- Import the RA device pack. Download the RA device pack archive file (ex: MDK_Device_Packs_2.x.x.zip) from the [FSP GitHub release page](#). Extract the archive file to locate the RA device pack. To import the RA device pack, launch the PackInstaller.exe from <keil_mdk_install_dir>\UV4. Select the menu item **File > Import...** and browse to the extracted .pack file.
- Verify that the latest updates for RA devices are included in Keil MDK. To verify, select the menu "Packs" in Pack Installer and verify that the menu item **Check for Updates on Launch** is selected. If not, select **Check for Updates on Launch** and relaunch Pack

Installer.

- For flashing and debugging, the latest Segger J-Link DLL is installed into Keil MDK.
- Install RA SC and FSP using the Platform Installer from the GitHub release page.

2.6.2.2 Create new RA project

The following steps are required to create an RA project using Keil MDK, RA SC and FSP:

1. Start the RA Smart Configurator.
2. Enter a project folder and project name.

Figure 125: RA SC project settings

3. Select the target device and IDE.

Figure 126: Target device and IDE selection

4. The rest of the project generator and FSP configuration is the same as e2 studio. Please

refer to the previous sections for details.

5. On completion of the FSP configuration, press "Generate Project Content"
6. A new Keil MDK project file will be generated in the project path. Double click this file to open MDK and continue development as usual.

Figure 127: uVision project workspace with imported project data

2.6.2.3 Modify existing RA project

Once an initial project has been generated and configured, it is also possible to make changes using RA SC as follows.

Note

This setup only needs to be done once per project.

Set up the following links to RA SC:

1. In Keil MDK uVision, select **Tools > Customize Tools Menu....**
2. Select the **new** icon and fill in the fields as follows for each tool:
 - a. RA Smart Configurator:
 - Menu item name: Enter: RA Smart Configurator
 - Command: Select "." and navigate to rasc.exe
 - Initial Folder: Enter: \$P
 - Arguments: Enter: --device \$D --compiler ARMv6 configuration.xml
 - b. Device Partition Manager:
 - Menu item name: Enter: Device Partition Manager
 - Command: Select "." and navigate to rasc.exe
 - Initial Folder: Enter: \$P
 - Arguments: Enter: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "SL%L"

To reconfigure an existing project select **Tools > RA Smart Configurator**

To reconfigure the TrustZone partitions select **Tools > Device Partition Manager**

2.6.2.4 Build and Debug RA project

The project can be built by selecting the menu item **Project > Build Target** or tool bar item **Rebuild** or the keyboard shortcut F7.

Assembler, Compiler, Linker and Debugger settings can be changed in **Options for Target** dialog, which can be launched using the menu item **Project > Options for Target**, the tool bar item **Options for Target** or the keyboard shortcut Alt+F7.

Figure 128: Options for Target

RA SC will set up the uVision project to debug the selected device using J-Link or J-Link OB debugger by default.

A Debug session can be started or stopped by selecting the menu item **Debug > Start/Stop Debug Session** or keyboard shortcut CTRL+F5. When debugging for the first time, J-Link firmware update may be needed if requested by the tool.

Refer to the documentation from Keil to get more information on the debug features in uVision. Note that not all features supported by uVision debugger are implemented in the J-Link interface. Consult SEGGER J-Link documentation for more information.

2.6.2.5 Notes and Restrictions

1. **When debugging a TrustZone based project, the Secure project image MUST be downloaded before the Non Secure project.**
2. For TrustZone enabled devices, the user will need to manually set up the memory partitions using the "Renesas Device Partition Manager" from inside RA SC before downloading.

Figure 129: Renesas Device partition Manager

3. RA FSP contains a full set of drivers and middleware and may not be compatible with other CMSIS packs from Keil, Arm or third parties.
4. Flash programming is currently only supported through the debugger connection.

2.6.3 Using RA Smart Configurator with IAR EWARM

IAR Systems Embedded Workbench for Arm (EWARM) includes support for Renesas RA devices. These can be set up as bare metal designs within EWARM. However, most RA developers will want to integrate RA FSP drivers and middleware into their designs. RA SC will facilitate this.

RA SC generates a "Project Connection" file that can be loaded directly into EWARM to update project files.

2.6.3.1 Prerequisites

- IAR EWARM installed and licensed. Please refer to the Release notes for the version to be installed.
- RA SC and FSP Installed

2.6.3.2 Create new RA project

The following steps are required to create an RA project using IAR EWARM, RA SC and FSP:

1. Start the RA Smart Configurator.
2. Enter a project folder and project name.

Figure 130: RA SC project settings

3. Select the target device and IDE.

Figure 131: Target device and IDE selection

4. The rest of the project generator and FSP configuration operates the same as e2 studio. Refer to the previous sections for details.
5. On completion of the FSP configuration, press **Generate Project Content**.
6. A new IAR EWARM project file will be generated in the project path. Double click this file to open IAR EWARM and continue development as usual.
7. To Use RA SC with EWARM, RA SC needs to be configured as a tool in EWARM by selecting the menu item **Tools > Configure Tools...**. Select **New** to create a new tool in the dialog shown and add the following information:
 - Menu Text: **RA Smart Configurator**
 - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RA SC
 - b. Argument: -compiler IAR configuration.xml
 - c. Initial Directory: \$PROJ_DIR\$
 - d. Tool Available: Always
 - Menu Text: **Device Partition Manager**
 - a. Command: Select **Browse...** and navigate to rasc.exe in the installed RA SC
 - b. Argument: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "\$TARGET_PATH\$"
 - c. Initial Directory: \$PROJ_DIR\$
 - d. Tool Available: Always
8. RA SC can now be re-launched from EWARM using the menu item **Tools > RA Smart Configurator**.
9. A Project connection needs to be set up in EWARM to build the project. Select **Project > Add Project Connection** in EWARM and select **IAR Project Connection**. Navigate to the project folder and select buildinfo.ipcf and click **Open**. The project can now build in EWARM.

2.6.3.3 Notes and Restrictions

When starting a TrustZone enabled debug session Partition sizes are checked automatically.

- If partition sizes are set correctly, the debug session will launch as normal.

- If partition sizes need to be changed, IAR EWARM will prompt to run the Renesas Device Partition Manager. Select **Yes**. The Device Partition Manager will start with the required partition sizes prefilled.
- Select **Set TrustZone secure / non-secure boundaries** as the only action.
- Enter debugger details, if required.
- Select **Run** to program the partitions.
- Return to the IDE and relaunch the debug session

Chapter 3 FSP Architecture

3.1 FSP Architecture Overview

This guide describes the Renesas Flexible Software Package (FSP) architecture and how to use the FSP Application Programming Interface (API).

3.1.1 C99 Use

The FSP uses the ISO/IEC 9899:1999 (C99) C programming language standard. Specific features introduced in C99 that are used include standard integer types (`stdint.h`), booleans (`stdbool.h`), designated initializers, and the ability to intermingle declarations and code.

3.1.2 Doxygen

Doxygen is the default documentation tool used by FSP. You can find Doxygen comments throughout the FSP source.

3.1.3 Weak Symbols

Weak symbols are used occasionally in the FSP. They are used to ensure that a project builds even when the user has not defined an optional function.

3.1.4 Memory Allocation

Dynamic memory allocation through use of the `malloc()` and `free()` functions are not used in FSP modules; all memory required by FSP modules is allocated in the application and passed to the module in a pointer. Exceptions are considered only for ports of 3rd party code that require dynamic memory.

3.1.5 FSP Terms

Term	Description	Reference
BSP	Short for Board Support Package. In the FSP the BSP provides just enough foundation to allow other FSP modules to work together without issue.	MCU Board Support Package

Module	Modules can be peripheral drivers, purely software, or anything in between. Each module consists of a folder with source code, documentation, and anything else that the customer needs to use the code effectively. Modules are independent units, but they may depend on other modules. Applications can be built by combining multiple modules to provide the user with the features they need.	FSP Modules
Driver	A driver is a specific kind of module that directly modifies registers on the MCU.	-
Interface	An interface contains API definitions that can be shared by modules with similar features. Interfaces are definitions only and do not add to code size.	FSP Interfaces
Stacks	The FSP architecture is designed such that modules work together to form a stack. A stack consists of a top level module and all its dependencies.	FSP Stacks
Module Instance	Single and independent instantiation of a module. An application may require two GPT timers. Each of these timers is a module instance of the r_gpt module.	-
Application	Code that is owned and maintained by the user. Application code may be based on sample application code provided by Renesas, but it is the responsibility of the user to maintain as necessary.	-

<p>Callback Function</p>	<p>This term refers to a function that is called when an event occurs. As an example, suppose the user would like to be notified every second based on the RTC. As part of the RTC configuration, a callback function can be supplied that will be jumped to during each RTC interrupt. When a single callback services multiple events, the arguments contain the triggering event. Callback functions for interrupts should be kept short and handled carefully because when they are called the MCU is still inside of an interrupt, delaying any pending interrupts.</p>	-
--------------------------	--	---

3.2 FSP Modules

Modules are the core building block of FSP. Modules can do many different things, but all modules share the basic concept of providing functionality upwards and requiring functionality from below.

Figure 132: Modules

The amount of functionality provided by a module is determined based on functional use cases. Common functionality required by multiple modules is often placed into a self-contained submodule so it can be reused. Code size, speed and complexity are also considered when defining a module.

The simplest FSP application consists of one module with the Board Support Package (BSP) and the user application on top.

Figure 133: Module with application

The Board Support Package (BSP) is the foundation for FSP modules, providing functionality to determine the MCU used as well as configuring clocks, interrupts and pins. For the sake of clarity, the BSP will be omitted from further diagrams.

3.3 FSP Stacks

When modules are layered atop one another, an FSP stack is formed. The stacking process is performed by matching what one module provides with what another module requires. For example, the SPI module ([Serial Peripheral Interface \(r_spi\)](#)) requires a module that provides the transfer interface ([Transfer Interface](#)) to send or receive data without a CPU interrupt. The transfer interface requirement can be fulfilled by the DTC driver module ([Data Transfer Controller \(r_dtc\)](#)).

Through this methodology the same code can be shared by several modules simultaneously. The example below illustrates how the same DTC module can be used with SPI ([Serial Peripheral Interface \(r_spi\)](#)), UART ([Serial Communications Interface \(SCI\) UART \(r_sci_uart\)](#)) and SDHI ([SD/MMC Host Interface \(r_sdhi\)](#)).

Figure 134: Stacks -- Shared DTC Module

The ability to stack modules ensures the flexibility of the architecture as a whole. If multiple modules include the same functionality issues arise when application features must work across different user designs. To ensure that modules are reusable, any dependent modules must be capable of being swapped out for other modules that provide the same features. The FSP

architecture provides this flexibility to swap modules in and out through the use of FSP interfaces.

3.4 FSP Interfaces

At the architecture level, interfaces are the way that modules provide common features. This commonality allows modules that adhere to the same interface to be used interchangeably. Interfaces can be thought of as a contract between two modules - the modules agree to work together using the information that was established in the contract.

On RA hardware there is occasionally an overlap of features between different peripherals. For example, I2C communications can be achieved through use of the IIC peripheral or the SCI peripheral. However, there is a difference in the level of features provided by both peripherals; in I2C mode the SCI peripheral will only support a subset of the capabilities of the fully-featured IIC.

Interfaces aim to provide support for the common features that most users would expect. This means that some of the advanced features of a peripheral (such as IIC) might not be available in the interface. In most cases these features are still available through interface extensions.

In FSP design, interfaces are defined in header files. All interface header files are located in the folder `ra/fsp/inc/api` and end with `*_api.h`. Interface extensions are defined in header files in the folder `ra/fsp/inc/instances`. The following sections detail what makes up an interface.

3.4.1 FSP Interface Enumerations

Whenever possible, interfaces use typed enumerations for function parameters and structure members.

```
typedef enum e_i2c_master_addr_mode
{
    I2C_MASTER_ADDR_MODE_7BIT = 1,    ///< Use 7-bit addressing mode
    I2C_MASTER_ADDR_MODE_10BIT = 2,   ///< Use 10-bit addressing mode
} i2c_master_addr_mode_t;
```

Enumerations remove uncertainty when deciding what values are available for a parameter. FSP enumeration options follow a strict naming convention where the name of the type is prefixed on the available options. Combining the naming convention with the autocomplete feature available in e2 studio (Ctrl + Space) provides the benefits of rapid coding while maintaining high readability.

3.4.2 FSP Interface Callback Functions

Callback functions allow modules to asynchronously alert the user application when an event has occurred, such as when a byte has been received over a UART channel or an IRQ pin is toggled. FSP driver modules define and handle the interrupt service routines for RA MCU peripherals to ensure any required hardware procedures are implemented. The interrupt service routines in FSP modules then call the user-defined callbacks to allow the application to respond.

Callback functions must be defined in the user application. They always return void and take a structure for their one parameter. The structure is defined in the interface for the module and is named `<interface>_callback_args_t`. The contents of the structure may vary depending on the

interface, but two members are common: event and p_context.

The event member is an enumeration defined in the interface used by the application to determine why the callback was called. Using the UART example, the callback could be triggered for many different reasons, including when a byte is received, all bytes have been transmitted, or a framing error has occurred. The event member allows the application to determine which of these three events has occurred and handle it appropriately.

The p_context member is used for providing user-specified data to the callback function. In many cases a callback function is shared between multiple channels or module instances; when the callback occurs, the code handling the callback needs context information so that it can determine which module instance the callback is for. For example, if the callback wanted to make an FSP API call in the callback, then at a minimum the callback will need a reference to the relevant control structure. To make this easy, the user can provide a pointer to the control structure as the p_context. When the callback occurs, the control structure is passed in the p_context element of the callback structure.

Callback functions are called from within an interrupt service routine. For this reason callback functions should be kept as short as possible so they do not affect the real time performance of the user's system. An example skeleton function for the flash interface callback is shown below.

```
void flash_callback (flash_callback_args_t * p_args)
{
    /* See what event caused this callback. */
    switch (p_args->event)
    {
        case FLASH_EVENT_ERASE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_WRITE_COMPLETE:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_BLANK:
            {
                /* Handle event. */
                break;
            }
        case FLASH_EVENT_NOT_BLANK:
```

```
    {  
    /* Handle event. */  
    break;  
    }  
    case FLASH_EVENT_ERR_DF_ACCESS:  
    {  
    /* Handle error. */  
    break;  
    }  
    case FLASH_EVENT_ERR_CF_ACCESS:  
    {  
    /* Handle error. */  
    break;  
    }  
    case FLASH_EVENT_ERR_CMD_LOCKED:  
    {  
    /* Handle error. */  
    break;  
    }  
    case FLASH_EVENT_ERR_FAILURE:  
    {  
    /* Handle error. */  
    break;  
    }  
    case FLASH_EVENT_ERR_ONE_BIT:  
    {  
    /* Handle error. */  
    break;  
    }  
    }  
}
```

When a module is not directly used in the user application (that is, it is not the top layer of the stack), its callback function will be handled by the module above. For example, if a module requires

a UART interface module the upper layer module will control and use the UART's callback function. In this case the user would not need to create a callback function for the UART module in their application code.

3.4.3 FSP Interface Data Structures

At a minimum, all FSP interfaces include three data structures: a configuration structure, an API structure, and an instance structure.

3.4.3.1 FSP Interface Configuration Structure

The configuration structure is used for the initial configuration of a module during the <MODULE>_Open() call. The structure consists of members such as channel number, bitrate, and operating mode.

The configuration structure is used purely as an input into the module. It may be stored and referenced by the module, so the configuration structure and anything it references must persist as long as the module is open.

The configuration structure is allocated for each module instance in files generated by the RA Configuration editor.

When FSP stacks are used, it is also important to understand that configuration structures only have members that apply to the current interface. If multiple layers in the same stack define the same configuration parameters then it becomes difficult to know where to modify the option. For example, the baud rate for a UART is only defined in the UART module instance. Any modules that use the UART interface rely on the baud rate being provided in the UART module instance and do not offer it in their own configuration structures.

3.4.3.2 FSP Interface API Structure

All interfaces include an API structure which contains function pointers for all the supported interface functions. An example structure for the [Digital to Analog Converter \(r_dac\)](#) is shown below.

```
typedef struct st_dac_api
{
    /** Initial configuration.
     * @par Implemented as
     * - @ref R_DAC_Open()
     * - @ref R_DAC8_Open()
     *
     * @param[in] p_ctrl Pointer to control block. Must be declared by user. Elements
set here.
     * @param[in] p_cfg Pointer to configuration structure. All elements of this
structure must be set by user.
     */
    fsp_err_t (* open)(dac_ctrl_t * const p_ctrl, dac_cfg_t const * const p_cfg);
}
```

```
/** Close the D/A Converter.
 * @par Implemented as
 * - @ref R_DAC_Close()
 * - @ref R_DAC8_Close()
 *
 * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
 */
fsp_err_t (* close)(dac_ctrl_t * const p_ctrl);
/** Write sample value to the D/A Converter.
 * @par Implemented as
 * - @ref R_DAC_Write()
 * - @ref R_DAC8_Write()
 *
 * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
 * @param[in] value Sample value to be written to the D/A Converter.
 */
fsp_err_t (* write)(dac_ctrl_t * const p_ctrl, uint16_t value);
/** Start the D/A Converter if it has not been started yet.
 * @par Implemented as
 * - @ref R_DAC_Start()
 * - @ref R_DAC8_Start()
 *
 * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
 */
fsp_err_t (* start)(dac_ctrl_t * const p_ctrl);
/** Stop the D/A Converter if the converter is running.
 * @par Implemented as
 * - @ref R_DAC_Stop()
 * - @ref R_DAC8_Stop()
 *
 * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
```

```
timer.  
    */  
    fsp_err_t (* stop)(dac_ctrl_t * const p_ctrl);  
} dac_api_t;
```

The API structure is what allows for modules to easily be swapped in and out for other modules that are instances of the same interface. Let's look at an example application using the DAC interface above.

RA MCUs have an internal DAC peripheral. If the DAC API structure in the DAC interface is not used the application can make calls directly into the module. In the example below the application is making calls to the [R_DAC_Write\(\)](#) function which is provided in the `r_dac` module.

Figure 135: DAC Write example

Now let's assume that the user needs more DAC channels than are available on the MCU and decides to add an external DAC module named `dac_external` using I2C for communications. The application must now distinguish between the two modules, adding complexity and further dependencies to the application.

Figure 136: DAC Write with two write modules

The use of interfaces and the API structure allows for the use of an abstracted DAC. This means that no extra logic is needed if the user's `dac_external` module implements the FSP DAC interface, so the application no longer depends upon hard-coded module function names. Instead the application now depends on the DAC interface API which can be implemented by any number of modules.

Figure 137: DAC Interface

3.4.3.3 FSP Interface Instance Structure

Every FSP interface also has an instance structure. The instance structure encapsulates everything required to use the module:

- A pointer to the instance API structure ([FSP Instance API](#))
- A pointer to the configuration structure
- A pointer to the control structure

The instance structure is not required at the application layer. It is used to connect modules to their dependencies (other than the BSP).

Instance structures have a standardized name of `<interface>_instance_t`. An example from the [Transfer Interface](#) is shown below.

```

typedef struct st_transfer_instance
{
    transfer_ctrl_t      * p_ctrl; ///< Pointer to the control structure for this
instance
    transfer_cfg_t const * p_cfg;   ///< Pointer to the configuration structure
for this instance
    transfer_api_t const * p_api;  ///< Pointer to the API structure for this
instance
} transfer_instance_t;
  
```

Note that when an instance structure variable is declared, the API is the only thing that is instance specific, not *module instance* specific. This is because all module instances of the same module share the same underlying module source code. If SPI is being used on SCI channels 0 and 2 then

both module instances use the same API while the configuration and control structures are typically different.

3.5 FSP Instances

While interfaces dictate the features that are provided, instances actually implement those features. Each instance is tied to a specific interface. Instances use the enumerations, data structures, and API prototypes from the interface. This allows an application that uses an interface to swap out the instance when needed.

On RA MCUs some peripherals are used to implement multiple interfaces. In the example below the IIC and SPI peripherals map to only one interface each while the SCI peripheral implements three interfaces.

Figure 138: Instances

In FSP design, instances consist of the interface extension and API defined in the instance header file located in the folder `ra/fsp/inc/instances` and the module source `ra/fsp/src/<module>`.

3.5.1 FSP Instance Control Structure

The control structure is used as a unique identifier for the module instance and contains memory required by the module. Elements in the control structure are owned by the module and *must not be modified* by the application. The user allocates storage for a control structure, often as a global variable, then sends a pointer to it into the `<MODULE>_Open()` call for a module. At this point, the module initializes the structure as needed. The user must then send in a pointer to the control structure for all subsequent module calls.

3.5.2 FSP Interface Extensions

In some cases, instances require more information than is provided in the interface. This situation can occur in the following cases:

- An instance offers extra features that are not common to most instances of the interface. An example of this is the start source selection of the GPT ([General PWM Timer \(r_gpt\)](#)). The GPT can be configured to start based on hardware events such as a falling edge on a trigger pin. This feature is not common to all timers, so it is included in the GPT instance.
- An interface must be very generic out of necessity. As an interface becomes more generic, the number of possible instances increases. An example of an interface that must be generic is a block media interface that abstracts functions required by a file system. Possible instances include SD card, SPI Flash, SDRAM, USB, and many more.

The `p_extend` member provides this extension function.

Use of interface extensions is not always necessary. Some instances do not offer an extension since

all functionality is provided in the interface. In these cases the `p_extend` member can be set to `NULL`. The documentation for each instance indicates whether an interface extension is available and whether it is mandatory or optional.

3.5.2.1 FSP Extended Configuration Structure

When extended configuration is required it can be supplied through the `p_extend` parameter of the interface configuration structure.

The extended configuration structure is part of the instance, but it is also still considered to be part of the configuration structure. All usage notes about the configuration structure described in [FSP Interface Configuration Structure](#) apply to the extended configuration structure as well.

The extended configuration structure and all typed structures and enumerations required to define it make up the interface extension.

3.5.3 FSP Instance API

Each instance includes a constant global variable tying the interface API functions to the functions provided by the module. The name of this structure is standardized as `g_<interface>_on_<instance>`. Examples include `g_spi_on_spi`, `g_transfer_on_dtc`, and `g_adc_on_adc`. This structure is available to be used through an extern in the instance header file (`r_spi.h`, `r_dtc.h`, and `r_adc.h` respectively).

3.6 FSP API Standards

3.6.1 FSP Function Names

FSP functions start with the uppercase module name (`<MODULE>`). All modules have `<MODULE>_Open()` and `<MODULE>_Close()` functions. The `<MODULE>_Open()` function must be called before any of the other functions.

Other functions that will commonly be found are `<MODULE>_Read()`, `<MODULE>_Write()`, `<MODULE>_InfoGet()`, and `<MODULE>_StatusGet()`. The `<MODULE>_StatusGet()` function provides a status that could change asynchronously, while `<MODULE>_InfoGet()` provides information that cannot change after open or can only be updated by API calls. Example function names include:

- `R_SPI_Read()`, `R_SPI_Write()`, `R_SPI_WriteRead()`
- `R_SDHI_StatusGet()`
- `R_RTC_CalendarAlarmSet()`, `R_RTC_CalendarAlarmGet()`
- `R_FLASH_HP_AccessWindowSet()`, `R_FLASH_HP_AccessWindowClear()`

3.6.2 Use of const in API parameters

The `const` qualifier is used with API parameters whenever possible. An example case is shown below.

```
fsp_err_t R_FLASH_HP_Open(flash_ctrl_t * const p_api_ctrl, flash_cfg_t const * const p_cfg);
```

In this example, `flash_cfg_t` is a structure of configuration parameters for the `r_flash_hp` module. The parameter `p_cfg` is a pointer to this structure. The first `const` qualifier on `p_cfg` ensures the

`flash_cfg_t` structure cannot be modified by `R_FLASH_HP_Open()`. This allows the structure to be allocated as a const variable and stored in ROM instead of RAM.

The const qualifier after the pointer star for both `p_ctrl` and `p_cfg` ensures the FSP function does not modify the input pointer addresses. While not fool-proof by any means this does provide some extra checking inside the FSP code to ensure that arguments that should not be altered are treated as such.

3.6.3 FSP Version Information

The BSP provides a function `R_FSP_VersionGet()` which fills in a structure of type `fsp_pack_version_t`. This can be used to determine the FSP version at runtime.

There are also `FSP_VERSION_*` macros in `fsp_version.h` that can be used to determine the FSP version at build time.

3.7 FSP Build Time Configurations

All modules have a build-time configuration header file. Most configuration options are supplied at run time, though options that are rarely used or apply to all instances of a module may be moved to build time. The advantage of using a build-time configuration option is to potentially reduce code size reduction by removing an unused feature.

All modules have a build time option to enable or disable parameter checking for the module. FSP modules check function arguments for validity when possible, though this feature is disabled by default to reduce code size. Enabling it can help catch parameter errors during development and debugging. By default, each module's parameter checking configuration inherits the BSP parameter checking setting (set on the BSP tab of the RA Configuration editor). Leaving each module's parameter checking configuration set to Default (BSP) allows parameter checking to be enabled or disabled globally in all FSP code through the parameter checking setting on the BSP tab.

If an error condition can reasonably be avoided it is only checked in a section of code that can be disabled by disabling parameter checking. Most FSP APIs can only return `FSP_SUCCESS` if parameter checking is disabled. An example of an error that cannot be reasonably avoided is the "bus busy" error that occurs when another master is using an I2C bus. This type of error can be returned even if parameter checking is disabled.

3.8 FSP File Structure

The high-level file structure of an FSP project is shown below.

```
ra_gen
ra
+---fsp
    +---inc
        |   +---api
        |   \---instances
    \---src
        +---bsp
```

```
    \---r_module
ra_cfg
+---fsp_cfg
    +---bsp
    +---driver
```

Directly underneath the base ra folder the folders are split into the source and include folders. Include folders are kept separate from the source for easy browsing and easy setup of include paths.

The ra_gen folder contains code generated by the RA Configuration editor. This includes global variables for the control structure and configuration structure for each module.

The ra_cfg folder is where configuration header files are stored for each module. See [FSP Build Time Configurations](#) for information on what is provided in these header files.

3.9 FSP TrustZone Support

TrustZone support for FSP is primarily handled in the RA Configuration Tool.

3.9.1 FSP TrustZone Projects

During development of a TrustZone project, users create an RA TrustZone Secure Project first, followed by an RA TrustZone Non-secure Project that is linked to the RA TrustZone Secure Project. Allocation of secure memory is handled automatically within the tooling. The non-secure project starts at the required alignment boundary beyond the memory taken by the secure project.

3.9.2 Non-Secure Callable Guard Functions

The tooling generates guard functions for any module marked as Non-secure Callable. These guard functions are owned by the application once generated, so they can be modified as necessary by the secure application developer.

The default non-secure callable guard functions limit the configuration and control structure to the structures generated in the secure project. They also check any input pointers to ensure the caller does not overwrite secure memory.

3.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules

If the non-secure project needs a callback function from a non-secure callable module, the callback can be registered after the module is opened using the `callback_set()` guard function.

3.9.4 Additional TrustZone Information

The following resources provide technical background, application notes and example projects that demonstrate key TrustZone concepts and implementation procedures.

- [The Benefits of Using Arm® TrustZone® in Your Design](#) (Brochure)

3.10 FSP Architecture in Practice

3.10.1 FSP Connecting Layers

FSP modules are meant to be both reusable and stackable. It is important to remember that modules are not dependent upon other modules, but upon other interfaces. The user is then free to fulfill the interface using the instance that best fits their needs.

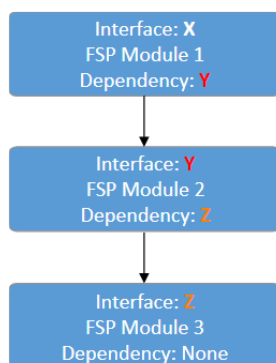

Figure 139: Connecting layers

In the image above interface Y is a dependency of interface X and has its own dependency on interface Z. Interface X only has a dependency on interface Y. Interface X has no knowledge of interface Z. This is a requirement for ensuring that layers can easily be swapped out.

3.10.2 Using FSP Modules in an Application

The typical use of an FSP module involves generating required module data then using the API in the application.

3.10.2.1 Create a Module Instance in the RA Configuration Editor

The RA Configuration editor (available both in the Renesas e2 studio IDE as well as through the standalone RA Smart Configurator) provides a graphical user interface for setting the parameters of the interface and instance configuration structures. It also automatically includes those structures (once they are configured in the GUI) in application-specific header files that can be included in application code.

The RA Configuration editor allocates storage for the control structures, all required configuration structures, and the instance structure in generated files in the ra_gen folder. Use the **Properties** window to set the values for the members of the configuration structures as needed. Refer to the Configuration section of the module usage notes for documentation about the configuration options.

If the interface has a callback function option then the application must declare and define the function. The return value is always of type void and the parameter to the function is a typed structure of name <interface>_callback_args_t. Once the function has been defined, assign its name to the p_callback member of the configuration structure. Callback function names can be assigned through the **Properties** window for the selected module.

3.10.2.2 Use the Instance API in the Application

Call the module's <MODULE>_Open() function. Pass pointers to the generated control structure and configuration structure. The names of these structures are based on the 'Name' field provided in the configuration editor. The control structure is <Name>_ctrl and the configuration structure is <Name>_cfg. An example <MODULE>_Open() call for an r_rtc module instance named g_clock is:

```
R_RTC_Open(&g_clock_ctrl, &g_clock_cfg);
```

Note

Each layer in the FSP Stack is responsible for calling the API functions of its dependencies. This means that users are only responsible for calling the API functions at the layer at which they are interfacing. Using the example above of a SPI module with a DTC dependency, the application uses only SPI APIs. The application starts by calling [R_SPI_Open\(\)](#). Internally, the SPI module opens the DTC. It locates [R_DTC_Open\(\)](#) by accessing the dependent transfer interface function pointers from the pointers DTC instances ([spi_cfg_t::p_transfer_tx](#) and [spi_cfg_t::p_transfer_rx](#)) to open the DTC.

Refer to the module usage notes for example code to help get started with any particular module.

Chapter 4 API Reference

This section includes the FSP API Reference for the Module and Interface level functions.

- ▶ [BSP](#) Common code shared by FSP drivers
- ▶ [Modules](#) Modules are the smallest unit of software available in the FSP. Each module implements one interface
- ▶ [Interfaces](#) The FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer

4.1 BSP

Detailed Description

Common code shared by FSP drivers.

Modules

[Common Error Codes](#)

[MCU Board Support Package](#)

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

[BSP I/O access](#)

This module provides basic read/write access to port pins.

Data Structures

union [fsp_pack_version_t](#)

struct [fsp_pack_version_t.__unnamed__](#)

Macros

```
#define FSP_VERSION_MAJOR
```

```
#define FSP_VERSION_MINOR
```

```
#define FSP_VERSION_PATCH
```

```
#define FSP_VERSION_BUILD
```

```
#define FSP_VERSION_STRING
```

```
#define FSP_VERSION_BUILD_STRING
```

Data Structure Documentation

◆ fsp_pack_version_t

union fsp_pack_version_t		
FSP Pack version structure		
Data Fields		
uint32_t	version_id	Version id
struct fsp_pack_version_t	__unnamed__	Code version parameters, little endian order.

◆ fsp_pack_version_t.__unnamed__

struct fsp_pack_version_t.__unnamed__		
Code version parameters, little endian order.		
Data Fields		
uint8_t	build	Build version of FSP Pack.
uint8_t	patch	Patch version of FSP Pack.
uint8_t	minor	Minor version of FSP Pack.
uint8_t	major	Major version of FSP Pack.

Macro Definition Documentation

◆ FSP_VERSION_MAJOR

#define FSP_VERSION_MAJOR
FSP pack major version.

◆ FSP_VERSION_MINOR

```
#define FSP_VERSION_MINOR
```

FSP pack minor version.

◆ FSP_VERSION_PATCH

```
#define FSP_VERSION_PATCH
```

FSP pack patch version.

◆ FSP_VERSION_BUILD

```
#define FSP_VERSION_BUILD
```

FSP pack version build number (currently unused).

◆ FSP_VERSION_STRING

```

```
#define FSP_VERSION_BUILD_STRING
```

Unique FSP version ID.

4.1.1 Common Error Codes

BSP

Detailed Description

All FSP modules share these common error codes.

Macros

```
#define FSP_PARAMETER_NOT_USED(p)
```

```
#define FSP_CPP_HEADER
```

```
#define FSP_HEADER
```

```
#define FSP_SECURE_ARGUMENT
```

Enumerations

```
enum fsp_err_t
```

Macro Definition Documentation

◆ FSP_PARAMETER_NOT_USED

```
#define FSP_PARAMETER_NOT_USED ( p)
```

This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.

◆ FSP_CPP_HEADER

```
#define FSP_CPP_HEADER
```

Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.

◆ FSP_HEADER

```
#define FSP_HEADER
```

FSP Header and Footer definitions

◆ FSP_SECURE_ARGUMENT

```
#define FSP_SECURE_ARGUMENT
```

Macro to be used when argument to function is ignored since function call is NSC and the parameter is statically defined on the Secure side.

Enumeration Type Documentation

◆ fsp_err_t

enum fsp_err_t	
Common error codes	
Enumerator	
FSP_ERR_ASSERTION	A critical assertion has failed.
FSP_ERR_INVALID_POINTER	Pointer points to invalid memory location.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_CHANNEL	Selected channel does not exist.
FSP_ERR_INVALID_MODE	Unsupported or incorrect mode.
FSP_ERR_UNSUPPORTED	Selected mode not supported by this API.
FSP_ERR_NOT_OPEN	Requested channel is not configured or API not open.
FSP_ERR_IN_USE	Channel/peripheral is running/busy.
FSP_ERR_OUT_OF_MEMORY	Allocate more memory in the driver's cfg.h.
FSP_ERR_HW_LOCKED	Hardware is locked.
FSP_ERR_IRQ_BSP_DISABLED	IRQ not enabled in BSP.
FSP_ERR_OVERFLOW	Hardware overflow.
FSP_ERR_UNDERFLOW	Hardware underflow.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_APPROXIMATION	Could not set value to exact result.
FSP_ERR_CLAMPED	Value had to be limited for some reason.
FSP_ERR_INVALID_RATE	Selected rate could not be met.
FSP_ERR_ABORTED	An operation was aborted.
FSP_ERR_NOT_ENABLED	Requested operation is not enabled.
FSP_ERR_TIMEOUT	Timeout error.

FSP_ERR_INVALID_BLOCKS	Invalid number of blocks supplied.
FSP_ERR_INVALID_ADDRESS	Invalid address supplied.
FSP_ERR_INVALID_SIZE	Invalid size/length supplied for operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_ERASE_FAILED	Erase operation failed.
FSP_ERR_INVALID_CALL	Invalid function call is made.
FSP_ERR_INVALID_HW_CONDITION	Detected hardware is in invalid condition.
FSP_ERR_INVALID_FACTORY_FLASH	Factory flash is not available on this MCU.
FSP_ERR_INVALID_STATE	API or command not valid in the current state.
FSP_ERR_NOT_ERASED	Erase verification failed.
FSP_ERR_SECTOR_RELEASE_FAILED	Sector release failed.
FSP_ERR_NOT_INITIALIZED	Required initialization not complete.
FSP_ERR_NOT_FOUND	The requested item could not be found.
FSP_ERR_NO_CALLBACK_MEMORY	Non-secure callback memory not provided for non-secure callback.
FSP_ERR_BUFFER_EMPTY	No data available in buffer.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed.
FSP_ERR_INTERNAL	Internal error.
FSP_ERR_WAIT_ABORTED	Wait aborted.
FSP_ERR_FRAMING	Framing error occurs.
FSP_ERR_BREAK_DETECT	Break signal detects.
FSP_ERR_PARITY	Parity error occurs.
FSP_ERR_RXBUF_OVERFLOW	Receive queue overflow.
FSP_ERR_QUEUE_UNAVAILABLE	Can't open s/w queue.
FSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular

	buffer.
FSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
FSP_ERR_TRANSFER_ABORTED	The data transfer was aborted.
FSP_ERR_MODE_FAULT	Mode fault error.
FSP_ERR_READ_OVERFLOW	Read overflow.
FSP_ERR_SPI_PARITY	Parity error.
FSP_ERR_OVERRUN	Overrun error.
FSP_ERR_CLOCK_INACTIVE	Inactive clock specified as system clock.
FSP_ERR_CLOCK_ACTIVE	Active clock source cannot be modified without stopping first.
FSP_ERR_NOT_STABILIZED	Clock has not stabilized after its been turned on/off.
FSP_ERR_PLL_SRC_INACTIVE	PLL initialization attempted when PLL source is turned off.
FSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop LOCO when Oscillation stop is enabled.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detection status flag is set.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active.
FSP_ERR_CLKOUT_EXCEEDED	Output on target output clock pin exceeds maximum supported limit.
FSP_ERR_USB_MODULE_ENABLED	USB clock configure request with USB Module enabled.
FSP_ERR_HARDWARE_TIMEOUT	A register read or write timed out.
FSP_ERR_LOW_VOLTAGE_MODE	Invalid clock setting attempted in low voltage mode.
FSP_ERR_PE_FAILURE	Unable to enter Programming mode.
FSP_ERR_CMD_LOCKED	Peripheral in command locked state.
FSP_ERR_FCLK	

	FCLK must be ≥ 4 MHz.
FSP_ERR_INVALID_LINKED_ADDRESS	Function or data are linked at an invalid region of memory.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.
FSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate < reference clock rate.
FSP_ERR_CLOCK_GENERATION	Clock cannot be specified as system clock.
FSP_ERR_INVALID_TIMING_SETTING	Invalid timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer parameter.
FSP_ERR_INVALID_ALIGNMENT	Invalid memory alignment found.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction parameter.
FSP_ERR_INVALID_LAYER_FORMAT	Invalid color format in layer.
FSP_ERR_INVALID_UPDATE_TIMING	Invalid timing for register update.
FSP_ERR_INVALID_CLUT_ACCESS	Invalid access to CLUT entry.
FSP_ERR_INVALID_FADE_SETTING	Invalid fade-in/fade-out setting.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid gamma correction parameter.
FSP_ERR_JPEG_ERR	JPEG error.
FSP_ERR_JPEG_SOI_NOT_DETECTED	SOI not detected until EOI detected.
FSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED	SOF1 to SOFF detected.
FSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT	Unprovided pixel format detected.
FSP_ERR_JPEG_SOF_ACCURACY_ERROR	SOF accuracy error: other than 8 detected.
FSP_ERR_JPEG_DQT_ACCURACY_ERROR	DQT accuracy error: other than 0 detected.
FSP_ERR_JPEG_COMPONENT_ERROR1	Component error 1: the number of SOF0 header components detected is other than 1, 3, or 4.
FSP_ERR_JPEG_COMPONENT_ERROR2	Component error 2: the number of components differs between SOF0 header and SOS.
FSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED	SOF0, DQT, and DHT not detected when SOS

	detected.
FSP_ERR_JPEG_SOS_NOT_DETECTED	SOS not detected: SOS not detected until EOI detected.
FSP_ERR_JPEG_EOI_NOT_DETECTED	EOI not detected (default)
FSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR	Restart interval data number error detected.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size error detected.
FSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR	Last MCU data number error detected.
FSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR	Block data number error detected.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	User provided buffer size not enough.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	JPEG Image size is not aligned with MCU.
FSP_ERR_CALIBRATE_FAILED	Calibration failed.
FSP_ERR_IP_HARDWARE_NOT_PRESENT	Requested IP does not exist on this device.
FSP_ERR_IP_UNIT_NOT_PRESENT	Requested unit does not exist on this device.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this device.
FSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool.
FSP_ERR_ILLEGAL_BUFFER_ADDRESS	Buffer address is out of block memory pool.
FSP_ERR_INVALID_WORKBUFFER_SIZE	Work buffer size is invalid.
FSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
FSP_ERR_TOO_MANY_BUFFERS	Number of buffer is too many.
FSP_ERR_NO_SUBSCRIBER_FOUND	No message subscriber found.
FSP_ERR_MESSAGE_QUEUE_EMPTY	No message found in the message queue.
FSP_ERR_MESSAGE_QUEUE_FULL	No room for new message in the message queue.
FSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.

FSP_ERR_BUFFER_RELEASED	Buffer has been released.
FSP_ERR_D2D_ERROR_INIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_DEINIT	D/AVE 2D has an error in the initialization.
FSP_ERR_D2D_ERROR_RENDERING	D/AVE 2D has an error in the rendering.
FSP_ERR_D2D_ERROR_SIZE	D/AVE 2D has an error in the rendering.
FSP_ERR_ETHER_ERROR_NO_DATA	No Data in Receive buffer.
FSP_ERR_ETHER_ERROR_LINK	ETHERC/EDMAC has an error in the Auto-negotiation.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, and transmission/reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_ETHER_ERROR_FILTERING	Detect multicast frame when multicast frame filtering enable.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	ETHERC/EDMAC has an error in the phy communication.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	Receive buffer is active.
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	PHY has an error in the Auto-negotiation.
FSP_ERR_QUEUE_FULL	Queue is full, cannot queue another data.
FSP_ERR_QUEUE_EMPTY	Queue is empty, no data to dequeue.
FSP_ERR_CTSU_SCANNING	Scanning.
FSP_ERR_CTSU_NOT_GET_DATA	Not processed previous scan data.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	

	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of Current source value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.
FSP_ERR_CARD_INIT_FAILED	SD card or eMMC device failed to initialize.
FSP_ERR_CARD_NOT_INSERTED	SD card not installed.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low or another operation is ongoing.
FSP_ERR_CARD_NOT_INITIALIZED	SD card was removed.
FSP_ERR_CARD_WRITE_PROTECTED	Media is write protected.
FSP_ERR_TRANSFER_BUSY	Transfer in progress.
FSP_ERR_RESPONSE	Card did not respond or responded with an error.
FSP_ERR_MEDIA_FORMAT_FAILED	Media format failed.
FSP_ERR_MEDIA_OPEN_FAILED	Media open failed.
FSP_ERR_CAN_DATA_UNAVAILABLE	No data available.

FSP_ERR_CAN_MODE_SWITCH_FAILED	Switching operation modes failed.
FSP_ERR_CAN_INIT_FAILED	Hardware initialization failed.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup as a receive mailbox.
FSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is setup as a transmit mailbox.
FSP_ERR_CAN_MESSAGE_LOST	Receive message has been overwritten or overrun.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_WIFI_CONFIG_FAILED	WiFi module Configuration failed.
FSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.
FSP_ERR_WIFI_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_WIFI_INVALID_MODE	API called when provisioned in client mode.
FSP_ERR_WIFI_FAILED	WiFi Failed.
FSP_ERR_WIFI_SCAN_COMPLETE	Wifi scan has completed.
FSP_ERR_WIFI_AP_NOT_CONNECTED	WiFi module is not connected to access point.
FSP_ERR_CELLULAR_CONFIG_FAILED	Cellular module Configuration failed.
FSP_ERR_CELLULAR_INIT_FAILED	Cellular module initialization failed.
FSP_ERR_CELLULAR_TRANSMIT_FAILED	Transmission failed.
FSP_ERR_CELLULAR_FW_UPTODATE	Firmware is uptodate.
FSP_ERR_CELLULAR_FW_UPGRADE_FAILED	Firmware upgrade failed.
FSP_ERR_CELLULAR_FAILED	Cellular Failed.
FSP_ERR_CELLULAR_INVALID_STATE	API Called in invalid state.
FSP_ERR_CELLULAR_REGISTRATION_FAILED	Cellular Network registration failed.
FSP_ERR_BLE_FAILED	BLE operation failed.
FSP_ERR_BLE_INIT_FAILED	BLE device initialization failed.

FSP_ERR_BLE_CONFIG_FAILED	BLE device configuration failed.
FSP_ERR_BLE_PRF_ALREADY_ENABLED	BLE device Profile already enabled.
FSP_ERR_BLE_PRF_NOT_ENABLED	BLE device not enabled.
FSP_ERR_BLE_ABS_INVALID_OPERATION	Invalid operation is executed.
FSP_ERR_BLE_ABS_NOT_FOUND	Valid data or free space is not found.
FSP_ERR_CRYPTO_CONTINUE	Continue executing function.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Hardware resource busy.
FSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
FSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid index.
FSP_ERR_CRYPTO_SCE_RETRY	Retry.
FSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verify is failed.
FSP_ERR_CRYPTO_SCE_ALREADY_OPEN	HW SCE module is already opened.
FSP_ERR_CRYPTO_NOT_OPEN	Hardware module is not initialized.
FSP_ERR_CRYPTO_UNKNOWN	Some unknown error occurred.
FSP_ERR_CRYPTO_NULL_POINTER	Null pointer input as a parameter.
FSP_ERR_CRYPTO_NOT_IMPLEMENTED	Algorithm/size not implemented.
FSP_ERR_CRYPTO_RNG_INVALID_PARAM	An invalid parameter is specified.
FSP_ERR_CRYPTO_RNG_FATAL_ERROR	A fatal error occurred.
FSP_ERR_CRYPTO_INVALID_SIZE	Size specified is invalid.
FSP_ERR_CRYPTO_INVALID_STATE	Function used in an valid state.
FSP_ERR_CRYPTO_ALREADY_OPEN	control block is already opened
FSP_ERR_CRYPTO_INSTALL_KEY_FAILED	Specified input key is invalid.
FSP_ERR_CRYPTO_AUTHENTICATION_FAILED	Authentication failed.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Failure to Init Cipher.

FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input date is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function call occurred.
FSP_ERR_CRYPTOCOMMON_NOT_OPENED	Crypto Framework Common is not opened.
FSP_ERR_CRYPTOHAL_ERROR	Crypto HAL module returned an error.
FSP_ERR_CRYPTOKEY_BUF_NOT_ENOUGH	Key buffer size is not enough to generate a key.
FSP_ERR_CRYPTOBUF_OVERFLOW	Attempt to write data larger than what the buffer can hold.
FSP_ERR_CRYPTONINVALID_OPERATION_MODE	Invalid operation mode.
FSP_ERR_MESSAGE_TOO_LONG	Message for RSA encryption is too long.
FSP_ERR_RSADecRYPTION_ERROR	RSA Decryption error.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid. <i>Note</i> <i>SF_CRYPTO APIs may return an error code starting from 0x10000 which is of Crypto module. Refer to sf_cryoto_err.h for Crypto error codes.</i>
FSP_ERR_SENSOR_IN_STABILIZATION	Sensor is stabilizing.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.
FSP_ERR_COMMS_BUS_NOT_OPEN	Bus is not open.

4.1.2 MCU Board Support Package

Detailed Description

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

Overview

BSP Features

BSP Clock Configuration

All system clocks are set up during BSP initialization based on the settings in `bsp_clock_cfg.h`. These settings are derived from clock configuration information provided from the RA Configuration editor **Clocks** tab.

- Clock configuration is performed prior to initializing the C runtime environment to speed up the startup process, as it is possible to start up on a relatively slow (that is, 32 kHz) clock.
- The BSP implements the required delays to allow the selected clock to stabilize.
- The BSP will configure the CMSIS `SystemCoreClock` variable after clock initialization with the current system clock frequency.

System Interrupts

As RA MCUs are based on the Cortex-M ARM architecture, the NVIC Nested Vectored Interrupt Controller (NVIC) handles exceptions and interrupt configuration, prioritization and interrupt masking. In the ARM architecture, the NVIC handles exceptions. Some exceptions are known as System Exceptions. System exceptions are statically located at the "top" of the vector table and occupy vector numbers 1 to 15. Vector zero is reserved for the MSP Main Stack Pointer (MSP). The remaining 15 system exceptions are shown below:

- Reset
- NMI
- Cortex-M4 Hard Fault Handler
- Cortex-M4 MPU Fault Handler
- Cortex-M4 Bus Fault Handler
- Cortex-M4 Usage Fault Handler
- Reserved
- Reserved
- Reserved
- Reserved
- Cortex-M4 SVCALL Handler
- Cortex-M4 Debug Monitor Handler
- Reserved

- Cortex-M4 PendSV Handler
- Cortex-M4 SysTick Handler

NMI and Hard Fault exceptions are enabled out of reset and have fixed priorities. Other exceptions have configurable priorities and some can be disabled.

Group Interrupts

Group interrupt is the term used to describe the 12 sources that can trigger the Non-Maskable Interrupt (NMI). When an NMI occurs the NMI Handler examines the NMISR (status register) to determine the source of the interrupt. NMI interrupts take precedence over all interrupts, are usable only as CPU interrupts, and cannot activate the RA peripherals Data Transfer Controller (DTC) or Direct Memory Access Controller (DMAC).

Possible group interrupt sources include:

- IWDT Underflow/Refresh Error
- WDT Underflow/Refresh Error
- Voltage-Monitoring 1 Interrupt
- Voltage-Monitoring 2 Interrupt
- VBATT monitor Interrupt
- Oscillation Stop is detected
- NMI pin
- RAM Parity Error
- RAM ECC Error
- MPU Bus Slave Error
- MPU Bus Master Error
- MPU Stack Error
- TrustZone Filter Error A user may enable notification for one or more group interrupts by registering a callback using the BSP API function [R_BSP_GroupIrqWrite\(\)](#). When an NMI interrupt occurs, the NMI handler checks to see if there is a callback registered for the cause of the interrupt and if so calls the registered callback function.

External and Peripheral Interrupts

User configurable interrupts begin with slot 16. These may be external, or peripheral generated interrupts.

Although the number of available slots for the NVIC interrupt vector table may seem small, the BSP defines up to 512 events that are capable of generating an interrupt. By using Event Mapping, the BSP maps user-enabled events to NVIC interrupts. For an RA6M3 MCU, only 96 of these events may be active at any one time, but the user has flexibility by choosing which events generate the active event.

By allowing the user to select only the events they are interested in as interrupt sources, we are able to provide an interrupt service routine that is fast and event specific.

For example, on other microcontrollers a standard NVIC interrupt vector table might contain a single vector entry for the SCI0 (Serial Communications Interface) peripheral. The interrupt service routine for this would have to check a status register for the 'real' source of the interrupt. In the RA implementation there is a vector entry for each of the SCI0 events that we are interested in.

BSP Weak Symbols

You might wonder how the BSP is able to place ISR addresses in the NVIC table without the user

having explicitly defined one. All that is required by the BSP is that the interrupt event be given a priority.

This is accomplished through the use of the 'weak' attribute. The weak attribute causes the declaration to be emitted as a weak symbol rather than a global. A weak symbol is one that can be overridden by an accompanying strong reference with the same name. When the BSP declares a function as weak, user code can define the same function and it will be used in place of the BSP function. By defining all possible interrupt sources as weak, the vector table can be built at compile time and any user declarations (strong references) will be used at runtime.

Weak symbols are supported for ELF targets and also for a.out targets when using the GNU assembler and linker.

Note that in CMSIS system.c, there is also a weak definition (and a function body) for the Warm Start callback function `R_BSP_WarmStart()`. Because this function is defined in the same file as the weak declaration, it will be called as the 'default' implementation. The function may be overridden by the user by copying the body into their user application and modifying it as necessary. The linker identifies this as the 'strong' reference and uses it.

Warm Start Callbacks

As the BSP is in the process of bringing up the board out of reset, there are three points where the user can request a callback. These are defined as the 'Pre Clock Init', 'Post Clock Init' and 'Post C' warm start callbacks.

As described above, this function is already weakly defined as `R_BSP_WarmStart()`, so it is a simple matter of redefining the function or copying the existing body from CMSIS system.c into the application code to get a callback. `R_BSP_WarmStart()` takes an event parameter of type `bsp_warm_start_event_t` which describes the type of warm start callback being made.

This function is not enabled/disabled and is always called for both events as part of the BSP startup. Therefore it needs a function body, which will not be called if the user is overriding it. The function body is located in system.c. To use this function just copy this function into your own code and modify it to meet your needs.

C Runtime Initialization

This BSP configuration allows the user to skip the FSP C runtime initialization code by setting the "C Runtime Initialization" to "Disabled" on the BSP tab of the RA Configuration editor. Disabling this option is useful in cases where a non-standard linker script is being used or other modifications to the runtime initialization are desired. If this macro is disabled, the user must use the 'Post Clock Init' event from the warm start (described above) to run their own runtime initialization code.

Heap Allocation

The relatively low amount of on-chip SRAM available and lack of memory protection in an MCU means that heap use must be very carefully controlled to avoid memory leaks, overruns and attempted overallocation. Further, many RTOSes provide their own dynamic memory allocation system. For these reasons the default heap size is set at 0 bytes, effectively disabling dynamic memory. If it is required for an application setting a positive value to the "Heap size (bytes)" option in the RA Common configurations on the **BSP** tab will allocate a heap.

Note

When using printf/sprintf (and other variants) to output floating point numbers a heap is required. A minimum size of 0x1000 (4096) bytes is recommended when starting development in this case.

Error Logging

When error logging is enabled, the error logging function can be redefined on the command line by defining `FSP_ERROR_LOG(err)` to the desired function call. The default function implementation is `FSP_ERROR_LOG(err)=fsp_error_log(err, FILE, LINE)`. This implementation uses the predefined macros `FILE` and `LINE` to help identify the location where the error occurred. Removing the line from the function call can reduce code size when error logging is enabled. Some compilers may support other predefined macros like `FUNCTION`, which could be helpful for customizing the error logger.

Register Protection

The BSP register protection functions utilize reference counters to ensure that an application which has specified a certain register and subsequently calls another function doesn't have its register protection settings inadvertently modified.

Each time `R_BSP_RegisterProtectDisable()` is called, the respective reference counter is incremented.

Each time `R_BSP_RegisterProtectEnable()` is called, the respective reference counter is decremented.

Both functions will only modify the protection state if their reference counter is zero.

```
/* Enable writing to protected CGC registers */
R_BSP_RegisterProtectDisable(BSP_REG_PROTECT_CGC);
/* Insert code to modify protected CGC registers. */
/* Disable writing to protected CGC registers */
R_BSP_RegisterProtectEnable(BSP_REG_PROTECT_CGC);
```

Option-setting memory

Option-setting memory includes OFS registers OFS0 and OFS1, OSIS debugger ID code, and block protections settings BPS and PBPS. Option-setting memory is MCU specific, and not all MCUs implement all option-setting registers. Option-setting configurations available on the selected device are configurable in the BSP properties. These configurations are placed in sections to be loaded at the required flash address by the linker.

The ID code is a 16-byte value that can be used to protect the MCU from being connected to a debugger or from connecting in Serial Boot Mode. There are different settings that can be set for the ID code; please refer to the hardware manual for your device for available options.

On MCUs that support TrustZone, option-setting registers are placed in a different locations for Non-Secure projects than for Secure or Flat projects. This is handled automatically by the BSP and linker scripts.

All `*_SEL` registers default to allowing both Secure and Non-Secure access unless otherwise noted here. If block protection is configured in a Secure project, the BSP sets the corresponding configuration to Secure access only by updating the corresponding `*_SEL` register. Similarly, the LVD related settings in the `OFSn_SEL` registers are automatically set to Secure if the corresponding LVD monitor is used in the Secure project.

TrustZone Security Attribution Registers

On MCUs that support TrustZone, Security Attribution Registers for modules used in the Secure project are configured to allow Secure access only as part of the startup code of the Secure project. This logic is skipped for Flat projects.

Software Delay

Implements a blocking software delay. A delay can be specified in microseconds, milliseconds or seconds. The delay is implemented based on the system clock rate.

```
/* Delay at least 1 second. Depending on the number of wait states required for the
region of memory
 * that the software_delay_loop has been linked in this could take longer. The
default is 4 cycles per loop.
 * This can be modified by redefining DELAY_LOOP_CYCLES. BSP_DELAY_UNITS_SECONDS,
BSP_DELAY_UNITS_MILLISECONDS,
 * and BSP_DELAY_UNITS_MICROSECONDS can all be used with R_BSP_SoftwareDelay. */
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
```

Trigonometric Function

Implements Trigonometric math inline functions utilizing TFU hardware. These functions can calculate sine, cosine, arctangent and hypotenuse. The trigonometric library functions `sinf()`, `cosf()`, `atan2f()`, and `hypotf()` can be mapped to respective TFU functions by enabling TFU Mathlib property in FSP Configuration tool. Extended functions `sincosf()` and `atan2hypotf()` are also available when the TFU Mathlib property is enabled in the RA Configuration editor.

TFU functions are not reentrant. Disable the TFU Mathlib property in RA Configuration editor if reentrant access to trigonometric library functions is required.

Note

Refer to the MCU hardware user's manual or datasheet to determine if it has TFU support.

Critical Section Macros

Implements a critical section. Some MCUs (MCUs with the BASEPRI register) support allowing high priority interrupts to execute during critical sections. On these MCUs, interrupts with priority less than or equal to `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION` are not serviced in critical sections. Interrupts with higher priority than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION` still execute in critical sections.

```
FSP_CRITICAL_SECTION_DEFINE;
/* Store the current interrupt posture. */
FSP_CRITICAL_SECTION_ENTER;
/* Interrupts cannot run in this section unless their priority is less than
BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. */
```

```
/* Restore saved interrupt posture. */
FSP_CRITICAL_SECTION_EXIT;
```

OctaClock Update

Supports changing the Octal-SPI Clock (OCTACLK) during runtime if supported by the MCU. The OCTACLK source and clock divisor can be updated. It is user's responsibility to ensure the selected clock source is running before attempting to update OCTACLK.

Sealing the Main Stack (TrustZone Secure Projects)

In TrustZone secure projects, the BSP seals the main stack by placing the value 0xFE5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": <https://developer.arm.com/documentation/100720/0300>.

Board Specific Features

The BSP will call the board's initialization function (bsp_init) which can initialize board specific features. Possible board features are listed below.

Board Feature	Description
SDRAM Support	The BSP will initialize SDRAM if the board supports it
QSPI Support	The BSP will initialize QSPI if the board supports it and put it into ROM mode. Use the R_QSPI module to write and erase the QSPI chip.

Configuration

The BSP is heavily data driven with most features and functionality being configured based on the content from configuration files. Configuration files represent the settings specified by the user and are generated when the project is built and/or when the Generate Project Content button is clicked in the RA Configuration editor.

Build Time Configurations for fsp_common

The following build time configurations are defined in fsp_cfg/bsp/bsp_cfg.h:

Configuration	Options	Default	Description
Main stack size (bytes)	Value must be an integer multiple of 8 and between 8 and 0xFFFFFFFF	0x400	Set the size of the main program stack. NOTE: This entry is for the main stack. When using an RTOS, thread stacks can be

			configured in the properties for each thread.
Heap size (bytes)	Value must be 0 or an integer multiple of 8 between 8 and 0xFFFFFFFF.	0	The main heap is disabled by default. Set the heap size to a positive integer divisible by 8 to enable it. A minimum of 4K (0x1000) is recommended if standard library functions are to be used.
MCU Vcc (mV)	Value must between 0 and 5500 (5.5V)	3300	Some peripherals require different settings based on the supplied voltage. Entering Vcc here (in mV) allows the relevant driver modules to configure the associated peripherals accordingly.
Parameter checking	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	When enabled, parameter checking for the BSP is turned on. In addition, any modules whose parameter checking configuration is set to 'Default (BSP)' will perform parameter checking as well.
Assert Failures	<ul style="list-style-type: none"> Return FSP_ERR_ASSERTION Call fsp_error_log then Return FSP_ERR_ASSERTION Use assert() to Halt Execution Disable checks that would return FSP_ERR_ASSERTION 	Return FSP_ERR_ASSERTION	Define the behavior of the FSP_ASSERT() macro.
Error Log	<ul style="list-style-type: none"> No Error Log Errors Logged via fsp_error_log 	No Error Log	Specify error logging behavior.

Clock Registers not Reset Values during Startup	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	If enabled, registers are assumed to be set to their reset value during startup. Enable this if another application such as a bootloader or Secure project has already configured the clocks before the startup code runs.
Main Oscillator Populated	<ul style="list-style-type: none"> • Populated • Not Populated 	Populated	Select whether or not there is a main oscillator (XTAL) on the board. This setting can be overridden in board_cfg.h.
PFS Protect	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	Keep the PFS registers locked when they are not being modified. If disabled they will be unlocked during startup.
C Runtime Initialization	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Select if the C runtime initialization in the BSP is to be used. If disabled, use the BSP_WARM_START_POST_CLOCK event to run user defined equivalent.
Early BSP Initialization	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable this option to use BSP functions before C runtime initialization (BSP_WARM_START_RESET or BSP_WARM_START_POST_CLOCK).
Main Oscillator Clock Source	<ul style="list-style-type: none"> • External Oscillator • Crystal or Resonator 	Crystal or Resonator	Select the main oscillator clock source. This setting can be overridden in board_cfg.h
Subclock Populated	<ul style="list-style-type: none"> • Populated • Not Populated 	Populated	Select whether or not there is a subclock crystal on the board. This setting can be overridden in board_cfg.h.
Subclock Drive (Drive capacitance availability varies by MCU)	<ul style="list-style-type: none"> • Standard/Normal mode • Low/Low power 	Standard/Normal mode	Select the subclock oscillator drive capacitance. This

	<ul style="list-style-type: none"> mode 1 • Low power mode 2 • Low power mode 3 	setting can be overridden in board_cfg.h
Subclock Stabilization Time (ms)	Value must between 0 1000 and 10000	Select the subclock oscillator stabilization time. This is only used in the startup code if the subclock is selected as the system clock on the Clocks tab or if the HOCO FLL function is enabled. This setting can be overridden in board_cfg.h

Macro Definition Documentation

◆ **BSP_IRQ_DISABLED**

```
#define BSP_IRQ_DISABLED
```

Used to signify that an ELC event is not able to be used as an interrupt.

◆ **FSP_LOG_PRINT**

```
#define FSP_LOG_PRINT ( X)
```

Macro that can be defined in order to enable logging in FSP modules.

◆ **FSP_RETURN**

```
#define FSP_RETURN ( err)
```

Macro to log and return error without an assertion.

◆ **FSP_ERROR_LOG**

```
#define FSP_ERROR_LOG ( err)
```

This function is called before returning an error code. To stop on a runtime error, define `fsp_error_log` in user code and do required debugging (breakpoints, stack dump, etc) in this function.

◆ **FSP_ASSERT**

```
#define FSP_ASSERT ( a)
```

Default assertion calls [FSP_ERROR_RETURN](#) if condition "a" is false. Used to identify incorrect use of API's in FSP functions.

◆ **FSP_ERROR_RETURN**

```
#define FSP_ERROR_RETURN ( a, err )
```

All FSP error codes are returned using this macro. Calls [FSP_ERROR_LOG](#) function if condition "a" is false. Used to identify runtime errors in FSP functions.

◆ **FSP_CRITICAL_SECTION_ENTER**

```
#define FSP_CRITICAL_SECTION_ENTER
```

This macro temporarily saves the current interrupt state and disables interrupts.

◆ **FSP_CRITICAL_SECTION_EXIT**

```
#define FSP_CRITICAL_SECTION_EXIT
```

This macro restores the previously saved interrupt state, reenabling interrupts.

◆ **FSP_INVALID_VECTOR**

```
#define FSP_INVALID_VECTOR
```

Used to signify that the requested IRQ vector is not defined in this system.

◆ **BSP_CFG_HANDLE_UNRECOVERABLE_ERROR**

```
#define BSP_CFG_HANDLE_UNRECOVERABLE_ERROR ( x)
```

In the event of an unrecoverable error the BSP will by default call the `__BKPT()` intrinsic function which will alert the user of the error. The user can override this default behavior by defining their own `BSP_CFG_HANDLE_UNRECOVERABLE_ERROR` macro.

◆ **BSP_STACK_ALIGNMENT**

```
#define BSP_STACK_ALIGNMENT
```

Stacks (and heap) must be sized and aligned to an integer multiple of this number.

◆ **R_BSP_MODULE_START**

```
#define R_BSP_MODULE_START ( ip, channel )
```

Cancels the module stop state.

Parameters

ip	fsp_ip_t enum value for the module to be stopped
channel	The channel. Use channel 0 for modules without channels.

◆ R_BSP_MODULE_STOP

```
#define R_BSP_MODULE_STOP ( ip, channel )
```

Enables the module stop state.

Parameters

ip	fsp_ip_t enum value for the module to be stopped
channel	The channel. Use channel 0 for modules without channels.

Enumeration Type Documentation

◆ fsp_ip_t

enum fsp_ip_t	
Available modules.	
Enumerator	
FSP_IP_CFLASH	Code Flash.
FSP_IP_DFLASH	Data Flash.
FSP_IP_RAM	RAM.
FSP_IP_LVD	Low Voltage Detection.
FSP_IP_CGC	Clock Generation Circuit.
FSP_IP_LPM	Low Power Modes.
FSP_IP_FCU	Flash Control Unit.
FSP_IP_ICU	Interrupt Control Unit.
FSP_IP_DMAC	DMA Controller.
FSP_IP_DTC	Data Transfer Controller.
FSP_IP_IOPORT	I/O Ports.
FSP_IP_PFS	Pin Function Select.
FSP_IP_ELC	Event Link Controller.
FSP_IP_MPU	Memory Protection Unit.
FSP_IP_MSTP	Module Stop.
FSP_IP_MMF	Memory Mirror Function.
FSP_IP_KEY	Key Interrupt Function.
FSP_IP_CAC	Clock Frequency Accuracy Measurement Circuit.
FSP_IP_DOC	Data Operation Circuit.
FSP_IP_CRC	Cyclic Redundancy Check Calculator.
FSP_IP_SCI	Serial Communications Interface.

FSP_IP_IIC	I2C Bus Interface.
FSP_IP_SPI	Serial Peripheral Interface.
FSP_IP_CTSU	Capacitive Touch Sensing Unit.
FSP_IP_SCE	Secure Cryptographic Engine.
FSP_IP_SLCDC	Segment LCD Controller.
FSP_IP_AES	Advanced Encryption Standard.
FSP_IP_TRNG	True Random Number Generator.
FSP_IP_FCACHE	Flash Cache.
FSP_IP_SRAM	SRAM.
FSP_IP_ADC	A/D Converter.
FSP_IP_DAC	12-Bit D/A Converter
FSP_IP_TSN	Temperature Sensor.
FSP_IP_DAAD	D/A A/D Synchronous Unit.
FSP_IP_ACMPHS	High Speed Analog Comparator.
FSP_IP_ACMPLP	Low Power Analog Comparator.
FSP_IP_OPAMP	Operational Amplifier.
FSP_IP_SDADC	Sigma Delta A/D Converter.
FSP_IP_RTC	Real Time Clock.
FSP_IP_WDT	Watch Dog Timer.
FSP_IP_IWDT	Independent Watch Dog Timer.
FSP_IP_GPT	General PWM Timer.
FSP_IP_POEG	Port Output Enable for GPT.
FSP_IP_OPS	Output Phase Switch.
FSP_IP_AGT	Asynchronous General-Purpose Timer.

FSP_IP_CAN	Controller Area Network.
FSP_IP_IRDA	Infrared Data Association.
FSP_IP_QSPI	Quad Serial Peripheral Interface.
FSP_IP_USBFS	USB Full Speed.
FSP_IP_SDHI	SD/MMC Host Interface.
FSP_IP_SRC	Sampling Rate Converter.
FSP_IP_SSI	Serial Sound Interface.
FSP_IP_DALI	Digital Addressable Lighting Interface.
FSP_IP_ETHER	Ethernet MAC Controller.
FSP_IP_EDMAC	Ethernet DMA Controller.
FSP_IP_EPTPC	Ethernet PTP Controller.
FSP_IP_PDC	Parallel Data Capture Unit.
FSP_IP_GLCDC	Graphics LCD Controller.
FSP_IP_DRW	2D Drawing Engine
FSP_IP_JPEG	JPEG.
FSP_IP_DAC8	8-Bit D/A Converter
FSP_IP_USBHS	USB High Speed.
FSP_IP_OSPI	Octa Serial Peripheral Interface.
FSP_IP_CEC	HDMI CEC.
FSP_IP_TFU	Trigonometric Function Unit.
FSP_IP_IIRFA	IIR Filter Accelerator.
FSP_IP_CANFD	CAN-FD.

◆ **fsp_signal_t**

enum fsp_signal_t	
Signals that can be mapped to an interrupt.	
Enumerator	
FSP_SIGNAL_ADC_COMPARE_MATCH	ADC COMPARE MATCH.
FSP_SIGNAL_ADC_COMPARE_MISMATCH	ADC COMPARE MISMATCH.
FSP_SIGNAL_ADC_SCAN_END	ADC SCAN END.
FSP_SIGNAL_ADC_SCAN_END_B	ADC SCAN END B.
FSP_SIGNAL_ADC_WINDOW_A	ADC WINDOW A.
FSP_SIGNAL_ADC_WINDOW_B	ADC WINDOW B.
FSP_SIGNAL_AES_RDREQ	AES RDREQ.
FSP_SIGNAL_AES_WRREQ	AES WRREQ.
FSP_SIGNAL_AGT_COMPARE_A	AGT COMPARE A.
FSP_SIGNAL_AGT_COMPARE_B	AGT COMPARE B.
FSP_SIGNAL_AGT_INT	AGT INT.
FSP_SIGNAL_CAC_FREQUENCY_ERROR	CAC FREQUENCY ERROR.
FSP_SIGNAL_CAC_MEASUREMENT_END	CAC MEASUREMENT END.
FSP_SIGNAL_CAC_OVERFLOW	CAC OVERFLOW.
FSP_SIGNAL_CAN_ERROR	CAN ERROR.
FSP_SIGNAL_CAN_FIFO_RX	CAN FIFO RX.
FSP_SIGNAL_CAN_FIFO_TX	CAN FIFO TX.
FSP_SIGNAL_CAN_MAILBOX_RX	CAN MAILBOX RX.
FSP_SIGNAL_CAN_MAILBOX_TX	CAN MAILBOX TX.
FSP_SIGNAL_CGC_MOSC_STOP	CGC MOSC STOP.
FSP_SIGNAL_LPM_SNOOZE_REQUEST	LPM SNOOZE REQUEST.

FSP_SIGNAL_LVD_LVD1	LVD LVD1.
FSP_SIGNAL_LVD_LVD2	LVD LVD2.
FSP_SIGNAL_VBATT_LVD	VBATT LVD.
FSP_SIGNAL_LVD_VBATT	LVD VBATT.
FSP_SIGNAL_ACMPHS_INT	ACMPHS INT.
FSP_SIGNAL_ACMPLP_INT	ACMPLP INT.
FSP_SIGNAL_CTSU_END	CTSU END.
FSP_SIGNAL_CTSU_READ	CTSU READ.
FSP_SIGNAL_CTSU_WRITE	CTSU WRITE.
FSP_SIGNAL_DALI_DEI	DALI DEI.
FSP_SIGNAL_DALI_CLI	DALI CLI.
FSP_SIGNAL_DALI_SDI	DALI SDI.
FSP_SIGNAL_DALI_BPI	DALI BPI.
FSP_SIGNAL_DALI_FEI	DALI FEI.
FSP_SIGNAL_DALI_SDI_OR_BPI	DALI SDI OR BPI.
FSP_SIGNAL_DMAC_INT	DMAC INT.
FSP_SIGNAL_DOC_INT	DOC INT.
FSP_SIGNAL_DRW_INT	DRW INT.
FSP_SIGNAL_DTC_COMPLETE	DTC COMPLETE.
FSP_SIGNAL_DTC_END	DTC END.
FSP_SIGNAL_EDMAC_EINT	EDMAC EINT.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_0	ELC SOFTWARE EVENT 0.
FSP_SIGNAL_ELC_SOFTWARE_EVENT_1	ELC SOFTWARE EVENT 1.
FSP_SIGNAL_EPTPC_IPLS	EPTPC IPLS.

FSP_SIGNAL_EPTPC_MINT	EPTPC MINT.
FSP_SIGNAL_EPTPC_PINT	EPTPC PINT.
FSP_SIGNAL_EPTPC_TIMER0_FALL	EPTPC TIMER0 FALL.
FSP_SIGNAL_EPTPC_TIMER0_RISE	EPTPC TIMER0 RISE.
FSP_SIGNAL_EPTPC_TIMER1_FALL	EPTPC TIMER1 FALL.
FSP_SIGNAL_EPTPC_TIMER1_RISE	EPTPC TIMER1 RISE.
FSP_SIGNAL_EPTPC_TIMER2_FALL	EPTPC TIMER2 FALL.
FSP_SIGNAL_EPTPC_TIMER2_RISE	EPTPC TIMER2 RISE.
FSP_SIGNAL_EPTPC_TIMER3_FALL	EPTPC TIMER3 FALL.
FSP_SIGNAL_EPTPC_TIMER3_RISE	EPTPC TIMER3 RISE.
FSP_SIGNAL_EPTPC_TIMER4_FALL	EPTPC TIMER4 FALL.
FSP_SIGNAL_EPTPC_TIMER4_RISE	EPTPC TIMER4 RISE.
FSP_SIGNAL_EPTPC_TIMER5_FALL	EPTPC TIMER5 FALL.
FSP_SIGNAL_EPTPC_TIMER5_RISE	EPTPC TIMER5 RISE.
FSP_SIGNAL_FCU_FIFERR	FCU FIFERR.
FSP_SIGNAL_FCU_FRDYI	FCU FRDYI.
FSP_SIGNAL_GLCDC_LINE_DETECT	GLCDC LINE DETECT.
FSP_SIGNAL_GLCDC_UNDERFLOW_1	GLCDC UNDERFLOW 1.
FSP_SIGNAL_GLCDC_UNDERFLOW_2	GLCDC UNDERFLOW 2.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_A	GPT CAPTURE COMPARE A.
FSP_SIGNAL_GPT_CAPTURE_COMPARE_B	GPT CAPTURE COMPARE B.
FSP_SIGNAL_GPT_COMPARE_C	GPT COMPARE C.
FSP_SIGNAL_GPT_COMPARE_D	GPT COMPARE D.
FSP_SIGNAL_GPT_COMPARE_E	GPT COMPARE E.

FSP_SIGNAL_GPT_COMPARE_F	GPT COMPARE F.
FSP_SIGNAL_GPT_COUNTER_OVERFLOW	GPT COUNTER OVERFLOW.
FSP_SIGNAL_GPT_COUNTER_UNDERFLOW	GPT COUNTER UNDERFLOW.
FSP_SIGNAL_GPT_AD_TRIG_A	GPT AD TRIG A.
FSP_SIGNAL_GPT_AD_TRIG_B	GPT AD TRIG B.
FSP_SIGNAL_OPS_UVW_EDGE	OPS UVW EDGE.
FSP_SIGNAL_ICU_IRQ0	ICU IRQ0.
FSP_SIGNAL_ICU_IRQ1	ICU IRQ1.
FSP_SIGNAL_ICU_IRQ2	ICU IRQ2.
FSP_SIGNAL_ICU_IRQ3	ICU IRQ3.
FSP_SIGNAL_ICU_IRQ4	ICU IRQ4.
FSP_SIGNAL_ICU_IRQ5	ICU IRQ5.
FSP_SIGNAL_ICU_IRQ6	ICU IRQ6.
FSP_SIGNAL_ICU_IRQ7	ICU IRQ7.
FSP_SIGNAL_ICU_IRQ8	ICU IRQ8.
FSP_SIGNAL_ICU_IRQ9	ICU IRQ9.
FSP_SIGNAL_ICU_IRQ10	ICU IRQ10.
FSP_SIGNAL_ICU_IRQ11	ICU IRQ11.
FSP_SIGNAL_ICU_IRQ12	ICU IRQ12.
FSP_SIGNAL_ICU_IRQ13	ICU IRQ13.
FSP_SIGNAL_ICU_IRQ14	ICU IRQ14.
FSP_SIGNAL_ICU_IRQ15	ICU IRQ15.
FSP_SIGNAL_ICU_SNOOZE_CANCEL	ICU SNOOZE CANCEL.
FSP_SIGNAL_IIC_ERI	IIC ERI.

FSP_SIGNAL_IIC_RXI	IIC RXI.
FSP_SIGNAL_IIC_TEI	IIC TEI.
FSP_SIGNAL_IIC_TXI	IIC TXI.
FSP_SIGNAL_IIC_WUI	IIC WUI.
FSP_SIGNAL_IOPORT_EVENT_1	IOPORT EVENT 1.
FSP_SIGNAL_IOPORT_EVENT_2	IOPORT EVENT 2.
FSP_SIGNAL_IOPORT_EVENT_3	IOPORT EVENT 3.
FSP_SIGNAL_IOPORT_EVENT_4	IOPORT EVENT 4.
FSP_SIGNAL_IOPORT_EVENT_B	IOPORT EVENT B.
FSP_SIGNAL_IOPORT_EVENT_C	IOPORT EVENT C.
FSP_SIGNAL_IOPORT_EVENT_D	IOPORT EVENT D.
FSP_SIGNAL_IOPORT_EVENT_E	IOPORT EVENT E.
FSP_SIGNAL_IWDT_UNDERFLOW	IWDT UNDERFLOW.
FSP_SIGNAL_JPEG_JDTI	JPEG JDTI.
FSP_SIGNAL_JPEG_JEDI	JPEG JEDI.
FSP_SIGNAL_KEY_INT	KEY INT.
FSP_SIGNAL_PDC_FRAME_END	PDC FRAME END.
FSP_SIGNAL_PDC_INT	PDC INT.
FSP_SIGNAL_PDC_RECEIVE_DATA_READY	PDC RECEIVE DATA READY.
FSP_SIGNAL_POEG_EVENT	POEG EVENT.
FSP_SIGNAL_QSPI_INT	QSPI INT.
FSP_SIGNAL_RTC_ALARM	RTC ALARM.
FSP_SIGNAL_RTC_PERIOD	RTC PERIOD.
FSP_SIGNAL_RTC_CARRY	RTC CARRY.

FSP_SIGNAL_SCE_INTEGRATE_RDRDY	SCE INTEGRATE RDRDY.
FSP_SIGNAL_SCE_INTEGRATE_WRRDY	SCE INTEGRATE WRRDY.
FSP_SIGNAL_SCE_LONG_PLG	SCE LONG PLG.
FSP_SIGNAL_SCE_PROC_BUSY	SCE PROC BUSY.
FSP_SIGNAL_SCE_RDRDY_0	SCE RDRDY 0.
FSP_SIGNAL_SCE_RDRDY_1	SCE RDRDY 1.
FSP_SIGNAL_SCE_ROMOK	SCE ROMOK.
FSP_SIGNAL_SCE_TEST_BUSY	SCE TEST BUSY.
FSP_SIGNAL_SCE_WRRDY_0	SCE WRRDY 0.
FSP_SIGNAL_SCE_WRRDY_1	SCE WRRDY 1.
FSP_SIGNAL_SCE_WRRDY_4	SCE WRRDY 4.
FSP_SIGNAL_SCI_AM	SCI AM.
FSP_SIGNAL_SCI_ERI	SCI ERI.
FSP_SIGNAL_SCI_RXI	SCI RXI.
FSP_SIGNAL_SCI_RXI_OR_ERI	SCI RXI OR ERI.
FSP_SIGNAL_SCI_TEI	SCI TEI.
FSP_SIGNAL_SCI_TXI	SCI TXI.
FSP_SIGNAL_SDADC_ADI	SDADC ADI.
FSP_SIGNAL_SDADC_SCANEND	SDADC SCANEND.
FSP_SIGNAL_SDADC_CALIEND	SDADC CALIEND.
FSP_SIGNAL_SDHIMMC_ACCS	SDHIMMC ACCS.
FSP_SIGNAL_SDHIMMC_CARD	SDHIMMC CARD.
FSP_SIGNAL_SDHIMMC_DMA_REQ	SDHIMMC DMA REQ.
FSP_SIGNAL_SDHIMMC_SDIO	SDHIMMC SDIO.

FSP_SIGNAL_SPI_ERI	SPI ERI.
FSP_SIGNAL_SPI_IDLE	SPI IDLE.
FSP_SIGNAL_SPI_RXI	SPI RXI.
FSP_SIGNAL_SPI_TEI	SPI TEI.
FSP_SIGNAL_SPI_TXI	SPI TXI.
FSP_SIGNAL_SRC_CONVERSION_END	SRC CONVERSION END.
FSP_SIGNAL_SRC_INPUT_FIFO_EMPTY	SRC INPUT FIFO EMPTY.
FSP_SIGNAL_SRC_OUTPUT_FIFO_FULL	SRC OUTPUT FIFO FULL.
FSP_SIGNAL_SRC_OUTPUT_FIFO_OVERFLOW	SRC OUTPUT FIFO OVERFLOW.
FSP_SIGNAL_SRC_OUTPUT_FIFO_UNDERFLOW	SRC OUTPUT FIFO UNDERFLOW.
FSP_SIGNAL_SSI_INT	SSI INT.
FSP_SIGNAL_SSI_RXI	SSI RXI.
FSP_SIGNAL_SSI_TXI	SSI TXI.
FSP_SIGNAL_SSI_TXI_RXI	SSI TXI RXI.
FSP_SIGNAL_TRNG_RDREQ	TRNG RDREQ.
FSP_SIGNAL_USB_FIFO_0	USB FIFO 0.
FSP_SIGNAL_USB_FIFO_1	USB FIFO 1.
FSP_SIGNAL_USB_INT	USB INT.
FSP_SIGNAL_USB_RESUME	USB RESUME.
FSP_SIGNAL_USB_USB_INT_RESUME	USB USB INT RESUME.
FSP_SIGNAL_WDT_UNDERFLOW	WDT UNDERFLOW.

◆ **bsp_warm_start_event_t**

enum <code>bsp_warm_start_event_t</code>	
Different warm start entry locations in the BSP.	
Enumerator	
<code>BSP_WARM_START_RESET</code>	Called almost immediately after reset. No C runtime environment, clocks, or IRQs.
<code>BSP_WARM_START_POST_CLOCK</code>	Called after clock initialization. No C runtime environment or IRQs.
<code>BSP_WARM_START_POST_C</code>	Called after clocks and C runtime environment have been set up.

◆ **fsp_priv_source_clock_t**

enum <code>fsp_priv_source_clock_t</code>	
Enumerator	
<code>FSP_PRIV_CLOCK_HOCO</code>	The high speed on chip oscillator.
<code>FSP_PRIV_CLOCK_MOCO</code>	The middle speed on chip oscillator.
<code>FSP_PRIV_CLOCK_LOCO</code>	The low speed on chip oscillator.
<code>FSP_PRIV_CLOCK_MAIN_OSC</code>	The main oscillator.
<code>FSP_PRIV_CLOCK_SUBCLOCK</code>	The subclock oscillator.
<code>FSP_PRIV_CLOCK_PLL</code>	The PLL oscillator.
<code>FSP_PRIV_CLOCK_PLL2</code>	The PLL2 oscillator.

◆ **bsp_delay_units_t**

enum <code>bsp_delay_units_t</code>	
Available delay units for <code>R_BSP_SoftwareDelay()</code> . These are ultimately used to calculate a total # of microseconds	
Enumerator	
<code>BSP_DELAY_UNITS_SECONDS</code>	Requested delay amount is in seconds.
<code>BSP_DELAY_UNITS_MILLISECONDS</code>	Requested delay amount is in milliseconds.
<code>BSP_DELAY_UNITS_MICROSECONDS</code>	Requested delay amount is in microseconds.

◆ **bsp_grp_irq_t**

enum <code>bsp_grp_irq_t</code>	
Which interrupts can have callbacks registered.	
Enumerator	
<code>BSP_GRP_IRQ_IWDT_ERROR</code>	IWDT underflow/refresh error has occurred.
<code>BSP_GRP_IRQ_WDT_ERROR</code>	WDT underflow/refresh error has occurred.
<code>BSP_GRP_IRQ_LVD1</code>	Voltage monitoring 1 interrupt.
<code>BSP_GRP_IRQ_LVD2</code>	Voltage monitoring 2 interrupt.
<code>BSP_GRP_IRQ_VBATT</code>	VBATT monitor interrupt.
<code>BSP_GRP_IRQ_OSC_STOP_DETECT</code>	Oscillation stop is detected.
<code>BSP_GRP_IRQ_NMI_PIN</code>	NMI Pin interrupt.
<code>BSP_GRP_IRQ_RAM_PARITY</code>	RAM Parity Error.
<code>BSP_GRP_IRQ_RAM_ECC</code>	RAM ECC Error.
<code>BSP_GRP_IRQ_MPU_BUS_SLAVE</code>	MPU Bus Slave Error.
<code>BSP_GRP_IRQ_MPU_BUS_MASTER</code>	MPU Bus Master Error.
<code>BSP_GRP_IRQ_MPU_STACK</code>	MPU Stack Error.
<code>BSP_GRP_IRQ_TRUSTZONE</code>	MPU Stack Error.
<code>BSP_GRP_IRQ_CACHE_PARITY</code>	MPU Stack Error.

◆ **bsp_reg_protect_t**

enum <code>bsp_reg_protect_t</code>	
The different types of registers that can be protected.	
Enumerator	
<code>BSP_REG_PROTECT_CGC</code>	Enables writing to the registers related to the clock generation circuit.
<code>BSP_REG_PROTECT_OM_LPC_BATT</code>	Enables writing to the registers related to operating modes, low power consumption, and battery backup function.
<code>BSP_REG_PROTECT_LVD</code>	Enables writing to the registers related to the LVD: LVCMPCR, LVDLVLRL, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR.
<code>BSP_REG_PROTECT_SAR</code>	Enables writing to the registers related to the security function.

Function Documentation◆ **R_FSP_VersionGet()**

<code>fsp_err_t R_FSP_VersionGet (fsp_pack_version_t *const p_version)</code>		
Get the FSP version based on compile time macros.		
Parameters		
[out]	<code>p_version</code>	Memory address to return version information to.
Return values		
<code>FSP_SUCCESS</code>		Version information stored.
<code>FSP_ERR_ASSERTION</code>		The parameter <code>p_version</code> is NULL.

◆ **Reset_Handler()**

<code>void Reset_Handler (void)</code>
MCU starts executing here out of reset. Main stack pointer is set up already.

◆ **Default_Handler()**

void Default_Handler (void)

Default exception handler.

◆ **NMI_Handler()**

void NMI_Handler (void)

Non-maskable interrupt handler. This exception is defined by the BSP, unlike other system exceptions, because there are many sources that map to the NMI exception.

◆ **SystemInit()**

void SystemInit (void)

Initialize the MCU and the runtime environment.

◆ **R_BSP_WarmStart()**

void R_BSP_WarmStart (bsp_warm_start_event_t event)
--

This function is called at various points during the startup process. This function is declared as a weak symbol higher up in this file because it is meant to be overridden by a user implemented version. One of the main uses for this function is to call functional safety code during the startup process. To use this function just copy this function into your own code and modify it to meet your needs.
--

Parameters

[in]	event	Where the code currently is in the start up process
------	-------	---

◆ **R_BSP_SourceClockHzGet()**

```
uint32_t R_BSP_SourceClockHzGet ( fsp_priv_source_clock_t clock)
```

Gets the frequency of a source clock.

Parameters

[in]	clock	Pointer to Octack setting structure which provides information regarding Octack source and divider settings to be applied.
------	-------	--

Returns

Frequency of requested clock in Hertz.

◆ **R_FSP_CurrentIrqGet()**

```
__STATIC_INLINE IRQn_Type R_FSP_CurrentIrqGet ( void )
```

Return active interrupt vector number value

Returns

Active interrupt vector number value

◆ **R_FSP_SystemClockHzGet()**

```
__STATIC_INLINE uint32_t R_FSP_SystemClockHzGet ( fsp_priv_clock_t clock)
```

Gets the frequency of a system clock.

Returns

Frequency of requested clock in Hertz.

◆ **R_BSP_UniqueIdGet()**

```
__STATIC_INLINE bsp_unique_id_t const* R_BSP_UniqueIdGet ( )
```

Get unique ID for this device.

Returns

A pointer to the unique identifier structure

◆ **R_BSP_FlashCacheDisable()**

```
__STATIC_INLINE void R_BSP_FlashCacheDisable ( )
```

Disables the flash cache.

◆ **R_BSP_FlashCacheEnable()**

```
__STATIC_INLINE void R_BSP_FlashCacheEnable ( )
```

Enables the flash cache.

◆ **R_BSP_SoftwareDelay()**

```
void R_BSP_SoftwareDelay ( uint32_t delay, bsp_delay_units_t units )
```

Delay for at least the specified duration in units and return.

Parameters

[in]	delay	The number of 'units' to delay.
[in]	units	The 'base' (bsp_delay_units_t) for the units specified. Valid values are: BSP_DELAY_UNITS_SECONDS , BSP_DELAY_UNITS_MILLISECONDS, BSP_DELAY_UNITS_MICROSECONDS. For example: At 1 MHz one cycle takes 1 microsecond (.000001 seconds). At 12 MHz one cycle takes 1/12 microsecond or 83 nanoseconds. Therefore one run through bsp_prv_software_delay_loop() takes: ~ (83 * BSP_DELAY_LOOP_CYCLES) or 332 ns. A delay of 2 us therefore requires 2000ns/332ns or 6 loops.

The 'theoretical' maximum delay that may be obtained is determined by a full 32 bit loop count and the system clock rate. @120MHz: $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 120000000) = 143$ seconds. @32MHz: $((0xFFFFFFFF \text{ loops} * 4 \text{ cycles /loop}) / 32000000) = 536$ seconds

Note that requests for very large delays will be affected by rounding in the calculations and the actual delay achieved may be slightly longer. @32 MHz, for example, a request for 532 seconds will be closer to 536 seconds.

Note also that if the calculations result in a loop_cnt of zero, the bsp_prv_software_delay_loop() function is not called at all. In this case the requested delay is too small (nanoseconds) to be carried out by the loop itself, and the overhead associated with executing the code to just get to this point has certainly satisfied the requested delay.

Note

This function calls `bsp_cpu_clock_get()` which ultimately calls `R_CGC_SystemClockFreqGet()` and therefore requires that the BSP has already initialized the CGC (which it does as part of the Sysinit). Care should be taken to ensure this remains the case if in the future this function were to be called as part of the BSP initialization.

This function will delay for **at least** the specified duration. Due to overhead in calculating the correct number of loops to delay, very small delay values (generally 1-5 microseconds) may be significantly longer than specified.

Approximate overhead for this function is as follows:

- CM4: 20-50 cycles
- CM33: 10-60 cycles
- CM23: 75-200 cycles

If more accurate microsecond timing must be performed in software it is recommended to use `bsp_prv_software_delay_loop()` directly. In this case, use `BSP_DELAY_LOOP_CYCLES` or `BSP_DELAY_LOOPS_CALCULATE()` to convert a calculated delay cycle count to a number of software delay loops.

Delays may be longer than expected when compiler optimization is turned off.

Warning

The delay will be longer than specified on CM23 devices when the core clock is greater than 32 MHz. Setting `BSP_DELAY_LOOP_CYCLES` to 6 will improve accuracy at 48 MHz but will result in shorter than expected delays at lower speeds.

◆ R_BSP_GroupIrqWrite()

```
fsp_err_t R_BSP_GroupIrqWrite ( bsp_grp_irq_t irq, void(*) (bsp_grp_irq_t irq) p_callback )
```

Register a callback function for supported interrupts. If NULL is passed for the callback argument then any previously registered callbacks are unregistered.

Parameters

[in]	irq	Interrupt for which to register a callback.
[in]	p_callback	Pointer to function to call when interrupt occurs.

Return values

FSP_SUCCESS	Callback registered
FSP_ERR_ASSERTION	Callback pointer is NULL

◆ R_BSP_RegisterProtectEnable()

```
void R_BSP_RegisterProtectEnable ( bsp_reg_protect_t regs_to_protect )
```

Enable register protection. Registers that are protected cannot be written to. Register protection is enabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

Parameters

[in]	regs_to_protect	Registers which have write protection enabled.
------	-----------------	--

◆ **R_BSP_RegisterProtectDisable()**

```
void R_BSP_RegisterProtectDisable ( bsp_reg_protect_t regs_to_unprotect)
```

Disable register protection. Registers that are protected cannot be written to. Register protection is disabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

Parameters

[in]	regs_to_unprotect	Registers which have write protection disabled.
------	-------------------	---

◆ **__sinf()**

```
BSP_TFU_INLINE float __sinf ( float angle)
```

Calculates sine of the given angle.

Parameters

[in]	angle	The value of an angle in radian.
------	-------	----------------------------------

Return values

Sine	value of an angle.
------	--------------------

◆ **__cosf()**

```
BSP_TFU_INLINE float __cosf ( float angle)
```

Calculates cosine of the given angle.

Parameters

[in]	angle	The value of an angle in radian.
------	-------	----------------------------------

Return values

Cosine	value of an angle.
--------	--------------------

◆ **__sincosf()**

```
BSP_TFU_INLINE void __sincosf ( float angle, float * sin, float * cos )
```

Calculates sine and cosine of the given angle.

Parameters

[in]	angle	The value of an angle in radian.
[out]	sin	Sine value of an angle.
[out]	cos	Cosine value of an angle.

◆ **__atan2f()**

```
BSP_TFU_INLINE float __atan2f ( float y_cord, float x_cord )
```

Calculates the arc tangent based on given X-cordinate and Y-cordinate values.

Parameters

[in]	y_cord	Y-Axis cordinate value.
[in]	x_cord	X-Axis cordinate value.

Return values

Arc	tangent for given values.
-----	---------------------------

◆ **__hypotf()**

```
BSP_TFU_INLINE float __hypotf ( float x_cord, float y_cord )
```

Calculates the hypotenuse based on given X-cordinate and Y-cordinate values.

Parameters

[in]	y_cord	Y-cordinate value.
[in]	x_cord	X-cordinate value.

Return values

Hypotenuse	for given values.
------------	-------------------

◆ **__atan2hypotf()**

```
BSP_TFU_INLINE void __atan2hypotf ( float y_cord, float x_cord, float * atan2, float * hypot )
```

Calculates the arc tangent and hypotenuse based on given X-cordinate and Y-cordinate values.

Parameters

[in]	y_cord	Y-cordinate value.
[in]	x_cord	X-cordinate value.
[out]	atan2	Arc tangent for given values.
[out]	hypot	Hypotenuse for given values.

Variable Documentation◆ **BSP_SECTION_EARLY_INIT**

```
uint32_t SystemCoreClock BSP_SECTION_EARLY_INIT
```

System Clock Frequency (Core Clock)

4.1.2.1 RA2A1

[BSP » MCU Board Support Package](#)

Detailed Description**Build Time Configurations for ra2a1_fsp**

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

Configuration	Options	Default	Description

Enumeration Type Documentation

◆ `elc_event_t`

enum `elc_event_t`

Sources of event signals to be linked to other peripherals or the CPU

Note

This list may change based on based on the device.

◆ `icu_event_t`

enum `icu_event_t`

Events to be used with the IELSR register to link interrupt events to the NVIC

Note

This list is device specific.

◆ `bsp_power_mode_t`

enum `bsp_power_mode_t`

Voltage regulator mode

Enumerator

<code>BSP_POWER_MODE_DCDC_2V4_TO_2V7</code>	DCDC mode; 2.4V to 2.7V supply.
<code>BSP_POWER_MODE_DCDC_2V7_TO_3V6</code>	DCDC mode; 2.7V to 3.6V supply.
<code>BSP_POWER_MODE_DCDC_3V6_TO_4V5</code>	DCDC mode; 3.6V to 4.5V supply.
<code>BSP_POWER_MODE_DCDC_4V5_TO_5V5</code>	DCDC mode; 4.5V to 5.5V supply.
<code>BSP_POWER_MODE_LDO</code>	LDO mode.

Function Documentation

◆ R_BSP_PowerModeSet()

```
bsp_power_mode_t R_BSP_PowerModeSet ( bsp_power_mode_t mode)
```

Select either the LDO or DCDC regulator and/or update the MCU supply voltage range. Returns the previously selected mode.

Note

DCDC mode has the following limitations:

- Supply voltage must be 2.4V or greater
- Low- and Subosc-speed modes are not available
- Software Standby is not available. Ensure these limitations are respected before entering DCDC mode. If supply voltage may drop below 2.4V during operation, configure a LVD channel to interrupt or reset the MCU near this threshold to switch back to the LDO.

Switching to DCDC mode temporarily disables all interrupts and blocks for 22 microseconds; switching to LDO from DCDC temporarily disables all peripherals and interrupts and blocks for 60 microseconds.

If the supply voltage falls outside the range originally specified when starting the DCDC regulator, call this function again with the updated supply voltage.

Returns

The previously selected power mode.

Clocks > HOCO FLL Function	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	<p>Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.</p> <p>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL</p>

Stabilization Time when setting up clocks at startup.

When FLL is enabled Software Standby and Deep Software Standby modes are not available.

Number of cycles to wait for the main oscillator clock to stabilize. Drive capability automatic switching function is by default disabled.

Main Oscillator Wait Time

- 35 cycles
- 67 cycles
- 131 cycles
- 259 cycles
- 547 cycles
- 1059 cycles
- 2147 cycles
- 4291 cycles
- 8163 cycles

8163 cycles

ID Code Mode

- Unlocked (Ignore ID)
- Locked with All Erase support
- Locked

Unlocked (Ignore ID)

When set to 'Locked with All Erase support', the ID Code must be set in the debugger to read or write data to the MCU, but the All Erase command is still accepted regardless. When set to 'Locked', all erase/download/debug access is disabled unless the ID Code is provided.

ID Code (32 Hex Characters)

Value must be a 32 character long hex string

FFFFFFFFFFFFFFFFFFFF
FFFFFFFFFFFF

Set the ID Code for locking debug access. This setting is only used when the ID Code Mode is not set to Unlocked.

BSP_IO_PORT_08_PIN_11	IO port 8 pin 11.
BSP_IO_PORT_08_PIN_12	IO port 8 pin 12.
BSP_IO_PORT_08_PIN_13	IO port 8 pin 13.
BSP_IO_PORT_08_PIN_14	IO port 8 pin 14.
BSP_IO_PORT_08_PIN_15	IO port 8 pin 15.
BSP_IO_PORT_09_PIN_00	IO port 9 pin 0.
BSP_IO_PORT_09_PIN_01	IO port 9 pin 1.

BSP_IO_PORT_09_PIN_02	IO port 9 pin 2.
BSP_IO_PORT_09_PIN_03	IO port 9 pin 3.
BSP_IO_PORT_09_PIN_04	IO port 9 pin 4.
BSP_IO_PORT_09_PIN_05	IO port 9 pin 5.
BSP_IO_PORT_09_PIN_06	IO port 9 pin 6.
BSP_IO_PORT_09_PIN_07	IO port 9 pin 7.
BSP_IO_PORT_09_PIN_08	IO port 9 pin 8.
BSP_IO_PORT_09_PIN_09	IO port 9 pin 9.
BSP_IO_PORT_09_PIN_10	IO port 9 pin 10.
BSP_IO_PORT_09_PIN_11	IO port 9 pin 11.
BSP_IO_PORT_09_PIN_12	IO port 9 pin 12.
BSP_IO_PORT_09_PIN_13	IO port 9 pin 13.
BSP_IO_PORT_09_PIN_14	IO port 9 pin 14.
BSP_IO_PORT_09_PIN_15	IO port 9 pin 15.
BSP_IO_PORT_10_PIN_00	IO port 10 pin 0.
BSP_IO_PORT_10_PIN_01	IO port 10 pin 1.
BSP_IO_PORT_10_PIN_02	IO port 10 pin 2.
BSP_IO_PORT_10_PIN_03	IO port 10 pin 3.
BSP_IO_PORT_10_PIN_04	IO port 10 pin 4.
BSP_IO_PORT_10_PIN_05	IO port 10 pin 5.
BSP_IO_PORT_10_PIN_06	IO port 10 pin 6.
BSP_IO_PORT_10_PIN_07	IO port 10 pin 7.
BSP_IO_PORT_10_PIN_08	IO port 10 pin 8.
BSP_IO_PORT_10_PIN_09	IO port 10 pin 9.

BSP_IO_PORT_10_PIN_10	IO port 10 pin 10.
BSP_IO_PORT_10_PIN_11	IO port 10 pin 11.
BSP_IO_PORT_10_PIN_12	IO port 10 pin 12.
BSP_IO_PORT_10_PIN_13	IO port 10 pin 13.
BSP_IO_PORT_10_PIN_14	IO port 10 pin 14.
BSP_IO_PORT_10_PIN_15	IO port 10 pin 15.
BSP_IO_PORT_11_PIN_00	IO port 11 pin 0.
BSP_IO_PORT_11_PIN_01	IO port 11 pin 1.
BSP_IO_PORT_11_PIN_02	IO port 11 pin 2.
BSP_IO_PORT_11_PIN_03	IO port 11 pin 3.
BSP_IO_PORT_11_PIN_04	IO port 11 pin 4.
BSP_IO_PORT_11_PIN_05	IO port 11 pin 5.
BSP_IO_PORT_11_PIN_06	IO port 11 pin 6.
BSP_IO_PORT_11_PIN_07	IO port 11 pin 7.
BSP_IO_PORT_11_PIN_08	IO port 11 pin 8.
BSP_IO_PORT_11_PIN_09	IO port 11 pin 9.
BSP_IO_PORT_11_PIN_10	IO port 11 pin 10.
BSP_IO_PORT_11_PIN_11	IO port 11 pin 11.
BSP_IO_PORT_11_PIN_12	IO port 11 pin 12.
BSP_IO_PORT_11_PIN_13	IO port 11 pin 13.
BSP_IO_PORT_11_PIN_14	IO port 11 pin 14.
BSP_IO_PORT_11_PIN_15	IO port 11 pin 15.
BSP_IO_PORT_12_PIN_00	IO port 12 pin 0.
BSP_IO_PORT_12_PIN_01	IO port 12 pin 1.

BSP_IO_PORT_12_PIN_02	IO port 12 pin 2.
BSP_IO_PORT_12_PIN_03	IO port 12 pin 3.
BSP_IO_PORT_12_PIN_04	IO port 12 pin 4.
BSP_IO_PORT_12_PIN_05	IO port 12 pin 5.
BSP_IO_PORT_12_PIN_06	IO port 12 pin 6.
BSP_IO_PORT_12_PIN_07	IO port 12 pin 7.
BSP_IO_PORT_12_PIN_08	IO port 12 pin 8.
BSP_IO_PORT_12_PIN_09	IO port 12 pin 9.
BSP_IO_PORT_12_PIN_10	IO port 12 pin 10.
BSP_IO_PORT_12_PIN_11	IO port 12 pin 11.
BSP_IO_PORT_12_PIN_12	IO port 12 pin 12.
BSP_IO_PORT_12_PIN_13	IO port 12 pin 13.
BSP_IO_PORT_12_PIN_14	IO port 12 pin 14.
BSP_IO_PORT_12_PIN_15	IO port 12 pin 15.
BSP_IO_PORT_13_PIN_00	IO port 13 pin 0.
BSP_IO_PORT_13_PIN_01	IO port 13 pin 1.
BSP_IO_PORT_13_PIN_02	IO port 13 pin 2.
BSP_IO_PORT_13_PIN_03	IO port 13 pin 3.
BSP_IO_PORT_13_PIN_04	IO port 13 pin 4.
BSP_IO_PORT_13_PIN_05	IO port 13 pin 5.
BSP_IO_PORT_13_PIN_06	IO port 13 pin 6.
BSP_IO_PORT_13_PIN_07	IO port 13 pin 7.
BSP_IO_PORT_13_PIN_08	IO port 13 pin 8.
BSP_IO_PORT_13_PIN_09	IO port 13 pin 9.

BSP_IO_PORT_13_PIN_10	IO port 13 pin 10.
BSP_IO_PORT_13_PIN_11	IO port 13 pin 11.
BSP_IO_PORT_13_PIN_12	IO port 13 pin 12.
BSP_IO_PORT_13_PIN_13	IO port 13 pin 13.
BSP_IO_PORT_13_PIN_14	IO port 13 pin 14.
BSP_IO_PORT_13_PIN_15	IO port 13 pin 15.
BSP_IO_PORT_14_PIN_00	IO port 14 pin 0.
BSP_IO_PORT_14_PIN_01	IO port 14 pin 1.
BSP_IO_PORT_14_PIN_02	IO port 14 pin 2.
BSP_IO_PORT_14_PIN_03	IO port 14 pin 3.
BSP_IO_PORT_14_PIN_04	IO port 14 pin 4.
BSP_IO_PORT_14_PIN_05	IO port 14 pin 5.
BSP_IO_PORT_14_PIN_06	IO port 14 pin 6.
BSP_IO_PORT_14_PIN_07	IO port 14 pin 7.
BSP_IO_PORT_14_PIN_08	IO port 14 pin 8.
BSP_IO_PORT_14_PIN_09	IO port 14 pin 9.
BSP_IO_PORT_14_PIN_10	IO port 14 pin 10.
BSP_IO_PORT_14_PIN_11	IO port 14 pin 11.
BSP_IO_PORT_14_PIN_12	IO port 14 pin 12.
BSP_IO_PORT_14_PIN_13	IO port 14 pin 13.
BSP_IO_PORT_14_PIN_14	IO port 14 pin 14.
BSP_IO_PORT_14_PIN_15	IO port 14 pin 15.

Function Documentation

◆ **R_BSP_PinRead()**

<code>__STATIC_INLINE uint32_t R_BSP_PinRead (bsp_io_port_pin_t pin)</code>		
Read the current input level of the pin.		
Parameters		
[in]	pin	The pin
Return values		
Current		input level

◆ **R_BSP_PinWrite()**

<code>__STATIC_INLINE void R_BSP_PinWrite (bsp_io_port_pin_t pin, bsp_io_level_t level)</code>		
Set a pin to output and set the output level to the level provided. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.		
Parameters		
[in]	pin	The pin
[in]	level	The level

◆ **R_BSP_PinCfg()**

<code>__STATIC_INLINE void R_BSP_PinCfg (bsp_io_port_pin_t pin, uint32_t cfg)</code>		
Configure a pin. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.		
Parameters		
[in]	pin	The pin
[in]	cfg	Configuration for the pin (PmnPFS register setting)

◆ **R_BSP_PinAccessEnable()**

<code>__STATIC_INLINE void R_BSP_PinAccessEnable (void)</code>		
Enable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.		

◆ R_BSP_PinAccessDisable()

```
__STATIC_INLINE void R_BSP_PinAccessDisable ( void )
```

Disable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

4.2 Modules

Detailed Description

Modules are the smallest unit of software available in the FSP. Each module implements one interface.

For more information on FSP Modules and Interfaces review [FSP Modules](#), [FSP Stacks](#) and [FSP Interfaces](#) in the FSP Architecture section of this manual.

Note

Not all modules are available for all MCUs. For more information, see the User's Manual for the specific MCU.

Organization of Module Sections

Each module within FSP has a detailed Users' Guide listed below. Each guide typically includes the following content:

- **Functions:** A list of all the API functions associated with the module
- **Detailed Description:** A short description of the module and the peripherals used
- **Overview:** An operational summary and a list of high level features provided by the module
- **Configuration:** A description of module specific settings available in the configuration tool including clock and pin configurations
- **Usage Notes:** Module specific documentation and limitations
- **Examples:** Illustrative code snippets that help the user better understand API use and operation
- **Data Structure and Enumeration:** Definitions for data structures, enumerations and similar elements used by the module API
- **Function Documentation:** Details on each API function, including the function prototype, a function summary, a simple use example, list of return values and links to documentation for any needed parameter definitions

Modules

High-Speed Analog Comparator (r_acmphs)

Driver for the ACPHPS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Low-Power Analog Comparator (r_acmplp)

Driver for the ACPLP peripheral on RA MCUs. This module

implements the [Comparator Interface](#).

[Analog to Digital Converter \(r_adc\)](#)

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

[Analog to Digital Converter \(r_adc_b\)](#)

Driver for the ADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

[Asynchronous General Purpose Timer \(r_agt\)](#)

Driver for the AGT peripheral on RA MCUs. This module implements the [Timer Interface](#).

[Bluetooth Low Energy Library of Balance Configuration \(r_ble\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[Bluetooth Low Energy Library of Compact Configuration \(r_ble\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#)

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

[Clock Frequency Accuracy Measurement Circuit \(r_cac\)](#)

Driver for the CAC peripheral on RA MCUs. This module implements the [CAC Interface](#).

[Controller Area Network \(r_can\)](#)

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

[Controller Area Network - Flexible Data \(r_canfd\)](#)

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

Consumer Electronics Control (r_cec)

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

Clock Generation Circuit (r_cgc)

Driver for the CGC peripheral on RA MCUs. This module implements the [CGC Interface](#).

Cyclic Redundancy Check (CRC) Calculator (r_crc)

Driver for the CRC peripheral on RA MCUs. This module implements the [CRC Interface](#).

Capacitive Touch Sensing Unit (r_ctsu)

This HAL driver supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [CTSUS Interface](#).

Digital to Analog Converter (r_dac)

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Digital to Analog Converter (r_dac8)

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Direct Memory Access Controller (r_dmac)

Driver for the DMAC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

Data Operation Circuit (r_doc)

Driver for the DOC peripheral on RA MCUs. This module implements the [DOC Interface](#).

D/AVE 2D Port Interface (r_drw)

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

Data Transfer Controller (r_dtc)

Driver for the DTC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

[Event Link Controller \(r_elc\)](#)

Driver for the ELC peripheral on RA MCUs. This module implements the [ELC Interface](#).

[Ethernet \(r_ether\)](#)

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

[Ethernet PHY \(r_ether_phy\)](#)

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

[High-Performance Flash Driver \(r_flash_hp\)](#)

Driver for the flash memory on RA high-performance MCUs. This module implements the [Flash Interface](#).

[Low-Power Flash Driver \(r_flash_lp\)](#)

Driver for the flash memory on RA low-power MCUs. This module implements the [Flash Interface](#).

[Graphics LCD Controller \(r_glcdc\)](#)

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

[General PWM Timer \(r_gpt\)](#)

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the [Timer Interface](#).

[General PWM Timer Three-Phase Motor Control Driver \(r_gpt_three_phase\)](#)

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the [Three-Phase Interface](#).

[I3C Bus Interface \(r_i3c\)](#)

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

[Interrupt Controller Unit \(r_icu\)](#)

Driver for the ICU peripheral on RA MCUs. This module implements the [External IRQ Interface](#).

[I2C Master on IIC/I3C \(r_iic_b_master\)](#)

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

[I2C Slave on IIC/I3C \(r_iic_b_slave\)](#)

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

[I2C Master on IIC \(r_iic_master\)](#)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

[I2C Slave on IIC \(r_iic_slave\)](#)

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

[I/O Ports \(r_ioport\)](#)

Driver for the I/O Ports peripheral on RA MCUs. This module implements the [I/O Port Interface](#).

[Independent Watchdog Timer \(r_iwdt\)](#)

Driver for the IWDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

[JPEG Codec \(r_jpeg\)](#)

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

[Key Interrupt \(r_kint\)](#)

Driver for the KINT peripheral on RA MCUs. This module implements

the [Key Matrix Interface](#).

[Low Power Modes \(r_lpm\)](#)

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

[Low Voltage Detection \(r_lvd\)](#)

Driver for the LVD peripheral on RA MCUs. This module implements the [Low Voltage Detection Interface](#).

[Operational Amplifier \(r_opamp\)](#)

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

[Octa Serial Peripheral Interface for Flash and RAM devices \(r_ospf\)](#)

Driver for the OSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

[Parallel Data Capture \(r_pdc\)](#)

Driver for the PDC peripheral on RA MCUs. This module implements the [PDC Interface](#).

[Port Output Enable for GPT \(r_poeg\)](#)

Driver for the POEG peripheral on RA MCUs. This module implements the [POEG Interface](#).

[Precision Time Protocol \(r_ptp\)](#)

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

[Quad Serial Peripheral Interface Flash \(r_qsfi\)](#)

Driver for the QSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

[Realtime Clock \(r_rtc\)](#)

Driver for the RTC peripheral on RA MCUs. This module implements the [RTC Interface](#).

Secure Crypto Engine (r_sce_protected)

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Serial Communications Interface (SCI) I2C (r_sci_b_i2c)

Driver for the SCI_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Serial Communications Interface (SCI) SPI (r_sci_b_spi)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Serial Communications Interface (SCI) UART (r_sci_b_uart)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Serial Communications Interface (SCI) I2C (r_sci_i2c)

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Serial Communications Interface (SCI) SPI (r_sci_spi)

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Serial Communications Interface (SCI) UART (r_sci_uart)

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Sigma Delta Analog to Digital Converter (r_sdadc)

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

SD/MMC Host Interface (r_sdhi)

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the [SD/MMC Interface](#).

Segment LCD Controller (r_slcdc)

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

Serial Peripheral Interface (r_spi)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Serial Peripheral Interface (r_spi_b)

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Serial Sound Interface (r_ssi)

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

USB (r_usb_basic)

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

USB Composite Class (r_usb_composite)

USB Host Communications Device Class Driver (r_usb_hcdc)

This module provides a USB Host Communications Device Class (HDCD) driver. It implements the [USB HDCD Interface](#).

USB Host Human Interface Device Class Driver (r_usb_hhid)

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

USB Host Mass Storage Class Driver (r_usb_hmsc)

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

USB Host Vendor Class (r_usb_hvnd)

USB Peripheral Communications Device Class (r_usb_pcdc)

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

USB Peripheral Human Interface Device Class (r_usb_phid)

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

USB Peripheral Mass Storage Class (r_usb_pmesc)

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

USB Peripheral Vendor Class (r_usb_pvnd)

Watchdog Timer (r_wdt)

Driver for the WDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

ADPCM Decoder (rm_adpcm_decoder)

Middleware to implement the ADPCM Audio Decoder. This module implements the [ADPCM Decoder Interface](#).

Audio Playback with PWM (rm_audio_playback_pwm)

Driver for the Audio Playback middleware on RA MCUs. This module implements the [AUDIO PLAYBACK Interface](#).

AWS PKCS11 PAL (rm_aws_pkcs11_pal)

PKCS#11 PAL layer implementation for use by FreeRTOS TLS.

AWS PKCS11 PAL LITTLEFS (rm_aws_pkcs11_pal_littlefs)

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Bluetooth Low Energy Abstraction (rm_ble_abs)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Bluetooth Low Energy Abstraction with RYZ012 (rm_ble_abs_spp)

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

[SD/MMC Block Media Implementation \(rm_block_media_sdmmc\)](#)

Middleware to implement the block media interface on SD cards. This module implements the [Block Media Interface](#).

[SPI Block Media Implementation \(rm_block_media_spi\)](#)

Middleware to implement the block media interface on SPI flash memory. This module implements the [Block Media Interface](#).

[USB HMSC Block Media Implementation \(rm_block_media_usb\)](#)

Middleware to implement the block media interface on USB mass storage devices. This module implements the [Block Media Interface](#).

[User Block Media Implementation \(rm_block_media_user\)](#)

Middleware that implements a block media interface on the media of your choice. This module implements the [Block Media Interface](#).

[I2C Communicatons Middleware \(rm_comms_i2c\)](#)

Middleware to implement the I2C communications interface. This module implements the [Communicatons Middleware Interface](#).

[SEGGER emWin Port \(rm_emwin_port\)](#)

SEGGER emWin port for RA MCUs.

[Azure RTOS FileX Block Media I/O Driver \(rm_filex_block_media\)](#)

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

[Azure RTOS FileX LevelX I/O Driver \(rm_filex_levelx_nor\)](#)

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

[FreeRTOS+FAT Port \(rm_freertos_plus_fat\)](#)

Middleware for the FAT File System control on RA MCUs.

[FreeRTOS Plus TCP \(rm_freertos_plus_tcp\)](#)

Middleware for using TCP on RA MCUs.

[FreeRTOS Port \(rm_freertos_port\)](#)

FreeRTOS port for RA MCUs.

[RTOS Context Management \(rm_tz_context\)](#)

RTOS Context Management for RA MCUs.

[FS2012 Sensor Middleware \(rm_fs2012\)](#)

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXX Middleware Interface](#).

[Azure RTOS GUIX Port \(rm_guix_port\)](#)[HS300X Sensor Middleware \(rm_hs300x\)](#)

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

[Azure RTOS LevelX NOR SPI Driver \(rm_levelx_nor_spi\)](#)

Middleware for using Azure RTOS LevelX on NOR SPI memory.

[LittleFS Flash Port \(rm_littlefs_flash\)](#)

Middleware for the LittleFS File System control on RA MCUs.

[MCUboot Port \(rm_mcuboot_port\)](#)

MCUboot Port for RA MCUs.

[Motor 120 Control Hall \(motor_120_control_hall\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

[Motor 120 Control Sensorless \(motor_120_control_sensorless\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

[Motor 120 Degree \(rm_motor_120_degree\)](#)

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 Degree](#)

([rm_motor_120_degree](#)).

[Motor 120 degree driver \(rm_motor_120_driver\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

[Motor Current \(rm_motor_current\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

[Motor Driver \(rm_motor_driver\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

[Motor encoder vector control \(rm_motor_encoder\)](#)

Control a SPM motor on RA MCUs. This module implements the [Motor encoder vector control \(rm_motor_encoder\)](#).

[Motor Angle and Speed Estimation \(rm_motor_estimate\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Position \(rm_motor_position\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

[Motor Angle and Speed Calculation with an Encoder \(rm_motor_sense_encoder\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

[Motor Sensorless Vector Control \(rm_motor_sensorless\)](#)

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm_motor_sensorless\)](#).

[Motor Speed \(rm_motor_speed\)](#)

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Azure RTOS NetX Secure Crypto Hardware Acceleration (rm_netx_secure_crypto)

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Azure RTOS NetX Duo Ether Driver (rm_netxduo_ether)

Azure RTOS NetX Duo WiFi Driver (rm_netxduo_wifi)

Crypto Middleware (rm_psa_crypto)

Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

Azure RTOS ThreadX Port (rm_threadx_port)

ThreadX port for RA MCUs.

Intel TinyCrypt (rm_tinycrypt_port)

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Capacitive Touch Middleware (rm_touch)

This module supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [Touch Middleware Interface](#).

USBX Porting Layer (rm_usbx_port)

Virtual EEPROM (rm_vee_flash)

Virtual EEPROM on RA MCUs. This module implements the [Virtual EEPROM Interface](#).

AWS Device Provisioning

AWS Device Provisioning example software.

AWS HTTPS

This module provides the AWS HTTPS integration documentation.

AWS MQTT

This module provides the AWS MQTT integration documentation.

Wifi Middleware (rm_wifi_onchip_silex)

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

AWS Secure Sockets

This module provides the AWS Secure Sockets implementation.

ZMOD4XXX Sensor Middleware (rm_zmod4xxx)

Middleware to implement the ZMOD4XXX sensor interface. This module implements the [ZMOD4XXX Middleware Interface](#).

4.2.1 High-Speed Analog Comparator (r_acmphs)

Modules

Functions

fsp_err_t R_ACMPHS_Open (comparator_ctrl_t *p_ctrl, comparator_cfg_t const *const p_cfg)

fsp_err_t R_ACMPHS_OutputEnable (comparator_ctrl_t *const p_ctrl)

fsp_err_t R_ACMPHS_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)

fsp_err_t R_ACMPHS_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)

fsp_err_t R_ACMPHS_Close (comparator_ctrl_t *const p_ctrl)

Detailed Description

Driver for the ACMPHS peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Overview

Features

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOOUT, CMPOUTn¹, or CMPOUT012¹ pin

- ELC event output

Note

1. This output pin is not available on all MCUs.

Configuration

Build Time Configurations for r_acmphs

The following build time configurations are defined in fsp_cfg/r_acmphs_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > Comparator, High-Speed (r_acmphs)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r_acmphs).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Trigger Edge Selector	<ul style="list-style-type: none"> • Rising • Falling • Both Edge 	Both Edge	The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Noise Filter	<ul style="list-style-type: none"> • No Filter • 8 • 16 • 32 	No Filter	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Maximum status retries (CMPMON)	Must be a valid non-negative integer between 2 and 32-bit maximum value	1024	Maximum number of status retries.
Output Polarity	<ul style="list-style-type: none"> • Not Inverted • Inverted 	Not Inverted	When enabled comparator output is inverted. This affects

the output read from `R_ACMPHS_StatusGet()`, the pin output level, and the edge trigger.

Turn this on to enable the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs.

Define this function in the application. It is called when the Trigger event occurs.

Select the interrupt priority for the comparator interrupt.

Select the Analog input voltage source. Channel mentioned in the options represents channel in ACMPHS

Select the Analog reference voltage source. Channel mentioned in the options represents channel in ACMPHS

Pin Output	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled
------------	---	----------

Callback	Name must be a valid C symbol	NULL
----------	-------------------------------	------

Comparator Interrupt Priority	MCU Specific Options
-------------------------------	----------------------

Analog Input Voltage Source (IVCMP)	MCU Specific Options
-------------------------------------	----------------------

Reference Voltage Input Source (IVREF)	MCU Specific Options
--	----------------------

Clock Configuration

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The IVCMPn pins are used as comparator inputs. The IVREFn pins are used as comparator reference values.

Usage Notes

Noise Filter

When the noise filter is enabled, the ACMPHP0/ACMPHP1 signal is sampled three times based on the

sampling clock selected. The filter clock frequency is determined by PCLKB and the `comparator_filter_t` setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the `R_ACMPHS_StatusGet()` will return an inverted status.

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- When the noise filter is not enabled the hardware requires software debouncing of the output (two consecutive equal values). This is automatically managed in `R_ACMPHS_StatusGet` but may result in delay or an API error in rare edge cases.
- Constraints apply on the simultaneous use of ACPHNS analog input and ADC analog input. Refer to the "Usage Notes" section in your MCU's User's Manual for the ADC unit(s) for more details.
- To allow ACPHNS0 to cancel Software Standby mode or enter Snooze, set the CSTEN bit to 1 and the CDFS bits to 00 in the CMPCTL0 register.

Examples

Basic Example

The following is a basic example of using the ACPHNS to detect when the analog voltage input to IVCMP rises above the analog voltage input to IVREF. A GPIO output acts as the comparator input and is externally connected to the IVCMP input of the ACPHNS. An analog voltage input should also be supplied to the IVREF input pin.

```
#define ADC_PGA_BYPASS_VALUE (0x9999)

/* Connect this control pin to the IVCMP input of the comparator. This can be any
GPIO pin
 * that is not input only. */
#define ACPHNS_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_05_PIN_03)

volatile uint32_t g_comparator_events = 0U;

/* This callback is called when a comparator event occurs. */
void acmphs_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}

void acmphs_example ()
{
    fsp_err_t err = FSP_SUCCESS;
```

```
/* Disable pin register write protection, if enabled */
R_BSP_PinAccessEnable();
/*
 * Start with the IVCMP pin low. This example assumes the comparator is configured
to trigger
 * when the voltage of the analog input to IVCMP rises above voltage of the analog
input to
 * IVREF.
 */
(void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
/* Initialize the ACMPHS module */
err = R_ACMPHS_Open(&g_comparator_ctrl, &g_comparator_cfg);
assert(FSP_SUCCESS == err);
/*
 * If an ADC PGA exists for the analog input pin, then the PGA must be manually
configured in order for the pin to be used as
 * an IVCMP input. This procedure is slightly different depending on the MCU (See
below).
 */
#if BSP_MCU_GROUP_RA6M3
/* The following applies for MCUs with the ADC peripheral:
 *
 * Bypass the PGA on ADC unit 0.
 * (See Table 50.2 "Input source configuration of the ACMPHS" in the RA6M3 User's
Manual (R01UH0886EJ0100)) */
R_BSP_MODULE_START(FSP_IP_ADC, 0);
R_ADC0->ADPGACR = ADC_PGA_BYPASS_VALUE;
R_ADC0->ADPGADCRCR0 = 0;
#elif BSP_MCU_GROUP_RA6T2
/* The following applies for MCUs with the ADC_B peripheral:
 *
 * Configure PGA on ADC unit 0.
 * (See Table 36.11 "PGA Settings and Available Related Functions" in the RA6T2
User's Manual (R01UH0951EJ0100)) */
```

```
R_BSP_MODULE_START(FSP_IP_ADC, 0);

    R_ADC_B->ADPGACR[0] = R_ADC_B0_ADPGACR_PGAGEN_Msk;
#endif

/* Wait for the minimum stabilization wait time before enabling output. */
comparator_info_t info;
R_ACMPHS_InfoGet(&g_comparator_ctrl, &info);
R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
/* Enable the comparator output */
(void) R_ACMPHS_OutputEnable(&g_comparator_ctrl);
/* Set the IVCMP pin high. */
(void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
{
/* Wait for interrupt. */
}
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
(void) R_ACMPHS_StatusGet(&g_comparator_ctrl, &status);
}
```

Function Documentation

◆ **R_ACMPHS_Open()**

```
fsp_err_t R_ACMPHS_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg )
```

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.

◆ **R_ACMPHS_OutputEnable()**

```
fsp_err_t R_ACMPHS_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

Return values

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_ACMPHS_InfoGet()**

```
fsp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements [comparator_api_t::infoGet\(\)](#).

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_ACMPHS_StatusGet()**

```
fsp_err_t R_ACMPHS_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements [comparator_api_t::statusGet\(\)](#).

Return values

FSP_SUCCESS	Operating status of the comparator is provided in p_status.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_TIMEOUT	The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts.

◆ **R_ACMPHS_Close()**

```
fsp_err_t R_ACMPHS_Close ( comparator_ctrl_t * p_ctrl)
```

Stops the comparator. Implements [comparator_api_t::close\(\)](#).

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

4.2.2 Low-Power Analog Comparator (r_acmplp)

Modules

Functions

fsp_err_t R_ACMLP_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)

fsp_err_t R_ACMLP_OutputEnable (comparator_ctrl_t *const p_ctrl)

fsp_err_t R_ACMLP_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)

fsp_err_t R_ACMLP_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)

fsp_err_t R_ACMLP_Close (comparator_ctrl_t *const p_ctrl)

Detailed Description

Driver for the ACMLP peripheral on RA MCUs. This module implements the [Comparator Interface](#).

Overview

Features

The ACMLP HAL module supports the following features:

- Normal mode or window mode
- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOOUT pin
- ELC event output

Configuration

Build Time Configurations for r_acmplp

The following build time configurations are defined in fsp_cfg/r_acmplp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Voltage Selection for ACMLP1	<ul style="list-style-type: none"> • IVREF0 • IVREF1 	IVREF1	ACMLP1 may optionally be

(Standard mode only)

configured to use IVREF0 as a reference input instead of IVREF1. Note that if IVREF0 is selected, ACMPLP0 and ACMPLP1 must use the same setting for IVREF.

Configurations for Analog > Comparator, Low-Power (r_acmplp)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, Low-Power (r_acmplp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comparator0	Module name.
Channel	Value must be a non-negative integer	0	Select the hardware channel.
Mode	<ul style="list-style-type: none"> Standard Window 	Standard	In standard mode, comparator output is high if VCMP > VREF. In window mode, comparator output is high if VCMP is outside the range of VREF0 to VREF1.
Trigger	<ul style="list-style-type: none"> Rising Falling Both Edge 	Both Edge	The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL.
Filter	<ul style="list-style-type: none"> No sampling (bypass) Sampling at PCLKB Sampling at PCLKB/8 Sampling at PCLKB/32 	No sampling (bypass)	Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update.
Output Polarity	<ul style="list-style-type: none"> Not Inverted Inverted 	Not Inverted	When enabled comparator output is inverted. This affects the output read from R_ACMLP_StatusGet() , the pin output level, and the edge trigger.
Pin Output (VCOUT)	<ul style="list-style-type: none"> Disabled 	Disabled	Turn this on to include

	<ul style="list-style-type: none"> Enabled 		the output from this comparator on VCOUT. The comparator output on VCOUT is OR'd with output from all other ACMPHS and ACMPLP comparators.
Vref (Standard mode only)	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If reference voltage selection is enabled then internal reference voltage is used as comparator input
Callback	Name must be a valid C symbol	NULL	Define this function in the application. It is called when the Trigger event occurs.
Comparator Interrupt Priority	MCU Specific Options		Select the interrupt priority for the comparator interrupt.
Analog Input Voltage Source (IVCMP)	MCU Specific Options		Select the comparator input source. Only options for the configured channel are valid.
Reference Voltage Input Source (IVREF)	MCU Specific Options		Select the comparator reference voltage source. If channel 1 is selected and the 'Reference Voltage Selection (ACMPLP1)' config option is set to IVREF0, select one of the Channel 0 options. In all other cases, only options for the configured channel are valid.

Clock Configuration

The ACMPLP peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The CMPINn pins are used as comparator inputs. The CMPREFn pins are used as comparator reference values.

Usage Notes

Figure 140: ACMLP Standard Mode Operation

Noise Filter

When the noise filter is enabled, the ACMLP0/ACMLP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the [R_ACMLP_StatusGet\(\)](#) will return an inverted status.

Window Mode

In window mode, the comparator indicates if the analog input voltage falls within the window (low and high reference voltage) or is outside the window.

Figure 141: ACMLP Window Mode Operation

Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.

- Low speed is not supported by the ACMPLP driver.

Examples

Basic Example

The following is a basic example of minimal use of the ACMPLP. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMPLP.

```
/* Connect this control pin to the VCMP input of the comparator. This can be any GPIO
pin
 * that is not input only. */
#define ACMPLP_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_04_PIN_08)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmplp_example_callback (comparator_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmplp_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Disable pin register write protection, if enabled */
    R_BSP_PinAccessEnable();
    /* Start with the VCMP pin low. This example assumes the comparator is configured to
trigger
 * when VCMP rises above VREF. */
    (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
    /* Initialize the ACMPLP module */
    err = R_ACMPLP_Open(&g_comparator_ctrl, &g_comparator_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Wait for the minimum stabilization wait time before enabling output. */
    comparator_info_t info;
    R_ACMPLP_InfoGet(&g_comparator_ctrl, &info);
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
```

```

/* Enable the comparator output */
(void) R_AC MPLP_OutputEnable(&g_comparator_ctrl);
/* Set VCMP low. */
(void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
{
/* Wait for interrupt. */
}
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
(void) R_AC MPLP_StatusGet(&g_comparator_ctrl, &status);
}

```

Enumerations

Function Documentation

◆ **R_ACMLP_Open()**

```
fsp_err_t R_ACMLP_Open ( comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg )
```

Configures the comparator and starts operation. Callbacks and pin output are not active until `outputEnable()` is called. `comparator_api_t::outputEnable()` should be called after the output has stabilized. Implements `comparator_api_t::open()`.

Comparator inputs must be configured in the application code prior to calling this function.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An input pointer is NULL
FSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. <code>p_cfg->p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.
FSP_ERR_ALREADY_OPEN	The control block is already open or the hardware lock is taken.
FSP_ERR_IN_USE	The channel is already in use.

◆ **R_ACMLP_OutputEnable()**

```
fsp_err_t R_ACMLP_OutputEnable ( comparator_ctrl_t *const p_ctrl)
```

Enables the comparator output, which can be polled using `comparator_api_t::statusGet()`. Also enables pin output and interrupts as configured during `comparator_api_t::open()`. Implements `comparator_api_t::outputEnable()`.

Return values

FSP_SUCCESS	Comparator output is enabled.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_ACMLP_InfoGet()**

```
fsp_err_t R_ACMLP_InfoGet ( comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements [comparator_api_t::infoGet\(\)](#).

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_ACMLP_StatusGet()**

```
fsp_err_t R_ACMLP_StatusGet ( comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status )
```

Provides the operating status of the comparator. Implements [comparator_api_t::statusGet\(\)](#).

Return values

FSP_SUCCESS	Operating status of the comparator is provided in p_status.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_ACMLP_Close()**

```
fsp_err_t R_ACMLP_Close ( comparator_ctrl_t * p_ctrl)
```

Stops the comparator. Implements [comparator_api_t::close\(\)](#).

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

Detailed Description

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The ADC module supports the following features:

- 12, 14, or 16 bit maximum resolution depending on the MCU
- Configure scans to include:
 - Multiple analog channels
 - Temperature sensor channel
 - Voltage sensor channel
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
 - External scan triggers from the ADTRGn port pins
- Configurable scan mode:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
 - Group scan mode, where channels are grouped into group A and group B. The groups can be assigned different start triggers, and group A can be given priority over group B. When group A has priority over group B, a group A trigger suspends an ongoing group B scan.
- Supports adding and averaging converted samples
- Optional callback when scan completes
- Sample and hold support
- Double-trigger support
- Hardware comparator with interrupt and event output

Configuration

Build Time Configurations for r_adc

The following build time configurations are defined in fsp_cfg/r_adc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > ADC (r_adc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_adc0	Module name
General > Unit	Unit must be a non-negative integer	0	Specifies the ADC Unit to be used.
General > Resolution	MCU Specific Options		Specifies the conversion resolution for this unit.
General > Alignment	MCU Specific Options		Specifies the conversion result

General > Clear after read	<ul style="list-style-type: none"> • Off • On 	On	alignment. Specifies if the result register will be automatically cleared after the conversion result is read.
General > Mode	<ul style="list-style-type: none"> • Single Scan • Continuous Scan • Group Scan 	Single Scan	Specifies the mode that this ADC unit is used in.
General > Double-trigger	<ul style="list-style-type: none"> • Disabled • Enabled • Enabled (extended mode) 	Disabled	When enabled, the scan-end interrupt for Group A is only thrown on every second scan. Extended double-trigger mode (single-scan only) triggers on both ELC events, allowing (for example) a scan on two different timer compare match values. In group mode Group B is unaffected.
Input > Sample and Hold > Sample and Hold Channels (Available only on selected MCUs)	<ul style="list-style-type: none"> • Channel 0 • Channel 1 • Channel 2 		Specifies if this channel is included in the Sample and Hold Mask.
Input > Sample and Hold > Sample Hold States (Applies only to channels 0, 1, 2)	Must be a valid non-negative integer with configurable value 4 to 255	24	Specifies the updated sample-and-hold count for the channel dedicated sample-and-hold circuit
Input > Window Compare > Window A > Enable	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable or disable comparison with Window A.
Input > Window Compare > Window A > Channels to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Select channels to be compared to Window A.
Input > Window Compare > Window A > Channel comparison mode (channel	Refer to the RA Configuration tool for available options.		Checking a box sets the comparison mode for that channel to Greater Than or Inside

availability varies by MCU and unit)			Window depending on whether Window Mode is disabled or enabled (respectively). If left unchecked the comparison mode will likewise be Less Than or Outside Window (respectively).
Input > Window Compare > Window A > Lower Reference	Must be a positive 16-bit integer.	0	Set the lower comparison value.
Input > Window Compare > Window A > Upper Reference	Must be a positive 16-bit integer.	0	Set the upper comparison value.
Input > Window Compare > Window B > Enable	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable or disable comparison with Window B.
Input > Window Compare > Window B > Channel to compare (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.	Channel 0	Select a channel to be compared to Window B.
Input > Window Compare > Window B > Comparison mode	<ul style="list-style-type: none"> • Less Than or Outside Window • Greater Than or Inside Window 	module.driver.adc.compare.window_b.mode	Select the comparison mode for Window B. For each option, the first condition applies when Window Mode is disabled and the second option applies when Window Mode is enabled.
Input > Window Compare > Window B > Lower Reference	Must be a positive 16-bit integer.	0	Set the lower comparison value.
Input > Window Compare > Window B > Upper Reference	Must be a positive 16-bit integer.	0	Set the upper comparison value.
Input > Window Compare > Window Mode	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	When disabled, ADC values will be compared only with the lower reference on each comparator. When enabled, both the lower and upper reference values will be used to create a comparison window.

Input > Window Compare > Event Output	<ul style="list-style-type: none"> • OR • XOR • AND 	OR	Select how comparison results should be composited for event output.
Input > Channel Scan Mask (channel availability varies by MCU)	Refer to the RA Configuration tool for available options.		In Normal mode of operation, this bitmask field specifies the channels that are enabled in that ADC unit. In group mode, this field specifies which channels belong to group A.
Input > Group B Scan Mask (channel availability varies by MCU)	Refer to the RA Configuration tool for available options.		In group mode, this field specifies which channels belong to group B.
Input > Add/Average Count	MCU Specific Options		Specifies if addition or averaging needs to be done for any of the channels in this unit.
Input > Reference Voltage control	MCU Specific Options		Specify VREFH/VREFADC output voltage control.
Input > Addition/Averaging Mask (channel availability varies by MCU and unit)	Refer to the RA Configuration tool for available options.		Select channels to include in the Addition/Averaging Mask
Interrupts > Normal/Group A Trigger	MCU Specific Options		Specifies the trigger type to be used for this unit.
Interrupts > Group B Trigger	MCU Specific Options		Specifies the trigger for Group B scanning in group scanning mode. This event is also used to trigger Group A in extended double-trigger mode.
Interrupts > Group Priority (Valid only in Group Scan Mode)	<ul style="list-style-type: none"> • Group A cannot interrupt Group B • Group A can interrupt Group B; Group B scan restarts at next trigger • Group A can interrupt Group B; Group B scan 	Group A cannot interrupt Group B	Determines whether an ongoing group B scan can be interrupted by a group A trigger, whether it should abort on a group A trigger, or if it should pause to allow group A scan and restart immediately after group A scan is complete.

- restarts immediately
- Group A can interrupt Group B; Group B scan restarts immediately and scans continuously

Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes.
Interrupts > Scan End Interrupt Priority	MCU Specific Options		Select scan end interrupt priority.
Interrupts > Scan End Group B Interrupt Priority	MCU Specific Options		Select group B scan end interrupt priority.
Interrupts > Window Compare A Interrupt Priority	MCU Specific Options		Select Window Compare A interrupt priority.
Interrupts > Window Compare B Interrupt Priority	MCU Specific Options		Select Window Compare B interrupt priority.
Extra > ADC Ring Buffer	MCU Specific Options		ADC Ring Buffer to be used only with DMAC transfers, keep this property disabled for normal ADC operations. When enabled, ADC converted data is stored in ADBUF registers in place of ADDR registers. The read API will not read from this location for normal ADC operations.

Clock Configuration

The ADC clock is PCLKC if the MCU has PCLKC, or PCLKD otherwise.

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKD
RA2E1	PCLKD

RA2E2	PCLKD
RA2L1	PCLKD
RA4E1	PCLKC
RA4M1	PCLKC
RA4M2	PCLKC
RA4M3	PCLKC
RA4W1	PCLKC
RA6E1	PCLKC
RA6M1	PCLKC
RA6M2	PCLKC
RA6M3	PCLKC
RA6M4	PCLKC
RA6M5	PCLKC
RA6T1	PCLKC
RA6T2	PCLKC

The ADC clock must be at least 1 MHz when the ADC is used. Many MCUs also have PCLK ratio restrictions when the ADC is used. For details on PCLK ratio restrictions, reference the footnotes in the second table of the Clock Generation Circuit chapter of the MCU User's Manual (for example, Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100).

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger for unit 0 and 1 respectively. When external triggers are used, ADC scans begin on the falling edge of the ADTRG pin.

Usage Notes

Sample Hold

Enabling the sample and hold functionality reduces the maximum scan frequency because the sample and hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

ADC Operational Modes

The driver supports three operation modes: single-scan, continuous-scan, and group-scan modes. In each mode, analog channels are converted in ascending order of channel number, followed by scans of the temperature sensor and voltage sensor if they are included in the mask of channels to scan.

Single-scan Mode

In single scan mode, one or more specified channels are scanned once per trigger.

Continuous-scan Mode

In continuous scan mode, a single trigger is required to start the scan. Scans continue until [R_ADC_ScanStop\(\)](#) is called.

Group-scan Mode

Group-scan mode allows the application to allocate channels to one of two groups (A and B). Conversion begins when the specified ELC start trigger for that group is received.

With the priority configuration parameter, you can optionally give group A priority over group B. If group A has priority over group B, a group B scan is interrupted when a group A scan trigger occurs. The following options exist for group B when group A has priority:

- To restart the interrupted group B scan after the group A scan completes.
- To wait for another group B trigger and forget the interrupted scan.
- To continuously scan group B and suspend scanning group B only when a group A trigger is received.

Note

If this option is selected, group B scanning begins immediately after [R_ADC_ScanCfg\(\)](#). Group A scan triggers must be enabled by [R_ADC_ScanStart\(\)](#) and can be disabled by [R_ADC_ScanStop\(\)](#). Group B scans can only be disabled by reconfiguring the group A priority to a different mode.

Double-triggering

When double-triggering is enabled a single channel is selected to be scanned twice before an interrupt is thrown. The first scan result when using double-triggering is always saved to the selected channel's data register. The second result is saved to the data duplexing register ([ADC_CHANNEL_DUPLEX](#)).

Double-triggering uses Group A; only one channel can be selected when enabled. No other scanning is possible on Group A while double-trigger mode is selected. In addition, any special ADC channels (such as temperature sensors or voltage references) are not valid double-trigger channels.

When extended double-triggering is enabled both ADC input events are routed to Group A. The interrupt is still thrown after every two scans regardless of the triggering event(s). While the first and second scan are saved to the selected ADC data register and the ADC duplexing register as before, scans associated with event A and B are additionally copied into duplexing register A and B, respectively ([ADC_CHANNEL_DUPLEX_A](#) and [ADC_CHANNEL_DUPLEX_B](#)).

When Interrupts Are Not Enabled

If interrupts are not enabled, the [R_ADC_StatusGet](#) API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result. This applies to both normal scans and calibration scans for MCUs that support calibration.

Window Compare Function

The ADC contains comparators that allow scan data to be compared to user-provided reference values. When a value meets the configured condition an interrupt and/or an ELC event can be produced.

Each unit has two configurable comparison units, Window A and Window B. Window A allows for configuring multiple simultaneous channels to compare while Window B only allows one channel at a time.

The window compare function can be configured both through the RA Configuration tool and at runtime by providing a pointer to an `adc_window_cfg_t` struct to `adc_channel_cfg_t::p_window_cfg` when calling `R_ADC_ScanCfg`. The available comparison modes are shown below:

Window setting	Channel mode 0	Channel mode 1
Disabled	Scan < Low Ref	Scan > Low Ref
Enabled	(Scan < Low Ref) OR (Scan > High Ref)	Low Ref < Scan < High Ref

Note

The window setting applies to all channels configured on a unit.

Sample-State Count Setting

The application program can modify the setting of the sample-state count for analog channels by calling the `R_ADC_SampleStateCountSet()` API function. The application program only needs to modify the sample-state count settings from their default values to increase the sampling time. This can be either because the impedance of the input signal is too high to secure sufficient sampling time under the default setting or if the ADCLK is too slow. To modify the sample-state count for a given channel, set the channel number and the number of states when calling the `R_ADC_SampleStateCountSet()` API function. Valid sample state counts are 7-255.

Note

Although the hardware supports a minimum number of sample states of 5, some MCUs require 7 states, so the minimum is set to 7. At the lowest supported ADC conversion clock rate (1 MHz), these extra states will lead to, at worst case, a 2 microsecond increase in conversion time. At 60 MHz the extra states will add 33.4 ns to the conversion time.

If the sample state count needs to be changed for multiple channels, the application program must call the `R_ADC_SampleStateCountSet()` API function repeatedly, with appropriately modified arguments for each channel.

If the ADCLK frequency changes, the sample states may need to be updated.

Sample States for Temperature Sensor and Internal Voltage Reference

Sample states for the temperature sensor and the internal reference voltage are calculated during `R_ADC_ScanCfg()` based on the ADCLK frequency at the time. The sample states for the temperature sensor and internal voltage reference cannot be updated with `R_ADC_SampleStateCountSet()`. If the ADCLK frequency changes, call `R_ADC_ScanCfg()` before using the temperature sensor or internal reference voltage again to ensure the sampling time for the temperature sensor and internal voltage reference is optimal.

Selecting Reference Voltage

The ADC16 can select VREFH0 or VREFADC as the high-potential reference voltage on selected MCU's. When using VREFADC stabilization time of 1500us is required after call for `R_ADC_Open()`.

Using the Temperature Sensor with the ADC

The ADC HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, $T = (V_s - V_1)/\text{slope} + T_1$, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); $\text{slope} = (V_2 - V_1)/(T_2 - T_1)$

Note

The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.

Reading CTSU TSCAP with ADC

Some MCUs support reading CTSU TSCAP with ADC. CTSU TSCAP is connected to ADC0 channel 16. Use existing enums for channel 16 to set sample states for the sensor connected to CTSU TSCAP, enable scanning of CTSU TSCAP, and read results for CTSU TSCAP.

Usage Notes for ADC16

Calibration

Calibration is required to use the ADC16 peripheral. When using this driver on an MCU that has ADC16, call `R_ADC_Calibrate()` after open, and prior to any other function.

Range of ADC16 Results

The range of the ADC16 is from 0 (lowest) to 0x7FFF (highest) when used in single-ended mode. This driver only supports single ended mode.

Limitations

Developers should be aware of the following limitations when using the ADC:

- When using the Window Compare function:
 - Only Single Scan mode may be configured when match or mismatch ELC events are used.
 - When one compare window is configured to check the temperature sensor or voltage reference the other window cannot be used.
 - Both windows cannot reference the same channel.

Examples

Basic Example

This is a basic example of minimal use of the ADC in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
```

```
options selected. If additional
* configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_ScanCfg. */
const adc_channel_cfg_t g_adc0_channel_cfg =
{
    .scan_mask          = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    .scan_mask_group_b = 0,
    .priority_group_a   = (adc_group_a_t) 0,
    .add_mask           = 0,
    .sample_hold_mask   = 0,
    .sample_hold_states = 0,
};
void adc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable channels. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
    /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
* triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
    }
    /* Read converted data. */
```

```
uint16_t channell_conversion_result;

err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result);

assert(FSP_SUCCESS == err);

}
```

Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC and the temperature sensor.

```
#define ADC_EXAMPLE_CALIBRATION_DATA_RA6M1 (0x7D5)
#define ADC_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_EXAMPLE_TEMPERATURE_RESOLUTION (12U)
#define ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE (127)

void adc_temperature_example (void)
{
    /* The following example calculates the temperature on an RA6M1 device using the
    data provided in the section
    * 44.3.1 "Preparation for Using the Temperature Sensor" of the RA6M1 manual
    R01UH0884EJ0100. */

    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Enable temperature sensor. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);

    /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
    modes, enable external
    * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);

    /* Wait for conversion to complete. */
    adc_status_t status;

    status.state = ADC_STATE_SCAN_IN_PROGRESS;
```

```
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
}

/* Read converted data. */
uint16_t temperature_conversion_result;
err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_TEMPERATURE,
&temperature_conversion_result);
assert(FSP_SUCCESS == err);

/* If the MCU does not provide calibration data, use the value in the hardware
manual or determine it
* experimentally. */
/* Get Calibration data from the MCU if available. */
int32_t    reference_calibration_data;
adc_info_t adc_info;
(void) R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);
reference_calibration_data = (int32_t) adc_info.calibration_data;

/* NOTE: The slope of the temperature sensor varies from sensor to sensor. Renesas
recommends calculating
* the slope of the temperature sensor experimentally.

Using the Temperature Sensor"
* of the RA6M1 manual R01UH0884EJ0100:
*
* In this MCU, the TSCDR register stores the temperature value (CAL127) of the
temperature sensor measured
* under the condition Ta = Tj = 127 C and AVCC0 = 3.3 V. By using this value as the
sample measurement result
* at the first point, preparation before using the temperature sensor can be
```

```

omitted.
*
* If V1 is calculated from CAL127,
* V1 = 3.3 * CAL127 / 4096 [V]
*
* Using this, the measured temperature can be calculated according to the following
formula.
*
* T = (Vs - V1) / Slope + 127 [C]
* T: Measured temperature (C)
* Vs: Voltage output by the temperature sensor when the temperature is measured (V)
* V1: Voltage output by the temperature sensor when Ta = Tj = 127 C and AVCC0 = 3.3
V (V)
* Slope: Temperature slope given in Table 52.38 / 1000 (V/C)
*/
int32_t v1_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
reference_calibration_data;
int32_t vs_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
temperature_conversion_result;
int32_t temperature_c = (vs_uv - v1_uv) / slope_uv_per_c +
ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE;
/* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
if ((temperature_c < 20) || (temperature_c > 25))
{
__BKPT(0);
}
}

```

Double-Trigger Example

This example demonstrates reading data from a double-trigger scan. A flag is used to wait for a callback event. Two scans must occur before the callback is called. These results are read via

`R_ADC_Read` using the selected channel enum value as well as `ADC_CHANNEL_DUPLEX`.

```
volatile bool scan_complete_flag = false;
void adc_callback (adc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    scan_complete_flag = true;
}
void adc_double_trigger_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable double-trigger channel. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
    /* Enable scan triggering from ELC events. */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. Two scans must be triggered before a callback
occurs. */
    scan_complete_flag = false;
    while (!scan_complete_flag)
    {
        /* Wait for callback to set flag. */
    }
    /* Read converted data from both scans. */
    uint16_t channell_conversion_result_0;
    uint16_t channell_conversion_result_1;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result_0);
    assert(FSP_SUCCESS == err);
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_DUPLEX,
&channell_conversion_result_1);
    assert(FSP_SUCCESS == err);
}
```

```
}

```

ADC-DMAC Repeat-Block Transfer Example

This example demonstrates writing multiple data from DAC peripheral to ADC channels and storing the data in memory through DMAC using Repeat-Block Transfer mode. It creates single block to multiple ring buffer type of transfer topology. Ping-Pong mechanism is used to read the data from memory in between the transfers. This example is valid only for MCUs that have ADBUF.

```
#define ADC_DMACH_EXAMPLE_DATA_LOW (0U)
#define ADC_DMACH_EXAMPLE_DATA_HIGH (0x000FU)
#define ADC_DMACH_EXAMPLE_DELAY_1000_MS (1000U)
#define ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS (2)
static uint16_t g_adc_dmac_example_buffer[ADC_DMACH_EXAMPLE_NUM_PING_PONG_BUFFERS][
    ADC_DMACH_EXAMPLE_ADC_CHANNELS_PER_BLOCK][ADC_DMACH_EXAMPLE_SAMPLES_PER_CHANNEL];
// Destination buffer for DMAC transfers
static volatile uint16_t g_adc_dmac_example_ping_pong_index = 0U;
static volatile void * gp_read_data;
/* DMAC callback */
void adc_dmac_callback (dmac_callback_args_t * p_args)
{
    (void) p_args;
    /* Store the pointer to the last buffer that was written
     * An array of data for the first enabled channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
     * an array of data for the next channel is at
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][1][0], etc.
     */
    gp_read_data =
    &g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0];
    /* Select the other ping-pong buffer which is free for writing */
    g_adc_dmac_example_ping_pong_index = !g_adc_dmac_example_ping_pong_index;
    /* Reset the destination pointer and DMAC peripheral */
    R_DMACH_Reset(&g_transfer0_ctrl,
        NULL,
        (void *)

```

```
&g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],

ADC Window Compare configuration		
Data Fields		
uint32_t	compare_mask	Channel mask to compare with Window A.
uint32_t	compare_mode_mask	Per-channel condition mask for Window A.
adc_compare_cfg_t	compare_cfg	Window Compare configuration.
uint16_t	compare_ref_low	Window A lower reference value.
uint16_t	compare_ref_high	Window A upper reference value.
uint16_t	compare_b_ref_low	Window B lower reference value.
uint16_t	compare_b_ref_high	Window A upper reference value.
adc_window_b_channel_t	compare_b_channel	Window B channel.
adc_window_b_mode_t	compare_b_mode	Window B condition setting.

◆ **adc_extended_cfg_t**

struct adc_extended_cfg_t		
Extended configuration structure for ADC.		
Data Fields		
adc_add_t	add_average_count	Add or average samples.
adc_clear_t	clearing	Clear after read.
adc_trigger_t	trigger_group_b	Group B trigger source; valid only for group mode.
adc_double_trigger_t	double_trigger_mode	Double-trigger mode setting.
adc_vref_control_t	adc_vref_control	VREFADC output voltage control.
uint8_t	enable_adbuf	Enable ADC Ring Buffer, Valid only to use along with DMAC transfer.
IRQn_Type	window_a_irq	IRQ number for Window Compare A interrupts.
IRQn_Type	window_b_irq	IRQ number for Window Compare B interrupts.
uint8_t	window_a_ipl	Priority for Window Compare A interrupts.
uint8_t	window_b_ipl	Priority for Window Compare B interrupts.

◆ **adc_channel_cfg_t**

struct adc_channel_cfg_t		
ADC channel(s) configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.
uint32_t	scan_mask_group_b	Valid for group modes.
uint32_t	add_mask	Valid if add enabled in Open().
adc_window_cfg_t *	p_window_cfg	Pointer to Window Compare configuration.
adc_group_a_t	priority_group_a	Valid for group modes.
uint8_t	sample_hold_mask	Channels/bits 0-2.
uint8_t	sample_hold_states	Number of states to be used for sample and hold. Affects channels 0-2.

◆ **adc_instance_ctrl_t**

```
struct adc_instance_ctrl_t
```

ADC instance control block. DO NOT INITIALIZE. Initialized in `adc_api_t::open()`.

Enumeration Type Documentation

◆ `adc_mask_t`

```
enum adc_mask_t
```

For ADC Scan configuration `adc_channel_cfg_t::scan_mask`, `adc_channel_cfg_t::scan_mask_group_b`, `adc_channel_cfg_t::add_mask` and `adc_channel_cfg_t::sample_hold_mask`. Use bitwise OR to combine these masks for desired channels and sensors.

Enumerator

ADC_MASK_OFF	No channels selected.
ADC_MASK_CHANNEL_0	Channel 0 mask.
ADC_MASK_CHANNEL_1	Channel 1 mask.
ADC_MASK_CHANNEL_2	Channel 2 mask.
ADC_MASK_CHANNEL_3	Channel 3 mask.
ADC_MASK_CHANNEL_4	Channel 4 mask.
ADC_MASK_CHANNEL_5	Channel 5 mask.
ADC_MASK_CHANNEL_6	Channel 6 mask.
ADC_MASK_CHANNEL_7	Channel 7 mask.
ADC_MASK_CHANNEL_8	Channel 8 mask.
ADC_MASK_CHANNEL_9	Channel 9 mask.
ADC_MASK_CHANNEL_10	Channel 10 mask.
ADC_MASK_CHANNEL_11	Channel 11 mask.
ADC_MASK_CHANNEL_12	Channel 12 mask.
ADC_MASK_CHANNEL_13	Channel 13 mask.
ADC_MASK_CHANNEL_14	Channel 14 mask.
ADC_MASK_CHANNEL_15	Channel 15 mask.

ADC_MASK_CHANNEL_16	Channel 16 mask.
ADC_MASK_CHANNEL_17	Channel 17 mask.
ADC_MASK_CHANNEL_18	Channel 18 mask.
ADC_MASK_CHANNEL_19	Channel 19 mask.
ADC_MASK_CHANNEL_20	Channel 20 mask.
ADC_MASK_CHANNEL_21	Channel 21 mask.
ADC_MASK_CHANNEL_22	Channel 22 mask.
ADC_MASK_CHANNEL_23	Channel 23 mask.
ADC_MASK_CHANNEL_24	Channel 24 mask.
ADC_MASK_CHANNEL_25	Channel 25 mask.
ADC_MASK_CHANNEL_26	Channel 26 mask.
ADC_MASK_CHANNEL_27	Channel 27 mask.
ADC_MASK_TEMPERATURE	Temperature sensor channel mask.
ADC_MASK_VOLT	Voltage reference channel mask.
ADC_MASK_SENSORS	All sensor channel mask.

◆ **adc_add_t**

enum <code>adc_add_t</code>	
ADC data sample addition and averaging options	
Enumerator	
<code>ADC_ADD_OFF</code>	Addition turned off for channels/sensors.
<code>ADC_ADD_TWO</code>	Add two samples.
<code>ADC_ADD_THREE</code>	Add three samples.
<code>ADC_ADD_FOUR</code>	Add four samples.
<code>ADC_ADD_SIXTEEN</code>	Add sixteen samples.
<code>ADC_ADD_AVERAGE_TWO</code>	Average two samples.
<code>ADC_ADD_AVERAGE_FOUR</code>	Average four samples.
<code>ADC_ADD_AVERAGE_EIGHT</code>	Average eight samples.
<code>ADC_ADD_AVERAGE_SIXTEEN</code>	Add sixteen samples.

◆ **adc_clear_t**

enum <code>adc_clear_t</code>	
ADC clear after read definitions	
Enumerator	
<code>ADC_CLEAR_AFTER_READ_OFF</code>	Clear after read off.
<code>ADC_CLEAR_AFTER_READ_ON</code>	Clear after read on.

◆ **adc_vref_control_t**

enum <code>adc_vref_control_t</code>	
Enumerator	
<code>ADC_VREF_CONTROL_VREFH</code>	VREFAMPcnt reset value. VREFADC Output voltage is Hi-Z.
<code>ADC_VREF_CONTROL_1_5V_OUTPUT</code>	BGR turn ON. VREFADC Output voltage is 1.5 V.
<code>ADC_VREF_CONTROL_2_0V_OUTPUT</code>	BGR turn ON. VREFADC Output voltage is 2.0 V.
<code>ADC_VREF_CONTROL_2_5V_OUTPUT</code>	BGR turn ON. VREFADC Output voltage is 2.5 V.
<code>ADC_VREF_CONTROL_AVCC0_AVSS0</code>	High potential is AVCC0, low potential is AVSS0.
<code>ADC_VREF_CONTROL_VREFH0_AVSS0</code>	High potential is VREFH0, low potential is AVSS0.
<code>ADC_VREF_CONTROL_IVREF_AVSS0</code>	High potential is internal reference voltage, low potential is AVSS0. When the high potential is set to the internal reference voltage, wait 5 us after <code>R_ADC_Open()</code> to start an ADC measurement.
<code>ADC_VREF_CONTROL_AVCC0_VREFLO</code>	High potential is AVCC0, low potential is VREFLO.
<code>ADC_VREF_CONTROL_VREFH0_VREFLO</code>	High potential is VREFH0, low potential is VREFLO.
<code>ADC_VREF_CONTROL_IVREF_VREFLO</code>	High potential is internal reference voltage, low potential is VREFLO. When the high potential is set to the internal reference voltage, wait 5 us after <code>R_ADC_Open()</code> to start an ADC measurement.

◆ **adc_sample_state_reg_t**

enum <code>adc_sample_state_reg_t</code>	
ADC sample state registers	
Enumerator	
<code>ADC_SAMPLE_STATE_CHANNEL_0</code>	Sample state register channel 0.
<code>ADC_SAMPLE_STATE_CHANNEL_1</code>	Sample state register channel 1.
<code>ADC_SAMPLE_STATE_CHANNEL_2</code>	Sample state register channel 2.
<code>ADC_SAMPLE_STATE_CHANNEL_3</code>	Sample state register channel 3.
<code>ADC_SAMPLE_STATE_CHANNEL_4</code>	Sample state register channel 4.
<code>ADC_SAMPLE_STATE_CHANNEL_5</code>	Sample state register channel 5.
<code>ADC_SAMPLE_STATE_CHANNEL_6</code>	Sample state register channel 6.
<code>ADC_SAMPLE_STATE_CHANNEL_7</code>	Sample state register channel 7.
<code>ADC_SAMPLE_STATE_CHANNEL_8</code>	Sample state register channel 8.
<code>ADC_SAMPLE_STATE_CHANNEL_9</code>	Sample state register channel 9.
<code>ADC_SAMPLE_STATE_CHANNEL_10</code>	Sample state register channel 10.
<code>ADC_SAMPLE_STATE_CHANNEL_11</code>	Sample state register channel 11.
<code>ADC_SAMPLE_STATE_CHANNEL_12</code>	Sample state register channel 12.
<code>ADC_SAMPLE_STATE_CHANNEL_13</code>	Sample state register channel 13.
<code>ADC_SAMPLE_STATE_CHANNEL_14</code>	Sample state register channel 14.
<code>ADC_SAMPLE_STATE_CHANNEL_15</code>	Sample state register channel 15.
<code>ADC_SAMPLE_STATE_CHANNEL_16_TO_31</code>	Sample state register channel 16 to 31.

◆ **adc_compare_cfg_t**

enum <code>adc_compare_cfg_t</code>
ADC comparison settings

◆ **adc_window_b_channel_t**

enum adc_window_b_channel_t
ADC Window B channel

◆ **adc_window_b_mode_t**

enum adc_window_b_mode_t
ADC Window B comparison mode

◆ **adc_group_a_t**

enum adc_group_a_t	
ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode.	
Enumerator	
ADC_GROUP_A_PRIORITY_OFF	Group A ignored and does not interrupt ongoing group B scan.
ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER	Group A interrupts Group B(single scan) which restarts at next Group B trigger.
ADC_GROUP_A_GROUP_B_RESTART_SCAN	Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete.
ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN	Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger.

◆ **adc_double_trigger_t**

enum <code>adc_double_trigger_t</code>	
ADC double-trigger mode definitions	
Enumerator	
<code>ADC_DOUBLE_TRIGGER_DISABLED</code>	Double-triggering disabled.
<code>ADC_DOUBLE_TRIGGER_ENABLED</code>	Double-triggering enabled.
<code>ADC_DOUBLE_TRIGGER_ENABLED_EXTENDED</code>	Double-triggering enabled on both ADC ELC events.

Function Documentation◆ **R_ADC_Open()**

```
fsp_err_t R_ADC_Open ( adc_ctrl_t* p_ctrl, adc_cfg_t const*const p_cfg )
```

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt is enabled, the function registers a callback function pointer for notifying the user whenever a scan has completed.

Return values

<code>FSP_SUCCESS</code>	Module is ready for use.
<code>FSP_ERR_ASSERTION</code>	An input argument is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance control structure has already been opened.
<code>FSP_ERR_IRQ_BSP_DISABLED</code>	A callback is provided, but the interrupt is not enabled.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	The requested unit does not exist on this MCU.
<code>FSP_ERR_INVALID_HW_CONDITION</code>	The ADC clock must be at least 1 MHz

◆ R_ADC_ScanCfg()

```
fsp_err_t R_ADC_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_channel_cfg )
```

Configures the ADC scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_channel_cfg_t` to `p_channel_cfg`.

Note

This starts group B scans if `adc_channel_cfg_t::priority_group_a` is set to `ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.

Return values

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_InfoGet()

```
fsp_err_t R_ADC_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned.

Also provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Note

In group mode, information is returned for group A only. Calculating information for group B is not currently supported.

Return values

FSP_SUCCESS	Information stored in <code>p_adc_info</code> .
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_ScanStart()**

`fsp_err_t R_ADC_ScanStart (adc_ctrl_t * p_ctrl)`

Starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_Open call. If the unit was configured for ELC or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call R_ADC_ScanCfg after R_ADC_Open before starting a scan.

On MCUs that support calibration, call R_ADC_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_IN_USE	Another scan is still in progress (software trigger).

◆ **R_ADC_ScanGroupStart()**

`fsp_err_t R_ADC_ScanGroupStart (adc_ctrl_t * p_ctrl, adc_group_mask_t group_id)`

`adc_api_t::scanStart` is not supported on the ADCH. Use `scanStart` instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R_ADC_ScanStop()**

```
fsp_err_t R_ADC_ScanStop ( adc_ctrl_t* p_ctrl)
```

Stops the software scan or disables the unit from being triggered by the hardware trigger (ELC or external) based on what type of trigger the unit was configured for in the R_ADC_Open function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

Return values

FSP_SUCCESS	Scan stopped (software trigger) or hardware triggers disabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R_ADC_StatusGet()**

```
fsp_err_t R_ADC_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_Read()**

```
fsp_err_t R_ADC_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const reg_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R_ADC_Read32()**

```
fsp_err_t R_ADC_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.

◆ **R_ADC_SampleStateCountSet()**

```
fsp_err_t R_ADC_SampleStateCountSet ( adc_ctrl_t * p_ctrl, adc_sample_state_t * p_sample )
```

Sets the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of reset.

Note

The sample states for the temperature and voltage sensor are set in R_ADC_ScanCfg.

Return values

FSP_SUCCESS	Sample state count updated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_INITIALIZED	Unit is not initialized.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_Close()**

```
fsp_err_t R_ADC_Close ( adc_ctrl_t * p_ctrl)
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_OffsetSet()**

```
fsp_err_t R_ADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

`adc_api_t::offsetSet` is not supported on the ADC.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R_ADC_Calibrate()**

```
fsp_err_t R_ADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC on MCUs that require calibration. This function must be called before starting a scan on MCUs that require calibration.

Calibration is complete when the callback is called with `ADC_EVENT_CALIBRATION_COMPLETE` or when `R_ADC_StatusGet` returns `ADC_STATUS_IDLE`. Reference Figure 32.35 "Software flow and operation example of calibration operation." in the RA2A1 manual R01UH0888EJ0100.

ADC calibration time: 12 PCLKB + 774,930 ADCLK. (Reference Table 32.16 "Required calibration time (shown as the number of ADCLK and PCLKB cycles)" in the RA2A1 manual R01UH0888EJ0100. The lowest supported ADCLK is 1MHz.

Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. This wait could take up to 780 milliseconds for a 1 MHz PCLKD (ADCLK).

Parameters

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument. Pass NULL.

Return values

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_INVALID_HW_CONDITION	A scan is in progress or hardware triggers are enabled.
FSP_ERR_UNSUPPORTED	Calibration not supported on this MCU.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_CallbackSet()**

```
fsp_err_t R_ADC_CallbackSet ( adc_ctrl_t *const p_api_ctrl, void (*)(adc_callback_args_t *)
p_callback, void const *const p_context, adc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.4 Analog to Digital Converter (r_adc_b)

Modules

Functions

```
fsp_err_t R_ADC_B_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)
```

```
fsp_err_t R_ADC_B_ScanCfg (adc_ctrl_t *p_ctrl, void const *const p_scan_cfg)
```

```
fsp_err_t R_ADC_B_InfoGet (adc_ctrl_t *p_ctrl, adc_info_t *p_adc_info)

```

Detailed Description

Driver for the ADC_B peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The ADC_B module supports the following features:

- 12 bit resolution
- Configure scans to include:
 - Multiple analog channels
 - Temperature sensor channel
 - Reference Voltage sensor channel
 - Self-Diagnostic channel
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
 - External scan triggers from the ADTRGn port pins
- Configurable scan modes:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
 - Synchronous scan mode, where A/D converters operate synchronously
- Variable sampling time
- Self-calibration
- Channel-dedicated sample-and-hold circuits
- Supports adding and averaging converted samples
- Selectable data format (16, 14, 12, and 10-bit)
- Limiter clip function
- User offset adjustment function
- User gain adjustment function
- Built-in FIFO
- Channel-dedicated programable gain amplifier (PGA):
 - Support single-ended or pseudo-differential input
 - 2.5x to 13.33x gain (1.5x to 5.56x for pseudo-differential inputs)
- Optional callback when scan completes, FIFO data is ready, an error occurs, or other

conditions are triggered.

Configuration

Virtual Channels and Scan Groups

A virtual channel is a group of registers that stores the A/D conversion configuration for a single analog pin. Each virtual channel has a number of options including the channel for conversion, settings for conversion, data processing method and so on.

To perform A/D conversion of an analog pin, the channel associated with the pin must first be assigned to a virtual channel. That virtual channel is then assigned to a scan group, which brings together one or more virtual channels to be converted in sequence with a specified conversion unit.

Note

Analog channels may be assigned to more than one virtual channel. However, a virtual channel can be assigned to only one scan group. When performing A/D conversion on one analog channel in different scan groups or when converting a channel several times within the same scan group, assign several virtual channels to one analog channel.

To avoid data being overwritten, when converting a channel multiple times within the same scan group use `R_ADC_B_FifoRead()` instead of `R_ADC_B_Read()`.

Configuring a Scan

To perform A/D conversion of a scan group the following should be configured:

- Assign the analog channel for conversion to a virtual channel.
- Assign the virtual channel to a scan group.
- Assign the scan group to an A/D Converter.

Note

Up to 8 virtual channels can be assigned to a scan group. If more than 8 are assigned only the lowest 8 will be targeted for A/D conversion.

Build Time Configurations for r_adc_b

The following build time configurations are defined in `fsp_cfg/r_adc_b_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	bsp	If selected, code for parameter checking is included in the build.

Note

The instance configurations available in this driver are too numerous to list here. Please refer to the RA Configuration editor in e2 studio for further details.

Clock Configuration

The ADC_B conversion clock source may be configured to use PCLKC, PCLKA, or GPT with a selectable division ratio. The ADC_B clock may operate between 25 MHz at a minimum and 60 MHz at a maximum.

Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_B.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger. When external triggers are used, ADC_B scans begin on the falling edge of the ADTRG pin.

Usage Notes

Self-Calibration

Calibration is required to use this peripheral; call `R_ADC_B_Calibrate()` after open, and prior to any other function. Self-Calibration should be performed any time ADC operating characteristics are modified, including after reset, releasing module-stop, when returning from software standby or deep software standby mode, or each time the ADC open function is called.

Note

Self-calibration is a non-blocking operation. The application should wait for an `ADC_EVENT_CALIBRATION_COMPLETE` callback before using other ADC_B functionality.

ADC_B Operational Modes

The driver supports two primary operational modes, single-scan and continuous-scan. In single scan mode, one or more groups are scanned once per trigger. In continuous scan mode, one or more groups are started with a single trigger. Scans continue until `R_ADC_B_ScanStop()` is called. In each mode, analog groups and virtual channels are converted in ascending order.

Synchronous-Scan Mode

When synchronous operation is enabled all A/D conversions are guaranteed to begin and end based on a user-configured period. When both conversion units are selected for synchronous scan they run from the same period, allowing for consistent timing of simultaneous conversions.

Sample and Hold

Enabling sample and hold on one or more channels instructs the ADC to perform sampling on all channels as soon as a group scan is started. Internal circuitry holds the sampled voltages until the conversion unit is ready.

Note

Each sample and hold unit is connected to two analog channels (0/1, 2/3 etc). When this function is enabled on both members of a pair only one of the two may be scanned at a time. Enabling sample and hold functionality reduces maximum scan frequency because the sample hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

Self-Diagnosis

ADC_B has a built-in self-diagnosis function that can be used to confirm the unit is working correctly. One of three self-diagnosis voltages can be converted and compared to reference values as shown below:

Self-diagnosis mode	Expected reference data	Error condition
Self-diagnosis mode 1	0x0000	Greater or less than reference data (16-bit signed)

Self-diagnosis mode 1	0x8000	Greater than reference data
Self-diagnosis mode 1	0x7FFF	Less than reference data

Add/Average Function

The ADC can be configured to automatically add or average a number of conversions into a single result. When enabled only the result of the operation is returned.

Note

When the A/D-converted value addition/average function is used, overflow of conversion data may occur. However, in certain conditions overflow may not be detected. See the [A/D Conversion Overflow](#) section below for details.

Data Format

The A/D converter in this peripheral has a resolution of 12 bits. When 16-bit or 14-bit data format is selected, the lower 2 or 4 bits (respectively) of the A/D conversion result are extended bits for data processing, error calibration (Self-Calibration), gain/offset adjustment and the averaging function. For 10-bit data length, the upper 6 bits (bit 15 to bit 10) are always 0.

Limiter Clip

The limit clipping function allows for setting upper and lower bounds on converted data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value.

The upper and lower limits are set in one of eight table entries. To perform limit clip functionality, each virtual channel may (optionally) have one of these entries assigned. Interrupts may be enabled for when limiter clip conditions are triggered.

Note

When 14-/12-/10-bit is selected as the data length of the A/D conversion data, the lower bits are cut based on the data-format selection. When 16-bit format is selected, the data length is not rounded.

Using the Temperature Sensor with the ADC_B

The ADC_B HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula:

$$T = (V_s - V_1) / \text{slope} + T_1$$

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- slope: Temperature gradient of the temperature sensor (V/degrees C), given as $(V_2 - V_1) / (T_2 - T_1)$
 - T2: Temperature at the experimental measurement of another point (degrees C)
 - V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)

Note

The slope value can be obtained from the hardware manual for each device in the [Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope](#) entry.

User Offset and Gain

The user offset adjustment function adds or subtracts a constant value to or from the A/D conversion data. Virtual channels select an offset from a table of values specified by the user.

The user gain adjustment function multiplies the A/D conversion data by an arbitrary coefficient value. As with offset adjustment, virtual channels may select a gain value from a table specified by the user.

Note

When the offset or gain adjusting functions are used overflow of A/D conversion data may occur. See the [A/D Conversion Overflow](#) section below for details.

When 14-/12-/10-bit is selected as the data length of converted data the lower bits of offset values are cut based on the data-format selection.

FIFO

The FIFOs consist of 8 stages and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. Each FIFO acts as a ring buffer and data will be lost if the FIFO is not read as needed. Interrupts may be enabled for a specific data storage threshold and on overrun.

Programmable Gain Amplifier

ADC has built-in Programmable Gain Amplifier (PGA). The PGA amplifies an external analog input signal and outputs it to A/D converter, Channel-dedicated sample-and-hold circuit, and High-Speed Analog Comparator (ACMPHS). PGA units are channel specific and utilize two analog input pins per unit. Please refer to the RA Configuration editor in e2 studio or the hardware manual for further details.

Note

When PGA is used, the analog input pin assigned to PGAVSS pin cannot be input to A/D conversion or Channel-dedicated sample-and-hold circuit.

Single-ended input

In single-ended input mode, PGA amplifies the input from PGAIN pin with the specified gain, between $\times 2.000$ to $\times 13.333$. When operating the PGA in single-ended input mode, PGAIN should be connected to the signal source and PGAVSS should be connected to the analog ground (AVSS0). The input voltage to PGAIN must not exceed the range specified in the Electrical Characteristics.

Pseudo-differential input

In pseudo differential input mode, PGA amplifies the difference between PGAIN pin and PGAVSS pin with the specified gain and output the voltage obtained by adding the offset of $0.5 * AV_{CC}$. Settable gains are $\times 1.500$, $\times 2.333$, $\times 4.000$, and $\times 5.667$.

When operating the PGA in Pseudo Differential Input Mode, PGAIN should be connected to the signal source, and PGAVSS should be connected to the reference ground of the signal source. The inputs to PGAIN and PGAVSS pins must not exceed the range specified in the Electrical Characteristics.

When Interrupts Are Not Enabled

Interrupts are enabled by default. If scan-complete interrupts are disabled, [R_ADC_B_StatusGet\(\)](#) can be used to poll the ADC_B driver to determine when the scan has completed. [R_ADC_B_Read\(\)](#) is used to access the converted ADC_B result.

A/D Conversion Overflow

A/D conversion overflow is detected when converted data exceeds the range that can be handled in the specified data format. When overflow occurs, data is restricted to the upper or lower limit value of the specified data format. Overflow is detected in the following cases:

- When the input to the A/D converter exceeds VREFH0 or falls below VREFL0
- When overflow occurs by the internal processing (calculation) for the A/D conversion data due to the following: – Gain Error and Offset Error Calibration – User Gain/Offset adjustment function – When using A/D-Converted Value Addition/Averaging Function – Data Formatting Process

Examples

Basic Example

This is a basic example of minimal use of the ADC_B in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_B_ScanCfg. */
extern const adc_b_scan_cfg_t g_adc_b0_scan_cfg;
void adc_b_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_ADC_B_Open(&g_adc_b0_ctrl, &g_adc_b0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_ADC_B_Calibrate(&g_adc_b0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete */
    adc_status_t status = {.state = ADC_STATE_SCAN_IN_PROGRESS};
    while ((ADC_STATE_SCAN_IN_PROGRESS == status.state) &&
           (FSP_SUCCESS == err))
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
        err = R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
    }
    assert(FSP_SUCCESS == err);
    /* Enable channels. */
```

```
err = R_ADC_B_ScanCfg(&g_adc_b0_ctrl, &g_adc_b0_scan_cfg);
assert(FSP_SUCCESS == err);

/* Start one or more scan groups by calling R_ADC_B_ScanGroupStart(). Alternatively,
all scan groups may be started
* by calling R_ADC_B_ScanCfg(). */
(void) R_ADC_B_ScanGroupStart(&g_adc_b0_ctrl, ADC_GROUP_MASK_0);
/* Wait for conversion to complete. */
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
    (void) R_ADC_B_StatusGet(&g_adc_b0_ctrl, &status);
}
/* Read converted data. */
uint16_t channel_0_conversion_result;
err = R_ADC_B_Read(&g_adc_b0_ctrl, ADC_CHANNEL_0, &channel_0_conversion_result);
assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ [adc_b_fifo_data_t](#)

struct adc_b_fifo_data_t		
ADC FIFO data type		
Data Fields		
uint32_t	data: 16	Conversion Data.
uint32_t	__pad0__: 8	
adc_channel_t	physical_channel: 7	Channel number for data.
uint32_t	err: 1	Error bit.

◆ [adc_b_fifo_read_t](#)

struct adc_b_fifo_read_t		
ADC FIFO Read data structure		
Data Fields		

uint8_t	count	Number of valid FIFO data read.
adc_b_fifo_data_t	fifo_data[8]	FIFO data.

◆ **adc_b_group_cfg_t**

struct adc_b_group_cfg_t		
ADC Group configuration data		
Data Fields		
adc_group_id_t	scan_group_id	Scan Group ID.
adc_b_unit_id_t	converter_selection	Converter selection.
bool	scan_group_enable	Scan Group enable state.
uint8_t	virtual_channel_count	Virtual Channel count.
bool	scan_end_interrupt_enable	Scan End Interrupt enable.
adc_b_external_trigger_t	external_trigger_enable_mask	External Trigger mask.
elc_peripheral_t	elc_trigger_enable_mask	ELC Trigger mask.
adc_b_gpt_trigger_t	gpt_trigger_enable_mask	GPT Trigger mask.
uint8_t	conversion_start_delay	Conversion start delay.
uint32_t	self_diagnosis_mask	Self-Diagnosis register data.
bool	limit_clip_interrupt_enable	Limiter Clip interrupt enable.
adc_b_virtual_channel_cfg_t **	p_virtual_channels	Pointer to virtual channel configuration array of size virtual_channel_count.

◆ **adc_b_scan_cfg_t**

struct adc_b_scan_cfg_t		
ADC Scan Group configuraiton		
Data Fields		
uint8_t	group_count	Group Count.
adc_b_group_cfg_t **	p_adc_groups	Pointer to ADC group configuration data.

◆ **adc_b_isr_cfg_t**

struct adc_b_isr_cfg_t		
ADC ISR configuration structure		
Data Fields		
uint8_t	calibration_end_ipl_adc_0	Calibration end IPL for A/D converter unit 0.
uint8_t	calibration_end_ipl_adc_1	Calibration end IPL for A/D converter unit 1.

uint8_t	conversion_error_ipl_adc_0	Conversion error IPL for A/D converter unit 0.
uint8_t	conversion_error_ipl_adc_1	Conversion error IPL for A/D converter unit 1.
uint8_t	fifo_overflow_ipl	FIFO Overflow IPL.
uint8_t	fifo_read_ipl_group_0	FIFO Read threshold request IPL for Group 0.
uint8_t	fifo_read_ipl_group_1	FIFO Read threshold request IPL for Group 1.
uint8_t	fifo_read_ipl_group_2	FIFO Read threshold request IPL for Group 2.
uint8_t	fifo_read_ipl_group_3	FIFO Read threshold request IPL for Group 3.
uint8_t	fifo_read_ipl_group_4	FIFO Read threshold request IPL for Group 4.
uint8_t	fifo_read_ipl_group_5678	FIFO Read threshold request IPL for Groups 5, 6, 7, and 8.
uint8_t	limit_clip_ipl	Limiter Clip IPL.
uint8_t	overflow_error_ipl_adc_0	Overflow error IPL for A/D converter unit 0.
uint8_t	overflow_error_ipl_adc_1	Overflow error IPL for A/D converter unit 1.
uint8_t	scan_end_ipl_group_0	Scan End IPL for A/D Group 0.
uint8_t	scan_end_ipl_group_1	Scan End IPL for A/D Group 1.
uint8_t	scan_end_ipl_group_2	Scan End IPL for A/D Group 2.
uint8_t	scan_end_ipl_group_3	Scan End IPL for A/D Group 3.
uint8_t	scan_end_ipl_group_4	Scan End IPL for A/D Group 4.
uint8_t	scan_end_ipl_group_5678	Scan End IRQ for A/D Groups 5, 6, 7, and 8.
IRQn_Type	calibration_end_irq_adc_0	Calibration end IRQ for A/D converter unit 0.
IRQn_Type	calibration_end_irq_adc_1	Calibration end IRQ for A/D converter unit 1.
IRQn_Type	conversion_error_irq_adc_0	Conversion error IRQ for A/D converter unit 0.
IRQn_Type	conversion_error_irq_adc_1	Conversion error IRQ for A/D converter unit 1.
IRQn_Type	fifo_overflow_irq	FIFO Overflow IRQ.
IRQn_Type	fifo_read_irq_group_0	FIFO Read threshold request IRQ for Group 0.

IRQn_Type	fifo_read_irq_group_1	FIFO Read threshold request IRQ for Group 1.
IRQn_Type	fifo_read_irq_group_2	FIFO Read threshold request IRQ for Group 2.
IRQn_Type	fifo_read_irq_group_3	FIFO Read threshold request IRQ for Group 3.
IRQn_Type	fifo_read_irq_group_4	FIFO Read threshold request IRQ for Group 4.
IRQn_Type	fifo_read_irq_group_5678	FIFO Read threshold request IRQ for Groups 5, 6, 7, and 8.
IRQn_Type	limit_clip_irq	Limiter Clip IRQ.
IRQn_Type	overflow_error_irq_adc_0	Overflow error IRQ for A/D converter unit 0.
IRQn_Type	overflow_error_irq_adc_1	Overflow error IRQ for A/D converter unit 1.
IRQn_Type	scan_end_irq_group_0	Scan End IRQ for A/D Group 0.
IRQn_Type	scan_end_irq_group_1	Scan End IRQ for A/D Group 1.
IRQn_Type	scan_end_irq_group_2	Scan End IRQ for A/D Group 2.
IRQn_Type	scan_end_irq_group_3	Scan End IRQ for A/D Group 3.
IRQn_Type	scan_end_irq_group_4	Scan End IRQ for A/D Group 4.
IRQn_Type	scan_end_irq_group_5678	Scan End IRQ for A/D Groups 5, 6, 7, and 8.

◆ adc_b_extended_cfg_t

struct adc_b_extended_cfg_t		
ADC extended configuration data		
Data Fields		
adc_b_pga_gain_t	pga_gain[4]	PGA Gain selection.
union adc_b_extended_cfg_t	__unnamed__	
uint32_t	clock_control_data	Clock control register data.
uint32_t	sync_operation_control	Synchronous Operation Control register data.
uint32_t	adc_b_mode	ADC_B mode register data.
uint32_t	scan_group_enable	Scan Group enable register data.
uint32_t	converter_selection_0	Converter Selection register data for groups 0,1,2,3.
uint32_t	converter_selection_1	Converter Selection register data for groups 4,5,6,7.

uint32_t	converter_selection_2	Converter Selection register data for group 8.
uint32_t	fifo_enable_mask	FIFO enable register data.
uint32_t	fifo_interrupt_enable_mask	FIFO interrupt enable register data.
uint32_t	fifo_interrupt_level0	FIFO data threshold interrupt level register data for Group 0 and 1.
uint32_t	fifo_interrupt_level1	FIFO data threshold interrupt level register data for Group 2 and 3.
uint32_t	fifo_interrupt_level2	FIFO data threshold interrupt level register data for Group 4 and 5.
uint32_t	fifo_interrupt_level3	FIFO data threshold interrupt level register data for Group 6 and 7.

uint32_t	start_trigger_delay_0	Start trigger delay register data for group 0 and 1.
uint32_t	start_trigger_delay_1	Start trigger delay register data for group 2 and 3.
uint32_t	start_trigger_delay_2	Start trigger delay register data for group 4 and 5.
uint32_t	start_trigger_delay_3	Start trigger delay register data for group 6 and 7.
uint32_t	start_trigger_delay_4	Start trigger delay register data for group 8.
uint32_t	calibration_adc_state	Calibration State register data.
uint32_t	calibration_sample_and_hold	Calibration Sample and Hold register data.
const adc_b_isr_cfg_t *	p_isr_cfg	Pointer to ISR configuration.
uint32_t	sampling_state_tables[8]	Sampling State Table register data.
uint8_t	sample_and_hold_enable_mask	Sample and Hold enable register data.
uint32_t	sample_and_hold_config_012	Sample and Hold configuration register data.
uint32_t	sample_and_hold_config_456	Sample and Hold configuration register data.
uint32_t	conversion_state	ADC 0/1 Successive

		Approximation Time Configuration.
int32_t	user_offset_tables[8]	User Offset Table register data.
uint32_t	user_gain_tables[8]	User Gain Table register data.
uint32_t	limiter_clip_interrupt_enable_mask	Limiter clip interrupt enable register data.
uint32_t	limiter_clip_tables[8]	Limiter clip Table register data.

◆ adc_b_instance_ctrl_t

struct adc_b_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open() .

Enumeration Type Documentation

◆ adc_b_clock_source_t

enum adc_b_clock_source_t	
ADC Clock source selection	
Enumerator	
ADC_B_CLOCK_SOURCE_PCLKC	ADC Clock Source PCLKC.
ADC_B_CLOCK_SOURCE_GPT	ADC Clock Source GPT.
ADC_B_CLOCK_SOURCE_PCLKA	ADC Clock Source PCLKA.

◆ **adc_b_clock_divider_t**

enum <code>adc_b_clock_divider_t</code>	
ADC clock divider selection	
Enumerator	
<code>ADC_B_CLOCK_DIV_1</code>	ADC Clock Division 1/1.
<code>ADC_B_CLOCK_DIV_2</code>	ADC Clock Division 1/2.
<code>ADC_B_CLOCK_DIV_3</code>	ADC Clock Division 1/3.
<code>ADC_B_CLOCK_DIV_4</code>	ADC Clock Division 1/4.
<code>ADC_B_CLOCK_DIV_5</code>	ADC Clock Division 1/5.
<code>ADC_B_CLOCK_DIV_6</code>	ADC Clock Division 1/6.
<code>ADC_B_CLOCK_DIV_7</code>	ADC Clock Division 1/7.
<code>ADC_B_CLOCK_DIV_8</code>	ADC Clock Division 1/8.

◆ **adc_b_resolution_t**

enum <code>adc_b_resolution_t</code>	
ADC_B data resolution definitions	
Enumerator	
<code>ADC_B_RESOLUTION_16_BIT</code>	16 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_14_BIT</code>	14 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_12_BIT</code>	12 bit <code>adc_b</code> resolution
<code>ADC_B_RESOLUTION_10_BIT</code>	10 bit <code>adc_b</code> resolution

◆ **adc_b_virtual_channel_t**

enum <code>adc_b_virtual_channel_t</code>	
ADC channels	
Enumerator	
<code>ADC_B_VIRTUAL_CHANNEL_0</code>	ADC B virtual channel 0.
<code>ADC_B_VIRTUAL_CHANNEL_1</code>	ADC B virtual channel 1.
<code>ADC_B_VIRTUAL_CHANNEL_2</code>	ADC B virtual channel 2.
<code>ADC_B_VIRTUAL_CHANNEL_3</code>	ADC B virtual channel 3.
<code>ADC_B_VIRTUAL_CHANNEL_4</code>	ADC B virtual channel 4.
<code>ADC_B_VIRTUAL_CHANNEL_5</code>	ADC B virtual channel 5.
<code>ADC_B_VIRTUAL_CHANNEL_6</code>	ADC B virtual channel 6.
<code>ADC_B_VIRTUAL_CHANNEL_7</code>	ADC B virtual channel 7.
<code>ADC_B_VIRTUAL_CHANNEL_8</code>	ADC B virtual channel 8.
<code>ADC_B_VIRTUAL_CHANNEL_9</code>	ADC B virtual channel 9.
<code>ADC_B_VIRTUAL_CHANNEL_10</code>	ADC B virtual channel 10.
<code>ADC_B_VIRTUAL_CHANNEL_11</code>	ADC B virtual channel 11.
<code>ADC_B_VIRTUAL_CHANNEL_12</code>	ADC B virtual channel 12.
<code>ADC_B_VIRTUAL_CHANNEL_13</code>	ADC B virtual channel 13.
<code>ADC_B_VIRTUAL_CHANNEL_14</code>	ADC B virtual channel 14.
<code>ADC_B_VIRTUAL_CHANNEL_15</code>	ADC B virtual channel 15.

<code>ADC_B_LIMIT_CLIP_TABLE_SELECTION_5</code>	Limiter Clip Table 5.
<code>ADC_B_LIMIT_CLIP_TABLE_SELECTION_6</code>	Limiter Clip Table 6.
<code>ADC_B_LIMIT_CLIP_TABLE_SELECTION_7</code>	Limiter Clip Table 7.

◆ **adc_b_unit_id_t**

enum <code>adc_b_unit_id_t</code>	
ADC unit selection options	
Enumerator	
<code>ADC_B_UNIT_ID_0</code>	ADC Unit ID 0.
<code>ADC_B_UNIT_ID_1</code>	ADC Unit ID 1.

◆ **adc_b_unit_mask_t**

enum <code>adc_b_unit_mask_t</code>	
ADC unit selection options	
Enumerator	
<code>ADC_B_UNIT_MASK_0</code>	ADC Unit Mask 0.
<code>ADC_B_UNIT_MASK_1</code>	ADC Unit Mask 1.
<code>ADC_B_UNIT_MASK_UNDEFINED</code>	ADC Unit Mask Unknown.

◆ **adc_b_add_avg_mode_t**

enum <code>adc_b_add_avg_mode_t</code>	
ADC data sample addition and averaging options	
Enumerator	
<code>ADC_B_ADD_AVERAGE_OFF</code>	Add/Average turned off for channels/sensors.
<code>ADC_B_ADD_AVERAGE_ADDITION_ENABLE</code>	Addition Mode Enabled.
<code>ADC_B_ADD_AVERAGE_AVERAGE_ENABLE</code>	Average Mode Enabled.

◆ **adc_b_add_avg_count_t**

enum adc_b_add_avg_count_t	
ADC data sample addition and averaging options	
Enumerator	
ADC_B_ADD_AVERAGE_1	Addition turned off for channels/sensors.
ADC_B_ADD_AVERAGE_2	Add/Average 2 samples.
ADC_B_ADD_AVERAGE_4	Add/Average 4 samples.
ADC_B_ADD_AVERAGE_8	Add/Average 8 samples.
ADC_B_ADD_AVERAGE_16	Add/Average 16 samples.
ADC_B_ADD_AVERAGE_32	Add/Average 32 samples.
ADC_B_ADD_AVERAGE_64	Add/Average 64 samples.
ADC_B_ADD_AVERAGE_128	Add/Average 128 samples.
ADC_B_ADD_AVERAGE_256	Add/Average 256 samples.
ADC_B_ADD_AVERAGE_512	Add/Average 512 samples.
ADC_B_ADD_AVERAGE_1024	Add/Average 1024 samples.

◆ **adc_b_gpt_trigger_t**

enum adc_b_gpt_trigger_t	
ADC GPT Trigger options	
Enumerator	
ADC_B_GPT_TRIGGER_NONE	GPT Trigger Disabled.
ADC_B_GPT_TRIGGER_A0	GPT Trigger A0.
ADC_B_GPT_TRIGGER_A1	GPT Trigger A1.
ADC_B_GPT_TRIGGER_A2	GPT Trigger A2.
ADC_B_GPT_TRIGGER_A3	GPT Trigger A3.
ADC_B_GPT_TRIGGER_A4	GPT Trigger A4.

ADC_B_GPT_TRIGGER_A5	GPT Trigger A5.
ADC_B_GPT_TRIGGER_A6	GPT Trigger A6.
ADC_B_GPT_TRIGGER_A7	GPT Trigger A7.
ADC_B_GPT_TRIGGER_A8	GPT Trigger A8.
ADC_B_GPT_TRIGGER_A9	GPT Trigger A9.
ADC_B_GPT_TRIGGER_B0	GPT Trigger B0.
ADC_B_GPT_TRIGGER_B1	GPT Trigger B1.
ADC_B_GPT_TRIGGER_B2	GPT Trigger B2.
ADC_B_GPT_TRIGGER_B3	GPT Trigger B3.
ADC_B_GPT_TRIGGER_B4	GPT Trigger B4.
ADC_B_GPT_TRIGGER_B5	GPT Trigger B5.
ADC_B_GPT_TRIGGER_B6	GPT Trigger B6.
ADC_B_GPT_TRIGGER_B7	GPT Trigger B7.
ADC_B_GPT_TRIGGER_B8	GPT Trigger B8.
ADC_B_GPT_TRIGGER_B9	GPT Trigger B9.

◆ adc_b_external_trigger_t

enum <code>adc_b_external_trigger_t</code>	
ADC External Trigger options	
Enumerator	
ADC_B_EXTERNAL_TRIGGER_NONE	External Trigger Disabled.
ADC_B_EXTERNAL_TRIGGER_ADTRG0	External Trigger ADTRG0 Selection.

<code>ADC_B_USER_OFFSET_TABLE_SELECTION_7</code>	User Offset table 7.

Function Documentation◆ **R_ADC_B_Open()**

`fsp_err_t R_ADC_B_Open (adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg)`

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If provided, the function registers a callback function pointer for notifying the user whenever a scan has completed, error has occurred, FIFO read request is generated, or other ADC interrupt event occurs. Implements `adc_api_t::open`.

Return values

<code>FSP_SUCCESS</code>	Module is ready for use.
<code>FSP_ERR_ASSERTION</code>	An input argument is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance control structure has already been opened.

◆ **R_ADC_B_ScanCfg()**

```
fsp_err_t R_ADC_B_ScanCfg ( adc_ctrl_t* p_ctrl, void const *const p_scan_cfg )
```

Configures the ADC_B scan parameters. Channel specific settings are set in this function. Pass a pointer to `adc_b_scan_cfg_t` to `p_channel_cfg`. Implements `adc_api_t::scanCfg`.

Note

This starts group B scans if `adc_b_scan_cfg_t::priority_group_a` is set to `ADC_B_GROUP_A_GROUP_B_CONTINUOUS_SCAN`.

Return values

FSP_SUCCESS	Channel specific settings applied.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_INVALID_STATE	Invalid Scan Configuration.

◆ **R_ADC_B_InfoGet()**

```
fsp_err_t R_ADC_B_InfoGet ( adc_ctrl_t* p_ctrl, adc_info_t* p_adc_info )
```

Provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

Return values

FSP_SUCCESS	Info is read into <code>p_adc_info</code> .
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ R_ADC_B_ScanStart()

`fsp_err_t R_ADC_B_ScanStart (adc_ctrl_t* p_ctrl)`

Enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_B_ScanCfg call. If the unit was configured for ELC, GPT, or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, This function was added to this ADC version for compatability with r_adc driver. For additional flexibility, it is recommended R_ADC_B_GroupScanStart.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.

Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ R_ADC_B_ScanGroupStart()

```
fsp_err_t R_ADC_B_ScanGroupStart ( adc_ctrl_t* p_ctrl, adc_group_mask_t group_mask )
```

Starts a software scan or enables the hardware trigger for a scan depending on how triggers were configured. If the group was configured for ELC, GPT, or external hardware triggering then this function allows the trigger signal to get to the ADC unit. The function itself is not able to control the generation of peripheral triggers. If the unit was configured for software triggering, then this function starts the software triggered scan.

Precondition

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.

Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

Return values

FSP_SUCCESS	Scan started (software trigger) or hardware triggers enabled.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	An invalid group has been provided.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_IN_USE	Another scan is still in progress (software trigger).

◆ R_ADC_B_ScanStop()

```
fsp_err_t R_ADC_B_ScanStop ( adc_ctrl_t* p_ctrl)
```

Disables the hardware trigger for a scan and immediately stops all active converters. This function will abort all active conversions.

Return values

FSP_SUCCESS	All scans stopped.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_ARGUMENT	No hardware triggers configured for groups.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.

◆ **R_ADC_B_StatusGet()**

```
fsp_err_t R_ADC_B_StatusGet ( adc_ctrl_t* p_ctrl, adc_status_t* p_status )
```

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

Return values

FSP_SUCCESS	Module status stored in the provided pointer p_status
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_B_Read()**

```
fsp_err_t R_ADC_B_Read ( adc_ctrl_t* p_ctrl, adc_channel_t const channel_id, uint16_t*const p_data )
```

Reads conversion results from a single channel or sensor.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

◆ **R_ADC_B_Read32()**

```
fsp_err_t R_ADC_B_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const channel_id, uint32_t *const p_data )
```

Reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_INVALID_DATA	Accuracy of data cannot be guaranteed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_CHANNEL	Invalid channel provided.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [adc_api_t::read](#)

◆ **R_ADC_B_FifoRead()**

```
fsp_err_t R_ADC_B_FifoRead ( adc_ctrl_t * p_ctrl, adc_group_mask_t const group_mask, adc_b_fifo_read_t *const p_data )
```

Reads conversion results from FIFO for the given group mask.

Return values

FSP_SUCCESS	Data read into provided p_data.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.
FSP_ERR_NOT_INITIALIZED	Unit not initialized.
FSP_ERR_INVALID_ARGUMENT	Invalid group provided.
FSP_ERR_UNDERFLOW	FIFO empty.

◆ **R_ADC_B_Close()**

```
fsp_err_t R_ADC_B_Close ( adc_ctrl_t * p_ctrl )
```

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **R_ADC_B_OffsetSet()**

```
fsp_err_t R_ADC_B_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t offset )
```

`adc_api_t::offsetSet` is not supported on the ADC_B.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R_ADC_B_Calibrate()**

```
fsp_err_t R_ADC_B_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Initiates calibration of the ADC_B. This function must be called before starting a scan and again whenever ADC_B configuration or state is changed.

Parameters

[in]	p_ctrl	Pointer to the instance control structure
[in]	p_extend	Unused argument.

Return values

FSP_SUCCESS	Calibration successfully initiated.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_HW_CONDITION	Error occurred during calibration.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ R_ADC_B_CallbackSet()

```
fsp_err_t R_ADC_B_CallbackSet ( adc_ctrl_t *const p_api_ctrl, void(*) (adc_callback_args_t *)
p_callback, void const *const p_context, adc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `adc_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.5 Asynchronous General Purpose Timer (r_agt)

```

Detailed Description

Driver for the AGT peripheral on RA MCUs. This module implements the [Timer Interface](#).

Overview

Features

The AGT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, including PCLKB, LOCO, SUBCLK, and external sources input to AGTIO.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to AGTIO.
- Supports debounce filter on AGTIO pins.
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a	The AGT runs off PCLKB, LOCO,

configurable divider up to 1024. It can also be configured to count ELC events or external pulses.

or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.

Configuration

Build Time Configurations for r_agt

The following build time configurations are defined in fsp_cfg/r_agt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	Enable input support to use pulse width measurement mode, pulse period measurement mode, or input from P402, P402, or AGTIO.

Configurations for Timers > Timer, Low-Power (r_agt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Low-Power (r_agt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.
General > Channel	Channel number does not exist	0	Physical hardware channel.
General > Mode	<ul style="list-style-type: none"> Periodic One-Shot PWM 	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
General > Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit.

When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x10000 for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x80000 when counting from PCLKB or 0x800000 when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum period.

If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the [timer_cfg_t](#) structure.

General > Period Unit

- Raw Counts
- Nanoseconds
- Microseconds
- Milliseconds
- Seconds
- Hertz
- Kilohertz

Raw Counts

Unit of the period specified above

General > Count Source

- PCLKB
- LOCO
- SUBCLOCK
- AGT Underflow
- P402 Input
- P403 Input
- AGTIO Input

PCLKB

AGT counter clock source. NOTE: The divisor is calculated automatically based on the selected period. See [agt_count_source_t](#) documentation for details.

Output > Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
Output > AGTOA Output	<ul style="list-style-type: none"> • Disabled • Start Level Low • Start Level High 	Disabled	Configure AGTOA output.
Output > AGTOB Output	<ul style="list-style-type: none"> • Disabled • Start Level Low • Start Level High 	Disabled	Configure AGTOB output.
Output > AGTO Output	<ul style="list-style-type: none"> • Disabled • Start Level Low • Start Level High 	Disabled	Configure AGTO output.
Input > Measurement Mode	<ul style="list-style-type: none"> • Measure Disabled • Measure Low Level Pulse Width • Measure High Level Pulse Width • Measure Pulse Period 	Measure Disabled	Select if the AGT should be used to measure pulse width or pulse period. In high level pulse width measurement mode, the AGT counts when AGTIO is high and starts counting immediately in the middle of a pulse if AGTIO is high when R_AGT_Start() is called. In low level pulse width measurement mode, the AGT counts when AGTIO is low and could start counting in the middle of a pulse if AGTIO is low when R_AGT_Start() is called.
Input > Input Filter	<ul style="list-style-type: none"> • No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8 • Filter sampled at PCLKB / 32 	No Filter	Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Input > Enable Pin	<ul style="list-style-type: none"> • Enable Pin Not Used • Enable Pin Active Low • Enable Pin Active High 	Enable Pin Not Used	Select active edge for the AGTEE pin if used. Only applies if the count source is P402, P403 or AGTIO.

Input > Trigger Edge	<ul style="list-style-type: none"> • Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both 	Trigger Edge Rising	Select the trigger edge. Applies if measurement mode is pulse period, or if the count source is P402, P403, or AGTIO. Do not select Trigger Edge Both with pulse period measurement.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Interrupts > Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The AGT clock is based on the PCLKB, LOCO, or Subclock frequency. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the AGTOA and AGTOB pins as output pins for periodic, one-shot, or PWM signals.

For input capture, the input signal must be applied to the AGTIO pin.

For event counting, the AGTEEn enable pin is optional.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	Maximum period (counts)
LOCO/Subclock	0x800000
PCLKB	0x80000
All other sources	0x10000

Note

Though the AGT is a 16-bit timer, because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Starting and Stopping the AGT

After starting or stopping the timer, AGT registers cannot be accessed until the AGT state is updated after 3 AGTCLK cycles. If another AGT function is called before the 3 AGTCLK period elapses, the function spins waiting for the AGT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of AGTCLK, which is derived from [timer_cfg_t::source_div](#) and [agt_extended_cfg_t::count_source](#).

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The AGT1 (channel 1 only) can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The AGT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the [Data Transfer Controller \(r_dtc\)](#).

One-Shot Mode Output

The output waveform in one-shot mode is one AGT clock cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

Figure 142: AGT One-Shot Output

Periodic Output

The AGTOA or AGTOB pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square (from rising edge to rising edge) matches the period of the AGT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

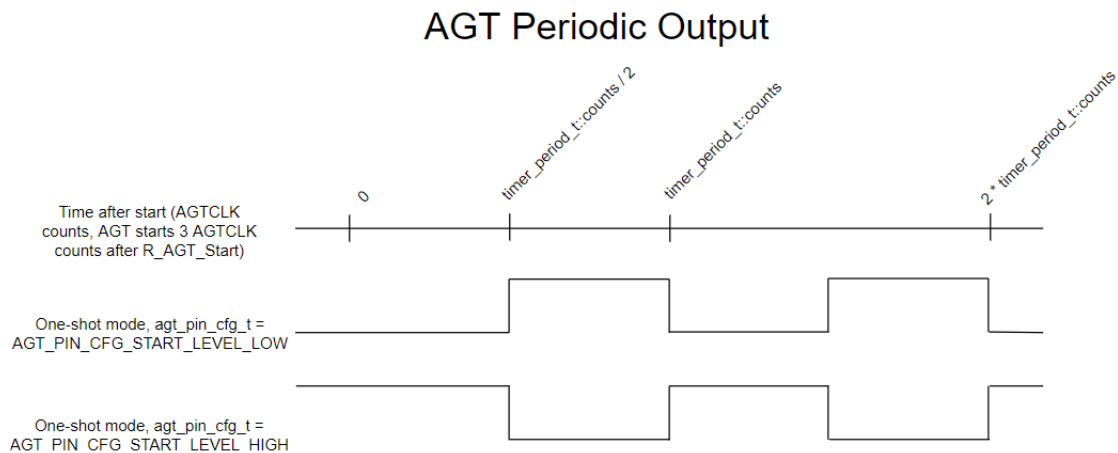

Figure 143: AGT Periodic Output

PWM Output

This module does not support in phase PWM output. The PWM output signal is low at the beginning of the cycle and high at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

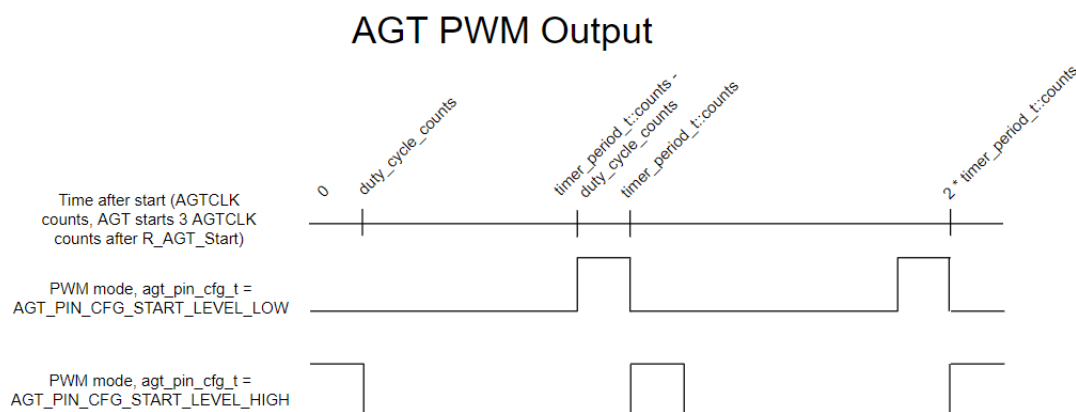

Figure 144: AGT PWM Output

Triggering ELC Events with AGT

The AGT timer can trigger the start of other peripherals. The [Event Link Controller \(r_elc\)](#) guide provides a list of all available peripherals.

Examples

AGT Basic Example

This is a basic example of minimal use of the AGT in an application.

```
void agt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
}
```

AGT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* Add application code to be called periodically here. */
    }
}
```

AGT Free Running Counter Example

To use the AGT as a free running counter, select periodic mode and set the the Period to 0xFFFF.

```
void agt_counter_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
    /* (Optional) Stop the timer. */
    (void) R_AGT_Stop(&g_timer0_ctrl);
    /* Read the current counter value. Counter value is in status.counter. */
    timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
}
```

AGT Input Capture Example

This is an example of using the AGT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CAPTURE_A == p_args->event)
    {
        /* (Optional) Get the current period if not known. */
        timer_info_t info;
        (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
        uint32_t period = info.period_counts;
        /* Process capture from AGTIO. */
        g_captured_time = ((uint64_t) period * g_capture_overflows) +
p_args->capture;
        g_capture_overflows = 0U;
    }
}
```

```
if (TIMER_EVENT_CYCLE_END == p_args->event)
{
    /* An overflow occurred during capture. This must be accounted for at the
application layer. */
    g_capture_overflows++;
}
}
void agt_capture_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_AGT_Enable(&g_timer0_ctrl);
    /* (Optional) Disable captures. */
    (void) R_AGT_Disable(&g_timer0_ctrl);
}
```

AGT Period Update Example

This an example of updating the period.

```
#define AGT_EXAMPLE_MSEC_PER_SEC (1000)
#define AGT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void agt_period_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
```

```

    (void) R_AGT_Start(&g_timer0_ctrl);

/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
 * This example uses the last option (R_FSP_SystemClockHzGet).
 */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclk_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
        (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
 * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}

```

AGT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
```

```
#define AGT_EXAMPLE_MAX_PERCENT (100)

/* This example shows how to calculate a new duty cycle value at runtime. */
void agt_duty_cycle_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);

    /* Get the current period setting. */
    timer_info_t info;
    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;

    /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                AGT_EXAMPLE_MAX_PERCENT;

    /* Set the calculated duty cycle. */
    err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
    assert(FSP_SUCCESS == err);
}
```

AGT Cascaded Timers Example

This is an example of using underflow from an even AGT channel as the count source for the next channel (in this case, AGT0 and AGT1).

```
/* This example shows how to use cascaded timers. The count source for AGT channel 1 is
set to AGT0 underflow. */
void agt_cascaded_timers_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
```

```

/* Initialize the timers in any order. */
err = R_AGT_Open(&g_timer_channel0_ctrl, &g_timer_channel0_cfg);
assert(FSP_SUCCESS == err);

err = R_AGT_Open(&g_timer_channel1_ctrl, &g_timer_channel1_cfg);
assert(FSP_SUCCESS == err);

/* Start AGT channel 1 first. */
(void) R_AGT_Start(&g_timer_channel1_ctrl);
(void) R_AGT_Start(&g_timer_channel0_ctrl);

/* (Optional) Stop AGT channel 0 first. */
(void) R_AGT_Stop(&g_timer_channel0_ctrl);
(void) R_AGT_Stop(&g_timer_channel1_ctrl);

/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
(void) R_AGT_StatusGet(&g_timer_channel1_ctrl, &status);
}

```

Data Structures

struct [agt_instance_ctrl_t](#)

struct [agt_extended_cfg_t](#)

Enumerations

enum [agt_clock_t](#)

enum [agt_measure_t](#)

enum [agt_agtio_filter_t](#)

enum [agt_enable_pin_t](#)

enum [agt_trigger_edge_t](#)

enum [agt_output_pin_t](#)

enum [agt_pin_cfg_t](#)

Data Structure Documentation

◆ agt_instance_ctrl_t

struct [agt_instance_ctrl_t](#)

Channel control block. DO NOT INITIALIZE. Initialization occurs when `timer_api_t::open` is called.

◆ agt_extended_cfg_t

struct agt_extended_cfg_t		
Optional AGT extension data structure.		
Data Fields		
<code>agt_clock_t</code>	<code>count_source</code>	AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
<code>union agt_extended_cfg_t</code>	<code>__unnamed__</code>	
<code>agt_pin_cfg_t</code>	<code>agto: 3</code>	Configure AGTO pin. <i>Note</i> <i>AGTIO polarity is opposite AGTO</i>
<code>agt_measure_t</code>	<code>measurement_mode</code>	Measurement mode.
<code>agt_agtio_filter_t</code>	<code>agtio_filter</code>	Input filter for AGTIO.
<code>agt_enable_pin_t</code>	<code>enable_pin</code>	Enable pin (event counting only)
<code>agt_trigger_edge_t</code>	<code>trigger_edge</code>	Trigger edge to start pulse period measurement or count external event.

Enumeration Type Documentation

◆ **agt_clock_t**

enum agt_clock_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	PCLKB count source, division by 1, 2, or 8 allowed.
AGT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_AGT_UNDERFLOW	Underflow event signal from next lowest AGT channel, division must be 1.
AGT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_P402	Counts events on P402, events are counted in deep software standby mode.
AGT_CLOCK_P403	Counts events on P403, events are counted in deep software standby mode.
AGT_CLOCK_AGTIO	Counts events on AGTIO, events are not counted in software standby modes.

◆ **agt_measure_t**

enum agt_measure_t	
Enable pin for event counting mode.	
Enumerator	
AGT_MEASURE_DISABLED	AGT used as a counter.
AGT_MEASURE_PULSE_WIDTH_LOW_LEVEL	AGT used to measure low level pulse width.
AGT_MEASURE_PULSE_WIDTH_HIGH_LEVEL	AGT used to measure high level pulse width.
AGT_MEASURE_PULSE_PERIOD	AGT used to measure pulse period.

◆ **agt_agtio_filter_t**

enum agt_agtio_filter_t	
Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
AGT_AGTIO_FILTER_NONE	No filter.
AGT_AGTIO_FILTER_PCLKB	Filter at PCLKB.
AGT_AGTIO_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
AGT_AGTIO_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

◆ **agt_enable_pin_t**

enum agt_enable_pin_t	
Enable pin for event counting mode.	
Enumerator	
AGT_ENABLE_PIN_NOT_USED	AGTEE/AGTWEE is not used.
AGT_ENABLE_PIN_ACTIVE_LOW	Events are only counted when AGTEE/AGTWEE is low.
AGT_ENABLE_PIN_ACTIVE_HIGH	Events are only counted when AGTEE/AGTWEE is high.

◆ **agt_trigger_edge_t**

enum agt_trigger_edge_t	
Trigger edge for pulse period measurement mode and event counting mode.	
Enumerator	
AGT_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
AGT_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
AGT_TRIGGER_EDGE_BOTH	Events are counted on both edges (n/a for pulse period mode)

◆ **agt_output_pin_t**

enum agt_output_pin_t	
Output pins, used to select which duty cycle to update in R_AGT_DutyCycleSet() .	
Enumerator	
AGT_OUTPUT_PIN_AGTOA	AGTOA.
AGT_OUTPUT_PIN_AGTOB	AGTOB.

◆ **agt_pin_cfg_t**

enum agt_pin_cfg_t	
Level of AGT pin	
Enumerator	
AGT_PIN_CFG_DISABLED	Not used as output pin.
AGT_PIN_CFG_START_LEVEL_LOW	Pin level low.
AGT_PIN_CFG_START_LEVEL_HIGH	Pin level high.

Function Documentation

◆ **R_AGT_Close()**

```
fsp_err_t R_AGT_Close ( timer_ctrl_t *const p_ctrl)
```

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements `timer_api_t::close`.

Return values

FSP_SUCCESS	Timer closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_PeriodSet()**

```
fsp_err_t R_AGT_PeriodSet ( timer_ctrl_t *const p_ctrl, uint32_t const period_counts )
```

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements `timer_api_t::periodSet`.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.

Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
 * This example uses the last option (R_FSP_SystemClockHzGet).
 */
uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
```

```
g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclk_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
 * period is larger than UINT16_MAX. */
err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_DutyCycleSet()**

```
fsp_err_t R_AGT_DutyCycleSet ( timer_ctrl_t *const p_ctrl, uint32_t const duty_cycle_counts,
uint32_t const pin )
```

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements [timer_api_t::dutyCycleSet](#).

Example:

```
/* Get the current period setting. */
timer_info_t info;
(void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
AGT_EXAMPLE_MAX_PERCENT;
/* Set the calculated duty cycle. */
err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not AGT_AGTO_AGTOA or AGT_AGTO_AGTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	AGT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ **R_AGT_Reset()**

```
fsp_err_t R_AGT_Reset ( timer_ctrl_t *const p_ctrl)
```

Resets the counter value to the period minus one. Implements `timer_api_t::reset`.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_Start()**

```
fsp_err_t R_AGT_Start ( timer_ctrl_t *const p_ctrl)
```

Starts timer. Implements `timer_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_AGT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_Enable()**

```
fsp_err_t R_AGT_Enable ( timer_ctrl_t *const p_ctrl)
```

Enables external event triggers that start, stop, clear, or capture the counter. Implements [timer_api_t::enable](#).

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
(void) R_AGT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_AGT_Disable()**

```
fsp_err_t R_AGT_Disable ( timer_ctrl_t *const p_ctrl)
```

Disables external event triggers that start, stop, clear, or capture the counter. Implements [timer_api_t::disable](#).

Example:

```
/* (Optional) Disable captures. */
(void) R_AGT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_AGT_InfoGet()**

```
fsp_err_t R_AGT_InfoGet ( timer_ctrl_t *const p_ctrl, timer_info_t *const p_info )
```

Gets timer information and store it in provided pointer p_info. Implements `timer_api_t::infoGet`.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;

(void) R_AGT_InfoGet(&g_timer0_ctrl, &info);

uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_StatusGet()**

```
fsp_err_t R_AGT_StatusGet ( timer_ctrl_t *const p_ctrl, timer_status_t *const p_status )
```

Retrieves the current state and counter value stores them in p_status. Implements `timer_api_t::statusGet`.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;

(void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Stop()

```
fsp_err_t R_AGT_Stop ( timer_ctrl_t *const p_ctrl)
```

Stops the timer. Implements `timer_api_t::stop`.

Example:

```
/* (Optional) Stop the timer. */  
(void) R_AGT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ **R_AGT_Open()**

```
fsp_err_t R_AGT_Open ( timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg )
```

Initializes the AGT module instance. Implements `timer_api_t::open`.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional `agt_extended_cfg_t` extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_AGT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on AGT.

◆ R_AGT_CallbackSet()

```
fsp_err_t R_AGT_CallbackSet ( timer_ctrl_t *const p_api_ctrl, void(*) (timer_callback_args_t *)
p_callback, void const *const p_context, timer_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `timer_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.6 Bluetooth Low Energy Library of Balance Configuration (r_ble)

Modules

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The bluetooth low energy library of balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- GAP
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- GATT Common
 - Get MTU size.

- **GATT Server**
 - Initialization of GATT Server.
 - Notification/Indication.
- **GATT Client**
 - Discovery services, characteristics.
 - Read/Write characteristic.
- **Vendor Specific**
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	Supported
GAP API	Supported	*1 Limited	*1 *2 Limited
GATT Common API	Supported	Supported	Supported
GATT Client API	Supported	Supported	Supported
GATT Client API	Supported	Supported	Supported
L2CAP API	Supported	Not Supported	Not supported
Vendor Specific API	Supported	Supported	Supported

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.

Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

Figure 145: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Limitations

Developers should be aware of the following limitations when using the ble:

- This configuration not supports LE Advertising Extensions functionality APIs. If those functionality needs your system, select [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#) configuration.
- This configuration dose not supports L2CAP functionality APIs. If those functionality needs your system, select [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#) configuration.

4.2.7 Bluetooth Low Energy Library of Compact Configuration (r_ble) Modules

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The bluetooth low energy library of compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- [GAP](#)
 - Initialization of the Host stack.
 - Start/Stop Advertising.
 - Initiate/Respond a pairing request.
- [GATT Common](#)
 - Get MTU size.
- [GATT Server](#)
 - Initialization of GATT Server.
 - Notification/Indication.
- [GATT Client](#)
 - Discovery services, characteristics.
 - Read/Write characteristic.
- [Vendor Specific](#)
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	Supported
GATT Common API	Supported	*1 Limited	*1 *2 Limited
GATT Common API	Supported	Supported	Supported
GATT Server API	Supported	Supported	Supported
GATT Client API	Supported	Supported	Supported
L2CAP API	Supported	Not supported	Not supported
Vendor Specific API	Supported	Supported	Supported

Note

1. This configuration dose not support LE Advertising Extensions functionality APIs.
2. This configuration dose not support Central and Observer functionality APIs.

Target Devices

The Renesas Bluetooth Low Energy Library supports the following devices.

- RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

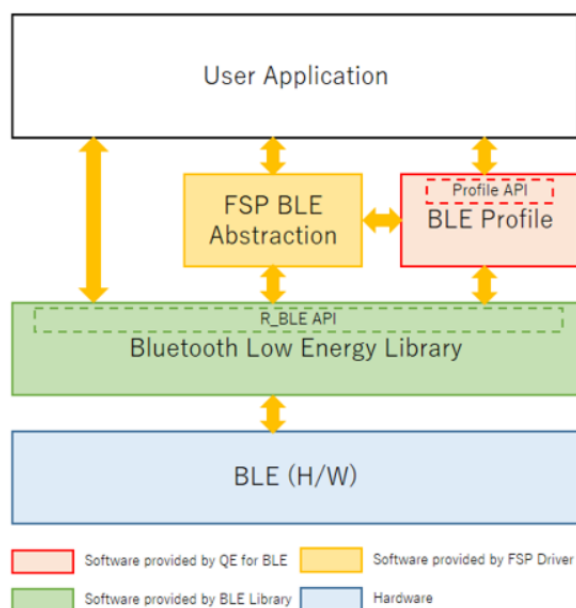

Figure 146: BLE software structure

The BLE FSP module consists of the BLE library.

The BLE Application uses the BLE functions via the [R_BLE API](#) provided by the BLE Library.

The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Limitations

Developers should be aware of the following limitations when using the ble:

- This configuration does not support LE Advertising Extensions functionality APIs. If those functionality needs your system, select [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#) configuration.
- This configuration does not support Central and Observer functionality APIs. If those functionality needs your system, select [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#) or [Bluetooth Low Energy Library of Balance Configuration \(r_ble\)](#) configuration.
- This configuration does not support L2CAP functionality APIs. If those functionality needs your system, select [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#) configuration.

4.2.8 Bluetooth Low Energy Library of Extended Configuration (r_ble) Modules

Driver for the Radio peripheral on RA MCUs. This module implements the [BLE Interface](#).

Overview

The Bluetooth low energy library of extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

- Common
 - Open/Close the BLE protocol stack.
 - Execute the BLE job.
 - Add an event in the BLE protocol stack internal queue.
- GAP
 - Initialization of the Host stack.
 - Start/Stop Advertising (Support LE Advertising Extensions).
 - Start/Stop Scan.
 - Connect/Disconnect a link.
 - Initiate/Respond a pairing request.
- GATT Common
 - Get MTU size.
- GATT Server
 - Initialization of GATT Server.
 - Notification/Indication.
- GATT Client
 - Discovery services, characteristics.
 - Read/Write characteristic.
- L2CAP
 - Credit-based flow control transaction.
- Vendor Specific
 - DTM.
 - Set/Get transmit power.
 - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	Supported

```

Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the [CAC Interface](#).

Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

Configuration

Build Time Configurations for r_cac

The following build time configurations are defined in fsp_cfg/r_cac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Clock Accuracy Circuit (r_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cac0	Module name.
Reference clock divider	<ul style="list-style-type: none"> • 32 • 128 • 1024 • 8192 	32	Reference clock divider.
Reference clock source	<ul style="list-style-type: none"> • Main Oscillator • Sub-clock • HOCO 	Main Oscillator	Reference clock source.

	<ul style="list-style-type: none"> • MOCO • LOCO • PCLKB • IWDT • External 		
Reference clock digital filter	<ul style="list-style-type: none"> • Disabled • Sampling clock =Measuring freq • Sampling clock =Measuring freq/4 • Sampling clock =Measuring freq/16 	Disabled	Reference clock digital filter.
Reference clock edge detect	<ul style="list-style-type: none"> • Rising • Falling • Both 	Rising	Reference clock edge detection.
Measurement clock divider	<ul style="list-style-type: none"> • 1 • 4 • 8 • 32 	1	Measurement clock divider.
Measurement clock source	<ul style="list-style-type: none"> • Main Oscillator • Sub-clock • HOCO • MOCO • LOCO • PCLKB • IWDT 	HOCO	Measurement clock source.
Upper Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Top end of allowable range for measurement completion.
Lower Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Bottom end of allowable range for measurement completion.
Frequency Error Interrupt Priority	MCU Specific Options		CAC frequency error interrupt priority.
Measurement End Interrupt Priority	MCU Specific Options		CAC measurement end interrupt priority.
Overflow Interrupt Priority	MCU Specific Options		CAC overflow interrupt priority.
Callback	Name must be a valid C symbol	NULL	Function name for callback

Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

Usage Notes

Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

Examples

Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;
void cac_basic_example ()
{
    g_callback_complete = 0;
    fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    (void) R_CAC_StartMeasurement(&g_cac_ctrl);
}
```

```
/* Wait for measurement to complete. */
while (0 == g_callback_complete)
{
}

uint16_t value;

/* Read the CAC measurement. */
(void) R_CAC_Read(&g_cac_ctrl, &value);
}

/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
    if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
    {
        g_callback_complete = 1U;
    }
}
```

Data Structures

struct [cac_instance_ctrl_t](#)

Data Structure Documentation

◆ [cac_instance_ctrl_t](#)

struct [cac_instance_ctrl_t](#)

CAC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ **R_CAC_Open()**

```
fsp_err_t R_CAC_Open ( cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg )
```

The Open function configures the CAC based on the provided user configuration settings.

Return values

FSP_SUCCESS	CAC is available and available for measurement(s).
FSP_ERR_ASSERTION	An argument is invalid.
FSP_ERR_ALREADY_OPEN	The CAC has already been opened.

Note

There is only a single CAC peripheral.

◆ **R_CAC_StartMeasurement()**

```
fsp_err_t R_CAC_StartMeasurement ( cac_ctrl_t *const p_ctrl)
```

Start the CAC measurement process.

Return values

FSP_SUCCESS	CAC measurement started.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ **R_CAC_StopMeasurement()**

```
fsp_err_t R_CAC_StopMeasurement ( cac_ctrl_t *const p_ctrl)
```

Stop the CAC measurement process.

Return values

FSP_SUCCESS	CAC measuring has been stopped.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ **R_CAC_Read()**

```
fsp_err_t R_CAC_Read ( cac_ctrl_t *const p_ctrl, uint16_t *const p_counter )
```

Read and return the CAC status and counter registers.

Return values

FSP_SUCCESS	CAC read successful.
FSP_ERR_ASSERTION	An argument is NULL.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ **R_CAC_Close()**

```
fsp_err_t R_CAC_Close ( cac_ctrl_t *const p_ctrl)
```

Release any resources that were allocated by the Open() or any subsequent CAC operations.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ **R_CAC_CallbackSet()**

```
fsp_err_t R_CAC_CallbackSet ( cac_ctrl_t *const p_ctrl, void(*) (cac_callback_args_t *) p_callback, void const *const p_context, cac_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cac_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Driver for the CAN peripheral on RA MCUs. This module implements the [CAN Interface](#).

Overview

The Controller Area network (CAN) HAL module provides a high-level API for CAN applications and supports the CAN peripherals available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when transmit, receive or error interrupts are received. The callback is passed a parameter which indicates the channel, mailbox and event as well as the received data (if available).

Features

- Supports both standard (11-bit) and extended (29-bit) messaging formats
- Supports speeds upto 1 Mbps
- Support for bit timing configuration as defined in the CAN specification
- Supports up to 32 transmit or receive mailboxes with standard or extended ID frames
- Optional support for a 4-stage transmit and receive FIFO
- Receive mailboxes can be configured to capture either data or remote CAN Frames
- Receive mailboxes can be configured to receive a range of IDs using mailbox masks
- Mailboxes can be configured with Overwrite or Overrun mode
- Supports a user-callback function when transmit, receive, or error interrupts are received

Configuration

Build Time Configurations for r_can

The following build time configurations are defined in fsp_cfg/r_can_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	When FIFOs are enabled, a transmit FIFO replaces mailboxes 24-27 and a receive FIFO replaces mailboxes 28-31.

Configurations for Connectivity > CAN (r_can)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN (r_can). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_can0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.
General > Clock Source	MCU Specific Options		Select the CAN clock source.
General > Overwrite/Overrun Mode	<ul style="list-style-type: none"> Overwrite Mode Overrun Mode 	Overwrite Mode	Select whether receive mailbox will be overwritten or overrun if data is not read in time.
General > Global ID Mode	<ul style="list-style-type: none"> Standard ID Mode Extended ID Mode Mixed ID Mode 	Standard ID Mode	Select whether the driver will use CAN Standard IDs, Extended IDs or a mix of both.
General > Number of Mailboxes	<ul style="list-style-type: none"> 4 Mailboxes 8 Mailboxes 16 Mailboxes 24 Mailboxes 32 Mailboxes 	32 Mailboxes	Select 4, 8, 16, 24 or 32 mailboxes. In FIFO mailbox mode up to 24 mailboxes are available.
Baud Rate Settings > Auto-generated Settings > Sample-	Must be a valid integer between 0 and 100. Ignore when Override	75	Sample-Point = (TSEG1 + 1) / (TSEG1 + TSEG2 + 1).

Point (%)	Baud Settings is Enabled.		
Baud Rate Settings > Auto-generated Settings > CAN Baud Rate (Hz)	Must be a valid integer configurable upto maximum 1MHz. Ignore when Override Baud Settings is Enabled.	500000	Specify baud rate in Hz. If the requested baud rate cannot be achieved, the settings with the largest possible baud rate that is less than or equal to the requested baud rate is used. If multiple combinations would result in the best baud rate, the combination with the least absolute error for the ratio is chosen. The theoretical calculated baud rate and ratio are printed in a comment in the generated can_bit_timing_cfg_t structure.
Baud Rate Settings > Override Auto-generated Settings > Override Baud Settings	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Override calculated baudrate parameters and instead use the ones specified below. This option ignores the parameters specified under Sample-Point (%) and CAN Baud Rate (Hz)
Baud Rate Settings > Override Auto-generated Settings > Baud Rate Prescaler	Value must be a non-negative integer between 1 and 1024.	1	Specify division value of baud rate prescaler (baud rate prescaler + 1).
Baud Rate Settings > Override Auto-generated Settings > Time Segment 1	Refer to the RA Configuration tool for available options.	4 Time Quanta	Select the time segment 1 value. (4-16). Check module usage notes for how to calculate this value.
Baud Rate Settings > Override Auto-generated Settings > Time Segment 2	<ul style="list-style-type: none"> • 2 Time Quanta • 3 Time Quanta • 4 Time Quanta • 5 Time Quanta • 6 Time Quanta • 7 Time Quanta • 8 Time Quanta 	2 Time Quanta	Select the time segment 2 value (2-8). Check module usage notes for how to calculate this value.
Baud Rate Settings >	<ul style="list-style-type: none"> • 1 Time Quanta 	1 Time Quanta	Select the

Override Auto-generated Settings > Synchronization Jump Width	<ul style="list-style-type: none"> • 2 Time Quanta • 3 Time Quanta • 4 Time Quanta 		Synchronization Jump Width value (1-4). Check module usage notes for how to calculate this value.
Interrupts > Callback	Name must be a valid C symbol	can_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Interrupts > Interrupt Priority Level	MCU Specific Options		Transmit/Receive/Error interrupt priority.
Interrupts > Transmit FIFO Interrupt Mode	<ul style="list-style-type: none"> • Every Message • Empty 	Every Message	Select whether the receive FIFO should throw an interrupt on every received message or when it becomes empty.
Input > Receive FIFO > Receive ID 1 > ID	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0	Select the first ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs.
Input > Receive FIFO > Receive ID 1 > ID Mode	<ul style="list-style-type: none"> • Standard ID • Extended ID 	Standard ID	Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'.

Input > Mailbox 28-31 Group > Mailbox Type > Mailbox 31 Type	• Receive Mailbox • Transmit Mailbox	Receive Mailbox	Select whether the mailbox is used for receive or transmit.
Input > Mailbox 28-31 Group > Mailbox Frame Type > Mailbox 28 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Input > Mailbox 28-31 Group > Mailbox Frame Type > Mailbox 29 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Input > Mailbox 28-31 Group > Mailbox Frame Type > Mailbox 30 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Input > Mailbox 28-31 Group > Mailbox Frame Type > Mailbox 31 Frame Type	• Data Mailbox • Remote Mailbox	Data Mailbox	Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes).
Input > Mailbox 28-31 Group > Mailbox 28-31 Group Mask	Value must be decimal or HEX integer of 0x1FFFFFFF or less.	0x1FFFFFFF	Select the Mask for mailboxes 28-31. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value.

Clock Configuration

The CAN peripheral uses the CANMCLK (main-clock oscillator) or PCLKB as its clock source (fCAN, CAN System Clock.) The default CAN configuration will provide a CAN bit rate of 500 Kbit using CANMCLK as the clock source. To set the PCLKB frequency, use the **Clocks** tab of the RA

Configuration editor. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Clock Limitations

The following clock limitations apply when using the CAN peripheral:

- When using the main oscillator (CANMCLK) as the clock source:
 - $f_{PCLKB} \geq f_{CANCLK}$ ($f_{CANCLK} = XTAL / \text{Baud Rate Prescaler}$)
 - The user application must start the main-clock oscillator (XTAL) at run-time using the CGC Interface if it has not already started (for example, if it is not used as the MCU clock source.)
- When using PCLKB as the clock source:
 - For RA6 and RA4 MCUs, the source of the peripheral module clocks must be PLL for the CAN HAL module.
- For RA4M1 and RA4W1 MCUs, the clock frequency ratio of PCLKA and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.
- For RA2 MCUs only CANMCLK (XTAL) may be used as a clock source. The clock frequency ratio of ICLK and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.

Note

When using CANMCLK (XTAL) as the CAN clock source while running at a reduced main clock speed (under 2x XTAL) be sure to confirm that the XTAL frequency divided by the baud rate prescaler is equal to or less than PCLKB.

Pin Configuration

The CAN peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. A CAN channel would consist of two pins - CRX and CTX for data transmission/reception.

Usage Notes

Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA Configuration editor using a best effort approach. If the auto-generated baud settings cause deviation that is not tolerable by the application, the user can override the auto-generated settings and put in manually calculated values through RA Configuration editor. For more details on how the baudrate is set refer to section 37.4 "Data Transfer Rate Configuration" of the RA6M3 User's Manual (R01UH0886EJ0100).

FIFO Support

When FIFO Support is enabled, mailboxes 24-27 form a 4-stage transmit FIFO and mailboxes 28-31 form a 4-stage receive FIFO. The receive FIFO supports two independent ID/mask settings for acceptance filtering.

Note

Only the base mailbox of each FIFO may be accessed. When writing to the TX FIFO it is recommended to use CAN_MAILBOX_ID_TX_FIFO.

Limitations

Developers should be aware of the following limitations when using CAN:

- The `can_frame_t::id_mode` field is only used when Global ID Mode is set to Mixed ID. It is ignored in all other modes.

Examples

Basic Example

This is a basic example of minimal use of the CAN in an application.

```
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile bool g_rx_flag = false;
volatile bool g_tx_flag = false;
volatile bool g_err_flag = false;
volatile uint32_t g_rx_id;
void can_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE: /* Receive complete event. */
            {
                g_rx_flag = true;
                g_rx_id = p_args->frame.id;
                /* Read received frame */
                g_can_rx_frame = p_args->frame;
            }
            break;
        case CAN_EVENT_TX_COMPLETE: /* Transmit complete event. */
            {
                g_tx_flag = true;
            }
            break;
        case CAN_EVENT_ERR_BUS_OFF: /* Bus error event. (bus off) */
        case CAN_EVENT_ERR_PASSIVE: /* Bus error event. (error passive) */
        case CAN_EVENT_ERR_WARNING: /* Bus error event. (error warning) */
        case CAN_EVENT_BUS_RECOVERY: /* Bus error event. (bus recovery) */
```

```
case CAN_EVENT_MAILBOX_MESSAGE_LOST: /* Overwrite/overrun error */
    {
/* Set error flag */
        g_err_flag = true;
break;
    }
default:
    {
break;
    }
}
}
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = CAN_BUSY_DELAY;
/* Initialize the CAN module */
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    g_can_tx_frame.id = CAN_DESTINATION_DEVICE_MAILBOX_NUMBER; /* CAN
Destination Device ID */
    g_can_tx_frame.type = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;
/* Write some data to the transmit frame */
    for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
/* Send data on the bus */
    g_tx_flag = false;
    g_err_flag = false;
    err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
```

```
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((true != g_tx_flag) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

        timeout_ms--;
    }
    if (true == g_err_flag)
    {
        __BKPT(0);
    }
}
```

External Loop-back Test

This example requires the CTX and CRX pins to be connected. If a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead. The mailbox numbers are arbitrarily chosen.

```
void can_external_loopback_example (void)
{
    fsp_err_t          err;

    uint32_t          timeout_ms      = CAN_BUSY_DELAY;
    can_operation_mode_t operation_mode = CAN_OPERATION_MODE_NORMAL;
    can_test_mode_t   test_mode       = CAN_TEST_MODE_LOOPBACK_EXTERNAL;
    int               diff = 0;

    uint32_t i      = 0;
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
    assert(FSP_SUCCESS == err);

    /* Clear the data part of receive frame */
    memset(g_can_rx_frame.data, 0, CAN_FRAME_TRANSMIT_DATA_BYTES);

    /* CAN Destination Device ID, in this case it is the same device with another
    mailbox */
}
```

```
g_can_tx_frame.id           = CAN_MAILBOX_NUMBER_4;
g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_FRAME_TRANSMIT_DATA_BYTES;

/* Write some data to the transmit frame */
for (i = 0; i < sizeof(g_can_tx_frame.data); i++)
{
    g_can_tx_frame.data[i] = (uint8_t) i;
}

/* Send data on the bus */
g_rx_flag = false;
g_err_flag = false;
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_rx_flag) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}

if (true == g_err_flag)
{
    __BKPT(0);
}

/* Verify received data */
diff = memcmp(&g_can_rx_frame.data[0], &g_can_tx_frame.data[0],
CAN_FRAME_TRANSMIT_DATA_BYTES);

if (0 != diff)
{
    __BKPT(0);
}
}
```

Data Structure Documentation

◆ [can_mailbox_t](#)

struct can_mailbox_t		
CAN Mailbox		
Data Fields		
uint32_t	mailbox_id	Mailbox ID.
can_id_mode_t	id_mode	Standard or Extended ID. Only used in Mixed ID mode.
can_frame_type_t	frame_type	Frame type for receive mailbox.
can_mailbox_send_receive_t	mailbox_type	Receive or Transmit mailbox type.

◆ [can_fifo_interrupt_cfg_t](#)

struct can_fifo_interrupt_cfg_t		
CAN FIFO interrupt configuration		
Data Fields		
can_fifo_interrupt_mode_t	fifo_int_mode	FIFO interrupts mode (RX and TX combined).
IRQn_Type	tx_fifo_irq	TX FIFO IRQ.

IRQn_Type	rx_fifo_irq	RX FIFO IRQ.
-----------	-------------	--------------

◆ **can_rx_fifo_cfg_t**

struct can_rx_fifo_cfg_t		
CAN RX FIFO configuration		
Data Fields		
uint32_t	rx_fifo_mask1	RX FIFO acceptance filter mask 1.
uint32_t	rx_fifo_mask2	RX FIFO acceptance filter mask 1.
can_mailbox_t	rx_fifo_id1	RX FIFO acceptance filter ID 1.
can_mailbox_t	rx_fifo_id2	RX FIFO acceptance filter ID 2.

◆ **can_extended_cfg_t**

struct can_extended_cfg_t		
CAN extended configuration		
Data Fields		
can_clock_source_t	clock_source	Source of the CAN clock.
uint32_t *	p_mailbox_mask	Mailbox mask, one for every 4 mailboxes.
can_mailbox_t *	p_mailbox	Pointer to mailboxes.
can_global_id_mode_t	global_id_mode	Standard or Extended ID mode.
uint32_t	mailbox_count	Number of mailboxes.
can_message_mode_t	message_mode	Overwrite message or overrun.
can_fifo_interrupt_cfg_t const *	p_fifo_int_cfg	Pointer to FIFO interrupt configuration.
can_rx_fifo_cfg_t *	p_rx_fifo_cfg	Pointer to RX FIFO configuration.

Enumeration Type Documentation

◆ **can_status_t**

enum <code>can_status_t</code>	
CAN Status	
Enumerator	
<code>CAN_STATUS_NEW_DATA</code>	New Data status flag.
<code>CAN_STATUS_SENT_DATA</code>	Sent Data status flag.
<code>CAN_STATUS_RECEIVE_FIFO</code>	Receive FIFO status flag.
<code>CAN_STATUS_TRANSMIT_FIFO</code>	Transmit FIFO status flag.
<code>CAN_STATUS_NORMAL_MBOX_MESSAGE_LOST</code>	Normal mailbox message lost status flag.
<code>CAN_STATUS_FIFO_MBOX_MESSAGE_LOST</code>	FIFO mailbox message lost status flag.
<code>CAN_STATUS_TRANSMISSION_ABORT</code>	Transmission abort status flag.
<code>CAN_STATUS_ERROR</code>	Error status flag.
<code>CAN_STATUS_RESET_MODE</code>	Reset mode status flag.
<code>CAN_STATUS_HALT_MODE</code>	Halt mode status flag.
<code>CAN_STATUS_SLEEP_MODE</code>	Sleep mode status flag.
<code>CAN_STATUS_ERROR_PASSIVE</code>	Error-passive status flag.
<code>CAN_STATUS_BUS_OFF</code>	Bus-off status flag.

◆ **can_error_t**

enum <code>can_error_t</code>	
CAN Error Code	
Enumerator	
<code>CAN_ERROR_STUFF</code>	Stuff Error.
<code>CAN_ERROR_FORM</code>	Form Error.
<code>CAN_ERROR_ACK</code>	ACK Error.
<code>CAN_ERROR_CRC</code>	CRC Error.
<code>CAN_ERROR_BIT_RECESSIVE</code>	Bit Error (recessive) Error.
<code>CAN_ERROR_BIT_DOMINANT</code>	Bit Error (dominant) Error.
<code>CAN_ERROR_ACK_DELIMITER</code>	ACK Delimiter Error.

◆ **can_mailbox_number_t**

enum <code>can_mailbox_number_t</code>
CAN Mailbox IDs (MB + FIFO)

◆ **can_mailbox_send_receive_t**

enum <code>can_mailbox_send_receive_t</code>	
CAN Mailbox type	
Enumerator	
<code>CAN_MAILBOX_RECEIVE</code>	Mailbox is for receiving.
<code>CAN_MAILBOX_TRANSMIT</code>	Mailbox is for sending.

◆ **can_global_id_mode_t**

enum can_global_id_mode_t	
Global CAN ID mode settings	
Enumerator	
CAN_GLOBAL_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_GLOBAL_ID_MODE_EXTENDED	Extended IDs of 29 bits used.
CAN_GLOBAL_ID_MODE_MIXED	Both Standard and Extended IDs used.

◆ **can_message_mode_t**

enum can_message_mode_t	
CAN Message Modes	
Enumerator	
CAN_MESSAGE_MODE_OVERWRITE	Receive data will be overwritten if not read before the next frame.
CAN_MESSAGE_MODE_OVERRUN	Receive data will be retained until it is read.

◆ **can_clock_source_t**

enum can_clock_source_t	
CAN Source Clock	
Enumerator	
CAN_CLOCK_SOURCE_PCLKB	PCLKB is the source of the CAN Clock.
CAN_CLOCK_SOURCE_CANMCLK	CANMCLK is the source of the CAN Clock.

◆ **can_fifo_interrupt_mode_t**

enum can_fifo_interrupt_mode_t	
CAN FIFO Interrupt Modes	

Function Documentation

◆ **R_CAN_Open()**

```
fsp_err_t R_CAN_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CAN channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_CAN_INIT_FAILED	Channel failed to initialize.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R_CAN_Close()**

```
fsp_err_t R_CAN_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CAN channel.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R_CAN_Write()**

```
fsp_err_t R_CAN_Write ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Write data to the CAN channel. Write up to eight bytes to the channel mailbox.

Example:

```
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_CAN_TRANSMIT_FIFO_FULL	Transmit FIFO is full.
FSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup for receive and cannot send.
FSP_ERR_INVALID_ARGUMENT	Data length or frame type invalid.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R_CAN_Read()**

```
fsp_err_t R_CAN_Read ( can_ctrl_t *const p_api_ctrl, uint32_t mailbox, can_frame_t *const p_frame )
```

Read data from a mailbox or FIFO.

Note

This function is not supported.

Return values

FSP_ERR_UNSUPPORTED	Function not supported.
---------------------	-------------------------

◆ **R_CAN_ModeTransition()**

```
fsp_err_t R_CAN_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t
operation_mode, can_test_mode_t test_mode )
```

CAN Mode Transition is used to change CAN driver state.

Example:

```
err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R_CAN_InfoGet()**

```
fsp_err_t R_CAN_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CAN state and status information for the channel.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ R_CAN_CallbackSet()

```
fsp_err_t R_CAN_CallbackSet ( can_ctrl_t *const p_api_ctrl, void (*)(can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.11 Controller Area Network - Flexible Data (r_canfd)

Modules

Functions

```
fsp_err_t R_CANFD_Open (can_ctrl_t *const p_api_ctrl, can_cfg_t const *const
p_cfg)
```

```
fsp_err_t R_CANFD_Close (can_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_CANFD_Write (can_ctrl_t *const p_api_ctrl, uint32_t const buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_Read (can_ctrl_t *const p_api_ctrl, uint32_t const buffer,
can_frame_t *const p_frame)
```

```
fsp_err_t R_CANFD_ModeTransition (can_ctrl_t *const p_api_ctrl,
can_operation_mode_t operation_mode, can_test_mode_t test_mode)
```

```
fsp_err_t R_CANFD_InfoGet (can_ctrl_t *const p_api_ctrl, can_info_t *const
p_info)
```

```
fsp_err_t R_CANFD_CallbackSet (can_ctrl_t *const p_api_ctrl,
void (*p_callback)(can_callback_args_t *), void const *const
p_context, can_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the CANFD peripheral on RA MCUs. This module implements the [CAN Interface](#).

Overview

The CANFD module can be used to communicate over CAN networks, optionally using Flexible Data (CAN-FD) to accelerate the data phase. A variety of message filtering and buffer options are available.

Features

Common Features

- Compatibility
 - Send and receive CAN 2.0 and CAN-FD frames on the same channel
 - Bitrate up to 1 Mbps with FD data phase speeds up to 5-8 Mbps
 - Supports both ISO 11898-1
- Buffers
 - 32 global receive Message Buffers (RX MBs)
 - 2-8 global receive FIFOs (RX FIFOs)
 - 4-16 transmit Message Buffers (TX MBs) per channel
- Filtering
 - Each filter rule can be individually configured to accept messages based on:
 - ID
 - Standard or Extended ID (IDE bit)
 - Data or Remote Frame (RTR bit)
 - ID/IDE/RTR mask
 - Minimum DLC (data length) value
- Interrupts
 - Configurable Global RX FIFO Interrupt
 - Configurable per FIFO
 - Interrupt at a certain depth or on every received message
 - Channel TX Interrupt
 - Global Error
 - DLC Check
 - Message Lost
 - FD Payload Overflow
 - Channel Error
 - Bus Error
 - Error Warning
 - Error Passive
 - Bus-Off Entry
 - Bus-Off Recovery
 - Overload
 - Bus Lock
 - Arbitration Loss
 - Transmission Aborted

Per-MCU Specifications

	RA6M5	RA6T2
Channels	2	1
Max nominal bitrate	1 Mbps	1 Mbps
Max data bitrate	8 Mbps	5 Mbps

Filter rules	128	32
TX message buffers	16/ch	4
RX message buffers	32	32
RX FIFOs	8	2
RX Buffer RAM	4864 bytes	1216 bytes
Standards	ISO or Bosch	ISO

Note

Each message buffer comprises 12 header bytes plus data length (8-64 bytes). The above buffer RAM values therefore correspond to the following capacities:

	RA6M5	RA6T2
Max 64-byte storage	64 messages	16 messages
Max 8-byte storage	243 messages	60 messages

Configuration

Build Time Configurations for r_canfd

The following build time configurations are defined in fsp_cfg/r_canfd_cfg.h:

Configuration	Options	Default	Description
Global Error Interrupt > Priority	MCU Specific Options		This interrupt is fired for each of the error sources selected below.
Global Error Interrupt > Sources	<ul style="list-style-type: none"> DLC Check Message Lost FD Payload Overflow 	0U	Select which errors should trigger an interrupt.
Global Error Interrupt > Callback Channel	<ul style="list-style-type: none"> Channel 0 Channel 1 	Channel 0	Specify which channel callback should be called to handle global errors. When starting the driver this channel must be opened first.
Flexible Data (FD) > FD Frame Format	MCU Specific Options		Select whether to use the FD frame standard provided by ISO or Bosch.
Flexible Data (FD) > Protocol Exceptions	<ul style="list-style-type: none"> Enabled (ISO 11898-1) Disabled 	Enabled (ISO 11898-1)	Select whether to enter the protocol exception handling state when a RES bit is sampled recessive as defined in

Flexible Data (FD) > Payload Overflow	<ul style="list-style-type: none"> • Reject • Truncate 	Reject	ISO 11898-1. Configure whether received messages larger than the destination buffer should be truncated or rejected.
Reception > Message Buffers > Number of Buffers	RX Message Buffer number must be an integer between 0 and 32.	0	Number of message buffers available for reception. As there is no interrupt for message buffer reception it is recommended to use RX FIFOs instead. Set this value to 0 to disable RX Message Buffers.
Reception > Message Buffers > Payload Size	<ul style="list-style-type: none"> • 8 bytes • 12 bytes • 16 bytes • 20 bytes • 24 bytes • 32 bytes • 48 bytes • 64 bytes 	8 bytes	Payload size for all RX Message Buffers.
Reception > FIFOs > FIFO 0 > Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable RX FIFO 0.
Reception > FIFOs > FIFO 0 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 0 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 0 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 0.
Reception > FIFOs > FIFO 0 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 0.

Reception > FIFOs > FIFO 1 > Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable or disable RX FIFO 1.
Reception > FIFOs > FIFO 1 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 1. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 1 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 1. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 1 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 1.
Reception > FIFOs > FIFO 1 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 1.
Reception > FIFOs > FIFO 2 > Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable or disable RX FIFO 2.
Reception > FIFOs > FIFO 2 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 2. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 2 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 2. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 2 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 2.
Reception > FIFOs > FIFO 2 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 2.
Reception > FIFOs > FIFO 3 > Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable or disable RX FIFO 3.
Reception > FIFOs > FIFO 3 > Interrupt	MCU Specific Options		Set the interrupt mode for RX FIFO 3.

Mode			Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.
Reception > FIFOs > FIFO 3 > Interrupt Threshold	MCU Specific Options		Set the interrupt threshold value for RX FIFO 3. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'.
Reception > FIFOs > FIFO 3 > Payload Size	MCU Specific Options		Select the message payload size for RX FIFO 3.
Reception > FIFOs > FIFO 3 > Depth	MCU Specific Options		Select the number of stages for RX FIFO 3.
Reception > FIFOs > FIFO 4 > Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable or disable RX FIFO 4.
Reception > FIFOs > FIFO 4 > Interrupt Mode	MCU Specific Options		Set the interrupt mode for RX FIFO 4. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below.

Configurations for Connectivity > CAN FD (r_canfd)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN FD (r_canfd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_canfd0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the CAN channel to use.
Bitrate > Automatic > Nominal Rate (bps)	Must be a valid integer with a maximum of 1MHz.	500000	Specify nominal bitrate in bits per second.
Bitrate > Automatic > Data Rate (bps)	Must be a valid integer greater than 0.	2000000	Specify data bitrate in bits per second.
Bitrate > Automatic > Sample Point (%)	Must be a valid integer between 60 and 99.	75	Specify desired sample point.
Bitrate > Manual > Nominal > Prescaler (divisor)	Value must be a non-negative integer between 1 and 1024.	1	Specify clock divisor for nominal bitrate.
Bitrate > Manual > Nominal > Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 256.	29	Select the Time Segment 1 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Nominal > Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 128.	10	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Nominal > Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 128.	4	Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Prescaler (divisor)	Value must be a non-negative integer between 1 and 1024.	1	Specify clock divisor for data bitrate.
Bitrate > Manual > Data > Time Segment 1 (Tq)	Value must be a non-negative integer between 2 and 256.	5	Select the Time Segment 1 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Time Segment 2 (Tq)	Value must be a non-negative integer between 2 and 128.	2	Select the Time Segment 2 value. Check module usage notes for how to calculate this value.
Bitrate > Manual > Data > Sync Jump Width (Tq)	Value must be a non-negative integer between 1 and 128.	1	Select the Synchronization Jump Width value. Check

module usage notes for how to calculate this value.

Bitrate > Manual > Use manual settings	<ul style="list-style-type: none"> • Yes • No 	No	Select whether or not to override automatic baudrate generation and instead use the values specified here.
Bitrate > Delay Compensation	<ul style="list-style-type: none"> • Enable • Disable 	Enable	When enabled the CANFD module will automatically compensate for any transceiver or bus delay between transmitted and received bits. When manually supplying bit timing values with delay compensation enabled be sure the data prescaler is 2 or smaller for correct operation.
Interrupts > Callback	Name must be a valid C symbol	canfd0_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Interrupts > Channel Interrupt Priority Level	MCU Specific Options		Channel Error/Transmit interrupt priority.
Transmit Interrupts	MCU Specific Options		Select which TX Message Buffers should trigger an interrupt when transmission is complete.
Channel Error Interrupts	<ul style="list-style-type: none"> • Error Warning • Error Passive • Bus-Off Entry • Bus-Off Recovery • Overload 	0U	Select which channel error interrupt sources to enable.
Filter List Array	Name must be a valid C symbol	p_canfd0_afl	Acceptance Filter List (AFL) rule array symbol name.

Clock Configuration

The CANFD peripheral uses either PLL, PLL2 or the main oscillator as its clock source. The RA Configuration editor will attempt to get as close as possible to the supplied bitrate with the

configured clock source. To achieve an exact bitrate the CANFD source clock or divisor may need to be adjusted to meet the criteria in the formula below:

```
bitrate = canfd_clock_hz / ((time_segment_1 + time_segment_2 + 1) * prescalar)
```

For CANFD, the possible values for each element are as follows:

Element	Min	Max (Nominal)	Max (Data)
Bitrate	-	1 Mbps	5-8 Mbps*
Time Segment 1	2 Tq	256 Tq	32 Tq
Time Segment 2	2 Tq	128 Tq	16 Tq
Sync Jump Width	1 Tq	Time Segment 2	Time Segment 2
Prescalar	1	1024	256

- RA6M5 supports up to 8 Mbps; RA6T2 supports up to 5 Mbps.

Use the **Clocks** tab of the RA Configuration editor to configure the CANFD clock source/divisor as well as to set the frequency of PLL or PLL2. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Pin Configuration

CANFD channels each control two pins: CRX (receive) and CTX (transmit).

Usage Notes

Buffers

The CANFD driver provides three types of buffers: Transmit Message Buffers (TX MBs), Receive Message Buffers (RX MBs) and Receive FIFOs (RX FIFOs).

TX Message Buffers

TX MBs are used for transmission only. Refer to the hardware manual for your device for information on which TX MBs are available.

Note

The CANFD peripheral continually scans TX MBs for new data. Depending on the provided clock it may be possible to write to multiple TX MBs before transmission begins. In this case, messages will be sent in the priority specified by the Transmission Priority option in the RA Configuration editor.

RX Message Buffers

RX MBs are for reception only and may only hold one message at a time. 32 total RX MBs are available and are shared across all channels.

No interrupts are provided for RX MBs. Use [R_CANFD_InfoGet](#) and [R_CANFD_Read](#) to poll and read them, respectively.

RX FIFOs

RX FIFOs provide interrupt-driven queue functionality for receiving messages and are shared across all channels. All FIFOs have the following capabilities:

- Up to 64 byte payloads
- Up to 48 (RA6T2) or 128 (RA6M5) message capacity
- Interrupt events:
 - On every received frame OR when filled to a specified fraction of its capacity
 - When a message is overwritten (message received on full FIFO)

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling `R_CANFD_InfoGet` and `R_CANFD_Read`, respectively.

RX Buffer Pool

The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. The RA Configuration editor will provide a warning when the limit is exceeded.

The number of bytes used by RX MBs and individual FIFOs can be calculated as follows:

```
Total RX MB bytes used = (number of RX MBs enabled) * (RX MB payload size + 12 header bytes)
RX FIFO bytes used = (number of FIFO stages) * (FIFO payload size + 12 header bytes)
```

Message Filtering (Acceptance Filter List)

To filter messages to the desired message buffer or FIFO the CANFD peripheral uses an Acceptance Filter List (AFL). Each entry in the AFL provides a rule to check a message against along with destination and other filtering information. When a message is received the CANFD peripheral internally checks against every configured AFL rule for the channel. If a match is found the message is transferred to the destination(s) specified in the rule. The default template with one entry is shown below:

```
static const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH0_RULE_NUM] =
{
    {
        .id =
        {
            /* Specify the ID, ID type and frame type to accept. */
            .id          = 0x00000000,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode     = CAN_ID_MODE_EXTENDED,
        },
    },
}
```

```
.mask =
{
/* These values mask which ID/mode bits to compare when filtering messages. */
.mask_id      = 0xFFFFFFFF,
.mask_frame_type = 1,
.mask_id_mode  = 1,
},
.destination =
{
/* If DLC checking is enabled any messages shorter than the below setting will be
rejected. */
.minimum_dlc = CANFD_MINIMUM_DLC_0,

/* Optionally specify a Receive Message Buffer (RX MB) to store accepted frames. RX
MBs do not have an
* interrupt or overwrite protection and must be checked with R_CANFD_InfoGet and
R_CANFD_Read. */
.rx_buffer    = CANFD_RX_MB_NONE,

/* Specify which FIFO(s) to send filtered messages to. Multiple FIFOs can be OR'd
together. */
.fifo_select_flags = CANFD_RX_FIFO_0,
}
}
};
```

AFL templates can be easily added to a project using the Developer Assistance feature in e2 studio. Once the CANFD module is added to a project, drag and drop the elements circled below to build a filter list:

Figure 148: CANFD Developer Assistance AFL Templates

For an example configuration refer to the [AFL Example](#) below.

Flexible Data (FD)

Flexible Data is an extension of the CAN protocol allowing for messages up to 64 bytes and higher data bitrates, among other features. The CANFD driver supports the following:

- Sending and receiving FD messages
- Bitrate switching for data phase
- Manual and automatic setting of the error state (ESI) bit

To specify one or more of these options when transmitting set `can_frame_t::options` with combined values from `canfd_frame_options_t`. Received messages will automatically have this field filled, if applicable.

```
/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
g_can_tx_frame.id           = CAN_EXAMPLE_ID;
g_can_tx_frame.id_mode      = CAN_ID_MODE_STANDARD;
g_can_tx_frame.type         = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
g_can_tx_frame.options      = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
```

Note

When using bitrate switching be sure to configure the Data Bitrate as desired in the RA Configuration editor.

Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA

Configuration editor using a best effort approach. To increase compliance and reliability two extra options are provided: Link Prescalers and Delay Compensation.

When Link Prescalers is enabled the prescalers for Nominal and Data bitrates will be kept the same, improving clock tolerance in networks using FD frames. This option somewhat limits the available options for bitrate settings, so be sure to check that the automatically generated values are acceptable.

Enabling Delay Compensation instructs the CANFD peripheral to measure TX to RX transceiver delay and automatically adjust for it, improving the reliability of high-speed FD messages. This option may severely limit available bitrate settings depending on the source clock; it is highly recommended to check the generated values when enabled.

If the auto-generated baud settings cause deviation that is not tolerable by the application the user can override the auto-generated settings and put in manually calculated values through the RA Configuration editor. For more details on how the bitrate is calculated refer to the [Clock Configuration](#) section above.

Sync Jump Width

The Sync Jump Width option specifies the maximum number of time quanta that the sample point may be delayed by to account for differences in oscillators on the bus. It should be set to a value between 1 and the configured Time Segment 2 value depending on the maximum permissible clock error.

Error Handling

The CANFD peripheral provides two types of error interrupts: Channel and Global. As the names imply, each channel has its own Channel Error interrupt but there is only one Global Error interrupt. Only the configured channel will receive callbacks for Global Errors.

Error interrupt callbacks will pass either `CAN_EVENT_ERR_CHANNEL` or `CAN_EVENT_ERR_GLOBAL` in the `can_callback_args_t::event` field. A second field, `can_callback_args_t::error`, provides the actual error code as `canfd_error_t`. Cast to this enum to retrieve the error condition. See the callback in the [Basic Example](#) below for a demonstration.

DLC Checking

When DLC Checking is enabled messages are checked against the `destination.minimum_dlc` value of each AFL rule. If the data length of a message is less than this value the message will be rejected. When DLC checking is set to "Enabled w/truncate" in the RA Configuration editor any data in excess of the minimum DLC setting will be truncated and the DLC value for the frame will be set to match.

FD Payload Overflow

When an FD message is received with a DLC larger than the destination buffer an FD Payload Overflow interrupt is thrown (if configured). When Payload Overflow is set to "Truncate" the message will still be accepted but only data up to the buffer capacity will be preserved. The DLC value is unchanged in this case; any data beyond this value in the `can_frame_t::data` array should not be used.

Test Modes

The CANFD peripheral provides three basic test modes: Listen Only, Internal Loopback and External Loopback. Use [R_CANFD_ModeTransition](#) to switch to a test mode.

On some MCUs an additional "Internal Bus" test mode is available that allows connecting both CANFD channels together on an internal bus, effectively creating an internal CAN network. See the [Internal Bus](#) example below for details.

Limitations

Developers should be aware of the following limitations when using CANFD:

- On RA6M5, RX Message Buffers do not have an associated interrupt. To use them in an application one of the following is recommended:
 - Use [R_CANFD_InfoGet](#) to determine if any RX MBs have received data, then use [R_CANFD_Read](#) to obtain it
 - Select an RX FIFO as an additional destination for the relevant filter rules and configure the FIFO interrupt/callback as desired
- The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. See the [RX Buffer Pool](#) section above for more information.
- When switching modes with [R_CANFD_ModeTransition](#) a delay of up to several CAN frames may be incurred. Consult Section 32.3.4.2 "Timing of Channel Mode Change" in the RA6M5 User's Manual (R01UH0891EJ0100) for details.
- Only one channel will receive callbacks for Global Errors. If a different channel is opened first these error interrupts will be suppressed until the specified handler channel is opened.

Examples

AFL Example

The below is an example Acceptance Filter List (AFL) declaration with two rules.

```
const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH1_RULE_NUM] =
{
    /* Store all data frames with at least 4 bytes from Standard IDs 0x40-0x4F in RX
    FIFO 0 and RX FIFO 1 */
    {
        .id =
        {
            .id          = 0x40,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode     = CAN_ID_MODE_STANDARD
        },
        .mask =
        {
            .mask_id          = 0x7F0,
            .mask_frame_type = 1,
            .mask_id_mode     = 1
        }
    }
}
```

```
    },
    .destination =
    {
        .minimum_dlc      = CANFD_MINIMUM_DLC_4,
        .rx_buffer        = CANFD_RX_MB_NONE,
        .fifo_select_flags = (canfd_rx_fifo_t) (CANFD_RX_FIFO_0 |
CANFD_RX_FIFO_1)
    }
},
/* Store all frames from Extended ID 0x1100 in RX FIFO 2 and RX MB 0 */
{
    .id =
    {
        .id          = 0x1100,
        .frame_type = CAN_FRAME_TYPE_DATA, // This setting is ignored by the mask
        .id_mode     = CAN_ID_MODE_EXTENDED
    },
    .mask =
    {
        .mask_id          = 0x1FFFFFFF,
        .mask_frame_type = 0,
        .mask_id_mode     = 1
    },
    .destination =
    {
        .minimum_dlc      = CANFD_MINIMUM_DLC_0,
        .rx_buffer        = CANFD_RX_MB_0,
        .fifo_select_flags = CANFD_RX_FIFO_2
    }
}
};
```

Basic Example

This is a basic example of minimal use of the CANFD module in an application.

Note

On RA6M5 it is recommended to use RX FIFOs for reception as there are no interrupts for RX message buffers.

```
#define CAN_EXAMPLE_ID (0x20)
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile canfd_error_t g_err_status = (canfd_error_t) 0;
void canfd_callback (can_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
            {
                /* Read received frame */
                memcpy(&g_can_rx_frame, p_args->p_frame, sizeof(can_frame_t));
                /* Handle event */
                break;
            }
        case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
            {
                /* Handle event */
                break;
            }
        case CAN_EVENT_ERR_GLOBAL:      /* Global error. */
        case CAN_EVENT_ERR_CHANNEL:    /* Channel error. */
            {
                /* Get error status */
                g_err_status = (canfd_error_t) p_args->error; /* Check error code with
canfd_error_t. */
                /* Handle event */
                break;
            }
        default:
            {
                break;
            }
    }
}
```

```
    }
}
}
void canfd_basic_example (void)
{
    fsp_err_t err;
    /* Initialize the CAN module */
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Setup frame to write to CAN ID 0x20 */
    g_can_tx_frame.id           = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = 8;
    g_can_tx_frame.options     = 0;
    /* Write some data to the transmit frame */
    for (uint32_t i = 0; i < 8; i++)
    {
        g_can_tx_frame.data[i] = (uint8_t) i;
    }
    /* Send data on the bus */
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
    /* Wait for a transmit callback event */
}
```

Flexible Data

This example demonstrates sending an FD message with bitrate switching over external loopback. The CTX and CRX pins must be connected when using external loopback, though if a CAN transceiver is onboard a 120 Ohm resistor should be connected across CANH and CANL instead.

```
#define CAN_EXAMPLE_64_BYTES 64
void canfd_fd_loopback_example (void)
{
```

```
fsp_err_t err;

err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Switch to external loopback mode */
err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
assert(FSP_SUCCESS == err);

/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
g_can_tx_frame.id           = CAN_EXAMPLE_ID;
g_can_tx_frame.id_mode     = CAN_ID_MODE_STANDARD;
g_can_tx_frame.type        = CAN_FRAME_TYPE_DATA;
g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
g_can_tx_frame.options     = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;

/* Write some data to the transmit frame */
for (uint32_t i = 0; i < CAN_DATA_BUFFER_LENGTH; i++)
{
    g_can_tx_frame.data[i] = (uint8_t) i;
}

/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);

/* Wait for a transmit and/or receive callback event */
}
```

Internal Bus

In this example two CANFD channels are connected to the Internal Bus test mode. API error checking has been omitted for clarity.

Note

Internal Bus mode is only available on MCUs with more than one CANFD channel. In addition, use of Global Modes for any other purpose is not recommended without consulting the device User's Manual.

CANFD_STATUS_SLEEP_MODE	Channel in Sleep mode.
CANFD_STATUS_ERROR_PASSIVE	Channel in error-passive state.
CANFD_STATUS_BUS_OFF	Channel in bus-off state.
CANFD_STATUS_TRANSMITTING	Channel is transmitting.
CANFD_STATUS_RECEIVING	Channel is receiving.
CANFD_STATUS_READY	Channel is ready for communication.
CANFD_STATUS_ESI	At least one CAN-FD message was received with the ESI flag set.

◆ canfd_error_t

enum canfd_error_t	
CANFD Error Code	
Enumerator	
CANFD_ERROR_CHANNEL_BUS	Bus Error.
CANFD_ERROR_CHANNEL_WARNING	Error Warning (TX/RX error count over 0x5F)
CANFD_ERROR_CHANNEL_PASSIVE	Error Passive (TX/RX error count over 0x7F)
CANFD_ERROR_CHANNEL_BUS_OFF_ENTRY	Bus-Off State Entry.
CANFD_ERROR_CHANNEL_BUS_OFF_RECOVERY	Recovery from Bus-Off State.
CANFD_ERROR_CHANNEL_OVERLOAD	Overload.
CANFD_ERROR_CHANNEL_BUS_LOCK	Bus Locked.
CANFD_ERROR_CHANNEL_ARBITRATION_LOSS	Arbitration Lost.
CANFD_ERROR_CHANNEL_STUFF	Stuff Error.
CANFD_ERROR_CHANNEL_FORM	Form Error.
CANFD_ERROR_CHANNEL_ACK	ACK Error.
CANFD_ERROR_CHANNEL_CRC	CRC Error.
CANFD_ERROR_CHANNEL_BIT_RECESSIVE	Bit Error (recessive) Error.
CANFD_ERROR_CHANNEL_BIT_DOMINANT	Bit Error (dominant) Error.
CANFD_ERROR_CHANNEL_ACK_DELIMITER	ACK Delimiter Error.
CANFD_ERROR_GLOBAL_DLC	DLC Error.
CANFD_ERROR_GLOBAL_MESSAGE_LOST	Message Lost.
CANFD_ERROR_GLOBAL_PAYLOAD_OVERFLOW	FD Payload Overflow.
CANFD_ERROR_GLOBAL_TXQ_OVERWRITE	TX Queue Message Overwrite.
CANFD_ERROR_GLOBAL_TXQ_MESSAGE_LOST	TX Queue Message Lost.
CANFD_ERROR_GLOBAL_CH0_SCAN_FAIL	Channel 0 RX Scan Failure.

CANFD_ERROR_GLOBAL_CH1_SCAN_FAIL	Channel 1 RX Scan Failure.
CANFD_ERROR_GLOBAL_CH0_ECC	Channel 0 ECC Error.
CANFD_ERROR_GLOBAL_CH1_ECC	Channel 1 ECC Error.

◆ canfd_tx_mb_t

enum canfd_tx_mb_t
CANFD Transmit Message Buffer (TX MB)

◆ canfd_rx_buffer_t

enum canfd_rx_buffer_t
CANFD Receive Buffer (MB + FIFO)

◆ canfd_rx_mb_t

enum canfd_rx_mb_t
CANFD Receive Message Buffer (RX MB)

◆ canfd_rx_fifo_t

enum canfd_rx_fifo_t
CANFD Receive FIFO (RX FIFO)

◆ canfd_minimum_dlc_t

enum canfd_minimum_dlc_t
CANFD AFL Minimum DLC settings

◆ **canfd_frame_options_t**

enum <code>canfd_frame_options_t</code>	
CANFD Frame Options	
Enumerator	
<code>CANFD_FRAME_OPTION_ERROR</code>	Error state set (ESI).
<code>CANFD_FRAME_OPTION_BRS</code>	Bit Rate Switching (BRS) enabled.
<code>CANFD_FRAME_OPTION_FD</code>	Flexible Data frame (FDF).

Function Documentation◆ **R_CANFD_Open()**

```
fsp_err_t R_CANFD_Open ( can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg )
```

Open and configure the CANFD channel for operation.

Example:

```
/* Initialize the CAN module */
err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
```

Return values

<code>FSP_SUCCESS</code>	Channel opened successfully.
<code>FSP_ERR_ALREADY_OPEN</code>	Driver already open.
<code>FSP_ERR_IN_USE</code>	Channel is already in use.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	Channel does not exist on this MCU.
<code>FSP_ERR_ASSERTION</code>	A required pointer was NULL.
<code>FSP_ERR_CAN_INIT_FAILED</code>	The provided nominal or data bitrate is invalid.
<code>FSP_ERR_CLOCK_INACTIVE</code>	CANFD source clock is disabled (PLL or PLL2).

◆ **R_CANFD_Close()**

```
fsp_err_t R_CANFD_Close ( can_ctrl_t *const p_api_ctrl)
```

Close the CANFD channel.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented.

◆ **R_CANFD_Write()**

```
fsp_err_t R_CANFD_Write ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Write data to the CANFD channel.

Example:

```
/* Send data on the bus */
err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
FSP_ERR_INVALID_ARGUMENT	Data length or buffer number invalid.
FSP_ERR_INVALID_MODE	An FD option was set on a non-FD frame.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R_CANFD_Read()**

```
fsp_err_t R_CANFD_Read ( can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame )
```

Read data from a CANFD Message Buffer or FIFO.

Example: snippet r_canfd_example.c R_CANFD_Read

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	Buffer number invalid.
FSP_ERR_ASSERTION	p_api_ctrl or p_frame is NULL.
FSP_ERR_BUFFER_EMPTY	Buffer or FIFO is empty.

◆ **R_CANFD_ModeTransition()**

```
fsp_err_t R_CANFD_ModeTransition ( can_ctrl_t *const p_api_ctrl, can_operation_mode_t operation_mode, can_test_mode_t test_mode )
```

Switch to a different channel, global or test mode.

Example:

```
/* Switch to external loopback mode */
err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented
FSP_ERR_INVALID_MODE	Cannot change to the requested mode from the current global mode.

◆ **R_CANFD_InfoGet()**

```
fsp_err_t R_CANFD_InfoGet ( can_ctrl_t *const p_api_ctrl, can_info_t *const p_info )
```

Get CANFD state and status information for the channel.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	Null pointer presented

◆ **R_CANFD_CallbackSet()**

```
fsp_err_t R_CANFD_CallbackSet ( can_ctrl_t *const p_api_ctrl, void(*) (can_callback_args_t *)
p_callback, void const *const p_context, can_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `can_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

4.2.12 Consumer Electronics Control (r_cec)

Modules

Functions

```

```

Detailed Description

Driver for the CEC peripheral on RA MCUs. This module implements the [CEC Interface](#).

Overview

The HDMI CEC HAL module provides a high-level API for CEC applications and supports the CEC peripheral available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when data received, transmission complete, or error interrupts are received. The callback is passed a parameter which indicates the event as well as received data (if available).

Features

- Conforms to High Definition Multimedia Interface (HDMI) Consumer Electronics Control (CEC) standard Ver. 1.4b.
- Full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Data filtering based on matching destination address and local address.
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

Configuration

Build Time Configurations for r_cec

The following build time configurations are defined in fsp_cfg/r_cec_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
CEC Message Max Data Size	Manual Entry	14	Maximum Data Size for CEC Message Transmission/Reception.

Configurations for Connectivity > CEC (r_cec)

This module can be added to the Stacks tab via New Stack > Connectivity > CEC (r_cec). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid	g_cec0	Module name

	C symbol		
General > Callback Function	Manual Entry	g_rm_cec0_callback	Callback function
Control Configuration > Clock Select	<ul style="list-style-type: none"> • PCLKB / 32 • PCLKB / 64 • PCLKB / 128 • PCLKB / 256 • PCLKB / 512 • PCLKB / 1024 	PCLKB / 1024	CEC Clock Select Configuration
Control Configuration > Ack Bit Timing Error Enable	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	CEC Ack Bit Timing Error Enable

Interrupts > Address Mismatch Interrupt Enable	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable to generate an interrupt when the addresses do not match.
Interrupts > Data Interrupt Timing Selection	<ul style="list-style-type: none"> • EOM timing (9th bit of data) • ACK Timing (10th bit of data) 	EOM timing (9th bit of data)	INTDA reception interrupt timing selection (EOM or ACK).

Clock Configuration

The CEC peripheral uses the CECCLK or PCLKB as its clock source. To set the PCLKB frequency, use the Clocks tab of the RA Configuration editor.

Note

The selected clock and configured divider must be configured in the range of 23.4375 to 78.125 kHz.

Pin Configuration

A CEC channel uses one data pin - CECIO for data transmission and reception.

The output type for each pin should be set to **n-ch open drain** for most hardware designs. This can be configured in **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection->Ports.

Usage Notes

CEC Device Addresses

The CEC standard provides 13 device addresses that may be requested based on a device's primary function. Use `R_CEC_MediaInit` to request a specific address before starting communication with other devices.

Note

Address 0 is always the primary display (TV). Do not attempt to allocate this address unless your device is intended to function as a display.

Limitations

Developers should be aware of the following limitations when using the CEC module:

- `R_CEC_MediaInit` may return `FSP_ERR_IN_USE` for up to 45 milliseconds after `R_CEC_Open` while the hardware initializes.
- The `CECIO` pin must be set to n-ch open drain mode.

Examples

Basic Example

This is a basic example of minimal use of the CEC in an application.

```
/* *****  
*****  
 * Application defined callback  
 * - May be assigned at compile-time via the e2 Studio configuration tool or set at  
run-time via R_CEC_CallbackSet()  
 * *****  
*****/  
void cec_callback (cec_callback_args_t * p_args)  
{  
    switch (p_args->event)  
    {  
        case CEC_EVENT_READY:  
            {  
                /* Application processing for address allocation success. */  
                break;  
            }  
    }  
}
```

```
    }
case CEC_EVENT_TX_COMPLETE:
    {
    /* Any required processing after transmission has completed. */
    break;
    }
case CEC_EVENT_ERR:
    {
    /* Error processing. See cec_error_t for possible errors. */
    break;
    }
case CEC_EVENT_RX_DATA:
    {
    /* Application to store and process received data bytes. */
    break;
    }
case CEC_EVENT_RX_COMPLETE:
    {
    /* Application processing for message reception complete. */
    }
}
/*****
*****
* Basic example
*****
*****/
#define CEC_TIMEOUT_MS (50)
#define CEC_MSG_STANDBY (0X36) /* See CEC Specification for message definitions */
void basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the CEC module */
    err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
```

```
    assert(FSP_SUCCESS == err);

    /* Initialize the CEC module and allocate an address */
    uint32_t timeout_ms = CEC_TIMEOUT_MS;

    do
    {
        /* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
        R_CEC_Open */
        err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
    } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
    assert(timeout_ms);
    assert(FSP_SUCCESS == err);

    /* Wait for local address allocation and CEC bus to be free */
    cec_status_t status;
    err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
    while ((FSP_SUCCESS == err) && (CEC_STATE_READY != status.state))
    {
        err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }

    cec_message_t cec_msg;

    uint8_t      total_transmit_size;

    cec_msg.destination = CEC_ADDR_BROADCAST;          /* For this example, send message
to all devices on the bus */

    cec_msg.opcode      = CEC_MSG_STANDBY;            /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */

    total_transmit_size = 2U;                          /* Total message size, including
header, opcode, and data */

    /* Send asynchronous message.
    * - Application will then be free for other processing while message is being sent.
    * - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
```

```
}

```

Function Documentation

◆ R_CEC_Open()

```
fsp_err_t R_CEC_Open ( cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg )
```

Open and configure the CEC module for operation.

Example:

```
/* Open the CEC module */
err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CEC Module opened successfully.
FSP_ERR_ALREADY_OPEN	Driver already open.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_IRQ_BSP_DISABLED	Interrupts are not enabled.

◆ **R_CEC_MediaInit()**

```
fsp_err_t R_CEC_MediaInit ( cec_ctrl_t*const p_ctrl, cec_addr_t local_address )
```

Allocate provided CEC Local Address and Initialize the CEC module for operation.

Note

After calling *R_CEC_Open* this function may return *FSP_ERR_IN_USE* for up to 45 milliseconds.

Example:

```
/* Initialize the CEC module and allocate an address */
uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
{
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
} while ((FSP_ERR_IN_USE == err) && --timeout_ms);
assert(timeout_ms);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CEC Module Initialized successfully.
FSP_ERR_ASSERTION	An input argument is invalid or callback has not been set.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again later.

◆ **R_CEC_Close()**

```
fsp_err_t R_CEC_Close ( cec_ctrl_t*const p_ctrl)
```

Close the CEC module.

Return values

FSP_SUCCESS	CEC Module closed successfully.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ **R_CEC_Write()**

```
fsp_err_t R_CEC_Write ( cec_ctrl_t *const p_ctrl, cec_message_t const *const p_message, uint32_t message_size )
```

Write data to the CEC bus. Data transmission is asynchronous. Provided message buffer should not be modified until transmission is complete.

Data Transmission follows the pattern defined by the HDMI CEC Specification:

Data	Description	Size
Start Bit	Managed by Hardware, per config	N/A
Header Block	Source/Destination Identifier	1 Byte
Data Block 1	Opcode Value (Optional)	1 Byte
Data Block 2	Operands (Optional)	Variable (0-14 Bytes Typical)

Example:

```
cec_message_t cec_msg;

uint8_t      total_transmit_size;

cec_msg.destination = CEC_ADDR_BROADCAST;          /* For this example, send message
to all devices on the bus */

cec_msg.opcode      = CEC_MSG_STANDBY;            /* Send Standby Request */

memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */

total_transmit_size = 2U;                          /* Total message size, including
header, opcode, and data */

/* Send asynchronous message.

* - Application will then be free for other processing while message is being sent.
* - Do not modify the message buffer until transmission has completed. */

err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);

assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_NOT_INITIALIZED	Module has not been successfully initialized.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_INVALID_SIZE	Invalid message size.
FSP_ERR_IN_USE	HDMI CEC Bus is currently in use. Try again

later.

◆ **R_CEC_StatusGet()**

```
fsp_err_t R_CEC_StatusGet ( cec_ctrl_t *const p_ctrl, cec_status_t *const p_status )
```

Provides the state and status information according to the provided CEC control instance.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_ASSERTION	An input argument is invalid.

◆ **R_CEC_CallbackSet()**

```
fsp_err_t R_CEC_CallbackSet ( cec_ctrl_t *const p_ctrl, void(*) (cec_callback_args_t *) p_callback, void const *const p_context, cec_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `cec_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

<code>fsp_err_t</code>	<code>R_CGC_OscStopStatusClear</code>	<code>(cgc_ctrl_t *const p_ctrl)</code>
<code>fsp_err_t</code>	<code>R_CGC_CallbackSet</code>	<code>(cgc_ctrl_t *const p_api_ctrl, void(*p_callback)(cgc_callback_args_t *), void const *const p_context, cgc_callback_args_t *const p_callback_memory)</code>
<code>fsp_err_t</code>	<code>R_CGC_Close</code>	<code>(cgc_ctrl_t *const p_ctrl)</code>

Detailed Description

Driver for the CGC peripheral on RA MCUs. This module implements the [CGC Interface](#).

Note

This module is not required for the initial clock configuration. Initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor. The initial clock settings are applied by the BSP during the startup process before main.

Overview

Features

The CGC module supports runtime modifications of clock settings. Key features include the following:

- Supports changing the system clock source to any of the following options (provided they are supported on the MCU):
 - High-speed on-chip oscillator (HOCO)
 - Middle-speed on-chip oscillator (MOCO)
 - Low-speed on-chip oscillator (LOCO)
 - Main oscillator (external resonator or external clock input frequency)
 - Sub-clock oscillator (external resonator)
 - PLL/PLL2 (not available on all MCUs)
- When the system core clock frequency changes, the following things are updated:
 - The CMSIS standard global variable `SystemCoreClock` is updated to reflect the new clock frequency.

- Wait states for ROM and RAM are adjusted to the minimum supported value for the new clock frequency.
- The operating power control mode is updated to the minimum supported value for the new clock settings.
- Supports starting or stopping any of the system clock sources
- Supports changing dividers for the internal clocks
- Supports the oscillation stop detection feature

Internal Clocks

The RA microcontrollers have up to seven internal clocks. Not all internal clocks exist on all MCUs. Each clock domain has its own divider that can be updated in `R_CGC_SystemClockSet()`. The dividers are subject to constraints described in the footnote of the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual.

The internal clocks include:

- System clock (ICLK): core clock used for CPU, flash, internal SRAM, DTC, and DMAC
- PCLKA/PCLKB/PCLKC/PCLKD: Peripheral clocks, refer to the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual to see which peripherals are controlled by which clocks.
- FCLK: Clock source for reading data flash and for programming/erasure of both code and data flash.
- BCLK: External bus clock

Configuration

Note

*The initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor.*

There is a configuration to enable the HOCO on reset in the OFS1 settings on the BSP tab.

The following clock related settings are configurable in the RA Common section on the BSP tab:

- Main Oscillator Wait Time
- Main Oscillator Clock Source (external oscillator or crystal/resonator)
- Subclock Populated
- Subclock Drive
- Subclock Stabilization Time (ms)

The default stabilization times are determined based on development boards provided by Renesas, but are generally valid for most designs. Depending on the target board hardware configuration and requirements these values may need to be adjusted for reliability or startup speed.

Build Time Configurations for r_cgc

The following build time configurations are defined in `fsp_cfg/r_cgc_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Clock Generation Circuit (r_cgc)

This module can be added to the Stacks tab via New Stack > System > Clock Generation Circuit (r_cgc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cgc0	Module name.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if oscillation stop detection is used. If this callback function is provided, it is called from the NMI handler if the main oscillator stops.

Clock Configuration

This module is used to configure the system clocks. There are no module specific clock configurations required to use it.

Pin Configuration

The CGC module controls the output of the CLOCKOUT signal.

If an external oscillator is used the XTAL and EXTAL pins must be configured accordingly. When running from an on chip oscillator there is no requirement for the main clock external oscillator. In this case, the XTAL and EXTAL pins can be set to a different function in the RA Configuration editor.

The functionality of the subclock external oscillator pins XCIN and XCOU is fixed.

Usage Notes

NMI Interrupt

The CGC timer uses the NMI for oscillation stop detection of the main oscillator after `R_CGC_OscStopDetectEnable` is called. The NMI is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during `R_CGC_Open()` is called.

Starting or Stopping the Subclock

If the Subclock Populated property is set to Populated on the BSP configuration tab, then the subclock is started in the BSP startup routine. Otherwise, it is stopped in the BSP startup routine. Starting and stopping the subclock at runtime is not recommended since the stabilization requirements typically negate the negligible power savings.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take up to several seconds to stabilize. RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. In this case the default wait time is 1000ms (1 second). When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation. Because there is no hardware stabilization status bit for the subclock `R_CGC_ClockCheck` cannot be used to optimize this wait.

Changing the subclock state during `R_CGC_ClocksCfg()` is not supported.

Low Power Operation

If "Use Low Voltage Mode" is enabled in the BSP MCU specific properties (not available on all MCUs), the MCU is always in low voltage mode and no other power modes are considered. The following conditions must be met for the MCU to run in low voltage mode:

- Requires HOCO to be running, so HOCO cannot be stopped in low voltage mode
- Requires PLL to be stopped, so PLL APIs are not available in low voltage mode
- Requires ICLK \leq 4 MHz
- If oscillation stop detection is used, dividers of 1 or 2 cannot be used for any clock

If "Use Low Voltage Mode" is not enabled, the MCU applies the lowest power mode by searching through the following list in order and applying the first power mode that is supported under the current conditions:

- Subosc-speed mode (lowest power)
 - Requires system clock to be LOCO or subclock
 - Requires MOCO, HOCO, main oscillator, and PLL (if present) to be stopped
 - Requires ICLK and FCLK dividers to be 1
- Low-speed mode
 - Requires PLL to be stopped
 - Requires ICLK \leq 1 MHz
 - If oscillation stop detection is used, dividers of 1, 2, 4, or 8 cannot be used for any clock
- Middle-speed mode (not supported on all MCUs)
 - Requires ICLK \leq 8 MHz
- High-speed mode
 - Default mode if no other operating mode is supported

Refer to the section "Function for Lower Operating Power Consumption" in the "Low Power Modes" chapter of the hardware manual for MCU specific information about operating power control modes.

Note

The DCDC regulator (if present) is only available in Middle- and High-speed modes. The BSP will automatically switch between DCDC and LDO when switching between compatible and incompatible modes if the DCDC regulator is in use. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

When low voltage mode is not used, the following functions adjust the operating power control mode to ensure it remains within the hardware specification and to ensure the MCU is running at the optimal operating power control mode:

- `R_CGC_ClockStart()`
- `R_CGC_ClockStop()`
- `R_CGC_SystemClockSet()`
- `R_CGC_OscStopDetectEnable()`
- `R_CGC_OscStopDetectDisable()`

Note

FSP APIs, including these APIs, are not thread safe. These APIs and any other user code that modifies the operating power control mode must not be allowed to interrupt each other. Proper care must be taken during application design if these APIs are used in threads or interrupts to ensure this constraint is met.

No action is required by the user of these APIs. This section is provided for informational purposes only.

Examples

Basic Example

This is a basic example of minimal use of the CGC in an application.

```
void cgc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Change the system clock to LOCO for power saving. */
    /* Start the LOCO. */
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
    assert(FSP_SUCCESS == err);
    /* Wait for the LOCO stabilization wait time.
     *
     * NOTE: The MOCO, LOCO and subclock do not have stabilization status bits, so any
    stabilization time must be
     * performed via a software wait when starting these oscillators. For all other
    oscillators, R_CGC_ClockCheck can
     * be used to verify stabilization status.
     */
    R_BSP_SoftwareDelay(BSP_FEATURE_CGC_LOCO_STABILIZATION_MAX_US,
    BSP_DELAY_UNITS_MICROSECONDS);
    /* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
    cgc_divider_cfg_t dividers =
    {
        /* PCLKB is not used in this application, so select the maximum divisor for lowest
    power. */
        .pclk_div = CGC_SYS_CLOCK_DIV_64,
        /* PCLKD is not used in this application, so select the maximum divisor for lowest
```

```
power. */
    .pclkd_div = CGC_SYS_CLOCK_DIV_64,
/* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
    .iclk_div = CGC_SYS_CLOCK_DIV_1,
/* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
    .pclka_div = CGC_SYS_CLOCK_DIV_1,
    .pclkc_div = CGC_SYS_CLOCK_DIV_1,
    .fclk_div = CGC_SYS_CLOCK_DIV_1,
    .bclk_div = CGC_SYS_CLOCK_DIV_1,
};
/* Switch the system clock to LOCO. */
err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
assert(FSP_SUCCESS == err);
}
```

Configuring Multiple Clocks

This example demonstrates switching to a new source clock and stopping the previous source clock in a single function call using [R_CGC_ClocksCfg\(\)](#).

```
void cgc_clocks_cfg_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
/* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Change the system clock to PLL running from the main oscillator. */
/* Assuming the system clock is MOCO, switch to HOCO. */
    cgc_clocks_cfg_t clocks_cfg;
    clocks_cfg.system_clock          = CGC_CLOCK_PLL;
    clocks_cfg.pll_state             = CGC_CLOCK_CHANGE_NONE;
    clocks_cfg.pll_cfg.source_clock = CGC_CLOCK_MAIN_OSC; // unused
    clocks_cfg.pll_cfg.multiplier   = CGC_PLL_MUL_10_0;  // unused
}
```

```
clocks_cfg pll_cfg divider = CGC_PLL_DIV_2; // unused
clocks_cfg divider_cfg iclk_div = CGC_SYS_CLOCK_DIV_1;
clocks_cfg divider_cfg pclka_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkb_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkc_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkd_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg bclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg fclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg mainosc_state = CGC_CLOCK_CHANGE_NONE;
clocks_cfg hoco_state = CGC_CLOCK_CHANGE_START;
clocks_cfg moco_state = CGC_CLOCK_CHANGE_STOP;
clocks_cfg loco_state = CGC_CLOCK_CHANGE_NONE;
err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
assert(FSP_SUCCESS == err);
#if BSP_FEATURE_CGC_HAS_PLL
/* Assuming the system clock is HOCO, switch to PLL running from main oscillator and
stop MOCO. */
clocks_cfg system_clock = CGC_CLOCK_PLL;
clocks_cfg pll_state = CGC_CLOCK_CHANGE_START;
clocks_cfg pll_cfg source_clock = CGC_CLOCK_MAIN_OSC;
clocks_cfg pll_cfg multiplier = (cgc_pll_mul_t) BSP_CFG_PLL_MUL;
clocks_cfg pll_cfg divider = (cgc_pll_div_t) BSP_CFG_PLL_DIV;
clocks_cfg divider_cfg iclk_div = CGC_SYS_CLOCK_DIV_1;
clocks_cfg divider_cfg pclka_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkb_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkc_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg pclkd_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg bclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg divider_cfg fclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg mainosc_state = CGC_CLOCK_CHANGE_START;
clocks_cfg hoco_state = CGC_CLOCK_CHANGE_STOP;
clocks_cfg moco_state = CGC_CLOCK_CHANGE_NONE;
clocks_cfg loco_state = CGC_CLOCK_CHANGE_NONE;
err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
```

```
    assert(FSP_SUCCESS == err);
#endif
}
```

Oscillation Stop Detection

This example demonstrates registering a callback for oscillation stop detection of the main oscillator.

```
/* Example callback called when oscillation stop is detected. */
void oscillation_stop_callback (cgc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) If the MCU was running on the main oscillator, the MCU is now running
on MOCO. Switch clocks if
    * desired. This example shows switching to HOCO. */
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
    assert(FSP_SUCCESS == err);

    do
    {
        /* Wait for HOCO to stabilize. */
        err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
    } while (FSP_SUCCESS != err);

    cgc_divider_cfg_t dividers =
    {
        .pclkb_div = CGC_SYS_CLOCK_DIV_4,
        .pclkd_div = CGC_SYS_CLOCK_DIV_4,
        .iclk_div = CGC_SYS_CLOCK_DIV_1,
        .pclka_div = CGC_SYS_CLOCK_DIV_4,
        .pclkc_div = CGC_SYS_CLOCK_DIV_4,
        .fclk_div = CGC_SYS_CLOCK_DIV_4,
        .bclk_div = CGC_SYS_CLOCK_DIV_4,
    };

    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_HOCO, &dividers);
    assert(FSP_SUCCESS == err);
}
```

```
#if BSP_FEATURE_CGC_HAS_PLL
/* (Optional) If the MCU was running on the PLL, the PLL is now in free-running
mode. Switch clocks if
* desired. This example shows switching to the PLL running on HOCO. */
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
assert(FSP_SUCCESS == err);
do
{
/* Wait for HOCO to stabilize. */
err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
} while (FSP_SUCCESS != err);
cgc_pll_cfg_t pll_cfg =
{
.source_clock = CGC_CLOCK_HOCO,
.multiplier   = (cgc_pll_mul_t) BSP_CFG_PLL_MUL,
.divider      = (cgc_pll_div_t) BSP_CFG_PLL_DIV,
};
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_PLL, &pll_cfg);
assert(FSP_SUCCESS == err);
do
{
/* Wait for PLL to stabilize. */
err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_PLL);
} while (FSP_SUCCESS != err);
cgc_divider_cfg_t pll_dividers =
{
.pclk_b_div = CGC_SYS_CLOCK_DIV_4,
.pclk_d_div = CGC_SYS_CLOCK_DIV_4,
.iclk_div   = CGC_SYS_CLOCK_DIV_1,
.pclk_a_div = CGC_SYS_CLOCK_DIV_4,
.pclk_c_div = CGC_SYS_CLOCK_DIV_4,
.fclk_div   = CGC_SYS_CLOCK_DIV_4,
.bclk_div   = CGC_SYS_CLOCK_DIV_4,
};
};
```

```
err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_PLL, &pll_dividers);
assert(FSP_SUCCESS == err);
#endif

/* (Optional) Clear the error flag. Only clear this flag after switching the MCU
clock source away from the main
* oscillator and if the main oscillator is stable again. */
err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
}

void cgc_osc_stop_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Open the module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable oscillation stop detection. The main oscillator must be running at this
point. */
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
    /* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
    err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
    __WFI();
    /* (Optional) Reenable oscillation stop detection after waking from low power mode.
*/
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct [cgc_instance_ctrl_t](#)

Data Structure Documentation

◆ **cgc_instance_ctrl_t**

```
struct cgc_instance_ctrl_t
```

CGC private control block. DO NOT MODIFY. Initialization occurs when [R_CGC_Open\(\)](#) is called.

Data Fields

void const *	p_context
--------------	---------------------------

Field Documentation◆ **p_context**

```
void const* cgc_instance_ctrl_t::p_context
```

Placeholder for user data. Passed to the user callback in [cgc_callback_args_t](#).

Function Documentation◆ **R_CGC_Open()**

```
fsp_err_t R_CGC_Open ( cgc_ctrl_t *const p_ctrl, cgc_cfg_t const *const p_cfg )
```

Initialize the CGC API. Implements [cgc_api_t::open](#).

Example:

```
/* Initializes the CGC module. */
err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
```

Return values

FSP_SUCCESS	CGC successfully initialized.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CGC_ClocksCfg()

```
fsp_err_t R_CGC_ClocksCfg ( cgc_ctrl_t *const p_ctrl, cgc_clocks_cfg_t const *const p_clock_cfg )
```

Reconfigures all main system clocks. This API can be used for any of the following purposes:

- start or stop clocks
- change the system clock source
- configure the PLL/PLL2 multiplication and division ratios when starting the PLL
- change the system dividers

If the requested system clock source has a stabilization flag, this function blocks waiting for the stabilization flag of the requested system clock source to be set. If the requested system clock source was just started and it has no stabilization flag, this function blocks for the stabilization time required by the requested system clock source according to the Electrical Characteristics section of the hardware manual. If the requested system clock source has no stabilization flag and it is already running, it is assumed to be stable and this function will not block. If the requested system clock is the subclock, the subclock must be stable prior to calling this function.

The internal dividers (`cgc_clocks_cfg_t::divider_cfg`) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

Do not attempt to stop the requested clock source or the source of a PLL if the PLL will be running after this operation completes.

Implements `cgc_api_t::clocksCfg`.

Example:

```
/* Assuming the system clock is MOCO, switch to HOCO. */
cgc_clocks_cfg_t clocks_cfg;

clocks_cfg.system_clock          = CGC_CLOCK_PLL;

clocks_cfg.pll_state             = CGC_CLOCK_CHANGE_NONE;

clocks_cfg.pll_cfg.source_clock = CGC_CLOCK_MAIN_OSC; // unused

clocks_cfg.pll_cfg.multiplier   = CGC_PLL_MUL_10_0;   // unused

clocks_cfg.pll_cfg.divider      = CGC_PLL_DIV_2;      // unused

clocks_cfg.divider_cfg.iclk_div = CGC_SYS_CLOCK_DIV_1;

clocks_cfg.divider_cfg.pclka_div = CGC_SYS_CLOCK_DIV_4;

clocks_cfg.divider_cfg.pclkb_div = CGC_SYS_CLOCK_DIV_4;

clocks_cfg.divider_cfg.pclkc_div = CGC_SYS_CLOCK_DIV_4;

clocks_cfg.divider_cfg.pclkd_div = CGC_SYS_CLOCK_DIV_4;

clocks_cfg.divider_cfg.bclk_div = CGC_SYS_CLOCK_DIV_4;
```

```

clocks_cfg.divider_cfg.fclk_div = CGC_SYS_CLOCK_DIV_4;
clocks_cfg.mainosc_state       = CGC_CLOCK_CHANGE_NONE;
clocks_cfg.hoco_state         = CGC_CLOCK_CHANGE_START;
clocks_cfg.moco_state         = CGC_CLOCK_CHANGE_STOP;
clocks_cfg.loco_state         = CGC_CLOCK_CHANGE_NONE;
err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
assert(FSP_SUCCESS == err);

```

Return values

FSP_SUCCESS	Clock configuration applied successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_NOT_STABILIZED	PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ **R_CGC_ClockStart()**

```
fsp_err_t R_CGC_ClockStart ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source, cgc_pll_cfg_t const
*const p_pll_cfg )
```

Start the specified clock if it is not currently active. The PLL configuration cannot be changed while the PLL is running. Implements `cgc_api_t::clockStart`.

The PLL source clock must be operating and stable prior to starting the PLL.

Example:

```
/* Start the LOCO. */
err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock initialized successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	The clock source is not stabilized after being turned off or PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ **R_CGC_ClockStop()**

```
fsp_err_t R_CGC_ClockStop ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source )
```

Stop the specified clock if it is active. Implements `cgc_api_t::clockStop`.

Do not attempt to stop the current system clock source. Do not attempt to stop the source clock of a PLL if the PLL is running.

Return values

FSP_SUCCESS	Clock stopped successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_OSC_STOP_DET_ENABLED	Attempt to stop MOCO when Oscillation stop is enabled.
FSP_ERR_NOT_STABILIZED	Clock not stabilized after starting.

◆ **R_CGC_ClockCheck()**

```
fsp_err_t R_CGC_ClockCheck ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source )
```

Check the specified clock for stability. Implements `cgc_api_t::clockCheck`.

Return values

FSP_SUCCESS	Clock is running and stable.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	Clock not stabilized.
FSP_ERR_CLOCK_INACTIVE	Clock not turned on.

◆ R_CGC_SystemClockSet()

```
fsp_err_t R_CGC_SystemClockSet ( cgc_ctrl_t *const p_ctrl, cgc_clock_t clock_source,
cgc_divider_cfg_t const *const p_divider_cfg )
```

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD, BCLK, and FCLK. Implements `cgc_api_t::systemClockSet`.

The requested clock source must be running and stable prior to calling this function. The internal dividers are subject to constraints described in the hardware manual table "Specifications of the Clock Generation Circuit for the internal clocks".

The internal dividers (`p_divider_cfg`) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

This function also updates the RAM and ROM wait states, the operating power control mode, and the SystemCoreClock CMSIS global variable.

Example:

```
/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
{
/* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
.pclkb_div = CGC_SYS_CLOCK_DIV_64,
/* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
.pclkd_div = CGC_SYS_CLOCK_DIV_64,
/* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
.iclk_div = CGC_SYS_CLOCK_DIV_1,
/* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
.pclka_div = CGC_SYS_CLOCK_DIV_1,
.pclkc_div = CGC_SYS_CLOCK_DIV_1,
.fclk_div = CGC_SYS_CLOCK_DIV_1,
.bclk_div = CGC_SYS_CLOCK_DIV_1,
};
/* Switch the system clock to LOCO. */
```

```
err = R_CGC_SystemClockSet(&g_cg0_ctrl, CGC_CLOCK_LOCO, &dividers);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
FSP_ERR_NOT_STABILIZED	The clock source has not stabilized

◆ R_CGC_SystemClockGet()

```
fsp_err_t R_CGC_SystemClockGet ( cgc_ctrl_t *const p_ctrl, cgc_clock_t *const p_clock_source,
cgc_divider_cfg_t *const p_divider_cfg )
```

Return the current system clock source and configuration. Implements `cgc_api_t::systemClockGet`.

Return values

FSP_SUCCESS	Parameters returned successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CGC_OscStopDetectEnable()

`fsp_err_t R_CGC_OscStopDetectEnable (cgc_ctrl_t *const p_ctrl)`

Enable the oscillation stop detection for the main clock. Implements `cgc_api_t::oscStopDetectEnable`.

The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Example:

```
/* Enable oscillation stop detection. The main oscillator must be running at this
point. */
err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_LOW_VOLTAGE_MODE	Settings not allowed in low voltage mode.

◆ **R_CGC_OscStopDetectDisable()**

```
fsp_err_t R_CGC_OscStopDetectDisable ( cgc_ctrl_t *const p_ctrl)
```

Disable the oscillation stop detection for the main clock. Implements [cgc_api_t::oscStopDetectDisable](#).

Example:

```
/* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
__WFI();
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.

◆ R_CGC_OscStopStatusClear()

```
fsp_err_t R_CGC_OscStopStatusClear ( cgc_ctrl_t *const p_ctrl)
```

Clear the Oscillation Stop Detection Status register. This register is not cleared automatically if the stopped clock is restarted. Implements `cgc_api_t::oscStopStatusClear`.

After clearing the status, oscillation stop detection is no longer enabled.

This register cannot be cleared while the main oscillator is the system clock or the PLL source clock.

Example:

```
/* (Optional) Clear the error flag. Only clear this flag after switching the MCU
clock source away from the main
* oscillator and if the main oscillator is stable again. */
err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	Main oscillator must be running to clear the oscillation stop detection flag.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.
FSP_ERR_INVALID_HW_CONDITION	Oscillation stop status was not cleared. Check preconditions and try again.

◆ **R_CGC_CallbackSet()**

```
fsp_err_t R_CGC_CallbackSet ( cgc_ctrl_t *const p_api_ctrl, void(*) (cgc_callback_args_t *)
p_callback, void const *const p_context, cgc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `cgc_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_CGC_Close()**

```
fsp_err_t R_CGC_Close ( cgc_ctrl_t *const p_ctrl)
```

Closes the CGC module. Implements `cgc_api_t::close`.

Return values

FSP_SUCCESS	The module is successfully closed.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.14 Cyclic Redundancy Check (CRC) Calculator (r_crc)

Modules

Functions

```
fsp_err_t R_CRC_Open (crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg)
```

```
fsp_err_t R_CRC_Close (crc_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_CRC_Calculate (crc_ctrl_t *const p_ctrl, crc_input_t *const
p_crc_input, uint32_t *calculatedValue)
```

```
fsp_err_t R_CRC_CalculatedValueGet (crc_ctrl_t *const p_ctrl, uint32_t
*calculatedValue)
```

```
fsp_err_t R_CRC_SnoopEnable (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)
```

```
fsp_err_t R_CRC_SnoopDisable (crc_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the CRC peripheral on RA MCUs. This module implements the [CRC Interface](#).

Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

Features

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
 - X^8+X^2+X+1 (CRC-8)
 - $X^{16}+X^{15}+X^2+1$ (CRC-16)
 - $X^{16}+X^{12}+X^5+1$ (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
 - $X^{32}+X^{26}+X^{23}+X^{22}+X^{16}+X^{12}+X^{11}+X^{10}+X^8+X^7+X^5+X^4+X^2+X+1$ (CRC-32)
 - $X^{32}+X^{28}+X^{27}+X^{26}+X^{25}+X^{23}+X^{22}+X^{20}+X^{19}+X^{18}+X^{14}+X^{13}+X^{11}+X^{10}+X^9+X^8+X^6+1$ (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

Configuration

Build Time Configurations for r_crc

The following build time configurations are defined in fsp_cfg/r_crc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > CRC (r_crc)

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Name	Name must be a valid C symbol	g_crc0	Module name.
CRC Polynomial	<ul style="list-style-type: none"> • CRC-8 • CRC-16 • CRC-CCITT • CRC-32 • CRC-32C 	CRC-32C	Select the CRC polynomial.
Bit Order	<ul style="list-style-type: none"> • LSB • MSB 	MSB	Select the CRC bit order.
Snoop Address	Refer to the RA Configuration tool for available options.	NONE	Select the SCI register address CRC snoop

Clock Configuration

There is no clock configuration for the CRC module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling `R_CRC_Calculate` on a block of data, `R_CRC_SnoopEnable` is called to start monitoring reads/writes and `R_CRC_CalculatedValueGet` is used to obtain the current CRC.

Note

Snoop mode is available for transmit/receive operations on SCI only.

Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of 0xFFFFFFFF needs to be used by both the online calculator and the `R_CRC` module API (CRC32 polynomials)
- Make sure the bit orientation of the `R_CRC` CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with 0xFFFFFFFF.

Examples

Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
    uint32_t length;
    uint32_t uint8_calculated_value;
    length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
    crc_input_t example_input =
    {
        .p_input_buffer = g_data_8bit,
        .num_bytes      = length,
        .crc_seed       = 0,
    };
    /* Open CRC module with 8 bit polynomial */
    R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
    /* 8-bit CRC calculation */
    R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}
```

Snoop Example

This example demonstrates CRC snoop operation.

```
void crc_snoop_example ()
{
    /* Open CRC module with 8 bit polynomial */
    R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
    /* Open SCI Driver */
    /* Configure Snoop address and enable snoop mode */
    R_CRC_SnoopEnable(&crc_ctrl, 0);
    /* Perform SCI read/write operation depending on the SCI snoop address configure */
    /* Read CRC value */
    R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}
```

Data Structures

struct [crc_instance_ctrl_t](#)

Data Structure Documentation

◆ [crc_instance_ctrl_t](#)

struct [crc_instance_ctrl_t](#)

Driver instance control structure.

Function Documentation

◆ [R_CRC_Open\(\)](#)

[fsp_err_t](#) [R_CRC_Open](#) ([crc_ctrl_t](#) *const *p_ctrl*, [crc_cfg_t](#) const *const *p_cfg*)

Open the CRC driver module

Implements [crc_api_t::open](#)

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	<i>p_ctrl</i> or <i>p_cfg</i> is NULL.
FSP_ERR_ALREADY_OPEN	Module already open

◆ [R_CRC_Close\(\)](#)

[fsp_err_t](#) [R_CRC_Close](#) ([crc_ctrl_t](#) *const *p_ctrl*)

Close the CRC module driver.

Implements [crc_api_t::close](#)

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	<i>p_ctrl</i> is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R_CRC_Calculate()**

```
fsp_err_t R_CRC_Calculate ( crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *
calculatedValue )
```

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements `crc_api_t::calculate`

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

Return values

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
FSP_ERR_INVALID_ARGUMENT	length value is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R_CRC_CalculatedValueGet()**

```
fsp_err_t R_CRC_CalculatedValueGet ( crc_ctrl_t *const p_ctrl, uint32_t * calculatedValue )
```

Return the current calculated value.

Implements `crc_api_t::crcResultGet`

CRC calculation operates on a running value. This function returns the current calculated value.

Return values

FSP_SUCCESS	Return of calculated value successful.
FSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R_CRC_SnoopEnable()**

```
fsp_err_t R_CRC_SnoopEnable ( crc_ctrl_t *const p_ctrl, uint32_t crc_seed )
```

Configure the snoop channel and set the CRC seed.

Implements [crc_api_t::snoopEnable](#)

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Return values

FSP_SUCCESS	Snoop configured successfully.
FSP_ERR_ASSERTION	Pointer to control structure is NULL
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ **R_CRC_SnoopDisable()**

```
fsp_err_t R_CRC_SnoopDisable ( crc_ctrl_t *const p_ctrl)
```

Disable snooping.

Implements [crc_api_t::snoopDisable](#)

Return values

FSP_SUCCESS	Snoop disabled.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

4.2.15 Capacitive Touch Sensing Unit (r_ctsu)

Modules

Functions

```
fsp_err_t R_CTSU_Open (ctsu_ctrl_t *const p_ctrl, ctstu_cfg_t const *const p_cfg)
```

Opens and configures the CTSU driver module. Implements [ctsu_api_t::open](#). [More...](#)

```
fsp_err_t R_CTSU_ScanStart (ctsu_ctrl_t *const p_ctrl)
```

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [R_CTSU_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [ctsu_api_t::scanStart](#). [More...](#)

`fsp_err_t R_CTSU_DataGet (ctsu_ctrl_t *const p_ctrl, uint16_t *p_data)`

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu_api_t::dataGet](#). [More...](#)

`fsp_err_t R_CTSU_ScanStop (ctsu_ctrl_t *const p_ctrl)`

This function scan stops the sensor as scanning by the CTSU. Implements [ctsu_api_t::scanStop](#). [More...](#)

`fsp_err_t R_CTSU_CallbackSet (ctsu_ctrl_t *const p_api_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctSU_callback_args_t *const p_callback_memory)`

`fsp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const p_ctrl)`

Diagnosis the CTSU peripheral. Implements [ctsu_api_t::diagnosis](#). [More...](#)

`fsp_err_t R_CTSU_Close (ctsu_ctrl_t *const p_ctrl)`

Disables specified CTSU control block. Implements [ctsu_api_t::close](#). [More...](#)

`fsp_err_t R_CTSU_SpecificDataGet (ctsu_ctrl_t *const p_ctrl, uint16_t *p_specific_data, ctSU_specific_data_type_t specific_data_type)`

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the [R_CTSU_DataGet\(\)](#) function. [More...](#)

`fsp_err_t R_CTSU_DataInsert (ctsu_ctrl_t *const p_ctrl, uint16_t *p_insert_data)`

This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R_CTSU_DataInsert\(\)](#) function. Implements [ctsu_api_t::dataInsert](#). [More...](#)

Detailed Description

This HAL driver supports the Capacitive Touch Sensing Unit (CTSUS). It implements the [CTSUS Interface](#).

Overview

The capacitive touch sensing unit HAL driver (r_ctsu) provides an API to control the CTSUS peripheral. This module performs capacitance measurement based on various settings defined by the configuration. This module is configured via the [QE for Capacitive Touch](#).

Features

- Supports multiple scan modes
 - Self-capacitance multi scan mode (CTSUS2 support active shield)
 - Mutual-capacitance full scan mode
 - Mutual-capacitance parallel scan mode (CTSUS2)
 - Current Measurement mode (CTSUS2)
 - Diagnosis scan mode
- Scans may be started by software or an external trigger
- Returns measured capacitance data on scan completion
- Support DTC transfer of scanned data
- Supports TrustZone
- Corrects accuracy for temperature drift (CTSUS2)

Configuration

Note

This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click Help -> Help Contents in e2 studio and search for "QE".

Build Time Configurations for r_ctsu

The following build time configurations are defined in fsp_cfg/r_ctsu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Support for using DTC	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable DTC support for the CTSUS module.
Interrupt priority level	MCU Specific Options		Priority level of all CTSUS interrupt (CSTU_WR, CTSUS_RD, CTSUS_FN)

Configurations for CapTouch > CTSUS (r_ctsu)

This module can be added to the Stacks tab via New Stack > CapTouch > CTSUS (r_ctsu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Scan Start Trigger

MCU Specific Options

CTSUScan Start
Trigger Select

Interrupt Configuration

The first [R_CTSU_Open](#) function call sets CTSU peripheral interrupts. The user should provide a callback function to be invoked at the end of the CTSU scan sequence. The callback argument will contain information about the scan status.

Clock Configuration

The CTSU peripheral module uses PCLKB as its clock source. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

The CTSU Drive pulse will be calculated and set by the tooling depending on the selected transfer rate.

Pin Configuration

The TS_n pins are sensor pins for the CTSU.

The TSCAP pin is used for an internal low-pass filter and must be connected to an external decoupling capacitor.

Usage Notes

The CTSU module is a CTSU driver for the Touch module. The CTSU module assumes the access from the Touch middleware layer, and it is also accessible from an user application. CTSU and CTSU2 are functionally different, so CTSU and CTSU2 are described in this application note as below.

Common description for CTSU and CTSU2 -> CTSU

Description only for CTSU -> CTSU1

Description only for CTSU2 -> CTSU2

Without mention, it means the common description for CTSU and CTSU2.

Functions

The CTSU module supports the following functions.

Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event Link Controller (ELC).

As the measurement process is carried out by the CTSU2 peripheral, it does not use up main processor processing time.

The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The data transfer controller (DTC) can also be used for these processes.

When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed.

Start the measurement with API function [R_CTSU_ScanStart\(\)](#).

Obtain the measurement results with API function [R_CTSU_DataGet\(\)](#).

Sensor ICO Correction function

The CTSU2 peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor ICO MCU.

The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.

When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor ICO.

Initial Offset Adjustment

The CTSU2 peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic capacitance for it to fit within the sensor ICO dynamic range.

This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, `R_CTSU_ScanStart()` and `R_CTSU_DataGet()` must be repeated several times after startup. Because the `cts_u_element_cfg_t` member "so" is the starting point for adjustments, you can set the appropriate value for "so" in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for "so" is a value adjusted by QE for Capacitive Touch.

Mode	Default target value
Self-capacitance	15360 (37.5%)
Self-capacitance using active shield	6144 (15%)
Mutual-capacitance	10240 (20%)

The percentage is for the CCO's input limit. 100% is the measured value 40960.

The default target value is based on 526us(CTS1) or 256us(CTS2).

When the measurement time is changed, the target value is adjusted by the ratio with the base time.

Example of target value in combination of CTSUSNUM and CTSUSDPA.
CTS1 (CTS clock = 32MHz, Self-capacitance mode)

Target value	CTSUSNUM	CTSUSDPA	Measurement time
15360	0x3	0x7	526usec
30720	0x7	0x7	1052usec
30720	0x3	0xF	1052usec
7680	0x1	0x7	263usec
7680	0x3	0x3	263usec

The measurement time changes depending on the combination of CTSUSNUM and CTSUSDPA. In the above table, CTSUPRRATIO is the recommended value of 3, and CSTUPRMODE is the recommended value of 2.

When changing CTSUPRRATIO and CTSUPRMODE from the recommended values, follow the Hardware Manual for the measurement time.

CTSUS2 (Self-capacitance mode)

Target value	Target value (multi frequency)	CTSUSNUM	Measurement time
7680	15360 (128us + 128us)	0x7	128usec
15360	30720 (256us + 256us)	0xF	256usec
3840	7680 (64us + 64us)	0x3	64usec

The measurement time changes depending on CTSUSNUM.

If STCLK cannot be set to 0.5MHz, it will not support the table above.

When setting STCLK to other than 0.5MHz because the CTSU clock is not an integer, follow the hardware manual for the measurement time.

Random Pulse Frequency Measurement (CTSUS1)

The CTSUS1 peripheral measures at one drive frequency.

The drive frequency determines the amperage to the electrode and generally uses the value tuned with QE for Capacitive Touch.

The drive frequency is calculated as below.

It is determined by PCLK frequency input to CTSU, CTSU Count Source Select bit(CTSUSCLK), and CTSU Sensor Drive pulse Division Control bit(CTSUSDPA). For example, If it is set PCLK = 32MHz, CTSUSCLK = PCLK/2, and CTSUSDPA = 1/16, then drive frequency is 0.5MHz. CTSUSDPA can change for each TS port.

Figure 149: Drive Frequency Settings

The actual drive pulse is phase-shifted and frequency-spread with respect to the clock based on the drive frequency as a measure against external environmental noise. This module is fixed at initialization and sets the following.

CTSUSOFF = 0, CTSUSSMOD = 0, CTSUSSCNT = 3

Multi-frequency Measurements (CTSUS2)

The CTSUS2 peripheral can measure in one of four drive frequencies to avoid synchronous noise. With the default settings, the module takes measurements at three different frequencies. After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as "normalization."

The three values standardized to the first frequency reference value are called correction data.

You can get the three correction data with `R_CTSU_SpecificDataGet()`.

Figure 150: Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.

Drive frequency is calculated in the following equation:

$$(\text{PCLKB frequency} / \text{CLK} / \text{STCLK}) \times \text{SUMULTIn} / 2 / \text{SDPA} : n = 0, 1, 2$$

The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

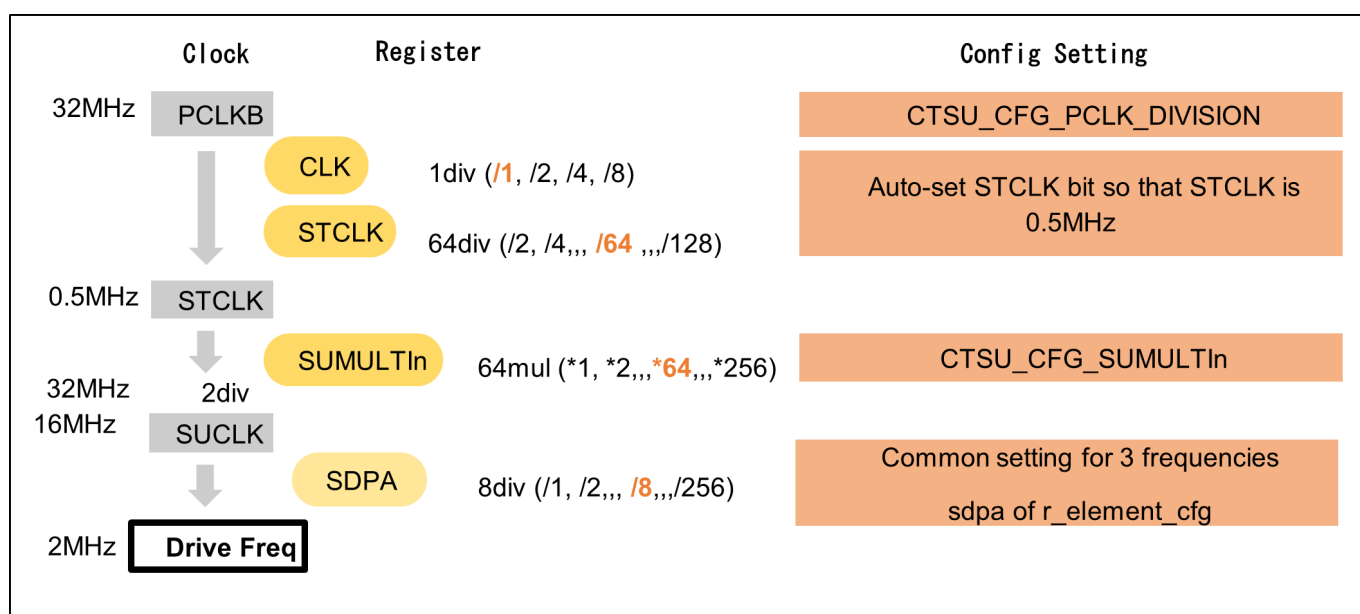

Figure 151: Drive Frequency Settings

Shield Function(CTS2)

The CTS2 peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.

This module allows the user to set a shield for each touch interface configuration.

For example, for the electrode configuration shown in , the members of `ctsu_cfg_t` should be set as follows. Other members have been omitted for the example.

```
.txvsel = CTSU_TXVSEL_INTERNAL_POWER,
.txvsel2 = CTSU_TXVSEL_MODE,
.md = CTSU_MODE_SELF_MULTI_SCAN,
.posel = CTSU_POSEL_SAME_PULSE,
.ctsuchac0 = 0x0F,
.ctsuchtrc0 = 0x08,
```

Figure 152: Example of Shield Electrode Structure

Measurement Error Message

When the CTSU2 peripheral detects an abnormal measurement, it sets the status register bit to 1. In the measurement complete interrupt process, the module reads ICOMP1, ICOMP0, and SENSOVF of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to “member event” in the `cts_callback_args_t` callback function argument.

Moving Average

This function calculates the moving average of the measured results. Set the number of times the moving average should be calculated in the config settings.

Diagnosis Function

The CTSU peripheral has a built-in function that diagnoses its own inner circuit. This diagnosis function provides the API for diagnosing the inner circuit.

The diagnostic requirements are different for CTSU1 and CTSU2 providing 5 types of diagnosis for CTSU1 and 9 types for CTSU2.

The diagnosis function is executed by calling the API function. This is executed independently from the other measurements and does not affect them.

To enable the diagnosis function, set `CTS_CFG_DIAG_SUPPORT_ENABLE` to 1.

For CTSU1, a 27pF condenser should be connected externally.

For CTSU2, use [Analog to Digital Converter \(r_adc\)](#).

Measurement Mode

This module supports all three modes offered by the CTSU2 peripheral: self-capacitance, mutual-capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).

The CTSU2 peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8.

Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].

[CTS1]

In default settings, the measurement period for each TS is wait-time plus approximately 526us.

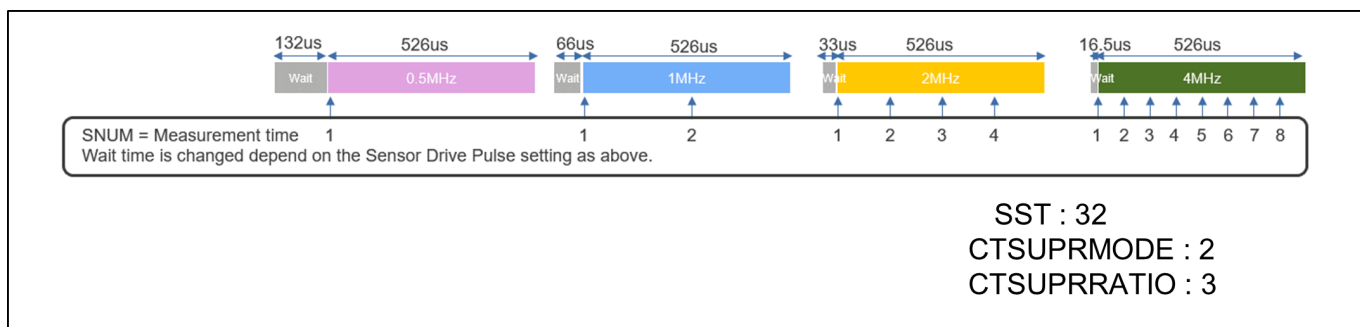

Figure 153: Self-capacitance Measurement Period (CTS1)

[CTS2]

In default settings, the measurement period for each TS is approximately 576us.

Figure 154: Self-capacitance Measurement Period (CTS2)

Mutual-Capacitance Mode

The mutual-capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.

The CTSU2 peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.

TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7

To measure the mutual-capacitance generated between electrodes, the CTSU2 peripheral performs the measurement process on the same electrode twice.

The mutual-capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs the secondary measured result.

[CTS1]

In default settings, the measurement period for each TS is twice of wait-time plus approximately 526us.

[CTS2]

In default settings, the measurement period for each TS is approximately 1152us.

Figure 155: Mutual-capacitance Measurement Period

Mutual-capacitance parallel scan mode(CTS2)

This mode provides fast measurement time by parallel scanning the RX lines with a CFC circuit. Operation is otherwise identical to normal CTSU mutual scanning.

- Scan Order
 - The hardware scans all RX pins simultaneously for each TX pin.
 - For example, if sensors TS10, TS11, and TS03 are specified as RX sensors, and sensors TS02, TS07, and TS04 are specified as TX sensors, the hardware will scan them in the following sensor-pair order:
TS02-(TS03, TS10, TS11), TS04-(TS03, TS10, TS11), TS07-(TS03, TS10, TS11)
- Element
 - An element refers to the index of a sensor-pair within the scan order. Using the previous example, TS07-TS10 is element 7.
- Scan Time
 - Because the RX lines are scanned in parallel, CFC mutual-capacitance scan is the same amount of times faster than a basic mutual matrix scan as the number of RX lines. In other words, on a matrix with N receive lines, CFC mutual scanning is N times faster than basic mutual scanning. Set CTSU_MODE_MUTUAL_CFC_SCAN to "md" of [cts_cfg_t](#).
Also, add the number of matrix used for this measurement to CTSU_CFG_NUM_MUTUAL_ELEMENTS. In addition, set the number of CTSU_CFG_NUM_CFC and CTSU_CFG_NUM_CFC_TX.
For details, refer to the configuration and sample application output by QE for Capacitive Touch.

Current Measurement Mode(CTS2)

The current measurement mode is used to measure the minute current input to the TS terminal. The order of measurement and data storage is the same as that of the self-capacitance mode. As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

Figure 156: Current Measurement Period

Temperature Correction Mode(CTS2)

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure of Temperature Correction Measurement Timing Chart.

1. Measure the correction circuit. One set comprises twelve measurements.
2. Measure the current when TSCAP voltage is applied to the external resistor to create a correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

Figure 157: Temperature Correction Measurement Timing Chart

Diagnosis Mode

The diagnosis mode is a mode in which various internal measurement values are scanned by using this diagnosis function [R_CTSU_Diagnosis\(\)](#).

Measurement Timing

Measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELC).

The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode.

The execution timing of software triggers and external triggers differ slightly.

Since a software trigger sets the start flag after setting the touch interface configuration with [R_CTSU_ScanStart\(\)](#), there is a slight delay after the timer event occurrence. However, as the delay is much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.

An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use [R_CTSU_ScanStart\(\)](#) to set another touch interface configuration after one measurement is completed.

TrustZone Support

In r_cts and rm_touch module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Data flow

The flow of storing data in RAM is as follows.

(CTS1)

1. Read registers and stored in RAM as raw data.
2. ICO correction calculation of raw data and stored in RAM as correction data.
3. The correction data is calculated by moving average and stored in RAM as measurement results.

(CTS2)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Three raw data is ICO-corrected, standardized to the first frequency reference value, and stored in RAM as three correction data.
3. Three correction data are calculated by majority decision and moving average, and stored in RAM as measurement results.

Add user's filter

There are two ways to add the user's filter.

1. Instead of filter calculation of [R_CTSU_DataGet\(\)](#), perform user filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user filter calculation result.
2. Using the correction data obtained by [R_CTSU_SpecificDataGet\(\)](#), instead of majority decision calculation and filter calculation of [R_CTSU_DataGet\(\)](#), perform user majority decision calculation & filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

Please check example.

[User's filter additional Example](#)

Examples

Basic Example

This is a basic example of minimal use of the CTSU in an application.

```
volatile bool g_scan_flag = false;

void ctsu_callback (ctsu_callback_args_t * p_args)
{
    if (CTSU_EVENT_SCAN_COMPLETE == p_args->event)
    {
        g_scan_flag = true;
    }
}

void ctsu_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];

    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        err = R_CTSU_ScanStart(&g_ctsu_ctrl);

        assert(FSP_SUCCESS == err);

        while (!g_scan_flag)
        {
            /* Wait for scan end callback */
        }

        g_scan_flag = false;

        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);

        if (FSP_SUCCESS == err)
        {
            /* Application specific data processing. */
        }
    }
}
```

```
}  
}
```

Multi-configuration Example

This is an optional example of using both Self-capacitance and Mutual-capacitance configurations in the same project.

```
void ctsu_optional_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS + (CTSU_CFG_NUM_MUTUAL_ELEMENTS * 2)];  
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);  
    assert(FSP_SUCCESS == err);  
    err = R_CTSU_Open(&g_ctsu_ctrl_mutual, &g_ctsu_cfg_mutual);  
    assert(FSP_SUCCESS == err);  
    while (true)  
    {  
        R_CTSU_ScanStart(&g_ctsu_ctrl);  
        while (!g_scan_flag)  
        {  
            /* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        R_CTSU_ScanStart(&g_ctsu_ctrl_mutual);  
        while (!g_scan_flag)  
        {  
            /* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);  
        assert(FSP_SUCCESS == err);  
        if (FSP_SUCCESS == err)  
        {  
            /* Application specific data processing. */  
        }  
    }  
}
```

```
    }  
    err = R_CTSU_DataGet(&g_ctsu_ctrl_mutual, data);  
    assert(FSP_SUCCESS == err);  
if (FSP_SUCCESS == err)  
    {  
/* Application specific data processing. */  
    }  
    }  
}
```

Diagnosis function Example

This is a Diagnosis function example of using the configuration in the basic example.

```
void ctsu_diag_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];  
    uint16_t dummy;  
    R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);  
    assert(FSP_SUCCESS == err);  
    R_CTSU_Open(&g_ctsu_ctrl_diagnosis, &g_ctsu_cfg_diagnosis);  
    assert(FSP_SUCCESS == err);  
    while (true)  
    {  
        R_CTSU_ScanStart(&g_ctsu_ctrl);  
        while (!g_scan_flag)  
        {  
/* Wait for scan end callback */  
        }  
        g_scan_flag = false;  
        err = R_CTSU_DataGet(&g_ctsu_ctrl, data);  
        assert(FSP_SUCCESS == err);  
        R_CTSU_ScanStart(&g_ctsu_ctrl_diagnosis);  
        while (!g_scan_flag)
```

```
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl_diagnosis, &dummy);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
{
break;
}
}
}
}
```

User's filter additional Example

This is a user's filter additional example of using the configuration in the basic example. To perform user's filter calculation, change the `num_moving_average` of the element in the target `ctsu_cfg_t` to 1.

Perform user filter calculation and use `R_CTSU_DataInsert()` to input user filter calculation result.

```
void ctsu_user_filter_example (void)
{
fsp_err_t err = FSP_SUCCESS;

uint16_t data[CTSUS_CFG_NUM_SELF_ELEMENTS];
uint16_t filter_data[CTSUS_CFG_NUM_SELF_ELEMENTS];

/* If you want to make a touch judgment, call RM_TOUCH_Open() instead of the
following. */

err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
while (true)
{
/* If you want to make a touch judgment, call RM_TOUCH_ScanStart() instead of the
following. */
err = R_CTSU_ScanStart(&g_ctsu_ctrl);
assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
/* User original function. */
ctsu_user_filter(data, filter_data);
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
assert(FSP_SUCCESS == err);
/* Call RM_TOUCH_DataGet() to make a touch decision. */
}
}
}
```

Using the correction data obtained by [R_CTSU_SpecificDataGet\(\)](#). Perform user majority decision calculation & filter calculation and use [R_CTSU_DataInsert\(\)](#) to input user majority decision calculation & filter calculation result.

```
void ctsu_user_majority_decition_example (void)
{
fsp_err_t err = FSP_SUCCESS;
uint16_t data[CTSUS_CFG_NUM_SELF_ELEMENTS];
uint16_t corr_data[CTSUS_CFG_NUM_SELF_ELEMENTS * CTSUS_CFG_NUM_SUMULTI];
uint16_t filter_data[CTSUS_CFG_NUM_SELF_ELEMENTS];
```

```
/* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
while (true)
{
/* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
err = R_CTSU_ScanStart(&g_ctsu_ctrl);
assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
/* Wait for scan end callback */
}
g_scan_flag = false;
err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSUSPECIFICCORRECTIONDATA);
assert(FSP_SUCCESS == err);
/* User original function */
ctsu_user_filter(corr_data, filter_data);
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
assert(FSP_SUCCESS == err);
/* Call RM_TOUCH_DataGet() to make a touch decision. */
}
}
}
```

	TS24-TS31 mutual-tx mask.
uint8_t	ctsuchtrc4
	TS32-TS39 mutual-tx mask.
uint16_t	self_elem_index
	self element index number for Current instance.
uint16_t	mutual_elem_index
	mutual element index number for Current instance.
uint16_t	ctsu_elem_index
	CTSU element index number for Current instance.
ctsu_cfg_t const *	p_ctsu_cfg
	Pointer to initial configurations.
IRQn_Type	write_irq
	Copy from config by Open API. CTSU_CTSUWR interrupt vector.

IRQn_Type	read_irq
	Copy from config by Open API. CTSU_CTSURD interrupt vector.
IRQn_Type	end_irq
	Copy from config by Open API. CTSU_CTSUFN interrupt vector.
void(*	p_callback)(ctsu_callback_args_t *)
	Callback provided when a CTSUFN occurs.
uint8_t	interrupt_reverse_flag
	Flag in which read interrupt and end interrupt are reversed.
ctsu_event_t	error_status
	error status variable to send to QE for serial tuning.
ctsu_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.
void const *	p_context
	Placeholder for user data.
bool	serial_tuning_enable
	Flag of serial tuning status.
uint16_t	serial_tuning_mutual_cnt
	Word index into ctsuwr register array.

uint16_t	tuning_self_target_value
	Target self value for initial offset tuning.
uint16_t	tuning_mutual_target_value
	Target mutual value for initial offset tuning.

<code>CTSU_RANGE_160UA</code>	160uA mode
<code>CTSU_RANGE_NUM</code>	number of range

Function Documentation

◆ R_CTSU_Open()

```
fsp_err_t R_CTSU_Open ( ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg )
```

Opens and configures the CTSU driver module. Implements `ctsu_api_t::open`.

Example:

```
err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

In the first Open, measurement for correction works, and it takes several tens of milliseconds.

◆ R_CTSU_ScanStart()

```
fsp_err_t R_CTSU_ScanStart ( ctsu_ctrl_t *const p_ctrl)
```

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [R_CTSU_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [ctsu_api_t::scanStart](#).

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ R_CTSU_DataGet()

```
fsp_err_t R_CTSU_DataGet ( ctsu_ctrl_t*const p_ctrl, uint16_t* p_data )
```

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [ctsu_api_t::dataGet](#).

Example:

```
while (true)
{
    err = R_CTSU_ScanStart(&g_ctsu_ctrl);
    assert(FSP_SUCCESS == err);
while (!g_scan_flag)
{
    /* Wait for scan end callback */
}
    g_scan_flag = false;
    err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
{
    /* Application specific data processing. */
}
}
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.

◆ R_CTSU_ScanStop()

```
fsp_err_t R_CTSU_ScanStop ( ctsu_ctrl_t *const p_ctrl)
```

This function scan stops the sensor as scanning by the CTSU. Implements `ctsu_api_t::scanStop`.

Return values

FSP_SUCCESS	CTSU successfully scan stop.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CTSU_CallbackSet()

```
fsp_err_t R_CTSU_CallbackSet ( ctsu_ctrl_t *const p_api_ctrl, void(*) (ctsu_callback_args_t *)
p_callback, void const *const p_context, ctsu_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `ctsu_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R_CTSU_Diagnosis()**

```
fsp_err_t R_CTSU_Diagnosis ( ctsu_ctrl_t *const p_ctrl)
```

Diagnosis the CTSU peripheral. Implements `ctsu_api_t::diagnosis`.

Example:

```
err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.
FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
FSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
FSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
FSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
FSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.
FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE	Diagnosis of LDO output voltage failed.
FSP_ERR_CTSU_DIAG_OVER_VOLTAGE	Diagnosis of over voltage detection circuit failed.
FSP_ERR_CTSU_DIAG_OVER_CURRENT	Diagnosis of over current detection circuit failed.
FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_CURRENT_SOURCE	Diagnosis of LDO internal resistance value failed.
FSP_ERR_CTSU_DIAG_SENSCLK_GAIN	Diagnosis of SENSCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_SUCLK_GAIN	Diagnosis of SUCLK frequency gain failed.
FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY	Diagnosis of SUCLK clock recovery function failed.
FSP_ERR_CTSU_DIAG_CFC_GAIN	Diagnosis of CFC oscillator gain failed.

◆ **R_CTSU_Close()**

```
fsp_err_t R_CTSU_Close ( ctsu_ctrl_t *const p_ctrl)
```

Disables specified CTSU control block. Implements `ctsu_api_t::close`.

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **R_CTSU_SpecificDataGet()**

```
fsp_err_t R_CTSU_SpecificDataGet ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_specific_data,
ctsu_specific_data_type_t specific_data_type )
```

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the `R_CTSU_DataGet()` function.

By setting the third argument to `CTSU_SPECIFIC_RAW_DATA`, RAW data can be output from the second argument.

By setting the third argument to `CTSU_SPECIFIC_CORRECTION_DATA`, the corrected data can be output from the second argument.

By setting the third argument to `CTSU_SPECIFIC_SELECTED_DATA`, Get bitmap of the frequency values used in majority decision from the second argument. The bit map is shown as follows.
 ||2bit | 1bit | 0bit || ||3rd frequency value | 2nd frequency value | 1st frequency value ||

Implements `ctsu_api_t::specificDataGet`.

Example:

```
err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
FSP_ERR_NOT_ENABLED	CTSU_SPECIFIC_SELECTED_FREQ is not enabled in CTSU1.(CTSU2 Only)

◆ R_CTSU_DataInsert()

```
fsp_err_t R_CTSU_DataInsert ( ctsu_ctrl_t *const p_ctrl, uint16_t * p_insert_data )
```

This function inserts the value of the second argument as the measurement result value. Call this function after calling the [R_CTSU_DataInsert\(\)](#) function. Implements [ctsu_api_t::dataInsert](#).

Example:

```
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
```

Return values

FSP_SUCCESS	CTSU successfully configured.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

4.2.16 Digital to Analog Converter (r_dac)

Modules

Functions

```
fsp_err_t R_DAC_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg)
```

```
fsp_err_t R_DAC_Write (dac_ctrl_t *p_api_ctrl, uint16_t value)
```

```
fsp_err_t R_DAC_Start (dac_ctrl_t *p_api_ctrl)
```

```
fsp_err_t R_DAC_Stop (dac_ctrl_t *p_api_ctrl)
```

```
fsp_err_t R_DAC_Close (dac_ctrl_t *p_api_ctrl)
```

Detailed Description

Driver for the DAC12 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Overview**Features**

The DAC module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers
- Supports output amplifiers on selected MCUs
- Supports charge pump on selected MCUs
- Supports synchronization with the Analog-to-Digital Converter (ADC) module

Configuration

Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC channels:

- Synchronize with ADC
- Data Format
- Charge Pump

Build Time Configurations for r_dac

The following build time configurations are defined in fsp_cfg/r_dac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > DAC (r_dac)

This module can be added to the Stacks tab via New Stack > Analog > DAC (r_dac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
Synchronize with ADC	MCU Specific Options		Enable DA/AD synchronization.
Data Format	<ul style="list-style-type: none"> • Right Justified • Left Justified 	Right Justified	Specify the DAC data format.
Output Amplifier	MCU Specific Options		Enable the DAC output amplifier.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.
Internal Output	MCU Specific Options		Enable DAC output to internal modules.
ELC Trigger Source	MCU Specific Options		ELC event source that will trigger the DAC to

start a conversion.

Clock Configuration

The DAC peripheral module uses PCLKB as its clock source.

Pin Configuration

The DAn pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC pin output while operating at $AV_{CC} < 2.7V$.

Note

The MOCO must be running to use the charge pump.

If the DAC output is to be routed to an internal signal, do not enable the charge pump.

Output to Internal Modules

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACMPHS, ADC) without outputting the voltage to an external pin.

On some MCUs this functionality must be enabled during configuration using [dac_extended_cfg_t::internal_output_enabled](#). When internal output is enabled, the DAC output will be routed to internal modules. If the DAC output amplifier is enabled or when internal output is disabled, the output will be routed to the DAC output pin (DAn).

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC conversion is started it will automatically be delayed until after the ADC conversion is complete.

Limitations

- For MCUs supporting ADC unit 1:
 - Once synchronization between DAC and ADC unit 1 is turned on during R_DAC_Open synchronization cannot be turned off by the driver. In order to desynchronize DAC with ADC unit 1, manually clear DAADSCR.DAADST to 0 when the ADCSR.ADST bit is 0 and ADC unit 1 is halted.
 - The DAC module can only be synchronized with ADC unit 1.
 - For MCUs having more than 1 DAC channel, both channels are synchronized with ADC unit 1 if synchronization is enabled.
- Pin configuration does not support setting ASEL and PSEL bit fields for the same pin. In order to set the PSEL when DAC pin is enabled, manually update the setting of the DAC pin to `.pin_cfg = ((uint32_t)IOPORT_CFG_ANALOG_ENABLE | IOPORT_CFG_PERIPHERAL_PIN | IOPORT_PERIPHERAL_CAC_AD)}`.

Examples

Basic Example

This is a basic example of minimal use of the R_DAC in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint16_t value;
    /* Pin configuration: Output enable DA0 as Analog. */
    /* Initialize the DAC channel */
    err = R_DAC_Open(&g_dac_ctrl, &g_dac_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint16_t) DAC_EXAMPLE_VALUE_ABC;
    err = R_DAC_Write(&g_dac_ctrl, value);
    assert(FSP_SUCCESS == err);
    err = R_DAC_Start(&g_dac_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct [dac_instance_ctrl_t](#)

struct [dac_extended_cfg_t](#)

Data Structure Documentation

◆ [dac_instance_ctrl_t](#)

struct [dac_instance_ctrl_t](#)

DAC instance control block.

◆ [dac_extended_cfg_t](#)

struct [dac_extended_cfg_t](#)

Data Fields

bool	enable_charge_pump	Enable DAC charge pump
------	------------------------------------	------------------------

		available on selected MCUs.
bool	output_amplifier_enabled	Output amplifier enable available on selected MCUs.
bool	internal_output_enabled	Internal output enable available on selected MCUs.
dac_data_format_t	data_format	Data format.

Function Documentation

◆ R_DAC_Open()

```
fsp_err_t R_DAC_Open ( dac_ctrl_t * p_api_ctrl, dac_cfg_t const *const p_cfg )
```

Perform required initialization described in hardware manual. Implements [dac_api_t::open](#). Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> 1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg 2. data_format value in p_cfg is out of range. 3. Extended configuration structure is set to NULL for MCU supporting charge pump.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel ID requested in p_cfg may not be available on the devices.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ **R_DAC_Write()**

```
fsp_err_t R_DAC_Write ( dac_ctrl_t* p_api_ctrl, uint16_t value )
```

Write data to the D/A converter and enable the output if it has not been enabled.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ **R_DAC_Start()**

```
fsp_err_t R_DAC_Start ( dac_ctrl_t* p_api_ctrl)
```

Start the D/A conversion output if it has not been started.

Return values

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_IN_USE	Attempt to re-start a channel.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ **R_DAC_Stop()**

```
fsp_err_t R_DAC_Stop ( dac_ctrl_t* p_api_ctrl)
```

Stop the D/A conversion and disable the output signal.

Return values

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

◆ R_DAC_Close()

```
fsp_err_t R_DAC_Close ( dac_ctrl_t * p_api_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

4.2.17 Digital to Analog Converter (r_dac8)

Modules

Functions

```
fsp_err_t R_DAC8_Open (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)
```

```
fsp_err_t R_DAC8_Close (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Write (dac_ctrl_t *const p_ctrl, uint16_t value)
```

```
fsp_err_t R_DAC8_Start (dac_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_DAC8_Stop (dac_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the DAC8 peripheral on RA MCUs. This module implements the [DAC Interface](#).

Overview**Features**

The DAC8 module outputs one of 256 voltage levels between the positive and negative reference voltages. DAC8 on selected MCUs have below features

- Charge pump control
- Synchronization with the Analog-to-Digital Converter (ADC) module
- Multiple Operation Modes
 - Normal
 - Real-Time (Event Link)

Configuration

Note

For MCUs supporting more than one channel, the following configuration options are shared by all the DAC8 channels:

- Synchronize with ADC
- Charge Pump

Build Time Configurations for r_dac8

The following build time configurations are defined in fsp_cfg/r_dac8_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > DAC8 (r_dac8)

This module can be added to the Stacks tab via New Stack > Analog > DAC8 (r_dac8).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_dac8_0	Module name.
Channel	Value must be an integer greater than or equal to 0	0	Specify the hardware channel.
D/A A/D Synchronous Conversion	MCU Specific Options		Synchronize the DAC8 update with the ADC to reduce interference with A/D conversions.
DAC Mode	MCU Specific Options		Select the DAC operating mode
Real-time Trigger Event	MCU Specific Options		Specify the event used to trigger conversion in Real-time mode. This setting is only valid when Real-time mode is enabled.
Charge Pump (Requires MOCO active)	MCU Specific Options		Enable the DAC charge pump.

Clock Configuration

The DAC8 peripheral module uses the PCLKB as its clock source.

Pin Configuration

The DA8_n pins are used as analog outputs. Each DAC8 channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply and reference pins for the DAC8.

Usage Notes

Charge Pump

The charge pump must be enabled when using DAC8 pin output while operating at $AV_{CC} < 2.7V$.

Note

The MOCO must be running to use the charge pump.

If DAC8 output is to be routed to an internal signal, do not enable the charge pump.

Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC8 conversion is started it will automatically be delayed until after the ADC conversion is complete.

Real-time Mode

When Real-time mode is selected, the DAC8 will perform a conversion each time the selected ELC event is received.

Limitations

- Synchronization between DAC8 and ADC is activated when calling R_DAC8_Open. At this point synchronization cannot be deactivated by the driver. In order to desynchronize DAC8 with ADC, manually clear DACADSCR.DACADST to 0 while the ADCSR.ADST bit is 0 and the ADC is halted.
- For MCUs having more than 1 DAC8 channel, both channels are synchronized with ADC if synchronization is enabled.
- Pin configuration does not support setting ASEL and PSEL bit fields for the same pin. In order to set the PSEL when DAC pin is enabled, manually update the setting of the DAC pin to `.pin_cfg = ((uint32_t)IOPORT_CFG_ANALOG_ENABLE | IOPORT_CFG_PERIPHERAL_PIN | IOPORT_CFG_PERIPHERAL_CAC_AD)`.

Examples

Basic Example

This is a basic example of minimal use of the R_DAC8 in an application. This example shows how this driver can be used for basic 8 bit Digital to Analog Conversion operations.

```
dac8_instance_ctrl_t g_dac8_ctrl;  
dac_cfg_t g_dac8_cfg =  
{  
    .channel                = 0U,  
    .ad_da_synchronized    = false,  
    .p_extend               = &g_dac8_cfg_extend
```

```
};

void basic_example (void)
{
    fsp_err_t err;

    uint16_t value;

    /* Pin configuration: Output enable DA8_0(RA2A1) as Analog. */
    /* Initialize the DAC8 channel */
    err = R_DAC8_Open(&g_dac8_ctrl, &g_dac8_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    value = (uint8_t) DAC8_EXAMPLE_VALUE_ABC;

    /* Write value to DAC module */
    err = R_DAC8_Write(&g_dac8_ctrl, value);
    assert(FSP_SUCCESS == err);

    /* Start DAC8 conversion */
    err = R_DAC8_Start(&g_dac8_ctrl);
    assert(FSP_SUCCESS == err);
}

```

Function Documentation

◆ [R_DAC8_Open\(\)](#)

`fsp_err_t R_DAC8_Open (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg)`

Perform required initialization described in hardware manual.

Implements [dac_api_t::open](#).

Configures a single DAC channel. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_ctrl or p_cfg
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was requested.
FSP_ERR_NOT_ENABLED	Setting DACADSCR is not enabled when ADCSR.ADST = 0.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ **R_DAC8_Close()**

```
fsp_err_t R_DAC8_Close ( dac_ctrl_t *const p_ctrl)
```

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.

◆ **R_DAC8_Write()**

```
fsp_err_t R_DAC8_Write ( dac_ctrl_t *const p_ctrl, uint16_t value )
```

Write data to the D/A converter.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_OVERFLOW	Data overflow when data value exceeds 8-bit limit.

◆ **R_DAC8_Start()**

```
fsp_err_t R_DAC8_Start ( dac_ctrl_t *const p_ctrl)
```

Start the D/A conversion output.

Return values

FSP_SUCCESS	The channel is started successfully.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.
FSP_ERR_IN_USE	Attempt to re-start a channel.

◆ R_DAC8_Stop()

`fsp_err_t R_DAC8_Stop (dac_ctrl_t *const p_ctrl)`

Stop the D/A conversion and disable the output signal.

Return values

FSP_SUCCESS	The control is successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Channel associated with p_instance_ctrl has not been opened.

`fsp_err_t R_DMAC_Close (transfer_ctrl_t *const p_api_ctrl)`

Detailed Description

Driver for the DMAC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

Overview

The Direct Memory Access Controller (DMAC) transfers data from one memory location to another without using the CPU.

Features

- Supports multiple transfer modes
 - Normal transfer
 - Repeat transfer
 - Block transfer
 - Repeat-Block transfer (Not available on all MCUs)
- Address increment, decrement, fixed, or offset modes
- Triggered by ELC events
 - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dmac

The following build time configurations are defined in fsp_cfg/r_dmac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Transfer > Transfer (r_dmac)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dmac).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Mode	<ul style="list-style-type: none"> • Normal • Repeat • Block • Repeat-Block 	Normal	Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of

			Blocks; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	<ul style="list-style-type: none"> • 1 Byte • 2 Bytes • 4 Bytes 	2 Bytes	Select the transfer size.
Destination Address Mode	<ul style="list-style-type: none"> • Fixed • Offset addition • Incremented • Decrementd 	Fixed	Select the address mode for the destination.
Source Address Mode	<ul style="list-style-type: none"> • Fixed • Offset addition • Incremented • Decrementd 	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	<ul style="list-style-type: none"> • Destination • Source 	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.
Number of Transfers	Value must be a non-negative integer	1	Specify the number of transfers for repeat and normal mode or block size for repeat-block transfer mode.
Number of Blocks (Valid only in Repeat,Block or Repeat-Block Mode)	Value must be a non-negative integer	0	Specify the number of blocks to transfer in Repeat,Block or Repeat-Block mode.
Activation Source	MCU Specific Options		Select the DMAC transfer start event. If no ELC event is chosen then software start can be used.
Callback	Name must be a valid C symbol	NULL	A user callback that is called at the end of the transfer.
Context	Manual Entry	NULL	Pointer to the context structure passed

Transfer End Interrupt Priority	MCU Specific Options		through the callback argument.
Interrupt Frequency	<ul style="list-style-type: none"> Interrupt after all transfers have completed Interrupt after each block, or repeat size is transferred 	Interrupt after all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Offset value (Valid only when address mode is '\Offset\')	Value must be a 24 bit signed integer.	1	Offset value is added to the address after each transfer.
Source Buffer Size	Value must be a non-negative integer	1	Specify the size of whole source buffer (valid only for Repeat-Block transfer mode with source address update mode other than offset addition).

Clock Configuration

The DMAC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build, or by using the CGC module at run-time.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Transfer Modes

The DMAC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time the configured ELC event is received by the DMAC channel. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment, decrement, or add an offset to the next data unit after each transfer. A 16-bit counter decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the ELC event and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,1024]. When the transfer counter reaches 0, the counter is reset to its configured value, the repeat area (source or destination address) resets to its starting address and the block count remaining will decrement by 1. When the block count reaches 0, transfers will no longer be triggered by the ELC event and the CPU may be interrupted to signal that all transfers have finished.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or

destination address) will reset to the original address and the other address will be incremented or decremented to the next block.

- **Repeat-Block Mode** - In repeat-block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can be configured to a 16 bit number. If the destination address mode is offset mode, maximum configurable number of blocks is 0xFFFF for block size(length) of one with data transfer size as byte, 0x7FFF for block size of one with data transfer size as half word and 0x3FFF for block size of one with data size as word. After each block transfer the source address and the destination address will be incremented or decremented to the next block address. In case of offset address mode for source address, the source address size is the total size of source buffer after which the source area is rolled over, block size can be smaller than the source buffer size. For source address mode as offset mode, the maximum configurable source buffer size is 0xFFFF for transfer data size of a byte, 0x7FFF for transfer data size of half word and 0x3FFF for transfer data size of word. Repeat-block mode can be used to implement single ring buffer to multiple ring buffer transfer type design.

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	<ul style="list-style-type: none"> • Repeats forever • Max repeat size is 256 x 4 bytes 	<ul style="list-style-type: none"> • Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	<ul style="list-style-type: none"> • Max block size is 256 x 4 bytes 	<ul style="list-style-type: none"> • Max block size is 1024 x 4 bytes
Channels	<ul style="list-style-type: none"> • One instance per interrupt 	<ul style="list-style-type: none"> • MCU specific (8 channels or less)
Chained Transfers	<ul style="list-style-type: none"> • Supported 	<ul style="list-style-type: none"> • Not Supported
Software Trigger	<ul style="list-style-type: none"> • Must use the software ELC event 	<ul style="list-style-type: none"> • Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	<ul style="list-style-type: none"> • Not supported 	<ul style="list-style-type: none"> • Supported

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC

TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Additional Considerations

- The DTC requires a moderate amount of RAM (one `transfer_info_t` struct per open instance + `DTC_VECTOR_TABLE_SIZE`).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.

Offset Address Mode

When the source or destination mode is configured to offset mode, a configurable offset is added to the source or destination pointer after each transfer. The offset is a signed 24 bit number.

Examples

Basic Example

This is a basic example of minimal use of the DMAC in an application. In this case, one or more events have been routed to the DMAC for handling so it only needs to be enabled to start accepting transfers.

```
void dmac_minimal_example (void)
{
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable the DMAC so that it responds to transfer requests. */
    err = R_DMAC_Enable(&g_transfer_ctrl);
}
```

```
    assert(FSP_SUCCESS == err);
}
```

CRC32 Example

In this example the DMAC is used to feed the CRC peripheral to perform a CRC32 operation.

```
volatile bool g_transfer_complete = false;
void dmac_callback (dmac_callback_args_t * cb_data)
{
    FSP_PARAMETER_NOT_USED(cb_data);
    g_transfer_complete = true;
}
void dmac_crc_example (void)
{
    uint8_t p_src[TRANSFER_LENGTH];
    /* Initialize p_src to [ABC..OP] */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        p_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Set transfer source address to p_src */
    g_transfer_cfg.p_info->p_src = (void *) p_src;
    /* Set transfer destination address to the CRC data input register */
    g_transfer_cfg.p_info->p_dest = (void *) &R_CRC->CRCDIR;
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DMAMC_Open(&g_transfer_ctrl, &g_transfer_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable DMAC transfers. */
    (void) R_DMAMC_Enable(&g_transfer_ctrl);
    /* Open the CRC module. */
    err = R_CRC_Open(&g_crc_ctrl, &g_crc_cfg);
    assert(FSP_SUCCESS == err);
    /* Clear the transfer complete flag. */
```

```

    g_transfer_complete = false;
/* Trigger the transfer using software. */
    err = R_DMxAC_SoftwareStart(&g_transfer_ctrl, TRANSFER_START_MODE_SINGLE);
    assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
    {
/* Wait for transfer complete interrupt */
    }
/* Get CRC result and perform final XOR. */
    uint32_t crc32;
    (void) R_CRC_CalculatedValueGet(&g_crc_ctrl, &crc32);
    crc32 ^= CRC32_FINAL_XOR_VALUE;
/* Verify that the CRC32 is calculated correctly. */
/* CRC32("ABCD...NOP") = 0xE0E8FF4D. */
const uint32_t expected_crc32 = 0xE0E8FF4D;
if (expected_crc32 != crc32)
    {
/* Handle any CRC errors. This function should be defined by the user. */
        handle_crc_error();
    }
}

```

Data Structures

struct [dmac_instance_ctrl_t](#)

struct [dmac_callback_args_t](#)

struct [dmac_extended_cfg_t](#)

Macros

#define [DMAC_MAX_NORMAL_TRANSFER_LENGTH](#)

#define [DMAC_MAX_REPEAT_TRANSFER_LENGTH](#)

#define [DMAC_MAX_BLOCK_TRANSFER_LENGTH](#)

#define [DMAC_MAX_REPEAT_COUNT](#)

Data Structure Documentation

◆ dmac_instance_ctrl_t

```
struct dmac_instance_ctrl_t
```

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in [transfer_api_t::open](#).

◆ dmac_callback_args_t

```
struct dmac_callback_args_t
```

Callback function parameter data.

Data Fields

void const *	p_context	Placeholder for user data. Set in r_transfer_t::open function in transfer_cfg_t .
--------------	-----------	---

◆ dmac_extended_cfg_t

```
struct dmac_extended_cfg_t
```

DMAC transfer configuration extension. This extension is required.

Data Fields

uint8_t	channel	Channel number, does not apply to all HAL drivers.
IRQn_Type	irq	DMAC interrupt number.
uint8_t	ipl	DMAC interrupt priority.
int32_t	offset	Offset value used with transfer_addr_mode_t::TRANSFER_ADDR_MODE_OFFSET .
uint16_t	src_buffer_size	

<code>elc_event_t</code>	<code>activation_source</code>
<code>void(*</code>	<code>p_callback)(dmac_callback_args_t *cb_data)</code>
<code>void const *</code>	<code>p_context</code>

Field Documentation

◆ `src_buffer_size`

`uint16_t dmac_extended_cfg_t::src_buffer_size`

Source ring buffer size for `TRANSFER_MODE_REPEAT_BLOCK`.

◆ `activation_source`

`elc_event_t dmac_extended_cfg_t::activation_source`

Select which event will trigger the transfer.

Note

Select `ELC_EVENT_NONE` for software activation in order to use `softwareStart` and `softwareStart` to trigger transfers.

◆ `p_callback`

`void(* dmac_extended_cfg_t::p_callback)(dmac_callback_args_t *cb_data)`

Callback for transfer end interrupt.

◆ `p_context`

`void const* dmac_extended_cfg_t::p_context`

Placeholder for user data. Passed to the user `p_callback` in `dmac_callback_args_t`.

Macro Definition Documentation

◆ `DMAC_MAX_NORMAL_TRANSFER_LENGTH`

```
#define DMAC_MAX_NORMAL_TRANSFER_LENGTH
```

Max configurable number of transfers in `TRANSFER_MODE_NORMAL`.

◆ `DMAC_MAX_REPEAT_TRANSFER_LENGTH`

```
#define DMAC_MAX_REPEAT_TRANSFER_LENGTH
```

Max number of transfers per repeat for `TRANSFER_MODE_REPEAT`.

◆ **DMAC_MAX_BLOCK_TRANSFER_LENGTH**

#define DMAC_MAX_BLOCK_TRANSFER_LENGTH

Max number of transfers per block in TRANSFER_MODE_BLOCK

◆ **DMAC_MAX_REPEAT_COUNT**

#define DMAC_MAX_REPEAT_COUNT

Max configurable number of repeats to transfer in TRANSFER_MODE_REPEAT

◆ **DMAC_MAX_BLOCK_COUNT**

#define DMAC_MAX_BLOCK_COUNT

Max configurable number of blocks to transfer in TRANSFER_MODE_BLOCK

Function Documentation◆ **R_DMAC_Open()**

fsp_err_t R_DMAC_Open (transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg)

Configure a DMAC channel.

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The configured channel is invalid.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ **R_DMAC_Reconfigure()**

```
fsp_err_t R_DMAC_Reconfigure ( transfer_ctrl_t *const p_api_ctrl, transfer_info_t * p_info )
```

Reconfigure the transfer with new transfer info.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R_DMAC_Reset()**

```
fsp_err_t R_DMAC_Reset ( transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers )
```

Reset transfer source, destination, and number of transfers.

Return values

FSP_SUCCESS	Transfer reset successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R_DMACE_SoftwareStart()**

```
fsp_err_t R_DMACE_SoftwareStart ( transfer_ctrl_t *const p_api_ctrl, transfer_start_mode_t mode )
```

If the mode is TRANSFER_START_MODE_SINGLE initiate a single transfer with software. If the mode is TRANSFER_START_MODE_REPEAT continue triggering transfers until all of the transfers are completed.

Return values

FSP_SUCCESS	Transfer started written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.
FSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

◆ **R_DMACE_SoftwareStop()**

```
fsp_err_t R_DMACE_SoftwareStop ( transfer_ctrl_t *const p_api_ctrl)
```

Stop software transfers if they were started with TRANSFER_START_MODE_REPEAT.

Return values

FSP_SUCCESS	Transfer stopped written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.

◆ **R_DMACE_Enable()**

```
fsp_err_t R_DMACE_Enable ( transfer_ctrl_t *const p_api_ctrl)
```

Enable transfers for the configured activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMACE_Open to initialize the control block.

◆ **R_DMAC_Disable()**

```
fsp_err_t R_DMAC_Disable ( transfer_ctrl_t *const p_api_ctrl)
```

Disable transfers so that they are no longer triggered by the activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ **R_DMAC_InfoGet()**

```
fsp_err_t R_DMAC_InfoGet ( transfer_ctrl_t *const p_api_ctrl, transfer_properties_t *const p_info )
```

Set driver specific information in provided pointer.

Return values

FSP_SUCCESS	Information has been written to p_info.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ **R_DMAC_Close()**

```
fsp_err_t R_DMAC_Close ( transfer_ctrl_t *const p_api_ctrl)
```

Disable transfer and clean up internal data. Implements [transfer_api_t::close](#).

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

4.2.19 Data Operation Circuit (r_doc)

Modules

Functions

`fsp_err_t R_DOC_Open (doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg)`

`fsp_err_t R_DOC_Close (doc_ctrl_t *const p_api_ctrl)`

`fsp_err_t R_DOC_StatusGet (doc_ctrl_t *const p_api_ctrl, doc_status_t *const p_status)`

`fsp_err_t R_DOC_Read (doc_ctrl_t *const p_api_ctrl, uint32_t *p_result)`

`fsp_err_t R_DOC_Write (doc_ctrl_t *const p_api_ctrl, uint32_t data)`

`fsp_err_t R_DOC_CallbackSet (doc_ctrl_t *const p_api_ctrl, void(*p_callback)(doc_callback_args_t *), void const *const p_context, doc_callback_args_t *const p_callback_memory)`

Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the [DOC Interface](#).

Overview

Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit¹ data and can detect the following events:

- Comparison Mode
 - Data is equal to the configured reference data setting.
 - Data is not equal to the configured reference data setting.
 - Data is less than the configured reference data setting².
 - Data is greater than the configured reference data setting².
 - Data is inside of a configurable pair of reference data settings².
 - Data is outside of a configurable pair of reference data settings².
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

Note

1. Operating on 32-bit data is not supported on all MCUs.
2. This comparison mode is not supported on all MCUs.

Configuration

Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_doc0	Module name.
Event	MCU Specific Options		Select the event that will trigger the DOC interrupt.
Bit Width	MCU Specific Options		The bit width for DOC operations.
Reference/Initial Data	Value must be an integer greater than or equal to 0.	0	Enter Initial Value for Addition/Subtraction or enter reference value for comparison.
Additional Reference Data	Value must be an integer greater than or equal to 0.	0	Additional reference data used for Window Compare modes.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs.
DOC Interrupt Priority	MCU Specific Options		Select the DOC interrupt priority.

Clock Configuration

The DOC HAL module does not require a specific clock configuration.

Pin Configuration

The DOC HAL module does not require and specific pin configurations.

Usage Notes

DMAC/DTC Integration

DOC can be used with [Direct Memory Access Controller \(r_dmac\)](#) or [Data Transfer Controller \(r_dtc\)](#) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set `transfer_info_t::p_dest` to `R_DOC->DODIR`.

Examples

Basic Example

This is a basic example of minimal use of the R_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000
uint32_t g_callback_event_counter = 0;
/* This callback is called when DOC overflow event occurs. It is registered in
doc_cfg_t when R_DOC_Open is
 * called. */
void doc_callback (doc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void basic_example (void)
{
    fsp_err_t err;
    /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
 * interrupt occurs. */
    for (int i = 0; i < 5; i++)
    {
```

```

    err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);

    assert(FSP_SUCCESS == err);

    if (g_callback_event_counter >= 1)
    {
        uint32_t result;

        /* Read the result of the operation */
        err = R_DOC_Read(&g_doc_ctrl, &result);

        assert(FSP_SUCCESS == err);
    }
}

```

Function Documentation

◆ R_DOC_Open()

`fsp_err_t R_DOC_Open (doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg)`

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```

/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);

```

Return values

FSP_SUCCESS	DOC successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid.

◆ **R_DOC_Close()**

```
fsp_err_t R_DOC_Close ( doc_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function will disable the DOC interrupt in the NVIC.

◆ **R_DOC_StatusGet()**

```
fsp_err_t R_DOC_StatusGet ( doc_ctrl_t *const p_api_ctrl, doc_status_t *const p_status )
```

DEPRECATED - Returns the result of addition/subtraction.

Return values

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ **R_DOC_Read()**

```
fsp_err_t R_DOC_Read ( doc_ctrl_t *const p_api_ctrl, uint32_t * p_result )
```

Returns the result of addition/subtraction.

Example:

```
uint32_t result;
/* Read the result of the operation */
err = R_DOC_Read(&g_doc_ctrl, &result);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ **R_DOC_Write()**

```
fsp_err_t R_DOC_Write ( doc_ctrl_t *const p_api_ctrl, uint32_t data )
```

Writes to the DODIR - DOC Input Register.

Example:

```
err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Values successfully written to the registers.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ **R_DOC_CallbackSet()**

```
fsp_err_t R_DOC_CallbackSet ( doc_ctrl_t *const p_api_ctrl, void (*)(doc_callback_args_t *)
p_callback, void const *const p_context, doc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [doc_api_t::callbackSet](#)

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

4.2.20 D/AVE 2D Port Interface (r_drw)

Modules

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

Overview

Note

The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the [TES Dave2D Driver Documentation](#) for further information on using the D2 API.

For cross-platform compatibility purposes the D1 and D2 APIs are not bound by the FSP coding guidelines for function names and general module functionality.

Configuration

Build Time Configurations for r_drw

The following build time configurations are defined in fsp_cfg/r_drw_cfg.h:

Configuration	Options	Default	Description
Allow Indirect Mode	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Enable indirect mode to allow no-copy mode for d2_adddlist (see the TES Dave2D Driver Documentation for details).
Memory Allocation	<ul style="list-style-type: none"> Default Custom 	Default	<p>Set Memory Allocation to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used.</p> <p>Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions:</p> <pre>void * d1_malloc(size_t size) void d1_free(void * ptr)</pre>

Configurations for Graphics > D/AVE 2D Port Interface (r_drw)

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r_drw).

Configuration	Options	Default	Description
D2 Device Handle Name	Name must be a valid C symbol	d2_handle0	Set the name for the d2_device handle used when calling D2 layer

functions.

Select the DRW_INT (display list completion) interrupt priority.

DRW Interrupt Priority MCU Specific Options

Heap Size

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * dl_malloc(size_t size);  
void dl_free(void * ptr);
```

Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

Note

It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.

Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call `d2_flushframe` before stopping the peripheral.

4.2.21 Data Transfer Controller (r_dtc)

Modules

Functions

fsp_err_t	R_DTC_Open (transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg)
fsp_err_t	R_DTC_Reconfigure (transfer_ctrl_t *const p_api_ctrl, transfer_info_t *p_info)
fsp_err_t	R_DTC_Reset (transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers)
fsp_err_t	R_DTC_SoftwareStart (transfer_ctrl_t *const p_api_ctrl, transfer_start_mode_t mode)
fsp_err_t	R_DTC_SoftwareStop (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DTC peripheral on RA MCUs. This module implements the [Transfer Interface](#).

Overview

The Data Transfer Controller (DTC) transfers data from one memory location to another without using the CPU.

The DTC uses a RAM based vector table. Each entry in the vector table corresponds to an entry in the ISR vector table. When the DTC is triggered by an interrupt, it reads the DTC vector table, fetches the transfer information, and then executes the transfer. After the transfer is executed, the DTC writes the updated transfer info back to the location pointed to by the DTC vector table.

Features

- Supports multiple transfer modes
 - Normal transfer
 - Repeat transfer
 - Block transfer
- Chain transfers

- Address increment, decrement or fixed modes
- Can be triggered by any event that has reserved a slot in the interrupt vector table.
 - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dtc

The following build time configurations are defined in fsp_cfg/r_dtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Linker section to keep DTC vector table	Manual Entry	.fsp_dtc_vector_table	Section to place the DTC vector table.

Configurations for Transfer > Transfer (r_dtc)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dtc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Mode	<ul style="list-style-type: none"> • Normal • Repeat • Block 	Normal	Select the transfer mode. Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer repeats until stopped; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	<ul style="list-style-type: none"> • 1 Byte • 2 Bytes • 4 Bytes 	2 Bytes	Select the transfer size.

Destination Address Mode	<ul style="list-style-type: none"> Fixed Incremented Decrement 	Fixed	Select the address mode for the destination.
Source Address Mode	<ul style="list-style-type: none"> Fixed Incremented Decrement 	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	<ul style="list-style-type: none"> Destination Source 	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.
Interrupt Frequency	<ul style="list-style-type: none"> After all transfers have completed After each transfer 	After all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Number of Transfers	Value must be a non-negative integer	0	Specify the number of transfers.
Number of Blocks (Valid only in Block Mode)	Must be a valid non-negative integer with a maximum configurable value of 65536. Applicable only in Block Mode.	0	Specify the number of blocks to transfer in Block mode.
Activation Source	MCU Specific Options		Select the DTC transfer start event.

Clock Configuration

The DTC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build or by using the CGC module at runtime.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Transfer Modes

The DTC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transferred every time an interrupt is

received by the DTC. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment or decrement to the next data unit after each transfer. A 16-bit counter (length) decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the interrupt source and the CPU can be interrupted to signal that all transfers have finished.

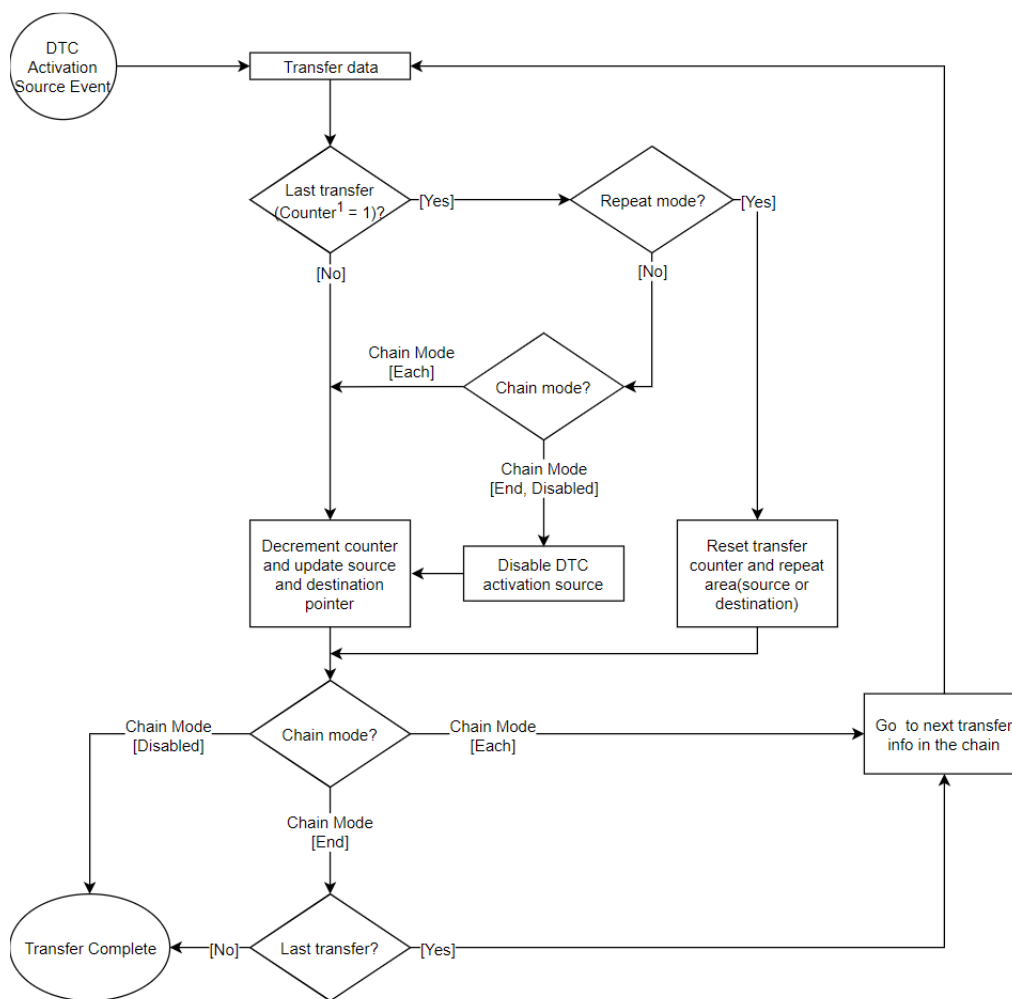

- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,256]. When the transfer counter reaches 0, the counter is reset to its configured value and the repeat area (source or destination address) resets to its starting address and transfers will still be triggered by the interrupt.
- **Block Mode** - In block mode, the amount of data units transferred by each interrupt can be set to an integer in the range [1,256]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.

Note

1. The source and destination address of the transfer must be aligned to the configured data unit.
2. In normal mode the length can be set to [0,65535]. When the length is set to 0, than the transaction will execute 65536 transfers not 0.
3. In block mode, num_blocks can be set to [0,65535]. When the length is set to 0, than the transaction will execute 65536 transfers not 0.

Chaining Transfers

Multiple transfers can be configured for the same interrupt source by specifying an array of `transfer_info_t` structs instead of just passing a pointer to one. In this configuration, every `transfer_info_t` struct must be configured for a chain mode except for the last one. There are two types of chain mode; `CHAIN_MODE_EACH` and `CHAIN_MODE_END`. If a transfer is configured in `CHAIN_MODE_EACH` then it triggers the next transfer in the chain after it completes each transfer. If a transfer is configured in `CHAIN_MODE_END` then it triggers the next transfer in the chain after it completes its last transfer.

1. Counter refers to transfer_info_t.length in normal and repeat mode and transfer_info_t.num_blocks in block mode.

Figure 158: DTC Transfer Flowchart

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	<ul style="list-style-type: none"> Repeats forever Max repeat size is 256 x 4 bytes 	<ul style="list-style-type: none"> Configurable number of repeats Max repeat size is 1024 x 4 bytes
Block Mode	<ul style="list-style-type: none"> Max block size is 256 x 4 bytes 	<ul style="list-style-type: none"> Max block size is 1024 x 4 bytes
Channels	<ul style="list-style-type: none"> One instance per interrupt 	<ul style="list-style-type: none"> MCU specific (8 channels or less)
Chained Transfers	<ul style="list-style-type: none"> Supported 	<ul style="list-style-type: none"> Not Supported
Software Trigger	<ul style="list-style-type: none"> Must use the software ELC event 	<ul style="list-style-type: none"> Has support for software trigger without using

- software ELC event
- Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT

Offset Address Mode

- Not supported

- Supported

Additional Considerations

- The DTC requires a moderate amount of RAM (one `transfer_info_t` struct per open instance + `DTC_VECTOR_TABLE_SIZE`).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.
- The DTC interrupts the CPU using the activation source's IRQ. Each DMAC channel has its own IRQ.

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The `transfer_info_t::irq` setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Note

$$DTC_VECTOR_TABLE_SIZE = (ICU_NVIC_IRQ_SOURCES \times 4) \text{ Bytes}$$

Peripheral Interrupts and DTC

When an interrupt is configured to trigger DTC transfers, the peripheral ISR will trigger on the

following conditions:

- Each transfer completed (transfer_info_t::irq = TRANSFER_IRQ_EACH)
- Last transfer completed (transfer_info_t::irq = TRANSFER_IRQ_END)

For example, if SCI1_RXI is configured to trigger DTC transfers and a SCI1_RXI event occurs, the interrupt will not fire until the DTC transfer is completed. If the DTC transfer_info_t::irq is configured to only interrupt on the last transfer, than no RXI interrupts will occur until the last transfer is completed.

Note

1. The DTC activation source must be enabled in the NVIC in order to trigger DTC transfers (Modules that are designed to integrate the R_DTC module will automatically handle this).
2. The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

Low Power Modes

DTCST must be set to 0 before transitioning to any of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode

Note

1. R_LPM Module stops the DTC before entering deep software standby mode and software standby without snooze mode transition.
2. For more information see 18.9 and 18.10 in the RA6M3 manual R01UH0886EJ0100.

Limitations

Developers should be aware of the following limitations when using the DTC:

- If the DTC is configured to service many different activation sources, the system could run in to performance issues due to memory contention. To address this issue, it is recommended that the DTC vector table and transfer information be moved to their own dedicated memory area (Ex: SRAM0, SRAM1, SRAMHS). This allows memory accesses from different BUS Masters (CPU, DTC, DMAC, EDMAC and Graphics IPs) to occur in parallel.

Examples

Basic Example

This is a basic example of minimal use of the DTC in an application.

```
void dtc_minimal_example (void)
{
    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```

/* Enable the DTC to handle incoming transfer requests. */
err = R_DTC_Enable(&g_transfer_ctrl);
assert(FSP_SUCCESS == err);
}

```

Data Structures

struct [dtc_instance_ctrl_t](#)

Macros

#define [DTC_MAX_NORMAL_TRANSFER_LENGTH](#)

#define [DTC_MAX_REPEAT_TRANSFER_LENGTH](#)

#define [DTC_MAX_BLOCK_TRANSFER_LENGTH](#)

#define [DTC_MAX_BLOCK_COUNT](#)

Data Structure Documentation

◆ [dtc_extended_cfg_t](#)

struct dtc_extended_cfg_t		
DTC transfer configuration extension. This extension is required.		
Data Fields		
IRQn_Type	activation_source	Select which IRQ will trigger the transfer.

◆ [dtc_instance_ctrl_t](#)

struct dtc_instance_ctrl_t
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open .

Macro Definition Documentation

◆ [DTC_MAX_NORMAL_TRANSFER_LENGTH](#)

#define DTC_MAX_NORMAL_TRANSFER_LENGTH
Max configurable number of transfers in NORMAL MODE

◆ **DTC_MAX_REPEAT_TRANSFER_LENGTH**

```
#define DTC_MAX_REPEAT_TRANSFER_LENGTH
```

Max number of transfers per repeat for REPEAT MODE

◆ **DTC_MAX_BLOCK_TRANSFER_LENGTH**

```
#define DTC_MAX_BLOCK_TRANSFER_LENGTH
```

Max number of transfers per block in BLOCK MODE

◆ **DTC_MAX_BLOCK_COUNT**

```
#define DTC_MAX_BLOCK_COUNT
```

Max configurable number of blocks to transfer in BLOCK MODE

Function Documentation◆ **R_DTC_Open()**

```
fsp_err_t R_DTC_Open ( transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg )
```

Configure the vector table if it hasn't been configured, enable the Module and copy the pointer to the transfer info into the DTC vector table. Implements [transfer_api_t::open](#).

Example:

```
/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
```

Return values

FSP_SUCCESS	Successful open. Transfer transfer info pointer copied to DTC Vector table. Module started. DTC vector table configured.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.
FSP_ERR_IN_USE	The index for this IRQ in the DTC vector table is already configured.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.

◆ **R_DTC_Reconfigure()**

```
fsp_err_t R_DTC_Reconfigure ( transfer_ctrl_t *const p_api_ctrl, transfer_info_t * p_info )
```

Copy pointer to transfer info into the DTC vector table and enable transfer in ICU. Implements [transfer_api_t::reconfigure](#).

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

Note

p_info must persist until all transfers are completed.

◆ **R_DTC_Reset()**

```
fsp_err_t R_DTC_Reset ( transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers )
```

Reset transfer source, destination, and number of transfers. Implements [transfer_api_t::reset](#).

Return values

FSP_SUCCESS	Transfer reset successfully (transfers are enabled).
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned correctly. Transfer destination address is NULL or is not aligned correctly.

◆ **R_DTC_SoftwareStart()**

```
fsp_err_t R_DTC_SoftwareStart ( transfer_ctrl_t *const p_api_ctrl, transfer_start_mode_t mode )
```

Placeholder for unsupported softwareStart function. Implements [transfer_api_t::softwareStart](#).

Return values

FSP_ERR_UNSUPPORTED	DTC software start is not supported.
---------------------	--------------------------------------

◆ **R_DTC_SoftwareStop()**

```
fsp_err_t R_DTC_SoftwareStop ( transfer_ctrl_t *const p_api_ctrl)
```

Placeholder for unsupported softwareStop function. Implements [transfer_api_t::softwareStop](#).

Return values

FSP_ERR_UNSUPPORTED	DTC software stop is not supported.
---------------------	-------------------------------------

◆ **R_DTC_Enable()**

```
fsp_err_t R_DTC_Enable ( transfer_ctrl_t *const p_api_ctrl)
```

Enable transfers on this activation source. Implements [transfer_api_t::enable](#).

Example:

```
/* Enable the DTC to handle incoming transfer requests. */
err = R_DTC_Enable(&g_transfer_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Transfers will be triggered by the activation source
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

◆ R_DTC_Disable()

```
fsp_err_t R_DTC_Disable ( transfer_ctrl_t *const p_api_ctrl)
```

Disable transfer on this activation source. Implements [transfer_api_t::disable](#).

Return values

FSP_SUCCESS	Transfers will not occur on activation events.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_InfoGet()

```
fsp_err_t R_DTC_InfoGet ( transfer_ctrl_t *const p_api_ctrl, transfer_properties_t *const p_properties )
```

Provides information about this transfer. Implements [transfer_api_t::infoGet](#).

Return values

FSP_SUCCESS	p_info updated with current instance information.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_Close()

```
fsp_err_t R_DTC_Close ( transfer_ctrl_t *const p_api_ctrl)
```

Disables DTC activation in the ICU, then clears transfer data from the DTC vector table. Implements [transfer_api_t::close](#).

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

4.2.22 Event Link Controller (r_elc)

Detailed Description

Driver for the ELC peripheral on RA MCUs. This module implements the [ELC Interface](#).

Overview

The event link controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect (link) them to different modules, allowing direct cooperation between the modules without central processing unit (CPU) intervention. The conceptual diagram below illustrates a potential setup where a pin interrupt triggers a timer which later triggers an ADC conversion and CTSU scan, while at the same time a serial communication interrupt automatically starts a data transfer. These tasks would be automatically handled without the need for polling or interrupt management.

Figure 159: Event Link Controller Conceptual Diagram

In essence, the ELC is an array of multiplexers to route a wide variety of interrupt signals to a subset of peripheral functions. Events are linked by setting the multiplexer for the desired function to the desired signal (through `R_ELC_LinkSet`). The diagram below illustrates one peripheral output of the ELC. In this example, a conversion start is triggered for ADC0 Group A when the GPT0 counter overflows:

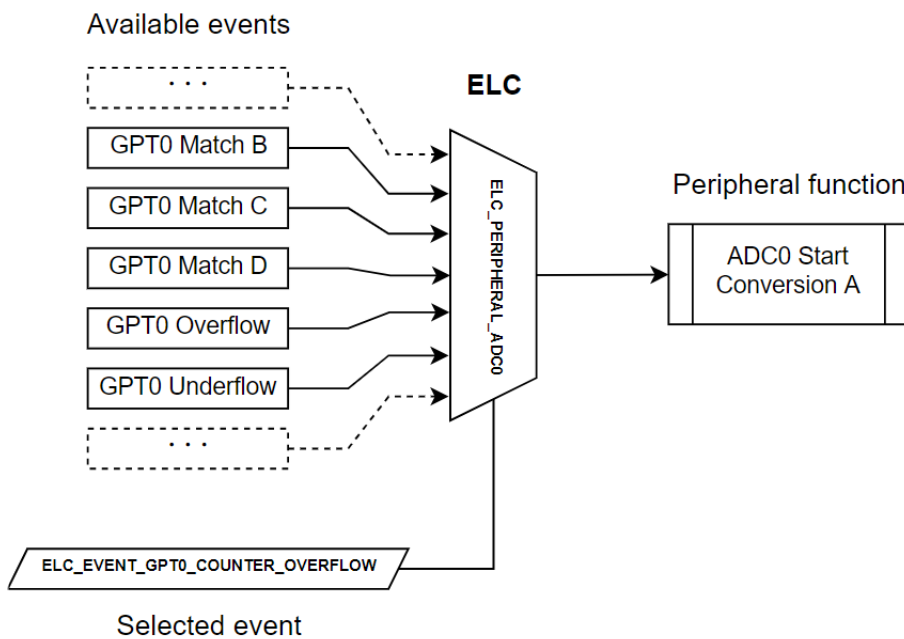

Figure 160: ELC Example

Features

The ELC HAL module can perform the following functions:

- Initialize the ELC to a pre-defined set of links
- Create an event link between two blocks
- Break an event link between two blocks
- Generate one of two software events that interrupt the CPU

- Globally enable or disable event links

A variety of functions can be activated via events, including:

- General-purpose timer (GPT) control
- ADC and DAC conversion start
- Synchronized I/O port output (ports 1-4 only)
- Capacitive touch unit (CTSU) measurement activation

Note

The available sources and peripherals may differ between devices. A full list of selectable peripherals and events is available in the User's Manual for your device.

Some peripherals have specific settings related to ELC event generation and/or reception. Details on how to enable event functionality for each peripheral are located in the usage notes for the related module(s) as well as in the User's Manual for your device.

Configuration

Note

Event links will be automatically generated based on the selections made in module properties. To view the currently linked events check the [Event Links tab in the RA Configuration editor](#).

Calling [R_ELC_Open](#) followed by [R_ELC_Enable](#) will automatically link all events shown in the Event Links tab.

To manually link an event to a peripheral at runtime perform the following steps:

1. Configure the operation of the destination peripheral (including any configuration necessary to receive events)
2. Use [R_ELC_LinkSet](#) to set the desired event link to the peripheral
3. Use [R_ELC_Enable](#) to enable transmission of event signals
4. Configure the signaling module to output the desired event (typically an interrupt)

To disable the event, either use [R_ELC_LinkBreak](#) to clear the link for a specific event or [R_ELC_Disable](#) to globally disable event linking.

Note

The ELC module needs no pin, clocking or interrupt configuration; it is merely a mechanism to connect signals between peripherals. However, when linking I/O Ports via the ELC the relevant I/O pins need to be configured as inputs or outputs.

Build Time Configurations for r_elc

The following build time configurations are defined in `fsp_cfg/r_elc_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Event Link Controller (r_elc)

This module can be added to the Stacks tab via `New Stack > System > Event Link Controller (r_elc)`. Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	ELC instance name must be <code>g_elc</code> to match <code>elc_cfg_t</code> data structure created in <code>elc_data.c</code>	<code>g_elc</code>	Module name. Fixed to <code>g_elc</code> .

Usage Notes

Limitations

Developers should be aware of the following limitations when using the ELC:

- To link events it is necessary for the ELC and the related modules to be enabled. The ELC cannot operate if the related modules are in the module stop state or the MCU is in a low power consumption mode for which the module is stopped.
- If two modules are linked across clock domains there may be a 1 to 2 cycle delay between event signaling and reception. The delay timing is based on the frequency of the slowest clock.

Examples

Basic Example

Below is a basic example of minimal use of event linking in an application.

```

/* This struct is automatically generated based on the events configured by
peripherals in the RA Configuration editor. */
static const elc_cfg_t g_elc_cfg =
{
    .link[ELC_PERIPHERAL_GPT_A] = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_GPT4_COUNTER_OVERFLOW
};

void elc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);

```

```
    assert(FSP_SUCCESS == err);  
/* Globally enable event linking in the ELC. */  
    err = R_ELC_Enable(&g_elc_ctrl);  
    assert(FSP_SUCCESS == err);  
}
```

Software-Generated Events

This example demonstrates how to use a software-generated event to signal a peripheral. This can be useful when the desired event source is not supported by the ELC hardware.

```
/* Interrupt handler for peripheral event not supported by the ELC */  
void peripheral_isr (void)  
{  
    fsp_err_t err;  
    /* Generate an event signal through software to the linked peripheral. */  
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);  
    assert(FSP_SUCCESS == err);  
}  
void elc_software_event (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    /* Open the module. */  
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
    /* Link ADC0 conversion start to software event 0. */  
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,  
ELC_EVENT_ELC_SOFTWARE_EVENT_0);  
    assert(FSP_SUCCESS == err);  
    while (true)  
    {  
        /* Application code here. */  
    }  
}
```

Data Structures

```
struct elc_instance_ctrl_t
```

Data Structure Documentation

◆ elc_instance_ctrl_t

```
struct elc_instance_ctrl_t
```

ELC private control block. DO NOT MODIFY. Initialization occurs when `R_ELC_Open()` is called.

Function Documentation

◆ R_ELC_Open()

```
fsp_err_t R_ELC_Open ( elc_ctrl_t *const p_ctrl, elc_cfg_t const *const p_cfg )
```

Initialize all the links in the Event Link Controller. Implements `elc_api_t::open`

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set or clear an individual link use `R_ELC_LinkSet` and `R_ELC_LinkBreak` respectively.

Example:

```
/* Initializes the software and sets the links defined in the control structure. */
err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl or p_cfg was NULL
FSP_ERR_ALREADY_OPEN	The module is currently open

◆ R_ELC_Close()

```
fsp_err_t R_ELC_Close ( elc_ctrl_t *const p_ctrl)
```

Globally disable ELC linking. Implements `elc_api_t::close`

Return values

FSP_SUCCESS	The ELC was successfully disabled
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R_ELC_SoftwareEventGenerate()**

```
fsp_err_t R_ELC_SoftwareEventGenerate ( elc_ctrl_t *const p_ctrl, elc_software_event_t
event_number )
```

Generate a software event in the Event Link Controller. Implements `elc_api_t::softwareEventGenerate`

Example:

```
/* Generate an event signal through software to the linked peripheral. */
err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	Invalid event number or p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R_ELC_LinkSet()**

```
fsp_err_t R_ELC_LinkSet ( elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral, elc_event_t signal )
```

Create a single event link. Implements `elc_api_t::linkSet`

Example:

```
/* Create or modify a link between a peripheral function and an event source. */
err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R_ELC_LinkBreak()**

```
fsp_err_t R_ELC_LinkBreak ( elc_ctrl_t *const p_ctrl, elc_peripheral_t peripheral )
```

Break an event link. Implements `elc_api_t::linkBreak`

Return values

FSP_SUCCESS	Event link broken
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R_ELC_Enable()**

```
fsp_err_t R_ELC_Enable ( elc_ctrl_t *const p_ctrl)
```

Enable the operation of the Event Link Controller. Implements `elc_api_t::enable`

Return values

FSP_SUCCESS	ELC enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ **R_ELC_Disable()**

```
fsp_err_t R_ELC_Disable ( elc_ctrl_t *const p_ctrl)
```

Disable the operation of the Event Link Controller. Implements `elc_api_t::disable`

Return values

FSP_SUCCESS	ELC disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

4.2.23 Ethernet (r_ether)

Modules

Functions

```
fsp_err_t R_ETHER_Open (ether_ctrl_t *const p_ctrl, ether_cfg_t const *const
```

p_cfg)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether_api_t::open](#). [More...](#)

fsp_err_t [R_ETHER_Close](#) ([ether_ctrl_t](#) *const p_ctrl)

Disables interrupts. Removes power and releases hardware lock. Implements [ether_api_t::close](#). [More...](#)

fsp_err_t [R_ETHER_Read](#) ([ether_ctrl_t](#) *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether_api_t::read](#). [More...](#)

fsp_err_t [R_ETHER_BufferRelease](#) ([ether_ctrl_t](#) *const p_ctrl)

Move to the next buffer in the circular receive buffer list. Implements [ether_api_t::bufferRelease](#). [More...](#)

fsp_err_t [R_ETHER_RxBufferUpdate](#) ([ether_ctrl_t](#) *const p_ctrl, void *const p_buffer)

Change the buffer pointer of the current rx buffer descriptor. Implements [ether_api_t::rxBufferUpdate](#). [More...](#)

fsp_err_t [R_ETHER_Write](#) ([ether_ctrl_t](#) *const p_ctrl, void *const p_buffer, uint32_t const frame_length)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements [ether_api_t::write](#). [More...](#)

fsp_err_t [R_ETHER_LinkProcess](#) ([ether_ctrl_t](#) *const p_ctrl)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements [ether_api_t::linkProcess](#). [More...](#)

fsp_err_t [R_ETHER_WakeOnLANEnable](#) ([ether_ctrl_t](#) *const p_ctrl)

The setting of ETHERC is changed from normal sending and

receiving mode to magic packet detection mode. Implements [ether_api_t::wakeOnLANEnable](#). [More...](#)

`fsp_err_t R_ETHER_TxStatusGet(ether_ctrl_t *const p_ctrl, void *const p_buffer_address)`

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the [Ethernet Interface](#).

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in `fsp_cfg/r_ether_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
ET0_LINKSTA Pin Status Flag	<ul style="list-style-type: none"> • Fall -> Rise • Rise -> Fall 	Fall -> Rise	Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise

and fall of the LINKSTA signal.

Link Signal Change Flag	<ul style="list-style-type: none"> • Unused • Used 	Unused	Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal)
-------------------------	--	--------	---

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ether0	Module name.
General > Channel	0	0	Select the ether channel number.
General > MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
General > Zero-copy Mode	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Enable or disable zero-copy mode.
General > Flow control functionality	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Enable or disable flow control.
Filters > Multicast Mode	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Enable or disable multicast frame reception.
Filters > Promiscuous Mode	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Enable this option to receive packets addressed to other NICs.
Filters > Broadcast filter	Must be a valid non-negative integer with maximum configurable value of 65535.	0	Limit of the number of broadcast frames received continuously
Buffers > Number of TX buffer	Must be an integer from 1 to 8	1	Number of transmit buffers
Buffers > Number of RX buffer	Must be an integer from 1 to 8	1	Number of receive buffers
Buffers > Allocate RX buffer	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Allocates the RX buffer when generating the configuration structure
Buffers > Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Buffers > Padding size	<ul style="list-style-type: none"> • Disable 	Disable	The padding size that

	<ul style="list-style-type: none"> • 1 Byte • 2 Bytes • 3 Bytes 		is automatically inserted into the received packets
Buffers > Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
Interrupts > Interrupt priority	MCU Specific Options		Select the EDMAC interrupt priority.
Interrupts > Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

Interrupt Configuration

The first [R_ETHER_Open](#) function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6E1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA

Note

1. When using *ETHERC*, the *PCLKA* frequency is in the range $12.5 \text{ MHz} \leq PCLKA \leq 120 \text{ MHz}$.
2. When using *ETHERC*, $PCLKA = ICLK$.

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the [R_ETHER_Open](#) function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

Figure 161: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

Figure 162: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

Figure 163: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for `R_ETHER_RxBufferUpdate` when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

MCU	Has Security Extension	Support Flat project	Support TZ project	
			Secure	Non-Secure
RA6M2	-	x	-	-
RA6M3	-	x	-	-
RA6M4	- *1	x	-	x
RA6M5	- *1	x	-	x

Note

1. *ETHERC/EDMAC is always Non-secure peripheral in this MCU.*

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

```
#define ETHER_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)
#define ETHER_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)

◆ ether_instance_ctrl_t

struct ether_instance_ctrl_t		
ETHER control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_cfg_t const *	p_ether_cfg	Pointer to initial configurations.
ether_instance_descriptor_t *	p_rx_descriptor	Pointer to the currently referenced transmit descriptor.
ether_instance_descriptor_t *	p_tx_descriptor	Pointer to the currently referenced receive descriptor.
void *	p_reg_etherc	Base register of ethernet controller for this channel.
void *	p_reg_edmac	Base register of EDMA controller for this channel.
ether_previous_link_status_t	previous_link_status	Previous link status.
ether_link_change_t	link_change	status of link change
ether_magic_packet_t	magic_packet	status of magic packet detection
ether_link_establish_status_t	link_establish_status	Current Link status.

Enumeration Type Documentation

◆ ether_previous_link_status_t

enum ether_previous_link_status_t	
Enumerator	
ETHER_PREVIOUS_LINK_STATUS_DOWN	Previous link status is down.
ETHER_PREVIOUS_LINK_STATUS_UP	Previous link status is up.

◆ ether_link_change_t

enum ether_link_change_t	
Enumerator	
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.

◆ ether_magic_packet_t

enum ether_magic_packet_t	
Enumerator	
ETHER_MAGIC_PACKET_NOT_DETECTED	Magic packet is not detected.
ETHER_MAGIC_PACKET_DETECTED	Magic packet is detected.

◆ ether_link_establish_status_t

enum ether_link_establish_status_t	
Enumerator	
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.

Function Documentation

◆ **R_ETHER_Open()**

```
fsp_err_t R_ETHER_Open ( ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg )
```

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements [ether_api_t::open](#).

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ **R_ETHER_Close()**

```
fsp_err_t R_ETHER_Close ( ether_ctrl_t *const p_ctrl)
```

Disables interrupts. Removes power and releases hardware lock. Implements [ether_api_t::close](#).

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_ETHER_Read()**

```
fsp_err_t R_ETHER_Read ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes )
```

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements [ether_api_t::read](#).

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.

◆ **R_ETHER_BufferRelease()**

```
fsp_err_t R_ETHER_BufferRelease ( ether_ctrl_t *const p_ctrl)
```

Move to the next buffer in the circular receive buffer list. Implements [ether_api_t::bufferRelease](#).

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.

◆ **R_ETHER_RxBufferUpdate()**

```
fsp_err_t R_ETHER_RxBufferUpdate ( ether_ctrl_t *const p_ctrl, void *const p_buffer )
```

Change the buffer pointer of the current rx buffer descriptor. Implements [ether_api_t::rxBufferUpdate](#).

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	All descriptor is active.

◆ **R_ETHER_Write()**

```
fsp_err_t R_ETHER_Write ( ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length )
```

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements [ether_api_t::write](#).

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ **R_ETHER_LinkProcess()**

```
fsp_err_t R_ETHER_LinkProcess ( ether_ctrl_t *const p_ctrl)
```

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements `ether_api_t::linkProcess`.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ **R_ETHER_WakeOnLANEnable()**

```
fsp_err_t R_ETHER_WakeOnLANEnable ( ether_ctrl_t *const p_ctrl)
```

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements `ether_api_t::wakeOnLANEnable`.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_TxStatusGet()

```
fsp_err_t R_ETHER_TxStatusGet ( ether_ctrl_t *const p_ctrl, void *const p_buffer_address )
```

Provides status of Ethernet driver in the user provided pointer. Implements [ether_api_t::txStatusGet](#).

Return values

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

4.2.24 Ethernet PHY (r_ether_phy)

Modules

Functions

```
fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg)
```

Resets Ethernet PHY device. Implements [ether_phy_api_t::open](#). [More...](#)

```
fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements [ether_phy_api_t::close](#). [More...](#)

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements [ether_phy_api_t::startAutoNegotiate](#). [More...](#)

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const p_ctrl, uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause)
```

Reports the other side's physical capability. Implements [ether_phy_api_t::linkPartnerAbilityGet](#). [More...](#)

```
fsp_err_t R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const p_ctrl)
```

Returns the status of the physical link. Implements `ether_phy_api_t::linkStatusGet`. [More...](#)

Detailed Description

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the [Ethernet PHY Interface](#).

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Configuration

Build Time Configurations for r_ether_phy

The following build time configurations are defined in `fsp_cfg/r_ether_phy_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Select PHY	<ul style="list-style-type: none"> • Default • Other • KSZ8091RNB • KSZ8041 • DP83620 	Default	Select PHY chip to use. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	<ul style="list-style-type: none"> • Default • Enabled • Disabled 	Default	Select whether to use the RMI reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ether_phy0	Module name.
Channel	<ul style="list-style-type: none"> • 0 • 1 	0	Select the Ethernet controller channel number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	<ul style="list-style-type: none"> • MII • RMII 	RMII	Specify whether to use MII or RMII.
MII/RMII Register Access Wait-time	Specify a value between 0x1 and 0x7FFFFFFF.	8	Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.
Flow Control	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select whether to enable or disable flow control.

Usage Notes

Note

See the [example](#) below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type	MII and RMI management frame								
Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE	
Number of bits	32	2	2	5	5	2	16	1	
Read	1...1	01	10	00001	RRRRR	Z0	DDDDD DDDDD DDDDD D	Z	
Write	1...1	01	01	00001	RRRRR	10	DDDDD DDDDD DDDDD D	Z	

Note

- *PRE (preamble): Send 32 consecutive 1s.*
- *ST (start of frame): Send 01b.*
- *OP (operation code): Send 10b for read or 01b for write.*
- *PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.*
- *REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.*
- *TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation. Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output). (This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)*
- *DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.*
- *IDLE (IDLE condition): Wait time before inputting the next MII or RMI management format. Release the bus during a write operation (Z is output). No control is required, because a bus was already released during a read operation.*

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported (KSZ8091RNB, KSZ8041 and DP83620). Use the existing code as a starting point for creating a custom implementation.

Examples**ETHER PHY Basic Example**

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    g_ether_phy0_ctrl.open    = 0U;

    g_ether_phy0_cfg.channel = 0;

    /* Initializes the module. */
}
```

```

err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Start auto negotiation. */
err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
assert(FSP_SUCCESS == err);
/* Polling until link is established. */
while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
{
/* Do nothing */
}
/* Get link partner ability from phy interface. */
err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                         &g_ether_phy0_line_speed_duplex,
                                         &g_ether_phy0_local_pause,
                                         &g_ether_phy0_partner_pause);

assert(FSP_SUCCESS == err);
/* Check current link status. */
err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
assert(FSP_SUCCESS == err);
}

```

Data Structures

struct [ether_phy_instance_ctrl_t](#)

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

struct ether_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg	Pointer to initial configurations.
volatile uint32_t *	p_reg_pir	Pointer to ETHERC peripheral registers.

uint32_t	local_advertise	Capabilities bitmap for local advertising.
----------	-----------------	--

Function Documentation

◆ R_ETHER_PHY_Open()

```
fsp_err_t R_ETHER_PHY_Open ( ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg )
```

Resets Ethernet PHY device. Implements `ether_phy_api_t::open`.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call <code>close()</code> then <code>open()</code> to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to <code>p_cfg</code> is NULL.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ R_ETHER_PHY_Close()

```
fsp_err_t R_ETHER_PHY_Close ( ether_phy_ctrl_t *const p_ctrl)
```

Close Ethernet PHY device. Implements `ether_phy_api_t::close`.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_ETHER_PHY_StartAutoNegotiate()**

```
fsp_err_t R_ETHER_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const p_ctrl)
```

Starts auto-negotiate. Implements `ether_phy_api_t::startAutoNegotiate`.

Return values

FSP_SUCCESS	ETHER_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_ETHER_PHY_LinkPartnerAbilityGet()**

```
fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const p_ctrl, uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause )
```

Reports the other side's physical capability. Implements `ether_phy_api_t::linkPartnerAbilityGet`.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed

◆ **R_ETHER_PHY_LinkStatusGet()**

```
fsp_err_t R_ETHER_PHY_LinkStatusGet ( ether_phy_ctrl_t *const p_ctrl)
```

Returns the status of the physical link. Implements `ether_phy_api_t::linkStatusGet`.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.

4.2.25 High-Performance Flash Driver (r_flash_hp)

Modules

Functions

fsp_err_t	R_FLASH_HP_Open (flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg)
fsp_err_t	R_FLASH_HP_Write (flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t flash_address, uint32_t const num_bytes)
fsp_err_t	R_FLASH_HP_Erase (flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t const num_blocks)
fsp_err_t	R_FLASH_HP_BlankCheck (flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t num_bytes, flash_result_t *blank_check_result)
fsp_err_t	R_FLASH_HP_Close (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_StatusGet (flash_ctrl_t *const p_api_ctrl, flash_status_t *const p_status)
fsp_err_t	R_FLASH_HP_AccessWindowSet (flash_ctrl_t *const p_api_ctrl, uint32_t const start_addr, uint32_t const end_addr)
fsp_err_t	R_FLASH_HP_AccessWindowClear (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_IdCodeSet (flash_ctrl_t *const p_api_ctrl, uint8_t const *const p_id_code, flash_id_code_mode_t mode)
fsp_err_t	R_FLASH_HP_Reset (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_StartUpAreaSelect (flash_ctrl_t *const p_api_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary)
fsp_err_t	R_FLASH_HP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void const *const p_context, flash_callback_args_t *const p_callback_memory)
fsp_err_t	R_FLASH_HP_BankSwap (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_InfoGet (flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info)

Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the [Flash Interface](#).

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The R_FLASH_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_hp

The following build time configurations are defined in fsp_cfg/r_flash_hp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming Enable	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

Configurations for Storage > Flash (r_flash_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.
Flash Error Interrupt Priority	MCU Specific Options		Select the flash error interrupt priority.

Clock Configuration

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_hp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in

the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the `flash_api_t::open` function the Flash clock source is checked will return `FSP_ERR_FCLK` if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the `flash_api_t::updateFlashClockFreq` API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, `flash_api_t::FLASH_EVENT_ERASE_COMPLETE`) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the `flash_api_t::open` API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000 /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
```

```
uint8_t      g_dest[TRANSFER_LENGTH];
uint8_t      g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
    /* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
    /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
    /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
    /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
```

```
/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);

assert(FSP_SUCCESS == err);

/* Enable interrupts after code flash operations are complete. */
__enable_irq();

assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context     = 0,
    .p_extend      = NULL,
    .data_flash_bgo = true,
    .ipl           = 5,
    .irq           = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};

void r_flash_hp_bgo_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);

    /* Handle any errors. */
}
```

```
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
/* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
while (!interrupt_called)
    {
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
/* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    flash_status_t status;
/* Wait until the current flash operation completes. */
do
    {
        err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
/* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
/* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
/* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
    /* Open the flash hp instance. */
    fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    /* Write the new application starting at 0x00200000. */
    /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
     * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
    /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    /* Handle any pre-reset operations here */
    /* Reset the MCU to swap to the other bank */
    __NVIC_SystemReset();
}
```

Data Structures

struct [flash_hp_instance_ctrl_t](#)

Enumerations

enum [flash_bgo_operation_t](#)

Data Structure Documentation

◆ flash_hp_instance_ctrl_t

struct flash_hp_instance_ctrl_t

Flash HP instance control block. DO NOT INITIALIZE.

Data Fields

uint32_t	opened
	To check whether api has been opened or not.

<code>flash_bgo_operation_t</code>	<code>current_operation</code>
	Operation in progress, for example, FLASH_OPERATION_CF_ERASE.

Enumeration Type Documentation

◆ `flash_bgo_operation_t`

enum <code>flash_bgo_operation_t</code>
Possible Flash operation states

Function Documentation

◆ `R_FLASH_HP_Open()`

<code>fsp_err_t R_FLASH_HP_Open (flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg)</code>										
Initializes the high performance flash peripheral. Implements <code>flash_api_t::open</code> .										
The Open function initializes the Flash.										
Example:										
<pre>/* Open the flash hp instance. */ fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);</pre>										
Return values										
<table border="1"> <tr> <td>FSP_SUCCESS</td> <td>Initialization was successful and timer has started.</td> </tr> <tr> <td>FSP_ERR_ALREADY_OPEN</td> <td>The flash control block is already open.</td> </tr> <tr> <td>FSP_ERR_ASSERTION</td> <td>NULL provided for p_ctrl or p_cfg.</td> </tr> <tr> <td>FSP_ERR_IRQ_BSP_DISABLED</td> <td>Caller is requesting BGO but the Flash interrupts are not enabled.</td> </tr> <tr> <td>FSP_ERR_FCLK</td> <td>FCLK must be a minimum of 4 MHz for Flash operations.</td> </tr> </table>	FSP_SUCCESS	Initialization was successful and timer has started.	FSP_ERR_ALREADY_OPEN	The flash control block is already open.	FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.	FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.	FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_SUCCESS	Initialization was successful and timer has started.									
FSP_ERR_ALREADY_OPEN	The flash control block is already open.									
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.									
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.									
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.									

◆ R_FLASH_HP_Write()

```
fsp_err_t R_FLASH_HP_Write ( flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t flash_address, uint32_t const num_bytes )
```

Writes to the specified Code or Data Flash memory area. Implements `flash_api_t::write`.

Example:

```
/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_Erase()

```
fsp_err_t R_FLASH_HP_Erase ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t const num_blocks )
```

Erases the specified Code or Data Flash blocks. Implements `flash_api_t::erase` by the `block_erase_address`.

Note

Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified. If the address is in code flash then code flash programming must be enabled.
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_BlankCheck()

```
fsp_err_t R_FLASH_HP_BlankCheck ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t
num_bytes, flash_result_t * p_blank_check_result )
```

Performs a blank check on the specified address area. Implements `flash_api_t::blankCheck`.

Example:

```
/* Check if block 0 is erased. */
err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blank check operation completed with result in <code>p_blank_check_result</code> , or blank check started and in-progress (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
FSP_ERR_ASSERTION	NULL provided for <code>p_ctrl</code> .
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.

◆ **R_FLASH_HP_Close()**

```
fsp_err_t R_FLASH_HP_Close ( flash_ctrl_t *const p_api_ctrl)
```

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements `flash_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ **R_FLASH_HP_StatusGet()**

```
fsp_err_t R_FLASH_HP_StatusGet ( flash_ctrl_t *const p_api_ctrl, flash_status_t *const p_status )
```

Query the FLASH peripheral for its status. Implements `flash_api_t::statusGet`.

Example:

```
flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	FLASH peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The Flash API is not Open.

◆ R_FLASH_HP_AccessWindowSet()

```
fsp_err_t R_FLASH_HP_AccessWindowSet ( flash_ctrl_t *const p_api_ctrl, uint32_t const start_addr,
uint32_t const end_addr )
```

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block -> last block inclusive. Anything outside this range of Code Flash is then write protected.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().

Implements [flash_api_t::accessWindowSet](#).

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R_FLASH_HP_AccessWindowClear()**

```
fsp_err_t R_FLASH_HP_AccessWindowClear ( flash_ctrl_t *const p_api_ctrl)
```

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements `flash_api_t::accessWindowClear`.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R_FLASH_HP_IdCodeSet()**

```
fsp_err_t R_FLASH_HP_IdCodeSet ( flash_ctrl_t *const p_api_ctrl, uint8_t const *const p_id_code,
flash_id_code_mode_t mode )
```

Implements `flash_api_t::idCodeSet`.

Return values

FSP_SUCCESS	ID Code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R_FLASH_HP_Reset()**

```
fsp_err_t R_FLASH_HP_Reset ( flash_ctrl_t *const p_api_ctrl)
```

Reset the FLASH peripheral. Implements `flash_api_t::reset`.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_UpdateFlashClockFreq()

`fsp_err_t R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const p_api_ctrl)`

Indicate to the already open Flash API that the FCLK has changed. Implements `flash_api_t::updateFlashClockFreq`.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_FCLK	FCLK is not within the acceptable range.

◆ R_FLASH_HP_StartUpAreaSelect()

```
fsp_err_t R_FLASH_HP_StartUpAreaSelect ( flash_ctrl_t *const p_api_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary )
```

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements [flash_api_t::startupAreaSelect](#).

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ **R_FLASH_HP_CallbackSet()**

```
fsp_err_t R_FLASH_HP_CallbackSet ( flash_ctrl_t *const p_api_ctrl, void(*) (flash_callback_args_t *)
p_callback, void const *const p_context, flash_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `flash_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_FLASH_HP_BankSwap()**

```
fsp_err_t R_FLASH_HP_BankSwap ( flash_ctrl_t *const p_api_ctrl)
```

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. `flash_api_t::bankSwap`.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for <code>p_ctrl</code> .
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_INVALID_MODE	Cannot switch banks while flash is in Linear mode.
FSP_ERR_WRITE_FAILED	Flash write operation failed.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_InfoGet()

```
fsp_err_t R_FLASH_HP_InfoGet ( flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info )
```

Returns the information about the flash regions. Implements `flash_api_t::infoGet`.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

4.2.26 Low-Power Flash Driver (r_flash_lp)

p_info)
```

Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the [Flash Interface](#).

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_lp

The following build time configurations are defined in fsp_cfg/r_flash_lp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Controls whether or not code-flash programming is

enabled. Disabling reduces the amount of ROM and RAM used by the API.

Data Flash Programming	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.
------------------------	---	---------	---

Configurations for Storage > Flash (r_flash_lp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_lp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.

Clock Configuration

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the [flash_api_t::open](#) function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the [flash_api_t::updateFlashClockFreq](#) API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, [flash_api_t::FLASH_EVENT_ERASE_COMPLETE](#)) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the [flash_api_t::open](#) API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000 /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t      g_dest[TRANSFER_LENGTH];
uint8_t      g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void R_FLASH_LP_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the flash lp instance. */
    fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
    /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
    /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
    /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
}
```

```
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));

    /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();

    /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);

    /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);

    /* Enable interrupts after code flash operations are complete. */
    __enable_irq();

    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context     = 0,
    .p_extend      = NULL,
    .data_flash_bgo = true,
    .ipl           = 5,
    .irq           = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};

void R_FLASH_LP_bgo_example (void)
{
```

```
/* Initialize p_src to known data */
for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
{
    g_src[i] = (uint8_t) ('A' + (i % 26));
}

/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

interrupt_called = false;

/* Erase 1 block of data flash starting at block 0. */
err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
assert(FSP_SUCCESS == err);

while (!interrupt_called)
{
    ;
}

assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);

interrupt_called = false;

/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
assert(FSP_SUCCESS == err);

flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));

/* If the interrupt wasn't called process the error. */
assert(interrupt_called);

/* If the event wasn't a write complete process the error. */
assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);

/* Verify the data was written correctly. */
```

```
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

Data Structures

struct [flash_lp_instance_ctrl_t](#)

Data Structure Documentation

◆ flash_lp_instance_ctrl_t

struct flash_lp_instance_ctrl_t

Flash instance control block. DO NOT INITIALIZE. Initialization occurs when [R_FLASH_LP_Open\(\)](#) is called.

Function Documentation

◆ **R_FLASH_LP_Open()**

```
fsp_err_t R_FLASH_LP_Open ( flash_ctrl_t *const p_api_ctrl, flash_cfg_t const *const p_cfg )
```

Initialize the Low Power flash peripheral. Implements `flash_api_t::open`.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Note

Providing a callback function in the supplied `p_cfg->callback` field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	NULL provided for <code>p_ctrl</code> , <code>p_cfg</code> or <code>p_callback</code> if BGO is enabled.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_ERR_ALREADY_OPEN	Flash Open() has already been called.
FSP_ERR_TIMEOUT	Failed to exit P/E mode after configuring flash.
FSP_ERR_INVALID_STATE	The system is not running from the required clock.

◆ **R_FLASH_LP_Write()**

```
fsp_err_t R_FLASH_LP_Write ( flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t
flash_address, uint32_t const num_bytes )
```

Write to the specified Code or Data Flash memory area. Implements `flash_api_t::write`.

Example:

```
/* Write 32 bytes to the first block of data flash. */
err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.

◆ **R_FLASH_LP_Erase()**

```
fsp_err_t R_FLASH_LP_Erase ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t const num_blocks )
```

Erase the specified Code or Data Flash blocks. Implements `flash_api_t::erase`.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.

◆ **R_FLASH_LP_BlankCheck()**

```
fsp_err_t R_FLASH_LP_BlankCheck ( flash_ctrl_t *const p_api_ctrl, uint32_t const address, uint32_t
num_bytes, flash_result_t * p_blank_check_result )
```

Perform a blank check on the specified address area. Implements `flash_api_t::blankCheck`.

Example:

```
/* Check if block 0 is erased. */
err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progress (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_BLANK_CHECK_FAILED	An error occurred during blank checking.

◆ **R_FLASH_LP_Close()**

```
fsp_err_t R_FLASH_LP_Close ( flash_ctrl_t *const p_api_ctrl)
```

Release any resources that were allocated by the Flash API. Implements `flash_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_IN_USE	The flash is currently in P/E mode.

◆ **R_FLASH_LP_StatusGet()**

```
fsp_err_t R_FLASH_LP_StatusGet ( flash_ctrl_t *const p_api_ctrl, flash_status_t *const p_status )
```

Query the FLASH for its status. Implements `flash_api_t::statusGet`.

Example:

```
flash_status_t status;

/* Wait until the current flash operation completes. */
do
{
    err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
} while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	Flash is ready and available to accept commands.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_AccessWindowSet()

```
fsp_err_t R_FLASH_LP_AccessWindowSet ( flash_ctrl_t *const p_api_ctrl, uint32_t const start_addr,
uint32_t const end_addr )
```

Configure an access window for the Code Flash memory. Implements `flash_api_t::accessWindowSet`

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing `start_addr` is the first block. The block containing `end_addr` is the last block. The access window then becomes first block (inclusive) -> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as `R_FLASH_LP_AccessWindowClear()`.

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Parameters

	<code>p_api_ctrl</code>	The p api control
[in]	<code>start_addr</code>	The start address
[in]	<code>end_addr</code>	The end address

Return values

<code>FSP_SUCCESS</code>	Access window successfully configured.
<code>FSP_ERR_INVALID_ADDRESS</code>	Invalid settings for <code>start_addr</code> and/or <code>end_addr</code> .
<code>FSP_ERR_IN_USE</code>	FLASH peripheral is busy with a prior operation.
<code>FSP_ERR_ASSERTION</code>	NULL provided for <code>p_ctrl</code> .
<code>FSP_ERR_UNSUPPORTED</code>	Code Flash Programming is not enabled.
<code>FSP_ERR_NOT_OPEN</code>	Flash API has not yet been opened.
<code>FSP_ERR_TIMEOUT</code>	Timed out waiting for the FCU to become ready.
<code>FSP_ERR_WRITE_FAILED</code>	Status is indicating a Programming error for the requested operation.

◆ **R_FLASH_LP_AccessWindowClear()**

```
fsp_err_t R_FLASH_LP_AccessWindowClear ( flash_ctrl_t *const p_api_ctrl)
```

Remove any access window that is configured in the Code Flash. Implements `flash_api_t::accessWindowClear`. On successful return from this call all Code Flash is writable.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ **R_FLASH_LP_IdCodeSet()**

```
fsp_err_t R_FLASH_LP_IdCodeSet ( flash_ctrl_t *const p_api_ctrl, uint8_t const *const p_id_code, flash_id_code_mode_t mode )
```

Write the ID code provided to the id code registers. Implements `flash_api_t::idCodeSet`.

Return values

FSP_SUCCESS	ID code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ **R_FLASH_LP_Reset()**

```
fsp_err_t R_FLASH_LP_Reset ( flash_ctrl_t *const p_api_ctrl)
```

Reset the FLASH peripheral. Implements `flash_api_t::reset`.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ **R_FLASH_LP_StartUpAreaSelect()**

```
fsp_err_t R_FLASH_LP_StartUpAreaSelect ( flash_ctrl_t *const p_api_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary )
```

Select which block is used as the startup area block. Implements `flash_api_t::startupAreaSelect`.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false.

◆ **R_FLASH_LP_CallbackSet()**

```
fsp_err_t R_FLASH_LP_CallbackSet ( flash_ctrl_t *const p_api_ctrl, void(*) (flash_callback_args_t *)
p_callback, void const *const p_context, flash_callback_args_t *const p_callback_memory )
```

Stub function Implements `flash_api_t::callbackSet`.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.
---------------------	------------------------------------

◆ **R_FLASH_LP_BankSwap()**

```
fsp_err_t R_FLASH_LP_BankSwap ( flash_ctrl_t *const p_api_ctrl)
```

Unsupported `flash_api_t::bankSwap`.

Return values

FSP_ERR_UNSUPPORTED	Module does not support Bank Swap.
---------------------	------------------------------------

◆ **R_FLASH_LP_UpdateFlashClockFreq()**

```
fsp_err_t R_FLASH_LP_UpdateFlashClockFreq ( flash_ctrl_t *const p_api_ctrl)
```

Indicate to the already open Flash API that the FCLK has changed. Implements `flash_api_t::updateFlashClockFreq`.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_FCLK	Invalid flash clock source frequency.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.

◆ **R_FLASH_LP_InfoGet()**

```
fsp_err_t R_FLASH_LP_InfoGet ( flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info )
```

Returns the information about the flash regions. Implements `flash_api_t::infoGet`.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.
FSP_ERR_NOT_OPEN	The flash is not open.

4.2.27 Graphics LCD Controller (r_glcdc)

Modules

Functions

```
fsp_err_t R_GLCDC_Open (display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg)
```

```
fsp_err_t R_GLCDC_Close (display_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_GLCDC_Start (display_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_GLCDC_Stop (display_ctrl_t *const p_api_ctrl)
```

```

```
fsp_err_t R_GLCDC_ClutEdit (display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer, uint8_t index, uint32_t color)
```

```
fsp_err_t R_GLCDC_StatusGet (display_ctrl_t const *const p_api_ctrl, display_status_t *const status)
```

Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the [Display Interface](#).

Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

Features

The following features are available:

Feature	Options
Input color formats	ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp
Output color formats	RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel)
Correction processes	Alpha blending, positioning, brightness and contrast, gamma correction, dithering
Timing signals	Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE)
Maximum resolution	Up to 1020 x 1008 pixels (dependent on sync signal width)
Maximum dot clock	60MHz for serial RGB mode, 54MHz otherwise
Internal clock divisors	1-9, 12, 16, 24, 32
Interrupts	Vsync (line detect), Layer 1 underflow, Layer 2 underflow
Other functions	Byte-order and endianness control, line repeat function

Configuration

Build Time Configurations for r_glcdc

The following build time configurations are defined in fsp_cfg/r_glcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected, code for

	<ul style="list-style-type: none"> • Enabled • Disabled 		parameter checking is included in the build.
Color Correction	<ul style="list-style-type: none"> • On • Off 	Off	If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored.

Configurations for Graphics > Graphics LCD (r_glcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r_glcdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_display0	Module name.
Interrupts > Callback Function	Name must be a valid C symbol	NULL	A user callback function can be defined here.
Interrupts > Line Detect Interrupt Priority	MCU Specific Options		Select the line detect (Vsync) interrupt priority.
Interrupts > Underflow 1 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 1.
Interrupts > Underflow 2 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 2.
Input > Graphics Layer 1 > General > Enabled	<ul style="list-style-type: none"> • Yes • No 	Yes	Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Input > Graphics Layer 1 > General > Horizontal size	Value must be between 16 and 1016	480	Specify the number of horizontal pixels.
Input > Graphics Layer 1 > General > Vertical size	Value must be between 16 and 1020	272	Specify the number of vertical pixels.
Input > Graphics Layer 1 > General > Horizontal position	Must be a valid non-negative integer with a maximum configurable	0	Specify the horizontal offset in pixels of the graphics layer from the

	value of 4091		background layer.
Input > Graphics Layer 1 > General > Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 1 > General > Color format	<ul style="list-style-type: none"> • ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit) 	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Input > Graphics Layer 1 > General > Line descending mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 1 > Background Color > Alpha	Value must be between 0 and 255	255	Based on the alpha value, either the graphics Layer 2 (foreground graphics layer) is blended into the graphics Layer 1 (background graphics layer) or the graphics Layer 1 is blended into the monochrome background layer.
Input > Graphics Layer 1 > Background Color > Red	Value must be between 0 and 255	255	Red component of the background color for layer 1.
Input > Graphics Layer 1 > Background Color > Green	Value must be between 0 and 255	255	Green component of the background color for layer 1.
Input > Graphics Layer 1 > Background Color > Blue	Value must be between 0 and 255	255	Blue component of the background color for layer 1.
Input > Graphics Layer 1 > Framebuffer > Framebuffer name	This property must be a valid C symbol	fb_background	Specify the name for the framebuffer for Layer 1.
Input > Graphics Layer 1 > Framebuffer > Number of framebuffers	Must be a valid non-negative integer with a maximum configurable value of 65535	2	Number of framebuffers allocated for Graphics Layer 1.
Input > Graphics Layer 1 > Framebuffer > Section for framebuffer	Manual Entry	.bss	Specify the section in which to allocate the framebuffer. When Arm

allocation			Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Input > Graphics Layer 1 > Line Repeat > Enable	<ul style="list-style-type: none"> • On • Off 	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Input > Graphics Layer 1 > Line Repeat > Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 1 > Fading > Mode	<ul style="list-style-type: none"> • None • Fade-in • Fade-out 	None	Select the fade method.
Input > Graphics Layer 1 > Fading > Speed	Value must be between 0 and 255	0	Specify the number of frames for the fading transition to complete.
Input > Graphics Layer 2 > General > Enabled	<ul style="list-style-type: none"> • Yes • No 	No	Specify Used if the graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Input > Graphics Layer 2 > General > Horizontal size	Value must be between 16 and 1016	480	Specify the number of horizontal pixels.
Input > Graphics Layer 2 > General > Vertical size	Value must be between 16 and 1020	272	Specify the number of vertical pixels.
Input > Graphics Layer 2 > General > Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer 2 > General > Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Input > Graphics Layer	<ul style="list-style-type: none"> • ARGB8888 	RGB565 (16-bit)	Specify the graphics

2 > General > Color format	(32-bit) <ul style="list-style-type: none"> • RGB8888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit) 		layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Input > Graphics Layer 2 > General > Line descending mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Select Used if the framebuffer starts from the bottom of the line.

Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

Pin Name	Function	Notes
LCD_EXTCLK	External clock signal input	The maximum input clock frequency is 60MHz.
LCD_CLK	Dot clock output	The maximum output frequency is 54MHz (60MHz in serial RGB mode).
LCD_DATAn	Pixel data output lines	Pin assignment and color order is based on the output block configuration. See the RA6M3 User's Manual (R01UH0886EJ0100) section 58.1.4 "Output Control for Data Format" for details.
LCD_TCONn	Panel timing signal output	These pins can be configured to output vertical and horizontal synchronization and data valid signals.

Note

There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (_A and _B). In most cases the _B bank will be used as _A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If _A and _B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in the RA6M3 User's Manual.

Usage Notes

Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation

block configuration and vice versa.

Initial Configuration

During R_GLCDC_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R_GLCDC_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available (excluding SRAMHS) without displacing the stack, heap and other program-critical structures. While the RA6M3 does contain a relatively large 640K of on-chip SRAM, for many screen sizes and color depths SDRAM will be required. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

Note

Framebuffers allocated through the RA Configuraton tool automatically follow the alignment and size requirements.

If your framebuffer will be placed into internal SRAM please note the following best practices:

- The framebuffer should ideally not be placed in the SRAMHS block of SRAM as there is no speed advantage for doing so. In particular, it is important to ensure the framebuffer does not push the stack or any heaps outside of SRAMHS to preserve CPU performance.
- It is recommended to not cross the boundary between SRAM0 and SRAM1 with a single framebuffer for performance reasons.
- If double-buffering is desired (and possible within SRAM), place one framebuffer in SRAM0 and the other in SRAM1.

If you are using SRAM for the framebuffer, to ensure correct placement you will need to edit the linker script to add new sections. Below is an example of the required edits in the GCC and IAR formats:

GCC Linker

```
/*
  Linker File for RA6M3 MCU
*/
/* Linker script to configure memory regions. */
MEMORY
{
  FLASH (rx)      : ORIGIN = 0x00000000, LENGTH = 0x0200000 /* 2M */
  RAM (rwx)       : ORIGIN = 0x1FFE0000, LENGTH = 0x00A0000 /* 640K */
  FB0 (rwx)       : ORIGIN = 0x20000000, LENGTH = 0x0080000 /* 512K */ // Section
```

```
for framebuffer 0 (or only framebuffer)
    FB1 (rwx)          : ORIGIN = 0x20040000, LENGTH = 0x0040000 /* 256K */ // Section
for framebuffer 1
    DATA_FLASH (rx)   : ORIGIN = 0x40100000, LENGTH = 0x0010000 /* 64K */
    QSPI_FLASH (rx)    : ORIGIN = 0x60000000, LENGTH = 0x4000000 /* 64M */
    SDRAM (rwx)        : ORIGIN = 0x90000000, LENGTH = 0x2000000 /* 32M */
    ID_CODE (rx)       : ORIGIN = 0x0100A150, LENGTH = 0x10 /* 16 bytes */
}
// ...

.noinit (NOLOAD):
{
    . = ALIGN(4);
    __noinit_start = .;
    KEEP(*(.noinit*))
    __noinit_end = .;
} > RAM

/* Place framebuffer sections first, then the rest of RAM */
.fb0 :
{
    . = ALIGN(64);
    __fb0_start = .;
    *(.fb0*);
    __fb0_end = .;
} > FB0

.fb1 :
{
    . = ALIGN(64);
    __fb1_start = .;
    *(.fb1*);
    __fb1_end = .;
} > FB1

.bss :
{
    . = ALIGN(4);
```

```

__bss_start__ = .;

*(.bss*)
*(COMMON)

. = ALIGN(4);

__bss_end__ = .;

} > RAM

// ...

```

IAR Linker

Note

The IAR linker does not place items correctly when sections overlap. As a result, it is advised to place your framebuffer(s) as high as possible in the SRAM region in the linker script to maximize the RAM available for everything else. The below is a general case that should be used unedited only if RAM usage (excluding framebuffers) is less than 128K.

```

/* ... */

/*-Memory Regions-*/

define symbol region_VECT_start      = 0x00000000;
define symbol region_VECT_end        = 0x000003FF;
define symbol region_ROMREG_start    = 0x00000400;
define symbol region_ROMREG_end      = 0x000004FF;
define symbol region_FLASH_start     = 0x00000500;
define symbol region_FLASH_end       = 0x001FFFFFF;
define symbol region_RAM_start       = 0x1FFE0000;
define symbol region_RAM_end         = 0x1FFFFFFF; /* RAM limited to SRAMHS */
define symbol region_FB0_start       = 0x20000000;
define symbol region_FB0_end         = 0x2003FFFF; /* SRAM0 dedicated to framebuffer 0 */
*/
define symbol region_FB1_start       = 0x20040000;
define symbol region_FB1_end         = 0x2007FFFF; /* SRAM1 dedicated to framebuffer 1 */
*/
define symbol region_DF_start        = 0x40100000;
define symbol region_DF_end          = 0x4010FFFF;
define symbol region_SDRAM_start     = 0x90000000;
define symbol region_SDRAM_end       = 0x91FFFFFF;
define symbol region_QSPI_start      = 0x60000000;

```

```

define symbol region_QSPI_end          = 0x63FFFFFF;
/* ... */
define memory mem with size           = 4G;
define region VECT_region              = mem:[from region_VECT_start    to region_VECT_end];
define region ROMREG_region           = mem:[from region_ROMREG_start to region_ROMREG_end];
define region FLASH_region            = mem:[from region_FLASH_start  to
region_FLASH_end];
define region RAM_region               = mem:[from region_RAM_start    to region_RAM_end];

define region DF_region                = mem:[from region_DF_start     to region_DF_end];
define region SDRAM_region             = mem:[from region_SDRAM_start  to
region_SDRAM_end];
define region QSPI_region              = mem:[from region_QSPI_start    to region_QSPI_end];
/* ... */
define block START_OF_RAM with fixed order { rw section .fsp_dtc_vector_table,
                                             block RAM_CODE };
place at start of RAM_region { block START_OF_RAM };
/* Place framebuffer sections first, then the rest of RAM */
place in FB0_region { rw section .fb0 };
place in FB1_region { rw section .fb1 };
place in RAM_region    { rw,
                        rw section .noinit,
                        rw section .bss,
                        rw section .data,
                        rw section HEAP,
                        rw section .stack };

```

Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the

layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the `display_cfg_t` struct is being referenced - for example, the width of the background layer would be `[display_cfg].output.htiming.display_cyc` as shown in the figure below.

Figure 164: GLCDC layers and timing

Note

The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.

Runtime Configuration Options

Note

All runtime configurations detailed below are also automatically configured during `R_GLCDC_Open` based on the options selected in the RA Configuration editor.

Blend processing

Control of layer positioning, alpha blending and fading is possible at runtime via `R_GLCDC_LayerChange`. This function takes a `display_runtime_cfg_t` parameter which contains the same input and layer elements as the `display_cfg_t` control block. Refer to the documentation for `display_runtime_cfg_t` as well as the [Examples](#) below to see what options are configurable.

Brightness and contrast

Brightness and contrast correction can be controlled through [R_GLCDC_ColorCorrection](#). The [display_correction_t](#) parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;

/* Brightness values are 0-1023 with +512 offset being neutral */
correction.brightness.r = 512;
correction.brightness.g = 512;
correction.brightness.b = 512;

/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
correction.contrast.r = 128;
correction.contrast.g = 128;
correction.contrast.b = 128;

/* Brightness and contrast correction can be enabled or disabled independent of one
another */
correction.brightness.enable = true;
correction.contrast.enable = true;

/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through [R_GLCDC_LayerChange](#)) in addition to filling the CLUT as appropriate via [R_GLCDC_ClutUpdate](#) as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
uint32_t clut_4[16] =
{
    0xFF000000, // Black
    0xFFFFFFFF, // White
    0xFF0000FF, // Blue
    0xFF0080FF, // Turquoise
    0xFF00FFFF, // Cyan
    0xFF00FF80, // Mint Green
    0xFF00FF00, // Green
```

```

    0xFF80FF00,          // Lime Green
    0xFFFFFFFF00,      // Yellow
    0xFFFF8000,        // Orange
    0xFFFF0000,        // Red
    0xFFFF0080,        // Pink
    0xFFFF00FF,        // Magenta
    0xFF8000FF,        // Purple
    0xFF808080,        // Gray
    0x00000000         // Transparent

};

/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
{
    .start = 0,
    .size  = 16,
    .p_base = clut_4
};

/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);

```

Note

If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using *emWin*) it is recommended to use `R_GLCDC_ClutEdit` to avoid repeated *memcpy* operations.

Other Configuration Options**Gamma correction**

Gamma correction is performed based on a gain curve defined in the RA Configuration editor. Each point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.12 "Calculation of gamma correction value" and the related description above it.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

Note

Gamma correction can only be applied via `R_GLCDC_Open`.

Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the RA6M3 User's Manual (R01UH0886EJ0100) Figure 58.13 "Configuration of dither correction block" and Figure 58.14 "Addition value selection method for 2x2 pattern dither".

Bus Utilization

Note

The data provided in this section consists of estimates only. Experimentation is necessary to obtain real-world performance data on any platform.

While the GLCDC is very flexible in size and color depth of displays there are considerations to be made in the tradeoff between color depth, framerate and bus utilization. Below is a table showing estimates of the load at various resolutions, framerates and color depths based on a PLL frequency of 120MHz (default) and an effective SDRAM throughput of 60 MB/sec. Bus utilization percentages are provided for the following use cases:

- Static image display (**GLCDC only**): One read
- Redrawing one framebuffer every display frame (**minimal redraw**): One write, one read
- Blitting one buffer to another then redrawing the entire buffer every display frame (**worst case**): Two writes, three reads

Name	Width	Height	Input color depth (bits)	Framerate (FPS)	Buffer size (bytes)	SRAM use	SRAM bus (GLCDC only)	SDRAM bus (GLCDC only)	SRAM bus (minimal redraw)	SDRAM bus (minimal redraw)	SRAM bus (worst case)	SDRAM bus (worst case)
HQVGA	240	160	8	60	38400	6%	1%	4%	2%	8%	5%	19%
HQVGA	240	160	16	60	76800	12%	2%	8%	4%	15%	10%	38%
QVGA	320	240	16	60	153600	23%	4%	15%	8%	31%	19%	77%
WQVGA	400	240	8	60	96000	15%	2%	10%	5%	19%	12%	48%
WQVGA	400	240	16	60	192000	29%	5%	19%	10%	38%	24%	96%
HVGA	480	320	16	60	307200	47%	8%	31%	15%	61%	38%	154%
VGA	640	480	16	30	614400	—	—	31%	—	61%	—	154%
WVGA	800	480	8	60	384000	59%	10%	38%	19%	77%	48%	192%

WVG A	800	480	16	30	7680 00	—	—	38%	—	77%	—	192%
WVG A	800	480	32	15	1536 000	—	—	38%	—	77%	—	192%
FWVG A	960	480	8	30	4608 00	70%	6%	23%	12%	46%	29%	115%
FWVG A	960	480	16	30	9216 00	—	—	46%	—	92%	—	230%
qHD	960	540	8	30	5184 00	79%	6%	26%	13%	52%	32%	130%

Note

Bus utilization values over 100% indicate that the bandwidth for that bus is exceeded in that scenario and GLCDC underflow and/or dropped frames may result depending on the bus priority setting. **It is recommended to avoid these scenarios if at all possible by reducing the buffer drawing rate, number of draw/copy operations or the input color depth.** Relaxing vertical timing (increasing total line count) or increasing the clock divider are the easiest ways to increase the time per frame.

Limitations

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See the descriptions for GRn.AB7 through .AB9 in the RA6M3 User's Manual for further details.
- Use of R_GLCDC_ClutUpdate and R_GLCDC_ClutEdit may not be mixed on the same frame.

Examples**Basic Example**

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
    fsp_err_t err;

    // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    // Start display output
}
```

```
err = R_GLCDC_Start(&g_disp_ctrl);  
assert(FSP_SUCCESS == err);  
}
```

Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;  
/* Callback function for GLCDC interrupts */  
static void glcdc_callback (display_callback_args_t * p_args)  
{  
    if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)  
    {  
        g_vsync_count++;  
    }  
}  
/* Simple wait that returns 1 if no Vsync happened within the timeout period */  
uint8_t vsync_wait (void)  
{  
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;  
    g_vsync_count = 0;  
    while (!g_vsync_count && --timeout_timer)  
    {  
        /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */  
    }  
    return timeout_timer ? 0 : 1;  
}  
/* Initiate a fade on Layer 2  
*  
* Parameters:  
* direction True for fade in, false for fade out  
* speed number of frames over which to fade  
*/
```

```
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
    fsp_err_t err;
    if (direction)
    {
        /* Set the runtime struct to the desired buffer */
        disp_rt_cfg->input.p_base      = (uint32_t *) g_framebuffer_1;
        disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
    }
    else
    {
        disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
    }
    /* Ensure speed is at least 1 frame */
    if (!speed)
    {
        speed = 1;
    }
    /* Set the fade speed to the desired change in alpha per frame */
    disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;
    /* Initiate the fade (will start on the next Vsync) */
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
    assert(FSP_SUCCESS == err);
}
/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
    fsp_err_t err;
    /* Set the config for the incoming layer to be just out of bounds on the right side
    */
    disp_rt_cfg_in->input.p_base      = (uint32_t *) g_framebuffer_1;
    disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;
```

```

/* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
{
/* Wait for a Vsync before starting */
    vsync_wait();

/* Set the X-coordinate of both layers then update them */
    disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
    disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1);
};
    assert(FSP_SUCCESS == err);
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2);
};
    assert(FSP_SUCCESS == err);
}
}

```

Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```

/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
{
    FSP_PARAMETER_NOT_USED(framebuffer);

    /* Draw buffer here */
}

/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;

    fsp_err_t err;

    /* Initialize and start the R_GLCDC module */
    glcdc_init();
}

```

```
while (1)
{
/* Swap the active framebuffer */
    p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
/* Draw the new framebuffer now */
    display_draw(p_framebuffer);
/* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
    err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
    assert(FSP_SUCCESS == err);
/* Wait for a Vsync event */
    vsync_wait();
}
}
```

<code>GLCDC_DITHERING_OUTPUT_FORMAT_RGB565</code>	Dithering output format RGB565.

Function Documentation

◆ **R_GLCDC_Open()**

```
fsp_err_t R_GLCDC_Open ( display_ctrl_t *const p_api_ctrl, display_cfg_t const *const p_cfg )
```

Open GLCDC module. Implements `display_api_t::open`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ALREADY_OPEN	Device was already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock source.
FSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
FSP_ERR_INVALID_ALIGNMENT	Input buffer alignment invalid.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

◆ **R_GLCDC_Close()**

```
fsp_err_t R_GLCDC_Close ( display_ctrl_t *const p_api_ctrl)
```

Close GLCDC module. Implements `display_api_t::close`.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to <code>DISPLAY_STATE_CLOSED</code> .
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCDC is updating register values internally.

Note

This API can be called when the driver is not in `DISPLAY_STATE_CLOSED` state. It returns an error if the register update operation for the background screen generation block is being held.

◆ **R_GLCDC_Start()**

```
fsp_err_t R_GLCDC_Start ( display_ctrl_t *const p_api_ctrl)
```

Start GLCDC module. Implements `display_api_t::start`.

Return values

FSP_SUCCESS	Device was started successfully.
FSP_ERR_NOT_OPEN	GLCDC module has not been opened.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called when the driver is not in DISPLAY_STATE_OPENED status.

◆ **R_GLCDC_Stop()**

```
fsp_err_t R_GLCDC_Stop ( display_ctrl_t *const p_api_ctrl)
```

Stop GLCDC module. Implements `display_api_t::stop`.

Return values

FSP_SUCCESS	Device was stopped successfully
FSP_ERR_ASSERTION	Pointer to the control block is NULL
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

◆ **R_GLCDC_LayerChange()**

```
fsp_err_t R_GLCDC_LayerChange ( display_ctrl_t const *const p_api_ctrl, display_runtime_cfg_t
const *const p_cfg, display_frame_layer_t layer )
```

Change layer parameters of GLCDC module at runtime. Implements `display_api_t::layerChange`.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ **R_GLCDC_BufferChange()**

```
fsp_err_t R_GLCDC_BufferChange ( display_ctrl_t const *const p_api_ctrl, uint8_t *const
framebuffer, display_frame_layer_t layer )
```

Change the framebuffer pointer for a layer. Implements `display_api_t::bufferChange`.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_ALIGNMENT	The framebuffer pointer is not 64-byte aligned.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ **R_GLCDC_ColorCorrection()**

```
fsp_err_t R_GLCDC_ColorCorrection ( display_ctrl_t const *const p_api_ctrl, display_correction_t const *const p_correction )
```

Perform color correction through the GLCDC module. Implements `display_api_t::correction`.

Return values

FSP_SUCCESS	Color correction by GLCDC module was performed successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

◆ **R_GLCDC_ClutUpdate()**

```
fsp_err_t R_GLCDC_ClutUpdate ( display_ctrl_t const *const p_api_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t layer )
```

Write an entire color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clut`.

Return values

FSP_SUCCESS	CLUT written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
FSP_ERR_INVALID_UPDATE_TIMING	R_GLCDC_ClutEdit was already used to edit the specified CLUT this frame.
FSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ **R_GLCDC_ClutEdit()**

```
fsp_err_t R_GLCDC_ClutEdit ( display_ctrl_t const *const p_api_ctrl, display_frame_layer_t layer,
uint8_t index, uint32_t color )
```

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements `display_api_t::clutEdit`.

Return values

FSP_SUCCESS	CLUT element updated successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ **R_GLCDC_StatusGet()**

```
fsp_err_t R_GLCDC_StatusGet ( display_ctrl_t const *const p_api_ctrl, display_status_t *const
p_status )
```

Get status of GLCDC module. Implements `display_api_t::statusGet`.

Return values

FSP_SUCCESS	Got status successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

Note

The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_PENDING, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

4.2.28 General PWM Timer (r_gpt)

Modules

Functions

```
fsp_err_t R_GPT_Open (timer_ctrl_t *const p_ctrl, timer_cfg_t const *const

fsp_err_t	R_GPT_CounterSet (timer_ctrl_t *const p_ctrl, uint32_t counter)
fsp_err_t	R_GPT_OutputEnable (timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin)
fsp_err_t	R_GPT_OutputDisable (timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin)
fsp_err_t	R_GPT_AdcTriggerSet (timer_ctrl_t *const p_ctrl, gpt_adc_compare_match_t which_compare_match, uint32_t compare_match_value)
fsp_err_t	R_GPT_PwmOutputDelaySet (timer_ctrl_t *const p_ctrl, gpt_pwm_output_delay_edge_t edge, gpt_pwm_output_delay_setting_t delay_setting, uint32_t const pin)
fsp_err_t	R_GPT_CallbackSet (timer_ctrl_t *const p_api_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_GPT_Close (timer_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_PwmOutputDelayInitialize ()

Detailed Description

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the [Timer Interface](#).

Overview

The GPT module can be used to count events, measure external input signals, generate a periodic interrupt, or output a periodic or PWM signal to a GTIOC pin.

This module supports the GPT peripherals GPT32EH, GPT32E, GPT32, and GPT16. GPT16 is a 16-bit timer. The other peripherals (GPT32EH, GPT32E, and GPT32) are 32-bit timers. The 32-bit timers are all treated the same in this module from the API perspective.

Features

The GPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Supports count source of PCLK, GTETRQ pins, GTIOC pins, or ELC events.
- Supports debounce filter on GTIOC pins.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Supports start, stop, clear, count up, count down, and capture by external sources from GTETRQ pins, GTIOC pins, or ELC events.
- Supports symmetric and asymmetric PWM waveform generation.
- Supports automatic addition of dead time.
- Supports generating ELC events to start an ADC scan at a compare match value (see [Event Link Controller \(r_elc\)](#)) and updating the compare match value.
- Supports linking with a POEG channel to automatically disable GPT output when an error condition is detected.
- Supports setting the counter value while the timer is stopped.
- Supports enabling and disabling output pins.
- Supports skipping up to seven overflow/underflow (crest/trough) interrupts at a time
- Supports generating custom PWM waveforms by configuring the pin's output level at each compare match and cycle end.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes.
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock.

Configuration

Build Time Configurations for r_gpt

The following build time configurations are defined in fsp_cfg/r_gpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	<ul style="list-style-type: none"> Disabled Enabled Enabled with Extra Features 	Disabled	Enables or disables support for outputting PWM waveforms on GTIOCx pins. The "Enabled with Extra Features" option enables support for Triangle wave modes and also enables the features located in the "Extra Features" section of each module instance.
Write Protect Enable	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If selected write protection is applied to all GPT channels.
Clock Source	MCU Specific Options		Select either the synchronous clock (PCLKD) or asynchronous clock (GPTCLK) as the source for the GPT core clock and PWM delay circuit.

Configurations for Timers > Timer, General PWM (r_gpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, General PWM (r_gpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.
General > Channel	Channel number must exist on this MCU	0	Specify the hardware channel.
General > Mode	<ul style="list-style-type: none"> Periodic One-Shot 	Periodic	Mode selection. Periodic: Generates

- PWM
- Triangle-Wave Symmetric PWM
- Triangle-Wave Asymmetric PWM
- Triangle-Wave Asymmetric PWM (Mode 3)

periodic interrupts or square waves.
 One-shot: Generate a single interrupt or a pulse wave. Note: One-shot mode is implemented in software. ISRs must be enabled for one-shot even if callback is unused.
 PWM: Generates basic PWM waveforms.
 Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough.
 Triangle-Wave Asymmetric PWM: Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.

General > Period

Value must be a non-negative integer less than or equal to 0x4000000000

0x100000000

Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x4000000000, which will use a divider of 1024 with the maximum period.

If the requested period cannot be achieved, the settings with the largest possible period

that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated [timer_cfg_t](#) structure.

General > Period Unit	<ul style="list-style-type: none"> • Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz 	Raw Counts	Unit of the period specified above
Output > Custom Waveform > GTIOA > Initial Output Level	<ul style="list-style-type: none"> • Pin Level Low • Pin Level High 	Pin Level Low	Set the initial output level of GTIOCxA.
Output > Custom Waveform > GTIOA > Cycle End Output Level	<ul style="list-style-type: none"> • Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle 	Pin Level Retain	Set the output level of GTIOCxA at cycle end.
Output > Custom Waveform > GTIOA > Compare Match Output Level	<ul style="list-style-type: none"> • Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle 	Pin Level Retain	Set the output level of GTIOCxA at compare match.
Output > Custom Waveform > GTIOA > Retain Output Level at Count Stop	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Retain the current GTIOxA output level when counting is stopped.
Output > Custom Waveform > GTIOB > Initial Output Level	<ul style="list-style-type: none"> • Pin Level Low • Pin Level High 	Pin Level Low	Set the initial output level of GTIOCxB.
Output > Custom Waveform > GTIOB > Cycle End Output Level	<ul style="list-style-type: none"> • Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle 	Pin Level Retain	Set the output level of GTIOCxB at cycle end.
Output > Custom Waveform > GTIOB > Compare Match Output Level	<ul style="list-style-type: none"> • Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle 	Pin Level Retain	Set the output level of GTIOCxB at compare match.
Output > Custom Waveform > GTIOB > Retain Output Level at Count Stop	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Retain the current GTIOxB output level when counting is stopped.

Output > Custom Waveform > Custom Waveform Enable	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable custom waveform configuration.
Output > Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
Output > GTIOCA Output Enabled	<ul style="list-style-type: none"> • True • False 	False	Enable the output of GTIOCA on a pin.
Output > GTIOCA Stop Level	<ul style="list-style-type: none"> • Pin Level Low • Pin Level High 	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Output > GTIOCB Output Enabled	<ul style="list-style-type: none"> • True • False 	False	Enable the output of GTIOCB on a pin.
Output > GTIOCB Stop Level	<ul style="list-style-type: none"> • Pin Level Low • Pin Level High 	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Input > Count Up Source	MCU Specific Options		Select external source that will increment the counter. If any count up source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Count Down Source	MCU Specific Options		Select external source that will decrement the counter. If any count down source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Start Source	MCU Specific Options		Select external source that will start the timer. For pulse width measurement, set the Start Source and the Clear Source to the trigger edge (the edge to start the measurement), and set the Stop Source and Capture Source (either A or B) to the opposite edge (the edge to stop the measurement). For pulse period

			measurement, set the Start Source, the Clear Source, and the Capture Source (either A or B) to the trigger edge (the edge to start the measurement).
Input > Stop Source	MCU Specific Options		Select external source that will stop the timer.
Input > Clear Source	MCU Specific Options		Select external source that will clear the timer.
Input > Capture A Source	MCU Specific Options		Select external source that will trigger a capture A event.
Input > Capture B Source	MCU Specific Options		Select external source that will trigger a capture B event.
Input > Noise Filter A Sampling Clock Select	<ul style="list-style-type: none"> • No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64 	No Filter	Select the input filter for GTIOCA.
Input > Noise Filter B Sampling Clock Select	<ul style="list-style-type: none"> • No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64 	No Filter	Select the input filter for GTIOCB.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the timer period elapses
Interrupts > Overflow/Crest Interrupt Priority	MCU Specific Options		Select the overflow interrupt priority. This is the crest interrupt for triangle-wave PWM.
Interrupts > Capture A Interrupt Priority	MCU Specific Options		Select the interrupt priority for capture A.
Interrupts > Capture B	MCU Specific Options		Select the interrupt

Interrupt Priority			priority for capture B.
Interrupts > Underflow/Trough Interrupt Priority	MCU Specific Options		Select the interrupt priority for the trough interrupt (triangle-wave PWM only).

Extra Features > Extra Features	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Select whether to enable extra features on this channel.

Clock Configuration

The GPT clock is based on the PCLKD frequency. You can set the PCLKD frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, GTETRGD, GTIOCA and GTIOCB pins as count sources.

This module can use GTIOCA and GTIOCB pins as output pins for periodic or PWM signals.

This module can use GTIOCA and GTIOCB as input pins to measure input signals.

Usage Notes

Maximum Period for GPT32

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x4000000000 on a 32-bit timer or 0x0x4000000 on a 16-bit timer. This will configure the timer with the maximum period and a count clock divisor of 128.

Note

When manually changing the timer period counts the maximum value for a 32-bit GPT is 0x100000000. This number overflows the 32-bit value for `timer_cfg_t::period_counts`. To configure the timer for the maximum period, set `timer_cfg_t::period_counts` to 0.

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter overflow after calling `R_GPT_PeriodSet()` or `R_GPT_DutyCycleSet()`. To force them to update before the next counter overflow, call `R_GPT_Reset()` while the counter is running.

One-Shot Mode

The GPT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the [Data Transfer Controller \(r_dtc\)](#).

One-Shot Mode Output

The output waveform in one-shot mode is one PCLKD cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

GPT One-Shot Output

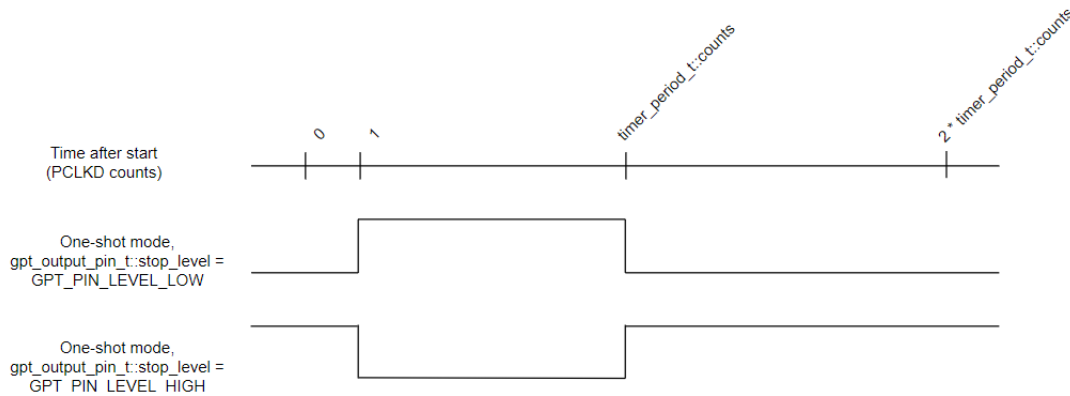

Figure 165: GPT One-Shot Output

Periodic Output

The GTIOC pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square wave (from rising edge to rising edge) matches the period of the GPT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

GPT Periodic Output

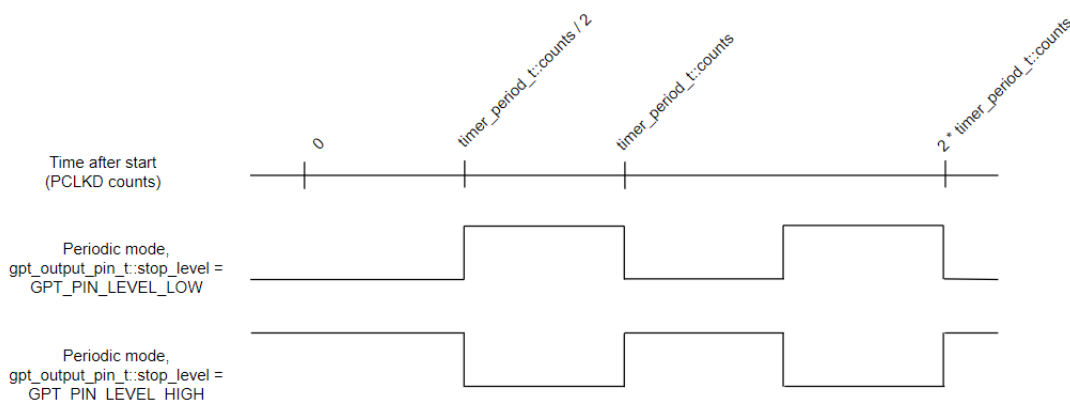

Figure 166: GPT Periodic Output

PWM Output

The PWM output signal is high at the beginning of the cycle and low at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

GPT PWM Output

Figure 167: GPT PWM Output

Triangle-Wave PWM Output

Examples of PWM signals that can be generated by this module are shown below. The `duty_cycle_counts` can be modified using `R_GPT_DutyCycleSet()` in the crest interrupt and updated at the following trough for symmetric PWM or modified in both the crest/trough interrupts and updated at the following trough/crest for asymmetric PWM.

GPT Triangle-Wave PWM Output

Figure 168: GPT Triangle-Wave PWM Output

PWM Output Delay Circuit

On select MCUs, an additional PWM output delay circuit can be configured in order to fine tune the rising and falling edge delays in increments of 1/32 times the period of the GPT core clock. The PWM output delay function must be configured prior to initializing the GPT channels using `R_GPT_PwmOutputDelayInitialize`.

Note

1. In Saw-wave PWM mode, the output delay setting cannot be changed while the capture compare setting (`GTCCRn`) is greater than or equal the period setting (`GTPR`) - 2.
2. In Triangle PWM modes, the output delay setting cannot be changed while the counter is counting down, and the capture compare setting (`GTCCRn`) is less than or equal to 2.
3. When the PWM Output Delay Circuit is enabled, the PWM signal is delayed by 3 GPT core clock cycles.
4. When the `GPTCLK` is used as the GPT core clock, the following delay is required between writes to the rising or falling edge output delay setting for a given pin: $Write_Interval[ns] = Period_of_PCLKA [ns] \times 6 + Period_of_GPTCLK [ns] \times 4$.

Event Counting

Event counting can be done by selecting up or down counting sources from GTETRГ pins, ELC events, or GTIOC pins. In event counting mode, the GPT counter is not affected by PCLKD.

Note

In event counting mode, the application must call `R_GPT_Start()` to enable event counting. The counter will not change after calling `R_GPT_Start()` until an event occurs.

Pulse Measurement

If the capture edge occurs before the start edge in pulse measurement, the first capture is invalid (0).

Controlling GPT with GTETRГ Edges

The GPT timer can be configured to stop, start, clear, count up, or count down when a GTETRГ rising or falling edge occurs.

Note

*The GTETRГ pins are shared by all GPT channels.
GTETRГ pins require POEG to be on (example code for this is provided in [GPT Free Running Counter Example](#)).
If input filtering is required on the GTETRГ pins, that must also be handled outside this module.*

Controlling GPT with ELC Events

The GPT timer can be configured to stop, start, clear, count up, or count down when an ELC event occurs.

Note

*The configurable ELC GPT sources are shared by all GPT channels.
The event links for the ELC must be configured outside this module.*

Triggering ELC Events with GPT

The GPT timer can trigger the start of other peripherals. The [Event Link Controller \(r_elc\)](#) guide provides a list of all available peripherals.

Enabling External Sources for Start, Stop, Clear, or Capture

`R_GPT_Enable()` must be called when external sources are used for start, stop, clear, or capture.

Interrupt Skipping

When an interrupt skipping source is selected a hardware counter will increment each time the selected event occurs. Each interrupt past the first (up to the specified skip count) will be suppressed. If ADC events are selected for skipping they will also be suppressed except during the timer period leading to the selected interrupt skipping event (see below diagram).

Figure 169: Crest interrupt skipping in triangle-wave PWM modes (skip count 2)

Complementary Output

By using the Custom Waveform option the output pins can be made to output complementary waveforms. To ensure these waveforms stay in sync, the duty cycle for both pins can be set simultaneously by calling `R_GPT_DutyCycleSet` once with a pin parameter of `GPT_IO_PIN_GTIOCA_AND_GTIOCB`.

Note

The pin level for 0% and 100% duty cycle is determined by the Cycle End Output Level in normal PWM mode and the Initial Output Level in triangle PWM modes. 100% duty will output the configured level and 0% will output the opposite. Do not use Pin Level Toggle or Pin Level Retain for the Cycle End Output Level if normal PWM waveforms are desired.

Examples

GPT Basic Example

This is a basic example of minimal use of the GPT in an application.

```
void gpt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
```

GPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* Add application code to be called periodically here. */
    }
}
```

GPT Free Running Counter Example

To use the GPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void gpt_counter_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) If event count mode is used to count edges on a GTETRG pin, POEG must
    be started to use GTETRG.

    * Reference Note 1 of Table 23.2 "GPT functions" in the RA6M3 manual
    R01UH0886EJ0100. */

    R_BSP_MODULE_START(FSP_IP_POEG, 0U);

    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);

    /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
}
```

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;

(void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
}
```

GPT Input Capture Example

This is an example of using the GPT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
    if ((TIMER_EVENT_CAPTURE_A == p_args->event) || (TIMER_EVENT_CAPTURE_B ==
p_args->event))
    {
        /* (Optional) Get the current period if not known. */
        timer_info_t info;
        (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
        uint64_t period = info.period_counts;

        /* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
        * timer_info_t::period_counts. */
        if (0U == period)
        {
            period = UINT32_MAX + 1U;
        }
        g_captured_time = (period * g_capture_overflows) + p_args->capture;
        g_capture_overflows = 0U;
    }
    if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
        /* An overflow occurred during capture. This must be accounted for at the
application layer. */
    }
}
```

```
        g_capture_overflows++;
    }
}

void gpt_capture_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_GPT_Enable(&g_timer0_ctrl);
    /* (Optional) Disable captures. */
    (void) R_GPT_Disable(&g_timer0_ctrl);
}
```

GPT Period Update Example

This an example of updating the period.

```
#define GPT_EXAMPLE_MSEC_PER_SEC (1000)
#define GPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void gpt_period_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
    /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
     * - If the PCLKD frequency has not changed since reset, the source clock frequency
    is
```

```

* BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
* - Use the R_GPT_InfoGet function (it accounts for the divider).
* - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
* by timer_cfg_t::source_div.
*
* This example uses the 3rd option (R_FSP_SystemClockHzGet).
*/
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
* desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);
}

```

GPT Duty Cycle Update Example

This an example of updating the duty cycle.

```

#define GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define GPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void gpt_duty_cycle_calculation_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    /* Handle any errors. This function should be defined by the user. */
}

```

```

    assert(FSP_SUCCESS == err);
/* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
/* Get the current period setting. */
timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
    * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
prevent this. The cast is
    * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
        (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                    GPT_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
}

```

GPT A/D Converter Start Request Example

This is an example of using the GPT to start the ADC at a configurable A/D converter compare match value.

```

#if ((1U << GPT_EXAMPLE_CHANNEL) & (BSP_FEATURE_GPTEH_CHANNEL_MASK |
BSP_FEATURE_GPTE_CHANNEL_MASK))
/* This example shows how to configure the GPT to generate an A/D start request at an
A/D start request compare
    * match value. This example can only be used with GPTE or GPTEH variants. */
void gpt_adc_start_request_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
/* Initialize and configure the ELC. */

```

```
err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Configure the ELC to start a scan on ADC unit 0 when GPT channel 0. Note: This is
typically configured in
* g_elc_cfg and already set during R_ELC_Open. */
err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0, ELC_EVENT_GPT0_AD_TRIG_A);
assert(FSP_SUCCESS == err);
/* Globally enable ELC events. */
err = R_ELC_Enable(&g_elc_ctrl);
assert(FSP_SUCCESS == err);
/* Initialize the ADC to start a scan based on an ELC event trigger. Set
adc_cfg_t::trigger to
* ADC_TRIGGER_SYNC_ELC. */
err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
assert(FSP_SUCCESS == err);
err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
assert(FSP_SUCCESS == err);
/* Enable ELC triggers by calling R_ADC_ScanStart(). */
(void) R_ADC_ScanStart(&g_adc0_ctrl);
/* Initializes the GPT module. Configure gpt_extended_pwm_cfg_t::adc_trigger to set
when the A/D start request
* is generated. Set gpt_extended_pwm_cfg_t::adc_a_compare_match to set the desired
compare match value. */
err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
assert(FSP_SUCCESS == err);
/* Start the timer. A/D converter start request events are generated each time the
counter is equal to the
* A/D start request compare match value. */
(void) R_GPT_Start(&g_timer0_ctrl);
}
#endif
```

Data Structure Documentation

◆ gpt_output_pin_t

struct [gpt_output_pin_t](#)

Configurations for output pins.

Data Fields

bool	output_enabled	Set to true to enable output, false to disable output.
------	----------------	--

gpt_pin_level_t	stop_level	Select a stop level from gpt_pin_level_t .
---------------------------------	------------	--

◆ **gpt_gtior_setting_t**

struct gpt_gtior_setting_t
Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

◆ **gpt_instance_ctrl_t**

struct gpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ **gpt_extended_pwm_cfg_t**

struct gpt_extended_pwm_cfg_t		
GPT extension for advanced PWM features.		
Data Fields		
uint8_t	trough_ipr	Trough interrupt priority.
IRQn_Type	trough_irq	Trough interrupt.
gpt_poeg_link_t	poeg_link	Select which POEG channel controls output disable for this GPT channel.
gpt_output_disable_t	output_disable	Select which trigger sources request output disable from POEG.
gpt_adc_trigger_t	adc_trigger	Select trigger sources to start A/D conversion.
uint32_t	dead_time_count_up	Set a dead time value for counting up.
uint32_t	dead_time_count_down	Set a dead time value for counting down (available on GPT32E and GPT32EH only)
uint32_t	adc_a_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_A.
uint32_t	adc_b_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_B.
gpt_interrupt_skip_source_t	interrupt_skip_source	Interrupt source to count for interrupt skipping.

gpt_interrupt_skip_count_t	interrupt_skip_count	Number of interrupts to skip between events.
gpt_interrupt_skip_adc_t	interrupt_skip_adc	ADC events to skip when interrupt skipping is enabled.
gpt_gtioc_disable_t	gtioca_disable_setting	DEPRECATED - Select how to configure GTIOCA when output is disabled.
gpt_gtioc_disable_t	gtiocb_disable_setting	DEPRECATED - Select how to configure GTIOCB when output is disabled.

◆ gpt_extended_cfg_t

struct gpt_extended_cfg_t		
GPT extension configures the output pins for GPT.		
Data Fields		
gpt_output_pin_t	gtioca	DEPRECATED - Configuration for GPT I/O pin A.
gpt_output_pin_t	gtiocb	DEPRECATED - Configuration for GPT I/O pin B.
gpt_source_t	start_source	Event sources that trigger the timer to start.
gpt_source_t	stop_source	Event sources that trigger the timer to stop.
gpt_source_t	clear_source	Event sources that trigger the timer to clear.
gpt_source_t	capture_a_source	Event sources that trigger capture of GTIOCA.
gpt_source_t	capture_b_source	Event sources that trigger capture of GTIOCB.
gpt_source_t	count_up_source	Event sources that trigger a single up count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_source_t	count_down_source	Event sources that trigger a single down count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_capture_filter_t	capture_filter_gtioca	
gpt_capture_filter_t	capture_filter_gtiocb	

uint8_t	capture_a_ipr	Capture A interrupt priority.
uint8_t	capture_b_ipr	Capture B interrupt priority.
IRQn_Type	capture_a_irq	Capture A interrupt.
IRQn_Type	capture_b_irq	Capture B interrupt.
gpt_extended_pwm_cfg_t const *	p_pwm_cfg	Advanced PWM features, optional.
gpt_gtior_setting_t	gtior_setting	Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

Enumeration Type Documentation

◆ [gpt_io_pin_t](#)

enum gpt_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_GPT_DutyCycleSet() .	
Enumerator	
GPT_IO_PIN_GTIOCA	GTIOCA.
GPT_IO_PIN_GTIOCB	GTIOCB.
GPT_IO_PIN_GTIOCA_AND_GTIOCB	GTIOCA and GTIOCB.
GPT_IO_PIN_TROUGH	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_CREST	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.

◆ [gpt_pin_level_t](#)

enum gpt_pin_level_t	
Level of GPT pin	
Enumerator	
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.

◆ gpt_source_t

enum gpt_source_t	
Sources can be used to start the timer, stop the timer, count up, or count down. These enumerations represent a bitmask. Multiple sources can be ORed together.	
Enumerator	
GPT_SOURCE_NONE	No active event sources.
GPT_SOURCE_GTETRGA_RISING	Action performed on GTETRGA rising edge.
GPT_SOURCE_GTETRGA_FALLING	Action performed on GTETRGA falling edge.
GPT_SOURCE_GTETRGB_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGB_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTETRGC_RISING	Action performed on GTETRGC rising edge.
GPT_SOURCE_GTETRGC_FALLING	Action performed on GTETRGC falling edge.
GPT_SOURCE_GTETRGD_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGD_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.

GPT_SOURCE_GPT_A	Action performed on ELC GPTA event.
GPT_SOURCE_GPT_B	Action performed on ELC GPTB event.
GPT_SOURCE_GPT_C	Action performed on ELC GPTC event.
GPT_SOURCE_GPT_D	Action performed on ELC GPTD event.
GPT_SOURCE_GPT_E	Action performed on ELC GPTE event.
GPT_SOURCE_GPT_F	Action performed on ELC GPTF event.
GPT_SOURCE_GPT_G	Action performed on ELC GPTG event.
GPT_SOURCE_GPT_H	Action performed on ELC GPTH event.

◆ gpt_capture_filter_t

enum gpt_capture_filter_t	
Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.	
Enumerator	
GPT_CAPTURE_FILTER_NONE	None - no filtering.
GPT_CAPTURE_FILTER_PCLKD_DIV_1	PCLK/1 - fast sampling.
GPT_CAPTURE_FILTER_PCLKD_DIV_4	PCLK/4.
GPT_CAPTURE_FILTER_PCLKD_DIV_16	PCLK/16.
GPT_CAPTURE_FILTER_PCLKD_DIV_64	PCLK/64 - slow sampling.

◆ **gpt_adc_trigger_t**

enum <code>gpt_adc_trigger_t</code>	
Trigger options to start A/D conversion.	
Enumerator	
<code>GPT_ADC_TRIGGER_NONE</code>	None - no output disable request.
<code>GPT_ADC_TRIGGER_UP_COUNT_START_ADC_A</code>	Request A/D conversion from ADC unit 0 at up counting compare match of <code>gpt_extended_pwm_cfg_t::adc_a_compare_match</code> .
<code>GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_A</code>	Request A/D conversion from ADC unit 0 at down counting compare match of <code>gpt_extended_pwm_cfg_t::adc_a_compare_match</code> .
<code>GPT_ADC_TRIGGER_UP_COUNT_START_ADC_B</code>	Request A/D conversion from ADC unit 1 at up counting compare match of <code>gpt_extended_pwm_cfg_t::adc_b_compare_match</code> .
<code>GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_B</code>	Request A/D conversion from ADC unit 1 at down counting compare match of <code>gpt_extended_pwm_cfg_t::adc_b_compare_match</code> .

◆ **gpt_poeg_link_t**

enum <code>gpt_poeg_link_t</code>	
POEG channel to link to this channel.	
Enumerator	
<code>GPT_POEG_LINK_POEG0</code>	Link this GPT channel to POEG channel 0 (GTETRGA)
<code>GPT_POEG_LINK_POEG1</code>	Link this GPT channel to POEG channel 1 (GTETRGB)
<code>GPT_POEG_LINK_POEG2</code>	Link this GPT channel to POEG channel 2 (GTETRGC)
<code>GPT_POEG_LINK_POEG3</code>	Link this GPT channel to POEG channel 3 (GTETRGD)

◆ **gpt_output_disable_t**

enum <code>gpt_output_disable_t</code>	
Select trigger to send output disable request to POEG.	
Enumerator	
<code>GPT_OUTPUT_DISABLE_NONE</code>	None - no output disable request.
<code>GPT_OUTPUT_DISABLE_DEAD_TIME_ERROR</code>	Request output disable if a dead time error occurs.
<code>GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_HIGH</code>	Request output disable if GTIOCA and GTIOCB are high at the same time.
<code>GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_LOW</code>	Request output disable if GTIOCA and GTIOCB are low at the same time.

◆ **gpt_gtioc_disable_t**

enum <code>gpt_gtioc_disable_t</code>	
Disable level options for GTIOC pins.	
Enumerator	
<code>GPT_GTIOC_DISABLE_PROHIBITED</code>	Do not allow output disable.
<code>GPT_GTIOC_DISABLE_SET_HI_Z</code>	Set GTIOC to high impedance when output is disabled.
<code>GPT_GTIOC_DISABLE_LEVEL_LOW</code>	Set GTIOC level low when output is disabled.
<code>GPT_GTIOC_DISABLE_LEVEL_HIGH</code>	Set GTIOC level high when output is disabled.

◆ **gpt_adc_compare_match_t**

enum <code>gpt_adc_compare_match_t</code>	
Trigger options to start A/D conversion.	
Enumerator	
<code>GPT_ADC_COMPARE_MATCH_ADC_A</code>	Set A/D conversion start request value for GPT A/D converter start request A.
<code>GPT_ADC_COMPARE_MATCH_ADC_B</code>	Set A/D conversion start request value for GPT A/D converter start request B.

◆ **gpt_interrupt_skip_source_t**

enum gpt_interrupt_skip_source_t	
Interrupt skipping modes	
Enumerator	
GPT_INTERRUPT_SKIP_SOURCE_NONE	Do not skip interrupts.
GPT_INTERRUPT_SKIP_SOURCE_OVERFLOW_UNDERFLOW	Count and skip overflow and underflow interrupts.
GPT_INTERRUPT_SKIP_SOURCE_CREST	Count crest interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t . When the interrupt does fire, the trough interrupt fires before the crest interrupt.
GPT_INTERRUPT_SKIP_SOURCE_TROUGH	Count trough interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t . When the interrupt does fire, the crest interrupt fires before the trough interrupt.

◆ **gpt_interrupt_skip_count_t**

enum gpt_interrupt_skip_count_t	
Number of interrupts to skip between events	
Enumerator	
GPT_INTERRUPT_SKIP_COUNT_0	Do not skip interrupts.
GPT_INTERRUPT_SKIP_COUNT_1	Skip one interrupt.
GPT_INTERRUPT_SKIP_COUNT_2	Skip two interrupts.
GPT_INTERRUPT_SKIP_COUNT_3	Skip three interrupts.
GPT_INTERRUPT_SKIP_COUNT_4	Skip four interrupts.
GPT_INTERRUPT_SKIP_COUNT_5	Skip five interrupts.
GPT_INTERRUPT_SKIP_COUNT_6	Skip six interrupts.
GPT_INTERRUPT_SKIP_COUNT_7	Skip seven interrupts.

◆ **gpt_interrupt_skip_adc_t**

enum gpt_interrupt_skip_adc_t	
ADC events to skip during interrupt skipping	
Enumerator	
GPT_INTERRUPT_SKIP_ADC_NONE	Do not skip ADC events.
GPT_INTERRUPT_SKIP_ADC_A	Skip ADC A events.
GPT_INTERRUPT_SKIP_ADC_B	Skip ADC B events.
GPT_INTERRUPT_SKIP_ADC_A_AND_B	Skip ADC A and B events.

◆ **gpt_pwm_output_delay_setting_t**

enum gpt_pwm_output_delay_setting_t	
Delay setting for the PWM Delay Generation Circuit (PDG).	
Enumerator	
GPT_PWM_OUTPUT_DELAY_SETTING_0_32	Delay is not applied.
GPT_PWM_OUTPUT_DELAY_SETTING_1_32	Delay of 1 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_2_32	Delay of 2 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_3_32	Delay of 3 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_4_32	Delay of 4 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_5_32	Delay of 5 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_6_32	Delay of 6 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_7_32	Delay of 7 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_8_32	Delay of 8 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_9_32	Delay of 9 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_10_32	Delay of 10 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_11_32	Delay of 11 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_12_32	Delay of 12 / 32 GTCLK period applied.

GPT_PWM_OUTPUT_DELAY_SETTING_13_32	Delay of 13 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_14_32	Delay of 14 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_15_32	Delay of 15 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_16_32	Delay of 16 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_17_32	Delay of 17 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_18_32	Delay of 18 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_19_32	Delay of 19 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_20_32	Delay of 20 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_21_32	Delay of 21 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_22_32	Delay of 22 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_23_32	Delay of 23 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_24_32	Delay of 24 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_25_32	Delay of 25 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_26_32	Delay of 26 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_27_32	Delay of 27 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_28_32	Delay of 28 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_29_32	Delay of 29 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_30_32	Delay of 30 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_31_32	Delay of 31 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_BYPASS	Bypass the PWM Output Delay Circuit.

◆ gpt_pwm_output_delay_edge_t

enum <code>gpt_pwm_output_delay_edge_t</code>	
Select which PWM Output Delay setting to apply.	
Enumerator	
<code>GPT_PWM_OUTPUT_DELAY_EDGE_RISING</code>	Configure the PWM Output Delay setting for rising edge.
<code>GPT_PWM_OUTPUT_DELAY_EDGE_FALLING</code>	Configure the PWM Output Delay setting for falling edge.

Function Documentation

◆ **R_GPT_Open()**

```
fsp_err_t R_GPT_Open ( timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg )
```

Initializes the timer module and applies configurations. Implements `timer_api_t::open`.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a `gpt_extended_cfg_t` extension parameter.

Example:

```
/* Initializes the module. */
err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	<code>timer_cfg_t::mode</code> is <code>TIMER_MODE_ONE_SHOT</code> or <code>timer_cfg_t::p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_INVALID_MODE	Triangle wave PWM is only supported if <code>GPT_CFG_OUTPUT_SUPPORT_ENABLE</code> is 2. Selected channel does not support external count sources.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the <code>p_cfg</code> parameter is not available on this device.

◆ **R_GPT_Stop()**

```
fsp_err_t R_GPT_Stop ( timer_ctrl_t *const p_ctrl)
```

Stops timer. Implements `timer_api_t::stop`.

Example:

```
/* (Optional) Stop the timer. */
(void) R_GPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_Start()**

```
fsp_err_t R_GPT_Start ( timer_ctrl_t *const p_ctrl)
```

Starts timer. Implements `timer_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_GPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_Reset()**

```
fsp_err_t R_GPT_Reset ( timer_ctrl_t *const p_ctrl)
```

Resets the counter value to 0. Implements `timer_api_t::reset`.

Note

This function also updates to the new period if no counter overflow has occurred since the last call to `R_GPT_PeriodSet()`.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_Enable()**

```
fsp_err_t R_GPT_Enable ( timer_ctrl_t *const p_ctrl)
```

Enables external event triggers that start, stop, clear, or capture the counter. Implements `timer_api_t::enable`.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
(void) R_GPT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_Disable()**

```
fsp_err_t R_GPT_Disable ( timer_ctrl_t *const p_ctrl)
```

Disables external event triggers that start, stop, clear, or capture the counter. Implements [timer_api_t::disable](#).

Note

The timer could be running after [R_GPT_Disable\(\)](#). To ensure it is stopped, call [R_GPT_Stop\(\)](#).

Example:

```
/* (Optional) Disable captures. */
(void) R_GPT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_PeriodSet()**

```
fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const p_ctrl, uint32_t const period_counts )
```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements [timer_api_t::periodSet](#).

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
 * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 * - Use the R_GPT_InfoGet function (it accounts for the divider).
 * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
 * by timer_cfg_t::source_div.
 *
```

```

* This example uses the 3rd option (R_FSP_SystemClockHzGet).
*/
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
/* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
* desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
assert(FSP_SUCCESS == err);

```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_DutyCycleSet()

```

fsp_err_t R_GPT_DutyCycleSet ( timer_ctrl_t *const p_ctrl, uint32_t const duty_cycle_counts,
uint32_t const pin )

```

Sets duty cycle on requested pin. Implements [timer_api_t::dutyCycleSet](#).

Duty cycle is updated in the buffer register. The updated duty cycle is reflected after the next cycle end (counter overflow).

Example:

```

/* Get the current period setting. */
timer_info_t info;
(void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
* UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to

```

```

prevent this. The cast is
 * not required for 16-bit timers. */
uint32_t duty_cycle_counts =
    (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                GPT_EXAMPLE_MAX_PERCENT);
/* Set the calculated duty cycle. */
err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
assert(FSP_SUCCESS == err);

```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use gpt_io_pin_t to select GPT_IO_PIN_GTIOCA or GPT_IO_PIN_GTIOCB

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of gpt_io_pin_t
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is larger than period.
FSP_ERR_INVALID_MODE	GPT_IO_PIN_TROUGH, and GPT_IO_PIN_CREST settings are invalid in the this mode.
FSP_ERR_UNSUPPORTED	GPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ **R_GPT_InfoGet()**

```
fsp_err_t R_GPT_InfoGet ( timer_ctrl_t *const p_ctrl, timer_info_t *const p_info )
```

Get timer information and store it in provided pointer p_info. Implements `timer_api_t::infoGet`.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
(void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
uint64_t period = info.period_counts;

/* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
* timer_info_t::period_counts. */
if (0U == period)
{
    period = UINT32_MAX + 1U;
}
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_StatusGet()**

```
fsp_err_t R_GPT_StatusGet ( timer_ctrl_t *const p_ctrl, timer_status_t *const p_status )
```

Get current timer status and store it in provided pointer p_status. Implements `timer_api_t::statusGet`.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;

(void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_CounterSet()**

```
fsp_err_t R_GPT_CounterSet ( timer_ctrl_t *const p_ctrl, uint32_t counter )
```

Set counter value.

Note

Do not call this API while the counter is counting. The counter value can only be updated while the counter is stopped.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	The timer is running. Stop the timer before calling this function.

◆ **R_GPT_OutputEnable()**

```
fsp_err_t R_GPT_OutputEnable ( timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin )
```

Enable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is enabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_OutputDisable()**

```
fsp_err_t R_GPT_OutputDisable ( timer_ctrl_t *const p_ctrl, gpt_io_pin_t pin )
```

Disable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is disabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_AdcTriggerSet()**

```
fsp_err_t R_GPT_AdcTriggerSet ( timer_ctrl_t *const p_ctrl, gpt_adc_compare_match_t  
which_compare_match, uint32_t compare_match_value )
```

Set A/D converter start request compare match value.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_PwmOutputDelaySet()**

```
fsp_err_t R_GPT_PwmOutputDelaySet ( timer_ctrl_t *const p_ctrl, gpt_pwm_output_delay_edge_t
edge, gpt_pwm_output_delay_setting_t delay_setting, uint32_t const pin )
```

Set the Output Delay setting for the PWM output pin.

Return values

FSP_SUCCESS	The output delay was set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_NOT_INITIALIZED	The PWM Output Delay Circuit has not been initialized.
FSP_ERR_INVALID_STATE	The PWM Output Delay setting cannot be updated in the current state.
FSP_ERR_UNSUPPORTED	This feature is not supported on this MCU.

◆ **R_GPT_CallbackSet()**

```
fsp_err_t R_GPT_CallbackSet ( timer_ctrl_t *const p_api_ctrl, void(*)(timer_callback_args_t *)
p_callback, void const *const p_context, timer_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `timer_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R_GPT_Close()**

```
fsp_err_t R_GPT_Close ( timer_ctrl_t *const p_ctrl)
```

Stops counter, disables output pins, and clears internal driver data. Implements `timer_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_PwmOutputDelayInitialize()**

```
fsp_err_t R_GPT_PwmOutputDelayInitialize ( )
```

Initialize the PWM Delay Generation Circuit (PDG). This function must be called before calling `R_GPT_PwmOutputDelaySet`.

Note

This function will delay for 20 microseconds.

Return values

FSP_SUCCESS	Initialization sequence completed successfully.
FSP_ERR_INVALID_STATE	The source clock frequency is out of the required range for the PDG.
FSP_ERR_UNSUPPORTED	This feature is not supported.

4.2.29 General PWM Timer Three-Phase Motor Control Driver (r_gpt_three_phase)

Modules

Functions

```

fsp_err_t R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const p_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the [Three-Phase Interface](#).

Overview

The General PWM Timer (GPT) Three-Phase driver provides basic functionality for synchronously starting and stopping three PWM channels for use in 3-phase motor control applications. A function is additionally provided to allow setting duty cycle values for all three channels, optionally with double-buffering.

Features

The GPT Three-Phase driver provides the following functions:

- Synchronize configuration of three GPT channels
- Synchronously start, stop and reset all three GPT channels
- Set duty cycle on all three channels with one function

Configuration

Build Time Configurations for r_gpt_three_phase

The following build time configurations are defined in fsp_cfg/r_gpt_three_phase_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Three-Phase PWM (r_gpt_three_phase)

This module can be added to the Stacks tab via New Stack > Timers > Three-Phase PWM (r_gpt_three_phase). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

--	--	---

Clock Configuration

Please refer to the [General PWM Timer \(r_gpt\)](#) section for more information.

Pin Configuration

Please refer to the [General PWM Timer \(r_gpt\)](#) section for more information.

Usage Notes

Warning

Be sure the GTIOCA/B stop level and dead time values are set appropriately for your application before attempting to drive a motor. Failure to do so may result in damage to the motor drive circuitry and/or the motor itself if the timer is stopped by software.

Initial Setup

The following should be configured once the GPT Three-Phase module has been added to a project:

1. Set "Pin Output Support" in one of the GPT submodules to "Enabled with Extra Features"
2. Configure common settings in the GPT Three-Phase module properties
3. Set the crest and trough interrupt priority and callback function in **one** of the three GPT submodules (if desired)
4. Set the "Extra Features -> Output Disable" settings in each GPT submodule as needed for your application

Note

Because all three modules are operated synchronously with the same period interrupts only need to be enabled in one of the three GPT modules.

Buffer Modes

There are two buffering modes available for duty cycle values - single- and double-buffered. In single buffer mode only the values specified in the duty array element of [three_phase_duty_cycle_t](#) are used by [R_GPT_THREE_PHASE_DutyCycleSet](#). At the next trough or crest event the output duty cycle will be internally updated to the set values.

In double buffer mode the [duty_buffer](#) array values are used as buffer values for the duty elements. Once passed to [R_GPT_THREE_PHASE_DutyCycleSet](#), the next trough or crest event will update the output duty cycle to the values specified in duty as before. However, at the following crest or trough event the output duty cycle will be updated to the values in [duty_buffer](#). This allows the duty cycle for both sides of an asymmetric PWM waveform to be set at only one trough or crest event per period instead of at every event.

Examples

GPT Three-Phase Basic Example

This is a basic example of minimal use of the GPT Three-Phase module in an application. The duty cycle is updated at every timer trough with the previously loaded buffer value, then the duty cycle buffer is reloaded in the trough interrupt callback.

```
void gpt_callback (timer_callback_args_t * p_args)
{
    fsp_err_t err;
    three_phase_duty_cycle_t duty_cycle;
    if (TIMER_EVENT_TROUGH == p_args->event)
    {
        /* Update duty cycle values (example) */
        duty_cycle.duty[THREE_PHASE_CHANNEL_U] =
get_duty_counts(THREE_PHASE_CHANNEL_U);
        duty_cycle.duty[THREE_PHASE_CHANNEL_V] =
get_duty_counts(THREE_PHASE_CHANNEL_V);
        duty_cycle.duty[THREE_PHASE_CHANNEL_W] =
get_duty_counts(THREE_PHASE_CHANNEL_W);
        /* Update duty cycle values */
        err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
        assert(FSP_SUCCESS == err);
    }
    else
    {
        /* Handle crest event. */
    }
}

void gpt_three_phase_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the timer. */
    (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
}
```

Data Structures

```
struct gpt_three_phase_instance_ctrl_t
```

Data Structure Documentation

◆ gpt_three_phase_instance_ctrl_t

```
struct gpt_three_phase_instance_ctrl_t
```

Channel control block. DO NOT INITIALIZE. Initialization occurs when `three_phase_api_t::open` is called.

Function Documentation

◆ R_GPT_THREE_PHASE_Open()

```
fsp_err_t R_GPT_THREE_PHASE_Open ( three_phase_ctrl_t *const p_ctrl, three_phase_cfg_t const *const p_cfg )
```

Initializes the 3-phase timer module (and associated timers) and applies configurations. Implements `three_phase_api_t::open`.

Example:

```
/* Initializes the module. */
err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_GPT_THREE_PHASE_Stop()

```
fsp_err_t R_GPT_THREE_PHASE_Stop ( three_phase_ctrl_t *const p_ctrl)
```

Stops all timers synchronously. Implements `three_phase_api_t::stop`.

Return values

FSP_SUCCESS	Timers successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_THREE_PHASE_Start()**

```
fsp_err_t R_GPT_THREE_PHASE_Start ( three_phase_ctrl_t *const p_ctrl)
```

Starts all timers synchronously. Implements `three_phase_api_t::start`.

Example:

```
/* Start the timer. */
(void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
```

Return values

FSP_SUCCESS	Timers successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_GPT_THREE_PHASE_Reset()**

```
fsp_err_t R_GPT_THREE_PHASE_Reset ( three_phase_ctrl_t *const p_ctrl)
```

Resets the counter values to 0. Implements `three_phase_api_t::reset`.

Return values

FSP_SUCCESS	Counters were reset successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_DutyCycleSet()

```
fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet ( three_phase_ctrl_t *const p_ctrl,
three_phase_duty_cycle_t *const p_duty_cycle )
```

Sets duty cycle for all three timers. Implements `three_phase_api_t::dutyCycleSet`.

In symmetric PWM mode duty cycle values are reflected after the next trough. In asymmetric PWM mode values are reflected at the next trough OR crest, whichever comes first.

When double-buffering is enabled the values in `three_phase_duty_cycle_t::duty_buffer` are set to the double-buffer registers. When values are reflected the first time the single buffer values (`three_phase_duty_cycle_t::duty`) are used. On the second reflection the `duty_buffer` values are used. In asymmetric PWM mode this enables both count-up and count-down PWM values to be set at trough (or crest) exclusively.

Note

It is recommended to call this function in a high-priority callback to ensure that it is not interrupted and that no GPT events occur during setting that would result in a duty cycle buffer load operation.

Example:

```
/* Update duty cycle values */
err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	One or more duty cycle count values was outside the range 0..(period - 1).

◆ R_GPT_THREE_PHASE_CallbackSet()

```
fsp_err_t R_GPT_THREE_PHASE_CallbackSet ( three_phase_ctrl_t *const p_ctrl,
void(*) (timer_callback_args_t *) p_callback, void const *const p_context, timer_callback_args_t
*const p_callback_memory )
```

Updates the user callback for the GPT U-channel with the option to provide memory for the callback argument structure. Implements `three_phase_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_GPT_THREE_PHASE_Close()

`fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)`

Stops counters, disables output pins, and clears internal driver data. Implements `three_phase_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Detailed Description

Driver for the I3C peripheral on RA MCUs. This module implements the [I3C Interface](#).

Overview

I3C is a communication protocol defined by MIPI that aims to improve on I2C by increasing the maximum transfer rate, as well as providing other features like "In-band Interrupts", "Dynamic Address Assignment", and a set of standard "Common Command Codes".

Features

- I3C Master Mode
- I3C Slave Mode
- Dynamic Address Assignment (ENTDAA/SETDASA)
- SDR Read/Write transfers
- I2C Legacy Read/Write transfers
- In-Band Interrupts (Interrupt Requests, Hot-Join Requests)
- Common Command Codes
- Clock Stalling
- Timeout Detection

Master Mode

On an I3C bus, only one device may operate in master mode at a time. The current master is responsible for initiating I2C Legacy transfers, SDR transfers, Common Command Codes, and handling IBIs (Interrupt Requests, Hot-Join Requests). In order to perform these operations, the driver has an internal device table that is used for storing configuration information for each device on the bus (See [i3c_device_table_cfg_t](#)). Each entry in the device table contains the static or dynamic address of the device, and IBI permissions for accepting or rejecting IBI requests from the device. The device table has four entries as well as one extended device entry that only contains the static or dynamic address of a device (See below).

Device Table Entries

- Static/Dynamic Address
- Accept/Reject Interrupt Requests
- Accept/Reject Mastership Requests
- IBI Payload Requirement
- Device Type (I3C / Legacy I2C)

Device Index 0

Device Index 1

Device Index 2

Device Index 3

Extended Device Table Entry

- Static/Dynamic Address
- Device Type (I3C / Legacy I3C)

Figure 170: Master Device Table

In order to initiate I2C Legacy transfers, SDR transfers, or Common Command Codes, the master must select a device entry from the device table using `i3c_api_t::deviceSelect`. Once a device has been selected, all subsequent operations will be directed to the selected device until a new device is selected using `i3c_api_t::deviceSelect`.

The master may also receive IBI requests that are initiated by slave devices on the bus. If there is a payload, then the driver will write the data into a buffer that is provided by the application by calling `i3c_api_t::ibiRead`. If the application has not provided an IBI buffer prior to receiving an IBI, then the it will get a callback requesting an IBI buffer. Once the IBI is completed, the application will be notified by a callback.

Note

1. Even though there are only four device table entries and one extended device table entry, the application can operate on more devices by maintaining its own list of devices and updating the extended device entry as needed. Note however that devices defined in the extended device table entry will not be able to initiate IBI requests.

Main Master

The main master is responsible for configuring the dynamic address of all devices on the bus. The driver initiates this procedure by calling `i3c_api_t::dynamicAddressAssignmentStart`. Before starting address assignment, the application must configure the device table using `i3c_api_t::masterDeviceTableSet`.

Enter Dynamic Address Assignment (ENTDAA):

The application initiates the ENTDAA operation by calling `i3c_api_t::dynamicAddressAssignmentStart`

with a starting index into the master device table and a count specifying the number of devices to configure. The master starts by sending the ENTDAAs command. Every I3C device on the bus that has not already been initialized will acknowledge the command and attempt to write its Provisional ID, DCR, and BCR registers. The device with the smallest value in these registers will win arbitration and be assigned with the first dynamic address defined in the master device table. The master will then increment the index and repeat the process by assigning the dynamic address to the next device. The process continues until the specified number of devices have been initialized or until there are no more devices to configure.

Note

1. The IBI payload setting will automatically be updated in the master device table based on the BCR setting that was read during ENTDAAs.
2. After each device successfully writes its Provisional ID, DCR, and BCR registers, the application will get a callback that will provide the value of the registers.
3. If the starting index is set to the extended device entry, then the device count must be set to 1.
4. The main master assigns its own dynamic address with `i3c_api_t::deviceCfgSet`.

Set Dynamic Address from Static Address (SETDASA):

The application initiates the SETDASA operation by calling `i3c_api_t::dynamicAddressAssignmentStart` with an index into the master device table. The master sends the SETDASA command to the static address defined in the given device table entry, and then assigns the associated dynamic address.

Note

1. Set the count to 0 when using SETDASA.

Slave Mode

In slave mode, the device configures its static address, Provisional ID, BCR, and DCR registers using `i3c_api_t::deviceCfgSet`, and then waits for the master to initiate communication. Prior to being assigned a dynamic address, the slave will operate as an I2C device using its static address. The application will receive a callback when the master assigns it a dynamic address, after which point, the slave will operate as an I3C device until it receives the RSTDAAs command.

Depending on the capabilities defined in its BCR register, the slave may also initiate IBI Interrupt Requests, and Hot-Join Requests using `i3c_api_t::ibiWrite`

Configuration

Build Time Configurations for r_i3c

The following build time configurations are defined in `fsp_cfg/r_i3c_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Buffer Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Unaligned buffer support may be optionally disabled for

improved performance.

Master Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If only slave mode is required, disable master support to decrease code size.
Slave Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If only master mode is required, disable slave support to decrease code size.

Configurations for Connectivity > I3C (r_i3c)

This module can be added to the Stacks tab via New Stack > Connectivity > I3C (r_i3c).

Configuration	Options	Default	Description
Bitrate Settings > Standard Mode > Open-Drain > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Standard Mode Open Drain transfers.
Bitrate Settings > Standard Mode > Open-Drain > Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Standard Mode Open Drain transfers.
Bitrate Settings > Standard Mode > Push-Pull > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Standard Mode Push Pull transfers.
Bitrate Settings > Standard Mode > Push-Pull > Frequency	Push-Pull frequency must be greater than or equal to 10000 Hz.	3400000	The Frequency of SCL during Standard Mode Push-Pull transfers.
Bitrate Settings > Extended Mode > Open-Drain > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Extended Mode Open Drain transfers.
Bitrate Settings > Extended Mode > Open-Drain > Frequency	Must be an integer greater than 0.	1000000	The Frequency of SCL during Extended Mode Open Drain transfers.
Bitrate Settings > Extended Mode > Push-Pull > Logic High Period (ns)	Must be an integer greater than 0.	167	The Logic High period of SCL during Extended Mode Push Pull transfers.
Bitrate Settings > Extended Mode > Push-Pull > Frequency	Push-Pull frequency must be greater than or equal to 10000 Hz.	3400000	The Frequency of SCL during Extended Mode Push-Pull transfers.
Bitrate Settings > Bus Timing > Open Drain Rising Time (ns)	Rising time must be greater than or equal to 0 nanoseconds.	0	The Open Drain rising time in nanoseconds.

Slave Mode > Command Response Info > GETMXDS > Include Max Read	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Configure whether the Max Read Turnaround time will be transmitted.

Turnaround Time

Slave Mode > Command Response Info > GETMXDS > Max Read Turnaround Time	Value must be in the range [0, 255].	0	Set max read turnaround time.
Slave Mode > Command Response Info > GETXTIME > Frequency Byte	Value must be in the range [0, 255].	0	Set the internal oscillator frequency in increments of 0.5 Mhz.
Slave Mode > Command Response Info > GETXTIME > Inaccuracy Byte	Value must be in the range [0, 255].	0	Set the oscillator inaccuracy byte in increments of 0.5%
Interrupts > Interrupt Priority	MCU Specific Options		The interrupt priority of the RX, TX, RESPONSE, RCV_STATUS, and IBI ISRs.
Interrupts > Error and Event Interrupt Priority	MCU Specific Options		The interrupt priority of the EEI ISR which is used to notify the application when an Internal Error, HDR Exit Pattern, or Timeout is detected.
Interrupts > Receive Status ICU Group 3	MCU Specific Options		The Receive Status IRQ can use ICU Group 3 or Group 5.
Interrupts > Receive Status ICU Group 5	MCU Specific Options		The Receive Status IRQ can use ICU Group 3 or Group 5.
Name	Name must be a valid C symbol	g_i3c0	Module name.
Callback	Name must be a valid C symbol	g_i3c0_callback	A user callback function must be provided. This will be called in order to notify the application of I3C events and provide status information.
Callback Context	Name must be a valid C symbol	NULL	A pointer to additional application specific information that is provided to the callback.
Device Type	<ul style="list-style-type: none"> • Main Master • Slave 	Slave	The role that the I3C instance will take on the I3C bus.

Bus Free Condition Detection Time (ns)	Must be greater than or equal to 38.4 nanoseconds.	38.4	The minimum period occurring after a STOP and before a START.
Bus Available Condition Detection Time (us)	Must be greater than or equal to 1 microsecond.	1	The minimum period occurring after the Bus Free Condition when Slaves can initiate IBI requests.
Bus Idle Condition Detection Time (us)	Must be greater than or equal to 1000 microseconds.	1000	The minimum period occurring after the Bus Available Condition when Slaves can initiate Hot-Join requests.
Timeout Detection	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the application will get a callback if SCL is stuck at a logic high or logic low level for more than 65535 cycles of the I3C source clock.

Clock Configuration

The I3C peripheral is clocked off of PCLKB and PCLKD. The SCL clock is generated by the I3C internal clock which is derived from PCLKD.

The following settings are used to configure SCL.

- Frequency of PCLKD
- Standard Mode
 - Open Drain High Period (T_{HIGH})
 - Open Drain Frequency
 - Push-Pull High Period (T_{HIGH})
 - Push-Pull Frequency
- Extended Mode
 - Open Drain High Period (T_{HIGH})
 - Open Drain Frequency
 - Push-Pull High Period (T_{HIGH})
 - Push-Pull Frequency
- `i3c_bitrate_mode_t` (Set during `i3c_api_t::deviceSelect`)

The Standard and Extended Mode settings define two separate SCL configurations that can be selected at run-time using `i3c_api_t::deviceSelect`.

In addition to selecting between the Standard and Extended Mode settings, the base SCL period can also be multiplied using the following options:

- `I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2`: Multiple the base Standard Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2`: Multiple the base Extended Open Drain and Push-Pull period by 2.
- `I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4`: Multiple the base Extended Open Drain and Push-

Pull period by 4.

In order to get accurate frequency calculations, the Rising and Falling edges must be input into the calculation. These values will depend on the topology the I3C bus that will be different for every application.

Note

1. The Standard and Extended Open Drain period settings define the period to use during legacy I2C transfers (Only use the following `i3c_bitrate_mode_1` settings with I2C transfers: `I3C_BITRATE_MODE_I2C_STDBR`, `I3C_BITRATE_MODE_I2C_EXTBR`).
2. The clock frequency ratio of `PCLKD` and `PCLKB` must be 2:1 or 1:1 when using the I3C module. Operation is not guaranteed for other settings.
3. T_{HIGH} is defined in Figure 31 in the MIPI I3C Specification v1.0 and describe the Logic High period.

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I3C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Read and Write in Slave Mode

In slave mode, calling read or write does not start a transfer. Instead, calling read or write will configure the driver to perform the next read or write transfer using the user provided buffer.

Provided that a transfer is not already in progress, `i3c_api_t::read` and `i3c_api_t::write` can be called to update the internal buffers even if the transfer has not been completed yet. Both the read and write buffers can be configured at the same time in order to prepare the driver for when the master initiates a read or a write transfer.

If there is no space remaining in a user configured read buffer, the application will get a `I3C_EVENT_READ_BUFFER_FULL` callback requesting for a new read buffer to be provided.

Event Status

When a write, read, `ibiWrite`, `ibiRead` or `commandSend`, operation is completed, the `i3c_callback_args_t::event_status` should be checked. The `event_status` will provide information about the success or failure of the operation.

The following are possible statuses:

- `I3C_EVENT_STATUS_SUCCESS`
- `I3C_EVENT_STATUS_PARITY`
- `I3C_EVENT_STATUS_FRAME`
- `I3C_EVENT_STATUS_ADDRESS_HEADER`
- `I3C_EVENT_STATUS_NACK`
- `I3C_EVENT_STATUS_OVERFLOW`
- `I3C_EVENT_STATUS_ABORTED_TO_MASTER`
- `I3C_EVENT_STATUS_ABORTED`

Note

In master mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will

be `I3C_EVENT_STATUS_ABORTED`.

In slave mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be `I3C_EVENT_STATUS_ABORTED_TO_MASTER`.

Direct Get Common Command Codes in Slave Mode

When an I3C slave receives a Command Code of type Direct Get, the response is automatically sent from the device Special Function Registers (SFR). The SFR contains information for each command code and can be configured during open (See `i3c_extended_cfg_t::slave_command_response_info`). This allows the slave to respond to Direct Get Command Codes much faster, and removes the burden of responding to these commands from the application.

The response to the GETSTATUS command can be configured at run-time using `i3c_api_t::slaveStatusSet`.

Disabling Unaligned Buffer Support

Support for performing read and write operations on unaligned buffers can be disabled in order to improve performance. When unaligned buffer support is disabled, all buffers passed to read, `ibiRead`, write, `ibiWrite`, and `commandSend` must be aligned to 4 bytes and the size of the buffers must be a multiple of 4 bytes.

In master mode, the value of the length passed to `i3c_api_t::read` and `i3c_api_t::write` sets the total length of the operation in bytes. During the read or write operation, the driver may read or write to the last word of memory during the operation. This means that the allocated memory for the buffer passed to read and write needs to be a multiple of 4 bytes even though the transfer length is not a multiple of 4 bytes.

In slave mode, the length passed to `i3c_api_t::read` must be a multiple of 4 bytes. The length passed to `i3c_api_t::write` sets the number of bytes that the slave will write. The size of the buffer passed to write still needs to be a multiple of 4 bytes.

Max Data Speed Limitation

In Slave Mode, it is highly recommended that `BCR[0]` be set to '1' in order to indicate to the master that the device doesn't support the max data speed. The master is then required to use the `GETMXDS` command to get the device specific data speed limitations.

This will allow the slave to specify its Maximum Supported Data Rate for read/write transfers and the Maximum Read Turnaround Time (See `GETMXDS` in the MIPI I3C Specification v1.0).

Mixed Fast Bus

The MIPI I3C Specification v1.0 defines a Mixed Fast Bus as a bus that has legacy I2C devices that all have a 50ns Spike Filter.

On Mixed Fast Buses, SCL has the following constraints during I3C SDR transfers:

- SCL High Period: $t_{DIG_H_MIXED(MIN)}$ to $t_{DIG_H_MIXED(MAX)}$
- SCL Low Period: Up to $t_{DIG_L(MAX)}$

In this case, configure the Extended Bitrate settings for I3C SDR transfers, and use the Standard Bitrate settings for I2C transfers.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

Mixed Slow Bus

The MIPI I3C Specification v1.0 defines a Mixed Slow Bus as a bus that has legacy I2C devices that do not have a 50ns Spike Filter.

In this case, the SCL frequency is limited to I2C Fast Mode or I2C Fast Mode Plus.

Note

1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.

Limitations

Developers should be aware of the following limitations when using the I3C:

- The I3C peripheral on the RA2E2 has a hardware defect related to using ENTDAAs in slave mode. When the ENTDAAs command is received, the peripheral will continue driving its PID, DCR, and BCR registers even after its dynamic address has been configured. This will prevent any other devices from being configured on the bus. One workaround for this limitation is to configure the device Provisional ID to all '1's in order to ensure that the device is initialized last. If more than one device with this limitation is present on the same bus, consider initializing them using another method (Eg. SETDASA).
- The MIPI Reserved area and Vendor Extension area of Command Codes are not supported.
- Mixed Fast Bus topology has the following limitation on RA2E2 MCUs. The minimum SCL high period (T_{DIG_H}) is 156 nanoseconds when PCLKD is 48 Mhz, and 120 nanoseconds when PCLKD is 64 Mhz. On a Mixed Fast Bus, the high period $T_{DIG_HIGH_MIXED}$ must be less than 45 nanoseconds in order to ensure that Legacy I2C devices do not interpret I3C signaling as valid I2C signaling (See Table 111 Push-Pull-Timing Parameters in the MIPI I3C Specification v1.1). This required high period cannot be achievable with RA2E2 MCUs.
- Secondary Master device role is not currently supported.

Examples

I3C Master Basic Example

This is a basic example of minimal use of the I3C Master in an application.

```
void i3c_master_basic_example (void)
{
    /* Initializes the module. */
    fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);

    static i3c_device_cfg_t master_device_cfg =
    {
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
        */
        .static_address = EXAMPLE_MASTER_STATIC_ADDRESS,
```

```
/* If the device is a main master, it must configure its own dynamic address. */
    .dynamic_address = EXAMPLE_MASTER_DYNAMIC_ADDRESS,
};
status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &master_device_cfg);
assert(FSP_SUCCESS == status);

static i3c_device_table_cfg_t device_table_cfg =
{
/* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
    .static_address      = EXAMPLE_STATIC_ADDRESS,
/* Dynamic address is not used in I2C. */
    .dynamic_address     = EXAMPLE_DYNAMIC_ADDRESS,
/* This is the type of device. It may be either an I2C device or an I3C device. */
    .device_protocol     = I3C_DEVICE_PROTOCOL_I3C,
    .ibi_accept          = false,
/* Depending on the device the IBI requests may have a data payload.
 * Note that this field will be automatically updated if the device is configured
using ENTDAAs.
*/
    .ibi_payload         = false,
/* Master requests cannot be accepted because Secondary Master is not supported. */
    .master_request_accept = false,
};
/* Set the device configuration in the master device table. */
status = R_I3C_MasterDeviceTableSet(&g_i3c_ctrl, 0, &device_table_cfg);
assert(FSP_SUCCESS == status);
/* Enable the I3C device. */
status = R_I3C_Enable(&g_i3c_ctrl);
assert(FSP_SUCCESS == status);
/* Start assigning dynamic addresses to devices on the bus using the ENTDAAs command.
*/
status = R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl,
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAAs, 0, 1);
assert(FSP_SUCCESS == status);
```

```
/* Wait for dynamic address assignment to complete. */
    i3c_app_event_wait(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
/* Select the configured device and bitrate mode for the following operations. */
    status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0, I3C_BITRATE_MODE_I3C_SDR0_STDBR);
    assert(FSP_SUCCESS == status);
/* Start a write transfer. */
static uint8_t p_write_buffer[] = {1, 2, 3, 4, 5};
    status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
    assert(FSP_SUCCESS == status);
/* Wait for the write transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
/* Start a read transfer. */
static uint8_t p_read_buffer[16];
    status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
    assert(FSP_SUCCESS == status);
/* Wait for the read transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
}
/* This function is called by the I3C driver from ISRs in order to notify the
application of I3C events. */
void i3c_master_basic_example_callback (i3c_callback_args_t const * const p_args)
{
    switch (p_args->event)
    {
        case I3C_EVENT_ENTDAA_ADDRESS_PHASE:
            {
                /* The device PID, DCR, and BCR registers will be available in
i3c_callback_args_t::p_slave_info. */
                break;
            }
        case I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE:
            {
                i3c_app_event_notify(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
                break;
            }
    }
}
```

```
    }  
    case I3C_EVENT_WRITE_COMPLETE:  
    {  
        i3c_app_event_notify(I3C_EVENT_WRITE_COMPLETE);  
        break;  
    }  
    case I3C_EVENT_READ_COMPLETE:  
    {  
        /* The number of bytes read from the slave will be available in  
i3c_callback_args_t::transfer_size. */  
        i3c_app_event_notify(I3C_EVENT_READ_COMPLETE);  
        break;  
    }  
    default:  
    {  
        break;  
    }  
    }  
}
```

I3C Slave Basic Example

This is a basic example of minimal use of the I3C Slave in an application.

```
void i3c_slave_basic_example (void)  
{  
    /* Initializes the module. */  
    fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);  
    assert(FSP_SUCCESS == status);  
    static i3c_device_cfg_t slave_device_cfg =  
    {  
        /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.  
*/  
        .static_address = EXAMPLE_STATIC_ADDRESS,  
        /* The dynamic address will be automatically updated when the master configures this
```

```
device using ENTDAAs. */
    .dynamic_address = 0,
/* Device Registers that are read by the master. */
    .slave_info      =
    {
        .bcr = EXAMPLE_BCR_SETTING,
        .dcr = EXAMPLE_DCR_SETTING,
        .pid =
        {
            0, 1, 2, 3, 4, 5
        }
    }
};

/* Set the device configuration for this device. */
status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &slave_device_cfg);
assert(FSP_SUCCESS == status);

/* Enable Slave Mode. */
status = R_I3C_Enable(&g_i3c_ctrl);
assert(FSP_SUCCESS == status);

static uint8_t p_read_buffer[EXAMPLE_READ_BUFFER_SIZE];
static uint8_t p_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE];

/* Set the buffer for storing data received during a read transfer. */
status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
assert(FSP_SUCCESS == status);

/* Wait for the master to complete a read transfer. */

    {
        break;
    }
    }

    default:
    {
        break;
    }
    }
}
```

I3C Slave In-band Interrupts Example

This is a basic example of writing In-band Interrupts in I3C Slave mode.

```
void i3c_slave_ibi_write_basic_example (void)
{
    uint8_t ibi_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE];

    /* Initiate an In-band interrupt in slave mode.
    * Note: If the slave does not have an IBI payload or if it is a Hot-Join request,
the write buffer should be set
    * to NULL and the write length should be set to 0. */
}
```

```
fsp_err_t status = R_I3C_IbiWrite(&g_i3c_ctrl, I3C_IBI_TYPE_INTERRUPT,
ibi_write_buffer, sizeof(ibi_write_buffer));

    assert(FSP_SUCCESS == status);

    /* Wait for the ibiWrite transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_IBI_WRITE_COMPLETE);
}

void i3c_slave_ibi_write_basic_example_callback (i3c_callback_args_t const * const
p_args)
{
    switch (p_args->event)
    {
        case I3C_EVENT_IBI_WRITE_COMPLETE:
            {
                /* Notify the application that the IBI write is complete. */
                i3c_app_event_notify(I3C_EVENT_IBI_WRITE_COMPLETE);
            }
            break;
        default:
            {
                break;
            }
    }
}
```

I3C Master Common Command Codes Example

This is a basic example of sending Common Command Codes in I3C Master mode.

```
void i3c_master_ccc_example (void)
{
    static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];

    /* Setup the command descriptor. */
    static i3c_command_descriptor_t command_descriptor =
    {
        .command_code = I3C_CCC_DIRECT_GETSTATUS,
```

```
/* Set a buffer for storing the data read by the command. */
    .p_buffer    = command_buffer,

/* The length for a GETSTATUS command is 2 bytes. */
    .length     = 2,

/* Terminate the transfer with a STOP condition. */
    .restart    = false,

/* The GETSTATUS command is a Direct Get Command so rnw should be true. */
    .rnw       = true,
};

/* Send the command. */
fsp_err_t status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);
assert(FSP_SUCCESS == status);

/* Wait for the command to complete. */
i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);

/* The command_buffer will have the status info that was read from the slave device.
*/
}

            break;
        }
        default:
            {
            }
            break;
        }
    }
}
```

I3C Slave Common Command Codes Example

This is a basic example of receiving Common Command Codes in I3C Slave mode.

```
void i3c_slave_ccc_example (void)
{
    static uint8_t read_buffer[EXAMPLE_READ_BUFFER_SIZE];

    /* Broadcast and Direct Set commands will be read into the read_buffer the same way
that
    * a normal SDR Master Write / Slave Read transfer is read. */
    fsp_err_t status = R_I3C_Read(&g_i3c_ctrl, read_buffer, sizeof(read_buffer), false);
    assert(FSP_SUCCESS == status);

    /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}

void i3c_slave_ccc_example_callback (i3c_callback_args_t const * const p_args)
{
    switch (p_args->event)
    {
        {
        case I3C_EVENT_COMMAND_COMPLETE:
            {
                /* The command code and transfer size will be available in p_args.
                * If the command code is a Broadcast or Direct Set, then data will
                * be stored in the read buffer provided by i3c_api_t::read.
                * If the command code is a Direct Get, then the data will be automatically
                * sent from device SFR. */
                i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);

            break;
                }
            default:
                {
            break;
                }
            }
        }
    }
}
```

Data Structure Documentation

◆ [i3c_clock_stalling_t](#)

struct i3c_clock_stalling_t		
Clock stalling settings.		
Data Fields		
uint32_t	assigned_address_phase_enable: 1	Enable Clock Stalling during the address phase of the ENTDAAC command.
uint32_t	transition_phase_enable: 1	Enable Clock Stalling during the transition bit in read transfers.
uint32_t	parity_phase_enable: 1	Enable Clock Stalling during the parity bit period in write transfers.
uint32_t	ack_phase_enable: 1	Enable Clock Stalling during the ACK/NACK phase.
uint16_t	clock_stalling_time	The amount of time to stall the clock in I3C source clock ticks.

◆ [i3c_bitrate_settings_t](#)

struct i3c_bitrate_settings_t		
Bitrate settings for configuring the SCL clock frequency.		
Data Fields		
uint32_t	stdbr	The standard bitrate settings.
uint32_t	extbr	The extended bitrate settings.
i3c_clock_stalling_t	clock_stalling	Clock Stalling settings (See

		Master Clock Stalling in the MIPI I3C Specification v1.0).
--	--	--

◆ i3c_ibi_control_t

struct i3c_ibi_control_t		
Settings for controlling the drivers behavior in response to IBIs.		
Data Fields		
uint32_t	hot_join_acknowledge: 1	If false, NACK all Hot Join requests.
uint32_t	notify_rejected_hot_join_requests: 1	Notify the application when an IBI Hot-Join request has been NACK'd.
uint32_t	notify_rejected_mastership_requests: 1	Notify the application when an IBI Mastership request has been NACK'd.
uint32_t	notify_rejected_interrupt_requests: 1	Notify the application when an IBI Interrupt request has been NACK'd.

◆ i3c_slave_command_response_info_t

struct i3c_slave_command_response_info_t		
Default configuration settings for the slave response to Direct Get Common Command Codes.		
Data Fields		
bool	inband_interrupt_enable	Enable IBI interrupts. Slave Event Settings (See ENEC and DISEC in the MIPI I3C Specification v1.0).
bool	mastership_request_enable	Enable Mastership requests.
bool	hotjoin_request_enable	Enable Hot-Join requests.
i3c_activity_state_t	activity_state	Starting Activity State (See ENTASn in the MIPI I3C Specification v1.0).
uint16_t	write_length	Max Write Length (See SETMWL and GETMWL in the MIPI I3C Specification v1.0).
uint16_t	read_length	Max Read Length (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).
uint8_t	ibi_payload_length	Number of bytes that will be written by an IBI (See SETMRL and GETMRL in the MIPI I3C Specification v1.0).

i3c_data_rate_setting_t	<code>write_data_rate</code>	Max Write Data Rate. Max Data Rate Settings (See GETMXDS in the MIPI I3C Specification v1.0).
i3c_data_rate_setting_t	<code>read_data_rate</code>	Max Read Data Rate.
i3c_clock_data_turnaround_t	<code>clock_data_turnaround</code>	Max Data Speed Turnaround.
<code>bool</code>	<code>read_turnaround_time_enable</code>	Enable transmission of the of the Max Read Max Read Turnaround Time.
<code>uint32_t</code>	<code>read_turnaround_time</code>	Max Read Turnaround Time.
<code>uint8_t</code>	<code>oscillator_frequency</code>	This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500kHz), up to 127.5 MHz. (See GETXTIME in the MIPI I3C Specification v1.1).
<code>uint8_t</code>	<code>oscillator_inaccuracy</code>	Oscillator inaccuracy in 0.5% increments of 0% up to 25.5% (See GETXTIME in the MIPI I3C Specification v1.1).

◆ [i3c_instance_ctrl_t](#)

<code>struct i3c_instance_ctrl_t</code>	
Channel control block. DO NOT INITIALIZE. Initialization occurs when i3c_api_t::open is called.	
Public Member Functions	
i3c_slave_info_t <code>current_slave_info</code>	BSP_ALIGN_VARIABLE (4) The last i3c_slave_info_t read during ENTDAAs.
Data Fields	
<code>uint32_t</code>	open Indicates whether the open() API has been successfully called.
<code>R_I3C0_Type *</code>	p_reg Base register for this channel.
<code>volatile uint32_t</code>	internal_state Used to track the current state of the driver.

uint8_t	current_command_code
	The current Common Command Code that is being transferred.
uint32_t	device_index
	The device index selected using i3c_api_t::deviceSelect .
i3c_bitrate_mode_t	device_bitrate_mode
	Runtime bitrate settings to use for the next transfer.
uint32_t	next_word
	The next word that will be written to the FIFO.
uint32_t	ibi_next_word
	The next word that will be written to the IBI FIFO.
i3c_write_buffer_descriptor_t	write_buffer_descriptor
	Buffer descriptor for keeping track of a write transfer.
i3c_read_buffer_descriptor_t	read_buffer_descriptor
	Buffer descriptor for keeping track of a read transfer.
i3c_read_buffer_descriptor_t	ibi_buffer_descriptor
	Buffer descriptor for keeping track of an IBI read/write transfer.
volatile uint32_t	read_transfer_count_final
	The total number of bytes read during a read transfer.

volatile uint32_t	ibi_transfer_count_final
	The total number of bytes read during an IBI transfer.
i3c_cfg_t const *	p_cfg
	A pointer to the configuration structure provided during open.

◆ **i3c_extended_cfg_t**

struct i3c_extended_cfg_t		
Extended configuration for r_i3c.		
Data Fields		
i3c_bitrate_settings_t	bitrate_settings	Bitrate settings configuring the frequency and duty cycle for SCL.
i3c_ibi_control_t	ibi_control	Configure the driver's behavior in response to IBIs.
uint32_t	bus_free_detection_time	The time in I3C reference clock ticks needed in order to detect the bus free condition (See "Bus Free Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_available_detection_time	The time in I3C reference clock ticks needed in order to detect the bus available condition (See "Bus Available Condition" in the MIPI I3C Specification v1.0).
uint32_t	bus_idle_detection_time	The time in I3C reference clock ticks needed in order to detect the bus idle condition (See "Bus Idle Condition" in the MIPI I3C Specification v1.0).
bool	timeout_detection_enable	Notify the application if SCL is stuck high or low.
i3c_slave_command_response_info_t	slave_command_response_info	Initial settings for configuring the slave's responses to received commands.
IRQn_Type	resp_irq	Response Queue Full IRQ number.
IRQn_Type	rx_irq	Receive FIFO Full IRQ number.
IRQn_Type	tx_irq	Transmit FIFO Empty IRQ

		number.
IRQn_Type	rcv_irq	Receive Status Queue Full IRQ number.
IRQn_Type	ibi_irq	IBI IRQ number.
IRQn_Type	eei_irq	EI IRQ number.
uint8_t	ipl	Interrupt Priority for Resp, Rx, Tx, and RCV IRQs.
uint8_t	eei_ipl	Error and Event Interrupt Priority.

Macro Definition Documentation

◆ I3C_DEVICE_INDEX_EXTENDED_DEVICE

```
#define I3C_DEVICE_INDEX_EXTENDED_DEVICE
```

Index for selecting the device defined in the extended address table.

◆ I3C_EVENT_STATUS_SUCCESS

```
#define I3C_EVENT_STATUS_SUCCESS
```

The transfer was completed as expected.

Event Status Provided by the callback.

Enumeration Type Documentation

◆ **i3c_bitrate_mode_t**

enum i3c_bitrate_mode_t	
Bitrate settings that can be selected at run-time using <code>i3c_api_t::deviceSelect</code> .	
Enumerator	
I3C_BITRATE_MODE_I2C_STDBR	Use the period settings defined in STDBRH/L.
I3C_BITRATE_MODE_I2C_EXTBR	Use the period settings defined in EXTBRH/L.
I3C_BITRATE_MODE_I3C_SDR0_STDBR	Use the period settings defined in STDBRH/L (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR1_EXTBR	Use the period settings defined in EXTBRH/L (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2	Use the period settings defined in STDBRH/L x 2 (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2	Use the period settings defined in EXTBRH/L x 2 (I3C Devices only).
I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4	Use the period settings defined in EXTBRH/L x 4 (I3C Devices only).

◆ **i3c_activity_state_t**

enum i3c_activity_state_t	
Supported activity states for ENTASn Command (See ENTASn in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_ACTIVITY_STATE_ENTAS0	Activity Interval (1 microsecond).
I3C_ACTIVITY_STATE_ENTAS1	Activity Interval (100 microseconds).
I3C_ACTIVITY_STATE_ENTAS2	Activity Interval (2 milliseconds).
I3C_ACTIVITY_STATE_ENTAS3	Activity Interval (50 milliseconds).

◆ **i3c_data_rate_setting_t**

enum i3c_data_rate_setting_t	
Maximum Sustained Data Rate for non-CCC messages sent by Master Device to Slave Device (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_DATA_RATE_SETTING_FSCL_MAX	There is no data rate limit.
I3C_DATA_RATE_SETTING_8MHZ	The max sustained data rate is 8 Mhz.
I3C_DATA_RATE_SETTING_6MHZ	The max sustained data rate is 6 Mhz.
I3C_DATA_RATE_SETTING_4MHZ	The max sustained data rate is 4 Mhz.
I3C_DATA_RATE_SETTING_2MHZ	The max sustained data rate is 2 Mhz.

◆ **i3c_clock_data_turnaround_t**

enum i3c_clock_data_turnaround_t	
Clock to Data Turnaround Time (See GETMXDS in the MIPI I3C Specification v1.0).	
Enumerator	
I3C_CLOCK_DATA_TURNAROUND_8NS	Clock to turnaround time is 8 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_9NS	Clock to turnaround time is 9 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_10NS	Clock to turnaround time is 10 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_11NS	Clock to turnaround time is 11 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_12NS	Clock to turnaround time is 12 nanoseconds or less.
I3C_CLOCK_DATA_TURNAROUND_EXTENDED	Clock to turnaround time is greater than 12 nanoseconds.

Function Documentation

◆ **R_I3C_Open()**

```
fsp_err_t R_I3C_Open ( i3c_ctrl_t *const p_api_ctrl, i3c_cfg_t const *const p_cfg )
```

Configure an I3C instance. Implements `i3c_api_t::open`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was invalid.
FSP_ERR_ALREADY_OPEN	Open has already been called for this instance.
FSP_ERR_UNSUPPORTED	A selected feature is not supported with the current configuration.

◆ **R_I3C_Enable()**

```
fsp_err_t R_I3C_Enable ( i3c_ctrl_t *const p_api_ctrl)
```

Enable the I3C device.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This instance is already enabled.

◆ **R_I3C_DeviceCfgSet()**

```
fsp_err_t R_I3C_DeviceCfgSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_cfg_t const *const p_device_cfg )
```

Set the configuration for this device.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	The device cannot be a secondary master if master support is disabled.

◆ **R_I3C_MasterDeviceTableSet()**

```
fsp_err_t R_I3C_MasterDeviceTableSet ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index,
i3c_device_table_cfg_t const *const p_device_table_cfg )
```

Configure an entry in the master device table. This function is called in master mode in order to configure the devices on the I3C bus. It may also be called in slave mode when the slave receives the DEFSVLS command.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_UNSUPPORTED	Mastership requests must be rejected is slave support is disabled.

◆ **R_I3C_SlaveStatusSet()**

```
fsp_err_t R_I3C_SlaveStatusSet ( i3c_ctrl_t *const p_api_ctrl, i3c_device_status_t status )
```

Set the status returned to the master in response to a GETSTATUS command.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	The instance is not in slave mode.
FSP_ERR_UNSUPPORTED	Slave support is disabled.

◆ **R_I3C_DeviceSelect()**

```
fsp_err_t R_I3C_DeviceSelect ( i3c_ctrl_t *const p_api_ctrl, uint32_t device_index, uint32_t
bitrate_mode )
```

In master mode, select the device for the next transfer. This function is not used in slave mode.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R_I3C_DynamicAddressAssignmentStart()**

```
fsp_err_t R_I3C_DynamicAddressAssignmentStart ( i3c_ctrl_t *const p_api_ctrl,
i3c_address_assignment_mode_t address_assignment_mode, uint32_t starting_device_index,
uint32_t device_count )
```

Start the Dynamic Address Assignment Process. Implements `i3c_api_t::dynamicAddressAssignmentStart`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This operation is prohibited in slave mode.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R_I3C_CommandSend()**

```
fsp_err_t R_I3C_CommandSend ( i3c_ctrl_t *const p_api_ctrl, i3c_command_descriptor_t *
p_command_descriptor )
```

Send a broadcast or direct command to slave devices on the bus. Implements `i3c_api_t::commandSend`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is not in master mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes. If it is a read operation, the length also be a multiple of 4 bytes.
FSP_ERR_UNSUPPORTED	Master support must be enabled to call this function. Slave support must be enabled when sending the GETACCMST command.

◆ **R_I3C_Write()**

```
fsp_err_t R_I3C_Write ( i3c_ctrl_t *const p_api_ctrl, uint8_t const *const p_data, uint32_t length,
bool restart )
```

Set the write buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::write`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.

◆ **R_I3C_Read()**

```
fsp_err_t R_I3C_Read ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length, bool restart )
```

Set the read buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements `i3c_api_t::read`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This driver is disabled.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes.

◆ **R_I3C_IbiWrite()**

```
fsp_err_t R_I3C_IbiWrite ( i3c_ctrl_t *const p_api_ctrl, i3c_ibi_type_t ibi_type, uint8_t const *const p_data, uint32_t length )
```

Initiate an IBI write operation (This function is only used in slave mode).

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_IN_USE	The operation could not be completed because the driver is busy.
FSP_ERR_INVALID_MODE	This function is only called in slave mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes.
FSP_ERR_UNSUPPORTED	Slave support is disabled.

◆ **R_I3C_IbiRead()**

```
fsp_err_t R_I3C_IbiRead ( i3c_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t length )
```

Set the read buffer for storing received IBI data (This function is only used in master mode).

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.
FSP_ERR_INVALID_MODE	This function is only called in master mode.
FSP_ERR_INVALID_ALIGNMENT	The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes.
FSP_ERR_UNSUPPORTED	Master support is disabled.

◆ **R_I3C_Close()**

```
fsp_err_t R_I3C_Close ( i3c_ctrl_t *const p_api_ctrl)
```

Close the I3C instance. Implements `i3c_api_t::close`.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_NOT_OPEN	This instance has not been opened yet.

```

```
fsp_err_t R_ICU_ExternalIrqClose (external_irq_ctrl_t *const p_api_ctrl)
```

Detailed Description

Driver for the ICU peripheral on RA MCUs. This module implements the [External IRQ Interface](#).

Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R_ICU software module only implements the [External IRQ Interface](#). The external_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

Note

Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.

Features

- Supports configuring interrupts for IRQ pins on the target MCUs
 - Enabling and disabling interrupt generation.
 - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level signal.
 - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module when an external pin interrupt is generated.

Configuration

Build Time Configurations for r_icu

The following build time configurations are defined in fsp_cfg/r_icu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Input > External IRQ (r_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

--	--	--	--

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_external_irq0	Module name.
Channel	Value must be an integer between 0 and 15	0	Specify the hardware channel.
Trigger	<ul style="list-style-type: none"> Falling Rising Both Edges Low Level 	Rising	Select the signal edge or state that triggers an interrupt.
Digital Filtering	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Select if the digital noise filter should be enabled.
Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled)	<ul style="list-style-type: none"> PCLK / 1 PCLK / 8 PCLK / 32 PCLK / 64 	PCLK / 64	Select the clock divider for the digital noise filter.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers
Pin Interrupt Priority	MCU Specific Options		Select the PIN interrupt priority.

Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

Note

The digital filter uses PCLKB as the clock source for sampling the IRQ pin.

Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

Usage Notes

Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and the external_irq_pclk_div_t setting.

$$\text{MIN_PULSE_WIDTH} = \text{EXTERNAL_IRQ_PCLKB_DIV} / \text{PCLKB_FREQUENCY} * 3$$

DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

Examples

Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
{
    /* Example Configuration */
    external_irq_cfg_t icu_cfg =
    {
        .channel      = ICU_IRQN,
        .trigger      = EXTERNAL_IRQ_TRIG_RISING,
        .filter_enable = false,
        .pclk_div     = EXTERNAL_IRQ_PCLK_DIV_BY_1,
        .p_callback   = external_irq_callback,
        .p_context    = 0,
        .ipl          = 0,
        .irq          = (IRQn_Type) 0,
    };
    /* Configure the external interrupt. */
    fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
    assert(FSP_SUCCESS == err);
    /* Enable the external interrupt. */
    /* Enable not required when used with ELC or DMAC. */
}
```

```

err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
assert(FSP_SUCCESS == err);
while (0 == g_external_irq_complete)
{
/* Wait for interrupt. */
}
}

```

Data Structures

struct [icu_instance_ctrl_t](#)

Data Structure Documentation

◆ icu_instance_ctrl_t

struct [icu_instance_ctrl_t](#)

ICU private control block. DO NOT MODIFY. Initialization occurs when [R_ICU_ExternalIrqOpen](#) is called.

Data Fields

uint32_t	open
	Used to determine if channel control block is in use.
IRQn_Type	irq
	NVIC interrupt number.
uint8_t	channel
	Channel.
void const *	p_context

Field Documentation

◆ p_context

void const* [icu_instance_ctrl_t::p_context](#)

Placeholder for user data. Passed to the user callback in [external_irq_callback_args_t](#).

Function Documentation

◆ R_ICU_ExternalIrqOpen()

```
fsp_err_t R_ICU_ExternalIrqOpen ( external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg )
```

Configure an IRQ input pin for use with the external interrupt interface. Implements [external_irq_api_t::open](#).

The Open function is responsible for preparing an external IRQ pin for operation.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	One of the following is invalid: <ul style="list-style-type: none"> • p_ctrl or p_cfg is NULL
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
FSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ R_ICU_ExternalIrqEnable()

```
fsp_err_t R_ICU_ExternalIrqEnable ( external_irq_ctrl_t *const p_api_ctrl)
```

Enable external interrupt for specified channel at NVIC. Implements [external_irq_api_t::enable](#).

Return values

FSP_SUCCESS	Interrupt Enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ **R_ICU_ExternalIrqDisable()**

```
fsp_err_t R_ICU_ExternalIrqDisable ( external_irq_ctrl_t *const p_api_ctrl)
```

Disable external interrupt for specified channel at NVIC. Implements `external_irq_api_t::disable`.

Return values

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ **R_ICU_ExternalIrqCallbackSet()**

```
fsp_err_t R_ICU_ExternalIrqCallbackSet ( external_irq_ctrl_t *const p_api_ctrl,
void(*) (external_irq_callback_args_t *) p_callback, void const *const p_context,
external_irq_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `external_irq_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **R_ICU_ExternalIrqClose()**

```
fsp_err_t R_ICU_ExternalIrqClose ( external_irq_ctrl_t *const p_api_ctrl)
```

Close the external interrupt channel. Implements `external_irq_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel is not opened.

Detailed Description

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The I2C master on IIC/I3C HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.

- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_b_master

The following build time configurations are defined in fsp_cfg/r_iic_b_master_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_iic_b_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_b_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> • Standard • Fast-mode • Fast-mode plus 	Standard	Select the transfer rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or

equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated [iic_b_master_extended_cfg_t](#) structure.

Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> • 7-Bit • 10-Bit 	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Timeout Mode	<ul style="list-style-type: none"> • Short Mode • Long Mode 	Short Mode	Select the timeout mode to detect bus hang.
Timeout during SCL Low	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.
Callback	Name must be a valid C symbol	g_iic_b_master0_callback	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

Clock Configuration

The I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the

bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current IICCLK/PCLKD (based on the MCU) settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the `r_iic_master` in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel      = I2C_CHANNEL,
    .rate        = I2C_MASTER_RATE_FAST,
    .slave       = I2C_SLAVE_EEPROM,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_callback,    // Callback
    .p_context   = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_b_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the IIC module */
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
```

```
    g_i2c_tx_buffer[i] = (uint8_t) i;
}

/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}

/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}

/* Verify the read data */
```

```
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel      = I2C_CHANNEL,
    .rate        = I2C_MASTER_RATE_STANDARD,
    .slave       = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_callback,    // Callback
    .p_context   = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_b_master_cfg_extend
};
void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);

    /* Read data from I2C slave */
```

```
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;

err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);

assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

timeout_ms--;;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
__BKPT(0);
}

/* Send data to I2C slave on the same channel */

err = R_IIC_B_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = 0xAA; // NOLINT
g_i2c_tx_buffer[1] = 0xBB; // NOLINT
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

timeout_ms--;;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
__BKPT(0);
}
}
```

fsp_err_t R_IIC_B_MASTER_Open (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg)	
Opens the I2C device.	
Return values	
<code>FSP_SUCCESS</code>	Requested clock rate was set exactly.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	Channel is not available on this MCU.
<code>FSP_ERR_ASSERTION</code>	Parameter check failure due to one or more reasons below: <ol style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ **R_IIC_B_MASTER_Read()**

```
fsp_err_t R_IIC_B_MASTER_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R_IIC_B_MASTER_Write()**

```
fsp_err_t R_IIC_B_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src,
uint32_t const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R_IIC_B_MASTER_Abort()**

```
fsp_err_t R_IIC_B_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ **R_IIC_B_MASTER_SlaveAddressSet()**

```
fsp_err_t R_IIC_B_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

◆ **R_IIC_B_MASTER_Close()**

```
fsp_err_t R_IIC_B_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ **R_IIC_B_MASTER_CallbackSet()**

```
fsp_err_t R_IIC_B_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_IIC_B_MASTER_StatusGet()

```
fsp_err_t R_IIC_B_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

4.2.33 I2C Slave on IIC/I3C (r_iic_b_slave)

```

Detailed Description

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

Overview**Features**

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.

- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.

Configuration

Build Time Configurations for r_iic_b_slave

The following build time configurations are defined in fsp_cfg/r_iic_b_slave_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > I2C Slave (r_iic_b_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_b_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupt Priority Level > Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.
Interrupt Priority Level > Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> • Standard • Fast-mode • Fast-mode plus 	Standard	Select the transfer rate. If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated

delay is printed in a comment in the generated `iic_b_slave_extended_cfg_t` structure.

Internal Reference Clock	<ul style="list-style-type: none"> I2C Clock / 1 I2C Clock / 2 I2C Clock / 4 I2C Clock / 8 I2C Clock / 16 I2C Clock / 32 I2C Clock / 64 I2C Clock / 128 	I2C Clock / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. I2C Clock can be either IICCLK or PCLKD based on the MCU.
Digital Noise Filter Stage Select	<ul style="list-style-type: none"> Disabled Single-stage filter 2-stage filter 3-stage filter 4-stage filter 	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
General Call	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	<ul style="list-style-type: none"> 7-Bit 10-Bit 	7-Bit	Select the slave address mode.
Clock Stretching	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Configure Clock Stretching.
Callback	Name must be a valid C symbol	<code>g_iic_b_slave0_callback</code>	A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

Clock Configuration

The IIC/I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC/I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

Note

: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.

: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
 - An I2C Master initiates a transmission or reception:
I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
 - A Transmission or reception has been completed:
I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
 - An I2C Master is requesting to read or write more data:
I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
 - Error conditions: I2C_SLAVE_EVENT_ABORTED
 - An I2C Master initiates a general call by passing 0x00 as slave address:
I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_B_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_B_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_B_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_B_SLAVE_Write API

I2C_SLAVE_EVENT_GENERAL_CALL

R_IIC_B_SLAVE_Read

- If parameter checking is enabled and R_IIC_B_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_B_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
 - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
 - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current I2C Clock (IICCLK or PCLKD based on the MCU) settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_B_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel          = I2C_MASTER_CHANNEL_2,
    .rate             = I2C_MASTER_RATE_STANDARD,
    .slave            = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode        = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback       = i2c_master_callback, // Callback
    .p_context        = &g_i2c_master_ctrl,
    .p_transfer_tx    = NULL,
    .p_transfer_rx    = NULL,
    .p_extend         = &g_iic_master_cfg_extend_standard_mode
};
```

```
iic_b_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel      = I2C_SLAVE_CHANNEL_0,
    .rate         = I2C_SLAVE_RATE_STANDARD,
    .slave        = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback   = i2c_slave_callback, // Callback
    .p_context    = &g_i2c_slave_ctrl,
    .p_extend     = &g_iic_slave_cfg_extend_standard_mode
};

Function Documentation

◆ **R_IIC_B_SLAVE_Open()**

```
fsp_err_t R_IIC_B_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

Return values

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ **R_IIC_B_SLAVE_Read()**

```
fsp_err_t R_IIC_B_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R_IIC_B_SLAVE_Write()**

```
fsp_err_t R_IIC_B_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R_IIC_B_SLAVE_Close()**

```
fsp_err_t R_IIC_B_SLAVE_Close ( i2c_slave_ctrl_t *const p_api_ctrl)
```

Closes the I2C device.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

◆ R_IIC_B_SLAVE_CallbackSet()

```
fsp_err_t R_IIC_B_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The I2C master on IIC HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_iic_master

The following build time configurations are defined in fsp_cfg/r_iic_master_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_iic_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_master). Non-secure callable guard functions can be generated for this module by right clicking

the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c_master0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> Standard Fast-mode Fast-mode plus 	Standard	<p>Select the transfer rate.</p> <p>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_master_extended_cfg_t structure.</p>
Rise Time (ns)	Value must be a non-negative integer	120	Set the rise time (tr) in nanoseconds.
Fall Time (ns)	Value must be a non-negative integer	120	Set the fall time (tf) in nanoseconds.
Duty Cycle (%)	Value must be an integer between 0 and 100	50	Set the SCL duty cycle.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> 7-Bit 10-Bit 	7-Bit	Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here.
Timeout Mode	<ul style="list-style-type: none"> Short Mode Long Mode 	Short Mode	Select the timeout mode to detect bus hang.
Timeout during SCL Low	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode.

Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status.
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts.

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel      = I2C_CHANNEL,
    .rate        = I2C_MASTER_RATE_FAST,
    .slave       = I2C_SLAVE_EEPROM,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_callback,    // Callback
    .p_context   = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
    fsp_err_t err;
```

```
uint32_t i;
uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
/* Initialize the IIC module */
err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Write some data to the transmit buffer */
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
{
    g_i2c_tx_buffer[i] = (uint8_t) i;
}
/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
```

```
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

Note

The callback function from the first example applies to this example as well.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel      = I2C_CHANNEL,
    .rate         = I2C_MASTER_RATE_STANDARD,
    .slave        = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback   = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend     = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)
```

```
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Send data to I2C slave on the same channel */
    err = R_IIC_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0] = 0xAA; // NOLINT
    g_i2c_tx_buffer[1] = 0xBB; // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```

R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

```

Function Documentation

◆ **R_IIC_MASTER_Open()**

```
fsp_err_t R_IIC_MASTER_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )
```

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ **R_IIC_MASTER_Read()**

```
fsp_err_t R_IIC_MASTER_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ **R_IIC_MASTER_Write()**

```
fsp_err_t R_IIC_MASTER_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_IN_USE	Bus busy condition. Another transfer was in progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ **R_IIC_MASTER_Abort()**

```
fsp_err_t R_IIC_MASTER_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

Return values

FSP_SUCCESS	Channel was reset successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ **R_IIC_MASTER_SlaveAddressSet()**

```
fsp_err_t R_IIC_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave, i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	Pointer to control structure is NULL.
FSP_ERR_IN_USE	Another transfer was in-progress.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

◆ **R_IIC_MASTER_Close()**

```
fsp_err_t R_IIC_MASTER_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block.

Note

A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.

◆ R_IIC_MASTER_CallbackSet()

```
fsp_err_t R_IIC_MASTER_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ R_IIC_MASTER_StatusGet()

```
fsp_err_t R_IIC_MASTER_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in <code>p_status</code> .
FSP_ERR_ASSERTION	NULL pointer.

4.2.35 I2C Slave on IIC (r_iic_slave)

Modules

Functions

```

p_context, i2c_slave_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the [I2C Slave Interface](#).

Overview

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100-kHz transaction rate.
 - Fast Mode Support with up to 400-kHz transaction rate.
 - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.

Configuration

Build Time Configurations for r_iic_slave

The following build time configurations are defined in fsp_cfg/r_iic_slave_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > I2C Slave (r_iic_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupt Priority Level > Transmit, Receive, and Transmit End	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts.

Interrupt Priority Level > Error	MCU Specific Options		Select the interrupt priority level. This is set for ERI interrupt.
Name	Name must be a valid C symbol	g_i2c_slave0	Module name.
Channel	Value must be a non-negative integer	0	Specify the IIC channel.
Rate	<ul style="list-style-type: none"> Standard Fast-mode Fast-mode plus 	Standard	<p>Select the transfer rate.</p> <p>If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_slave_extended_cfg_t structure.</p>
Internal Reference Clock	<ul style="list-style-type: none"> PCLKB / 1 PCLKB / 2 PCLKB / 4 PCLKB / 8 PCLKB / 16 PCLKB / 32 PCLKB / 64 PCLKB / 128 	PCLKB / 1	Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples.
Digital Noise Filter Stage Select	<ul style="list-style-type: none"> Disabled Single-stage filter 2-stage filter 3-stage filter 4-stage filter 	3-stage filter	Select the number of digital filter stages for IIC Slave.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
General Call	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Allows the slave to respond to general call address: 0x00.
Address Mode	<ul style="list-style-type: none"> 7-Bit 10-Bit 	7-Bit	Select the slave address mode.
Clock Stretching	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Configure Clock Stretching.
Callback	Name must be a valid	NULL	A user callback

C symbol

function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status.

Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.

Note

: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.

: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.

Callback

- A callback function must be provided which will be invoked for the cases below:
 - An I2C Master initiates a transmission or reception:
I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
 - A Transmission or reception has been completed:
I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
 - An I2C Master is requesting to read or write more data:
I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
 - Error conditions: I2C_SLAVE_EVENT_ABORTED
 - An I2C Master initiates a general call by passing 0x00 as slave address:
I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

IIC Slave Callback Event	IIC Slave API expected to be called
I2C_SLAVE_EVENT_ABORTED	Handle event based on application
I2C_SLAVE_EVENT_RX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_TX_COMPLETE	Handle event based on application
I2C_SLAVE_EVENT_RX_REQUEST	R_IIC_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_REQUEST	R_IIC_SLAVE_Write API
I2C_SLAVE_EVENT_RX_MORE_REQUEST	R_IIC_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	R_IIC_SLAVE_Write API
I2C_SLAVE_EVENT_GENERAL_CALL	R_IIC_SLAVE_Read

- If parameter checking is enabled and R_IIC_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
 - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
 - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.

Examples

Basic Example

This is a basic example of minimal use of the R_IIC_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
```

```
{
    .channel      = I2C_MASTER_CHANNEL_2,
    .rate        = I2C_MASTER_RATE_STANDARD,
    .slave       = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode   = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback  = i2c_master_callback, // Callback
    .p_context   = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend    = &g_iic_master_cfg_extend_standard_mode
};

iic_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel      = I2C_SLAVE_CHANNEL_0,
    .rate        = I2C_SLAVE_RATE_STANDARD,
    .slave       = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode   = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback  = i2c_slave_callback, // Callback
    .p_context   = &g_i2c_slave_ctrl,
    .p_extend    = &g_iic_slave_cfg_extend_standard_mode
};

void i2c_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_master_callback_event = p_args->event;
}

void i2c_slave_callback (i2c_slave_callback_args_t * p_args)
{
    g_i2c_slave_callback_event = p_args->event;
    if ((p_args->event == I2C_SLAVE_EVENT_RX_COMPLETE) || (p_args->event ==
I2C_SLAVE_EVENT_TX_COMPLETE))
    {
        /* Transaction Successful */
    }
}
```

```

struct [iic_slave_extended_cfg_t](#)

Data Structure Documentation

◆ [iic_slave_clock_settings_t](#)

struct iic_slave_clock_settings_t
I2C clock settings
Data Fields

uint8_t	cks_value	Internal Reference Clock Select.
uint8_t	brl_value	Low-level period of SCL clock.
uint8_t	digital_filter_stages	Number of digital filter stages based on brl_value.

◆ iic_slave_extended_cfg_t

struct iic_slave_extended_cfg_t		
R_IIC_SLAVE extended configuration		
Data Fields		
iic_slave_clock_settings_t	clock_settings	I2C Clock settings.

Function Documentation

◆ R_IIC_SLAVE_Open()

```
fsp_err_t R_IIC_SLAVE_Open ( i2c_slave_ctrl_t *const p_api_ctrl, i2c_slave_cfg_t const *const p_cfg )
```

Opens the I2C slave device.

Return values

FSP_SUCCESS	I2C slave device opened successfully.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel is not available on this MCU.
FSP_ERR_INVALID_ARGUMENT	Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Set the rate to fast mode plus on a channel which does not support it. 5. Invalid IRQ number assigned

◆ **R_IIC_SLAVE_Read()**

```
fsp_err_t R_IIC_SLAVE_Read ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes )
```

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue
FSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R_IIC_SLAVE_Write()**

```
fsp_err_t R_IIC_SLAVE_Write ( i2c_slave_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes )
```

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
FSP_ERR_IN_USE	Another transfer was in progress.
FSP_ERR_NOT_OPEN	Device is not open.

◆ **R_IIC_SLAVE_Close()**

```
fsp_err_t R_IIC_SLAVE_Close ( i2c_slave_ctrl_t *const p_api_ctrl)
```

Closes the I2C device.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_NOT_OPEN	Device not opened.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.

◆ **R_IIC_SLAVE_CallbackSet()**

```
fsp_err_t R_IIC_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const p_api_ctrl,
void(*) (i2c_slave_callback_args_t *) p_callback, void const *const p_context,
i2c_slave_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_slave_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Driver for the I/O Ports peripheral on RA MCUs. This module implements the [I/O Port Interface](#).

Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

Features

The IOPORT HAL module can configure the following pin settings:

- Pin direction
- Default output state
- Pull-up
- NMOS/PMOS
- Drive strength
- Event edge trigger (falling, rising or both)
- Whether the pin is to be used as an IRQ pin

- Whether the pin is to be used as an analog pin
- Peripheral connection

The module also provides the following functionality:

- Read/write GPIO pins/ports
- Sets event output data
- Reads event input data

Configuration

The I/O PORT HAL module must be configured by the user for the desired operation. The operating state of an I/O pin can be set via the RA Configuraton tool. When the project is built a pin configuration file is created. The BSP will automatically configure the MCU IO ports accordingly at startup using the same API functions mentioned in this document.

Build Time Configurations for r_ioport

The following build time configurations are defined in fsp_cfg/r_ioport_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > I/O Port (r_ioport)

This module can be added to the Stacks tab via New Stack > System > I/O Port (r_ioport).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ioport	Module name.
Port 1 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT1
Port 2 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT2
Port 3 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT3
Port 4 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT4
Port B ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTB
Port C ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTC
Port D ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTD

Port E ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTE
Pin Configuration Name	Name must be a valid C symbol	g_bsp_pin_cfg	Name for pin configuration structure

Clock Configuration

The I/O PORT HAL module does not require a specific clock configuration.

Pin Configuration

The IOPORT module is used for configuring pins.

Usage Notes

Port Group Function for ELC

Depending on pin configuration, the IOPORT module can perform automatic reads and writes on ports 1-4 on receipt of an ELC event.

When an event is received by a port, the state of the input pins on the port is saved in a hardware register. Simultaneously, the state of output pins on the port is set or cleared based on settings configured by the user. The functions [R_IOPORT_PinEventInputRead](#) and [R_IOPORT_PortEventInputRead](#) allow reading the last event input state of a pin or port, and event-triggered pin output can be configured through [R_IOPORT_PinEventOutputWrite](#) and [R_IOPORT_PortEventOutputWrite](#).

In addition, each pin on ports 1-4 can be configured to trigger an ELC event on rising, falling or both edges. This event can be used to activate other modules when the pin changes state.

Note

The number of ELC-aware ports vary across MCUs. Refer to the Hardware User's Manual for your device for more details.

Examples

Basic Example

This is a basic example of minimal use of the IOPORT in an application.

```
void basic_example ()
{
    bsp_io_level_t readLevel;
    fsp_err_t      err;

    /* Initialize the IOPORT module and configure the pins
     * Note: The default pin configuration name in the RA Configuraton tool is
     * g_bsp_pin_cfg */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
}
```

```
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

/* Call R_IOPORT_PinsCfg if the configuration was not part of initial configurations
made in open */
    err = R_IOPORT_PinsCfg(&g_ioport_ctrl, &g_runtime_pin_cfg);
    assert(FSP_SUCCESS == err);

/* Set Pin 00 of Port 06 to High */
    err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, BSP_IO_LEVEL_HIGH
);
    assert(FSP_SUCCESS == err);

/* Read Pin 00 of Port 06*/
    err = R_IOPORT_PinRead(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, &readLevel);
    assert(FSP_SUCCESS == err);
}
```

Blinky Example

This example uses IOPORT to configure and toggle a pin to blink an LED.

```
void blinky_example ()
{
    fsp_err_t err;

/* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);

/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

/* Configure Pin as output
 * Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00,
BSP_IO_DIRECTION_OUTPUT);
    assert(FSP_SUCCESS == err);

    bsp_io_level_t level = BSP_IO_LEVEL_LOW;

    while (1)
    {
```

```
/* Determine the next state of the LEDs */
if (BSP_IO_LEVEL_LOW == level)
{
    level = BSP_IO_LEVEL_HIGH;
}
else
{
    level = BSP_IO_LEVEL_LOW;
}

/* Update LED on RA6M3-PK */
err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, level);
assert(FSP_SUCCESS == err);

/* Delay */
R_BSP_SoftwareDelay(100, BSP_DELAY_UNITS_MILLISECONDS); // NOLINT
}
}
```

ELC Example

This is an example of using IOPORT with ELC events. The ELC event system allows the captured data to be stored when it occurs and then read back at a later time.

```
static elc_instance_ctrl_t g_elc_ctrl;
static elc_cfg_t g_elc_cfg;
void ioport_elc_example ()
{
    bsp_io_level_t eventValue;
    fsp_err_t err;

    /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, (elc_peripheral_t) ELC_PERIPHERAL_IOPORT2,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
```

```

    assert(FSP_SUCCESS == err);

    /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);

    /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    assert(FSP_SUCCESS == err);

    /* Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
BSP_IO_DIRECTION_INPUT);
    assert(FSP_SUCCESS == err);

    /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);

    /* Read Pin Event Input. The data(BSP_IO_LEVEL_HIGH/ BSP_IO_LEVEL_LOW) from
BSP_IO_PORT_02_PIN_00 is read into the
    * EIDR bit */
    err = R_IOPORT_PinEventInputRead(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
&eventValue);
    assert(FSP_SUCCESS == err);
}

```

Function Documentation

◆ R_IOPORT_Open()

`fsp_err_t R_IOPORT_Open (ioport_ctrl_t *const p_ctrl, const ioport_cfg_t * p_cfg)`

Initializes internal driver data, then calls pin configuration function to configure pins.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_IOPORT_Close()

`fsp_err_t R_IOPORT_Close (ioport_ctrl_t *const p_ctrl)`

Resets IOPORT registers. Implements `ioport_api_t::close`

Return values

FSP_SUCCESS	The IOPORT was successfully uninitialized
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_IOPORT_PinsCfg()

```
fsp_err_t R_IOPORT_PinsCfg ( ioport_ctrl_t *const p_ctrl, const ioport_cfg_t * p_cfg )
```

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements `ioport_api_t::pinsCfg`.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the Pins tab of the RA Configuration editor or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and testing.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

◆ R_IOPORT_PinCfg()

```
fsp_err_t R_IOPORT_PinCfg ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, uint32_t cfg )
```

Configures the settings of a pin. Implements `ioport_api_t::pinCfg`.

Return values

FSP_SUCCESS	Pin configured
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

◆ R_IOPORT_PinEventInputRead()

```
fsp_err_t R_IOPORT_PinEventInputRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin,
bsp_io_level_t * p_pin_event )
```

Reads the value of the event input data of a specific pin. Implements `ioport_api_t::pinEventInputRead`.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_INVALID_ARGUMENT	Port is not valid ELC PORT.

Note

This function is re-entrant.

◆ R_IOPORT_PinEventOutputWrite()

```
fsp_err_t R_IOPORT_PinEventOutputWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin,
bsp_io_level_t pin_value )
```

This function writes the event output data value to a pin. Implements `ioport_api_t::pinEventOutputWrite`.

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Return values

FSP_SUCCESS	Pin event data written
FSP_ERR_INVALID_ARGUMENT	Port or Pin or value not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinRead()

```
fsp_err_t R_IOPORT_PinRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t *
p_pin_value )
```

Reads the level on a pin. Implements `ioport_api_t::pinRead`.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PinWrite()

```
fsp_err_t R_IOPORT_PinWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t
level )
```

Sets a pin's output either high or low. Implements `ioport_api_t::pinWrite`.

Return values

FSP_SUCCESS	Pin written to
FSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid
FSP_ERR_NOT_OPEN	The module has not been opene
FSP_ERR_ASSERTION	NULL pointerd

Note

This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

◆ R_IOPORT_PortDirectionSet()

```
fsp_err_t R_IOPORT_PortDirectionSet ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t
direction_values, ioport_size_t mask )
```

Sets the direction of individual pins on a port. Implements `ioport_api_t::portDirectionSet()`.

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Return values

FSP_SUCCESS	Port direction updated
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventInputRead()

```
fsp_err_t R_IOPORT_PortEventInputRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port,
ioport_size_t * p_event_data )
```

Reads the value of the event input data. Implements `ioport_api_t::portEventInputRead()`.

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Port read
FSP_ERR_INVALID_ARGUMENT	Port not a valid ELC port
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventOutputWrite()

```
fsp_err_t R_IOPORT_PortEventOutputWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port,
ioport_size_t event_data, ioport_size_t mask_value )
```

This function writes the set and reset event output data for a port. Implements `ioport_api_t::portEventOutputWrite`.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Return values

FSP_SUCCESS	Port event data written
FSP_ERR_INVALID_ARGUMENT	Port or Mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortRead()

```
fsp_err_t R_IOPORT_PortRead ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t *
p_port_value )
```

Reads the value on an IO port. Implements `ioport_api_t::portRead`.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

Return values

FSP_SUCCESS	Port read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortWrite()

```
fsp_err_t R_IOPORT_PortWrite ( ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t value,
ioport_size_t mask )
```

Writes to multiple pins on a port. Implements `ioport_api_t::portWrite`.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. For example, value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Return values

FSP_SUCCESS	Port written to
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointerd

Note

This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

4.2.37 Independent Watchdog Timer (r_iwdt)

p_context, wdt_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
 - Resetting of the device
 - Generation of an NMI
- The IWDT begins counting at reset.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Configuration

Build Time Configurations for r_iwdt

The following build time configurations are defined in fsp_cfg/r_iwdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled 	Default (BSP)	If selected code for parameter checking is

- Disabled

included in the build.

Configurations for Monitoring > Independent Watchdog (r_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
NMI callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

Note

The IWDT has additional configurable settings in the OFS0 register in the **BSP** tab properties window. These settings include the following:

- Start Mode
- Timeout Period
- Dedicated Clock Frequency Divisor
- Window End Position
- Window Start Position
- Reset Interrupt Request Select
- Stop Control

Review the OFS0 properties window to see additional details.

Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds

Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling `R_IWDT_Refresh()` after the MCU wakes from low power mode.

Examples

IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
    on. */

    /* Initializes the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */

        /* Refresh before the counter underflows to prevent reset or NMI based on the
        setting. */
        (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

```
}  
  
}
```

IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)  
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)  
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)  
/* Example callback called when a watchdog NMI occurs. */  
void iwdt_callback (wdt_callback_args_t * p_args)  
{  
    FSP_PARAMETER_NOT_USED(p_args);  
    fsp_err_t err = FSP_SUCCESS;  
    /* (Optional) Determine the source of the NMI. */  
    wdt_status_t status = WDT_STATUS_NO_ERROR;  
    err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);  
    assert(FSP_SUCCESS == err);  
    /* (Optional) Log source of NMI and any other debug information. */  
    /* (Optional) Clear the error flags. */  
    err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);  
    assert(FSP_SUCCESS == err);  
    /* (Optional) Issue a software reset to reset the MCU. */  
    __NVIC_SystemReset();  
}  
void iwdt_advanced_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    /* (Optional) Enable the IWDT to count and generate NMI or reset when the  
    * debugger is connected. */  
    R_DEBUG->DBGSTOPPCR_b.DBGSTOP_IWDT = 0;  
    /* (Optional) Check if the IWDTRF flag is set to know if the system is  
    * recovering from a IWDT reset. */
```

```
if (R_SYSTEM->RSTSR1_b.IWDTRF)
{
/* Clear the flag. */
    R_SYSTEM->RSTSR1 = 0U;
}

/* Open the module. */
err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Initialize other application code. */
/* Do not call R_IWDT_Refresh() in auto start mode unless the
 * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
while (true)
{
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the IWDT counter is past the start window
 * before refreshing the IWDT. */
    uint32_t iwdt_counter = 0U;
do
{
/* Read the current IWDT counter value. */
    err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
    assert(FSP_SUCCESS == err);
} while (iwdt_counter >= IWDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
}
}
```

Data Structures

struct [iwdt_instance_ctrl_t](#)

Data Structure Documentation

◆ iwdt_instance_ctrl_t

struct iwdt_instance_ctrl_t	
IWDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called.	
Data Fields	
uint32_t	wdt_open
	Indicates whether the open() API has been successfully called.
void const *	p_context
	Placeholder for user data. Passed to the user callback in wdt_callback_args_t .
R_IWDT_Type *	p_reg
	Pointer to register base address.
void(*	p_callback)(wdt_callback_args_t *p_args)
	Callback provided when a WDT NMI ISR occurs.

Function Documentation

◆ **R_IWDT_Refresh()**

```
fsp_err_t R_IWDT_Refresh ( wdt_ctrl_t *const p_api_ctrl)
```

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
(void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

Return values

FSP_SUCCESS	IWDT successfully refreshed.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ **R_IWDT_Open()**

```
fsp_err_t R_IWDT_Open ( wdt_ctrl_t *const p_api_ctrl, wdt_cfg_t const *const p_cfg )
```

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

Return values

FSP_SUCCESS	IWDT successfully configured.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_ENABLED	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

◆ **R_IWDT_StatusClear()**

```
fsp_err_t R_IWDT_StatusClear ( wdt_ctrl_t *const p_api_ctrl, const wdt_status_t status )
```

Clear the IWDT status and error flags. Implements `wdt_api_t::statusClear`.

Example:

```
/* (Optional) Clear the error flags. */
err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <code>R_IWDT_Open()</code> first.

◆ **R_IWDT_StatusGet()**

```
fsp_err_t R_IWDT_StatusGet ( wdt_ctrl_t *const p_api_ctrl, wdt_status_t *const p_status )
```

Read the IWDT status flags. When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags can be read after reset to establish if the IWDT caused the reset. Reading the status and error flags in NMI output mode indicates whether the IWDT generated the NMI interrupt.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform <code>R_IWDT_Open()</code> first.

◆ **R_IWDT_CounterGet()**

```
fsp_err_t R_IWDT_CounterGet ( wdt_ctrl_t *const p_api_ctrl, uint32_t *const p_count )
```

Read the current count value of the IWDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current IWDT counter value. */
err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ **R_IWDT_TimeoutGet()**

```
fsp_err_t R_IWDT_TimeoutGet ( wdt_ctrl_t *const p_api_ctrl, wdt_timeout_values_t *const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

Return values

FSP_SUCCESS	IWDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_CallbackSet()

```
fsp_err_t R_IWDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void(*) (wdt_callback_args_t *) p_callback,
void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `wdt_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.38 JPEG Codec (r_jpeg)

```

```
fsp_err_t R_JPEG_ModeSet (jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode)
```

Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the [JPEG Codec Interface](#).

Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

Feature	Options
Decompression input formats	Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1
Decompression output formats	ARGB8888, RGB565
Compression input formats	Raw Y'CbCr 4:2:2 only
Compression output formats	Baseline JPEG Y'CbCr 4:2:2 only
Byte reordering	Byte, halfword and/or word swapping on input and output
Interrupt sources	Image size acquired, input/output data pause, decode complete, error

Compatible image sizes

See [Minimum Coded Unit \(MCU\)](#) below

Configuration

Build Time Configurations for r_jpeg

The following build time configurations are defined in fsp_cfg/r_jpeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected, code for parameter checking is included in the build.
Decode Support	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	If selected, code for decoding JPEG images is included in the build.
Encode Support	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If selected, code for encoding JPEG images is included in the build.

Configurations for Graphics > JPEG Codec (r_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r_jpeg).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_jpeg0	Module name.
General > Default mode	<ul style="list-style-type: none"> Decode Encode 	Decode	Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled.
Decode > Input byte order	MCU Specific Options		Select the byte order of the input data for decoding.
Decode > Output byte order	MCU Specific Options		Select the byte order of the output data for decoding.
Decode > Output color format	<ul style="list-style-type: none"> ARGB8888 (32-bit) RGB565 (16-bit) 	RGB565 (16-bit)	Select the output pixel format for decode operations.
Decode > Output alpha (ARGB8888 only)	Value must be an 8-bit integer (0-255)	255	Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen.
Decode > Callback	Name must be a valid	NULL	If a callback function is

	C symbol		
Encode > Horizontal resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 16	480	provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers. Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet.
Encode > Vertical resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 8	272	Vertical resolution of the raw image. This value can be configured at runtime via R_JPEG_ImageSizeSet.
Encode > Horizontal stride	Value cannot be greater than 65535 and must be a non-negative integer	480	Horizontal stride of the raw image buffer (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet.
Encode > Input byte order	MCU Specific Options		Select the byte order of the input data for encoding.
Encode > Output byte order	MCU Specific Options		Select the byte order of the output data for encoding.
Encode > Reset interval	Value cannot be greater than 65535 and must be a non-negative integer	512	Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output.
Encode > Quality factor	Value must be between 1 and 100 and must be an integer	50	Set the quality factor for encoding (1-100). Lower values produce smaller images at the cost of image quality.
Encode > Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Interrupts > Decode Process Interrupt Priority	MCU Specific Options		Select the decompression interrupt priority.
Interrupts > Data	MCU Specific Options		Select the data transfer

Transfer Interrupt
Priority

interrupt priority.

Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

Pin Configuration

This module does not have any input or output pin connections.

Usage Notes

Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use [R_JPEG_ModeSet](#) while the JPEG Codec is idle.

Status

The status value ([jpeg_status_t](#)) provided by the callback and by [R_JPEG_StatusGet](#) is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
 - Set the input buffer, stride and output buffer then wait for a callback with status [JPEG_STATUS_OPERATION_COMPLETE](#).
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
 - Call [R_JPEG_InputBufferSet](#) before setting the output buffer and wait for a callback with status [JPEG_STATUS_IMAGE_SIZE_READY](#).
- To decode a partial JPEG image then pause until the next chunk is available:
 - Specify a size smaller than the full JPEG data when calling [R_JPEG_InputBufferSet](#).
- To pause decoding once an output buffer is filled:
 - Specify a size smaller than the full decoded image when calling [R_JPEG_OutputBufferSet](#).

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in [blue](#) are part of [jpeg_status_t](#) with the JPEG_DECODE_STATUS prefix omitted.

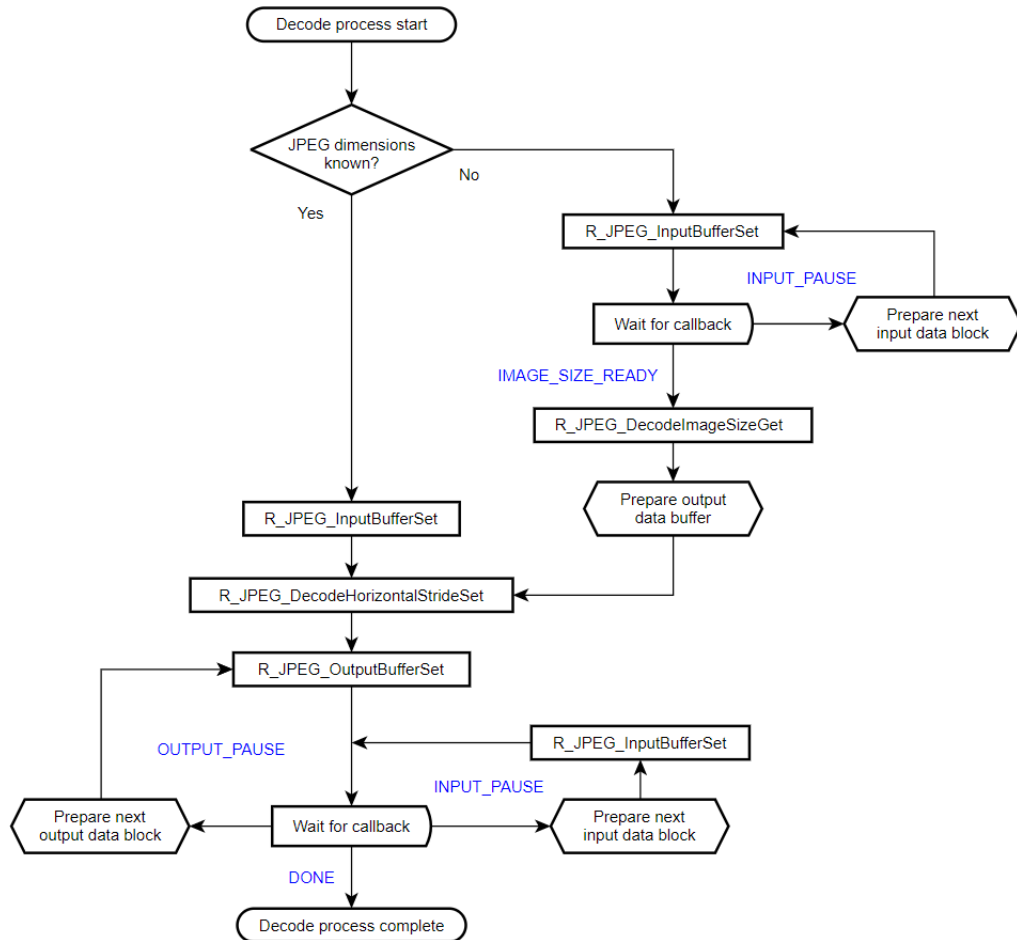

Figure 171: JPEG Decode Operational Flow

Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

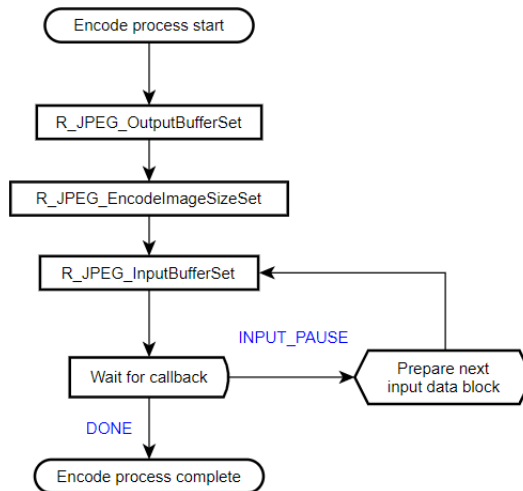

Figure 172: JPEG Encode Operational Flow

Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling [R_JPEG_Close](#) followed by [R_JPEG_Open](#).

Limitations

Developers should be aware of the following limitations when using the JPEG API.

Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

Format	Horizontal	Vertical
Y'CbCr 4:4:4	8 pixels	8 lines
Y'CbCr 4:2:2	16 pixels	8 lines
Y'CbCr 4:1:1	32 pixels	8 lines
Y'CbCr 4:2:0	16 pixels	16 lines

Note

Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.

Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

```
y = (0.299000f * r) + (0.587000f * g) + (0.114000f * b);
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y = ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```

y =      (   (r << 6) + (r << 3) + (r << 2) + r
          + (g << 7) + (g << 4) + (g << 2) + (g << 1)
          + (b << 4) + (b << 3) + (b << 2) + b
          ) >> 8;

cb = 128 - (   (r << 5) + (r << 3) + (r << 1) + r
             + (g << 6) + (g << 4) + (g << 2) + g
             - (b << 7)
             ) >> 8;

cr = 128 + (   (r << 7)
             - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
             - (b << 4) - (b << 2) - b
             ) >> 8;

```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```

cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);

```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG_DATA_ORDER_NORMAL):

```

out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);

```

Note

RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on [Y'CbCr Conversion](#) for implementation details.

Examples

Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```

void jpeg_decode_basic (void)
{

```

```
fsp_err_t err;

/* Open JPEG Codec */
err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Set input buffer */
err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
assert(FSP_SUCCESS == err);

/* Set horizontal stride of output buffer */
err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
assert(FSP_SUCCESS == err);

/* Set output buffer */
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
assert(FSP_SUCCESS == err);

/* Wait for decode completion */
jpeg_status_t status = (jpeg_status_t) 0;
while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
{
    err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
}
```

Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

Note

Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.

```
#define JPEG_INPUT_SIZE_BYTES 512U

/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;

/* JPEG event flag */
```

```
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
    /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
    while (!jpeg_event && --timeout_timer)
    {
        /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
    return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
{
    uint8_t * p_jpeg = (uint8_t *) JPEG_PTR;
    jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t timeout = 0;
    fsp_err_t err;
    /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
    /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    while (!(status & JPEG_STATUS_ERROR) && !timeout)
```

```
{
/* Set the input buffer to read `input_bytes` bytes at a time */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
    assert(FSP_SUCCESS == err);
/* This delay is required for streaming input mode to function correctly.
 * (Without this delay the JPEG Codec will not correctly locate markers in the file
header.) */
R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
/* Wait for a callback */
    timeout = jpeg_event_wait();
/* Get the status from the callback */
    status = g_jpeg_status;
/* Break if the header has finished decoding */
if (status & JPEG_STATUS_IMAGE_SIZE_READY)
    {
break;
    }
/* Move pointer to next block of input data (if needed) */
    p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
}
/* Get image size */
    uint16_t horizontal;
    uint16_t vertical;
    err = R_JPEG_DecodeImageSizeGet(&g_jpeg_ctrl, &horizontal, &vertical);
    assert(FSP_SUCCESS == err);
/* Prepare output data buffer here if needed (already allocated in this example) */
    uint8_t * p_output = decode_buffer;
/* Set horizontal stride */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, horizontal);
    assert(FSP_SUCCESS == err);
/* Calculate the number of bytes that will fit in the buffer (16 lines in this
example) */
    uint32_t output_size = horizontal * 16U * 4U;
/* Start decoding by setting the output buffer */
```

```
err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
assert(FSP_SUCCESS == err);

while (!(status & JPEG_STATUS_ERROR) && !timeout)
{
/* Wait for a callback */
    timeout = jpeg_event_wait();
/* Get the status from the callback */
    status = g_jpeg_status;
/* Break if decoding is complete */
    if (status & JPEG_STATUS_OPERATION_COMPLETE)
    {
break;
    }
    if (status & JPEG_STATUS_OUTPUT_PAUSE)
    {
/* Draw the JPEG work buffer to the framebuffer here (if needed) */
/* Move pointer to next block of output data (if needed) */
        p_output += output_size;
/* Set the output buffer to the next 16-line block */
        err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
        assert(FSP_SUCCESS == err);
    }
    if (status & JPEG_STATUS_INPUT_PAUSE)
    {
/* Get next block of input data */
        p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
/* Set the new input buffer pointer */
        err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
        assert(FSP_SUCCESS == err);
    }
}

/* Close driver to allow encode operations if needed */
err = R_JPEG_Close(&g_jpeg_ctrl);
assert(FSP_SUCCESS == err);
```

```
}
```

Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

Note

This example assumes image dimensions are provided in the configuration. If this is not the case, [R_JPEG_EncodeImageSizeSet](#) must be used to set the size before calling [R_JPEG_InputBufferSet](#).

```
void jpeg_encode_basic (void)
{
    fsp_err_t err;

    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);

    /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
    assert(FSP_SUCCESS == err);

    /* Wait for decode completion */
    jpeg_status_t status = (jpeg_status_t) 0;
    while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
    {
        err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
}
```

Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
    /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;

    /* Set JPEG flag */
    jpeg_event = 1;
}

void jpeg_encode_streaming (void)
{
    uint8_t    timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;
    fsp_err_t  err;

    /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);

    /* Set the image size */
    jpeg_encode_image_size_t image_size;
    image_size.horizontal_resolution    = X_RESOLUTION;
    image_size.vertical_resolution     = Y_RESOLUTION;
    image_size.horizontal_stride_pixels = H_STRIDE;
    err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
    assert(FSP_SUCCESS == err);

    /* Calculate the size of the input data chunk (16 lines in this example) */
    uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;

    while (!timeout)
    {
        /* Set the input buffer */
        err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
        assert(FSP_SUCCESS == err);
    }
}
```

```
/* Wait for a callback */
    timeout = jpeg_event_wait();
if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
    {
/* Encode complete */
break;
    }
if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
    {
/* Load next block of input data here (if needed) */
    p_chunk += chunk_size;
    }
    }
}
```

Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

Note

This function is only partially optimized for clarity. Further application-specific size- or speed-based optimizations should be considered when implementing in an actual project.

```
#define RGB565_G_MASK 0x07E0
#define RGB565_B_MASK 0x001F
#define C_0 128
typedef enum e_pixel_format
{
    PIXEL_FORMAT_ARGB8888,
    PIXEL_FORMAT_RGB565
} pixel_format_t;
/* 5-bit to 8-bit LUT */
const uint8_t lut_32[] =
{
    0, 8, 16, 25, 33, 41, 49, 58,
    66, 74, 82, 90, 99, 107, 115, 123,
```

```

    132, 140, 148, 156, 165, 173, 181, 189,
    197, 206, 214, 222, 230, 239, 247, 255
};
/* 6-bit to 8-bit LUT */
const uint8_t lut_64[] =
{
    0,  4,  8,  12, 16, 20, 24, 28,
    32, 36, 40, 45, 49, 53, 57, 61,
    65, 69, 73, 77, 81, 85, 89, 93,
    97, 101, 105, 109, 113, 117, 121, 125,
    130, 134, 138, 142, 146, 150, 154, 158,
    162, 166, 170, 174, 178, 182, 186, 190,

Data Structures

struct [jpeg_instance_ctrl_t](#)

Data Structure Documentation

◆ jpeg_instance_ctrl_t

struct jpeg_instance_ctrl_t		
JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpeg_api_t::open is called.		
Data Fields		
uint32_t	open	JPEG Codec driver status.
jpeg_status_t	status	JPEG Codec operational status.
fsp_err_t	error_code	JPEG Codec error code (if any).
jpeg_mode_t	mode	Current mode (decode or encode).
uint32_t	horizontal_stride_bytes	Horizontal Stride settings.
uint32_t	output_buffer_size	Output buffer size.
jpeg_cfg_t const *	p_cfg	JPEG Decode configuration struct.
void const *	p_extend	JPEG Codec hardware dependent configuration */.
jpeg_decode_pixel_format_t	pixel_format	Pixel format.
uint16_t	total_lines_decoded	Track the number of lines decoded so far.
jpeg_decode_subsample_t	horizontal_subsample	Horizontal sub-sample setting.
uint16_t	lines_to_encode	Number of lines to encode.
uint16_t	vertical_resolution	vertical size
uint16_t	total_lines_encoded	Number of lines encoded.

Function Documentation

◆ **R_JPEG_Open()**

```
fsp_err_t R_JPEG_Open ( jpeg_ctrl_t *const p_api_ctrl, jpeg_cfg_t const *const p_cfg )
```

Initialize the JPEG Codec module.

Note

This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.

Return values

FSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
FSP_ERR_ALREADY_OPEN	JPEG Codec is already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_IRQ_BSP_DISABLED	JEDI interrupt does not have an IRQ number.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

◆ R_JPEG_OutputBufferSet()

```
fsp_err_t R_JPEG_OutputBufferSet ( jpeg_ctrl_t * p_api_ctrl, void * p_output_buffer, uint32_t
output_buffer_size )
```

Assign a buffer to the JPEG Codec for storing output data.

Note

In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

Return values

FSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
FSP_ERR_ASSERTION	Pointer to the control block or output_buffer is NULL or output_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	The number of horizontal pixels exceeds horizontal memory stride.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size.
FSP_ERR_IN_USE	The output buffer cannot be changed during codec operation.

◆ R_JPEG_InputBufferSet()

```
fsp_err_t R_JPEG_InputBufferSet ( jpeg_ctrl_t *const p_api_ctrl, void * p_data_buffer, uint32_t
data_buffer_size )
```

Assign an input data buffer to the JPEG codec for processing.

Note

After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_PRV_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so processing can resume.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

Note

When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.

Return values

FSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
FSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	The input buffer cannot be changed while the codec is running.
FSP_ERR_INVALID_CALL	In encode mode the output buffer must be set first.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	The buffer size is smaller than the minimum coded unit (MCU).

◆ R_JPEG_StatusGet()

```
fsp_err_t R_JPEG_StatusGet ( jpeg_ctrl_t* p_api_ctrl, jpeg_status_t* p_status )
```

Get the status of the JPEG codec. This function can also be used to poll the device.

Return values

FSP_SUCCESS	The status information is successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block or p_status is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_Close()

```
fsp_err_t R_JPEG_Close ( jpeg_ctrl_t* p_api_ctrl)
```

Cancel an outstanding JPEG codec operation and close the device.

Return values

FSP_SUCCESS	The JPEG unit is stopped and the driver is closed.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_EncodeImageSizeSet()

```
fsp_err_t R_JPEG_EncodeImageSizeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_encode_image_size_t *
p_image_size )
```

Set the image dimensions for an encode operation.

Note

Image dimensions must be set before setting the input buffer.

Return values

FSP_SUCCESS	Image size was successfully written to the JPEG Codec.
FSP_ERR_ASSERTION	Pointer to the control block or p_image_size is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.
FSP_ERR_INVALID_ARGUMENT	Horizontal or vertical resolution is invalid or zero.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	Image parameters cannot be changed while the codec is running.

◆ R_JPEG_DecodeLinesDecodedGet()

```
fsp_err_t R_JPEG_DecodeLinesDecodedGet ( jpeg_ctrl_t * p_api_ctrl, uint32_t * p_lines )
```

Returns the number of lines decoded into the output buffer.

Note

Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.

Return values

FSP_SUCCESS	Line count successfully returned.
FSP_ERR_ASSERTION	Pointer to the control block or p_lines is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DeCodeHorizontalStrideSet()

```
fsp_err_t R_JPEG_DeCodeHorizontalStrideSet ( jpeg_ctrl_t * p_api_ctrl, uint32_t horizontal_stride )
```

Configure horizontal stride setting for decode operations.

Note

If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the `jpeg_cfg_t` structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.

Return values

FSP_SUCCESS	Horizontal stride value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DeCodeImageSizeGet()

```
fsp_err_t R_JPEG_DeCodeImageSizeGet ( jpeg_ctrl_t * p_api_ctrl, uint16_t * p_horizontal_size, uint16_t * p_vertical_size )
```

Obtain the size of an image being decoded.

Return values

FSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by <code>p_horizontal_size</code> and <code>p_vertical_size</code> .
FSP_ERR_ASSERTION	Pointer to the control block is NULL and/or size is not ready.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ **R_JPEG_DecodeImageSubsampleSet()**

```
fsp_err_t R_JPEG_DecodeImageSubsampleSet ( jpeg_ctrl_t *const p_api_ctrl,
jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample )
```

Configure horizontal and vertical subsampling.

Note

This function can be used to scale the output of decoded image data.

Return values

FSP_SUCCESS	Horizontal subsample value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ **R_JPEG_DecodePixelFormatGet()**

```
fsp_err_t R_JPEG_DecodePixelFormatGet ( jpeg_ctrl_t * p_api_ctrl, jpeg_color_space_t *
p_color_space )
```

Get the color format of the JPEG being decoded.

Return values

FSP_SUCCESS	The color format was successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_ModeSet()

```
fsp_err_t R_JPEG_ModeSet ( jpeg_ctrl_t *const p_api_ctrl, jpeg_mode_t mode )
```

Switch between encode and decode mode (or vice-versa).

Note

The codec must not be idle in order to switch modes.

Return values

FSP_SUCCESS	Mode changed successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	JPEG Codec is currently in use.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

4.2.39 Key Interrupt (r_kint)

Modules

Functions

```

const *const p_cfg)
```

```
fsp_err_t R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl)
```

Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the [Key Matrix Interface](#).

Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

Configuration

Build Time Configurations for r_kint

The following build time configurations are defined in fsp_cfg/r_kint_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Input > Key Matrix (r_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r_kint).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_kint0	Module name.
Input > Key Interrupt Flag Mask	<ul style="list-style-type: none"> • Channel 0 • Channel 1 • Channel 2 • Channel 3 • Channel 4 • Channel 5 • Channel 6 • Channel 7 		Select channels to enable.
Interrupts > Trigger Type	<ul style="list-style-type: none"> • Falling Edge • Rising Edge 	Rising Edge	Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge.
Interrupts > Callback	Name must be a valid C symbol	kint_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.

Interrupts > Key
Interrupt Priority

MCU Specific Options

Select the key interrupt
priority.

Clock Configuration

The KINT peripheral runs on PCLKB.

Pin Configuration

The KRn pins are key switch matrix row input pins.

Usage Notes

Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

Note

In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.

Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

Examples

Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask      = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
    /* Configure the KINT. */
    fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
```

```

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Enable the KINT. */
err = R_KINT_Enable(&g_kint_ctrl);
assert(FSP_SUCCESS == err);

while (0 == g_kint_edge_detected)
{
/* Wait for interrupt. */
}
}

```

Data Structures

struct [kint_instance_ctrl_t](#)

Data Structure Documentation

◆ kint_instance_ctrl_t

struct [kint_instance_ctrl_t](#)

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [keymatrix_api_t::open](#) is called.

Function Documentation

◆ R_KINT_Open()

[fsp_err_t](#) R_KINT_Open ([keymatrix_ctrl_t](#)*const *p_api_ctrl*, [keymatrix_cfg_t](#) const *const *p_cfg*)

Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements [keymatrix_api_t::open](#).

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One of the following parameters may be NULL: <i>p_cfg</i> , or <i>p_ctrl</i> or the callback.
FSP_ERR_ALREADY_OPEN	The module has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel mask is invalid.

◆ **R_KINT_Enable()**

`fsp_err_t R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl)`

This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements `keymatrix_api_t::enable`.

Return values

FSP_SUCCESS	Interrupt enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The peripheral is not opened.

◆ **R_KINT_Disable()**

`fsp_err_t R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl)`

This function disables interrupts for the KINT peripheral. Implements `keymatrix_api_t::disable`.

Return values

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_KINT_Close()**

`fsp_err_t R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl)`

Clear the KINT configuration and disable the KINT IRQ. Implements `keymatrix_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The module is not opened.

4.2.40 Low Power Modes (r_lpm)

Modules

Functions

`fsp_err_t R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)`

`fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)`

`fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)`

`fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)`

`fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)`

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the [Low Power Modes Interface](#).

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
 - Deep Software Standby mode (On supported MCUs)
 - Software Standby mode
 - Sleep mode
 - Snooze mode
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in `fsp_cfg/r_lpm_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Standby Limit	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, standby configuration only

applies in R_LPM_LowPowerModeEnter.
Otherwise, standby configuration applies to any WFI call.

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_lpm0	Module name.
General > Low Power Mode	MCU Specific Options		Power mode to be entered.
General > Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Standby Options > Wake Sources	MCU Specific Options		Enable wake from standby from these Sources.
Standby Options > Snooze Request Source	MCU Specific Options		Select the event that will enter snooze.
Standby Options > Snooze End Sources	MCU Specific Options		Enable wake from snooze from these sources.
Standby Options > DTC state in Snooze Mode	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable wake from snooze from this source.
Standby Options > Snooze Cancel Source	MCU Specific Options		Select an interrupt source to cancel snooze.
Deep Standby Options > I/O Port Retention	MCU Specific Options		Select the state of the IO Pins after exiting deep standby mode.
Deep Standby Options > Power-Supply Control	MCU Specific Options		Select the state of the internal power supply in deep standby mode.
Deep Standby Options > Cancel Sources	MCU Specific Options		Enable wake from deep standby using these sources.
Deep Standby Options	MCU Specific Options		Falling edge trigger is

> Cancel Edges

default. Select sources to enable wake from deep standby with rising edge.

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

Deep Software Standby Mode is only available on some MCU devices. The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the [R_LPM_IoKeepClear](#) API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
    fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
    fsp_err_t err;
```

```
err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Check the Deep Software Standby Reset Flag. */
if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
{
/* Clear the IOKEEP bit to allow I/O Port use. */
err = R_LPM_IoKeepClear(&g_lpm_ctrl);
assert(FSP_SUCCESS == err);
}
/* Add user code here. */
/* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
assert(FSP_SUCCESS == err);
err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
/* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
* Deep software standby exits by resetting the MCU. */
assert(FSP_SUCCESS == err);
}
```

Data Structures

struct [lpm_instance_ctrl_t](#)

Data Structure Documentation

◆ [lpm_instance_ctrl_t](#)

struct [lpm_instance_ctrl_t](#)

LPM private control block. DO NOT MODIFY. Initialization occurs when [R_LPM_Open\(\)](#) is called.

Function Documentation

◆ **R_LPM_Open()**

```
fsp_err_t R_LPM_Open ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Perform any necessary initialization

Return values

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: <ul style="list-style-type: none"> • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_Close()`fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)`

Close the LPM Instance

Return values

FSP_SUCCESS	LPM driver closed
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_ASSERTION	Null Pointer

◆ R_LPM_LowPowerReconfigure()

```
fsp_err_t R_LPM_LowPowerReconfigure ( lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg )
```

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

FSP_SUCCESS	Low power mode successfully applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: <ul style="list-style-type: none"> Invalid snooze entry source Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> Invalid low power mode Invalid DTC option for snooze mode Invalid deep standby end sources Invalid deep standby end sources edges Invalid power supply option for deep standby Invalid IO port option for deep standby Invalid output port state setting for standby or deep standby Invalid sources for wake from standby mode Invalid power supply option for standby Invalid IO port option for standby Invalid standby end sources Invalid standby end sources edges

◆ **R_LPM_LowPowerModeEnter()**

`fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)`

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: <ul style="list-style-type: none"> • HOCO was not system clock when using snooze mode with SCIO/RXD0. • HOCO was not stable when using snooze mode with SCIO/RXD0. • MOCO was running when using snooze mode with SCIO/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCIO/RXD0. • PLL was running when using snooze mode with SCIO/RXD0. • Unable to disable oscillator stop detect when using standby or deep standby.

◆ **R_LPM_IoKeepClear()**

`fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)`

Clear the IOKEEP bit after deep software standby

Return values

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

4.2.41 Low Voltage Detection (r_lvd)

Modules

Functions

`fsp_err_t` `R_LVD_Open` (`lvd_ctrl_t *const p_api_ctrl`, `lvd_cfg_t const *const p_cfg`)

`fsp_err_t` `R_LVD_StatusGet` (`lvd_ctrl_t *const p_api_ctrl`, `lvd_status_t *p_lvd_status`)

`fsp_err_t` `R_LVD_StatusClear` (`lvd_ctrl_t *const p_api_ctrl`)

`fsp_err_t` `R_LVD_CallbackSet` (`lvd_ctrl_t *const p_api_ctrl`, `void(*p_callback)(lvd_callback_args_t*)`, `void const *const p_context`, `lvd_callback_args_t *const p_callback_memory`)

Detailed Description

Driver for the LVD peripheral on RA MCUs. This module implements the [Low Voltage Detection Interface](#).

Overview

The Low Voltage Detection module configures the voltage monitors to detect when V_{CC} crosses a specified threshold.

Features

The LVD HAL module supports the following functions:

- Two run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2)
 - Configurable voltage threshold
 - Digital filter (Available on specific MCUs)
 - Support for both interrupt or polling
 - NMI or maskable interrupt can be configured
 - Rising, falling, or both edge event detection
 - Support for resetting the MCU when V_{CC} falls below configured threshold.

Configuration

Build Time Configurations for r_lvd

The following build time configurations are defined in `fsp_cfg/r_lvd_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Low Voltage Detection (r_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low Voltage Detection (r_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_lvd	Module name.
Monitor Number	MCU Specific Options		Select the LVD monitor.
Digital Filter	MCU Specific Options		Enable the digital filter and select the digital filter clock divider.
Voltage Threshold	MCU Specific Options		Select the low voltage detection threshold.
Detection Response	<ul style="list-style-type: none"> • Maskable interrupt • Non-maskable interrupt • Reset MCU (Only available for falling edge) • No response (Voltage monitor status will be polled) 	No response (Voltage monitor status will be polled)	Select what happens when the voltage crosses the threshold voltage.
Voltage Slope	<ul style="list-style-type: none"> • Falling voltage • Rising voltage • Rising or falling voltage 	Falling voltage	Select detection on rising voltage, falling voltage or both.
Negation Delay	<ul style="list-style-type: none"> • Delay from reset • Delay from voltage returning to normal range 	Delay from reset	Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range.
Monitor Interrupt Callback	Name must be a valid C symbol.	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
LVD Monitor Interrupt Priority	MCU Specific Options		Select the LVD Monitor interrupt priority.

Clock Configuration

The LOCO clock must be enabled in order to use the digital filter.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Startup Edge Detection

If V_{CC} is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If V_{CC} is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until V_{CC} falls below the threshold and then rises above it again.

Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold (V_{DET0})
- Reset the device when V_{CC} falls below V_{DET0}

Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- When the detection response is set to reset, only voltage falling edge detection is possible.

Examples

Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
    while (1)
    {
        lvd_status_t status;
        err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
    }
}
```

```
    assert(FSP_SUCCESS == err);
if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
    {
        err = R_LVD_StatusClear(&g_lvd_ctrl);
        assert(FSP_SUCCESS == err);
/* Do something */
    }
}
```

Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
while (1)
    {
/* Application Process */
/* Application will be interrupted when Vcc crosses the configured threshold. */
    }
}
/* Called when Vcc crosses configured threshold. */
void lvd_callback (lvd_callback_args_t * p_args)
{
    if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
    {
/* Do Something */
    }
}
```

Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
    if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
    {
        /* The system is coming out of reset because Vcc crossed configured voltage
        threshold. */
        /* Clear Voltage Monitor 1 Reset Detect Flag. */
        R_SYSTEM->RSTSR0_b.LVD1RF = 0;
    }
    fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    while (1)
    {
        /* Application Process */
        /* Application will reset when Vcc crosses the configured threshold. */
    }
}
```

Data Structures

struct [lvd_instance_ctrl_t](#)

Data Structure Documentation

◆ [lvd_instance_ctrl_t](#)

struct [lvd_instance_ctrl_t](#)

LVD instance control structure

Function Documentation

◆ R_LVD_Open()

```
fsp_err_t R_LVD_Open ( lvd_ctrl_t *const p_api_ctrl, lvd_cfg_t const *const p_cfg )
```

Initializes a voltage monitor and detector according to the passed-in configuration structure.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

Note

Digital filter is not to be used with standby modes.

Startup time can take on the order of milliseconds for some configurations.

Example:

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	Requested configuration was invalid
FSP_ERR_ALREADY_OPEN	The instance was already opened
FSP_ERR_IN_USE	Another instance is already using the desired monitor
FSP_ERR_UNSUPPORTED	Digital filter was enabled on a device that does not support it

◆ **R_LVD_Close()**

```
fsp_err_t R_LVD_Close ( lvd_ctrl_t *const p_api_ctrl)
```

Disables the LVD peripheral. Closes the driver instance.

Parameters

[in]	p_api_ctrl	Pointer to the control block structure for the driver instance
------	------------	--

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ **R_LVD_StatusGet()**

```
fsp_err_t R_LVD_StatusGet ( lvd_ctrl_t *const p_api_ctrl, lvd_status_t * p_lvd_status )
```

Get the current state of the monitor (threshold crossing detected, voltage currently above or below threshold).

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[out]	p_lvd_status	Pointer to status structure

Example:

```
err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ **R_LVD_StatusClear()**

```
fsp_err_t R_LVD_StatusClear ( lvd_ctrl_t *const p_api_ctrl)
```

Clears the latched status of the monitor.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
------	------------	--

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

◆ **R_LVD_CallbackSet()**

```
fsp_err_t R_LVD_CallbackSet ( lvd_ctrl_t *const p_api_ctrl, void(*)(lvd_callback_args_t *)
p_callback, void const *const p_context, lvd_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `lvd_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

4.2.42 Operational Amplifier (r_opamp)

Modules

Functions

```
fsp_err_t R_OPAMP_Open (opamp_ctrl_t *const p_api_ctrl, opamp_cfg_t const
*const p_cfg)
```

```
fsp_err_t R_OPAMP_InfoGet (opamp_ctrl_t *const p_api_ctrl, opamp_info_t
*const p_info)
```

```
fsp_err_t R_OPAMP_Start (opamp_ctrl_t *const p_api_ctrl, uint32_t const
channel_mask)
```

```
fsp_err_t R_OPAMP_Stop (opamp_ctrl_t *const p_api_ctrl, uint32_t const
channel_mask)
```

```
fsp_err_t R_OPAMP_StatusGet (opamp_ctrl_t *const p_api_ctrl, opamp_status_t
*const p_status)
```

```
fsp_err_t R_OPAMP_Trim (opamp_ctrl_t *const p_api_ctrl, opamp_trim_cmd_t
const cmd, opamp_trim_args_t const *const p_args)
```

```
fsp_err_t R_OPAMP_Close (opamp_ctrl_t *const p_api_ctrl)
```

Detailed Description

Driver for the OPAMP peripheral on RA MCUs. This module implements the [OPAMP Interface](#).

Overview

The OPAMP HAL module provides a high level API for signal amplification applications and supports the OPAMP peripheral available on RA MCUs.

Features

- Low power or high-speed mode
- Start by software or AGT compare match
- Stop by software or ADC conversion end (stop by ADC conversion end only supported on op-amp channels configured to start by AGT compare match)
- Trimming available on some MCUs (see hardware manual)

Configuration

Build Time Configurations for r_opamp

The following build time configurations are defined in fsp_cfg/r_opamp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > Operational Amplifier (r_opamp)

This module can be added to the Stacks tab via New Stack > Analog > Operational Amplifier

(r_opamp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_opamp0	Module name.
AGT Start Trigger Configuration (N/A unless AGT Start Trigger is Selected for the Channel)	<ul style="list-style-type: none"> AGT1 Compare Match Starts OPAMPs 0 and 2 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 1 and 3 if configured for AGT Start AGT1 Compare Match Starts OPAMPs 0 and 1 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 2 and 3 if configured for AGT Start AGT1 Compare Match Starts all OPAMPs configured for AGT Start 	AGT1 Compare Match Starts all OPAMPs configured for AGT Start	Configure which AGT channel event triggers which op-amp channel. The AGT compare match event only starts the op-amp channel if the AGT Start trigger is selected in the Trigger configuration for the channel.
Power Mode	MCU Specific Options		Configure the op-amp based on power or speed requirements. This setting affects the minimum required stabilization time. Middle speed is not available for all MCUs.
Trigger Channel 0	MCU Specific Options		Select the event triggers to start or stop op-amp channel 0. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 1	MCU Specific Options		Select the event triggers to start or stop

			op-amp channel 1. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 2	<ul style="list-style-type: none"> • Software Start • Software Stop • AGT Start • Software Stop • AGT Start ADC • Stop 	Software Start Software Stop	Select the event triggers to start or stop op-amp channel 2. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
Trigger Channel 3	MCU Specific Options		Select the event triggers to start or stop op-amp channel 3. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel.
OPAMP AMP0OS	MCU Specific Options		Select output to connect to AMP0O pin
OPAMP AMP0PS	MCU Specific Options		Select input to connect to AMP0+ pin
OPAMP AMP0MS	MCU Specific Options		Select input to connect to AMP0- pin
OPAMP AMP1PS	MCU Specific Options		Select input to connect to AMP1+ pin
OPAMP AMP1MS	MCU Specific Options		Select input to connect to AMP1- pin
OPAMP AMP2PS	MCU Specific Options		Select input to connect to AMP2+ pin
OPAMP AMP2MS	MCU Specific Options		Select input to connect to AMP2- pin

Clock Configuration

The OPAMP runs on PCLKB.

Pin Configuration

To use the OPAMP HAL module, the port pins for the channels receiving the analog input must be set as inputs on the **Pins** tab of the RA Configuration editor.

Refer to the most recent FSP Release Notes for any additional operational limitations for this module.

Usage Notes

Trimming the OPAMP

- On MCUs that support trimming, the op-amp trim register is set to the factory default after the Open API is called.
- This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default trim values.
- Supported on selected MCUs. See hardware manual for details.
- Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).
- This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling the trim API with the command OPAMP_TRIM_CMD_START again.
 - The trim procedure works as follows:
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
 - Connect a fixed voltage to the Pch (+) input.
 - Connect the Nch (-) input to the op-amp output to create a voltage follower.
 - Ensure the op-amp is operating and stabilized.
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
 - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
 - Iterate over the following loop 5 times:
 - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
 - If $A \leq B$, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
 - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
 - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
 - Iterate over the following loop 5 times:
 - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
 - If $A \leq B$, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Examples

Basic Example

This is a basic example of minimal use of the R_OPAMP in an application. The example demonstrates

configuring OPAMP channel 0 for high speed mode, starting the OPAMP and reading the status of the OPAMP channel running. It also verifies that the stabilization wait time is the expected time for selected power mode

```
#define OPAMP_EXAMPLE_CHANNEL (0U)

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);

    /* Look up the required stabilization wait time. */
    opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);

    /* Wait for the OPAMP to stabilize. */
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
}

```

Trim Example

This example demonstrates the typical trimming procedure for opamp channel 0 using [R_OPAMP_Trim\(\)](#) API.

```
#ifndef OPAMP_EXAMPLE_CHANNEL
#define OPAMP_EXAMPLE_CHANNEL (0U)
#endif

#ifndef OPAMP_EXAMPLE_ADC_CHANNEL
#define OPAMP_EXAMPLE_ADC_CHANNEL (ADC_CHANNEL_2)
#endif

#define ADC_SCAN_END_DELAY (100U)
#define OPAMP_TRIM_LOOP_COUNT (5)
#define ADC_SCAN_END_MAX_TIMEOUT (0xFFFF)

```

```
uint32_t          g_callback_event_counter = 0;
opamp_trim_args_t trim_args_ch =
{
    .channel = OPAMP_EXAMPLE_CHANNEL,
    .input   = OPAMP_TRIM_INPUT_PCH
};
/* This callback is called when ADC Scan Complete event is generated. */
void adc_callback (adc_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void trimming_example (void)
{
    fsp_err_t err;
    /* On RA2A1, configure negative feedback and put DAC12 signal on AMP0+ Pin. */
    g_opamp_cfg_extend.plus_input_select_opamp0 = OPAMP_PLUS_INPUT_AMPPS7;
    g_opamp_cfg_extend.minus_input_select_opamp0 = OPAMP_MINUS_INPUT_AMPMS7;
    /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);
    /* Look up the required stabilization wait time. */
    opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);
    /* Wait for the OPAMP to stabilize. */
    R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
    /* Call trim() for the Pch (+) side input */
    trim_procedure(&trim_args_ch);
    assert(FSP_SUCCESS == err);
}
```

```
    trim_args_ch.input = OPAMP_TRIM_INPUT_NCH;
/* Call trim() for the Nch (-) side input */
    trim_procedure(&trim_args_ch);
}
void trim_procedure (opamp_trim_args_t * trim_args)
{
    fsp_err_t err;
/* Call trim() for the selected channel and input with command OPAMP_TRIM_CMD_START.
*/
    err = R_OPAMP_Trim(&g_opamp_ctrl, OPAMP_TRIM_CMD_START, trim_args);
    assert(FSP_SUCCESS == err);
/* Measure the fixed voltage connected to the channel input using the SAR ADC and
save the value
* (referred to as result_a later in this procedure). */
/* Reset the ADC callback counter */
    g_callback_event_counter = 0;
    err = R_ADC_ScanStart(&g_adc_ctrl);
    assert(FSP_SUCCESS == err);
/* Wait for ADC scan complete flag */
    uint32_t timeout = ADC_SCAN_END_MAX_TIMEOUT;
while (g_callback_event_counter == 0 && timeout != 0)
    {
        timeout--;
    }
if (0 == timeout)

Data Structure Documentation

◆ opamp_extended_cfg_t

```
struct opamp_extended_cfg_t
```

OPAMP configuration extension. This extension is required and must be provided in [opamp_cfg_t::p_extend](#).

Data Fields

opamp_agt_link_t	agt_link	Configure which AGT links are paired to which channel. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel.
opamp_mode_t	mode	Low power, middle speed, or high speed mode.

opamp_trigger_t	trigger_channel_0	Start and stop triggers for channel 0.
opamp_trigger_t	trigger_channel_1	Start and stop triggers for channel 1.
opamp_trigger_t	trigger_channel_2	Start and stop triggers for channel 2.
opamp_trigger_t	trigger_channel_3	Start and stop triggers for channel 3.
opamp_plus_input_t	plus_input_select_opamp0	OPAMP0+ connection.
opamp_minus_input_t	minus_input_select_opamp0	OPAMP0- connection.
opamp_output_t	output_select_opamp0	OPAMP0O connection.
opamp_plus_input_t	plus_input_select_opamp1	OPAMP1+ connection.
opamp_minus_input_t	minus_input_select_opamp1	OPAMP1- connection.
opamp_plus_input_t	plus_input_select_opamp2	OPAMP2+ connection.
opamp_minus_input_t	minus_input_select_opamp2	OPAMP2- connection.

◆ opamp_instance_ctrl_t

struct opamp_instance_ctrl_t
OPAMP instance control block. DO NOT INITIALIZE. Initialized in opamp_api_t::open() .

Macro Definition Documentation

◆ OPAMP_MASK_CHANNEL_0

#define OPAMP_MASK_CHANNEL_0
Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ **opamp_trigger_t**

enum <code>opamp_trigger_t</code>	
Start and stop trigger for the op-amp.	
Enumerator	
<code>OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP</code>	Start and stop with APIs.
<code>OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP</code>	Start by AGT compare match and stop with API.
<code>OPAMP_TRIGGER_AGT_START_ADC_STOP</code>	Start by AGT compare match and stop after ADC conversion.

◆ **opamp_agt_link_t**

enum <code>opamp_agt_link_t</code>	
Which AGT timer starts the op-amp. Only applies to channels if <code>OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP</code> or <code>OPAMP_TRIGGER_AGT_START_ADC_STOP</code> is selected for the channel. If <code>OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP</code> is selected for a channel, then no AGT compare match event will start that op-amp channel.	
Enumerator	
<code>OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPA_MP_1_3</code>	OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match.
<code>OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPA_MP_2_3</code>	OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match.
<code>OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3</code>	All OPAMP channels are started by AGT1 compare match.

◆ **opamp_mode_t**

enum <code>opamp_mode_t</code>	
Op-amp mode.	
Enumerator	
OPAMP_MODE_LOW_POWER	Low power mode.
OPAMP_MODE_MIDDLE_SPEED	Middle speed mode (not supported on all MCUs)
OPAMP_MODE_HIGH_SPEED	High speed mode.

◆ **opamp_plus_input_t**

enum <code>opamp_plus_input_t</code>	
Options to connect AMPnPS pins.	
Enumerator	
OPAMP_PLUS_INPUT_NONE	No Connection.
OPAMP_PLUS_INPUT_AMPPS0	Set AMPPS0. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS1	Set AMPPS1. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS2	Set AMPPS2. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS3	Set AMPPS3. See hardware manual for channel specific options.
OPAMP_PLUS_INPUT_AMPPS7	Set AMPPS7. See hardware manual for channel specific options.

◆ **opamp_minus_input_t**

enum <code>opamp_minus_input_t</code>	
Options to connect AMPnMS pins.	
Enumerator	
OPAMP_MINUS_INPUT_NONE	No Connection.
OPAMP_MINUS_INPUT_AMPMS0	Set AMPMS0. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS1	Set AMPMS1. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS2	Set AMPMS2. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS3	Set AMPMS3. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS4	Set AMPMS4. See hardware manual for channel specific options.
OPAMP_MINUS_INPUT_AMPMS7	Set AMPMS7. See hardware manual for channel specific options.

◆ **opamp_output_t**

enum <code>opamp_output_t</code>	
Options to connect AMP0OS pin.	
Enumerator	
OPAMP_OUTPUT_NONE	No Connection.
OPAMP_OUTPUT_AMPOS0	Set AMPOS0. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS1	Set AMPOS1. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS2	Set AMPOS2. See hardware manual for channel specific options.
OPAMP_OUTPUT_AMPOS3	Set AMPOS3. See hardware manual for channel specific options.

Function Documentation

◆ R_OPAMP_Open()

```
fsp_err_t R_OPAMP_Open ( opamp_ctrl_t *const p_api_ctrl, opamp_cfg_t const *const p_cfg )
```

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements `opamp_api_t::open`.

The op-amp is not operational until the `opamp_api_t::start` is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until `opamp_api_t::start` and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Initialize the OPAMP module. */
err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
```

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Control block is already opened.
FSP_ERR_INVALID_ARGUMENT	An attempt to configure OPAMP in middle speed mode on MCU that does not support middle speed mode.

◆ **R_OPAMP_InfoGet()**

```
fsp_err_t R_OPAMP_InfoGet ( opamp_ctrl_t*const p_api_ctrl, opamp_info_t*const p_info )
```

Provides the minimum stabilization wait time in microseconds. Implements `opamp_api_t::infoGet`.

• **Example:**

```
/* Look up the required stabilization wait time. */
opamp_info_t info;

err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);

assert(FSP_SUCCESS == err);

/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us,
BSP_DELAY_UNITS_MICROSECONDS);
```

Return values

FSP_SUCCESS	information on <code>opamp_power_mode</code> stored in <code>p_info</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_OPAMP_Start()**

```
fsp_err_t R_OPAMP_Start ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements `opamp_api_t::start`.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after `opamp_api_t::open` and before `opamp_api_t::start`.

Example:

```
/* Start the OPAMP module. */
err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Op-amp started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

◆ **R_OPAMP_Stop()**

```
fsp_err_t R_OPAMP_Stop ( opamp_ctrl_t *const p_api_ctrl, uint32_t const channel_mask )
```

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements `opamp_api_t::stop`.

Return values

FSP_SUCCESS	Op-amp stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

◆ R_OPAMP_StatusGet()

```
fsp_err_t R_OPAMP_StatusGet ( opamp_ctrl_t *const p_api_ctrl, opamp_status_t *const p_status )
```

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements `opamp_api_t::statusGet`.

Return values

FSP_SUCCESS	Operating status of each op-amp provided in <code>p_status</code> .
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_OPAMP_Trim()

```
fsp_err_t R_OPAMP_Trim ( opamp_ctrl_t *const p_api_ctrl, opamp_trim_cmd_t const cmd,
opamp_trim_args_t const *const p_args )
```

On MCUs that support trimming, the op-amp trim register is set to the factory default after `open()`. This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (`OPAMP_MODE_LOW_POWER`).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling `trim()` with command `OPAMP_TRIM_CMD_START` again.

Implements `opamp_api_t::trim`.

Reference: Section 37.9 "User Offset Trimming" RA2A1 hardware manual R01UM0008EU0130. The trim procedure works as follows:

- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Connect a fixed voltage to the Pch (+) input.
- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
 - Call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.
 - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
 - If $A \leq B$, call `trim()` for the Pch (+) side input with command `OPAMP_TRIM_CMD_CLEAR_BIT`.
- Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_START`.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
 - Call `trim()` for the Nch (-) side input with command `OPAMP_TRIM_CMD_NEXT_STEP`.

- Measure the op-amp output using the SAR ADC (referred to as B in the next step).
- If $A \leq B$, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Return values

FSP_SUCCESS	Conversion result in p_data.
FSP_ERR_UNSUPPORTED	Trimming is not supported on this MCU.
FSP_ERR_INVALID_STATE	The command is not valid in the current state of the trim state machine.
FSP_ERR_INVALID_ARGUMENT	The requested channel is not operating or the trim procedure is not in progress for this channel/input combination.
FSP_ERR_INVALID_MODE	Trim is not allowed in low power mode.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_OPAMP_Close()

```
fsp_err_t R_OPAMP_Close ( opamp_ctrl_t*const p_api_ctrl)
```

Stops the op-amps. Implements `opamp_api_t::close`.

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

Variable Documentation**◆ g_opamp_on_opamp**

```
const opamp_api_t g_opamp_on_opamp
```

fsp_err_t	R_OSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)

Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes
- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device
- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read and write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

Note

For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI Flash:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI Flash (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable	100	Specify the read idle time.

	value of 127		
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_osp0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the OSPI chip select line to use.
General > Flash Size	Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF	0x04000000	Specify the OctaFlash size in bytes.
General > SPI Protocol	<ul style="list-style-type: none"> • SPI • Single data rate OPI • Dual data rate OPI 	SPI	Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using R_OSPI_DirectTransfer() .
General > Address Bytes	<ul style="list-style-type: none"> • 3 • 4 	4	Select the number of address bytes.
OPI Mode > Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
OPI Mode > Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
OPI Mode > Command Definitions > Page Program Command	Must be a 16-bit OSPI Page Program Command under OPI Mode Command Definitions	0x12ED	The command to program a page in OPI mode.
OPI Mode > Command Definitions > Read Command	Must be a 16-bit OSPI Read Command under OPI Mode Command Definitions	0xEC13	The command to read in SOPI mode (8READ).
OPI Mode > Command Definitions > Dual Read Command	Must be a 16-bit OSPI Dual Read Command under OPI Mode Command Definitions	0xEE11	The command to read in DOPI mode (8DTRD).
OPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under OPI	0x06F9	The command to enable write in OPI mode.

	Mode Command Definitions		
OPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under OPI Mode Command Definitions	0x05FA	The command to query the status of a write or erase command in OPI mode.
OPI Mode > OM_DQS Enable Counter > SOPI	Must be an integer between 0 and 255	9	OM_DQS enable counter for memory access. Setting for SOPI mode.
OPI Mode > OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	6	OM_DQS enable counter for memory access. Setting for DOPI mode.
OPI Mode > Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
OPI Mode > Memory Read Dummy Cycles	Must be an integer between 6 and 10	10	Memory read dummy cycles
OPI Mode > DOPI Byte Order	<ul style="list-style-type: none"> • Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2 	Byte0, Byte1, Byte2, Byte3	Byte order on the external bus
SPI Mode > Command Definitions > Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode Command Definitions	0x12	The command to program a page in SPI mode.
SPI Mode > Command Definitions > Read Command	Must be a 8-bit OSPI Read Command under SPI Mode Command Definitions	0x13	The command to read in SPI mode.
SPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode Command Definitions	0x06	The command to enable write in SPI mode.
SPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under SPI Mode Command Definitions	0x05	The command to query the status of a write or erase command in SPI mode.
Common Command Definitions > Sector Erase Command	Must be a value greater than or equal to 0	0x21DE	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Common Command Definitions > Block Erase Command	Must be a value greater than or equal to 0	0xDC23	The command to erase a block. Set Block Erase Size to 0 if

Common Command Definitions > Chip Erase Command	Must be a value greater than or equal to 0	0xC738	unused. The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Common Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Common Command Definitions > Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Common Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Common Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Chip Select Timing Setting > Memory Mapped Read Command Interval	<ul style="list-style-type: none"> • 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17 	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	<ul style="list-style-type: none"> • 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17 	2	Memory mapped write command execution interval setting in OCTACLK units

Memory Write Dummy Cycles	Must be an integer between 3 and 8	4	Memory write dummy cycles
DOPI Byte Order	<ul style="list-style-type: none"> • Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2 	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus
Chip Select Maximum Low Time (us)	Must be an integer greater than or equal to 0	4	Chip Select Maximum Low Time (tCSM).

Clock Configuration

PCLKB is the Octal-SPI bus interface, and PCLKA is used to set OSPI registers.

The signals to the OSPI device are derived from OCTASPICK. The OMSCLK signal is OCTASPICK / 2. Data can be output at the OCTASPICK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTASPICK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTASPICK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O

- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with `IOPORT_CFG_DRIVE_HS_HIGH`.

Chip Select pins should be configured with at least `IOPORT_CFG_DRIVE_MEDIUM`.

Usage Notes

Usage Notes for OctaFlash support

Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer [Direct Memory Access Controller \(r_dmac\)](#).

OSPI Memory Mapped Access

After [R_OSPI_Open\(\)](#) completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling [R_OSPI_Open\(\)](#) with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using [R_OSPI_SpiProtocolSet\(\)](#) API. The appropriate preamble pattern can be written to the desired address using the [R_OSPI_Write\(\)](#) API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling [R_OSPI_Open\(\)](#).

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using [R_OSPI_SpiProtocolSet\(\)](#), please select latencies required for DOPI before calling [R_OSPI_Open\(\)](#).

OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

Usage Notes for OctaRAM support

OSPI Memory Mapped Access

After `R_OSPI_Open()` completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call `R_OSPI_Open()` without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. `R_OSPI_AutoCalibrate()` should be then called to perform auto-calibration.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

Limitations

Developers should be aware of the following limitations when using the OSPI driver:

OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).
- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMCLK greater than 50MHz.

Examples

OSPI Flash:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =
"ABCDEFGHJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));
void r_ospi_example_function (void)
```

```
{
/* Add code here. */
}
void r_ospi_basic_example (void)
{
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
assert(FSP_SUCCESS == err);
/* (Optional) Change SPI to DOPI mode */
r_ospi_example_spi_to_dopi();
/* After R_OSPI_Open() and any required device specific intiialization, data can be
read directly from the OSPI flash. */
memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
/* After R_OSPI_Open() and any required device specific intiialization, functions in
the OSPI flash can be called. */
r_ospi_example_function();
}
```

Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
spi_flash_direct_transfer_t ospi_test_direct_transfer =
{
.command = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
.address = 0U,
.data = 0U,
.command_length = 1U,
.address_length = 0U,
.data_length = 0U,
.dummy_cycles = 0U
}
```

```

};

/* Open the OSPI instance. */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
assert(FSP_SUCCESS == err);

/* Write Enable */
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
assert(FSP_SUCCESS == err);

/* Read Status Register */
ospi_test_direct_transfer.command = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
ospi_test_direct_transfer.data_length = 1U;
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
assert(FSP_SUCCESS == err);

/* Check if Write Enable is set */
if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
{
    __BKPT(0);
}
}

```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```

#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
    0xF7, 0x00, 0xF7
};

void ospi_example_wait_until_wip (void)
{

```

```
fsp_err_t          err = FSP_SUCCESS;
spi_flash_status_t status;

status.write_in_progress = true;

uint32_t timeout = UINT32_MAX;

while ((status.write_in_progress) && (--timeout))
{
    err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
    assert(FSP_SUCCESS == err);
}

if (0 == timeout)
{
    assert(FSP_SUCCESS == err);
}
}

void r_ospi_auto_calibrate_example (void)
{
    /* Open the OSPI instance. */
    /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
    fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);

    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);

    /* Wait until write has been completed */
    ospi_example_wait_until_wip();

    /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
}
```

Octack Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctackUpdate to change the Octal-SPI clock frequency during run time. The OCTACK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
    /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}

```

OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

OSPI RAM:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
/* Place uninitialized data buffers in the ospi_device_0_no_load section.
 * Use ospi_device_1_no_load section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
void r_ospi_ram_basic_example (void)
{
    /* Open the OSPI instancee.
 * Ensure valid setting of the 'Data latching delay' field in the configurator.
 * To successfully perform OSPI RAM reads this value must not be 0.
 */
    fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
    /* After R_OSPI_Open() and any required device specific initialization, data can be

```

```
read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
    /* Open the OSPI instancee */
    fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
    /* OctaRAM Configuration Register (cr) read and write command definition */
    spi_flash_direct_transfer_t read_cr =
    {

Function Documentation

◆ **R_OSPI_Open()**

```
fsp_err_t R_OSPI_Open ( spi_flash_ctrl_t * p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements `spi_flash_api_t::open`.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ **R_OSPI_Close()**

```
fsp_err_t R_OSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the OSPI driver module.

Implements `spi_flash_api_t::close`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_OSPI_DirectWrite()**

```
fsp_err_t R_OSPI_DirectWrite ( spi_flash_ctrl_t* p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements `spi_flash_api_t::directWrite`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_DirectRead()**

```
fsp_err_t R_OSPI_DirectRead ( spi_flash_ctrl_t* p_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements `spi_flash_api_t::directRead`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_DirectTransfer()**

```
fsp_err_t R_OSPI_DirectTransfer ( spi_flash_ctrl_t* p_ctrl, spi_flash_direct_transfer_t*const p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements `spi_flash_api_t::directTransfer`.

Example:

```
/* Write Enable */
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_OSPI_SpiProtocolSet()**

```
fsp_err_t R_OSPI_SpiProtocolSet ( spi_flash_ctrl_t * p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements `spi_flash_api_t::spiProtocolSet`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ **R_OSPI_XipEnter()**

```
fsp_err_t R_OSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)
```

Enters Single Continuous Read/Write mode.

Implements `spi_flash_api_t::xipEnter`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_XipExit()**

```
fsp_err_t R_OSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)
```

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_Write()**

```
fsp_err_t R_OSPI_Write ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

Example:

```
err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> , <code>p_dest</code> or <code>p_src</code> is NULL, or <code>byte_count</code> crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R_OSPI_Erase()**

```
fsp_err_t R_OSPI_Erase ( spi_flash_ctrl_t* p_ctrl, uint8_t*const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or <code>byte_count</code> is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R_OSPI_StatusGet()**

```
fsp_err_t R_OSPI_StatusGet ( spi_flash_ctrl_t* p_ctrl, spi_flash_status_t*const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

Example:

```
err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The write status is in <code>p_status</code> .
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_status</code> is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_BankSet()**

```
fsp_err_t R_OSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access.

Implements `spi_flash_api_t::bankSet`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_AutoCalibrate()**

```
fsp_err_t R_OSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern.

Note

The preamble pattern must be written to the configured address before calling this API. Implements `spi_flash_api_t::autoCalibrate`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

4.2.44 Parallel Data Capture (r_pdc)

Modules

Functions

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t *const p_api_ctrl, pdc_cfg_t const *const p_cfg)
```

Powers on PDC, handles required initialization described in the hardware manual. [More...](#)

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t *const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts. [More...](#)

```
fsp_err_t R_PDC_CaptureStart (pdc_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer)
```

Starts a capture. Enables interrupts. [More...](#)

Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the [PDC Interface](#).

Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianess of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

Configuration

Build Time Configurations for r_pdc

The following build time configurations are defined in fsp_cfg/r_pdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_pdc0	Module name.
Input > Signal polarity > HSYNC	<ul style="list-style-type: none"> • High • Low 	High	Specify the active polarity of the HSYNC signal.

Input > Signal polarity > VSYNC	<ul style="list-style-type: none"> • High • Low 	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications > Number of pixels to capture horizontally	Value must be an integer greater than 0	640	Specify the number of horizontal pixels to capture.
Input > Capture Specifications > Number of lines to capture vertically	Value must be an integer greater than 0	480	Specify the number of vertical pixels to capture.
Input > Capture Specifications > Horizontal pixel to start capture from	Value must be an integer	0	Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Input > Capture Specifications > Line to start capture from	Value must be an integer	0	Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Input > Bytes per pixel	Value must be an integer greater than 0	2	Specify the number of bytes per pixel of the captured image data.
Input > Clock divider	<ul style="list-style-type: none"> • CLK/2 • CLK/4 • CLK/6 • CLK/8 • CLK/10 • CLK/12 • CLK/14 • CLK/16 	CLK/2	Specify the clock divider of the clock input to the PDC peripheral.
Input > Endianness	<ul style="list-style-type: none"> • Little • Big 	Little	Specify the endianness of the captured image data.
Output > Buffer > Image buffer name	Name must be a valid C symbol	g_user_buffer	Specify the name of the data buffer to create or set to NULL, if it is to be created by the user external to the PDC driver.
Output > Buffer > Image buffer section	This property must be a valid section name	.bss	Specify the RAM section for the image data buffer. Typically .bss (internal RAM) or

.sdram. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.

Output > Buffer > Number of image buffers	Value must be an integer greater than 0	1	Specify the number of buffers to create.
Interrupts > Callback	Name must be a valid C symbol	g_pdc_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions
Interrupts > PDC Interrupt Priority	MCU Specific Options		Select the PDC interrupt priority.
Interrupts > DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is $PCLKB / 2$.

Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Usage Notes

Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun, vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer [Direct Memory Access Controller \(r_dmac\)](#)
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

Examples

Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (pdc_callback_args_t * p_args)
{
    if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_capture_ready = true;
    }
}

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
    camera_module_initialization();

    /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
}
```

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
uint32_t timeout_ms = PDC_DELAY_MS;
/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_capture_ready) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;;
}
if (0U == timeout_ms)
{
    __BKPT(0);
}
}
static void camera_module_initialization (void)
{
/* Camera vendor specific initialization to be done here */
}
```

Data Structures

struct [pdc_instance_ctrl_t](#)

Data Structure Documentation

◆ pdc_instance_ctrl_t

struct pdc_instance_ctrl_t

PDC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ **R_PDC_Open()**

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t *const p_api_ctrl, pdc_cfg_t const *const p_cfg )
```

Powers on PDC, handles required initialization described in the hardware manual.

Implements `pdc_api_t::open`.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in `pdc_api_t::captureStart`. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ol style="list-style-type: none"> 1. p_cfg is NULL 2. p_api_ctrl is NULL 3. The pointer to the transfer interface in the p_cfg parameter is NULL 4. Callback parameter is NULL. 5. Invalid IRQ number assigned
FSP_ERR_INVALID_ARGUMENT	One or more of the following parameters is incorrect <ol style="list-style-type: none"> 1. bytes_per_pixel is zero 2. x_capture_pixels is zero 3. y_capture_pixels is zero 4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR 5. y_capture_start_pixel + y_capture_pixels is greater than 4095
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ **R_PDC_Close()**

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t *const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements `pdc_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	<code>p_api_ctrl</code> is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ **R_PDC_CaptureStart()**

```
fsp_err_t R_PDC_CaptureStart ( pdc_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer )
```

Starts a capture. Enables interrupts.

Implements `pdc_api_t::captureStart`.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the `pdc_api_t::open` API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during `pdc_api_t::open` API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Capture start successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ul style="list-style-type: none"> 1. <code>p_api_ctrl</code> is NULL 2. <code>p_buffer</code> is NULL while <code>p_buffer</code> field of the control structure is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_IN_USE	PDC transfer is already in progress.
FSP_ERR_TIMEOUT	Reset operation timed out.

`fsp_err_t` `R_POEG_Close` (`poeg_ctrl_t *const p_ctrl`)

Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the [POEG Interface](#).

Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRGM input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the [High-Speed Analog Comparator \(r_acmphs\)](#) driver).
- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the [General PWM Timer \(r_gpt\)](#) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

Configuration

Build Time Configurations for r_poeg

The following build time configurations are defined in `fsp_cfg/r_poeg_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Port Output Enable for GPT (r_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_poeg0	Module name.
General > Channel	Must be a valid POEG channel	0	Specify the hardware channel.
General > Trigger	MCU Specific Options		Select the trigger sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input > GTETRGR Polarity	<ul style="list-style-type: none"> Active High Active Low 	Active High	Select the polarity of the GTETRGR pin. Only applicable if GTETRGR pin is selected under Trigger.
Input > GTETRGR Noise Filter	<ul style="list-style-type: none"> Disabled PCLKB/1 PCLKB/8 PCLKB/32 PCLKB/128 	Disabled	Configure the noise filter for the GTETRGR pin. Only applicable if GTETRGR pin is selected under Trigger.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupts > Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

Clock Configuration

The POEG clock is based on the PCLKB frequency.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

Usage Notes

POEG GTETRGM Pin and Channel

The POEG channel number corresponds to the GTETRGM input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in `R_POEG_Close()`, but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

Examples

POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
```

```
FSP_PARAMETER_NOT_USED(p_args);

/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;

(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);

/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
(void) R_POEG_Reset(&g_poeg0_ctrl);

/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
* again. */
do
{
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
} while (POEG_STATE_NO_DISABLE_REQUEST != status.state);

/* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
* Update the 0 in the macro below to match the POEG channel number. */
NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

Data Structures

```
struct poeg_instance_ctrl_t
```

Data Structure Documentation

◆ poeg_instance_ctrl_t

```
struct poeg_instance_ctrl_t
```

Channel control block. DO NOT INITIALIZE. Initialization occurs when `poeg_api_t::open` is called.

Function Documentation

◆ **R_POEG_Open()**

```
fsp_err_t R_POEG_Open ( poeg_ctrl_t *const p_ctrl, poeg_cfg_t const *const p_cfg )
```

Initializes the POEG module and applies configurations. Implements `poeg_api_t::open`.

Note

The `poeg_cfg_t::trigger` setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.

Example:

```
/* Initializes the POEG. */
err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	<code>poeg_cfg_t::p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the <code>p_cfg</code> parameter is not available on this device.

◆ **R_POEG_StatusGet()**

```
fsp_err_t R_POEG_StatusGet ( poeg_ctrl_t *const p_ctrl, poeg_status_t *const p_status )
```

Get current POEG status and store it in provided pointer `p_status`. Implements `poeg_api_t::statusGet`.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	<code>p_ctrl</code> or <code>p_status</code> was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_CallbackSet()**

```
fsp_err_t R_POEG_CallbackSet ( poeg_ctrl_t *const p_ctrl, void(*)(poeg_callback_args_t *)
p_callback, void const *const p_context, poeg_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `poeg_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_POEG_OutputDisable()**

```
fsp_err_t R_POEG_OutputDisable ( poeg_ctrl_t *const p_ctrl)
```

Disables GPT output pins. Implements `poeg_api_t::outputDisable`.

Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	<code>p_ctrl</code> was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_Reset()**

```
fsp_err_t R_POEG_Reset ( poeg_ctrl_t *const p_ctrl)
```

Resets status flags. Implements `poeg_api_t::reset`.

Note

Status flags are only reset if the original POEG trigger is resolved. Check the status using `R_POEG_StatusGet` after calling this function to verify the status is cleared.

Example:

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
(void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
* again. */
do
{
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
} while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

Return values

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_Close()**

```
fsp_err_t R_POEG_Close ( poeg_ctrl_t *const p_ctrl)
```

Disables POEG interrupt. Implements `poeg_api_t::close`.

Note

This function does not disable the POEG.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

p_comparison)

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
 - Master mode
 - Slave mode
- Peer-to-peer
- End-to-end
- Frame formats
 - Ethernet II frames
 - IEEE802.3 + LLC + SNAP frames
 - IPv4 + UDP
- Clock correction modes
 - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
 - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

Configuration	Options	Default	Description
Clock Properties > Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Clock Properties > Class	Value must in the range [0,255].	248	Class field advertised in generated announce

Clock Properties > Accuracy	Value must in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Clock Properties > Variance	Value must in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Clock Properties > Priority 2	Value must in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Clock Properties > Time Source	Value must in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet > Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC.
Ethernet > Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
Ethernet > PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.
IP > Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
IP > PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
IP > Event Message TOS	Value must in the range [0,255].	0	The IP packet TOS for event messages.
IP > General Message TOS	Value must in the range [0,255].	0	The IP packet TOS for general messages.
IP > Primary Message TTL	Value must in the range [0,255].	1	The IP packet TTL for primary messages.
IP > PDelay Message TTL	Value must in the range [0,255].	1	The IP packet TTL for p_delay messages.
IP > Event Port	Value must in the range [0,65535].	319	The UDP port for event messages.

IP > General Port	Value must be in the range [0,65535].	320	The UDP port for general messages.
Synchronization Detection > Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Synchronization Detection > Count	Value must be in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection > Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.
Synchronization Lost Detection > Count	Value must be in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master.
Interrupts > Callback	Name must be a valid C symbol	<code>_\${module.driver.ptp.name}_callback</code>	Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
Interrupts > MINT Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Interrupts > Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC IPLS priority.
Name	Name must be a valid C symbol	<code>g_ptp0</code>	Module name.
Ethernet PHY Interface Type	<ul style="list-style-type: none"> • MII • RMII 	RMII	The interface type used to communicate with the Ethernet PHY.
Frame Filter	<ul style="list-style-type: none"> • Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast 	Unicast	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.

Frame Format	<ul style="list-style-type: none"> Ethernet II Ethernet II IPv4 UDP IEEE802.3 LLC SNAP IEEE802.3 LLC SNAP IPv4 UDP 	Ethernet II	The format of the frames that encapsulate the PTP messages.
Clock Domain	Value must in the range [0,255].	0	The PTP clock will only respond to clocks in its domain.
Clock Domain Filter	<ul style="list-style-type: none"> Enable Disable 	Enable	Filter out PTP messages from other clock domains.
Buffer Size	Value must in the range [64,1536].	1536	The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC.
Number of transmit buffers	Value must in the range [1,16].	4	The number of transmit buffers in the packet queue.
Number of receive buffers	Value must in the range [1,16].	4	The number of receive buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	<ul style="list-style-type: none"> PCLKA / 1 PCLKA / 2 PCLKA / 3 PCLKA / 4 PCLKA / 5 PCLKA / 6 REF50CK0 	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	<ul style="list-style-type: none"> Clock 	Clock Correction Mode	Clock correction mode

	Correction Mode 1	1	1 corrects the local clock using the current <code>offsetFromMaster</code> value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.
	• Clock Correction Mode 2		
Gradient Worst10 Interval	Value must in the range [0,255].	32	The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the [Ethernet \(r_ether\)](#) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req

- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

Figure 173: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by [Ethernet \(r_ether\)](#). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#). All multicast frames that match `ptp_synfp_cfg_t::p_multicast_addr_filter` are received by [Ethernet \(r_ether\)](#).
- Unicast - Only Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize [Ethernet \(r_ether\)](#). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. [FreeRTOS Plus TCP \(rm_freertos_plus_tcp\)](#)), however this means the application must execute the [Ethernet \(r_ether\)](#) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION`. This is to guarantee that PTP register accesses are atomic.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
    /* Wait for the link to be established. */
    do
    {
        err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
    /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
    /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
    while (!g_first_announce_message_received && --timeout)
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
}
```

```
    assert(0U != timeout);

/* When a master clock is found, change to the slave state to start synchronizing
 * the local clock to the master clock. */

    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
    assert(FSP_SUCCESS == err);

/* Wait for local clock to be synchronized with the master clock. */

    timeout = EXAMPLE_TIMEOUT;
while (!g_sync_acquired && --timeout)
    {
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);

/* The local clock is now synchronized with the grand master clock. */
}

/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
    switch (p_args->event)
    {
    case PTP_EVENT_SYNC_ACQUIRED:
        {
/* The offsetFromMaster value is now within the configured threshold to be
 * synchronized with the master clock.
 */

            g_sync_acquired = true;

        break;
        }
    case PTP_EVENT_MESSAGE_RECEIVED:
        {
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
    {
case PTP_MESSAGE_TYPE_ANNOUNCE:
        {
```

```
        int8_t comparison = 0;
    if (!g_first_announce_message_received)
    {
        /* If this is the first announce packet, immediately switch to this master clock. */
        comparison = 1;
        g_first_announce_message_received = true;
    }
    else
    {
        /*
         * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
         * packet is better than the current master clock.
         */
        fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                             p_args->p_message,
                                             &comparison);

        assert(FSP_SUCCESS == err);
    }
    if (1 == comparison)
    {
        /* Save the message as the new master announce message. */
        g_current_master_announce_message = *p_args->p_message;
        /* Set the master clock ID and sourcePortID in the PTP instance so that it
         * synchronizes with the new best master clock.
         */
        fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                             g_current_master_annou
nce_message.header.clock_id,
                                             g_current_master_annou
nce_message.header.source_port_id);
        assert(FSP_SUCCESS == err);
    }
    break;
```

```
    }  
default:  
    {  
break;  
    }  
    }  
break;  
    }  
default:  
    {  
break;  
    }  
    }  
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)  
void master_mode_basic_example (void)  
{  
    /* The PTP Instance must be opened before R_ETHER is opened. */  
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);  
    assert(FSP_SUCCESS == err);  
    /* Configure the PTP MAC address. */  
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);  
    assert(FSP_SUCCESS == err);  
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */  
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);  
    assert(FSP_SUCCESS == err);  
    /* Get the current time from an external time source (Eg. RTC). */  
    ptp_time_t current_time;  
    get_current_time_example(&current_time);  
    /* Set the PTP local time to the current time. */
```

```
err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
assert(FSP_SUCCESS == err);

/* Set the currentUtcOffset field in announce messages. */
err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
assert(FSP_SUCCESS == err);

/* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
ptp_message_flags_t flags;
flags.value = 0;
flags.value_b.currentUtcOffsetValid = 1;
flags.value_b.ptpTimescale = 1;
err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
assert(FSP_SUCCESS == err);

/* Open the r_ether_api instance. */
err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
assert(FSP_SUCCESS == err);

/* Wait for the link to be established. */
do
{
    err = R_ETHER_LinkProcess(&g_ether_ctrl);
} while (FSP_SUCCESS != err);

/* Set the PTP instance to passive state and listen for announce message. */
err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
assert(FSP_SUCCESS == err);

/*
 * The master clock is now operational and will automatically generate announce and
sync messages
 * as well as respond to delay_req messages.
 */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)

static uint32_t g_transmit_complete = 0U;

void send_message_example (void)
{
    static ptp_message_t message;
    static uint8_t      p_tlv_data[6];

    memset(&message, 0, sizeof(ptp_message_t));

    /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;

    /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
sizeof(ptp_message_management_t) +
sizeof(p_tlv_data));

    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;

    /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));

    message.management.target_port_id      = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops      = 1;
    message.management.action              = PTP_MANAGEMENT_ACTION_GET;

    /*
    * Fill in TLV data (Note that TLV data is big endian).
    *
    * Type (Management)
    */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
```

```
/* Length */
p_tlv_data[2] = 0;
p_tlv_data[3] = 2;

/* Management ID (Clock Description) */
p_tlv_data[4] = 0;
p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;

/* Send the message. */
fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));

assert(FSP_SUCCESS == err);

uint32_t timeout = EXAMPLE_TIMEOUT;

while (0U == g_transmit_complete && --timeout)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
}

/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
    switch (p_args->event)
    {
        case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
            {
                g_transmit_complete = 1U;
            }
            break;

        case PTP_EVENT_MESSAGE_RECEIVED:
            {
                switch (p_args->p_message->header.message_type)

                    case PTP_MESSAGE_TYPE_MANAGEMENT:
                        {
                            /* Handle the response message. */
                        }
                    }
                }
            }
            break;
    }
}
```

```

    }
    default:
    {
    break;
    }
    }
    }
    default:
    {
    break;
    }
    }
}

```

Data Structures

struct [ptp_instance_ctrl_t](#)

Data Structure Documentation

◆ ptp_instance_ctrl_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

Function Documentation

◆ **R_PTP_Open()**

```
fsp_err_t R_PTP_Open ( ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg )
```

This function initializes PTP. Implements `ptp_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other **PTP Interface** functions.

Return values

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ **R_PTP_MacAddrSet()**

```
fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_mac_addr )
```

This function sets the MAC address for the PTP instance. Implements `ptp_api_t::macAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ **R_PTP_IpAddrSet()**

```
fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const p_ctrl, uint32_t ip_addr )
```

This function sets the IP address for the PTP instance. Implements [ptp_api_t::ipAddrSet](#).

Note

This function may only be called while the PTP instance is in [ptp_port_state_t::PTP_PORT_STATE_DISABLE](#).

Return values

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state.

◆ **R_PTP_LocalClockIdSet()**

```
fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id )
```

This function sets the local clock ID for the PTP instance. Implements [ptp_api_t::localClockIdSet](#).

Note

This function may only be called while the PTP instance is in [ptp_port_state_t::PTP_PORT_STATE_DISABLE](#). Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ **R_PTP_MasterClockIdSet()**

```
fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id,
uint16_t port_id )
```

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements [ptp_api_t::masterClockIdSet](#).

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_MessageFlagsSet()**

```
fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const p_ctrl, ptp_message_type_t message_type,
ptp_message_flags_t flags )
```

This function sets the flags field for the given message type. Implements [ptp_api_t::messageFlagsSet](#).

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_CurrentUtcOffsetSet()**

```
fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const p_ctrl, uint16_t offset )
```

This function sets the currentUtcOffset value in announce messages. [ptp_api_t::currentUtcOffsetSet](#).

Return values

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PortStateSet()**

```
fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const p_ctrl, uint32_t state )
```

This function changes the current state of the PTP instance. Implements `ptp_api_t::portStateSet`.

Return values

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_MessageSend()**

```
fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const p_ctrl, ptp_message_t const *const p_message,
uint8_t const *const p_tlv_data, uint16_t tlv_data_size )
```

This function sends a PTP message. `ptp_api_t::messageSend`.

Return values

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ **R_PTP_LocalClockValueSet()**

```
fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const p_ctrl, ptp_time_t const *const p_time )
```

This function sets the local clock value. Implements `ptp_api_t::localClockValueSet`.

Return values

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_LocalClockValueGet()**

```
fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function gets the local clock value. Implements `ptp_api_t::localClockValueGet`.

Return values

FSP_SUCCESS	The local clock value has been written in p_time.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_PulseTimerCommonConfig()**

```
fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const p_ctrl,
ptp_pulse_timer_common_cfg_t *const p_timer_cfg )
```

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements `ptp_api_t::pulseTimerCommonConfig`.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PulseTimerEnable()**

```
fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const p_ctrl, uint32_t channel,
ptp_pulse_timer_cfg_t *const p_timer_cfg )
```

This function enables a pulse timer channel. Implements `ptp_api_t::pulseTimerEnable`.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PulseTimerDisable()**

```
fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const p_ctrl, uint32_t channel )
```

This function disables a pulse timer channel. Implements `ptp_api_t::pulseTimerDisable`.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_Close()**

```
fsp_err_t R_PTP_Close ( ptp_ctrl_t *const p_ctrl)
```

Disable the PTP instance. Implements `ptp_api_t::close`.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_BestMasterClock()**

```
fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const p_announce1, ptp_message_t const *const p_announce2, int8_t *const p_comparison )
```

This function compares two clocks to determine which one is the better master clock.

`p_comparison`:

- Set to -1 if `p_announce1` defines the best master clock.
- Set to 1 if `p_announce2` defines the best master clock.
- Set to 0 if `p_announce1` and `p_announce2` define the same clock.

Return values

FSP_SUCCESS	The valid result has been written to <code>p_use_announce_clock</code> .
FSP_ERR_ASSERTION	An argument was NULL.

fsp_err_t	R_QSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)

Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

Overview

Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash

- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

Configuration

Build Time Configurations for r_qspi

The following build time configurations are defined in driver/r_qspi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If selected code for programming on multiple lines in extended SPI mode is included in the build.

Configurations for Storage > QSPI (r_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r_qspi).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_qspi0	Module name.
General > SPI Protocol	<ul style="list-style-type: none"> • Extended SPI • QPI 	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
General > Address Bytes	<ul style="list-style-type: none"> • 3 • 4 • 4 with 4-byte read code 	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
General > Read Mode	<ul style="list-style-type: none"> • Standard Read • Fast Read 	Fast Read Quad I/O	Select the read mode for memory mapped

	<ul style="list-style-type: none"> • Fast Read Dual Output • Fast Read Dual I/O • Fast Read Quad Output • Fast Read Quad I/O 		access.
General > Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read
General > Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions > Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.
Command Definitions > Page Program Address Lines	<ul style="list-style-type: none"> • 1 • 2 • 4 	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Command Definitions > Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Command Definitions > Status Command	Must be an 8-bit QSPI Status Command under	0x05	The command to query the status of a write or

	Command Definitions		
Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	erase command. Which bit contains the write in progress status returned from the Write Status Command.
Command Definitions > Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Command Definitions > Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command Definitions	0xD8	The command to erase a block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Command Definitions > Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not supported.
Command Definitions > Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Command Definitions > XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
Command Definitions > XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing > QSPKCLK Divisor	Refer to the RA Configuration tool for available options.	2	Select the divisor to apply to PCLK to get QSPCLK.
Bus Timing > Minimum	Refer to the RA	4 QSPCLK	Define the minimum

QSSL Deselect Cycles	Configuration tool for available options.	number of QSPCLK cycles for QSSL to remain high between operations.
----------------------	---	---

Clock Configuration

The QSPI clock is derived from PCLKA.

Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O
- QIO3: Data 3 I/O

Note

It is recommended to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

QSPI Memory Mapped Access

After `R_QSPI_Open()` completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

Examples

Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHIJKLMNPOQRSTUVWXYZ";
/* Place code in the .code_in_qspi section to flash it during programming. */
```

```
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_qspi")
__attribute__((noinline));

void r_qspi_example_function (void)
{
    /* Add code here. */
}

void r_qspi_basic_example (void)
{
    /* Open the QSPI instance. */
    fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);

    /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();

    /* After R_QSPI_Open() and any required device specific initialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);

    /* After R_QSPI_Open() and any required device specific initialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
```

Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)

static void r_qspi_example_init (void)
{
    /* Write status registers */
    /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t data[4];
```

```

fsp_err_t err;

data[0] = QSPI_COMMAND_WRITE_ENABLE;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
assert(FSP_SUCCESS == err);

/* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
* status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
* QSSL line. */
data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
assert(FSP_SUCCESS == err);

/* Wait for status register to update. */
spi_flash_status_t status;
do
{
(void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
} while (true == status.write_in_progress);

/* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
* protocol to QPI mode on the MCU peripheral. */
data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
assert(FSP_SUCCESS == err);

(void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}

```

Reading Status Register Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
```

```
void r_qspi_direct_example (void)
{
    /* Read a status register. */
    /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t  data;
    fsp_err_t err;

    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);

    /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
    assert(FSP_SUCCESS == err);

    /* Status register contents are available in variable 'data'. */
}
```

Querying Device Size Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
    /* Many QSPI devices support more than one way to query the device size. Consult the
    datasheet for your
    * QSPI device to determine which of these methods are supported (if any). */
    uint32_t device_size_bytes;
    fsp_err_t err;
#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
    /* This example shows how to get the device size by reading the manufacturer ID. */
    uint8_t data[4];
    data[0] = QSPI_EXAMPLE_COMMAND_READ_ID;
    err     = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, true);
    assert(FSP_SUCCESS == err);
```

```
/* Read 3 bytes. The third byte often represents the size of the QSPI, where the
size of the QSPI = 2 ^ N. */
err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data[0], 3);
assert(FSP_SUCCESS == err);
device_size_bytes = 1U << data[2];
FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
#ifdef QSPI_EXAMPLE_COMMAND_READ_SFDP
/* Read the JEDEC SFDP header to locate the JEDEC flash parameters table. Reference
JESD216 "Serial Flash
* Discoverable Parameters (SFDP)". */
/* Send the standard 0x5A command followed by 3 address bytes (SFDP header is at
address 0). */
uint8_t buffer[16];
memset(&buffer[0], 0, sizeof(buffer));
buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
assert(FSP_SUCCESS == err);
/* Read out 16 bytes (1 dummy byte followed by 15 data bytes). */
err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 16);
assert(FSP_SUCCESS == err);
/* Read the JEDEC flash parameters to locate the memory size. */
/* Send the standard 0x5A command followed by 3 address bytes (located in big endian
order at offset 0xC-0xE).
* These bytes are accessed at 0xD-0xF because the first byte read is a dummy byte.
*/
buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
buffer[1] = buffer[0xF];
buffer[2] = buffer[0xE];
buffer[3] = buffer[0xD];
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
assert(FSP_SUCCESS == err);
/* Read out 9 bytes (1 dummy byte followed by 8 data bytes). */
err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 9);
```

```

    assert(FSP_SUCCESS == err);

    /* Read the memory density (located in big endian order at offset 0x4-0x7). These
bytes are accessed at 0x5-0x8
    * because the first byte read is a dummy byte. */
    uint32_t memory_density = (uint32_t) ((buffer[8] << 24) | (buffer[7] << 16) |
(buffer[6] << 8) | buffer[5]);
    if ((1U << 31) & memory_density)
    {
        /* For densities 4 gigabits and above, bit-31 is set to 1b. The field 30:0 defines
'N' where the density is
        * computed as 2^N bits (N must be >= 32). This code subtracts 3 from N to divide by
8 to get the size in
        * bytes instead of bits. */
        device_size_bytes = 1U << ((memory_density & ~(1U << 31)) - 3U);
    }
    else
    {
        /* For densities 2 gigabits or less, bit-31 is set to 0b. The field 30:0 defines the
size in bits. This
        * code divides the memory density by 8 to get the size in bytes instead of bits. */
        device_size_bytes = (memory_density / 8) + 1;
    }
    FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
}

```

Function Documentation

◆ R_QSPI_Open()

```
fsp_err_t R_QSPI_Open ( spi_flash_ctrl_t * p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements `spi_flash_api_t::open`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter <code>p_instance_ctrl</code> or <code>p_cfg</code> is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same <code>p_instance_ctrl</code> .

◆ **R_QSPI_Close()**

```
fsp_err_t R_QSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the QSPI driver module.

Implements `spi_flash_api_t::close`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_DirectWrite()**

```
fsp_err_t R_QSPI_DirectWrite ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the QSPI.

Implements `spi_flash_api_t::directWrite`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_DirectRead()**

```
fsp_err_t R_QSPI_DirectRead ( spi_flash_ctrl_t* p_ctrl, uint8_t*const p_dest, uint32_t const bytes )
```

Reads raw data directly from the QSPI. This API can only be called after R_QSPI_DirectWrite with read_after_write set to true.

Implements `spi_flash_api_t::directRead`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after R_QSPI_DirectWrite with read_after_write set to true.

◆ **R_QSPI_SpiProtocolSet()**

```
fsp_err_t R_QSPI_SpiProtocolSet ( spi_flash_ctrl_t* p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements `spi_flash_api_t::spiProtocolSet`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ **R_QSPI_XipEnter()**

```
fsp_err_t R_QSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)
```

Enters XIP (execute in place) mode.

Implements `spi_flash_api_t::xipEnter`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_XipExit()**

```
fsp_err_t R_QSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)
```

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_Write()**

```
fsp_err_t R_QSPI_Write ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> , <code>p_dest</code> or <code>p_src</code> is NULL, or <code>byte_count</code> crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_Erase()**

```
fsp_err_t R_QSPI_Erase ( spi_flash_ctrl_t * p_ctrl, uint8_t *const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, or <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_StatusGet()**

```
fsp_err_t R_QSPI_StatusGet ( spi_flash_ctrl_t * p_ctrl, spi_flash_status_t *const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ **R_QSPI_BankSet()**

```
fsp_err_t R_QSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements `spi_flash_api_t::bankSet`.

Return values

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_DirectTransfer()**

```
fsp_err_t R_QSPI_DirectTransfer ( spi_flash_ctrl_t * p_ctrl, spi_flash_direct_transfer_t *const p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements `spi_flash_api_t::directTransfer`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI.
---------------------	----------------------------

◆ R_QSPI_AutoCalibrate()

```
fsp_err_t R_QSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements `spi_flash_api_t::autoCalibrate`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI
---------------------	---------------------------

4.2.48 Realtime Clock (r_rtc)

Modules

Functions

```

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the [RTC Interface](#).

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calendar to get accurate time readings.

Note

See section "23.3.5 Reading 64-Hz Counter and Time" of the RA6M3 manual R01UH0886EJ0100 for more details.

A user-defined callback function can be registered (in the [rtc_api_t::open](#) API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure ([rtc_callback_args_t](#)) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for `calendarTimeSet` and `calendarAlarmSet` APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the `calendarAlarmSet` API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initializing the driver. Application must

make calls to the error adjustment api's for desired adjustment. See section 26.3.8 "Time Error Adjustment Function" of the RA6M3 manual R01UH0886EJ0100) for more details on this feature

Configuration

Build Time Configurations for r_rtc

The following build time configurations are defined in fsp_cfg/r_rtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Realtime Clock (r_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	<ul style="list-style-type: none"> Sub-Clock LOCO 	LOCO	Select the RTC clock source.
Frequency Comparison Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO
Automatic Adjustment Mode	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment Period	<ul style="list-style-type: none"> 10 Seconds 1 Minute NONE 	10 Seconds	Select the Error Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	<ul style="list-style-type: none"> NONE Addition Subtraction 	NONE	Select the Error Adjustment type
Error Adjustment Value	Value must be a positive integer less than equal to 63	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).

Alarm Interrupt Priority	MCU Specific Options	Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options	Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options	Select the carry interrupt priority.

Note

See 23.2.20 Frequency Register (RFRH/RFRL) of the RA6M3 manual R01UH0886EJ0100) for more details

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

The LOCO is the default selection during configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from `calendarTimeGet` API during roll-over.
- Even when only running in Periodic Interrupt mode `R_RTC_CalendarTimeSet` must be called successfully to start the RTC.

Limitations

Developers should be aware of the following limitations when using the RTC:

- R_RTC operates in 24-hour mode.
- Binary-count mode is not supported.
- The `R_RTC_CalendarTimeGet()` cannot be used from an interrupt that has higher priority

than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set the calendar time */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Get the calendar time */
    R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_periodic_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Set the periodic interrupt rate to 1 second */
    R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
    /* Wait for the periodic interrupt */
    while (1)
    {
        /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /*Initialize the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
    R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
    /* Wait for the Alarm interrupt */
    while (1)
    {
        /* Wait for interrupt */
    }
}
```

```

    }
}

```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```

void rtc_erroradj_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /*Initialize the RTC module*/
    R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
    /* Modify Error Adjustment after RTC is running */
    err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
    assert(FSP_SUCCESS == err);
}

```

Data Structures

struct [rtc_instance_ctrl_t](#)

Data Structure Documentation

◆ rtc_instance_ctrl_t

struct rtc_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.
volatile bool	carry_isr_triggered
	Was the carry isr triggered.

Function Documentation

◆ R_RTC_Open()

```
fsp_err_t R_RTC_Open ( rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const p_cfg )
```

Opens and configures the RTC driver module. Implements `rtc_api_t::open`. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Initialize the RTC module */
err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_Close()

```
fsp_err_t R_RTC_Close ( rtc_ctrl_t *const p_ctrl)
```

Close the RTC driver. Implements `rtc_api_t::close`

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ **R_RTC_CalendarTimeSet()**

```
fsp_err_t R_RTC_CalendarTimeSet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Set the calendar time.

Implements `rtc_api_t::calendarTimeSet`.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ **R_RTC_CalendarTimeGet()**

```
fsp_err_t R_RTC_CalendarTimeGet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements `rtc_api_t::calendarTimeGet`

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R_RTC_CalendarAlarmSet()**

```
fsp_err_t R_RTC_CalendarAlarmSet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Set the calendar alarm time.

Implements `rtc_api_t::calendarAlarmSet`.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R_RTC_CalendarAlarmGet()**

```
fsp_err_t R_RTC_CalendarAlarmGet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Get the calendar alarm time.

Implements `rtc_api_t::calendarAlarmGet`

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_PeriodicIrqRateSet()

```
fsp_err_t R_RTC_PeriodicIrqRateSet ( rtc_ctrl_t *const p_ctrl, rtc_periodic_irq_select_t const rate )
```

Set the periodic interrupt rate and enable periodic interrupt.

Implements `rtc_api_t::periodicIrqRateSet`

Note

To start the RTC `R_RTC_CalendarTimeSet` must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_ErrorAdjustmentSet()

```
fsp_err_t R_RTC_ErrorAdjustmentSet ( rtc_ctrl_t *const p_ctrl, rtc_error_adjustment_cfg_t const *const err_adj_cfg )
```

This function sets time error adjustment

Implements `rtc_api_t::errorAdjustmentSet`

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

◆ **R_RTC_InfoGet()**

```
fsp_err_t R_RTC_InfoGet ( rtc_ctrl_t *const p_ctrl, rtc_info_t *const p_rtc_info )
```

Set RTC clock source and running status information and store it in provided pointer p_rtc_info

Implements `rtc_api_t::infoGet`

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ **R_RTC_CallbackSet()**

```
fsp_err_t R_RTC_CallbackSet ( rtc_ctrl_t *const p_ctrl, void(*) (rtc_callback_args_t *) p_callback, void const *const p_context, rtc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `rtc_api_t::callbackSet`

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
 - Symmetric Encryption/Decryption

- AES
 - ECB 128/256bit
 - CBC 128/256bit
 - GCM 128/256bit
 - CCM 128/256bit
- Asymmetric Encryption/Decryption
 - RSA
 - RSAES-PKCS1-V1_5 1024/2048bit
 - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
 - RSASSA-PKCS1-V1_5 1024/2048bit
 - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
 - ECC
 - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
 - ECDH secp192r1/secp224r1/secp256r1/secp384r1
- Hash Functions
 - SHA-2
 - SHA-256
- Message Authentication Code
 - HMAC-SHA256bit
 - AES-CMAC 128/256bit
- Key Support
 - AES 128/256bit
 - RSA 1024/2048bit
 - RSA 3072/4096bit (public key only)
 - ECC secp192r1/secp224r1/secp256r1/secp384r1
 - HMAC-SHA256bit
- TRNG

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Driver > Crypto > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by

the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument `message_length` from the address specified by the argument `message`. The calculation result should be stored at the address specified by the argument `digest`.

Parameters

<code>message</code>	[in] Start address of message
<code>digest</code>	[in,out] address for storing hash calculation result (48 bytes)
<code>message_length</code>	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
```

```
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
    sce_aes_handle_t      handle;
    sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t              dummy;
    /* SCE power on */
    R_SCE_Open(&sce_ctrl, &sce_cfg);
    /* Generate a random key */
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
    /* Encrypt a plain text */
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
    R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
    /* Decrypt a cipher text using same key as Encryption */
    R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
    R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
    /* SCE power off */
    R_SCE_Close(&sce_ctrl);
    /* Compare plain and plain_calculated */
    if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
        while (1)
        {
            /* plain and plain_calculated are different (incorrect) */

```

```
    }  
  }  
else  
{  
  while (1)  
  {  
    /* plain and plain_calculated are the same (correct) */  
  }  
}  
}
```

Data Structures

struct [sce_instance_ctrl_t](#)

Data Structure Documentation

◆ [sce_instance_ctrl_t](#)

struct [sce_instance_ctrl_t](#)

SCE private control block. DO NOT MODIFY. Initialization occurs when [R_SCE_Open\(\)](#) is called.

Function Documentation

◆ R_SCE_Open()

```
fsp_err_t R_SCE_Open ( sce_ctrl_t *const p_ctrl, sce_cfg_t const *const p_cfg )
```

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

```
fsp_err_t R_SCE_Close ( sce_ctrl_t *const p_ctrl )
```

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.
------	--------	-------------------------------

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * wrapped_key)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key
----------	-------------	-------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

```
fsp_err_t R_SCE_AES256_WrappedKeyGenerate ( sce_aes_wrapped_key_t * wrapped_key)
```

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key
----------	-------------	-------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate ( sce_rsa1024_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair
----------	------------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * wrapped_pair_key)`

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by `wrapped_pair_key->pub_key`, and a private wrapped key is generated by `wrapped_pair_key->priv_key`. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	<code>wrapped_pair_key</code>	User key index for RSA 2048-bit public key and private key pair
----------	-------------------------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp192r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp224r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp256r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp384r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

`fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * random)`

This API can generate 4 words random number.

Parameters

[in,out]	<code>random</code>	Stores 4words (16 bytes) random data.
----------	---------------------	---------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128_EncryptedKeyWrap()**

```
fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_EncryptedKeyWrap()**

```
fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_hmac_sha_wrapped_key_t*
wrapped_key )
```

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa1024_public_wrapped_key_t *
wrapped_key )
```

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa1024_private_wrapped_key_t*
wrapped_key )
```

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA2048_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa2048_public_wrapped_key_t *
wrapped_key )
```

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa2048_private_wrapped_key_t*
wrapped_key )
```

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa3072_public_wrapped_key_t *
wrapped_key )
```

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA4096_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa4096_public_wrapped_key_t *
wrapped_key )
```

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

```
fsp_err_t R_SCE_AES128ECB_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key )
```

The `R_SCE_AES128ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_EncryptUpdate()` function and `R_SCE_AES128ECB_EncryptFinal()` function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES128ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

```
fsp_err_t R_SCE_AES128ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

```
fsp_err_t R_SCE_AES256ECB_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key )
```

The `R_SCE_AES256ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256ECB_EncryptUpdate()` function and `R_SCE_AES256ECB_EncryptFinal()` function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES256ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

```
fsp_err_t R_SCE_AES256ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

```
fsp_err_t R_SCE_AES128CBC_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* initial_vector )
```

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES128CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPT_SCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION</code>	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptFinal()

```
fsp_err_t R_SCE_AES128CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128CBC_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

```
fsp_err_t R_SCE_AES128CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The `R_SCE_AES128CBC_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CBC_DecryptUpdate()` function and `R_SCE_AES128CBC_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CBC_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128CBC_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

```
fsp_err_t R_SCE_AES256CBC_EncryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES256CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_EncryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256CBC_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

```
fsp_err_t R_SCE_AES256CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptFinal()

```
fsp_err_t R_SCE_AES256CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

```
fsp_err_t R_SCE_AES128GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES128GCM_EncryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128GCM_EncryptUpdate()` function and `R_SCE_AES128GCM_EncryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL</code>	Invalid wrapped key was input.
<code>FSP_ERR_CRYPTTO_SCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTTO_SCE_FAIL</code>	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

```
fsp_err_t R_SCE_AES128GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES128GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128GCM_DecryptUpdate()` function and `R_SCE_AES128GCM_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTOSCE_KEY_SET_FAIL</code>	Invalid wrapped key was input.
<code>FSP_ERR_CRYPTOSCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTOSCE_FAIL</code>	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

```
fsp_err_t R_SCE_AES128GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES128GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES128GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

```
fsp_err_t R_SCE_AES256GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_EncryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_EncryptUpdate()` function and `R_SCE_AES256GCM_EncryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

```
fsp_err_t R_SCE_AES256GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_DecryptUpdate()` function and `R_SCE_AES256GCM_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTOSCE_KEY_SET_FAIL</code>	Invalid wrapped key was input.
<code>FSP_ERR_CRYPTOSCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTOSCE_FAIL</code>	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

```
fsp_err_t R_SCE_AES256GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES256GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES256GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

```
fsp_err_t R_SCE_AES128CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_EncryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_EncryptUpdate()` and `R_SCE_AES128CCM_EncryptFinal()` use `handle` as an argument.

Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>nonce</code>	Nonce
[in]	<code>nonce_length</code>	Nonce data length (7 to 13 bytes)
[in]	<code>adata</code>	additional authentication data
[in]	<code>a_length</code>	additional authentication data length (0 to 110 bytes)
[in]	<code>payload_length</code>	Payload length (any number of bytes)
[in]	<code>mac_length</code>	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_EncryptInit()` to specify the total data length of plain that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES128CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES128CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes128CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

```
fsp_err_t R_SCE_AES128CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_DecryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_DecryptUpdate()` and `R_SCE_AES128CCM_DecryptFinal()` use `handle` as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES128GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES128GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes128CcmDecryptInit\(\)](#).

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

```
fsp_err_t R_SCE_AES256CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES256CCM_EncryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES256CCM_EncryptUpdate()` and `R_SCE_AES256CCM_EncryptFinal()` use `handle` as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPT_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t
* cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES256CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES256CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes256CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

```
fsp_err_t R_SCE_AES256CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t
payload_length, uint32_t mac_length )
```

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES256GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES256GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes256CcmDecryptInit\(\)](#).

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

```
fsp_err_t R_SCE_AES128CMAC_GenerateInit ( sce_cmact_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_GenerateUpdate()` function and `R_SCE_AES128CMAC_GenerateFinal()` function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES128CMAC_GenerateUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The `R_SCE_AES128CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES128CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

```
fsp_err_t R_SCE_AES128CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES128CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES128CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

```
fsp_err_t R_SCE_AES128CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

```
fsp_err_t R_SCE_AES128CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES128CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

```
fsp_err_t R_SCE_AES256CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_GenerateUpdate()` function and `R_SCE_AES256CMAC_GenerateFinal()` function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES256CMAC_GenerateUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The `R_SCE_AES256CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES256CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_GenerateFinal()**

```
fsp_err_t R_SCE_AES256CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES256CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES256CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_VerifyUpdate()` function and `R_SCE_AES256CMAC_VerifyFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-CMAC handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_AES256CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The **R_SCE_AES256CMAC_VerifyUpdate()** function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in **R_SCE_AES256CMAC_VerifyInit()**. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_VerifyFinal()**

```
fsp_err_t R_SCE_AES256CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES256CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256_Init()**

```
fsp_err_t R_SCE_SHA256_Init ( sce_sha_md5_handle_t* handle)
```

The `R_SCE_SHA256_Init()` function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_SHA256_Update()` function and `R_SCE_SHA256_Final()` function.

Parameters

[in,out]	handle	SHA handler (work area)
----------	--------	-------------------------

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

```
fsp_err_t R_SCE_SHA256_Update ( sce_sha_md5_handle_t * handle, uint8_t * message, uint32_t message_length )
```

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

```
fsp_err_t R_SCE_SHA256_Final ( sce_sha_md5_handle_t * handle, uint8_t * digest, uint32_t *
digest_length )
```

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hash data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate ( sce_hmac_sha_handle_t* handle, uint8_t* message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_GenerateUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_GenerateFinal()` function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac )
```

The `R_SCE_SHA256HMAC_GenerateFinal()` function uses the handle specified by the first argument `handle` and writes the calculation result to the second argument `mac`.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate ( sce_hmac_sha_handle_t * handle, uint8_t *
message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_VerifyUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_VerifyFinal()` function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_VerifyFinal()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac,
uint32_t mac_length )
```

The `R_SCE_SHA256HMAC_VerifyFinal()` function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSASSA_PKCS1024_SignatureGenerate()**

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa1024_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS1024_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value
------	--------------	--

			<ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature		Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length
[in]	wrapped_key		Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type		Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa1024_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS1024_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa2048_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, `message_hash`, using the private wrapped key input to the third argument, `wrapped_key`, and writes the signature text to the second argument, `signature`. When a message is specified in the first argument, `message_hash->data_type`, a hash value is calculated for the message as specified by the fourth argument, `hash_type`. When specifying a hash value in the first argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> • <code>message_hash->pdata</code> : Specifies pointer to array storing the message or hash value • <code>message_hash->data_length</code> : Specifies effective data length of the array (Specify only when Message is selected) • <code>message_hash->data_type</code> : Selects the
------	--------------	--

		data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa2048_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa3072_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS3072_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata

			<p>ta : Specifies pointer to array storing the message or hash value</p> <ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key		Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type		Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa4096_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS4096_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa1024_public_wrapped_key_t* wrapped_key )
```

The `R_SCE_RSAES_PKCS1024_Encrypt()` function RSA-encrypts the plaintext input to the first argument, `plain`, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, `cipher`.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa1024_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
--------------------------	-----------------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa2048_public_wrapped_key_t* wrapped_key )
```

The `R_SCE_RSAES_PKCS2048_Encrypt()` function RSA-encrypts the plaintext input to the first argument, `plain`, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, `cipher`.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa2048_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
-------------------------	-----------------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa3072_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa4096_public_wrapped_key_t* wrapped_key )
```

The `R_SCE_RSAES_PKCS4096_Encrypt()` function RSA-encrypts the plaintext input to the first argument, `plain`, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, `cipher`.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate ( sce_ecdsa_byte_data_t * message_hash,
sce_ecdsa_byte_data_t * signature, sce_ecc_private_wrapped_key_t * wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". signature->data_length : Data length (byte units)

[in]	wrapped_key	Input wrapped key of secp192r1 private key.
------	-------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash
------	--------------	--

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate ( sce_ecdsa_byte_data_t * message_hash,
sce_ecdsa_byte_data_t * signature, sce_ecc_private_wrapped_key_t * wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash
------	--------------	--

		value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp192r1 public key.
------	-------------	--

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
------	-----------	--

[in,out]	message_hash	<p>Message or hash value to be verified</p> <ul style="list-style-type: none"> • message_hash->data : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of

secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
------	-----------	--

[in,out]	message_hash	<p>Message or hash value to be verified</p> <ul style="list-style-type: none"> message_hash->data : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

```
fsp_err_t R_SCE_ECDH_secp256r1_Init ( sce_ecdh_handle_t * handle, uint32_t key_type, uint32_t use_key_id )
```

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign ( sce_ecdh_handle_t * handle,
sce_ecc_public_wrapped_key_t * ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t *
ecc_private_wrapped_key, uint8_t * public_key, sce_ecdsa_byte_data_t * signature,
sce_ecc_private_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_PublicKeySign()` function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to `public_key` and the private key is output to `wrapped_key`.

If ECDH is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the public key input as `ecc_public_wrapped_key` is output to `public_key` and nothing is output to `wrapped_key`.

The succeeding function `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` uses the first argument, `handle`, as an argument. `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses `wrapped_key` as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using <code>key_id</code> , input <code>handle->key_id</code> after running <code>R_SCE_ECDH_secp256r1_Init()</code> .
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using <code>key_id</code> , <code>key_id</code> (8-bit) public key (512-bit) 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) signature s (256 bits)" signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, uint8_t* public_key_data,
sce_ecdsa_byte_data_t* signature, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().

R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature ( sce_ecdh_handle_t* handle,
uint8_t* public_key_data, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

```
fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t*
ecc_private_wrapped_key, sce_ecdh_wrapped_key_t* shared_secret_wrapped_key )
```

The `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, `ecc_public_wrapped_key`, the public wrapped key whose signature was verified by `R_SCE_ECDH_secp256r1_PublicKeyVerify()`. When `key_type` of `R_SCE_ECDH_secp256r1_Init()` is 0, input as the third argument, `ecc_private_wrapped_key`, the private wrapped key generated from a random number by `R_SCE_ECDH_secp256r1_PublicKeySign()`, and when `key_type` is other than 0, input the private wrapped key that forms a pair with the second argument of `R_SCE_ECDH_secp256r1_PublicKeySign()`. The subsequent `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses `shared_secret_wrapped_key` as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by <code>R_SCE_ECDH_secp256r1_PublicKeyVerify()</code>
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

```
fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation ( sce_ecdh_handle_t * handle,
sce_ecdh_wrapped_key_t * shared_secret_wrapped_key, uint32_t key_type, uint32_t kdf_type,
uint8_t * other_info, uint32_t other_info_length, sce_hmac_sha_wrapped_key_t *
salt_wrapped_key, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses the shared secret "Z (shared_secret_index)" calculated by the `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function as the key material to derive the wrapped key specified by the third argument, `key_type`. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, `kdf_type`. When SHA-256 HMAC is specified, the wrapped key output by the `R_SCE_SHA256HMAC_EncryptedKeyWrap()` function is specified as the seventh argument, `salt_wrapped_key`. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, `other_info`. A wrapped key corresponding to `key_type` is output as the eighth argument, `wrapped_key`. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: `R_SCE_SHA256HMAC_GenerateInit()` function and `R_SCE_SHA256HMAC_VerifyInit()` function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by <code>R_SCE_ECDH_secp256r1_SharedSecretCalculate</code>
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID PartyUInfo PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when <code>kdf_type</code> is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to <code>key_type</code> . When the value of <code>key_type</code> is 2, an SHA256-HMAC wrapped key is output. <code>wrapped_key</code> can be specified by casting the start address of the area

		reserved beforehand by the <code>sce_hmac_sha_wrapped_key_t</code> type with the <code>(sce_aes_wrapped_key_t*)</code> type.
--	--	--

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

```
fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall ( uint8_t *
encrypted_provisioning_key, uint8_t * initial_vector, uint8_t * encrypted_key,
sce_tls_ca_certification_public_wrapped_key_t * wrapped_key )
```

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

```
fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (
sce_tls_p256_ecc_wrapped_key_t* tls_p256_ecc_wrapped_key, uint8_t*
ephemeral_ecdh_public_key )
```

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

```
fsp_err_t R_SCE_TLS_RootCertificateVerify ( uint32_t public_key_type, uint8_t* certificate,
uint32_t certificate_length, uint32_t public_key_n_start_position, uint32_t
public_key_n_end_position, uint32_t public_key_e_start_position, uint32_t
public_key_e_end_position, uint8_t* signature, uint32_t* encrypted_root_public_key )
```

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

```
fsp_err_t R_SCE_TLS_CertificateVerify ( uint32_t public_key_type, uint32_t *
encrypted_input_public_key, uint8_t * certificate, uint32_t certificate_length, uint8_t * signature,
uint32_t public_key_n_start_position, uint32_t public_key_n_end_position, uint32_t
public_key_e_start_position, uint32_t public_key_e_end_position, uint32_t *
encrypted_output_public_key )
```

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()**

`fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * encrypted_public_key, uint32_t * sce_pre_master_secret, uint8_t * encrypted_pre_master_secret)`

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_TLS_PreMasterSecretGenerateForRSA2048()**

`fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * sce_pre_master_secret)`

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.
-------	-----------------------	----------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

```
fsp_err_t R_SCE_TLS_MasterSecretGenerate ( uint32_t select_cipher_suite, uint32_t *
sce_pre_master_secret, uint8_t * client_random, uint8_t * server_random, uint32_t *
sce_master_secret )
```

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

```
fsp_err_t R_SCE_TLS_SessionKeyGenerate ( uint32_t select_cipher_suite, uint32_t*
sce_master_secret, uint8_t* client_random, uint8_t* server_random, uint8_t* nonce_explicit,
sce_hmac_sha_wrapped_key_t* client_mac_wrapped_key, sce_hmac_sha_wrapped_key_t*
server_mac_wrapped_key, sce_aes_wrapped_key_t* client_crypto_wrapped_key,
sce_aes_wrapped_key_t* server_crypto_wrapped_key, uint8_t* client_initial_vector, uint8_t*
server_initial_vector )
```

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

```
fsp_err_t R_SCE_TLS_VerifyDataGenerate ( uint32_t select_verify_data, uint32_t *
sce_master_secret, uint8_t * hand_shake_hash, uint8_t * verify_data )
```

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_TLS_ServerKeyExchangeVerify()**

```
fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify ( uint32_t public_key_type, uint8_t *
client_random, uint8_t * server_random, uint8_t * server_ephemeral_ecdh_public_key, uint8_t *
server_key_exchange_signature, uint32_t * encrypted_public_key, uint32_t *
encrypted_ephemeral_ecdh_public_key )
```

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange signature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

```
fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 ( uint32_t *
encrypted_public_key, sce_tls_p256_ecc_wrapped_key_t * tls_p256_ecc_wrapped_key, uint32_t *
sce_pre_master_secret )
```

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

```

Detailed Description

Driver for the SCI_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_b_i2c

The following build time configurations are defined in fsp_cfg/r_sci_b_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled 	Disabled	If enabled, the driver

- Disabled

will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_b_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_b_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> • 7-Bit • 10-Bit 	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> • Standard • Fast-mode 	Standard	Select the I2C data rate.
			If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_b_i2c_extended_cfg_t structure.
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise filter setting	<ul style="list-style-type: none"> • Use clock signal divided by 1 with noise filter • Use clock signal divided by 2 with noise filter 	Use clock signal divided by 1 with noise filter	Select the sampling clock for the digital noise filter

			<ul style="list-style-type: none"> • Use clock signal divided by 4 with noise filter • Use clock signal divided by 8 with noise filter 	
Clock Source	<ul style="list-style-type: none"> • PCLK • SCISPICK 	PCLK		Select the clock source for the SCI I2C module.
Bit Rate Modulation	<ul style="list-style-type: none"> • Enable • Disable 	Enable		Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_b_i2c_master_callback		A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options			Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options			Select the interrupt priority level. This is set for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA

RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

The actual I2C transfer rate can be derived from either SCISPICLK or the peripheral clock (PCLK)¹, and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Note

1. See Figure 26.2 in the RA6T2 manual for more information.

Pin Configuration

The SCI_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI_B I2C

driver provides two DTC instances for transmission and reception respectively.

- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI_B_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_b_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the I2C module */
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
```

```
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }

    /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }

    /* Verify the read data */
    if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI_B I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
    /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
    /* Send data to I2C slave on the same channel */
    err = R_SCI_B_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
}
```

```

err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

```

FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ **R_SCI_B_I2C_Close()**

```
fsp_err_t R_SCI_B_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Read()**

```
fsp_err_t R_SCI_B_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Write()**

```
fsp_err_t R_SCI_B_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Abort()**

```
fsp_err_t R_SCI_B_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ R_SCI_B_I2C_SlaveAddressSet()

```
fsp_err_t R_SCI_B_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ R_SCI_B_I2C_CallbackSet()

```
fsp_err_t R_SCI_B_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_I2C_StatusGet()

```
fsp_err_t R_SCI_B_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

4.2.51 Serial Communications Interface (SCI) SPI (r_sci_b_spi)

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_b_spi

The following build time configurations are defined in fsp_cfg/r_sci_b_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If support for transferring data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_b_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_b_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> • Master • Slave 	Master	Select the SPI operating mode.

Clock Phase	<ul style="list-style-type: none"> • Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge 	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> • Low when idle • High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> • MSB First • LSB First 	MSB First	Select the data bit order.
Clock Source	<ul style="list-style-type: none"> • PCLK • SCISPICK 	PCLK	Select whether the peripheral clock (PCLK) or SCISPICK is used for generating the SCK frequency.
Callback	Name must be a valid C symbol	sci_b_spi_callback	A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this

means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Examples

Basic Example

This is a basic example of minimal use of the SCI_B_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
    {
        ;
    }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
    {
        ;
    }
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

```
struct sci_b_spi_div_setting_t
```

Data Structure Documentation

◆ sci_b_spi_div_setting_t

```
struct sci_b_spi_div_setting_t
```

Settings for adjusting the SPI CLK.

Function Documentation

◆ R_SCI_B_SPI_Open()

```
fsp_err_t R_SCI_B_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

<code>p_api_ctrl</code>	Pointer to the control structure.
<code>p_cfg</code>	Pointer to a configuration structure.

Return values

<code>FSP_SUCCESS</code>	Channel initialized successfully.
<code>FSP_ERR_ASSERTION</code>	An input parameter is invalid or NULL.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance has already been opened.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	The channel number is invalid.

◆ R_SCI_B_SPI_Read()

```
fsp_err_t R_SCI_B_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_B_SPI_Write()

```
fsp_err_t R_SCI_B_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_B_SPI_WriteRead()

```
fsp_err_t R_SCI_B_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_B_SPI_CallbackSet()

```
fsp_err_t R_SCI_B_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_SPI_Close()

```
fsp_err_t R_SCI_B_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SCI_B_SPI_CalculateBitrate()

```
fsp_err_t R_SCI_B_SPI_CalculateBitrate ( uint32_t bitrate, sci_b_spi_clock_source_t clock_source,
sci_b_spi_div_setting_t* sclk_div )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	clock_source	clock source (PCLKA or SCISPICLK) used for bit rate calculation.
	sclk_div	Pointer to sci_b_spi_div_setting_t used to configure baudrate settings.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

```

```
fsp_err_t R_SCI_B_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t
*remaining_bytes)
```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

FIFO Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable FIFO support for the SCI_UART module.
DTC Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable RS232 and RS485 flow control support using a user provided pin.

Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> • 8bits • 7bits • 9bits 	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> • None • Odd • Even 	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> • 1bit • 2bits 	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure.
Baud > Baud Rate Modulation	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It

Baud > Max Error (%)	Must be a valid non negative integer with a maximum configurable value of 100	5	<p>does this by modulating the number of cycles per clock, so some bits are slightly longer than others.</p> <p>Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.</p> <p>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated sci_b_baud_setting_t structure.</p>
Flow Control > CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Flow Control > Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Flow Control > Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra > Clock Source	<ul style="list-style-type: none"> Internal Clock Internal Clock With Output on SCK External Clock 8x baud rate External Clock 16x baud rate 	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Extra > Start bit	<ul style="list-style-type: none"> Falling Edge 	Falling Edge	Start bit detected as

detection	• Low Level		falling edge or low level.
Extra > Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Extra > Receive FIFO Trigger Level	• One • Max	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Callback	Name must be a valid C symbol	user_uart_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Interrupts > Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Interrupts > Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Interrupts > Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA

RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SCI_B_UART_Read()`. The logic required to combine bytes received through

[R_SCI_B_UART_Read\(\)](#) (UART_EVENT_RX_COMPLETE) and bytes received between calls ([UART_EVENT_RX_CHAR](#)) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.

- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. [uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}
```

```
}  
  
void example_callback (uart_callback_args_t * p_args)  
{  
    /* Handle the UART event */  
    switch (p_args->event)  
    {  
        /* Received a character */  
        case UART_EVENT_RX_CHAR:  
            {  
                /* Only put the next character in the receive buffer if there is space for it */  
                if (sizeof(g_out_of_band_received) > g_out_of_band_index)  
                    {  
                        /* Write either the next one or two bytes depending on the receive data size */  
                        if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)  
                            {  
                                g_out_of_band_received[g_out_of_band_index++] = (uint8_t)  
p_args->data;  
                            }  
                        else  
                            {  
                                uint16_t * p_dest = (uint16_t *)  
&g_out_of_band_received[g_out_of_band_index];  
                                *p_dest = (uint16_t) p_args->data;  
                                g_out_of_band_index += 2;  
                            }  
                        }  
                    }  
                break;  
            }  
        /* Receive complete */  
        case UART_EVENT_RX_COMPLETE:  
            {  
                g_receive_complete = 1;  
                break;  
            }  
    }  
}
```

```

/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
    }
break;
}
default:
    {
    }
}
}

```

SCI UART Baud Set Example

```

#define SCI_B_UART_BAUDRATE_19200 (19200)
void r_sci_b_uart_baud_example (void)
{
    sci_b_baud_setting_t baud_setting;
    uint32_t          baud_rate          = SCI_B_UART_BAUDRATE_19200;
    bool              enable_bitrate_modulation = false;
    uint32_t          error_rate_x_1000    = 5;
    fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}

```

UART on SCI device Configuration

Data Fields

sci_b_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_b_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_b_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
sci_b_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_b_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_b_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.

Enumeration Type Documentation

◆ **sci_b_clk_src_t**

enum sci_b_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_B_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_B_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_B_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ **sci_b_uart_flow_control_t**

enum sci_b_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_B_UART_FLOW_CONTROL_RTS	Use CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTS	Use CTSn_RTSn pin for CTS.
SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn pin for CTS, CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.

◆ **sci_b_uart_rx_fifo_trigger_t**

enum sci_b_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_B_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_B_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_b_uart_start_bit_detect_t

enum <code>sci_b_uart_start_bit_detect_t</code>	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
<code>SCI_B_UART_START_BIT_LOW_LEVEL</code>	Detect low level on RXDn pin as start bit.
<code>SCI_B_UART_START_BIT_FALLING_EDGE</code>	Detect falling level on RXDn pin as start bit.

◆ sci_b_uart_noise_cancellation_t

enum <code>sci_b_uart_noise_cancellation_t</code>	
Noise cancellation configuration.	
Enumerator	
<code>SCI_B_UART_NOISE_CANCELLATION_DISABLE</code>	Disable noise cancellation.
<code>SCI_B_UART_NOISE_CANCELLATION_ENABLE</code>	Enable noise cancellation.

Function Documentation

◆ **R_SCI_B_UART_Open()**

```
fsp_err_t R_SCI_B_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SCI_B_UART_Read()**

```
fsp_err_t R_SCI_B_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_RX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_B_UART_Write()**

```
fsp_err_t R_SCI_B_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_TX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_B_UART_BaudSet()**

```
fsp_err_t R_SCI_B_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a [sci_b_baud_setting_t](#) structure. Implements [uart_api_t::baudSet](#)

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_SCI_B_UART_InfoGet()**

```
fsp_err_t R_SCI_B_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_SCI_B_UART_Close()**

```
fsp_err_t R_SCI_B_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_SCI_B_UART_Abort()**

```
fsp_err_t R_SCI_B_UART_Abort ( uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort )
```

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::communicationAbort](#)

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

◆ **R_SCI_B_UART_BaudCalculate()**

```
fsp_err_t R_SCI_B_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, sci_b_baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	<baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', source clock frequency could not be read, or error in calculated baud rate is larger than 10%.

◆ **R_SCI_B_UART_CallbackSet()**

```
fsp_err_t R_SCI_B_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *)
p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `uart_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_UART_ReadStop()

```
fsp_err_t R_SCI_B_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::readStop](#)

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

4.2.53 Serial Communications Interface (SCI) I2C (r_sci_i2c)

Modules

Functions

fsp_err_t R_SCI_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl,
```

i2c_master_status_t *p_status)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_i2c

The following build time configurations are defined in fsp_cfg/r_sci_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> 7-Bit 10-Bit 	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> Standard Fast-mode 	Standard	Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_i2c_extended_cfg_t structure.
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise filter setting	<ul style="list-style-type: none"> Use clock signal divided by 1 with noise filter Use clock signal divided by 2 with noise filter Use clock signal divided by 4 with noise filter Use clock signal divided by 8 with noise filter 	Use clock signal divided by 1 with noise filter	Select the sampling clock for the digital noise filter

Bit Rate Modulation	<ul style="list-style-type: none"> • Enable • Disable 	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options		Select the interrupt priority level. This is set for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA

RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;

    uint32_t i;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    /* Initialize the I2C module */
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }

    /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);

    /* Since there is nothing else to do, block until Callback triggers*/
    while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;;
    }

    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
```

```

    __BKPT(0);
}

/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
    __BKPT(0);
}
}

```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI I2C driver can be used to communicate with different slave devices which are on the same channel.

```

void single_channel_multi_slave (void)
{
    fsp_err_t err;

    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
}

```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Clear the receive buffer */
memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);

/* Read data from I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_SCI_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}

/* Send data to I2C slave on the same channel */
err = R_SCI_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}

if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```

{
    __BKPT(0);
}
}

```

Data Structures

struct [sci_i2c_instance_ctrl_t](#)

struct [sci_i2c_extended_cfg_t](#)

Data Structure Documentation

◆ sci_i2c_clock_settings_t

struct sci_i2c_clock_settings_t		
I2C clock settings		
Data Fields		
bool	bitrate_modulation	Bit-rate Modulation Function enable or disable.
uint8_t	brr_value	Bit rate register settings.
uint8_t	clk_divisor_value	Clock Select settings.
uint8_t	mddr_value	Modulation Duty Register settings.
uint8_t	cycles_value	SDA Delay Output Cycles Select.
uint8_t	snfr_value	Noise Filter Setting Register value.

◆ sci_i2c_instance_ctrl_t

struct sci_i2c_instance_ctrl_t
I2C control structure. DO NOT INITIALIZE.

◆ sci_i2c_extended_cfg_t

struct sci_i2c_extended_cfg_t		
SCI I2C extended configuration		
Data Fields		
sci_i2c_clock_settings_t	clock_settings	I2C Clock settings.

Function Documentation

◆ R_SCI_I2C_Open()

```
fsp_err_t R_SCI_I2C_Open ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg )
```

Opens the I2C device.

Return values

FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ R_SCI_I2C_Close()

```
fsp_err_t R_SCI_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Read()**

```
fsp_err_t R_SCI_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Write()**

```
fsp_err_t R_SCI_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Abort()**

```
fsp_err_t R_SCI_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_SlaveAddressSet()**

```
fsp_err_t R_SCI_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ **R_SCI_I2C_CallbackSet()**

```
fsp_err_t R_SCI_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_SCI_I2C_StatusGet()**

```
fsp_err_t R_SCI_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t * p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in <code>p_status</code> .
FSP_ERR_ASSERTION	NULL pointer.

4.2.54 Serial Communications Interface (SCI) SPI (r_sci_spi)

Modules

Functions

spi_callback_args_t *const p_callback_memory)
```

```
fsp_err_t R_SCI_SPI_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SCI_SPI_CalculateBitrate (uint32_t bitrate, sci_spi_div_setting_t
*sclk_div, bool use_mddr)
```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_spi

The following build time configurations are defined in fsp_cfg/r_sci_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled 	Enabled	If support for

- Disabled

transferring data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> • Master • Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> • Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge 	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> • Low when idle • High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> • MSB First • LSB First 	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	sci_spi_callback	A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.
Bitrate Modulation	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA

RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

Examples

Basic Example

This is a basic example of minimal use of the SCI_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
```

```

    {
        ;
    }

    /* De-assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Wait for minimum time required between transfers. */
    R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
    /* Assert Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
    /* De-assert Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}

```

Data Structures

struct [sci_spi_div_setting_t](#)

Data Structure Documentation

◆ sci_spi_div_setting_t

struct sci_spi_div_setting_t		
Settings for adjusting the SPI CLK.		
Data Fields		
uint8_t	brr	
uint8_t	cks: 2	
uint8_t	mddr	Set to 0 to disable MDDR.

Function Documentation

◆ R_SCI_SPI_Open()

```
fsp_err_t R_SCI_SPI_Open ( spi_ctrl_t* p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

<code>p_api_ctrl</code>	Pointer to the control structure.
<code>p_cfg</code>	Pointer to a configuration structure.

Return values

<code>FSP_SUCCESS</code>	Channel initialized successfully.
<code>FSP_ERR_ASSERTION</code>	An input parameter is invalid or NULL.
<code>FSP_ERR_ALREADY_OPEN</code>	The instance has already been opened.
<code>FSP_ERR_IP_CHANNEL_NOT_PRESENT</code>	The channel number is invalid.

◆ R_SCI_SPI_Read()

```
fsp_err_t R_SCI_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_Write()

```
fsp_err_t R_SCI_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>).

Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_WriteRead()

```
fsp_err_t R_SCI_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>).

Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_SPI_CallbackSet()

```
fsp_err_t R_SCI_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_SPI_Close()

```
fsp_err_t R_SCI_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SCI_SPI_CalculateBitrate()

```
fsp_err_t R_SCI_SPI_CalculateBitrate ( uint32_t bitrate, sci_spi_div_setting_t * sclk_div, bool use_mddr )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	sclk_div	Pointer to <code>sci_spi_div_setting_t</code> used to configure baudrate settings.
[in]	use_mddr	Calculate the divider settings for use with MDDR.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

4.2.55 Serial Communications Interface (SCI) UART (r_sci_uart)

Modules

Functions

`fsp_err_t` `R_SCI_UART_ReadStop` (`uart_ctrl_t *const p_api_ctrl`, `uint32_t *remaining_bytes`)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_uart

The following build time configurations are defined in `fsp_cfg/r_sci_uart_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable FIFO support for the SCI_UART module.

DTC Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable RS232 and RS485 flow control support using a user provided pin.

Configurations for Connectivity > UART (r_sci_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> • 8bits • 7bits • 9bits 	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> • None • Odd • Even 	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> • 1bit • 2bits 	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.
Baud > Baud Rate Modulation	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number

of cycles per clock, so some bits are slightly longer than others.

Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.

NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated [baud_setting_t](#) structure.

Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).

Specify the flow control pin port for the MCU.

Specify the flow control pin for the MCU.

Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.

Start bit detected as falling edge or low level.

Baud > Max Error (%)	Must be a valid non negative integer with a maximum configurable value of 100	5	
Flow Control > CTS/RTS Selection	MCU Specific Options		
Flow Control > Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	
Flow Control > Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	
Extra > Clock Source	<ul style="list-style-type: none"> Internal Clock Internal Clock With Output on SCK External Clock 8x baud rate External Clock 16x baud rate 	Internal Clock	
Extra > Start bit detection	<ul style="list-style-type: none"> Falling Edge Low Level 	Falling Edge	

Extra > Noise Filter	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Extra > Receive FIFO Trigger Level	<ul style="list-style-type: none"> • One • Max 	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Callback	Name must be a valid C symbol	user_uart_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Interrupts > Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Interrupts > Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Interrupts > Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA

RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after [uart_api_t::communicationAbort](#) API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to [R_SCI_UART_Read\(\)](#). The logic required to combine bytes received through

[R_SCI_UART_Read\(\)](#) (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.

- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. [uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}
```

```
}  
  
void example_callback (uart_callback_args_t * p_args)  
{  
    /* Handle the UART event */  
    switch (p_args->event)  
    {  
        /* Received a character */  
        case UART_EVENT_RX_CHAR:  
            {  
                /* Only put the next character in the receive buffer if there is space for it */  
                if (sizeof(g_out_of_band_received) > g_out_of_band_index)  
                    {  
                        /* Write either the next one or two bytes depending on the receive data size */  
                        if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)  
                            {  
                                g_out_of_band_received[g_out_of_band_index++] = (uint8_t)  
p_args->data;  
                            }  
                        else  
                            {  
                                uint16_t * p_dest = (uint16_t *)  
&g_out_of_band_received[g_out_of_band_index];  
                                *p_dest = (uint16_t) p_args->data;  
                                g_out_of_band_index += 2;  
                            }  
                        }  
                    }  
                break;  
            }  
        /* Receive complete */  
        case UART_EVENT_RX_COMPLETE:  
            {  
                g_receive_complete = 1;  
                break;  
            }  
    }  
}
```

```
/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
    }
break;
}
default:
    {
    }
}
}
```

SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
void r_sci_uart_baud_example (void)
{
    baud_setting_t baud_setting;
    uint32_t baud_rate = SCI_UART_BAUDRATE_19200;
    bool enable_bitrate_modulation = false;
    uint32_t error_rate_x_1000 = 5;
    fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

struct [baud_setting_t](#)

Register settings to achieve a desired baud rate and modulation duty.

Data Fields

union baud_setting_t	<code>__unnamed__</code>	
uint8_t	cks: 2	CKS value to get divisor (CKS = N)
uint8_t	brr	Bit Rate Register setting.
uint8_t	mddr	Modulation Duty Register setting.

◆ [sci_uart_extended_cfg_t](#)

struct [sci_uart_extended_cfg_t](#)

UART on SCI device Configuration

Data Fields

sci_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.

bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.

Enumeration Type Documentation

◆ sci_clk_src_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_uart_flow_control_t

enum sci_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_UART_FLOW_CONTROL_RTS	Use SCI pin for RTS.
SCI_UART_FLOW_CONTROL_CTS	Use SCI pin for CTS.
SCI_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.
SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options.

◆ **sci_uart_rx_fifo_trigger_t**

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ **sci_uart_start_bit_detect_t**

enum sci_uart_start_bit_detect_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ **sci_uart_noise_cancellation_t**

enum sci_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

Function Documentation

◆ **R_SCI_UART_Open()**

```
fsp_err_t R_SCI_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SCI_UART_Read()**

```
fsp_err_t R_SCI_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_UART_Write()**

```
fsp_err_t R_SCI_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_UART_BaudSet()**

```
fsp_err_t R_SCI_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a [baud_setting_t](#) structure. Implements [uart_api_t::baudSet](#)

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_InfoGet()

```
fsp_err_t R_SCI_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Close()

```
fsp_err_t R_SCI_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Abort()

`fsp_err_t R_SCI_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)`

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements `uart_api_t::communicationAbort`

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

◆ **R_SCI_UART_BaudCalculate()**

```
fsp_err_t R_SCI_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, baud_setting_t*const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	<baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', source clock frequency could not be read, or error in calculated baud rate is larger than 10%.

◆ **R_SCI_UART_CallbackSet()**

```
fsp_err_t R_SCI_UART_CallbackSet ( uart_ctrl_t*const p_api_ctrl, void(*) (uart_callback_args_t*)
p_callback, void const*const p_context, uart_callback_args_t*const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `uart_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_UART_ReadStop()

```
fsp_err_t R_SCI_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements [uart_api_t::readStop](#)

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::disable](#)

4.2.56 Sigma Delta Analog to Digital Converter (r_sdadc)

```

Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
 - Multiple analog channels
 - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes
- Supports reading converted data
- Sample and hold support

Selecting an ADC

All RA MCUs have an [Analog to Digital Converter \(r_adc\)](#). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

	ADC	SDADC
Availability	Available on all RA MCUs.	Available on select RA MCUs.
Resolution	The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU.	The SDADC has a maximum accuracy of 24 bits.
Number of Channels	The ADC has more channels than the SDADC.	The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1.
Frequency	The ADC sampling time is shorter (more samples per second).	The SDADC sampling time is longer (fewer samples per second).

Settling Time

The ADC does not have a settling time when switching between channels.

The SDADC requires a settling time when switching between channels.

Configuration

Build Time Configurations for r_sdadc

The following build time configurations are defined in fsp_cfg/r_sdadc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > ADC (r_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_sdadc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adc0	Module name.
Mode	<ul style="list-style-type: none"> Single Scan Continuous Scan 	Continuous Scan	In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned. In continuous scan mode, conversion starts after a start trigger, then continues until stopped in software.
Resolution	<ul style="list-style-type: none"> 16 Bit 24 Bit 	24 Bit	Select 24-bit or 16-bit resolution.
Alignment	<ul style="list-style-type: none"> Right Left 	Right	Select left or right alignment.
Trigger	MCU Specific Options		Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API.

Vref Source	<ul style="list-style-type: none"> Internal External 	Internal	Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI.
Vref Voltage	<ul style="list-style-type: none"> 0.8 V 1.0 V 1.2 V 1.4 V 1.6 V 1.8 V 2.0 V 2.2 V 2.4 V 	1.0 V	Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%.
Callback	Name must be a valid C symbol	NULL	Enter the name of the callback function to be called when conversion completes or a scan ends.
Conversion End Interrupt Priority	MCU Specific Options		[Required] Select the interrupt priority for the conversion end interrupt.
Scan End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the scan end interrupt.
Calibration End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the calibration end interrupt.

Configurations for Analog > SDADC Channel Configuration (r_sdadc)

Configuration	Options	Default	Description
Input	<ul style="list-style-type: none"> Differential Single Ended 	Differential	Select differential or single-ended input.
Stage 1 Gain	<ul style="list-style-type: none"> 1 2 3 4 8 	1	Select the gain for stage 1 of the PGA. Must be 1 for single-ended input.
Stage 2 Gain	<ul style="list-style-type: none"> 1 2 4 8 	1	Select the gain for stage 2 of the PGA. Must be 1 for single-ended input.
Oversampling Ratio	<ul style="list-style-type: none"> 64 128 256 512 	256	Select the oversampling ratio for the PGA. Must be 256 for single-ended input.

	<ul style="list-style-type: none"> • 1024 • 2048 		
Polarity (Valid for Single-Ended Input Only)	<ul style="list-style-type: none"> • Positive • Negative 	Positive	Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input.
Conversions to Average per Result	<ul style="list-style-type: none"> • Do Not Average (Interrupt after Each Conversion) • Average 8 • Average 16 • Average 32 • Average 64 	Do Not Average (Interrupt after Each Conversion)	Select the number of conversions to average for each result. The ADC_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled.
Invert (Valid for Negative Single-Ended Input Only)	<ul style="list-style-type: none"> • Result Not Inverted • Result Inverted 	Result Not Inverted	Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of $2^{\text{resolution}} - 1$.
Number of Conversions Per Scan	Refer to the RA Configuration tool for available options.	1	Number of conversions on this channel before AUTOSCAN moves to the next channel. When all conversions of all channels are complete, the ADC_EVENT_SCAN_END event occurs.

Clock Configuration

The SDADC clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

Usage Notes

Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as

follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). The FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.
4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
 - Single-scan mode performs one scan per trigger (hardware trigger or software start using [R_SDADC_ScanStart](#)).
 - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

When Interrupts Are Not Enabled

If interrupts are not enabled, the [R_SDADC_StatusGet\(\)](#) API can be used to poll the SDADC to determine when the scan has completed. The [R_SDADC_Read\(\)](#) API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call [R_SDADC_Calibrate\(\)](#) after open, and prior to any other function, then wait for a calibration complete event before using the SDADC. [R_SDADC_Calibrate\(\)](#) should not be called if all channels are configured for single-ended mode.

Examples

Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */

    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
}
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Calibrate all differential channels. */
sdadc_calibrate_args_t calibrate_args;

calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
calibrate_args.channel   = ADC_CHANNEL_0;

err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);

assert(FSP_SUCCESS == err);

/* Wait for calibration to complete. */
adc_status_t status;

status.state = ADC_STATE_SCAN_IN_PROGRESS;

while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}

/* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
* triggers by calling R_SDADC_ScanStart(). */
(void) R_SDADC_ScanStart(&g_adc0_ctrl);

/* Wait for conversion to complete. */
status.state = ADC_STATE_SCAN_IN_PROGRESS;

while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}

/* Read converted data. */
uint32_t channell_conversion_result;

R_SDADC_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result);
}
```

Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
 * configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)
uint32_t g_sdadc_example_buffer[SDADC_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_transfer_info =
{
    .dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .irq            = TRANSFER_IRQ_END,
    .chain_mode     = TRANSFER_CHAIN_MODE_DISABLED,
    .src_addr_mode  = TRANSFER_ADDR_MODE_FIXED,
    .mode           = TRANSFER_MODE_REPEAT,
    /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
Bit 24 contains a status flag
 * indicating if the result overflowed or not. Bits 27:25 contain the channel number
+ 1. The settings for
 * resolution and alignment and ignored when DTC or DMAC is used. */
    .size           = TRANSFER_SIZE_4_BYTE,
    /* NOTE: It is strongly recommended to enable averaging on all channels or no
channels when using DTC with SDADC
 * because the result register is different when averaging is used. If averaging is
enabled on all channels,
 * set transfer_info_t::p_src to &R_SDADC->ADAR. */
    .p_src          = (void const *) &R_SDADC0->ADCR,
    .p_dest         = &g_sdadc_example_buffer[0],
    .length         = SDADC_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_dtc_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
```

```
err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Calibrate all differential channels. */
sdadc_calibrate_args_t calibrate_args;
calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
calibrate_args.channel  = ADC_CHANNEL_0;
err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
assert(FSP_SUCCESS == err);
/* Wait for calibration to complete. */
adc_status_t status;
status.state = ADC_STATE_SCAN_IN_PROGRESS;
while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
{
R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}
/* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
* triggers by calling R_SDADC_ScanStart(). */
(void) R_SDADC_ScanStart(&g_adc0_ctrl);
/* After each conversion, the converted data is transferred to the next index in
g_sdadc_example_buffer. After
* the entire scan completes, the index in g_sdadc_example_buffer resets. The data
in g_sdadc_example_buffer
* is:
* - g_sdadc_example_buffer[0] = SDADC channel 1 conversion 0
* - g_sdadc_example_buffer[1] = SDADC channel 1 conversion 1
* - g_sdadc_example_buffer[2] = SDADC channel 1 conversion 2
* - g_sdadc_example_buffer[3] = SDADC channel 2 conversion 0
* - g_sdadc_example_buffer[4] = SDADC channel 4 conversion 0
*/* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
* from the buffer like this. Shifting removes the unrelated bits in the result
register and propagates the sign
```

```
* bit so the value can be interpreted as a signed result. This assumes channel 2 is
configured in differential
* mode. */
int32_t channel_2_data = (int32_t) (g_sdadc_example_buffer[3] << 8) >> 8;
FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

Data Structure Documentation

◆ [sdadc_calibrate_args_t](#)

struct sdadc_calibrate_args_t		
Structure to pass to the adc_api_t::calibrate p_extend argument.		
Data Fields		
adc_channel_t	channel	Which channel to calibrate.
sdadc_calibration_t	mode	Calibration mode.

◆ **sdadc_channel_cfg_t**

struct sdadc_channel_cfg_t		
SDADC per channel configuration.		

◆ **sdadc_scan_cfg_t**

struct sdadc_scan_cfg_t		
SDADC active channel configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.

◆ **sdadc_extended_cfg_t**

struct sdadc_extended_cfg_t		
SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend .		
Data Fields		
uint8_t	conv_end_ipl	Conversion end interrupt priority.
IRQn_Type	conv_end_irq	
sdadc_vref_src_t	vref_src	Source of Vref (internal or external)
sdadc_vref_voltage_t	vref_voltage	Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%.
sdadc_channel_cfg_t const *	p_channel_cfgs[SDADC_MAX_N UM_CHANNELS]	Configuration for each channel, set to NULL if unused.

◆ **sdadc_instance_ctrl_t**

struct sdadc_instance_ctrl_t		
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open() .		

Enumeration Type Documentation

◆ sdadc_vref_src_t

enum sdadc_vref_src_t	
Source of Vref.	
Enumerator	
SDADC_VREF_SRC_INTERNAL	Vref is internally sourced, can be output as SBIAS.
SDADC_VREF_SRC_EXTERNAL	Vref is externally sourced from the VREFI pin.

◆ sdadc_vref_voltage_t

enum sdadc_vref_voltage_t	
Voltage of Vref.	
Enumerator	
SDADC_VREF_VOLTAGE_800_MV	Vref is 0.8 V.
SDADC_VREF_VOLTAGE_1000_MV	Vref is 1.0 V.
SDADC_VREF_VOLTAGE_1200_MV	Vref is 1.2 V.
SDADC_VREF_VOLTAGE_1400_MV	Vref is 1.4 V.
SDADC_VREF_VOLTAGE_1600_MV	Vref is 1.6 V.
SDADC_VREF_VOLTAGE_1800_MV	Vref is 1.8 V.
SDADC_VREF_VOLTAGE_2000_MV	Vref is 2.0 V.
SDADC_VREF_VOLTAGE_2200_MV	Vref is 2.2 V.
SDADC_VREF_VOLTAGE_2400_MV	Vref is 2.4 V (only valid for external Vref)

◆ **sdadc_channel_input_t**

enum <code>sdadc_channel_input_t</code>	
Per channel input mode.	
Enumerator	
<code>SDADC_CHANNEL_INPUT_DIFFERENTIAL</code>	Differential input.
<code>SDADC_CHANNEL_INPUT_SINGLE_ENDED</code>	Single-ended input.

◆ **sdadc_channel_stage_1_gain_t**

enum <code>sdadc_channel_stage_1_gain_t</code>	
Per channel stage 1 gain options.	
Enumerator	
<code>SDADC_CHANNEL_STAGE_1_GAIN_1</code>	Gain of 1.
<code>SDADC_CHANNEL_STAGE_1_GAIN_2</code>	Gain of 2.
<code>SDADC_CHANNEL_STAGE_1_GAIN_3</code>	Gain of 3 (only valid for stage 1)
<code>SDADC_CHANNEL_STAGE_1_GAIN_4</code>	Gain of 4.
<code>SDADC_CHANNEL_STAGE_1_GAIN_8</code>	Gain of 8.

◆ **sdadc_channel_stage_2_gain_t**

enum <code>sdadc_channel_stage_2_gain_t</code>	
Per channel stage 2 gain options.	
Enumerator	
<code>SDADC_CHANNEL_STAGE_2_GAIN_1</code>	Gain of 1.
<code>SDADC_CHANNEL_STAGE_2_GAIN_2</code>	Gain of 2.
<code>SDADC_CHANNEL_STAGE_2_GAIN_4</code>	Gain of 4.
<code>SDADC_CHANNEL_STAGE_2_GAIN_8</code>	Gain of 8.

◆ **sdadc_channel_oversampling_t**

enum <code>sdadc_channel_oversampling_t</code>	
Per channel oversampling ratio.	
Enumerator	
<code>SDADC_CHANNEL_OVERSAMPLING_64</code>	Oversampling ratio of 64.
<code>SDADC_CHANNEL_OVERSAMPLING_128</code>	Oversampling ratio of 128.
<code>SDADC_CHANNEL_OVERSAMPLING_256</code>	Oversampling ratio of 256.
<code>SDADC_CHANNEL_OVERSAMPLING_512</code>	Oversampling ratio of 512.
<code>SDADC_CHANNEL_OVERSAMPLING_1024</code>	Oversampling ratio of 1024.
<code>SDADC_CHANNEL_OVERSAMPLING_2048</code>	Oversampling ratio of 2048.

◆ **sdadc_channel_polarity_t**

enum <code>sdadc_channel_polarity_t</code>	
Per channel polarity, valid for single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_POLARITY_POSITIVE</code>	Positive-side single-ended input.
<code>SDADC_CHANNEL_POLARITY_NEGATIVE</code>	Negative-side single-ended input.

◆ **sdadc_channel_average_t**

enum <code>sdadc_channel_average_t</code>	
Per channel number of conversions to average before conversion end callback.	
Enumerator	
<code>SDADC_CHANNEL_AVERAGE_NONE</code>	Do not average (callback for each conversion)
<code>SDADC_CHANNEL_AVERAGE_8</code>	Average 8 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_16</code>	Average 16 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_32</code>	Average 32 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_64</code>	Average 64 samples for each conversion end callback.

◆ **sdadc_channel_inversion_t**

enum <code>sdadc_channel_inversion_t</code>	
Per channel polarity, valid for negative-side single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_INVERSION_OFF</code>	Do not invert conversion result.
<code>SDADC_CHANNEL_INVERSION_ON</code>	Invert conversion result.

◆ **sdadc_channel_count_formula_t**enum `sdadc_channel_count_formula_t`

Select a formula to specify the number of conversions. The following symbols are used in the formulas:

- N: Number of conversions
- n: `sdadc_channel_cfg_t::coefficient_n`, do not set to 0 if m is 0
- m: `sdadc_channel_cfg_t::coefficient_m`, do not set to 0 if n is 0

Either m or n must be non-zero.

Enumerator

<code>SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL</code>	$N = 32 * (2 ^ n - 1) + m * 2 ^ n.$
<code>SDADC_CHANNEL_COUNT_FORMULA_LINEAR</code>	$N = (32 * n) + m.$

◆ **sdadc_calibration_t**enum `sdadc_calibration_t`

Calibration mode.

Enumerator

<code>SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET</code>	Use internal reference to calibrate offset and gain.
<code>SDADC_CALIBRATION_EXTERNAL_OFFSET</code>	Use external reference to calibrate offset.
<code>SDADC_CALIBRATION_EXTERNAL_GAIN</code>	Use external reference to calibrate gain.

Function Documentation

◆ **R_SDADC_Open()**

```
fsp_err_t R_SDADC_Open ( adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg )
```

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. [R_SDADC_Calibrate\(\)](#) must be called after this function before using the SDADC if any channels are used in differential mode. Implements [adc_api_t::open\(\)](#).

Note

This function delays at least 2 ms as required by the SDADC power on procedure.

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Control block is already open.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt is disabled

◆ **R_SDADC_ScanCfg()**

```
fsp_err_t R_SDADC_ScanCfg ( adc_ctrl_t * p_ctrl, void const *const p_extend )
```

Configures the enabled channels of the ADC. Pass a pointer to [sdadc_scan_cfg_t](#) to p_extend. Implements [adc_api_t::scanCfg\(\)](#).

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_InfoGet()**

```
fsp_err_t R_SDADC_InfoGet ( adc_ctrl_t * p_ctrl, adc_info_t * p_adc_info )
```

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements `adc_api_t::infoGet()`.

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_ScanStart()**

```
fsp_err_t R_SDADC_ScanStart ( adc_ctrl_t * p_ctrl)
```

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements `adc_api_t::scanStart()`.

Return values

FSP_SUCCESS	Scan started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_IN_USE	A conversion or calibration is in progress.

◆ **R_SDADC_ScanGroupStart()**

```
fsp_err_t R_SDADC_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the SDADC. Use `scanStart` instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R_SDADC_ScanStop()**

`fsp_err_t R_SDADC_ScanStop (adc_ctrl_t * p_ctrl)`

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements `adc_api_t::scanStop()`.

Return values

FSP_SUCCESS	Scan stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_StatusGet()**

`fsp_err_t R_SDADC_StatusGet (adc_ctrl_t * p_ctrl, adc_status_t * p_status)`

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements `adc_api_t::scanStatusGet()`.

Return values

FSP_SUCCESS	No software scan or calibration is in progress.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_Read()**

```
fsp_err_t R_SDADC_Read ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data )
```

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements `adc_api_t::read()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_Read32()**

```
fsp_err_t R_SDADC_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data )
```

Reads the most recent conversion result from a channel. Implements `adc_api_t::read32()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_OffsetSet()**

```
fsp_err_t R_SDADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset )
```

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements `adc_api_t::offsetSet()`.

Note: The offset is cleared if `adc_api_t::calibrate()` is called. The offset can be re-applied if necessary after the the callback with event `ADC_EVENT_CALIBRATION_COMPLETE` is called.

Parameters

[in]	p_ctrl	See p_instance_ctrl in <code>adc_api_t::offsetSet()</code> .
[in]	reg_id	See reg_id in <code>adc_api_t::offsetSet()</code> .
[in]	offset	Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain.

Return values

FSP_SUCCESS	Offset updated successfully.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Calibrate()

```
fsp_err_t R_SDADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Requires `sdadc_calibrate_args_t` passed to `p_extend`. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event `ADC_EVENT_CALIBRATION_COMPLETE` is called when calibration completes. Implements `adc_api_t::calibrate()`.

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between $0.4 \text{ V} / \text{total_gain}$ and $0.8 \text{ V} / \text{total_gain}$. The differential voltage applied during calibration is corrected to a conversion result of `0x7FFFFFFF`, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using `adc_api_t::offsetSet`.

Return values

FSP_SUCCESS	Calibration began successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Close()

```
fsp_err_t R_SDADC_Close ( adc_ctrl_t * p_ctrl)
```

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements `adc_api_t::close()`.

Note

This function delays at least 3 us as required by the SDADC24 stop procedure.

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

4.2.57 SD/MMC Host Interface (r_sdhi)

Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the

[SD/MMC Interface.](#)

Overview

Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
 - Supports reading, writing and erasing SD memory devices
 - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
 - Supports detection of device write protection (SD cards only)
 - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

Configuration

Build Time Configurations for r_sdhi

The following build time configurations are defined in fsp_cfg/r_sdhi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	If selected code for SD card support is included in the build.
eMMC Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	If selected code for eMMC device support is included in the build.

Configurations for Storage > SD/MMC (r_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Name	Name must be a valid C symbol	g_sdmmc0	Module name.
Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Block Size	Value must be an integer between 1 and 512	512	Select the media block size. Must be 512 for SD cards or eMMC devices. Must be 1-512 for SDIO.
Card Detection	<ul style="list-style-type: none"> • Not Used • CD Pin 	CD Pin	Select the card detection method.
Write Protection	<ul style="list-style-type: none"> • Not Used • WP Pin 	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Interrupt Configurations:

The following interrupts are required to use the r_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

Usage Notes

Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during [R_SDHI_Open\(\)](#).

[R_SDHI_StatusGet\(\)](#) can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, [R_SDHI_MediaInit\(\)](#) must be called before reading from the card or writing to the card.

Note

[R_SDHI_StatusGet\(\)](#) should be used to initially determine the card state after opening the interface.

DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

Timing Notes for R_SDHI_MediaInit

The [R_SDHI_MediaInit\(\)](#) API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or

less.

Limitations

Developers should be aware of the following limitations when using the SDHI:

Blocking Calls

The following functions block execution until the response is received for at least one command:

- [R_SDHI_MediaInit](#)
- [R_SDHI_Erase](#)

Once the function returns the status of the operation can be determined via [R_SDHI_StatusGet](#) or through receipt of a callback.

Note

Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.

Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the `read()`, `write()`, `readloExt()`, and `writeloxExt()` APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the `r_sdhi` driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

Examples

Basic Example

This is a basic example of minimal use of the `r_sdhi` in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the SDHI driver. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
```

```
    assert(FSP_SUCCESS == err);

    /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1

    * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */

    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

    /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */

    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);

    assert(FSP_SUCCESS == err);

    err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);

    assert(FSP_SUCCESS == err);

while (!g_transfer_complete)
    {
    /* Wait for transfer. */

    }

    err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);

    assert(FSP_SUCCESS == err);

while (!g_transfer_complete)
    {
    /* Wait for transfer. */

    }
}

/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
    if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = 1;
    }
}
```

Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt

must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
    /* Open the SDHI driver. This enables the card detection interrupt. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Check if card is inserted. */
    sdmmc_status_t status;
    err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    if (!status.card_inserted)
    {
        while (!g_card_inserted)
        {
            /* Wait for a card insertion interrupt. */
        }
        /* A device shall be ready to accept the first command within 1ms from detecting VDD
        min. Reference section 6.4.1.1
        * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
        6.00. */
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        /* Initialize the SD card after card insertion is detected. */
        err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
        assert(FSP_SUCCESS == err);
    }
    /* The callback is called when a card detection event occurs if the card detection
    interrupt is enabled. */
    void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
    {
        if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
        {

```

```

        g_card_inserted = true;
    }
    if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
    {
        g_card_inserted = false;
    }
}

```

Function Documentation

◆ R_SDHI_Open()

```
fsp_err_t R_SDHI_Open ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_cfg_t const *const p_cfg )
```

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. [R_SDHI_MediaInit](#) must be called after this function before any other functions can be used.

Implements [sdmmc_api_t::open\(\)](#).

Example:

```

/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);

```

Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ R_SDHI_MediaInit()

```
fsp_err_t R_SDHI_MediaInit ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_device_t *const p_device )
```

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements `sdmmc_api_t::mediaInit()`.

Example:

```
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
 * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

Return values

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card, eMMC device, or SDIO card.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_Read()**

```
fsp_err_t R_SDHI_Read ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
start_sector, uint32_t const sector_count )
```

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements `sdmmc_api_t::read()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ **R_SDHI_Write()**

```
fsp_err_t R_SDHI_Write ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source, uint32_t
const start_sector, uint32_t const sector_count )
```

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements `sdmmc_api_t::write()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written and the device is no longer holding `DAT0` low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ **R_SDHI_Readlo()**

```
fsp_err_t R_SDHI_Readlo ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address )
```

The Read function reads a one byte register from an SDIO card. Implements `sdmmc_api_t::readlo()`.

This function blocks until the command is sent and the response is received. `p_data` contains the register value read when this function returns.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_Writel0()**

```
fsp_err_t R_SDHI_Writel0 ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address, sdmmc_io_write_mode_t const read_after_write )
```

Writes a one byte register to an SDIO card. Implements `sdmmc_api_t::writel0()`.

This function blocks until the command is sent and the response is received. The register has been written when this function returns. If `read_after_write` is true, `p_data` contains the register value read when this function returns.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_ReadloExt()**

```
fsp_err_t R_SDHI_ReadloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
function, uint32_t const address, uint32_t *const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Reads data from an SDIO card function. Implements `sdmmc_api_t::readloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_WriteloExt()**

```
fsp_err_t R_SDHI_WriteloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source,
uint32_t const function, uint32_t const address, uint32_t const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Writes data to an SDIO card function. Implements `sdmmc_api_t::writeloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_IoIntEnable()**

```
fsp_err_t R_SDHI_IoIntEnable ( sdmmc_ctrl_t *const p_api_ctrl, bool enable )
```

Enables or disables the SDIO Interrupt. Implements `sdmmc_api_t::IoIntEnable()`.

Return values

FSP_SUCCESS	Card enabled or disabled SDIO interrupts successfully.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_StatusGet()**

```
fsp_err_t R_SDHI_StatusGet ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_status_t *const p_status )
```

Provides driver status. Implements `sdmmc_api_t::statusGet()`.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ **R_SDHI_Erase()**

```
fsp_err_t R_SDHI_Erase ( sdmmc_ctrl_t *const p_api_ctrl, uint32_t const start_sector, uint32_t const sector_count )
```

Erases sectors of an SD card or eMMC device. Implements `sdmmc_api_t::erase()`.

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_CallbackSet()**

```
fsp_err_t R_SDHI_CallbackSet ( sdmmc_ctrl_t *const p_api_ctrl, void(*) (sdmmc_callback_args_t *)
p_callback, void const *const p_context, sdmmc_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `sdmmc_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_SDHI_Close()**

```
fsp_err_t R_SDHI_Close ( sdmmc_ctrl_t *const p_api_ctrl)
```

Closes an open SD/MMC device. Implements `sdmmc_api_t::close()`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

4.2.58 Segment LCD Controller (r_slcdc)

Modules

Functions

slcdc_display_area_t const display_area)
```

```
fsp_err_t R_SLCDC_Close (slcdc_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)

Configuration

Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Segment LCD (r_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

--	--	--	--

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_slcdc0	Module Name
Clock > Source	<ul style="list-style-type: none"> • LOCO • SOSC • MOSC • HOCO 	HOCO	Select the clock source.
Clock > Divisor	Refer to the RA Configuration tool for available options.	(HOCO/MOSC) 16384	Select the clock divisor.
Output > Bias method	<ul style="list-style-type: none"> • 1/2 bias • 1/3 bias • 1/4 bias 	1/2 bias	Select the bias method. This determines the number of voltage levels used to create the waveforms.
Output > Timeslice	<ul style="list-style-type: none"> • Static • 2-slice • 3-slice • 4-slice • 8-slice 	Static	Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel.
Output > Waveform	<ul style="list-style-type: none"> • Waveform A • Waveform B 	Waveform A	Select the LCD waveform.
Output > Drive method	<ul style="list-style-type: none"> • External resistance division • Internal voltage boosting • Capacitor split 	External resistance division	Select the LCD drive method.
Output > Default contrast	Refer to the RA Configuration tool for available options.	0	Select the default contrast level.

Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Waveform	Slices	Bias	External Resistance	Internal Boost	Capacitor Split
A	8	1/4	Available	Available	—
A	4	1/3	Available	Available	Available
A	3	1/3	Available	Available	Available
A	3	1/2	Available	—	—
A	2	1/2	Available	—	—
A	Static	—	Available	—	—

B	8	1/4	Available	Available	Available
B	4	1/3	Available	Available	—

Clock Configuration

The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

Note

*Make sure your desired source clock is enabled and running before starting SLCDC output.
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.*

Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

Pin Name	Function	Notes
SEGN	Segment data output	Connect these signals to the segment pins of the LCD.
COMn	Common signal output	Connect these signals to the common pins of the LCD.
VLn	Voltage reference	These pins should be connected to passive components based on the selected drive method (see section 45.7 "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the RA4M1 User's Manual (R01UH0887EJ0100)).
CAPH, CAPL	Drive voltage generator capacitor	Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using resistance division.

Interrupt Configuration

The SLCDC provides no interrupt signals.

Note

Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC_DISP_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling `R_SLCDC_Open` and `R_SLCDC_Start` to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

Examples

Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
    fsp_err_t err;

    /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See RA4M1 User's
    * Manual (R01UH0887EJ0100) 8.2.18 "Segment LCD Source Clock Control Register
(SLDCSCKCR)" for details. */
    R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);

    /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

Note

While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.

Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
    fsp_err_t err;

    /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);

    /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
    RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);

    /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);

    /* Display will now continuously blink */
}
```

Data Structures

struct [slcdc_instance_ctrl_t](#)

Data Structure Documentation

◆ [slcdc_instance_ctrl_t](#)

struct [slcdc_instance_ctrl_t](#)

SLCDC control block. DO NOT INITIALIZE. Initialization occurs when [slcdc_api_t::open](#) is called

Function Documentation

◆ R_SLCDC_Open()

```
fsp_err_t R_SLCDC_Open ( slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg )
```

Opens the SLCDC driver. Implements `slcdc_api_t::open`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Invalid display mode.

◆ R_SLCDC_Write()

```
fsp_err_t R_SLCDC_Write ( slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const *p_data, uint8_t const segment_count )
```

Writes a sequence of display data to the segment data registers. Implements `slcdc_api_t::write`.

Return values

FSP_SUCCESS	Data was written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or data is NULL.
FSP_ERR_INVALID_ARGUMENT	Segment index is (or will be) out of range.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Modify()

```
fsp_err_t R_SLCDC_Modify ( slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data, uint8_t const data_mask )
```

Modifies a single segment register based on a mask and the desired data. Implements `slcdc_api_t::modify`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_Start()**

```
fsp_err_t R_SLCDC_Start ( slcdc_ctrl_t *const p_ctrl)
```

Starts output of LCD signals. Implements `slcdc_api_t::start`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_Stop()**

```
fsp_err_t R_SLCDC_Stop ( slcdc_ctrl_t *const p_ctrl)
```

Stops output of LCD signals. Implements `slcdc_api_t::stop`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_SetContrast()**

```
fsp_err_t R_SLCDC_SetContrast ( slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast )
```

Sets contrast to the specified level. Implements `slcdc_api_t::setContrast`.

Note

Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See RA4M1 User's Manual (R01UH0887EJ0100) section 45.2.4 "LCD Boost Level Control Register (VLCD)" for voltage levels at each setting.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized
FSP_ERR_UNSUPPORTED	Unsupported operation

◆ **R_SLCDC_SetDisplayArea()**

```
fsp_err_t R_SLCDC_SetDisplayArea ( slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area )
```

Sets output to Waveform A, Waveform B or blinking output. Implements `slcdc_api_t::setDisplayArea`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_UNSUPPORTED	Pattern selection has no effect in 8-time-slice mode.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ **R_SLCDC_Close()**

```
fsp_err_t R_SLCDC_Close ( slcdc_ctrl_t *const p_ctrl)
```

Closes the SLCDC driver. Implements `slcdc_api_t::close`.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

4.2.59 Serial Peripheral Interface (r_spi)

Modules

Functions

```
fsp_err_t R_SPI_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SPI_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void
*p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_CalculateBitrate (uint32_t bitrate, rspck_div_setting_t
*spck_div)
```

```
fsp_err_t R_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl,
void(*p_callback)(spi_callback_args_t*), void const *const p_context,
spi_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8-Bit, 9-bit, 10-bit, 11-bit, 12-bit, 13-bit, 14-bit, 15-bit, 16-Bit, 20-bit, 24-bit, and 32-Bit data frames
 - Hardware endian swap in 16-Bit and 32-Bit mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi

The following build time configurations are defined in fsp_cfg/r_spi_cfg.h:

--	--	--	--

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> Master Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> Data sampling 	Data sampling on odd	Select the clock edge

	<ul style="list-style-type: none"> on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge 	edge, data variation on even edge	to sample data.
Clock Polarity	<ul style="list-style-type: none"> • Low when idle • High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> • MSB First • LSB First 	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation 	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> • Full Duplex • Transmit Only 	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> • Active Low • Active High 	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High 	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> • Disabled • Odd • Even 	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the

bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated [spi_extended_cfg_t](#) structure.

Clock Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA

RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T2	PCLKA

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.

Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP_ERR_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    fsp_err_t err = FSP_SUCCESS;

    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Start a write/read transfer */
}
```

```
err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);

    fsp_err_t err = FSP_SUCCESS;

    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Assert Slave Select Line 1 */
}
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);  
  
/* Start a write/read transfer */  
g_transfer_complete = false;  
err                  = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,  
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);  
assert(FSP_SUCCESS == err);  
  
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */  
while (false == g_transfer_complete)  
{  
    ;  
}  
  
/* De-assert Slave Select Line 1 */  
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);  
  
/* Wait for minimum time required between transfers. */  
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);  
  
/* Assert Slave Select Line 2 */  
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);  
  
/* Start a write/read transfer */  
g_transfer_complete = false;  
err                  = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,  
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);  
assert(FSP_SUCCESS == err);  
  
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */  
while (false == g_transfer_complete)  
{  
    ;  
}  
  
/* De-assert Slave Select Line 2 */  
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    g_spi_cfg.p_extend = &g_spi_extended_cfg;
    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */
    err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

Data Structure Documentation

◆ [rspck_div_setting_t](#)

struct rspck_div_setting_t		
SPI Clock Divider settings.		
Data Fields		
uint8_t	spbr	SPBR register setting.
uint8_t	brdv: 2	BRDV setting in SPCMD0.

◆ spi_extended_cfg_t

struct spi_extended_cfg_t		
Extended SPI interface configuration		
Data Fields		
spi_ssl_mode_t	spi_clksyn	Select spi or clock syn mode operation.
spi_communication_t	spi_comm	Select full-duplex or transmit-only communication.
spi_ssl_polarity_t	ssl_polarity	Select SSLn signal polarity.
spi_ssl_select_t	ssl_select	Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3.
spi_mosi_idle_value_fixing_t	mosi_idle	Select MOSI idle fixed value and selection.
spi_parity_t	parity	Select parity and enable/disable parity.
spi_byte_swap_t	byte_swap	Select byte swap mode.
rspck_div_setting_t	spck_div	Register values for configuring the SPI Clock Divider.
spi_delay_count_t	spck_delay	SPI Clock Delay Register Setting.
spi_delay_count_t	ssl_negation_delay	SPI Slave Select Negation Delay Register Setting.
spi_delay_count_t	next_access_delay	SPI Next-Access Delay Register Setting.

◆ spi_instance_ctrl_t

struct spi_instance_ctrl_t		
Channel control block. DO NOT INITIALIZE. Initialization occurs when <code>spi_api_t::open</code> is called.		
Data Fields		
uint32_t	open	
		Indicates whether the <code>open()</code> API has been successfully called.

<code>spi_cfg_t const *</code>	<code>p_cfg</code>
	Pointer to instance configuration.
<code>R_SPI0_Type *</code>	<code>p_regs</code>
	Base register for this channel.
<code>void const *</code>	<code>p_tx_data</code>
	Buffer to transmit.
<code>void *</code>	<code>p_rx_data</code>
	Buffer to receive.
<code>uint32_t</code>	<code>tx_count</code>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
<code>uint32_t</code>	<code>rx_count</code>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
<code>uint32_t</code>	<code>count</code>
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
<code>spi_bit_width_t</code>	<code>bit_width</code>
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ spi_ssl_mode_t

enum spi_ssl_mode_t	
3-Wire or 4-Wire mode.	
Enumerator	
SPI_SSL_MODE_SPI	SPI operation (4-wire method)
SPI_SSL_MODE_CLK_SYN	Clock Synchronous operation (3-wire method)

◆ spi_communication_t

enum spi_communication_t	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
SPI_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication.
SPI_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication.

◆ spi_ssl_polarity_t

enum spi_ssl_polarity_t	
Slave Select Polarity.	
Enumerator	
SPI_SSLP_LOW	SSLP signal polarity active low.
SPI_SSLP_HIGH	SSLP signal polarity active high.

◆ spi_ssl_select_t

enum spi_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_SSL_SELECT_SSL0	Select SSL0.
SPI_SSL_SELECT_SSL1	Select SSL1.
SPI_SSL_SELECT_SSL2	Select SSL2.
SPI_SSL_SELECT_SSL3	Select SSL3.

◆ spi_mosi_idle_value_fixing_t

enum spi_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_parity_t

enum spi_parity_t	
Parity Mode	
Enumerator	
SPI_PARITY_MODE_DISABLE	Disable parity.
SPI_PARITY_MODE_ODD	Select even parity.
SPI_PARITY_MODE_EVEN	Select odd parity.

◆ spi_byte_swap_t

enum spi_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_delay_count_t

enum spi_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

Function Documentation

◆ **R_SPI_Open()**

```
fsp_err_t R_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_Read()**

```
fsp_err_t R_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_Write()**

```
fsp_err_t R_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_WriteRead()**

```
fsp_err_t R_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest, uint32_t
const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_Close()**

```
fsp_err_t R_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements `spi_api_t::close`.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ **R_SPI_CalculateBitrate()**

```
fsp_err_t R_SPI_CalculateBitrate ( uint32_t bitrate, rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

◆ R_SPI_CallbackSet()

```
fsp_err_t R_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void (*)(spi_callback_args_t *) p_callback,
void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `spi_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.60 Serial Peripheral Interface (r_spi_b)

Modules

Functions

```
fsp_err_t R_SPI_B_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SPI_B_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t
const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t
const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src,
void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_B_CalculateBitrate (uint32_t bitrate, spi_b_clock_source_t
clock_source, rspck_div_setting_t *spck_div)
```

```
fsp_err_t R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl,
void (*p_callback)(spi_callback_args_t *), void const *const p_context,
spi_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8- to 32-Bit data frames
 - Hardware endian swap in 16-Bit and 32-Bit mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi_b

The following build time configurations are defined in fsp_cfg/r_spi_b_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a

performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi_b)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> Master Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> Data sampling on odd edge, data variation on even edge Data sampling on even edge, data variation on odd edge 	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> Low when idle High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> Enable Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> MSB First LSB First 	MSB First	Select the data bit order.

Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation 	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> • Full Duplex • Transmit Only 	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> • Active Low • Active High 	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High 	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> • Disabled • Odd • Even 	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Clock Source	<ul style="list-style-type: none"> • SCISPICK • PCLK 	PCLK	Select the clock source for communication.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated spi_extended_cfg_t

Clock Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	structure. Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The SPI peripheral uses the SCISPICLK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates it may be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH` to maintain signal integrity.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.

Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Start a write/read transfer */
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    g_spi_cfg.p_extend = &g_spi_extended_cfg;  
    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the  
desired bitrate. */  
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICKL,  
&(g_spi_extended_cfg.spck_div));  
    assert(FSP_SUCCESS == err);  
    /* Initialize the SPI module. */  
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
}
```

struct spi_b_instance_ctrl_t		
Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called.		
Data Fields		
uint32_t	open	
		Indicates whether the open() API has been successfully called.
spi_cfg_t const *	p_cfg	
		Pointer to instance configuration.
R_SPI_B0_Type *	p_regs	
		Base register for this channel.
void const *	p_tx_data	
		Buffer to transmit.
void *	p_rx_data	
		Buffer to receive.
uint32_t	tx_count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	rx_count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)

<code>spi_bit_width_t</code>	<code>bit_width</code>
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ `spi_b_ssl_mode_t`

enum <code>spi_b_ssl_mode_t</code>	
3-Wire or 4-Wire mode.	
Enumerator	
<code>SPI_B_SSL_MODE_SPI</code>	SPI operation (4-wire method)
<code>SPI_B_SSL_MODE_CLK_SYN</code>	Clock Synchronous operation (3-wire method)

◆ `spi_b_communication_t`

enum <code>spi_b_communication_t</code>	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
<code>SPI_B_COMMUNICATION_FULL_DUPLEX</code>	Full-Duplex synchronous serial communication.
<code>SPI_B_COMMUNICATION_TRANSMIT_ONLY</code>	Transit only serial communication.

◆ `spi_b_ssl_polarity_t`

enum <code>spi_b_ssl_polarity_t</code>	
Slave Select Polarity.	
Enumerator	
<code>SPI_B_SSLP_LOW</code>	SSLP signal polarity active low.
<code>SPI_B_SSLP_HIGH</code>	SSLP signal polarity active high.

◆ spi_b_ssl_select_t

enum spi_b_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_B_SSL_SELECT_SSL0	Select SSL0.
SPI_B_SSL_SELECT_SSL1	Select SSL1.
SPI_B_SSL_SELECT_SSL2	Select SSL2.
SPI_B_SSL_SELECT_SSL3	Select SSL3.

◆ spi_b_mosi_idle_value_fixing_t

enum spi_b_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_B_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_b_parity_t

enum spi_b_parity_t	
Parity Mode	
Enumerator	
SPI_B_PARITY_MODE_DISABLE	Disable parity.
SPI_B_PARITY_MODE_ODD	Select even parity.
SPI_B_PARITY_MODE_EVEN	Select odd parity.

◆ spi_b_byte_swap_t

enum spi_b_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_B_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_B_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_b_delay_count_t

enum spi_b_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_B_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_B_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_B_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_B_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_B_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_B_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_B_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_B_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

◆ spi_b_clock_source_t

enum spi_b_clock_source_t
SPI communication clock source.

Function Documentation

◆ **R_SPI_B_Open()**

```
fsp_err_t R_SPI_B_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_B_Read()**

```
fsp_err_t R_SPI_B_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_Write()**

```
fsp_err_t R_SPI_B_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_WriteRead()**

```
fsp_err_t R_SPI_B_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_Close()**

```
fsp_err_t R_SPI_B_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements `spi_api_t::close`.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ **R_SPI_B_CalculateBitrate()**

```
fsp_err_t R_SPI_B_CalculateBitrate ( uint32_t bitrate, spi_b_clock_source_t clock_source,
rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[in]	clock_source	SPI communication clock source to be used
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

◆ **R_SPI_B_CallbackSet()**

```
fsp_err_t R_SPI_B_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `spi_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.61 Serial Sound Interface (r_ssi)

Modules

Functions

```

```

```
fsp_err_t R_SSI_Stop (i2s_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_SSI_StatusGet (i2s_ctrl_t *const p_ctrl, i2s_status_t *const
p_status)
```

```
fsp_err_t R_SSI_Write (i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t
const bytes)
```

```
fsp_err_t R_SSI_Read (i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t
const bytes)
```

```
fsp_err_t R_SSI_WriteRead (i2s_ctrl_t *const p_ctrl, void const *const p_src,
void *const p_dest, uint32_t const bytes)
```

```
fsp_err_t R_SSI_Mute (i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable)
```

```
fsp_err_t R_SSI_Close (i2s_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_SSI_CallbackSet (i2s_ctrl_t *const p_api_ctrl,
```

```
void(*p_callback)(i2s_callback_args_t*), void const *const p_context,
i2s_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

Overview

Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master mode
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

Configuration

Build Time Configurations for r_ssi

The following build time configurations are defined in fsp_cfg/r_ssi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If code for DTC transfer support is included in the build.

Configurations for Connectivity > I2S (r_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2s0	Module name.
Channel	Value must be an integer between 0 and 1	0	Specify the I2S channel.
Bit Depth	<ul style="list-style-type: none"> • 8 Bits 	16 Bits	Select the bit depth of

	<ul style="list-style-type: none"> • 16 Bits • 18 Bits • 20 Bits • 22 Bits • 24 Bits • 32 Bits 		one sample of audio data.
Word Length	<ul style="list-style-type: none"> • 8 Bits • 16 Bits • 24 Bits • 32 Bits • 48 Bits • 64 Bits • 128 Bits • 256 Bits 	16 Bits	Select the word length of audio data. Must be at least as large as Data bits.
WS Continue Mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable WS continue mode to output the word select (WS) pin even when transmission is idle.
Bit Clock Source	<ul style="list-style-type: none"> • External AUDIO_CLK • Internal AUDIO_CLK 	External AUDIO_CLK	Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal
Bit Clock Divider	Refer to the RA Configuration tool for available options.	Audio Clock / 1	Select divider used to generate bit clock from audio clock.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from all three interrupt service routines (ISR).
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Idle/Error Interrupt Priority	MCU Specific Options		Select the Idle/Error interrupt priority.

Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO_CLK pin in master mode.

Pin Configuration

The SSI uses the following pins:

- AUDIO_CLK (optional, master mode only): The AUDIO_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFSn: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

Usage Notes

SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

Figure 174: SSI Frame Diagram (8-bit word, 8-bit samples)

Note

If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.

Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

Bit Depth	Array Data Type	Required Alignment	Required Length (bytes)
8 Bits	8-bit integer	1 byte alignment	Multiple of 2
16 Bits	16-bit integer	2 byte alignment	Multiple of 4
18 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8

20 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
22 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
24 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
32 Bits	32-bit integer	4 byte alignment	Multiple of 8

Note

The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.

Audio Clock

The audio clock is only required for master mode.

Audio Clock Frequency

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

$$\text{bit_clock (Hz)} = \text{sampling_frequency (Hz)} * \text{channels} * \text{system_word_bits}$$

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

$$44100 * 2 * 16 = 1,411,200 \text{ Hz}$$

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

$$\text{audio_clock (Hz)} = \text{desired_bit_clock (Hz)} * \text{bit_clock_divider}$$

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

Audio Clock Source

The audio clock source can come from:

- An external source input to the AUDIO_CLK pin
- An internal connection to the GPT timer output

Note

When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.

See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.

Limitations

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only transmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

Examples

Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
    / sampling_frequency) */

    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
    for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
        float input = (((float) (freq * t)) * (M_TWOPI)) /
        SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;

        g_src[2 * t] = (int16_t) ((INT16_MAX * sinf(input)));
        g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }

    /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Transfer data. */
    (void) R_SSI_WriteRead(&g_i2s_ctrl,
                           (uint8_t *) &g_src[0],
                           (uint8_t *) &g_dest[0],
                           SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}
```

```
}
```

Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart transmission in the main loop.

This example also checks the return code of `R_SSI_Write()` because `R_SSI_Write()` can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the `I2S_EVENT_IDLE` callback is received.

```
#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t      g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t      g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;
/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
    /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
    SSI is idle because it was
    * stopped after a transmit FIFO overflow. */
    if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {
        if (g_data_ready)
        {
            /* Reload FIFO and handle errors. */
            ssi_example_write();
        }
        else
        {
            /* Data was not ready yet, send it in the main loop. */
            g_send_data_in_main_loop = true;
        }
    }
}
```

```
    }
}
}
/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
{
    /* Transfer data. This call is non-blocking. */
    fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                               (uint8_t *) &g_stream_src[g_buffer_index][0],
                               SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
    if (FSP_SUCCESS == err)
    {
        /* Switch the buffer after data is sent. */
        g_buffer_index = !g_buffer_index;
        /* Allow loop to calculate next buffer only if transmission was successful. */
        g_data_ready = false;
    }
    else
    {

Data Structures

struct [ssi_instance_ctrl_t](#)

struct [ssi_extended_cfg_t](#)

Enumerations

enum [ssi_audio_clock_t](#)

enum [ssi_clock_div_t](#)

Data Structure Documentation

◆ [ssi_instance_ctrl_t](#)

struct [ssi_instance_ctrl_t](#)

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [i2s_api_t::open](#) is called.

◆ [ssi_extended_cfg_t](#)

struct [ssi_extended_cfg_t](#)

SSI configuration extension. This extension is optional.

Data Fields

ssi_audio_clock_t	audio_clock	Audio clock source, default is SSI_AUDIO_CLOCK_EXTERNAL .
ssi_clock_div_t	bit_clock_div	Select bit clock division ratio.

Enumeration Type Documentation

◆ **ssi_audio_clock_t**

enum <code>ssi_audio_clock_t</code>	
Audio clock source.	
Enumerator	
<code>SSI_AUDIO_CLOCK_EXTERNAL</code>	Audio clock source is the AUDIO_CLK input pin.
<code>SSI_AUDIO_CLOCK_INTERNAL</code>	Audio clock source is internal connection to a MCU specific GPT channel output.

◆ **ssi_clock_div_t**

enum <code>ssi_clock_div_t</code>	
Bit clock division ratio. Bit clock frequency = audio clock frequency / bit clock division ratio.	
Enumerator	
<code>SSI_CLOCK_DIV_1</code>	Clock divisor 1.
<code>SSI_CLOCK_DIV_2</code>	Clock divisor 2.
<code>SSI_CLOCK_DIV_4</code>	Clock divisor 4.
<code>SSI_CLOCK_DIV_6</code>	Clock divisor 6.
<code>SSI_CLOCK_DIV_8</code>	Clock divisor 8.
<code>SSI_CLOCK_DIV_12</code>	Clock divisor 12.
<code>SSI_CLOCK_DIV_16</code>	Clock divisor 16.
<code>SSI_CLOCK_DIV_24</code>	Clock divisor 24.
<code>SSI_CLOCK_DIV_32</code>	Clock divisor 32.
<code>SSI_CLOCK_DIV_48</code>	Clock divisor 48.
<code>SSI_CLOCK_DIV_64</code>	Clock divisor 64.
<code>SSI_CLOCK_DIV_96</code>	Clock divisor 96.
<code>SSI_CLOCK_DIV_128</code>	Clock divisor 128.

Function Documentation

◆ **R_SSI_Open()**

```
fsp_err_t R_SSI_Open ( i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg )
```

Opens the SSI. Implements [i2s_api_t::open](#).

This function sets this clock divisor and the configurations specified in [i2s_cfg_t](#). It also opens the timer and transfer instances if they are provided.

Return values

FSP_SUCCESS	Ready for I2S communication.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_cfg is null.
FSP_ERR_ALREADY_OPEN	The control block has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel number is not available on this MCU.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SSI_Stop()**

```
fsp_err_t R_SSI_Stop ( i2s_ctrl_t *const p_ctrl)
```

Stops SSI. Implements [i2s_api_t::stop](#).

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

Return values

FSP_SUCCESS	I2S communication stop request issued.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See [Common Error Codes](#) or lower level drivers for other possible return codes.

◆ **R_SSI_StatusGet()**

```
fsp_err_t R_SSI_StatusGet ( i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status )
```

Gets SSI status and stores it in provided pointer p_status. Implements `i2s_api_t::statusGet`.

Return values

FSP_SUCCESS	Information stored successfully.
FSP_ERR_ASSERTION	The p_instance_ctrl or p_status parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_Write()**

```
fsp_err_t R_SSI_Write ( i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes )
```

Writes data buffer to SSI. Implements `i2s_api_t::write`.

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

Write() cannot be called if another write(), read() or writeRead() operation is in progress. Write can be called when the SSI is idle, or after the I2S_EVENT_TX_EMPTY event.

Return values

FSP_SUCCESS	Write initiated successfully.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_src was null, or bytes requested was 0.
FSP_ERR_IN_USE	Another transfer is in progress, data was not written.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reset`

◆ **R_SSI_Read()**

```
fsp_err_t R_SSI_Read ( i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes )
```

Reads data into provided buffer. Implements `i2s_api_t::read`.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

FSP_SUCCESS	Read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_dest was null, or bytes requested was 0.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_WriteRead()**

```
fsp_err_t R_SSI_WriteRead ( i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest,
uint32_t const bytes )
```

Writes from source buffer and reads data into destination buffer. Implements [i2s_api_t::writeRead](#).

This function calls [R_SSI_Write](#) and [R_SSI_Read](#).

[writeRead\(\)](#) cannot be called if another [write\(\)](#), [read\(\)](#) or [writeRead\(\)](#) operation is in progress. [writeRead\(\)](#) can be called when the SSI is idle, or after the [I2S_EVENT_RX_FULL](#) event.

Return values

FSP_SUCCESS	Write and read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_Mute()**

```
fsp_err_t R_SSI_Mute ( i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable )
```

Mutes SSI on the next frame boundary. Implements [i2s_api_t::mute](#).

Data is still written while mute is enabled, but the transmit line outputs zeros.

Return values

FSP_SUCCESS	Transmission is muted.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_Close()**

```
fsp_err_t R_SSI_Close ( i2s_ctrl_t *const p_ctrl)
```

Closes SSI. Implements `i2s_api_t::close`.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_CallbackSet()**

```
fsp_err_t R_SSI_CallbackSet ( i2s_ctrl_t *const p_api_ctrl, void(*) (i2s_callback_args_t *) p_callback, void const *const p_context, i2s_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2s_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.62 USB (r_usb_basic)

Modules

Functions

```
fsp_err_t R_USB_Open (usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const p_cfg)
```

Applies power to the USB module specified in the argument (`p_ctrl`).
[More...](#)

`fsp_err_t` [R_USB_Close](#) (`usb_ctrl_t *const p_api_ctrl`)
Terminates power to the USB module specified in argument (`p_ctrl`). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module). [More...](#)

`fsp_err_t` [R_USB_Read](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t destination`)
Bulk/interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R_USB_Write](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t const *const p_buf`, `uint32_t size`, `uint8_t destination`)
Bulk/Interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R_USB_Stop](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_transfer_t direction`, `uint8_t destination`)
Requests a data read/write transfer be terminated when a data read/write transfer is being performed. [More...](#)

`fsp_err_t` [R_USB_Suspend](#) (`usb_ctrl_t *const p_api_ctrl`)
Sends a SUSPEND signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_Resume](#) (`usb_ctrl_t *const p_api_ctrl`)
Sends a RESUME signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_VbusSet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t state`)
Specifies starting or stopping the VBUS supply. [More...](#)

`fsp_err_t` [R_USB_InfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_info_t *p_info`, `uint8_t destination`)
Obtains completed USB-related events. [More...](#)

`fsp_err_t` [R_USB_PipeRead](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t pipe_number`)
Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument. [More...](#)

`fsp_err_t` [R_USB_PipeWrite](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`, `uint8_t pipe_number`)

Requests a data write (bulk/interrupt transfer). [More...](#)

`fsp_err_t` [R_USB_PipeStop](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t pipe_number`)

Terminates a data read/write operation. [More...](#)

`fsp_err_t` [R_USB_UsedPipesGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t *p_pipe`, `uint8_t destination`)

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information. [More...](#)

`fsp_err_t` [R_USB_PipeInfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_pipe_t *p_info`, `uint8_t pipe_number`)

Gets the following pipe information regarding the pipe specified in the argument (`p_ctrl`) member (`pipe`): endpoint number, transfer type, transfer direction and maximum packet size. [More...](#)

`fsp_err_t` [R_USB_PullUp](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t state`)

This API enables or disables pull-up of D+/D- line. [More...](#)

`fsp_err_t` [R_USB_EventGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_status_t *event`)

Obtains completed USB related events. (OS-less Only) [More...](#)

`fsp_err_t` [R_USB_Callback](#) (`usb_callback_t *p_callback`)

Register a callback function to be called upon completion of a USB related event. (RTOS only) [More...](#)

`fsp_err_t` [R_USB_HostControlTransfer](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_setup_t *p_setup`, `uint8_t *p_buf`, `uint8_t device_address`)

Performs settings and transmission processing when transmitting a setup packet. [More...](#)

`fsp_err_t` [R_USB_PeriControlDataGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`)

Receives data sent by control transfer. [More...](#)

`fsp_err_t` `R_USB_PeriControlDataSet` (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t size`)

Performs transfer processing for control transfer. [More...](#)

`fsp_err_t` `R_USB_PeriControlStatusSet` (`usb_ctrl_t *const p_api_ctrl`, `usb_setup_status_t status`)

Set the response to the setup packet. [More...](#)

`fsp_err_t` `R_USB_RemoteWakeup` (`usb_ctrl_t *const p_api_ctrl`)

Sends a remote wake-up signal to the connected Host. [More...](#)

`fsp_err_t` `R_USB_ModuleNumberGet` (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *module_number`)

This API gets the module number. [More...](#)

`fsp_err_t` `R_USB_ClassTypeGet` (`usb_ctrl_t *const p_api_ctrl`, `usb_class_t *class_type`)

This API gets the class type. [More...](#)

`fsp_err_t` `R_USB_DeviceAddressGet` (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *device_address`)

This API gets the device address. [More...](#)

`fsp_err_t` `R_USB_PipeNumberGet` (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *pipe_number`)

This API gets the pipe number. [More...](#)

`fsp_err_t` `R_USB_DeviceStateGet` (`usb_ctrl_t *const p_api_ctrl`, `uint16_t *state`)

This API gets the state of the device. [More...](#)

`fsp_err_t` `R_USB_DataSizeGet` (`usb_ctrl_t *const p_api_ctrl`, `uint32_t *data_size`)

This API gets the data size. [More...](#)

`fsp_err_t` `R_USB_SetupGet` (`usb_ctrl_t *const p_api_ctrl`, `usb_setup_t *setup`)

This API gets the setup type. [More...](#)

Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

Features

The USB module has the following key features:

- USB Host mode
 - Enumerates Low/Full/High-speed devices (see note below)
 - Automatic transfer error determination and retry
- USB Peripheral mode
 - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
 - Control transfers supported on pipe 0
 - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

Note

Supported speeds are dependent on the MCU.

Configuration

Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
PLL Frequency	<ul style="list-style-type: none"> • 24MHz • 20MHz • 12MHz • Other 	24MHz	Specify the PLL frequency supplied to the USB module. This setting only applies to USB1 (not USB0).
CPU Bus Access Wait Cycles	Refer to the RA Configuration tool for available options.	9 cycles	This setting controls the delay for consecutive USB peripheral register access. Set this value to a number of CPU cycles that is equivalent to 40.8ns or more.

Battery Charging	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Specify whether or not to include battery charging functionality.
Power IC Shutdown Polarity	<ul style="list-style-type: none"> • Active High • Active Low 	Active High	Select the polarity of the Shutdown signal on the power supply IC (if provided).
Dedicated Charging Port (DCP) Mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, USB communication is disabled and the port is used for charging only.
Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	When enabled, the application will receive notifications for SET_INTERFACE, SET_FEATURE and CLEAR_FEATURE messages.
Double Buffering	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	When enabled, the FIFOs for Pipes 1-5 are double-buffered.
Continuous Transfer Mode	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enable or disable continuous transfer mode.
LDO Regulator	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Enable or disable LDO regulator.
DMA Support	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Enable or disable DMA support for the USB module.
DMA Source Address	<ul style="list-style-type: none"> • DMA Disabled • FS Address • HS Address 	DMA Disabled	Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.
DMA Destination Address	<ul style="list-style-type: none"> • DMA Disabled • FS Address • HS Address 	DMA Disabled	Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.
USB Compliance Test mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Display the information required to take the compliance test.
USB TPL table name	Enter the TPL table name.	NULL	Enter the name of the TPL Table.

Configurations for Connectivity > USB (r_usb_basic)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_basic0	Module name.

USB Mode	<ul style="list-style-type: none"> • Host mode • Peri mode 	Host mode	Select the usb mode.
USB Speed	<ul style="list-style-type: none"> • Full Speed • Hi Speed • Low Speed 	Full Speed	Select the USB speed.
USB Module Number	<ul style="list-style-type: none"> • USB_IP0 Port • USB_IP1 Port 	USB_IP0 Port	Specify the USB module number to be used.
USB Device Class	<ul style="list-style-type: none"> • Peripheral Communications Device Class • Peripheral Human Interface Device Class • Peripheral Mass Storage Class • Peripheral Vendor Class • Peripheral Audio Class • Host Communications Device Class • Host Human Interface Device Class • Host Mass Storage Class • Host Vendor Class 	Peripheral Communications Device Class	Select the USB device class.
USB Descriptor	USB Descriptor must be a valid C symbol.	g_usb_descriptor	Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when using the Host class.
USB Compliance Callback	Compliance Callback must be a valid C symbol.	NULL	Set the callback for compliance tests here.
USBFS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBFS ISR.
USBFS Resume Priority	MCU Specific Options		Select the interrupt priority used by the USBFS Resume ISR.
USBFS D0FIFO	MCU Specific Options		Select the interrupt

Interrupt Priority			priority used by the USBFS D0FIFO.
USBFS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D1FIFO.
USBHS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBHS ISR.
USBHS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D0FIFO ISR.
USBHS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D1FIFO ISR.
USB RTOS Callback	Enter the address of the function.	NULL	If an FreeRTOS is used, set the callback function here.
USB Callback Context	Enter the address of the context.	NULL	Set the callback context here.

Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

Note

When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.

Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

Note

USB_VBUS and USBHS_VBUS are 5V-tolerant pins.

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

Config Name	Select Name	Description
Transfer Size	2 Bytes 4 Bytes	In FS mode, select "2 Bytes" In HS mode, select "4 Bytes"
Activation source	USBFS FIFO 0	USB FS Reception

USBFS FIFO 1
 USBHS FIFO 0
 USBHS FIFO 1

USB FS Transmission
 USB HS Reception
 USB HS Transmission

Descriptor definition

In Peripheral mode, the `usb_descriptor_t` structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string;  /* Number of strings in table */
} usb_descriptor_t;
```

Note

Even in high-speed mode the full-speed configuration must be made available:

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
    NULL,
    smp_str_table,
    3,
};

/* Example USB HS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
```

```
smp_config_f,  
smp_config_h,  
smp_qualifier,  
smp_str_table,  
3,  
};
```

String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */  
uint8_t str_descriptor_0[]  
{  
    0x04,      /* Length */  
    0x03,      /* Descriptor type */  
    0x09, 0x04 /* Language ID */  
};  
uint8_t str_descriptor_manufacturer[] =  
{  
    0x10,      /* Length */  
    0x03,      /* Descriptor type */  
    'R', 0x00,  
    'E', 0x00,  
    'N', 0x00,  
    'E', 0x00,  
    'S', 0x00,  
    'A', 0x00,  
    'S', 0x00  
};  
uint8_t str_descriptor_product[] =  
{  
    0x12,      /* Length */  
    0x03,      /* Descriptor type */
```

```
'C', 0x00,
'D', 0x00,
'C', 0x00,
'_', 0x00,
'D', 0x00,
'E', 0x00,
'M', 0x00,
'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,          /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
    str_descriptor_product,    /* Index: 2 */
};
```

Note

Set the string index values in the device/configuration descriptors (*iManufacturer*, *iConfiguration* etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in *str_descriptor_manufacturer* and the value of *iManufacturer* in the device descriptor is **1**.

Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (<http://www.usb.org/developers/docs/>) for details on how to construct the device, configuration and qualifier descriptors.

Usage Notes

Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or *R_USB_EventGet* should be used to provide event data to the application loop where a switch statement handles the event.

Note

1. The *USB_STATUS_CONFIGURED* event should be confirmed before calling *R_USB_Read* or *R_USB_Write*.
2. When attaching to USB Host, Suspend event is notified to the application program in USB peripheral mode. Notification of this event to the application program does not affect the operation.

Limitations

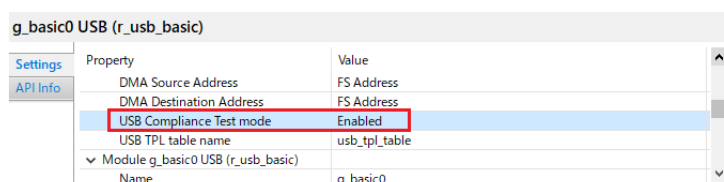

Developers should be aware of the following limitations when using the USB driver:

- The current USB driver does not support hub.
- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- Only one device-class driver may be used at a time.
- The USB Hi-Speed module only supports Hi-Speed operation.
- In USB host mode, this USB driver does not support the composite device.
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.

Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

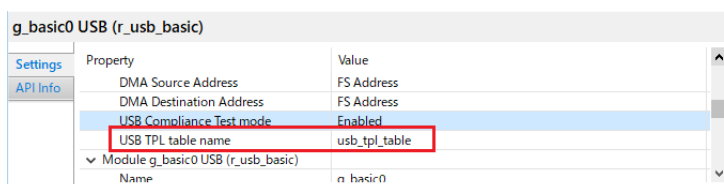

1.USB Compliance Test mode Set "Enabled" in this item.

Property	Value
DMA Source Address	FS Address
DMA Destination Address	FS Address
USB Compliance Test mode	Enabled
USB TPL table name	usb_tpl_table
Module g_basic0 USB (r_usb_basic)	
Name	basic0

Figure 175: Compliance Test Setting

2.USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

Property	Value
DMA Source Address	FS Address
DMA Destination Address	FS Address
USB Compliance Test mode	Enabled
USB TPL table name	usb_tpl_table
Module g_basic0 USB (r_usb_basic)	
Name	basic0

Figure 176: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,          /* Number of tpl */
    0,          /* Reserved */
    0x0123, 0x4567, /* Vendor ID, Product ID (1st device) */
};
```

```
0x89ab, 0xcdef /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

Figure 177: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t              print_data[32];
    disp_data = (usb_compliance_t*)param;
    switch(disp_data->status)
    {
        case USB_COMPLIANCETEST_ATTACH:          /* Device Attach Detection */
            display("\nATTACH \n");
            break;
        case USB_COMPLIANCETEST_DETACH:         /* Device Detach Detection */
            display("\nDETACH \n");
            break;
        case USB_COMPLIANCETEST_TPL:           /* TPL device connect */
            display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
            break;
        case USB_COMPLIANCETEST_NOTTPL:       /* Not TPL device connect */
            display("\nNOTTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
            break;
        case USB_COMPLIANCETEST_HUB:         /* USB Hub connect */
            display("\nHub \n");
    }
}
```

```
break;

case USB_COMPLIANCETEST_OVRC:           /* over current */
break;

case USB_COMPLIANCETEST_NORES:         /* Responce Time out for Control Read
Transfer */
    display("\nNOTRESP \n");
break;

case USB_COMPLIANCETEST_SETUP_ERR:     /* Setup Transaction Error */
break;

default:
break;
    }
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

TrustZone

The USB driver for FreeRTOS cannot be allocated in Secure region.

UCLK setting

Enable UCLK in "Clocks" tab on e2 studio when using the following MCU.

1. RA6M4

Examples

USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t     event;

    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    /* Loop back between PC(TerminalSoft) and USB MCU */
    while (1)
```

```
{
    g_usb_on_usb.eventGet(&event_info, &event);
switch (event)
{
case USB_STATUS_CONFIGURED:
case USB_STATUS_WRITE_COMPLETE:
    g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
break;
case USB_STATUS_READ_COMPLETE:
    g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
break;
case USB_STATUS_REQUEST: /* Receive Class Request */
if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
{
    g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
}
else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
{
    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
}
else
{
    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
}
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
}
```

```

    }
}
} /* End of function usb_main() */

```

Typedefs

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

Typedef Documentation

◆ usb_instance_ctrl_t

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

ICU private control block. DO NOT MODIFY. Initialization occurs when R_ICU_ExternallrqOpen is called.

Function Documentation

◆ R_USB_Open()

```
fsp_err_t R_USB_Open ( usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const p_cfg )
```

Applies power to the USB module specified in the argument (p_ctrl).

Return values

FSP_SUCCESS	Success in open.
FSP_ERR_USB_BUSY	Specified USB module now in use.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ R_USB_Close()

```
fsp_err_t R_USB_Close ( usb_ctrl_t *const p_api_ctrl)
```

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ R_USB_Read()

```
fsp_err_t R_USB_Read ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t destination )
```

Bulk/interrupt data transfer and control data transfer.

1. Bulk/interrupt data transfer

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

2. Control data transfer

The R_USB_Read function is used to receive data in the data stage and the R_USB_Write function is used to send data to the USB host.

Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ R_USB_Write()

```
fsp_err_t R_USB_Write ( usb_ctrl_t *const p_api_ctrl, uint8_t const *const p_buf, uint32_t size,
uint8_t destination )
```

Bulk/Interrupt data transfer and control data transfer.

1. Bulk/Interrupt data transfer

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

2. Control data transfer

The R_USB_Read function is used to receive data in the data stage and the R_USB_Write function is used to send data to the USB host.

Return values

FSP_SUCCESS	Successfully completed. (Data write request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data write request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet (ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow. e.g)

```
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Stop()**

```
fsp_err_t R_USB_Stop ( usb_ctrl_t *const p_api_ctrl, usb_transfer_t direction, uint8_t destination )
```

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_WRITE as the argument (type).

Return values

FSP_SUCCESS	Successfully completed. (stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Stop processing is called multiple times.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_Suspend()**

```
fsp_err_t R_USB_Suspend ( usb_ctrl_t *const p_api_ctrl)
```

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	During a suspend request to the specified USB module, or when the USB module is already in the suspended state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_Resume()**

```
fsp_err_t R_USB_Resume ( usb_ctrl_t *const p_api_ctrl)
```

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Resume already requested for same device address. (USB host mode only)
FSP_ERR_USB_NOT_SUSPEND	USB device is not in the SUSPEND state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_VbusSet()**

```
fsp_err_t R_USB_VbusSet ( usb_ctrl_t *const p_api_ctrl, uint16_t state )
```

Specifies starting or stopping the VBUS supply.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_InfoGet()**

```
fsp_err_t R_USB_InfoGet ( usb_ctrl_t *const p_api_ctrl, usb_info_t * p_info, uint8_t destination )
```

Obtains completed USB-related events.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PipeRead()**

```
fsp_err_t R_USB_PipeRead ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_PipeWrite()**

```
fsp_err_t R_USB_PipeWrite ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data write (bulk/interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet (ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets `USB_NULL` in the third argument (size) of `R_USB_PipeWrite` function as follow.

e.g)

```
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PipeStop()**

```
fsp_err_t R_USB_PipeStop ( usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number )
```

Terminates a data read/write operation.

Return values

FSP_SUCCESS	Successfully completed. (Stop request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_UsedPipesGet()**

```
fsp_err_t R_USB_UsedPipesGet ( usb_ctrl_t *const p_api_ctrl, uint16_t * p_pipe, uint8_t destination )
```

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PipeInfoGet()**

```
fsp_err_t R_USB_PipeInfoGet ( usb_ctrl_t *const p_api_ctrl, usb_pipe_t * p_info, uint8_t pipe_number )
```

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PullUp()**

```
fsp_err_t R_USB_PullUp ( usb_ctrl_t *const p_api_ctrl, uint8_t state )
```

This API enables or disables pull-up of D+/D- line.

Return values

FSP_SUCCESS	Successful completion. (Pull-up enable/disable setting completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_EventGet()**

```
fsp_err_t R_USB_EventGet ( usb_ctrl_t *const p_api_ctrl, usb_status_t * event )
```

Obtains completed USB related events. (OS-less Only)

In USB host mode, the device address value of the USB device that completed an event is specified in the `usb_ctrl_t` structure member (address) specified by the event's argument. In USB peripheral mode, `USB_NULL` is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned.

Return values

FSP_SUCCESS	Event Get Success.
FSP_ERR_USB_FAILED	If called in the RTOS environment, an error is returned.

Note

*Do not use the same variable as the first argument of `R_USB_Open` for the first argument.
Do not call this API in the interrupt function.*

◆ **R_USB_Callback()**

```
fsp_err_t R_USB_Callback ( usb_callback_t * p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	If this function is called in the OS-less execution environment, a failure is returned.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not call this API in the interrupt function.

◆ **R_USB_HostControlTransfer()**

```
fsp_err_t R_USB_HostControlTransfer ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * p_setup, uint8_t * p_buf, uint8_t device_address )
```

Performs settings and transmission processing when transmitting a setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PericontrolDataGet()**

```
fsp_err_t R_USB_PericontrolDataGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Receives data sent by control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlDataSet()**

```
fsp_err_t R_USB_PeriControlDataSet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Performs transfer processing for control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlStatusSet()**

```
fsp_err_t R_USB_PeriControlStatusSet ( usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status )
```

Set the response to the setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_RemoteWakeup()**

```
fsp_err_t R_USB_RemoteWakeup ( usb_ctrl_t *const p_api_ctrl)
```

Sends a remote wake-up signal to the connected Host.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_NOT_SUSPEND	Device is not suspended.
FSP_ERR_USB_BUSY	The device is in resume operation.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_ModuleNumberGet()**

```
fsp_err_t R_USB_ModuleNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * module_number )
```

This API gets the module number.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_ClassTypeGet()**

```
fsp_err_t R_USB_ClassTypeGet ( usb_ctrl_t *const p_api_ctrl, usb_class_t * class_type )
```

This API gets the class type.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DeviceAddressGet()**

```
fsp_err_t R_USB_DeviceAddressGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* device_address )
```

This API gets the device address.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_PipeNumberGet()**

```
fsp_err_t R_USB_PipeNumberGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* pipe_number )
```

This API gets the pipe number.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DeviceStateGet()**

```
fsp_err_t R_USB_DeviceStateGet ( usb_ctrl_t*const p_api_ctrl, uint16_t* state )
```

This API gets the state of the device.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DataSizeGet()**

```
fsp_err_t R_USB_DataSizeGet ( usb_ctrl_t*const p_api_ctrl, uint32_t* data_size )
```

This API gets the data size.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ R_USB_SetupGet()

```
fsp_err_t R_USB_SetupGet ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * setup )
```

This API gets the setup type.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

4.2.63 USB Composite Class (r_usb_composite)**Modules****Functions**

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.

This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC

How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

Figure 178: Select USB Composite

- The following is displayed when selecting [USB Composite].

Figure 179: USB Composite Stack

- Select the supported 2 device classes as follows.

Figure 180: Select Device Classes

Note

1. Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configuring for "PCDC + PCDC".

- Select the supported 2 device classes as follows. The following is displayed when selecting 2 device classes.

Figure 181: Delete USB Basic Instance

Note

1. Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)
2. The error is output when selecting the following device classes.
 - a. PMSC + PMSC
 - b. PHID + PHID

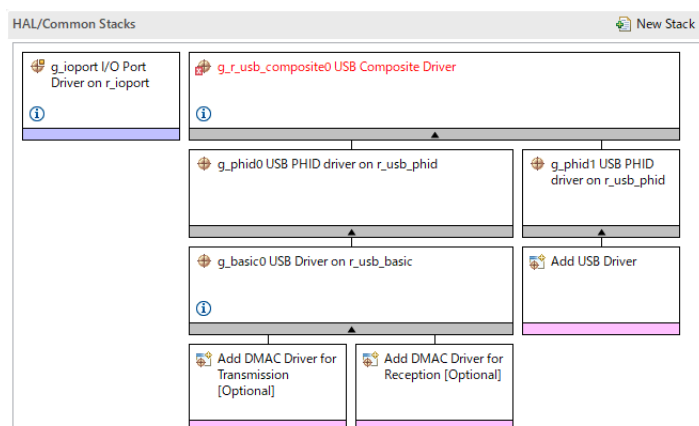

Figure 182: Device Class Selection Error

Limitations

1. The following composite device is not supported when using RA2A1(MCU).

1. PMSC + PCDC
2. PCDC + PCDC

2. If you use PMSC, make sure to use usb_basic module with PMSC. There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

Notes

Please determine by the member "pipe" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC.
Don't refer to the member "type" in "usb_event_info" structure.

Descriptor

Templates for composite device descriptors can be found in ra/fsp/src/r_usb_composite folder. Also, please be sure to use your vendor ID.

1. r_usb_pcdc_pmsc_descriptor.c.template (for PCDC + PMSC)
2. r_usb_pcdc_phid_descriptor.c.template (for PCDC + PHID)
3. r_usb_phid_pmsc_descriptor.c.template (for PHID + PMSC)
4. r_usb_pcdc_pcdc_descriptor.c.template (for PCDC + PCDC)

Examples

USB COMPOSITE Example

- PCDC + PHID

```

4.2.64 USB Host Communications Device Class Driver (r_usb_hcdc)

Modules

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).
