Chip Select Timing Setting > Memory Mapped Write Pull-down Timing	<ul style="list-style-type: none"> • 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI 	3 SPI/SOPI, 2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Pull-down Timing	<ul style="list-style-type: none"> • 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI 	3 SPI/SOPI, 2.5 DOPI	Signal pull-down timing setting in OCTACLK units

Note

The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.

OSPI RAM:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > OSPI RAM (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the read idle time.
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_ospi_ram0	Module name.
General > Channel	Channel should be 0 or 1 [Channel 0 recommended]	0	Specify the OSPI chip select line to use.
General > RAM Size	Must be an integer greater than 0 with maximum configurable value of 0x00800000	0x00800000	Specify the OctaRam size in bytes.
General > SPI Protocol	Dual data rate OPI	Dual data rate OPI	Select the initial SPI protocol. OctaRAM only supports DOPI mode.
General > Address Bytes	4	4	Select the number of address bytes. OctaRAM only supports 4 byte addresses in DOPI mode.
Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.

Command Definitions > Memory Read Command	Must be a 16-bit OSPI Dual Read Command under Command Definitions	0xA000	The command to read in DOPI mode.
Command Definitions > Memory Write Command	Must be a 16-bit OSPI Write Command under Command Definitions	0x2000	The command to write in DOPI mode.
OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	3	OM_DQS enable counter for memory access. Setting for DOPI mode.
Chip Select Timing Setting > Memory Mapped Read Command Interval	<ul style="list-style-type: none"> • 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17 	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	<ul style="list-style-type: none"> • 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17 	2	Memory mapped write command execution interval setting in OCTACLK units
Chip Select Timing Setting > Command Interval	<ul style="list-style-type: none"> • 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17 	2	Command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-up Timing	<ul style="list-style-type: none"> • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI 	6.5 DOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-up Timing	<ul style="list-style-type: none"> • 1.5 DOPI • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI • 5.5 DOPI • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI 	1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Pull-up Timing	<ul style="list-style-type: none"> • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI 	6.5 DOPI	Signal pull-up timing setting in OCTACLK units

Chip Select Timing Setting > Memory Mapped Read Pull-down Timing	<ul style="list-style-type: none"> • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI 	2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-down Timing	<ul style="list-style-type: none"> • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI 	2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Pull-down Timing	<ul style="list-style-type: none"> • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI 	2.5 DOPI	Signal pull-down timing setting in OCTACLK units
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 3 and 8	4	Memory read dummy cycles
Memory Write Dummy Cycles	Must be an integer between 3 and 8	4	Memory write dummy cycles
DOPI Byte Order	<ul style="list-style-type: none"> • Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2 	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus
Chip Select Maximum Low Time (us)	Must be an integer greater than or equal to 0	4	Chip Select Maximum Low Time (tCSM).

Clock Configuration

PCLKB is the Octal-SPI bus interface, and PCLKA is used to set OSPI registers.

The signals to the OSPI device are derived from OCTASPICK. The OMSCLK signal is OCTASPICK / 2. Data can be output at the OCTASPICK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTASPICK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTASPICK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with `IOPORT_CFG_DRIVE_HS_HIGH`.

Chip Select pins should be configured with at least `IOPORT_CFG_DRIVE_MEDIUM`.

Usage Notes

Usage Notes for OctaFlash support

Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer [Direct Memory Access Controller \(r_dmac\)](#).

OSPI Memory Mapped Access

After [R_OSPI_Open\(\)](#) completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling [R_OSPI_Open\(\)](#) with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using [R_OSPI_SpiProtocolSet\(\)](#) API. The appropriate preamble pattern can be written to the desired address using the [R_OSPI_Write\(\)](#) API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling [R_OSPI_Open\(\)](#).

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using [R_OSPI_SpiProtocolSet\(\)](#), please select latencies required for DOPI before calling [R_OSPI_Open\(\)](#).

OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

Usage Notes for OctaRAM support

OSPI Memory Mapped Access

After [R_OSPI_Open\(\)](#) completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call `R_OSPI_Open()` without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. `R_OSPI_AutoCalibrate()` should be then called to perform auto-calibration.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

Limitations

Developers should be aware of the following limitations when using the OSPI driver:

OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).
- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an `OM_SCLK` greater than 50MHz.

Examples

OSPI Flash:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi_flash section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =
"ABCDEFGHJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));
void r_ospi_example_function (void)
{
    /* Add code here. */
}
void r_ospi_basic_example (void)
```

```
{
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
/* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
/* After R_OSPI_Open() and any required device specific initialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
/* After R_OSPI_Open() and any required device specific initialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
}
```

Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
    spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
        .command      = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
        .address      = 0U,
        .data         = 0U,
        .command_length = 1U,
        .address_length = 0U,
        .data_length  = 0U,
        .dummy_cycles = 0U
    };
/* Open the OSPI instance. */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
```

```

/* Write Enable */
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);

assert(FSP_SUCCESS == err);

/* Read Status Register */
ospi_test_direct_transfer.command = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
ospi_test_direct_transfer.data_length = 1U;
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);

assert(FSP_SUCCESS == err);

/* Check if Write Enable is set */
if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
{
    __BKPT(0);
}
}

```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```

#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
    0xF7, 0x00, 0xF7
};

void ospi_example_wait_until_wip (void)
{
    fsp_err_t err = FSP_SUCCESS;
    spi_flash_status_t status;

    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;

```

```
while ((status.write_in_progress) && (--timeout))
{
    err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
    assert(FSP_SUCCESS == err);
}
if (0 == timeout)
{
    assert(FSP_SUCCESS == err);
}
}
void r_ospi_auto_calibrate_example (void)
{
    /* Open the OSPI instance. */
    /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
    fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
    /* Wait until write has been completed */
    ospi_example_wait_until_wip();
    /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

Octack Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctackUpdate to change the Octal-SPI clock frequency during run time. The OCTACK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
    /* Ensure clock source (PLL2 in this example) is running before changing the OCTACK
```

```
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

OSPI RAM:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
/* Place uninitialized data buffers in the ospi_device_0_no_load section.
 * Use ospi_device_1_no_load section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
void r_ospi_ram_basic_example (void)
{
    /* Open the OSPI instancee.
     * Ensure valid setting of the 'Data latching delay' field in the configurator.
     * To successfully perform OSPI RAM reads this value must not be 0.
     */
    fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
    /* After R_OSPI_Open() and any required device specific initialization, data can be
    read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

```
}

```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
    /* Open the OSPI instancee */
    fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
    /* OctaRAM Configuration Register (cr) read and write command definition */
    spi_flash_direct_transfer_t read_cr =
    {
        .command      = 0xC000U,    // NOLINT(readability-magic-numbers)
        .address      = 0x00040000U, // NOLINT(readability-magic-numbers)
        .data         = 0U,
        .command_length = 2U,
        .address_length = 4U,
        .data_length  = 2U,

        /* Dummy Cycles set to the default value specified in the OctaRAM device
        Configuration Register */
        .dummy_cycles = 5U
    };
    spi_flash_direct_transfer_t write_cr =
    {
        .command      = 0x4000U,    // NOLINT(readability-magic-numbers)
        .address      = 0x00040000U, // NOLINT(readability-magic-numbers)
        .data         = 0U,
        .command_length = 2U,
    }

```

```
.address_length = 4U,  
.data_length    = 2U,  
.dummy_cycles   = 0U  
};  
  
/* Read OctaRAM device Configuration Register */  
err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,  
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);  
  
assert(FSP_SUCCESS == err);  
  
uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &  
~OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK) |  
                                ((uint16_t)  
(OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING <<  
                                OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENC  
Y_COUNTER_POS) &  
                                OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MA  
SK));  
  
/* Write Configuration Register */  
write_cr.data = (uint32_t) config_reg;  
  
err      = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &write_cr,  
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);  
  
assert(FSP_SUCCESS == err);  
  
read_cr.data = 0;

Function Documentation

◆ **R_OSPI_Open()**

```
fsp_err_t R_OSPI_Open ( spi_flash_ctrl_t * p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements `spi_flash_api_t::open`.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ **R_OSPI_Close()**

```
fsp_err_t R_OSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the OSPI driver module.

Implements `spi_flash_api_t::close`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_OSPI_DirectWrite()**

```
fsp_err_t R_OSPI_DirectWrite ( spi_flash_ctrl_t* p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements `spi_flash_api_t::directWrite`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_DirectRead()**

```
fsp_err_t R_OSPI_DirectRead ( spi_flash_ctrl_t* p_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements `spi_flash_api_t::directRead`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_DirectTransfer()**

```
fsp_err_t R_OSPI_DirectTransfer ( spi_flash_ctrl_t* p_ctrl, spi_flash_direct_transfer_t*const p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements `spi_flash_api_t::directTransfer`.

Example:

```
/* Write Enable */
err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_OSPI_SpiProtocolSet()**

```
fsp_err_t R_OSPI_SpiProtocolSet ( spi_flash_ctrl_t * p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements `spi_flash_api_t::spiProtocolSet`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ **R_OSPI_XipEnter()**

```
fsp_err_t R_OSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)
```

Enters Single Continuous Read/Write mode.

Implements `spi_flash_api_t::xipEnter`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_XipExit()**

```
fsp_err_t R_OSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)
```

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_Write()**

```
fsp_err_t R_OSPI_Write ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

Example:

```
err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> , <code>p_dest</code> or <code>p_src</code> is NULL, or <code>byte_count</code> crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R_OSPI_Erase()**

```
fsp_err_t R_OSPI_Erase ( spi_flash_ctrl_t* p_ctrl, uint8_t*const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or <code>byte_count</code> is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ **R_OSPI_StatusGet()**

```
fsp_err_t R_OSPI_StatusGet ( spi_flash_ctrl_t* p_ctrl, spi_flash_status_t*const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

Example:

```
err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The write status is in <code>p_status</code> .
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_status</code> is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ **R_OSPI_BankSet()**

```
fsp_err_t R_OSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access.

Implements `spi_flash_api_t::bankSet`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.
---------------------	----------------------------

◆ **R_OSPI_AutoCalibrate()**

```
fsp_err_t R_OSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern.

Note

The preamble pattern must be written to the configured address before calling this API. Implements `spi_flash_api_t::autoCalibrate`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

4.2.46 Parallel Data Capture (r_pdc)

Modules

Functions

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t *const p_api_ctrl, pdc_cfg_t const *const p_cfg)
```

Powers on PDC, handles required initialization described in the hardware manual. [More...](#)

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t *const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts. [More...](#)

```
fsp_err_t R_PDC_CaptureStart (pdc_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer)
```

Starts a capture. Enables interrupts. [More...](#)

Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the [PDC Interface](#).

Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianess of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

Configuration

Build Time Configurations for r_pdc

The following build time configurations are defined in fsp_cfg/r_pdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_pdc0	Module name.
Input > Signal polarity > HSYNC	<ul style="list-style-type: none"> • High • Low 	High	Specify the active polarity of the HSYNC signal.

Input > Signal polarity > VSYNC	<ul style="list-style-type: none"> • High • Low 	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications > Number of pixels to capture horizontally	Value must be an integer greater than 0	640	Specify the number of horizontal pixels to capture.
Input > Capture Specifications > Number of lines to capture vertically	Value must be an integer greater than 0	480	Specify the number of vertical pixels to capture.
Input > Capture Specifications > Horizontal pixel to start capture from	Value must be an integer	0	Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Input > Capture Specifications > Line to start capture from	Value must be an integer	0	Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Input > Bytes per pixel	Value must be an integer greater than 0	2	Specify the number of bytes per pixel of the captured image data.
Input > Clock divider	<ul style="list-style-type: none"> • CLK/2 • CLK/4 • CLK/6 • CLK/8 • CLK/10 • CLK/12 • CLK/14 • CLK/16 	CLK/2	Specify the clock divider of the clock input to the PDC peripheral.
Input > Endianness	<ul style="list-style-type: none"> • Little • Big 	Little	Specify the endianness of the captured image data.
Output > Buffer > Image buffer name	Name must be a valid C symbol	g_user_buffer	Specify the name of the data buffer to create or set to NULL, if it is to be created by the user external to the PDC driver.
Output > Buffer > Image buffer section	This property must be a valid section name	.bss	Specify the RAM section for the image data buffer. Typically .bss (internal RAM) or

.sdram. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.

Output > Buffer > Number of image buffers	Value must be an integer greater than 0	1	Specify the number of buffers to create.
Interrupts > Callback	Name must be a valid C symbol	g_pdc_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions
Interrupts > PDC Interrupt Priority	MCU Specific Options		Select the PDC interrupt priority.
Interrupts > DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is $PCLKB / 2$.

Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Usage Notes

Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun, vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer [Direct Memory Access Controller \(r_dmac\)](#)
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

Examples

Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (pdc_callback_args_t * p_args)
{
    if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_capture_ready = true;
    }
}

void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
    camera_module_initialization();

    /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
}
```

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
uint32_t timeout_ms = PDC_DELAY_MS;
/* Since there is nothing else to do, block until Callback triggers*/
while ((true != g_capture_ready) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (0U == timeout_ms)
{
    __BKPT(0);
}
}
static void camera_module_initialization (void)
{
/* Camera vendor specific initialization to be done here */
}
```

Data Structures

struct [pdc_instance_ctrl_t](#)

Data Structure Documentation

◆ pdc_instance_ctrl_t

struct [pdc_instance_ctrl_t](#)

PDC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ **R_PDC_Open()**

```
fsp_err_t R_PDC_Open ( pdc_ctrl_t *const p_api_ctrl, pdc_cfg_t const *const p_cfg )
```

Powers on PDC, handles required initialization described in the hardware manual.

Implements `pdc_api_t::open`.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in `pdc_api_t::captureStart`. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ol style="list-style-type: none"> 1. p_cfg is NULL 2. p_api_ctrl is NULL 3. The pointer to the transfer interface in the p_cfg parameter is NULL 4. Callback parameter is NULL. 5. Invalid IRQ number assigned
FSP_ERR_INVALID_ARGUMENT	One or more of the following parameters is incorrect <ol style="list-style-type: none"> 1. bytes_per_pixel is zero 2. x_capture_pixels is zero 3. y_capture_pixels is zero 4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR 5. y_capture_start_pixel + y_capture_pixels is greater than 4095
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ **R_PDC_Close()**

```
fsp_err_t R_PDC_Close ( pdc_ctrl_t *const p_api_ctrl)
```

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements `pdc_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	<code>p_api_ctrl</code> is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ **R_PDC_CaptureStart()**

```
fsp_err_t R_PDC_CaptureStart ( pdc_ctrl_t *const p_api_ctrl, uint8_t *const p_buffer )
```

Starts a capture. Enables interrupts.

Implements `pdc_api_t::captureStart`.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the `pdc_api_t::open` API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during `pdc_api_t::open` API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Capture start successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL <ul style="list-style-type: none"> 1. <code>p_api_ctrl</code> is NULL 2. <code>p_buffer</code> is NULL while <code>p_buffer</code> field of the control structure is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_IN_USE	PDC transfer is already in progress.
FSP_ERR_TIMEOUT	Reset operation timed out.

4.2.47 Port Output Enable for GPT (r_poeg)

Modules

Functions

`fsp_err_t` `R_POEG_Open` (`poeg_ctrl_t *const p_ctrl`, `poeg_cfg_t const *const p_cfg`)

`fsp_err_t` `R_POEG_StatusGet` (`poeg_ctrl_t *const p_ctrl`, `poeg_status_t *const p_status`)

`fsp_err_t` `R_POEG_CallbackSet` (`poeg_ctrl_t *const p_ctrl`, `void(*p_callback)(poeg_callback_args_t *)`, `void const *const p_context`, `poeg_callback_args_t *const p_callback_memory`)

`fsp_err_t` `R_POEG_OutputDisable` (`poeg_ctrl_t *const p_ctrl`)

`fsp_err_t` `R_POEG_Reset` (`poeg_ctrl_t *const p_ctrl`)

`fsp_err_t` `R_POEG_Close` (`poeg_ctrl_t *const p_ctrl`)

Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the [POEG Interface](#).

Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRGM input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the [High-Speed Analog Comparator \(r_acmphs\)](#) driver).
- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the [General PWM Timer \(r_gpt\)](#) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

Configuration

Build Time Configurations for r_poeg

The following build time configurations are defined in `fsp_cfg/r_poeg_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Port Output Enable for GPT (r_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_poeg0	Module name.
General > Channel	Must be a valid POEG channel	0	Specify the hardware channel.
General > Trigger	MCU Specific Options		Select the trigger sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input > GTETRGR Polarity	<ul style="list-style-type: none"> Active High Active Low 	Active High	Select the polarity of the GTETRGR pin. Only applicable if GTETRGR pin is selected under Trigger.
Input > GTETRGR Noise Filter	<ul style="list-style-type: none"> Disabled PCLKB/1 PCLKB/8 PCLKB/32 PCLKB/128 	Disabled	Configure the noise filter for the GTETRGR pin. Only applicable if GTETRGR pin is selected under Trigger.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupts > Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

Clock Configuration

The POEG clock is based on the PCLKB frequency.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

Usage Notes

POEG GTETRGM Pin and Channel

The POEG channel number corresponds to the GTETRGM input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in `R_POEG_Close()`, but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

Examples

POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
```

```
FSP_PARAMETER_NOT_USED(p_args);

/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;

(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);

/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
(void) R_POEG_Reset(&g_poeg0_ctrl);

/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
* again. */
do
{
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
} while (POEG_STATE_NO_DISABLE_REQUEST != status.state);

/* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
* Update the 0 in the macro below to match the POEG channel number. */
NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

Data Structures

```
struct poeg_instance_ctrl_t
```

Data Structure Documentation

◆ poeg_instance_ctrl_t

```
struct poeg_instance_ctrl_t
```

Channel control block. DO NOT INITIALIZE. Initialization occurs when `poeg_api_t::open` is called.

Function Documentation

◆ **R_POEG_Open()**

```
fsp_err_t R_POEG_Open ( poeg_ctrl_t *const p_ctrl, poeg_cfg_t const *const p_cfg )
```

Initializes the POEG module and applies configurations. Implements `poeg_api_t::open`.

Note

The `poeg_cfg_t::trigger` setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.

Example:

```
/* Initializes the POEG. */
err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	<code>poeg_cfg_t::p_callback</code> is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the <code>p_cfg</code> parameter is not available on this device.

◆ **R_POEG_StatusGet()**

```
fsp_err_t R_POEG_StatusGet ( poeg_ctrl_t *const p_ctrl, poeg_status_t *const p_status )
```

Get current POEG status and store it in provided pointer `p_status`. Implements `poeg_api_t::statusGet`.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	<code>p_ctrl</code> or <code>p_status</code> was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_CallbackSet()**

```
fsp_err_t R_POEG_CallbackSet ( poeg_ctrl_t *const p_ctrl, void(*)(poeg_callback_args_t *)
p_callback, void const *const p_context, poeg_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `poeg_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_POEG_OutputDisable()**

```
fsp_err_t R_POEG_OutputDisable ( poeg_ctrl_t *const p_ctrl)
```

Disables GPT output pins. Implements `poeg_api_t::outputDisable`.

Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	<code>p_ctrl</code> was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_Reset()**

```
fsp_err_t R_POEG_Reset ( poeg_ctrl_t *const p_ctrl)
```

Resets status flags. Implements `poeg_api_t::reset`.

Note

Status flags are only reset if the original POEG trigger is resolved. Check the status using `R_POEG_StatusGet` after calling this function to verify the status is cleared.

Example:

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
(void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
* again. */
do
{
(void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
} while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

Return values

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ **R_POEG_Close()**

```
fsp_err_t R_POEG_Close ( poeg_ctrl_t *const p_ctrl)
```

Disables POEG interrupt. Implements `poeg_api_t::close`.

Note

This function does not disable the POEG.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the [PTP Interface](#).

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
 - Master mode
 - Slave mode
- Peer-to-peer
- End-to-end
- Frame formats
 - Ethernet II frames
 - IEEE802.3 + LLC + SNAP frames
 - IPv4 + UDP
- Clock correction modes
 - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
 - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

Configuration	Options	Default	Description
Clock Properties > Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Clock Properties > Class	Value must in the range [0,255].	248	Class field advertised in generated announce packets.

Clock Properties > Accuracy	Value must be in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Clock Properties > Variance	Value must be in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Clock Properties > Priority 2	Value must be in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Clock Properties > Time Source	Value must be in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet > Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC.
Ethernet > Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
Ethernet > PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.
IP > Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
IP > PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
IP > Event Message TOS	Value must be in the range [0,255].	0	The IP packet TOS for event messages.
IP > General Message TOS	Value must be in the range [0,255].	0	The IP packet TOS for general messages.
IP > Primary Message TTL	Value must be in the range [0,255].	1	The IP packet TTL for primary messages.
IP > PDelay Message TTL	Value must be in the range [0,255].	1	The IP packet TTL for p_delay messages.
IP > Event Port	Value must be in the range [0,65535].	319	The UDP port for event messages.
IP > General Port	Value must be in the range [0,65535].	320	The UDP port for general messages.

Synchronization Detection > Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Synchronization Detection > Count	Value must in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection > Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.
Synchronization Lost Detection > Count	Value must in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master.
Interrupts > Callback	Name must be a valid C symbol	ptp0_user_callback	Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
Interrupts > MINT Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Interrupts > Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC IPLS priority.
Name	Name must be a valid C symbol	g_ptp0	Module name.
Ethernet PHY Interface Type	<ul style="list-style-type: none"> • MII • RMII 	RMII	The interface type used to communicate with the Ethernet PHY.
Frame Filter	<ul style="list-style-type: none"> • Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast 	Unicast	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.
Frame Format	<ul style="list-style-type: none"> • Ethernet II • Ethernet II 	Ethernet II	The format of the frames that

	<ul style="list-style-type: none"> • IPv4 UDP • IEEE802.3 LLC SNAP • IEEE802.3 LLC SNAP IPv4 UDP 		encapsulate the PTP messages.
Clock Domain	Value must in the range [0,255].	0	The PTP clock will only respond to clocks in its domain.
Clock Domain Filter	<ul style="list-style-type: none"> • Enable • Disable 	Enable	Filter out PTP messages from other clock domains.
Buffer Size	Value must in the range [64,1536].	1536	The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC.
Number of transmit buffers	Value must in the range [1,16].	4	The number of transmit buffers in the packet queue.
Number of receive buffers	Value must in the range [1,16].	4	The number of receive buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	<ul style="list-style-type: none"> • PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0 	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	<ul style="list-style-type: none"> • Clock Correction Mode 1 	Clock Correction Mode 1	Clock correction mode 1 corrects the local clock using the current

- Clock Correction Mode 2

offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.

Gradient Worst10 Interval

Value must be in the range [0,255].

32

The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the [Ethernet \(r_ether\)](#) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req

- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

Figure 175: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by [Ethernet \(r_ether\)](#). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by [Ethernet \(r_ether\)](#).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#). All multicast frames that match `ptp_synfp_cfg_t::p_multicast_addr_filter` are received by [Ethernet \(r_ether\)](#).
- Unicast - Only Unicast frames destined for the PTP are received by [Ethernet \(r_ether\)](#).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize [Ethernet \(r_ether\)](#). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. [FreeRTOS Plus TCP \(rm_freertos_plus_tcp\)](#)), however this means the application must execute the [Ethernet \(r_ether\)](#) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than `BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION`. This is to guarantee that PTP register accesses are atomic.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
    /* The PTP Instance must be opened before R_ETHER is opened. */
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);

    /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);

    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);

    /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);

    /* Wait for the link to be established. */
    do
    {
        err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);

    /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);

    /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
    while (!g_first_announce_message_received && --timeout)
    {
        R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
}
```

```
    assert(0U != timeout);

/* When a master clock is found, change to the slave state to start synchronizing
 * the local clock to the master clock. */

    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
    assert(FSP_SUCCESS == err);

/* Wait for local clock to be synchronized with the master clock. */

    timeout = EXAMPLE_TIMEOUT;

while (!g_sync_acquired && --timeout)
    {
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }

    assert(0U != timeout);

/* The local clock is now synchronized with the grand master clock. */
}

/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
    switch (p_args->event)
    {
    case PTP_EVENT_SYNC_ACQUIRED:
        {
/* The offsetFromMaster value is now within the configured threshold to be
 * synchronized with the master clock.
 */

            g_sync_acquired = true;

        break;
        }
    case PTP_EVENT_MESSAGE_RECEIVED:
        {
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
    {
case PTP_MESSAGE_TYPE_ANNOUNCE:
        {
```

```
        int8_t comparison = 0;
    if (!g_first_announce_message_received)
    {
        /* If this is the first announce packet, immediately switch to this master clock. */
        comparison = 1;
        g_first_announce_message_received = true;
    }
    else
    {
        /*
         * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
         * packet is better than the current master clock.
         */
        fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                             p_args->p_message,
                                             &comparison);

        assert(FSP_SUCCESS == err);
    }
    if (1 == comparison)
    {
        /* Save the message as the new master announce message. */
        g_current_master_announce_message = *p_args->p_message;
        /* Set the master clock ID and sourcePortID in the PTP instance so that it
         * synchronizes with the new best master clock.
         */
        fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                             g_current_master_annou
nce_message.header.clock_id,
                                             g_current_master_annou
nce_message.header.source_port_id);
        assert(FSP_SUCCESS == err);
    }
    break;
```

```
    }  
default:  
    {  
break;  
    }  
    }  
break;  
    }  
default:  
    {  
break;  
    }  
    }  
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)  
void master_mode_basic_example (void)  
{  
    /* The PTP Instance must be opened before R_ETHER is opened. */  
    fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);  
    assert(FSP_SUCCESS == err);  
    /* Configure the PTP MAC address. */  
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);  
    assert(FSP_SUCCESS == err);  
    /* Configure the PTP Local Clock ID (Usually generated from MAC address). */  
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);  
    assert(FSP_SUCCESS == err);  
    /* Get the current time from an external time source (Eg. RTC). */  
    ptp_time_t current_time;  
    get_current_time_example(&current_time);  
    /* Set the PTP local time to the current time. */
```

```
err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
assert(FSP_SUCCESS == err);

/* Set the currentUtcOffset field in announce messages. */
err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
assert(FSP_SUCCESS == err);

/* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
ptp_message_flags_t flags;

flags.value = 0;
flags.value_b.currentUtcOffsetValid = 1;
flags.value_b.ptpTimescale          = 1;

err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
assert(FSP_SUCCESS == err);

/*
 * The master clock is now operational and will automatically generate announce and
sync messages
 * as well as respond to delay_req messages.
 */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)

static uint32_t g_transmit_complete = 0U;

void send_message_example (void)
{
    static ptp_message_t message;
    static uint8_t      p_tlv_data[6];

    memset(&message, 0, sizeof(ptp_message_t));

    /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;

    /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
sizeof(ptp_message_management_t) +
sizeof(p_tlv_data));

    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;

    /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));

    message.management.target_port_id      = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops      = 1;
    message.management.action              = PTP_MANAGEMENT_ACTION_GET;

    /*
* Fill in TLV data (Note that TLV data is big endian).
*
* Type (Management)
*/
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
```

```
/* Length */
p_tlv_data[2] = 0;
p_tlv_data[3] = 2;

/* Management ID (Clock Description) */
p_tlv_data[4] = 0;
p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;

/* Send the message. */
fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));

assert(FSP_SUCCESS == err);

uint32_t timeout = EXAMPLE_TIMEOUT;

while (0U == g_transmit_complete && --timeout)
{
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
}

/* Callback called whenever a PTP event occurs. */

                        }
                    }
                break;
            }
    }
}
```

```

    }
    default:
    {
    break;
    }
    }
    }
    default:
    {
    break;
    }
    }
}

```

Data Structures

struct [ptp_instance_ctrl_t](#)

Data Structure Documentation

◆ ptp_instance_ctrl_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

Function Documentation

◆ R_PTP_Open()

```
fsp_err_t R_PTP_Open ( ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg )
```

This function initializes PTP. Implements `ptp_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [PTP Interface](#) functions.

Return values

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ R_PTP_MacAddrSet()

```
fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_mac_addr )
```

This function sets the MAC address for the PTP instance. Implements `ptp_api_t::macAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_IpAddrSet()

```
fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const p_ctrl, uint32_t ip_addr )
```

This function sets the IP address for the PTP instance. Implements `ptp_api_t::ipAddrSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`.

Return values

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured <code>ptp_synfp_cfg_t::frame_format</code> is not configured to use IP packets, or the instance is not in the correct state.

◆ R_PTP_LocalClockIdSet()

```
fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id )
```

This function sets the local clock ID for the PTP instance. Implements `ptp_api_t::localClockIdSet`.

Note

This function may only be called while the PTP instance is in `ptp_port_state_t::PTP_PORT_STATE_DISABLE`. Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ **R_PTP_MasterClockIdSet()**

```
fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const p_ctrl, uint8_t const *const p_clock_id,
uint16_t port_id )
```

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements [ptp_api_t::masterClockIdSet](#).

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_MessageFlagsSet()**

```
fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const p_ctrl, ptp_message_type_t message_type,
ptp_message_flags_t flags )
```

This function sets the flags field for the given message type. Implements [ptp_api_t::messageFlagsSet](#).

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_CurrentUtcOffsetSet()**

```
fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const p_ctrl, uint16_t offset )
```

This function sets the currentUtcOffset value in announce messages. [ptp_api_t::currentUtcOffsetSet](#).

Return values

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PortStateSet()**

```
fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const p_ctrl, uint32_t state )
```

This function changes the current state of the PTP instance. Implements `ptp_api_t::portStateSet`.

Return values

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_MessageSend()**

```
fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const p_ctrl, ptp_message_t const *const p_message,
uint8_t const *const p_tlv_data, uint16_t tlv_data_size )
```

This function sends a PTP message. `ptp_api_t::messageSend`.

Return values

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ **R_PTP_LocalClockValueSet()**

```
fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const p_ctrl, ptp_time_t const *const p_time )
```

This function sets the local clock value. Implements `ptp_api_t::localClockValueSet`.

Return values

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_LocalClockValueGet()**

```
fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const p_ctrl, ptp_time_t *const p_time )
```

This function gets the local clock value. Implements `ptp_api_t::localClockValueGet`.

Return values

FSP_SUCCESS	The local clock value has been written in <code>p_time</code> .
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ **R_PTP_PulseTimerCommonConfig()**

```
fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const p_ctrl,
ptp_pulse_timer_common_cfg_t *const p_timer_cfg )
```

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements `ptp_api_t::pulseTimerCommonConfig`.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PulseTimerEnable()**

```
fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const p_ctrl, uint32_t channel,
ptp_pulse_timer_cfg_t *const p_timer_cfg )
```

This function enables a pulse timer channel. Implements `ptp_api_t::pulseTimerEnable`.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_PulseTimerDisable()**

```
fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const p_ctrl, uint32_t channel )
```

This function disables a pulse timer channel. Implements `ptp_api_t::pulseTimerDisable`.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_Close()**

```
fsp_err_t R_PTP_Close ( ptp_ctrl_t *const p_ctrl)
```

Disable the PTP instance. Implements `ptp_api_t::close`.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ **R_PTP_BestMasterClock()**

```
fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const p_announce1, ptp_message_t const *const p_announce2, int8_t *const p_comparison )
```

This function compares two clocks to determine which one is the better master clock.

`p_comparison`:

- Set to -1 if `p_announce1` defines the best master clock.
- Set to 1 if `p_announce2` defines the best master clock.
- Set to 0 if `p_announce1` and `p_announce2` define the same clock.

Return values

FSP_SUCCESS	The valid result has been written to <code>p_use_announce_clock</code> .
FSP_ERR_ASSERTION	An argument was NULL.

4.2.49 Quad Serial Peripheral Interface Flash (r_qspi)

Modules

Functions

fsp_err_t	R_QSPI_AutoCalibrate (spi_flash_ctrl_t *p_ctrl)

Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the [SPI Flash Interface](#).

Overview

Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash

- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

Configuration

Build Time Configurations for r_qspi

The following build time configurations are defined in driver/r_qspi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If selected code for programming on multiple lines in extended SPI mode is included in the build.

Configurations for Storage > QSPI (r_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r_qspi).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_qspi0	Module name.
General > SPI Protocol	<ul style="list-style-type: none"> • Extended SPI • QPI 	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
General > Address Bytes	<ul style="list-style-type: none"> • 3 • 4 • 4 with 4-byte read code 	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
General > Read Mode	<ul style="list-style-type: none"> • Standard Read • Fast Read 	Fast Read Quad I/O	Select the read mode for memory mapped

	<ul style="list-style-type: none"> • Fast Read Dual Output • Fast Read Dual I/O • Fast Read Quad Output • Fast Read Quad I/O 		access.
General > Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read
General > Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions > Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.
Command Definitions > Page Program Address Lines	<ul style="list-style-type: none"> • 1 • 2 • 4 	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Command Definitions > Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Command Definitions > Status Command	Must be an 8-bit QSPI Status Command under	0x05	The command to query the status of a write or

	Command Definitions		
Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	erase command. Which bit contains the write in progress status returned from the Write Status Command.
Command Definitions > Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Command Definitions > Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command Definitions	0xD8	The command to erase a block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Command Definitions > Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not supported.
Command Definitions > Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Command Definitions > XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
Command Definitions > XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing > QSPKCLK Divisor	Refer to the RA Configuration tool for available options.	2	Select the divisor to apply to PCLK to get QSPCLK.
Bus Timing > Minimum	Refer to the RA	4 QSPCLK	Define the minimum

QSSL Deselect Cycles	Configuration tool for available options.	number of QSPCLK cycles for QSSL to remain high between operations.
----------------------	---	---

Clock Configuration

The QSPI clock is derived from PCLKA.

Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O
- QIO3: Data 3 I/O

Note

It is recommended to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

QSPI Memory Mapped Access

After `R_QSPI_Open()` completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

Examples

Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_qspi section to flash it during programming. */
```

```
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_qspi")
__attribute__((noinline));

void r_qspi_example_function (void)
{
    /* Add code here. */
}

void r_qspi_basic_example (void)
{
    /* Open the QSPI instance. */
    fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);

    /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();

    /* After R_QSPI_Open() and any required device specific initialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);

    /* After R_QSPI_Open() and any required device specific initialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
}
```

Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)

static void r_qspi_example_init (void)
{
    /* Write status registers */
    /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t data[4];
```

```

fsp_err_t err;

data[0] = QSPI_COMMAND_WRITE_ENABLE;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
assert(FSP_SUCCESS == err);

/* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
* status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
* QSSL line. */
data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
assert(FSP_SUCCESS == err);

/* Wait for status register to update. */
spi_flash_status_t status;
do
{
(void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
} while (true == status.write_in_progress);

/* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
* protocol to QPI mode on the MCU peripheral. */
data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
assert(FSP_SUCCESS == err);

(void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}

```

Reading Status Register Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
```

```
void r_qspi_direct_example (void)
{
    /* Read a status register. */
    /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t  data;
    fsp_err_t err;

    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);

    /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
    assert(FSP_SUCCESS == err);

    /* Status register contents are available in variable 'data'. */
}
```

Querying Device Size Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
    /* Many QSPI devices support more than one way to query the device size. Consult the
    datasheet for your
    * QSPI device to determine which of these methods are supported (if any). */
    uint32_t device_size_bytes;
    fsp_err_t err;
#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
    /* This example shows how to get the device size by reading the manufacturer ID. */
    uint8_t data[4];
    data[0] = QSPI_EXAMPLE_COMMAND_READ_ID;
    err     = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, true);
    assert(FSP_SUCCESS == err);
```

```
/* Read 3 bytes. The third byte often represents the size of the QSPI, where the
size of the QSPI = 2 ^ N. */
err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data[0], 3);
assert(FSP_SUCCESS == err);
device_size_bytes = 1U << data[2];
FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
#ifdef QSPI_EXAMPLE_COMMAND_READ_SFDP
/* Read the JEDEC SFDP header to locate the JEDEC flash parameters table. Reference
JESD216 "Serial Flash
* Discoverable Parameters (SFDP)". */
/* Send the standard 0x5A command followed by 3 address bytes (SFDP header is at
address 0). */
uint8_t buffer[16];
memset(&buffer[0], 0, sizeof(buffer));
buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
assert(FSP_SUCCESS == err);
/* Read out 16 bytes (1 dummy byte followed by 15 data bytes). */
err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 16);
assert(FSP_SUCCESS == err);
/* Read the JEDEC flash parameters to locate the memory size. */
/* Send the standard 0x5A command followed by 3 address bytes (located in big endian
order at offset 0xC-0xE).
* These bytes are accessed at 0xD-0xF because the first byte read is a dummy byte.
*/
buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;

Function Documentation

◆ R_QSPI_Open()

```
fsp_err_t R_QSPI_Open ( spi_flash_ctrl_t * p_ctrl, spi_flash_cfg_t const *const p_cfg )
```

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements `spi_flash_api_t::open`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter <code>p_instance_ctrl</code> or <code>p_cfg</code> is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same <code>p_instance_ctrl</code> .

◆ **R_QSPI_Close()**

```
fsp_err_t R_QSPI_Close ( spi_flash_ctrl_t * p_ctrl)
```

Close the QSPI driver module.

Implements `spi_flash_api_t::close`.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_DirectWrite()**

```
fsp_err_t R_QSPI_DirectWrite ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint32_t const bytes, bool const read_after_write )
```

Writes raw data directly to the QSPI.

Implements `spi_flash_api_t::directWrite`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_DirectRead()**

```
fsp_err_t R_QSPI_DirectRead ( spi_flash_ctrl_t * p_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Reads raw data directly from the QSPI. This API can only be called after R_QSPI_DirectWrite with read_after_write set to true.

Implements `spi_flash_api_t::directRead`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after R_QSPI_DirectWrite with read_after_write set to true.

◆ **R_QSPI_SpiProtocolSet()**

```
fsp_err_t R_QSPI_SpiProtocolSet ( spi_flash_ctrl_t * p_ctrl, spi_flash_protocol_t spi_protocol )
```

Sets the SPI protocol.

Implements `spi_flash_api_t::spiProtocolSet`.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ **R_QSPI_XipEnter()**

```
fsp_err_t R_QSPI_XipEnter ( spi_flash_ctrl_t * p_ctrl)
```

Enters XIP (execute in place) mode.

Implements `spi_flash_api_t::xipEnter`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_XipExit()**

```
fsp_err_t R_QSPI_XipExit ( spi_flash_ctrl_t * p_ctrl)
```

Exits XIP (execute in place) mode.

Implements `spi_flash_api_t::xipExit`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_Write()**

```
fsp_err_t R_QSPI_Write ( spi_flash_ctrl_t * p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest,
uint32_t byte_count )
```

Program a page of data to the flash.

Implements `spi_flash_api_t::write`.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> , <code>p_dest</code> or <code>p_src</code> is NULL, or <code>byte_count</code> crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_Erase()**

```
fsp_err_t R_QSPI_Erase ( spi_flash_ctrl_t * p_ctrl, uint8_t *const p_device_address, uint32_t
byte_count )
```

Erase a block or sector of flash. The `byte_count` must exactly match one of the erase sizes defined in `spi_flash_cfg_t`. For chip erase, `byte_count` must be `SPI_FLASH_ERASE_SIZE_CHIP_ERASE`.

Implements `spi_flash_api_t::erase`.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	<code>p_instance_ctrl</code> or <code>p_device_address</code> is NULL, or <code>byte_count</code> doesn't match an erase size defined in <code>spi_flash_cfg_t</code> , or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ **R_QSPI_StatusGet()**

```
fsp_err_t R_QSPI_StatusGet ( spi_flash_ctrl_t * p_ctrl, spi_flash_status_t *const p_status )
```

Gets the write or erase status of the flash.

Implements `spi_flash_api_t::statusGet`.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ **R_QSPI_BankSet()**

```
fsp_err_t R_QSPI_BankSet ( spi_flash_ctrl_t * p_ctrl, uint32_t bank )
```

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements `spi_flash_api_t::bankSet`.

Return values

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ **R_QSPI_DirectTransfer()**

```
fsp_err_t R_QSPI_DirectTransfer ( spi_flash_ctrl_t * p_ctrl, spi_flash_direct_transfer_t *const p_transfer, spi_flash_direct_transfer_dir_t direction )
```

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements `spi_flash_api_t::directTransfer`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI.
---------------------	----------------------------

◆ R_QSPI_AutoCalibrate()

```
fsp_err_t R_QSPI_AutoCalibrate ( spi_flash_ctrl_t * p_ctrl)
```

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements `spi_flash_api_t::autoCalibrate`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI
---------------------	---------------------------

4.2.50 Realtime Clock (r_rtc)

Modules

Functions

```

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the [RTC Interface](#).

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calendar to get accurate time readings.

Note

See section "23.3.5 Reading 64-Hz Counter and Time" of the RA6M3 manual R01UH0886EJ0100 for more details.

A user-defined callback function can be registered (in the [rtc_api_t::open](#) API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure ([rtc_callback_args_t](#)) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for `calendarTimeSet` and `calendarAlarmSet` APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the `calendarAlarmSet` API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initializing the driver. Application must

make calls to the error adjustment api's for desired adjustment. See section 26.3.8 "Time Error Adjustment Function" of the RA6M3 manual R01UH0886EJ0100) for more details on this feature

Configuration

Build Time Configurations for r_rtc

The following build time configurations are defined in fsp_cfg/r_rtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Realtime Clock (r_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	<ul style="list-style-type: none"> Sub-Clock LOCO 	LOCO	Select the RTC clock source.
Frequency Comparison Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO
Automatic Adjustment Mode	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment Period	<ul style="list-style-type: none"> 10 Seconds 1 Minute NONE 	10 Seconds	Select the Error Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	<ul style="list-style-type: none"> NONE Addition Subtraction 	NONE	Select the Error Adjustment type
Error Adjustment Value	Value must be a positive integer less than equal to 63	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).

Alarm Interrupt Priority	MCU Specific Options	Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options	Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options	Select the carry interrupt priority.

Note

See 23.2.20 Frequency Register (RFRH/RFRL) of the RA6M3 manual R01UH0886EJ0100) for more details

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

The LOCO is the default selection during configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from `calendarTimeGet` API during roll-over.
- Even when only running in Periodic Interrupt mode `R_RTC_CalendarTimeSet` must be called successfully to start the RTC.
- When handling power-on reset events in software, the application must ensure that the RTC is stopped prior to clearing the power-on reset flag (`RSTSRO.PORF`).

Limitations

Developers should be aware of the following limitations when using the RTC:

- `R_RTC` operates in 24-hour mode.

- Binary-count mode is not supported.
- The `R_RTC_CalendarTimeGet()` cannot be used from an interrupt that has higher priority than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
void rtc_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Set the calendar time */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Get the calendar time */
    R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_periodic_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
    /* Set the periodic interrupt rate to 1 second */
    R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
    /* Wait for the periodic interrupt */
    while (1)
    {
        /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /*Initialize the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
    R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
    /* Wait for the Alarm interrupt */
    while (1)
    {
```

```

/* Wait for interrupt */
}
}

```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```

void rtc_erroradj_example ()
{
    fsp_err_t err = FSP_SUCCESS;
    /*Initialize the RTC module*/
    R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
    R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
    /* Modify Error Adjustment after RTC is running */
    err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
    assert(FSP_SUCCESS == err);
}

```

Data Structures

struct [rtc_instance_ctrl_t](#)

Data Structure Documentation

◆ [rtc_instance_ctrl_t](#)

struct rtc_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.
volatile bool	carry_isr_triggered

	Was the carry isr triggered.
--	------------------------------

Function Documentation

◆ R_RTC_Open()

```
fsp_err_t R_RTC_Open ( rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const p_cfg )
```

Opens and configures the RTC driver module. Implements `rtc_api_t::open`. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Initialize the RTC module */
err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_Close()

```
fsp_err_t R_RTC_Close ( rtc_ctrl_t *const p_ctrl)
```

Close the RTC driver. Implements `rtc_api_t::close`

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ **R_RTC_CalendarTimeSet()**

```
fsp_err_t R_RTC_CalendarTimeSet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Set the calendar time.

Implements `rtc_api_t::calendarTimeSet`.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ **R_RTC_CalendarTimeGet()**

```
fsp_err_t R_RTC_CalendarTimeGet ( rtc_ctrl_t *const p_ctrl, rtc_time_t *const p_time )
```

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements `rtc_api_t::calendarTimeGet`

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R_RTC_CalendarAlarmSet()**

```
fsp_err_t R_RTC_CalendarAlarmSet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Set the calendar alarm time.

Implements `rtc_api_t::calendarAlarmSet`.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ **R_RTC_CalendarAlarmGet()**

```
fsp_err_t R_RTC_CalendarAlarmGet ( rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *const p_alarm )
```

Get the calendar alarm time.

Implements `rtc_api_t::calendarAlarmGet`

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_PeriodicIrqRateSet()

```
fsp_err_t R_RTC_PeriodicIrqRateSet ( rtc_ctrl_t *const p_ctrl, rtc_periodic_irq_select_t const rate )
```

Set the periodic interrupt rate and enable periodic interrupt.

Implements `rtc_api_t::periodicIrqRateSet`

Note

To start the RTC `R_RTC_CalendarTimeSet` must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_ErrorAdjustmentSet()

```
fsp_err_t R_RTC_ErrorAdjustmentSet ( rtc_ctrl_t *const p_ctrl, rtc_error_adjustment_cfg_t const *const err_adj_cfg )
```

This function sets time error adjustment

Implements `rtc_api_t::errorAdjustmentSet`

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

◆ **R_RTC_InfoGet()**

```
fsp_err_t R_RTC_InfoGet ( rtc_ctrl_t *const p_ctrl, rtc_info_t *const p_rtc_info )
```

Set RTC clock source and running status information and store it in provided pointer p_rtc_info

Implements `rtc_api_t::infoGet`

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ **R_RTC_CallbackSet()**

```
fsp_err_t R_RTC_CallbackSet ( rtc_ctrl_t *const p_ctrl, void(*) (rtc_callback_args_t *) p_callback, void const *const p_context, rtc_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `rtc_api_t::callbackSet`

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
 - Symmetric Encryption/Decryption
 - AES
 - ECB 128/256bit
 - CBC 128/256bit
 - GCM 128/256bit
 - CCM 128/256bit
 - Asymmetric Encryption/Decryption
 - RSA
 - RSAES-PKCS1-V1_5 1024/2048bit
 - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
 - RSASSA-PKCS1-V1_5 1024/2048bit
 - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
 - ECC
 - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
 - ECDH secp192r1/secp224r1/secp256r1/secp384r1
 - Hash Functions
 - SHA-2
 - SHA-256
- Message Authentication Code
 - HMAC-SHA256bit
 - AES-CMAC 128/256bit
- Key Support
 - AES 128/256bit
 - AES Key Wrap/Key Unwrap 128/256bit
 - RSA 1024/2048bit
 - RSA 3072/4096bit (public key only)
 - ECC secp192r1/secp224r1/secp256r1/secp384r1
 - HMAC-SHA256bit
- TRNG

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Driver > Crypto > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
    0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
    0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
    sce_aes_handle_t      handle;
    sce_aes_wrapped_key_t wrapped_key;
    uint8_t                cipher_calculated[32] = {0};
    uint8_t                plain_calculated[32] = {0};
    uint32_t               dummy;
    /* SCE power on */
    R_SCE_Open(&sce_ctrl, &sce_cfg);
    /* Generate a random key */
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
    /* Encrypt a plain text */
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
    R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
    /* Decrypt a cipher text using same key as Encryption */
    R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK * 2);
}
```

```
2);  
  
R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);  
  
/* SCE power off */  
  
R_SCE_Close(&sce_ctrl);  
  
/* Compare plain and plain_calculated */  
if (memcmp(plain, plain_calculated, BLOCK * 2))  
{  
while (1)  
{  
/* plain and plain_calculated are different (incorrect) */  
}  
}  
else  
{  
while (1)  
{  
/* plain and plain_calculated are the same (correct) */  
}  
}  
}
```

Data Structures

struct [sce_instance_ctrl_t](#)

Data Structure Documentation

◆ [sce_instance_ctrl_t](#)

struct [sce_instance_ctrl_t](#)

SCE private control block. DO NOT MODIFY. Initialization occurs when [R_SCE_Open\(\)](#) is called.

Function Documentation

◆ R_SCE_Open()

```
fsp_err_t R_SCE_Open ( sce_ctrl_t *const p_ctrl, sce_cfg_t const *const p_cfg )
```

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

```
fsp_err_t R_SCE_Close ( sce_ctrl_t *const p_ctrl )
```

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.
------	--------	-------------------------------

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * wrapped_key)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key
----------	-------------	-------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ **R_SCE_AES256_WrappedKeyGenerate()**

```
fsp_err_t R_SCE_AES256_WrappedKeyGenerate ( sce_aes_wrapped_key_t * wrapped_key)
```

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key
----------	-------------	-------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * wrapped_pair_key)`

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by `wrapped_pair_key->pub_key`, and a private wrapped key is generated by `wrapped_pair_key->priv_key`. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	<code>wrapped_pair_key</code>	User key index for RSA 1024-bit public key and private key pair
----------	-------------------------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate ( sce_rsa2048_wrapped_pair_key_t *
wrapped_pair_key)
```

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair
----------	------------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp192r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp224r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

`fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * wrapped_pair_key)`

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in `wrapped_pair_key->pub_key`, and the private key index is generated in `wrapped_pair_key->priv_key`.

Parameters

[in,out]	<code>wrapped_pair_key</code>	Wrapped pair key for secp256r1 public key and private key pair
----------	-------------------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

```
fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t *
wrapped_pair_key)
```

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair
----------	------------------	--

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

```
fsp_err_t R_SCE_RandomNumberGenerate ( uint32_t * random)
```

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.
----------	--------	---------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

```
fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t* encrypted_key,
sce_key_update_key_t* key_update_key, sce_aes_wrapped_key_t* wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES128_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

```
fsp_err_t R_SCE_AES256_RFC3394KeyWrap ( sce_aes_wrapped_key_t* master_key, uint32_t
target_key_type, sce_aes_wrapped_key_t* target_key, uint32_t* rfc3394_wrapped_key )
```

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.

◆ **R_SCE_AES128_RFC3394KeyUnwrap()**

```
fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

◆ **R_SCE_AES256_RFC3394KeyUnwrap()**

```
fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * master_key, uint32_t
target_key_type, uint32_t * rfc3394_wrapped_key, sce_aes_wrapped_key_t * target_key )
```

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

```
fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_hmac_sha_wrapped_key_t*
wrapped_key )
```

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA1024_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa1024_public_wrapped_key_t *
wrapped_key )
```

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA1024_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa1024_private_wrapped_key_t*
wrapped_key )
```

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA2048_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa2048_public_wrapped_key_t *
wrapped_key )
```

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA2048_EncryptedPrivateKeyWrap()**

```
fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( uint8_t* initial_vector, uint8_t*
encrypted_key, sce_key_update_key_t* key_update_key, sce_rsa2048_private_wrapped_key_t*
wrapped_key )
```

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA3072_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa3072_public_wrapped_key_t *
wrapped_key )
```

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSA4096_EncryptedPublicKeyWrap()**

```
fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_rsa4096_public_wrapped_key_t *
wrapped_key )
```

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_public_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

```
fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( uint8_t * initial_vector, uint8_t *
encrypted_key, sce_key_update_key_t * key_update_key, sce_ecc_private_wrapped_key_t *
wrapped_key )
```

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encrypted and MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

```
fsp_err_t R_SCE_AES128ECB_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key )
```

The `R_SCE_AES128ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_EncryptUpdate()` function and `R_SCE_AES128ECB_EncryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTTO_SCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION</code>	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

```
fsp_err_t R_SCE_AES128ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

```
fsp_err_t R_SCE_AES128ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES128ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

```
fsp_err_t R_SCE_AES256ECB_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key )
```

The `R_SCE_AES256ECB_EncryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256ECB_EncryptUpdate()` function and `R_SCE_AES256ECB_EncryptFinal()` function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES256ECB_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256ECB_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_EncryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

```
fsp_err_t R_SCE_AES256ECB_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128ECB_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128ECB_DecryptUpdate()` function and `R_SCE_AES128ECB_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

```
fsp_err_t R_SCE_AES256ECB_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256ECB_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES256ECB_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256ECB_DecryptFinal()**

```
fsp_err_t R_SCE_AES256ECB_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256ECB_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

```
fsp_err_t R_SCE_AES128CBC_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* initial_vector )
```

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t *
cipher, uint32_t plain_length )
```

The `R_SCE_AES128CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES128CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPT_SCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION</code>	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CBC_EncryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES128CBC_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

```
fsp_err_t R_SCE_AES128CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CBC_DecryptUpdate()` function decrypts the second argument, `cipher`, utilizing the key index stored in the handle specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, `plain`. After plaintext input is completed, call `R_SCE_AES128CBC_DecryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CBC_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the **R_SCE_AES128CBC_DecryptFinal()** function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

```
fsp_err_t R_SCE_AES256CBC_EncryptInit ( sce_aes_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* initial_vector )
```

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CBC_EncryptUpdate ( sce_aes_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CBC_EncryptUpdate()` function encrypts the second argument, `plain`, utilizing the key index stored in the `handle` specified in the first argument, `handle`, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, `cipher`. After plaintext input is completed, call `R_SCE_AES256CBC_EncryptFinal()`.

Specify areas for `plain` and `cipher` that do not overlap. For `plain` and `cipher`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in,out]	<code>plain_length</code>	plaintext data length (must be a multiple of 16)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION</code>	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_EncryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_EncryptFinal ( sce_aes_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256CBC_EncryptFinal\(\)](#) function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPT_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

```
fsp_err_t R_SCE_AES256CBC_DecryptInit ( sce_aes_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector )
```

The `R_SCE_AES256CBC_DecryptInit()` function performs preparations for the execution of an AES calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CBC_DecryptUpdate()` function and `R_SCE_AES256CBC_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (16byte)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTOSCE_KEY_SET_FAIL</code>	Input illegal wrapped key.
<code>FSP_ERR_CRYPTOSCE_FAIL</code>	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_DecryptUpdate()**

```
fsp_err_t R_SCE_AES256CBC_DecryptUpdate ( sce_aes_handle_t * handle, uint8_t * cipher, uint8_t * plain, uint32_t cipher_length )
```

The **R_SCE_AES256CBC_DecryptUpdate()** function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call **R_SCE_AES256CBC_DecryptFinal()**.

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CBC_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CBC_DecryptFinal ( sce_aes_handle_t * handle, uint8_t * plain, uint32_t * plain_length )
```

Using the handle specified in the first argument, handle, the [R_SCE_AES256CBC_DecryptFinal\(\)](#) function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

```
fsp_err_t R_SCE_AES128GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES128GCM_EncryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128GCM_EncryptUpdate()` function and `R_SCE_AES128GCM_EncryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

```
fsp_err_t R_SCE_AES128GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES128GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128GCM_DecryptUpdate()` function and `R_SCE_AES128GCM_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES128GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES128GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

```
fsp_err_t R_SCE_AES128GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES128GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES128GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

```
fsp_err_t R_SCE_AES256GCM_EncryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_EncryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_EncryptUpdate()` function and `R_SCE_AES256GCM_EncryptFinal()` function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_EncryptUpdate ( sce_gcm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_data_length, uint8_t * aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_EncryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `plain` reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, `cipher`. The lengths of the `plain` and `aad` data to input are respectively specified in the fourth argument, `plain_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `plain` input data, but rather the data length to input when the user calls this function. If the input values `plain` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `plain`. If `aad` data is input after starting to input `plain` data, an error will occur. If `aad` data and `plain` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `plain` data input state.

Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256GCM_EncryptFinal ( sce_gcm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_data_length, uint8_t * atag )
```

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

```
fsp_err_t R_SCE_AES256GCM_DecryptInit ( sce_gcm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * initial_vector, uint32_t initial_vector_length )
```

The `R_SCE_AES256GCM_DecryptInit()` function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256GCM_DecryptUpdate()` function and `R_SCE_AES256GCM_DecryptFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-GCM handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key
[in]	<code>initial_vector</code>	initialization vector area (<code>initial_vector_length</code> byte)
[in]	<code>initial_vector_length</code>	initialization vector length (1 or more bytes)

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT</code>	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
<code>FSP_ERR_CRYPTOSCE_KEY_SET_FAIL</code>	Invalid wrapped key was input.
<code>FSP_ERR_CRYPTOSCE_PARAMETER</code>	Input data is illegal.
<code>FSP_ERR_CRYPTOSCE_FAIL</code>	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256GCM_DecryptUpdate ( sce_gcm_handle_t* handle, uint8_t* cipher,
uint8_t* plain, uint32_t cipher_data_length, uint8_t* aad, uint32_t aad_length )
```

The `R_SCE_AES256GCM_DecryptUpdate()` function decrypts the ciphertext specified in the second argument, `cipher`, in GCM mode using the values specified for `wrapped_key` and `initial_vector` in `R_SCE_AES256GCM_DecryptInit()`, along with the additional authentication data specified in the fifth argument, `aad`. Inside this function, the data that is input by the user is buffered until the input values of `aad` and `plain` exceed 16 bytes. After the input data from `cipher` reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, `plain`. The lengths of the cipher and `aad` data to input are respectively specified in the fourth argument, `cipher_data_length`, and the sixth argument, `aad_length`. For these, specify not the total byte count for the `aad` and `cipher` input data, but rather the data length to input when the user calls this function. If the input values `cipher` and `aad` are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from `aad`, and then process the data that is input from `cipher`. If `aad` data is input after starting to input `cipher` data, an error will occur. If `aad` data and `cipher` data are input to this function at the same time, the `aad` data will be processed, and then the function will transition to the `cipher` data input state. Specify areas for `plain` and `cipher` that do not overlap. For `plain`, `cipher`, `stage`, `initial_vector`, and `aad`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	After the data from <code>plain</code> was input, an invalid handle was input from <code>aad</code> .
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

```
fsp_err_t R_SCE_AES256GCM_DecryptFinal ( sce_gcm_handle_t* handle, uint8_t* plain, uint32_t* plain_data_length, uint8_t* atag, uint32_t atag_length )
```

The `R_SCE_AES256GCM_DecryptFinal()` function decrypts, in GCM mode, the fractional ciphertext specified by `R_SCE_AES256GCM_DecryptUpdate()` that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, `plain`, and the authentication tag area specified in the fourth argument, `atag`. The decoded data length is output to the third argument, `plain_data_length`. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. For the fourth argument, `atag`, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For `plain` and `atag`, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

```
fsp_err_t R_SCE_AES128CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES128CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_EncryptInit()` to specify the total data length of plain that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPT_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES128CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES128CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES128CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes128CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

```
fsp_err_t R_SCE_AES128CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The `R_SCE_AES128CCM_DecryptInit()` function prepares to perform CCM computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_AES128CCM_DecryptUpdate()` and `R_SCE_AES128CCM_DecryptFinal()` use `handle` as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEYSET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES128CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES128CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES128CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES128CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES128CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES128GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES128GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes128CcmDecryptInit\(\)](#).

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

```
fsp_err_t R_SCE_AES256CCM_EncryptInit ( sce_ccm_handle_t* handle, sce_aes_wrapped_key_t* wrapped_key, uint8_t* nonce, uint32_t nonce_length, uint8_t* adata, uint8_t a_length, uint32_t payload_length, uint32_t mac_length )
```

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_EncryptUpdate ( sce_ccm_handle_t * handle, uint8_t * plain, uint8_t * cipher, uint32_t plain_length )
```

The `R_SCE_AES256CCM_EncryptUpdate()` function encrypts the plaintext specified in the second argument, `plain`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_EncryptInit()`. This function buffers internally the data input by the user until the input value of `plain` exceeds 16 bytes. Once the amount of `plain` input data is 16 bytes or greater, the encrypted result is output to `cipher`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_EncryptInit()` to specify the total data length of `plain` that will be input. Use `plain_length` in this function to specify the data length to be input when the user calls this function. If the input value of `plain` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `plain` and `cipher` do not overlap. Also, specify RAM addresses that are multiples of 4 for `plain` and `cipher`.

Parameters

[in,out]	<code>handle</code>	AES-CCM handler (work area)
[in]	<code>plain</code>	plaintext data area
[in,out]	<code>cipher</code>	ciphertext data area
[in]	<code>plain_length</code>	plaintext data length

Return values

<code>FSP_SUCCESS</code>	Normal termination
<code>FSP_ERR_CRYPT_SCE_PROHIBIT_FUNCTION</code>	An invalid function was called.
<code>FSP_ERR_CRYPT_SCE_PARAMETER</code>	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

```
fsp_err_t R_SCE_AES256CCM_EncryptFinal ( sce_ccm_handle_t * handle, uint8_t * cipher, uint32_t * cipher_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of plain input in `R_SCE_AES256CCM_EncryptUpdate()` results in leftover data after 16 bytes, the `R_SCE_AES256CCM_EncryptFinal()` function outputs the leftover encrypted data to `cipher`, which is specified in the second argument. The MAC value is output to the fourth argument, `mac`. Set the fifth argument, `mac_length` to the same value as that specified for the argument `mac_length` in `Aes256CcmEncryptInit()`. Also, specify RAM addresses that are multiples of 4 for `cipher` and `mac`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

```
fsp_err_t R_SCE_AES256CCM_DecryptInit ( sce_ccm_handle_t * handle, sce_aes_wrapped_key_t *
wrapped_key, uint8_t * nonce, uint32_t nonce_length, uint8_t * adata, uint8_t a_length, uint32_t
payload_length, uint32_t mac_length )
```

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

```
fsp_err_t R_SCE_AES256CCM_DecryptUpdate ( sce_ccm_handle_t * handle, uint8_t * cipher,
uint8_t * plain, uint32_t cipher_length )
```

The `R_SCE_AES256CCM_DecryptUpdate()` function decrypts the ciphertext specified by the second argument, `cipher`, in CCM mode using the values specified by `wrapped_key`, `nonce`, and `adata` in `R_SCE_AES256CCM_DecryptInit()`. This function buffers internally the data input by the user until the input value of `cipher` exceeds 16 bytes. Once the amount of `cipher` input data is 16 bytes or greater, the decrypted result is output to `plain`, which is specified in the third argument. Use `payload_length` in `R_SCE_AES256CCM_DecryptInit()` to specify the total data length of `cipher` that will be input. Use `cipher_length` in this function to specify the data length to be input when the user calls this function. If the input value of `cipher` is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to `cipher` and `plain` do not overlap. Also, specify RAM addresses that are multiples of 4 for `cipher` and `plain`.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CCM_DecryptFinal()**

```
fsp_err_t R_SCE_AES256CCM_DecryptFinal ( sce_ccm_handle_t * handle, uint8_t * plain, uint32_t * plain_length, uint8_t * mac, uint32_t mac_length )
```

If the data length of cipher input in [R_SCE_AES256GCM_DecryptUpdate\(\)](#) results in leftover data after 16 bytes, the [R_SCE_AES256GCM_DecryptFinal\(\)](#) function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in [Aes256CcmDecryptInit\(\)](#).

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

```
fsp_err_t R_SCE_AES128CMAC_GenerateInit ( sce_cmact_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_GenerateUpdate()` function and `R_SCE_AES128CMAC_GenerateFinal()` function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES128CMAC_GenerateUpdate ( sce_cmact_handle_t* handle, uint8_t* message,
uint32_t message_length )
```

The `R_SCE_AES128CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES128CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES128CMAC_GenerateFinal()**

```
fsp_err_t R_SCE_AES128CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES128CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES128CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES128CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES128CMAC_VerifyUpdate()` function and `R_SCE_AES128CMAC_VerifyFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-CMAC handler (work area)
[in]	<code>wrapped_key</code>	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

```
fsp_err_t R_SCE_AES128CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

```
fsp_err_t R_SCE_AES128CMAC_VerifyFinal ( sce_cmact_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES128CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

```
fsp_err_t R_SCE_AES256CMAC_GenerateInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_GenerateInit()` function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_GenerateUpdate()` function and `R_SCE_AES256CMAC_GenerateFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-CMAC handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

```
fsp_err_t R_SCE_AES256CMAC_GenerateUpdate ( sce_cmac_handle_t* handle, uint8_t* message,
uint32_t message_length )
```

The `R_SCE_AES256CMAC_GenerateUpdate()` function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in `R_SCE_AES256CMAC_GenerateInit()`. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_GenerateFinal()**

```
fsp_err_t R_SCE_AES256CMAC_GenerateFinal ( sce_cmac_handle_t* handle, uint8_t* mac )
```

The `R_SCE_AES256CMAC_GenerateFinal()` function outputs the MAC value to the MAC data area specified in the second argument, `mac`, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

```
fsp_err_t R_SCE_AES256CMAC_VerifyInit ( sce_cmac_handle_t * handle, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_AES256CMAC_VerifyInit()` function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_AES256CMAC_VerifyUpdate()` function and `R_SCE_AES256CMAC_VerifyFinal()` function.

Parameters

[in,out]	<code>handle</code>	AES-CMAC handler (work area)
[in]	<code>wrapped_key</code>	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_AES256CMAC_VerifyUpdate ( sce_cmact_handle_t * handle, uint8_t * message,
uint32_t message_length )
```

The **R_SCE_AES256CMAC_VerifyUpdate()** function performs MAC value generation based on the message specified in the second argument, `message`, using the value specified for `wrapped_key` in **R_SCE_AES256CMAC_VerifyInit()**. Inside this function, the data that is input by the user is buffered until the input value of `message` exceeds 16 bytes. The length of the message data to input is specified in the third argument, `message_len`. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, `message`, is not a multiple of 16 bytes, it will be padded within the function. For `message`, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_AES256CMAC_VerifyFinal()**

```
fsp_err_t R_SCE_AES256CMAC_VerifyFinal ( sce_cmec_handle_t* handle, uint8_t* mac, uint32_t mac_length )
```

The `R_SCE_AES256CMAC_VerifyFinal()` function inputs the MAC value in the MAC data area specified in the second argument, `mac`, and verifies the MAC value. If authentication fails, the return value will be `TSIP_ERR_AUTHENTICATION`. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256_Init()**

```
fsp_err_t R_SCE_SHA256_Init ( sce_sha_md5_handle_t* handle)
```

The `R_SCE_SHA256_Init()` function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, `handle`. The value of `handle` is used as an argument in the subsequent `R_SCE_SHA256_Update()` function and `R_SCE_SHA256_Final()` function.

Parameters

[in,out]	handle	SHA handler (work area)
----------	--------	-------------------------

Return values

FSP_SUCCESS	Normal termination
-------------	--------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

```
fsp_err_t R_SCE_SHA256_Update ( sce_sha_md5_handle_t * handle, uint8_t * message, uint32_t message_length )
```

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

```
fsp_err_t R_SCE_SHA256_Final ( sce_sha_md5_handle_t * handle, uint8_t * digest, uint32_t *
digest_length )
```

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hash data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate ( sce_hmac_sha_handle_t* handle, uint8_t* message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_GenerateUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_GenerateFinal()` function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

```
fsp_err_t R_SCE_SHA256HMAC_GenerateFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac )
```

The `R_SCE_SHA256HMAC_GenerateFinal()` function uses the handle specified by the first argument `handle` and writes the calculation result to the second argument `mac`.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyInit ( sce_hmac_sha_handle_t* handle,
sce_hmac_sha_wrapped_key_t* wrapped_key )
```

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_SHA256HMAC_VerifyUpdate()**

```
fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate ( sce_hmac_sha_handle_t * handle, uint8_t *
message, uint32_t message_length )
```

The `R_SCE_SHA256HMAC_VerifyUpdate()` function uses the handle specified by the first argument `handle`, calculates a hash value from the second argument `message` and third argument `message_length`, then writes the intermediate result to the first argument `handle`. After message input finishes, call the `R_SCE_SHA256HMAC_VerifyFinal()` function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

```
fsp_err_t R_SCE_SHA256HMAC_VerifyFinal ( sce_hmac_sha_handle_t* handle, uint8_t* mac,
uint32_t mac_length )
```

The `R_SCE_SHA256HMAC_VerifyFinal()` function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa1024_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS1024_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value
------	--------------	--

			<ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature		Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length
[in]	wrapped_key		Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type		Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_RSASSA_PKCS1024_SignatureVerify()**

```
fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa1024_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The **R_SCE_RSASSA_PKCS1024_SignatureVerify()** function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument *signature*, and the message text or hash value input to the second argument, *message_hash*, using the public wrapped key input to the third argument, *wrapped_key*. When a message is specified in the second argument, *message_hash->data_type*, a hash value is calculated using the public wrapped key input to the third argument, *wrapped_key*, and as specified by the fourth argument, *hash_type*. When specifying a hash value in the second argument, *message_hash->data_type*, a hash value calculated with a hash algorithm as specified by the fourth argument, *hash_type*, must be input to *message_hash->pdata*.

Parameters

[in]	<i>signature</i>	Signature text information to verify <ul style="list-style-type: none"> <i>signature->pdata</i> : Specifies pointer to array storing the signature text <i>signature->data_length</i> : Specifies effective data length of the array
[in]	<i>message_hash</i>	Message text or hash value to verify <ul style="list-style-type: none"> <i>message_hash->pdata</i> : Specifies pointer to array storing the message or hash value <i>message_hash->data_length</i> : Specifies effective data length of the array (Specify only when Message is selected) <i>message_hash->data_type</i> : Selects the data type of <i>message_hash</i> (Message: 0 Hash value: 1)
[in]	<i>wrapped_key</i>	Inputs the 1024-bit RSA public wrapped key.
[in]	<i>hash_type</i>	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate ( sce_rsa_byte_data_t* message_hash,
sce_rsa_byte_data_t* signature, sce_rsa2048_private_wrapped_key_t* wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureGenerate()` function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, `message_hash`, using the private wrapped key input to the third argument, `wrapped_key`, and writes the signature text to the second argument, `signature`. When a message is specified in the first argument, `message_hash->data_type`, a hash value is calculated for the message as specified by the fourth argument, `hash_type`. When specifying a hash value in the first argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> • <code>message_hash->pdata</code> : Specifies pointer to array storing the message or hash value • <code>message_hash->data_length</code> : Specifies effective data length of the array (Specify only when Message is selected) • <code>message_hash->data_type</code> : Selects the
------	--------------	--

		data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa2048_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS2048_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa3072_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS3072_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata

			<p>ta : Specifies pointer to array storing the message or hash value</p> <ul style="list-style-type: none"> message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key		Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type		Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

```
fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify ( sce_rsa_byte_data_t * signature,
sce_rsa_byte_data_t * message_hash, sce_rsa4096_public_wrapped_key_t * wrapped_key, uint8_t
hash_type )
```

The `R_SCE_RSASSA_PKCS4096_SignatureVerify()` function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument `signature`, and the message text or hash value input to the second argument, `message_hash`, using the public wrapped key input to the third argument, `wrapped_key`. When a message is specified in the second argument, `message_hash->data_type`, a hash value is calculated using the public wrapped key input to the third argument, `wrapped_key`, and as specified by the fourth argument, `hash_type`. When specifying a hash value in the second argument, `message_hash->data_type`, a hash value calculated with a hash algorithm as specified by the fourth argument, `hash_type`, must be input to `message_hash->pdata`.

Parameters

[in]	signature	Signature text information to verify <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing the signature text signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported
--	--	-------------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa1024_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa1024_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
-------------------------	-----------------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa2048_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

```
fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt ( sce_rsa_byte_data_t* cipher, sce_rsa_byte_data_t*
plain, sce_rsa2048_private_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext <ul style="list-style-type: none"> • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext <ul style="list-style-type: none"> • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
-------------------------	-----------------------------

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa3072_public_wrapped_key_t* wrapped_key )
```

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

```
fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt ( sce_rsa_byte_data_t* plain, sce_rsa_byte_data_t*
cipher, sce_rsa4096_public_wrapped_key_t* wrapped_key )
```

The `R_SCE_RSAES_PKCS4096_Encrypt()` function RSA-encrypts the plaintext input to the first argument, `plain`, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, `cipher`.

Parameters

[in]	plain	plaintext <ul style="list-style-type: none"> plain->pdata : Specifies pointer to array containing plaintext. plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext <ul style="list-style-type: none"> cipher->pdata : Specifies pointer to array containing ciphertext. cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". • signature->data_length : Data length (byte units)

[in]	wrapped_key	Input wrapped key of secp192r1 private key.
------	-------------	---

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash
------	--------------	--

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate ( sce_ecdsa_byte_data_t * message_hash,
sce_ecdsa_byte_data_t * signature, sce_ecc_private_wrapped_key_t * wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	<p>Message or hash value to which to attach signature</p> <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	<p>Signature text storage destination information</p> <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate ( sce_ecdsa_byte_data_t* message_hash,
sce_ecdsa_byte_data_t* signature, sce_ecc_private_wrapped_key_t* wrapped_key )
```

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash
------	--------------	--

		value: 1)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) signature r (192 bits) 0 padding (64 bits) signature s (192 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp192r1 public key.
------	-------------	--

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) signature r (224 bits) 0 padding (32 bits) signature s (224 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
------	-----------	--

[in,out]	message_hash	<p>Message or hash value to be verified</p> <ul style="list-style-type: none"> • message_hash->data : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify ( sce_ecdsa_byte_data_t* signature,
sce_ecdsa_byte_data_t* message_hash, sce_ecc_public_wrapped_key_t* wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) signature s (256 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified <ul style="list-style-type: none"> message_hash->pdata : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of

secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

```
fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify ( sce_ecdsa_byte_data_t * signature,
sce_ecdsa_byte_data_t * message_hash, sce_ecc_public_wrapped_key_t * wrapped_key )
```

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) signature s (384 bits)". signature->data_length : Specifies the data length (byte units) (nonuse)
------	-----------	--

[in,out]	message_hash	<p>Message or hash value to be verified</p> <ul style="list-style-type: none"> message_hash->data : Specifies pointer to array storing the message or hash value message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

```
fsp_err_t R_SCE_ECDH_secp256r1_Init ( sce_ecdh_handle_t * handle, uint32_t key_type, uint32_t use_key_id )
```

The `R_SCE_ECDH_secp256r1_Init()` function prepares to perform ECDH key exchange computation and writes the result to the first argument, `handle`. The succeeding functions `R_SCE_ECDH_secp256r1_PublicKeySign()`, `R_SCE_ECDH_secp256r1_PublicKeyVerify()`, `R_SCE_ECDH_secp256r1_SharedSecretCalculate()`, and `R_SCE_ECDH_secp256r1_KeyDerivation()` use `handle` as an argument.

Use the second argument, `key_type`, to select the type of ECDH key exchange. When ECDHE is selected, the `R_SCE_ECDH_secp256r1_PublicKeySign()` function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, `use_key_id`, to use `key_id` when key exchange is performed. `key_id` is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign ( sce_ecdh_handle_t * handle,
sce_ecc_public_wrapped_key_t * ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t *
ecc_private_wrapped_key, uint8_t * public_key, sce_ecdsa_byte_data_t * signature,
sce_ecc_private_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_PublicKeySign()` function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to `public_key` and the private key is output to `wrapped_key`.

If ECDH is specified by the `key_type` argument of the `R_SCE_ECDH_secp256r1_Init()` function, the public key input as `ecc_public_wrapped_key` is output to `public_key` and nothing is output to `wrapped_key`.

The succeeding function `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` uses the first argument, `handle`, as an argument. `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses `wrapped_key` as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using <code>key_id</code> , input <code>handle->key_id</code> after running <code>R_SCE_ECDH_secp256r1_Init()</code> .
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using <code>key_id</code> , <code>key_id</code> (8-bit) public key (512-bit) 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information <ul style="list-style-type: none"> signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) signature s (256 bits)" signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, uint8_t* public_key_data,
sce_ecdsa_byte_data_t* signature, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().

R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

```
fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature ( sce_ecdh_handle_t* handle,
uint8_t* public_key_data, sce_ecc_public_wrapped_key_t* wrapped_key )
```

The `R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()` function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, `handle`, is used as an argument in the subsequent function `R_SCE_ECDH_secp256r1_SharedSecretCalculate()`. `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` uses `wrapped_key` as input to calculate Z. This API does not verify signature of `public_key_data`, please protect this data by upper layer software.

Parameters

[in,out]	<code>handle</code>	ECDH handler (work area)
[in]	<code>public_key_data</code>	secp256r1 public key (512-bit). When <code>key_id</code> is used: <code>key_id</code> (8-bit) public key (512-bit)
[in,out]	<code>wrapped_key</code>	wrapped key of <code>public_key_data</code>

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

```
fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate ( sce_ecdh_handle_t* handle,
sce_ecc_public_wrapped_key_t* ecc_public_wrapped_key, sce_ecc_private_wrapped_key_t*
ecc_private_wrapped_key, sce_ecdh_wrapped_key_t* shared_secret_wrapped_key )
```

The `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, `ecc_public_wrapped_key`, the public wrapped key whose signature was verified by `R_SCE_ECDH_secp256r1_PublicKeyVerify()`. When `key_type` of `R_SCE_ECDH_secp256r1_Init()` is 0, input as the third argument, `ecc_private_wrapped_key`, the private wrapped key generated from a random number by `R_SCE_ECDH_secp256r1_PublicKeySign()`, and when `key_type` is other than 0, input the private wrapped key that forms a pair with the second argument of `R_SCE_ECDH_secp256r1_PublicKeySign()`. The subsequent `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses `shared_secret_wrapped_key` as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by <code>R_SCE_ECDH_secp256r1_PublicKeyVerify()</code>
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTOSCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTOSCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTOSCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

```
fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation ( sce_ecdh_handle_t * handle,
sce_ecdh_wrapped_key_t * shared_secret_wrapped_key, uint32_t key_type, uint32_t kdf_type,
uint8_t * other_info, uint32_t other_info_length, sce_hmac_sha_wrapped_key_t *
salt_wrapped_key, sce_aes_wrapped_key_t * wrapped_key )
```

The `R_SCE_ECDH_secp256r1_KeyDerivation()` function uses the shared secret "Z (shared_secret_index)" calculated by the `R_SCE_ECDH_secp256r1_SharedSecretCalculate()` function as the key material to derive the wrapped key specified by the third argument, `key_type`. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, `kdf_type`. When SHA-256 HMAC is specified, the wrapped key output by the `R_SCE_SHA256HMAC_EncryptedKeyWrap()` function is specified as the seventh argument, `salt_wrapped_key`. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, `other_info`. A wrapped key corresponding to `key_type` is output as the eighth argument, `wrapped_key`. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: `R_SCE_SHA256HMAC_GenerateInit()` function and `R_SCE_SHA256HMAC_VerifyInit()` function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by <code>R_SCE_ECDH_secp256r1_SharedSecretCalculate</code>
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID PartyUInfo PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when kdf_type is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to <code>key_type</code> . When the value of <code>key_type</code> is 2, an SHA256-HMAC wrapped key is output. <code>wrapped_key</code> can be specified by casting the start address of the area

		reserved beforehand by the <code>sce_hmac_sha_wrapped_key_t</code> type with the <code>(sce_aes_wrapped_key_t*)</code> type.
--	--	--

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

```
fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall ( uint8_t *
encrypted_provisioning_key, uint8_t * initial_vector, uint8_t * encrypted_key,
sce_tls_ca_certification_public_wrapped_key_t * wrapped_key )
```

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

```
fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (
sce_tls_p256_ecc_wrapped_key_t* tls_p256_ecc_wrapped_key, uint8_t*
ephemeral_ecdh_public_key )
```

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

```
fsp_err_t R_SCE_TLS_RootCertificateVerify ( uint32_t public_key_type, uint8_t* certificate,
uint32_t certificate_length, uint32_t public_key_n_start_position, uint32_t
public_key_n_end_position, uint32_t public_key_e_start_position, uint32_t
public_key_e_end_position, uint8_t* signature, uint32_t* encrypted_root_public_key )
```

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

```
fsp_err_t R_SCE_TLS_CertificateVerify ( uint32_t public_key_type, uint32_t *
encrypted_input_public_key, uint8_t * certificate, uint32_t certificate_length, uint8_t * signature,
uint32_t public_key_n_start_position, uint32_t public_key_n_end_position, uint32_t
public_key_e_start_position, uint32_t public_key_e_end_position, uint32_t *
encrypted_output_public_key )
```

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()**

`fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * encrypted_public_key, uint32_t * sce_pre_master_secret, uint8_t * encrypted_pre_master_secret)`

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ **R_SCE_TLS_PreMasterSecretGenerateForRSA2048()**

`fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * sce_pre_master_secret)`

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.
-------	-----------------------	----------------------------------

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

```
fsp_err_t R_SCE_TLS_MasterSecretGenerate ( uint32_t select_cipher_suite, uint32_t *
sce_pre_master_secret, uint8_t * client_random, uint8_t * server_random, uint32_t *
sce_master_secret )
```

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

```
fsp_err_t R_SCE_TLS_SessionKeyGenerate ( uint32_t select_cipher_suite, uint32_t*
sce_master_secret, uint8_t* client_random, uint8_t* server_random, uint8_t* nonce_explicit,
sce_hmac_sha_wrapped_key_t* client_mac_wrapped_key, sce_hmac_sha_wrapped_key_t*
server_mac_wrapped_key, sce_aes_wrapped_key_t* client_crypto_wrapped_key,
sce_aes_wrapped_key_t* server_crypto_wrapped_key, uint8_t* client_initial_vector, uint8_t*
server_initial_vector )
```

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

```
fsp_err_t R_SCE_TLS_VerifyDataGenerate ( uint32_t select_verify_data, uint32_t *
sce_master_secret, uint8_t * hand_shake_hash, uint8_t * verify_data )
```

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

```
fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify ( uint32_t public_key_type, uint8_t *
client_random, uint8_t * server_random, uint8_t * server_ephemeral_ecdh_public_key, uint8_t *
server_key_exchange_signature, uint32_t * encrypted_public_key, uint32_t *
encrypted_ephemeral_ecdh_public_key )
```

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange signature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

```
fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 ( uint32_t *
encrypted_public_key, sce_tls_p256_ecc_wrapped_key_t * tls_p256_ecc_wrapped_key, uint32_t *
sce_pre_master_secret )
```

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTOSCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTOSCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

4.2.52 Secure Crypto Engine (r_sce_protected_cavp)

Modules

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.0.0

The version that appears on the Components tab of the FSP Configuration editor is v1.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See [Module Versioning](#) for more information about component versioning in FSP.

Functions

The user documentation for the functions in this module.

- [Secure Crypto Engine \(r_sce_protected\)](#)

Overview

This module provides SCE CAVP Certified functions.

HW Overview

Obtained device certification with RA6M4.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
 - Symmetric Encryption/Decryption
 - AES
 - ECB 128/256bit
 - CBC 128/256bit
 - GCM 128/256bit
 - CCM 128/256bit
 - Asymmetric Encryption/Decryption
 - RSA
 - RSAES-PKCS1-V1_5 1024/2048bit
 - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
 - RSASSA-PKCS1-V1_5 1024/2048bit
 - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
 - ECC
 - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
 - ECDH secp192r1/secp224r1/secp256r1/secp384r1
 - Hash Functions
 - SHA-2
 - SHA-256
- Message Authentication Code
 - HMAC-SHA256bit
 - AES-CMAC 128/256bit
- Key Support
 - AES 128/256bit
 - RSA 1024/2048bit
 - RSA 3072/4096bit (public key only)
 - ECC secp192r1/secp224r1/secp256r1/secp384r1
 - HMAC-SHA256bit
- TRNG
- TLS
 - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Driver > Crypto > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- [R_SCE_ECDSA_secp384r1_SignatureGenerate\(\)](#)
- [R_SCE_ECDSA_secp384r1_SignatureVerify\(\)](#)

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
    0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
    0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
    sce_aes_handle_t      handle;
    sce_aes_wrapped_key_t wrapped_key;
    uint8_t                cipher_calculated[32] = {0};
    uint8_t                plain_calculated[32] = {0};
    uint32_t               dummy;
    /* SCE power on */
    R_SCE_Open(&sce_ctrl, &sce_cfg);
    /* Generate a random key */
    R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
    /* Encrypt a plain text */
    R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
    R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
}
```

```

R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
/* Decrypt a cipher text using same key as Encryption */
R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
/* SCE power off */
R_SCE_Close(&sce_ctrl);
/* Compare plain and plain_calculated */
if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
while (1)
    {
/* plain and plain_calculated are different (incorrect) */
    }
}
else
    {
while (1)
    {
/* plain and plain_calculated are the same (correct) */
    }
}
}
}

```

fsp_err_t R_SCI_B_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *p_status)

Detailed Description

Driver for the SCI_B peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_b_i2c

The following build time configurations are defined in fsp_cfg/r_sci_b_i2c_cfg.h:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_b_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_b_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> • 7-Bit • 10-Bit 	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> • Standard • Fast-mode 	Standard	Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_b_i2c_extended_cfg_t structure.
SDA Output Delay	Must be a valid non-	300	Specify the SDA output

(nano seconds)	negative integer with maximum configurable value of 300		delay in nanoseconds.
Noise Filter Clock Select	<ul style="list-style-type: none"> The on-chip baud rate generator source clock divided by 1 The on-chip baud rate generator source clock divided by 2 The on-chip baud rate generator source clock divided by 4 The on-chip baud rate generator source clock divided by 8 	The on-chip baud rate generator source clock divided by 1	Select the on-chip baud rate generator source clock division setting for the digital noise filter
Clock Source	<ul style="list-style-type: none"> PCLK SCISPICK 	PCLK	Select the clock source for the SCI I2C module.
Bit Rate Modulation	<ul style="list-style-type: none"> Enable Disable 	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	sci_b_i2c_master_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when	MCU Specific Options		Select the interrupt priority level. This is set

DTC is enabled]

for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA

The actual I2C transfer rate can be derived from either SCISPICK or the peripheral clock (PCLK)¹, and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Note

1. See Figure 26.2 in the RA6T2 manual for more information.

Pin Configuration

The SCI_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI_B I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI_B_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_b_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the I2C module */

SCI clock source

Function Documentation

◆ R_SCI_B_I2C_Open()

fsp_err_t R_SCI_B_I2C_Open (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg)	
Opens the I2C device.	
Return values	
FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ **R_SCI_B_I2C_Close()**

```
fsp_err_t R_SCI_B_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Read()**

```
fsp_err_t R_SCI_B_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Write()**

```
fsp_err_t R_SCI_B_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_Abort()**

```
fsp_err_t R_SCI_B_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_B_I2C_SlaveAddressSet()**

```
fsp_err_t R_SCI_B_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ **R_SCI_B_I2C_CallbackSet()**

```
fsp_err_t R_SCI_B_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_I2C_StatusGet()

```
fsp_err_t R_SCI_B_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *
p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_b_spi

The following build time configurations are defined in fsp_cfg/r_sci_b_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If support for transferring data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_b_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_b_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> • Master • Slave 	Master	Select the SPI operating mode.

Clock Phase	<ul style="list-style-type: none"> • Data sampling on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge 	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> • Low when idle • High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> • MSB First • LSB First 	MSB First	Select the data bit order.
Clock Source	<ul style="list-style-type: none"> • PCLK • SCISPICK 	PCLK	Select whether the peripheral clock (PCLK) or SCISPICK is used for generating the SCK frequency.
Callback	Name must be a valid C symbol	sci_b_spi_callback	A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	PCLKA

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Examples

Basic Example

This is a basic example of minimal use of the SCI_B_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
```

```
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}

void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
    /* De-assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
}
```

```
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Data Structures

```
struct sci_b_spi_div_setting_t
```

Data Structure Documentation

◆ sci_b_spi_div_setting_t

```
struct sci_b_spi_div_setting_t
```

Settings for adjusting the SPI CLK.

Function Documentation

◆ **R_SCI_B_SPI_Open()**

```
fsp_err_t R_SCI_B_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

◆ R_SCI_B_SPI_Read()

```
fsp_err_t R_SCI_B_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_B_SPI_Write()

```
fsp_err_t R_SCI_B_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ **R_SCI_B_SPI_WriteRead()**

```
fsp_err_t R_SCI_B_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_B_SPI_CallbackSet()

```
fsp_err_t R_SCI_B_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_SPI_Close()

```
fsp_err_t R_SCI_B_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ R_SCI_B_SPI_CalculateBitrate()

```
fsp_err_t R_SCI_B_SPI_CalculateBitrate ( uint32_t bitrate, sci_b_spi_clock_source_t clock_source,
sci_b_spi_div_setting_t* sclk_div )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	clock_source	clock source (PCLKA or SCISPICLK) used for bit rate calculation.
	sclk_div	Pointer to sci_b_spi_div_setting_t used to configure baudrate settings.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

4.2.55 Serial Communications Interface (SCI) UART (r_sci_b_uart)

Modules

Functions

```

```
fsp_err_t R_SCI_B_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t
*remaining_bytes)
```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> • Enable 	Disable	Enable FIFO support for

	<ul style="list-style-type: none"> • Disable 		the SCI_UART module.
DTC Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.

Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> • 8bits • 7bits • 9bits 	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> • None • Odd • Even 	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> • 1bit • 2bits 	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure.
Baud > Baud Rate Modulation	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by

modulating the number of cycles per clock, so some bits are slightly longer than others.

Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.

NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated [sci_b_baud_setting_t](#) structure.

Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).

Specify the flow control pin port for the MCU.

Specify the flow control pin for the MCU.

Enable or disable the DE pin for use in RS-485 half-duplex mode.

Select the polarity of the DE pin.

Configure the time between assertion of the DE pin and the start of a write

Baud > Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	
Flow Control > CTS/RTS Selection	MCU Specific Options		
Flow Control > Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	
Flow Control > Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	
Extra > RS-485 > DE Pin	<ul style="list-style-type: none"> • Disable • Enable 	Disable	
Extra > RS-485 > DE Pin Polarity	<ul style="list-style-type: none"> • Active Low • Active High 	Active High	
Extra > RS-485 > DE Pin Assertion Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	

Extra > RS-485 > DE Pin Negation Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	transfer. The time is specified in multiples of the SCI base clock period.
Extra > Clock Source	<ul style="list-style-type: none"> Internal Clock Internal Clock With Output on SCK External Clock 8x baud rate External Clock 16x baud rate 	Internal Clock	Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI base clock period.
Extra > Start bit detection	<ul style="list-style-type: none"> Falling Edge Low Level 	Falling Edge	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Extra > Noise Filter	<ul style="list-style-type: none"> Enable Disable 	Disable	Start bit detected as falling edge or low level.
Extra > Receive FIFO Trigger Level	<ul style="list-style-type: none"> One Max 	Max	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Interrupts > Callback	Name must be a valid C symbol	NULL	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Receive Interrupt Priority	MCU Specific Options		A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Transmit Data Empty Interrupt	MCU Specific Options		Select the receive interrupt priority.
			Select the transmit interrupt priority.

Priority

Interrupts > Transmit End Interrupt Priority	MCU Specific Options	Select the transmit end interrupt priority.
Interrupts > Error Interrupt Priority	MCU Specific Options	Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	SCISPICK

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CSTn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CSTn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SCI_B_UART_Read()`. The logic required to combine bytes received through `R_SCI_B_UART_Read()` (`UART_EVENT_RX_COMPLETE`) and bytes received between calls (`UART_EVENT_RX_CHAR`) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer.

[uart_api_t::infoGet](#) API can be used to get the max transfer size allowed.

- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_b_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);

    while (!g_transfer_complete)
    {
    }

    while (!g_receive_complete)
    {
    }
}

void example_callback (uart_callback_args_t * p_args)
```

```
{
/* Handle the UART event */
switch (p_args->event)
{
/* Received a character */
case UART_EVENT_RX_CHAR:
{
/* Only put the next character in the receive buffer if there is space for it */
if (sizeof(g_out_of_band_received) > g_out_of_band_index)
{
/* Write either the next one or two bytes depending on the receive data size */
if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
{
g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
}
else
{
uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
*p_dest = (uint16_t) p_args->data;
g_out_of_band_index += 2;
}
}
break;
}
/* Receive complete */
case UART_EVENT_RX_COMPLETE:
{
g_receive_complete = 1;
break;
}
/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
```

```
    {
        g_transfer_complete = 1;
    }
    break;
}
default:
    {
    }
}
}
```

SCI UART Baud Set Example

```
#define SCI_B_UART_BAUDRATE_19200 (19200)
#define SCI_B_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_b_uart_baud_example (void)
{
    sci_b_baud_setting_t baud_setting;
    uint32_t          baud_rate          = SCI_B_UART_BAUDRATE_19200;
    bool              enable_bitrate_modulation = false;
    uint32_t          error_rate_x_1000   =
SCI_B_UART_BAUDRATE_ERROR_PERCENT_5;
    fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Configuration settings for controlling the DE signal for RS-485.

Data Fields

sci_b_uart_rs485_enable_t	enable	Enable the DE signal.
sci_b_uart_rs485_de_polarity_t	polarity	DE signal polarity.
uint8_t	assertion_time: 5	Time in baseclock units after assertion of the DE signal and before the start of the write transfer.
uint8_t	negation_time: 5	Time in baseclock units after the end of a write transfer and before the DE signal is negated.

◆ [sci_b_uart_extended_cfg_t](#)

struct [sci_b_uart_extended_cfg_t](#)

UART on SCI device Configuration		
Data Fields		
sci_b_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_b_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_b_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
sci_b_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_b_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_b_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_b_uart_rs485_setting_t	rs485_setting	RS-485 settings.

Enumeration Type Documentation

◆ [sci_b_clk_src_t](#)

enum sci_b_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_B_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_B_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_B_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_b_uart_flow_control_t

enum sci_b_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_B_UART_FLOW_CONTROL_RTS	Use CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTS	Use CTSn_RTSn pin for CTS.
SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn pin for CTS, CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.

◆ sci_b_uart_rx_fifo_trigger_t

enum sci_b_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_B_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_B_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_b_uart_start_bit_detect_t

enum sci_b_uart_start_bit_detect_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_B_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_B_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ sci_b_uart_noise_cancellation_t

enum sci_b_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_B_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_B_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ sci_b_uart_rs485_enable_t

enum sci_b_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_B_UART_RS485_DISABLE	RS-485 disabled.
SCI_B_UART_RS485_ENABLE	RS-485 enabled.

◆ sci_b_uart_rs485_de_polarity_t

enum sci_b_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_B_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_B_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

Function Documentation

◆ **R_SCI_B_UART_Open()**

```
fsp_err_t R_SCI_B_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SCI_B_UART_Read()**

```
fsp_err_t R_SCI_B_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_RX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_B_UART_Write()**

```
fsp_err_t R_SCI_B_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_TX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_B_UART_BaudSet()**

```
fsp_err_t R_SCI_B_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a [sci_b_baud_setting_t](#) structure. Implements [uart_api_t::baudSet](#)

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_SCI_B_UART_InfoGet()**

```
fsp_err_t R_SCI_B_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ **R_SCI_B_UART_Close()**

```
fsp_err_t R_SCI_B_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_Abort()

`fsp_err_t R_SCI_B_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)`

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements `uart_api_t::communicationAbort`

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

◆ R_SCI_B_UART_BaudCalculate()

```
fsp_err_t R_SCI_B_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, sci_b_baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

◆ R_SCI_B_UART_CallbackSet()

```
fsp_err_t R_SCI_B_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *)
p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `uart_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ R_SCI_B_UART_ReadStop()

```
fsp_err_t R_SCI_B_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event `UART_EVENT_RX_CHAR`. Implements `uart_api_t::readStop`

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [I2C Master Interface](#).

Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

Features

- Supports multiple transmission rates
 - Standard Mode Support with up to 100 kHz transaction rate.
 - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
 - Optional (build time) DTC support for read and write respectively.
 - Optional (build time) support for 10-bit slave addressing.

Configuration

Build Time Configurations for r_sci_i2c

The following build time configurations are defined in fsp_cfg/r_sci_i2c_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC on Transmission and Reception	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, DTC instances will be included in the build for both transmission and reception.
10-bit slave addressing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode.

Configurations for Connectivity > I2C Master (r_sci_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2c0	Module name.
Channel	Value must be an integer between 0 and 9	0	Select the SCI channel.
Slave Address	Value must be a hex value	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> • 7-Bit • 10-Bit 	7-Bit	Select the address mode.
Rate	<ul style="list-style-type: none"> • Standard • Fast-mode 	Standard	Select the I2C data rate. If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment

			in the generated <code>sci_i2c_extended_cfg_t</code> structure.
SDA Output Delay (nano seconds)	Must be a valid non-negative integer with maximum configurable value of 300	300	Specify the SDA output delay in nanoseconds.
Noise filter setting	<ul style="list-style-type: none"> • Use clock signal divided by 1 with noise filter • Use clock signal divided by 2 with noise filter • Use clock signal divided by 4 with noise filter • Use clock signal divided by 8 with noise filter 	Use clock signal divided by 1 with noise filter	Select the sampling clock for the digital noise filter
Bit Rate Modulation	<ul style="list-style-type: none"> • Enable • Disable 	Enable	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.
Callback	Name must be a valid C symbol	<code>sci_i2c_master_callback</code>	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupt Priority Level	MCU Specific Options		Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts.
RX Interrupt Priority Level [Only used when DTC is enabled]	MCU Specific Options		Select the interrupt priority level. This is set for RXI only when DTC is enabled.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

Usage Notes

Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is

calculated and used.

- If a valid clock rate could not be calculated, an error is returned by the tool.

Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer [Data Transfer Controller \(r_dtc\)](#)

Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

Examples

Basic Example

This is a basic example of minimal use of the r_sci_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
    fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    /* Initialize the I2C module */
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Write some data to the transmit buffer */
    for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
        g_i2c_tx_buffer[i] = (uint8_t) i;
    }
}
```

```
/* Send data to I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
err = R_SCI_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
__BKPT(0);
}
/* Read data back from the I2C slave */
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
err = R_SCI_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
__BKPT(0);
}
/* Verify the read data */
if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
{
```

```
    __BKPT(0);  
}  
}
```

Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)  
{  
    fsp_err_t err;  
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;  
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
    /* Clear the receive buffer */  
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);  
    /* Read data from I2C slave */  
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;  
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],  
I2C_BUFFER_SIZE_BYTES, false);  
    assert(FSP_SUCCESS == err);  
    while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)  
    {  
        R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);  
        timeout_ms--;;  
    }  
    if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)  
    {  
        __BKPT(0);  
    }  
    /* Send data to I2C slave on the same channel */  
    err = R_SCI_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,  
I2C_MASTER_ADDR_MODE_7BIT);
```

```

assert(FSP_SUCCESS == err);

g_i2c_tx_buffer[0] = (uint8_t) I2C_EXAMPLE_DATA_1;
g_i2c_tx_buffer[1] = (uint8_t) I2C_EXAMPLE_DATA_2;
g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;

err = R_SCI_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
assert(FSP_SUCCESS == err);

while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
{
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    timeout_ms--;
}
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
{
    __BKPT(0);
}
}

```

◆ sci_i2c_extended_cfg_t

struct sci_i2c_extended_cfg_t		
SCI I2C extended configuration		
Data Fields		
sci_i2c_clock_settings_t	clock_settings	I2C Clock settings.

Function Documentation

◆ R_SCI_I2C_Open()

fsp_err_t R_SCI_I2C_Open (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_cfg_t const *const p_cfg)	
Opens the I2C device.	
Return values	
FSP_SUCCESS	Requested clock rate was set exactly.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_ASSERTION	Parameter check failure due to one or more reasons below: <ul style="list-style-type: none"> 1. p_api_ctrl or p_cfg is NULL. 2. extended parameter is NULL. 3. Callback parameter is NULL. 4. Clock rate requested is greater than 400KHz 5. Invalid IRQ number assigned

◆ **R_SCI_I2C_Close()**

```
fsp_err_t R_SCI_I2C_Close ( i2c_master_ctrl_t *const p_api_ctrl)
```

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Device closed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Read()**

```
fsp_err_t R_SCI_I2C_Read ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t
const bytes, bool const restart )
```

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Write()**

```
fsp_err_t R_SCI_I2C_Write ( i2c_master_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t
const bytes, bool const restart )
```

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

FSP_SUCCESS	Function executed without issue.
FSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
FSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_Abort()**

```
fsp_err_t R_SCI_I2C_Abort ( i2c_master_ctrl_t *const p_api_ctrl)
```

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

FSP_SUCCESS	Transaction was aborted without issue.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.

◆ **R_SCI_I2C_SlaveAddressSet()**

```
fsp_err_t R_SCI_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const p_api_ctrl, uint32_t const slave,
i2c_master_addr_mode_t const addr_mode )
```

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

FSP_SUCCESS	Address of the slave is set correctly.
FSP_ERR_ASSERTION	p_ctrl or address is NULL.
FSP_ERR_NOT_OPEN	Device was not even opened.
FSP_ERR_IN_USE	An I2C Transaction is in progress.

◆ **R_SCI_I2C_CallbackSet()**

```
fsp_err_t R_SCI_I2C_CallbackSet ( i2c_master_ctrl_t *const p_api_ctrl,
void(*) (i2c_master_callback_args_t *) p_callback, void const *const p_context,
i2c_master_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2c_master_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_I2C_StatusGet()

```
fsp_err_t R_SCI_I2C_StatusGet ( i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t * p_status )
```

Provides driver status.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

4.2.57 Serial Communications Interface (SCI) SPI (r_sci_spi)

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview**Features**

- Standard SPI Modes
 - Master or Slave Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Select data sampling on leading edge, data change on trailing edge
 - CPHA=1 Select data change on leading edge, data sampling on trailing edge
 - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

Configuration

Build Time Configurations for r_sci_spi

The following build time configurations are defined in fsp_cfg/r_sci_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If support for transferring data using the DTC will be compiled in.

Configurations for Connectivity > SPI (r_sci_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Operating Mode	<ul style="list-style-type: none"> • Master • Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> • Data sampling on odd edge, 	Data sampling on odd edge, data variation on	Select the clock edge to sample data.

	data variation on even edge	even edge	
	<ul style="list-style-type: none"> Data sampling on even edge, data variation on odd edge 		
Clock Polarity	<ul style="list-style-type: none"> Low when idle High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> Enable Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> MSB First LSB First 	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	sci_spi_callback	A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.
Bitrate	Value must be an integer greater than 0	8000000	Enter the desired bitrate. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure.
Bitrate Modulation	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by

modulating the number of cycles per clock output pulse, so the clock is no longer a square wave.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

Note

At high bit rates, it might be necessary to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

Examples

Basic Example

This is a basic example of minimal use of the SCI_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
}
```

```
/* Configure Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Configure Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
fsp_err_t err = FSP_SUCCESS;
/* Initialize the SPI module. */
err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
```

```

{
    ;
}

/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}

```

Data Structures

struct [sci_spi_div_setting_t](#)

Data Structure Documentation

◆ sci_spi_div_setting_t

struct sci_spi_div_setting_t		
Settings for adjusting the SPI CLK.		
Data Fields		
uint8_t	brr	
uint8_t	cks: 2	
uint8_t	mddr	Set to 0 to disable MDDR.

Function Documentation

◆ **R_SCI_SPI_Open()**

```
fsp_err_t R_SCI_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

Initialize a channel for SPI communication mode. Implements `spi_api_t::open`.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

Parameters

p_api_ctrl	Pointer to the control structure.
p_cfg	Pointer to a configuration structure.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ASSERTION	An input parameter is invalid or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

◆ R_SCI_SPI_Read()

```
fsp_err_t R_SCI_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length,
spi_bit_width_t const bit_width )
```

Receive data from an SPI device. Implements `spi_api_t::read`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS).

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_UNSUPPORTED	The given <code>bit_width</code> is not supported.
FSP_ERR_IN_USE	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_Write()

```
fsp_err_t R_SCI_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

Transmit data to a SPI device. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>).

Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reconfigure`

◆ R_SCI_SPI_WriteRead()

```
fsp_err_t R_SCI_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Parameters

	<code>p_api_ctrl</code>	Pointer to the control structure.
	<code>p_src</code>	Pointer to the source buffer.
	<code>p_dest</code>	Pointer to the destination buffer.
[in]	<code>length</code>	The number of bytes to transfer.
[in]	<code>bit_width</code>	Invalid for SCI_SPI (Set to <code>SPI_BIT_WIDTH_8_BITS</code>).

Return values

<code>FSP_SUCCESS</code>	Write operation successfully completed.
<code>FSP_ERR_ASSERTION</code>	One of the following invalid parameters passed: <ul style="list-style-type: none"> • Pointer <code>p_api_ctrl</code> is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
<code>FSP_ERR_NOT_OPEN</code>	The channel has not been opened. Open the channel first.
<code>FSP_ERR_UNSUPPORTED</code>	The given <code>bit_width</code> is not supported.
<code>FSP_ERR_IN_USE</code>	A transfer is already in progress.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reconfigure](#)

◆ R_SCI_SPI_CallbackSet()

```
fsp_err_t R_SCI_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements [spi_api_t::callbackSet](#)

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_SPI_Close()

```
fsp_err_t R_SCI_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

Disable the SCI channel and set the instance as not open. Implements [spi_api_t::close](#).

Parameters

p_api_ctrl	Pointer to an opened instance.
------------	--------------------------------

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ **R_SCI_SPI_CalculateBitrate()**

```
fsp_err_t R_SCI_SPI_CalculateBitrate ( uint32_t bitrate, sci_spi_div_setting_t * sclk_div, bool use_mddr )
```

Calculate the register settings required to achieve the desired bitrate.

Parameters

[in]	bitrate	bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc.
	sclk_div	Pointer to <code>sci_spi_div_setting_t</code> used to configure baudrate settings.
[in]	use_mddr	Calculate the divider settings for use with MDDR.

Return values

FSP_SUCCESS	Baud rate is set successfully.
FSP_ERR_ASSERTION	Baud rate is not achievable.

Note

The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.

```

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the [UART Interface](#).

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Configuration

Build Time Configurations for r_sci_uart

The following build time configurations are defined in fsp_cfg/r_sci_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable FIFO support for the SCI_UART module.

DTC Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.
RS-485 Support	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Enable support for controlling the RS-485 DE pin.

Configurations for Connectivity > UART (r_sci_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_uart0	Module name.
General > Channel	Value must be a non-negative integer	0	Select the SCI channel.
General > Data Bits	<ul style="list-style-type: none"> • 8bits • 7bits • 9bits 	8bits	Select the number of bits per word.
General > Parity	<ul style="list-style-type: none"> • None • Odd • Even 	None	Select the parity mode.
General > Stop Bits	<ul style="list-style-type: none"> • 1bit • 2bits 	1bit	Select the number of stop bits.
Baud > Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.
Baud > Baud Rate Modulation	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the

requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.

Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.

NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated [baud_setting_t](#) structure.

Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).

Specify the flow control pin port for the MCU.

Specify the flow control pin for the MCU.

Enable or disable the DE pin for use in RS-485 half-duplex mode.

Select the polarity of the DE pin.

GPIO output port number to use for

Baud > Max Error (%) Must be a valid non-negative integer with a maximum configurable value of 100 5

Flow Control > CTS/RTS Selection MCU Specific Options

Flow Control > Software RTS Port Refer to the RA Configuration tool for available options. Disabled

	available options.		generating the DE signal.
Extra > RS-485 > DE Pin Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output pin number to use for generating the DE signal.
Extra > Clock Source	<ul style="list-style-type: none"> Internal Clock Internal Clock With Output on SCK External Clock 8x baud rate External Clock 16x baud rate 	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Extra > Start bit detection	<ul style="list-style-type: none"> Falling Edge Low Level 	Falling Edge	Start bit detected as falling edge or low level.
Extra > Noise Filter	<ul style="list-style-type: none"> Enable Disable 	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Extra > Receive FIFO Trigger Level	<ul style="list-style-type: none"> One Max 	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Interrupts > Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Interrupts > Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Interrupts > Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Interrupts > Error	MCU Specific Options		Select the error

Interrupt Priority

interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.

- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after `uart_api_t::communicationAbort` API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event `UART_EVENT_RX_CHAR`.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to `R_SCI_UART_Read()`. The logic required to combine bytes received through `R_SCI_UART_Read()` (`UART_EVENT_RX_COMPLETE`) and bytes received between calls (`UART_EVENT_RX_CHAR`) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. `uart_api_t::infoGet` API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_uart_basic_example (void)
{
    /* Initialize p_src to known data */
    for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the transfer instance with initial configuration. */
    fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
```

```
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
    {
    }
while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
    /* Handle the UART event */
    switch (p_args->event)
    {
        /* Received a character */
        case UART_EVENT_RX_CHAR:
            {
                /* Only put the next character in the receive buffer if there is space for it */
                if (sizeof(g_out_of_band_received) > g_out_of_band_index)
                    {
                        /* Write either the next one or two bytes depending on the receive data size */
                        if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
                            {
                                g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
                            }
                        else
                            {
                                uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                                *p_dest = (uint16_t) p_args->data;
                            }
                    }
            }
    }
}
```

```
                g_out_of_band_index += 2;
            }
        }
break;
    }

/* Receive complete */
case UART_EVENT_RX_COMPLETE:
    {
        g_receive_complete = 1;
break;
    }

/* Transmit complete */
case UART_EVENT_TX_COMPLETE:
    {
        g_transfer_complete = 1;
break;
    }
default:
    {
    }
}
}
```

SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_uart_baud_example (void)
{
    baud_setting_t baud_setting;
    uint32_t baud_rate = SCI_UART_BAUDRATE_19200;
    bool enable_bitrate_modulation = false;
    uint32_t error_rate_x_1000 = SCI_UART_BAUDRATE_ERROR_PERCENT_5;
    fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
}
```

```

assert(FSP_SUCCESS == err);

err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);

assert(FSP_SUCCESS == err);
}

```

Register settings to achieve a desired baud rate and modulation duty.

Data Fields

union baud_setting_t	<code>__unnamed__</code>	
<code>uint8_t</code>	<code>cks: 2</code>	CKS value to get divisor (CKS = N)

uint8_t	brr	Bit Rate Register setting.
uint8_t	mddr	Modulation Duty Register setting.

◆ sci_uart_rs485_setting_t

struct sci_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
sci_uart_rs485_enable_t	enable	Enable the DE signal.
sci_uart_rs485_de_polarity_t	polarity	DE signal polarity.
bsp_io_port_pin_t	de_control_pin	UART Driver Enable pin.

◆ sci_uart_extended_cfg_t

struct sci_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
sci_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_uart_rs485_setting_t	rs485_setting	RS-485 settings.

Enumeration Type Documentation

◆ sci_clk_src_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_uart_flow_control_t

enum sci_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_UART_FLOW_CONTROL_RTS	Use SCI pin for RTS.
SCI_UART_FLOW_CONTROL_CTS	Use SCI pin for CTS.
SCI_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.
SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options.

◆ sci_uart_rx_fifo_trigger_t

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ **sci_uart_start_bit_detect_t**

enum sci_uart_start_bit_detect_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ **sci_uart_noise_cancellation_t**

enum sci_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ **sci_uart_rs485_enable_t**

enum sci_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_UART_RS485_DISABLE	RS-485 disabled.
SCI_UART_RS485_ENABLE	RS-485 enabled.

◆ **sci_uart_rs485_de_polarity_t**

enum sci_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

Function Documentation

◆ R_SCI_UART_Open()

```
fsp_err_t R_SCI_UART_Open ( uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg )
```

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements [uart_api_t::open](#)

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SCI_UART_Read()**

```
fsp_err_t R_SCI_UART_Read ( uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes )
```

Receives user specified number of bytes into destination buffer pointer. Implements [uart_api_t::read](#)

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ **R_SCI_UART_Write()**

```
fsp_err_t R_SCI_UART_Write ( uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes )
```

Transmits user specified number of bytes from the source buffer pointer. Implements [uart_api_t::write](#)

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ **R_SCI_UART_BaudSet()**

```
fsp_err_t R_SCI_UART_BaudSet ( uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting )
```

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a [baud_setting_t](#) structure. Implements [uart_api_t::baudSet](#)

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_InfoGet()

```
fsp_err_t R_SCI_UART_InfoGet ( uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info )
```

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements `uart_api_t::infoGet`

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Close()

```
fsp_err_t R_SCI_UART_Close ( uart_ctrl_t *const p_api_ctrl)
```

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements `uart_api_t::close`

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Abort()

`fsp_err_t R_SCI_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)`

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements `uart_api_t::communicationAbort`

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

◆ R_SCI_UART_BaudCalculate()

```
fsp_err_t R_SCI_UART_BaudCalculate ( uint32_t baudrate, bool bitrate_modulation, uint32_t
baud_rate_error_x_1000, baud_setting_t *const p_baud_setting )
```

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

◆ R_SCI_UART_CallbackSet()

```
fsp_err_t R_SCI_UART_CallbackSet ( uart_ctrl_t *const p_api_ctrl, void(*) (uart_callback_args_t *)
p_callback, void const *const p_context, uart_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `uart_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ R_SCI_UART_ReadStop()

```
fsp_err_t R_SCI_UART_ReadStop ( uart_ctrl_t *const p_api_ctrl, uint32_t * remaining_bytes )
```

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event `UART_EVENT_RX_CHAR`. Implements `uart_api_t::readStop`

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::disable`

4.2.59 Sigma Delta Analog to Digital Converter (r_sdadc)

Modules

Functions

```
fsp_err_t R_SDADC_Open (adc_ctrl_t *p_ctrl, adc_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SDADC_ScanCfg (adc_ctrl_t *p_ctrl, void const *const p_extend)
```

```
fsp_err_t R_SDADC_InfoGet (adc_ctrl_t *p_ctrl, adc_info_t *p_adc_info)
```

```
fsp_err_t R_SDADC_ScanStart (adc_ctrl_t *p_ctrl)
```

```
fsp_err_t R_SDADC_ScanGroupStart (adc_ctrl_t *p_ctrl, adc_group_mask_t  
group_id)
```

```
fsp_err_t R_SDADC_ScanStop (adc_ctrl_t *p_ctrl)
```

```
fsp_err_t R_SDADC_StatusGet (adc_ctrl_t *p_ctrl, adc_status_t *p_status)
```

```
fsp_err_t R_SDADC_Read (adc_ctrl_t *p_ctrl, adc_channel_t const reg_id,  
uint16_t *const p_data)
```

```
fsp_err_t R_SDADC_Read32 (adc_ctrl_t *p_ctrl, adc_channel_t const reg_id,  
uint32_t *const p_data)
```

```
fsp_err_t R_SDADC_OffsetSet (adc_ctrl_t *const p_ctrl, adc_channel_t const  
reg_id, int32_t const offset)
```

```
fsp_err_t R_SDADC_Calibrate (adc_ctrl_t *const p_ctrl, void const *p_extend)
```

```
fsp_err_t R_SDADC_Close (adc_ctrl_t *p_ctrl)
```

Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the [ADC Interface](#).

Overview

Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
 - Multiple analog channels
 - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
 - Software scan triggers
 - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
 - Single scan mode, where each trigger starts a single scan
 - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes
- Supports reading converted data
- Sample and hold support

Selecting an ADC

All RA MCUs have an [Analog to Digital Converter \(r_adc\)](#). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

	ADC	SDADC
Availability	Available on all RA MCUs.	Available on select RA MCUs.
Resolution	The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU.	The SDADC has a maximum accuracy of 24 bits.
Number of Channels	The ADC has more channels than the SDADC.	The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1.
Frequency	The ADC sampling time is shorter (more samples per second).	The SDADC sampling time is longer (fewer samples per second).
Settling Time	The ADC does not have a settling time when switching between channels.	The SDADC requires a settling time when switching between channels.

Configuration

Build Time Configurations for r_sdadc

The following build time configurations are defined in fsp_cfg/r_sdadc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Analog > ADC (r_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_sdadc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adc0	Module name.
Mode	<ul style="list-style-type: none"> Single Scan Continuous Scan 	Continuous Scan	In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned. In continuous scan mode, conversion

			starts after a start trigger, then continues until stopped in software.
Resolution	<ul style="list-style-type: none"> • 16 Bit • 24 Bit 	24 Bit	Select 24-bit or 16-bit resolution.
Alignment	<ul style="list-style-type: none"> • Right • Left 	Right	Select left or right alignment.
Trigger	MCU Specific Options		Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API.
Vref Source	<ul style="list-style-type: none"> • Internal • External 	Internal	Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI.
Vref Voltage	<ul style="list-style-type: none"> • 0.8 V • 1.0 V • 1.2 V • 1.4 V • 1.6 V • 1.8 V • 2.0 V • 2.2 V • 2.4 V 	1.0 V	Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%.
Callback	Name must be a valid C symbol	NULL	Enter the name of the callback function to be called when conversion completes or a scan ends.
Conversion End Interrupt Priority	MCU Specific Options		[Required] Select the interrupt priority for the conversion end interrupt.
Scan End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the scan end interrupt.
Calibration End Interrupt Priority	MCU Specific Options		[Optional] Select the interrupt priority for the calibration end interrupt.

Configurations for Analog > SDADC Channel Configuration (r_sdadc)

Configuration	Options	Default	Description
Input	<ul style="list-style-type: none"> Differential Single Ended 	Differential	Select differential or single-ended input.
Stage 1 Gain	<ul style="list-style-type: none"> 1 2 3 4 8 	1	Select the gain for stage 1 of the PGA. Must be 1 for single-ended input.
Stage 2 Gain	<ul style="list-style-type: none"> 1 2 4 8 	1	Select the gain for stage 2 of the PGA. Must be 1 for single-ended input.
Oversampling Ratio	<ul style="list-style-type: none"> 64 128 256 512 1024 2048 	256	Select the oversampling ratio for the PGA. Must be 256 for single-ended input.
Polarity (Valid for Single-Ended Input Only)	<ul style="list-style-type: none"> Positive Negative 	Positive	Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input.
Conversions to Average per Result	<ul style="list-style-type: none"> Do Not Average (Interrupt after Each Conversion) Average 8 Average 16 Average 32 Average 64 	Do Not Average (Interrupt after Each Conversion)	Select the number of conversions to average for each result. The AD_C_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled.
Invert (Valid for Negative Single-Ended Input Only)	<ul style="list-style-type: none"> Result Not Inverted Result Inverted 	Result Not Inverted	Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of $2^{\text{resolution}} - 1$.
Number of Conversions Per Scan	Refer to the RA Configuration tool for available options.	1	Number of conversions on this channel before AUTOSCAN moves to the next channel. When all conversions of

all channels are complete, the ADC_EVENT_SCAN_END event occurs.

Clock Configuration

The SDADC clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

Usage Notes

Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). The FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.
4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
 - Single-scan mode performs one scan per trigger (hardware trigger or software start using [R_SDADC_ScanStart](#)).
 - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

When Interrupts Are Not Enabled

If interrupts are not enabled, the [R_SDADC_StatusGet\(\)](#) API can be used to poll the SDADC to determine when the scan has completed. The [R_SDADC_Read\(\)](#) API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call `R_SDADC_Calibrate()` after open, and prior to any other function, then wait for a calibration complete event before using the SDADC. `R_SDADC_Calibrate()` should not be called if all channels are configured for single-ended mode.

Examples

Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Calibrate all differential channels. */
    sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
    /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
    * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
    /* Wait for conversion to complete. */
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
```

```
{
R_SDADC_StatusGet(&g_adc0_ctrl, &status);
}
/* Read converted data. */
uint32_t channell_conversion_result;
R_SDADC_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channell_conversion_result);
}
```

Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
* configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)
uint32_t g_sdadc_example_buffer[SDADC_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_transfer_info =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq           = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode    = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode         = TRANSFER_MODE_REPEAT,
    /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
Bit 24 contains a status flag
* indicating if the result overflowed or not. Bits 27:25 contain the channel number
+ 1. The settings for
* resolution and alignment and ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size          = TRANSFER_SIZE_4_BYTE,
    /* NOTE: It is strongly recommended to enable averaging on all channels or no
```

```
channels when using DTC with SDADC

* because the result register is different when averaging is used. If averaging is
enabled on all channels,

* set transfer_info_t::p_src to &R_SDADC->ADAR. */
.p_src = (void const *) &R_SDADC0->ADCR,
.p_dest = &g_sdadc_example_buffer[0],
.length = SDADC_EXAMPLE_TRANSFER_LENGTH,
};

void sdadc_dtc_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Calibrate all differential channels. */
    sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode      = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel  = ADC_CHANNEL_0;
    err = R_SDADC_Calibrate(&g_adc0_ctrl, &calibrate_args);
    assert(FSP_SUCCESS == err);
    /* Wait for calibration to complete. */
    adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
    while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
        R_SDADC_StatusGet(&g_adc0_ctrl, &status);
    }
    /* In software trigger mode, start a scan by calling R_SDADC_ScanStart(). In other
modes, enable external
    * triggers by calling R_SDADC_ScanStart(). */
    (void) R_SDADC_ScanStart(&g_adc0_ctrl);
    /* After each conversion, the converted data is transferred to the next index in
g_sdadc_example_buffer. After
```

```

* the entire scan completes, the index in g_sdadc_example_buffer resets. The data
in g_sdadc_example_buffer
* is:
* - g_sdadc_example_buffer[0] = SDADC channel 1 conversion 0
* - g_sdadc_example_buffer[1] = SDADC channel 1 conversion 1
* - g_sdadc_example_buffer[2] = SDADC channel 1 conversion 2
* - g_sdadc_example_buffer[3] = SDADC channel 2 conversion 0
* - g_sdadc_example_buffer[4] = SDADC channel 4 conversion 0
**/* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
* from the buffer like this. Shifting removes the unrelated bits in the result
register and propagates the sign
* bit so the value can be interpreted as a signed result. This assumes channel 2 is
configured in differential
* mode. */
int32_t channel_2_data = (int32_t) (g_sdadc_example_buffer[3] << 8) >> 8;

Data Structure Documentation

◆ [sdadc_calibrate_args_t](#)

struct sdadc_calibrate_args_t		
Structure to pass to the adc_api_t::calibrate p_extend argument.		
Data Fields		
adc_channel_t	channel	Which channel to calibrate.
sdadc_calibration_t	mode	Calibration mode.

◆ [sdadc_channel_cfg_t](#)

struct sdadc_channel_cfg_t		
SDADC per channel configuration.		

◆ [sdadc_scan_cfg_t](#)

struct sdadc_scan_cfg_t		
SDADC active channel configuration		
Data Fields		
uint32_t	scan_mask	Channels/bits: bit 0 is ch0; bit 15 is ch15.

◆ [sdadc_extended_cfg_t](#)

struct sdadc_extended_cfg_t		
SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend .		
Data Fields		
uint8_t	conv_end_ipl	Conversion end interrupt priority.
IRQn_Type	conv_end_irq	

sdadc_vref_src_t	vref_src	Source of Vref (internal or external)
sdadc_vref_voltage_t	vref_voltage	Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%.
sdadc_channel_cfg_t const *	p_channel_cfgs[SDADC_MAX_NUM_CHANNELS]	Configuration for each channel, set to NULL if unused.

◆ [sdadc_instance_ctrl_t](#)

struct sdadc_instance_ctrl_t
ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open() .

Enumeration Type Documentation

◆ [sdadc_vref_src_t](#)

enum sdadc_vref_src_t	
Source of Vref.	
Enumerator	
SDADC_VREF_SRC_INTERNAL	Vref is internally sourced, can be output as SBIAS.
SDADC_VREF_SRC_EXTERNAL	Vref is externally sourced from the VREFI pin.

◆ **sdadc_vref_voltage_t**

enum <code>sdadc_vref_voltage_t</code>	
Voltage of Vref.	
Enumerator	
<code>SDADC_VREF_VOLTAGE_800_MV</code>	Vref is 0.8 V.
<code>SDADC_VREF_VOLTAGE_1000_MV</code>	Vref is 1.0 V.
<code>SDADC_VREF_VOLTAGE_1200_MV</code>	Vref is 1.2 V.
<code>SDADC_VREF_VOLTAGE_1400_MV</code>	Vref is 1.4 V.
<code>SDADC_VREF_VOLTAGE_1600_MV</code>	Vref is 1.6 V.
<code>SDADC_VREF_VOLTAGE_1800_MV</code>	Vref is 1.8 V.
<code>SDADC_VREF_VOLTAGE_2000_MV</code>	Vref is 2.0 V.
<code>SDADC_VREF_VOLTAGE_2200_MV</code>	Vref is 2.2 V.
<code>SDADC_VREF_VOLTAGE_2400_MV</code>	Vref is 2.4 V (only valid for external Vref)

◆ **sdadc_channel_input_t**

enum <code>sdadc_channel_input_t</code>	
Per channel input mode.	
Enumerator	
<code>SDADC_CHANNEL_INPUT_DIFFERENTIAL</code>	Differential input.
<code>SDADC_CHANNEL_INPUT_SINGLE_ENDED</code>	Single-ended input.

◆ **sdadc_channel_stage_1_gain_t**

enum <code>sdadc_channel_stage_1_gain_t</code>	
Per channel stage 1 gain options.	
Enumerator	
<code>SDADC_CHANNEL_STAGE_1_GAIN_1</code>	Gain of 1.
<code>SDADC_CHANNEL_STAGE_1_GAIN_2</code>	Gain of 2.
<code>SDADC_CHANNEL_STAGE_1_GAIN_3</code>	Gain of 3 (only valid for stage 1)
<code>SDADC_CHANNEL_STAGE_1_GAIN_4</code>	Gain of 4.
<code>SDADC_CHANNEL_STAGE_1_GAIN_8</code>	Gain of 8.

◆ **sdadc_channel_stage_2_gain_t**

enum <code>sdadc_channel_stage_2_gain_t</code>	
Per channel stage 2 gain options.	
Enumerator	
<code>SDADC_CHANNEL_STAGE_2_GAIN_1</code>	Gain of 1.
<code>SDADC_CHANNEL_STAGE_2_GAIN_2</code>	Gain of 2.
<code>SDADC_CHANNEL_STAGE_2_GAIN_4</code>	Gain of 4.
<code>SDADC_CHANNEL_STAGE_2_GAIN_8</code>	Gain of 8.

◆ **sdadc_channel_oversampling_t**

enum <code>sdadc_channel_oversampling_t</code>	
Per channel oversampling ratio.	
Enumerator	
<code>SDADC_CHANNEL_OVERSAMPLING_64</code>	Oversampling ratio of 64.
<code>SDADC_CHANNEL_OVERSAMPLING_128</code>	Oversampling ratio of 128.
<code>SDADC_CHANNEL_OVERSAMPLING_256</code>	Oversampling ratio of 256.
<code>SDADC_CHANNEL_OVERSAMPLING_512</code>	Oversampling ratio of 512.
<code>SDADC_CHANNEL_OVERSAMPLING_1024</code>	Oversampling ratio of 1024.
<code>SDADC_CHANNEL_OVERSAMPLING_2048</code>	Oversampling ratio of 2048.

◆ **sdadc_channel_polarity_t**

enum <code>sdadc_channel_polarity_t</code>	
Per channel polarity, valid for single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_POLARITY_POSITIVE</code>	Positive-side single-ended input.
<code>SDADC_CHANNEL_POLARITY_NEGATIVE</code>	Negative-side single-ended input.

◆ **sdadc_channel_average_t**

enum <code>sdadc_channel_average_t</code>	
Per channel number of conversions to average before conversion end callback.	
Enumerator	
<code>SDADC_CHANNEL_AVERAGE_NONE</code>	Do not average (callback for each conversion)
<code>SDADC_CHANNEL_AVERAGE_8</code>	Average 8 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_16</code>	Average 16 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_32</code>	Average 32 samples for each conversion end callback.
<code>SDADC_CHANNEL_AVERAGE_64</code>	Average 64 samples for each conversion end callback.

◆ **sdadc_channel_inversion_t**

enum <code>sdadc_channel_inversion_t</code>	
Per channel polarity, valid for negative-side single-ended input only.	
Enumerator	
<code>SDADC_CHANNEL_INVERSION_OFF</code>	Do not invert conversion result.
<code>SDADC_CHANNEL_INVERSION_ON</code>	Invert conversion result.

◆ **sdadc_channel_count_formula_t**enum `sdadc_channel_count_formula_t`

Select a formula to specify the number of conversions. The following symbols are used in the formulas:

- N: Number of conversions
- n: `sdadc_channel_cfg_t::coefficient_n`, do not set to 0 if m is 0
- m: `sdadc_channel_cfg_t::coefficient_m`, do not set to 0 if n is 0

Either m or n must be non-zero.

Enumerator	
<code>SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL</code>	$N = 32 * (2 ^ n - 1) + m * 2 ^ n.$
<code>SDADC_CHANNEL_COUNT_FORMULA_LINEAR</code>	$N = (32 * n) + m.$

◆ **sdadc_calibration_t**enum `sdadc_calibration_t`

Calibration mode.

Enumerator	
<code>SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET</code>	Use internal reference to calibrate offset and gain.
<code>SDADC_CALIBRATION_EXTERNAL_OFFSET</code>	Use external reference to calibrate offset.
<code>SDADC_CALIBRATION_EXTERNAL_GAIN</code>	Use external reference to calibrate gain.

Function Documentation

◆ **R_SDADC_Open()**

```
fsp_err_t R_SDADC_Open ( adc_ctrl_t * p_ctrl, adc_cfg_t const *const p_cfg )
```

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. [R_SDADC_Calibrate\(\)](#) must be called after this function before using the SDADC if any channels are used in differential mode. Implements [adc_api_t::open\(\)](#).

Note

This function delays at least 2 ms as required by the SDADC power on procedure.

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Control block is already open.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt is disabled

◆ **R_SDADC_ScanCfg()**

```
fsp_err_t R_SDADC_ScanCfg ( adc_ctrl_t * p_ctrl, void const *const p_extend )
```

Configures the enabled channels of the ADC. Pass a pointer to [sdadc_scan_cfg_t](#) to p_extend. Implements [adc_api_t::scanCfg\(\)](#).

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer is NULL or an input parameter is invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_InfoGet()**

```
fsp_err_t R_SDADC_InfoGet ( adc_ctrl_t * p_ctrl, adc_info_t * p_adc_info )
```

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements `adc_api_t::infoGet()`.

Return values

FSP_SUCCESS	Information stored in p_adc_info.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_ScanStart()**

```
fsp_err_t R_SDADC_ScanStart ( adc_ctrl_t * p_ctrl)
```

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements `adc_api_t::scanStart()`.

Return values

FSP_SUCCESS	Scan started or hardware triggers enabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.
FSP_ERR_IN_USE	A conversion or calibration is in progress.

◆ **R_SDADC_ScanGroupStart()**

```
fsp_err_t R_SDADC_ScanGroupStart ( adc_ctrl_t * p_ctrl, adc_group_mask_t group_id )
```

`adc_api_t::scanStart` is not supported on the SDADC. Use `scanStart` instead.

Return values

FSP_ERR_UNSUPPORTED	Function not supported in this implementation.
---------------------	--

◆ **R_SDADC_ScanStop()**

```
fsp_err_t R_SDADC_ScanStop ( adc_ctrl_t * p_ctrl)
```

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements [adc_api_t::scanStop\(\)](#).

Return values

FSP_SUCCESS	Scan stopped or hardware triggers disabled successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_StatusGet()**

```
fsp_err_t R_SDADC_StatusGet ( adc_ctrl_t * p_ctrl, adc_status_t * p_status )
```

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements [adc_api_t::scanStatusGet\(\)](#).

Return values

FSP_SUCCESS	No software scan or calibration is in progress.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_Read()**

```
fsp_err_t R_SDADC_Read ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data )
```

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements `adc_api_t::read()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_Read32()**

```
fsp_err_t R_SDADC_Read32 ( adc_ctrl_t * p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data )
```

Reads the most recent conversion result from a channel. Implements `adc_api_t::read32()`.

Note

The result stored in `p_data` is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0. Do not use this API if the conversion end interrupt (`SDADC0_ADI`) is used to trigger the DTC unless the interrupt mode is set to `TRANSFER_IRQ_EACH`.

Return values

FSP_SUCCESS	Conversion result in <code>p_data</code> .
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ **R_SDADC_OffsetSet()**

```
fsp_err_t R_SDADC_OffsetSet ( adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset )
```

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements `adc_api_t::offsetSet()`.

Note: The offset is cleared if `adc_api_t::calibrate()` is called. The offset can be re-applied if necessary after the the callback with event `ADC_EVENT_CALIBRATION_COMPLETE` is called.

Parameters

[in]	p_ctrl	See p_instance_ctrl in <code>adc_api_t::offsetSet()</code> .
[in]	reg_id	See reg_id in <code>adc_api_t::offsetSet()</code> .
[in]	offset	Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain.

Return values

FSP_SUCCESS	Offset updated successfully.
FSP_ERR_ASSERTION	An input pointer was NULL or an input parameter was invalid.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Calibrate()

```
fsp_err_t R_SDADC_Calibrate ( adc_ctrl_t *const p_ctrl, void const * p_extend )
```

Requires `sdadc_calibrate_args_t` passed to `p_extend`. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event `ADC_EVENT_CALIBRATION_COMPLETE` is called when calibration completes. Implements `adc_api_t::calibrate()`.

During external offset calibration, apply a differential voltage of 0 to `ANSDnP - ANSDnN`, where `n` is the input channel and `ANSDnP` is `OPAMP0` for channel 4 and `ANSDnN` is `OPAMP1` for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between $0.4 \text{ V} / \text{total_gain}$ and $0.8 \text{ V} / \text{total_gain}$. The differential voltage applied during calibration is corrected to a conversion result of `0x7FFFFFFF`, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using `adc_api_t::offsetSet`.

Return values

FSP_SUCCESS	Calibration began successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_IN_USE	A conversion or calibration is in progress.
FSP_ERR_NOT_OPEN	Instance control block is not open.

◆ R_SDADC_Close()

```
fsp_err_t R_SDADC_Close ( adc_ctrl_t * p_ctrl)
```

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements `adc_api_t::close()`.

Note

This function delays at least 3 us as required by the SDADC24 stop procedure.

Return values

FSP_SUCCESS	Instance control block closed successfully.
FSP_ERR_ASSERTION	An input pointer was NULL.
FSP_ERR_NOT_OPEN	Instance control block is not open.

4.2.60 SD/MMC Host Interface (r_sdhi)

Modules

Functions

Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the [SD/MMC Interface](#).

Overview

Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
 - Supports reading, writing and erasing SD memory devices
 - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
 - Supports detection of device write protection (SD cards only)
 - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

Configuration

Build Time Configurations for r_sdhi

The following build time configurations are defined in fsp_cfg/r_sdhi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	If selected code for SD card support is included in the build.
eMMC Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	If selected code for eMMC device support is included in the build.

Configurations for Storage > SD/MMC (r_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sdmmc0	Module name.

Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Block Size	Value must be an integer between 1 and 512	512	Select the media block size. Must be 512 for SD cards or eMMC devices. Must be 1-512 for SDIO.
Card Detection	<ul style="list-style-type: none"> • Not Used • CD Pin 	CD Pin	Select the card detection method.
Write Protection	<ul style="list-style-type: none"> • Not Used • WP Pin 	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Interrupt Configurations:

The following interrupts are required to use the r_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

Usage Notes

Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during [R_SDHI_Open\(\)](#).

[R_SDHI_StatusGet\(\)](#) can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, [R_SDHI_MediaInit\(\)](#) must be called before reading from the card or writing to the card.

Note

[R_SDHI_StatusGet\(\)](#) should be used to initially determine the card state after opening the interface.

DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

Timing Notes for R_SDHI_MediaInit

The [R_SDHI_MediaInit\(\)](#) API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or less.

Limitations

Developers should be aware of the following limitations when using the SDHI:

Blocking Calls

The following functions block execution until the response is received for at least one command:

- [R_SDHI_MediaInit](#)
- [R_SDHI_Erase](#)

Once the function returns the status of the operation can be determined via [R_SDHI_StatusGet](#) or through receipt of a callback.

Note

Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.

Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the `read()`, `write()`, `readloExt()`, and `writeloxExt()` APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the `r_sdhi` driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

Examples

Basic Example

This is a basic example of minimal use of the `r_sdhi` in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the SDHI driver. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    assert(FSP_SUCCESS == err);
}
```

```
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
 * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
assert(FSP_SUCCESS == err);
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
{
/* Wait for transfer. */
}
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
assert(FSP_SUCCESS == err);
while (!g_transfer_complete)
{
/* Wait for transfer. */
}
}
/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
{
g_transfer_complete = 1;
}
}
}
```

Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
    /* Open the SDHI driver. This enables the card detection interrupt. */
    fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Check if card is inserted. */
    sdmmc_status_t status;
    err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    if (!status.card_inserted)
    {
        while (!g_card_inserted)
        {
            /* Wait for a card insertion interrupt. */
        }
    }
    /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
    * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
    R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
    /* Initialize the SD card after card insertion is detected. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
}
/* The callback is called when a card detection event occurs if the card detection
interrupt is enabled. */
void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
{
    if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
    {
        g_card_inserted = true;
    }
}
```

```

    }
    if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
    {
        g_card_inserted = false;
    }
}

```

Function Documentation

◆ R_SDHI_Open()

`fsp_err_t R_SDHI_Open (sdmmc_ctrl_t *const p_api_ctrl, sdmmc_cfg_t const *const p_cfg)`

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. `R_SDHI_MediaInit` must be called after this function before any other functions can be used.

Implements `sdmmc_api_t::open()`.

Example:

```

/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);

```

Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ **R_SDHI_MediaInit()**

```
fsp_err_t R_SDHI_MediaInit ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_device_t *const p_device )
```

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements `sdmmc_api_t::mediaInit()`.

Example:

```
/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
 * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

Return values

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card, eMMC device, or SDIO card.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_Read()**

```
fsp_err_t R_SDHI_Read ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
start_sector, uint32_t const sector_count )
```

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements `sdmmc_api_t::read()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ **R_SDHI_Write()**

```
fsp_err_t R_SDHI_Write ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source, uint32_t
const start_sector, uint32_t const sector_count )
```

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements `sdmmc_api_t::write()`.

A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written and the device is no longer holding `DAT0` low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ **R_SDHI_Readlo()**

```
fsp_err_t R_SDHI_Readlo ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address )
```

The Read function reads a one byte register from an SDIO card. Implements `sdmmc_api_t::readlo()`.

This function blocks until the command is sent and the response is received. `p_data` contains the register value read when this function returns.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_Writelo()**

```
fsp_err_t R_SDHI_Writelo ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const
function, uint32_t const address, sdmmc_io_write_mode_t const read_after_write )
```

Writes a one byte register to an SDIO card. Implements `sdmmc_api_t::writelo()`.

This function blocks until the command is sent and the response is received. The register has been written when this function returns. If `read_after_write` is true, `p_data` contains the register value read when this function returns.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_ReadloExt()**

```
fsp_err_t R_SDHI_ReadloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const
function, uint32_t const address, uint32_t *const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Reads data from an SDIO card function. Implements `sdmmc_api_t::readloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the read data is available.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_WriteloExt()**

```
fsp_err_t R_SDHI_WriteloExt ( sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source,
uint32_t const function, uint32_t const address, uint32_t const count, sdmmc_io_transfer_mode_t
transfer_mode, sdmmc_io_address_mode_t address_mode )
```

Writes data to an SDIO card function. Implements `sdmmc_api_t::writeloExt()`.

This function blocks until the command is sent and the response is received. A callback with the event `SDMMC_EVENT_TRANSFER_COMPLETE` is called when the all data has been written.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_IoIntEnable()**

```
fsp_err_t R_SDHI_IoIntEnable ( sdmmc_ctrl_t *const p_api_ctrl, bool enable )
```

Enables or disables the SDIO Interrupt. Implements `sdmmc_api_t::IoIntEnable()`.

Return values

FSP_SUCCESS	Card enabled or disabled SDIO interrupts successfully.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in <code>SDHI_CFG_SDIO_SUPPORT_ENABLE</code> .

◆ **R_SDHI_StatusGet()**

```
fsp_err_t R_SDHI_StatusGet ( sdmmc_ctrl_t *const p_api_ctrl, sdmmc_status_t *const p_status )
```

Provides driver status. Implements `sdmmc_api_t::statusGet()`.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ **R_SDHI_Erase()**

```
fsp_err_t R_SDHI_Erase ( sdmmc_ctrl_t *const p_api_ctrl, uint32_t const start_sector, uint32_t const sector_count )
```

Erases sectors of an SD card or eMMC device. Implements `sdmmc_api_t::erase()`.

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ **R_SDHI_CallbackSet()**

```
fsp_err_t R_SDHI_CallbackSet ( sdmmc_ctrl_t *const p_api_ctrl, void(*) (sdmmc_callback_args_t *)
p_callback, void const *const p_context, sdmmc_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `sdmmc_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **R_SDHI_Close()**

```
fsp_err_t R_SDHI_Close ( sdmmc_ctrl_t *const p_api_ctrl)
```

Closes an open SD/MMC device. Implements `sdmmc_api_t::close()`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter <code>p_ctrl</code> is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

4.2.61 Segment LCD Controller (r_slcdc)

Modules

Functions

```
fsp_err_t R_SLCDC_Open (slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const
p_cfg)
```

```

slcdc_display_area_t const display_area)
```

```
fsp_err_t R_SLCDC_Close (slcdc_ctrl_t *const p_ctrl)
```

Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the [SLCDC Interface](#).

Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)

Configuration

Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Segment LCD (r_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

--	--	--	--

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_slcdc0	Module Name
Clock > Source	<ul style="list-style-type: none"> • LOCO • SOSC • MOSC • HOCO 	HOCO	Select the clock source.
Clock > Divisor	Refer to the RA Configuration tool for available options.	(HOCO/MOSC) 16384	Select the clock divisor.
Output > Bias method	<ul style="list-style-type: none"> • 1/2 bias • 1/3 bias • 1/4 bias 	1/2 bias	Select the bias method. This determines the number of voltage levels used to create the waveforms.
Output > Timeslice	<ul style="list-style-type: none"> • Static • 2-slice • 3-slice • 4-slice • 8-slice 	Static	Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel.
Output > Waveform	<ul style="list-style-type: none"> • Waveform A • Waveform B 	Waveform A	Select the LCD waveform.
Output > Drive method	<ul style="list-style-type: none"> • External resistance division • Internal voltage boosting • Capacitor split 	External resistance division	Select the LCD drive method.
Output > Default contrast	Refer to the RA Configuration tool for available options.	0	Select the default contrast level.

Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Waveform	Slices	Bias	External Resistance	Internal Boost	Capacitor Split
A	8	1/4	Available	Available	—
A	4	1/3	Available	Available	Available
A	3	1/3	Available	Available	Available
A	3	1/2	Available	—	—
A	2	1/2	Available	—	—
A	Static	—	Available	—	—

B	8	1/4	Available	Available	Available
B	4	1/3	Available	Available	—

Clock Configuration

The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

Note

*Make sure your desired source clock is enabled and running before starting SLCDC output.
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.*

Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

Pin Name	Function	Notes
SEGN	Segment data output	Connect these signals to the segment pins of the LCD.
COMn	Common signal output	Connect these signals to the common pins of the LCD.
VLn	Voltage reference	These pins should be connected to passive components based on the selected drive method (see section 45.7 "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the RA4M1 User's Manual (R01UH0887EJ0100)).
CAPH, CAPL	Drive voltage generator capacitor	Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using resistance division.

Interrupt Configuration

The SLCDC provides no interrupt signals.

Note

Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC_DISP_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling R_SLCDC_Open and R_SLCDC_Start to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

Examples

Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
    fsp_err_t err;

    /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See RA4M1 User's
    * Manual (R01UH0887EJ0100) 8.2.18 "Segment LCD Source Clock Control Register
(SLDCSCKCR)" for details. */
    R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);

    /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

Note

While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.

Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
    fsp_err_t err;

    /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);

    /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
    RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);

    /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);

    /* Display will now continuously blink */
}
```

Data Structures

struct [slcdc_instance_ctrl_t](#)

Data Structure Documentation

◆ [slcdc_instance_ctrl_t](#)

struct [slcdc_instance_ctrl_t](#)

SLCDC control block. DO NOT INITIALIZE. Initialization occurs when [slcdc_api_t::open](#) is called

Function Documentation

◆ **R_SLCDC_Open()**

```
fsp_err_t R_SLCDC_Open ( slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg )
```

Opens the SLCDC driver. Implements `slcdc_api_t::open`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Invalid display mode.

◆ **R_SLCDC_Write()**

```
fsp_err_t R_SLCDC_Write ( slcdc_ctrl_t *const p_ctrl, uint8_t const start_segment, uint8_t const * p_data, uint8_t const segment_count )
```

Writes a sequence of display data to the segment data registers. Implements `slcdc_api_t::write`.

Return values

FSP_SUCCESS	Data was written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or data is NULL.
FSP_ERR_INVALID_ARGUMENT	Segment index is (or will be) out of range.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ **R_SLCDC_Modify()**

```
fsp_err_t R_SLCDC_Modify ( slcdc_ctrl_t *const p_ctrl, uint8_t const segment, uint8_t const data, uint8_t const data_mask )
```

Modifies a single segment register based on a mask and the desired data. Implements `slcdc_api_t::modify`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_Start()**

```
fsp_err_t R_SLCDC_Start ( slcdc_ctrl_t *const p_ctrl)
```

Starts output of LCD signals. Implements `slcdc_api_t::start`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_Stop()**

```
fsp_err_t R_SLCDC_Stop ( slcdc_ctrl_t *const p_ctrl)
```

Stops output of LCD signals. Implements `slcdc_api_t::stop`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ **R_SLCDC_SetContrast()**

```
fsp_err_t R_SLCDC_SetContrast ( slcdc_ctrl_t *const p_ctrl, slcdc_contrast_t const contrast )
```

Sets contrast to the specified level. Implements `slcdc_api_t::setContrast`.

Note

Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See RA4M1 User's Manual (R01UH0887EJ0100) section 45.2.4 "LCD Boost Level Control Register (VLCD)" for voltage levels at each setting.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized
FSP_ERR_UNSUPPORTED	Unsupported operation

◆ R_SLCDC_SetDisplayArea()

```
fsp_err_t R_SLCDC_SetDisplayArea ( slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area )
```

Sets output to Waveform A, Waveform B or blinking output. Implements `slcdc_api_t::setDisplayArea`.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_UNSUPPORTED	Pattern selection has no effect in 8-time-slice mode.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Close()

```
fsp_err_t R_SLCDC_Close ( slcdc_ctrl_t *const p_ctrl)
```

Closes the SLCDC driver. Implements `slcdc_api_t::close`.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

4.2.62 Serial Peripheral Interface (r_spi)

Modules

Functions

```

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8-16 bit, 20-bit, 24-bit, and 32-bit data frames
 - Hardware endian swap in 16-bit and 32-bit modes
 - SSL level keep (burst transfer) supported if available
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi

The following build time configurations are defined in fsp_cfg/r_spi_cfg.h:

--	--	--	--

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> Master Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> Data sampling 	Data sampling on odd	Select the clock edge

	<ul style="list-style-type: none"> on odd edge, data variation on even edge • Data sampling on even edge, data variation on odd edge 	edge, data variation on even edge	to sample data.
Clock Polarity	<ul style="list-style-type: none"> • Low when idle • High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> • MSB First • LSB First 	MSB First	Select the data bit order.
Callback	Name must be a valid C symbol	spi_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation 	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> • Full Duplex • Transmit Only 	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> • Active Low • Active High 	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High 	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> • Disabled • Odd • Even 	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the

bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated [spi_extended_cfg_t](#) structure.

Clock Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2L1	PCLKB
RA4E1	PCLKA

RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates, it might be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH`.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.

Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP_ERR_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Start a write/read transfer */
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
```

```
    assert(FSP_SUCCESS == err);

    /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
    while (false == g_transfer_complete)
    {
        ;
    }
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
    fsp_err_t err = FSP_SUCCESS;
    /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Assert Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
    /* Start a write/read transfer */
```

```
g_transfer_complete = false;

err                = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err                = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
```

```

fsp_err_t err = FSP_SUCCESS;

g_spi_cfg.p_extend = &g_spi_extended_cfg;

/* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */

err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
assert(FSP_SUCCESS == err);

/* Initialize the SPI module. */

err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */

assert(FSP_SUCCESS == err);
}

```

Data Structure Documentation

◆ [rspck_div_setting_t](#)

struct [rspck_div_setting_t](#)

SPI Clock Divider settings.

Data Fields		
uint8_t	spbr	SPBR register setting.
uint8_t	brdv: 2	BRDV setting in SPCMD0.

◆ spi_extended_cfg_t

struct spi_extended_cfg_t		
Extended SPI interface configuration		
Data Fields		
spi_ssl_mode_t	spi_clksyn	Select spi or clock syn mode operation.
spi_communication_t	spi_comm	Select full-duplex or transmit-only communication.
spi_ssl_polarity_t	ssl_polarity	Select SSLn signal polarity.
spi_ssl_select_t	ssl_select	Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3.
spi_mosi_idle_value_fixing_t	mosi_idle	Select MOSI idle fixed value and selection.
spi_parity_t	parity	Select parity and enable/disable parity.
spi_byte_swap_t	byte_swap	Select byte swap mode.
rspck_div_setting_t	spck_div	Register values for configuring the SPI Clock Divider.
spi_delay_count_t	spck_delay	SPI Clock Delay Register Setting.
spi_delay_count_t	ssl_negation_delay	SPI Slave Select Negation Delay Register Setting.
spi_delay_count_t	next_access_delay	SPI Next-Access Delay Register Setting.

◆ spi_instance_ctrl_t

struct spi_instance_ctrl_t		
Channel control block. DO NOT INITIALIZE. Initialization occurs when <code>spi_api_t::open</code> is called.		
Data Fields		
uint32_t	<code>open</code>	
		Indicates whether the <code>open()</code> API has been successfully called.
<code>spi_cfg_t</code> const *	<code>p_cfg</code>	
		Pointer to instance configuration.

R_SPI0_Type *	p_regs
	Base register for this channel.
void const *	p_tx_data
	Buffer to transmit.
void *	p_rx_data
	Buffer to receive.
uint32_t	tx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	rx_count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	count
	Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
spi_bit_width_t	bit_width
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ spi_ssl_mode_t

enum spi_ssl_mode_t	
3-Wire or 4-Wire mode.	
Enumerator	
SPI_SSL_MODE_SPI	SPI operation (4-wire method)
SPI_SSL_MODE_CLK_SYN	Clock Synchronous operation (3-wire method)

◆ spi_communication_t

enum spi_communication_t	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
SPI_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication.
SPI_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication.

◆ spi_ssl_polarity_t

enum spi_ssl_polarity_t	
Slave Select Polarity.	
Enumerator	
SPI_SSPL_LOW	SSPL signal polarity active low.
SPI_SSPL_HIGH	SSPL signal polarity active high.

◆ spi_ssl_select_t

enum spi_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_SSL_SELECT_SSL0	Select SSL0.
SPI_SSL_SELECT_SSL1	Select SSL1.
SPI_SSL_SELECT_SSL2	Select SSL2.
SPI_SSL_SELECT_SSL3	Select SSL3.

◆ spi_mosi_idle_value_fixing_t

enum spi_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_parity_t

enum spi_parity_t	
Parity Mode	
Enumerator	
SPI_PARITY_MODE_DISABLE	Disable parity.
SPI_PARITY_MODE_ODD	Select even parity.
SPI_PARITY_MODE_EVEN	Select odd parity.

◆ spi_byte_swap_t

enum spi_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_delay_count_t

enum spi_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

Function Documentation

◆ **R_SPI_Open()**

```
fsp_err_t R_SPI_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_Read()**

```
fsp_err_t R_SPI_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_Write()**

```
fsp_err_t R_SPI_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_WriteRead()**

```
fsp_err_t R_SPI_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest, uint32_t
const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_Close()**

```
fsp_err_t R_SPI_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements `spi_api_t::close`.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ **R_SPI_CalculateBitrate()**

```
fsp_err_t R_SPI_CalculateBitrate ( uint32_t bitrate, rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

◆ R_SPI_CallbackSet()

```
fsp_err_t R_SPI_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void(*) (spi_callback_args_t *) p_callback,
void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `spi_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.63 Serial Peripheral Interface (r_spi_b)

Modules

Functions

```
fsp_err_t R_SPI_B_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SPI_B_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t
const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t
const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src,
void *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

```
fsp_err_t R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl)
```

```
fsp_err_t R_SPI_B_CalculateBtrate (uint32_t bitrate, spi_b_clock_source_t
clock_source, rspck_div_setting_t *spck_div)
```

```
fsp_err_t R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl,
void(*p_callback)(spi_callback_args_t *), void const *const p_context,
spi_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the [SPI Interface](#).

Overview

Features

- Standard SPI Modes
 - Master or Slave Mode
 - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
 - Clock Polarity (CPOL)
 - CPOL=0 SCLK is low when idle
 - CPOL=1 SCLK is high when idle
 - Clock Phase (CPHA)
 - CPHA=0 Data Sampled on the even edge of SCLK (Master Mode Only)
 - CPHA=1 Data Sampled on the odd edge of SCLK
 - MSB/LSB first
 - 8- to 32-Bit data frames
 - Hardware endian swap in 16-Bit and 32-Bit mode
 - SSL level keep (burst transfer) supported
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- Callback Events
 - Transfer Complete
 - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
 - TX Underrun Error (No data to load into shift register for transmitting)
 - Parity Error (When parity is enabled and a parity error is detected)

Configuration

Build Time Configurations for r_spi_b

The following build time configurations are defined in fsp_cfg/r_spi_b_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Enable Support for using DTC	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If enabled, DTC instances will be included in the build for both transmission and reception.
Enable Transmitting from RXI Interrupt	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost

when DTC is not used.
In addition, Transmit Only mode is not supported when this configuration is enabled.

Configurations for Connectivity > SPI (r_spi_b)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_spi0	Module name.
Channel	Value must be a non-negative integer	0	Select the SPI channel.
Receive Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transmit Buffer Empty Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Transfer Complete Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Error Interrupt Priority	MCU Specific Options		Select the interrupt priority for all SPI interrupts.
Operating Mode	<ul style="list-style-type: none"> Master Slave 	Master	Select the SPI operating mode.
Clock Phase	<ul style="list-style-type: none"> Data sampling on odd edge, data variation on even edge Data sampling on even edge, data variation on odd edge 	Data sampling on odd edge, data variation on even edge	Select the clock edge to sample data.
Clock Polarity	<ul style="list-style-type: none"> Low when idle High when idle 	Low when idle	Select clock level when idle.
Mode Fault Error	<ul style="list-style-type: none"> Enable Disable 	Disable	Detect master/slave mode conflicts.
Bit Order	<ul style="list-style-type: none"> MSB First LSB First 	MSB First	Select the data bit order.
Callback	Name must be a valid	spi_callback	A user callback

	C symbol		function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
SPI Mode	<ul style="list-style-type: none"> • SPI Operation • Clock Synchronous Operation 	Clock Synchronous Operation	Select the clock sync mode.
Full or Transmit Only Mode	<ul style="list-style-type: none"> • Full Duplex • Transmit Only 	Full Duplex	Select Full Duplex or Transmit Only Mode.
Slave Select Polarity	<ul style="list-style-type: none"> • Active Low • Active High 	Active Low	Select the slave select active level.
Select SSL(Slave Select)	<ul style="list-style-type: none"> • SSL0 • SSL1 • SSL2 • SSL3 	SSL0	Select which slave to use.
MOSI Idle State	<ul style="list-style-type: none"> • MOSI Idle Value Fixing Disable • MOSI Idle Value Fixing Low • MOSI Idle Value Fixing High 	MOSI Idle Value Fixing Disable	Select the MOSI idle level if MOSI idle is enabled.
Parity Mode	<ul style="list-style-type: none"> • Disabled • Odd • Even 	Disabled	Select the parity mode if parity is enabled.
Byte Swapping	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select the byte swap mode for 16/32-Bit Data Frames.
Clock Source	<ul style="list-style-type: none"> • SCISPICK • PCLK 	PCLK	Select the clock source for communication.
Bitrate	Value must be an integer greater than 0	16000000	Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The theoretical bitrate is printed in a comment in the generated spi_extended_cfg_t structure.

Clock Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles before each data frame.
SSL Negation Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles after each data frame.
Next Access Delay	<ul style="list-style-type: none"> • 1 Clock • 2 Clocks • 3 Clocks • 4 Clocks • 5 Clocks • 6 Clocks • 7 Clocks • 8 Clocks 	1 Clock	Configure the number of SPI clock cycles between each data frame.

Clock Configuration

The SPI peripheral uses the SCISPICK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

Note

At high bitrates it may be necessary to configure the pins with `IOPORT_CFG_DRIVE_HIGH` to maintain signal integrity.

Usage Notes

Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC is not being used.

Note

Configuring the module to use RX DTC instance without also providing a TX DTC instance results in an invalid configuration when RXI transmit is enabled.

Transmit Only mode is not supported when Transmit from RXI is enabled.

Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

Examples

Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;
void spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Start a write/read transfer */
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);

assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

static void r_spi_callback (spi_callback_args_t * p_args)
{
    if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
        g_transfer_complete = true;
    }
}
```

Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];

    /* Configure Slave Select Line 1 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

    /* Configure Slave Select Line 2 */
    R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

```
fsp_err_t err = FSP_SUCCESS;

/* Initialize the SPI module. */
err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);

/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);

/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);

/* Start a write/read transfer */
g_transfer_complete = false;
err = R_SPI_B_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
assert(FSP_SUCCESS == err);

/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
{
    ;
}

/* De-assert Slave Select Line 2 */
```

```
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);  
}
```

Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)  
{  
    fsp_err_t err = FSP_SUCCESS;  
    g_spi_cfg.p_extend = &g_spi_extended_cfg;  
    /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the  
desired bitrate. */  
    err = R_SPI_B_CalculateBitrate(BITRATE, SPI_B_CLOCK_SOURCE_SCISPICKL,  
&(g_spi_extended_cfg.spck_div));  
    assert(FSP_SUCCESS == err);  
    /* Initialize the SPI module. */  
    err = R_SPI_B_Open(&g_spi_ctrl, &g_spi_cfg);  
    /* Handle any errors. This function should be defined by the user. */  
    assert(FSP_SUCCESS == err);  
}
```

struct spi_b_instance_ctrl_t		
Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called.		
Data Fields		
uint32_t	open	
		Indicates whether the open() API has been successfully called.
spi_cfg_t const *	p_cfg	
		Pointer to instance configuration.
R_SPI_B0_Type *	p_regs	
		Base register for this channel.
void const *	p_tx_data	
		Buffer to transmit.
void *	p_rx_data	
		Buffer to receive.
uint32_t	tx_count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	rx_count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)
uint32_t	count	
		Number of Data Frames to transfer (8-bit, 16-bit, 32-bit)

<code>spi_bit_width_t</code>	<code>bit_width</code>
	Bits per Data frame (8-bit, 16-bit, 32-bit)

Enumeration Type Documentation

◆ `spi_b_ssl_mode_t`

enum <code>spi_b_ssl_mode_t</code>	
3-Wire or 4-Wire mode.	
Enumerator	
<code>SPI_B_SSL_MODE_SPI</code>	SPI operation (4-wire method)
<code>SPI_B_SSL_MODE_CLK_SYN</code>	Clock Synchronous operation (3-wire method)

◆ `spi_b_communication_t`

enum <code>spi_b_communication_t</code>	
Transmit Only (Half Duplex), or Full Duplex.	
Enumerator	
<code>SPI_B_COMMUNICATION_FULL_DUPLEX</code>	Full-Duplex synchronous serial communication.
<code>SPI_B_COMMUNICATION_TRANSMIT_ONLY</code>	Transit only serial communication.

◆ `spi_b_ssl_polarity_t`

enum <code>spi_b_ssl_polarity_t</code>	
Slave Select Polarity.	
Enumerator	
<code>SPI_B_SSLP_LOW</code>	SSLP signal polarity active low.
<code>SPI_B_SSLP_HIGH</code>	SSLP signal polarity active high.

◆ spi_b_ssl_select_t

enum spi_b_ssl_select_t	
The Slave Select Line	
Enumerator	
SPI_B_SSL_SELECT_SSL0	Select SSL0.
SPI_B_SSL_SELECT_SSL1	Select SSL1.
SPI_B_SSL_SELECT_SSL2	Select SSL2.
SPI_B_SSL_SELECT_SSL3	Select SSL3.

◆ spi_b_mosi_idle_value_fixing_t

enum spi_b_mosi_idle_value_fixing_t	
MOSI Idle Behavior.	
Enumerator	
SPI_B_MOSI_IDLE_VALUE_FIXING_DISABLE	MOSI output value=value set in MOIFV bit.
SPI_B_MOSI_IDLE_VALUE_FIXING_LOW	MOSIn level low during MOSI idling.
SPI_B_MOSI_IDLE_VALUE_FIXING_HIGH	MOSIn level high during MOSI idling.

◆ spi_b_parity_t

enum spi_b_parity_t	
Parity Mode	
Enumerator	
SPI_B_PARITY_MODE_DISABLE	Disable parity.
SPI_B_PARITY_MODE_ODD	Select even parity.
SPI_B_PARITY_MODE_EVEN	Select odd parity.

◆ spi_b_byte_swap_t

enum spi_b_byte_swap_t	
Byte Swapping Enable/Disable.	
Enumerator	
SPI_B_BYTE_SWAP_DISABLE	Disable Byte swapping for 16/32-Bit transfers.
SPI_B_BYTE_SWAP_ENABLE	Enable Byte swapping for 16/32-Bit transfers.

◆ spi_b_delay_count_t

enum spi_b_delay_count_t	
Delay count for SPI delay settings.	
Enumerator	
SPI_B_DELAY_COUNT_1	Set RSPCK delay count to 1 RSPCK.
SPI_B_DELAY_COUNT_2	Set RSPCK delay count to 2 RSPCK.
SPI_B_DELAY_COUNT_3	Set RSPCK delay count to 3 RSPCK.
SPI_B_DELAY_COUNT_4	Set RSPCK delay count to 4 RSPCK.
SPI_B_DELAY_COUNT_5	Set RSPCK delay count to 5 RSPCK.
SPI_B_DELAY_COUNT_6	Set RSPCK delay count to 6 RSPCK.
SPI_B_DELAY_COUNT_7	Set RSPCK delay count to 7 RSPCK.
SPI_B_DELAY_COUNT_8	Set RSPCK delay count to 8 RSPCK.

◆ spi_b_clock_source_t

enum spi_b_clock_source_t
SPI communication clock source.

Function Documentation

◆ **R_SPI_B_Open()**

```
fsp_err_t R_SPI_B_Open ( spi_ctrl_t * p_api_ctrl, spi_cfg_t const *const p_cfg )
```

This function initializes a channel for SPI communication mode. Implements [spi_api_t::open](#).

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel initialized successfully.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.
FSP_ERR_UNSUPPORTED	A requested setting is not possible on this device with the current build configuration.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel number is invalid.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls: [transfer_api_t::open](#)

Note

This function is reentrant.

◆ **R_SPI_B_Read()**

```
fsp_err_t R_SPI_B_Read ( spi_ctrl_t *const p_api_ctrl, void * p_dest, uint32_t const length, spi_bit_width_t const bit_width )
```

This function receives data from a SPI device. Implements [spi_api_t::read](#).

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

Return values

FSP_SUCCESS	Read operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_Write()**

```
fsp_err_t R_SPI_B_Write ( spi_ctrl_t *const p_api_ctrl, void const * p_src, uint32_t const length,
spi_bit_width_t const bit_width )
```

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements `spi_api_t::write`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_WriteRead()**

```
fsp_err_t R_SPI_B_WriteRead ( spi_ctrl_t *const p_api_ctrl, void const * p_src, void * p_dest,
uint32_t const length, spi_bit_width_t const bit_width )
```

This function simultaneously transmits and receive data. Implements `spi_api_t::writeRead`.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

Return values

FSP_SUCCESS	Write operation successfully completed.
FSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
FSP_ERR_IN_USE	A transfer is already in progress.

◆ **R_SPI_B_Close()**

```
fsp_err_t R_SPI_B_Close ( spi_ctrl_t *const p_api_ctrl)
```

This function manages the closing of a channel by the following task. Implements `spi_api_t::close`.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with [SPI Interface](#) functions.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	A required pointer argument is NULL.
FSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

◆ **R_SPI_B_CalculateBitrate()**

```
fsp_err_t R_SPI_B_CalculateBitrate ( uint32_t bitrate, spi_b_clock_source_t clock_source,
rspck_div_setting_t * spck_div )
```

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

Parameters

[in]	bitrate	Desired bitrate
[in]	clock_source	SPI communication clock source to be used
[out]	spck_div	Memory location to store bitrate register settings.

Return values

FSP_SUCCESS	Valid spbr and brdv values were calculated
FSP_ERR_UNSUPPORTED	Bitrate is not achievable

◆ R_SPI_B_CallbackSet()

```
fsp_err_t R_SPI_B_CallbackSet ( spi_ctrl_t *const p_api_ctrl, void (*)(spi_callback_args_t *)
p_callback, void const *const p_context, spi_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `spi_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.64 Serial Sound Interface (r_ssi)

Modules

Functions

```
fsp_err_t R_SSI_Open (i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg)
```

```
fsp_err_t R_SSI_Stop (i2s_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_SSI_StatusGet (i2s_ctrl_t *const p_ctrl, i2s_status_t *const
p_status)
```

```
fsp_err_t R_SSI_Write (i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t
const bytes)
```

```
fsp_err_t R_SSI_Read (i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t
const bytes)
```

```
fsp_err_t R_SSI_WriteRead (i2s_ctrl_t *const p_ctrl, void const *const p_src,
void *const p_dest, uint32_t const bytes)
```

```
fsp_err_t R_SSI_Mute (i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable)
```

```
fsp_err_t R_SSI_Close (i2s_ctrl_t *const p_ctrl)
```

```
fsp_err_t R_SSI_CallbackSet (i2s_ctrl_t *const p_api_ctrl,
void (*p_callback)(i2s_callback_args_t *), void const *const p_context,
i2s_callback_args_t *const p_callback_memory)
```

Detailed Description

Driver for the SSIE peripheral on RA MCUs. This module implements the [I2S Interface](#).

Overview

Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master mode
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

Configuration

Build Time Configurations for r_ssi

The following build time configurations are defined in fsp_cfg/r_ssi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	If code for DTC transfer support is included in the build.

Configurations for Connectivity > I2S (r_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_i2s0	Module name.
Channel	Value must be an integer between 0 and 1	0	Specify the I2S channel.
Bit Depth	<ul style="list-style-type: none"> • 8 Bits • 16 Bits • 18 Bits 	16 Bits	Select the bit depth of one sample of audio data.

	<ul style="list-style-type: none"> • 20 Bits • 22 Bits • 24 Bits • 32 Bits 		
Word Length	<ul style="list-style-type: none"> • 8 Bits • 16 Bits • 24 Bits • 32 Bits • 48 Bits • 64 Bits • 128 Bits • 256 Bits 	16 Bits	Select the word length of audio data. Must be at least as large as Data bits.
WS Continue Mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable WS continue mode to output the word select (WS) pin even when transmission is idle.
Bit Clock Source	<ul style="list-style-type: none"> • External AUDIO_CLK • Internal AUDIO_CLK 	External AUDIO_CLK	Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal
Bit Clock Divider	Refer to the RA Configuration tool for available options.	Audio Clock / 1	Select divider used to generate bit clock from audio clock.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from all three interrupt service routines (ISR).
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Idle/Error Interrupt Priority	MCU Specific Options		Select the Idle/Error interrupt priority.

Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the

RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO_CLK pin in master mode.

Pin Configuration

The SSI uses the following pins:

- AUDIO_CLK (optional, master mode only): The AUDIO_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFS_n: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

Usage Notes

SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

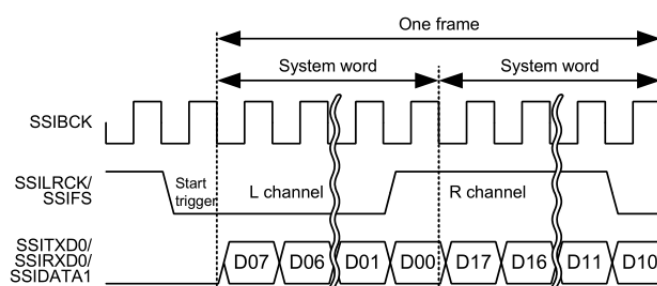

Figure 176: SSI Frame Diagram (8-bit word, 8-bit samples)

Note

If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.

Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

Bit Depth	Array Data Type	Required Alignment	Required Length (bytes)
8 Bits	8-bit integer	1 byte alignment	Multiple of 2
16 Bits	16-bit integer	2 byte alignment	Multiple of 4
18 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
20 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8

22 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
24 Bits	32-bit integer, right justified	4 byte alignment	Multiple of 8
32 Bits	32-bit integer	4 byte alignment	Multiple of 8

Note

The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.

Audio Clock

The audio clock is only required for master mode.

Audio Clock Frequency

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

$$\text{bit_clock (Hz)} = \text{sampling_frequency (Hz)} * \text{channels} * \text{system_word_bits}$$

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

$$44100 * 2 * 16 = 1,411,200 \text{ Hz}$$

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

$$\text{audio_clock (Hz)} = \text{desired_bit_clock (Hz)} * \text{bit_clock_divider}$$

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

Audio Clock Source

The audio clock source can come from:

- An external source input to the AUDIO_CLK pin
- An internal connection to the GPT timer output

Note

When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.

See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.

Limitations

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only transmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

Examples

Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
    / sampling_frequency) */

    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
    for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
        float input = (((float) (freq * t)) * (M_TWOPI)) /
        SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;

        g_src[2 * t] = (int16_t) ((INT16_MAX * sinf(input)));
        g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }

    /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Transfer data. */
    (void) R_SSI_WriteRead(&g_i2s_ctrl,
                           (uint8_t *) &g_src[0],
                           (uint8_t *) &g_dest[0],
                           SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}
```

Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart transmission in the main loop.

This example also checks the return code of `R_SSI_Write()` because `R_SSI_Write()` can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the `I2S_EVENT_IDLE` callback is received.

```
#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)

int16_t      g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t     g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;

/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
    /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
    SSI is idle because it was
    * stopped after a transmit FIFO overflow. */
    if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {
        if (g_data_ready)
        {
            /* Reload FIFO and handle errors. */
            ssi_example_write();
        }
    }
    else
    {
        /* Data was not ready yet, send it in the main loop. */
        g_send_data_in_main_loop = true;
    }
}
```

```
    }
}

/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
{
    /* Transfer data. This call is non-blocking. */
    fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                                (uint8_t *) &g_stream_src[g_buffer_index][0],
                                SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
    if (FSP_SUCCESS == err)
    {
        /* Switch the buffer after data is sent. */
        g_buffer_index = !g_buffer_index;
        /* Allow loop to calculate next buffer only if transmission was successful. */
        g_data_ready = false;
    }
    else
    {
        /* Getting here most likely means a transmit overflow occurred before the FIFO could
be reloaded. The
        * application must wait until the SSI is idle, then restart transmission. In this
example, the idle
        * callback transmits data or resets the flag g_send_data_in_main_loop. */
    }
}

/* Calculate samples. This example is just a sine wave. For this type of data, it
would be better to calculate
* one period and loop it. This example should be updated for the audio data used by
the application. */
void ssi_example_calculate_samples (uint32_t buffer_index)
{
    static uint32_t t = 0U;

    }
}

```

Data Structures

struct [ssi_instance_ctrl_t](#)

struct [ssi_extended_cfg_t](#)

Enumerations

enum [ssi_audio_clock_t](#)

enum [ssi_clock_div_t](#)

Data Structure Documentation

◆ [ssi_instance_ctrl_t](#)

struct [ssi_instance_ctrl_t](#)

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when [i2s_api_t::open](#) is called.

◆ [ssi_extended_cfg_t](#)

struct [ssi_extended_cfg_t](#)

SSI configuration extension. This extension is optional.

Data Fields

ssi_audio_clock_t	audio_clock	Audio clock source, default is SSI_AUDIO_CLOCK_EXTERNAL.
ssi_clock_div_t	bit_clock_div	Select bit clock division ratio.

Enumeration Type Documentation

◆ **ssi_audio_clock_t**

enum <code>ssi_audio_clock_t</code>	
Audio clock source.	
Enumerator	
<code>SSI_AUDIO_CLOCK_EXTERNAL</code>	Audio clock source is the AUDIO_CLK input pin.
<code>SSI_AUDIO_CLOCK_INTERNAL</code>	Audio clock source is internal connection to a MCU specific GPT channel output.

◆ **ssi_clock_div_t**

enum <code>ssi_clock_div_t</code>	
Bit clock division ratio. Bit clock frequency = audio clock frequency / bit clock division ratio.	
Enumerator	
<code>SSI_CLOCK_DIV_1</code>	Clock divisor 1.
<code>SSI_CLOCK_DIV_2</code>	Clock divisor 2.
<code>SSI_CLOCK_DIV_4</code>	Clock divisor 4.
<code>SSI_CLOCK_DIV_6</code>	Clock divisor 6.
<code>SSI_CLOCK_DIV_8</code>	Clock divisor 8.
<code>SSI_CLOCK_DIV_12</code>	Clock divisor 12.
<code>SSI_CLOCK_DIV_16</code>	Clock divisor 16.
<code>SSI_CLOCK_DIV_24</code>	Clock divisor 24.
<code>SSI_CLOCK_DIV_32</code>	Clock divisor 32.
<code>SSI_CLOCK_DIV_48</code>	Clock divisor 48.
<code>SSI_CLOCK_DIV_64</code>	Clock divisor 64.
<code>SSI_CLOCK_DIV_96</code>	Clock divisor 96.
<code>SSI_CLOCK_DIV_128</code>	Clock divisor 128.

Function Documentation

◆ **R_SSI_Open()**

```
fsp_err_t R_SSI_Open ( i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg )
```

Opens the SSI. Implements [i2s_api_t::open](#).

This function sets this clock divisor and the configurations specified in [i2s_cfg_t](#). It also opens the timer and transfer instances if they are provided.

Return values

FSP_SUCCESS	Ready for I2S communication.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_cfg is null.
FSP_ERR_ALREADY_OPEN	The control block has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Channel number is not available on this MCU.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::open](#)

◆ **R_SSI_Stop()**

```
fsp_err_t R_SSI_Stop ( i2s_ctrl_t *const p_ctrl)
```

Stops SSI. Implements [i2s_api_t::stop](#).

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

Return values

FSP_SUCCESS	I2S communication stop request issued.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See [Common Error Codes](#) or lower level drivers for other possible return codes.

◆ **R_SSI_StatusGet()**

```
fsp_err_t R_SSI_StatusGet ( i2s_ctrl_t *const p_ctrl, i2s_status_t *const p_status )
```

Gets SSI status and stores it in provided pointer p_status. Implements `i2s_api_t::statusGet`.

Return values

FSP_SUCCESS	Information stored successfully.
FSP_ERR_ASSERTION	The p_instance_ctrl or p_status parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_Write()**

```
fsp_err_t R_SSI_Write ( i2s_ctrl_t *const p_ctrl, void const *const p_src, uint32_t const bytes )
```

Writes data buffer to SSI. Implements `i2s_api_t::write`.

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

Write() cannot be called if another write(), read() or writeRead() operation is in progress. Write can be called when the SSI is idle, or after the I2S_EVENT_TX_EMPTY event.

Return values

FSP_SUCCESS	Write initiated successfully.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_src was null, or bytes requested was 0.
FSP_ERR_IN_USE	Another transfer is in progress, data was not written.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `transfer_api_t::reset`

◆ **R_SSI_Read()**

```
fsp_err_t R_SSI_Read ( i2s_ctrl_t *const p_ctrl, void *const p_dest, uint32_t const bytes )
```

Reads data into provided buffer. Implements `i2s_api_t::read`.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

FSP_SUCCESS	Read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	The pointer to p_ctrl or p_dest was null, or bytes requested was 0.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_WriteRead()**

```
fsp_err_t R_SSI_WriteRead ( i2s_ctrl_t *const p_ctrl, void const *const p_src, void *const p_dest,
uint32_t const bytes )
```

Writes from source buffer and reads data into destination buffer. Implements [i2s_api_t::writeRead](#).

This function calls [R_SSI_Write](#) and [R_SSI_Read](#).

[writeRead\(\)](#) cannot be called if another [write\(\)](#), [read\(\)](#) or [writeRead\(\)](#) operation is in progress. [writeRead\(\)](#) can be called when the SSI is idle, or after the [I2S_EVENT_RX_FULL](#) event.

Return values

FSP_SUCCESS	Write and read initiated successfully.
FSP_ERR_IN_USE	Peripheral is in the wrong mode or not idle.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_UNDERFLOW	A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication.
FSP_ERR_OVERFLOW	A receive overflow error is pending. Wait for the SSI to go idle before resuming communication.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [transfer_api_t::reset](#)

◆ **R_SSI_Mute()**

```
fsp_err_t R_SSI_Mute ( i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable )
```

Mutes SSI on the next frame boundary. Implements [i2s_api_t::mute](#).

Data is still written while mute is enabled, but the transmit line outputs zeros.

Return values

FSP_SUCCESS	Transmission is muted.
FSP_ERR_ASSERTION	The pointer to p_ctrl was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_Close()**

```
fsp_err_t R_SSI_Close ( i2s_ctrl_t *const p_ctrl)
```

Closes SSI. Implements `i2s_api_t::close`.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

Return values

FSP_SUCCESS	Device closed successfully.
FSP_ERR_ASSERTION	The pointer to <code>p_ctrl</code> was null.
FSP_ERR_NOT_OPEN	The channel is not opened.

◆ **R_SSI_CallbackSet()**

```
fsp_err_t R_SSI_CallbackSet ( i2s_ctrl_t *const p_api_ctrl, void(*) (i2s_callback_args_t *) p_callback, void const *const p_context, i2s_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `i2s_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.65 USB (r_usb_basic)

Modules

Functions

```
fsp_err_t R_USB_Open (usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const p_cfg)
```

Applies power to the USB module specified in the argument (`p_ctrl`).
More...

```
fsp_err_t R_USB_Close (usb_ctrl_t *const p_api_ctrl)
```

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module). [More...](#)

`fsp_err_t` [R_USB_Read](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t` size, `uint8_t` destination)

Bulk/interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R_USB_Write](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t const *const p_buf`, `uint32_t` size, `uint8_t` destination)

Bulk/Interrupt data transfer and control data transfer. [More...](#)

`fsp_err_t` [R_USB_Stop](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_transfer_t` direction, `uint8_t` destination)

Requests a data read/write transfer be terminated when a data read/write transfer is being performed. [More...](#)

`fsp_err_t` [R_USB_Suspend](#) (`usb_ctrl_t *const p_api_ctrl`)

Sends a SUSPEND signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_Resume](#) (`usb_ctrl_t *const p_api_ctrl`)

Sends a RESUME signal from the USB module assigned to the member (module) of the `usb_ctrl_t` structure. [More...](#)

`fsp_err_t` [R_USB_VbusSet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t` state)

Specifies starting or stopping the VBUS supply. [More...](#)

`fsp_err_t` [R_USB_InfoGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_info_t *p_info`, `uint8_t` destination)

Obtains completed USB-related events. [More...](#)

`fsp_err_t` [R_USB_PipeRead](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t *p_buf`, `uint32_t` size, `uint8_t` pipe_number)

Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument. [More...](#)

`fsp_err_t R_USB_PipeWrite (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number)`

Requests a data write (bulk/interrupt transfer). [More...](#)

`fsp_err_t R_USB_PipeStop (usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number)`

Terminates a data read/write operation. [More...](#)

`fsp_err_t R_USB_UsedPipesGet (usb_ctrl_t *const p_api_ctrl, uint16_t *p_pipe, uint8_t destination)`

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information. [More...](#)

`fsp_err_t R_USB_PipeInfoGet (usb_ctrl_t *const p_api_ctrl, usb_pipe_t *p_info, uint8_t pipe_number)`

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size. [More...](#)

`fsp_err_t R_USB_PullUp (usb_ctrl_t *const p_api_ctrl, uint8_t state)`

This API enables or disables pull-up of D+/D- line. [More...](#)

`fsp_err_t R_USB_EventGet (usb_ctrl_t *const p_api_ctrl, usb_status_t *event)`

Obtains completed USB related events. (OS-less Only) [More...](#)

Register a callback function to be called upon completion of a USB related event. (RTOS only) [More...](#)

`fsp_err_t R_USB_HostControlTransfer (usb_ctrl_t *const p_api_ctrl, usb_setup_t *p_setup, uint8_t *p_buf, uint8_t device_address)`

Performs settings and transmission processing when transmitting a setup packet. [More...](#)

`fsp_err_t R_USB_PericontrolDataGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size)`

Receives data sent by control transfer. [More...](#)

`fsp_err_t R_USB_PericontrolDataSet (usb_ctrl_t *const p_api_ctrl, uint8_t`

*p_buf, uint32_t size)

Performs transfer processing for control transfer. [More...](#)

`fsp_err_t` [R_USB_PeriControlStatusSet](#) (`usb_ctrl_t *const p_api_ctrl`,
`usb_setup_status_t status`)

Set the response to the setup packet. [More...](#)

`fsp_err_t` [R_USB_RemoteWakeup](#) (`usb_ctrl_t *const p_api_ctrl`)

Sends a remote wake-up signal to the connected Host. [More...](#)

`fsp_err_t` [R_USB_ModuleNumberGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t`
`*module_number`)

This API gets the module number. [More...](#)

`fsp_err_t` [R_USB_ClassTypeGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_class_t`
`*class_type`)

This API gets the class type. [More...](#)

`fsp_err_t` [R_USB_DeviceAddressGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t`
`*device_address`)

This API gets the device address. [More...](#)

`fsp_err_t` [R_USB_PipeNumberGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint8_t`
`*pipe_number`)

This API gets the pipe number. [More...](#)

`fsp_err_t` [R_USB_DeviceStateGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint16_t *state`)

This API gets the state of the device. [More...](#)

`fsp_err_t` [R_USB_DataSizeGet](#) (`usb_ctrl_t *const p_api_ctrl`, `uint32_t *data_size`)

This API gets the data size. [More...](#)

`fsp_err_t` [R_USB_SetupGet](#) (`usb_ctrl_t *const p_api_ctrl`, `usb_setup_t *setup`)

This API gets the setup type. [More...](#)

`fsp_err_t` [R_USB_OtgCallbackSet](#) (`usb_ctrl_t *const p_api_ctrl`,

```
usb_otg_callback_t *p_callback)
```

Set callback function to be called when the OTG role swap was completed on Azure RTOS. [More...](#)

```
fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl)
```

Start the SRP processing for OTG on Azure RTOS. [More...](#)

Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the [USB Interface](#).

Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

Features

The USB module has the following key features:

- USB Host mode
 - Enumerates Low/Full/High-speed devices (see note below)
 - Automatic transfer error determination and retry
- USB Peripheral mode
 - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
 - Control transfers supported on pipe 0
 - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

Note

Supported speeds are dependent on the MCU.

Configuration

Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
PLL Frequency	MCU Specific Options		Specify the PLL frequency supplied to the USB module. This

setting only applies to USB1 (not USB0).

CPU Bus Access Wait Cycles	MCU Specific Options			This setting controls the delay for consecutive USB peripheral register access. Set this value to a number of CPU cycles that is equivalent to 40.8ns or more.
Battery Charging	MCU Specific Options			Specify whether or not to include battery charging functionality.
Power IC Shutdown Polarity	MCU Specific Options			Select the polarity of the Shutdown signal on the power supply IC (if provided).
Dedicated Charging Port (DCP) Mode	MCU Specific Options			When enabled, USB communication is disabled and the port is used for charging only.
Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled		When enabled, the application will receive notifications for SET_INTERFACE, SET_FEATURE and CLEAR_FEATURE messages.
Double Buffering	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled		When enabled, the FIFOs for Pipes 1-5 are double-buffered.
Continuous Transfer Mode	MCU Specific Options			Enable or disable continuous transfer mode.
LDO Regulator	MCU Specific Options			Enable or disable LDO regulator.
DMA Support	MCU Specific Options			Enable or disable DMA support for the USB module.
DMA Source Address	<ul style="list-style-type: none"> • DMA Disabled • FS Address • HS Address 	DMA Disabled		Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.
DMA Destination Address	<ul style="list-style-type: none"> • DMA Disabled • FS Address • HS Address 	DMA Disabled		Set this to match the speed mode when DMA is enabled. Otherwise, set to 'DMA Disabled'.

USB Compliance Test mode	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Display the information required to take the compliance test.
USB TPL table name	Enter the TPL table name.	NULL	Enter the name of the TPL Table.

Configurations for Connectivity > USB (r_usb_basic)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_basic0	Module name.
USB Mode	<ul style="list-style-type: none"> • Host mode • Peri mode • OTG mode 	Host mode	Select the usb mode.
USB Speed	<ul style="list-style-type: none"> • Full Speed • Hi Speed • Low Speed 	Full Speed	Select the USB speed.
USB Module Number	<ul style="list-style-type: none"> • USB_IP0 Port • USB_IP1 Port 	USB_IP0 Port	Specify the USB module number to be used.
USB Device Class	<ul style="list-style-type: none"> • Peripheral Communications Device Class • Peripheral Human Interface Device Class • Peripheral Mass Storage Class • Peripheral Vendor Class • Peripheral Audio Class • Host Communications Device Class • Host Human Interface Device Class • Host Mass Storage Class • Host Vendor Class 	Peripheral Communications Device Class	Select the USB device class.
USB Descriptor	USB Descriptor must be a valid C symbol.	g_usb_descriptor	Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when

using the Host class.

USB Compliance Callback	Compliance Callback must be a valid C symbol.	NULL	Set the callback for compliance tests here.
USBFS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBFS ISR.
USBFS Resume Priority	MCU Specific Options		Select the interrupt priority used by the USBFS Resume ISR.
USBFS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D0FIFO.
USBFS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D1FIFO.
USBHS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBHS ISR.
USBHS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D0FIFO ISR.
USBHS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D1FIFO ISR.
USB RTOS Callback	Enter the address of the function.	NULL	If an FreeRTOS is used, set the callback function here.
USB Callback Context	Enter the address of the context.	NULL	Set the callback context here.

Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

Note

When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.

Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

Note

USB_VBUS and USBHS_VBUS are 5V-tolerant pins.

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

Config Name	Select Name	Description
Transfer Size	2 Bytes	In FS mode, select "2 Bytes"
	4 Bytes	In HS mode, select "4 Bytes"
Activation source	USBFS FIFO 0	USB FS Reception
	USBFS FIFO 1	USB FS Transmission
	USBHS FIFO 0	USB HS Reception
	USBHS FIFO 1	USB HS Transmission

Descriptor definition

In Peripheral mode, the `usb_descriptor_t` structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device; /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string; /* Number of strings in table */
} usb_descriptor_t;
```

Note

Even in high-speed mode the full-speed configuration must be made available:

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
```

```
    NULL,  
    smp_str_table,  
    3,  
};  
  
/* Example USB HS descriptor struct */  
usb_descriptor_t g_usb_descriptor =  
{  
    smp_device,  
    smp_config_f,  
    smp_config_h,  
    smp_qualifier,  
    smp_str_table,  
    3,  
};
```

String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */  
uint8_t str_descriptor_0[]  
{  
    0x04,      /* Length */  
    0x03,      /* Descriptor type */  
    0x09, 0x04 /* Language ID */  
};  
  
uint8_t str_descriptor_manufacturer[] =  
{  
    0x10,      /* Length */  
    0x03,      /* Descriptor type */  
    'R', 0x00,  
    'E', 0x00,  
    'N', 0x00,  
    'E', 0x00,
```

```
'S', 0x00,
'A', 0x00,
'S', 0x00
};
uint8_t str_descriptor_product[] =
{
    0x12,      /* Length */
    0x03,      /* Descriptor type */
    'C', 0x00,
    'D', 0x00,
    'C', 0x00,
    '_', 0x00,
    'D', 0x00,
    'E', 0x00,
    'M', 0x00,
    'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,      /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
    str_descriptor_product, /* Index: 2 */
};
```

Note

Set the string index values in the device/configuration descriptors (*iManufacturer*, *iConfiguration* etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in *str_descriptor_manufacturer* and the value of *iManufacturer* in the device descriptor is **1**.

Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (<http://www.usb.org/developers/docs/>) for details on how to construct the device, configuration and qualifier descriptors.

Usage Notes

Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or R_USB_EventGet should be used to provide event data to the application loop where a switch statement handles the event.

Note

1. The `USB_STATUS_CONFIGURED` event should be confirmed before calling `R_USB_Read` or `R_USB_Write`.
2. When attaching to USB Host, Suspend event is notified to the application program in USB peripheral mode. Notification of this event to the application program does not affect the operation.

Limitations

Developers should be aware of the following limitations when using the USB driver:

- The current USB driver does not support hub.
- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- Only one device-class driver may be used at a time.
- The USB Hi-Speed module only supports Hi-Speed operation.
- In USB host mode, this USB driver does not support the composite device.
- The user can not specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature. USB multi-port function: Simultaneous operation feature of USB Host and Peripheral.

Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

1. USB Compliance Test mode Set "Enabled" in this item.

g_basic0 USB (r_usb_basic)		
Property	Value	
DMA Source Address	FS Address	
DMA Destination Address	FS Address	
USB Compliance Test mode	Enabled	
USB TPL table name	usb_tpl_table	
Module g_basic0 USB (r_usb_basic)		
Name	r_basic0	

Figure 177: Compliance Test Setting

2. USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

g_basic0 USB (r_usb_basic)		
Property	Value	
DMA Source Address	FS Address	
DMA Destination Address	FS Address	
USB Compliance Test mode	Enabled	
USB TPL table name	usb_tpl_table	
Module g_basic0 USB (r_usb_basic)		
Name	r_basic0	

Figure 178: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,          /* Number of tpl */
    0,          /* Reserved */
    0x0123, 0x4567, /* Vendor ID, Product ID (1st device) */
    0x89ab, 0xcdef /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

Figure 179: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t              print_data[32];
    disp_data = (usb_compliance_t*)param;
    switch(disp_data->status)
    {
    case USB_COMPLIANCE_TEST_ATTACH:          /* Device Attach Detection */
        display("\nATTACH \n");
        break;
    case USB_COMPLIANCE_TEST_DETACH:         /* Device Detach Detection */
        display("\nDETACH \n");
        break;
    case USB_COMPLIANCE_TEST_TPL:           /* TPL device connect */
```

```
        display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
break;
case USB_COMPLIANCETEST_NOTTPL:                /* Not TPL device connect */
        display("\nNOTTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
break;
case USB_COMPLIANCETEST_HUB:                   /* USB Hub connect */
        display("\nHub \n");
break;
case USB_COMPLIANCETEST_OVRC:                 /* over current */
break;
case USB_COMPLIANCETEST_NORES:                /* Responce Time out for Control Read
Transfer */
        display("\nNOTRESP \n");
break;
case USB_COMPLIANCETEST_SETUP_ERR:           /* Setup Transaction Error */
break;
default:
break;
}
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

TrustZone

The USB driver for FreeRTOS cannot be allocated in Secure region.

UCLK setting

Enable UCLK in "Clocks" tab on e2 studio when using the following MCU.

1. RA6M4

Examples

USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t     event;

    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    /* Loop back between PC(TerminalSoft) and USB MCU */
    while (1)
    {
        g_usb_on_usb.eventGet(&event_info, &event);
        switch (event)
        {
            case USB_STATUS_CONFIGURED:
            case USB_STATUS_WRITE_COMPLETE:
                g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
                break;
            case USB_STATUS_READ_COMPLETE:
                g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
                USB_CLASS_PCDC);
                break;
            case USB_STATUS_REQUEST: /* Receive Class Request */
                if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
                {
                    g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
                    &g_line_coding, LINE_CODING_LENGTH);
                }
                else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
                {
                    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
                    &g_line_coding, LINE_CODING_LENGTH);
                }
                else
                {
                    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
                    USB_SETUP_STATUS_ACK);
                }
            }
        }
    }
}
```

```

    }
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
    }
}
} /* End of function usb_main() */

```

Typedefs

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

Typedef Documentation

◆ usb_instance_ctrl_t

```
typedef usb_event_info_t  usb_instance_ctrl_t
```

ICU private control block. DO NOT MODIFY. Initialization occurs when R_ICU_ExtrenalIrqOpen is called.

Function Documentation

◆ R_USB_Open()

```
fsp_err_t R_USB_Open ( usb_ctrl_t *const p_api_ctrl, usb_cfg_t const *const p_cfg )
```

Applies power to the USB module specified in the argument (p_ctrl).

Return values

FSP_SUCCESS	Success in open.
FSP_ERR_USB_BUSY	Specified USB module now in use.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ R_USB_Close()

```
fsp_err_t R_USB_Close ( usb_ctrl_t *const p_api_ctrl)
```

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Read()**

```
fsp_err_t R_USB_Read ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t destination )
```

Bulk/interrupt data transfer and control data transfer.

1. Bulk/interrupt data transfer

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

2. Control data transfer

The R_USB_Read function is used to receive data in the data stage and the R_USB_Write function is used to send data to the USB host.

Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ R_USB_Write()

```
fsp_err_t R_USB_Write ( usb_ctrl_t *const p_api_ctrl, uint8_t const *const p_buf, uint32_t size,
uint8_t destination )
```

Bulk/Interrupt data transfer and control data transfer.

1. Bulk/Interrupt data transfer

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

2. Control data transfer

The R_USB_Read function is used to receive data in the data stage and the R_USB_Write function is used to send data to the USB host.

Return values

FSP_SUCCESS	Successfully completed. (Data write request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data write request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet (ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow. e.g)

```
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_Stop()**

```
fsp_err_t R_USB_Stop ( usb_ctrl_t *const p_api_ctrl, usb_transfer_t direction, uint8_t destination )
```

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_WRITE as the argument (type).

Return values

FSP_SUCCESS	Successfully completed. (stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Stop processing is called multiple times.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_Suspend()**

```
fsp_err_t R_USB_Suspend ( usb_ctrl_t *const p_api_ctrl)
```

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	During a suspend request to the specified USB module, or when the USB module is already in the suspended state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_Resume()**

```
fsp_err_t R_USB_Resume ( usb_ctrl_t *const p_api_ctrl)
```

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_t structure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Resume already requested for same device address. (USB host mode only)
FSP_ERR_USB_NOT_SUSPEND	USB device is not in the SUSPEND state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_VbusSet()**

```
fsp_err_t R_USB_VbusSet ( usb_ctrl_t *const p_api_ctrl, uint16_t state )
```

Specifies starting or stopping the VBUS supply.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_InfoGet()**

```
fsp_err_t R_USB_InfoGet ( usb_ctrl_t *const p_api_ctrl, usb_info_t * p_info, uint8_t destination )
```

Obtains completed USB-related events.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PipeRead()**

```
fsp_err_t R_USB_PipeRead ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data read (bulk/interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_ctrl_t structure.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

- Do not call this API in the following function.
- (1). Interrupt function.
 - (2). Callback function (for RTOS).

◆ **R_USB_PipeWrite()**

```
fsp_err_t R_USB_PipeWrite ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size, uint8_t pipe_number )
```

Requests a data write (bulk/interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_PipeWrite function as follow.

e.g)

```
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
```

2. Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PipeStop()**

```
fsp_err_t R_USB_PipeStop ( usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number )
```

Terminates a data read/write operation.

Return values

FSP_SUCCESS	Successfully completed. (Stop request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_UsedPipesGet()**

```
fsp_err_t R_USB_UsedPipesGet ( usb_ctrl_t *const p_api_ctrl, uint16_t * p_pipe, uint8_t destination )
```

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PipeInfoGet()**

```
fsp_err_t R_USB_PipeInfoGet ( usb_ctrl_t *const p_api_ctrl, usb_pipe_t * p_info, uint8_t pipe_number )
```

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_PullUp()**

```
fsp_err_t R_USB_PullUp ( usb_ctrl_t *const p_api_ctrl, uint8_t state )
```

This API enables or disables pull-up of D+/D- line.

Return values

FSP_SUCCESS	Successful completion. (Pull-up enable/disable setting completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

- (1). Interrupt function.
- (2). Callback function (for RTOS).

◆ **R_USB_EventGet()**

```
fsp_err_t R_USB_EventGet ( usb_ctrl_t *const p_api_ctrl, usb_status_t * event )
```

Obtains completed USB related events. (OS-less Only)

In USB host mode, the device address value of the USB device that completed an event is specified in the `usb_ctrl_t` structure member (address) specified by the event's argument. In USB peripheral mode, `USB_NULL` is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned.

Return values

FSP_SUCCESS	Event Get Success.
FSP_ERR_USB_FAILED	If called in the RTOS environment, an error is returned.

Note

*Do not use the same variable as the first argument of `R_USB_Open` for the first argument.
Do not call this API in the interrupt function.*

◆ **R_USB_Callback()**

```
fsp_err_t R_USB_Callback ( usb_callback_t * p_callback)
```

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	If this function is called in the OS-less execution environment, a failure is returned.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not call this API in the interrupt function.

◆ **R_USB_HostControlTransfer()**

```
fsp_err_t R_USB_HostControlTransfer ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * p_setup, uint8_t * p_buf, uint8_t device_address )
```

Performs settings and transmission processing when transmitting a setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_PeriControlDataGet()**

```
fsp_err_t R_USB_PeriControlDataGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Receives data sent by control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ R_USB_PericontrolDataSet()

```
fsp_err_t R_USB_PericontrolDataSet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_buf, uint32_t size )
```

Performs transfer processing for control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ R_USB_PericontrolStatusSet()

```
fsp_err_t R_USB_PericontrolStatusSet ( usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status )
```

Set the response to the setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_RemoteWakeup()**

```
fsp_err_t R_USB_RemoteWakeup ( usb_ctrl_t *const p_api_ctrl)
```

Sends a remote wake-up signal to the connected Host.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_NOT_SUSPEND	Device is not suspended.
FSP_ERR_USB_BUSY	The device is in resume operation.

Note

Do not call this API in the following function.

(1). Interrupt function.

(2). Callback function (for RTOS).

◆ **R_USB_ModuleNumberGet()**

```
fsp_err_t R_USB_ModuleNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * module_number )
```

This API gets the module number.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_ClassTypeGet()**

```
fsp_err_t R_USB_ClassTypeGet ( usb_ctrl_t *const p_api_ctrl, usb_class_t * class_type )
```

This API gets the class type.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DeviceAddressGet()**

```
fsp_err_t R_USB_DeviceAddressGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* device_address )
```

This API gets the device address.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_PipeNumberGet()**

```
fsp_err_t R_USB_PipeNumberGet ( usb_ctrl_t*const p_api_ctrl, uint8_t* pipe_number )
```

This API gets the pipe number.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DeviceStateGet()**

```
fsp_err_t R_USB_DeviceStateGet ( usb_ctrl_t*const p_api_ctrl, uint16_t* state )
```

This API gets the state of the device.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_DataSizeGet()**

```
fsp_err_t R_USB_DataSizeGet ( usb_ctrl_t*const p_api_ctrl, uint32_t* data_size )
```

This API gets the data size.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_SetupGet()**

```
fsp_err_t R_USB_SetupGet ( usb_ctrl_t *const p_api_ctrl, usb_setup_t * setup )
```

This API gets the setup type.

Return values

FSP_SUCCESS	Successful completion.
-------------	------------------------

◆ **R_USB_OtgCallbackSet()**

```
fsp_err_t R_USB_OtgCallbackSet ( usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t * p_callback )
```

Set callback function to be called when the OTG role swap was completed on Azure RTOS.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

◆ **R_USB_OtgSRP()**

```
fsp_err_t R_USB_OtgSRP ( usb_ctrl_t *const p_api_ctrl)
```

Start the SRP processing for OTG on Azure RTOS.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not support the VBUS Pulsing since OTG 2.0 does not support the VBUS Pulsing..

4.2.66 USB Composite Class (r_usb_composite)

Modules

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.

This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC

How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

Figure 180: Select USB Composite

- The following is displayed when selecting [USB Composite].

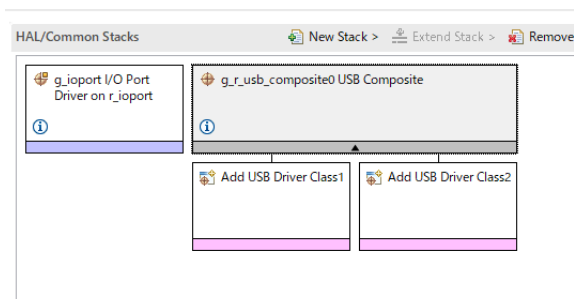

Figure 181: USB Composite Stack

- Select the supported 2 device classes as follows.

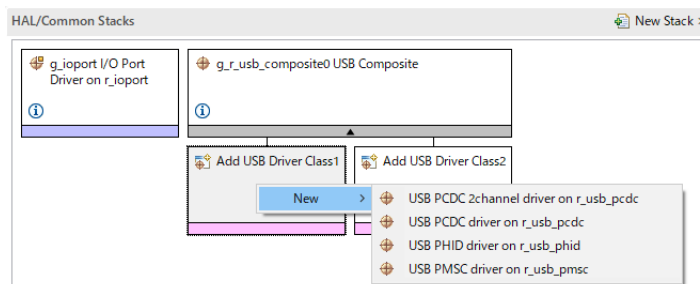

Figure 182: Select Device Classes

Note

1. Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configuring for "PCDC + PCDC".

- Select the supported 2 device classes as follows. The following is displayed when selecting 2 device classes.

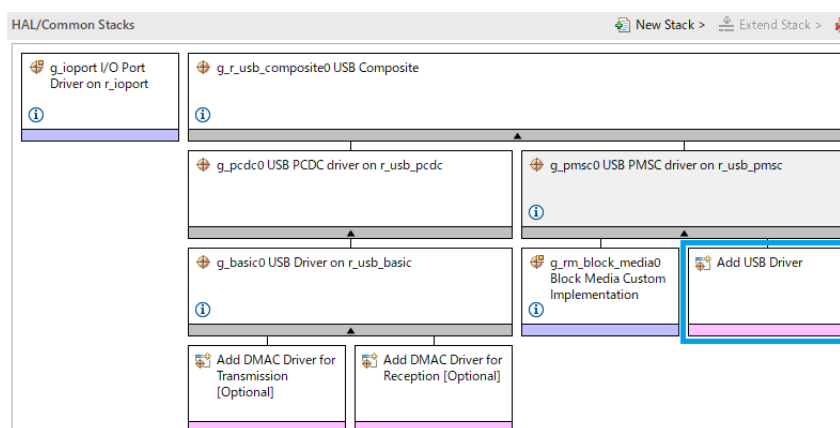

Figure 183: Delete USB Basic Instance

Note

1. Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)
2. The error is output when selecting the following device classes.
 - a. PMSC + PMSC
 - b. PHID + PHID

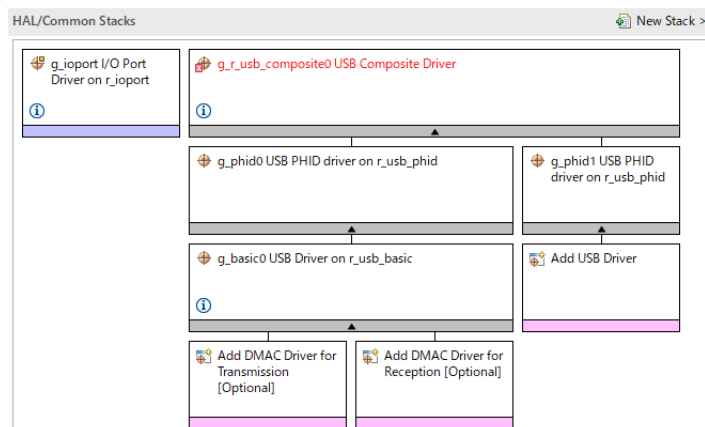

Figure 184: Device Class Selection Error

Limitations

1. The following composite device is not supported when using RA2A1(MCU).

1. PMSC + PCDC
2. PCDC + PCDC

2. If you use PMSC, make sure to use `usb_basic` module with PMSC. There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

Notes

Please determine by the member "pipe" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC. Don't refer to the member "type" in "usb_event_info" structure.

Descriptor

Templates for composite device descriptors can be found in `ra/fsp/src/r_usb_composite` folder. Also, please be sure to use your vendor ID.

1. `r_usb_pcdc_pmsc_descriptor.c.template` (for PCDC + PMSC)
2. `r_usb_pcdc_phid_descriptor.c.template` (for PCDC + PHID)
3. `r_usb_phid_pmsc_descriptor.c.template` (for PHID + PMSC)
4. `r_usb_pcdc_pcdc_descriptor.c.template` (for PCDC + PCDC)

Examples

4.2.67 USB Host Communications Device Class Driver (r_usb_hcdc)

Modules

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the [USB HCDC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_hcdc module, when used in combination with the r_usb_basic module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

Features

The r_usb_hcdc module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

Configuration

Build Time Configurations for r_usb_hcdc

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

Configuration	Options	Default	Description
Target Peripheral Device Class ID	<ul style="list-style-type: none"> • CDC class supported device • Vendor class device 	CDC class supported device	Specify the device class ID of the CDC device to be connected.
Bulk Input Transfer Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Interrupt In Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE6	Select the USB pipe to use for interrupts.

Configurations for Connectivity > USB HCDC (r_usb_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hcdc0	Module name.

Note

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

Basic Functions

The main functions of H CDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state
- Transfer data to and from the CDC peripheral device

Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

Request	Code	Description
SendEncapsulatedCommand	0x00	Transmits an AT command as defined by the protocol used by the device (normally 0 for USB).
GetEncapsulatedResponse	0x01	Requests a response to a command transmitted by SendEncapsulatedCommand.
SetCommFeature	0x02	Enables or disables features such as device-specific 2-byte code and country setting.
GetCommFeature	0x03	Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting.
ClearCommFeature	0x04	Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country setting.
SetLineCoding	0x20	Makes communication line settings (communication speed, data length, parity bit, and stop bit length).
GetLineCoding	0x21	Acquires the communication line setting state.
SetControlLineState	0x22	Makes communication line control signal (RTS, DTR) settings.
SendBreak	0x23	Transmits a break signal.

Note

For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

The expected data format for each command is shown below followed by dependent structures.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SEND_ENCAPSULATED_COMMAND (0x00)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	GET_ENCAPSULATED_RESPONSE (0x01)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	SET_COMM_FEATURE (0x02)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_comfeature_t
0x21	GET_COMM_FEATURE (0x03)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_comfeature_t
0x21	CLEAR_COMM_FEATURE (0x04)	usb_hcdc_feature_selector_t	0x0000	Data length	None
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0000	usb_hcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_hcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_hcdc_control_line_state_t	0x0000	0x0000	None
0x21	SEND_BREAK (0x23)	usb_hcdc_break_duration_t	0x0000	0x0000	None

ACM Notifications from Device to Host

The following class notifications are supported:

Notification	Code	Description
RESPONSE_AVAILABLE	0x01	Response to GET_ENCAPSULATED_RESPONSE
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	RESPONSE_AVAILABLE (0x01)	0x0000	0x0000	0x0000	None
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_hcdc_serialstate_t

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected.

Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

Examples

USB HCDC Loopback Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

Figure 185: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```

Obtains max packet size for the connected HID device. The max packet size is set to the area. Set the direction (USB_HID_IN/USB_HID_OUT). [More...](#)

Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the [USB HHID Interface](#).

Overview

The r_usb_hhid module combines with the r_usb_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID device.

Features

The r_usb_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

Configuration

Build Time Configurations for r_usb_hhid

The following build time configurations are defined in fsp_cfg/r_usb_hhid_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE6	Select the pipe number to use for input interrupt events.
Interrupt Out Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE9	Select the pipe number to use for output interrupt events.

Configurations for Connectivity > USB HHID (r_usb_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r_usb_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid	g_hhid0	Module name.

C symbol

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes*Note*

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.

Class Requests

The class requests supported by this driver are shown below:

Request	Code	Description
USB_GET_REPORT	0x01	Receives a report from the HID device.
USB_SET_REPORT	0x09	Sends a report to the HID device.
USB_GET_IDLE	0x02	Receives a duration (time) from the HID device.
USB_SET_IDLE	0x0A	Sends a duration (time) to the HID device.
USB_GET_PROTOCOL	0x03	Reads a protocol from the HID device.
USB_SET_PROTOCOL	0x0B	Sends a protocol to the HID device.
USB_GET_REPORT_DESCRIPTOR	0x06	Requests a report descriptor.
USB_GET_HID_DESCRIPTOR	0x06	Requests a HID descriptor.

Data Format

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

offset	Keyboard (8 Bytes)	Mouse (3 Bytes)
0 (Top Byte)	Modifier keys	b0 : Button 1 b1 : Button 2 b2 : Button 3 b3-b7 : Reserved
+1	Reserved	X displacement

+2	Keycode 1	Y displacement
+3	Keycode 2	-
+4	Keycode 3	-
+5	Keycode 4	-
+6	Keycode 5	-
+7	Keycode 6	-

Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.
- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.
- This driver does not support simultaneous operation with the other device class.

Examples

USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (`usb_apl_callback`) in order to pass events to the main loop through a queue.

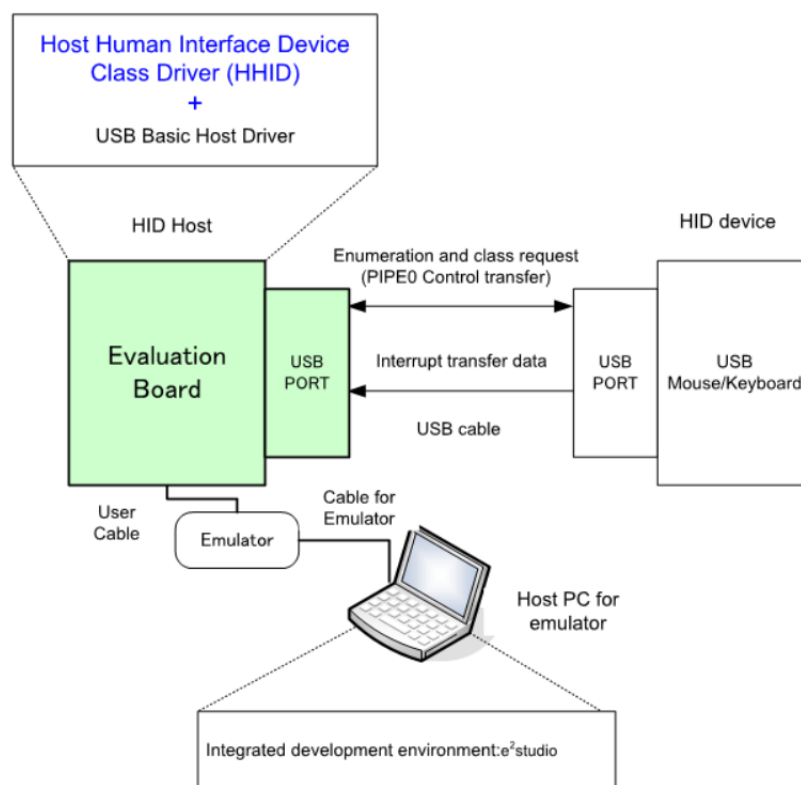

Figure 186: Example Operating Environment

Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (`usb_apl_callback`). In the callback function (`usb_apl_callback`), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step 2 above is `USB_STATUS_CONFIGURED`, APL sends the class request (`SET_PROTOCOL`) to the HID device.
4. If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step 2 above is `USB_STATUS_REQUEST_COMPLETE`, APL performs a data reception request to receive data transmitted from the HID device by calling the `R_USB_Read` function.
5. The above processing is repeated.

Figure 187: Main Loop (Normal mode)

Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R_USB_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB_STATUS_CONFIGURED is set as the return value. When the APL confirms USB_STATUS_CONFIGURED, it calls the R_USB_Write function to request transmission of data to the HID device.
2. When the R_USB_GetEvent function is called after sending of class request SET_PROTOCOL to the HID device has completed, USB_STATUS_REQUEST_COMPLETE is set as the return value. When the APL confirms USB_STATUS_REQUEST_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
3. When the R_USB_GetEvent function is called after reception of data from the HID device has completed, USB_STATUS_READ_COMPLETE is set as the return value. When the APL confirms USB_STATUS_READ_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the [USB HMSC Interface](#).

Overview

The r_usb_hmsc module, when used in combination with the r_usb_basic module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

Note

This module should be used in combination with the FreeRTOS+FAT File System.

Features

The r_usb_hmsc module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported

- Storage command communication using the BOT protocol
- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

Class Requests

The class requests supported by this driver are shown below.

Request	Description
GetMaxLun	Gets the maximum number of units that are supported.
MassStorageReset	Cancels a protocol error.

Storage Commands

This driver supports the following storage commands:

- TEST_UNIT_READY
- MODE_SELECT10
- MODE_SENSE10
- PREVENT_ALLOW
- READ_FORMAT_CAPACITY
- READ10
- WRITE10

Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

Multi Port

This driver supports simultaneous operation with Peripheral Communication Device Class(PCDC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run HMSC on one USB module and PCDC on the other. This driver does not support simultaneous operation using device classes other than PCDC.

For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

RA Common	
Main stack size (bytes)	0x800
Heap size (bytes)	0x800
MCU Vcc (mV)	3300
Parameter checking	Disabled
Assert Failures	Return FSP_ERR_ASSERTION
Error Log	No Error Log
Soft Reset	Disabled
Main Oscillator Populated	Populated

Figure 189: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

The screenshot shows the RA configurator interface. On the left, a tree view shows the project structure with 'FreeRTOS+FAT Port for RA' selected. On the right, the 'API Info' panel displays the configuration for this module. The 'Callback' field is highlighted with a red box and contains the value 'NULL'.

API Info	
Common	Default (BSP)
Parameter Checking	Default (BSP)
Module FreeRTOS+FAT Port for RA	
Name	g_rm_freertos_plus_fat0
Total Number of Sectors	31293440
Sector Size (bytes)	512
Cache Size (bytes)	1024
Partition Number	0
Callback	NULL

Figure 190: For Bare Metal Setting

Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

Examples

USB HMSC Example

Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

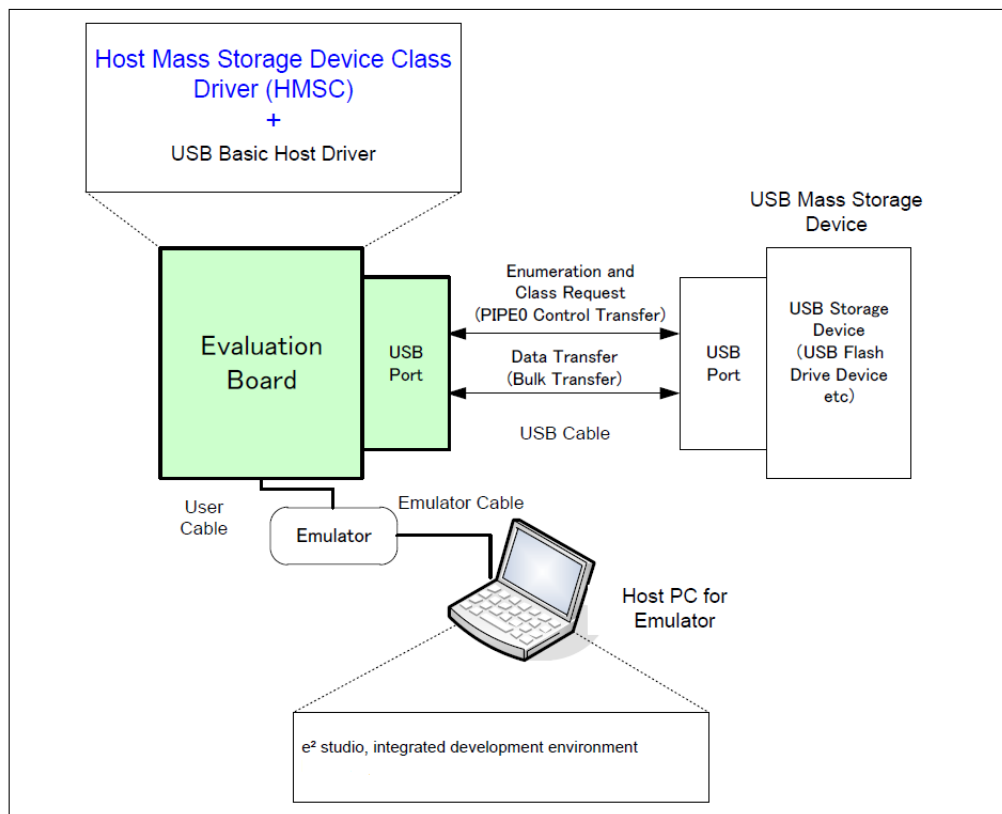

Figure 191: Example Operating Environment

Application Specifications

The main functions of the application are as follows:

1. Performs enumeration and drive recognition processing on MSC devices.
2. After the above processing finishes, the application writes the file to the MSC device once.
3. After writing the above file, the APL repeatedly reads the file. It continues to read the file repeatedly until the switch is pressed again.

Application Processing (for RTOS)

This application has two tasks. An overview of the processing in these two tasks is provided below.

usb_apl_task

1. After start up, MCU pin setting, USB controller initialization, and application program initialization are performed.
2. The MSC device is attached to the kit. When enumeration and drive recognition processing have completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task is notified of the USB completion event using the FreeRTOS functionality.
3. In the application task, information regarding the USB completion event about which notification was received from the callback function is retrieved using the real-time OS

functionality.

4. If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step 2 above is `USB_STS_CONFIGURED` then, based on the USB completion event, the MSC device is mounted and the file is written to the MSC device.
5. If the USB completion event (the event member of the `usb_ctrl_t` structure) retrieved in step 2 above is `USB_STS_DETACH`, the application initializes the variables for state management.

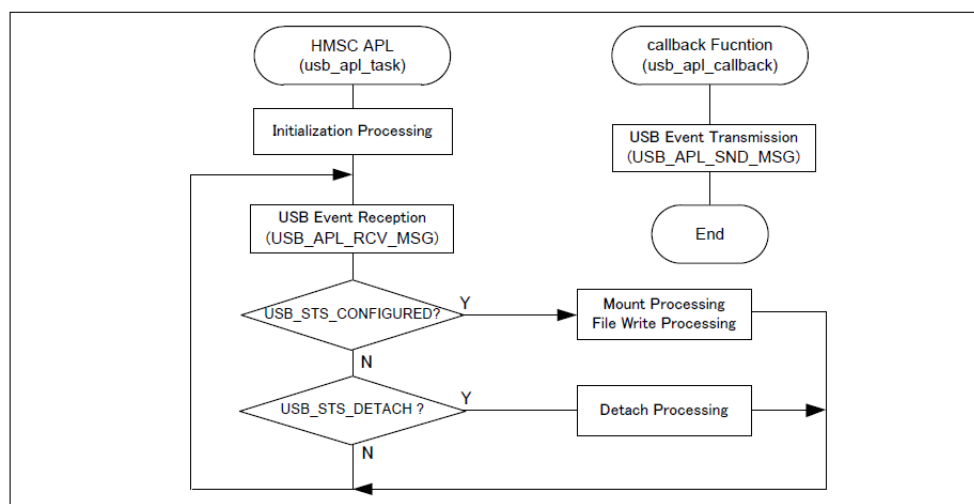

Figure 192: `usb_apl_task`

file_read_task

Of the application tasks `usb_apl_task` and `file_read_task`, `file_read_task` is processed while `usb_apl_task` is in the wait state. This task performs file read processing on the file that was written to the MSC device.

Function Documentation

◆ R_USB_HMSC_StorageCommand()

`fsp_err_t R_USB_HMSC_StorageCommand (usb_ctrl_t *const p_api_ctrl, uint8_t * buf, uint8_t command, uint8_t destination)`

Processing for MassStorage(ATAPI) command.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_HMSSC_DriveNumberGet()**

```
fsp_err_t R_USB_HMSSC_DriveNumberGet ( usb_ctrl_t *const p_api_ctrl, uint8_t * p_drive, uint8_t destination )
```

Get number of Storage drive.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ **R_USB_HMSSC_SemaphoreGet()**

```
fsp_err_t R_USB_HMSSC_SemaphoreGet ( void )
```

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

◆ **R_USB_HMSSC_SemaphoreRelease()**

```
fsp_err_t R_USB_HMSSC_SemaphoreRelease ( void )
```

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

◆ R_USB_HMSC_StorageReadSector()

```
fsp_err_t R_USB_HMSC_StorageReadSector ( uint16_t drive_number, uint8_t *const buff, uint32_t
sector_number, uint16_t sector_count )
```

Read sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument *buff* must be 4-byte aligned.

◆ R_USB_HMSC_StorageWriteSector()

```
fsp_err_t R_USB_HMSC_StorageWriteSector ( uint16_t drive_number, uint8_t const *const buff,
uint32_t sector_number, uint16_t sector_count )
```

Write sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument *buff* must be 4-byte aligned.

4.2.70 USB Host Vendor Class (r_usb_hvnd)**Modules****Functions**

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB Host Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r_usb_hvnd].

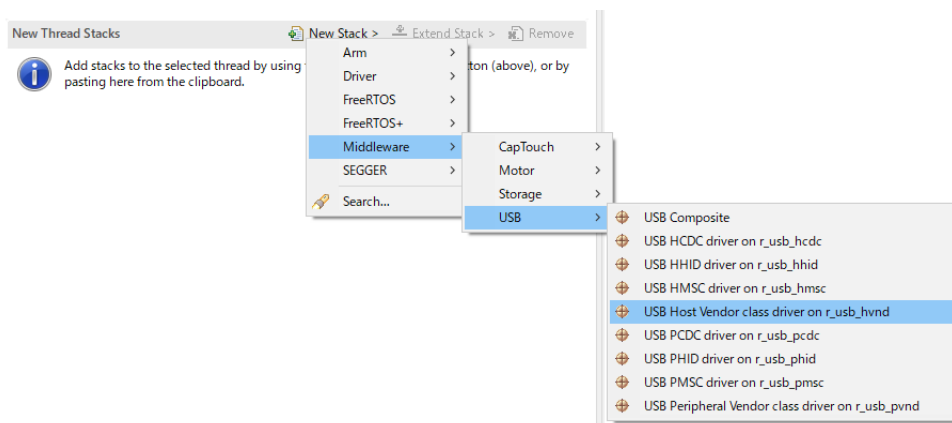

Figure 193: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r_usb_hvnd]. The user does not specify USB pipe number in Vendor class.

Figure 194: USB Host Vendor Class Stack

API

Use the following APIs in Host Vendor class application program.

- For Data Transfer
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

1. R_USB_PipeRead()
2. R_USB_PipeWrite()

3. R_USB_PipeStop()

- For Control Transfer
Use the following API for the class request processing.

1. R_USB_HostControlTransfer()

- For USB Pipe Information
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

1. R_USB_UsedPipesGet()
2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

```

/*****

4.2.71 USB Peripheral Communications Device Class (r_usb_pcdc)

Modules

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the [USB PCDC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pcdc module combines with the r_usb_basic module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

Features

The r_usb_pcdc module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

Configuration

Build Time Configurations for r_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

Configuration	Options	Default	Description
Bulk In Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Out Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Interrupt Out Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE6	Select the USB pipe to use for interrupts.

Configurations for Connectivity > USB PCDC (r_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (r_usb_pcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pcdc0	Module name.

Note

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB

devices and earlier modems (employing RS-232C connections), enabling use of application programs designed for older modems.

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
SetLineCoding	0x20	Sets communication line settings (bitrate, data length, parity, and stop bit length)
GetLineCoding	0x21	Acquires the communication line setting state
SetControlLineState	0x22	Set communication line control signals (RTS, DTR)

Note

For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

Data Format of Class Requests

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_pcdc_ctrllinestate_t	0x0000	0x0000	None

Class Notifications (Peripheral to Host)

The following class notifications are supported:

Notification	Code	Description
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_serial_state_bitmap_t

Note

The host is notified with `SERIAL_STATE` whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.

Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests `GetLineCoding` and `SetControlLineState` are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as `PuTTY`. When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request `SetLineCoding`.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

Multi Port

This driver supports simultaneous operation with Host Mass Storage Class(HMSC). If the user are using MCU that supports 2 USB modules, such as RA6M3, the user can run PCDC on one USB module and HMSC on the other. This driver does not support simultaneous operation using device classes other than HMSC.

Limitations

- This module must be incorporated into a project using `r_usb_basic` and does not provide any public APIs.
- This driver does not support Low-speed.

Examples

USB PCDC Loopback Example

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

Figure 195: Example Operating Environment

Figure 196: Main Loop processing (Echo mode)

```

void usb_basic_example (void)
{
    usb_event_info_t event_info;
    usb_status_t event;
    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    while (1)
    {
        /* Get USB event data */
        g_usb_on_usb.eventGet(&event_info, &event);
        /* Handle the received event (if any) */
        switch (event)
        {
            case USB_STATUS_CONFIGURED:

```

```
case USB_STATUS_WRITE_COMPLETE:
/* Initialization complete; get data from host */
    g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
break;
case USB_STATUS_READ_COMPLETE:
/* Loop back received data to host */
    g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
break;
case USB_STATUS_REQUEST: /* Receive Class Request */
if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
    {
/* Configure virtual UART settings */
    g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
    }
else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
    {
/* Send virtual UART settings back to host */
    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
    }
else
    {
/* ACK all other status requests */
    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
    }
break;
case USB_STATUS_SUSPEND:
case USB_STATUS_DETACH:
break;
default:
break;
```

Descriptor

A template for PCDC descriptors can be found in `ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template`. Also, please be sure to use your vendor ID.

4.2.72 USB Peripheral Human Interface Device Class (r_usb_phid)

Modules

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the [USB PHID Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Detailed Description

Overview

The `r_usb_phid` module combines with the `r_usb_basic` module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

Features

The `r_usb_phid` module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Configuration

Build Time Configurations for r_usb_phid

The following build time configurations are defined in fsp_cfg/r_usb_phid_cfg.h:

Configuration	Options	Default	Description
Interrupt In Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE6	Select the pipe number for input interrupt events.
Interrupt Out Pipe	<ul style="list-style-type: none"> • USB PIPE6 • USB PIPE7 • USB PIPE8 • USB PIPE9 	USB PIPE7	Select the pipe number for output interrupt events.

Configurations for Connectivity > USB PHID (r_usb_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r_usb_phid).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_phid0	Module name.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
Get_Report	0x01	Receives a report from the HID host
Set_Report	0x09	Sends a report to the HID host
Get_Idle	0x02	Receives a duration (time) from the HID host
Set_Idle	0x0A	Sends a duration (time) to the HID host
Get_Protocol	0x03	Reads a protocol from the HID host
Set_Protocol	0x0B	Sends a protocol to the HID host
Get_Descriptor	0x06	Transmits a report or HID

descriptor

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_REPORT (0x01)	ReportType & ReportID	Interface	ReportLength	Report
0x21	SET_REPORT (0x09)	ReportType & ReportID	Interface	ReportLength	Report
0xA1	GET_IDLE (0x02)	0 & ReportID	Interface	1	Idle rate
0x21	SET_IDLE (0x0A)	Duration & ReportID	Interface	0	Idle rate
0xA1	GET_PROTOCOL (0x03)	0	Interface	0	0 (Boot) or 1 (Report)
0x21	SET_PROTOCOL (0x0B)	0 (Boot) or 1 (Report)	Interface	0	Not applicable

Limitations

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.

Examples

Descriptors

A template for PHID descriptors can be found in ra/fsp/src/r_usb_phid. Be sure to replace the vendor ID with your own.

Keyboard templates should be referred to r_usb_phid_descriptor_keyboard.c.template.

Mouse templates should be referred to r_usb_phid_descriptor_mouse.c.template.

4.2.73 USB Peripheral Mass Storage Class (r_usb_pmesc)

Modules

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the [USB PMSC Interface](#).

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pmsc module combines with the r_usb_basic module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).

The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.

When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

Features

The r_usb_pmsc module has the following key features:

- Storage command control using the BOT protocol
- Supports SFF-8070i (ATAPI)
- Response to mass storage device class requests from a USB host

Configuration

Build Time Configurations for r_usb_pmsc

The following build time configurations are defined in fsp_cfg/r_usb_pmsc_cfg.h:

Configuration	Options	Default	Description
Bulk Input Transfer Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE1	Select the USB pipe to use for bulk input transfers.
Bulk Output Transfer Pipe	<ul style="list-style-type: none"> • USB PIPE1 • USB PIPE2 • USB PIPE3 • USB PIPE4 • USB PIPE5 	USB PIPE2	Select the USB pipe to use for bulk output transfers.
Vendor Information	Vendor Information must be 8 bytes long; pad with spaces if shorter.	Vendor	Specify the vendor information field (part of the Inquiry command response).
Product Information	Product Information must be 16 bytes long; pad with spaces if shorter.	Mass Storage	Specify the product information field (part of the Inquiry command response).
Product Revision Level	Product Revision Level	1.00	Specify the product

	must be 4 bytes long; pad with spaces if shorter.		revision level field (part of the Inquiry command response).
Sector size	<ul style="list-style-type: none"> • 512 • 4096 	512	Specifies the sector size.
Number of Transfer Sectors	Please enter a number between 1 and 255.	8	Specify the maximum sector size to request with one data transfer.

Configurations for Connectivity > USB PMSC (r_usb_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r_usb_pmsc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pmsc0	Module name.

Refer to the [USB \(r_usb_basic\)](#) module for hardware configuration options.

Clock Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Pin Configuration

Refer to the [USB \(r_usb_basic\)](#) module.

Usage Notes

Class Requests

The class requests supported by this driver are shown below.

Request	Code	Description
Bulk-Only Mass Storage Reset	0xFF	Resets the connection interface to the mass storage device.
Get Max Logical Unit Number	0xFE	Reports the logical numbers supported by the device.

Storage Commands

This driver supports the following storage commands.

Command	Code	Description
TEST_UNIT_READY	0x00	Checks the state of the peripheral device.
REQUEST_SENSE	0x03	Gets the error information of the previous storage command

INQUIRY	0x12	execution result.
READ_FORMAT_CAPACITY	0x23	Gets the formattable capacity.
READ_CAPACITY	0x25	Gets the capacity information of the logical unit.
READ10	0x28	Reads data.
WRITE10	0x1A	Writes data.
MODE_SENSE10	0x5A	Gets the parameters of the logical unit.

Note

A *STALL* or *FAIL* error is sent to the host upon receipt of any command not listed in the above table.

BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

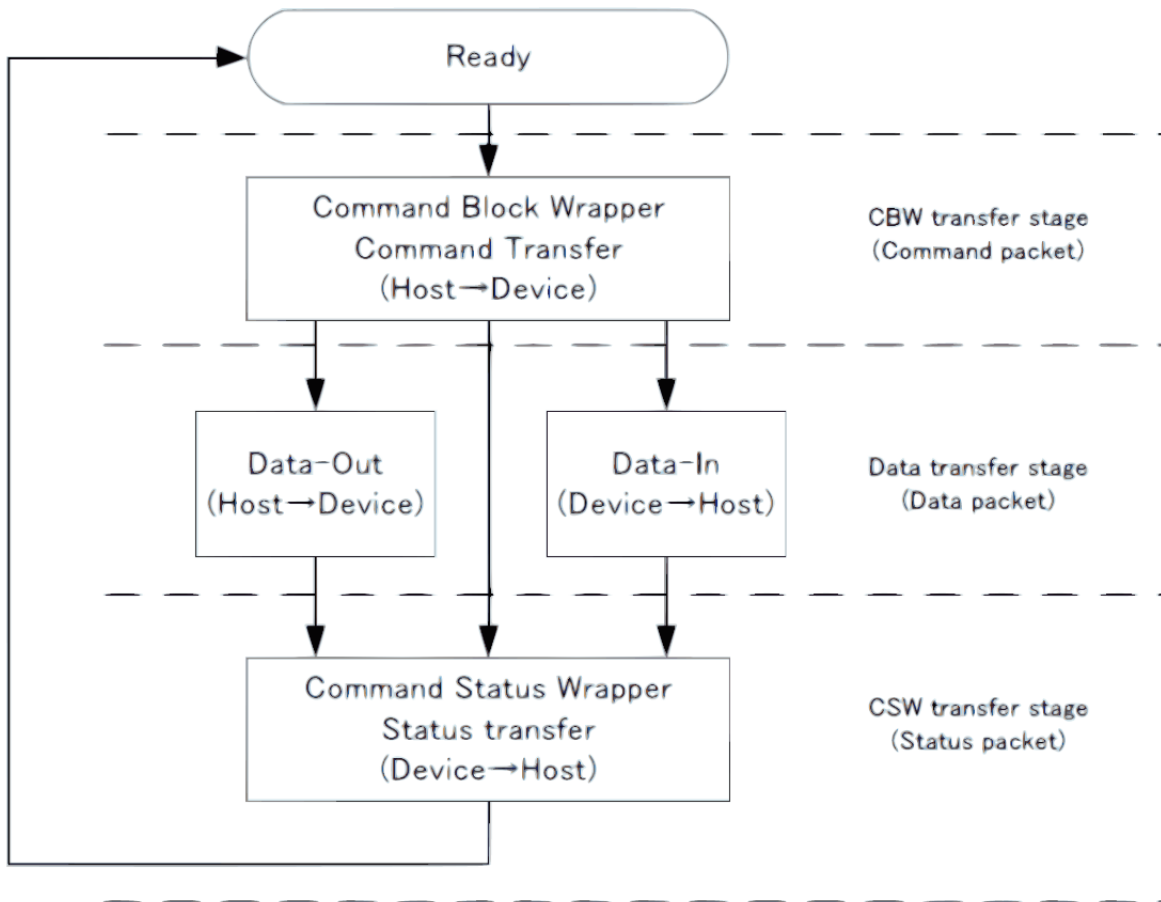

Figure 200: BOT protocol Overview

Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

Note

When the user develops the storage media driver, be sure to define the instance named "g_rm_block_media0".

Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm_block_media_sdmmc), "Card Detection" must be set to "Not Used" in the SD/MMC Host Interface (r_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.

Examples

USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

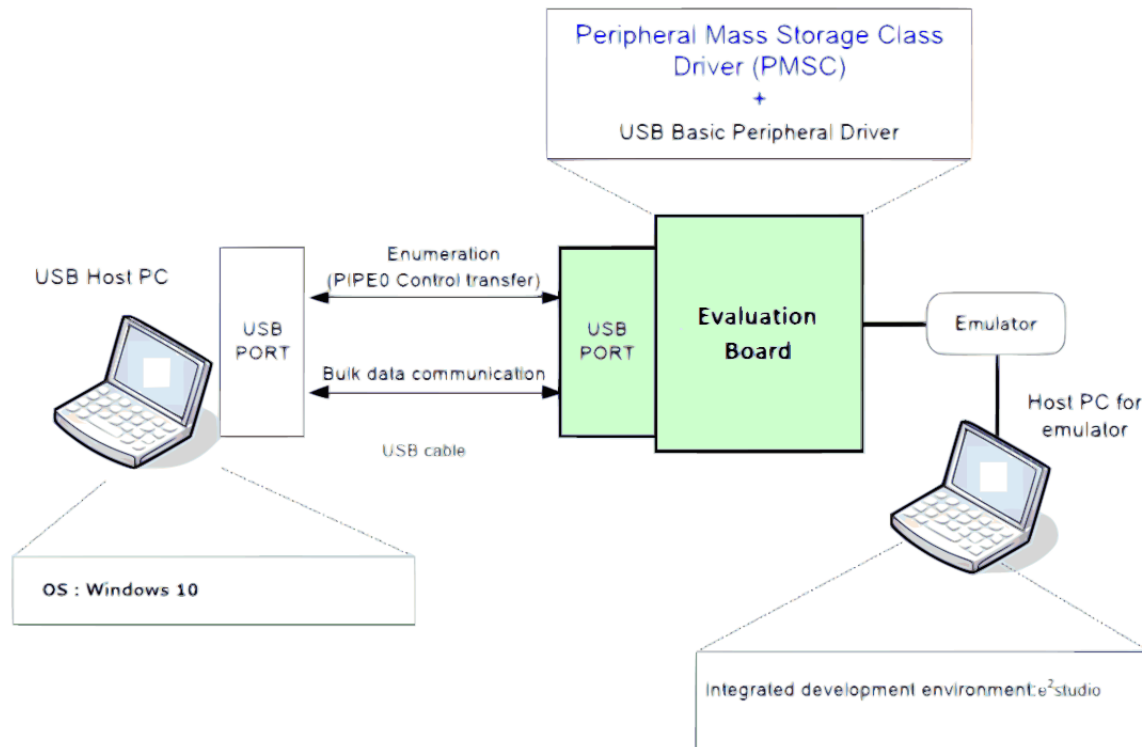

Figure 201: Example Operating Environment

```

void usb_pmsc_example (void)
{
    usb_event_info_t usb_event;
#if (BSP_CFG_RTOS == 2)
    usb_event_info_t * p_mess;
#else
    usb_status_t event;
#endif
    g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
    /* Loop back between PC(TerminalSoft) and USB MCU */
    while (1)
    {
#if (BSP_CFG_RTOS == 2)
        USB_APL_RCV_MSG(USB_APL_MBX, (usb_msg_t **) &p_mess);
        usb_event = *p_mess;
        /* Analyzing the received message */
        switch (usb_event.event)
#else /* (BSP_CFG_RTOS == 2) */

```

```
    g_usb_on_usb.eventGet (&usb_event, &event);
    switch (event)
#endif /* (BSP_CFG_RTOS == 2) */
    {
    case USB_STATUS_CONFIGURED:
        {
        break;
        }
    case USB_STATUS_SUSPEND:
    case USB_STATUS_DETACH:
        {
#if USB_SUPPORT_LPW == USB_APL_ENABLE
// @@ low_power_mcu();
#endif /* USB_SUPPORT_LPW == USB_APL_ENABLE */
        break;
        }
    default:
        {
        break;
        }
    }
} /* End of function usb_main() */
```

Descriptor

A template for PMSC descriptors can be found in `ra/fsp/src/r_usb_pmsc/r_usb_pmsc_descriptor.c.template`. Also, please be sure to use your vendor ID.

4.2.74 USB Peripheral Vendor Class (r_usb_pvnd)

Modules

Functions

Refer to [USB \(r_usb_basic\)](#) for the common API (r_usb_basic) to be called from the application.

Overview

USB Peripheral Vendor class works by combining r_usb_basic module.

How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r_usb_pvnd].

Figure 202: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r_usb_pvnd]. The user does not specify USB pipe number in Vendor class.

Figure 203: USB Peripheral Vendor Class Stack

API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer
Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

1. R_USB_PipeRead()
2. R_USB_PipeWrite()
3. R_USB_PipeStop()

- For Control Transfer
Use the following API for the class request processing.

1. R_USB_PeriControlDataGet()
2. R_USB_PeriControlDataSet()
3. R_USB_PeriControlStatusSet()

- For USB Pipe Information
The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

1. R_USB_UsedPipesGet()
2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

Limitations

This Peripheral Vendor class can not be included in composite device.

Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r_usb_pvnd folder. Also, please be sure to use your vendor ID.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Information
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

Detailed Description

Driver for the WDT peripheral on RA MCUs. This module implements the [WDT Interface](#).

Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

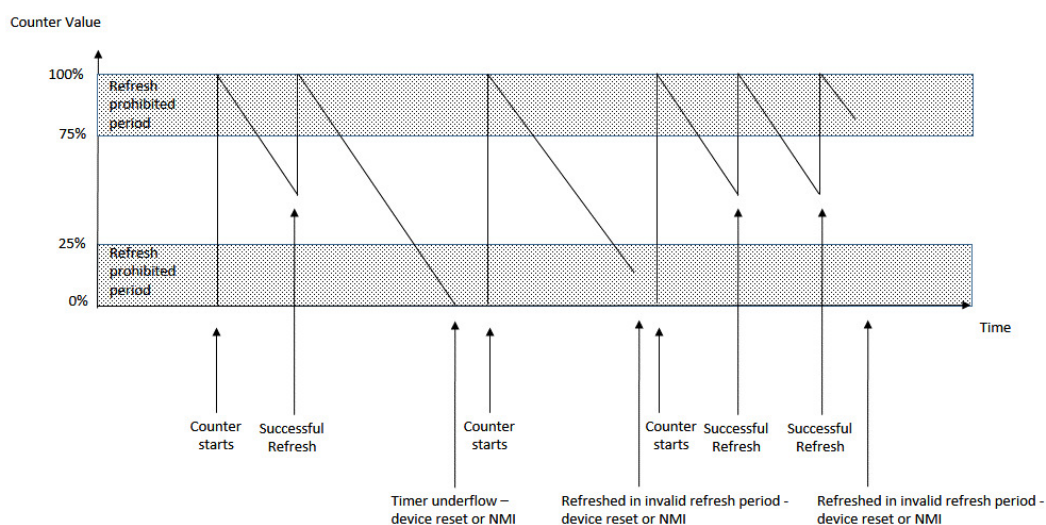

Figure 204: Watchdog Timer Operation Example

Features

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
 - Resetting of the device
 - Generation of an NMI
- The WDT has two supported modes:
 - In auto start mode, the WDT begins counting at reset.
 - In register start mode, the WDT can be started from the application.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the **OFS** settings on the **BSP** tab.

Build Time Configurations for r_wdt

The following build time configurations are defined in fsp_cfg/r_wdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	If enabled, code for NMI support in register start mode is included in the build.

Configurations for Monitoring > Watchdog (r_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	<ul style="list-style-type: none"> 1,024 Cycles 4,096 Cycles 8,192 Cycles 16,384 Cycles 	16,384 Cycles	Select the watchdog timeout in cycles.
Clock Division Ratio	<ul style="list-style-type: none"> PCLK/4 PCLK/64 PCLK/128 PCLK/512 PCLK/2048 PCLK/8192 	PCLK/8192	Select the watchdog clock divisor.
Window Start Position	<ul style="list-style-type: none"> 100% (Window Position Not Specified) 75% 50% 25% 	100% (Window Position Not Specified)	Select the allowed watchdog refresh start point.
Window End Position	<ul style="list-style-type: none"> 0% (Window 	0% (Window Position	Select the allowed

	Position Not Specified)	Not Specified)	watchdog refresh end point.
	<ul style="list-style-type: none"> • 25% • 50% • 75% 		
Reset Control	<ul style="list-style-type: none"> • Reset Output • NMI Generated 	Reset Output	Select what happens when the watchdog timer expires.
Stop Control	<ul style="list-style-type: none"> • WDT Count Enabled in Low Power Mode • WDT Count Disabled in Low Power Mode 	WDT Count Disabled in Low Power Mode	Select the watchdog state in low power mode.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the watchdog triggers.

Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling [R_WDT_StatusClear](#) before restarting the timer via [R_WDT_Refresh](#).

Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz
Clock division ratio = PCLKB / 8192
Timeout period = 16384 cycles
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz
Cycle time = 1 / 7.324 kHz = 136.53 us
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling [R_WDT_Refresh\(\)](#) after the MCU wakes from low power mode.

Examples

WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* In auto start mode, the WDT starts counting immediately when the MCU is powered
    on. */

    /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
    }
}
```

```
/* Refresh before the counter underflows to prevent reset or NMI. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
}
}
```

WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
    FSP_PARAMETER_NOT_USED(p_args);
    fsp_err_t err = FSP_SUCCESS;
    /* (Optional) Determine the source of the NMI. */
    wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    /* (Optional) Log source of NMI and any other debug information. */
    /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
    /* (Register start mode) In register start mode, call R_WDT_Refresh() to
    * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
    /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;

    /* (Optional) Enable the WDT to count and generate NMI or reset when the
     * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;

    /* (Optional) Check if the WDTRF flag is set to know if the system is
     * recovering from a WDT reset. */
    if (R_SYSTEM->RSTSR1_b.WDTRF)
    {
        /* Clear the flag. */
        R_SYSTEM->RSTSR1 = 0U;
    }

    /* Open the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize other application code. */
    /* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
     * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
     * counter is in the acceptable refresh window. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);

    while (true)
    {
        /* Application work here. */
        /* (Optional) If there is a chance the application takes less time than
         * the start window, verify the WDT counter is past the start window
         * before refreshing the WDT. */
        uint32_t wdt_counter = 0U;

    do
        {
            /* Read the current WDT counter value. */
            err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
            assert(FSP_SUCCESS == err);
```

```

    } while (wdt_counter >= WDT_START_WINDOW_75);

/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);
}
}

```

Data Structures

struct [wdt_instance_ctrl_t](#)

Data Structure Documentation

◆ wdt_instance_ctrl_t

struct [wdt_instance_ctrl_t](#)

WDT private control block. DO NOT MODIFY. Initialization occurs when [R_WDT_Open\(\)](#) is called.

Function Documentation

◆ R_WDT_Refresh()

[fsp_err_t](#) [R_WDT_Refresh](#) ([wdt_ctrl_t](#) *const *p_ctrl*)

Refresh the watchdog timer. Implements [wdt_api_t::refresh](#).

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```

/* Refresh before the counter underflows to prevent reset or NMI. */
err = R_WDT_Refresh(&g_wdt0_ctrl);
assert(FSP_SUCCESS == err);

```

Return values

FSP_SUCCESS	WDT successfully refreshed.
FSP_ERR_ASSERTION	<i>p_ctrl</i> is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function only returns FSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

◆ **R_WDT_Open()**

```
fsp_err_t R_WDT_Open ( wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg )
```

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements `wdt_api_t::open`.

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

Return values

FSP_SUCCESS	WDT successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

Note

In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.

◆ **R_WDT_StatusClear()**

```
fsp_err_t R_WDT_StatusClear ( wdt_ctrl_t *const p_ctrl, const wdt_status_t status )
```

Clear the WDT status and error flags. Implements `wdt_api_t::statusClear`.

Example:

```
/* (Optional) Clear the error flags. */
err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_WDT_StatusGet()**

```
fsp_err_t R_WDT_StatusGet ( wdt_ctrl_t*const p_ctrl, wdt_status_t*const p_status )
```

Read the WDT status flags. Implements `wdt_api_t::statusGet`.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ **R_WDT_CounterGet()**

```
fsp_err_t R_WDT_CounterGet ( wdt_ctrl_t*const p_ctrl, uint32_t*const p_count )
```

Read the current count value of the WDT. Implements `wdt_api_t::counterGet`.

Example:

```
/* Read the current WDT counter value. */
err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ **R_WDT_TimeoutGet()**

```
fsp_err_t R_WDT_TimeoutGet ( wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout )
```

Read timeout information for the watchdog timer. Implements `wdt_api_t::timeoutGet`.

Return values

FSP_SUCCESS	WDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ **R_WDT_CallbackSet()**

```
fsp_err_t R_WDT_CallbackSet ( wdt_ctrl_t *const p_ctrl, void(*)(wdt_callback_args_t *) p_callback, void const *const p_context, wdt_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `wdt_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

4.2.76 ADPCM Decoder (rm_adpcm_decoder)

Modules

Functions

```
fsp_err_t RM_ADPCM_DECODER_Open (adpcm_decoder_ctrl_t *p_ctrl, adpcm_decoder_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_ADPCM_DECODER_Decode (adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)
```

```
fsp_err_t RM_ADPCM_DECODER_Reset (adpcm_decoder_ctrl_t *p_ctrl)
```

```
fsp_err_t RM_ADPCM_DECODER_Close (adpcm_decoder_ctrl_t *p_ctrl)
```

Detailed Description

Middleware to implement the ADPCM Audio Decoder. This module implements the [ADPCM Decoder Interface](#).

Overview

Features

The ADPCM Audio Decoder has the following key features:

- Decodes 4-bit ADPCM input to 16-bit PCM output

Configuration

Build Time Configurations for rm_adpcm_decoder

The following build time configurations are defined in fsp_cfg/rm_adpcm_decoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Audio > ADPCM Decoder (rm_adpcm_decoder)

This module can be added to the Stacks tab via New Stack > Audio > ADPCM Decoder (rm_adpcm_decoder).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_adpcm_decoder0	Module name.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the ADPCM Audio Decoder implementation in an application.

```

void rm_adpcm_decoder_example ()
{
    /* Open the ADPCM audio decoder instance. */
    fsp_err_t err = RM_ADPCM_DECODER_Open(&g_adpcmdec_ctrl, &g_adpcmdec_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Decode the data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream1, g_pcm_stream,
ADPCM_BUFFER_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
    /* Reset the ADPCM audio decoder instance before decoding a new stream. */
    err = RM_ADPCM_DECODER_Reset(&g_adpcmdec_ctrl);
    assert(FSP_SUCCESS == err);
    /* Decode the first chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream2, g_pcm_stream,
(ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
    /* Decode the second chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl,
&g_adpcm_stream2[ADPCM_BUFFER_SIZE_BYTES/2],
                                g_pcm_stream, (ADPCM_BUFFER_SIZE_BYTES/2));
    assert(FSP_SUCCESS == err);
}

```

Data Structures

struct [adpcm_decoder_instance_ctrl_t](#)

Data Structure Documentation

◆ adpcm_decoder_instance_ctrl_t

struct [adpcm_decoder_instance_ctrl_t](#)

RM_ADPCM_DECODER instance control block. DO NOT INITIALIZE. Initialized in [adpcm_decoder_api_t::open\(\)](#).

Function Documentation

◆ **RM_ADPCM_DECODER_Open()**

```
fsp_err_t RM_ADPCM_DECODER_Open ( adpcm_decoder_ctrl_t * p_ctrl, adpcm_decoder_cfg_t const *const p_cfg )
```

Initializes ADPCM audio decoder device.

Implements `adpcm_decoder_api_t::open()`.

Return values

FSP_SUCCESS	Module is ready for use.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_ALREADY_OPEN	The instance control structure has already been opened.

◆ **RM_ADPCM_DECODER_Decode()**

```
fsp_err_t RM_ADPCM_DECODER_Decode ( adpcm_decoder_ctrl_t *const p_ctrl, void const * p_src, void * p_dest, uint32_t src_len_bytes )
```

Decodes 4bit ADPCM data to 16bit PCM data. It reads ADPCM data from area pointed by inputAddr pointer, decodes the number of samples specified and stores the decoded data in buffer pointed with outputAddr pointer.

Implements `adpcm_decoder_api_t::decode()`.

Return values

FSP_SUCCESS	Decode operation successfully completed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ **RM_ADPCM_DECODER_Reset()**

```
fsp_err_t RM_ADPCM_DECODER_Reset ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function resets the ADPCM decoder device.

Implements `adpcm_decoder_api_t::reset()`.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

◆ RM_ADPCM_DECODER_Close()

```
fsp_err_t RM_ADPCM_DECODER_Close ( adpcm_decoder_ctrl_t * p_ctrl)
```

This function closes the ADPCM decoder device.

Implements `adpcm_decoder_api_t::close()`.

Return values

FSP_SUCCESS	Module closed.
FSP_ERR_ASSERTION	An input argument is invalid.
FSP_ERR_NOT_OPEN	Unit is not open.

4.2.77 Audio Playback with PWM (rm_audio_playback_pwm)

Modules

Functions

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open (audio_playback_ctrl_t *const
p_api_ctrl, audio_playback_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start (audio_playback_ctrl_t *const
p_api_ctrl)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop (audio_playback_ctrl_t *const
p_api_ctrl)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play (audio_playback_ctrl_t *const
p_api_ctrl, void const *const p_buffer, uint32_t length)
```

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close (audio_playback_ctrl_t *const
p_api_ctrl)
```

Detailed Description

Driver for the Audio Playback middleware on RA MCUs. This module implements the [AUDIO PLAYBACK Interface](#).

Overview**Features**

The Audio Playback with PWM middleware is used to play audio streams at user selected playback rate using Pulse Width Modulation hardware on GPT or AGT timers. This module can play the 16 bit

uncompressed, unsigned PCM audio stream when AGT is selected as PWM interface and can play 32 bit uncompressed, unsigned PCM audio stream when GPT is used as PWM interface. The application code is expected to convert the signed PCM data to unsigned PCM data and scale it with the playback rate before starting the playback.

Configuration

Build Time Configurations for rm_audio_playback_pwm

The following build time configurations are defined in fsp_cfg/rm_audio_playback_pwm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	Select if DMAC will be used.

Configurations for Audio > Audio Playback PWM (rm_audio_playback_pwm)

This module can be added to the Stacks tab via New Stack > Audio > Audio Playback PWM (rm_audio_playback_pwm).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_rm_audio_playback0	Module name.
General > Playback Speed (Hz)	Manual Entry	44100	Enter playback sample rate in Hz.
Interrupts > Callback	Name must be a valid C symbol	g_rm_audio_playback0_callback	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the playback completes.
PWM Output Pin	<ul style="list-style-type: none"> Pin A Pin B 	Pin A	Select which timer output pin should be used for audio output.

Clock Configuration

The Audio Playback with PWM module does not require a specific clock configuration.

Pin Configuration

Configure the PWM output pins for selected PWM HAL layer peripheral (AGT/GPT). One of the following pins needs to be selected and enabled as PWM output for selected channel n,

If GPT is used as PWM interface,

- GTIOCA_n
- GTIOCB_n

If AGT is used as PWM interface,

- AGTOA_n
- AGTOB_n

Usage Notes

DMAC/DTC Integration

DMAC/DTC is used as a lower level transfer instance with this module and is operated in Normal mode to transfer 16 bit or 32 bit data from the audio stream buffer to the PWM peripheral AGT or GPT respectively. Destination address for transfer instance needs to be the Duty Cycle setting register GTCCR for GPT as PWM driver or AGTMA/AGTCMB in case of AGT as PWM driver. The Audio Playback with PWM module internally configures 'Transfer Size' as 2 Bytes if AGT is used for PWM generation, otherwise it configures 'Transfer Size' as 4 Bytes if GPT is used for PWM generation.

Examples

Basic Example

This is a basic example of minimal use of the RM_AUDIO_PLAYBACK_PWM in an application. This example shows how this driver can be used for playing a 16 bit uncompressed PCM audio from a single input buffer.

```
int16_t play_buffer[AUDIO_EXAMPLE_LENGTH];
uint32_t g_audio_callback_counter = 0;
void g_audio_example_counter_callback (audio_playback_callback_args_t * p_args)
{
    if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
        g_audio_callback_counter++;
    }
}
void basic_example (void)
{
    fsp_err_t err;

    /* Initialize the Audio Playback module for playing an audio stream. */
    err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

```
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Set the 16 Bit PCM audio stream to play next */
err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Start to the play the selected audio stream*/
err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* Wait till the playback is completed */
while (g_audio_callback_counter == 0)
{
    ;
}

/* Stop playing. */
err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
}
```

Streaming Example

This is an example of using Audio Playback module to play audio stream. This application uses a double buffer to store PCM sine wave data. It starts playing in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart playing in the main loop. This example also demonstrates conversion of signed PCM format data to unsigned PWM format data along with scaling the data samples for optimum PWM wave generation.

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_PERIOD_VALUE_AT_22050HZ (0x11B7U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER (1024U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_CONVERT_TO_PWM_SAMPLES (32768U)
```

```

```

Data Structures

```
struct audio_playback_pwm_instance_ctrl_t
```

Data Structure Documentation

◆ audio_playback_pwm_instance_ctrl_t

```
struct audio_playback_pwm_instance_ctrl_t
```

AUDIO_PLAYBACK_PWM instance control block. DO NOT MODIFY. Initialization occurs when [RM_AUDIO_PLAYBACK_PWM_Open\(\)](#) is called.

Data Fields

void(*	p_callback)(audio_playback_callback_args_t *p_args)
void *	p_context
audio_playback_cfg_t const *	p_cfg
	Pointer to the configuration structure.
uint32_t	open
	Used by driver to check if the control structure is valid.
timer_instance_t const *	p_lower_lvl_timer
	Timer API used to generate sampling frequency and GPT/AGT API used to access PWM hardware.
transfer_instance_t const *	p_lower_lvl_transfer
	Transfer API used to transfer data each sampling frequency.

Field Documentation

◆ **p_callback**

```
void(* audio_playback_pwm_instance_ctrl_t::p_callback) (audio_playback_callback_args_t *p_args)
```

Callback called when play is complete.

◆ **p_context**

```
void* audio_playback_pwm_instance_ctrl_t::p_context
```

Placeholder for user data. Passed to the user callback in [audio_playback_callback_args_t](#).

Function Documentation◆ **RM_AUDIO_PLAYBACK_PWM_Open()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open ( audio_playback_ctrl_t *const p_api_ctrl,
audio_playback_cfg_t const *const p_cfg )
```

Opens and configures the Audio Playback with PWM driver. Sets playback speed and transfer rate to read the audio buffer.

Example:

```
/* Initialize the Audio Playback module for playing an audio stream. */
err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

Return values

FSP_SUCCESS	Audio Playback module successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL.

◆ **RM_AUDIO_PLAYBACK_PWM_Start()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start ( audio_playback_ctrl_t *const p_api_ctrl)
```

Start the PWM HAL driver (AGT or GPT) and timer HAL (AGT or GPT) drivers.

• Example:

```
/* Start to the play the selected audio stream*/
err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Audio playback hardware started successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls <ul style="list-style-type: none"> • timer_api_t::start

◆ **RM_AUDIO_PLAYBACK_PWM_Stop()**

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop ( audio_playback_ctrl_t *const p_api_ctrl)
```

Stop the PWM HAL driver (AGT or GPT) and timer HAL driver (AGT or GPT).

• Example:

```
/* Stop playing. */
err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Audio playback hardware stopped successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not open. This function calls <ul style="list-style-type: none"> • timer_api_t::stop

◆ RM_AUDIO_PLAYBACK_PWM_Play()

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play ( audio_playback_ctrl_t *const p_api_ctrl, void const *const p_buffer, uint32_t length )
```

Play a single audio buffer by input samples to the PWM HAL (AGT or GPT) at the sampling frequency configured by the timer.

- Example:

```
/* Set the 16 Bit PCM audio stream to play next */
err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Buffer playback began successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_buffer is NULL or buffer length is greater than 0x10000.
FSP_ERR_NOT_OPEN	Driver not open.. This function calls <ul style="list-style-type: none"> • transfer_api_t::reset

◆ RM_AUDIO_PLAYBACK_PWM_Close()

```
fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close ( audio_playback_ctrl_t *const p_api_ctrl)
```

Closes the module driver. Enables module stop mode.

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function will close all the lower level HAL drivers as well.

4.2.78 AWS PKCS11 PAL (rm_aws_pkcs11_pal)

Modules

PKCS#11 PAL layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.

Configuration

There is no user configuration for this module

Data Flash Usage

The current implementation utilizes 16K of Data flash of which 8K is used for storage and the other 8K is used for backup.

Usage Notes

Limitations

- Interrupts are disabled while write or erase operations are being performed.
- Credentials are stored on data flash with no tamper protection other than SHA256 for integrity.
- Credential access is not limited in any way. The credential access and tamper issues can be resolved by updating the implementation to use code flash instead of data flash and using the Secure MPU to control access to it.

4.2.79 AWS PKCS11 PAL LITTLEFS (rm_aws_pkcs11_pal_littlefs)

Modules

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: <https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html>.

Configuration

There is no user configuration for this module

Usage Notes

The current implementation utilizes [LittleFS Flash Port \(rm_littlefs_flash\)](#) for storage.

Limitations

- Credential access is not limited in any way.

4.2.80 AWS Transport Interface Port (rm_aws_transport_interface_port)

Modules

Middleware implementing a transport interface through MbedTLS and PKCS11.

Overview

This module implements a transport interface that provides an interface between MbedTLS and CoreMQTT/CoreHTTP. At a lower level the transport interface connects to a sockets wrapper in order to call down to the Cellular API.

Note

When using this transport interface with Cellular modules the user should call `Cellular_Init()` before trying to connect to anything.

Examples

MQTT Example

```
#define EXAMPLE_PDN_CONTEXT_NUMBER (1)
#define EXAMPLE_TIMEOUT_MS (5000)
#define EXAMPLE_DISABLE_SNI (false)
#define EXAMPLE_MQTT_HOST ("mqtt_host_server")
#define EXAMPLE_MQTT_HOST_PORT (8883)
#define EXAMPLE_MQTT_SEND_TIMEOUT (5000)
#define EXAMPLE_MQTT_RECEIVE_TIMEOUT (5000)
#define EXAMPLE_MQTT_TOPIC ("example_topic")
#define EXAMPLE_MQTT_CLIENT_IDENTIFIER ("client_id")
#define EXAMPLE_MQTT_KEEP_ALIVE_SECONDS (60)
```

```

#define EXAMPLE_MQTT_PAYLOAD ("helloworld")

Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard services defined by standardization organization and custom services defined by user. [Bluetooth LE Profile API Document User's Manual](#) describes the APIs for standard services.

Features

The Bluetooth Low Energy Abstraction module supports the following features:

- following GAP Role support
 - Central: The device that sends a connection request to the Peripheral device.
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
 - Observer : The device that scans for advertising.
 - Broadcaster : The device that sends advertising.

- LE 2M PHY
 - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
 - Up to four independent adverts can be executed simultaneously.
 - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
 - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
 - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
 - The ability to support non-connectable advertising with a minimum interval of up to 20 msec.
- LE Secure Connections
 - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
 - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
 - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
 - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
 - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
 - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
 - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
 - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

BLE library feature	Extended	Balance	Compact
GAP Role	Central Peripheral Observer Broadcaster	Central Peripheral Observer Broadcaster	Peripheral Broadcaster
LE 2M PHY	Yes	Yes	No
LE Coded PHY	Yes	Yes	No
LE Advertising Extensions	Yes	No	No

LE Channel Selection Algorithm #2	Yes	Yes	No
High Duty Cycle Non-Connectable Advertising	Yes	Yes	Yes
LE Secure Connections	Yes	Yes	Yes
Link Layer privacy	Yes	Yes	Yes
Link Layer Extended Scanner Filter policies	Yes	Yes	No
LE Data Packet Length Extension	Yes	Yes	Yes
LE L2CAP Connection Oriented Channel Support	Yes	No	No
Low Duty Cycle Directed Advertising	Yes	Yes	Yes
LE Link Layer Topology	Yes	Yes	No
LE Ping	Yes	Yes	Yes
32-bit UUID Support in LE	Yes	Yes	Yes

Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enable • Disable 	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7	7	Maximum number of connections.

Maximum connection data length	Value must be an integer between 27 and 251	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2	2	Maximum periodic sync set number.
Store Security Data	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7	7	Number of remote device bonding information.
Connection Event Start Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start	<ul style="list-style-type: none"> • Disable 	Disable	Set RF_DEEP_SLEEP

Notify	<ul style="list-style-type: none"> • Enable 		start notify enable/disable.
RF Deep Sleep Wakeup Notify	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15	6	Load capacitance adjustment.
DC-DC converter	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Set DC-DC converter for RF part.
Slow Clock Source	<ul style="list-style-type: none"> • Use RF_LOCO • Use External 32.768kHz 	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	<ul style="list-style-type: none"> • P109 • P205 	P109	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	<ul style="list-style-type: none"> • MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz 	MCU CLKOUT frequency 32.768kHz	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500	250	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	<ul style="list-style-type: none"> • max +0dBm • max +4dBm 	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	<ul style="list-style-type: none"> • High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +4dBm) 	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW).

Configuration	Options	Default	Description
CLKOUT_RF Output	<ul style="list-style-type: none"> No output 4MHz output 2MHz output 1MHz output 	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	<ul style="list-style-type: none"> Disable Enable 	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an integer between 23 and 247	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10	10	The maximum number of timer slot.

Configurations for Networking > BLE Abstraction (rm_ble_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ble_abs0	Module name.
General > Gap callback	Name must be a valid C symbol	gap_cb	A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to

			NULL.
General > Vendor specific callback	Name must be a valid C symbol	vs_cb	A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used, set to NULL.
General > GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	Set GATT server callback parameter. If QE is used, set to NULL.
General > GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
General > GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to NULL.
General > GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.
Security > Pairing parameters	Name must be a valid C symbol	gs_abs_pairing_param	Set pairing parameters.
Security > IO capabilities of local device.	<ul style="list-style-type: none"> • BLE_GAP_IOCAP_DISPLAY_ONLY • BLE_GAP_IOCAP_DISPLAY_YESN O • BLE_GAP_IOCAP_KEYBOARD_ON LY • BLE_GAP_IOCAP_NOINPUT_NOO UTPUT • BLE_GAP_IOCAP_KEYBOARD_DI SPLAY 	BLE_GAP_IOCAP_NOINP UT_NOOUTPUT	Select IO capabilities of local device.
Security > MITM protection policy.	<ul style="list-style-type: none"> • BLE_GAP_SEC_MITM_BEST_EFF ORT • BLE_GAP_SEC_MITM_STRICT 	BLE_GAP_SEC_MITM_BE ST_EFFORT	Select MITM protection policy.
Security > Determine whether to accept only Secure Connections or not.	<ul style="list-style-type: none"> • BLE_GAP_SC_BE ST_EFFORT • BLE_GAP_SC_ST RICT 	BLE_GAP_SC_BEST_EFF ORT	Select determine whether to accept only Secure Connections or not.
Security > Type of keys to be distributed from	<ul style="list-style-type: none"> • BLE_GAP_KEY_D IST_ENCKEY 		Select type of keys to be distributed from

local device.	<ul style="list-style-type: none"> • BLE_GAP_KEY_D IST_IDKEY • BLE_GAP_KEY_D IST_SIGNKEY 	local device.	
Security > Type of keys which local device requests a remote device to distribute.	<ul style="list-style-type: none"> • BLE_GAP_KEY_D IST_ENCKEY • BLE_GAP_KEY_D IST_IDKEY • BLE_GAP_KEY_D IST_SIGNKEY 	Set type of keys which local device requests a remote device to distribute.	
Security > Maximum LTK size.	Valid range is 7 - 16	16	Set Maximum LTK size.
Interrupts > Callback provided when an ISR occurs	Name must be a valid C symbol	NULL	Callback provided when BLE ABS ISR occurs

Clock Configuration

Note

System clock (ICLK): 8 MHz or more

Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.

It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Examples

BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
```

```
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',  
'm', 'p', 'l', 'e'

Data Structure Documentation

◆ [abs_advertising_parameter_t](#)

struct abs_advertising_parameter_t		
advertising set parameters structure		
Data Fields		
union abs_advertising_parameter_t	advertising_parameter	Advertising parameters.
uint32_t	advertising_status	Advertising status.
ble_device_address_t	remote_device_address	Remote device address for direct advertising.

◆ [abs_scan_parameter_t](#)

struct abs_scan_parameter_t
scan parameters structure

Data Fields		
ble_abs_scan_parameter_t	scan_parameter	Scan parameters.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_1M	1M phy parameters for scan.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_coded	Coded phy parameters for scan. */.
uint32_t	scan_status	

◆ **ble_abs_instance_ctrl_t**

Data Fields		
struct ble_abs_instance_ctrl_t		
BLE ABS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_ABS_Open() is called.		
Data Fields		
uint32_t	open	Indicates whether the open() API has been successfully called.
void const *	p_context	Placeholder for user data. Passed to the user callback in ble_abs_callback_args_t .
ble_gap_application_callback_t	abs_gap_callback	GAP callback function.
ble_vendor_specific_application_callback_t	abs_vendor_specific_callback	Vendor specific callback function.
ble_abs_delete_bond_application_callback_t	abs_delete_bond_callback	Delete bond information callback function.
uint32_t	connection_timer_handle	Cancel a request for connection timer.
uint32_t	advertising_timer_handle	Advertising timer for legacy advertising.
uint32_t	scan_timer_handle	Scan interval timer.
abs_advertising_parameter_t	advertising_set s[BLE_MAX_NO_OF_ADV_SETS_SUPPORTED]	Advertising set information.
abs_scan_parameter_t	abs_scan	Scan information.
st_ble_dev_addr_t	loc_bd_addr	Local device address.
uint8_t	privacy_mode	Privacy mode.
uint32_t	set_privacy_status	Local privacy status.
ble_abs_timer_t	timer[BLE_ABS_CFG_TIMER_NUMBER_OF_SLOT]	
uint8_t	local_irk[BLE_GAP_IRK_SIZE]	
ble_abs_identity_address_info_t	identity_address_info	

uint32_t	current_timeout_ms	Current timeout.
uint32_t	elapsed_timeout_ms	Elapsed timeout.
ble_abs_cfg_t const *	p_cfg	Pointer to the BLE ABS configuration block.

◆ st_ble_rf_notify_t

struct st_ble_rf_notify_t		
This structure is RF event notify management.		
Data Fields		
uint32_t	enable	Set enable/disable of each RF event notification. Bit0 Notify Connection event start(0:Disable/1:Enable) Bit1 Notify Advertising event start(0:Disable/1:Enable) Bit2 Notify Scanning event start(0:Disable/1:Enable) Bit3 Notify Initiating event start(0:Disable/1:Enable) Bit4 Notify Connection event close(0:Disable/1:Enable) Bit5 Notify Advertising event close(0:Disable/1:Enable) Bit6 Notify Scanning event close(0:Disable/1:Enable) Bit7 Notify Initiating event close(0:Disable/1:Enable) Bit8 Notify RF_DEEP_SLEEP event start(0:Disable/1:Enable) Bit9 Notify RF_DEEP_SLEEP event close(0:Disable/1:Enable) Other Bit: Reserved for future use.
ble_rf_notify_cb_t	start_cb	Set callback function pointer for RF event start.
ble_rf_notify_cb_t	close_cb	Set callback function pointer for RF event close.
ble_rf_notify_cb_t	dsleep_cb	Set callback function pointer for RF_DEEP_SLEEP.

Typedef Documentation

◆ **ble_abs_timer_cb_t**

```
typedef void(* ble_abs_timer_cb_t) (uint32_t timer_hdl)
```

The timer callback invoked when the timer expired.

◆ **ble_mcu_clock_change_cb_t**

```
ble_mcu_clock_change_cb_t
```

ble_mcu_clock_change_cb_t is the callback function type to use CLKOUT_RF as the MCU main clock source.

Parameters

none	
------	--

Returns

none

◆ **ble_rf_notify_cb_t**

```
ble_rf_notify_cb_t
```

ble_rf_notify_cb_t is the RF event notify callback function type.

Parameters

[in]	uint32_t	The information of RF event notification.
------	----------	---

Returns

none

Enumeration Type Documentation◆ **e_ble_timer_type_t**

```
enum e_ble_timer_type_t
```

The timer type.

Enumerator	
BLE_TIMER_ONE_SHOT	One shot timer type
BLE_TIMER_PERIODIC	Periodic timer type

Function Documentation

◆ RM_BLE_ABS_Open()

```
fsp_err_t RM_BLE_ABS_Open ( ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg )
```

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_INVALID_CHANNEL	The channel number is invalid.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements [ble_abs_api_t::open](#).

Example:

```
/* Open the module. */
err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

◆ **RM_BLE_ABS_Close()**

```
fsp_err_t RM_BLE_ABS_Close ( ble_abs_ctrl_t *const p_ctrl)
```

Close the BLE channel. Implements `ble_abs_api_t::close`.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ **RM_BLE_ABS_Reset()**

```
fsp_err_t RM_BLE_ABS_Reset ( ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback )
```

BLE is reset with this function. The process is carried out in the following order. [R_BLE_Close\(\)](#) -> [R_BLE_GAP_Terminate\(\)](#) -> [R_BLE_Open\(\)](#) -> [R_BLE_SetEvent\(\)](#). The `init_cb` callback initializes the others (Host Stack, timer, etc...). Implements [ble_abs_api_t::reset](#).

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

This function is not implemented. To perform this function call [R_BLE_Close](#) followed by [R_BLE_Open](#). Implements [ble_abs_api_t::reset](#).

Return values

FSP_ERR_UNSUPPORTED	Function is not supported
---------------------	---------------------------

◆ **RM_BLE_ABS_StartLegacyAdvertising()**

```
fsp_err_t RM_BLE_ABS_StartLegacyAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter )
```

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.

FSP_ERR_INVALID_ARGUMENT

The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startLegacyAdvertising](#)

Example:

```
/* Start advertising. */
err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

◆ RM_BLE_ABS_StartExtendedAdvertising()

```
fsp_err_t RM_BLE_ABS_StartExtendedAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter )
```

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements [ble_abs_api_t::startExtendedAdvertising](#)

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

◆ RM_BLE_ABS_StartNonConnectableAdvertising()

```
fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter )
```

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startNonConnectableAdvertising](#).

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Feature not yet supported.

◆ RM_BLE_ABS_StartPeriodicAdvertising()

```
fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter )
```

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements [ble_abs_api_t::startPeriodicAdvertising](#)

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

◆ RM_BLE_ABS_StartScanning()

```
fsp_err_t RM_BLE_ABS_StartScanning ( ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t
const *const p_scan_parameter )
```

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements `ble_abs_api_t::startScanning`.

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The scan parameter is out of range.
FSP_ERR_IN_USE	This API is called in scanning.
FSP_ERR_BLE_ABS_NOT_FOUND	Usable timer slot not found.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements `ble_abs_api_t::startScanning`.

Example:

```
/* Start scanning. */
err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

◆ RM_BLE_ABS_CreateConnection()

```
fsp_err_t RM_BLE_ABS_CreateConnection ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_connection_parameter_t const *const p_connection_parameter )
```

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_IN_USE	This API is called while creating a link by previous API call.
FSP_ERR_BLE_ABS_NOT_FOUND	Couldn't find a valid timer.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has been established, BLE_GAP_EVENT_CONN_IND event is notified. Implements [ble_abs_api_t::createConnection](#).

Example:

```
/* Create connection with remote device. */
err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as

	NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

◆ RM_BLE_ABS_SetLocalPrivacy()

```
fsp_err_t RM_BLE_ABS_SetLocalPrivacy ( ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk,
uint8_t privacy_mode )
```

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Example:

```
/* Set local privacy. */
err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements [ble_abs_api_t::setLocalPrivacy](#)

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

◆ RM_BLE_ABS_StartAuthentication()

```
fsp_err_t RM_BLE_ABS_StartAuthentication ( ble_abs_ctrl_t *const p_ctrl, uint16_t
connection_handle )
```

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The connection handle parameter is out of range.

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by [RM_BLE_ABS_Open\(\)](#) or [R_BLE_GAP_SetPairingParams\(\)](#). If the pairing parameters are configure by [RM_BLE_ABS_Open\(\)](#),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements [ble_abs_api_t::startAuthentication](#).

Example:

```
/* Start authentication with remote device. */
err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

◆ RM_BLE_ABS_DeleteBondInformation()

```
fsp_err_t RM_BLE_ABS_DeleteBondInformation ( ble_abs_ctrl_t *const p_ctrl,
ble_abs_bond_information_parameter_t const *const p_bond_information_parameter )
```

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements [ble_abs_api_t::deleteBondInformation](#).

Example:

```
/* Delete bonding information. */
err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_ImportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ImportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Import key information to BLE stack and storage. Implements `ble_abs_api_t::importKeyInformation`.

Example:

```
/* Import local key information. */
err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter <code>p_instance_ctrl</code> is NULL.
FSP_ERR_INVALID_POINTER	The parameter <code>p_local_identity_address</code> , <code>p_local_irk</code> or <code>p_local_csrk</code> is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_HW_CONDITION	Failure to access internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

◆ RM_BLE_ABS_ExportKeyInformation()

```
fsp_err_t RM_BLE_ABS_ExportKeyInformation ( ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *
p_local_identity_address, uint8_t * p_local_irk, uint8_t * p_local_csrk )
```

Export key information to BLE stack and storage. Implements `ble_abs_api_t::exportKeyInformation`.

Example:

```
/* Export local key information. */
err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_BUFFER_EMPTY	Dynamic memory allocation failed.
FSP_ERR_OUT_OF_MEMORY	Failure to access internal storage.
FSP_ERR_NOT_INITIALIZED	Not initialized internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

4.2.82 Bluetooth Low Energy Abstraction with RYZ012 (rm_ble_abs_spp)**Modules**

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the [BLE ABS Interface](#).

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the [QE for BLE](#). QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The connection to the host is done through connecting the module to a PMOD on the development board. The `rm_ble_abs_spp` driver interfaces with the RYZ012 module over UART.

Features

The Bluetooth Low Energy Abstraction module with SPP supports the following features:

- Common functionality
 - Open/Close the BLE protocol stack.
 - Setting Transmit Power Level.
- The following GAP Role support
 - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
 - Initialize the Host stack.
 - Setting address.
 - Start/Stop Advertising.
 - Connect/Disconnect a link.
- GATT Common functionality
 - Get MTU Size.
- GATT Server functionality
 - Initialization of GATT Server.
 - Loading of Profile definition.
 - Notification of characteristics modification.
 - Read/Write of GATT Profile from host.

Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA6 line of devices using a PMOD connector for the RYZ012 module
- RA4 Line of devices using a PMOD connector for the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enable • Disable 	Default (BSP)	Specify whether to include code for API parameter checking.
Reset Port	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin port for the MCU.
Reset Pin	Refer to the RA Configuration tool for available options.	10	Specify the module reset pin for the MCU.
UART/SPI Select Port (PB5)	Refer to the RA Configuration tool for available options.	03	Specify the module PB5 port for the MCU.
UART/SPI Select Pin (PB5)	Refer to the RA Configuration tool for available options.	11	Specify the module PB5 pin for the MCU.

Transmit Power Level (in dBm)	Refer to the RA Configuration tool for available options.	4.57	Specify the module transmit power in dBm.
-------------------------------	---	------	---

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ble_abs0	Module name.
General > GAP callback	Name must be a valid C symbol	gap_cb	If QE is used, set to NULL.
General > Vendor specific callback	Name must be a valid C symbol	vs_cb	If QE is used, set to NULL.
General > GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	If QE is used, set to NULL.
General > GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
General > GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to NULL.
General > GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.

Pin Configuration

Refer to [Serial Communications Interface \(SCI\) UART \(r_sci_uart\)](#). [R_SCI_UART_Open\(\)](#) is called by [Bluetooth Low Energy Abstraction with RYZ012 \(rm_ble_abs_spp\)](#)

GPIO pins used by the BLE driver to control RYZ012:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI from module communication. UART is selected with output low and SPI with output high.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close

- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the E2 Studio Configurator is 4.5 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
    FSP_PARAMETER_NOT_USED(result);
    FSP_PARAMETER_NOT_USED(p_data);
    switch (type)
    {
    case BLE_GAP_EVENT_STACK_ON:
        {
            g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
            break;
        }
    case BLE_GAP_EVENT_ADV_ON:
        {
            st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;

            g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_ON;

            break;
        }
    case BLE_GAP_EVENT_ADV_OFF:
        {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;

            break;
        }
    case BLE_GAP_EVENT_CONN_IND:
        {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
        }
    }
```

```
break;
    }
    {
/* Do nothing. */
break;
    }
default:
break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)

Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the [Block Media Interface](#).

Overview

Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
```

```
    g_src[i] = (uint8_t) ('A' + (i % 26));
}

/* Open the RM_BLOCK_MEDIA_SDMMC driver. */
fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);

/* Handle any errors. This function should be defined by the user. */
assert(FSP_SUCCESS == err);

/* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
* "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);

/* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
assert(FSP_SUCCESS == err);

/* Write a block of data to sector 3 of an SD card. */
err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
assert(FSP_SUCCESS == err);

/* Read a block of data from sector 3 of an SD card. */
err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ **RM_BLOCK_MEDIA_SDMMC_Open()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg )
```

Opens the module.

Implements `rm_block_media_api_t::open()`.

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `sdmmc_api_t::open`

◆ **RM_BLOCK_MEDIA_SDMMC_MediaInit()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements `rm_block_media_api_t::mediaInit()`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `sdmmc_api_t::mediaInit`

◆ **RM_BLOCK_MEDIA_SDMMC_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const
p_dest_address, uint32_t const block_address, uint32_t const num_blocks )
```

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements [rm_block_media_api_t::read\(\)](#).

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc_api_t::read](#)

◆ **RM_BLOCK_MEDIA_SDMMC_Write()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const
*const p_src_address, uint32_t const block_address, uint32_t const num_blocks )
```

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements [rm_block_media_api_t::write\(\)](#).

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc_api_t::write](#)

◆ **RM_BLOCK_MEDIA_SDMMC_Erase()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
block_address, uint32_t const num_blocks )
```

Erases sectors of an SD card or eMMC device. Implements [rm_block_media_api_t::erase\(\)](#).

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [sdmmc_api_t::erase](#)
- [sdmmc_api_t::statusGet](#)

◆ **RM_BLOCK_MEDIA_SDMMC_CallbackSet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements [rm_block_media_api_t::callbackSet](#).

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ **RM_BLOCK_MEDIA_SDMMC_StatusGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet ( rm_block_media_ctrl_t *const p_api_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status. Implements `rm_block_media_api_t::statusGet()`.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_BLOCK_MEDIA_SDMMC_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information. Implements `rm_block_media_api_t::infoGet()`.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM_BLOCK_MEDIA_SDMMC_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes an open SD/MMC device. Implements `rm_block_media_api_t::close()`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.84 SPI Block Media Implementation (rm_block_media_spi)

Modules

Functions

fsp_err_t	RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void const *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the [Block Media Interface](#).

Overview

Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

Note

By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.

Configuration

Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected, code for parameter checking is included in the build

Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.
[DEPRECATED] Callback Context	Name must be a valid C symbol	NULL	A user specified context that will be provided back to the user when a callback occurs.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

Examples

Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)

uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the RM_BLOCK_MEDIA_SPI driver. */
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);

    /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

```
}
```

Non-Blocking Example

This is a basic example of using the optional SPI callback to impliment non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }

    /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
    &g_rm_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
    RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
}

/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
* been blocked by the lower level SPI driver busy indication.
*/
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
    if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
```

```
/* TODO: Process operation complete. */
}
else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
{
    rm_block_media_status_t status;
    rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
    fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
    assert(FSP_SUCCESS == err);
    if (true == status.busy)
    {
        /* Run waiting tasks */
        vTaskSuspend(xTaskGetCurrentTaskHandle());
    }
}
else
{
    assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
    /* TODO: Process Read, Write, or Erase error. */
}
}
```

Function Documentation

◆ **RM_BLOCK_MEDIA_SPI_Open()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Open ( rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t
const *const p_cfg )
```

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements `rm_block_media_api_t::open`.

Return values

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

Returns

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::open`

◆ **RM_BLOCK_MEDIA_SPI_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information.

Implements `rm_block_media_api_t::infoGet`.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM_BLOCK_MEDIA_SPI_MediaInit()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the Block Media SPI Flash device.

Implements `rm_block_media_api_t::mediaInit`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_BLOCK_MEDIA_SPI_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest,
uint32_t const start_block, uint32_t const num_blocks )
```

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::read`.

Return values

FSP_SUCCESS	SPI data read successfully
FSP_ERR_ASSERTION	p_ctrl or p_dest is NULL, or num_blocks is zero
FSP_ERR_NOT_OPEN	Block Media SPI module is not yet open
FSP_ERR_INVALID_ADDRESS	Invalid address range for read operation
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

◆ RM_BLOCK_MEDIA_SPI_StatusGet()

```
fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status.

Implements `rm_block_media_api_t::statusGet`.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::statusGet`

◆ RM_BLOCK_MEDIA_SPI_Write()

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const
p_src, uint32_t const start_block, uint32_t const num_blocks )
```

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::write`.

Return values

FSP_SUCCESS	Flash write finished successfully.
FSP_ERR_ASSERTION	p_ctrl or p_src is NULL. Or num_blocks is zero.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

Returns

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::write`

◆ **RM_BLOCK_MEDIA_SPI_CallbackSet()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements `rm_block_media_api_t::callbackSet`.

Return values

FSP_ERR_UNSUPPORTED	API not supported by RM_BLOCK_MEDIA_SPI.
---------------------	--

◆ **RM_BLOCK_MEDIA_SPI_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes the Block Media SPI device. Implements `rm_block_media_api_t::close`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	One of the following parameters may be null: <code>p_ctrl</code> .
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.

Returns

See [Common Error Codes](#) or HAL driver for other possible return codes or causes. This function calls

- `spi_flash_api_t::close`

◆ RM_BLOCK_MEDIA_SPI_Erase()

```
fsp_err_t RM_BLOCK_MEDIA_SPI_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
start_block, uint32_t const num_blocks )
```

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements `rm_block_media_api_t::erase`.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `spi_flash_api_t::erase`
- `spi_flash_api_t::statusGet`

4.2.85 USB HMSC Block Media Implementation (rm_block_media_usb)

Modules

Functions

```
fsp_err_t RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit (rm_block_media_ctrl_t *const
p_ctrl)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Read (rm_block_media_ctrl_t *const p_ctrl,
uint8_t *const p_dest_address, uint32_t const block_address,
uint32_t const num_blocks)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Write (rm_block_media_ctrl_t *const p_ctrl,
uint8_t const *const p_src_address, uint32_t const block_address,
uint32_t const num_blocks)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Erase (rm_block_media_ctrl_t *const p_ctrl,
uint32_t const block_address, uint32_t const num_blocks)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet (rm_block_media_ctrl_t *const
```

```
p_ctrl, void(*p_callback)(rm_block_media_callback_args_t*), void
const *const p_context, rm_block_media_callback_args_t *const
p_callback_memory)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet (rm_block_media_ctrl_t *const
p_api_ctrl, rm_block_media_status_t *const p_status)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info)
```

```
fsp_err_t RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const p_ctrl)
```

Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the [Block Media Interface](#).

Overview

Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_usb

The following build time configurations are defined in driver/rm_block_media_usb_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media USB (rm_block_media_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm_block_media_usb).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this

callback function is provided, it will be called when a device is attached or removed.

A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed.

Pointer to user context Name must be a valid C symbol NULL

Note

RM_BLOCK_MEDIA_USB_MediaInit function must be called after receiving the insert event notification.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t      g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t      g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
    /* Initialize g_src to known data */
    for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
        g_src[i] = (uint8_t) ('A' + (i % 26));
    }
    /* Open the RM_BLOCK_MEDIA_USB driver. */
    fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
while (!g_usb_inserted)
    {
    /* Wait for a card insertion interrupt. */
    }

    /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);

    /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);

    /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
    if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
        g_usb_inserted = true;
    }

    if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
        g_usb_inserted = false;
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_USB_Open()

```
fsp_err_t RM_BLOCK_MEDIA_USB_Open ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_cfg_t const *const p_cfg )
```

Opens the module.

Implements `rm_block_media_api_t::open()`.

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_MediaInit()

```
fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit ( rm_block_media_ctrl_t *const p_ctrl)
```

Initializes the USB device.

Implements `rm_block_media_api_t::mediaInit()`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_BLOCK_MEDIA_USB_Read()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Read ( rm_block_media_ctrl_t *const p_ctrl, uint8_t *const
p_dest_address, uint32_t const block_address, uint32_t const num_blocks )
```

Reads data from an USB device. Implements `rm_block_media_api_t::read()`.

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_BLOCK_MEDIA_USB_Write()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Write ( rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const
p_src_address, uint32_t const block_address, uint32_t const num_blocks )
```

Writes data to an USB device. Implements `rm_block_media_api_t::write()`.

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Erase()

```
fsp_err_t RM_BLOCK_MEDIA_USB_Erase ( rm_block_media_ctrl_t *const p_ctrl, uint32_t const
block_address, uint32_t const num_blocks )
```

Erases sectors of an USB device. Implements `rm_block_media_api_t::erase()`.

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_CallbackSet()

```
fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet ( rm_block_media_ctrl_t *const p_ctrl,
void(*) (rm_block_media_callback_args_t *) p_callback, void const *const p_context,
rm_block_media_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure. Implements `rm_block_media_api_t::callbackSet`.

Note

This function is currently unsupported for Block Media over USB.

Return values

FSP_ERR_UNSUPPORTED	CallbackSet is not currently supported for Block Media over USB.
---------------------	--

◆ **RM_BLOCK_MEDIA_USB_StatusGet()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet ( rm_block_media_ctrl_t *const p_api_ctrl,
rm_block_media_status_t *const p_status )
```

Provides driver status. Implements `rm_block_media_api_t::statusGet()`.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ **RM_BLOCK_MEDIA_USB_InfoGet()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet ( rm_block_media_ctrl_t *const p_ctrl,
rm_block_media_info_t *const p_info )
```

Retrieves module information. Implements `rm_block_media_api_t::infoGet()`.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ **RM_BLOCK_MEDIA_USB_Close()**

```
fsp_err_t RM_BLOCK_MEDIA_USB_Close ( rm_block_media_ctrl_t *const p_ctrl)
```

Closes an open USB device. Implements `rm_block_media_api_t::close()`.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.86 User Block Media Implementation (rm_block_media_user)

Modules

Middleware that implements a block media interface on the media of your choice. This module implements the [Block Media Interface](#).

Overview

Features

This module is for using Block media with user-selected media.

Configuration

Block Media User has no output config settings.

The user is required to create the config settings etc. in the application.

The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write     = RM_BLOCK_MEDIA_RAM_Write,
    .erase     = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close     = RM_BLOCK_MEDIA_RAM_Close,
};

extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);

const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };

rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

Note

If you use `block_media_user`, you need to create a function that matches the media you are using. In the above example, this is the function with `RM_BLOCK_MEDIA_`. Register the created function in `rm_block_media_api_t`. The registered `rm_block_media_api_t` is registered in `p_api`, which is a member of `rm_block_media_instance_t`.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples**Basic Example**

Please refer to [USB Peripheral Mass Storage Class \(r_usb_pmsc\)](#) for the PMSC application given as an example.

4.2.87 AWS Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)**Modules****Functions**

CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Open (<code>rm_cellular_comm_uart_aws_instance_ctrl_t *p_instance_ctrl</code> , <code>CellularCommInterfaceReceiveCallback_t receive_callback</code> , <code>void *pUserData</code>)

------	--

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works:

https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Receive Buffer	Size should be greater than zero	256	Temporary buffer for received bytes. When read function is called remaining bytes will be read directly into buffer specified by read function argument.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_cellular_comm_uart0	Module name.

Function Documentation

◆ **RM_CELLULAR_COMM_UART_AWS_Open()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (
rm_cellular_comm_uart_aws_instance_ctrl_t * p_instance_ctrl,
CellularCommInterfaceReceiveCallback_t receive_callback, void * pUserData )
```

Implements open for CellularCommInterface_t

Parameters

[in]	receive_callback	Callback to call upon receiving data
[in]	pUserData	Pointer to user data to be passed through callback
[in]	p_instance_ctrl	Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t

Return values

IOT_COMM_INTERFACE_SUCCESS	Open succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ **RM_CELLULAR_COMM_UART_AWS_Send()**

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (
CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t* pData, uint32_t
dataLength, uint32_t timeoutMilliseconds, uint32_t* pDataSentLength )
```

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pData	Pointer to data to send
[in]	dataLength	Length of data to send
[in]	timeoutMilliseconds	Timeout in MS to wait for data to send
[in]	pDataSentLength	Actual length of data sent

Return values

IOT_COMM_INTERFACE_SUCCESS	Send succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure
IOT_COMM_INTERFACE_TIMEOUT	Send operation timed out

◆ RM_CELLULAR_COMM_UART_AWS_Receive()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (
CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t* pBuffer, uint32_t bufferSize,
uint32_t timeoutMilliseconds, uint32_t* pDataReceivedLength )
```

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pBuffer	Pointer to buffer to receive to
[in]	bufferLength	Length of buffer
[in]	timeoutMilliseconds	Timeout in MS to wait for data reception
[in]	pDataReceivedLength	Actual length of data received

Return values

IOT_COMM_INTERFACE_SUCCESS	Receive succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Close()

```
CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (
CellularCommInterfaceHandle_t commInterfaceHandle)
```

Implements close for CellularCommInterface_t

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
------	---------------------	--

Return values

IOT_COMM_INTERFACE_SUCCESS	Close succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure

◆ comm_uart_aws_callback()

```
void comm_uart_aws_callback ( uart_callback_args_t* p_args)
```

Callback for UART driver

Parameters

[in]	p_args	Arguments from UART RX/TX callback
------	--------	------------------------------------

4.2.88 RYZ AWS Cellular Interface Port (rm_cellular_ryz_aws)**Modules**

Middleware implementing the AWS Cellular API for RYZ cellular modems.

Overview

See AWS documentation for how the Cellular API works: <https://www.freertos.org/Documentation/api-ref/cellular/index.html>

Features

All APIs are supported by the RYZ port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the RYZ port:

- CERE/CREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other RYZ URCs can be possibly added by request in future releases.

Limitations

- This module does not handle the RYZ reset pin. The user should manually configure this pin in order to reset the module.
- The RYZ can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow remote port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

Configuration

AWS Cellular Interface

Build Time Configurations for source

The following build time configurations are defined in `aws/cellular_interface/cellular_config.h`:

Configuration	Options	Default	Description
Mobile Country Code Max Size	Value must be a positive integer	3	Mobile country code max size.
Mobile Network Node Max Size	Value must be a positive integer	3	Mobile network code max size.
Integrated Circuit Card Identity Max Size	Value must be a positive integer	20	Integrated circuit card identity max size.
International Mobile Subscriber Identity Max Size	Value must be a positive integer	15	International Mobile Subscriber Identity max size.
Firmware Version Max Size	Value must be a positive integer	32	Cellular module firmware version max size.
Hardware Version Max Size	Value must be a positive integer	12	Cellular module hardware version max size.
Serial Number Max Size	Value must be a positive integer	12	Cellular module serial number max size.
International Mobile Equipment Identity Max Size	Value must be a positive integer	15	International Mobile Equipment Identity number max size.
Registered Network operator Name Max Size	Value must be a positive integer	32	Registered network operator name max size.
Access Point Name Max Size	Value must be a positive integer	64	Access point name max size.
Packet Data Network Username Max Size	Value must be a positive integer	32	Packet data network username max size.
Packet Data Network Password Max Size	Value must be a positive integer	32	Packet data network password max size.
Data Network IP Address Max Size	Value must be a positive integer	40	Cellular data network IP address max size.
AT Command Max Size	Value must be a positive integer	200	Cellular AT command max size.
Max Number of Sockets	Value must be a positive integer	6	Cellular module number of socket max size.

Manufacturer ID Max Size	Value must be a positive integer	20	Cellular module manufacturer ID max size.
Model ID Max Size	Value must be a positive integer	10	Model ID max size.
EDRX List Max Size	Value must be a positive integer	4	EDRX list max size.
PDN Context ID Min Value	Value must be a positive integer	1	PDN context ID min value.
PDN Context ID Max Value	Value must be a positive integer	16	PDN context ID max value.
RAT Priority Count	Value must be a positive integer	3	RAT (radio access technology) priority count.
Socket Max Send Data Length (bytes)	Value must be a positive integer	1460	Socket max send data length.
Socket Max Receive Data Length (bytes)	Value must be a positive integer	1500	Socket max receive data length.
GetHostByName Support	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables/disable GetHostByName.
Comm Interface Receive Timeout (ms)	Value must be a positive integer	1000	Cellular comm interface receive timeout in ms.
Comm Interface Receive Timeout (ms)	Value must be a positive integer	1000	Cellular comm interface receive timeout in ms.
Static Allocation Context	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Disabled	Use statically allocated context.
Comm Interface Static Allocation Context	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Disabled	Use statically allocated context for comm interface.
Default RAT	<ul style="list-style-type: none"> • GSM • WCDMA • EDGE • HSDPA • HSUPA • HSDPAHSUPA • LTE • CATM1 • NBIOT 	CATM1	Default Radio Access Technology.
GSM Support	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	This should be disabled when a modem doesn't support GSM or the AT+CGREG command.

Static Socket Context	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Disabled	Use statically allocated socket.
Log Level	<ul style="list-style-type: none"> • Off • Error • Warning • Info • Debug 	Off	Log level for the cellular interface. Defaults to using printf when enabled

RYZ Cellular Interface Port

Configurations for Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws)

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on RYZ (rm_cellular_ryz_aws).

Configuration	Options	Default	Description
Module Reset Pin (Port Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control port for the RYZ module. This property is only used in devassist.
Module Reset Pin (Pin Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control pin for the RYZ module. This property is only used in devassist.

Examples

Basic Example

```
void rm_cellular_ryz_aws_basic_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;

    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);

    /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}

```

Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_recv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
pCallbackContext)
{
    FSP_PARAMETER_NOT_USED(socketHandle);
    FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_recv_event_count++;
}
void rm_cellular_ryz_aws_socket_example (void)
{
    CellularHandle_t      cellular_handle = NULL;
    char                  * p_data       = "hello_world";
    char                  recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t              sent_data_length = 0;
    uint32_t              received_data_length = 0;
    uint32_t              timeout_ms      = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
        .ipAddress =
        {
            CELLULAR_IP_ADDRESS_V4,
            SOCKET_EXAMPLE_IP
        },
        .port      = SOCKET_EXAMPLE_PORT
    };
    /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
```

```
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
/* Create a TCP socket */
    err = Cellular_CreateSocket(cellular_handle,
                               1,
                               CELLULAR_SOCKET_DOMAIN_AF_INET,
                               CELLULAR_SOCKET_TYPE_STREAM,
                               CELLULAR_SOCKET_PROTOCOL_TCP,
                               &socket_handle);

    assert(CELLULAR_SUCCESS == err);
/* Register the data ready callback */
    err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
                                                    socket_handle,
                                                    socket_example_data_ready_callback
,
                                                    NULL);

    assert(CELLULAR_SUCCESS == err);
    g_rcv_event_count = 0;
/* Connect the TCP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);

    assert(CELLULAR_SUCCESS == err);
/* Send data over the socket */
    err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);

    assert(CELLULAR_SUCCESS == err);
    assert(strlen(p_data) == sent_data_length);
/* Wait for data ready callback */
    timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
while (timeout_ms > 0)
    {
if (g_rcv_event_count > 0)
    {
break;

```

```

    }

    R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);

    timeout_ms--;
}

assert(0 != timeout_ms);

/* Receive data back */

err = Cellular_SocketRecv(cellular_handle,

                           socket_handle,

                           (uint8_t *) recv_buffer,

                           SOCKET_EXAMPLE_BUFFER_SIZE,

                           &received_data_length);

assert(CELLULAR_SUCCESS == err);

/* Close the socket */

err = Cellular_SocketClose(cellular_handle, socket_handle);

assert(CELLULAR_SUCCESS == err);
}

```

4.2.89 I2C Communicatons Middleware (rm_comms_i2c)

Modules

Functions

fsp_err_t [RM_COMMS_I2C_Open](#) ([rm_comms_ctrl_t](#) *const p_api_ctrl, [rm_comms_cfg_t](#) const *const p_cfg)

Opens and configures the Communications Middle module. Implements [rm_comms_api_t::open](#). [More...](#)

fsp_err_t [RM_COMMS_I2C_Close](#) ([rm_comms_ctrl_t](#) *const p_api_ctrl)

Disables specified Communications Middle module. Implements [rm_comms_api_t::close](#). [More...](#)

fsp_err_t [RM_COMMS_I2C_Read](#) ([rm_comms_ctrl_t](#) *const p_api_ctrl, [uint8_t](#) *const p_dest, [uint32_t](#) const bytes)

Performs a read from the I2C device. Implements [rm_comms_api_t::read](#). [More...](#)

`fsp_err_t RM_COMMS_I2C_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes)`

Performs a write from the I2C device. Implements `rm_comms_api_t::write`. [More...](#)

`fsp_err_t RM_COMMS_I2C_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params)`

Performs a write to, then a read from the I2C device. Implements `rm_comms_api_t::writeRead`. [More...](#)

`void rm_comms_i2c_callback (i2c_master_callback_args_t *p_args)`

Common callback function called in the I2C driver callback function.

Detailed Description

Middleware to implement the I2C communications interface. This module implements the [Communications Middleware Interface](#).

Overview

Features

The implementation of the I2C communications interface has the following key features:

- Reading data from, writing data to I2C bus
- Writes to I2C bus, then reads with restart
- A single I2C bus used by multiple I2C devices

Configuration

Build Time Configurations for `rm_comms_i2c`

The following build time configurations are defined in `fsp_cfg/rm_comms_i2c_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > I2C Shared Bus (`rm_comms_i2c`)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Shared Bus (`rm_comms_i2c`).

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Name	Manual Entry	g_comms_i2c_bus0	Module name.
Bus Timeout	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for locking bus in using RTOS.
Semaphore for Blocking	<ul style="list-style-type: none"> • Unuse • Use 	Unuse	Set Semaphore for blocking in using RTOS.
Recursive Mutex for Bus	<ul style="list-style-type: none"> • Unuse • Use 	Unuse	Set Mutex for locking bus in using RTOS.

Configurations for Connectivity > I2C Communication Device (rm_comms_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Communication Device (rm_comms_i2c).

Configuration	Options	Default	Description
Name	Manual Entry	g_comms_i2c_device0	Module name.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Slave Address	Value must be non-negative	0x00	Specify the slave address.
Address Mode	<ul style="list-style-type: none"> • 7-Bit • 10-Bit 	7-Bit	Select the I2C address mode.
Callback	Name must be a valid C symbol	comms_i2c_callback	A user callback function can be provided.

Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The I2C communications interface expects a bus instance to be opened before opening any specific I2C comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of I2C communications implementation in an application.

```
void rm_comms_i2c_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
(rm_comms_i2c_bus_extended_cfg_t *) g_comms_i2c_cfg.p_extend;

    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;

    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
            p_extend->p_blocking_semaphore->p_semaphore_name,
            (ULONG) 0);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                (UBaseType_t) 0,
p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
    }
#endif

    /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
    if (NULL != p_extend->p_bus_recursive_mutex)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
            p_extend->p_bus_recursive_mutex->p_mutex_name,
            TX_INHERIT);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
```

```
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
mutex_memory);
#endif
}
#endif

err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;
    /* Send data to an I2C device. */
    RM_COMMS_I2C_Write(&g_comms_i2c_ctrl, &write_data, 1);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
    g_flag = 0;
    /* Receive data from an I2C device. */
    RM_COMMS_I2C_Read(&g_comms_i2c_ctrl, &read_data, 1);
    while (0 == g_flag)
    {
        /* Wait callback */
    }
}
}
```

Data Structures

struct [rm_comms_i2c_instance_ctrl_t](#)

Data Structure Documentation

◆ rm_comms_i2c_instance_ctrl_t

struct [rm_comms_i2c_instance_ctrl_t](#)

Communications middleware control structure.

Data Fields	
rm_comms_cfg_t const *	p_cfg
	middleware configuration.
rm_comms_i2c_bus_extended_cfg_t *	p_bus
	Bus using this device;.
void *	p_lower_level_cfg
	Used to reconfigure I2C driver.
uint32_t	open
	Open flag.
uint32_t	transfer_data_bytes
	Size of transfer data.
uint8_t *	p_transfer_data
	Pointer to transfer data buffer.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ **RM_COMMS_I2C_Open()**

```
fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const
*const p_cfg )
```

Opens and configures the Communications Middle module. Implements `rm_comms_api_t::open`.

Example:

```
err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
```

Return values

FSP_SUCCESS	Communications Middle module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_COMMS_BUS_NOT_OPEN	I2C driver is not open.

◆ **RM_COMMS_I2C_Close()**

```
fsp_err_t RM_COMMS_I2C_Close ( rm_comms_ctrl_t *const p_api_ctrl)
```

Disables specified Communications Middle module. Implements `rm_comms_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_COMMS_I2C_Read()**

```
fsp_err_t RM_COMMS_I2C_Read ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest,
uint32_t const bytes )
```

Performs a read from the I2C device. Implements `rm_comms_api_t::read`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_I2C_Write()

```
fsp_err_t RM_COMMS_I2C_Write ( rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes )
```

Performs a write from the I2C device. Implements `rm_comms_api_t::write`.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_I2C_WriteRead()

```
fsp_err_t RM_COMMS_I2C_WriteRead ( rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params )
```

Performs a write to, then a read from the I2C device. Implements `rm_comms_api_t::writeRead`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.90 SEGGER emWin Port (rm_emwin_port)

Modules

SEGGER emWin port for RA MCUs.

Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG) as well as FreeRTOS.

Figure 205: SEGGER emWin FSP Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r_drw)
 - Drawing bitmaps (ARGB8888 and RGB565)
 - 4bpp font rendering
 - Rectangle fill
 - Line and shape drawing
 - Anti-aliased operations
 - Circle stroke and fill
 - Polygon stroke and fill
 - Lines and arcs
- JPEG Codec (r_jpeg)
 - JPEG decoding
- Graphics LCD Controller (r_glcdc)
 - Brightness, contrast and gamma correction
 - Pixel format conversion (framebuffer to LCD)

Configuration**Build Time Configurations for rm_emwin_port**

The following build time configurations are defined in fsp_cfg/rm_emwin_port_cfg.h:

Configuration	Options	Default	Description
Memory Allocation > GUI Heap Size	Value must be a non-negative integer	32768	Set the size of the heap to be allocated for use exclusively by emWin.
Memory Allocation > Section for GUI Heap	Manual Entry	.noinit	Specify the section in which to allocate the GUI heap. When Arm Compiler 6 is used to

			place this memory in on-chip SRAM, the section name must be .bss or start with .bss. to avoid consuming unnecessary ROM space.
Memory Allocation > Maximum Layers	Value must be a non-negative integer	16	Set the maximum number of available display layers in emWin. This setting is not related to GLCDC Layer 1 or 2.
Memory Allocation > AA Font Conversion Buffer Size	Value must be a non-negative integer	400	Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered.
Configuration > Multi-thread Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable multithreading support.
Configuration > Number of emWin-supported threads	Manual Entry	5	If multithreading support is enabled this configuration specifies the number of different tasks that can call emWin functions.
Configuration > Touch Panel Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable touch panel support.
Configuration > Mouse Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable or disable support for mouse input.
Configuration > Memory Devices	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable support for memory devices, which allow the user to allocate their own memory in the GUI heap.
Configuration > Text Rotation	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable support for displaying rotated text.
Configuration > Window Manager	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enable or disable the emWin Window Manager (WM).
Configuration >	<ul style="list-style-type: none"> • Enabled 	Disabled	Enable or disable

Bidirectional Text	<ul style="list-style-type: none"> • Disabled 		support for bidirectional text (such as Arabic or Hebrew).
Configuration > Debug Logging Level	<ul style="list-style-type: none"> • None (0) • Parameter checking only (1) • All checks enabled (2) • Log errors (3) • Log warnings (4) • Log all messages (5) 	All checks enabled (2)	Set the debug logging level.
LCD Settings > Wait for Vertical Sync	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	<p>When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync.</p> <p>WARNING: Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used.</p>
JPEG Decoding > General > Input Alignment	<ul style="list-style-type: none"> • 8-byte aligned (faster) • Unaligned (slower) 	8-byte aligned (faster)	<p>Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM overhead, but all JPEG images must reside on an 8-byte boundary.</p> <p>When this option is enabled the input buffer is not allocated.</p>
JPEG Decoding > General > Double-Buffer Output	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display

at the same time as decoding at the cost of additional RAM usage.

Enabling this option automatically allocates double the output buffer size.

Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error.

Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process.

Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer.

Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.

Specify the section in which to allocate the JPEG work buffers. When Arm Compiler 6 is used to place this memory in on-chip SRAM, the section name must be `.bss` or start with `.bss.` to avoid

JPEG Decoding >
General > Error
Timeout Value must be a non-
negative integer 50

JPEG Decoding >
Buffers > Input Buffer
Size Value must be a non-
negative integer 0x1000

JPEG Decoding >
Buffers > Output Buffer
Size Value must be a non-
negative integer 0x3C00

JPEG Decoding >
Buffers > Section for
Buffers Manual Entry .noinit

consuming unnecessary ROM space.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Usage Notes

Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
 - GLCDC Vertical Position (Vpos) Interrupt
 - DRW Interrupt (if applicable)
 - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
 - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
 - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.
- Anti-aliased shapes:
 - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
 - Set the text mode to GUI_TM_TRANS or create the relevant widget with WM_CF_HASTRANS set.
 - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
 - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
 - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:

- Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

Note

Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.

Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.

Examples

Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

Note

emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
#include "DIALOG.h"

#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100

static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;

    switch (pMsg->MsgId)
```

```
{
case WM_CREATE:
    {
break;
    }
case WM_PAINT:
    {
/* Clear background to white */
        GUI_SetBkColor(COLOR_WHITE);
        GUI_Clear();
/* Draw "Hello World!" in black in the center */
        WM_GetClientRect(&Rect);
        GUI_SetColor(COLOR_BLACK);
        GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);
break;
    }
default:
    {
        WM_DefaultProc(pMsg);
break;
    }
}
}

void emWinTask (void)
{
    int32_t xSize;
    int32_t ySize;
/* Initialize emWin */
    GUI_Init();
/* Get screen dimensions */
    xSize = LCD_GetXSize();
    ySize = LCD_GetYSize();
/* Create main window */
```

```

    WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);
/* Enter main drawing loop */
while (1)
{
    GUI_Delay(GUI_DRAW_DELAY);
}
}

```

Note

For further example code please consult SEGGER emWin documentation, which can be downloaded [here](#), as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).

4.2.91 Azure RTOS FileX Block Media I/O Driver (rm_filex_block_media)

Modules

Functions

`fsp_err_t` [RM_FILEX_BLOCK_MEDIA_Open](#) (`rm_filex_block_media_ctrl_t *const p_ctrl, rm_filex_block_media_cfg_t const *const p_cfg`)

`fsp_err_t` [RM_FILEX_BLOCK_MEDIA_Close](#) (`rm_filex_block_media_ctrl_t *const p_ctrl`)

`void` [RM_FILEX_BLOCK_MEDIA_BlockDriver](#) (`FX_MEDIA *p_fx_media`)
 Access Block Media device functions open, close, read, write and control. [More...](#)

Detailed Description

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: <https://docs.microsoft.com/en-us/azure/rtos/filex/>

Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.

- ThreadX is typically required for FileX. To use FileX without ThreadX `FX_STANDALONE_ENABLE` must be defined.
- Unless `FX_SINGLE_THREAD` or `FX_STANDALONE_ENABLE` are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for `rm_filex_block_media`

The following build time configurations are defined in `fsp_cfg/middleware/rm_filex_block_media_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (`rm_filex_block_media`)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	<code>g_rm_filex_block_media_0</code>	Module name.
Callback	Name must be a valid C symbol	<code>g_rm_filex_block_media_0_callback</code>	A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
Partition Number	<ul style="list-style-type: none"> • 0 • 1 • 2 • 3 	0	The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0.

Build Time Configurations for `fx`

The following build time configurations are defined in `fsp_cfg/azure/fx/fx_user.h`:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector Cache	Value must be greater than 0 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at <code>fx_media_open</code> . The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is

updated every 10 seconds.

Threading > No Timer	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading > Standalone	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.

Fault Tolerant > Fault Tolerant Service	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol <code>FX_FAULT_TOLERANT</code> and <code>FX_FAULT_TOLERA NT_DATA</code> .
Fault Tolerant > Fault Tolerant Data	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should

be enabled separately.

When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.

Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.

Fault Tolerant > Fault Tolerant

- Enabled
- Disabled (default)

Disabled (default)

Fault Tolerant > Fault Tolerant Boot Index

Value must be greater than or equal to 116 and less than or equal to 119

Error Checking

- Enabled (default)
- Disabled

Enabled (default)

Configurations for Storage > Azure RTOS FileX on Block Media

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values

greater than 1 result in additional FAT copies being maintained at run-time.

Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	3751936	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Bytes per Sector	Bytes per Sector must be multiple of 32	512	Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer	12345	Serial number to be used for this volume.

	greater than 0		exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is `rm_block_media_spi` (SPI blocks on read/write operations):

- The user will receive `RM_BLOCK_MEDIA_EVENT_POLL_STATUS` in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is `rm_block_media_sdmmc` (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive `RM_BLOCK_MEDIA_EVENT_WAIT` in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive `RM_BLOCK_MEDIA_EVENT_WAIT_END` in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send `RM_BLOCK_MEDIA_EVENT_POLL_STATUS` to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

Partitioned Media

When using `fx_format` to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

Unused User Callback Events

Certain events are defined in `rm_block_media_event_t` but not returned by the FileX Block Media user

callback:

- **RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE:** This event is handled internally and operation success is indicated by FileX API calls returning **FX_SUCCESS**.
- **RM_BLOCK_MEDIA_EVENT_ERROR:** This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK (1)

extern rm_filex_block_media_instance_t g_filex_block_media0;
extern rm_filex_block_media_instance_ctrl_t g_filex_block_media0_ctrl;
extern rm_filex_block_media_cfg_t g_filex_block_media0_cfg;

extern FX_MEDIA g_fx_media0;

extern uint8_t g_fx_media0_memory[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];

void rm_filex_block_media_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
    &g_filex_block_media0_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

```
/* Initialize FileX */
    fx_system_initialize();

/* Open the media. If the media is removable, it must be inserted before calling
 * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
    "filex_example_media",
    RM_FILEX_BLOCK_MEDIA_BlockDriver,
                                &g_filex_block_media0,
                                g_fx_media0_memory,
    sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);

/* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);

/* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);

/* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);

/* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);

/* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);

/* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
    &actual_size_read);
    handle_fx_error(fx_err);
```

```
    assert(sizeof(g_file_data) == actual_size_read);
/* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
/* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0, // Pointer to
FileX media control block.
    RM_FILEX_BLOCK_MEDIA_BlockDriver, // Driver entry
    &g_filex_block_media0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
```

```

// Directory Entries

                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,

// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,          // Total sectors

                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,

// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,    // Sectors per cluster

                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,

// Heads

                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);

// Sectors per track

    handle_fx_error(fx_err);
}

```

Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```

TX_SEMAPHORE g_operation_wait_semaphore;

/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
        /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
        tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }

    if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
        /* Interrupt has occurred for operation, post semaphore so that wait will end. This

```

```
will be called from an interrupt context. */
    tx_semaphore_put(&g_operation_wait_semaphore);
}
if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
{
    /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.
    * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
    tx_thread_sleep(1);
}
}
void rm_filex_block_media_callback_pend_example (void)
{
    /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0, // Pointer to
FileX media control block.
    RM_FILEX_BLOCK_MEDIA_BlockDriver, // Driver entry
    &g_filex_block_media0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
```

```
// Directory Entries
                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,          // Total sectors
                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,    // Sectors per cluster
                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
        g_rm_filex_block_media_insertion_events++;
    }
    if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
        g_rm_filex_block_media_removal_events++;
    }
}
```

```
void rm_filex_block_media_media_insertion_example (void)
{
    /* Open media driver.*/
    fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Wait for media insertion. */
    while (0U == g_rm_filex_block_media_insertion_events)
    {
        /* Wait for media insertion. */
    }
    /* Open the media. If the media is removable, it must be inserted before calling
    * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
"filex_example_media",
RM_FILEX_BLOCK_MEDIA_BlockDriver,
                                &g_filex_block_media0,
                                g_fx_media0_memory,
                                sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}
```

Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with `rm_filex_block_media` the custom implementation must call `rm_filex_block_media_memory_callback` upon the completion of a read/write operation. This callback should be called with an event of `RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE` and `p_context` of `rm_filex_block_media_instance_ctrl_t*`. The following example shows how this should be done in the context of a demo RAM block media read function.

```
#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
```

```

uint8_t * const
    p_dest_address,
uint32_t const
block_address,
uint32_t const    num_blocks)
{
    FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
           (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
           (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
    /* Notify FileX port of operation complete through calling the callback, this is
required for custom block media/FileX port integration */
    rm_block_media_callback_args_t args;
    args.event    = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context = (void *) &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
    return FSP_SUCCESS;
}

```

Data Structures

```
struct  rm_filex_block_media_instance_ctrl_t
```

Data Structure Documentation

◆ rm_filex_block_media_instance_ctrl_t

```
struct rm_filex_block_media_instance_ctrl_t
```

Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_BLOCK_MEDIA_Open is called.

Function Documentation

◆ RM_FILEX_BLOCK_MEDIA_Open()

```
fsp_err_t RM_FILEX_BLOCK_MEDIA_Open ( rm_filex_block_media_ctrl_t *const p_ctrl,
rm_filex_block_media_cfg_t const *const p_cfg )
```

The file system relies on the media to be formatted prior to creating directories and files. The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements `rm_filex_block_media_api_t::open()`.

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_Close()

```
fsp_err_t RM_FILEX_BLOCK_MEDIA_Close ( rm_filex_block_media_ctrl_t *const p_ctrl)
```

Closes media device.

Implements `rm_filex_block_media_api_t::close()`.

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_BlockDriver()

```
void RM_FILEX_BLOCK_MEDIA_BlockDriver ( FX_MEDIA * p_fx_media)
```

Access Block Media device functions open, close, read, write and control.

The RM_FILEX_BLOCK_MEDIA_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.
----------	------------	---

Return values

None	
------	--

Returns

Nothing, but updates FileX media control block.

4.2.92 Azure RTOS FileX LevelX I/O Driver (rm_filex_levelx_nor)**Modules****Functions**

```
void RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media)
```

Access LevelX NOR device functions open, close, read, write and control. [More...](#)

Detailed Description

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: <https://docs.microsoft.com/en-us/azure/rtos/filex/>

Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX `FX_STANDALONE_ENABLE` must be defined.
- Unless `FX_SINGLE_THREAD` or `FX_STANDALONE_ENABLE` are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for `rm_filex_levelx_nor`

The following build time configurations are defined in `fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (`rm_filex_levelx_nor`)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	<code>g_rm_filex_levelx_nor0</code>	Module name.
Callback	Name must be a valid C symbol	<code>g_rm_filex_levelx_nor_0_callback</code>	A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
LevelX NOR Name (String)	Manual Entry	<code>g_rm_filex_levelx_nor_0</code>	String name to be input into LevelX API.

Build Time Configurations for `fx`

The following build time configurations are defined in `fsp_cfg/azure/fx/fx_user.h`:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to		Specifies the maximum file name size for FileX. If left blank the default

	256, or empty		value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector Cache	Value must be greater than 0 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at <code>fx_media_open</code> . The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
Threading > No Timer	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled (default)	Eliminates the ThreadX timer setup to update

	(default)		the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading > Standalone	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Extra Features > Rename Path Inherit	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, renaming inherits path information.
Extra Features > No Local Path	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
Extra Features > 64-bit LBA	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Extra Features > Cache	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables the cache, default is enabled.

Extra Features > File Close	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables file close, default is enabled.
Extra Features > Fast Close	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables fast open, default is enabled.
Extra Features > Force Memory Operation	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables force memory operation, default is enabled.
Extra Features > Build Options	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables build options, default is enabled.
Extra Features > One Line Function	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables one line function, default is enabled.
Extra Features > FAT Entry Refresh	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Extra Features > Consecutive Detect	<ul style="list-style-type: none"> • Enabled (default) • Disabled 	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Extra Features > Enable exFAT	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant > Fault Tolerant Service	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol <code>FX_FAULT_TOLERANT</code> and <code>FX_FAULT_TOLERANT_DATA</code> .
Fault Tolerant > Fault Tolerant Data	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled (default)	When enabled, FileX immediately passes

(default)

write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.

Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.

Fault Tolerant > Fault Tolerant Boot Index

Value must be greater than or equal to 116 and less than or equal to 119

Error Checking

- Enabled (default)
- Disabled

Enabled (default)

Configurations for Storage > Azure RTOS FileX on LevelX NOR

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.

Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	3751936	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an

OS-specific thread wait. This callback will also pass up block erase events.

Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_levelx_nor_instance_t g_filex_levelx_nor0;
extern rm_filex_levelx_nor_instance_ctrl_t g_filex_levelx_nor0_ctrl;
extern rm_filex_levelx_nor_cfg_t g_filex_levelx_nor0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_levelx_nor_example (void)
{
    /* Initialize FileX */
    fx_system_initialize();

    /* Initialize LevelX */
    lx_nor_flash_initialize();

    /* Open the media. This assumes the flash is already formatted. */
}
```

```
    UINT fx_err = fx_media_open(&g_fx_media0,
    "filex_example_media",
    RM_FILEX_LEVELX_NOR_DeviceDriver,
                                &g_filex_levelx_nor0,
                                g_fx_media0_memory,
    sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
    /* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);
    /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
    /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
    /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
    /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
    RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
    /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
    &actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
    /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
```

```
/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
/* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE (4096)
void rm_filex_levelx_nor_format_example (void)
{
    spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
    spi_flash_status_t    status;
    /* Erase flash prior to usage */
    fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
    for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
        i < g_levelx_nor_spi0_cfg.size;
        i += RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE)
    {
        err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,
RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE);
        assert(FSP_SUCCESS == err);
        status.write_in_progress = true;
        while (status.write_in_progress)
        {
```

```
        err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
        assert(FSP_SUCCESS == err);
    }
}

err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
assert(FSP_SUCCESS == err);

/* Format the media */
UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
RM_FILEX_LEVELX_NOR_DeviceDriver,           // Driver entry
                                           &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                           g_fx_media0_memory, // Media buffer pointer
sizeof(g_fx_media0_memory),                // Media buffer size
"EXAMPLE_VOLUME",                          // Volume Name
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS, // Total sectors
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size
RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                           RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
    if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
        /* Put the thread to sleep while waiting for operation to complete. */
        tx_thread_sleep(1);
    }
}

void rm_filex_levelx_nor_callback_wait_example (void)
{
    /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
    RM_FILEX_LEVELX_NOR_DeviceDriver, // Driver entry
    &g_filex_levelx_nor0, // Pointer to Block Media
Driver
    g_fx_media0_memory, // Media buffer pointer
    sizeof(g_fx_media0_memory), // Media buffer size
    "EXAMPLE_VOLUME", // Volume Name
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors
    RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS, // Total sectors
```

```

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,

// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER, // Sectors per cluster

RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,

// Heads

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);

// Sectors per track

handle_fx_error(fx_err);
}

```

Data Structures

struct [rm_filex_levelx_nor_callback_args_t](#)

struct [rm_filex_levelx_nor_cfg_t](#)

struct [rm_filex_levelx_nor_instance_ctrl_t](#)

struct [rm_filex_levelx_nor_instance_t](#)

Enumerations

enum [rm_filex_levelx_nor_event_t](#)

Data Structure Documentation

◆ [rm_filex_levelx_nor_callback_args_t](#)

struct rm_filex_levelx_nor_callback_args_t		
Callback function parameter data		
Data Fields		
rm_filex_levelx_nor_event_t	event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data.

◆ [rm_filex_levelx_nor_cfg_t](#)

struct rm_filex_levelx_nor_cfg_t		
FileX LevelX configuration		
Data Fields		
UINT(*)	nor_driver_initialize	(LX_NOR_FLASH *)

	Pointer to the initialization function.
LX_NOR_FLASH *	p_nor_flash
	NOR Flash instance.
CHAR *	p_nor_flash_name
	NOR Flash instance name.
fsp_err_t (*	close)()
	Pointer to underlying driver close.
void(*	p_callback)(rm_filex_levelx_nor_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	Placeholder for user data.

◆ rm_filex_levelx_nor_instance_ctrl_t

struct rm_filex_levelx_nor_instance_ctrl_t		
FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_LEVELX_NOR_Open is called.		
Data Fields		
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to instance configuration.

◆ rm_filex_levelx_nor_instance_t

struct rm_filex_levelx_nor_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
rm_filex_levelx_nor_instance_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
rm_filex_levelx_nor_cfg_t *const	p_cfg	Pointer to the configuration

	structure for this instance.

Enumeration Type Documentation

◆ rm_filex_levelx_nor_event_t

enum <code>rm_filex_levelx_nor_event_t</code>	
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.	
Enumerator	
<code>RM_FILEX_LEVELX_NOR_EVENT_BUSY</code>	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_FILEX_LEVELX_NOR_DeviceDriver()

void <code>RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA * p_fx_media)</code>		
Access LevelX NOR device functions open, close, read, write and control.		
The <code>RM_FILEX_LEVELX_NOR_DeviceDriver</code> function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.		
Parameters		
	<code>p_fx_media</code>	FileX media control block. All information about each open media device are maintained in the <code>FX_MEDIA</code> data type. The I/O driver communicates the success or failure of the request through the <code>fx_media_driver_status</code> member of <code>FX_MEDIA</code> (<code>p_fx_media->fx_media_driver_status</code>). Possible values are documented in the FileX User Guide.
Return values		
	None	
Returns		
Nothing, but updates FileX media control block.		

4.2.93 FreeRTOS+FAT Port (rm_freertos_plus_fat)

Modules

fsp_err_t	RM_FREERTOS_PLUS_FAT_DiskDeinit (rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t *const p_disk)
fsp_err_t	RM_FREERTOS_PLUS_FAT_InfoGet (rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t *const p_disk, rm_freertos_plus_fat_info_t *const p_info)
fsp_err_t	RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the FAT File System control on RA MCUs.

Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system:

https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html

Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF_Disk_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

Configuration

Build Time Configurations for rm_freertos_plus_fat

The following build time configurations are defined in fsp_cfg/middleware/rm_freertos_plus_fat_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_freertos_plus_fat_0	Module name.
Total Number of Sectors	Must be a non-negative integer	31293440	Enter the total number of sectors on the device. If this is not known, update <code>rm_freertos_plus_fat_disk_cfg_t::num_blocks</code> after calling RM_FREERTOS_PLUS_FAT_MediaInit() .
Sector Size (bytes)	Must be a power of 2 multiple of 512	512	Select the sector size. Must match the underlying media sector size and at least 512. If this is not known, update <code>rm_freertos_plus_fat_disk_cfg_t::num_blocks</code> after calling RM_FREERTOS_PLUS_FAT_MediaInit() .
Cache Size (bytes)	Must be a power of 2 multiple of 512	1024	Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size.
Partition Number	Must be a non-negative integer	0	Select the partition number for this disk.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Usage Notes

Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active

FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.

Also, update the Malloc function to malloc and the Free function to free in the Common configurations.

Examples

Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
    /* Open media driver.*/

    assert(1 == size_return);
/* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
/* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Data Structures

struct [rm_freertos_plus_fat_instance_ctrl_t](#)

Data Structure Documentation

◆ [rm_freertos_plus_fat_instance_ctrl_t](#)

struct [rm_freertos_plus_fat_instance_ctrl_t](#)

FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when `RM_FREERTOS_PLUS_FAT_Open` is called.

Function Documentation

◆ RM_FREERTOS_PLUS_FAT_Open()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_Open ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_cfg_t const *const p_cfg )
```

Initializes lower layer media device.

Implements `rm_freertos_plus_fat_api_t::open()`.

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_OUT_OF_MEMORY	Not enough memory to create semaphore.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `rm_block_media_api_t::open`

◆ RM_FREERTOS_PLUS_FAT_MediaInit()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_device_t *const p_device )
```

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements `rm_freertos_plus_fat_api_t::mediaInit()`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `rm_block_media_api_t::mediaInit`
- `rm_block_media_api_t::infoGet`

◆ **RM_FREERTOS_PLUS_FAT_DiskInit()**

```
fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl,
rm_freertos_plus_fat_disk_cfg_t const *const p_disk_cfg, FF_Disk_t *const p_disk )
```

Initializes a FreeRTOS+FAT disk structure. This function calls FF_CreateIOManger.

Implements `rm_freertos_plus_fat_api_t::diskInit()`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.
FSP_ERR_INTERNAL	Call to FF_CreateIOManger failed.

◆ **RM_FREERTOS_PLUS_FAT_DiskDeinit()**

```
fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit ( rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t
*const p_disk )
```

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF_DeleteIOManger.

Implements `rm_freertos_plus_fat_api_t::diskDeinit()`.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

◆ RM_FREERTOS_PLUS_FAT_InfoGet()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet ( rm_freertos_plus_fat_ctrl_t *const p_ctrl, FF_Disk_t
*const p_disk, rm_freertos_plus_fat_info_t *const p_info )
```

Get partition information. This function can only be called after [rm_freertos_plus_fat_api_t::diskInit\(\)](#)

Implements [rm_freertos_plus_fat_api_t::infoGet\(\)](#).

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_NOT_FOUND	The value of p_iomanager is NULL.

◆ RM_FREERTOS_PLUS_FAT_Close()

```
fsp_err_t RM_FREERTOS_PLUS_FAT_Close ( rm_freertos_plus_fat_ctrl_t *const p_ctrl)
```

Closes media device.

Implements [rm_freertos_plus_fat_api_t::close\(\)](#).

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- [rm_block_media_api_t::close](#)

4.2.94 FreeRTOS Plus TCP (rm_freertos_plus_tcp)**Modules**

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the [Ethernet \(r_ether\)](#) driver.

Please refer to the [FreeRTOS Plus TCP documentation](#) for further details.

Configuration

Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

Configuration	Options	Default	Description
Print debug messages	<ul style="list-style-type: none"> Disable Enable 	Disable	If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging messages.
Print info messages	<ul style="list-style-type: none"> Disable Enable 	Disable	Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages.
Byte order of the target MCU	pdFREERTOS_LITTLE_ENDIAN	pdFREERTOS_LITTLE_ENDIAN	Define the byte order of the target MCU
IP/TCP/UDP checksums	<ul style="list-style-type: none"> Disable Enable 	Enable	If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations.
Receive Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_recv() will

			block for. The timeouts can be set per socket, using <code>setsockopt()</code> .
Send Block Time	Value must be a non-negative integer	10000	Amount of time <code>FreeRTOS_send()</code> will block for. The timeouts can be set per socket, using <code>setsockopt()</code> .
DNS caching	<ul style="list-style-type: none"> • Disable • Enable 	Enable	DNS caching
DNS Request Attempts	Value must be an integer	2	When a cache is present, <code>ipconfigDNS_REQUEST_ATTEMPTS</code> can be kept low and also DNS may use small timeouts.
IP stack task priority	Manual Entry	<code>configMAX_PRIORITIES - 2</code>	Set the priority of the task that executes the IP stack.
Stack size in words (not bytes)	Manual Entry	<code>configMINIMAL_STACK_SIZE * 5</code>	The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack.
Network Events call vApplicationIPNetworkEventHook	<ul style="list-style-type: none"> • Disable • Enable 	Enable	<code>vApplicationIPNetworkEventHook</code> is called when the network connects or disconnects.
Max UDP send block time	Manual Entry	<code>15000 / portTICK_PERIOD_MS</code>	Max UDP send block time
Use DHCP	<ul style="list-style-type: none"> • Disable • Enable 	Enable	If <code>ipconfigUSE_DHCP</code> is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server.
DHCP Register Hostname	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Register hostname when using DHCP
DHCP Uses Unicast	<ul style="list-style-type: none"> • Disable • Enable 	Enable	DHCP uses unicast.
DHCP Send Discover After Auto IP	<ul style="list-style-type: none"> • Disable • Enable 	Disable	DHCP Send Discover After Auto IP
DHCP callback function	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Provide an implementation of the DHCP callback function

Interval between transmissions	Manual Entry	120000 / portTICK_PERIOD_MS	(xApplicationDHCPHook) When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD.
ARP Cache Entries	Value must be an integer	6	The maximum number of entries that can exist in the ARP table at any one time
ARP Request Retransmissions	Value must be an integer	5	ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted.
Maximum time before ARP table entry becomes stale	Value must be an integer	150	The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale
Use string for IP Address	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters
Total number of available network buffers	Value must be an integer	10	Define the total number of network buffer that are available to the IP stack
Set the maximum	Please enter a valid	ipconfigNUM_NETWORK	Set the maximum

number of events	function name without spaces or funny characters	<code>_BUFFER_DESCRIPTOR</code> + 5	number of events that can be queued for processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers
Enable <code>FreeRTOS_sendto()</code> without calling <code>Bind</code>	<ul style="list-style-type: none"> • Enable • Disable 	Disable	Set to 1 then calling <code>FreeRTOS_sendto()</code> on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range <code>socketAUTO_PORT_ALL</code> <code>OCATION_START_NUMBER</code> to <code>0xffff</code> . If <code>ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND</code> is set to 0 then calling <code>FreeRTOS_sendto()</code> on a socket that has not yet been bound will result in the send operation being aborted.
TTL values for UDP packets	Value must be an integer	128	Define the Time To Live (TTL) values used in outgoing UDP packets
TTL values for TCP packets	Value must be an integer	128	Defines the Time To Live (TTL) values used in outgoing TCP packets
Use TCP and all its features	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Use TCP and all its features
Let TCP use windowing mechanism	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Let TCP use windowing mechanism
Maximum number of bytes the payload of a network frame can contain	Value must be an integer	1500	Maximum number of bytes the payload of a network frame can contain
Basic DNS client or resolver	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Set <code>ipconfigUSE_DNS</code> to 1 to include a basic DNS client/resolver. DNS is used through the <code>FreeRTOS_gethostbyname()</code> API function.
Reply to incoming ICMP	<ul style="list-style-type: none"> • Disable 	Enable	If <code>ipconfigREPLY_TO_IN</code>

echo (ping) requests	<ul style="list-style-type: none"> • Enable 		COMING_PINGS is set to 1 then the IP stack will generate replies to incoming ICMP echo (ping) requests.
FreeRTOS_SendPingRequest() is available	<ul style="list-style-type: none"> • Disable • Enable 	Disable	If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available.
FreeRTOS_select() (and associated) API function is available	<ul style="list-style-type: none"> • Disable • Enable 	Disable	If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the FreeRTOS_select() (and associated) API function is available
Filter out non Ethernet II frames.	<ul style="list-style-type: none"> • Disable • Enable 	Enable	If ipconfigFILTER_OUT_NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments
Responsibility of the Ethernet interface to filter out packets	<ul style="list-style-type: none"> • Disable • Enable 	Disable	If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest.
Send RST packets, when receive unknown packets.	<ul style="list-style-type: none"> • Disable • Enable 	Enable	TCP will not send RST packets in reply to TCP unknown or out-of-order packets
Block time to simulate MAC interrupts	Please enter a valid function name without spaces or funny characters	20 / portTICK_PERIOD_MS	The windows simulator cannot really simulate MAC interrupts, and needs to block occasionally to allow other tasks to run
Access 32-bit fields in the IP packets	Value must be an integer	2	To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit

Size of the pool of TCP window descriptors	Value must be an integer	240	fields are 32-bit-aligned, plus 16-bit
Size of Rx buffer for TCP sockets	Value must be an integer	3000	Define the size of the pool of TCP window descriptors
Size of Tx buffer for TCP sockets	Value must be an integer	3000	Define the size of Rx buffer for TCP sockets
TCP keep-alive	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Define the size of Tx buffer for TCP sockets
TCP keep-alive interval	Value must be an integer	120	TCP keep-alive is available or not
The socket semaphore to unblock the MQTT task (USER_SEMAPHORE)	<ul style="list-style-type: none"> • Disable • Enable 	Disable	TCP keep-alive interval in second
The socket semaphore to unblock the MQTT task (WAKE_CALLBACK)	<ul style="list-style-type: none"> • Disable • Enable 	Enable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (USE_CALLBACKS)	<ul style="list-style-type: none"> • Disable • Enable 	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (TX_DRIVER)	<ul style="list-style-type: none"> • Disable • Enable 	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (RX_DRIVER)	<ul style="list-style-type: none"> • Disable • Enable 	Disable	The socket semaphore is used to unblock the MQTT task
Possible optimisation for expert users	<ul style="list-style-type: none"> • Disable • Enable 	Disable	The socket semaphore is used to unblock the MQTT task

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an `r_ether` instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
extern ether_instance_t const * gp_freertos_ether;

...

/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Follow the TCP stack initialization procedure as described here: [FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack](#)

Note

The MAC address passed to `FreeRTOS_IPInit` must match the MAC address configured in the `r_ether` instance. `g_ether_instance` must have `vEtherISRcallback` configured as the callback. The `xApplicationGetRandomNumber` and `ulApplicationGetNextSequenceNumber` functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets. To connect to a server using an IP address the macro `ipconfigINCLUDE_FULL_INET_ADDR` must be set to 1.

Limitations

- Zero-copy is not currently supported by the NetworkInterface.

4.2.95 FreeRTOS Port (rm_freertos_port)

Modules

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at <https://www.freertos.org/Documentation> for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General > Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Use Preemption	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled to use the cooperative RTOS scheduler.
General > Use Port Optimised Task Selection	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	<p>Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port.</p> <p>The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities.</p> <p>A port specific method: Is not available for all ports. Is used when Use Port Optimized Task</p>

Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.

Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.

Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.

The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time

General > Use Tickless Idle

- Enabled
- Disabled

Disabled

General > Cpu Clock Hz

Manual Entry

SystemCoreClock

General > Tick Rate Hz

Must be an integer and greater than 0 1000

so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required.

More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the 'time slice' given to each task.

The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.

The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on

General > Max
Priorities

Must be an integer and
greater than 0 5

General > Minimal
Stack Size

Must be an integer and
greater than 0 128

General > Max Task Name Len	Must be an integer and greater than 0	16	the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).
General > Use 16-bit Ticks	Disabled	Disabled	<p>The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.</p> <p>Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type.</p> <p>Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.</p>

General > Idle Should Yield

- Enabled
- Disabled

Enabled

This parameter controls the behaviour of tasks at the idle priority. It only has an effect if:

- The preemptive scheduler is being used.
- The application creates tasks that run at the idle priority.
- If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case.
- When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are

application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

This situation can be avoided by:

If appropriate, using an idle hook in place of separate tasks at the idle priority.

Creating all application tasks at a priority greater than the idle priority.

Setting Idle Should Yield to Disabled.

Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.

Setting Use Task Notifications to Enabled will include direct to

General > Use Task Notifications

- Enabled
- Disabled

Enabled

task notification functionality and its associated API in the build.
Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build.

Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.

Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.

Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.

Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.

The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging:

General > Use Mutexes • Enabled Disabled
 • Disabled

General > Use Recursive Mutexes • Enabled Disabled
 • Disabled

General > Use Counting Semaphores • Enabled Enabled
 • Disabled

General > Queue Registry Size Must be an integer and greater than 0 10

It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI.

It contains the information required by a debugger to locate each registered queue and semaphore.

The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for `vQueueAddToRegistry()` and `vQueueUnregisterQueue()` for more information.

Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.

If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on

General > Use Queue Sets

- Enabled
- Disabled

Disabled

General > Use Time Slicing

- Enabled
- Disabled

Disabled

General > Use Newlib
Reentrant

- Enabled
- Disabled

Disabled

every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.

If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.

General > Enable
Backward Compatibility

- Enabled
- Disabled

Disabled

The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward

Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.

Sets the number of indexes in each task's thread local storage array.

Sets the type used to specify the stack depth in calls to `xTaskCreate()`, and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type `UBaseType_t`, but that was found to be too restrictive on 8-bit microcontrollers. `Stack Depth Type` removes that restriction by enabling application developers to specify the type to use.

FreeRTOS Message buffers use variables of type `Message Buffer Length Type` to store the length of each message. If `Message Buffer Length Type` is not defined then it will default to `size_t`. If the messages stored in a message buffer will never be larger than 255 bytes then defining `Message Buffer Length Type` to `uint8_t` will save 3 bytes per message on a 32-bit microcontroller.

General > Num Thread Local Storage Pointers Must be an integer and greater than 0 5

General > Stack Depth Type Manual Entry `uint32_t`

General > Message Buffer Length Type Manual Entry `size_t`

Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.

The highest interrupt priority that can be used by any interrupt service routine that makes calls to interrupt safe FreeRTOS API functions. **DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS!** (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

General > Library Max
Syscall Interrupt
Priority

MCU Specific Options

A full interrupt nesting model is achieved by setting `configMAX_SYSCALL_INTERRUPT_PRIORITY` above (that is, at a higher priority level) than `configKERNEL_INTERRUPT_PRIORITY`. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above `configMAX_SYSCALL_INTERRUPT_PRIORITY` and therefore never be delayed by the RTOS kernel execution.

A special note for ARM Cortex-M users: Please read the page dedicated to interrupt priority settings on ARM Cortex-M devices. As a minimum, remember that ARM Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your

system crash if this priority is above configMAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a ARM Cortex-M core is in fact 255 - however different ARM Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest priority you can specify is 15 - and the highest priority you can specify is 0.

The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT() defined.

The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (`__FILE__` and `__LINE__` are standard macros provided by most compilers). This is just

General > Assert

Manual Entry

assert(x)

for demonstration as `vAssertCalled()` is not a FreeRTOS function, `configASSERT()` can be defined to take whatever action the application writer deems appropriate.

It is normal to define `configASSERT()` in such a way that it will prevent the application from executing any further. This is for two reasons; stopping the application at the point of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining `configASSERT()` will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the `configASSERT()` definition in `FreeRTOSConfig.h`.

```
/* Define
configASSERT() to call
vAssertCalled() if the
assertion fails. The
assertion
has failed if the value
of the parameter
passed into
configASSERT() equals
zero. */
#define configASSERT(
( x ) ) if( ( x ) == 0 )
vAssertCalled( __FILE__,
__LINE__ )
If running FreeRTOS
```

under the control of a debugger, then `configASSERT()` can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

```
/* Define
configASSERT() to
disable interrupts and
sit in a loop. */
#define configASSERT(
( x ) ) if( ( x ) == 0 ) { t
askDISABLE_INTERRUPTS(); for( ;; ); }
```

Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.

Functions implemented in "application_defined_privileged_functions.h

General > Include
Application Defined
Privileged Functions

- Enabled
 - Disabled
- Disabled

" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can be encapsulated in a privileged function using the following code:

```
void MPU_debug_printf(
const char *pcMessage
)
{
/* State the privilege
level of the processor
when the function was
called. */
BaseType_t
xRunningPrivileged =
prvRaisePrivilege();

/* Call the library
function, which now
has access to all RAM.
*/
debug_printf(
pcMessage );

/* Reset the processor
privilege level to its
original value. */
portRESET_PRIVILEGE(
xRunningPrivileged );
}
```

This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Set to Enabled if you

Hooks > Use Idle Hook

• Enabled

Enabled

	<ul style="list-style-type: none"> • Disabled 		wish to use an idle hook, or Disabled to omit an idle hook.
Hooks > Use Malloc Failed Hook	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	<p>The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed.</p> <p>If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Disabled then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below.</p>

Hooks > Use Daemon Task Startup Hook	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	<p>void vApplicationMallocFailedHook(void);</p> <p>If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task (also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function.</p> <pre>void void vApplicationDaemonTaskStartupHook(void);</pre>

Enabled

the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStats() from the build.

The Run Time Stats page describes the use of this parameter.

If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap.

If Support Static Allocation is left undefined it will default to 0.

If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplicationGetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vApplicationGetTimerTaskMemory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below.

/* Support Static Allocation is Enabled, so the application must provide an implementation of vApplicationGetIdleTaskMe

```
mory() to provide the
memory that is
used by the Idle task. */
void vApplicationGetIdleTaskMemory(
    StaticTask_t **ppxIdleTaskTCBBuffer, <br>
    StackType_t **ppxIdleTaskStackBuffer, <br>
    uint32_t
    *puxIdleTaskStackSize )
{
    /* If the buffers to be
    provided to the Idle
    task are declared
    inside this
    function then they
    must be declared static
    - otherwise they will be
    allocated on
    the stack and so not
    exists after this
    function exits. */
    static StaticTask_t
    xIdleTaskTCB;
    static StackType_t
    uxIdleTaskStack[ configMINIMAL_STACK_SIZE ];

    /* Pass out a pointer to
    the StaticTask_t
    structure in which the
    Idle task's
    state will be stored. */
    *ppxIdleTaskTCBBuffer
    =

    /* Pass out the array
    that will be used as the
    Idle task's stack. */
    *ppxIdleTaskStackBuffer
    = uxIdleTaskStack;

    /* Pass out the size of
    the array pointed to by
    *ppxIdleTaskStackBuffer.
    Note that, as the array
    is necessarily of type
    StackType_t,
    configMINIMAL_STACK_SIZE
    is specified in
    words, not bytes. */
    *puxIdleTaskStackSize
    = configMINIMAL_STACK
```

```

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using `R_BSP_GroupIrqWrite()` to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define `configRECORD_STACK_HIGH_ADDRESS` as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes `WFI()` when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes `WFI()`, the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from `SysTick`. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using `portALLOCATE_SECURE_CONTEXT`).

The secure context can be freed by deleting the thread or using the `portCLEAN_UP_TCB(pxTCB)` macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);

    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }

    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
```

```
{
/* Handle process stack monitor error here. */
}
}
void rm_freertos_port_stack_monitor_example (void)
{
/* Register a callback to be called when the stack goes outside the allocated stack
area. */
R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
register uint32_t cfsr = SCB->CFSR;
if (cfsr & SCB_CFSR_STKOF_Msk)
{
/* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
__set_PSP((uint32_t) p_exception_stack_frame);
__set_PSPLIM((uint32_t) p_exception_stack_frame);
/* Clear XPSR, only set T-bit. */
p_exception_stack_frame[7] = 1U << 24;
/* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
* stack_overflow_error_occurred function. It cannot return to the location where
```

```
the fault occurred because
 * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
    p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
}
/* Clear flags. */
SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the task to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
    /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
 * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
```

```
portALLOCATE_SECURE_CONTEXT(0);
rm_freertos_port_nsc_function();
}
```

4.2.96 RTOS Context Management (rm_tz_context)

Modules

RTOS Context Management for RA MCUs.

Overview

Add this module to a secure TrustZone project to allow the associated non-secure project to use an RTOS. It is used by an RTOS port for RA MCUs (for example, the [FreeRTOS Port \(rm_freertos_port\)](#), which is automatically added to RA projects when FreeRTOS is selected during project creation).

Note

The RTOS Context Management module does not provide any interfaces to the user. To use this module to port an RTOS, consult the Arm documentation at https://arm-software.github.io/CMSIS_5/Core/html/group__context__trustzone__functions.html for further information.

Configuration

Build Time Configurations for rm_tz_context

The following build time configurations are defined in fsp_cfg/rm_tz_context_cfg.h:

Configuration	Options	Default	Description
Process Stack Slots	Value must be a non-negative integer greater than 0	8	The maximum number of threads that can allocate a secure context. For applications using FreeRTOS, the Idle task requires 1 context as well.
Process Stack Size	Value must be a non-negative multiple of 8	256	The maximum stack size of all non-secure callable functions.

Clock Configuration

This module does not use peripheral clocks.

Pin Configuration

This module does not use I/O pins.

Usage Notes

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context. To allocate a secure context, reference the documentation for the RTOS port used. For example, reference [TrustZone Integration](#) when FreeRTOS is used.

Sealing the Process Stack

This module seals each process stack by placing the value 0xFE5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": <https://developer.arm.com/documentation/100720/0300>.

4.2.97 FS2012 Sensor Middleware (rm_fs2012)

Modules

Functions

fsp_err_t	RM_FS2012_Open (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg)	Opens and configures the FS2012 Middle module. Implements rm_fsxxxx_api_t::open . More...
fsp_err_t	RM_FS2012_Close (rm_fsxxxx_ctrl_t *const p_api_ctrl)	Disables specified FS2012 control block. Implements rm_fsxxxx_api_t::close . More...
fsp_err_t	RM_FS2012_Read (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data)	Reads ADC data from FS2012. Implements rm_fsxxxx_api_t::read . More...
fsp_err_t	RM_FS2012_DataCalculate (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data, rm_fsxxxx_data_t *const p_fs2012_data)	Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic centimeter per minute) Implements rm_fsxxxx_api_t::dataCalculate . More...

Detailed Description

Middleware to implement the FS2012 sensor interface. This module implements the [FSXXXX Middleware Interface](#).

Overview

Features

The FS2012 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Configuration

Build Time Configurations for rm_fs2012

The following build time configurations are defined in fsp_cfg/rm_fs2012_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	<ul style="list-style-type: none"> • FS2012-1020-N G • FS2012-1100-N G 	FS2012-1100-NG	Select FS2012 device type.

Configurations for Sensor > FS2012 Flow Sensor (rm_fs2012)

This module can be added to the Stacks tab via New Stack > Sensor > FS2012 Flow Sensor (rm_fs2012).

Configuration	Options	Default	Description
Name	Manual Entry	g_fs2012_sensor0	Module name.
Callback	Name must be a valid C symbol	fs2012_callback	A user callback function can be provided.

Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[FS2012 datasheet is here](#). The module only supports FS2012-1020-NG and FS2012-1100-NG.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS2012 interface expects a bus instance to be opened before opening any FS2012 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of FS2012 sensor implementation in an application.

```
void rm_fs2012_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    rm_fsxxxx_raw_data_t fs2012_raw_data;
    rm_fsxxxx_data_t   fs2012_data;
    /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
        (rm_comms_i2c_bus_extended_cfg_t *) g_fs2012_cfg.p_instance->p_cfg->p_extend;
    i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
    /* Create a semaphore for blocking if a semaphore is not NULL */
    if (NULL != p_extend->p_blocking_semaphore)
    {
#ifdef BSP_CFG_RTOS == 1 // AzureOS
        tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
            p_extend->p_blocking_semaphore->p_semaphore_name,
            (ULONG) 0);
#elseif BSP_CFG_RTOS == 2 // FreeRTOS
        *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
```

```
                                (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);

#endif

}

/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#ifdef BSP_CFG_RTOS == 1 // AzureOS
    tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                   p_extend->p_bus_recursive_mutex->p_mutex_name,
                   TX_INHERIT);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
#endif
}
#endif

err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
/* Handle any errors. This function should be defined by the user. */
handle_error(err);

while (true)
{
    g_flag = 0;

    /* Read ADC Data from FS2012 */
    RM_FS2012_Read(&g_fs2012_ctrl,
                  &fs2012_raw_data);

    while (0 == g_flag)
    {
        /* Wait callback */
    }

    /* Calculate Flow value from ADC data */
    RM_FS2012_DataCalculate(&g_fs2012_ctrl, &fs2012_raw_data, &fs2012_data);
```

```

/* FS2012 sample rate. See table 4 on the page 5 of the datasheet. */
/* Gas : 409.6ms, Liquid : 716.8ms */
R_BSP_SoftwareDelay(FS2012_GAS_SAMPLE_RATE, BSP_DELAY_UNITS_MICROSECONDS);
}
}

```

Data Structures

```
struct rm_fs2012_instance_ctrl_t
```

Data Structure Documentation

◆ rm_fs2012_instance_ctrl_t

struct rm_fs2012_instance_ctrl_t	
FS2012 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS2012 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ **RM_FS2012_Open()**

```
fsp_err_t RM_FS2012_Open ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg )
```

Opens and configures the FS2012 Middle module. Implements `rm_fsxxxx_api_t::open`.

Example:

```
err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
```

Return values

FSP_SUCCESS	FS2012 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ **RM_FS2012_Close()**

```
fsp_err_t RM_FS2012_Close ( rm_fsxxxx_ctrl_t *const p_api_ctrl)
```

Disables specified FS2012 control block. Implements `rm_fsxxxx_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_FS2012_Read()**

```
fsp_err_t RM_FS2012_Read ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data )
```

Reads ADC data from FS2012. Implements `rm_fsxxxx_api_t::read`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS2012_DataCalculate()

```
fsp_err_t RM_FS2012_DataCalculate ( rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t
*const p_raw_data, rm_fsxxxx_data_t *const p_fs2012_data )
```

Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic centimeter per minute) Implements `rm_fsxxxx_api_t::dataCalculate`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.98 Azure RTOS GUIX Port (rm_guix_port)

Modules

Functions

```
UINT rm_guix_port_hw_initialize (GX_DISPLAY *p_display)
```

Detailed Description

Overview

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

Figure 206: Azure RTOS GUIX Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX Studio (including example code) please consult the [Azure RTOS GUIX documentation](#).

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine ([D/AVE 2D Port Interface \(r_drw\)](#))
 - Drawing bitmaps
 - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
 - Line and shape drawing
 - Anti-aliased operations
 - Circle stroke and fill
 - Polygon stroke and fill
 - Lines and arcs
- [JPEG Codec \(r_jpeg\)](#)
 - JPEG decoding
- [Graphics LCD Controller \(r_glcdc\)](#)
 - Brightness, contrast and gamma correction
 - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for gx

The following build time configurations are defined in fsp_cfg/azure/gx/gx_user.h:

Configuration	Options	Default	Description
Hardware Acceleration > JPEG Codec Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Select whether or not to use the JPEG Codec for hardware acceleration.
Hardware Acceleration > DRW Engine Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Select whether or not to use the DRW Engine for hardware acceleration.
Hardware Acceleration > Max DRW Operations	Value must be a positive integer	85	Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance.
Internal Thread > Stack Size	Value must be greater than zero	4096	GUIX internal thread stack size in bytes. Must be greater than zero.
Internal Thread >	Value must be between	30	Priority of the GUIX

Priority	0 to 31		Internal Thread. The value must be between 0 to 31.
Internal Thread > Time Slice	Value must be a non-negative integer	10	Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF.
System Timer (ms)	Value must be greater than or equal to 10	20	GUIX system timer period (GX_SYSTEM_TIMER_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX_TIMER_TICKS_PER_SECOND).
Multithread Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead.
UTF8 Support	<ul style="list-style-type: none"> • Disabled • Enabled 	Enabled	Select whether to enable or disable support for UTF8 characters.
Event Queue Size	Value must be greater than zero	48	Maximum number of events in the GUIX event queue.
Enable GX_WIDGET User Data	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Set to Enabled to use the gx_widget_user_data member in the GX_WIDGET structure.

Build Time Configurations for rm_guix_port

The following build time configurations are defined in fsp_cfg/middleware/rm_guix_port_cfg.h:

Configuration	Options	Default	Description
DRW Buffer Cache	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enabling this option significantly improves DRW Engine performance. Set to

Disabled only if Display underflow events are triggered under high graphics load.

Configurations for Graphics > Azure RTOS GUIX Port (rm_guix_port)

Configuration	Options	Default	Description
Display Rotation > Screen Orientation	<ul style="list-style-type: none"> None CW (90 degrees) FLIP (180 degrees) CCW (270 degrees) 	None	Select the display orientation specified in the GUIX Studio project. The Canvas Buffer must be enabled when rotating 180 degrees (FLIP).
Display Rotation > Use Canvas Buffer	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	When screen rotation is set to a value other than 0 a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module.
Display Rotation > Canvas Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the GUIX Canvas Buffer will be allocated.
JPEG Decoding > Work Buffer Size	Must be a valid integer	0xC800	Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled. Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
JPEG Decoding > Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the JPEG Work Buffer will be allocated.
Name	Name must be a valid C symbol	g_rm_guix_port0	Module name.
Target Display Layer	<ul style="list-style-type: none"> Graphics Layer 	Graphics Layer 1	Specify which graphics

	1		screen to inherit the buffer and display dimensions from.
	• Graphics Layer		
	2		
Callback Function	Must be a valid C symbol	NULL	If a callback function is provided it will be called when Display events occur.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Usage Notes

Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e2 studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer * -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

Note

It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:

- Polygons (more sides = more heap)
- Filled arcs and ellipses (more framebuffer lines occupied = more heap)
- gx_canvas_pixmap_tile (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to gx_canvas_pixmap_tile as well as certain arc/ellipse fill functions as GUIX manually draws pixmaps to fill these shapes (at the expense of heap space).

Examples

Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

Note

GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
GX_WINDOW_ROOT * p_window_root;

void guix_user_start (void)
{
    /* Initialize GUIX */
    gx_system_initialize();

    /* Configure GUIX Studio project main display and get a pointer to the root window
    */
    gx_studio_display_configure(MAIN_DISPLAY,
    rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);

    /* Set pointer to the first buffer generated by the configuration
    (rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,
                            p_window_root->gx_window_root_canvas->gx_canvas_memory_size);

    /* Create and show the root window in the GUIX Studio project */
    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
    GX_NULL);
}
```

```

    gx_widget_show(p_window_root);

/* Start GUIX */
    gx_system_start();

/* GUIX will continue to run in its own thread */
}

```

Data Structures

struct [rm_guix_port_callback_args_t](#)

Enumerations

enum [rm_guix_port_device_t](#)

enum [rm_guix_port_event_t](#)

Data Structure Documentation

◆ rm_guix_port_callback_args_t

struct rm_guix_port_callback_args_t		
Callback arguments for the FSP GUIX Port		
Data Fields		
rm_guix_port_device_t	device	Device code.
rm_guix_port_event_t	event	Event code of the low level hardware.
uint32_t	error	Error code if RM_GUIX_PORT_EVENT_ERROR.

Enumeration Type Documentation

◆ rm_guix_port_device_t

enum rm_guix_port_device_t	
Low level device code for the GUIX	
Enumerator	
RM_GUIX_PORT_DEVICE_NONE	Non hardware.
RM_GUIX_PORT_DEVICE_DISPLAY	Display device.
RM_GUIX_PORT_DEVICE_DRW	2D Graphics Engine
RM_GUIX_PORT_DEVICE_JPEG	JPEG Codec.

◆ **rm_guix_port_event_t**

enum <code>rm_guix_port_event_t</code>	
Display event codes	
Enumerator	
<code>RM_GUIX_PORT_EVENT_ERROR</code>	Low level driver error occurs.
<code>RM_GUIX_PORT_EVENT_DISPLAY_VSYNC</code>	Display interface VSYNC.
<code>RM_GUIX_PORT_EVENT_UNDERFLOW</code>	Display interface underflow.

Function Documentation◆ **rm_guix_port_hw_initialize()**

UINT <code>rm_guix_port_hw_initialize (GX_DISPLAY * p_display)</code>	
Callback function to be passed to <code>gx_studio_display_configure</code> in order to start hardware modules. Example:	
<pre> /* Configure GUIX Studio project main display and get a pointer to the root window */ gx_studio_display_configure(MAIN_DISPLAY, rm_guix_port_hw_initialize, MAIN_DISPLAY_LANGUAGE_ENGLISH, MAIN_DISPLAY_THEME, &p_window_root); </pre>	
<i>Note</i> This function should only be called by GUIX.	
Return values	
<code>GX_SUCCESS</code>	Device driver setup is successfully done.
<code>GX_FAILURE</code>	Device driver setup failed.

Modules

Functions

`fsp_err_t` `RM_HS300X_Open` (`rm_hs300x_ctrl_t *const p_api_ctrl`,
`rm_hs300x_cfg_t const *const p_cfg`)

Opens and configures the HS300X Middle module. Implements `rm_hs300x_api_t::open`. [More...](#)

`fsp_err_t` `RM_HS300X_Close` (`rm_hs300x_ctrl_t *const p_api_ctrl`)

Disables specified HS300X control block. Implements `rm_hs300x_api_t::close`. [More...](#)

`fsp_err_t` `RM_HS300X_MeasurementStart` (`rm_hs300x_ctrl_t *const p_api_ctrl`)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements `rm_hs300x_api_t::measurementStart`. [More...](#)

`fsp_err_t` `RM_HS300X_Read` (`rm_hs300x_ctrl_t *const p_api_ctrl`,
`rm_hs300x_raw_data_t *const p_raw_data`)

Reads ADC data from HS300X. Implements `rm_hs300x_api_t::read`. [More...](#)

`fsp_err_t` `RM_HS300X_DataCalculate` (`rm_hs300x_ctrl_t *const p_api_ctrl`,
`rm_hs300x_raw_data_t *const p_raw_data`, `rm_hs300x_data_t *const p_hs300x_data`)

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements `rm_hs300x_api_t::dataCalculate`. [More...](#)

`fsp_err_t` `RM_HS300X_ProgrammingModeEnter` (`rm_hs300x_ctrl_t *const p_api_ctrl`)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements `rm_hs300x_api_t::programmingModeEnter`. [More...](#)

`fsp_err_t` `RM_HS300X_ResolutionChange` (`rm_hs300x_ctrl_t *const p_api_ctrl`,
`rm_hs300x_data_type_t const data_type`, `rm_hs300x_resolution_t const resolution`)

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements `rm_hs300x_api_t::resolutionChange`. [More...](#)

`fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const p_sensor_id)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements `rm_hs300x_api_t::sensorIdGet`. [More...](#)

`fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const p_api_ctrl)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements `rm_hs300x_api_t::programmingModeExit`. [More...](#)

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the [HS300X Middleware Interface](#).

Overview

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for `rm_hs300x`

The following build time configurations are defined in `fsp_cfg/rm_hs300x_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	<ul style="list-style-type: none"> • Both humidity and temperature • Humidity only 	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.

Programming Mode	<ul style="list-style-type: none"> • ON • OFF 	OFF	If selected the programming mode can be entered.
------------------	---	-----	--

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x)

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x).

Configuration	Options	Default	Description
Name	Manual Entry	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[HS300x datasheet is here.](#)

If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
```

```
fsp_err_t          err = FSP_SUCCESS;
rm_hs300x_raw_data_t hs300x_raw_data;
rm_hs300x_data_t    hs300x_data;
uint8_t            calculated_flag = 0;
/* Open the I2C bus if it is not already open. */
rm_comms_i2c_bus_extended_cfg_t * p_extend =
    (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#ifdef BSP_CFG_RTOS
/* Create a semaphore for blocking if a semaphore is not NULL */
if (NULL != p_extend->p_blocking_semaphore)
{
#ifdef BSP_CFG_RTOS == 1 // AzureOS
    tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
        p_extend->p_blocking_semaphore->p_semaphore_name,
        (ULONG) 0);
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
        xSemaphoreCreateCountingStatic((UBaseType_t) 1,
            (UBaseType_t) 0,
p_extend->p_blocking_semaphore->p_semaphore_memory);
#endif
}
/* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
if (NULL != p_extend->p_bus_recursive_mutex)
{
#ifdef BSP_CFG_RTOS == 1 // AzureOS
    tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
        p_extend->p_bus_recursive_mutex->p_mutex_name,
        TX_INHERIT);
```

```
#elif BSP_CFG_RTOS == 2 // FreeRTOS
    *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
        xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
#endif
}
#endif

err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);

Function Documentation

◆ **RM_HS300X_Open()**

```
fsp_err_t RM_HS300X_Open ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_cfg_t const *const p_cfg )
```

Opens and configures the HS300X Middle module. Implements `rm_hs300x_api_t::open`.

Example:

```
err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ **RM_HS300X_Close()**

```
fsp_err_t RM_HS300X_Close ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

Disables specified HS300X control block. Implements `rm_hs300x_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_HS300X_MeasurementStart()**

```
fsp_err_t RM_HS300X_MeasurementStart ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements `rm_hs300x_api_t::measurementStart`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_HS300X_Read()**

```
fsp_err_t RM_HS300X_Read ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data )
```

Reads ADC data from HS300X. Implements `rm_hs300x_api_t::read`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_HS300X_DataCalculate()**

```
fsp_err_t RM_HS300X_DataCalculate ( rm_hs300x_ctrl_t *const p_api_ctrl, rm_hs300x_raw_data_t *const p_raw_data, rm_hs300x_data_t *const p_hs300x_data )
```

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements `rm_hs300x_api_t::dataCalculate`.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ **RM_HS300X_ProgrammingModeEnter()**

```
fsp_err_t RM_HS300X_ProgrammingModeEnter ( rm_hs300x_ctrl_t *const p_api_ctrl)
```

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements `rm_hs300x_api_t::programmingModeEnter`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ **RM_HS300X_ResolutionChange()**

```
fsp_err_t RM_HS300X_ResolutionChange ( rm_hs300x_ctrl_t *const p_api_ctrl,
rm_hs300x_data_type_t const data_type, rm_hs300x_resolution_t const resolution )
```

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements [rm_hs300x_api_t::resolutionChange](#).

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ **RM_HS300X_SensorIdGet()**

```
fsp_err_t RM_HS300X_SensorIdGet ( rm_hs300x_ctrl_t *const p_api_ctrl, uint32_t *const
p_sensor_id )
```

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements [rm_hs300x_api_t::sensorIdGet](#).

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ProgrammingModeExit()

`fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const p_api_ctrl)`

This function must be called after calling the `RM_HS300X_ProgrammingModeEnter` function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements `rm_hs300x_api_t::programmingModeExit`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

4.2.100 Azure RTOS LevelX NOR SPI Driver (rm_levelx_nor_spi)

Modules

Functions

`fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, rm_levelx_nor_spi_cfg_t const *const p_cfg)`

Initializes LevelX NOR SPI port read/write and control. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_Read (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG *const p_flash_addr, ULONG *const p_dest, ULONG word_count)`

LevelX NOR driver "read sector" service. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_Write (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG *const p_flash_addr, ULONG *const p_src, ULONG word_count)`

LevelX NOR driver "write sector" service. [More...](#)

`fsp_err_t RM_LEVELX_NOR_SPI_BlockErase (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG block, ULONG erase_count)`

LevelX NOR driver "block erase" service. [More...](#)

`fsp_err_t` [RM_LEVELX_NOR_SPI_BlockErasedVerify](#)
(`rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG block`)
LevelX NOR driver "block erased verify" service. [More...](#)

`fsp_err_t` [RM_LEVELX_NOR_SPI_Close](#) (`rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl`)
LevelX NOR driver close service. [More...](#)

Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: <https://docs.microsoft.com/en-us/azure/rtos/levelx/>

Configuration

Build Time Configurations for `rm_levelx_nor_spi`

The following build time configurations are defined in `fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Write Verify	<ul style="list-style-type: none"> Enabled Disabled 	Disabled	When enabled reads back data written to SPI memory in order to verify it.
Page Buffer Size (bytes)	Size should be greater than zero	256	When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source location also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to

temporarily store data to write out.

Configurations for Storage > LevelX NOR Port (rm_levelx_nor_spi)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_levelx_nor_spi0	Module name.
Memory Start Address Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Build Time Configurations for lx

The following build time configurations are defined in fsp_cfg/azure/lx/lx_user.h:

Configuration	Options	Default	Description
NOR > Direct Read	<ul style="list-style-type: none"> Enabled (default) Disabled 	Enabled (default)	When enabled, this option bypasses the NOR flash driver read routine in favor of reading the NOR memory directly, resulting in a significant performance increase.
NOR > Free Sector Data Verify	<ul style="list-style-type: none"> Enabled Disabled (default) 	Disabled (default)	When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones.
NOR > Extended Cache	<ul style="list-style-type: none"> Enabled (default) Disabled 	Enabled (default)	Enables the extended NOR cache.
NOR > Extended Cache Size	Manual Entry		If not set this value defaults to 8, which

NOR > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty	represents a maximum of 8 sectors that can be cached in a NOR instance.	
NAND > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty	If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.	
NAND > Flash Direct Mapping Cache	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device.
Thread Safe	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API.
Standalone Mode	<ul style="list-style-type: none"> • Enabled • Disabled (default) 	Disabled (default)	When enabled, allows LevelX to be used in standalone mode (without Azure RTOS).

Usage Notes

Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

Closing the driver

When `lx_nor_flash_close` is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. `g_rm_levelx_nor_spi0_close`) in order to close out the driver instance.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on `lx_nor_flash_open` due to any areas in flash memory that have been written/set.

Examples

Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t          read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t          write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
    spi_flash_status_t  status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
    /* Erase flash prior to usage */
    fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
    for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
        i < g_levelx_nor_spi0_cfg.size;
        i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
```

```
err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                         (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,
RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
assert(FSP_SUCCESS == err);

handle_lx_error(lx_err);
assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}
```

Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by LevelX NOR SPI driver needs to wait on operation. */
```

```

void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
    if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
        /* Put the thread to sleep while waiting for operation to complete. */
        tx_thread_sleep(1);
    }
}

```

Data Structures

struct rm_levelx_nor_spi_instance_ctrl_t		
SF_EL_LX_NOR Control Block Type		
Data Fields		
rm_levelx_nor_spi_cfg_t const *	p_cfg	Pointer to instance configuration.
uint32_t	start_address	Start address of partition to use within memory mapped region.
uint32_t	minimum_erase_size	Minimum erase size of SPI memory.

uint8_t	page_buffer[RM_LEVELX_NOR_S PI_CFG_BUFFER_SIZE]	Page buffer for situations when writing to SPI memory from a source within SPI memory.
uint32_t	open	Used to determine if module is initialized.

Enumeration Type Documentation

◆ rm_levelx_nor_spi_event_t

enum <code>rm_levelx_nor_spi_event_t</code>	
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.	
Enumerator	
RM_LEVELX_NOR_SPI_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_LEVELX_NOR_SPI_Open()

<code>fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, rm_levelx_nor_spi_cfg_t const *const p_cfg)</code>		
Initializes LevelX NOR SPI port read/write and control. Calls lower level SPI memory functions.		
Parameters		
[in,out]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_cfg	Configuration for LevelX NOR SPI port.
Return values		
FSP_SUCCESS	LevelX NOR driver is successfully opened.	
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.	
FSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.	
Returns		
See Common_Error_Codes or lower level drivers for other possible return codes. This function calls <ul style="list-style-type: none"> ◦ <code>spi_flash_api_t:open</code> 		

◆ **RM_LEVELX_NOR_SPI_Read()**

```
fsp_err_t RM_LEVELX_NOR_SPI_Read ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG
*const p_flash_addr, ULONG *const p_dest, ULONG word_count )
```

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

Return values

FSP_SUCCESS	LevelX NOR flash sector read successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_dest is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.

Returns

See `Common_Error_Codes` or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Write()

```
fsp_err_t RM_LEVELX_NOR_SPI_Write ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl, ULONG
*const p_flash_addr, ULONG *const p_src, ULONG word_count )
```

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

Return values

FSP_SUCCESS	LevelX NOR flash sector write successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_src is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.
FSP_ERR_WRITE_FAILED	Verification of Write operation failed.
FSP_ERR_INVALID_ADDRESS	Write address or size falls outside of flash memory range.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- [spi_flash_api_t:write](#)

◆ RM_LEVELX_NOR_SPI_BlockErase()

```
fsp_err_t RM_LEVELX_NOR_SPI_BlockErase ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl,
ULONG block, ULONG erase_count )
```

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

Return values

FSP_SUCCESS	LevelX NOR flash block erase successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:erase

◆ **RM_LEVELX_NOR_SPI_BlockErasedVerify()**

```
fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl,
ULONG block )
```

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which block to verify that it is erased.

Return values

FSP_SUCCESS	LevelX flash block erase verification successful.
FSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
FSP_ERR_NOT_ERASED	The block is not erased properly.

Returns

See `Common_Error_Codes` or lower level drivers for other possible return codes.

◆ **RM_LEVELX_NOR_SPI_Close()**

```
fsp_err_t RM_LEVELX_NOR_SPI_Close ( rm_levelx_nor_spi_instance_ctrl_t *const p_ctrl)
```

LevelX NOR driver close service.

This is responsible for closing the driver properly.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
------	--------	--

Return values

FSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

Returns

See `Common_Error_Codes` or lower level drivers for other possible return codes. This function calls

- `spi_flash_api_t:close`

4.2.101 LittleFS Flash Port (rm_littlefs_flash)

Modules

Functions

```
fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl,
    rm_littlefs_cfg_t const *const p_cfg)
```

```
fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)
```

Detailed Description

Middleware for the LittleFS File System control on RA MCUs.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:

<https://github.com/ARMmbed/littlefs>

Configuration

Build Time Configurations for rm_littlefs_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on Flash (rm_littlefs_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.

Block Size (bytes)	Must be a multiple of 64	128	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Count	Manual Entry	(BSP_DATA_FLASH_SIZE_BYTES/128)	Number of erasable blocks on the device.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is

stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enables thread safety in LittleFS.
Use Malloc	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Configures the use of malloc by LittleFS.
Use Assert	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Configures the use of assert by LittleFS.
Debug Messages	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Configures debug messages.
Warning Messages	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Configures warning messages.
Error Messages	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Configures error messages.
Trace Messages	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Configures trace messages.
Intrinsics	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Configures intrinsic functions such as <code>__builtin_clz</code> .
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

Limitations

This module is not thread safe.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
    /* Open LittleFS Flash port.*/
    fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    /* Format the filesystem. */
    int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
    /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
}
```

```
/* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);

/* Create a file toast in the breakfast directory. */
const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
/*****
*****
* By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
* Buffers will be generated from the configuration for the read, program and
lookahead buffers.
* When opening a file a unique buffer must be passed in for use as a file buffer.
* The buffer size must be equal to the cache size.
*****
*****/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                              &file,
                              path,
                              LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                              &g_file_cfg);

    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif

const char * contents = "butter";
    lfs_size_t len = strlen(contents);

/* Apply butter to toast 10 times. */
for (uint32_t i = 0; i < 10; i++)
{
    lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
    if (lfs_err < 0)
```

```
    {
        handle_lfs_error(lfs_err);
    }
}

/* Close the file. */
lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
handle_lfs_error(lfs_err);

/* Unmount the filesystem. */
lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
handle_lfs_error(lfs_err);

/* Remount the filesystem. */
lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
handle_lfs_error(lfs_err);

/* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);

/* Verify the toast is buttered the correct amount. */
for (uint32_t i = 0; i < 10; i++)
    {
        lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
        if (lfs_err < 0)
            {
                handle_lfs_error(lfs_err);
            }
        assert(0 == memcmp(buffer, contents, len));
    }

/* Close the file. */
```

```

lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);

handle_lfs_error(lfs_err);

}

```

Function Documentation

◆ RM_LITTLEFS_FLASH_Open()

`fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)`

Opens the driver and initializes lower layer driver.

Implements `rm_littlefs_api_t::open()`.

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `flash_api_t::open`

◆ RM_LITTLEFS_FLASH_Close()

`fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)`

Closes the lower level driver.

Implements `rm_littlefs_api_t::close()`.

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- `flash_api_t::close`

4.2.102 MCUboot Port (rm_mcuboot_port)

Modules

MCUboot Port for RA MCUs.

Overview

Note

The MCUboot Port does not provide any interfaces to the user. Consult the MCUboot documentation at <https://mcu-tools.github.io/mcuboot/> for further information.

Configuration

Build Time Configurations for MCUboot

The following build time configurations are defined in mcu-tools/include/mcuboot_config/mcuboot_config.h:

Configuration	Options	Default	Description
General > Custom mcuboot_config.h	Manual Entry		Add a path to your custom mcuboot_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Upgrade Mode	<ul style="list-style-type: none"> Swap Overwrite Only Overwrite Only Fast Direct XIP 	Overwrite Only	Swap supports A/B image swapping with rollback. Other modes with simpler code path, which only supports overwriting the existing image with the update image or running the newest image directly from its flash partition, are also available.
General > Validate Primary Image	<ul style="list-style-type: none"> Enabled Disabled 	Enabled	Always check the signature of the image in the primary slot before booting, even if no upgrade was performed. This is recommended if the

General > Downgrade Prevention (Overwrite Only)	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	boot time penalty is acceptable.
General > Number of Images Per Application	<ul style="list-style-type: none"> • 1 • 2 (TrustZone) 	1	Prevent downgrades by enforcing incrementing version numbers. When this option is set, any upgrade must have greater major version or greater minor version with equal major version. This mechanism only protects against some attacks against version downgrades (for example, a JTAG could be used to write an older version).
General > Watchdog Feed	Manual Entry		Number of separately updateable images.
General > Measured Boot	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	This function might be implemented if the OS / HW watchdog is enabled while doing a swap upgrade and the time it takes for a swapping is long enough to cause an unwanted reset. If implementing this, the OS main.c must also enable the watchdog (if required)!
General > Data Sharing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Copies the boot data into the secure RAM, intended to be used by the secure App.
General > Data Sharing	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Copies the user data into the secure RAM, intended to be used by the secure App.
Signing Options > TrustZone > Boot Record (Image 2)	String length must be 12 characters or less.		Create CBOR encoded boot record TLV for Image 2. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters]
Signing Options > TrustZone > Custom	Manual Entry	--confirm	Add any custom options to pass to

(Image 2)

imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent.

Signing Options >
Signature Type

- None
- ECDSA P-256
- RSA 2048
- RSA 3072

ECDSA P-256

Configure the signature type.

Signing Options > Boot
Record

String length must be 12 characters or less.

Create CBOR encoded boot record TLV. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters]

Signing Options >
Custom

Manual Entry

--confirm

Add any custom options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent.

Signing Options >
Python

Manual Entry

python

Name of the python command to use. Default is python, but can be updated to python3 for Linux or an absolute path if needed.

Flash Layout >
TrustZone > Non-Secure Callable Region

Value must be an integer multiple of the 1024.

0x0

Size of the Non-Secure Callable region of the Secure image.

Size (Bytes)

Flash Layout > TrustZone > Non-Secure Flash Area Size (Bytes) (TrustZone Non-Secure)	Value must be an integer multiple of the largest erase size on the mcu.	0x0	Size of the Non-Secure region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image. If the Non-Secure region can be updated separately, this size must account for the header and trailer.
Flash Layout > TrustZone > Non-Secure Callable RAM Region Size (Bytes)	Value must be an integer multiple of the 1024.	0x0	Size of the Non-Secure Callable RAM region of the Secure image.
Flash Layout > TrustZone > Non-Secure RAM Region Size (Bytes) (TrustZone Non-Secure)	Value must be an integer multiple of the 8192.	0x0	Size of the Non-Secure RAM region. This must be non-zero for all TrustZone projects to ensure memory is partitioned correctly, even if the Secure and Non-Secure regions are treated as a single image.
Flash Layout > TrustZone > Image 2 Header Size (Bytes)	Value must be an integer multiple of 0x80 (alignment required by VTOR).	0x200	Size of the flash reserved for the application image header for Image 2.
Flash Layout > Bootloader Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x20000	Size of the flash reserved for the bootloader.
Flash Layout > Image 1 Header Size (Bytes)	Value must be an integer multiple of 0x80 (alignment required by VTOR).	0x200	Size of the flash reserved for the application image header. Must meet minimum VTOR alignment requirements for the core (0x100 for Cortex-M23, 0x80 for Cortex-M4 and Cortex-M33).
Flash Layout > Image 1 Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on	0x20000	Size of the application image 1, including the header and trailer. For

the mcu.

TrustZone projects, enter the combined size of the Secure and Non-Secure Callable regions if the Non-Secure image can be updated separately, or enter the size of the entire image slot if Secure, Non-Secure Callable, and Non-Secure regions are updated as a single image.

Flash Layout > Scratch Flash Area Size (Bytes)	Value must be an integer multiple of the largest erase size on the mcu.	0x0	Size of the scratch area. Only required for swap update method.
Data Sharing > Maximum Measured Boot Record Size (Bytes)	Value must be an integer.	0x64	Maximum size of the boot record.
Data Sharing > Shared Data Size (Bytes)	Value must be an integer.	0x380	Size of the shared RAM area. Required for Measured Boot.
Data Sharing > Shared Data Address	Value must be an integer	0x20000000	Shared RAM start address. Required for Measured Boot.

Clock Configuration

This module does not use peripheral clocks.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating an MCUboot Project

Start by creating a new project in e2 studio or RA SC. If the MCU supports TrustZone, select a Flat project. The bootloader resides entirely in Secure memory, but it is considered a flat project because it does not provide any Non-Secure Callable functions. On the Stacks tab, add New > Bootloader > MCUboot. Resolve any constraint errors and edit configurations as desired. Add either the example keys or generate your own key. The MCUboot key generation tool is provided at ra/mcu-tools/MCUboot/scripts/imgtool.py and documented at <https://github.com/mcu-tools/mcuboot/blob/master/docs/imgtool.md>. Install the following required python packages to use imgtool.py: <https://github.com/mcu-tools/mcuboot/blob/master/scripts/requirements.txt>.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot > Quick Setup > Call Quick Setup. Add a call to mcuboot_quick_setup() in the application and make any desired updates.

Note

MCUboot will contain either the verification public key or its hash. During production it is necessary to permanently lock the flash region where MCUboot is programmed to prevent the keys or the code from being modified.

Getting Started: Signing Tool Prerequisite

To use the MCUboot signing tool, ensure you have Python 3.x installed on your system. Then install the Python packages required for the signing tool with the following command:

```
pip3 install --user -r ra/mcu-tools/MCUboot/scripts/requirements.txt
```

Getting Started: Converting a Project to an MCUboot Image

MCUboot application images must execute from the image slot defined by the MCUboot project. They are also limited to a single downloadable flash region. All of this is handled by specifying a BootloaderDataFile in the FSP Configuration tool.

Any existing project can be converted to an MCUboot image.

1. If the project was created with a version prior to FSP v3.0.0, update the linker script to the v3.0.0 version before using it as an MCUboot application image.
2. Right click the project to convert in e2 studio or RA SC and select Properties.
3. Open C/C++ Build and select Build Variables.
4. Click Add...
5. For Variable Name, enter BootloaderDataFile. For Type, select File. Browse to the *.bld file created alongside the *.elf file for the associated MCUboot project.
6. Click OK, then Apply and Close.

To convert a TrustZone image, follow the steps above for both the Secure project and the Non-Secure project.

MCUboot application images must also be signed to work with MCUboot. At a minimum, this involves adding a SHA and MCUboot specific constant data called boot magic in the image trailer.

Signing can be done on the as a post-build step in e2 studio. To sign the image as a post-build step:

1. If Linux is used to develop the application image, change the MCUboot property Signing > Python to python3.
2. Build the bootloader project to generate the *.bld file. Make sure to build the bootloader project on the same computer as the application image to ensure the path to the signing script is correct.
3. Define environment variables in the Properties of the application image project in e2 studio.
 - a. Right click the application image project, and select **Properties**.
 - b. Select **C/C++ Build > Environment** on the left.
 - c. Click **Add...**
 - d. Define the following environment variables one at a time:
 - **MCUBOOT_IMAGE_VERSION**: Set to the version of the application image.
 - **MCUBOOT_IMAGE_SIGNING_KEY**: Set the path to the key used for signing. If signing is not required, do not set this variable. If example keys are used, set **MCUBOOT_IMAGE_SIGNING_KEY** as follows (replace <boot_project> with the bootloader project path):
 - ECC: <boot_project>/ra/mcu-tools/MCUboot/root-ec-p256.pem
 - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-2048.pem

- RSA 3K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-3072.pem
 - MCUBOOT_APP_BIN_CONVERTER: Optional. Set to path to objcopy, arm-none-eabi-objcopy, fromelf, or ielftool. Not required if one of these tools is on the path.
4. Build the project.
 5. The signed image is output next to the application <project>.elf file with the name <project>.bin.signed.

Getting Started: Download and Debug

For projects that do not use TrustZone, debug the MCUboot project using the default configuration. Before running, load the signed image to the address specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e2 studio. Upgrade images can be loaded to the upgrade image slots using the same method.

For TrustZone projects, debug using the Secure project to ensure the IDAU is partitioned correctly when debugging in e2 studio. Make the following modifications before debugging in e2 studio:

1. In the Debug Configurations for your project, on the Startup tab, click Add... to add the MCUboot project *.elf file (Image and Symbols), and optionally the Non-Secure project *.elf file.
2. For the Secure and Non-Secure project *.elf file, load Symbols Only.
3. After starting to debug, load the signed Secure image and the signed Non-Secure image into the addresses specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e2 studio. Upgrade images can be loaded to the upgrade image slots using the same method.

Confirming Upgrade in Swap Mode

In Swap Mode operation, if the upgrade image is signed with the -pad option, MCUboot will install that image as a temporary update where if nothing else is done, a reboot will cause MCUboot to revert to the image version that was swapped out during the upgrade. In order for the updated image to prevent this reversion and make the update permanent, the boot_set_confirmed() must be called from the application.

To avail this capability in the application image, from the Stacks tab, add New > Bootloader > MCUboot Image Utilities (Swap Mode). Resolve any constraint errors and edit configurations as desired.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot Image Utilities > Quick Setup > Confirm Primary Image. Add a call to boot_set_confirmed() in the application and confirm the image in the primary slot.

XIP Mode operation

XIP mode is enabled selecting "Direct XIP" as the Upgrade Mode option in the configurator or by defining "MCUBOOT_DIRECT_XIP" in the mcuboot config file. The linker script defines the symbol "XIP_SECONDARY_SLOT_IMAGE" by default to 0. To link an application to the secondary slot in XIP mode, set XIP_SECONDARY_SLOT_IMAGE to 1 in the application linker script. Direct XIP mode does not support TrustZone projects.

Dual Bank operation

MCUboot can be used with Dual bank mode to leverage the advantages of dual bank flash operation. When Dual Bank mode is enabled, only the XIP upgrade mode can be used.

Note

Unlike in normal XIP Mode operation, the linker script symbol "XIP_SECONDARY_SLOT_IMAGE" must be undefined in Dual Bank mode. An example flash layout in this configuration for a 1 MB is shown below. Note that there are 2 copies of the bootloader, one in Bank 0 and another in Bank 1.

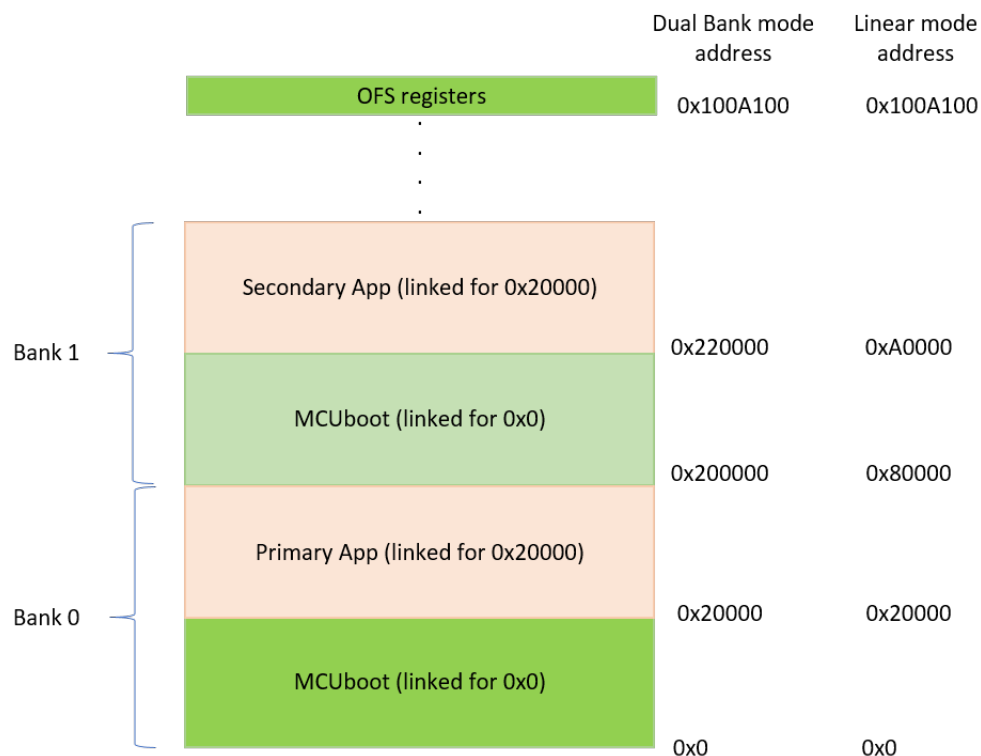

Figure 207: MCUboot Dual Bank layout for 1 MB Memory

For this example layout, the following files are generated when Dual Bank mode with XIP is enabled:

1. Bootloader Project: srec file linked to address 0 and includes the OFS region.
2. Application Project (Primary): signed bin file linked to address 0x20000.
3. Application Project (Secondary): signed bin file linked to address 0x20000.

In Dual Bank mode, the available flash memory is split into two halves and referred to as Bank 0 and Bank 1. In this example Bank 0 would span from address 0x0 - 0x7FFFF and Bank 1 from 0x200000 - 0x27FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x80000 - 0xFFFFF.

Programming in Dual Bank Mode

The bootloader must be duplicated in Dual Bank mode. Bank 0 can be programmed using the srec file generated from the MCUboot project; this will also program the OFS region which contains the dual bank enable bit, so it must either be programmed last if each file is programmed independently. Another option is to combine all images: MCUboot in Bank 0, primary image, MCUboot in Bank 1 (no OFS), and secondary image (optional). To program MCUboot to Bank 1, offset MCUboot by half the flash size and cut off the OFS region (0x0100A100 to address 0x0100A2FF on CM33 MCUs that

support dual bank). Using `srec-cat` for a 1 MB flash MCU (0x80000 flash per bank), an example command to create the bootloader image for Bank 1: `"srec_cat MCUboot_dualbank.srec -crop 0 0x80000 -offset 0x80000 -o MCUboot_dualbank_offset.srec"`. The application project for Bank 1 can be similarly offset using `srec_cat`: `"srec_cat app1.bin.signed -binary -offset 0xA0000 -o app1_offset.srec"`, where 0xA0000 is 0x80000 (half the flash) + 0x20000 (MCUboot size). The signed binary file for Bank 0 can be converted to srec format using `srec_cat`: `"srec_cat app0.bin.signed -binary -offset 0x20000 -o app0.srec"`

To combine all the files into one srec file, use `"srec_cat MCUboot_dualbank.srec MCUboot_dualbank_offset.srec app0.srec app1_offset.srec -o combined_srec"`.

External Memory Support

QSPI support for secondary image storage can be enabled in the configurator. The bootloader expects the QSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has configured the QSPI in Extended-SPI mode and that `R_QSPI_Open()` has been called prior to invoking `boot_go()`; For an example on how to initialize the QSPI device, refer to the QSPI module. The QSPI sector size must be the same as that of the MCU internal flash (`BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE`) for swap mode operation.

MCUboot Memory Map

For single image projects with no external memory support, the default memory map looks like:

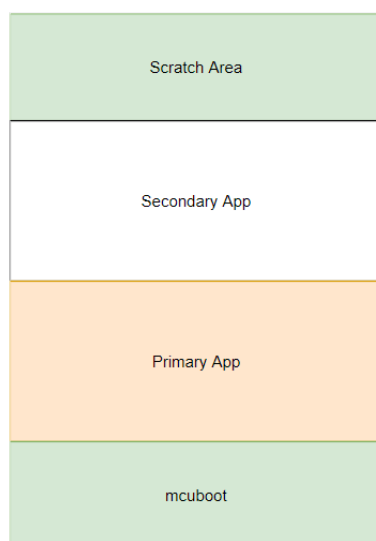

Figure 208: MCUboot Memory Map

For projects with 2 separately updateable images (used for TrustZone applications where the Secure and Non-Secure images can be updated separately), the default memory map with no external memory support looks like:

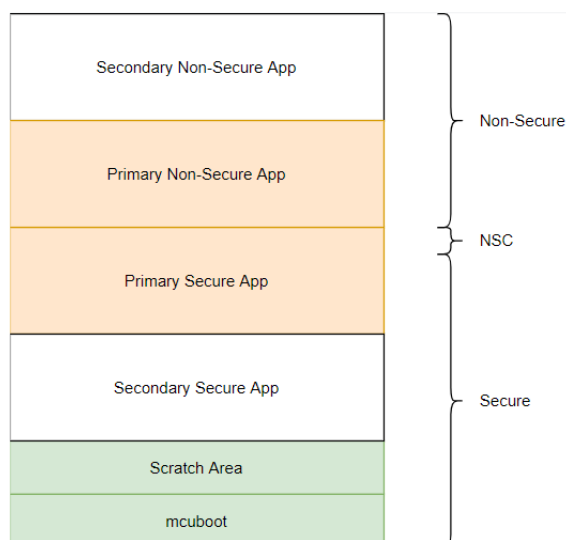

Figure 209: MCUboot Memory Map (TrustZone)

For single image projects with QSPI, the default memory map looks like:

Figure 210: MCUboot Memory Map with QSPI

MCUboot Crypto Stack Options

The following crypto stacks can be used with MCUboot in FSP:

1. MbedTLS, which is hardware accelerated on all RA devices. On the RA2 which has an AES engine only, ECC/RSA/SHA operations are in software.
2. TinyCrypt (S/W Only) can be used with all devices.
3. TinyCrypt (H/W Accelerated) has AES operations accelerated for the RA2 family only. When using MCUboot without encryption there is no difference between using this or the S/W only version.
4. SCE9 Protected Mode on devices that have the SCE9 (eg: RA6M4, RA4M3, RA4M2)

MbedTLS provides the best performance for MCUBoot signature verification on the RA6 and RA4 devices but has a much larger code footprint compared to TinyCrypt. For RA2 devices TinyCrypt is the best option.

Using SCE9 Protected Mode Crypto Stack

Using this crypto stack with MCUBoot provides additional security by ensuring that any keys that are used were securely provisioned for the specific device. The Application Note R11AN0496 provides detailed steps on how to go about installing these keys. Since the section "Preparing Keys for Installation and Update Using RFP" document currently only provides information on how to install an AES key, this section will provide information on how to install an ECC public key.

Note

When using the SCE9 Protected Mode Stack with MCUboot it is required that the public keys in the format described in the "MCUboot Example Keys" module in the stack is also provided in the project.

1. Generate an ECC key pair. There are various ways to do this but you can use openssl to do so: "openssl ecparam -name secp256k1 -genkey -noout -out my_ecc_secp256k1_key.pem".
2. Once the key is generated, in order to install the public key using RFP (Renesas Flash Programmer) the user needs to have their own UFPK (User Factory Programming Key) and W-UFPK (Wrapped User Factory Programming Key). Refer to R11AN0496 on how to obtain these keys.
3. Once the UFPK and W-UFPK are available, we need to extract the public key from the pem file. The public key can be viewed by using "openssl ec -noout -text -in my_ecc_secp256k1_key.pem". Note that when the ECC public key is printed out this way, it will contain a 0x04 ASN.1 demarcator at the start which should be discarded.
4. Use the rfp-util.exe utility from the RFP installation folder to wrap the public key using the UFPK and W-UFPK into a format that can be installed by RFP and the factory bootloader on the MCU.
5. Use RFP as described in R11AN0496 to install the key to the location of mcuboot_sce9_key section.

These are examples that install the default keys provided with MCUboot in ra/mcu-tools/MCUboot/. The examples assume that UFPK and W-UFPK are already available.

```
//Print out the EC-P256 Public Key using openssl
C:\>openssl ec -noout -text -in root-ec-p256.pem
read EC key
Private-Key: (256 bit)

// From the bootloader map file determine the address of mcuboot_sce9_key section
Use RFP to install "ECC_pub_install.rkey" as described in R11AN0496 to the address
where the mcuboot_sce9_key section is located.
```

Examples

Basic Example

This is an example of using MCUboot in an application.

```
void rm_mcuboot_port_example (void)
{
#ifdef MCUBOOT_USE_MBED_TLS
    /* Initialize mbedtls. */
    mbedtls_platform_context ctx = {0};
    assert(0 == mbedtls_platform_setup(&ctx));
#elif defined(MCUBOOT_USE_TINYCRYPT)
    /* Initialize TinyCrypt port. */
    assert(FSP_SUCCESS == RM_TINYCRYPT_PORT_Init());
#else
    /* Initialize SCE9 Protected Mode driver. */
    sce_instance_ctrl_t sce_ctrl;
    const sce_cfg_t    sce_cfg =
        {.lifecycle = SCE_SSD};
    assert(FSP_SUCCESS == R_SCE_Open(&sce_ctrl, &sce_cfg));
#endif

    /* (Optional) To check for updates, call boot_set_pending. */
}
```

```
bool update = 0;

if (update)
{
    boot_set_pending(0);
}

/* Verify the boot image and get its location. */
struct boot_rsp rsp;
assert(0 == boot_go(&rsp));
/* Enter the application. */
RM_MCUBOOT_PORT_BootApp(&rsp);
}
```

4.2.103 Motor 120 Control Hall (motor_120_control_hall)

Modules

Functions

`fsp_err_t` [RM_MOTOR_120_CONTROL_HALL_Open](#) (`motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t const *const p_cfg`)
Opens and configures the motor hall 120 detection module. Implements [motor_120_control_api_t::open](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_HALL_Close](#) (`motor_120_control_ctrl_t *const p_ctrl`)
Disables specified motor hall 120 detection module. Implements [motor_120_control_api_t::close](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_HALL_Run](#) (`motor_120_control_ctrl_t *const p_ctrl`)
Run motor (Start motor rotation). Implements [motor_120_control_api_t::run](#). [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_HALL_Stop](#) (`motor_120_control_ctrl_t *const p_ctrl`)
Stop motor (Stop motor rotation). Implements [motor_120_control_api_t::stop](#). [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset (motor_120_control_ctrl_t *const p_ctrl)`

Reset variables of motor hall 120 detection module. Implements `motor_120_control_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet (motor_120_control_ctrl_t *const p_ctrl, float const speed_rpm)`

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet (motor_120_control_ctrl_t *const p_ctrl, float *const p_speed_rpm)`

Get speed. Implements `motor_120_control_api_t::speedGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet (motor_120_control_ctrl_t *const p_ctrl, motor_120_driver_current_status_t *const p_current_status)`

Get current. Implements `motor_120_control_api_t::currentGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag)`

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag)`

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag)`

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet (motor_120_control_ctrl_t *const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref)`

Get voltage ref. Implements [motor_120_control_api_t::voltageRefGet](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_HALL_ParameterUpdate](#)
 (`motor_120_control_ctrl_t *const p_ctrl, motor_120_control_cfg_t`
`const *const p_cfg`)

Update the parameters of hall 120 detection module. Implements
[motor_120_control_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for `rm_motor_120_control_hall`

The following build time configurations are defined in `fsp_cfg/rm_motor_120_control_hall_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control with Hall sensors (`rm_motor_120_control_hall`)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (`rm_motor_120_control_hall`).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	<code>g_motor_120_control_h</code> <code>all0</code>	Module name.

General > Conduction type	<ul style="list-style-type: none"> • First 60 degree PWM • Complementary First 60 degree PWM 	First 60 degree PWM	Select conduction type
General > Timeout counts (msec)	Must be a valid non-negative value.	200	Counts to judge rotor unrotate
General > Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
General > Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
General > Speed PI decimation	Must be a valid non-negative value.	0	Speed PI control decimation count
General > Freerun timer frequency (MHz)	Must be a valid non-negative value.	120	Freerun timer frequency (MHz)
General > Speed LPF	Must be a valid non-negative value.	1.0	Speed LPF parameter
General > Step of speed reference change	Must be a valid non-negative value.	0.2	Speed ref change step
General > Start reference voltage (V)	Must be a valid non-negative value.	5.8	Reference voltage for boot mode (V)
General > Hall wait counts	Must be a valid non-negative value.	12	Wait counts of hall interrupts to start speed calculation
General > Stop judge time	Must be a valid non-negative value.	1000	Stop judge time
General > Minimum limit speed (rpm)	Must be a valid non-negative value.	550	Minimum limit speed (rpm) (mechanical angle)
General > PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
General > PI control KI	Must be a valid non-negative value.	0.0005	PI control gain of integral term
General > PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term
General > Hall interrupt mask value	Must be a valid non-negative value.	15	For limiting hall interrupt processing. Limited by the number of ADC interrupts
Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance

Motor Parameter > Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm ²)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	Callback function
Hall sensor port U	Manual Entry	BSP_IO_PORT_04_PIN_1	Hall sensor port U
Hall sensor port V	Manual Entry	BSP_IO_PORT_04_PIN_1	Hall sensor port V
Hall sensor port W	Manual Entry	BSP_IO_PORT_04_PIN_0	Hall sensor port W

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

Depend on included ICU module.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */

    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
```

```
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
    /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
    /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
    /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
    /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
    /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
    /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
    /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
    (void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    /* Stop motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
    /* Reset the process. */
```

```

(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
/* Close the module. */
(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}

```

Data Structures

```
struct motor_120_control_hall_extended_cfg_t
```

```
struct motor_120_control_hall_instance_ctrl_t
```

Data Structure Documentation

◆ motor_120_control_hall_extended_cfg_t

struct motor_120_control_hall_extended_cfg_t		
Extended configurations for motor 120 control hall		
Data Fields		
bsp_io_port_pin_t	port_hall_sensor_u	Hall sensor port U.
bsp_io_port_pin_t	port_hall_sensor_v	Hall sensor port V.
bsp_io_port_pin_t	port_hall_sensor_w	Hall sensor port W.
float	f4_start_refv	Reference voltage for boot mode.
uint32_t	u4_hall_wait_cnt	Wait counts of hall interrupts for speed calculation.
uint32_t	u4_stop_judge_time	Stop judge time.
uint32_t	u4_min_speed_rpm	Minimum limit speed (rpm) (mechanical angle)
uint32_t	u4_hall_interrupt_mask_value	For limiting hall interrupt processing. Limited by the number of ADC interrupts.
motor_120_driver_instance_t const *	p_motor_120_driver_instance	Motor 120 driver access module.
timer_instance_t const *	p_speed_cyclic_timer_instance	Cyclic process of speed control timer module.
timer_instance_t const *	p_speed_calc_timer_instance	Speed calculate timer module.
external_irq_instance_t const *	p_u_hall_irq_instance	U phase hall interrupt.
external_irq_instance_t const *	p_v_hall_irq_instance	V phase hall interrupt.
external_irq_instance_t const *	p_w_hall_irq_instance	W phase hall interrupt.

◆ motor_120_control_hall_instance_ctrl_t

struct motor_120_control_hall_instance_ctrl_t		
120 control hall instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
motor_120_control_status_t	active	Flag to set active/inactive the motor 120 control.
motor_120_control_run_mode_t	run_mode	Drive mode.
motor_120_control_timeout_error_flag_t	timeout_error_flag	Timeout error status.
motor_120_control_pattern_error_flag_t	pattern_error_flag	Hall pattern error status.
motor_120_control_rotation_direction_t	direction	Rotational direction (0:CCW, 1:CCW)
float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
uint32_t	u4_cnt_wait_stop	Counter for waiting motor stop.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.
uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_hall_timer_cnt	Value of timer counter.
uint32_t	u4_pre_hall_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_	Counts for 60 degrees.

	CONTROL_HALL_TIMES]	
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
uint32_t	u4_hall_intr_cnt	For start timing of speed calculation.
uint32_t	u4_adc_interrupt_cnt	Number of ADC interrupt processing.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
external_irq_callback_args_t	hall_interrupt_args	For call IRQ callbackSet function.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Function Documentation

◆ RM_MOTOR_120_CONTROL_HALL_Open()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor hall 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_120_CONTROL_HALL_Close()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor hall 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_HALL_Run()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_HALL_Stop()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_HALL_Reset()**

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor hall 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedSet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet ( motor_120_control_ctrl_t *const p_ctrl, float
const speed_rpm )
```

Set speed[rpm]. Implements `motor_120_control_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet ( motor_120_control_ctrl_t *const p_ctrl, float
*const p_speed_rpm )
```

Get speed. Implements `motor_120_control_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_CurrentGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smp1_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smp1_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_VoltageRefGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements [motor_120_control_api_t::voltageRefGet](#).

Example:

```
/* Get voltage ref */
(void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of hall 120 detection module. Implements [motor_120_control_api_t::parameterUpdate](#).

Example:

```
(void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

4.2.104 Motor 120 Control Sensorless (motor_120_control_sensorless)

Modules

Functions

`fsp_err_t` `RM_MOTOR_120_CONTROL_SENSORLESS_Open`
(`motor_120_control_ctrl_t *const p_ctrl`, `motor_120_control_cfg_t const *const p_cfg`)

Opens and configures the motor sensorless 120 detection module. Implements `motor_120_control_api_t::open`. [More...](#)

`fsp_err_t` [RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate](#)
 ([motor_120_control_ctrl_t](#) *const p_ctrl, [motor_120_control_cfg_t](#)
 const *const p_cfg)

Update the parameters of sensorless 120 detection module.
 Implements [motor_120_control_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current

and rotor angle.

Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_control_s ensorless0	Module name.
General > Conduction type	<ul style="list-style-type: none"> • First 60 degree PWM • Complementary First 60 degree PWM 	First 60 degree PWM	Select conduction type
General > Stop BEMF	Must be a valid non-negative value.	0.5	Value of stop motor BEMF (U+V+W)
General > Timeout counts (msec)	Must be a valid non-negative value.	2000	Undetected time
General > Maximum voltage for BOOT (V)	Must be a valid non-negative value.	8.0	Maximum output voltage for boot mode (V)
General > Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
General > Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
General > Carrier	Must be a valid non-	20.0	PWM carrier frequency

frequency (kHz)	negative value.		(kHz)
General > Adjusting angle	Manual Entry	0	Adjusting angle
General > Speed PI decimation	Must be a valid non-negative value.	1	Speed PI control decimation count
General > Free run timer frequency (MHz)	Must be a valid non-negative value.	120	Freerun timer frequency (MHz)
General > Speed LPF K	Must be a valid non-negative value.	1.0	Speed LPF parameter
General > Step of speed change	Must be a valid non-negative value.	0.2	Speed reference change step
General > Boot reference voltage (V)	Must be a valid non-negative value.	3.0	Voltage reference for boot mode
General > Voltage lamping time	Must be a valid non-negative value.	128	Voltage lamping time
General > Voltage constant adjust time	Must be a valid non-negative value.	64	Voltage constant adjust time value (msec)
General > Open loop start speed (rpm)	Manual Entry	150	Open loop start speed (rpm)
General > Open loop mode2 speed (rpm)	Manual Entry	185	to mode2 change speed (rpm)
General > Open loop mode3 speed (rpm)	Manual Entry	1000	to mode3 change speed (rpm)
General > Open loop start voltage (V)	Must be a valid non-negative value.	3.0	start reference voltage (V)
General > Open loop mode1 speed rate	Must be a valid non-negative value.	0.25	increase rate of reference speed (rpm/control period)
General > Open loop mode2 voltage rate	Must be a valid non-negative value.	0.00285	increase rate of reference voltage (v/control period)
General > Open loop mode2 speed rate	Must be a valid non-negative value.	0.71	increase rate of reference speed (rpm/control period)
General > Open loop mode3 voltage rate	Must be a valid non-negative value.	0.002	increase rate of reference voltage (v/control period)
General > Open loop maximum voltage (V)	Must be a valid non-negative value.	6.5	openloop maximum voltage (V)
General > PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
General > PI control KI	Must be a valid non-negative value.	0.004	PI control gain of integral term

General > PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term
Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm ²)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	callback function

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err =
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                       g_motor_120_control_sensorless0.p_cfg);

    assert(FSP_SUCCESS == err);

/* Set speed reference before motor run */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);

/* Start motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);

/* Get current motor speed */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);

/* Get current */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);

/* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,

                                       &smpl_wait_stop_flag);

/* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,

                                       &smpl_timeout_error_fl
ag);

/* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
```

```

                                                                    &smpl_pattern_error_fl
ag);
/* Get voltage ref */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
/* Stop motor rotation */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
/* Reset the process. */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
/* Close the module. */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}

```

Extended configurations for motor 120 control sensorless

Data Fields		
float	f4_stop_bemf	Value of stop motor BEMF (U+V+W)
float	f4_max_boot_v	Max output voltage for boot mode (V)
float	f4_carrier_freq	Carrier wave frequency (kHz)
int32_t	s4_angle_shift_adjust	Adjusting angle.
float	f4_boot_ref_v	Voltage reference when zero speed (V)
uint32_t	u4_v_up_time	Voltage lamping time.
uint32_t	u4_v_const_time	Voltage constant adjust time value (ms)
int32_t	s4_ol_start_rpm	Start speed (rpm)
int32_t	s4_ol_mode1_change_rpm	To mode2 change speed (rpm)
int32_t	s4_ol_mode2_change_rpm	To mode3 change speed (rpm)
float	f4_ol_start_refv	Start reference voltage (V)
float	f4_ol_mode1_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode2_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode2_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode3_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode3_max_refv	Openloop max voltage (V)
motor_120_driver_instance_t const *	p_motor_120_driver_instance	Motor 120 driver access module.
timer_instance_t const *	p_speed_cyclic_timer_instance	Cyclic process of speed control timer module.
timer_instance_t const *	p_speed_calc_timer_instance	Speed calculate timer module.

◆ motor_120_control_sensorless_instance_ctrl_t

struct motor_120_control_sensorless_instance_ctrl_t		
120 control sensorless instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
motor_120_control_status_t	active	Flag to set active/inactive the motor 120 control.

motor_120_control_run_mode_t	run_mode	Drive mode.
motor_120_control_timeout_error_flag_t	timeout_error_flag	Timeout error status.
motor_120_control_pattern_error_flag_t	pattern_error_flag	Bemf pattern error status.
motor_120_control_rotation_direction_t	direction	Rotational direction (0: CW, 1: CCW)
float	f4_ol_pattern_set_calc	Counts to change timing of open loop pattern.
float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
uint32_t	u4_pwm_duty	PWM duty.
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
float	f4_vn_ad	Neutral voltage.
uint32_t	u4_cnt_adj_v	Voltage lamping count adjustment.
motor_120_control_sensorless_draw_in_position_t	flag_draw_in	Status of draw in a initial position.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
uint32_t	u4_v_pattern_num	Selecting pattern number for openloop drive.
uint32_t	u4_bemf_signal	Pattern of BEMF.
uint32_t	u4_pre_bemf_signal	Previous pattern of BEMF.
motor_120_control_sensorless_pattern_change_flag_t	flag_pattern_change	Pattern change flag.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.

uint32_t	u4_ol_signal	Pattern of BEMF.
uint32_t	u4_ol_pattern_set	Openloop frequency.
uint32_t	u4_cnt_ol_pattern_set	Counter for openloop pattern change.
uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_bemf_timer_cnt	Value of timer counter.
uint32_t	u4_pre_bemf_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_SENSORLESS_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
uint32_t	u4_cnt_carrier	Counter for carrier interrupt.
uint32_t	u4_pre_cnt_carrier	Previous carrier interrupt count.
uint32_t	u4_angle_shift_cnt	Shift degrees count.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Enumeration Type Documentation

◆ [motor_120_control_sensorless_draw_in_position_t](#)

enum motor_120_control_sensorless_draw_in_position_t	
Draw in a initial position	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT	Initial parameter.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME	Draw in a initial position of the 1st time.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME	Draw in a initial position of the 2nd time.

◆ **motor_120_control_sensorless_pattern_change_flag_t**

enum <code>motor_120_control_sensorless_pattern_change_flag_t</code>	
Pattern change	
Enumerator	
<code>MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR</code>	Initial parameter.
<code>MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET</code>	Voltage pattern change.

Function Documentation◆ **RM_MOTOR_120_CONTROL_SENSORLESS_Open()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open ( motor_120_control_ctrl_t *const p_ctrl,
motor_120_control_cfg_t const *const p_cfg )
```

Opens and configures the motor sensorless 120 detection module. Implements `motor_120_control_api_t::open`.

Example:

```
/* Initializes the module. */
err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

Return values

<code>FSP_SUCCESS</code>	Motor driver successfully configured.
<code>FSP_ERR_ASSERTION</code>	Null pointer, or one or more configuration options is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open. This module can only be opened once.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Input parameter error.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_Close()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close ( motor_120_control_ctrl_t *const p_ctrl)
```

Disables specified motor sensorless 120 detection module. Implements `motor_120_control_api_t::close`.

Example:

```
/* Close the module. */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_Run()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run ( motor_120_control_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_control_api_t::run`.

Example:

```
/* Start motor rotation */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Stop()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop ( motor_120_control_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_control_api_t::stop`.

Example:

```
/* Stop motor rotation */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Reset()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset ( motor_120_control_ctrl_t *const p_ctrl)
```

Reset variables of motor sensorless 120 detection module. Implements `motor_120_control_api_t::reset`.

Example:

```
/* Reset the process. */
```

```
(void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet ( motor_120_control_ctrl_t *const
p_ctrl, float const speed_rpm )
```

Set speed[rpm]. Implements [motor_120_control_api_t::speedSet](#).

Example:

```
/* Set speed reference before motor run */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet ( motor_120_control_ctrl_t *const
p_ctrl, float *const p_speed_rpm )
```

Get speed. Implements [motor_120_control_api_t::speedGet](#).

Example:

```
/* Get current motor speed */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet ( motor_120_control_ctrl_t *const
p_ctrl, motor_120_driver_current_status_t *const p_current_status )
```

Get current. Implements `motor_120_control_api_t::currentGet`.

Example:

```
/* Get current */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_120_control_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_timeout_error_flag_t *const p_timeout_error_flag )
```

Get timeout error flag. Implements `motor_120_control_api_t::timeoutErrorFlagGet`.

Example:

```
/* Get timeout error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                     &smpl_timeout_error_fl
ag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_pattern_error_flag_t *const p_pattern_error_flag )
```

Get pattern error flag. Implements `motor_120_control_api_t::patternErrorFlagGet`.

Example:

```
/* Get pattern error flag */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
&smpl_pattern_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_voltage_ref_t *const p_voltage_ref )
```

Get voltage ref. Implements `motor_120_control_api_t::voltageRefGet`.

Example:

```
/* Get voltage ref */
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate ( motor_120_control_ctrl_t
*const p_ctrl, motor_120_control_cfg_t const *const p_cfg )
```

Update the parameters of sensorless 120 detection module. Implements [motor_120_control_api_t::parameterUpdate](#).

Example:

```
(void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,
g_motor_120_control_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

4.2.105 Motor 120 Degree (rm_motor_120_degree)

Modules

Functions

```
fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const p_ctrl,
motor_cfg_t const *const p_cfg)
```

Configure the motor in register start mode. Implements [motor_api_t::open](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_DEGREE_Close (motor_ctrl_t *const p_ctrl)
```

Disables specified motor control block. Implements [motor_api_t::close](#). [More...](#)

```
fsp_err_t RM_MOTOR_120_DEGREE_Run (motor_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements [motor_api_t::run](#). [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Stop (motor_ctrl_t *const p_ctrl)`
Stop motor (Stop motor rotation). Implements `motor_api_t::stop`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_Reset (motor_ctrl_t *const p_ctrl)`
Reset motor control block. Implements `motor_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const p_ctrl, motor_error_t const error)`
Set error information. Implements `motor_api_t::errorSet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const p_ctrl, float const speed_rpm)`
Set speed reference[rpm]. Implements `motor_api_t::speedSet`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const p_ctrl, uint8_t *const p_status)`
Get current control status. Implements `motor_api_t::statusGet`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const p_ctrl, float *const p_speed_rpm)`
Get rotational speed. Implements `motor_api_t::speedGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet (motor_ctrl_t *const p_ctrl, motor_wait_stop_flag_t *const p_flag_wait_stop)`
Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`. [More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck (motor_ctrl_t *const p_ctrl, uint16_t *const p_error)`
Check the occurrence of error. Implements `motor_api_t::errorCheck`.
[More...](#)

`fsp_err_t RM_MOTOR_120_DEGREE_PositionSet (motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position)`
Set position reference. Implements `motor_api_t::positionSet`. [More...](#)

```
fsp_err_t RM_MOTOR_120_DEGREE_AngleGet (motor_ctrl_t *const p_ctrl, float
*const p_angle_rad)
```

Set position reference. Implements [motor_api_t::angleGet](#). [More...](#)

Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the [Motor 120 Degree \(rm_motor_120_degree\)](#).

Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for rm_motor_120_degree

The following build time configurations are defined in `fsp_cfg/rm_motor_120_degree_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via `New Stack > Motor > Motor 120 degree control (rm_motor_120_degree)`.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_degree0	Module name.
General > Limit of over current (A)	Must be a valid non-negative value.	4.0	Limit of over current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid non-negative value.	28.0	Limit of over voltage.(Detection threshold)

General > Limit of over speed (rpm)	Must be a valid non-negative value.	3000.0	Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid non-negative value.	14.0	Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
    assert(FSP_SUCCESS == err);

    /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);

    /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);

    /* Get current status */
}
```

```

    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
/* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
/* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
/* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
/* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
/* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}

```

struct [motor_120_degree_extended_cfg_t](#)

Enumerations

enum [motor_120_degree_ctrl_status_t](#)

enum [motor_120_degree_ctrl_event_t](#)

Data Structure Documentation

◆ motor_120_degree_statemachine_t

Data Fields		
motor_120_degree_ctrl_status_t	status	The current system status.
motor_120_degree_ctrl_status_t	status_next	The next system status.
motor_120_degree_ctrl_event_t	current_event	The current event index.

uint16_t	u2_error_status	The error information.
----------	-----------------	------------------------

◆ motor_120_degree_extended_cfg_t

struct motor_120_degree_extended_cfg_t		
Extended configurations for motor 120 degree		
Data Fields		
motor_120_control_instance_t const *	p_motor_120_control_instance	120 degree control Instance
float	f_overcurrent_limit	Over-current limit (A)
float	f_overvoltage_limit	Over-voltage limit (V)
float	f_overspeed_limit	Over-speed limit (rad/s)
float	f_lowvoltage_limit	Low-voltage limit (V)

Enumeration Type Documentation

◆ motor_120_degree_ctrl_status_t

enum motor_120_degree_ctrl_status_t	
Control state	
Enumerator	
MOTOR_120_DEGREE_CTRL_STATUS_STOP	Stop mode.
MOTOR_120_DEGREE_CTRL_STATUS_RUN	Run mode.
MOTOR_120_DEGREE_CTRL_STATUS_ERROR	Error mode.

◆ motor_120_degree_ctrl_event_t

enum motor_120_degree_ctrl_event_t	
Control event	
Enumerator	
MOTOR_120_DEGREE_CTRL_EVENT_STOP	Stop event.
MOTOR_120_DEGREE_CTRL_EVENT_RUN	Run event.
MOTOR_120_DEGREE_CTRL_EVENT_ERROR	Error event.
MOTOR_120_DEGREE_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_120_DEGREE_Open()

```
fsp_err_t RM_MOTOR_120_DEGREE_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the motor in register start mode. Implements `motor_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Note

This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.

◆ RM_MOTOR_120_DEGREE_Close()

```
fsp_err_t RM_MOTOR_120_DEGREE_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified motor control block. Implements `motor_api_t::close`.

Example:

```
/* Close the module. */
(void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ **RM_MOTOR_120_DEGREE_Run()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Run ( motor_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ **RM_MOTOR_120_DEGREE_Stop()**

```
fsp_err_t RM_MOTOR_120_DEGREE_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements [motor_api_t::stop](#).

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Reset()

```
fsp_err_t RM_MOTOR_120_DEGREE_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset motor control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset the process. */
(void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_ErrorSet()

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
(void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully set error infomation.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_SpeedSet()

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully set speed reference.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_StatusGet()

```
fsp_err_t RM_MOTOR_120_DEGREE_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully got current control status.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ **RM_MOTOR_120_DEGREE_SpeedGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const
p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully got rotational speed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ **RM_MOTOR_120_DEGREE_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag_wait_stop )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

```
/* Get wait stop flag */
(void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully got wait stop flag.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ **RM_MOTOR_120_DEGREE_ErrorCheck()**

```
fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully error checke process.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ **RM_MOTOR_120_DEGREE_PositionSet()**

```
fsp_err_t RM_MOTOR_120_DEGREE_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

Note

◆ RM_MOTOR_120_DEGREE_AngleGet()

```
fsp_err_t RM_MOTOR_120_DEGREE_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Set position reference. Implements [motor_api_t::angleGet](#).

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Interface](#).

Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

BLOCK DIAGRAM OF SENSORLESS VECTOR CONTROL

It is a block diagram of sensorless vector control. This shows the correspondence between modules and functional blocks.

Figure 211: Image of Current Control Module(yellow block)

Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

Configuration

Build Time Configurations for rm_motor_120_driver

The following build time configurations are defined in fsp_cfg/rm_motor_120_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_120_driver0	Module name.

General > 120 degree control type	<ul style="list-style-type: none"> • Sensorless • Hall 	Sensorless	120 degree control type
General > PWM output port UP	Manual Entry	BSP_IO_PORT_06_PIN_0_1	PWM output port UP
General > PWM output port UN	Manual Entry	BSP_IO_PORT_06_PIN_0_0	PWM output port UN
General > PWM output port VP	Manual Entry	BSP_IO_PORT_01_PIN_1_3	PWM output port VP
General > PWM output port VN	Manual Entry	BSP_IO_PORT_01_PIN_1_4	PWM output port VN
General > PWM output port WP	Manual Entry	BSP_IO_PORT_01_PIN_1_1	PWM output port WP
General > PWM output port WN	Manual Entry	BSP_IO_PORT_01_PIN_1_2	PWM output port WN
General > PWM timer frequency (MHz)	Must be a valid non-negative value.	120	GPT PWM timer frequency
General > PWM carrier period (Microseconds)	Must be a valid non-negative value.	50	GPT PWM carrier period
General > Dead time (Raw counts)	Must be a valid non-negative value.	240	GPT PWM dead time
General > Current range (A)	Must be a valid non-negative value.	27.5	Current range to measure(Maximum input current)
General > Voltage range (V)	Must be a valid non-negative value.	111.0	Voltage range to measure(Maximum input main line voltage)
General > Resolution of A/D conversion	Manual Entry	0xFFF	Resolution of A/D conversion
General > Offset of A/D conversion for current	Manual Entry	0x745	Offset of A/D conversion for current
General > Conversion level of A/D conversion for voltage	Must be a valid non-negative value.	0.66	Conversion level of A/D conversion for voltage
General > Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
General > Input voltage	Must be a valid non-negative value.	24.0	Input voltage
General > A/D conversion channel for U phase current	Manual Entry	ADC_CHANNEL_0	Specify the A/D channel for U phase current
General > A/D	Manual Entry	ADC_CHANNEL_2	Specify the A/D

conversion channel for W phase current				channel for W phase current
General > A/D conversion channel for main line voltage	Manual Entry		ADC_CHANNEL_5	Specify the A/D channel for main line voltage
General > A/D conversion channel for U phase voltage	Manual Entry		ADC_CHANNEL_18	Specify the A/D channel for U phase voltage
General > A/D conversion channel for V phase voltage	Manual Entry		ADC_CHANNEL_20	Specify the A/D channel for V phase voltage
General > A/D conversion channel for W phase voltage	Manual Entry		ADC_CHANNEL_6	Specify the A/D channel for W phase voltage
General > GTIOCA stop level	<ul style="list-style-type: none"> Pin Level Low Pin Level High 		Pin Level High	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB stop level	<ul style="list-style-type: none"> Pin Level Low Pin Level High 		Pin Level High	Select the behavior of the output pin when the timer is stopped.
Modulation > Maximum duty	Must be a valid non-negative value.		0.9375	Maximum duty of PWM
Interrupts > Callback	Name must be a valid C symbol		NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT three phase module and ADC module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
    &g_motor_120_driver0.p_cfg);
    /* Start PWM output */
    err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
    intterrupt).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Caclutarion of current offset */
        (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
        /* Get electric current, main line voltage and maximum voltage component */
        (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
    &g_current_status);
        /* Get the flag of A/D convderted current offset */
        (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
    &ul_get_flg_offset);
        // Perform current control process here
        /* Set phase voltage */
        (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
    1.0F, 1.0F);
        /* Set phase pattern */
        (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
    MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
        (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
    &g_motor_120_driver0.p_cfg);
    }
    (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
}
```

```

(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);

//

(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}

```

Data Structure Documentation

◆ motor_120_driver_modulation_t

struct motor_120_driver_modulation_t		
Modulation parameter		
Data Fields		
float	f4_vdc	Main line voltage (Vdc) (V)
float	f4_max_duty	Maximum duty cycle.
float	f4_min_duty	Minimum duty cycle.
float	f4_neutral_duty	Duty cycle that represents 0 (V)

◆ motor_120_driver_extended_cfg_t

struct motor_120_driver_extended_cfg_t		
Extended configurations for motor 120 driver		
Data Fields		
adc_instance_t const *	p_adc_instance	ADC module instance.
three_phase_instance_t const *	p_three_phase_instance	PWM output module instance (GPT three phase)
motor_120_driver_type_t	motor_120_type	120 degree control type
adc_channel_t	iu_ad_ch	A/D channel for U phase current.
adc_channel_t	iw_ad_ch	A/D channel for W phase current.

adc_channel_t	vdc_ad_ch	A/D channel for main line voltage.
adc_channel_t	vu_ad_ch	A/D channel for U phase voltage.
adc_channel_t	vv_ad_ch	A/D channel for V phase voltage.
adc_channel_t	vw_ad_ch	A/D channel for W phase voltage.
bsp_io_port_pin_t	port_up	PWM output port UP.
bsp_io_port_pin_t	port_un	PWM output port UN.
bsp_io_port_pin_t	port_vp	PWM output port VP.
bsp_io_port_pin_t	port_vn	PWM output port VN.
bsp_io_port_pin_t	port_wp	PWM output port WP.
bsp_io_port_pin_t	port_wn	PWM output port WN.
uint32_t	u4_pwm_timer_freq	PWM timer frequency (MHz)
uint32_t	u4_pwm_carrier_freq	PWM carrier frequency (kHz)
uint32_t	u4_deadtime	PWM deadtime (usec)
float	f_current_range	A/D current measure range (max current) (A)
float	f_vdc_range	A/D main line voltage measure range (max voltage) (V)
float	f_ad_resolution	A/D resolution.
float	f_ad_current_offset	A/D offset (Center value)
float	f_ad_voltage_conversion	A/D conversion level.
uint32_t	u4_offset_calc_count	Calculation counts for current offset.
motor_120_driver_modulation_t	mod_param	Modulation parameter.

Enumeration Type Documentation

◆ [motor_120_driver_status_t](#)

enum motor_120_driver_status_t

Function Documentation◆ **RM_MOTOR_120_DRIVER_Open()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Open ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Opens and configures the motor 120 driver module. Implements `motor_120_driver_api_t::open`.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

<code>FSP_SUCCESS</code>	Motor 120 driver successfully configured.
<code>FSP_ERR_ASSERTION</code>	Null pointer, or one or more configuration options is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open. This module can only be opened once.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Input parameter error.

◆ **RM_MOTOR_120_DRIVER_Close()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Close ( motor_120_driver_ctrl_t *const p_ctrl)
```

Disables specified motor 120 driver module. Implements `motor_120_driver_api_t::close`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_DRIVER_Run()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Run ( motor_120_driver_ctrl_t *const p_ctrl)
```

Run motor (Start motor rotation). Implements `motor_120_driver_api_t::run`.

Example:

```
/* Start PWM output */
err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_DRIVER_Stop()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Stop ( motor_120_driver_ctrl_t *const p_ctrl)
```

Stop motor (Stop motor rotation). Implements `motor_120_driver_api_t::stop`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_120_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_120_DRIVER_Reset ( motor_120_driver_ctrl_t *const p_ctrl)
```

Reset variables of motor 120 driver module. Implements `motor_120_driver_api_t::reset`.

Example:

```
(void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhaseVoltageSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet ( motor_120_driver_ctrl_t *const p_ctrl, float
const u_voltage, float const v_voltage, float const w_voltage )
```

Set phase voltage data to calculate PWM duty. Implements `motor_120_driver_api_t::phaseVoltageSet`.

Example:

```
/* Set phase voltage */
(void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

```
fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_phase_pattern_t const pattern )
```

Set phase voltage pattern. Implements `motor_120_driver_api_t::phasePatternSet`.

Example:

```
/* Set phase pattern */
(void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_CurrentGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_current_status_t *const p_current_status )
```

Get calculated phase current, Vdc & Va_max data. Implements `motor_120_driver_api_t::currentGet`

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
(void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

```
fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc ( motor_120_driver_ctrl_t *const p_ctrl)
```

current offset detection. Implements `motor_120_driver_api_t::currentOffsetCalc`

Example:

```
/* Caclutarion of current offset */
(void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

```
fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_flag_offset_calc_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_120_driver_api_t::flagCurrentOffsetGet`.

Example:

```
/* Get the flag of A/D converted current offset */
(void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&ul_get_flg_offset);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

```
fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate ( motor_120_driver_ctrl_t *const p_ctrl,
motor_120_driver_cfg_t const *const p_cfg )
```

Update the parameters of 120 driver module. Implements `motor_120_driver_api_t::parameterUpdate`.

Example:

```
(void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

4.2.107 Motor Current (rm_motor_current)

Modules

Functions

`fsp_err_t RM_MOTOR_CURRENT_Open (motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)`

Opens and configures the Motor Current Module. Implements `motor_current_api_t::open`. [More...](#)

`fsp_err_t RM_MOTOR_CURRENT_Close (motor_current_ctrl_t *const p_ctrl)`

Disables specified Motor Current Module. Implements `motor_current_api_t::close`. [More...](#)

`void rm_motor_current_encoder_cyclic (motor_current_instance_t const *p_ctrl)`

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor current Interface](#).

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

Configuration

Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> Default (BSP) Enabled Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_current0	Module name.
General > Sensor type	<ul style="list-style-type: none"> Sensorless Encoder 	Sensorless	Select sensor type
General > Shunt type	<ul style="list-style-type: none"> 1 shunt 2 shunt 3 shunt 	2 shunt	Select shunt type
General > Current control decimation	Must be a valid non-negative value.	0	Decimation of current control.
General > PWM carrier frequency (kHz)	Must be a valid value	20.0F	PWM carrier frequency.
General > Input voltage (V)	Must be a valid value	24.0F	Input voltage for limitation of current PI control.
General > Sample delay compensation	<ul style="list-style-type: none"> Disable Enable 	Enable	Select enable/disable sample delay compensation.
General > Voltage error compensation	<ul style="list-style-type: none"> Disable Enable 	Enable	Select enable/disable voltage error compensation.
General > Voltage error compensation table of voltage 1	Must be a valid value	0.672F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 2	Must be a valid value	0.945F	Voltage error compensation table of voltage.
General > Voltage error compensation table of voltage 3	Must be a valid value	1.054F	Voltage error compensation table of voltage.
General > Voltage error compensation	Must be a valid value	1.109F	Voltage error compensation table of

table of voltage 4			voltage.
General > Voltage error compensation table of voltage 5	Must be a valid value	1.192F	Voltage error compensation table of voltage.
General > Voltage error compensation table of current 1	Must be a valid value	0.013F	Voltage error compensation table of current.
General > Voltage error compensation table of current 2	Must be a valid value	0.049F	Voltage error compensation table of current.
General > Voltage error compensation table of current 3	Must be a valid value	0.080F	Voltage error compensation table of current.
General > Voltage error compensation table of current 4	Must be a valid value	0.184F	Voltage error compensation table of current.
General > Voltage error compensation table of current 5	Must be a valid value	0.751F	Voltage error compensation table of current.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.
Design Parameter > Current PI loop omega (Hz)	Must be a valid value	300.0F	Current PI loop omega
Design Parameter > Current PI loop zeta	Must be a valid value	1.0F	Current PI loop zeta
Motor Parameter > Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm ²)	Must be a valid value	0.0000028F	Rotor inertia

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
    motor_current_input_current_t temp_input_current;
    motor_current_input_voltage_t temp_input_voltage;
    motor_current_get_voltage_t temp_get_voltage;

    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);

    assert(FSP_SUCCESS == err);

    /* Basically run this module at A/D conversion finish interrupt.
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Set current reference before get phase voltage */
        (void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);

        /* Set speed and phase data before get phase voltage */
        (void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
```

```
1.0F);

    temp_input_current.iu    = 1.0F;
    temp_input_current.iv    = 1.0F;
    temp_input_current.iw    = 1.0F;
    temp_input_voltage.vdc   = 24.0F;
    temp_input_voltage.va_max = 24.0F;

/* Set electric current and voltage before get phase voltage */
    (void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);

/* Activate the process. */
    (void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);

/* Get d/q-axis current*/
    (void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);

/* Get the flag of PI control */
    (void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);

/* Get Output Parameter */
    (void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);

    (void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
}

/* Reset the process. */
    (void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);

/* Close the module. */
    (void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}
```

Enumerations

```
enum motor_current_shunt_type_t
```

Enumeration Type Documentation

◆ **motor_current_shunt_type_t**

enum <code>motor_current_shunt_type_t</code>	
Selection of shunt type	
Enumerator	
<code>MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT</code>	Only use U phase current.
<code>MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT</code>	Use U and W phase current.
<code>MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT</code>	Use all phase current.

Function Documentation◆ **RM_MOTOR_CURRENT_Open()**

<code>fsp_err_t RM_MOTOR_CURRENT_Open (motor_current_ctrl_t *const p_ctrl, motor_current_cfg_t const *const p_cfg)</code>	
Opens and configures the Motor Current Module. Implements <code>motor_current_api_t::open</code> .	
Return values	
<code>FSP_SUCCESS</code>	Motor Current successfully configured.
<code>FSP_ERR_ASSERTION</code>	Null pointer, or one or more configuration options is invalid.
<code>FSP_ERR_ALREADY_OPEN</code>	Module is already open. This module can only be opened once.
<code>FSP_ERR_INVALID_ARGUMENT</code>	Configuration parameter error.

◆ **RM_MOTOR_CURRENT_Close()**

<code>fsp_err_t RM_MOTOR_CURRENT_Close (motor_current_ctrl_t *const p_ctrl)</code>	
Disables specified Motor Current Module. Implements <code>motor_current_api_t::close</code> .	
Return values	
<code>FSP_SUCCESS</code>	Successfully closed.
<code>FSP_ERR_ASSERTION</code>	Null pointer.
<code>FSP_ERR_NOT_OPEN</code>	Module is not open.

◆ **RM_MOTOR_CURRENT_Reset()**

```
fsp_err_t RM_MOTOR_CURRENT_Reset ( motor_current_ctrl_t *const p_ctrl)
```

Reset variables of Motor Current Module. Implements `motor_current_api_t::reset`.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_CURRENT_Run()**

```
fsp_err_t RM_MOTOR_CURRENT_Run ( motor_current_ctrl_t *const p_ctrl)
```

Run(Start) the Current Control. Implements `motor_current_api_t::run`.

Return values

FSP_SUCCESS	Successfully run.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_CURRENT_ParameterSet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_t const *const p_st_input )
```

Set (Input) Parameter Data. Implements `motor_current_api_t::parameterSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input argument error.

◆ **RM_MOTOR_CURRENT_CurrentReferenceSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet ( motor_current_ctrl_t *const p_ctrl, float
const id_reference, float const iq_reference )
```

Set Current Reference Data. Implements `motor_current_api_t::currentReferenceSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_CURRENT_SpeedPhaseSet()**

```
fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet ( motor_current_ctrl_t *const p_ctrl, float const
speed, float const phase )
```

Set Current Speed & rotor phase Data. Implements `motor_current_api_t::speedPhaseSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_CURRENT_CurrentSet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentSet ( motor_current_ctrl_t *const p_ctrl,
motor_current_input_current_t const *const p_st_current, motor_current_input_voltage_t const
*const p_st_voltage )
```

Set d/q-axis Current & Voltage Data. Implements `motor_current_api_t::currentSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_CURRENT_ParameterGet()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_output_t *const p_st_output )
```

Get Output Parameters. Implements `motor_current_api_t::parameterGet`.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_CURRENT_CurrentGet()**

```
fsp_err_t RM_MOTOR_CURRENT_CurrentGet ( motor_current_ctrl_t *const p_ctrl, float *const p_id,
float *const p_iq )
```

Get d/q-axis Current. Implements `motor_current_api_t::currentGet`.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_CURRENT_PhaseVoltageGet()**

```
fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet ( motor_current_ctrl_t *const p_ctrl,
motor_current_get_voltage_t *const p_voltage )
```

Gets the set phase voltage. Implements `motor_current_api_t::phaseVoltageGet`.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_CURRENT_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate ( motor_current_ctrl_t *const p_ctrl,
motor_current_cfg_t const *const p_cfg )
```

Update the parameters of Current Control. Implements `motor_current_api_t::parameterUpdate`.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **rm_motor_current_encoder_cyclic()**

```
void rm_motor_current_encoder_cyclic ( motor_current_instance_t const * p_ctrl)
```

```
(end addtogroup MOTOR_CURRENT)
```

4.2.108 Motor Driver (rm_motor_driver)

Modules

Functions

```
fsp_err_t RM_MOTOR_DRIVER_Open (motor_driver_ctrl_t *const p_ctrl,

`fsp_err_t` [RM_MOTOR_DRIVER_CurrentGet](#) (`motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get`)

Get calculated phase Current, Vdc & Va_max data. Implements [motor_driver_api_t::currentGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_DRIVER_FlagCurrentOffsetGet](#) (`motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset`)

Get the flag of finish current offset detection. Implements [motor_driver_api_t::flagCurrentOffsetGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_DRIVER_CurrentOffsetRestart](#) (`motor_driver_ctrl_t *const p_ctrl`)

Restart the current offset detection. Implements [motor_driver_api_t::currentOffsetRestart](#). [More...](#)

`fsp_err_t` [RM_MOTOR_DRIVER_ParameterUpdate](#) (`motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg`)

Update the parameters of Driver Module. Implements [motor_driver_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor driver Interface](#).

Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

Configuration

Build Time Configurations for rm_motor_driver

The following build time configurations are defined in fsp_cfg/rm_motor_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Select ADC_B module support.

Configurations for Motor > ADC and PWM Modulation (rm_motor_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm_motor_driver).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_driver0	Module name.
General > Shunt type	<ul style="list-style-type: none"> • 1 shunt • 2 shunt • 3 shunt 	2 shunt	Select shunt type
General > Modulation method	<ul style="list-style-type: none"> • SVPWM • SPWM 	SVPWM	Select PWM modulation method
General > PWM Timer Frequency (MHz)	Must be a valid non-negative value.	120	GPT PWM timer frequency
General > PWM Carrier Period (Microseconds)	Must be a valid non-negative value.	50	GPT PWM carrier period
General > Dead Time (Raw Counts)	Must be a valid non-negative value.	240	GPT PWM dead time
General > Current Range (A)	Must be a valid value	27.5F	Current range to measure(Maximum input current)
General > Voltage Range (V)	Must be a valid value	111.0F	Voltage range to measure(Maximum input Main Line Voltage)
General > Counts for current offset measurement	Must be a valid non-negative value.	500	How many times to measure current offset
General > A/D conversion channel for U Phase current	Manual Entry	0	Specify the A/D channel for U phase current
General > A/D conversion channel for W Phase current	Manual Entry	2	Specify the A/D channel for W phase current

General > A/D conversion channel for Main Line Voltage	Manual Entry	5	Specify the A/D channel for main line voltage
General > A/D conversion channel for V Phase current	Manual Entry	1	Specify the A/D channel for V phase current
General > Adjustment value to current A/D	Must be a valid non-negative value.	20.0	Value to adjust 1shunt A/D double buffer
General > Minimum difference of PWM duty	Manual Entry	300	Minimum difference of PWM duty
General > Adjustment delay of A/D conversion	Manual Entry	240	Adjustment delay of A/D conversion
General > Input Voltage (V)	Must be a valid value	24.0F	Input voltage
General > Resolution of A/D conversion	Manual Entry	0xFFFF	Resolution of A/D conversion
General > Offset of A/D conversion for current	Manual Entry	0x745	Offset of A/D conversion for current
General > Conversion level of A/D conversion for voltage	Must be a valid value	0.66F	Conversion level of A/D conversion for voltage
General > GTIOCA Stop Level	<ul style="list-style-type: none"> Pin Level Low Pin Level High 	Pin Level High	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB Stop Level	<ul style="list-style-type: none"> Pin Level Low Pin Level High 	Pin Level High	Select the behavior of the output pin when the timer is stopped.
Modulation > Maximum Duty	Must be a valid value	0.9375F	Maximum duty of PWM
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);

    /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
    interrupt).
    * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Get electric current, main line voltage and maximum voltage component */
        (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
        &f_get_iw, &f_get_vdc, &f_get_va_max);

        /* Get the flag of A/D converted current offset */
        (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
        &ul_get_flg_offset);

        // Perform current control process here

        /* Set phase voltage */
        (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
        1.0F);

        (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
        &g_motor_driver0.p_cfg);
    }

    (void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);

    //

    (void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}
```

}

Enumerations

```
enum motor_driver_modulation_method_t
```

Enumeration Type Documentation

◆ motor_driver_modulation_method_t

enum motor_driver_modulation_method_t	
Enumerator

MOTOR_DRIVER_MODULATION_METHOD_SVPWM	Space vector pulse-width-modulation.

Function Documentation

◆ RM_MOTOR_DRIVER_Open()

fsp_err_t RM_MOTOR_DRIVER_Open (motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg)	
Opens and configures the Motor Driver module. Implements motor_driver_api_t::open .	
Return values	
FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_DRIVER_Close()

fsp_err_t RM_MOTOR_DRIVER_Close (motor_driver_ctrl_t *const p_ctrl)	
Disables specified Motor Driver Module. Implements motor_driver_api_t::close .	
Return values	
FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_DRIVER_Reset()**

```
fsp_err_t RM_MOTOR_DRIVER_Reset ( motor_driver_ctrl_t *const p_ctrl)
```

Reset variables of Motor Driver Module. Implements `motor_driver_api_t::reset`.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_DRIVER_PhaseVoltageSet()**

```
fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet ( motor_driver_ctrl_t *const p_ctrl, float const u_voltage, float const v_voltage, float const w_voltage )
```

Set Phase Voltage Data to calculate PWM duty. Implements `motor_driver_api_t::phaseVoltageSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_DRIVER_CurrentGet()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentGet ( motor_driver_ctrl_t *const p_ctrl, motor_driver_current_get_t *const p_current_get )
```

Get calculated phase Current, Vdc & Va_max data. Implements `motor_driver_api_t::currentGet`.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_DRIVER_FlagCurrentOffsetGet()**

```
fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet ( motor_driver_ctrl_t *const p_ctrl, uint8_t *const p_flag_offset )
```

Get the flag of finish current offset detection. Implements `motor_driver_api_t::flagCurrentOffsetGet`.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ **RM_MOTOR_DRIVER_CurrentOffsetRestart()**

```
fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart ( motor_driver_ctrl_t *const p_ctrl)
```

Restart the current offset detection. Implements `motor_driver_api_t::currentOffsetRestart`.

Return values

FSP_SUCCESS	Successfully restarted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_DRIVER_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate ( motor_driver_ctrl_t *const p_ctrl, motor_driver_cfg_t const *const p_cfg )
```

Update the parameters of Driver Module. Implements `motor_driver_api_t::parameterUpdate`.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Control a SPM motor on RA MCUs. This module implements the [Motor encoder vector control \(rm_motor_encoder\)](#).

Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for `rm_motor_encoder`

The following build time configurations are defined in `fsp_cfg/rm_motor_encoder_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

- Enabled
- Disabled

parameter checking is included in the build.

Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_encoder0	Module name.
General > Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
General > Limit of over speed (rpm)	Must be a valid value	2100.0F	Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
```

```
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
    /* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
    /* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
    /* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
    /* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
    /* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
    /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
    /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
    /* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
    /* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

Data Structures

```
struct motor_encoder_callback_args_t
```

Enumerations

Function Documentation◆ **RM_MOTOR_ENCODER_Open()**

```
fsp_err_t RM_MOTOR_ENCODER_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements [motor_api_t::open](#).

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ **RM_MOTOR_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_ENCODER_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Encoder Control block. Implements [motor_api_t::close](#).

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ **RM_MOTOR_ENCODER_Run()**

```
fsp_err_t RM_MOTOR_ENCODER_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#).

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Stop()

```
fsp_err_t RM_MOTOR_ENCODER_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements [motor_api_t::stop](#).

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Reset()

```
fsp_err_t RM_MOTOR_ENCODER_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Encoder Control block. Implements [motor_api_t::reset](#).

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_ErrorSet()

```
fsp_err_t RM_MOTOR_ENCODER_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_SpeedSet()

```
fsp_err_t RM_MOTOR_ENCODER_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ **RM_MOTOR_ENCODER_PositionSet()**

```
fsp_err_t RM_MOTOR_ENCODER_PositionSet ( motor_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position )
```

Set position reference[degree]. Implements `motor_api_t::positionSet`.

Example:

```
/* Set position reference before motor run */
(void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

Note

◆ **RM_MOTOR_ENCODER_StatusGet()**

```
fsp_err_t RM_MOTOR_ENCODER_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_ENCODER_AngleGet()**

```
fsp_err_t RM_MOTOR_ENCODER_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_ENCODER_SpeedGet()**

```
fsp_err_t RM_MOTOR_ENCODER_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_ENCODER_ErrorCheck()**

```
fsp_err_t RM_MOTOR_ENCODER_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_ENCODER_WaitStopFlagGet()**

```
fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

Note

4.2.110 Motor Angle and Speed Estimation (rm_motor_estimate)

Modules

Functions

```
fsp_err_t RM_MOTOR_ESTIMATE_Open (motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg)
```

Opens and configures the Angle Estimation module. Implements `motor_angle_api_t::open`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_Close (motor_angle_ctrl_t *const p_ctrl)`
Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_Reset (motor_angle_ctrl_t *const p_ctrl)`
Reset variables of Angle Estimation module. Implements `motor_angle_api_t::reset`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet (motor_angle_ctrl_t *const p_ctrl, motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage)`
Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet (motor_angle_ctrl_t *const p_ctrl, float const speed_ctrl, float const damp_speed)`
Set Speed Information. Implements `motor_angle_api_t::speedSet`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet (motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi)`
Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`. [More...](#)

`fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet (motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err)`

`fsp_err_t RM_MOTOR_ESTIMATE_InfoGet (motor_angle_ctrl_t *const p_ctrl, motor_angle_encoder_info_t *const p_info)`

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`. [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for `rm_motor_estimate`

The following build time configurations are defined in `fsp_cfg/rm_motor_estimate_cfg.h`:

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
--------------------	--	---------------	---

Configurations for Motor > Motor Angle (rm_motor_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle (rm_motor_estimate).

Configuration	Options	Default	Description
Motor Parameter > Pole pairs	Manual Entry	2	Pole pairs
Motor Parameter > Resistance[ohm]	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux[Wb]	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia[kgm ²]	Must be a valid value	0.0000028F	Rotor inertia
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Openloop damping	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Openloop damping functionally enable or disable
Natural frequency of BEMF observer	Must be a valid value	1000.0F	Natural frequency of BEMF observer
Damping ratio of BEMF observer	Must be a valid value	1.0F	Damping ratio of BEMF observer
Natural frequency of PLL Speed estimate loop	Must be a valid value	20.0F	Natural frequency of PLL Speed estimate loop
Damping ratio of PLL Speed estimate loop	Must be a valid value	1.0F	Damping ratio of PLL Speed estimate loop
Control period	Must be a valid value	0.00005F	Control period

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

Examples

Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;
    motor_angle_current_t smpl_current;
    motor_angle_voltage_reference_t smpl_voltage;
    /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    while (true)
    {
        /* Application work here. */
        /* Set PI Control Flag before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
        smpl_current.id = 1.0F;
        smpl_current.iq = 1.0F;
        smpl_voltage.vd = 10.0F;
        smpl_voltage.vq = 10.0F;
        /* Set Current and Speed data before get Angle/Speed and Estimated Component */
        (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
        /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
        (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
    }
}
```

```

/* Get Angle/Speed data */
    (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);

/* Get Estimated Component */
    (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
}
}

```

Function Documentation

◆ RM_MOTOR_ESTIMATE_Open()

```
fsp_err_t RM_MOTOR_ESTIMATE_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t const
*const p_cfg )
```

Opens and configures the Angle Estimation module. Implements `motor_angle_api_t::open`.

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_ESTIMATE_Close()

```
fsp_err_t RM_MOTOR_ESTIMATE_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Estimation module. Implements `motor_angle_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_Reset()**

```
fsp_err_t RM_MOTOR_ESTIMATE_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Estimation module. Implements `motor_angle_api_t::reset`.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_CurrentSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_SpeedSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_EstimatedComponentGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements `motor_angle_api_t::estimatedComponentGet`.

Return values

FSP_SUCCESS	Successfully data gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed Estimation. Implements [motor_angle_api_t::parameterUpdate](#).

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_InternalCalculate()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements [motor_angle_api_t::internalCalculate](#).

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_AngleAdjust()**

```
fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements [motor_angle_api_t::angleAdjust](#).

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_ESTIMATE_InfoGet()**

```
fsp_err_t RM_MOTOR_ESTIMATE_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.111 Motor Position (rm_motor_position)

Modules

Functions

```
fsp_err_t RM_MOTOR_POSITION_Open (motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg)
```

Opens and configures the Motor Position Module. Implements `motor_position_api_t::open`. [More...](#)

```
fsp_err_t RM_MOTOR_POSITION_Close (motor_position_ctrl_t *const p_ctrl)
```

Disables specified Motor Position Module. Implements `motor_position_api_t::close`. [More...](#)

```
fsp_err_t RM_MOTOR_POSITION_Reset (motor_position_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Position Module. Implements [motor_position_api_t::reset](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_PositionGet](#) (`motor_position_ctrl_t *const p_ctrl, int16_t *const p_position`)

Get Rotor Position Data [degree]. Implements [motor_position_api_t::positionGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_PositionSet](#) (`motor_position_ctrl_t *const p_ctrl, float const position_rad`)

Set Position Data from Encoder [radian]. Implements [motor_position_api_t::positionSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_PositionReferenceSet](#) (`motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg`)

Calculates the q-axis current reference by P control. Implements [motor_position_api_t::ipdSpeedPControl](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_SpeedReferencePControlGet](#) (`motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref`)

Get Speed Reference by P Control. Implements [motor_position_api_t::speedReferencePControlGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_POSITION_SpeedReferenceIpdControlGet](#)

(motor_position_ctrl_t *const p_ctrl, float const max_speed_rad, float *const p_speed_ref)

Get Speed Reference by IPD Control. Implements [motor_position_api_t::speedReferenceIpdControlGet](#). [More...](#)

fsp_err_t [RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet](#) (motor_position_ctrl_t *const p_ctrl, float *const p_speed_ref)

Get Speed Reference by Feedforward. Implements [motor_position_api_t::speedReferenceFeedforwardGet](#). [More...](#)

fsp_err_t [RM_MOTOR_POSITION_ParameterUpdate](#) (motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t const *const p_cfg)

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#). [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor position Interface](#).

Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

Features

The Motor Position Module has below features.

- Calculate speed reference.

Configuration

Build Time Configurations for rm_motor_position

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Position Controller (rm_motor_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller

(rm_motor_position).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_position0	Module name.
General > Position Dead Band	Manual Entry	1U	Ignored Area of Position Control.
General > Position Band Limit	Manual Entry	3U	Ignored Area of Position Control.
General > Speed Feedforward Ratio	Must be a valid value	0.8F	Speed Feedforward Ratio.
General > Encoder Counts per one rotation	Must be a valid value	1200.0F	Encoder Counts per one rotation.
General > Position Omega	Must be a valid value	10.0F	Position Control Omega.
General > Period of Speed Control[sec]	Must be a valid value	0.0005F	Period of Speed Control.
IPD > IPD LPF	<ul style="list-style-type: none"> • Disable • Enable 	Disable	IPD LPF process enable or disable
IPD > Position Kp ratio	Must be a valid value	0.3F	Position Kp ratio.
IPD > Position Feedforward ratio	Must be a valid value	0.0F	Position Feedforward ratio.
IPD > Speed K ratio	Must be a valid value	2.0F	Speed K ratio
IPD > Error Limit #1	Must be a valid value	10.0F	Error Limitation #1
IPD > Error Limit #2	Must be a valid value	0.2F	Error Limitation #2
IPD > LPF Omega	Must be a valid value	500.0F	LPF Omega.
IPD > LPF Zeta	Must be a valid value	1.0F	LPF Zeta.
Position Profiling > Interval Time	Manual Entry	400U	Interval Time.
Position Profiling > Accel Time	Must be a valid value	0.3F	Accel Time.
Position Profiling > Maximum Accel Time	Must be a valid value	8117.96F	Maximum Acceleration Time [sec]
Position Profiling > Acceleration Maximum Speed	Must be a valid value	2000.0F	Acceleration Maximum Speed.
Position Profiling > Update Step of Timer	Must be a valid value	0.0005F	Update Step of Timer.
Motor Parameter > Pole Pair	Manual Entry	7	Pole Pair
Motor Parameter >	Must be a valid value	0.453F	Resistance

Resistance[ohm]

Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0009447F	Inductance of d-axis
--	-----------------------	------------	----------------------

Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0009447F	Inductance of q-axis
--	-----------------------	------------	----------------------

Motor Parameter > Inertia[kgm^2]	Must be a valid value	0.006198F	Inertia
-------------------------------------	-----------------------	-----------	---------

Motor Parameter > Motor Inertia[kgm^2]	Must be a valid value	0.00000962F	Motor Inertia
---	-----------------------	-------------	---------------

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

Examples

Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);

    /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);

    /* Set position reference */
    RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);

    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
```

```

* This implementation is an example. */
// while (true)
{
/* Application work here. */
/* Perform Position Control Process */
RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
/* Perform Speed IPD Control Process */
RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
/* Get Position */
RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
/* Update parameters */
RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
}
/* Reset Speed Control */
RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);
/* Close Speed Control */
RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}

```

Enumerations

Function Documentation

◆ **RM_MOTOR_POSITION_Open()**

```
fsp_err_t RM_MOTOR_POSITION_Open ( motor_position_ctrl_t *const p_ctrl, motor_position_cfg_t
const *const p_cfg )
```

Opens and configures the Motor Position Module. Implements [motor_position_api_t::open](#).

Return values

FSP_SUCCESS	Motor Position Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Set parameter is invalid.

◆ **RM_MOTOR_POSITION_Close()**

```
fsp_err_t RM_MOTOR_POSITION_Close ( motor_position_ctrl_t *const p_ctrl)
```

Disables specified Motor Position Module. Implements [motor_position_api_t::close](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_Reset()**

```
fsp_err_t RM_MOTOR_POSITION_Reset ( motor_position_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Position Module. Implements [motor_position_api_t::reset](#).

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_PositionGet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionGet ( motor_position_ctrl_t *const p_ctrl, int16_t *const p_position )
```

Get Rotor Position Data [degree]. Implements `motor_position_api_t::positionGet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM_MOTOR_POSITION_PositionSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionSet ( motor_position_ctrl_t *const p_ctrl, float const position_rad )
```

Set Position Data from Encoder [radian]. Implements `motor_position_api_t::positionSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet ( motor_position_ctrl_t *const p_ctrl, int16_t const position_reference_deg )
```

Set Position Reference Data [degree]. Implements `motor_position_api_t::positionReferenceSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_ControlModeSet()**

```
fsp_err_t RM_MOTOR_POSITION_ControlModeSet ( motor_position_ctrl_t *const p_ctrl,
motor_position_ctrl_mode_t const mode )
```

Set Position Control Mode. Implements [motor_position_api_t::controlModeSet](#).

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_PositionControl()**

```
fsp_err_t RM_MOTOR_POSITION_PositionControl ( motor_position_ctrl_t *const p_ctrl)
```

Calculates internal position reference.(Main process of Position Control) Implements [motor_position_api_t::positionControl](#).

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_POSITION_IpdSpeedPControl()**

```
fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl ( motor_position_ctrl_t *const p_ctrl, float const
ref_speed_rad, float const speed_rad, float *const p_iq_ref )
```

Calculates the q-axis current reference by P control. Implements [motor_position_api_t::ipdSpeedPControl](#).

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM_MOTOR_POSITION_SpeedReferencePControlGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet ( motor_position_ctrl_t *const p_ctrl,
float *const p_speed_ref )
```

Get Speed Reference by P Control. Implements [motor_position_api_t::speedReferencePControlGet](#).

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet ( motor_position_ctrl_t *const p_ctrl,
float const max_speed_rad, float *const p_speed_ref )
```

Get Speed Reference by IPD Control. Implements [motor_position_api_t::speedReferenceIpdControlGet](#).

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()**

```
fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet ( motor_position_ctrl_t *const
p_ctrl, float *const p_speed_ref )
```

Get Speed Reference by Feedforward. Implements [motor_position_api_t::speedReferenceFeedforwardGet](#).

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_ParameterUpdate()

```
fsp_err_t RM_MOTOR_POSITION_ParameterUpdate ( motor_position_ctrl_t *const p_ctrl,
motor_position_cfg_t const *const p_cfg )
```

Update the parameters of Position Control Calculation. Implements [motor_position_api_t::parameterUpdate](#).

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor angle Interface](#).

Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (`rm_motor_current`).

Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for `rm_motor_sense_encoder`

The following build time configurations are defined in `fsp_cfg/rm_motor_sense_encoder_cfg.h`:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle (`rm_motor_sense_encoder`)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle (`rm_motor_sense_encoder`).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	<code>g_motor_sense_encode</code> <code>r0</code>	Module name.
Motor Parameter > Pole pairs	Must be a valid non-negative value.	7	Pole pairs

Motor Parameter > Resistance (ohm)	Must be a valid value	0.453F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0009447F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0009447F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.006198F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm ²)	Must be a valid value	0.00000962F	Rotor inertia
Control Type	<ul style="list-style-type: none"> • Speed • Position 	Position	Select control Type
Period of Current control (kHz)	Must be a valid value	20.0F	Period of Current control
Period of Speed control (sec)	Must be a valid value	0.0005F	Period of Speed control
PWM Carrier Frequency (kHz)	Must be a valid value	20.0F	PWM Carrier Frequency
Decimation of Interrupt	Manual Entry	0U	Decimation of Interrupt
Counts per Rotation	Must be a valid non-negative value.	1200U	Encoder Counts per One Rotation
Counts for Angle Adjust	Must be a valid non-negative value.	512U	Counts for Angle Adjust (as working time)
Zero speed counts	Must be a valid non-negative value.	20000000U	Threshold counts to judge zero speed
Occupancy Time	Must be a valid value	0.30F	Occupancy time of carrier interrupt
Carrier Time	Must be a valid value	0.000013F	Processing time of carrier interrupt
Process Time	Must be a valid value	0.000001F	Processing time of encoder interrupt
Highspeed Change Margin (rpm)	Must be a valid non-negative value.	150U	Margin of toggle speed for high speed mode
LPF parameter for Highspeed Filter	Must be a valid value	0.1F	Highspeed mode speed LPF parameter
Counts to change speed	Must be a valid non-negative value.	8U	Counts for mode change of position speed calculation

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
    /* Basically run this module at A/D conversion finish interrupt.
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Initialize motor with the encoder */
        (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
        /* Perform cyclic encoder process*/
        (void) RM_MOTOR_SENSE_ENCODER_EncoderCyclic(&g_mtr_angle0_ctrl);
        /* Calculate information with encoder signal input */
        (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
        /* Get angle/speed data */
        (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
        /* Get calculated component */
        (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
    }
    /* Reset the module */
}
```

```

(void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
(void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}

```

Function Documentation

◆ **RM_MOTOR_SENSE_ENCODER_Open()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Open ( motor_angle_ctrl_t *const p_ctrl, motor_angle_cfg_t
const *const p_cfg )
```

Opens and configures the Angle Encoder module. Implements [motor_angle_api_t::open](#).

Return values

FSP_SUCCESS	Angle Encoder module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ **RM_MOTOR_SENSE_ENCODER_Close()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Close ( motor_angle_ctrl_t *const p_ctrl)
```

Disables specified Angle Encoder module. Implements [motor_angle_api_t::close](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_Reset()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset ( motor_angle_ctrl_t *const p_ctrl)
```

Reset variables of Angle Encoder module. Implements [motor_angle_api_t::reset](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_InternalCalculate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate ( motor_angle_ctrl_t *const p_ctrl)
```

Calculate internal parameters. Implements `motor_angle_api_t::internalCalculate`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_AngleSpeedGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet ( motor_angle_ctrl_t *const p_ctrl, float *const p_angle, float *const p_speed, float *const p_phase_err )
```

Gets the current rotor's angle and rotation speed. Implements `motor_angle_api_t::angleSpeedGet`.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_AngleAdjust()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust ( motor_angle_ctrl_t *const p_ctrl)
```

Angle Adjustment Process. Implements `motor_angle_api_t::angleAdjust`.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_EncoderCyclic()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic ( motor_angle_ctrl_t *const p_ctrl)
```

Encoder Cyclic Process (Call in cyclic timer). Implements `motor_angle_api_t::encoderCyclic`.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_InfoGet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_encoder_info_t *const p_info )
```

Gets information of Encoder Angle Module. Implements `motor_angle_api_t::infoGet`.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_ParameterUpdate()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_cfg_t const *const p_cfg )
```

Update the parameters of Angle&Speed calculation with an encoder. Implements `motor_angle_api_t::parameterUpdate`.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SENSE_ENCODER_CurrentSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet ( motor_angle_ctrl_t *const p_ctrl,
motor_angle_current_t *const p_st_current, motor_angle_voltage_reference_t *const p_st_voltage
)
```

Set d/q-axis Current Data & Voltage Reference. Implements `motor_angle_api_t::currentSet`.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software currentSet is not supported.
---------------------	---

◆ **RM_MOTOR_SENSE_ENCODER_SpeedSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_SpeedSet ( motor_angle_ctrl_t *const p_ctrl, float const
speed_ctrl, float const damp_speed )
```

Set Speed Information. Implements `motor_angle_api_t::speedSet`.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software speedSet is not supported.
---------------------	---

◆ **RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet()**

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet ( motor_angle_ctrl_t *const p_ctrl, uint32_t
const flag_pi )
```

Set the flag of PI Control runs. Implements `motor_angle_api_t::flagPiCtrlSet`.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software flagPiCtrlSet is not supported.
---------------------	--

◆ RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet()

```
fsp_err_t RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet ( motor_angle_ctrl_t *const
p_ctrl, float *const p_ed, float *const p_eq )
```

Gets estimated d/q-axis component. Implements [motor_angle_api_t::estimatedComponentGet](#).

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software estimatedComponentGet is not supported.
---------------------	--

4.2.113 Motor Sensorless Vector Control (rm_motor_sensorless)

Modules

Functions

```
fsp_err_t RM_MOTOR_SENSORLESS_Open (motor_ctrl_t *const p_ctrl,
motor_cfg_t const *const p_cfg)

```

Disables specified Motor Sensorless Control block. Implements [motor_api_t::close](#). [More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_Run (motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements [motor_api_t::run](#). [More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_Stop (motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements [motor_api_t::stop](#). [More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_Reset (motor_ctrl_t *const p_ctrl)
```

Reset Motor Sensorless Control block. Implements [motor_api_t::reset](#). [More...](#)

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet (motor_ctrl_t *const p_ctrl,
motor_error_t const error)
```

Set error information. Implements [motor_api_t::errorSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_SpeedSet](#) (`motor_ctrl_t *const p_ctrl`, `float const speed_rpm`)

Set speed reference[rpm]. Implements [motor_api_t::speedSet](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_StatusGet](#) (`motor_ctrl_t *const p_ctrl`, `uint8_t *const p_status`)

Get current control status. Implements [motor_api_t::statusGet](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_AngleGet](#) (`motor_ctrl_t *const p_ctrl`, `float *const p_angle_rad`)

Get current rotor angle. Implements [motor_api_t::angleGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_SpeedGet](#) (`motor_ctrl_t *const p_ctrl`, `float *const p_speed_rpm`)

Get rotational speed. Implements [motor_api_t::speedGet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_ErrorCheck](#) (`motor_ctrl_t *const p_ctrl`, `uint16_t *const p_error`)

Check the occurrence of Error. Implements [motor_api_t::errorCheck](#).
[More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_PositionSet](#) (`motor_ctrl_t *const p_ctrl`, `motor_speed_position_data_t const *const p_position`)

Set position reference. Implements [motor_api_t::positionSet](#). [More...](#)

`fsp_err_t` [RM_MOTOR_SENSORLESS_WaitStopFlagGet](#) (`motor_ctrl_t *const p_ctrl`, `motor_wait_stop_flag_t *const p_flag`)

Get wait stop flag. Implements [motor_api_t::waitStopFlagGet](#). [More...](#)

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the [Motor Sensorless Vector Control \(rm_motor_sensorless\)](#).

Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Configuration

Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_sensorless0	Module name.
General > Limit of over current (A)	Must be a valid value	0.42F	Limit of over current.(Detection threshold)
General > Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
General > Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
General > Limit of low voltage (V)	Must be a valid value	14.0F	Limit of low voltage.(Detection threshold)
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
    /* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
    /* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
    /* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
    /* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
    /* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
    /* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
    /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
    /* Stop motor rotation */
}
```

```

(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
/* Reset Speed Control */
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
/* Close Speed Control */
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}

```

Data Structures

struct [motor_sensorless_callback_args_t](#)

Enumerations

enum [motor_sensorless_callback_event_t](#)

Data Structure Documentation

◆ motor_sensorless_callback_args_t

struct motor_sensorless_callback_args_t		
Callback function parameter data		
Data Fields		
void const *	p_context	Placeholder for user data.
motor_sensorless_callback_event_t	event	

Enumeration Type Documentation

◆ motor_sensorless_callback_event_t

enum motor_sensorless_callback_event_t	
Events that can trigger a callback function	
Enumerator	
MOTOR_SENSORLESS_CALLBACK_EVENT_SPEED_FORWARD	Event forward Speed Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_SPEED_BACKWARD	Event backward Speed Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_CURRENT_FORWARD	Event forward Current Control.
MOTOR_SENSORLESS_CALLBACK_EVENT_CURRENT_BACKWARD	Event backward Current Control.

Function Documentation

◆ RM_MOTOR_SENSORLESS_Open()

```
fsp_err_t RM_MOTOR_SENSORLESS_Open ( motor_ctrl_t *const p_ctrl, motor_cfg_t const *const p_cfg )
```

Configure the MOTOR in register start mode. Implements `motor_api_t::open`.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_SENSORLESS_Close()

```
fsp_err_t RM_MOTOR_SENSORLESS_Close ( motor_ctrl_t *const p_ctrl)
```

Disables specified Motor Sensorless Control block. Implements `motor_api_t::close`.

Example:

```
/* Close Speed Control */
(void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Run()

```
fsp_err_t RM_MOTOR_SENSORLESS_Run ( motor_ctrl_t *const p_ctrl)
```

Run Motor (Start motor rotation). Implements `motor_api_t::run`.

Example:

```
/* Start motor rotation */
(void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Stop()

```
fsp_err_t RM_MOTOR_SENSORLESS_Stop ( motor_ctrl_t *const p_ctrl)
```

Stop Motor (Stop motor rotation). Implements `motor_api_t::stop`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Reset()

```
fsp_err_t RM_MOTOR_SENSORLESS_Reset ( motor_ctrl_t *const p_ctrl)
```

Reset Motor Sensorless Control block. Implements `motor_api_t::reset`.

Example:

```
/* Reset Speed Control */
(void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_ErrorSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet ( motor_ctrl_t *const p_ctrl, motor_error_t const error )
```

Set error information. Implements `motor_api_t::errorSet`.

Example:

```
/* Stop motor rotation */
(void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_SpeedSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet ( motor_ctrl_t *const p_ctrl, float const speed_rpm )
```

Set speed reference[rpm]. Implements `motor_api_t::speedSet`.

Example:

```
/* Set speed reference before motor run */
(void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_StatusGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_StatusGet ( motor_ctrl_t *const p_ctrl, uint8_t *const p_status )
```

Get current control status. Implements `motor_api_t::statusGet`.

Example:

```
/* Get current status */
(void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_SENSORLESS_AngleGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_AngleGet ( motor_ctrl_t *const p_ctrl, float *const p_angle_rad )
```

Get current rotor angle. Implements `motor_api_t::angleGet`.

Example:

```
/* Get current rotor angle */
(void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ **RM_MOTOR_SENSORLESS_SpeedGet()**

```
fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet ( motor_ctrl_t *const p_ctrl, float *const p_speed_rpm )
```

Get rotational speed. Implements `motor_api_t::speedGet`.

Example:

```
/* Get current motor speed */
(void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_ErrorCheck()

```
fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck ( motor_ctrl_t *const p_ctrl, uint16_t *const p_error )
```

Check the occurrence of Error. Implements `motor_api_t::errorCheck`.

Example:

```
/* Check error */
(void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_PositionSet()

```
fsp_err_t RM_MOTOR_SENSORLESS_PositionSet ( motor_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position )
```

Set position reference. Implements `motor_api_t::positionSet`.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

Note

◆ RM_MOTOR_SENSORLESS_WaitStopFlagGet()

```
fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet ( motor_ctrl_t *const p_ctrl,
motor_wait_stop_flag_t *const p_flag )
```

Get wait stop flag. Implements `motor_api_t::waitStopFlagGet`.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
---------------------	--------------

Note

4.2.114 Motor Speed (rm_motor_speed)

Modules

Functions

```
fsp_err_t RM_MOTOR_SPEED_Open (motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg)
```

Opens and configures the Motor Speed Module. Implements `motor_speed_api_t::open`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Close (motor_speed_ctrl_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements `motor_speed_api_t::close`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Reset (motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_Run (motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`. [More...](#)

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet (motor_speed_ctrl_t *const
p_ctrl, float const speed_reference_rpm)
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet (motor_speed_ctrl_t *const p_ctrl, motor_speed_position_data_t const *const p_position_data)`

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterSet (motor_speed_ctrl_t *const p_ctrl, motor_speed_input_t const *const p_st_input)`

Set Input parameters. Implements `motor_speed_api_t::parameterSet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_SpeedControl (motor_speed_ctrl_t *const p_ctrl)`

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements `motor_speed_api_t::speedControl`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterGet (motor_speed_ctrl_t *const p_ctrl, motor_speed_output_t *const p_st_output)`

Get Speed Control Parameters. Implements `motor_speed_api_t::parameterGet`. [More...](#)

`fsp_err_t RM_MOTOR_SPEED_ParameterUpdate (motor_speed_ctrl_t *const p_ctrl, motor_speed_cfg_t const *const p_cfg)`

Update the parameters of Speed Control Calculation. Implements `motor_speed_api_t::parameterUpdate`. [More...](#)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the [Motor speed Interface](#).

Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.

- Speed observer function when using encoder type.

Configuration

Build Time Configurations for rm_motor_speed

The following build time configurations are defined in fsp_cfg/rm_motor_speed_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Position Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable position algorithm support.

Configurations for Motor > Motor Speed Controller (rm_motor_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm_motor_speed).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_motor_speed0	Module name.
General > Speed control period (sec)	Must be a valid value	0.0005F	Period of speed control function.
General > Step of speed climbing (rpm)	Must be a valid value	0.5F	Step of speed change at start of open-loop.
General > Maximum rotational speed (rpm)	Manual Entry	2650	Maximum rotational speed (Limit speed).
General > Speed LPF omega	Must be a valid value	10.0F	Design parameter for speed LPF.
General > Speed at Id climbing (rpm)	Manual Entry	500	From this speed d-axis current is controlled climbing.
General > Limit of q-axis current (A)	Must be a valid value	0.42F	Limit of q-axis current.
General > Step of speed feedback at open-loop	Must be a valid value	0.20F	Step of speed feedback at open-loop.
General > Open-loop damping	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Select enable/disable Open-loop damping control.
General > Flux weakening	<ul style="list-style-type: none"> • Disable • Enable 	Disable	Select enable/disable flux weakening control.
General > Torque compensation for	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Select enable/disable torque compensation

sensorless transition			for sensorless transition.
General > Speed observer	<ul style="list-style-type: none"> • Disable • Enable 	Enable	Select enable/disable Speed observer process.
General > Control method	<ul style="list-style-type: none"> • PID • IPD 	PID	Select the control method [PID or IPD].
General > Control type	<ul style="list-style-type: none"> • Sensoreless • Encoder 	Sensoreless	
Open-Loop > Step of d-axis current climbing	Must be a valid value	0.3F	Step of d-axis current climbing
Open-Loop > Step of d-axis current descending	Must be a valid value	0.3F	Step of d-axis current descending
Open-Loop > Step of q-axis current descending ratio	Must be a valid value	1.0F	Step of q-axis current descending ratio
Open-Loop > Reference of d-axis current	Must be a valid value	0.3F	Reference of d-axis current
Open-Loop > Threshold of speed control descending	Manual Entry	600	When rotational speed reaches this speed, d-axis current is controlled descending.
Open-Loop > Threshold of speed control climbing	Manual Entry	500	Until rotational speed reaches this speed, d-axis current is controlled climbing.
Open-Loop > Period between open-loop to BEMF (sec)	Must be a valid value	0.025F	Margin time between open-loop control changes to BEMF PI control.
Open-Loop > Phase error(degree) to decide sensor-less switch timing	Manual Entry	10	Phase error(degree) to decide sensor-less switch timing.
Design parameter > Speed PI loop omega	Must be a valid value	5.0F	Speed PI loop omega
Design parameter > Speed PI loop zeta	Must be a valid value	1.0F	Speed PI loop zeta
Design parameter > Estimated d-axis HPF omega	Must be a valid value	2.5F	HPF cutoff frequency for ed (Hz)
Design parameter > Open-loop damping	Must be a valid value	1.0F	Damping ratio of open-loop damping control

zeta

Design parameter > Cutoff frequency of phase error LPF	Must be a valid value	10.0F	Cutoff frequency of phase error LPF
Design parameter > Speed observer omega	Must be a valid value	200.0F	Speed observer loop omega
Design parameter > Speed observer zeta	Must be a valid value	1.0F	Speed observer loop zeta
Motor Parameter > Pole pairs	Manual Entry	2	Pole pairs
Motor Parameter > Resistance (ohm)	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm ²)	Must be a valid value	0.0000028F	Rotor inertia
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at timer interrupt.
Interrupts > Input data	Name must be a valid C symbol	NULL	Structure for Speed control Input. If you set this content, Speed Control function read these data automatically. (No need to use Set API.)
Interrupts > Output data	Name must be a valid C symbol	NULL	Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.)

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;
    /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);

    /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
    /* Set position reference before get current reference
     * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
    (void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
    &g_posref_sample);

    /* Basically run this module at cyclic interrupt (e.g. AGT timer).
     * This implementation is an example. */
    // while (true)
    {
        /* Application work here. */
        /* Set input parameter data before get current reference */
        (void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
    &g_test_speed_input);

        /* Activate Speed Process */
        (void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);
    }
}
```

```

/* Perform Speed Control Process */
    (void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);
/* Get output parameters */
    (void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,
&g_test_speed_output);
//

/* Update parameters */
    (void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,
&g_motor_speed0.p_cfg);
}
/* Reset Speed Control */
    (void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);
/* Close Speed Control */
    (void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);
}

```

Enumerations

Enumeration Type Documentation

◆ [motor_speed_control_type_t](#)

enum motor_speed_control_type_t	
Enumerator	
MOTOR_SPEED_CONTROL_TYPE_SENSORLESS	Sensorless type.
MOTOR_SPEED_CONTROL_TYPE_ENCODER	Encoder type.

◆ **motor_speed_openloop_damping_t**

enum motor_speed_openloop_damping_t	
Enumerator	
MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE	Disable openloop damping.
MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE	Enable openloop damping.

◆ **motor_speed_flux_weaken_t**

enum motor_speed_flux_weaken_t	
Enumerator	
MOTOR_SPEED_FLUX_WEAKEN_DISABLE	Disable flux-weakening control.
MOTOR_SPEED_FLUX_WEAKEN_ENABLE	Enable flux-weakening control.

◆ **motor_speed_less_switch_t**

enum motor_speed_less_switch_t	
Enumerator	
MOTOR_SPEED_LESS_SWITCH_DISABLE	Disable soft switching between open-loop mode and normal FOC mode.
MOTOR_SPEED_LESS_SWITCH_ENABLE	Enable soft switching between open-loop mode and normal FOC mode.

◆ **motor_speed_observer_switch_t**

enum motor_speed_observer_switch_t	
Enumerator	
MOTOR_SPEED_OBSERVER_SWITCH_DISABLE	Disable speed observer.
MOTOR_SPEED_OBSERVER_SWITCH_ENABLE	Enable speed observer.

◆ **motor_speed_ctrl_status_t**

enum motor_speed_ctrl_status_t	
Enumerator	
MOTOR_SPEED_CTRL_STATUS_INIT	Speed control status is INIT.
MOTOR_SPEED_CTRL_STATUS_BOOT	Speed control status is BOOT.
MOTOR_SPEED_CTRL_STATUS_RUN	Speed control status is RUN.

Function Documentation◆ **RM_MOTOR_SPEED_Open()**

```
fsp_err_t RM_MOTOR_SPEED_Open ( motor\_speed\_ctrl\_t *const p_ctrl, motor\_speed\_cfg\_t const *const p_cfg )
```

Opens and configures the Motor Speed Module. Implements [motor_speed_api_t::open](#).

Return values

FSP_SUCCESS	Motor Speed Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ **RM_MOTOR_SPEED_Close()**

```
fsp_err_t RM_MOTOR_SPEED_Close ( motor\_speed\_ctrl\_t *const p_ctrl)
```

Disables specified Motor Speed Module. Implements [motor_speed_api_t::close](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SPEED_Reset()**

```
fsp_err_t RM_MOTOR_SPEED_Reset ( motor_speed_ctrl_t *const p_ctrl)
```

Reset the variables of Motor Speed Module. Implements `motor_speed_api_t::reset`.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SPEED_Run()**

```
fsp_err_t RM_MOTOR_SPEED_Run ( motor_speed_ctrl_t *const p_ctrl)
```

Run(Start) the Motor Speed Control. Implements `motor_speed_api_t::run`.

Return values

FSP_SUCCESS	Successfully start.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SPEED_SpeedReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet ( motor_speed_ctrl_t *const p_ctrl, float const speed_reference_rpm )
```

Set Speed Reference Data. Implements `motor_speed_api_t::speedReferenceSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_MOTOR_SPEED_PositionReferenceSet()**

```
fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_position_data_t const *const p_position_data )
```

Set Position Reference Data. Implements `motor_speed_api_t::positionReferenceSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input structure pointer is NULL.

◆ **RM_MOTOR_SPEED_ParameterSet()**

```
fsp_err_t RM_MOTOR_SPEED_ParameterSet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_input_t const *const p_st_input )
```

Set Input parameters. Implements `motor_speed_api_t::parameterSet`.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ **RM_MOTOR_SPEED_SpeedControl()**

```
fsp_err_t RM_MOTOR_SPEED_SpeedControl ( motor_speed_ctrl_t *const p_ctrl)
```

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements `motor_speed_api_t::speedControl`.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_ParameterGet()

```
fsp_err_t RM_MOTOR_SPEED_ParameterGet ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_output_t *const p_st_output )
```

Get Speed Control Parameters. Implements [motor_speed_api_t::parameterGet](#).

Return values

FSP_SUCCESS	Successfully the flag is gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_SPEED_ParameterUpdate()

```
fsp_err_t RM_MOTOR_SPEED_ParameterUpdate ( motor_speed_ctrl_t *const p_ctrl,
motor_speed_cfg_t const *const p_cfg )
```

Update the parameters of Speed Control Calculation. Implements [motor_speed_api_t::parameterUpdate](#).

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

4.2.115 Azure RTOS NetX Secure Crypto Hardware Acceleration (rm_netx_secure_crypto)

Modules

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the [NetXDuo - NetX Crypto documentation](#) for further details.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

Note

NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.

Features

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
 - HMAC with SHA224
 - HMAC with SHA256
- AES
 - Keybits - 128, 192, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated
GCM	Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated
- Random number generation
- ECC
 - ECDSA: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
 - ECDH: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
- RSA
 - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
 - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
 - Supported encoding scheme: PKCS1V15 This module provides SCE7 hardware support for the following NetX Crypto operations
- AES
 - Keybits - 128, 256
 - Encryption and Decryption.
 - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
-------------------	-----------------

CBC	Fully accelerated
CTR	Fully accelerated
GCM	Only block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	<ul style="list-style-type: none"> Use Standalone Crypto Only Use with TLS 	Use Standalone Crypto Only	Defines NX_CRYPTOSTANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	<ul style="list-style-type: none"> 1024 2048 3072 4096 	4096	

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDSA Scratch Buffer Size (Bytes)	Value must be an integer	3016	Sets value of NX_CRYPTOTO_ECDSA_SCRATCH_BUFFER_SIZE.
Hardware Acceleration > Public Key	Value must be an integer	2464	Sets value of NX_CRYPTOTO_ECDH_SCRATCH_BUFFER_SIZE.

Cryptography (PKC) > ECC > ECDH Scratch Buffer Size (Bytes)			FFER_SIZE
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA	MCU Specific Options		Enables/Disables RSA HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_RSA_2048_AL T to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_RSA_3072_AL T to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SEC URE_CRYPTONX_CRYPT O_METHODS_RSA_409 6_ALT to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_Cryp TO_RSA_SCRATCH_BUF FER_SIZE
Hardware Acceleration > TRNG	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Enables NETX_SECURE_ CRYPTO_NX_CRYPTO_M ETHODS_TRNG_ALT.
Standalone Usage	<ul style="list-style-type: none"> • Use Standalone Crypto Only • Use with TLS 	Use Standalone Crypto Only	Defines NX_CRYPTONX_ CRYPTO_METHODS_ST ANDALONE_ENABLE.

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro `NETX_SECURE_CRYPTONX_CRYPTONX_METHODS_TRNG_ALT` must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `NETX_SECURE_CRYPTONX_CRYPTONX_METHODS_SHA256_ALT` must be defined in the configuration file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT` must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1, SECP256R1 and SECP224R1, the macro `NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT` must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be defined in the configuration file:

Configuration Macro	Feature / Operation
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT</code>	Signature Generation / Signature Verification (Encryption / Decryption)
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT</code>	Signature Verification (Encryption Only)
<code>NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT</code>	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

`_nx_crypto_initialize()` must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer [Azure RTOS NetX Crypto API description](#) for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the `_nx_crypto_method_aes_operation` must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in [Using Advanced Encryption Standard \(AES\) Counter Mode With IPsec Encapsulating Security Payload \(ESP\)](#) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to `_nx_crypto_method_aes_operation` through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the `_nx_crypto_method_aes_operation` during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by `NX_CRYPT0_ECDSA_SCRATCH_BUFFER_SIZE` and `NX_CRYPT0_ECDH_SCRATCH_BUFFER_SIZE` macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key
Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key
ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under [RFC5480](#)
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral. (Qx and Qy are zero padded for

224 bit curves).

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during `_nx_crypto_method_rsa_init` API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_rsa_operation` API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of `_nx_crypto_method_pkcs1_v1_5_init` are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the `_nx_crypto_method_pkcs1_v1_5_operation` API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is enabled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */
err = _nx_crypto_initialize();
assert(NX_CRYPTOSUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTOMETHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
    0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
```

```
};  
  
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =  
{  
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,  
    0xd7, 0x6f, 0x0c,  
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,  
    0xf4, 0x41, 0xb9  
};  
  
void netx_secure_crypto_sha256_example (void)  
{  
    size_t    actual_hash_len = RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;  
    uint8_t  actual_hash[RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES];  
    uint8_t  metadata[sizeof(NX_CRYPTO_SHA256)];  
    uint32_t metadata_size = sizeof(NX_CRYPTO_SHA256);  
  
    void * handler          = NX_CRYPTO_NULL;  
    uint32_t err            = NX_CRYPTO_SUCCESS;  
  
    /* Setup the platform; initialize the SCE and the TRNG */  
    err = _nx_crypto_initialize();  
    assert(NX_CRYPTO_SUCCESS == err);  
  
    /* Nx Crypto SHA256 init */  
    err = _nx_crypto_method_sha256_init(&crypto_method_sha256, NX_CRYPTO_NULL, 0,  
&handler, metadata, metadata_size);  
    assert(NX_CRYPTO_SUCCESS == err);  
  
    /* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_INITIALIZE */  
    err = _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_INITIALIZE,  
                                             handler,  
                                             &crypto_method_sha256,  
                                             NX_CRYPTO_NULL,  
                                             0,  
                                             NX_CRYPTO_NULL,  
                                             0,  
                                             NX_CRYPTO_NULL,  
                                             NX_CRYPTO_NULL,  
                                             0,
```

```
        metadata,  
        metadata_size,  
        NX_CRYPTO_NULL,  
        NX_CRYPTO_NULL);  
  
    assert(NX_CRYPTO_SUCCESS == err);  
/* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_UPDATE,

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPT_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

4.2.116 Azure RTOS NetX Duo Ether Driver (rm_netxduo_ether)

Modules

Overview

This module provides a NetX Duo driver that is implemented using the [Ethernet Interface](#).

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - ARP
 - IPv4
 - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_netxduo_ether_0	Module name.
IP MTU	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured [ether_cfg_t::ether_buffer_size](#). The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

[ether_cfg_t::ether_buffer_size](#) is calculated from the IP MTU using the following formula:

$$\text{ceil}((\text{rm_netxduo_ether_cfg_t::mtu} + \text{Ethernet Header (14)} + \text{Padding Bytes (2)}) / 32) * 32$$

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUEXAMPLE_IP_STACK_SIZE (2048U)
```

```
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)

BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
    /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
    UINT status;
    nx_system_initialize();
    /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
"Packet Pool",
                                NETXDUO_EXAMPLE_PACKET_SIZE,
                                &g_packet_pool_memory[0],
                                NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
    /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
```

```
"IP Instance",  
  
    IP_ADDRESS(192, 168, 1, 2),  
    IP_ADDRESS(255, 255, 255, 0),  
  
    &g_packet_pool,  
  
    rm_netxduo_ether0,  
  
    &g_ip_stack_memory[0],  
  
sizeof(g_ip_stack_memory),  
  
    0);  
  
    assert(NX_SUCCESS == status);  
  
/* Enable all modules that are required by the application. */  
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof  
(g_ip_arp_cache_memory));  
  
    assert(NX_SUCCESS == status);  
  
    status = nx_tcp_enable(&g_ip);  
  
    assert(NX_SUCCESS == status);  
  
    status = nx_icmp_enable(&g_ip);  
  
    assert(NX_SUCCESS == status);  
  
}
```

4.2.117 Azure RTOS NetX Duo WiFi Driver (rm_netxduo_wifi)

Modules

Overview

This module provides a NetX Duo driver that is implemented using the `rm_wifi_onchip_silex` driver.

Please refer to the [NetXDuo documentation](#) for further details.

Features

- Packet Types Supported
 - TCP/IPv4
 - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

Configuration	Options	Default	Description
IP MTU (bytes)	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- `rm_wifi_onchip_silex_open()` should be called to initialize the WiFi module driver.
- `rm_wifi_onchip_silex_scan()` should be used to scan for access points.
- `rm_wifi_onchip_silex_connect()` should be used before opening a NetX IP instance in order to connect it to a network.
- `rm_wifi_onchip_silex_network_info_get()` should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

TCP client sockets are the sole feature supported by both the hardware TCP/IP feature in NetX Duo and the WiFi driver as well. Any protocol that does not utilize a TCP client socket will be unsupported.

- TCP server mode is not currently supported.
- DNS is not supported. The user can preform a DNS lookup by calling `rm_wifi_onchip_silex_dns_query`.
- ICMP is not supported. The user can perform a ping by calling `rm_wifi_onchip_silex_ping`.
- ARP is not supported. This should be handled directly by the WiFi module.
- SNTP is not supported. See the public APIs for communication with time servers [Wifi Middleware \(rm_wifi_onchip_silex\)](#).
- Static address assignment is not currently supported by the `rm_wifi_onchip_silex` driver. You must use DHCP.

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)

```

UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUEXAMPLE_SOCKET_TIMEOUT (3000)
#define NETXDUEXAMPLE_UDP_TX_PORT (5000)
#define NETXDUEXAMPLE_SERVER_IP (0xC0A80064)
void rm_netxdue_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
/* IP Address of the remote socket. */
    NXD_ADDRESS g_ip_address = NETXDUEXAMPLE_SERVER_IP;
/* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
```

```

NX_FRAGMENT_OKAY, 0, 5);

/* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUAL_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);

    NX_PACKET * p_nx_packet = NX_NULL;

/* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUAL_TESTS_SOCKET_TIMEOUT)

/* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);

/* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUAL_TESTS_UDP_TX_PORT);

    NX_PACKET * p_nx_packet_rcv;

/* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_rcv,
NETXDUAL_TESTS_SOCKET_TIMEOUT);

/* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}

```

4.2.118 Crypto Middleware (rm_psa_crypto)

Modules

Functions

fsp_err_t [RM_PSA_CRYPTO_TRNG_Read](#) (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer. [More...](#)

int [mbedtls_platform_setup](#) (mbedtls_platform_context *ctx)

void [mbedtls_platform_teardown](#) (mbedtls_platform_context *ctx)

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the Mbed TLS version 2.24.0 which conforms to the PSA Crypto API 1.0 specification. Consult the ARM documentation at <https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface> for further information. FSP 3.0 onward adopts a change by ARM where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

Features

The PSA_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation
- SHA224 calculation
 - MAC Operations
- AES
 - Keybits - 128, 192, 256
 - Plain-Text Key Generation
 - Wrapped Key Generation
 - Encryption and Decryption with no padding and with PKCS7 padding.
 - CBC, CTR, CCM and GCM modes
 - MAC operations
 - Export and Import for Plaintext and Wrapped keys
- ECC
 - Curves:
 - SECP256R1
 - SECP256K1
 - Brainpool256R1
 - SECP384R1
 - Brainpool384R1
 - Plain-Text Key Generation (Unavailable on SCE9)
 - Wrapped Key Generation
 - Signing and Verification
 - Export and Import for Plaintext and Wrapped keys
 - ECDH Support
- RSA

- Keybits - 2048. Verification only for 3072 and 4096 bits
- Plain-Text Key Generation (Unavailable on SCE9)
- Wrapped Key Generation
- Signature Generation
- Verification
- Encryption and Decryption with PKCS1V15 and OAEP padding
- Export and Import for Plaintext and Wrapped keys
- Random number generation
- Persistent Key Storage

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration > Key Format > AES	MCU Specific Options		Select AES key formats used
Hardware Acceleration > Key Format > ECC	MCU Specific Options		Select ECC key formats used
Hardware Acceleration > Key Format > RSA	MCU Specific Options		Select RSA key formats used
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECC	MCU Specific Options		Defines MBEDTLS_ECP_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECDSA	MCU Specific Options		Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > RSA	MCU Specific Options		Defines MBEDTLS_RSA_ALT.
Hardware Acceleration	MCU Specific Options		Enables RSA 3072

> Public Key Cryptography (PKC) > RSA 3072 Verify			Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 Verify	MCU Specific Options		Enables RSA 4096 Verify.
Hardware Acceleration > TRNG	Enabled	Enabled	Defines MBEDTLS_ENT ROPY_HARDWARE_ALT.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro `MBEDTLS_SHA256_ALT` and `MBEDTLS_SHA256_PROCESS_ALT` must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro `MBEDTLS_AES_SETKEY_ENC_ALT`, `MBEDTLS_AES_SETKEY_DEC_ALT`, `MBEDTLS_AES_ENCRYPT_ALT` and `MBEDTLS_AES_DECRYPT_ALT` must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro `MBEDTLS_ECP_ALT` must be defined in the configuration file. For ECDSA, the macros `MBEDTLS_ECDSA_SIGN_ALT` and `MBEDTLS_ECDSA_VERIFY_ALT` must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine `MBEDTLS_ECP_C`, `MBEDTLS_ECDSA_C` and `MBEDTLS_ECDH_C`. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro `MBEDTLS_RSA_ALT` must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine `MBEDTLS_RSA_C`, `MBEDTLS_PK_C`, `MBEDTLS_PK_PARSE_C`, `MBEDTLS_PK_WRITE_C`. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use `PSA_KEY_TYPE_AES_WRAPPED` or `PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve)` or `PSA_KEY_TYPE_RSA_KEY_PAIR` when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later.

for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining `MBEDTLS_FS_IO`, `MBEDTLS_PSA_CRYPTO_STORAGE_C`, and `MBEDTLS_PSA_ITS_FILE_C`. The key lifetime must also be specified as `PSA_KEY_LIFETIME_PERSISTENT`. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the `psa_set_key_id` api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
{
/* Set the id to a positive integer. */
    psa_set_key_id(&attributes, (psa_key_id_t) 5);
}
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT` must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|`MBEDTLS_CHECK_PARAMS`) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro `MBEDTLS_ENTROPY_HARDWARE_ALT` must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

`mbedtls_platform_setup()` must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

Algorithm	Required Heap (bytes)
SHA256/224	None
AES	0x200
Hardware ECC	0x400
Software ECC	0x1800
RSA	0x1500

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the `psa_key_agreement()` function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

Figure 212: PSA Crypto Non-secure callable example

- Secure project
 - During secure project boot-up, `psa_crypto_init()` is called.
 - The RSA private key is programmed into secure flash either at the factory or by calling `psa_generate_key()` in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
 - `psa_import_key()/psa_open_key()` are called with the resultant handle held in secure RAM.
 - The Non-secure callable section contains the following **user-defined** functions
 - `verify_with_my_rsa_key(input_signature, input_hash, verification_result)`
 - The implementation of this function in secure region will call `psa_verify_hash()` and return the result via `verification_result`.
 - `sign_with_my_rsa_key(input_hash, output_signature)`
 - The implementation of this function in secure region will call `psa_sign_hash()` and return the signature via `output_signature`.

- Non-secure project
 - Calls `verify_with_my_rsa_key()` to verify a signature. The implementation will use the public key that is present in the secure project.
 - Calls `sign_with_my_rsa_key()` to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
```

```
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};

/* All the operations succeeded for MAC verification */
}
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size

must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.

* It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.

* It then re-imports that key, and performs signing and verification operations. */
unsigned char          payload[] = "ASYMMETRIC_INPUT_FOR_SIGN.....";
unsigned char          signature1[PSA_SIGNATURE_MAX_SIZE] = {0};

Function Documentation

◆ RM_PSA_CRYPTO_TRNG_Read()

```
fsp_err_t RM_PSA_CRYPTO_TRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes,
uint32_t * p_num_gen_bytes )
```

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

◆ mbedtls_platform_setup()

```
int mbedtls_platform_setup ( mbedtls_platform_context * ctx)
```

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};
/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

◆ mbedtls_platform_teardown()

```
void mbedtls_platform_teardown ( mbedtls_platform_context * ctx)
```

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the [mbedtls_platform_setup\(\)](#) function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
```

Return values

N/A

4.2.119 Azure RTOS ThreadX Port (rm_threadx_port)**Modules**

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at <https://docs.microsoft.com/en-us/azure/rtos/threadx/> for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration**Build Time Configurations for ThreadX**

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

Configuration	Options	Default	Description
General > Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It

General > Error Checking	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Max Priorities	Value must be a multiple of 32 or empty	32	The ThreadX basic API error checking can be bypassed by compiling with the symbol <code>TX_DISABLE_ERROR_CHECKING</code> defined.
General > Minimum Stack	Value must be greater than 0 or empty	200	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
General > Stack Filling	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
General > Preemption Threshold	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature.
General > Notify	<ul style="list-style-type: none"> • Enabled 	Disabled	Determine if the notify

Callbacks	<ul style="list-style-type: none"> • Disabled 		callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.
General > Inline Thread Resume Suspend	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.
General > Not Interruptable	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.
General > IAR Library Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option --threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
General > BSD Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
General > FileX Pointer	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards

compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.

Timer > Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer > Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Thread Priority	Value must be greater than 0 or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Process In ISR	<ul style="list-style-type: none"> • Enabled • Disabled 	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.
Timer > Reactivate Inline	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled,

				reactivating is performed in-line resulting in faster timer processing but slightly larger code size.
Timer > Timer	<ul style="list-style-type: none"> Enabled Disabled 	Enabled		Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.
Trace > Event Trace	<ul style="list-style-type: none"> Enabled Disabled 	Disabled		Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.
Trace > Trace Buffer Name	Name must be a valid C symbol	g_tx_trace_buffer		Name of trace buffer symbol, only used if Event Trace is enabled.
Trace > Memory section for Trace Buffer	Manual Entry	.bss		Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled. To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and open it with Microsoft Azure RTOS TraceX.
Trace > Trace Buffer Size	Value must be greater than 0	65536		Trace buffer size in bytes, only used if Event Trace is enabled
Trace > Trace Buffer Number of Registries	Value must be greater than 0	30		Number of registries available to TraceX, only used if Event Trace is enabled
Performance > Block Pool Performance Info	<ul style="list-style-type: none"> Enabled Disabled 	Disabled		When enabled, ThreadX gathers block pool performance information.
Performance > Byte Pool Performance Info	<ul style="list-style-type: none"> Enabled Disabled 	Disabled		When enabled, ThreadX gathers byte

Performance > Event Flags Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	pool performance information. When enabled, ThreadX gathers event flags performance information.
Performance > Mutex Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, ThreadX gathers mutex performance information.
Performance > Queue Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, ThreadX gathers queue performance information.
Performance > Semaphore Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, ThreadX gathers semaphore performance information.
Performance > Thread Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, ThreadX gathers thread performance information.
Performance > Timer Performance Info	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	When enabled, ThreadX gathers timer performance information.
RA > Hardware Thread Stack Monitoring	MCU Specific Options		Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.
Interrupts > SysTick Interrupt Priority	MCU Specific Options		Select the SysTick interrupt priority.
Interrupts > Maximum Interrupt Priority	MCU Specific Options		The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the

BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See [Low Power Modes \(r_lpm\)](#) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using [R_BSP_GroupIrqWrite\(\)](#) to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using [tx_thread_secure_stack_allocate](#)).

The secure context can be freed by deleting the thread or calling [tx_thread_secure_stack_free](#).

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
    FSP_PARAMETER_NOT_USED(irq);
    if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
        /* Handle main stack monitor error here. */
    }
    if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
        /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
    /* Register a callback to be called when the stack goes outside the allocated stack
area. */
    R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
* occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
    register uint32_t cfsr = SCB->CFSR;
    if (cfsr & SCB_CFSR_STKOF_Msk)
    {
```

```
/* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
    __set_PSP((uint32_t) p_exception_stack_frame);
    __set_PSPLIM((uint32_t) p_exception_stack_frame);
/* Clear XPSR, only set T-bit. */
    p_exception_stack_frame[7] = 1U << 24;
/* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
    * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
    * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
    p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
}
/* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
    /* When recovering from a stack overflow, move the thread to a while(1) loop. */
    while (1)
    {
        /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
    /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling `tx_thread_secure_stack_allocate` before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;

void rm_threadx_port_trustzone_thread_example (void)
{
    /* When ThreadX is used in a non-secure TrustZone application,
    tx_thread_secure_stack_allocate must be called prior
    * to calling any non-secure callable function in a thread. The first parameter is a
    pointer to the thread control block.
    * This function can be called when the thread is created or in the thread before an
    non-secure callable function is
    * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
    rm_threadx_port_nsc_function();
}
```

4.2.120 Intel TinyCrypt (rm_tinycrypt_port)

Modules

Functions

`fsp_err_t` [RM_TINCYRYPT_PORT_TRNG_Read](#) (uint8_t *const p_rngbuf, uint32_t num_req_bytes)

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. [More...](#)

`fsp_err_t` [RM_TINCYRYPT_PORT_Init](#) (void)

`int` [default_CSPRNG](#) (uint8_t *dest, unsigned int size)

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt. [More...](#)

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at <https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst> for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
 - Keybits - 128
 - ECB, CBC, CTR, CCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke RM_TINCRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in `rm_tinycrypt_port` must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the `RM_TINCRYPT_PORT_TRNG_Read()` function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then `RM_TINCRYPT_PORT_TRNG_Read()` can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the `default_CSPRNG()` function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement `default_CSPRNG()` if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in `aes_encrypt.decrypt.c`. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function `default_CSPRNG()` must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

CTR-PRNG Example

This is an example on using the CTR_PRNG module in TinyCrypt to obtain random data.

```
#define TC_ENTROPY_SIZE 64U  
#define TC_CTRPRNG_OUTPUT_SIZE 32U  
void tinycrypt_ctr_prng_example (void)  
{  
    TCctrPrng_t cprng_ctx;  
    uint8_t seed[TC_ENTROPY_SIZE];  
    uint8_t ctr_prng_output_1[TC_CTRPRNG_OUTPUT_SIZE] = {0};  
    uint8_t ctr_prng_output_2[TC_CTRPRNG_OUTPUT_SIZE] = {0};  
    /* Setup the platform; initialize the crypto engine. */  
    if (0 != RM_TINCRYPT_PORT_Init())  
    {  
        debugger_break();  
    }  
    /* Read random data from the TRNG to use as seed for the CTR_PRNG. */  
    else if (FSP_SUCCESS != RM_TINCRYPT_PORT_TRNG_Read(seed, sizeof(seed)))  
    {  
        debugger_break();  
    }  
    /* Initialize and seed the CTR_PRNG with the random data from the TRNG. */  
    else if (TC_CRYPTOSUCCESS != tc_ctr_prng_init(&cprng_ctx, seed, sizeof(seed), 0,  
0))  
    {  
        debugger_break();  
    }  
    /* Read random data from the CTR_PRNG. */  
    else if (TC_CRYPTOSUCCESS !=
```

```
        tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1))
    {
        debugger_break();
    }
    /* Check that the generated value is not 0. */
    else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1))
    {
        debugger_break();
    }
    /* Read random data again from the TRNG. */
    else if (TC_CRYPTOSUCCESS !=
        tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1))
    {
        debugger_break();
    }
    /* Check that the generated value is different than the previous call. */
    else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1))
    {
        debugger_break();
    }
    else
    {
        /* Operation successful. */
        while (1)
        {
            ;
        }
    }
}
```

Function Documentation

◆ RM_TINYCRYPT_PORT_TRNG_Read()

```
fsp_err_t RM_TINYCRYPT_PORT_TRNG_Read ( uint8_t *const p_rngbuf, uint32_t num_req_bytes )
```

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- HW_SCE_RNG_Read

◆ RM_TINYCRYPT_PORT_Init()

```
fsp_err_t RM_TINYCRYPT_PORT_Init ( )
```

Initialize the SCE.

◆ default_CSPRNG()

```
int default_CSPRNG ( uint8_t * dest, unsigned int size )
```

Implements the Cryptographically Secure Pseudo-Random Number Generator function required by TinyCrypt.

Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

Returns

See [Common Error Codes](#) or functions called by this function for other possible return codes. This function calls:

- RM_TINYCRYPT_PORT_TRNG_Read

4.2.121 Capacitive Touch Middleware (rm_touch)

Modules

Functions

`fsp_err_t RM_TOUCH_Open (touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg)`

Opens and configures the TOUCH Middle module. Implements [touch_api_t::open](#). [More...](#)

`fsp_err_t RM_TOUCH_ScanStart (touch_ctrl_t *const p_ctrl)`

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with [RM_TOUCH_DataGet\(\)](#). If a different control block scan should be run, check the scan is complete before executing. Implements [touch_api_t::scanStart](#). [More...](#)

`fsp_err_t RM_TOUCH_DataGet (touch_ctrl_t *const p_ctrl, uint64_t *p_button_status, uint16_t *p_slider_position, uint16_t *p_wheel_position)`

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [touch_api_t::dataGet](#). [More...](#)

`fsp_err_t RM_TOUCH_PadDataGet (touch_ctrl_t *const p_ctrl, uint16_t *p_pad_rx_coordinate, uint16_t *p_pad_tx_coordinate, uint8_t *p_pad_num_touch)`

This function gets the current position of pad is being pressed. Implements [touch_api_t::padDataGet](#) , [g_touch_on_ctsu](#). [More...](#)

`fsp_err_t RM_TOUCH_ScanStop (touch_ctrl_t *const p_ctrl)`

Scan stop specified TOUCH control block. Implements [touch_api_t::scanStop](#). [More...](#)

`fsp_err_t RM_TOUCH_CallbackSet (touch_ctrl_t *const p_api_ctrl, void(*p_callback)(touch_callback_args_t *), void const *const p_context, touch_callback_args_t *const p_callback_memory)`

`fsp_err_t RM_TOUCH_Close (touch_ctrl_t *const p_ctrl)`

Disables specified TOUCH control block. Implements [touch_api_t::close](#). [More...](#)

`fsp_err_t RM_TOUCH_SensitivityRatioGet (touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info)`

Get the touch sensitivity ratio. Implements

[touch_api_t::sensitivityRatioGet. More...](#)

`fsp_err_t` [RM_TOUCH_ThresholdAdjust](#) (`touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *p_touch_sensitivity_info`)

Adjust the touch judgment threshold. Implements [touch_api_t::thresholdAdjust. More...](#)

`fsp_err_t` [RM_TOUCH_DriftControl](#) (`touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq`)

Control drift correction. Implements [touch_api_t::driftControl. More...](#)

Detailed Description

This module supports the Capacitive Touch Sensing Unit (CTSUs). It implements the [Touch Middleware Interface](#).

Overview

The Touch Middleware uses the [Capacitive Touch Sensing Unit \(r_ctsu\)](#) API and provides application-level APIs for scanning touch buttons, sliders, and wheels. This module is configured via the [QE for Capacitive Touch](#).

Features

- Supports touch buttons (Self and Mutual), sliders, and wheels
- Can retrieve the status of up to 64 buttons at once
- Software and external triggering
- Callback on scan end
- Collects and calculates usable scan results:
 - Slider position from 1 to 100 (percent)
 - Wheel position from 1 to 360 (degrees)
- Dynamic touch-judgment-threshold adjustment
- Calculate the XY coordinates of the pad(CTSUs)
- Optional (build time) support for real-time monitoring functionality through the QE tool over UART
- Optional (build time) support for tuning function through the QE Standalone Version tool over UART
- TrustZone Support

Configuration

Note

This module is configured via the [QE for Capacitive Touch](#). For information on how to use the QE tool, once the tool is installed click [Help](#) -> [Help Contents in e2 studio](#) and search for "QE".

This module supports the QE monitor function. The monitor determines whether to use debugger or serial communications, determines the type of the information from QE and sends only the

necessary information. This module supports the serial tuning function with the standalone version of QE. Generates a configuration configuration file by UART communication with QE.

Note

Multiple configurations can be defined within a single project allowing for different scan procedures or button layouts.

Build Time Configurations for rm_touch

The following build time configurations are defined in fsp_cfg/rm_touch_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Support for QE monitoring using UART	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable SCI_UART support for QE monitoring.
Support for QE Tuning using UART	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Enable SCI_UART support for QE Tuning.

Configurations for CapTouch > Touch (rm_touch)

This module can be added to the Stacks tab via New Stack > CapTouch > Touch (rm_touch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
---------------	---------	---------	-------------

Interrupt Configuration

Refer to the [Capacitive Touch Sensing Unit \(r_ctsu\)](#) section for details.

Clock Configuration

Refer to the [Capacitive Touch Sensing Unit \(r_ctsu\)](#) section for details.

Pin Configuration

Refer to the [Capacitive Touch Sensing Unit \(r_ctsu\)](#) section for details.

Usage Notes

Measurements and Data Processing

The module determines whether the button has been touched based on the change in capacitance and detects the position of the slider or wheel. This requires continued periodic measurements of capacitance. When developing your application, make sure to periodically call [RM_TOUCH_ScanStart\(\)](#) and [RM_TOUCH_DataGet\(\)](#). For more details, refer to the sample application.

Button Touch Determination

Creating reference value and threshold

A touch button is not a mechanical button in which the ON/OFF state is switched by hardware. The ON/OFF state is determined via software.

First, a reference value is created based on measurement results in the non-touch state. The initial reference value is the first measured value. The threshold is then determined with an arbitrary offset. If a measured value exceeds the threshold, the button is determined to be in the ON state, if it does not exceed the threshold, it is in the OFF state.

Processing for self-capacitance and mutual capacitance are basically the same. However, because the amount of capacitance decreases when a mutual capacitance button is touched, the user needs to set the threshold based on decreasing measured values to determine the ON/OFF state.

You can set the threshold for each button separately in the configuration settings (threshold in [touch_button_cfg_t](#)). The following functions are also included to deal with issues such as chattering suppression and changes in the external environment which affect actual touch recognition.

Positive Noise Filter/Negative Noise Filter

As a chattering countermeasure, you can confirm the ON/OFF state after a set number of consecutive ON or OFF determinations.

In the configuration settings (on_freq and off_freq in [touch_cfg_t](#)) set the number of consecutive ON or OFF states. You can do this for all buttons in the touch interface configuration. Be aware that, although this is an effective solution to improving chattering, the greater the number of consecutive states, the slower the response to actual touch.

Hysteresis

This is another chattering countermeasure. Offset the constant to the threshold after the state goes to ON, and prevent chattering by using hysteresis as the OFF-to-ON and ON-to-OFF threshold.

You can set the hysteresis value for each button in the configuration settings (hysteresis in [touch_button_cfg_t](#)). The larger the hysteresis, the more effective the countermeasure is in suppressing chattering. However, keep in mind that this will make it more difficult to return the state from ON-to-OFF or OFF-to-ON.

Drift Correction Process

As a countermeasure for changes in the external environment, the drift correction process refreshes the reference value.

After averaging the measured value in the OFF state over a set period, if the button is in the touch OFF state after a set period, the reference value is refreshed. The drift correction is only executed in the OFF state and is cleared when touch ON is determined.

Set the period in the configuration settings (drift_freq in [touch_cfg_t](#)). You can do this for all buttons in the touch interface configuration. This allows you to adjust the ability to determine the touch state despite changes in the external environment.

Figure 213: Button Touch Determination

Press and hold cancel

Strong noise or other sudden environment changes can disable the drift correction process, preventing return from the ON state. The press and hold cancel function implements the drift correction process and returns the button from the ON state by forcibly turning the state to OFF after a certain number of consecutive ON state periods.

Set the number of consecutive ON periods required for the press and hold cancel function to return the button to the OFF state in the configuration settings (`cancel_freq` in `touch_cfg_t`). You can do this for all buttons in the touch interface configuration.

Touch Position Detection of Slider/Wheel

Configure a slider with multiple terminals to be measured (TS) physically arranged in a straight line. Configure a wheel with multiple terminals physically arranged in a circle.

The touch position is calculated from the measured values of the TS in the configuration. The calculation method for sliders and wheels is fundamentally the same.

1. Detect the maximum value (TS_MAX) among the terminals in the configuration.
2. Calculate the difference (d1, d2) between TS_MAX and the terminals on either side. (If the TS_MAX terminal is at one end of the slider, use the values of the two terminals to the right or left, accordingly.)
3. If the total of d1 and d2 exceeds the threshold, position calculation is initiated. If the total amount does not exceed the threshold, the position calculation process is ended.
4. With TS_MAX as the middle position, the ratio of d1 to d2 is used to calculate the position. The slider has a range of 1 to 100, and the while has a range of 1 to 360.

	Slider	Wheel
Electrode type	Self capacitance only	Self capacitance only
Number of electrodes	3-10	4+
Touch position output range	1-100	1-360
Default value (no touch)	0xFFFF	0xFFFF

Tuning the Touch Determination Adjustment

When QE tuning, a measurement is performed with a finger touching the button and the tuned parameters are output in the configuration file. The setting value of the threshold is 60% of the touch sensitivity between touch and non-touch state, and the setting value of the hysteresis coefficient is 5% of the threshold.

This module provides the functions for dynamic adjusting of these threshold and hysteresis coefficient.

They are two functions as below.

Adjusting the threshold and hysteresis coefficient to an arbitrary ratio.

Use **RM_TOUCH_ThresholdAdjust()**.

When changing the touch determination threshold ratio from 60% QE set to 70% user specified, the touch determination thresholds are as below.

If you want to make this setting, set the member of the second argument as follows. It is also necessary to set the ratio of the amount of touch change and the hysteresis value.

```
*p_touch_sensitivity_ratio = 100,
old_threshold_ratio = 60,
new_threshold_ratio = 70,
new_hysteresis_ratio = 5
```

Figure 214: Example of changing the threshold ratio

Adjusting the threshold and hysteresis coefficient according to the current touch sensitivity.

Use **RM_TOUCH_SensitivityRatioGet()**, **RM_TOUCH_ThresholdAdjust()**, and **RM_TOUCH_DriftControl()**.

When changing the kind of the overlay panel, the touch sensitivity differs from the one QE tuned. Wanting to use the software as it is without re-tuning. If you use a thicker overlay than that at QE tuning, the touch sensitivity decreases, and a touch may not be determined because of the same

touch determination threshold. This function adjusts the touch determination threshold based on the ratio of the touch sensitivity after changing the overlay to the touch sensitivity at the QE tuning.

`RM_TOUCH_SensitivityRatioGet()` outputs the ratio of the current touch sensitivity assuming that the touch sensitivity at the QE setting is 100%.

The following figure shows the case where an overlay panel is thinner and the touch sensitivity increases.

Figure 215: Example of increase touch sensitivity for thin overlay panels

Following figure shows the case where an overlay panel is thicker and the touch sensitivity decreases.

Figure 216: Example of decrease touch sensitivity for thicker overlay panels

[RM_TOUCH_ThresholdAdjust\(\)](#) sets the new touch determination threshold and the hysteresis value by using the touch sensitivity ratio obtained with [RM_TOUCH_SensitivityRatioGet\(\)](#) as arguments.

Example of calculation 1:

The touch sensitivity ratio is 140%, and the threshold set by QE is 1500.

Threshold = $140 * 1500 / 100 = 2100$

*p_touch_sensitivity_ratio = 140,

old_threshold_ratio = 60,

new_threshold_ratio = 60,

new_hysteresis_ratio = 5

Figure 217: Example of calculation 1

Example of calculation 2:

The touch sensitivity ratio is 60%, and the threshold set by QE is 1500.
 Threshold = 60 * 1500 / 100 = 900

*p_touch_sensitivity_ratio = 60,
 old_threshold_ratio = 60,
 new_threshold_ratio = 60,
 new_hysteresis_ratio = 5

Figure 218: Example of calculation 2

RM_TOUCH_DriftControl() set the second argument to 0 to stop the drift correction function.

When calculating the ratio of the touch change amount using `RM_TOUCH_SensitivityRatioGet()`, the touch change amount decreases due to the thick overlay, and the threshold value is not exceeded even if touched. Prevents the reference value from drifting.

Example of the application for adjustment using data flash without re-tuning or software rewriting

Enable UART communication to PC and 'tuning mode'. In tuning mode, the MCU transmits the ratio of the touch sensitivity in the touch state to the PC in real time. A user sends a command to decide the ratio while monitoring on the PC. The MCU stores the received ratio in the data flash. Make sure that the ratio stored in the data flash is read at the software activation, and the touch determination threshold is adjusted based on this stored value.

Pad

Configure a pad with multiple terminals physically arranged in cross.

The current position is Calculated from the measured values of the CTSU mutual scanning in the configuration.

Use `RM_TOUCH_PadDataGet()`.

Pad is subject so some limitations:

	Pad
Electrode type	CFC mutual capacitance only
Number of electrodes	RX(TS-CFC)3+, TX(Any TS)3+
Touch position output range	rx_coodinate:(0 ~ rx_pixel), tx_coodinate:(0 ~ tx_pixsel)
Default value (no touch)	rx_coodinate:0xFFFF, tx_coodinate:0xFFFF
Pixel range	rx_pixel:(1 ~ 65535), tx_pixsel:(1 ~ 65535)

Pitch for each terminal can be set with QE. Pitch's default value is 64.

The relationship between pixel and pitch : $\text{Pixel} = \text{Pitch} \times \text{number of TS} - 1$

Figure 219: Example of Pad

TrustZone Support

In `r_ctsu` and `rm_touch` module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

Examples

Basic Example

This is a basic example of minimal use of the TOUCH in an application.

```
void touch_basic_example (void)
{
    fsp_err_t err = FSP_SUCCESS;

    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);

    /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);

    while (true)
    {
        RM_TOUCH_ScanStart(&g_touch_ctrl);
    }
}
```

```
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
{
/* Application specific data processing. */
}
}
}
```

Multi Mode Example

This is an optional example of using both Self-capacitance and Mutual-capacitance. Refer to the Multi Mode Example in CTSU usage notes.

```
void touch_optional_example (void)
{
fsp_err_t err = FSP_SUCCESS;
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
assert(FSP_SUCCESS == err);
err = RM_TOUCH_Open(&g_touch_ctrl_mutual, &g_touch_cfg_mutual);
assert(FSP_SUCCESS == err);
while (true)
{
RM_TOUCH_ScanStart(&g_touch_ctrl);
while (0 == g_flag)
{
/* Wait scan end callback */
}
g_flag = 0;
RM_TOUCH_ScanStart(&g_touch_ctrl_mutual);
while (0 == g_flag)
```

```

    {
/* Wait scan end callback */
    }
    g_flag = 0;
    err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
    {
/* Application specific data processing. */
    }
    err = RM_TOUCH_DataGet(&g_touch_ctrl_mutual, &button, slider, wheel);
if (FSP_SUCCESS == err)
    {
/* Application specific data processing. */
    }
    }
}

```

Data Fields		
uint16_t *	p_rx_coordinate	RX coordinate.
uint16_t *	p_tx_coordinate	TX coordinate.
uint16_t *	p_num_touch	number of touch
uint16_t *	p_threshold	Coordinate calculation threshold value.
uint16_t *	p_base_buf	ScanData Base Value Buffer.
uint16_t *	p_rx_pixel	X coordinate resolution.
uint16_t *	p_tx_pixel	Y coordinate resolution.
uint8_t *	p_max_touch	Maximum number of touch judgments used by the pad.
int32_t *	p_drift_buf	Drift reference value. g_touch_button_drift_buf[] is set by Open API.
uint16_t *	p_drift_count	Drift counter. g_touch_button_drift_count[] is set by Open API.
uint8_t	num_drift	Copy from config by Open API.

◆ touch_instance_ctrl_t

struct touch_instance_ctrl_t		
TOUCH private control block. DO NOT MODIFY. Initialization occurs when RM_TOUCH_Open() is called.		
Data Fields		
uint32_t	open	Whether or not driver is open.
touch_button_info_t	binfo	Information of button.
touch_slider_info_t	sinfo	Information of slider.
touch_wheel_info_t	winfo	Information of wheel.
bool	serial_tuning_enable	Flag of serial tuning status.
touch_pad_info_t	pinfo	Information of pad.
touch_cfg_t const *	p_touch_cfg	Pointer to initial configurations.
ctsu_instance_t const *	p_ctsu_instance	Pointer to CTSU instance.

Function Documentation

◆ RM_TOUCH_Open()

```
fsp_err_t RM_TOUCH_Open ( touch_ctrl_t *const p_ctrl, touch_cfg_t const *const p_cfg )
```

Opens and configures the TOUCH Middle module. Implements `touch_api_t::open`.

Example:

```
err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
```

Return values

FSP_SUCCESS	TOUCH successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_TOUCH_ScanStart()

```
fsp_err_t RM_TOUCH_ScanStart ( touch_ctrl_t *const p_ctrl)
```

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with `RM_TOUCH_DataGet()`. If a different control block scan should be run, check the scan is complete before executing. Implements `touch_api_t::scanStart`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance or other.
FSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ RM_TOUCH_DataGet()

```
fsp_err_t RM_TOUCH_DataGet ( touch_ctrl_t *const p_ctrl, uint64_t * p_button_status, uint16_t *
p_slider_position, uint16_t * p_wheel_position )
```

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements [touch_api_t::dataGet](#).

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ RM_TOUCH_PadDataGet()

```
fsp_err_t RM_TOUCH_PadDataGet ( touch_ctrl_t *const p_ctrl, uint16_t * p_pad_rx_coordinate,
uint16_t * p_pad_tx_coordinate, uint8_t * p_pad_num_touch )
```

This function gets the current position of pad is being pressed. Implements [touch_api_t::padDataGet](#) , [g_touch_on_ctsu](#).

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.

◆ RM_TOUCH_ScanStop()

```
fsp_err_t RM_TOUCH_ScanStop ( touch_ctrl_t *const p_ctrl)
```

Scan stop specified TOUCH control block. Implements [touch_api_t::scanStop](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_TOUCH_CallbackSet()**

```
fsp_err_t RM_TOUCH_CallbackSet ( touch_ctrl_t *const p_api_ctrl, void(*) (touch_callback_args_t *)
p_callback, void const *const p_context, touch_callback_args_t *const p_callback_memory )
```

Updates the user callback and has option of providing memory for callback structure. Implements `touch_api_t::callbackSet`

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ **RM_TOUCH_Close()**

```
fsp_err_t RM_TOUCH_Close ( touch_ctrl_t *const p_ctrl)
```

Disables specified TOUCH control block. Implements `touch_api_t::close`.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_TOUCH_SensitivityRatioGet()**

```
fsp_err_t RM_TOUCH_SensitivityRatioGet ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Get the touch sensitivity ratio. Implements `touch_api_t::sensitivityRatioGet`.

Return values

FSP_SUCCESS	Successfully touch sensitivity ratio got.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CTSU_SCANNING	Scanning this instance.
FSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ RM_TOUCH_ThresholdAdjust()

```
fsp_err_t RM_TOUCH_ThresholdAdjust ( touch_ctrl_t *const p_ctrl, touch_sensitivity_info_t *
p_touch_sensitivity_info )
```

Adjust the touch judgment threshold. Implements `touch_api_t::thresholdAdjust`.

Return values

FSP_SUCCESS	Successfully touch judgment threshold was adjusted.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_TOUCH_DriftControl()

```
fsp_err_t RM_TOUCH_DriftControl ( touch_ctrl_t *const p_ctrl, uint16_t input_drift_freq )
```

Control drift correction. Implements `touch_api_t::driftControl`.

Return values

FSP_SUCCESS	Successfully drift correction was controlled.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.122 USBX Porting Layer (rm_usbx_port)**Modules****Functions**

Refer to [USB \(r_usb_basic\)](#) for the common API (`r_usb_basic`) to be called from the application.

Overview

This USB driver works by combining USBX and `r_usb_basic` module.

How to Configuration

- Using a class other than HMSC and OTG. The following describes how to configure USBX

using PCDC as an example.

1. Select [New Stack]->[Connectivity]->[Azure RTOS PCDC]

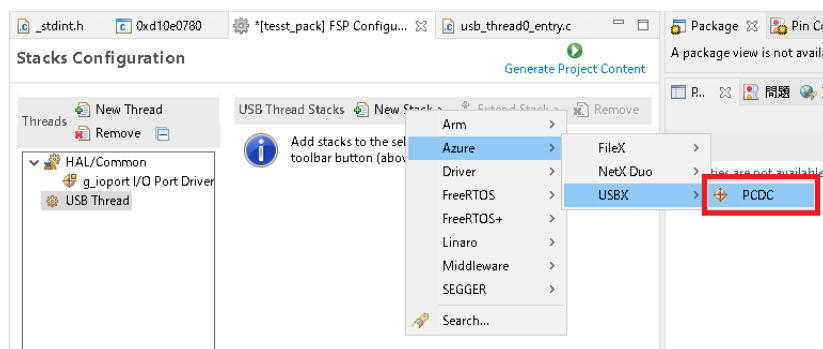

Figure 220: Select USB Device Class

2. Select the USB pipe to use.

Figure 221: Select using USB Pipe

- Using HMSC. Since HMSC is used in a different way from other USBX modules, the usage is described below.

1. Select [New Stack]->[Storage]->[Azure RTOS FileX on USBX]

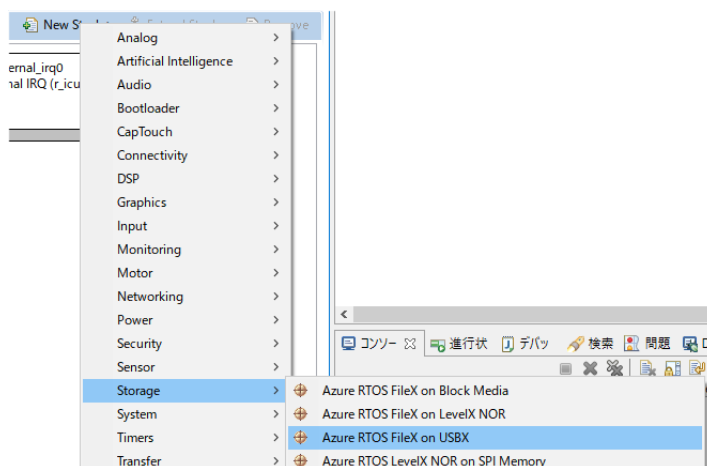

Figure 222: Select USB Device Class

2. The following is displayed when selecting Filex on USBX.

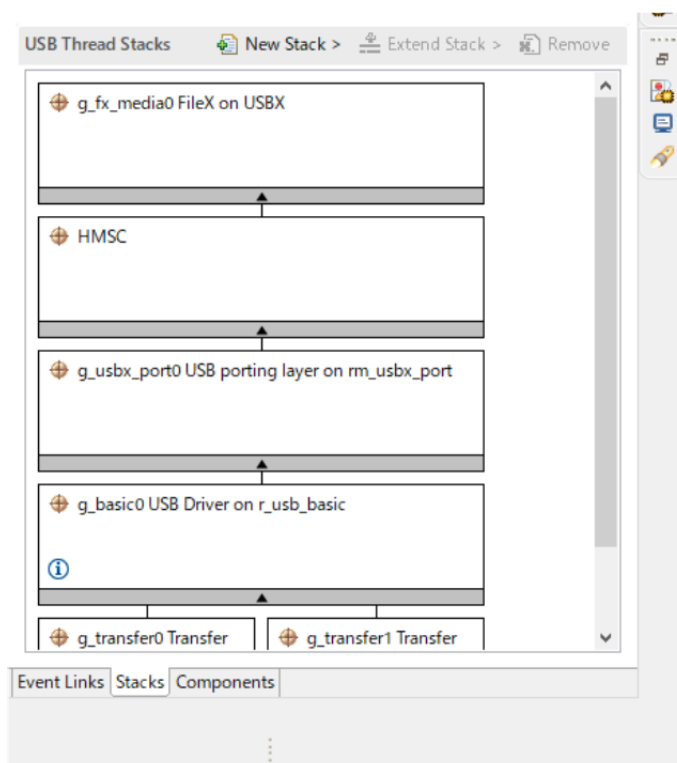

Figure 223: FileX on USBX Stack

- Using OTG. The following describes how to configure USBX using CDC as an example.

1. Select [New Stack]->[Connectivity]->[Azure RTOS USBX OTG CDC]

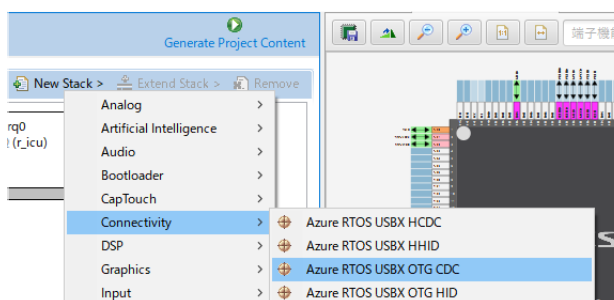

Figure 224: Select USB Device Class for OTG

2. Select [New Stack]->[Input] -> [External IRQ(r_icu)] (Be sure to select "r_icu" in OTG. The "r_icu" is used to detect the attaching of A cable.)

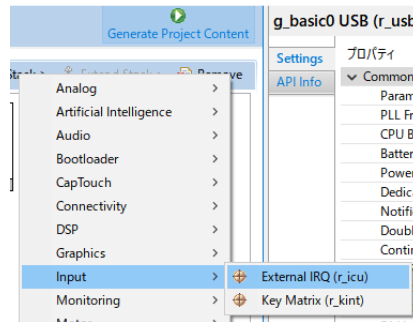

Figure 225: Select USB Device Class for OTG

3. Be sure to set the following to each item in "r_ircu". (1). Specify "7" to "Channel" item. (2). Specify "Both Edges" to "Trigger" item. (3). Specify "Enabled" to "Digital Filtering" item. (4). Specify "usb_otg_irq_callback" to "Callback" item.

Figure 226: Select USB Device Class for OTG

1. Set "Full Speed" to "USB Speed" item in r_usb_basic.
2. Set "USB_IP0 Port" to "USB Module Number" item in r_usb_basic.
3. Set "Not Supported" to "USBFS Resume Priority" item in r_usb_basic.

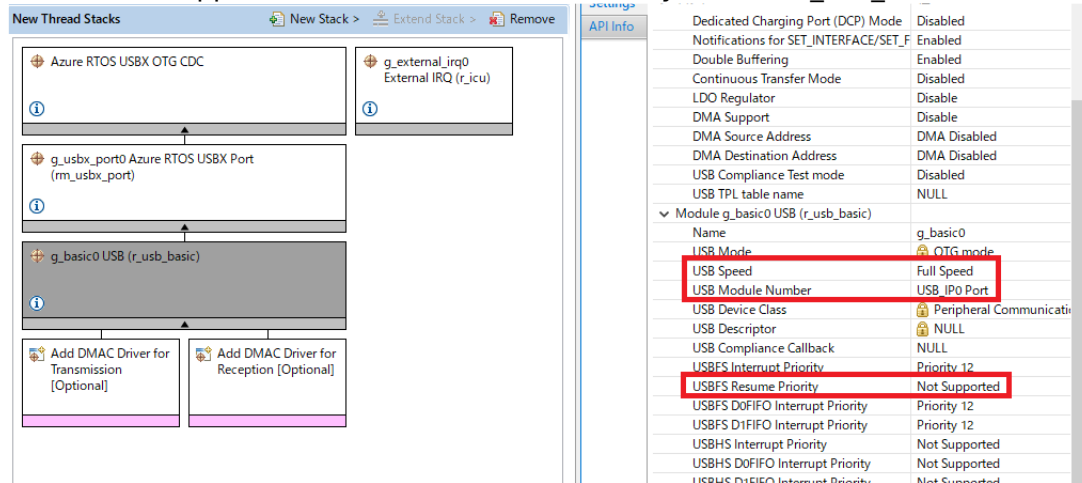

Figure 227: Select USB Device Class

1. Set the following pins for USB (r_usb_basic).

(1). VBUSEN

(2). VBUS

(3). EXICEN

2. Set the following pins for IRQ (r_icu). (1). IRQ07

Figure 228: IRQ Pin Setting

Note

- The following are notes on using the `ux_host_class_cdc_acm_read` function or the `ux_device_class_cdc_acm_read` function.
 - Please specify a multiple of `MaxPacketSize` to the 3rd argument (`requested_length`). Since the value of the 3rd argument is not a multiple of `MaxPacketSize`, all data sent by USB Host or USB Peripheral may not be received correctly.
 - Please specify the start address of the area allocated a size larger than the 3rd argument (`requested_length`) to the 2nd argument (`data_pointer` or `buffer`).
- HMSC uses FileX. For more information on FileX, please refer to the following URL.
<https://docs.microsoft.com/en-us/azure/rtos/filex/>
- OTG
 - Be able to set `UX_OTG_HOST_REQUEST_FLAG` in USB Peripheral mode or call `ux_host_stack_role_swap()` function in USB Host mode when data other than control transfer is not being transferred.
 - Register the callback function for the application using `R_USB_OtgCallbackSet()` function. This callback function is called when switching the operation mode (`UX_OTG_MODE_IDLE/UX_OTG_MODE_SLAVE/UX_OTG_MODE_HOST`).
 - Use `R_USB_OtgSRP()` function when doing SRP (Session Request Protocol). The `R_USB_OtgSRP()` function does not support VBUS pulsing.
 - After starting up MCU, USB is initialized as USB peripheral mode until connecting A cable.
 - When A cable is connected, USB module is initialized as USB Host mode.
 - Call `R_ICU_ExtrenalIrqOpen()` and `R_ICU_ExtrenalIrqEnable()` function in the application program since the IRQ interrupt is used to detect attaching or detaching of A cable.
 - Add the OTG descriptor in the configuration descriptor in each descriptor file.

Offset	Field	Size	Value	Description
0	bLength	1	5	Size of Descriptor
1	bDescriptor Type	1	9	OTG type = 9
2	bmAttribute	1	3 or 2	D1: HNP support D0: SRP support
3	bcdOTG	2	0x200	Binary Code Decimal

1. Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Limitations

1. Please call the initialization function in the application program. Please be sure to call `R_USB_Open()` function after calling the following functions.

- Peripheral
 - PCDC / PHID / PAUD / OTG
 - `ux_system_initialize`
 - `ux_device_stack_initialize`
 - `ux_device_stack_class_register`
 - PMSC
 - `ux_system_initialize`
 - `ux_device_stack_initialize`
- Host
 - HCDC / HHID / OTG
 - `ux_system_initialize`
 - `ux_host_stack_initialize`
 - HMSC
 - `ux_system_initialize`
 - `ux_host_stack_initialize`
 - `fx_system_initialize`

2. Set the value for 1000 Ticks per second in the "Timer Ticks Per Second" item.

Property	Value
Common	
General	
Timer	
Timer Ticks Per Second	1000
Timer Thread Stack Size	1024
Timer Thread Priority	0
Timer Process In ISR	Enabled
Reactivate Inline	Disabled
Timer	Enabled

Figure 229: Specify value of Timer Ticks Per Second

3. Set the Thread priority to a value of 21.

▼ Thread	
Symbol	usb_thread0
Name	USB Thread
Stack size (bytes)	1024
Priority	15
Auto start	Enabled
Time slicing interval (ticks)	1

Figure 230: Specify value of Thread priority

4. When using the following functions, call the following functions in the following order after calling the R_USB_Close function. NOTE : Do not call R_USB_Close function in Peripheral Audio Class.

- Peripheral
 - PCDC / PHID
 - _ux_device_stack_class_unregister
 - _ux_device_stack_uninitialize
 - PMSC
 - _ux_device_stack_uninitialize
- Host
 - _ux_host_stack_uninitialize

5. The USBX HID class does not support OUT transfer.

6. When using USBX HHID, please use Wired device.

7. This module does not support the MCU(RA4M1 and RA2A1) since the RAM size is small.

8. The OTG for High-speed is not supported.

9. The OTG does not support the DMA transfer.

Descriptor

Templates for USBX descriptors can be found in ra/fsp/src/rm_usbx_port folder. Also, please be sure to use your vendor ID.

Change the descriptor.c.template file for each class as follows if High-speed mode is used.

- rm_usbx_pcdc_descriptor.c.template
 1. Comment on lines 108 and 243.
 2. Delete the "//" on lines 109 and 242.
- rm_usbx_pmsc_descriptor.c.template
 1. Comment on lines 78 and 153.
 2. Delete the "//" on lines 79 and 152.
- rm_usbx_paud_descriptor.c.template
 1. Comment on lines 167 and 485.
 2. Delete the "//" on lines 168 and 486.

There are two types of templates for PHID descriptor.

Keyboard templates should be referred to rm_usbx_phid_descriptor_keyboard.c.template.

Mouse templates should be referred to rm_usbx_phid_descriptor_mouse.c.template.

Examples

USBX PCDC Example

PCDC loopback example is as follows.

```

```

USBX HCDC Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```

#define VALUE_100 (100)

Detailed Description

Virtual EEPROM on RA MCUs. This module implements the [Virtual EEPROM Interface](#).

Overview

This VEE module emulates basic EEPROM capabilities. Support is provided for reading and writing both common records and reference data (originally programmed during product assembly or test). A count of the number of segments erased throughout the lifetime of the application is maintained and can be accessed at any time. Wear leveling is handled automatically by the driver.

Features

- Writing and reading user defined records of any length to data flash.
- Wear leveling is handled automatically.
- Reference data such as calibration data programmed at assembly or test time is preserved.
- Reference data can be updated at run time.
- Fault resilient design.

Data Flash Segmentation

Wear leveling is handled by changing the location in the data flash where a record is stored every time that it is updated. This change in physical location of the record is transparent to the user. Any

time an update for a specific record ID is written, it is written to the next unused location in data flash and its location is stored in RAM for quick look-up later. When required, only the most recent version of these records is automatically copied to the next blank segment in data flash. The data flash area is divided into a number of equal-size segments. There is only one segment active at a time. A segment contains two areas- the record area (which is the vast majority of the segment) and the reference data area which contains optional data typically programmed during assembly or final test. Records and updated reference data are written to this segment until one of the two areas becomes full. The record area must be able to hold at least one of every record ID possible and still have space left over for record updates.

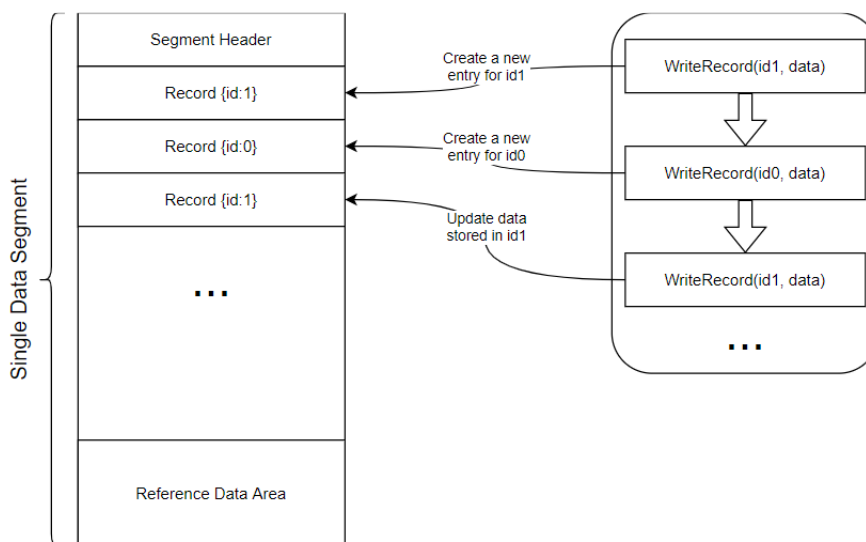

Figure 231: Segment Data Format

When a segment does not have sufficient space for additional records or updated reference data, a Refresh occurs. This process copies the most recent record for each ID as well as the latest version of reference data (if any) to the next segment. The very first time VEE runs on an MCU, it marks the last segment as active whether there is reference data configured or not. The end of VEE data flash area is used to provide an easily identified physical flash address that can be used while programming reference data without requiring Virtual EEPROM middleware.

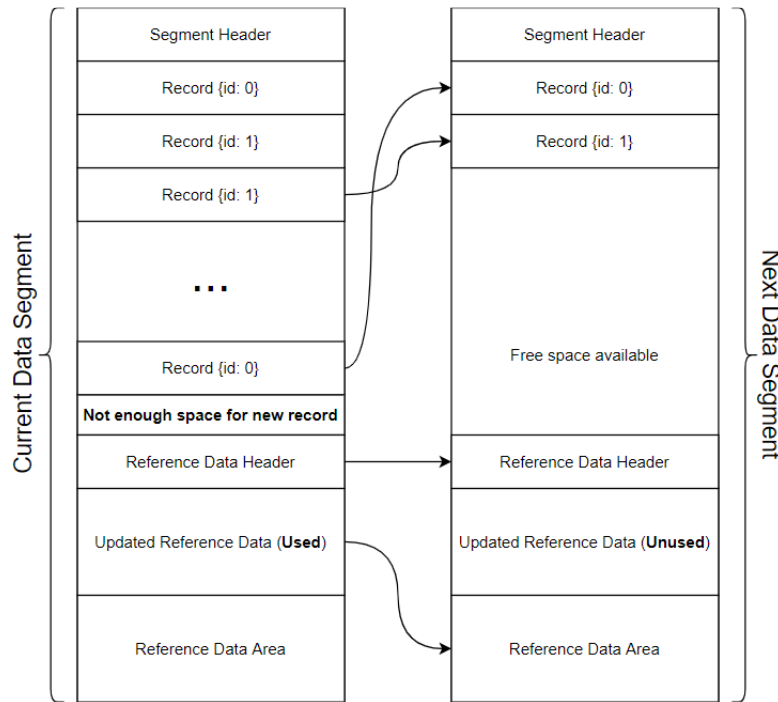

Figure 232: Refresh Operation

Record Format

Each record begins with a header that contains the record size, followed by the data, and the trailer. The trailer contains a validation code which is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the record data passed to the driver. Padding is added between the end of user data and the trailer to ensure the trailer is aligned properly.

Figure 233: Record Format

Reference Data Area

VEE can be configured for the presence of reference data. The original programmed reference data must be located at the end of the VEE data flash area. An area of equal size is reserved below this in case updated reference data becomes available later. Below that is a header which indicates whether the update area has been written to.

Figure 234: Reference Data Area Format

Just as with records, the validation code is used for internal purposes only and is not a 16-bit CRC or

ECC value. If that level of error checking is desired, the user should include that in the updated reference data passed to the driver.

Fault Tolerance

The Virtual EEPROM has a fault tolerant design. If for any reason an operation fails before it is completed the next time the module is opened a refresh will occur. Any corrupted data will be discarded.

Configuration

Build Time Configurations for rm_vee_flash

The following build time configurations are defined in fsp_cfg/rm_vee_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Data Support	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Support writing reference data to the end of the segment.
Refresh Buffer Size	Value must be an integer greater than 0 and a multiple of 4 bytes.	32	The size of the internal buffer used to copying data from one flash segment to another during a refresh operation. This is required because data flash to data flash transfers are not supported by the hardware.

Configurations for Storage > Virtual EEPROM on Flash (rm_vee_flash)

This module can be added to the Stacks tab via New Stack > Storage > Virtual EEPROM on Flash (rm_vee_flash). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_vee0	Module name.
Record Max ID	Value must be an integer.	16	Set this value to the highest record ID in use.
Number of Segments	Value must be an integer.	2	Set value to number of segments desired in data flash (minimum 2). The fewer the

segments, the fewer refreshes occur, but the longer refreshes take to complete (erase time).

Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the flash area used by Virtual EEPROM.
Total Size	Manual Entry	BSP_DATA_FLASH_SIZE_BYTES	The total size (In bytes) of the flash area used by Virtual EEPROM.
Reference Data Size	Value must be an integer.	0	The size of the reference area (In bytes) used by Virtual EEPROM.
Callback	Name must be a valid C symbol	vee_callback	A user callback function can be provided. If this callback function is provided, it will be called from the flash interrupt service routine (ISR).

Clock Configuration

There is no clock configuration for the RM_VEE_FLASH module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

A refresh buffer is required to copy data between segments. Data flash cannot be simultaneously read from and written to. Data will be temporarily copied into RAM during refresh operations.

Examples

Basic Example

This is a basic example of minimal use of the RM_VEE_FLASH module in an application.

```
volatile bool callback_called = false;
/* Record ID to use for storing pressure data. */
#define ID_PRESSURE (0U)
/* Example data structure. */
typedef struct st_pressure
```

```
{
    uint32_t timestamp;
    uint16_t low;
    uint16_t average;
    uint16_t high;
} pressure_t;

void rm_vee_example ()
{
    /* Open the Virtual EEPROM Module. */
    fsp_err_t err = RM_VEE_FLASH_Open(&g_vee_ctrl, &g_vee_cfg);
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }

    /* Read pressure data from external sensor. */
    pressure_t pressure_data;
    get_pressure_data(&pressure_data);

    /* Write the pressure data to a Virtual EEPROM Record. */
    err = RM_VEE_FLASH_RecordWrite(&g_vee_ctrl, ID_PRESSURE, (uint8_t *)
&pressure_data, sizeof(pressure_t));
    if (FSP_SUCCESS != err)
    {
        error_handler();
    }

    /* Wait for the Virtual EEPROM callback to indicate it finished writing data. */
    while (false == callback_called)
    {
        ;
    }

    /* Get a pointer to the record that is stored in data flash. */
    uint32_t length;
    pressure_t * p_pressure_data;
    err = RM_VEE_FLASH_RecordPtrGet(&g_vee_ctrl, ID_PRESSURE, (uint8_t **)
&p_pressure_data, &length);
```

```

if (FSP_SUCCESS != err)
{
    error_handler();
}

/* Close the Virtual EEPROM Module. */
err = RM_VEE_FLASH_Close(&g_vee_ctrl);
if (FSP_SUCCESS != err)
{
    error_handler();
}
}

void rm_vee_tests_callback (rm_vee_callback_args_t * p_args)
{
    callback_called = true;
    FSP_PARAMETER_NOT_USED(p_args);
}

```

Data Structures

struct [rm_vee_flash_cfg_t](#)

struct [rm_vee_flash_instance_ctrl_t](#)

Data Structure Documentation

◆ [rm_vee_flash_cfg_t](#)

struct rm_vee_flash_cfg_t		
User configuration structure, used in open function		
Data Fields		
flash_instance_t const *	p_flash	Pointer to a flash instance.

◆ [rm_vee_flash_instance_ctrl_t](#)

struct rm_vee_flash_instance_ctrl_t
Instance control block. This is private to the FSP and should not be used or modified by the application.

Function Documentation

◆ **RM_VEE_FLASH_Open()**

```
fsp_err_t RM_VEE_FLASH_Open ( rm_vee_ctrl_t *const p_api_ctrl, rm_vee_cfg_t const *const p_cfg )
```

Open the RM_VEE_FLASH driver module

Implements `rm_vee_api_t::open`

Initializes the driver's internal structures and opens the Flash driver. The Flash driver must be closed prior to opening VEE. The error code FSP_SUCCESS_RECOVERY indicates that VEE detected corrupted data; most likely due to a power loss during a data flash write or erase. In these cases, an automatic internal Refresh is performed and the partially written data is lost.

Return values

FSP_SUCCESS	Successful. FSP_SUCCESS_RECOVERY changed to FSP_SUCCESS
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_ALREADY_OPEN	This function has already been called.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Interrupts disabled outside of VEE
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.
FSP_ERR_INVALID_ARGUMENT	The supplied configuration is invalid.

◆ **RM_VEE_FLASH_RecordWrite()**

```
fsp_err_t RM_VEE_FLASH_RecordWrite ( rm_vee_ctrl_t *const p_api_ctrl, uint32_t const rec_id,
uint8_t const *const p_rec_data, uint32_t const num_bytes )
```

Writes a record to data flash.

Implements `rm_vee_api_t::recordWrite`

This function writes `num_bytes` of data pointed to by `p_rec_data` to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes. This includes exiting the calling function when the data buffer is a local variable (stack may be used by another function and corrupt the data buffer contents).

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_ARGUMENT	An argument contains an illegal value.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM_VEE_FLASH_RecordPtrGet()**

```
fsp_err_t RM_VEE_FLASH_RecordPtrGet ( rm_vee_ctrl_t *const p_api_ctrl, uint32_t const rec_id,
uint8_t **const pp_rec_data, uint32_t *const p_num_bytes )
```

Gets a pointer to the most recent record data.

Implements `rm_vee_api_t::recordPtrGet`

This function sets the argument pointer to the most recent version of the record data in flash. Flash cannot be accessed for reading and writing at the same time. Therefore, reading the data at `p_ref_data` must be completed prior to initiating any type of Flash write.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	<code>p_ref_data</code> is NULL.
FSP_ERR_INVALID_ARGUMENT	Record data not configured.
FSP_ERR_NOT_FOUND	The record associated with the requested ID could not be found.

◆ RM_VEE_FLASH_RefDataWrite()

```
fsp_err_t RM_VEE_FLASH_RefDataWrite ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t const *const p_ref_data )
```

Writes new Reference data to the reference update area.

Implements `rm_vee_api_t::refDataWrite`

This function writes VEE_CFG_REF_DATA_SIZE bytes pointed to by p_ref_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes.

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM_VEE_FLASH_RefDataPtrGet()**

```
fsp_err_t RM_VEE_FLASH_RefDataPtrGet ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t **const pp_ref_data )
```

Gets a pointer to the most recent reference data.

Implements `rm_vee_api_t::recordPtrGet`

This function sets the argument pointer to the most recent version of the reference data in flash. Flash cannot be accessed for reading and writing at the same time.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_FOUND	No reference data was found.

◆ **RM_VEE_FLASH_StatusGet()**

```
fsp_err_t RM_VEE_FLASH_StatusGet ( rm_vee_ctrl_t *const p_api_ctrl, rm_vee_status_t *const p_status )
```

Get the current status of the driver.

Implements `rm_vee_api_t::statusGet`

This command is typically used to verify that the last Write or Refresh command has completed before attempting to perform another API call.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

◆ **RM_VEE_FLASH_Refresh()**

```
fsp_err_t RM_VEE_FLASH_Refresh ( rm_vee_ctrl_t *const p_api_ctrl)
```

Manually start a refresh operation

Implements `rm_vee_api_t::refresh`

This function is used to start a segment Refresh at any time. The Refresh process by default occurs automatically when no more record or reference data space is available and a Write is requested. However, the app may desire to force a refresh when it knows it is running low on space and large amounts of data are about to be recorded.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM_VEE_FLASH_Format()**

```
fsp_err_t RM_VEE_FLASH_Format ( rm_vee_ctrl_t *const p_api_ctrl, uint8_t const *const p_ref_data )
```

Start a manual format operation.

Implements `rm_vee_api_t::format`

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ **RM_VEE_FLASH_CallbackSet()**

```
fsp_err_t RM_VEE_FLASH_CallbackSet ( rm_vee_ctrl_t *const p_api_ctrl, void(*) (rm_vee_callback_args_t *) p_callback, void const *const p_context, rm_vee_callback_args_t *const p_callback_memory )
```

Updates the user callback with the option to provide memory for the callback argument structure.

Implements `rm_vee_api_t::callbackSet`.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	<code>p_callback</code> is non-secure and <code>p_callback_memory</code> is either secure or NULL.

◆ **RM_VEE_FLASH_Close()**

```
fsp_err_t RM_VEE_FLASH_Close ( rm_vee_ctrl_t *const p_api_ctrl)
```

Closes the Flash driver and VEE driver.

Implements `rm_vee_api_t::close`

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

4.2.124 AWS Device Provisioning

Modules

AWS Device Provisioning example software.

Overview**Terminology**

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example, Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the [X.509 format](#) which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between [service providers](#). There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality. Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an [example](#) of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal `rm_aws_pkcs11_pal` module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (`aws_dev_mode_key_provisioning.c`) exposes two functions:

1. `vDevModeKeyProvisioning()`
2. `vAlternateKeyProvisioning()`

Both of these functions require that the device credentials be provided in PEM format. Using either of these example functions as is in production is not recommended; but `vAlternateKeyProvisioning()` provides more flexibility because of the ability to provide credentials as arguments.

Credentials can be created as follows:

- [Create your own CA](#) and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example [Register your CA with AWS](#).
- [Use AWS](#) to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

being linked into the image.

    * The same example provisioning function, vAlternateKeyProvisioning, can be used in
```

```
that case. */
    params.pucClientPrivateKey      = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
    params.pucClientCertificate     = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
    params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);
    params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength  = 0;
    vAlternateKeyProvisioning(&params);
}
```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

4.2.125 AWS HTTPS

Modules

This module provides the AWS HTTPS integration documentation.

Overview

The AWS HTTPS core library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: [coreHTTP](#).

Features

- Secure and Non-secure HTTP requests
- [Mutually authenticated connections](#)

Configuration

Memory Usage

The AWS HTTPS library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

AWS IoT Common

- IoT Thread Default Stack Size
- IoT Network Receive Task Stack Size

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to [AWS Secure Sockets](#).

Examples

HTTPS GET request

```

/* The HTTPS request has completed. The result is stored in xResponse. */  
}
```

4.2.126 AWS MQTT

Modules

This module provides the AWS MQTT integration documentation.

Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as [Mosquitto](#). The documentation for the library can be found at the following link: [coreMQTT](#).

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server
- Unsecure MQTT connections to Mosquitto servers. This is not recommended for production and should only be done to a local server for testing.

Configuration

Memory Usage

The AWS MQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

AWS IoT Common

- IoT Thread Default Stack Size
- IoT Network Receive Task Stack Size

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

The AWS MQTT library utilizes a system taskpool to queue up messages. This system task pool must be created before calling into the MQTT library. `iot_init.c` has been provided for easy initialization of this taskpool via `lotSdk_Init()`.

The AWS MQTT Demo has been provided to easily demonstrate MQTT functionality. An example of initializing the system taskpool and running the MQTT demo has been provided below.

Limitations

- `aws_clientcredential.h` and `aws_clientcredential_keys.h` need to be added manually.
- The IoT Thread must have a higher priority than the Network Receive Thread.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to [AWS Secure Sockets](#).

Examples

Non-secure connection to a Mosquitto server

```
#define IOT_LOG_STACK_SIZE (256)
const uint8_t g_ip_address[4] = {169, 254, 57, 49};
const uint8_t g_net_mask[4] = {255, 255, 0, 0};
const uint8_t g_gateway_address[4] = {169, 254, 57, 49};
const uint8_t g_dns_address[4] = {8, 8, 8, 8};
const uint8_t g_mac_address[6] = {0x66, 0x66, 0x66, 0x66, 0x66, 0x66};
void mqtt_non_secure_example ()
{
    /* Initialize IOT FreeRTOS Libraries */
    SYSTEM_Init();
    /* Initialize the crypto hardware acceleration. */
    mbedtls_platform_setup(NULL);
    xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);
    /* Start up the network stack. */
    FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);
    while (pdFALSE == FreeRTOS_IsNetworkUp())
    {
        vTaskDelay(1);
    }
    /* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
*/
```

```

/* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}

```

Secure connection to a Mosquitto server

Note

MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to [AWS Secure Sockets](#).

```

#define keyCLIENT_CERTIFICATE_PEM \
    "-----BEGIN CERTIFICATE-----\n" \
    "example_certificate_formatting\n" \
    "-----END CERTIFICATE-----"
#define keyCLIENT_PRIVATE_KEY_PEM \
    "-----BEGIN RSA PRIVATE KEY-----\n" \
    "example_certificate_formatting\n" \
    "-----END RSA PRIVATE KEY-----"
void mqtt_secure_example ()
{
    /* Initialize IOT FreeRTOS Libraries */
    SYSTEM_Init();
    /* Initialize the crypto hardware acceleration. */
    mbedtls_platform_setup(NULL);
    xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);
    ProvisioningParams_t params;
    /* Write the keys into a secure region in data flash. */
    params.pucClientPrivateKey      = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
    params.pucClientCertificate     = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
    params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);
    params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength  = 0;
    vAlternateKeyProvisioning(&params);
    /* Start up the network stack. */

```

```

FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);
while (pdFALSE == FreeRTOS_IsNetworkUp())
{
    vTaskDelay(1);
}
/* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
*/
/* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}

```

4.2.127 Wifi Middleware (rm_wifi_onchip_silex)

Modules

Functions

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t *p_utc_time)

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet (uint8_t *p_local_time, uint32_t size_string)

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet (wifi_onchip_silex_sntp_enable_t enable)

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t *p_ip_address)

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet (int32_t hours, uint32_t minutes, wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable)

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the [FreeRTOS Secure Sockets and WiFi interfaces](#) using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: [Secure Sockets API](#) or [Wifi API](#).

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the [Silex Web Site](#)

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports a BSD style Secure Socket interface.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA	03	Specify the module

	Configuration tool for available options.		reset pin for the MCU.
Enable SNTP Client	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
STNP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
STNP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	<ul style="list-style-type: none"> • Enabled • Disabled 	Disabled	Specify if daytime savings should be used for local time calculation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to [Serial Communications Interface \(SCI\) UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [Wifi Middleware \(rm_wifi_onchip_silex\)](#).

Clock Configuration

Refer to [Serial Communications Interface \(SCI\) UART \(r_sci_uart\)](#).

Pin Configuration

Refer to [Serial Communications Interface \(SCI\) UART \(r_sci_uart\)](#). `R_SCI_UART_Open()` is called by [Wifi Middleware \(rm_wifi_onchip_silex\)](#)

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The `rm_wifi_onchip_silex_connect()` function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call `WIFI_Scan()`, `WIFI_Ping()`, `SOCKETS_GetHostByName()`, `WIFI_GetMAC()`, or `WIFI_GetIPInfo()`. Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
    /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucChannel                = 0,
        .xPassword.xWPA.cPassphrase = "password",
        .ucSSID                   = "access_point_ssid",
        .xPassword.xWPA.ucLength  = 8,
        .ucSSIDLength             = 17,
        .xSecurity                 = eWiFiSecurityWPA2,
    };
    SocketsSockaddr_t addr        = {0};
    int32_t                number_bytes_rx = 0;
    int32_t                number_bytes_tx = 0;
    memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
}
```

```
memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
wifi_err = WIFI_On();

Data Structure Documentation

◆ [wifi_onchip_silex_cfg_t](#)

struct wifi_onchip_silex_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uint32_t	num_sockets	Number of sockets to initialize.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.
const uart_instance_t *	uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const wifi_onchip_silex_sntp_enable_t	sntp_enabled	Enable/Disable the SNTP Client.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_timezone_offset_from_utc_hours	Timezone offset from UTC in (+/-) hours.
const uint32_t	sntp_timezone_offset_from_utc_minutes	Timezone offset from UTC in minutes.
const wifi_onchip_silex_sntp_daylight_savings_enable_t	sntp_timezone_use_daylight_savings	Enable/Disable use of daylight saving time.
void const *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ [ulpgn_socket_t](#)

struct ulpgn_socket_t		

Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_rcv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.
uint32_t	socket_rcv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

◆ wifi_onchip_silex_instance_ctrl_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.
uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket

		instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GATeway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Silex WiFi module enable/disable for SNTP

Function Documentation◆ **RM_WIFI_ONCHIP_SILEX_EpochTimeGet()**`fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * p_utc_time)`

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

[out]	p_utc_time	Returns the epoch time in seconds.
-------	------------	------------------------------------

Return values

FSP_SUCCESS	Successfully retrieved the system time from module.
FSP_ERR_ASSERTION	The parameter utc_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_WIFI_ONCHIP_SILEX_LocalTimeGet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet ( uint8_t * p_local_time, uint32_t size_string )
```

Get the current local time based on current timezone in a string format

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

◆ **RM_WIFI_ONCHIP_SILEX_SntpEnableSet()**

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet ( wifi_onchip_silex_sntp_enable_t enable)
```

Enable or Disable the SNTP Client Service

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Can be set to enable/disable for SNTP support.
------	--------	--

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ **RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()**

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * p_ip_address)

Update the SNTP Server IP Address

Set the SNTP Client Server IP Address

Parameters

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.
------	--------------	--

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

```
fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet ( int32_t hours, uint32_t minutes,
wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable )
```

Update the SNTP Timezone

Set the SNTP Client Timezone

Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

4.2.128 AWS Secure Sockets

Modules

This module provides the AWS Secure Sockets implementation.

Overview

Features

Information about the features provided by the AWS Secure Sockets Library is available in the [FreeRTOS Libraries User Guide](#).

The FSP implementation supports using Secure Sockets with either Ethernet or WiFi. These stacks can be added in FSP via the RA Configuration editor under FreeRTOS | Secure Sockets.

Dependencies

The Secure Sockets library has two dependencies:

1. A TCP/IP implementation
2. A TLS implementation

For TCP/IP, AWS have provided the FreeRTOS TCP/IP implementation. For TLS, AWS have chosen mbedTLS, but use PKCS11 for storage and invoking the crypto portion of mbedTLS. For more information about AWS Secure Sockets, refer to the [AWS documentation](#). An example of Secure Sockets usage is on the same page.

mbedTLS

[mbedTLS](#) is ARM's implementation of the TLS and SSL protocols as well as the cryptographic primitives required by those implementations. mbedTLS is also solely used for its cryptographic features even if the TLS/SSL portions are not used. With [PSA](#), ARM have created a separate API for cryptography. Starting with mbedTLS3, crypto implementation has been moved out to a new module called mbedCrypto (PSA Crypto API) and a build time configuration can direct the mbedTLS3 implementation to use either the old mbedtls cryptography functions or use the new PSA Crypto API. Since the current version of mbedCrypto (PSA Crypto API) implements both the old mbedtls crypto API as well as the new PSA Crypto API, either option is functional for now.

CipherSuites

During the TLS connection setup stage, the client has to indicate to the server the type of cryptographic operations that it supports. This is referred to as the ciphersuite. The entire list of ciphersuites supported by mbedTLS can be found in `mbedtls/ssl_ciphersuites.h`.

Configuration

In FSP, Secure Sockets can be added as a new stack via FreeRTOS | Secure Sockets | Secure Sockets on WiFi or Secure Sockets on FreeRTOS Plus TCP. All required dependant modules, except heap, are automatically added. To complete the configuration,

- Add a heap instance and use the same one for all dependencies.
- Resolve the module configuration requirements.

Usage Notes

For detailed documentation on Secure Sockets consult the [AWS documentation](#).

Examples

Basic Example

This is a basic example of using the Secure Sockets API with Ethernet. The message "hello, world!" is sent to a remote socket.

4.2.129 ZMOD4XXX Sensor Middleware (rm_zmod4xxx)

Modules

Functions

`fsp_err_t` [RM_ZMOD4XXX_Open](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl`,
`rm_zmod4xxx_cfg_t const *const p_cfg`)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements `rm_zmod4xxx_api_t::open`. [More...](#)

`fsp_err_t` [RM_ZMOD4XXX_MeasurementStart](#) (`rm_zmod4xxx_ctrl_t *const p_api_ctrl`)

This function should be called when start a measurement.
Implements [rm_zmod4xxx_api_t::measurementStart](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_MeasurementStop](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#))

This function should be called when stop a measurement.
Implements [rm_zmod4xxx_api_t::measurementStop](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_StatusCheck](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#))

This function should be called when polling is used. It reads the status of sensor. Implements [rm_zmod4xxx_api_t::statusCheck](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_Read](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#),
[rm_zmod4xxx_raw_data_t](#) *const [p_raw_data](#))

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::read](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_TemperatureAndHumiditySet](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#), float temperature, float humidity)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements [rm_zmod4xxx_api_t::temperatureAndHumiditySet](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_DeviceErrorCheck](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#))

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements [rm_zmod4xxx_api_t::deviceErrorCheck](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_Iaq1stGenDataCalculate](#) ([rm_zmod4xxx_ctrl_t](#) *const [p_api_ctrl](#),
[rm_zmod4xxx_raw_data_t](#) *const [p_raw_data](#),
[rm_zmod4xxx_iaq_1st_data_t](#) *const [p_zmod4xxx_data](#))

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::iaq1stGenDataCalculate](#). [More...](#)

[fsp_err_t](#) [RM_ZMOD4XXX_Iaq2ndGenDataCalculate](#) ([rm_zmod4xxx_ctrl_t](#)

```
*const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data,
rm_zmod4xxx_iaq_2nd_data_t *const p_zmod4xxx_data)
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::iaq2ndGenDataCalculate`. [More...](#)

```
fsp_err_t RM_ZMOD4XXX_OdorDataCalculate (rm_zmod4xxx_ctrl_t *const
p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data,
rm_zmod4xxx_odor_data_t *const p_zmod4xxx_data)
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::odorDataCalculate`. [More...](#)

```
fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t
*const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data,
rm_zmod4xxx_sulfur_odor_data_t *const p_zmod4xxx_data)
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::sulfurOdorDataCalculate`. [More...](#)

```
fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t
*const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data,
rm_zmod4xxx_oaq_1st_data_t *const p_zmod4xxx_data)
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::oaq1stGenDataCalculate`. [More...](#)

```
fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t
*const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data,
rm_zmod4xxx_oaq_2nd_data_t *const p_zmod4xxx_data)
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::oaq2ndGenDataCalculate`. [More...](#)

```
fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when close the sensor. Implements `rm_zmod4xxx_api_t::close`. [More...](#)

Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the [ZMOD4XXX Middleware Interface](#).

Overview

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

Configuration

RM_ZMOD4XXX_CFG_OPERATION_MODE is set according to the library selected.

Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	<ul style="list-style-type: none"> • Default (BSP) • Enabled • Disabled 	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for rm_zmod4410_iaq_1st

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_lib_cfg.h:

Configuration	Options	Default	Description
[DEPRECATED] Power mode (This will be removed in FSP v4.0.0)	<ul style="list-style-type: none"> • Continuous • Low Power 	Continuous	Select power mode

Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx)

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx).

Configuration	Options	Default	Description
Name	Manual Entry	g_zmod4xxx_sensor0	Module name.

Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

Configurations for Sensor > ZMOD4410 IAQ 1st Generation (rm_zmod4xxx)

Configuration	Options	Default	Description
Operation Mode	<ul style="list-style-type: none"> Continuous Low Power 	Continuous	Select the operation mode.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

[ZMOD4410 datasheet is here.](#)

The ZMOD4410 has five modes of operation.

The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO ₂ , provides continuous data
IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO ₂ , fixed sampling interval of 6 seconds
IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO ₂ functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO ₂ functionality. This method offers a much lower power consumption
Odor	Control signal based on Air Quality Changes
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

[ZMOD4510 datasheet is here.](#)

The ZMOD4510 has two modes of operation.

The ZMOD4510 in OAQ 1st Gen operation will respond to typical outdoor gases after a warm-up time of 60 min, consisting of 20 min for stabilization and 40 min for baseline finding.

For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.

In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 1st Generation	Measurement of Air Quality
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power

A library corresponding to each of these modes is required. By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate [I2C Master Interface](#) open call.

Initialization

Initialize with [RM_ZMOD4XXX_Open\(\)](#). One channel of timer is required to measure the waiting time at initialization.

From measurement start to data acquisition

After normal completion, start the measurement with [RM_ZMOD4XXX_MeasurementStart\(\)](#). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Call [RM_ZMOD4XXX_MeasurementStart\(\)](#).
2. Wait until `RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE` is received via IRQ callback.
3. Call [RM_ZMOD4XXX_Read\(\)](#). This function will read the ADC data.
4. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
5. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call [RM_ZMOD4XXX_MeasurementStart\(\)](#).
2. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
3. Call [RM_ZMOD4XXX_StatusCheck\(\)](#). This function will execute a status check over I2C.
4. If `RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE` is received in callback, user should wait some time and then call [RM_ZMOD4XXX_StatusCheck\(\)](#) again.
5. Wait until `RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE` is received.
6. Call [RM_ZMOD4XXX_Read\(\)](#) and read the ADC data.
7. Wait until `RM_ZMOD4XXX_EVENT_SUCCESS` is received.
8. Call the DataCalculate API according to the mode.

Checking device error for IAQ 2nd Gen.

1. Call [RM_ZMOD4XXX_DeviceErrorCheck\(\)](#). This function will execute a device error check

over I2C.

2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

Examples

Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
    fsp_err_t          err = FSP_SUCCESS;

Enumerations

enum [rm_zmod4xxx_lib_type_t](#)

Data Structure Documentation

◆ **rm_zmod4xxx_init_process_params_t**

struct rm_zmod4xxx_init_process_params_t		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ **rm_zmod4xxx_instance_ctrl_t**

struct rm_zmod4xxx_instance_ctrl_t		
ZMOD4XXX control block		
Data Fields		
uint32_t	open	
		Open flag.
uint8_t	buf [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]	
		Buffer for I2C communications.
uint8_t	register_address	
		Register address to access.
rm_zmod4xxx_status_params_t	status	
		Status parameter.
volatile bool	dev_err_check	
		Flag for checking device error.
volatile rm_zmod4xxx_event_t	event	

	Callback event.
<code>rm_zmod4xxx_init_process_params_t</code>	<code>init_process_params</code>
	For the initialization process.
<code>rm_zmod4xxx_cfg_t const *</code>	<code>p_cfg</code>
	Pointer of configuration block.
<code>rm_comms_instance_t const *</code>	<code>p_comms_i2c_instance</code>
	Pointer of I2C Communications Middleware instance structure.
<code>rm_zmod4xxx_lib_extended_cfg_t *</code>	<code>p_zmod4xxx_lib</code>
	Pointer of ZMOD4XXX Lib extended configuration.
<code>void const *</code>	<code>p_irq_instance</code>
	Pointer to IRQ instance.
<code>void const *</code>	<code>p_context</code>
	Pointer to the user-provided context.
<code>void(*</code>	<code>p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)</code>
	I2C Communications callback.
<code>void(*</code>	<code>p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)</code>
	IRQ callback.

Enumeration Type Documentation

◆ rm_zmod4xxx_lib_type_t

enum `rm_zmod4xxx_lib_type_t`

ZMOD4XXX Library type

Function Documentation

◆ RM_ZMOD4XXX_Open()

`fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_cfg_t const *const p_cfg)`

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements `rm_zmod4xxx_api_t::open`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Unsupport product ID.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_MeasurementStart()

`fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const p_api_ctrl)`

This function should be called when start a measurement. Implements `rm_zmod4xxx_api_t::measurementStart`.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ **RM_ZMOD4XXX_MeasurementStop()**

```
fsp_err_t RM_ZMOD4XXX_MeasurementStop ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when stop a measurement. Implements [rm_zmod4xxx_api_t::measurementStop](#).

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ **RM_ZMOD4XXX_StatusCheck()**

```
fsp_err_t RM_ZMOD4XXX_StatusCheck ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when polling is used. It reads the status of sensor. Implements [rm_zmod4xxx_api_t::statusCheck](#).

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Read()

```
fsp_err_t RM_ZMOD4XXX_Read ( rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::read`.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

```
fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet ( rm_zmod4xxx_ctrl_t *const p_api_ctrl, float temperature, float humidity )
```

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements `rm_zmod4xxx_api_t::temperatureAndHumiditySet`.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ **RM_ZMOD4XXX_DeviceErrorCheck()**

```
fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting invalid ADC data. Implements `rm_zmod4xxx_api_t::deviceErrorCheck`.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ **RM_ZMOD4XXX_Iaq1stGenDataCalculate()**

```
fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_1st_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements `rm_zmod4xxx_api_t::iaq1stGenDataCalculate`.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::iaq2ndGenDataCalculate](#).

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_OdorDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_OdorDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_odor_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::odorDataCalculate](#).

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_sulfur_odor_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::sulfurOdorDataCalculate](#).

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq1stGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_1st_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::oaq1stGenDataCalculate](#).

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

```
fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const p_api_ctrl,
rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_2nd_data_t *const
p_zmod4xxx_data )
```

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements [rm_zmod4xxx_api_t::oaq2ndGenDataCalculate](#).

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Close()

```
fsp_err_t RM_ZMOD4XXX_Close ( rm_zmod4xxx_ctrl_t *const p_api_ctrl)
```

This function should be called when close the sensor. Implements [rm_zmod4xxx_api_t::close](#).

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

4.3 Interfaces

Detailed Description

The FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer.

Modules

ADC Interface

Interface for A/D Converters.

BLE Interface

Interface for Bluetooth Low Energy functions.

CAC Interface

Interface for clock frequency accuracy measurements.

CAN Interface

Interface for CAN peripheral.

CEC Interface

Interface for CEC peripheral.

CGC Interface

Interface for clock generation.

Comparator Interface

Interface for comparators.

CRC Interface

Interface for cyclic redundancy checking.

CTSU Interface

Interface for Capacitive Touch Sensing Unit (CTSU) functions.

DAC Interface

Interface for D/A converters.

Display Interface

Interface for LCD panel displays.

DOC Interface

Interface for the Data Operation Circuit.

ELC Interface

Interface for the Event Link Controller.

Ethernet Interface

Interface for Ethernet functions.

Ethernet PHY Interface

Interface for Ethernet PHY functions.

External IRQ Interface

Interface for detecting external interrupts.

Flash Interface

Interface for the Flash Memory.

I2C Master Interface

Interface for I2C master communication.

I2C Slave Interface

Interface for I2C slave communication.

I2S Interface

Interface for I2S audio communication.

I3C Interface

Interface for I3C.

IIR Interface

Interface for IIR filter functionality.

I/O Port Interface

Interface for accessing I/O ports and configuring I/O functionality.

JPEG Codec Interface

Interface for JPEG functions.

Key Matrix Interface

Interface for key matrix functions.

[Low Power Modes Interface](#)

Interface for accessing low power modes.

[Low Voltage Detection Interface](#)

Interface for Low Voltage Detection.

[OPAMP Interface](#)

Interface for Operational Amplifiers.

[PDC Interface](#)

Interface for PDC functions.

[POEG Interface](#)

Interface for the Port Output Enable for GPT.

[PTP Interface](#)

Interface for PTP functions.

[RTC Interface](#)

Interface for accessing the Realtime Clock.

[SD/MMC Interface](#)

Interface for accessing SD, eMMC, and SDIO devices.

[SLCDC Interface](#)

Interface for Segment LCD controllers.

[SPI Interface](#)

Interface for SPI communications.

[SPI Flash Interface](#)

Interface for accessing external SPI flash devices.

Three-Phase Interface

Interface for three-phase timer functions.

Timer Interface

Interface for timer functions.

Transfer Interface

Interface for data transfer functions.

UART Interface

Interface for UART communications.

USB Interface

Interface for USB functions.

USB HCDC Interface

Interface for USB HCDC functions.

USB HHID Interface

Interface for USB HHID functions.

USB HMSC Interface

Interface for USB HMSC functions.

USB PCDC Interface

Interface for USB PCDC functions.

USB PHID Interface

Interface for USB PHID functions.

USB PMSC Interface

Interface for USB PMSC functions.

WDT Interface

Interface for watch dog timer functions.

ADPCM Decoder Interface

Interface for ADPCM decoder.

AUDIO PLAYBACK Interface

Interface for the Audio Playback.

BLE ABS Interface

Interface for Bluetooth Low Energy Abstraction functions.

BLE Mesh Access Interface

Interface for Bluetooth Low Energy Mesh Access functions.

BLE Mesh Interface

Interface for Bluetooth Low Energy Abstraction functions.

BLE Mesh Bearer Interface

Interface for Bluetooth Low Energy Mesh Bearer functions.

BLE Mesh Model Configuration Client Interface

Interface for Bluetooth Low Energy Mesh Model Configuration Client functions.

BLE Mesh Health Server Interface

Interface for Bluetooth Low Energy Mesh Model Health Server functions.

BLE Mesh Lower Trans Interface

Interface for Bluetooth Low Energy Mesh Lower Trans functions.

BLE Mesh Model Client Interface

Interface for Bluetooth Low Energy Mesh Model Model Client functions.

BLE Mesh Model Server Interface

Interface for Bluetooth Low Energy Mesh Model Model Server functions.

BLE Mesh Network Interface

Interface for Bluetooth Low Energy Mesh Network functions.

BLE Mesh Provision Interface

Interface for Bluetooth Low Energy Mesh Provision functions.

BLE Mesh Scene Server Interface

Interface for Bluetooth Low Energy Mesh Model Scene Server functions.

BLE Mesh Upper Trans Interface

Interface for Bluetooth Low Energy Mesh Upper Trans functions.

Block Media Interface

Interface for block media memory access.

Communicatons Middleware Interface

Interface for Communications Middleware functions.

FileX Block Media Port Interface

Interface for FileX Block Media port.

FreeRTOS+FAT Port Interface

Interface for FreeRTOS+FAT port.

FSXXX Middleware Interface

Interface for FSXXX Middleware functions.

HS300X Middleware Interface

Interface for HS300X Middleware functions.

[LittleFS Interface](#)

Interface for LittleFS access.

[BLE Mesh Bearer Platform Interface](#)

Interface for Bluetooth Low Energy Mesh Bearer Platform functions.

[Interface](#)

Interface for motor 120 control functions.

[Interface](#)

Interface for motor driver functions.

[Motor angle Interface](#)

Interface for motor angle and speed calculation functions.

[Motor Interface](#)

Interface for Motor functions.

[Motor current Interface](#)

Interface for motor current functions.

[Motor driver Interface](#)

Interface for motor driver functions.

[Motor position Interface](#)

Interface for motor position functions.

[Motor speed Interface](#)

Interface for motor speed functions.

[Touch Middleware Interface](#)

Interface for Touch Middleware functions.

Virtual EEPROM Interface

Interface for Virtual EEPROM access.

ZMOD4XXX Middleware Interface

Interface for ZMOD4XXX Middleware functions.

SCE Interface

Interface for Secure Crypto Engine (SCE) functions.

4.3.1 ADC Interface

Interfaces

Detailed Description

Interface for A/D Converters.

Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

Implemented by: [Analog to Digital Converter \(r_adc\)](#)

Data Structures

struct [adc_status_t](#)

struct [adc_callback_args_t](#)

struct [adc_info_t](#)

struct [adc_cfg_t](#)

struct [adc_api_t](#)

struct [adc_instance_t](#)

Typedefs

typedef void [adc_ctrl_t](#)

Enumerations

enum [adc_mode_t](#)enum [adc_resolution_t](#)enum [adc_alignment_t](#)enum [adc_trigger_t](#)enum [adc_event_t](#)enum [adc_channel_t](#)enum [adc_group_id_t](#)enum [adc_group_mask_t](#)enum [adc_state_t](#)

Data Structure Documentation

◆ [adc_status_t](#)

struct adc_status_t		
ADC status.		
Data Fields		
adc_state_t	state	Current state.

◆ [adc_callback_args_t](#)

struct adc_callback_args_t		
ADC callback arguments definitions		
Data Fields		
uint16_t	unit	ADC device in use.
adc_event_t	event	ADC callback event.
void const *	p_context	Placeholder for user data.
adc_channel_t	channel	Channel of conversion result. Only valid for r_adc ADC_EVENT_CONVERSION_COMPLETE.
uint64_t	channel_mask	Channel mask for conversion result. Only valid for r_adc_b.
adc_group_mask_t	group_mask	Group Mask.

◆ [adc_info_t](#)

--	--	--

struct adc_info_t		
ADC Information Structure for Transfer Interface		
Data Fields		
__l void *	p_address	The address to start reading the data from.
uint32_t	length	The total number of transfers to read.
transfer_size_t	transfer_size	The size of each transfer.
elc_peripheral_t	elc_peripheral	Name of the peripheral in the ELC list.
elc_event_t	elc_event	Name of the ELC event for the peripheral.
uint32_t	calibration_data	Temperature sensor calibration data (0xFFFFFFFF if unsupported) for reference voltage.
int16_t	slope_microvolts	Temperature sensor slope in microvolts/degrees C.
bool	calibration_ongoing	Calibration is in progress.

◆ **adc_cfg_t**

struct adc_cfg_t	
ADC general configuration	
Data Fields	
uint16_t	unit
	ADC unit to be used.
adc_mode_t	mode
	ADC operation mode.
adc_resolution_t	resolution
	ADC resolution.
adc_alignment_t	alignment
	Specify left or right alignment; ignored if addition used.

<code>adc_trigger_t</code>	<code>trigger</code>
	Default and Group A trigger source.
<code>IRQn_Type</code>	<code>scan_end_irq</code>
	Scan end IRQ number.
<code>IRQn_Type</code>	<code>scan_end_b_irq</code>
	Scan end group B IRQ number.
<code>uint8_t</code>	<code>scan_end_ipl</code>
	Scan end interrupt priority.
<code>uint8_t</code>	<code>scan_end_b_ipl</code>
	Scan end group B interrupt priority.
<code>void(*</code>	<code>p_callback)(adc_callback_args_t *p_args)</code>
	Callback function; set to NULL for none.
<code>void const *</code>	<code>p_context</code>
	Placeholder for user data. Passed to the user callback in <code>adc_callback_args_t</code> .
<code>void const *</code>	<code>p_extend</code>
	Extension parameter for hardware specific settings.

◆ `adc_api_t`

`struct adc_api_t`

ADC functions implemented at the HAL layer will follow this API.

Data Fields	
fsp_err_t(*	open)(adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)
fsp_err_t(*	scanCfg)(adc_ctrl_t *const p_ctrl, void const *const p_extend)
fsp_err_t(*	scanStart)(adc_ctrl_t *const p_ctrl)
fsp_err_t(*	scanGroupStart)(adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)
fsp_err_t(*	scanStop)(adc_ctrl_t *const p_ctrl)
fsp_err_t(*	scanStatusGet)(adc_ctrl_t *const p_ctrl, adc_status_t *p_status)
fsp_err_t(*	read)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)
fsp_err_t(*	read32)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)
fsp_err_t(*	calibrate)(adc_ctrl_t *const p_ctrl, void const *p_extend)
fsp_err_t(*	offsetSet)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)
fsp_err_t(*	callbackSet)(adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(adc_ctrl_t *const p_ctrl)
fsp_err_t(*	infoGet)(adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)
Field Documentation	

◆ **open**

```
fsp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)
```

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.

Implemented as

- R_ADC_Open()
- R_ADC_B_Open()
- R_SDADC_Open()

Precondition

Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ **scanCfg**

```
fsp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, void const *const p_extend)
```

Configure the scan including the channels, groups, and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_ScanCfg()
- R_ADC_B_ScanCfg()
- R_SDADC_ScanCfg()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	See implementation for details

◆ scanStart

```
fsp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)
```

Start the scan (in case of a software trigger), or enable the hardware trigger.

Implemented as

- R_ADC_ScanStart()
- R_SDADC_ScanStart()

Parameters

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ scanGroupStart

```
fsp_err_t(* adc_api_t::scanGroupStart) (adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)
```

Start the scan group (in case of a software trigger), or enable the hardware trigger.

Implemented as

- R_ADC_B_ScanGroupStart()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	group_mask	Mask of groups to start

◆ scanStop

```
fsp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)
```

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.

Implemented as

- R_ADC_ScanStop()
- R_SDADC_ScanStop()

Parameters

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **scanStatusGet**

```
fsp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl, adc_status_t *p_status)
```

Check scan status.

Implemented as

- R_ADC_StatusGet()
- R_ADC_B_StatusGet()
- R_SDADC_StatusGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_status	Pointer to store current status in

◆ **read**

```
fsp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)
```

Read ADC conversion result.

Implemented as

- R_ADC_Read()
- R_ADC_B_Read()
- R_SDADC_Read()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ read32

```
fsp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)
```

Read ADC conversion result into a 32-bit word.

Implemented as

- R_ADC_Read32()
- R_ADC_B_Read32()
- R_SDADC_Read32()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ calibrate

```
fsp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void const *p_extend)
```

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_Calibrate()
- R_ADC_B_Calibrate()
- R_SDADC_Calibrate()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	Pointer to implementation specific arguments

◆ **offsetSet**

```
fsp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)
```

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.

Implemented as

- [R_SDADC_OffsetSet\(\)](#)

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration <code>adc_channel_t</code>)
[in]	offset	See implementation for details.

◆ **callbackSet**

```
fsp_err_t(* adc_api_t::callbackSet) (adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)
```

Specify callback function and optional context pointer and working memory pointer.

Implemented as

- [R_ADC_CallbackSet\(\)](#)
- [R_ADC_B_CallbackSet\(\)](#)

Parameters

[in]	p_ctrl	Pointer to the ADC control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ **close**

```
fsp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)
```

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Implemented as

- R_ADC_Close()
- R_ADC_B_Close()
- R_SDADC_Close()

Parameters

[in]	p_ctrl	Pointer to control handle structure
------	--------	-------------------------------------

◆ **infoGet**

```
fsp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)
```

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.

Implemented as

- R_ADC_InfoGet()
- R_ADC_B_InfoGet()
- R_SDADC_InfoGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_adc_info	Pointer to ADC information structure

◆ **adc_instance_t**

```
struct adc_instance_t
```

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

adc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
void const *	p_channel_cfg	Pointer to the channel configuration structure for this instance.
adc_api_t const *	p_api	Pointer to the API structure for

		this instance.
--	--	----------------

Typedef Documentation

◆ `adc_ctrl_t`

```
typedef void adc_ctrl_t
```

ADC control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ `adc_mode_t`

```
enum adc_mode_t
```

ADC operation mode definitions

Enumerator

<code>ADC_MODE_SINGLE_SCAN</code>	Single scan - one or more channels.
<code>ADC_MODE_GROUP_SCAN</code>	Two trigger sources to trigger scan for two groups which contain one or more channels.
<code>ADC_MODE_CONTINUOUS_SCAN</code>	Continuous scan - one or more channels.

◆ `adc_resolution_t`

```
enum adc_resolution_t
```

ADC data resolution definitions

Enumerator

<code>ADC_RESOLUTION_12_BIT</code>	12 bit resolution
<code>ADC_RESOLUTION_10_BIT</code>	10 bit resolution
<code>ADC_RESOLUTION_8_BIT</code>	8 bit resolution
<code>ADC_RESOLUTION_14_BIT</code>	14 bit resolution
<code>ADC_RESOLUTION_16_BIT</code>	16 bit resolution
<code>ADC_RESOLUTION_24_BIT</code>	24 bit resolution

◆ **adc_alignment_t**

enum adc_alignment_t	
ADC data alignment definitions	
Enumerator	
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

◆ **adc_trigger_t**

enum adc_trigger_t	
ADC trigger mode definitions	
Enumerator	
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_ASYNC_EXTERNAL	External asynchronous trigger; not for group modes.

◆ **adc_event_t**

enum adc_event_t	
ADC callback event definitions	
Enumerator	
ADC_EVENT_SCAN_COMPLETE	Normal/Group A scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_B	Group B scan complete.
ADC_EVENT_CALIBRATION_COMPLETE	Calibration complete.
ADC_EVENT_CONVERSION_COMPLETE	Conversion complete.
ADC_EVENT_CALIBRATION_REQUEST	Calibration requested.
ADC_EVENT_CONVERSION_ERROR	Scan error.
ADC_EVENT_OVERFLOW	Overflow occurred.
ADC_EVENT_LIMIT_CLIP	Limiter clipping occurred.
ADC_EVENT_FIFO_READ_REQUEST	FIFO read requested.
ADC_EVENT_FIFO_OVERFLOW	FIFO overflow occurred.
ADC_EVENT_WINDOW_COMPARE_A	Window A comparison condition met.
ADC_EVENT_WINDOW_COMPARE_B	Window B comparison condition met.

◆ **adc_channel_t**

enum adc_channel_t	
ADC channels	
Enumerator	
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.

ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.

ADC_CHANNEL_DUPLEX_A	Data duplexing register A.
ADC_CHANNEL_DUPLEX_B	Data duplexing register B.
ADC_CHANNEL_DUPLEX	Data duplexing register.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.
ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.

ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.
ADC_CHANNEL_SELF_DIAGNOSIS	Self-Diagnosis channel.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.
ADC_CHANNEL_DA0	D/A Converter Channel 0.
ADC_CHANNEL_DA1	D/A Converter Channel 1.
ADC_CHANNEL_DA2	D/A Converter Channel 2.
ADC_CHANNEL_DA3	D/A Converter Channel 3.

◆ **adc_group_id_t**

enum <code>adc_group_id_t</code>	
Enumerator	
<code>ADC_GROUP_ID_0</code>	Group ID 0.
<code>ADC_GROUP_ID_1</code>	Group ID 1.
<code>ADC_GROUP_ID_2</code>	Group ID 2.
<code>ADC_GROUP_ID_3</code>	Group ID 3.
<code>ADC_GROUP_ID_4</code>	Group ID 4.
<code>ADC_GROUP_ID_5</code>	Group ID 5.
<code>ADC_GROUP_ID_6</code>	Group ID 6.
<code>ADC_GROUP_ID_7</code>	Group ID 7.
<code>ADC_GROUP_ID_8</code>	Group ID 8.

◆ **adc_group_mask_t**

enum <code>adc_group_mask_t</code>	
Enumerator	
<code>ADC_GROUP_MASK_NONE</code>	Group Mask Unknown or None.
<code>ADC_GROUP_MASK_0</code>	Group Mask 0.
<code>ADC_GROUP_MASK_1</code>	Group Mask 1.
<code>ADC_GROUP_MASK_2</code>	Group Mask 2.
<code>ADC_GROUP_MASK_3</code>	Group Mask 3.
<code>ADC_GROUP_MASK_4</code>	Group Mask 4.
<code>ADC_GROUP_MASK_5</code>	Group Mask 5.
<code>ADC_GROUP_MASK_6</code>	Group Mask 6.
<code>ADC_GROUP_MASK_7</code>	Group Mask 7.
<code>ADC_GROUP_MASK_8</code>	Group Mask 8.
<code>ADC_GROUP_MASK_ALL</code>	All Groups.

◆ **adc_state_t**

enum <code>adc_state_t</code>	
ADC states.	
Enumerator	
<code>ADC_STATE_IDLE</code>	ADC is idle.
<code>ADC_STATE_SCAN_IN_PROGRESS</code>	ADC scan in progress.

4.3.2 BLE Interface

Interfaces

Functions

ble_status_t [R_BLE_Open](#) (void)
Open the BLE protocol stack. [More...](#)

ble_status_t [R_BLE_Close](#) (void)
Close the BLE protocol stack. [More...](#)

ble_status_t [R_BLE_Execute](#) (void)
Execute the BLE task. [More...](#)

uint32_t [R_BLE_IsTaskFree](#) (void)
Check the BLE task queue is free or not. [More...](#)

ble_status_t [R_BLE_SetEvent](#) (ble_event_cb_t cb)
Set event. [More...](#)

uint32_t [R_BLE_GetVersion](#) (void)
Get the BLE FIT module version. [More...](#)

uint32_t [R_BLE_GetLibType](#) (void)
Get the type of BLE protocol stack library. [More...](#)

Detailed Description

Interface for Bluetooth Low Energy functions.

Summary

The BLE interface for the Bluetooth Low Energy (BLE) peripheral provides Bluetooth Low Energy functionality.

The Bluetooth Low Energy interface can be implemented by:

- [Bluetooth Low Energy Library of Extended Configuration \(r_ble\)](#)
- [Bluetooth Low Energy Library of Balance Configuration \(r_ble\)](#)
- [Bluetooth Low Energy Library of Compact Configuration \(r_ble\)](#)

Modules

GAP

Typedefs

typedef void(* ble_event_cb_t) (void)

ble_event_cb_t is the callback function type for R_BLE_SetEvent().
More...

Macro Definition Documentation

◆ BLE_VERSION_MAJOR

#define BLE_VERSION_MAJOR

BLE Module Major Version.

◆ BLE_VERSION_MINOR

#define BLE_VERSION_MINOR

BLE Module Minor Version.

◆ BLE_LIB_EXTENDED

#define BLE_LIB_EXTENDED

BLE Protocol Stack Library Extended type.

◆ **BLE_LIB_BALANCE**

#define BLE_LIB_BALANCE

BLE Protocol Stack Library Balance type.

◆ **BLE_LIB_COMPACT**

#define BLE_LIB_COMPACT

BLE Protocol Stack Library Compacy type.

Typedef Documentation◆ **ble_event_cb_t**

ble_event_cb_t

ble_event_cb_t is the callback function type for [R_BLE_SetEvent\(\)](#).**Parameters**

[in]

void

Returns

none

Function Documentation◆ **R_BLE_Open()**

ble_status_t R_BLE_Open (void)

Open the BLE protocol stack.

This function should be called once before using the BLE protocol stack.

Return values

BLE_SUCCESS(0x0000)

Success

◆ **R_BLE_Close()**

ble_status_t R_BLE_Close (void)

Close the BLE protocol stack.

This function should be called once to close the BLE protocol stack.

Return values

BLE_SUCCESS(0x0000)	Success
---------------------	---------

◆ **R_BLE_Execute()**

ble_status_t R_BLE_Execute (void)

Execute the BLE task.

This handles all the task queued in the BLE protocol stack internal task queue and return. This function should be called repeatedly in the main loop.

Return values

BLE_SUCCESS(0x0000)	Success
---------------------	---------

◆ **R_BLE_IsTaskFree()**

uint32_t R_BLE_IsTaskFree (void)

Check the BLE task queue is free or not.

This function returns the BLE task queue free status. When this function returns 0x0, call [R_BLE_Execute\(\)](#) to execute the BLE task.

Return values

0x0	BLE task queue is not free
0x1	BLE task queue is free

◆ **R_BLE_SetEvent()**

```
ble_status_t R_BLE_SetEvent ( ble_event_cb_t cb)
```

Set event.

This function add an event in the BLE protocol stack internal queue. The event is handled in R_BLE_Execute just like Bluetooth event. This function is intended to be called in hardware interrupt context. Even if calling this function with the same cb before the cb is invoked, only one event is registered. The maximum number of the events can be registered at a time is eight.

Parameters

cb	The callback for the event.
----	-----------------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_ALREADY_IN_PROGRESS(0x000A)	The event already registered with the callback.
BLE_ERR_CONTEXT_FULL(0x000B)	No free slot for the event.

◆ **R_BLE_GetVersion()**

```
uint32_t R_BLE_GetVersion ( void )
```

Get the BLE FIT module version.

This function returns the BLE FIT module version.

The major version(BLE_VERSION_MAJOR) is contained in the two most significant bytes, and the minor version(BLE_VERSION_MINOR) occupies the remaining two bytes.

Return values

BLE_VERSION_MAJOR BLE_VERSION_MINOR	
---------------------------------------	--

◆ R_BLE_GetLibType()

uint32_t R_BLE_GetLibType (void)

Get the type of BLE protocol stack library.

This function returns the type of BLE protocol stack library.

Return values

BLE_LIB_EXTENDED(0x00)	Extended
BLE_LIB_BALANCE(0x01)	Balance
BLE_LIB_COMPACT(0x02)	Compact

4.3.2.1 GAP

Interfaces » BLE Interface

Functions

ble_status_t R_BLE_GAP_Init (ble_gap_app_cb_t gap_cb)

Initialize the Host Stack. [More...](#)

ble_status_t R_BLE_GAP_Terminate (void)

Terminate the Host Stack. [More...](#)

ble_status_t R_BLE_GAP_UpdConn (uint16_t conn_hdl, uint8_t mode, uint16_t accept, st_ble_gap_conn_param_t *p_conn_updt_param)

Update the connection parameters. [More...](#)

ble_status_t R_BLE_GAP_SetDataLen (uint16_t conn_hdl, uint16_t tx_octets, uint16_t tx_time)

Update the packet size and the packet transmit time. [More...](#)

ble_status_t R_BLE_GAP_Disconnect (uint16_t conn_hdl, uint8_t reason)

Disconnect the link. [More...](#)

ble_status_t R_BLE_GAP_SetPhy (uint16_t conn_hdl, st_ble_gap_set_phy_param_t *p_phy_param)

Set the phy for connection. [More...](#)

ble_status_t [R_BLE_GAP_SetDefPhy](#) (st_ble_gap_set_def_phy_param_t *p_def_phy_param)
Set the default phy which allows remote device to change. [More...](#)

ble_status_t [R_BLE_GAP_SetPrivMode](#) (st_ble_dev_addr_t *p_addr, uint8_t *p_privacy_mode, uint8_t device_num)
Set the privacy mode. [More...](#)

ble_status_t [R_BLE_GAP_ConfWhiteList](#) (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t device_num)
Set White List. [More...](#)

ble_status_t [R_BLE_GAP_GetVerInfo](#) (void)
Get the version number of the Controller and the host stack. [More...](#)

ble_status_t [R_BLE_GAP_ReadPhy](#) (uint16_t conn_hdl)
Get the phy settings. [More...](#)

ble_status_t [R_BLE_GAP_ConfRslvList](#) (uint8_t op_code, st_ble_dev_addr_t *p_addr, st_ble_gap_rslv_list_key_set_t *p_peer_irk, uint8_t device_num)
Set Resolving List. [More...](#)

ble_status_t [R_BLE_GAP_EnableRpa](#) (uint8_t enable)
Enable/Disable address resolution and generation of a resolvable private address. [More...](#)

ble_status_t [R_BLE_GAP_SetRpaTo](#) (uint16_t rpa_timeout)
Set the update time of resolvable private address. [More...](#)

ble_status_t [R_BLE_GAP_ReadRpa](#) (st_ble_dev_addr_t *p_addr)
Get the resolvable private address of local device. [More...](#)

ble_status_t [R_BLE_GAP_ReadRssi](#) (uint16_t conn_hdl)
Get RSSI. [More...](#)

ble_status_t [R_BLE_GAP_ReadChMap](#) (uint16_t conn_hdl)
Get the Channel Map. [More...](#)

ble_status_t [R_BLE_GAP_SetRandAddr](#) (uint8_t *p_random_addr)
Set a random address. [More...](#)

ble_status_t [R_BLE_GAP_SetAdvParam](#) (st_ble_gap_adv_param_t *p_adv_param)
Set advertising parameters. [More...](#)

ble_status_t [R_BLE_GAP_SetAdvSresData](#) (st_ble_gap_adv_data_t *p_adv_srsp_data)
Set advertising data/scan response data/periodic advertising data. [More...](#)

ble_status_t [R_BLE_GAP_StartAdv](#) (uint8_t adv_hdl, uint16_t duration, uint8_t max_extd_adv_evts)
Start advertising. [More...](#)

ble_status_t [R_BLE_GAP_StopAdv](#) (uint8_t adv_hdl)
Stop advertising. [More...](#)

ble_status_t [R_BLE_GAP_SetPerdAdvParam](#) (st_ble_gap_perd_adv_param_t *p_perd_adv_param)
Set periodic advertising parameters. [More...](#)

ble_status_t [R_BLE_GAP_StartPerdAdv](#) (uint8_t adv_hdl)
Start periodic advertising. [More...](#)

ble_status_t [R_BLE_GAP_StopPerdAdv](#) (uint8_t adv_hdl)
Stop periodic advertising. [More...](#)

ble_status_t [R_BLE_GAP_GetRemainAdvBufSize](#) (uint16_t *p_remain_adv_data_size, uint16_t *p_remain_perd_adv_data_size)
Get buffer size for advertising data/scan response data/periodic advertising data in the Controller. [More...](#)

ble_status_t [R_BLE_GAP_RemoveAdvSet](#) (uint8_t op_code, uint8_t adv_hdl)
Delete advertising set. [More...](#)

ble_status_t [R_BLE_GAP_CreateConn](#) (st_ble_gap_create_conn_param_t *p_param)
Request for a link establishment. [More...](#)

ble_status_t [R_BLE_GAP_CancelCreateConn](#) (void)
Cancel the request for a link establishment. [More...](#)

ble_status_t [R_BLE_GAP_SetChMap](#) (uint8_t *p_channel_map)
Set the Channel Map. [More...](#)

ble_status_t [R_BLE_GAP_StartScan](#) (st_ble_gap_scan_param_t *p_scan_param, st_ble_gap_scan_on_t *p_scan_enable)
Set scan parameter and start scan. [More...](#)

ble_status_t [R_BLE_GAP_StopScan](#) (void)
Stop scan. [More...](#)

ble_status_t [R_BLE_GAP_CreateSync](#) (st_ble_dev_addr_t *p_addr, uint8_t adv_sid, uint16_t skip, uint16_t sync_to)
Request for a periodic sync establishment. [More...](#)

ble_status_t [R_BLE_GAP_CancelCreateSync](#) (void)
Cancel the request for a periodic sync establishment. [More...](#)

ble_status_t [R_BLE_GAP_TerminateSync](#) (uint16_t sync_hdl)
Terminate the periodic sync. [More...](#)

ble_status_t [R_BLE_GAP_ConfPerdAdvList](#) (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t *p_adv_sid_set, uint8_t device_num)
Set Periodic Advertiser List. [More...](#)

ble_status_t [R_BLE_GAP_AuthorizeDev](#) (uint16_t conn_hdl, uint8_t author_flag)

Authorize a remote device. [More...](#)

ble_status_t [R_BLE_GAP_GetRemDevInfo](#) (uint16_t conn_hdl)
Get the information about remote device. [More...](#)

ble_status_t [R_BLE_GAP_SetPairingParams](#) (st_ble_gap_pairing_param_t *p_pair_param)
Set the parameters using pairing. [More...](#)

ble_status_t [R_BLE_GAP_SetLocIdInfo](#) (st_ble_dev_addr_t *p_lc_id_addr, uint8_t *p_lc_irk)
Set the IRK and the identity address distributed to a remote device. [More...](#)

ble_status_t [R_BLE_GAP_SetLocCsrk](#) (uint8_t *p_local_csrk)
Set the CSRK distributed to a remote device. [More...](#)

ble_status_t [R_BLE_GAP_StartPairing](#) (uint16_t conn_hdl)
Start pairing. [More...](#)

ble_status_t [R_BLE_GAP_ReplyPairing](#) (uint16_t conn_hdl, uint8_t response)
Reply the pairing request from a remote device. [More...](#)

ble_status_t [R_BLE_GAP_StartEnc](#) (uint16_t conn_hdl)
Encryption the link. [More...](#)

ble_status_t [R_BLE_GAP_ReplyPasskeyEntry](#) (uint16_t conn_hdl, uint32_t passkey, uint8_t response)
Reply the passkey entry request. [More...](#)

ble_status_t [R_BLE_GAP_ReplyNumComp](#) (uint16_t conn_hdl, uint8_t response)
Reply the numeric comparison request. [More...](#)

ble_status_t [R_BLE_GAP_NotifyKeyPress](#) (uint16_t conn_hdl, uint8_t key_press)
Notify the input key type which a remote device inputs in the passkey entry. [More...](#)

ble_status_t [R_BLE_GAP_GetDevSecInfo](#) (uint16_t conn_hdl, st_ble_gap_auth_info_t *p_sec_info)
Get the security information about the remote device. [More...](#)

ble_status_t [R_BLE_GAP_ReplyExKeyInfoReq](#) (uint16_t conn_hdl)
Distribute the keys of local device. [More...](#)

ble_status_t [R_BLE_GAP_SetRemOobData](#) (st_ble_dev_addr_t *p_addr, uint8_t oob_data_flag, st_ble_gap_oob_data_t *p_oob)
Set the oob data from a remote device. [More...](#)

ble_status_t [R_BLE_GAP_CreateScOobData](#) (void)
Create data for oob in secure connection. [More...](#)

ble_status_t [R_BLE_GAP_SetBondInfo](#) (st_ble_gap_bond_info_t *p_bond_info, uint8_t device_num, uint8_t *p_set_num)
Set the bonding information stored in non-volatile memory to the host stack. [More...](#)

void [R_BLE_GAP_DeleteBondInfo](#) (int32_t local, int32_t remote, st_ble_dev_addr_t *p_addr, ble_gap_del_bond_cb_t gap_del_bond_cb)
This function deletes the bonding information in Host Stack. When a function for deleting the bonding information stored in non-volatile area is registered by the gap_del_bond_cb parameter, it is deleted as well as the bonding information in Host Stack. [More...](#)

ble_status_t [R_BLE_GAP_ReplyLtkReq](#) (uint16_t conn_hdl, uint16_t ediv, uint8_t *p_peer_rand, uint8_t response)
Reply the LTK request from a remote device. [More...](#)

Detailed Description

(end addtogroup BLE_API)

Data Structures

struct [st_ble_evt_data_t](#)
[st_ble_evt_data_t](#) is the type of the data notified in a GAP Event. [More...](#)

struct [st_ble_dev_addr_t](#)
[st_ble_dev_addr_t](#) is the type of bluetooth device address(BD_ADDR).
[More...](#)

struct [st_ble_gap_ext_adv_param_t](#)
Advertising parameters. [More...](#)

struct [st_ble_gap_adv_data_t](#)
Advertising data/scan response data/periodic advertising data.
[More...](#)

struct [st_ble_gap_perd_adv_param_t](#)
Periodic advertising parameter. [More...](#)

struct [st_ble_gap_scan_phy_param_t](#)
Scan parameters per scan PHY. [More...](#)

struct [st_ble_gap_ext_scan_param_t](#)
Scan parameters. [More...](#)

struct [st_ble_gap_scan_on_t](#)
Parameters configured when scanning starts. [More...](#)

struct [st_ble_gap_conn_param_t](#)
Connection parameters included in connection interval, slave latency, supervision timeout, ce length. [More...](#)

struct [st_ble_gap_conn_phy_param_t](#)
Connection parameters per PHY. [More...](#)

struct [st_ble_gap_create_conn_param_t](#)
Connection parameters used in [R_BLE_GAP_CreateConn\(\)](#). [More...](#)

struct [st_ble_gap_rslv_list_key_set_t](#)

IRK of a remote device and IRK type of local device used in [R_BLE_GAP_ConfRslvList\(\)](#). [More...](#)

struct [st_ble_gap_set_phy_param_t](#)

PHY configuration parameters used in [R_BLE_GAP_SetPhy\(\)](#). [More...](#)

struct [st_ble_gap_set_def_phy_param_t](#)

PHY preferences which allows a remote device to set used in [R_BLE_GAP_SetDefPhy\(\)](#). [More...](#)

struct [st_ble_gap_auth_info_t](#)

Pairing parameters required from a remote device or information about keys distributed from a remote device. [More...](#)

struct [st_ble_gap_key_dist_t](#)

Keys distributed from a remote device. [More...](#)

struct [st_ble_gap_key_ex_param_t](#)

This structure includes the distributed keys and negotiated LTK size. [More...](#)

struct [st_ble_gap_pairing_param_t](#)

Pairing parameters used in [R_BLE_GAP_SetPairingParams\(\)](#). [More...](#)

struct [st_ble_gap_oob_data_t](#)

Oob data received from the remote device. This is used in [R_BLE_GAP_SetRemOobData\(\)](#). [More...](#)

struct [st_ble_gap_ver_num_t](#)

Version number of host stack. [More...](#)

struct [st_ble_gap_loc_ver_info_t](#)

Version number of Controller. [More...](#)

struct [st_ble_gap_loc_dev_info_evt_t](#)

Version information of local device. [More...](#)

struct [st_ble_gap_hw_err_evt_t](#)
Hardware error that is notified from Controller. [More...](#)

struct [st_ble_gap_cmd_err_evt_t](#)
HCI Command error. [More...](#)

struct [st_ble_gap_adv_rept_t](#)
Advertising Report. [More...](#)

struct [st_ble_gap_ext_adv_rept_t](#)
Extended Advertising Report. [More...](#)

struct [st_ble_gap_perd_adv_rept_t](#)
Periodic Advertising Report. [More...](#)

struct [st_ble_gap_adv_rept_evt_t](#)
Advertising report. [More...](#)

union [st_ble_gap_adv_rept_evt_t.param](#)
Advertising Report. [More...](#)

struct [st_ble_gap_adv_set_evt_t](#)
Advertising handle. [More...](#)

struct [st_ble_gap_adv_off_evt_t](#)
Information about the advertising set which stops advertising.
[More...](#)

struct [st_ble_gap_adv_data_evt_t](#)
This structure notifies that advertising data has been set to
Controller by [R_BLE_GAP_SetAdvSresData\(\)](#). [More...](#)

struct [st_ble_gap_rem_adv_set_evt_t](#)
This structure notifies that an advertising set has been removed.

[More...](#)

struct [st_ble_gap_conn_evt_t](#)

This structure notifies that a link has been established. [More...](#)

struct [st_ble_gap_disconn_evt_t](#)

This structure notifies that a link has been disconnected. [More...](#)

struct [st_ble_gap_rd_ch_map_evt_t](#)

This structure notifies that Channel Map has been retrieved by [R_BLE_GAP_ReadChMap\(\)](#). [More...](#)

struct [st_ble_gap_rd_rssi_evt_t](#)

This structure notifies that RSSI has been retrieved by [R_BLE_GAP_ReadRssi\(\)](#). [More...](#)

struct [st_ble_gap_dev_info_evt_t](#)

This structure notifies that information about remote device has been retrieved by [R_BLE_GAP_GetRemDevInfo\(\)](#). [More...](#)

struct [st_ble_gap_conn_upd_evt_t](#)

This structure notifies that connection parameters has been updated. [More...](#)

struct [st_ble_gap_conn_upd_req_evt_t](#)

This structure notifies that a request for connection parameters update has been received. [More...](#)

struct [st_ble_gap_conn_hdl_evt_t](#)

This structure notifies that a GAP Event that includes only connection handle has occurred. [More...](#)

struct [st_ble_gap_data_len_chg_evt_t](#)

This structure notifies that the packet data length has been updated. [More...](#)

struct [st_ble_gap_rd_rpa_evt_t](#)

This structure notifies that the local resolvable private address has been retrieved by [R_BLE_GAP_ReadRpa\(\)](#). [More...](#)

struct [st_ble_gap_phy_upd_evt_t](#)

This structure notifies that PHY for a connection has been updated. [More...](#)

struct [st_ble_gap_phy_rd_evt_t](#)

This structure notifies that the PHY settings has been retrieved by [R_BLE_GAP_ReadPhy\(\)](#). [More...](#)

struct [st_ble_gap_scan_req_rcv_evt_t](#)

This structure notifies that a Scan Request packet has been received from a Scanner. [More...](#)

struct [st_ble_gap_sync_est_evt_t](#)

This structure notifies that a Periodic sync has been established. [More...](#)

struct [st_ble_gap_sync_hdl_evt_t](#)

This structure notifies that a GAP Event that includes only sync handle has occurred. [More...](#)

struct [st_ble_gap_white_list_conf_evt_t](#)

This structure notifies that White List has been configured. [More...](#)

struct [st_ble_gap_rslv_list_conf_evt_t](#)

This structure notifies that Resolving List has been configured. [More...](#)

struct [st_ble_gap_perd_list_conf_evt_t](#)

This structure notifies that Periodic Advertiser List has been configured. [More...](#)

struct [st_ble_gap_set_priv_mode_evt_t](#)

This structure notifies that Privacy Mode has been configured.

[More...](#)

struct [st_ble_gap_pairing_req_evt_t](#)

This structure notifies that a pairing request from a remote device has been received. [More...](#)

struct [st_ble_gap_passkey_display_evt_t](#)

This structure notifies that a request for Passkey display in pairing has been received. [More...](#)

struct [st_ble_gap_num_comp_evt_t](#)

This structure notifies that a request for Numeric Comparison in pairing has been received. [More...](#)

struct [st_ble_gap_key_press_ntf_evt_t](#)

This structure notifies that the remote device has input a key in Passkey Entry. [More...](#)

struct [st_ble_gap_pairing_info_evt_t](#)

This structure notifies that the pairing has completed. [More...](#)

struct [st_ble_gap_enc_chg_evt_t](#)

This structure notifies that the encryption status of a link has been changed. [More...](#)

struct [st_ble_gap_peer_key_info_evt_t](#)

This structure notifies that the remote device has distributed the keys. [More...](#)

struct [st_ble_gap_ltk_req_evt_t](#)

This structure notifies that a LTK request from a remote device has been received. [More...](#)

struct [st_ble_gap_ltk_rsp_evt_t](#)

This structure notifies that local device has replied to the LTK request from the remote device. [More...](#)

struct [st_ble_gap_sc_oob_data_evt_t](#)

This structure notifies that OOB data for Secure Connections has been generated by [R_BLE_GAP_CreateScOobData\(\)](#). [More...](#)

struct [st_ble_gap_bond_info_t](#)

Bonding information used in [R_BLE_GAP_SetBondInfo\(\)](#). [More...](#)

Macros

#define [BLE_BD_ADDR_LEN](#)

#define [BLE_MASTER](#)

#define [BLE_SLAVE](#)

#define [BLE_GAP_ADDR_PUBLIC](#)

#define [BLE_GAP_ADDR_RAND](#)

#define [BLE_GAP_ADDR_RPA_ID_PUBLIC](#)

Resolvable Private Address. [More...](#)

#define [BLE_GAP_ADDR_RPA_ID_RANDOM](#)

Resolvable Private Address. [More...](#)

#define [BLE_GAP_AD_FLAGS_LE_LIM_DISC_MODE](#)

LE Limited Discoverable Mode flag used in AD type.

#define [BLE_GAP_AD_FLAGS_LE_GEN_DISC_MODE](#)

LE General Discoverable Mode flag used in AD type.

#define [BLE_GAP_AD_FLAGS_BR_EDR_NOT_SUPPORTED](#)

BR/EDR Not Supported flag used in AD type.

#define [BLE_GAP_ADV_DATA_MODE](#)

Advertising data.

#define [BLE_GAP_SCAN_RSP_DATA_MODE](#)

Scan response data.

```
#define BLE_GAP_PERD_ADV_DATA_MODE  
Periodic advertising data.
```

```
#define BLE_GAP_ADV_CH_37  
Use 37 CH.
```

```
#define BLE_GAP_ADV_CH_38  
Use 38 CH.
```

```
#define BLE_GAP_ADV_CH_39  
Use 39 CH.
```

```
#define BLE_GAP_ADV_CH_ALL  
Use 37 - 39 CH.
```

```
#define BLE_GAP_SCAN_PASSIVE  
Passive Scan.
```

```
#define BLE_GAP_SCAN_ACTIVE  
Active Scan.
```

```
#define BLE_GAP_SCAN_INTV_MIN  
Active Scan.
```

```
#define BLE_GAP_SCAN_FILT_DUPLIC_DISABLE  
Duplicate filter disabled.
```

```
#define BLE_GAP_SCAN_FILT_DUPLIC_ENABLE  
Duplicate filter enabled.
```

```
#define BLE_GAP_SCAN_FILT_DUPLIC_ENABLE_FOR_PERIOD  
Duplicate filtering enabled, reset for each scan period.
```

```
#define BLE_GAP_SCAN_ALLOW_ADV_ALL
```

Accept all advertising and scan response PDUs except directed advertising PDUs not addressed to local device.

```
#define BLE_GAP_SCAN_ALLOW_ADV_WLST
```

Accept only advertising and scan response PDUs from remote devices whose address is registered in the White List. Directed advertising PDUs which are not addressed to local device is ignored.

```
#define BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED
```

Accept all advertising and scan response PDUs except directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.

```
#define BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST
```

Accept all advertising and scan response PDUs.
The following are excluded. [More...](#)

```
#define BLE_GAP_INIT_FILT_USE_ADDR
```

White List is not used.

```
#define BLE_GAP_INIT_FILT_USE_WLST
```

White List is used.

```
#define BLE_GAP_DATA_0_CLEAR
```

Clear the advertising data/scan response data/periodic advertising data in the advertising set.

```
#define BLE_GAP_DATA_0_DID_UPD
```

Update Advertising DID without changing advertising data.

```
#define BLE_GAP_NET_PRIV_MODE
```

Network Privacy Mode.

```
#define BLE_GAP_DEV_PRIV_MODE
```

Device Privacy Mode.

```
#define BLE_GAP_REM_FEATURE_SIZE  
The length of the features supported by a remote device.
```

```
#define BLE_GAP_NOT_AUTHORIZED  
Not authorize the remote device.
```

```
#define BLE_GAP_AUTHORIZED  
Authorize the remote device.
```

```
#define BLE_GAP_RMV_ADV_SET_REM_OP  
Delete an advertising set.
```

```
#define BLE_GAP_RMV_ADV_SET_CLR_OP  
Delete all the advertising sets.
```

```
#define BLE_GAP_SC_PROC_GEN  
General Discovery Procedure.
```

```
#define BLE_GAP_SC_PROC_LIM  
Limited Discovery Procedure.
```

```
#define BLE_GAP_SC_PROC_OBS  
Observation Procedure.
```

```
#define BLE_GAP_LIST_ADD_DEV  
Add the device to the list.
```

```
#define BLE_GAP_LIST_REM_DEV  
Delete the device from the list.
```

```
#define BLE_GAP_LIST_CLR  
Clear the list.
```

```
#define BLE_GAP_WHITE_LIST_MAX_ENTRY
```

The maximum entry number of White List.

```
#define BLE_GAP_RSLV_LIST_MAX_ENTRY
```

The maximum entry number of Resolving List.

```
#define BLE_GAP_PERD_LIST_MAX_ENTRY
```

The maximum entry number of Periodic Advertiser List.

```
#define BLE_GAP_RPA_DISABLED
```

Disable RPA generation/resolution.

```
#define BLE_GAP_RPA_ENABLED
```

Enable RPA generation/resolution.

```
#define BLE_GAP_RL_LOC_KEY_ALL_ZERO
```

All-zero IRK.

```
#define BLE_GAP_RL_LOC_KEY_REGISTERED
```

The IRK registered by `R_BLE_GAP_SetLocIdInfo()`.

```
#define BLE_MAX_NO_OF_ADV_SETS_SUPPORTED
```

The maximum number of advertising set for the Abstraction API.

```
#define BLE_GAP_LEGACY_PROP_ADV_IND
```

Connectable and scannable undirected Legacy Advertising Packet.

```
#define BLE_GAP_LEGACY_PROP_ADV_DIRECT_IND
```

Connectable directed (low duty cycle) Legacy Advertising Packet.

```
#define BLE_GAP_LEGACY_PROP_ADV_HDC_DIRECT_IND
```

Connectable directed (high duty cycle) Legacy Advertising Packet.

```
#define BLE_GAP_LEGACY_PROP_ADV_SCAN_IND  
Scannable undirected Legacy Advertising Packet.
```

```
#define BLE_GAP_LEGACY_PROP_ADV_NONCONN_IND  
Non-connectable and non-scannable undirected Legacy Advertising  
Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_UNDIRECT  
Connectable and non-scannable undirected Extended Advertising  
Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_DIRECT  
Connectable and non-scannable directed (low duty cycle) Extended  
Advertising Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_HDC_DIRECT  
Connectable and non-scannable directed (high duty cycle) Extended  
Advertising Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_UNDIRECT  
Non-connectable and scannable undirected Extended Advertising  
Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_DIRECT  
Non-connectable and scannable directed (low duty cycle) Extended  
Advertising Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_HDC_DIRECT  
Non-connectable and scannable directed (high duty cycle) Extended  
Advertising Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_UNDIRECT  
Non-connectable and non-scannable undirected Extended  
Advertising Packet.
```

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_DIRECT  
Non-connectable and non-scannable directed (low duty cycle)
```

Extended Advertising Packet.

```
#define BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_HDC_DIRECT
```

Non-connectable and non-scannable directed (high duty cycle) Extended Advertising Packet.

```
#define BLE_GAP_EXT_PROP_ADV_ANONYMOUS
```

Omit the advertiser address from Extended Advertising Packet.

```
#define BLE_GAP_EXT_PROP_ADV_INCLUDE_TX_POWER
```

Indicate that the advertising data includes TX Power.

```
#define BLE_GAP_ADV_ALLOW_SCAN_ANY_CONN_ANY
```

Process scan and connection requests from all devices.

```
#define BLE_GAP_ADV_ALLOW_SCAN_WLST_CONN_ANY
```

Process connection requests from all devices and scan requests from only devices that are in the White List.

```
#define BLE_GAP_ADV_ALLOW_SCAN_ANY_CONN_WLST
```

Process scan requests from all devices and connection requests from only devices that are in the White List.

```
#define BLE_GAP_ADV_ALLOW_SCAN_WLST_CONN_WLST
```

Process scan and connection requests from only devices in the White List.

```
#define BLE_GAP_ADV_PHY_1M
```

Use 1M PHY.

```
#define BLE_GAP_ADV_PHY_2M
```

Use 2M PHY.

```
#define BLE_GAP_ADV_PHY_CD
```

Use Coded PHY.

```
#define BLE_GAP_SCAN_REQ_NTF_DISABLE  
Disable Scan Request Notification.
```

```
#define BLE_GAP_SCAN_REQ_NTF_ENABLE  
Enable Scan Request Notification.
```

```
#define BLE_GAP_PERD_PROP_TX_POWER  
Indicate that periodic advertising data includes Tx Power.
```

```
#define BLE_GAP_INVALID_ADV_HDL  
Invalid advertising handle.
```

```
#define BLE_GAP_SET_PHYS_HOST_PREF_1M  
Use 1M PHY.
```

```
#define BLE_GAP_SET_PHYS_HOST_PREF_2M  
Use 2M PHY.
```

```
#define BLE_GAP_SET_PHYS_HOST_PREF_CD  
Use Coded PHY.
```

```
#define BLE_GAP_SET_PHYS_OP_HOST_NO_PREF  
No preferred coding.
```

```
#define BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2  
Use S=2 coding.
```

```
#define BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8  
Use S=8 coding.
```

```
#define BLE_GAP_CONN_UPD_MODE_REQ  
Request for updating the connection parameters.
```

`#define BLE_GAP_CONN_UPD_MODE_RSP`
Reply a connection parameter update request.

`#define BLE_GAP_CONN_UPD_ACCEPT`
Accept the update request.

`#define BLE_GAP_CONN_UPD_REJECT`
Reject the update request.

`#define BLE_GAP_CH_MAP_SIZE`
The size of channel map.

`#define BLE_GAP_INVALID_CONN_HDL`
Invalid Connection handle.

`#define BLE_GAP_NOT_USE_CONN_HDL`
This macro indicates that connection handle is not used.

`#define BLE_GAP_INIT_CONN_HDL`
Initial Connection handle.

`#define BLE_GAP_PAIRING_ACCEPT`
Accept a request regarding pairing.

`#define BLE_GAP_PAIRING_REJECT`
Reject a request regarding pairing.

`#define BLE_GAP_LTK_REQ_ACCEPT`
Reply for the LTK request.

`#define BLE_GAP_LTK_REQ_DENY`
Reject the LTK request.

`#define BLE_GAP_LESC_PASSKEY_ENTRY_STARTED`

Notify that passkey entry started.

```
#define BLE_GAP_LESC_PASKEY_DIGIT_ENTERED  
Notify that passkey digit entered.
```

```
#define BLE_GAP_LESC_PASKEY_DIGIT_ERASED  
Notify that passkey digit erased.
```

```
#define BLE_GAP_LESC_PASKEY_CLEARED  
Notify that passkey cleared.
```

```
#define BLE_GAP_LESC_PASKEY_ENTRY_COMPLETED  
Notify that passkey entry completed.
```

```
#define BLE_GAP_SEC_MITM_BEST_EFFORT  
MITM Protection not required.
```

```

enum e_ble_gap_evt_t
```

GAP Event Identifier. [More...](#)

Data Structure Documentation

◆ st_ble_evt_data_t

```
struct st_ble_evt_data_t
```

st_ble_evt_data_t is the type of the data notified in a GAP Event.

Data Fields

uint16_t	param_len	The size of GAP Event parameters.
void *	p_param	GAP Event parameters. This parameter differs in each GAP Event.

◆ st_ble_dev_addr_t

```
struct st_ble_dev_addr_t
```

st_ble_dev_addr_t is the type of bluetooth device address(BD_ADDR).

Note

The BD address setting format is little endian.

If the address is "AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.

Data Fields

uint8_t	addr[BLE_BD_ADDR_LEN]	BD_ADDR.
---------	-----------------------	----------

uint8_t	type	Bluetooth address type.	
		macro	description
		BLE_GAP_ADD R_PUBLIC(0x00)	Public Address.
		BLE_GAP_ADD R_RAND(0x01)	Random Address.

◆ st_ble_gap_ext_adv_param_t

struct st_ble_gap_ext_adv_param_t											
Advertising parameters.											
Data Fields											
uint8_t	adv_hdl	Advertising handle identifying the advertising set to be set the advertising parameters. Valid range is 0x00 - 0x03. In the first advertising parameters setting, the advertising set specified by adv_hdl is generated. The Advertising Set ID(Advertising SID) of the advertising set is same as adv_hdl.									
uint16_t	adv_prop_type	Advertising packet type. Legacy advertising PDU type, or bitwise or of Extended advertising PDU type and Extended advertising option.

Notify advertising PDUs from devices in the limited discoverable mode and the general discoverable mode.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_SCAN_PROC_OBS(0x00)	Observation Procedure. Notify all advertising PDUs.	BLE_GAP_SCAN_PROC_LIM(0x01)	Limited Discovery Procedure. Notify advertising PDUs from only devices in the limited discoverable mode.
macro	description							
BLE_GAP_SCAN_PROC_OBS(0x00)	Observation Procedure. Notify all advertising PDUs.							
BLE_GAP_SCAN_PROC_LIM(0x01)	Limited Discovery Procedure. Notify advertising PDUs from only devices in the limited discoverable mode.							
BLE_GAP_SCAN_PROC_GEN(0x02)	General Discovery Procedure. Notify advertising PDUs from devices in the limited discoverable mode and the general discoverable mode.							
uint8_t	filter_dups	Filter duplicates.						
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_SCAN_FILTER_DUPLICATION_DISABLE(0x00)</td> <td>Duplicate filter disabled.</td> </tr> <tr> <td>BLE_GAP_SCAN_FILTER_DUPLICATION_ENABLE(0x01)</td> <td>Duplicate filter enabled.</td> </tr> <tr> <td>BLE_GAP_SCAN_FILTER_DUPLICATION_ENABLE_RESET_PERIOD(0x02)</td> <td>Duplicate filtering enabled, reset for each scan period</td> </tr> </tbody> </table>	macro	description	BLE_GAP_SCAN_FILTER_DUPLICATION_DISABLE(0x00)	Duplicate filter disabled.	BLE_GAP_SCAN_FILTER_DUPLICATION_ENABLE(0x01)	Duplicate filter enabled.
macro	description							
BLE_GAP_SCAN_FILTER_DUPLICATION_DISABLE(0x00)	Duplicate filter disabled.							
BLE_GAP_SCAN_FILTER_DUPLICATION_ENABLE(0x01)	Duplicate filter enabled.							
BLE_GAP_SCAN_FILTER_DUPLICATION_ENABLE_RESET_PERIOD(0x02)	Duplicate filtering enabled, reset for each scan period							

uint16_t	duration	Scan duration. Time(ms) = duration * 10. Valid range is 0x0000 - 0xFFFF. If this field is set to 0x0000, scanning is continued until R_BLE_GAP_StopScan() is called. When the period field is zero and the time specified the duration field expires, BLE_GAP_EVENT_SCAN_TO event notifies the application layer that scanning stops.
uint16_t	period	Scan period. Time(s) = N * 1.28. Valid range is 0x0000 - 0xFFFF. If the duration field is set to 0x0000, this field is ignored.

◆ st_ble_gap_conn_param_t

struct st_ble_gap_conn_param_t		
Connection parameters included in connection interval, slave latency, supervision timeout, ce length.		
This structure is used in R_BLE_GAP_CreateConn() and R_BLE_GAP_UpdConn() .		
Set the fields in this structure to match the following condition.		
Supervision_timeout(ms) >= (1 + conn_latency) * conn_intv_max_Time(ms)		
conn_intv_max_Time(ms) = conn_intv_max * 1.25 Supervision_timeout(ms) = sup_to * 10		
Data Fields		
uint16_t	conn_intv_min	Minimum connection interval. Time(ms) = conn_intv_min * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	conn_intv_max	Maximum connection interval. Time(ms) = conn_intv_max * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	conn_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Supervision timeout.

		Time(ms) = sup_to * 10. Valid range is 0x000A - 0x0C80.
uint16_t	min_ce_length	Minimum CE Length. Valid range is 0x0000 - 0xFFFF.
uint16_t	max_ce_length	Maximum CE Length. Valid range is 0x0000 - 0xFFFF.

◆ st_ble_gap_conn_phy_param_t

struct st_ble_gap_conn_phy_param_t		
Connection parameters per PHY.		
Data Fields		
uint16_t	scan_intv	Scan interval. Time(ms) = scan_intv * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	scan_window	Scan window. Time(ms) = scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
st_ble_gap_conn_param_t *	p_conn_param	Connection interval, slave latency, supervision timeout, and CE length.

◆ st_ble_gap_create_conn_param_t

struct st_ble_gap_create_conn_param_t						
Connection parameters used in R_BLE_GAP_CreateConn().						
Data Fields						
uint8_t	init_filter_policy	This field specifies whether the White List is used or not, when connecting with a remote device.				
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_INIT_FILTER_USE_ADDR(0x00)</td> <td>White List is not used. If the IRK of local device has not been registered in Resolving List, the random address set by <code>R_BLE_GAP_SetRandAddr()</code>.</p>
<code>st_ble_gap_conn_phy_param_t *</code>	<code>p_conn_param_1M</code>	<p>Connection parameters for 1M PHY.</p> <p>If this field is set to NULL, 1M PHY is not used in connecting.</p>
<code>st_ble_gap_conn_phy_param_t *</code>	<code>p_conn_param_2M</code>	<p>Connection parameters for 2M PHY.</p> <p>If this field is set to NULL, 2M PHY is not used in connecting.</p>
<code>st_ble_gap_conn_phy_param_t *</code>	<code>p_conn_param_coded</code>	<p>Connection parameters for Coded PHY.</p> <p>If this field is set to NULL, Coded PHY is not used in connecting.</p>

◆ `st_ble_gap_rslv_list_key_set_t`

<code>struct st_ble_gap_rslv_list_key_set_t</code>	
IRK of a remote device and IRK type of local device used in <code>R_BLE_GAP_ConfRslvList()</code> .	
Data Fields	

uint8_t	remote_irk[BLE_GAP_IRK_SIZE]	IRK of a remote device to be registered in the Resolving List.						
uint8_t	local_irk_type	IRK type of the local device to be registered in the Resolving List. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_RL_LOCAL_KEY_ALL_ZERO(0x00)</td> <td>All-zero IRK.</td> </tr> <tr> <td>BLE_GAP_RL_LOCAL_KEY_REGISTERED(0x01)</td> <td>The IRK registered by <code>R_BLE_GAP_SetLocIdInfo()</code>.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_RL_LOCAL_KEY_ALL_ZERO(0x00)	All-zero IRK.	BLE_GAP_RL_LOCAL_KEY_REGISTERED(0x01)	The IRK registered by <code>R_BLE_GAP_SetLocIdInfo()</code> .
macro	description							
BLE_GAP_RL_LOCAL_KEY_ALL_ZERO(0x00)	All-zero IRK.							
BLE_GAP_RL_LOCAL_KEY_REGISTERED(0x01)	The IRK registered by <code>R_BLE_GAP_SetLocIdInfo()</code> .							

◆ st_ble_gap_set_phy_param_t

struct st_ble_gap_set_phy_param_t										
PHY configuration parameters used in <code>R_BLE_GAP_SetPhy()</code> .										
Data Fields										
uint8_t	tx_phys	Transmitter PHY preference. The tx_phys field is set to a bitwise OR of the following values. All other values are ignored. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)</td> <td>Use 1M PHY for Transmitter PHY.</td> </tr> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)</td> <td>Use 2M PHY for Transmitter PHY.</td> </tr> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)</td> <td>Use Coded PHY for Transmitter PHY.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)	Use 1M PHY for Transmitter PHY.	BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)	Use 2M PHY for Transmitter PHY.	BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)	Use Coded PHY for Transmitter PHY.
macro	description									
BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)	Use 1M PHY for Transmitter PHY.									
BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)	Use 2M PHY for Transmitter PHY.									
BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)	Use Coded PHY for Transmitter PHY.									
uint8_t	rx_phys	Receiver PHY preference. The rx_phys field is set to a bitwise OR of the following values. All other values are ignored. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> </tbody> </table>	macro	description						
macro	description									

		<p><code>BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)</code> Use 1M PHY for Receiver PHY.</p> <p><code>BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)</code> Use 2M PHY for Receiver PHY.</p> <p><code>BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)</code> Use Coded PHY for Receiver PHY.</p>								
<code>uint16_t</code>	<code>phy_options</code>	<p>Coding scheme used in Coded PHY.</p> <p>Select one of the following.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_GAP_SET_PHYS_OP_HOST_NO_PREF(0x00)</code></td> <td>No preferred coding.</td> </tr> <tr> <td><code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2(0x01)</code></td> <td>Use S=2 coding.</td> </tr> <tr> <td><code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8(0x02)</code></td> <td>Use S=8 coding.</td> </tr> </tbody> </table>	macro	description	<code>BLE_GAP_SET_PHYS_OP_HOST_NO_PREF(0x00)</code>	No preferred coding.	<code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2(0x01)</code>	Use S=2 coding.	<code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8(0x02)</code>	Use S=8 coding.
macro	description									
<code>BLE_GAP_SET_PHYS_OP_HOST_NO_PREF(0x00)</code>	No preferred coding.									
<code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2(0x01)</code>	Use S=2 coding.									
<code>BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8(0x02)</code>	Use S=8 coding.									

◆ `st_ble_gap_set_def_phy_param_t`

<code>struct st_ble_gap_set_def_phy_param_t</code>						
PHY preferences which allows a remote device to set used in <code>R_BLE_GAP_SetDefPhy()</code> .						
Data Fields						
<code>uint8_t</code>	<code>tx_phys</code>	<p>Transmitter PHY preferences which a remote device may change.</p> <p>The <code>tx_phys</code> field is set to a bitwise OR of the following values. All other values are ignored.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td><code>BLE_GAP_SET_PHYS_HOST_</code></td> <td>Allow a remote device</td> </tr> </tbody> </table>	macro	description	<code>BLE_GAP_SET_PHYS_HOST_</code>	Allow a remote device
macro	description					
<code>BLE_GAP_SET_PHYS_HOST_</code>	Allow a remote device

uint8_t	rx_phys	<p>Receiver PHY preferences which a remote device may change.</p> <p>The rx_phys field is set to a bitwise OR of the following values. All other values are ignored.</p> <table border="1" data-bbox="1029 1070 1473 1700"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)</td> <td>Allow a remote device to set 1M PHY for receiver PHY.</td> </tr> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)</td> <td>Allow a remote device to set 2M PHY for receiver PHY.</td> </tr> <tr> <td>BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)</td> <td>Allow a remote device to set Coded PHY for receiver PHY.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)	Allow a remote device to set 1M PHY for receiver PHY.	BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)	Allow a remote device to set 2M PHY for receiver PHY.	BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)	Allow a remote device to set Coded PHY for receiver PHY.
macro	description									
BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01)	Allow a remote device to set 1M PHY for receiver PHY.									
BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02)	Allow a remote device to set 2M PHY for receiver PHY.									
BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04)	Allow a remote device to set Coded PHY for receiver PHY.									

◆ **st_ble_gap_auth_info_t**

struct st_ble_gap_auth_info_t		
Pairing parameters required from a remote device or information about keys distributed from a remote device.		
Data Fields		
uint8_t	security	Security level.

		<table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The remote device requests Unauthenticated pairing.</td> </tr> <tr> <td>0x02</td> <td>The remote device requests Authenticated pairing.</td> </tr> </tbody> </table>	value	description	0x01	The remote device requests Unauthenticated pairing.	0x02	The remote device requests Authenticated pairing.
value	description							
0x01	The remote device requests Unauthenticated pairing.							
0x02	The remote device requests Authenticated pairing.							
uint8_t	pair_mode	Pairing mode. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The remote device requests Legacy pairing.</td> </tr> <tr> <td>0x02</td> <td>The remote device requests Secure Connections.</td> </tr> </tbody> </table>	value	description	0x01	The remote device requests Legacy pairing.	0x02	The remote device requests Secure Connections.
value	description							
0x01	The remote device requests Legacy pairing.							
0x02	The remote device requests Secure Connections.							
uint8_t	bonding	Bonding policy. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>The remote device does not store the Bonding information.</td> </tr> <tr> <td>0x01</td> <td>The remote device stores the Bonding information.</td> </tr> </tbody> </table>	value	description	0x00	The remote device does not store the Bonding information.	0x01	The remote device stores the Bonding information.
value	description							
0x00	The remote device does not store the Bonding information.							
0x01	The remote device stores the Bonding information.							
uint8_t	ekey_size	Encryption key size.						

◆ st_ble_gap_key_dist_t

struct st_ble_gap_key_dist_t		
Keys distributed from a remote device.		
Data Fields		
uint8_t	enc_info[BLE_GAP_LTK_SIZE]	LTK.
uint8_t	mid_info[BLE_GAP_EDIV_SIZE + BLE_GAP_RAND_64_BIT_SIZE]	Ediv and rand. The first two bytes is ediv, the remaining bytes are rand.

uint8_t	id_info[BLE_GAP_IRK_SIZE]	IRK.
uint8_t	id_addr_info[BLE_GAP_ID_ADDR_SIZE]	Identity address. The first byte is address type. The remaining bytes are device address.
uint8_t	sign_info[BLE_GAP_CSRK_SIZE]	CSRK.

◆ st_ble_gap_key_ex_param_t

struct st_ble_gap_key_ex_param_t										
This structure includes the distributed keys and negotiated LTK size.										
Data Fields										
st_ble_gap_key_dist_t *	p_keys_info	Key information.								
uint8_t	keys	Type of the distributed keys. This field is a bitwise OR of the following values. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Bit Number</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>LTK and Master Identification. LTK is distributed in Secure Connections, even if the bit is 1.</td> </tr> <tr> <td>1</td> <td>IRK and Identity Address Information.</td> </tr> <tr> <td>2</td> <td>CSRK</td> </tr> </tbody> </table>	Bit Number	description	0	LTK and Master Identification. LTK is distributed in Secure Connections, even if the bit is 1.	1	IRK and Identity Address Information.	2	CSRK
Bit Number	description									
0	LTK and Master Identification. LTK is distributed in Secure Connections, even if the bit is 1.									
1	IRK and Identity Address Information.									
2	CSRK									
uint8_t	ekey_size	The negotiated LTK size.								

◆ st_ble_gap_pairing_param_t

struct st_ble_gap_pairing_param_t						
Pairing parameters used in R_BLE_GAP_SetPairingParams() .						
Data Fields						
uint8_t	iocap	IO capabilities of local device. Select one of the following. <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_IOC</td> <td>Output</td> </tr> </tbody> </table>	macro	description	BLE_GAP_IOC	Output
macro	description					
BLE_GAP_IOC	Output					

AP_DISPLAY_ONLY(0x00) function :
Local device has the ability to display a 6 digit decimal number.
Input function : None

BLE_GAP_IOC AP_DISPLAY_YESNO(0x01) Output function :
Output function :
Local device has the ability to display a 6 digit decimal number.
Input function : Local device has the ability to indicate 'yes' or 'no'

BLE_GAP_IOC AP_KEYBOARD_ONLY(0x02) Output function :
None
Input function : Local device has the ability to input the number '0' - '9'.

BLE_GAP_IOC AP_NOINPUT_NOOUTPUT(0x03) Output function :
None
Input function : None

BLE_GAP_IOC AP_KEYBOARD_DISPLAY(0x04) Output function :
Output function :
Local device has the ability to display a 6 digit decimal number.
Input function : Local device has the ability

		to input the number '0' - '9'.						
uint8_t	mitm	<p>MITM protection policy.</p> <p>Select one of the following.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_SEC_MITM_BEST_EFFORT(0x00)</td> <td>MITM Protection not required.</td> </tr> <tr> <td>BLE_GAP_SEC_MITM_STRICT(0x01)</td> <td>MITM Protection required.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_SEC_MITM_BEST_EFFORT(0x00)	MITM Protection not required.	BLE_GAP_SEC_MITM_STRICT(0x01)	MITM Protection required.
macro	description							
BLE_GAP_SEC_MITM_BEST_EFFORT(0x00)	MITM Protection not required.							
BLE_GAP_SEC_MITM_STRICT(0x01)	MITM Protection required.							
uint8_t	bonding	<p>Bonding policy.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_BONDING_NONE(0x00)</td> <td>Local device doesn't store Bonding information.</td> </tr> <tr> <td>BLE_GAP_BONDING(0x01)</td> <td>Local device stores Bonding information.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_BONDING_NONE(0x00)	Local device doesn't store Bonding information.	BLE_GAP_BONDING(0x01)	Local device stores Bonding information.
macro	description							
BLE_GAP_BONDING_NONE(0x00)	Local device doesn't store Bonding information.							
BLE_GAP_BONDING(0x01)	Local device stores Bonding information.							
uint8_t	max_key_size	<p>Maximum LTK size(in bytes).</p> <p>Valid range is 7 - 16. This field shall be set to a value not less than the min_key_size field.</p>						
uint8_t	min_key_size	<p>Minimum LTK size(in bytes).</p> <p>Valid range is 7 - 16. This field shall be set to a value not more than the max_key_size field.</p>						
uint8_t	loc_key_dist	<p>Type of keys to be distributed from local device.</p> <p>The loc_key_dist field is set to a bitwise OR of the following values.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_KEY_DIST_ENCKEY</td> <td>LTK</td> </tr> </tbody> </table>	macro	description	BLE_GAP_KEY_DIST_ENCKEY	LTK

macro	description									
BLE_GAP_SC_BEST_EFFORT(0x00)	Accept Legacy pairing and Secure									

		Connections. BLE_GAP_SC_STRICT(0x01) Accept only Secure Connections.
--	--	--

◆ st_ble_gap_oob_data_t

struct st_ble_gap_oob_data_t		
Oob data received from the remote device. This is used in R_BLE_GAP_SetRemOobData().		
Data Fields		
uint8_t	legacy_oob[BLE_GAP_LEGACY_OOB_SIZE]	OOB data used in Legacy Pairing.
uint8_t	sc_cnf_val[BLE_GAP_OOB_CONFIRM_VAL_SIZE]	OOB confirmation value used in Secure Connections.
uint8_t	sc_rand[BLE_GAP_OOB_RANDOM_VAL_SIZE]	OOB rand used in Secure Connections.

◆ st_ble_gap_ver_num_t

struct st_ble_gap_ver_num_t		
Version number of host stack.		
Data Fields		
uint8_t	major	Major version number.
uint8_t	minor	Minor version number.
uint8_t	subminor	Subminor version number.

◆ st_ble_gap_loc_ver_info_t

struct st_ble_gap_loc_ver_info_t		
Version number of Controller. Refer Bluetooth SIG Assigned Number(https://www.bluetooth.com/specifications/assigned-numbers).		
Data Fields		
uint8_t	hci_ver	Bluetooth HCI version.
uint16_t	hci_rev	Bluetooth HCI revision.
uint8_t	imp_ver	Link Layer revision.
uint16_t	mnf_name	Manufacturer ID.
uint16_t	imp_sub_ver	Link Layer subversion.

◆ st_ble_gap_loc_dev_info_evt_t

struct st_ble_gap_loc_dev_info_evt_t		
--------------------------------------	--	--

Version information of local device.		
Data Fields		
<code>st_ble_dev_addr_t</code>	<code>l_dev_addr</code>	Bluetooth Device Address.
<code>st_ble_gap_ver_num_t</code>	<code>l_ver_num</code>	Version number of host stack in local device.
<code>st_ble_gap_loc_ver_info_t</code>	<code>l_bt_info</code>	Version number of Controller in local device.

◆ `st_ble_gap_hw_err_evt_t`

struct <code>st_ble_gap_hw_err_evt_t</code>		
Hardware error that is notified from Controller.		
Data Fields		
<code>uint8_t</code>	<code>hw_code</code>	The <code>hw_code</code> field indicates the cause of the hardware error.

◆ `st_ble_gap_cmd_err_evt_t`

struct <code>st_ble_gap_cmd_err_evt_t</code>		
HCI Command error.		
Data Fields		
<code>uint16_t</code>	<code>op_code</code>	The opcode of HCI Command which caused the error.
<code>uint32_t</code>	<code>module_id</code>	Module ID which caused the error.

◆ `st_ble_gap_adv_rept_t`

struct <code>st_ble_gap_adv_rept_t</code>								
Advertising Report.								
Data Fields								
<code>uint8_t</code>	<code>num</code>	The number of Advertising Reports received.						
<code>uint8_t</code>	<code>adv_type</code>	Type of Advertising Packet. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">valuer</th> <th style="width: 80%;">description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Connectable and scannable undirected advertising(ADV_IND).</td> </tr> <tr> <td>0x01</td> <td>Connectable directed advertising(ADV_DIRECT_IND).</td> </tr> </tbody> </table>	valuer	description	0x00	Connectable and scannable undirected advertising(ADV_IND).	0x01	Connectable directed advertising(ADV_DIRECT_IND).
valuer	description							
0x00	Connectable and scannable undirected advertising(ADV_IND).							
0x01	Connectable directed advertising(ADV_DIRECT_IND).							

		<p>0x02 Scannable undirected advertising(ADV_SCAN_IND).</p> <p>0x03 Non-connectable undirected advertising(ADV_NONCONN_IND).</p> <p>0x04 Scan response(SCAN_RSP).</p>

value	description											
0x00	Public Address.											
0x01	Random Address.											
0x02	Public Identity Address which could be resolved in Controller.											
0x03	Random Identity Address which could be resolved in Controller.											
uint8_t *	p_addr	<p>Address of the advertiser.</p> <p><i>Note</i> The BD address setting format is little endian.</p>										
uint8_t	len	<p>Length of Advertising data(in bytes).</p> <p>Valid range is 0 - 31.</p>										
int8_t	rss_i	<p>RSSI(in dBm).</p> <p>Valid range is $-127 \leq tx_pwr \leq 20$ and 127. If the tx_pwr is 127, it means that RSSI could not be retrieved.</p>										
uint8_t *	p_data	Advertising data/Scan Response Data.										

◆ **st_ble_gap_ext_adv_rept_t**

struct st_ble_gap_ext_adv_rept_t																
Extended Advertising Report.																
Data Fields																
uint8_t	num	The number of Advertising Reports received.														
uint16_t	adv_type	Type of Advertising Packet.														
		<table border="1"> <thead> <tr> <th>Bit Number</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Connectable advertising.</td> </tr> <tr> <td>1</td> <td>Scannable advertising.</td> </tr> <tr> <td>2</td> <td>Directed advertising.</td> </tr> <tr> <td>3</td> <td>Scan response.</td> </tr> <tr> <td>4</td> <td>Legacy advertising PDU.</td> </tr> <tr> <td>5-6</td> <td>The status of Advertising Data/Scan Response Data. Data Status: 00b = Complete 01b = Incomplete, more data come 10b = Incomplete, data truncated, no more to come</td> </tr> <tr> <td>All other bits</td> <td>Reserved for future use</td> </tr> </tbody> </table>	Bit Number	description	0	Connectable advertising.	1	Scannable advertising.	2	Directed advertising.	3	Scan response.	4	Legacy advertising PDU.	5-6	The status of Advertising Data/Scan Response Data. Data Status: 00b = Complete 01b = Incomplete, more data come 10b = Incomplete, data truncated, no more to come
Bit Number	description															
0	Connectable advertising.															
1	Scannable advertising.															
2	Directed advertising.															
3	Scan response.															
4	Legacy advertising PDU.															
5-6	The status of Advertising Data/Scan Response Data. Data Status: 00b = Complete 01b = Incomplete, more data come 10b = Incomplete, data truncated, no more to come															
All other bits	Reserved for future use															
uint8_t	addr_type	Address type of the advertiser.														
		<table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Public Address.</td> </tr> <tr> <td>0x01</td> <td>Random</td> </tr> </tbody> </table>	value	description	0x00	Public Address.	0x01	Random								
value	description															
0x00	Public Address.															
0x01	Random															

		<p>Address.</p> <p>0x02 Public Identity Address which could be resolved in Controller.</p> <p>0x03 Random Identity Address which could be resolved in Controller.</p> <p>0xFF Anonymous advertisement</p>								
uint8_t *	p_addr	<p>Address of the advertiser.</p> <p><i>Note</i> The BD address setting format is little endian.</p>								
uint8_t	adv_phy	<p>The primary PHY configuration of the advertiser.</p> <p>The primary PHY configuration of the advertiser.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>1M PHY</td> </tr> <tr> <td>0x03</td> <td>Coded PHY</td> </tr> </tbody> </table>	value	description	0x01	1M PHY	0x03	Coded PHY		
value	description									
0x01	1M PHY									
0x03	Coded PHY									
uint8_t	sec_adv_phy	<p>The secondary PHY configuration of the advertiser.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Nothing has been received with Secondary Advertising Channel.</td> </tr> <tr> <td>0x01</td> <td>The Secondary Advertising PHY configuration was 1M PHY.</td> </tr> <tr> <td>0x02</td> <td>The Secondary Advertising</td> </tr> </tbody> </table>	value	description	0x00	Nothing has been received with Secondary Advertising Channel.	0x01	The Secondary Advertising PHY configuration was 1M PHY.	0x02	The Secondary Advertising
value	description									
0x00	Nothing has been received with Secondary Advertising Channel.									
0x01	The Secondary Advertising PHY configuration was 1M PHY.									
0x02	The Secondary Advertising									

		<p>PHY configuration was 2M PHY.</p> <p>0x03 The Secondary Advertising PHY configuration was Coded PHY.</p>						
uint8_t	adv_sid	<p>Advertising SID included in the received Advertising Report.</p> <p>Valid range is $0 \leq \text{adv_sid} \leq 0x0F$ and $0xFF$. If the adv_sid is 0xFF, there is no field which includes SID.</p>						
int8_t	tx_pwr	<p>TX power(in dBm).</p> <p>Valid range is $-127 \leq \text{tx_pwr} \leq 20$ and 127. If the tx_pwr is 127, it means that Tx power could not be retrieved.</p>						
int8_t	rssr	<p>RSSI(in dBm).</p> <p>Valid range is $-127 \leq \text{tx_pwr} \leq 20$ and 127. If the tx_pwr is 127, it means that RSSI could not be retrieved.</p>						
uint16_t	perd_adv_intv	<p>Periodic Advertising interval.</p> <p>If the perd_adv_intv is 0x0000, it means that this advertising is not periodic advertising. If the perd_adv_intv is 0x0006 - 0xFFFF, it means that this field is the Periodic Advertising interval. Periodic Advertising interval = per_adv_intr * 1.25ms.</p>						
uint8_t	dir_addr_type	<p>The address type of Direct Advertising PDU.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Public Address.</td> </tr> <tr> <td>0x01</td> <td>Random Address.</td> </tr> </tbody> </table>	value	description	0x00	Public Address.	0x01	Random Address.
value	description							
0x00	Public Address.							
0x01	Random Address.							

		0x02 Public Identity Address which could be resolved in Controller. 0x03 Random Identity Address which could be resolved in Controller. 0xFE Resolvable Privacy Address which could not be resolved in Controller.
uint8_t *	p_dir_addr	Address of Direct Advertising PDU. <i>Note</i> <i>The BD address setting format is little endian.</i>
uint8_t	len	Length of Advertising data(in bytes). Valid range is 0 - 229.
uint8_t *	p_data	Advertising data/Scan Response Data.

◆ st_ble_gap_perd_adv_rept_t

struct st_ble_gap_perd_adv_rept_t		
Periodic Advertising Report.		
Data Fields		
uint16_t	sync_hdl	Sync handle. Valid range is 0x0000 - 0x0EFF.
int8_t	tx_pwr	TX power(in dBm). Valid range is -127 <= tx_pwr <= 20 and 127. If tx_pwr is 127, it means that Tx power could not be retrieved.
int8_t	rssr	RSSI(in dBm). Valid range is -127 <= rssr <=

		20 and 127. If rssi is 127, it means that RSSI could not be retrieved.								
uint8_t	rfu	Reserved for future use.								
uint8_t	data_status	Reserved for future use. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Data Complete.</td> </tr> <tr> <td>0x01</td> <td>Data incomplete, more data to come.</td> </tr> <tr> <td>0x02</td> <td>Data incomplete, data truncated, no more to come.</td> </tr> </tbody> </table>	value	description	0x00	Data Complete.	0x01	Data incomplete, more data to come.	0x02	Data incomplete, data truncated, no more to come.
value	description									
0x00	Data Complete.									
0x01	Data incomplete, more data to come.									
0x02	Data incomplete, data truncated, no more to come.									
uint8_t	len	Length of Periodic Advertising data(in bytes). Valid range is 0 - 247.								
uint8_t *	p_data	Periodic Advertising data.								

◆ **st_ble_gap_adv_rept_evt_t**

struct st_ble_gap_adv_rept_evt_t										
Advertising report.										
Data Fields										
uint8_t	adv_rpt_type	Data type. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Advertising Report.</td> </tr> <tr> <td>0x01</td> <td>Extended Advertising Report.</td> </tr> <tr> <td>0x02</td> <td>Periodic Advertising Report.</td> </tr> </tbody> </table> <p>If the BLE Protocol Stack library type is "extended", the adv_rpt_type field in a Legacy Advertising Report event is 0x01.</p>	value	description	0x00	Advertising Report.	0x01	Extended Advertising Report.	0x02	Periodic Advertising Report.
value	description									
0x00	Advertising Report.									
0x01	Extended Advertising Report.									
0x02	Periodic Advertising Report.									

union st_ble_gap_adv_rept_evt_t	param	Advertising Report.
--	-------	---------------------

◆ [st_ble_gap_adv_rept_evt_t.param](#)

union st_ble_gap_adv_rept_evt_t.param		
Advertising Report.		
Data Fields		
st_ble_gap_adv_rept_t *	p_adv_rpt	Advertising Report.
st_ble_gap_ext_adv_rept_t *	p_ext_adv_rpt	Extended Advertising Report.
st_ble_gap_perd_adv_rept_t *	p_per_adv_rpt	Periodic Advertising Report.

◆ [st_ble_gap_adv_set_evt_t](#)

struct st_ble_gap_adv_set_evt_t		
Advertising handle.		
Data Fields		
uint8_t	adv_hdl	Advertising handle specifying the advertising set configured advertising parameters.

◆ [st_ble_gap_adv_off_evt_t](#)

struct st_ble_gap_adv_off_evt_t								
Information about the advertising set which stops advertising.								
Data Fields								
uint8_t	adv_hdl	Advertising handle identifying the advertising set which has stopped advertising. Valid range is 0x00 - 0x03.						
uint8_t	reason	The reason for stopping advertising. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">value</th> <th style="width: 80%;">description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>Advertising has been stopped by R_BLE_GAP_StopAdv().</td> </tr> <tr> <td>0x02</td> <td>Because the duration specified by R_BLE_GAP_StartAdv() was expired, advertising</td> </tr> </tbody> </table>	value	description	0x01	Advertising has been stopped by R_BLE_GAP_StopAdv() .	0x02	Because the duration specified by R_BLE_GAP_StartAdv() was expired, advertising
value	description							
0x01	Advertising has been stopped by R_BLE_GAP_StopAdv() .							
0x02	Because the duration specified by R_BLE_GAP_StartAdv() was expired, advertising							

		<p>has terminated.</p> <p>0x03 Because the max_extd_adv_evts parameter specified by R_BLE_GAP_StartAdv() was reached, advertising has terminated.</p> <p>0x04 Because the connection was established with the remote device, advertising has terminated.</p>
uint16_t	conn_hdl	<p>Connection handle.</p> <p>If the reason field is 0x04, this field indicates connection handle identifying the remote device connected with local device. If other reasons, ignore this field.</p>
uint8_t	num_comp_ext_adv_evts	<p>The number of the advertising event that has been received until advertising has terminated.</p> <p>If max_extd_adv_evts by R_BLE_GAP_StartAdv() is not 0, this parameter is valid.</p>

◆ st_ble_gap_adv_data_evt_t

struct st_ble_gap_adv_data_evt_t		
This structure notifies that advertising data has been set to Controller by R_BLE_GAP_SetAdvSresData() .		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to which advertising data/scan response data/periodic advertising data is set.

uint8_t	data_type	Type of the data set to the advertising set.	
		value	description
		BLE_GAP_ADV_DATA_MODE(0x00)	Advertising data
		BLE_GAP_SCAN_RSP_DATA_MODE(0x01)	Scan response data
		BLE_GAP_PERIODIC_ADV_DATA_MODE(0x02)	Periodic advertising data

◆ st_ble_gap_rem_adv_set_evt_t

struct st_ble_gap_rem_adv_set_evt_t			
This structure notifies that an advertising set has been removed.			
Data Fields			
uint8_t	remove_op	This field indicates that the advertising set has been removed or cleared.	
		value	description
		0x01	The advertising set has been removed.
		0x02	The advertising set has been cleared.
uint8_t	adv_hdl	Advertising handle identifying the advertising set which has been removed.	
		If the advertising set has been cleared, this field is ignored.	

◆ st_ble_gap_conn_evt_t

struct st_ble_gap_conn_evt_t			
This structure notifies that a link has been established.			
Data Fields			
uint16_t	conn_hdl	Connection handle identifying the created link.	
uint8_t	role	The role of the link.	

		value	description
		0x00	Master
		0x01	Slave
uint8_t	remote_addr_type	Address type of the remote device.	
		value	description
		0x00	Public Address
		0x01	Random Address
		0x02	Public Identity Address. It indicates that the Controller could resolve the resolvable private address of the remote device.
		0x03	Random Identity Address. It indicates that the Controller could resolve the resolvable private address of the remote device.
uint8_t	remote_addr[BLE_BD_ADDR_LEN]	Address of the remote device.	
		<i>Note</i> The BD address setting format is little endian.	
uint8_t	local_rpa[BLE_BD_ADDR_LEN]	Resolvable private address that local device used in connection procedure.	
		The local device address used in creating the link when the address type was set to BLE_GAP_ADDR_RPA_ID_PUBLIC or BLE_GAP_ADDR_RPA_ID_RANDOM by	

		<p>R_BLE_GAP_SetAdvParam() or R_BLE_GAP_CreateConn(). If the address type was set to other than BLE_GAP_ADDR_RPA_ID_PUBLIC and BLE_GAP_ADDR_RPA_ID_RANDOM, this field is set to all-zero.</p> <p><i>Note</i> The BD address setting format is little endian.</p>														
uint8_t	remote_rpa[BLE_BD_ADDR_LEN]	<p>Resolvable private address that the remote device used in connection procedure.</p> <p>This field indicates the remote resolvable private address when remote_addr_type is 0x02 or 0x03. If remote_addr_type is other than 0x02 and 0x03, this field is set to all-zero.</p> <p><i>Note</i> The BD address setting format is little endian.</p>														
uint16_t	conn_intv	<p>Connection interval.</p> <p>Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv * 1.25.</p>														
uint16_t	conn_latency	<p>Slave latency.</p> <p>Valid range is 0x0000 - 0x01F3.</p>														
uint16_t	sup_to	<p>Supervision timeout.</p> <p>Valid range is 0x000A - 0x0C80. Time(ms) = sup_to * 10.</p>														
uint8_t	clk_acc	<p>Master_Clock_Accuracy.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>500ppm</td> </tr> <tr> <td>0x01</td> <td>250ppm</td> </tr> <tr> <td>0x02</td> <td>150ppm</td> </tr> <tr> <td>0x03</td> <td>100ppm</td> </tr> <tr> <td>0x04</td> <td>75ppm</td> </tr> <tr> <td>0x05</td> <td>50ppm</td> </tr> </tbody> </table>	value	description	0x00	500ppm	0x01	250ppm	0x02	150ppm	0x03	100ppm	0x04	75ppm	0x05	50ppm
value	description															
0x00	500ppm															
0x01	250ppm															
0x02	150ppm															
0x03	100ppm															
0x04	75ppm															
0x05	50ppm															

		0x06	30ppm
		0x07	20ppm

◆ st_ble_gap_disconn_evt_t

struct st_ble_gap_disconn_evt_t		
This structure notifies that a link has been disconnected.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link disconnected.
uint8_t	reason	The reason for disconnection. Refer Core Specification Vol.2 Part D , "2 Error Code Descriptions".

◆ st_ble_gap_rd_ch_map_evt_t

struct st_ble_gap_rd_ch_map_evt_t		
This structure notifies that Channel Map has been retrieved by R_BLE_GAP_ReadChMap() .		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link whose Channel Map was retrieved.
uint8_t	ch_map[BLE_GAP_CH_MAP_SIZE]	Channel Map.

◆ st_ble_gap_rd_rssi_evt_t

struct st_ble_gap_rd_rssi_evt_t		
This structure notifies that RSSI has been retrieved by R_BLE_GAP_ReadRssi() .		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link whose RSSI was retrieved.
int8_t	rssi	RSSI(in dBm). Valid range is $-127 < rssi < 20$ and 127. If this field is 127, it indicates that RSSI could not be retrieved.

◆ st_ble_gap_dev_info_evt_t

struct st_ble_gap_dev_info_evt_t		

This structure notifies that information about remote device has been retrieved by [R_BLE_GAP_GetRemDevInfo\(\)](#).

Data Fields												
uint16_t	conn_hdl	Connection handle identifying the remote device whose information has been retrieved.										
uint8_t	get_status	Information about the remote device. This field is a bitwise OR of the following values. <table border="1" data-bbox="1034 577 1471 958"> <thead> <tr> <th>Bit Number</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>bit0</td> <td>Address</td> </tr> <tr> <td>bit1</td> <td>Version, company_id, subversion</td> </tr> <tr> <td>bit2</td> <td>Feature</td> </tr> <tr> <td>All other bits</td> <td>Reserved for future use</td> </tr> </tbody> </table>	Bit Number	description	bit0	Address	bit1	Version, company_id, subversion	bit2	Feature	All other bits	Reserved for future use
Bit Number	description											
bit0	Address											
bit1	Version, company_id, subversion											
bit2	Feature											
All other bits	Reserved for future use											
st_ble_dev_addr_t	addr	Address of the remote device.										
uint8_t	version	The version of Link Layer of the remote device. Refer to Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers) regarding defined number.										
uint16_t	company_id	The manufacturer ID of the remote device. Refer to Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers) regarding defined number.										
uint16_t	subversion	The subversion of Link Layer.										
uint8_t	features[BLE_GAP_REM_FEATURE_SIZE]	LE feature supported in the remote device. Refer to Core Spec Vol 6, Part B 4.6 FEATURE SUPPORT.										

◆ [st_ble_gap_conn_upd_evt_t](#)

```
struct st_ble_gap_conn_upd_evt_t
```

This structure notifies that connection parameters has been updated.

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the connection whose parameters has been updated.
uint16_t	conn_intv	Updated Connection Interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv * 1.25.
uint16_t	conn_latency	Updated slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Updated supervision timeout. Valid range is 0x000A - 0x0C80. Time(ms) = sup_to * 10.

◆ st_ble_gap_conn_upd_req_evt_t

```
struct st_ble_gap_conn_upd_req_evt_t
```

This structure notifies that a request for connection parameters update has been received.

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link that was requested to update connection parameters.
uint16_t	conn_intv_min	Minimum connection interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv_min * 1.25.
uint16_t	conn_intv_max	Maximum connection interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv_max * 1.25.
uint16_t	conn_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Supervision timeout. Valid range is 0x000A - 0x0C80. Time(ms) = sup_to * 10

◆ st_ble_gap_conn_hdl_evt_t

```
struct st_ble_gap_conn_hdl_evt_t
```

This structure notifies that a GAP Event that includes only connection handle has occurred.

Data Fields

uint16_t	conn_hdl	Connection handle.
----------	----------	--------------------

◆ **st_ble_gap_data_len_chg_evt_t**

struct st_ble_gap_data_len_chg_evt_t

This structure notifies that the packet data length has been updated.

Data Fields

uint16_t	conn_hdl	Connection handle identifying the link that updated Data Length.
uint16_t	tx_octets	Updated transmission packet size(in bytes). Valid range is 0x001B - 0x00FB.
uint16_t	tx_time	Updated transmission time(us). Valid range is 0x0148 - 0x4290.
uint16_t	rx_octets	Updated receive packet size(in bytes). Valid range is 0x001B - 0x00FB.
uint16_t	rx_time	Updated receive time(us). Valid range is 0x0148 - 0x4290.

◆ **st_ble_gap_rd_rpa_evt_t**

struct st_ble_gap_rd_rpa_evt_t

This structure notifies that the local resolvable private address has been retrieved by [R_BLE_GAP_ReadRpa\(\)](#).

Data Fields

st_ble_dev_addr_t	addr	The resolvable private address of local device.
-----------------------------------	------	---

◆ **st_ble_gap_phy_upd_evt_t**

struct st_ble_gap_phy_upd_evt_t

This structure notifies that PHY for a connection has been updated.

Data Fields

uint16_t	conn_hdl	Connection handle identifying
----------	----------	-------------------------------

		the link that has been updated.								
uint8_t	tx_phy	Transmitter PHY. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The transmitter PHY has been updated to 1M PHY.</td> </tr> <tr> <td>0x02</td> <td>The transmitter PHY has been updated to 2M PHY.</td> </tr> <tr> <td>0x03</td> <td>The transmitter PHY has been updated to Coded PHY.</td> </tr> </tbody> </table>	value	description	0x01	The transmitter PHY has been updated to 1M PHY.	0x02	The transmitter PHY has been updated to 2M PHY.	0x03	The transmitter PHY has been updated to Coded PHY.
value	description									
0x01	The transmitter PHY has been updated to 1M PHY.									
0x02	The transmitter PHY has been updated to 2M PHY.									
0x03	The transmitter PHY has been updated to Coded PHY.									
uint8_t	rx_phy	Receiver PHY. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The receiver PHY has been updated to 1M PHY.</td> </tr> <tr> <td>0x02</td> <td>The receiver PHY has been updated to 2M PHY.</td> </tr> <tr> <td>0x03</td> <td>The receiver PHY has been updated to Coded PHY.</td> </tr> </tbody> </table>	value	description	0x01	The receiver PHY has been updated to 1M PHY.	0x02	The receiver PHY has been updated to 2M PHY.	0x03	The receiver PHY has been updated to Coded PHY.
value	description									
0x01	The receiver PHY has been updated to 1M PHY.									
0x02	The receiver PHY has been updated to 2M PHY.									
0x03	The receiver PHY has been updated to Coded PHY.									

◆ st_ble_gap_phy_rd_evt_t

struct st_ble_gap_phy_rd_evt_t						
This structure notifies that the PHY settings has been retrieved by R_BLE_GAP_ReadPhy() .						
Data Fields						
uint16_t	conn_hdl	Connection handle identifying the link that has been retrieved the PHY settings.				
uint8_t	tx_phy	Transmitter PHY. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The transmitter</td> </tr> </tbody> </table>	value	description	0x01	The transmitter
value	description					
0x01	The transmitter					

		<p>0x02 The transmitter PHY has been updated to 1M PHY.</p> <p>0x03 The transmitter PHY has been updated to Coded PHY.</p>								
uint8_t	rx_phy	<p>Receiver PHY.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>The receiver PHY has been updated to 1M PHY.</td> </tr> <tr> <td>0x02</td> <td>The receiver PHY has been updated to 2M PHY.</td> </tr> <tr> <td>0x03</td> <td>The receiver PHY has been updated to Coded PHY.</td> </tr> </tbody> </table>	value	description	0x01	The receiver PHY has been updated to 1M PHY.	0x02	The receiver PHY has been updated to 2M PHY.	0x03	The receiver PHY has been updated to Coded PHY.
value	description									
0x01	The receiver PHY has been updated to 1M PHY.									
0x02	The receiver PHY has been updated to 2M PHY.									
0x03	The receiver PHY has been updated to Coded PHY.									

◆ **st_ble_gap_scan_req_rcv_evt_t**

struct st_ble_gap_scan_req_rcv_evt_t										
This structure notifies that a Scan Request packet has been received from a Scanner.										
Data Fields										
uint8_t	adv_hdl	Advertising handle identifying the advertising set that has received the Scan Request.								
uint8_t	scanner_addr_type	<p>Address type of the Scanner.</p> <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Public Address.</td> </tr> <tr> <td>0x01</td> <td>Random Address.</td> </tr> <tr> <td>0x02</td> <td>Public Identity Address which could be resolved in</td> </tr> </tbody> </table>	value	description	0x00	Public Address.	0x01	Random Address.	0x02	Public Identity Address which could be resolved in
value	description									
0x00	Public Address.									
0x01	Random Address.									
0x02	Public Identity Address which could be resolved in									

		0x03	Controller. Random Identity Address which could be resolved in Controller.
uint8_t	scanner_addr[BLE_BD_ADDR_LEN]	Address of the Scanner. <i>Note</i> The BD address setting format is little endian.	

◆ st_ble_gap_sync_est_evt_t

struct st_ble_gap_sync_est_evt_t			
This structure notifies that a Periodic sync has been established.			
Data Fields			
uint16_t	sync_hdl	Sync handle identifying the Periodic Sync that has been established.	
uint8_t	adv_sid	Advertising SID identifying the advertising set that has established the Periodic Sync.	
uint8_t	adv_addr_type	Address type of the advertiser.	
		value	description
		0x00	Public Address.
		0x01	Random Address.
		0x02	Public Identity Address which could be resolved in Controller.
		0x03	Random Identity Address which could be resolved in Controller.
uint8_t *	p_adv_addr	Address of the advertiser. <i>Note</i> The BD address setting format is little endian.	

uint8_t	adv_phy	Advertising PHY.	
		value	description
		0x01	Advertiser PHY is 1M PHY.
		0x02	Advertiser PHY is 2M PHY.
	0x03	Advertiser PHY is Coded PHY.	
uint16_t	perd_adv_intv	Periodic Advertising Interval. Valid range is 0x0006 - 0xFFFF. Time(ms) = perd_adv_intv * 1.25.	
uint8_t	adv_clk_acc	Advertiser Clock Accuracy.	
		value	description
		0x00	500ppm
		0x01	250ppm
		0x02	150ppm
		0x03	100ppm
		0x04	75ppm
		0x05	50ppm
		0x06	30ppm
0x07	20ppm		

◆ **st_ble_gap_sync_hdl_evt_t**

struct st_ble_gap_sync_hdl_evt_t		
This structure notifies that a GAP Event that includes only sync handle has occurred.		
Data Fields		
uint16_t	sync_hdl	Sync handle.

◆ **st_ble_gap_white_list_conf_evt_t**

struct st_ble_gap_white_list_conf_evt_t			
This structure notifies that White List has been configured.			
Data Fields			
uint8_t	op_code	The operation for White List.	
		value	description

		0x01	A device was added to White List.
		0x02	A device was deleted from White List.
		0x03	White List was cleared.
uint8_t	num	The number of devices which have been added to or deleted from White List.	

◆ st_ble_gap_rslv_list_conf_evt_t

struct st_ble_gap_rslv_list_conf_evt_t			
This structure notifies that Resolving List has been configured.			
Data Fields			
uint8_t	op_code	The operation for Resolving List.	
		value	description
		0x01	A device was added to Resolving List.
		0x02	A device was deleted from Resolving List.
		0x03	Resolving List was cleared.
uint8_t	num	The number of devices which have been added to or deleted from Resolving List.	

◆ st_ble_gap_perd_list_conf_evt_t

struct st_ble_gap_perd_list_conf_evt_t			
This structure notifies that Periodic Advertiser List has been configured.			
Data Fields			
uint8_t	op_code	The operation for Periodic Advertiser List.	
		value	description
		0x01	A device was added to Periodic Advertiser List.

		0x02	A device was deleted from Periodic Advertiser List.
		0x03	Periodic Advertiser List was cleared.
uint8_t	num	The number of devices which have been added to or deleted from Periodic Advertiser List.	

◆ st_ble_gap_set_priv_mode_evt_t

struct st_ble_gap_set_priv_mode_evt_t			
This structure notifies that Privacy Mode has been configured.			
Data Fields			
uint8_t	num	The number of devices which have been set privacy mode.	

◆ st_ble_gap_pairing_req_evt_t

struct st_ble_gap_pairing_req_evt_t			
This structure notifies that a pairing request from a remote device has been received.			
Data Fields			
uint16_t	conn_hdl	Connection handle identifying the remote device that sent the pairing request.	
st_ble_dev_addr_t	bd_addr	The address of the remote device.	
st_ble_gap_auth_info_t	auth_info	The Pairing parameters of the remote device.	

◆ st_ble_gap_passkey_display_evt_t

struct st_ble_gap_passkey_display_evt_t			
This structure notifies that a request for Passkey display in pairing has been received.			
Data Fields			
uint16_t	conn_hdl	Connection handle identifying the remote device that requested Passkey display.	
uint32_t	passkey	Passkey. This field is a 6 digit decimal number(000000-999999).	

◆ st_ble_gap_num_comp_evt_t

struct st_ble_gap_num_comp_evt_t		
This structure notifies that a request for Numeric Comparison in pairing has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that requested Numeric Comparison.
uint32_t	numeric	The number to be confirmed in Numeric Comparison. This field is a 6 digit decimal number(000000-999999).

◆ st_ble_gap_key_press_ntf_evt_t

struct st_ble_gap_key_press_ntf_evt_t														
This structure notifies that the remote device has input a key in Passkey Entry.														
Data Fields														
uint16_t	conn_hdl	Connection handle identifying the remote device that input a key.												
uint8_t	key_type	Type of the key that the remote device input. <table border="1" data-bbox="1034 1137 1471 1630"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Passkey entry started.</td> </tr> <tr> <td>0x01</td> <td>Passkey digit entered.</td> </tr> <tr> <td>0x02</td> <td>Passkey digit erased.</td> </tr> <tr> <td>0x03</td> <td>Passkey cleared.</td> </tr> <tr> <td>0x04</td> <td>Passkey entry completed.</td> </tr> </tbody> </table>	value	description	0x00	Passkey entry started.	0x01	Passkey digit entered.	0x02	Passkey digit erased.	0x03	Passkey cleared.	0x04	Passkey entry completed.
value	description													
0x00	Passkey entry started.													
0x01	Passkey digit entered.													
0x02	Passkey digit erased.													
0x03	Passkey cleared.													
0x04	Passkey entry completed.													

◆ st_ble_gap_pairing_info_evt_t

struct st_ble_gap_pairing_info_evt_t		
This structure notifies that the pairing has completed.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that the pairing has been done with.
st_ble_dev_addr_t	bd_addr	Address of the remote device.

st_ble_gap_auth_info_t	auth_info	Key information exchanged in pairing. If local device supports bonding, store the information in non-volatile memory in order to set it to host stack after power re-supply.
--	-----------	---

◆ st_ble_gap_enc_chg_evt_t

struct st_ble_gap_enc_chg_evt_t										
This structure notifies that the encryption status of a link has been changed.										
Data Fields										
uint16_t	conn_hdl	Connection handle identifying the link that has been changed.								
uint8_t	enc_status	Encryption Status. <table border="1" style="width: 100%;"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Encryption OFF.</td> </tr> <tr> <td>0x01</td> <td>Encryption ON.</td> </tr> <tr> <td>0x03</td> <td>Encryption updated by Encryption Key Refresh Completed.</td> </tr> </tbody> </table>	value	description	0x00	Encryption OFF.	0x01	Encryption ON.	0x03	Encryption updated by Encryption Key Refresh Completed.
value	description									
0x00	Encryption OFF.									
0x01	Encryption ON.									
0x03	Encryption updated by Encryption Key Refresh Completed.									

◆ st_ble_gap_peer_key_info_evt_t

struct st_ble_gap_peer_key_info_evt_t		
This structure notifies that the remote device has distributed the keys.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that has distributed the keys.
st_ble_dev_addr_t	bd_addr	Address of the remote device.
st_ble_gap_key_ex_param_t	key_ex_param	Distributed keys. If local device supports bonding, store the keys in non-volatile memory and at power re-supply set to the host stack by R_BLE_GAP_SetBondInfo() .

◆ st_ble_gap_ltk_req_evt_t

--	--	--

struct st_ble_gap_ltk_req_evt_t		
This structure notifies that a LTK request from a remote device has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device which requests for the LTK.
uint16_t	ediv	Ediv.
uint8_t *	p_peer_rand	Rand.

◆ st_ble_gap_ltk_rsp_evt_t

struct st_ble_gap_ltk_rsp_evt_t								
This structure notifies that local device has replied to the LTK request from the remote device.								
Data Fields								
uint16_t	conn_hdl	Connection handle identifying the remote device to be sent the response to the LTK request.						
uint8_t	response	The response to the LTK request. <table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Local device replied with the stored LTK.</td> </tr> <tr> <td>0x01</td> <td>Local device rejected the LTK request, because the LTK was not found.</td> </tr> </tbody> </table>	value	description	0x00	Local device replied with the stored LTK.	0x01	Local device rejected the LTK request, because the LTK was not found.
value	description							
0x00	Local device replied with the stored LTK.							
0x01	Local device rejected the LTK request, because the LTK was not found.							

◆ st_ble_gap_sc_oob_data_evt_t

struct st_ble_gap_sc_oob_data_evt_t		
This structure notifies that OOB data for Secure Connections has been generated by R_BLE_GAP_CreateScOobData() .		
Data Fields		
uint8_t *	p_sc_oob_conf	Confirmation value(16 bytes) of OOB Data.
uint8_t *	p_sc_oob_rand	Rand(16bytes) of OOB Data.

◆ st_ble_gap_bond_info_t

struct st_ble_gap_bond_info_t		

Bonding information used in `R_BLE_GAP_SetBondInfo()`.

Data Fields		
<code>st_ble_dev_addr_t *</code>	<code>p_addr</code>	Address of the device which exchanged the keys.
<code>st_ble_gap_auth_info_t *</code>	<code>p_auth_info</code>	Information about the keys.
<code>st_ble_gap_key_ex_param_t *</code>	<code>p_keys</code>	Keys distributed from the remote device in pairing.

Macro Definition Documentation

◆ BLE_BD_ADDR_LEN

```
#define BLE_BD_ADDR_LEN
```

Bluetooth Device Address Size

◆ BLE_MASTER

```
#define BLE_MASTER
```

Master Role.

◆ BLE_SLAVE

```
#define BLE_SLAVE
```

Slave Role.

◆ BLE_GAP_ADDR_PUBLIC

```
#define BLE_GAP_ADDR_PUBLIC
```

Public Address.

◆ BLE_GAP_ADDR_RAND

```
#define BLE_GAP_ADDR_RAND
```

Random Address.

◆ BLE_GAP_ADDR_RPA_ID_PUBLIC

```
#define BLE_GAP_ADDR_RPA_ID_PUBLIC
```

Resolvable Private Address.

If the IRK of local device has not been registered in Resolving List, public address is used.

◆ BLE_GAP_ADDR_RPA_ID_RANDOM

```
#define BLE_GAP_ADDR_RPA_ID_RANDOM
```

Resolvable Private Address.

If the IRK of local device has not been registered in Resolving List, random address is used.

◆ BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST

```
#define BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST
```

Accept all advertising and scan response PDUs.

The following are excluded.

- Advertising and scan response PDUs where the advertiser's identity address is not in the White List.
- Directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.

◆ BLE_GAP_IOCAP_DISPLAY_ONLY

```
#define BLE_GAP_IOCAP_DISPLAY_ONLY
```

Display Only iocapability.

Output function : Local device has the ability to display a 6 digit decimal number.

Input function : None

◆ BLE_GAP_IOCAP_DISPLAY_YESNO

```
#define BLE_GAP_IOCAP_DISPLAY_YESNO
```

Display Yes/No iocapability.

Output function : Output function : Local device has the ability to display a 6 digit decimal number.

Input function : Local device has the ability to indicate 'yes' or 'no'

◆ **BLE_GAP_IOCAP_KEYBOARD_ONLY**

#define BLE_GAP_IOCAP_KEYBOARD_ONLY

Keyboard Only iocapability.

Output function : None

Input function : Local device has the ability to input the number '0' - '9'.

◆ **BLE_GAP_IOCAP_NOINPUT_NOOUTPUT**

#define BLE_GAP_IOCAP_NOINPUT_NOOUTPUT

No Input No Output iocapability.

Output function : None

Input function : None

◆ **BLE_GAP_IOCAP_KEYBOARD_DISPLAY**

#define BLE_GAP_IOCAP_KEYBOARD_DISPLAY

Keyboard Display iocapability.

Output function : Output function : Local device has the ability to display a 6 digit decimal number.

Input function : Local device has the ability to input the number '0' - '9'.

Typedef Documentation◆ **ble_gap_app_cb_t**

ble_gap_app_cb_t

ble_gap_app_cb_t is the GAP Event callback function type.

Parameters

[in]	event_type	The type of GAP Event.
[in]	event_result	The result of API call which generates the GAP Event.
[in]	p_event_data	Data notified in the GAP Event.

Returns

none

◆ **ble_gap_del_bond_cb_t**

ble_gap_del_bond_cb_t

ble_gap_del_bond_cb_t is the type of the callback function for delete bonding information stored in non-volatile area.

This type is used in [R_BLE_GAP_DeleteBondInfo\(\)](#).

Parameters

[in]	p_addr	The parameter returns the address of the remote device whose keys are deleted by R_BLE_GAP_DeleteBondInfo() . If R_BLE_GAP_DeleteBondInfo() deletes the keys of all remote devices, the parameter returns NULL.
------	--------	--

Returns

none

◆ **st_ble_gap_adv_param_t**

typedef [st_ble_gap_ext_adv_param_t](#) st_ble_gap_adv_param_t

Advertising parameters.

See also

[st_ble_gap_ext_adv_param_t](#)

◆ **st_ble_gap_scan_param_t**

typedef [st_ble_gap_ext_scan_param_t](#) st_ble_gap_scan_param_t

Scan parameters.

See also

[st_ble_gap_ext_scan_param_t](#)

Enumeration Type Documentation

Function Documentation

◆ R_BLE_GAP_Init()

```
ble_status_t R_BLE_GAP_Init ( ble_gap_app_cb_t gap_cb)
```

Initialize the Host Stack.

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback function is registered with this function. In order to receive the GAP event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event.

Parameters

[in]	gap_cb	A callback function registered with this function.
------	--------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	gap_cb is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> • Host Stack was already initialized. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_Terminate()

```
ble_status_t R_BLE_GAP_Terminate ( void )
```

Terminate the Host Stack.

Host stack is terminated with this function. In order to reset all the Bluetooth functions, it's necessary to call this function. The result of this API call is notified in BLE_GAP_EVENT_STACK_OFF event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	Host stack hasn't been initialized.

◆ R_BLE_GAP_UpdConn()

```
ble_status_t R_BLE_GAP_UpdConn ( uint16_t conn_hdl, uint8_t mode, uint16_t accept,
st_ble_gap_conn_param_t * p_conn_updt_param )
```

Update the connection parameters.

This function updates the connection parameters or replies a request for updating connection parameters notified by BLE_GAP_EVENT_CONN_PARAM_UPD_REQ event. When the connection parameters has been updated, BLE_GAP_EVENT_CONN_PARAM_UPD_COMP event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link to be updated.						
[in]	mode	Connection parameter update request or response. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_CONN_UPD_MODE_REQ (0x01)</td> <td>Request for updating the connection parameters.</td> </tr> <tr> <td>BLE_GAP_CONN_UPD_MODE_RSP (0x02)</td> <td>Reply a connection parameter update request.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_CONN_UPD_MODE_REQ (0x01)	Request for updating the connection parameters.	BLE_GAP_CONN_UPD_MODE_RSP (0x02)	Reply a connection parameter update request.
macro	description							
BLE_GAP_CONN_UPD_MODE_REQ (0x01)	Request for updating the connection parameters.							
BLE_GAP_CONN_UPD_MODE_RSP (0x02)	Reply a connection parameter update request.							
[in]	accept	When mode is BLE_GAP_CONN_UPD_MODE_RSP, accept or reject the connection parameters update request. If mode is BLE_GAP_CONN_UPD_MODE_REQ, accept is ignored. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_CONN_UPD_ACCEPT (0x0000)</td> <td>Accept the update request.</td> </tr> <tr> <td>BLE_GAP_CONN_UPD_REJECT (0x0001)</td> <td>Reject the update request.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_CONN_UPD_ACCEPT (0x0000)	Accept the update request.	BLE_GAP_CONN_UPD_REJECT (0x0001)	Reject the update request.
macro	description							
BLE_GAP_CONN_UPD_ACCEPT (0x0000)	Accept the update request.							
BLE_GAP_CONN_UPD_REJECT (0x0001)	Reject the update request.							
[in]	p_conn_updt_param	Connection parameters to be updated. When mode is BLE_GAP_CONN_UPD_MODE_RSP and accept is						

		BLE_GAP_CONN_UPD_REJECT, p_conn_updt_param is ignored.
--	--	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	When accept is BLE_GAP_CONN_UPD_ACCEPT, p_conn_updt_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following is out of range. <ul style="list-style-type: none"> • mode • accept • conn_intv_min field in p_conn_updt_param • conn_intv_max field in p_conn_updt_param • conn_latency in p_conn_updt_param • sup_to in p_conn_updt_param • conn_hdl
BLE_ERR_INVALID_STATE(0x0008)	Not connected with the remote device.
BLE_ERR_CONTEXT_FULL(0x000B)	Sending a L2CAP command, an error occurred.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ **R_BLE_GAP_SetDataLen()**

```
ble_status_t R_BLE_GAP_SetDataLen ( uint16_t conn_hdl, uint16_t tx_octets, uint16_t tx_time )
```

Update the packet size and the packet transmit time.

This function requests for changing the maximum transmission packet size and the maximum packet transmission time. When Controller has received the request from host stack, BLE_GAP_EVENT_SET_DATA_LEN_COMP event is notified to the application layer. When the transmission packet size or the transmission time has been changed, BLE_GAP_EVENT_DATA_LEN_CHG event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose the transmission packet size or the transmission time to be changed.
[in]	tx_octets	Maximum transmission packet size. Valid range is 0x001B - 0x00FB.
[in]	tx_time	Maximum transmission time(us). Valid range is 0x0148 - 0x4290.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_Disconnect()**

```
ble_status_t R_BLE_GAP_Disconnect ( uint16_t conn_hdl, uint8_t reason )
```

Disconnect the link.

This function disconnects a link. When the link has disconnected, BLE_GAP_EVENT_DISCONN_IND event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link to be disconnected.
[in]	reason	The reason for disconnection. Usually, set 0x13 which indicates that a user disconnects the link. If setting other than 0x13, refer the error code described in Core Specification Vol.2 Part D ,"2 Error Code Descriptions".

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_SetPhy()

```
ble_status_t R_BLE_GAP_SetPhy ( uint16_t conn_hdl, st_ble_gap_set_phy_param_t * p_phy_param )
```

Set the phy for connection.

This function sets the PHY preferences for the connection. The result of this API call is notified in BLE_GAP_EVENT_PHY_SET_COMP event. When the PHY has been updated, BLE_GAP_EVENT_PHY_UPD event is notified to the application layer.

After PHY update, the PHY accept configuration of local device is the same as the values in BLE_GAP_EVENT_PHY_UPD event.

For example, after calling R_BLE_GAP_SetPhy(), if tx_phy, rx_phy by BLE_GAP_EVENT_PHY_UPD event are updated to 2M PHY, the PHY accept configuration is 2M PHY only.

Therefore after receiving BLE_GAP_EVENT_PHY_UPD event, if local device wants to accept the other PHY configuration, it needs to call R_BLE_GAP_SetPhy() with the desired PHY accept configuration.

Because the maximum transmission packet size or the maximum transmission time might be updated by PHY update, if the same packet size or transmission time as the previous one is desired, change the maximum transmission packet size or the maximum transmission time by R_BLE_GAP_SetDataLen().

Parameters

[in]	conn_hdl	Connection handle identifying the link whose PHY to be updated.
[in]	p_phy_param	PHY preferences.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_phy_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl or option field in p_phy_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetDefPhy()**

```
ble_status_t R_BLE_GAP_SetDefPhy ( st_ble_gap_set_def_phy_param_t* p_def_phy_param)
```

Set the default phy which allows remote device to change.

This function sets the PHY preferences which a remote device may change. The result of this API call is notified in BLE_GAP_EVENT_DEF_PHY_SET_COMP event.

Parameters

[in]	p_def_phy_param	The PHY preference which a remote device may change.
------	-----------------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_def_phy_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	tx_phys or tx_phys field in p_def_phy_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetPrivMode()**

```
ble_status_t R_BLE_GAP_SetPrivMode ( st_ble_dev_addr_t* p_addr, uint8_t* p_privacy_mode, uint8_t device_num )
```

Set the privacy mode.

This function sets privacy mode for the remote device registered in Resolving List. By default, Network Privacy Mode is set.

The result of this API call is notified in BLE_GAP_EVENT_PRIV_MODE_SET_COMP event.

Parameters

[in]	p_addr	An array of identity address of the remote device to set privacy mode. The number of elements is specified by device_num.
[in]	p_privacy_mode	An array of privacy mode to set to remote device. The number of elements is specified by device_num. The following value is set as

the privacy mode.

macro	description
BLE_GAP_NETWORK_PRIVACY_MODE (0x00)	Network Privacy Mode.
BLE_GAP_DEVICE_PRIVACY_MODE (0x01)	Device Privacy Mode.

[in]	device_num	The number of devices to set privacy mode. Valid range is 1-BLE_GAP_RSLV_LIST_MAX_ENTRY.
------	------------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr or p_privacy_mode is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following parameter is out of range. <ul style="list-style-type: none"> The address type in p_addr. The privacy mode specified by p_privacy_mode. device_num
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> While configuring privacy mode, this function was called. The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ConfWhiteList()**

```
ble_status_t R_BLE_GAP_ConfWhiteList ( uint8_t op_code, st_ble_dev_addr_t* p_addr, uint8_t device_num )
```

Set White List.

This function supports the following operations regarding White List.

- Add the device to White List.
- Delete the device from White List.
- Clear White List.

The total number of White List entries is defined as BLE_GAP_WHITE_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_WHITE_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for White List.								
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_LIST_ADD_D EV(0x01)</td> <td>Add the device to the list.</td> </tr> <tr> <td>BLE_GAP_LIST_REMOVE_D EV(0x02)</td> <td>Delete the device from the list.</td> </tr> <tr> <td>BLE_GAP_LIST_CLEAR(0x03)</td> <td>Clear the list.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_LIST_ADD_D EV(0x01)	Add the device to the list.	BLE_GAP_LIST_REMOVE_D EV(0x02)	Delete the device from the list.	BLE_GAP_LIST_CLEAR(0x03)	Clear the list.
macro	description									
BLE_GAP_LIST_ADD_D EV(0x01)	Add the device to the list.									
BLE_GAP_LIST_REMOVE_D EV(0x02)	Delete the device from the list.									
BLE_GAP_LIST_CLEAR(0x03)	Clear the list.									
[in]	p_addr	An array of device address to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.								
[in]	device_num	The number of devices add / delete to the list. Valid range is 1-BLE_GAP_WHITE_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.								

Return values

BLE_SUCCESS(0x0000)	Success
---------------------	---------

BLE_ERR_INVALID_PTR(0x0001)	When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	op_code or address type field in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> • While operating White List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating the White List.

◆ R_BLE_GAP_GetVerInfo()

ble_status_t R_BLE_GAP_GetVerInfo (void)

Get the version number of the Controller and the host stack.

This function retrieves the version information of local device. The result of this API call is notified in BLE_GAP_EVENT_LOC_VER_INFO event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ReadPhy()**

```
ble_status_t R_BLE_GAP_ReadPhy ( uint16_t conn_hdl)
```

Get the phy settings.

This function gets the PHY settings for the connection. The result of this API call is notified in BLE_GAP_EVENT_PHY_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose PHY settings to be retrieved.
------	----------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ConfRslvList()**

```
ble_status_t R_BLE_GAP_ConfRslvList ( uint8_t op_code, st_ble_dev_addr_t* p_addr,
st_ble_gap_rslv_list_key_set_t* p_peer_irk, uint8_t device_num )
```

Set Resolving List.

This function supports the following operations regarding Resolving List.

- Add the device to Resolving List.
- Delete the device from Resolving List.
- Clear Resolving List.

In order to generate a resolvable private address, a local IRK needs to be registered by [R_BLE_GAP_SetLocIdInfo\(\)](#). If communicating with the identity address, register all-zero IRK as local IRK. In order to resolve resolvable private address of the remote device, the IRK distributed from the remote device needs to be added to Resolving List. The total number of Resolving List entries is defined as BLE_GAP_RESOLV_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_RSLV_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for Resolving List.	
		macro	description
		BLE_GAP_LIST_ADD_DEV	Add the device to the list.
		BLE_GAP_LIST_REMOVE_DEV	Delete the device from the list.
		BLE_GAP_LIST_CLR	Clear the list.
[in]	p_addr	An array of Identity Addresses to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.	
[in]	p_peer_irk	The remote IRK and the type of local IRK added to Resolving List. If op_code is other than BLE_GAP_LIST_ADD_DEV, p_peer_irk is ignored. The number of elements is	

		specified by device_num.
[in]	device_num	The number of devices add / delete to the list. Valid range is 1-BLE_GAP_RSLV_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: <ul style="list-style-type: none"> • When added to or deleted from the list, p_addr is specified as NULL. • When added to the list, p_peer_irk is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: <ul style="list-style-type: none"> • op_code is out of range. • When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, device_num is out of range. • When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, address type field in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> • While operating Resolving List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating the Resolving List.
BLE_ERR_INVALID_HDL(0x000E)	The specified Identity Address was not found in Resolving List.

◆ R_BLE_GAP_EnableRpa()

ble_status_t R_BLE_GAP_EnableRpa (uint8_t enable)

Enable/Disable address resolution and generation of a resolvable private address.

This function enables or disables RPA functionality. The RPA functionality includes the following.

- Generation of local resolvable private address
- Resolution of remote resolvable private address

In order to do advertising, scanning or creating a link with local resolvable private address, the RPA functionality needs to be enabled. After enabling the RPA functionality and the identity address of remote device and the IRKs of local/remote device is registered, local device can generate own resolvable private address in the time interval set by R_BLE_GAP_SetRpaTo(), and can resolve a resolvable private address of a remote device. It is recommended that the RPA functionality is called immediately after the initialization by R_BLE_GAP_Init(). The result of this API call is notified in BLE_GAP_EVENT_RPA_EN_COMP event.

Parameters

[in]	enable	Enable or disable address resolution function.						
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_RPA_DISABLED (0x00)</td> <td>Disable RPA generation/resolution.</td> </tr> <tr> <td>BLE_GAP_RPA_ENABLED (0x01)</td> <td>Enable RPA generation/resolution.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_RPA_DISABLED (0x00)	Disable RPA generation/resolution.	BLE_GAP_RPA_ENABLED (0x01)	Enable RPA generation/resolution.
macro	description							
BLE_GAP_RPA_DISABLED (0x00)	Disable RPA generation/resolution.							
BLE_GAP_RPA_ENABLED (0x01)	Enable RPA generation/resolution.							

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	enable is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetRpaTo()**

```
ble_status_t R_BLE_GAP_SetRpaTo ( uint16_t rpa_timeout)
```

Set the update time of resolvable private address.

This function sets the time interval to update the resolvable private address. The result of this API call is notified in BLE_GAP_EVENT_SET_RPA_TO_COMP event.

Parameters

[in]	rpa_timeout	Time interval to update resolvable private address in seconds. Valid range is 0x003C - 0xA1B8. Default is 900s.
------	-------------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ReadRpa()**

```
ble_status_t R_BLE_GAP_ReadRpa ( st_ble_dev_addr_t* p_addr)
```

Get the resolvable private address of local device.

This function retrieves the local resolvable private address. Before getting the address, enable the resolvable private address function by [R_BLE_GAP_EnableRpa\(\)](#). The result of this API call is notified in BLE_GAP_EVENT_RD_RPA_COMP event.

Parameters

[in]	p_addr	Identity address registered in Resolving List.
------	--------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	Address type in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows. <ul style="list-style-type: none"> • When retrieving the local resolvable private address, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ReadRssi()**

```
ble_status_t R_BLE_GAP_ReadRssi ( uint16_t conn_hdl)
```

Get RSSI.

This function retrieves RSSI. The result of this API call is notified in BLE_GAP_EVENT_RSSI_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose RSSI to be retrieved.
------	----------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_ReadChMap()**

```
ble_status_t R_BLE_GAP_ReadChMap ( uint16_t conn_hdl)
```

Get the Channel Map.

This function retrieves the channel map. The result of this API call is notified in BLE_GAP_EVENT_CH_MAP_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose channel map to be retrieved.
------	----------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetRandAddr()**

```
ble_status_t R_BLE_GAP_SetRandAddr ( uint8_t* p_random_addr)
```

Set a random address.

This function sets static address or non-resolvable private address to Controller. Refer to Core Specification Vol 6, PartB, "1.3.2 Random Device Address" regarding the format of the random address. Resolvable private address cannot set by this API. The result of this API call is notified in BLE_GAP_EVENT_RAND_ADDR_SET_COMP event.

Parameters

[in]	p_random_addr	Static address or non-resolvable private address. The BD address setting format is little endian.
------	---------------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_random_addr is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetAdvParam()

```
ble_status_t R_BLE_GAP_SetAdvParam ( st_ble_gap_adv_param_t * p_adv_param)
```

Set advertising parameters.

This function sets advertising parameters. It's possible to do advertising where the advertising parameters are different every each advertising set. The number of advertising set in the Controller is defined as BLE_MAX_NO_OF_ADV_SETS_SUPPORTED. Each advertising set is identified with advertising handle (0x00-0x03). Create an advertising set with this function before start advertising, setting periodic advertising parameters, start periodic advertising, setting advertising data/scan response data/periodic advertising data. The result of this API call is notified in BLE_GAP_EVENT_ADV_PARAM_SET_COMP event.

Parameters

[in]	p_adv_param	Advertising parameters.
------	-------------	-------------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_adv_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The below p_adv_param field value is out of range. <ul style="list-style-type: none"> • adv_handle • adv_intv_min/adv_intv_max • adv_ch_map • o_addr_type • p_addr_type • adv_phy • sec_adv_phy • scan_req_ntf_flag
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetAdvSresData()

```
ble_status_t R_BLE_GAP_SetAdvSresData ( st_ble_gap_adv_data_t * p_adv_srsp_data)
```

Set advertising data/scan response data/periodic advertising data.

This function sets advertising data/scan response data/periodic advertising data to the advertising set. It is necessary to create an advertising set by R_BLE_GAP_SetAdvParam(), before calling this function. Set advertising data/scan response data/periodic advertising data, after allocating the memory for the data. The following shall be applied regarding the adv_prop_type field and the data_type field in st_ble_gap_adv_param_t parameter specified in R_BLE_GAP_SetAdvParam().

The following shall be applied regarding the adv_prop_type field and the data_type field in st_ble_gap_adv_param_t parameter specified in R_BLE_GAP_SetAdvParam().

- When `adv_prop_type` is Legacy Advertising PDU type,
 - it's possible to set advertising data/scan response data up to 31 bytes.
 - advertising data/scan response data can be updated by this function in advertising.
- When `adv_prop_type` is Extended Advertising PDU type,
 - it's possible to set at most 1650 bytes of data as advertising data/scan response data per 1 advertising set.
 - the total buffer size in Controller for advertising data/scan response data is 4250 bytes. Therefore please note that more than 4250 bytes of advertising data/scan response data can not be set to all the advertising sets. Please refer to Figure 1.1 and Figure 1.2 about examples of setting advertising data/scan response data.
 - it's possible to update advertising data/scan response data in advertising, if the `data_length` field in `st_ble_gap_adv_data_t` parameter is up to 251 bytes.

Figure 235: Figure 1.1

Figure 236: Figure 1.2

- When periodic advertising data is set,
 - At most 1650 bytes of data can be set to 1 advertising set.
 - The total buffer size in Controller for periodic advertising data is 4306 bytes. Therefore please note that more than 4306 bytes of periodic advertising data can not be set to all the advertising sets.
 - it's possible to update periodic advertising data in advertising, if the data_length field in `st_ble_gap_adv_data_t` parameter is up to 252 bytes.

The result of this API call is notified in `BLE_GAP_EVENT_ADV_DATA_UPD_COMP` event.

Parameters

[in]	p_adv_srsp_data	Advertising data/scan response data/periodic advertising data.
------	-----------------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: <ul style="list-style-type: none"> • p_adv_srsp_data is specified as NULL. • data_length field in p_adv_srsp_data parameter is not 0 and p_data field is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following field in p_adv_srsp_data parameter is out of range. <ul style="list-style-type: none"> • adv_hdl • data_type • data_length • zero_length_flag
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_StartAdv()**

```
ble_status_t R_BLE_GAP_StartAdv ( uint8_t adv_hdl, uint16_t duration, uint8_t
max_extd_adv_evts )
```

Start advertising.

This function starts advertising. Create the advertising set specified with `adv_hdl` by [R_BLE_GAP_SetAdvParam\(\)](#), before calling this function. The result of this API call is notified in `BLE_GAP_EVENT_ADV_ON` event.

Parameters

[in]	<code>adv_hdl</code>	The advertising handle pointing to the advertising set which starts advertising. The valid range is 0x00 - 0x03.
[in]	<code>duration</code>	The duration for which the advertising set identified by <code>adv_hdl</code> is enabled. Time = duration * 10ms. When the duration expires, <code>BLE_GAP_EVENT_ADV_OFF</code> event notifies that advertising is stopped. The valid range is 0x0000 - 0xFFFF. The duration parameter is ignored when the value is set to 0x0000.
[in]	<code>max_extd_adv_evts</code>	The maximum number of advertising events that be sent during advertising. When all the advertising events(<code>max_extd_adv_evts</code>) have been sent, <code>BLE_GAP_EVENT_ADV_OFF</code> event notifies that advertising is stopped. The <code>max_extd_adv_evts</code> parameter is ignored when the value is set to 0x00.

Return values

<code>BLE_SUCCESS(0x0000)</code>	Success
<code>BLE_ERR_INVALID_ARG(0x0003)</code>	<code>adv_hdl</code> is out of range.
<code>BLE_ERR_INVALID_STATE(0x0008)</code>	The task for host stack is not running.
<code>BLE_ERR_MEM_ALLOC_FAILED(0x000C)</code>	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StopAdv()

```
ble_status_t R_BLE_GAP_StopAdv ( uint8_t adv_hdl)
```

Stop advertising.

This function stops advertising. The result of this API call is notified in BLE_GAP_EVENT_ADV_OFF event.

Parameters

[in]	adv_hdl	The advertising handle pointing to the advertising set which stops advertising. The valid range is 0x00 - 0x03.
------	---------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetPerdAdvParam()**

```
ble_status_t R_BLE_GAP_SetPerdAdvParam ( st_ble_gap_perd_adv_param_t * p_perd_adv_param)
```

Set periodic advertising parameters.

This function sets periodic advertising parameters. Create the advertising set which supports Non-Connectable, Non-Scannable advertising by [R_BLE_GAP_SetAdvParam\(\)](#) before setting periodic advertising parameters. The result of this API call is notified in BLE_GAP_EVENT_PERD_ADV_PARAM_SET_COMP event.

Parameters

[in]	p_perd_adv_param	Periodic advertising parameters.
------	------------------	----------------------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_perd_adv_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following field in the p_perd_adv_param parameter is out of range. <ul style="list-style-type: none"> adv_hdl perd_intv_min or per_d_intv_max prop_type is neither 0x0000 nor 0x0040(BLE_GAP_PERD_PROP_TX_POWER)
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_StartPerdAdv()**

```
ble_status_t R_BLE_GAP_StartPerdAdv ( uint8_t adv_hdl)
```

Start periodic advertising.

This function starts periodic advertising. Set periodic advertising parameters to the advertising set, before starting periodic advertising. The result of this API call is notified in BLE_GAP_EVENT_PERD_ADV_ON event.

Parameters

[in]	adv_hdl	Advertising handle identifying the advertising set which starts periodic advertising.
------	---------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_StopPerdAdv()**

```
ble_status_t R_BLE_GAP_StopPerdAdv ( uint8_t adv_hdl)
```

Stop periodic advertising.

This function stops periodic advertising. If the return value of this API is BLE_SUCCESS, the result is notified in BLE_GAP_EVENT_PERD_ADV_OFF event.

Parameters

[in]	adv_hdl	Specify the handle of Advertising Set to stop Periodic Advertising.
------	---------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_GetRemainAdvBufSize()**

```
ble_status_t R_BLE_GAP_GetRemainAdvBufSize ( uint16_t* p_remain_adv_data_size, uint16_t*
p_remain_perd_adv_data_size )
```

Get buffer size for advertising data/scan response data/periodic advertising data in the Controller.

This function gets the total size of advertising data/scan response data/periodic advertising data which can be currently set to Controller(all of the advertising sets). The application layer gets the data sizes via the parameters. By this API function call, no events occur.

Parameters

[out]	p_remain_adv_data_size	The free buffer size of Controller to which advertising data/scan response data can be currently set.
[out]	p_remain_perd_adv_data_size	The free buffer size of Controller to which periodic advertising data can be currently set.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_remain_adv_data_size or p_remain_perd_adv_data_size is specified as NULL.

◆ R_BLE_GAP_RemoveAdvSet()

```
ble_status_t R_BLE_GAP_RemoveAdvSet ( uint8_t op_code, uint8_t adv_hdl )
```

Delete advertising set.

This function deletes an advertising set or deletes all the advertising sets. The result of this API call is notified in BLE_GAP_EVENT_ADV_SET_REMOVE_COMP event.

Parameters

[in]	op_code	The operation for delete or clear.						
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_RM_V_ADV_SET_REM_OP(0x01)</td> <td>Delete an advertising set.</td> </tr> <tr> <td>BLE_GAP_RM_V_ADV_SET_CLR_OP(0x02)</td> <td>Delete all the advertising sets.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_RM_V_ADV_SET_REM_OP(0x01)	Delete an advertising set.	BLE_GAP_RM_V_ADV_SET_CLR_OP(0x02)	Delete all the advertising sets.
macro	description							
BLE_GAP_RM_V_ADV_SET_REM_OP(0x01)	Delete an advertising set.							
BLE_GAP_RM_V_ADV_SET_CLR_OP(0x02)	Delete all the advertising sets.							
[in]	adv_hdl	Advertising handle identifying the advertising set deleted. If op_code is BLE_GAP_RMV_ADV_SET_CLR_OP, adv_hdl is ignored.						

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: <ul style="list-style-type: none"> op_code is out of range. When op_code is BLE_GAP_RMV_ADV_SET_REM_OP(0x01), adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CreateConn()

```
ble_status_t R_BLE_GAP_CreateConn ( st_ble_gap_create_conn_param_t* p_param)
```

Request for a link establishment.

This function sends a connection request to a remote device to create a link. When Controller has received a request for establishment of a link from host stack, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified to the application layer. When the link is established, BLE_GAP_EVENT_CONN_IND event is notified to the application layer.

Parameters

[in]	p_param	Connection parameters.
------	---------	------------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: <ul style="list-style-type: none"> • p_param is specified as NULL. • p_conn_param_1M field and p_conn_param_2M and p_conn_param_coded field in p_param are specified as NULL. • When creating a link with 1M PHY, p_conn_param in p_conn_param_1M field in p_param is specified as NULL. • When creating a link with 2M PHY, p_conn_param in p_conn_param_2M field in p_param is specified as NULL. • When creating a link with coded MPHY, p_conn_param in p_conn_param_coded field in p_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: <ul style="list-style-type: none"> • init_filter_policy in p_param is out of range. • remote_bd_addr_type field or own_addr_type address field in p_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_CancelCreateConn()**

```
ble_status_t R_BLE_GAP_CancelCreateConn ( void )
```

Cancel the request for a link establishment.

This function cancels a request for establishing a link. When Controller has received the cancel request from host stack, BLE_GAP_EVENT_CONN_CANCEL_COMP event is notified to the application layer. When the cancel procedure has completed, BLE_GAP_EVENT_CONN_IND event is notified to the application layer.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetChMap()**

```
ble_status_t R_BLE_GAP_SetChMap ( uint8_t* p_channel_map)
```

Set the Channel Map.

This function sets the channel map. The result of this API call is notified in BLE_GAP_EVENT_CH_MAP_SET_COMP event.

Parameters

[in]	p_channel_map	Channel map.
------	---------------	--------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_channel_map is specified as NULL.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_StartScan()**

```
ble_status_t R_BLE_GAP_StartScan ( st_ble_gap_scan_param_t* p_scan_param,
st_ble_gap_scan_on_t* p_scan_enable )
```

Set scan parameter and start scan.

This function starts scanning. When scanning for the first time, set the `p_scan_param`. Setting scan parameters can be omitted by specifying `p_scan_param` as `NULL` after next time. The result of this API call is notified in `BLE_GAP_EVENT_SCAN_ON` event. Advertising report is notified in `BLE_GAP_EVENT_ADV_REPT_IND` event. Figure 1.3 shows the relationship between scan period, scan duration, scan interval and scan window.

Figure 237: Figure 1.3

When scan duration is non-zero, scan period is zero and scan duration expires, BLE_GAP_EVENT_SCAN_TO event is notified to the application layer.

Parameters

[in]	p_scan_param	Scan parameter. When p_scan_param is specified as NULL, host stack doesn't set scan parameters and start scanning with the previous parameters.
[in]	p_scan_enable	Scan period, scan duration, duplicate filter and procedure type.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: <ul style="list-style-type: none"> p_scan_enable is specified as NULL. p_phy_param_1M field and p_phy_param_coded field in p_scan_param are specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: <ul style="list-style-type: none"> proc_type field in p_scan_enable is out of range. filter_dups in p_scan_enable is out of range. o_addr_type in p_scan_param is out of range. filter_policy in p_scan_param is out of range. scan_type of p_scan_param's p_phy_param_1M or p_phy_param_coded is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_StopScan()**

```
ble_status_t R_BLE_GAP_StopScan ( void )
```

Stop scan.

This function stops scanning. The result of this API call is notified in BLE_GAP_EVENT_SCAN_OFF event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_CreateSync()**

```
ble_status_t R_BLE_GAP_CreateSync ( st_ble_dev_addr_t * p_addr, uint8_t adv_sid, uint16_t skip, uint16_t sync_to )
```

Request for a periodic sync establishment.

This function sends a request for establishment of a periodic sync to a advertiser. In order to create a periodic sync, scan needs to be starting by [R_BLE_GAP_StartScan\(\)](#). When Controller has received the request from host stack, BLE_GAP_EVENT_CREATE_SYNC_COMP event is notified to the application layer. When the periodic sync is established, BLE_GAP_EVENT_SYNC_EST event is notified to the application layer.

Parameters

[in]	p_addr	The address of periodic advertiser. When p_addr is specified as NULL, local device creates a periodic sync with the advertiser registered in Periodic Advertiser List.
[in]	adv_sid	Advertising SID. When p_addr is specified as NULL, adv_sid is ignored. Valid range is 0x00 - 0x0F.
[in]	skip	The number of consecutive periodic advertising packets that local device may skip after receiving a periodic advertising packet. Valid range is 0x0000 - 0x01F3.

[in]	sync_to	The maximum permitted time between successful receives. When sync_to expires, the periodic sync is lost. Time(ms) = sync_to * 10. Valid range is 0x000A - 0x4000.
------	---------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following parameter is out of range. <ul style="list-style-type: none"> • address type in p_addr • adv_sid • skip • sync_to
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CancelCreateSync()

```
ble_status_t R_BLE_GAP_CancelCreateSync ( void )
```

Cancel the request for a periodic sync establishment.

This function cancels a request for establishing a periodic sync. The result of this API call is notified in BLE_GAP_EVENT_SYNC_CREATE_CANCEL_COMP event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_TerminateSync()**

```
ble_status_t R_BLE_GAP_TerminateSync ( uint16_t sync_hdl)
```

Terminate the periodic sync.

This function terminates a periodic sync. The result of this API call is notified in BLE_GAP_EVENT_SYNC_TERM event.

Parameters

[in]	sync_hdl	Sync handle identifying the periodic sync to be terminated.
------	----------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	sync_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ConfPerdAdvList()

```
ble_status_t R_BLE_GAP_ConfPerdAdvList ( uint8_t op_code, st_ble_dev_addr_t * p_addr, uint8_t *
p_adv_sid_set, uint8_t device_num )
```

Set Periodic Advertiser List.

This function supports the following operations regarding Periodic Advertiser List.

- Add the device to Periodic Advertiser List.
- Delete the device from Periodic Advertiser List.
- Clear Periodic Advertiser List.

The total number of Periodic Advertiser List entries is defined as BLE_GAP_PERD_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_PERD_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for Periodic Advertiser List.								
		<table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_LIST_ADD_DV(0x01)</td> <td>Add the device to the list.</td> </tr> <tr> <td>BLE_GAP_LIST_REMOVE_DV(0x02)</td> <td>Delete the device from the list.</td> </tr> <tr> <td>BLE_GAP_LIST_CLEAR(0x03)</td> <td>Clear the list.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_LIST_ADD_DV(0x01)	Add the device to the list.	BLE_GAP_LIST_REMOVE_DV(0x02)	Delete the device from the list.	BLE_GAP_LIST_CLEAR(0x03)	Clear the list.
macro	description									
BLE_GAP_LIST_ADD_DV(0x01)	Add the device to the list.									
BLE_GAP_LIST_REMOVE_DV(0x02)	Delete the device from the list.									
BLE_GAP_LIST_CLEAR(0x03)	Clear the list.									
[in]	p_addr	An array of device address to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.								
[in]	p_adv_sid_set	An array of SID of the advertiser to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_adv_sid_set is ignored.								
[in]	device_num	The number of devices add / delete to the list.								

		Valid range is 1-BLE_GAP_PERD_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.
--	--	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, p_addr or p_adv_sid_set is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	op_code or address type field in p_addr or p_adv_sid_set or device_num is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> • While operating Periodic Advertiser List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating periodic advertiser.

◆ R_BLE_GAP_AuthorizeDev()

```
ble_status_t R_BLE_GAP_AuthorizeDev ( uint16_t conn_hdl, uint8_t author_flag )
```

Authorize a remote device.

User authorizes a remote device by this function. This function is used when a remote device accesses a GATT Characteristic in local device which requests user authorization. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to be authorized or not by user.						
[in]	author_flag	Authorize or not the remote device. <table border="1" data-bbox="1072 831 1469 1167"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_NOT_AUTHORIZE(0x00)</td> <td>Not authorize the remote device.</td> </tr> <tr> <td>BLE_GAP_AUTHORIZED(0x01)</td> <td>Authorize the remote device.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_NOT_AUTHORIZE(0x00)	Not authorize the remote device.	BLE_GAP_AUTHORIZED(0x01)	Authorize the remote device.
macro	description							
BLE_GAP_NOT_AUTHORIZE(0x00)	Not authorize the remote device.							
BLE_GAP_AUTHORIZED(0x01)	Authorize the remote device.							

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	author_flag is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ **R_BLE_GAP_GetRemDevInfo()**

```
ble_status_t R_BLE_GAP_GetRemDevInfo ( uint16_t conn_hdl)
```

Get the information about remote device.

This function retrieves information about the remote device. The information includes BD_ADDR, the version number and LE features. The result of this API call is notified in BLE_GAP_EVENT_GET_REM_DEV_INFO event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device whose information to be retrieved.
------	----------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetPairingParams()**

```
ble_status_t R_BLE_GAP_SetPairingParams ( st_ble_gap_pairing_param_t * p_pair_param)
```

Set the parameters using pairing.

This function sets the parameters used in pairing. The parameters set by this API are sent to the remote device when pairing occurred. The result of this API call is returned by a return value.

Parameters

[in]	p_pair_param	Pairing parameters.
------	--------------	---------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The following field in p_pair_param is out of range. <ul style="list-style-type: none"> • iocap • max_key_size • mitm • bonding • key_notf • sec_conn_only

◆ **R_BLE_GAP_SetLocIdInfo()**

```
ble_status_t R_BLE_GAP_SetLocIdInfo ( st_ble_dev_addr_t * p_lc_id_addr, uint8_t * p_lc_irk )
```

Set the IRK and the identity address distributed to a remote device.

This function registers local IRK and identity address of local device in host stack. The IRK and the identity address are distributed to a remote device in pairing. The result of this API call is returned by a return value.

Parameters

[in]	p_lc_id_addr	Identity address to be registered in host stack.
[in]	p_lc_irk	IRK to be registered in host stack.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_lc_id_addr or p_lc_irk is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	Address type field in p_lc_id_addr is out of range.

◆ **R_BLE_GAP_SetLocCsrk()**

```
ble_status_t R_BLE_GAP_SetLocCsrk ( uint8_t * p_local_csrk )
```

Set the CSRK distributed to a remote device.

This function registers local CSRK in host stack. The CSRK is distributed to a remote device in pairing. The result of this API call is returned by a return value.

Parameters

[in]	p_local_csrk	CSRK to be registered in host stack.
------	--------------	--------------------------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_local_csrk is specified as NULL.

◆ **R_BLE_GAP_StartPairing()**

```
ble_status_t R_BLE_GAP_StartPairing ( uint16_t conn_hdl)
```

Start pairing.

This function starts pairing with a remote device. The result of this API call is returned by a return value. The result of pairing is notified in BLE_GAP_EVENT_PAIRING_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which local device starts pairing with.
------	----------	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	While generating OOB data, this function was called.
BLE_ERR_CONTEXT_FULL(0x000B)	While pairing, this function was called.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ **R_BLE_GAP_ReplyPairing()**

```
ble_status_t R_BLE_GAP_ReplyPairing ( uint16_t conn_hdl, uint8_t response )
```

Reply the pairing request from a remote device.

This function replies to the pairing request from the remote device. The pairing request from the remote device is notified in BLE_GAP_EVENT_PAIRING_REQ event. The result of this API call is returned by a return value. The result of pairing is notified in BLE_GAP_EVENT_PAIRING_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which local device starts pairing with.						
[in]	response	Accept or reject the pairing request from the remote device. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_PAIRING_ACCEPT(0x00)</td> <td>Accept the pairing request.</td> </tr> <tr> <td>BLE_GAP_PAIRING_REJECT(0x01)</td> <td>Reject the pairing request.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_PAIRING_ACCEPT(0x00)	Accept the pairing request.	BLE_GAP_PAIRING_REJECT(0x01)	Reject the pairing request.
macro	description							
BLE_GAP_PAIRING_ACCEPT(0x00)	Accept the pairing request.							
BLE_GAP_PAIRING_REJECT(0x01)	Reject the pairing request.							

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	While generating OOB data, this function was called.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, host stack has not yet received BLE_GAP_EVENT_PAIRING_REQ event.

◆ **R_BLE_GAP_StartEnc()**

```
ble_status_t R_BLE_GAP_StartEnc ( uint16_t conn_hdl)
```

Encryption the link.

This function starts encryption of the link. In case of master device, the local device requests for the encryption to a remote device. In case of slave device, the local device sends a Security Request to a remote device. After receiving the Security Request, the remote device requests for the encryption to the local device. The result of the encryption is returned in BLE_GAP_EVENT_ENC_CHG event.

Parameters

[in]	conn_hdl	Connection handle identifying the link which is encrypted.
------	----------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none"> • Pairing has not been completed. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_ReplyPasskeyEntry()

```
ble_status_t R_BLE_GAP_ReplyPasskeyEntry ( uint16_t conn_hdl, uint32_t passkey, uint8_t response )
```

Reply the passkey entry request.

When BLE_GAP_EVENT_PASSKEY_ENTRY_REQ event is notified, the response to passkey entry is sent by this function. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which the reply to passkey entry is sent.						
[in]	passkey	Passkey. The valid range is 000000 - 999999 in decimal.						
[in]	response	Active or negative reply to passkey entry. <table border="1" data-bbox="1075 920 1469 1288"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_PAIRING_ACCEPT(0x00)</td> <td>Accept the passkey entry pairing.</td> </tr> <tr> <td>BLE_GAP_PAIRING_REJECT(0x01)</td> <td>Reject the passkey entry pairing.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_PAIRING_ACCEPT(0x00)	Accept the passkey entry pairing.	BLE_GAP_PAIRING_REJECT(0x01)	Reject the passkey entry pairing.
macro	description							
BLE_GAP_PAIRING_ACCEPT(0x00)	Accept the passkey entry pairing.							
BLE_GAP_PAIRING_REJECT(0x01)	Reject the passkey entry pairing.							

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	passkey or response is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_ReplyNumComp()

```
ble_status_t R_BLE_GAP_ReplyNumComp ( uint16_t conn_hdl, uint8_t response )
```

Reply the numeric comparison request.

When BLE_GAP_EVENT_NUM_COMP_REQ event is notified, the response to Numeric Comparison is sent by this function. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which the reply to Numeric Comparison is sent.						
[in]	response	Active or negative reply in Numeric Comparison. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_PAIRING_ACCEPT(0x00)</td> <td>The number displayed in the local is the same as the one of the remote.</td> </tr> <tr> <td>BLE_GAP_PAIRING_REJECT(0x01)</td> <td>The number displayed in the local is differs from the one of the remote.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_PAIRING_ACCEPT(0x00)	The number displayed in the local is the same as the one of the remote.	BLE_GAP_PAIRING_REJECT(0x01)	The number displayed in the local is differs from the one of the remote.
macro	description							
BLE_GAP_PAIRING_ACCEPT(0x00)	The number displayed in the local is the same as the one of the remote.							
BLE_GAP_PAIRING_REJECT(0x01)	The number displayed in the local is differs from the one of the remote.							

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	When this function was called, host stack has not yet received BLE_GAP_EVENT_NUM_COMP_REQ event.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_NotifyKeyPress()

```
ble_status_t R_BLE_GAP_NotifyKeyPress ( uint16_t conn_hdl, uint8_t key_press )
```

Notify the input key type which a remote device inputs in the passkey entry.

This function notifies the input key type to the remote device in passkey entry. The result is returned from this API.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to which the key notification is sent.												
[in]	key_press	Input key type. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_LE_SC_PASSKEY_ENTRY_STARTED(0x00)</td> <td>Notify that passkey entry started.</td> </tr> <tr> <td>BLE_GAP_LE_SC_PASSKEY_DIGIT_ENTERED(0x01)</td> <td>Notify that passkey digit entered.</td> </tr> <tr> <td>BLE_GAP_LE_SC_PASSKEY_DIGIT_ERASED(0x02)</td> <td>Notify that passkey digit erased.</td> </tr> <tr> <td>BLE_GAP_LE_SC_PASSKEY_CLEARED(0x03)</td> <td>Notify that passkey cleared.</td> </tr> <tr> <td>BLE_GAP_LE_SC_PASSKEY_ENTRY_COMPLETED(0x04)</td> <td>Notify that passkey entry completed.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_LE_SC_PASSKEY_ENTRY_STARTED(0x00)	Notify that passkey entry started.	BLE_GAP_LE_SC_PASSKEY_DIGIT_ENTERED(0x01)	Notify that passkey digit entered.	BLE_GAP_LE_SC_PASSKEY_DIGIT_ERASED(0x02)	Notify that passkey digit erased.	BLE_GAP_LE_SC_PASSKEY_CLEARED(0x03)	Notify that passkey cleared.	BLE_GAP_LE_SC_PASSKEY_ENTRY_COMPLETED(0x04)	Notify that passkey entry completed.
macro	description													
BLE_GAP_LE_SC_PASSKEY_ENTRY_STARTED(0x00)	Notify that passkey entry started.													
BLE_GAP_LE_SC_PASSKEY_DIGIT_ENTERED(0x01)	Notify that passkey digit entered.													
BLE_GAP_LE_SC_PASSKEY_DIGIT_ERASED(0x02)	Notify that passkey digit erased.													
BLE_GAP_LE_SC_PASSKEY_CLEARED(0x03)	Notify that passkey cleared.													
BLE_GAP_LE_SC_PASSKEY_ENTRY_COMPLETED(0x04)	Notify that passkey entry completed.													

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	key_press parameter is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ **R_BLE_GAP_GetDevSecInfo()**

```
ble_status_t R_BLE_GAP_GetDevSecInfo ( uint16_t conn_hdl, st_ble_gap_auth_info_t * p_sec_info )
```

Get the security information about the remote device.

This function gets the parameters which has been negotiated with the remote device in pairing. The parameters can be retrieved after pairing. The result is returned by p_sec_info.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device whose bonding information is retrieved.
[in]	p_sec_info	Return the security information which has been negotiated in pairing.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_sec_info is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The remote device bonding information has not been set to host stack.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ **R_BLE_GAP_ReplyExKeyInfoReq()**

```
ble_status_t R_BLE_GAP_ReplyExKeyInfoReq ( uint16_t conn_hdl)
```

Distribute the keys of local device.

When key exchange request is notified by BLE_GAP_EVENT_EX_KEY_REQ event at pairing, keys of the local device are distributed. The result is returned from this API.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to which the key is distributed.
------	----------	--

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_SetRemOobData()

```
ble_status_t R_BLE_GAP_SetRemOobData ( st_ble_dev_addr_t * p_addr, uint8_t oob_data_flag,
st_ble_gap_oob_data_t * p_oob )
```

Set the oob data from a remote device.

This function registers the OOB data received from a remote device. When oob_data_flag indicates that the OOB data has been received, the setting regarding OOB data is reflected in pairing. In order to do OOB pairing, set the OOB data received from the remote device before pairing. The result is returned from this API.

Parameters

[in]	p_addr	The remote device address.						
[in]	oob_data_flag	This parameter indicates whether the local device has received the OOB data from the remote device or not. <table border="1" data-bbox="1072 864 1469 1400"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GAP_OOB_DATA_NO_T_PRESENT(0x00)</td> <td>Reply that No OOB data has been received when pairing.</td> </tr> <tr> <td>BLE_GAP_OOB_DATA_PRESENT(0x01)</td> <td>Reply that the OOB data has been received when pairing.</td> </tr> </tbody> </table>	macro	description	BLE_GAP_OOB_DATA_NO_T_PRESENT(0x00)	Reply that No OOB data has been received when pairing.	BLE_GAP_OOB_DATA_PRESENT(0x01)	Reply that the OOB data has been received when pairing.
macro	description							
BLE_GAP_OOB_DATA_NO_T_PRESENT(0x00)	Reply that No OOB data has been received when pairing.							
BLE_GAP_OOB_DATA_PRESENT(0x01)	Reply that the OOB data has been received when pairing.							
[in]	p_oob	The OOB data received from the remote device.						

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows. <ul style="list-style-type: none"> p_addr is specified as NULL. oob_data_flag is BLE_GAP_OOB_DATA_PRESENT and p_oob is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	oob_data_flag is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	There is no room to register the OOB data received from a remote device.

◆ R_BLE_GAP_CreateScOobData()

ble_status_t R_BLE_GAP_CreateScOobData (void)

Create data for oob in secure connection.

This function generates the OOB data distributed to a remote device in Secure Connections. The result of this API call is notified in BLE_GAP_EVENT_SC_OOB_CREATE_COMP event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: <ul style="list-style-type: none">• This function was called in pairing.• The task for host stack is not running.
BLE_ERR_ALREADY_IN_PROGRESS(0x000A)	This function was called in creating OOB data.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ **R_BLE_GAP_SetBondInfo()**

```
ble_status_t R_BLE_GAP_SetBondInfo ( st_ble_gap_bond_info_t* p_bond_info, uint8_t device_num,
uint8_t* p_set_num )
```

Set the bonding information stored in non-volatile memory to the host stack.

Set the bonding information of the remote device in the host stack. After power re-supply, when the remote device bonding information stored in non-volatile memory is set to host stack, this function is used. Host stack can be set the number specified by the device_num parameter of bonding information.

Parameters

[in]	p_bond_info	An array of bonding information. The number of elements is specified by device_num.
[in]	device_num	The number of the devices of which host stack registers bonding information.
[in]	p_set_num	The number of the devices whose bonding information was registered in host stack.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_bond_info or p_set_num is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	device_num is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	Host stack already has the maximum number of bonding information.

◆ R_BLE_GAP_DeleteBondInfo()

```
void R_BLE_GAP_DeleteBondInfo ( int32_t local, int32_t remote, st_ble_dev_addr_t* p_addr,
ble_gap_del_bond_cb_t gap_del_bond_cb )
```

This function deletes the bonding information in Host Stack.
When a function for deleting the bonding information stored in non-volatile area is registered by the gap_del_bond_cb parameter, it is deleted as well as the bonding information in Host Stack.

Parameters

[in]	local	The type of the local bonding information to be deleted.
[in]	remote	The type of the remote bonding information to be deleted.

macro	description
BLE_GAP_SE C_DEL_LOC_ NONE(0x00)	Delete no local keys.
BLE_GAP_SE C_DEL_LOC_ IRK(0x01)	Delete local IRK and identity address.
BLE_GAP_SE C_DEL_LOC_ CSRK(0x02)	Delete local CSRK.
BLE_GAP_SE C_DEL_LOC_ ALL(0x03)	Delete all local keys.

macro	description
BLE_GAP_SE C_DEL_REM_ NONE(0x00)	Delete no remote device keys.
BLE_GAP_SE C_DEL_REM_ SA(0x01)	Delete the keys specified by the p_addr parameter.
BLE_GAP_SE C_DEL_REM_ NOT_CONN(0x02)	Delete keys of not connected remote devices.
BLE_GAP_SE C_DEL_REM_ ALL(0x03)	Delete all remote device keys.

[in]	p_addr	p_addr is specified as the address of the remote device whose keys are deleted when the rem_info parameter is set to BLE_GAP_SEC_DEL_REM_SA(0x01) .
[in]	gap_del_bond_cb	This parameter is a callback function which deletes the bonding information stored in non-volatile area. After deleting the bonding information stored in Host Stack, the callback function is called. If no bonding information is stored in non-volatile area, specify the parameter as NULL.
Return values		
none		

◆ R_BLE_GAP_ReplyLtkReq()

```
ble_status_t R_BLE_GAP_ReplyLtkReq ( uint16_t conn_hdl, uint16_t ediv, uint8_t* p_peer_rand,
uint8_t response )
```

Reply the LTK request from a remote device.

This function replies to the LTK request in BLE_GAP_EVENT_LTK_REQ event from a remote device. The result of the LTK reply is returned in BLE_GAP_EVENT_LTK_RSP_COMP event. When the link encryption has completed, BLE_GAP_EVENT_ENC_CHG event is notified.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which sent the LTK request.
[in]	ediv	Ediv notified in BLE_GAP_EVENT_LTK_REQ event.
[in]	p_peer_rand	Rand notified in BLE_GAP_EVENT_LTK_REQ event.
[in]	response	Response to the LTK request. If

"BLE_GAP_LTK_REQ_ACCEPT" is specified, when no LTK has been exchanged in pairing, reject the LTK request.

macro	description
BLE_GAP_LTK_REQ_ACCEPT(0x00)	Reply for the LTK request.
BLE_GAP_LTK_REQ_DENY(0x01)	Reject the LTK request.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	<code>p_peer_rand</code> is specified as NULL in case of legacy pairing.
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by <code>conn_hdl</code> is not found.

Functions

`ble_status_t` [R_BLE_GATT_GetMtu](#) (`uint16_t conn_hdl`, `uint16_t *p_mtu`)

This function gets the current MTU used in GATT communication.

[More...](#)

Detailed Description

Function Documentation

◆ **R_BLE_GATT_GetMtu()**

```
ble_status_t R_BLE_GATT_GetMtu ( uint16_t conn_hdl, uint16_t* p_mtu )
```

This function gets the current MTU used in GATT communication.

Both GATT server and GATT Client can use this function.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the GATT Server or the GATT Client.
[in]	p_mtu	The Current MTU. Before MTU exchange, this parameter is 23 bytes. After MTU exchange, this parameter is the negotiated MTU.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The mtu parameter is NULL.
BLE_ERR_INVALID_HDL(0x000E)	The GATT Server or the GATT Client specified by conn_hdl was not found.

4.3.2.3 GATT_SERVER

[Interfaces](#) » [BLE Interface](#)

Functions

```
ble_status_t R_BLE_GATTS_Init (uint8_t cb_num)
```

This function initializes the GATT Server and registers the number of the callbacks for GATT Server event. [More...](#)

```
ble_status_t R_BLE_GATTS_SetDbInst (st_ble_gatts_db_cfg_t *p_db_inst)
```

This function sets GATT Database to host stack. [More...](#)

```
ble_status_t R_BLE_GATTS_RegisterCb (ble_gatts_app_cb_t cb, uint8_t priority)
```

This function registers a callback for GATT Server event. [More...](#)

```
ble_status_t R_BLE_GATTS_DeregisterCb (ble_gatts_app_cb_t cb)
```

This function deregisters the callback function for GATT Server event. [More...](#)

`ble_status_t` [R_BLE_GATTS_Notification](#) (`uint16_t conn_hdl`,
`st_ble_gatt_hdl_value_pair_t *p_ntf_data`)

This function sends a notification of an attribute's value. [More...](#)

`ble_status_t` [R_BLE_GATTS_Indication](#) (`uint16_t conn_hdl`,
`st_ble_gatt_hdl_value_pair_t *p_ind_data`)

This function sends a indication of an attribute's value. [More...](#)

`ble_status_t` [R_BLE_GATTS_GetAttr](#) (`uint16_t conn_hdl`, `uint16_t attr_hdl`,
`st_ble_gatt_value_t *p_value`)

This function gets a attribute value from the GATT Database. [More...](#)

`ble_status_t` [R_BLE_GATTS_SetAttr](#) (`uint16_t conn_hdl`, `uint16_t attr_hdl`,
`st_ble_gatt_value_t *p_value`)

This function sets an attribute value to the GATT Database. [More...](#)

`ble_status_t` [R_BLE_GATTS_SendErrRsp](#) (`uint16_t error_code`)

This function sends an error response to a remote device. [More...](#)

`ble_status_t` [R_BLE_GATTS_RspExMtu](#) (`uint16_t conn_hdl`, `uint16_t mtu`)

This function replies to a MTU Exchange Request from a remote device. [More...](#)

`ble_status_t` [R_BLE_GATTS_SetPrepareQueue](#) (`st_ble_gatt_pre_queue_t`
`*p_pre_queues`, `uint8_t queue_num`)

Register prepare queue and buffer in Host Stack. [More...](#)

Detailed Description

Data Structures

struct [st_ble_gatt_value_t](#)
Attribute Value. [More...](#)

struct [st_ble_gatt_hdl_value_pair_t](#)
Attribute handle and attribute Value. [More...](#)

struct [st_ble_gatt_queue_att_val_t](#)
Queued writes Attribute Value. [More...](#)

struct [st_ble_gatt_queue_pair_t](#)
Queued writes Attribute Value. [More...](#)

struct [st_ble_gatt_queue_elm_t](#)
Prepare Write Queue element for long characteristic. [More...](#)

struct [st_ble_gatt_pre_queue_t](#)
Prepare Write Queue for long characteristic. [More...](#)

struct [st_ble_gatts_db_params_t](#)
Attribute value to be set to or retrieved from the GATT Database and the access type from the GATT Client. [More...](#)

struct [st_ble_gatts_db_conn_hdl_t](#)
Information about the service or the characteristic that the attribute belongs to. [More...](#)

struct [st_ble_gatts_db_access_evt_t](#)
This structure notifies that the GATT Database has been accessed from a GATT Client. [More...](#)

struct [st_ble_gatts_conn_evt_t](#)
This structure notifies that the link with the GATT Client has been established. [More...](#)

struct [st_ble_gatts_disconn_evt_t](#)
This structure notifies that the link with the GATT Client has been disconnected. [More...](#)

struct [st_ble_gatts_ex_mtu_req_evt_t](#)

This structure notifies that a MTU Exchange Request PDU has been received from a GATT Client. [More...](#)

struct [st_ble_gatts_cfm_evt_t](#)

This structure notifies that a Confirmation PDU has been received from a GATT Client. [More...](#)

struct [st_ble_gatts_read_by_type_rsp_evt_t](#)

This structure notifies that a Read By Type Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_read_rsp_evt_t](#)

This structure notifies that a Read Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_read_blob_rsp_evt_t](#)

This structure notifies that a Read Blob Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_read_multi_rsp_evt_t](#)

This structure notifies that a Read Multiple Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_write_rsp_evt_t](#)

This structure notifies that a Write Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_prepare_write_rsp_evt_t](#)

This structure notifies that a Prepare Write Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_exe_write_rsp_evt_t](#)

This structure notifies that a Execute Write Response PDU has been sent from GATT Server. [More...](#)

struct [st_ble_gatts_db_uuid_cfg_t](#)

A structure that defines the information on the position where UUIDs

are used. [More...](#)

struct [st_ble_gatts_db_attr_cfg_t](#)

A structure that defines the detailed information of the attributes. [More...](#)

struct [st_ble_gatts_db_attr_list_t](#)

The number of attributes are stored. [More...](#)

struct [st_ble_gatts_db_char_cfg_t](#)

A structure that defines the detailed information of the characteristics. [More...](#)

struct [st_ble_gatts_db_serv_cfg_t](#)

A structure that defines the detailed information of the characteristics. [More...](#)

struct [st_ble_gatts_db_cfg_t](#)

This is the structure of GATT Database that is specified in [R_BLE_GATTS_SetDbInst\(\)](#). [More...](#)

struct [st_ble_gatts_evt_data_t](#)

[st_ble_gatts_evt_data_t](#) is the type of the data notified in a GATT Server Event. [More...](#)

Macros

`#define` [BLE_GATT_DEFAULT_MTU](#)

GATT Default MTU.

`#define` [BLE_GATT_16_BIT_UUID_FORMAT](#)

GATT Identification for 16-bit UUID Format.

`#define` [BLE_GATT_128_BIT_UUID_FORMAT](#)

GATT Identification for 128-bit UUID Format.

`#define` [BLE_GATT_16_BIT_UUID_SIZE](#)

GATT 16-bit UUID Size.

```
#define BLE_GATT_128_BIT_UUID_SIZE  
GATT 128-bit UUID Size.
```

```
#define BLE_GATT_INVALID_ATTR_HDL_VAL  
GATT Invalid Attribute Handle Value.
```

```
#define BLE_GATT_ATTR_HDL_START_RANGE  
GATT Attribute Handle Start Range.
```

```
#define BLE_GATT_ATTR_HDL_END_RANGE  
GATT Attribute Handle End Range.
```

```
#define BLE_GATTS_CLI_CNFG_NOTIFICATION  
GATT Client Configuration values. Enable Notification.
```

```
#define BLE_GATTS_CLI_CNFG_INDICATION  
GATT Client Configuration values. Enable Indication.
```

```
#define BLE_GATTS_CLI_CNFG_DEFAULT  
GATT Client Configuration values. Default value or disable  
notification/indication.
```

```
#define BLE_GATTS_SER_CNFG_BROADCAST  
GATT Server Configuration values. Enable broadcast.
```

```
#define BLE_GATTS_SER_CNFG_DEFAULT  
GATT Server Configuration values. Default value.
```

```
#define BLE_GATTS_MAX_CB  
GATT Server Callback Number.
```

```
#define BLE_GATTS_OP_CHAR_VALUE_READ_REQ
```

Characteristic Value Local Read Operation.

```
#define BLE_GATTS_OP_CHAR_VALUE_WRITE_REQ
```

Characteristic Value Local Write Operation.

```
#define BLE_GATTS_OP_CHAR_VALUE_WRITE_WITHOUT_REQ
```

Characteristic Value Local Write Without Response Operation.

```
#define BLE_GATTS_OP_CHAR_CLI_CNFG_READ_REQ
```

Characteristic Client Configuration Local Read Operation.

```
#define BLE_GATTS_OP_CHAR_CLI_CNFG_WRITE_REQ
```

Characteristic Client Configuration Local Write Operation.

```
#define BLE_GATTS_OP_CHAR_SER_CNFG_READ_REQ
```

Characteristic Server Configuration Local Read Operation.

```
#define BLE_GATTS_OP_CHAR_SER_CNFG_WRITE_REQ
```

Characteristic Server Configuration Local Write Operation.

```
#define BLE_GATTS_OP_CHAR_PEER_READ_REQ
```

Characteristic Value Peer Read Operation.

```
#define BLE_GATTS_OP_CHAR_PEER_WRITE_REQ
```

Characteristic Value Peer Write Operation.

```
#define BLE_GATTS_OP_CHAR_PEER_WRITE_CMD
```

Characteristic Value Peer Write Command.

```
#define BLE_GATTS_OP_CHAR_PEER_CLI_CNFG_READ_REQ
```

Characteristic Client Configuration Peer Read Operation.

```
#define BLE_GATTS_OP_CHAR_PEER_CLI_CNFG_WRITE_REQ
```

Characteristic Client Configuration Peer Write Operation.

```
#define BLE_GATTS_OP_CHAR_PEER_SER_CNFG_READ_REQ  
Characteristic Server Configuration Peer Read Operation.
```

```
#define BLE_GATTS_OP_CHAR_PEER_SER_CNFG_WRITE_REQ  
Characteristic Server Configuration Peer Write Operation.
```

```
#define BLE_GATTS_OP_CHAR_PEER_USR_DESC_READ_REQ  
Characteristic User Description Peer Read Operation.
```

```
#define BLE_GATTS_OP_CHAR_PEER_USR_DESC_WRITE_REQ  
Characteristic User Description Peer Write Operation.
```

```
#define BLE_GATTS_OP_CHAR_PEER_HLD_DESC_READ_REQ  
Characteristic Higher Layer Defined Descriptor Peer Read Operation.
```

```
#define BLE_GATTS_OP_CHAR_PEER_HLD_DESC_WRITE_REQ  
Characteristic Higher Layer Defined Descriptor Peer Write Operation.
```

```
#define BLE_GATTS_OP_CHAR_REQ_AUTHOR  
Operation Required Authorization.
```

```
#define BLE_GATT_DB_READ  
Allow clients to read.
```

```
#define BLE_GATT_DB_WRITE  
Allow clients to write.
```

```
#define BLE_GATT_DB_WRITE_WITHOUT_RSP  
Allow clients to write without response.
```

```
#define BLE_GATT_DB_READ_WRITE  
Allow clients to access of all.
```

```
#define BLE_GATT_DB_NO_AUXILIARY_PROPERTY
```

No auxiliary properties.

```
#define BLE_GATT_DB_FIXED_LENGTH_PROPERTY
```

Fixed length attribute value.

```
#define BLE_GATT_DB_AUTHORIZATION_PROPERTY
```

Attributes requiring authorization.

```
#define BLE_GATT_DB_ATTR_DISABLED
```

The attribute is disabled. If this value is set, the attribute cannot be found and accessed by a GATT Client.

```
#define BLE_GATT_DB_128_BIT_UUID_FORMAT
```

Attribute with 128 bit UUID.

```
#define BLE_GATT_DB_PEER_SPECIFIC_VAL_PROPERTY
```

Attribute managed by each GATT Client.

```
#define BLE_GATT_DB_CONST_ATTR_VAL_PROPERTY
```

Fixed attribute value.

```
#define BLE_GATT_DB_SER_SECURITY_UNAUTH
```

Unauthenticated pairing(Security Mode1 Security Level 2, Security Mode 2 Security Level 1). Unauthenticated pairing is required to access the service.

```
#define BLE_GATT_DB_SER_SECURITY_AUTH
```

Authenticated pairing(Security Mode1 Security Level 3, Security Mode 2 Security Level 2). Authenticated pairing is required to access the service.

```
#define BLE_GATT_DB_SER_SECURITY_SECONN
```

Authenticated LE secure connections that generates 16bytes LTK(Security Mode1 Security Level 4). Authenticated LE secure connections pairing that generates 16bytes LTK is required to access the service. If this bit is set, bit24-27 are ignored.

```
#define BLE_GATT_DB_SER_SECURITY_ENC  
Encryption. Encryption by the LTK exchanged in pairing is required to access.
```

```
#define BLE_GATT_DB_SER_NO_SECURITY_PROPERTY  
No Security(Security Mode1 Security Level 1).
```

```
#define BLE_GATT_DB_SER_ENC_KEY_SIZE_DONT_CARE  
7-byte or larger encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_7  
7-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_8  
8-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_9  
9-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_10  
10-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_11  
11-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_12  
12-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_13  
13-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_14  
14-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_15
    15-byte encryption key.
```

```
#define BLE_GATT_DB_SER_ENCRYPT_KEY_SIZE_16
    16-byte encryption key.
```

Typedefs

```
typedef void(* ble_gatts_app_cb_t) (uint16_t event_type, ble_status_t event_result,
    st_ble_gatts_evt_data_t *p_event_data)

ble_gatts_app_cb_t is the GATT Server Event callback function type.
More...
```

Enumerations

```
enum e_r_ble_gatts_evt_t
    GATT Server Event Identifier. More...
```

Data Structure Documentation

◆ st_ble_gatt_value_t

struct st_ble_gatt_value_t		
Attribute Value.		
Data Fields		
uint16_t	value_len	Length of the attribute value.
uint8_t *	p_value	Attribute Value.

◆ st_ble_gatt_hdl_value_pair_t

struct st_ble_gatt_hdl_value_pair_t		
Attribute handle and attribute Value.		
Data Fields		
uint16_t	attr_hdl	Attribute Handle.
st_ble_gatt_value_t	value	Attribute Value.

◆ st_ble_gatt_queue_att_val_t

struct st_ble_gatt_queue_att_val_t		
Queued writes Attribute Value.		
Data Fields		

uint8_t *	p_value	Attribute Value for Queued Write .
uint16_t	value_len	Length of the attribute value.
uint16_t	padding	padding.

◆ st_ble_gatt_queue_pair_t

struct st_ble_gatt_queue_pair_t		
Queued writes Attribute Value.		
Data Fields		
st_ble_gatt_queue_att_val_t	queue_value	Attribute Value for Queued Write.
uint16_t	attr_hdl	Attribute Handle.

◆ st_ble_gatt_queue_elm_t

struct st_ble_gatt_queue_elm_t		
Prepare Write Queue element for long characteristic.		
Data Fields		
st_ble_gatt_queue_pair_t	queue_value_pair	Part of Long Characteristic Value and Characteristic Value Handle.
uint16_t	offset	Offset that indicates the location to be written.

◆ st_ble_gatt_pre_queue_t

struct st_ble_gatt_pre_queue_t		
Prepare Write Queue for long characteristic.		
Data Fields		
uint8_t *	p_buf_start	Buffer start address for Write Long Characteristic Request.
st_ble_gatt_queue_elm_t *	p_queue	Prepare Write Queue for Long Characteristic Value.
uint16_t	buffer_len	Buffer length.
uint16_t	conn_hdl	Connection Handle.
uint16_t	buf_offset	Current buffer offset.
uint8_t	queue_size	Number of elements in the prepare write queue.
uint8_t	queue_idx	Index of Prepare Write Queue.

◆ st_ble_gatts_db_params_t

struct st_ble_gatts_db_params_t		
---------------------------------	--	--

Attribute value to be set to or retrieved from the GATT Database and the access type from the GATT Client.		
Data Fields		
st_ble_gatt_value_t	value	Attribute value to be set to or retrieved from the GATT Database. Note that the address of the value field in the value field is invalid in case of read access.
uint16_t	attr_hdl	Attribute handle identifying the attribute to be set or retrieved.
uint8_t	db_op	Type of the access to GATT Database from the GATT Client. See also access_type_to_gatt_database

◆ [st_ble_gatts_db_conn_hdl_t](#)

struct st_ble_gatts_db_conn_hdl_t		
Information about the service or the characteristic that the attribute belongs to.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the GATT Client that accesses to the GATT DataBase.
uint8_t	service_id	ID of the service that the attribute belongs to.
uint8_t	char_id	ID of the Characteristic that the attribute belongs to.

◆ [st_ble_gatts_db_access_evt_t](#)

struct st_ble_gatts_db_access_evt_t		
This structure notifies that the GATT Database has been accessed from a GATT Client.		
Data Fields		
st_ble_gatts_db_conn_hdl_t *	p_handle	Information about the service or the characteristic that the attribute belongs to.
st_ble_gatts_db_params_t *	p_params	Attribute value to be set to or retrieved from the GATT Database and the access type from the GATT Client.

◆ [st_ble_gatts_conn_evt_t](#)

struct st_ble_gatts_conn_evt_t		
--	--	--

This structure notifies that the link with the GATT Client has been established.

Data Fields		
-------------	--	--

<code>st_ble_dev_addr_t*</code>	<code>p_addr</code>	Address of the GATT Client.
---------------------------------	---------------------	-----------------------------

◆ `st_ble_gatts_disconn_evt_t`

<code>struct st_ble_gatts_disconn_evt_t</code>
--

This structure notifies that the link with the GATT Client has been disconnected.

Data Fields		
-------------	--	--

<code>st_ble_dev_addr_t*</code>	<code>p_addr</code>	Address of the GATT Client.
---------------------------------	---------------------	-----------------------------

◆ `st_ble_gatts_ex_mtu_req_evt_t`

<code>struct st_ble_gatts_ex_mtu_req_evt_t</code>

This structure notifies that a MTU Exchange Request PDU has been received from a GATT Client.

Data Fields		
-------------	--	--

<code>uint16_t</code>	<code>mtu</code>	Maximum receive MTU size by GATT Client.
-----------------------	------------------	--

◆ `st_ble_gatts_cfm_evt_t`

<code>struct st_ble_gatts_cfm_evt_t</code>
--

This structure notifies that a Confirmation PDU has been received from a GATT Client.

Data Fields		
-------------	--	--

<code>uint16_t</code>	<code>attr_hdl</code>	Attribute handle identifying the Characteristic sent by the Indication PDU.
-----------------------	-----------------------	---

◆ `st_ble_gatts_read_by_type_rsp_evt_t`

<code>struct st_ble_gatts_read_by_type_rsp_evt_t</code>

This structure notifies that a Read By Type Response PDU has been sent from GATT Server.

Data Fields		
-------------	--	--

<code>uint16_t</code>	<code>attr_hdl</code>	Attribute handle identifying the Characteristic read by the Read By Type Request PDU.
-----------------------	-----------------------	---

◆ `st_ble_gatts_read_rsp_evt_t`

<code>struct st_ble_gatts_read_rsp_evt_t</code>

This structure notifies that a Read Response PDU has been sent from GATT Server.

Data Fields		
-------------	--	--

<code>uint16_t</code>	<code>attr_hdl</code>	Attribute handle identifying the Characteristic read by the Read Request PDU.
-----------------------	-----------------------	---

◆ **st_ble_gatts_read_blob_rsp_evt_t**

struct st_ble_gatts_read_blob_rsp_evt_t		
This structure notifies that a Read Blob Response PDU has been sent from GATT Server.		
Data Fields		
uint16_t	attr_hdl	Attribute handle identifying the Characteristic read by the Read Blob Request PDU.

◆ **st_ble_gatts_read_multi_rsp_evt_t**

struct st_ble_gatts_read_multi_rsp_evt_t		
This structure notifies that a Read Multiple Response PDU has been sent from GATT Server.		
Data Fields		
uint8_t	count	The number of attribute read by the Read Multiple Request PDU.
uint16_t*	p_attr_hdl_list	The list of attribute read by the Read Multiple Request PDU.

◆ **st_ble_gatts_write_rsp_evt_t**

struct st_ble_gatts_write_rsp_evt_t		
This structure notifies that a Write Response PDU has been sent from GATT Server.		
Data Fields		
uint16_t	attr_hdl	Attribute handle identifying the Characteristic written by the Write Request PDU.

◆ **st_ble_gatts_prepare_write_rsp_evt_t**

struct st_ble_gatts_prepare_write_rsp_evt_t		
This structure notifies that a Prepare Write Response PDU has been sent from GATT Server.		
Data Fields		
uint16_t	attr_hdl	Attribute handle identifying the Characteristic written by the Prepare Write Request PDU.
uint16_t	length	The length of written bytes by the Prepare Write Request PDU.
uint16_t	offset	The offset of the first octet to be written.

◆ **st_ble_gatts_exe_write_rsp_evt_t**

struct st_ble_gatts_exe_write_rsp_evt_t		
This structure notifies that a Execute Write Response PDU has been sent from GATT Server.		
Data Fields		

uint8_t	exe_flag	The flag that indicates whether execution or cancellation.	
		value	description
		0x00	Cancellation.
		0x01	Execution.

◆ st_ble_gatts_db_uuid_cfg_t

struct st_ble_gatts_db_uuid_cfg_t		
A structure that defines the information on the position where UUIDs are used.		
Data Fields		
uint16_t	offset	The position of the defined UUID is specified by offset value in uuid_table of st_ble_gatts_db_cfg_t .
uint16_t	first	The attribute handle that indicates the first position in st_ble_gatts_db_attr_cfg_t for the defined UUID is specified.
uint16_t	last	The attribute handle that indicates the last position in st_ble_gatts_db_attr_cfg_t for the defined UUID is specified.

◆ st_ble_gatts_db_attr_cfg_t

struct st_ble_gatts_db_attr_cfg_t			
A structure that defines the detailed information of the attributes.			
Data Fields			
uint8_t	desc_prop	The properties of attribute are specified.	
		Set the following properties by a bitwise OR.	
		macro	description
		BLE_GATT_DB_READ(0x01)	Allow clients to read.
		BLE_GATT_DB_WRITE(0x02)	Allow clients to write.
BLE_GATT_DB_WRITE_WITH_OUT_RSP(0x04)	Allow clients to write.		
BLE_GATT_DB	Allow clients		

		<p><code>_READ_WRITE (0x07)</code> to access of all.</p>														
<p>uint8_t</p>	<p>aux_prop</p>	<p>The auxiliary properties of attribute are specified.</p> <p>Set the following properties by a bitwise OR.</p> <table border="1" data-bbox="1034 501 1473 555"> <thead> <tr> <th data-bbox="1034 501 1254 555">macro</th> <th data-bbox="1254 501 1473 555">description</th> </tr> </thead> <tbody> <tr> <td data-bbox="1034 566 1254 696"> <p><code>BLE_GATT_DB_NO_AUXILIARY_PROPERTY(0x00)</code></p> </td> <td data-bbox="1254 566 1473 831"> <p>No auxiliary properties. <p><code>BLE_GATT_DB_ATTR_DISABLED(0x10)</code></p>	<p>The attribute is disabled. If this value is set, the attribute cannot be found and accessed by a GATT Client. It is invalid when used with other properties at the same time.</p>															
<p><code>BLE_GATT_DB_128_BIT_UUID_FORMAT(0x20)</code></p>	<p>Attribute with 128 bit UUID. If this macro is not set, the attribute value is 16-bits UUID.</p>															
<p><code>BLE_GATT_DB_PEER_SPECIFIC_VALUE_PROPERTY</code></p>	<p>Attribute managed by each GATT</p>															

		<p>RTY(0x40) Client.</p> <p>BLE_GATT_DB_FIXED_ATTR_VAL_PROPERTY(0x80) Fixed attribute value. Writing from Client and setting from Server are prohibited.</p>
uint16_t	length	The length of the attribute value is specified.
uint16_t	next	The position of the next attribute with the same UUID as the defined attribute is specified by an attribute handle.
uint16_t	uuid_offset	<p>The storage area of attribute value.</p> <p>UUID of the defined attribute is set by specifying the position of the UUID registered in <code>uuid_table</code> of <code>st_ble_gatts_db_cfg_t</code> with the array offset value.</p>
uint8_t *	p_data_offset	<p>Storage area of attribute value.</p> <p>The address in the array registered in No.1-No.4 is specified to set the attribute value storage area of the defined attribute.</p>

◆ st_ble_gatts_db_attr_list_t

struct st_ble_gatts_db_attr_list_t		
The number of attributes are stored.		
Data Fields		
uint8_t	count	The number of the services or the characteristics.

◆ st_ble_gatts_db_char_cfg_t

struct st_ble_gatts_db_char_cfg_t		
A structure that defines the detailed information of the characteristics.		
Data Fields		
st_ble_gatts_db_attr_list_t	list	The total number of attributes in the defined characteristic is

		specified.
uint16_t	start_hdl	The first attribute handle of the characteristic is specified.
uint8_t	service_id	The index of service to which the characteristic belongs is specified.

◆ st_ble_gatts_db_serv_cfg_t

struct st_ble_gatts_db_serv_cfg_t								
A structure that defines the detailed information of the characteristics.								
Data Fields								
st_ble_gatts_db_attr_list_t	list	The total number of service declarations in the defined service is specified.						
uint32_t	desc	<p>The properties of the defined service are specified.</p> <p>Set the security level, the security mode and the key size with a bitwise OR. The bit0-bit3 are specified as the security level. Select one of the following.</p> <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GATT_DB_SER_SECURITY_UNAUTH(0x00000001)</td> <td>Unauthenticated pairing(Security Mode1 Security Level 2, Security Mode 2 Security Level 1) Unauthenticated pairing is required to access the service.</td> </tr> <tr> <td>BLE_GATT_DB_SER_SECURITY_AUTH(0x00000002)</td> <td>Authenticated pairing(Security Mode1 Security Level 3, Security Mode 2 Security Level 2) Authenticated pairing is required to</td> </tr> </tbody> </table>	macro	description	BLE_GATT_DB_SER_SECURITY_UNAUTH(0x00000001)	Unauthenticated pairing(Security Mode1 Security Level 2, Security Mode 2 Security Level 1) Unauthenticated pairing is required to access the service. The bit4 is specified as the security mode.

macro	description
-------	-------------

BLE_GATT_DB_SER_SECURITY_ENC(0x00000010)	Encryption Encryption by the LTK exchanged in pairing is required to access.
--	--

If the security requirement of the service is not needed, specify the bit0-bit4 to [BLE_GATT_DB_SER_NO_SECURITY_PROPERTY\(0x00000000\)](#) .(Security Mode1 Security Level 1)

The bit24-bit27 are specified as the key size required by the defined service.

Select one of the following.

macro	description
-------	-------------

BLE_GATT_DB_SER_ENCRYP	7-byte encryption
--	-------------------

T_KEY_SIZE_7(0x01000000)	key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_8(0x02000000)	8-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_9(0x03000000)	9-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_10(0x04000000)	10-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_11(0x05000000)	11-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_12(0x06000000)	12-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_13(0x07000000)	13-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_14(0x08000000)	14-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_15(0x09000000)	15-byte encryption key.
BLE_GATT_DB_SER_ENCRYP_T_KEY_SIZE_16(0x0A000000)	16-byte encryption key.
BLE_GATT_DB_SER_ENC_KEY_SIZE_DONT_CARE(0x0000)	7-byte or larger encryption key.

		0000) Other bits are reserved.
uint16_t	start_hdl	The start attribute handle of the defined service is specified.
uint16_t	end_hdl	The end attribute handle of the defined service is specified.
uint8_t	char_start_idx	The start index of the characteristic that belongs to the defined service is specified.
uint8_t	char_end_idx	The end index of the characteristic that belongs to the defined service is specified.

◆ st_ble_gatts_db_cfg_t

struct st_ble_gatts_db_cfg_t		
This is the structure of GATT Database that is specified in R_BLE_GATTS_SetDbInst() .		
Data Fields		
const uint8_t *	p_uuid_table	The array to register the UUID to be used.
uint8_t *	p_attr_val_table	The array to register variable attribute values.
const uint8_t *	p_const_attr_val_table	The array to register fixed attribute values.
uint8_t *	p_rem_spec_val_table	The array to manage the attribute values handled for each GATT client.
const uint8_t *	p_const_rem_spec_val_table	The array to register the default of the attribute value handled by each GATT client.
const st_ble_gatts_db_uuid_cfg_t *	p_uuid_cfg	The array to register information on the position where UUIDs are used.
const st_ble_gatts_db_attr_cfg_t *	p_attr_cfg	The array to register the detailed information of attributes.
const st_ble_gatts_db_char_cfg_t *	p_char_cfg	The array to register the detailed information of characteristics.
const st_ble_gatts_db_serv_cfg_t *	p_serv_cfg	The array to register the detailed information of services.
uint8_t	serv_cnt	The number of services included in the GATT Database.

uint8_t	char_cnt	The number of characteristics included in the GATT Database.
uint8_t	uuid_type_cnt	The number of UUIDs included in the GATT Database.
uint8_t	peer_spec_val_cnt	The total size of attribute value that needs to be managed for each GATT client.

◆ st_ble_gatts_evt_data_t

struct st_ble_gatts_evt_data_t		
st_ble_gatts_evt_data_t is the type of the data notified in a GATT Server Event.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the GATT Client.
uint16_t	param_len	The size of GATT Server Event parameters.
void *	p_param	GATT Server Event parameters. This parameter differs in each GATT Server Event.

Typedef Documentation

◆ ble_gatts_app_cb_t

ble_gatts_app_cb_t		
ble_gatts_app_cb_t is the GATT Server Event callback function type.		
Parameters		
[in]	event_type	The type of GATT Server Event.
[in]	event_result	The result of GATT Server Event
[in]	p_event_data	Data notified by GATT Server Event.
Returns		
none		

Enumeration Type Documentation

◆ e_r_ble_gatts_evt_t

Function Documentation

◆ R_BLE_GATTS_Init()

```
ble_status_t R_BLE_GATTS_Init ( uint8_t cb_num)
```

This function initializes the GATT Server and registers the number of the callbacks for GATT Server event.

Specify the `cb_num` parameter to a value between 1 and `BLE_GATTS_MAX_CB`.

[R_BLE_GATTS_RegisterCb\(\)](#) registers the callback.

The result of this API call is returned by a return value.

Parameters

[in]	<code>cb_num</code>	The number of callbacks to be registered.
------	---------------------	---

Return values

<code>BLE_SUCCESS(0x0000)</code>	Success
<code>BLE_ERR_INVALID_ARG(0x0003)</code>	The <code>cb_num</code> parameter is out of range.

◆ R_BLE_GATTS_SetDbInst()

```
ble_status_t R_BLE_GATTS_SetDbInst ( st_ble_gatts_db_cfg_t * p_db_inst)
```

This function sets GATT Database to host stack.

The result of this API call is returned by a return value.

Parameters

[in]	<code>p_db_inst</code>	GATT Database to be set.
------	------------------------	--------------------------

Return values

<code>BLE_SUCCESS(0x0000)</code>	Success
<code>BLE_ERR_INVALID_PTR(0x0001)</code>	The reason for this error is as follows. <ul style="list-style-type: none"> • The <code>db_inst</code> parameter is specified as NULL. • The array in the <code>db_inst</code> is specified as NULL.

◆ **R_BLE_GATTS_RegisterCb()**

```
ble_status_t R_BLE_GATTS_RegisterCb ( ble_gatts_app_cb_t cb, uint8_t priority )
```

This function registers a callback for GATT Server event.

The number of the callback that may be registered by this function is the value specified by [R_BLE_GATTS_Init\(\)](#).

The result of this API call is returned by a return value.

Parameters

[in]	cb	Callback function for GATT Server event.
[in]	priority	The priority of the callback function. Valid range is $1 \leq \text{priority} \leq \text{BLE_GATTS_MAX_CB}$. A lower priority number means a higher priority level.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The cb parameter is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The priority parameter is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	Host stack has already registered the maximum number of callbacks.

◆ **R_BLE_GATTS_DeregisterCb()**

```
ble_status_t R_BLE_GATTS_DeregisterCb ( ble_gatts_app_cb_t cb)
```

This function deregisters the callback function for GATT Server event.

The result of this API call is returned by a return value.

Parameters

[in]	cb	The callback function to be deregistered.
------	----	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The cb parameter is specified as NULL.
BLE_ERR_NOT_FOUND(0x000D)	The callback has not been registered.

◆ R_BLE_GATTS_Notification()

```
ble_status_t R_BLE_GATTS_Notification ( uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t *
p_ntf_data )
```

This function sends a notification of an attribute's value.

The maximum length of the attribute value that can be sent with notification is MTU-3.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to be sent the notification.
[in]	p_ntf_data	The attribute value to send.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_ntf_data parameter or the value field in the value field in the p_ntf_data parameter is NULL.
BLE_ERR_INVALID_ARG(0x0003)	The value_len field in the value field in the p_ntf_data parameter is 0 or the attr_hdl field in the p_ntf_data parameters is 0.
BLE_ERR_INVALID_OPERATION(0x0009)	This function was called while processing other request.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl was not found.

◆ **R_BLE_GATTS_Indication()**

```
ble_status_t R_BLE_GATTS_Indication ( uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t*
p_ind_data )
```

This function sends a indication of an attribute's value.

The maximum length of the attribute value that can be sent with indication is MTU-3.

The result of this API call is returned by a return value.

The remote device that receives a indication sends a confirmation.

BLE_GATTS_EVENT_HDL_VAL_CNF event notifies the application layer that the confirmation has been received.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to be sent the indication.
[in]	p_ind_data	The attribute value to send.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_ind_data parameter or the value field in the value field in the p_ind_data parameter is NULL.
BLE_ERR_INVALID_ARG(0x0003)	The value_len field in the value field in the p_ind_data parameter is 0 or the attr_hdl field in the p_ind_data parameters is 0.
BLE_ERR_INVALID_OPERATION(0x0009)	This function was called while processing other request.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl was not found.

◆ R_BLE_GATTS_GetAttr()

```
ble_status_t R_BLE_GATTS_GetAttr ( uint16_t conn_hdl, uint16_t attr_hdl, st_ble_gatt_value_t *
p_value )
```

This function gets a attribute value from the GATT Database.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	If the attribute value that has information about the remote device is retrieved, specify the remote device with the conn_hdl parameter. When information about the remote device is not required, set the conn_hdl parameter to BLE_GAP_INVALID_CONN_HDL.
[in]	attr_hdl	The attribute handle of the attribute value to be retrieved.
[out]	p_value	The attribute value to be retrieved.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_value parameter is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The attr_hdl parameter is 0 or larger than the last attribute handle of GATT Database.
BLE_ERR_INVALID_STATE(0x0008)	The attribute is not in a state to be read.
BLE_ERR_INVALID_OPERATION(0x0009)	The attribute cannot be read.
BLE_ERR_NOT_FOUND(0x000D)	The attribute specified by the attr_hdl parameter is not belonging to any services or characteristics.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by the conn_hdl parameter was not found.

◆ R_BLE_GATTS_SetAttr()

```
ble_status_t R_BLE_GATTS_SetAttr ( uint16_t conn_hdl, uint16_t attr_hdl, st_ble_gatt_value_t *
p_value )
```

This function sets an attribute value to the GATT Database.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	If the attribute value that has information about the remote device is retrieved, specify the remote device with the conn_hdl parameter. When information about the remote device is not required, set the conn_hdl parameter to BLE_GAP_INVALID_CONN_HDL.
[in]	attr_hdl	The attribute handle of the attribute value to be set.
[in]	p_value	The attribute value to be set.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_value parameter is specified as NULL.
BLE_ERR_INVALID_DATA(0x0002)	The write size is larger than the length of the attribute value.
BLE_ERR_INVALID_ARG(0x0003)	The attr_hdl parameter is 0 or larger than the last attribute handle of GATT Database.
BLE_ERR_INVALID_STATE(0x0008)	The attribute is not in a state to be written.
BLE_ERR_INVALID_OPERATION(0x0009)	The attribute cannot be written.
BLE_ERR_NOT_FOUND(0x000D)	The attribute specified by the attr_hdl parameter is not belonging to any services or characteristics.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by the conn_hdl parameter was not found.

◆ R_BLE_GATTS_SendErrRsp()

```
ble_status_t R_BLE_GATTS_SendErrRsp ( uint16_t error_code)
```

This function sends an error response to a remote device.

The result is returned from the API.
 The error code specified in the callback is notified as Error Response to the remote device.
 The result of this API call is returned by a return value.

Parameters

[in]	error_code	The error codes to be notified the client. It is a bitwise OR of GATT Error Group ID : 0x3000 and the following error codes defined in Core Spec and Core Spec Supplement.		
		<table border="1"> <thead> <tr> <th data-bbox="1078 640 1273 689">Error Code</th> <th data-bbox="1279 640 1457 689">description</th> </tr> </thead> </table>	Error Code	description

		<table border="1"> <tbody> <tr> <td data-bbox="1078 1684 1273 1818">BLE_ERR_GATT_INVALID_OFFSET(0x3007)</td> <td data-bbox="1279 1684 1457 1930">The specified offset is larger than the length of the attribute value.</td> </tr> </tbody> </table>	BLE_ERR_GATT_INVALID_OFFSET(0x3007)	The specified offset is larger than the length of the attribute value.
BLE_ERR_GATT_INVALID_OFFSET(0x3007)	The specified offset is larger than the length of the attribute value.			
		<table border="1"> <tbody> <tr> <td data-bbox="1078 1953 1273 2045">BLE_ERR_GATT_INSUFFICIENT_AUTHORIZATION</td> <td data-bbox="1279 1953 1457 2045">Authorization is required to access</td> </tr> </tbody> </table>	BLE_ERR_GATT_INSUFFICIENT_AUTHORIZATION	Authorization is required to access
BLE_ERR_GATT_INSUFFICIENT_AUTHORIZATION	Authorization is required to access			

RIZATION(0x3008)	the attribute.
BLE_ERR_GATT_PREPARE_WRITE_QUEUE_FULL(0x3009)	The Write Queue in the GATT Server is full.
BLE_ERR_GATT_ATTRIBUTE_NOT_FOUND(0x300A)	The specified attribute is not found.
BLE_ERR_GATT_ATTRIBUTE_NOT_READ_BY_READ_BLOB_REQUEST(0x300B)	The attribute cannot be read by Read Blob Request.
BLE_ERR_GATT_ENCRYPTION_KEY_SIZE_INSUFFICIENT(0x300C)	The Encryption Key Size is insufficient.
BLE_ERR_GATT_INVALID_ATTRIBUTE_LENGTH(0x300D)	The length of the specified attribute is invalid.
BLE_ERR_GATT_UNLIKELY_ERROR(0x300E)	Because an error has occurred, the process cannot be advanced.
BLE_ERR_GATT_ENCRYPTION_REQUIRED_TO_ACCESS_ATTRIBUTE(0x300F)	Encryption is required to access the attribute.
BLE_ERR_GATT_UNSUPPORTED_ATTRIBUTE_TYPE(0x3010)	The type of the specified attribute is not supported.
BLE_ERR_GATT_INSUFFICIENT_RESOURCES(0x3011)	The resource to complete the request is insufficient.
0x3080 -	Application

			0x309F	Error. The upper layer defines the error codes.
			0x30E0 - 0x30FF	The error code defined in Common Profile and Service Error Core Specification Supplement(CSS). CSS ver.7 defines the error codes from 0x30FC to 0x30FF.
			BLE_ERR_GATT_WRITE_REQUEST_REJECTED(0x30FC)	The Write Request has not been completed due to the reason other than Permission.
			BLE_ERR_GATT_CCCD_IMPROPERLY_CONFIGURED(0x30FD)	The CCCD is set to be invalid.
			BLE_ERR_GATT_PROCESS_ALREADY_IN_PROGRESS(0x30FE)	The request is now in progress.
			BLE_ERR_GATT_OUT_OF_RANGE(0x30FF)	The attribute value is out of range.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The Group ID of the error_code parameter is not 0x3000, or it is 0x3000.
BLE_ERR_INVALID_OPERATION(0x0009)	While processing other error response, this function was called.

◆ **R_BLE_GATTS_RspExMtu()**

```
ble_status_t R_BLE_GATTS_RspExMtu ( uint16_t conn_hdl, uint16_t mtu )
```

This function replies to a MTU Exchange Request from a remote device.

BLE_GATTS_EVENT_EX_MTU_REQ event notifies the application layer that a MTU Exchange Request has been received. Therefore when the callback has received the event, call this function.

The new MTU is the minimum of the mtu parameter specified by this function and the mtu field in BLE_GATTS_EVENT_EX_MTU_REQ event.

Default MTU size is 23 bytes.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to be sent MTU Exchange Response.
[in]	mtu	The maximum size(in bytes) of the GATT PDU that GATT Server can receive. Valid range is 23 <= mtu <= 247.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The mtu parameter is out of range.
BLE_ERR_INVALID_OPERATION(0x0009)	This function was called while processing other request.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl was not found.

◆ R_BLE_GATTS_SetPrepareQueue()

```
ble_status_t R_BLE_GATTS_SetPrepareQueue ( st_ble_gatt_pre_queue_t * p_pre_queues, uint8_t queue_num )
```

Register prepare queue and buffer in Host Stack.

This function registers the prepare queue and buffer for long characteristic write and reliable writes. The result of this API call is returned by a return value.

Parameters

[in]	p_pre_queues	The prepare write queues to be registered.
[in]	queue_num	The number of prepare write queues to be registered.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_pre_queue parameter is specified as NULL.

4.3.2.4 GATT_CLIENT

Interfaces » BLE Interface

Functions

ble_status_t [R_BLE_GATTC_Init](#) (uint8_t cb_num)

This function initializes the GATT Client and registers the number of the callbacks for GATT Client event. [More...](#)

ble_status_t [R_BLE_GATTC_RegisterCb](#) (ble_gattc_app_cb_t cb, uint8_t priority)

This function registers a callback function for GATT Client event. [More...](#)

ble_status_t [R_BLE_GATTC_DeregisterCb](#) (ble_gattc_app_cb_t cb)

This function deregisters the callback function for GATT Client event. [More...](#)

ble_status_t [R_BLE_GATTC_ReqExMtu](#) (uint16_t conn_hdl, uint16_t mtu)

This function sends a MTU Exchange Request PDU to a GATT Server

in order to change the current MTU. [More...](#)

ble_status_t [R_BLE_GATTC_DiscAllPrimServ](#) (uint16_t conn_hdl)

This function discovers all Primary Services in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscPrimServ](#) (uint16_t conn_hdl, uint8_t *p_uuid, uint8_t uuid_type)

This function discovers Primary Service specified by p_uuid in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscAllSecondServ](#) (uint16_t conn_hdl)

This function discovers all Secondary Services in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscInclServ](#) (uint16_t conn_hdl, st_ble_gatt_hdl_range_t *p_range)

This function discovers Included Services within the specified attribute handle range in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscAllChar](#) (uint16_t conn_hdl, st_ble_gatt_hdl_range_t *p_range)

This function discovers Characteristic within the specified attribute handle range in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscCharByUuid](#) (uint16_t conn_hdl, uint8_t *p_uuid, uint8_t uuid_type, st_ble_gatt_hdl_range_t *p_range)

This function discovers Characteristic specified by uuid within the specified attribute handle range in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_DiscAllCharDesc](#) (uint16_t conn_hdl, st_ble_gatt_hdl_range_t *p_range)

This function discovers Characteristic Descriptor within the specified attribute handle range in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_ReadChar](#) (uint16_t conn_hdl, uint16_t value_hdl)

This function reads a Characteristic/Characteristic Descriptor in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_ReadCharUsingUuid](#) (uint16_t conn_hdl, uint8_t *p_uuid, uint8_t uuid_type, st_ble_gatt_hdl_range_t *p_range)

This function reads a Characteristic in a GATT Server using a specified UUID. [More...](#)

ble_status_t [R_BLE_GATTC_ReadLongChar](#) (uint16_t conn_hdl, uint16_t value_hdl, uint16_t offset)

This function reads a Long Characteristic in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_ReadMultiChar](#) (uint16_t conn_hdl, st_ble_gattc_rd_multi_req_param_t *p_list)

This function reads multiple Characteristics in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_WriteCharWithoutRsp](#) (uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t *p_write_data)

This function writes a Characteristic in a GATT Server without response. [More...](#)

ble_status_t [R_BLE_GATTC_SignedWriteChar](#) (uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t *p_write_data)

This function writes Signed Data to a Characteristic in a GATT Server without response. [More...](#)

ble_status_t [R_BLE_GATTC_WriteChar](#) (uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t *p_write_data)

This function writes a Characteristic in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_WriteLongChar](#) (uint16_t conn_hdl, st_ble_gatt_hdl_value_pair_t *p_write_data, uint16_t offset)

This function writes a Long Characteristic in a GATT Server. [More...](#)

ble_status_t [R_BLE_GATTC_ReliableWrites](#) (uint16_t conn_hdl, st_ble_gattc_reliable_writes_char_pair_t *p_char_pair, uint8_t pair_num, uint8_t auto_flag)

This function performs the Reliable Writes procedure described in GATT Specification. [More...](#)

ble_status_t [R_BLE_GATTC_ExecWrite](#) (uint16_t conn_hdl, uint8_t exe_flag)

If the auto execute of Reliable Writes is not specified by

[R_BLE_GATTC_ReliableWrites\(\)](#), this function is used to execute a write to Characteristic. [More...](#)

Detailed Description

Data Structures

struct [st_ble_gatt_hdl_range_t](#)
Attribute handle range. [More...](#)

struct [st_ble_gattc_reliable_writes_char_pair_t](#)
This is used in [R_BLE_GATTC_ReliableWrites\(\)](#) to specify the pair of Characteristic Value and Characteristic Value Handle. [More...](#)

struct [st_ble_gattc_conn_evt_t](#)
This structure notifies that the link with the GATT Server has been established. [More...](#)

struct [st_ble_gattc_disconn_evt_t](#)
This structure notifies that the link with the GATT Server has been disconnected. [More...](#)

struct [st_ble_gattc_ex_mtu_rsp_evt_t](#)
This structure notifies that a MTU Exchange Response PDU has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_serv_16_evt_t](#)
This structure notifies that a 16-bit UUID Service has been discovered. [More...](#)

struct [st_ble_gattc_serv_128_evt_t](#)
This structure notifies that a 128-bit UUID Service has been discovered. [More...](#)

struct [st_ble_gattc_inc_serv_16_evt_t](#)
This structure notifies that a 16-bit UUID Included Service has been discovered. [More...](#)

struct [st_ble_gattc_inc_serv_128_evt_t](#)

This structure notifies that a 128-bit UUID Included Service has been discovered. [More...](#)

struct [st_ble_gattc_char_16_evt_t](#)

This structure notifies that a 16-bit UUID Characteristic has been discovered. [More...](#)

struct [st_ble_gattc_char_128_evt_t](#)

This structure notifies that a 128-bit UUID Characteristic has been discovered. [More...](#)

struct [st_ble_gattc_char_desc_16_evt_t](#)

This structure notifies that a 16-bit UUID Characteristic Descriptor has been discovered. [More...](#)

struct [st_ble_gattc_char_desc_128_evt_t](#)

This structure notifies that a 128-bit UUID Characteristic Descriptor has been discovered. [More...](#)

struct [st_ble_gattc_err_rsp_evt_t](#)

This structure notifies that a Error Response PDU has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_ntf_evt_t](#)

This structure notifies that a Notification PDU has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_ind_evt_t](#)

This structure notifies that a Indication PDU has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_rd_char_evt_t](#)

This structure notifies that read response to [R_BLE_GATTC_ReadChar\(\)](#) or [R_BLE_GATTC_ReadCharUsingUuid\(\)](#) has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_wr_char_evt_t](#)

This structure notifies that write response to [R_BLE_GATTC_WriteChar\(\)](#) has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_rd_multi_char_evt_t](#)

This structure notifies that read response to [R_BLE_GATTC_ReadMultiChar\(\)](#) has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_char_part_wr_evt_t](#)

This structure notifies that write response to [R_BLE_GATTC_WriteLongChar\(\)](#) or [R_BLE_GATTC_ReliableWrites\(\)](#) has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_reliable_writes_comp_evt_t](#)

This structure notifies that a response to [R_BLE_GATTC_ExecWrite\(\)](#) has been received from a GATT Server. [More...](#)

struct [st_ble_gattc_rd_multi_req_param_t](#)

This is used in [R_BLE_GATTC_ReadMultiChar\(\)](#) to specify multiple Characteristics to be read. [More...](#)

struct [st_ble_gattc_evt_data_t](#)

[st_ble_gattc_evt_data_t](#) is the type of the data notified in a GATT Client Event. [More...](#)

struct [st_ble_gatt_value_t](#)

Attribute Value. [More...](#)

struct [st_ble_gatt_hdl_value_pair_t](#)

Attribute handle and attribute Value. [More...](#)

Macros

#define [BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG](#)

#define [BLE_GATTC_EXECUTE_WRITE_EXEC_FLAG](#)

#define [BLE_GATTC_MAX_CB](#)

GATT Client Callback Number.

```
#define BLE_GATTC_EXEC_AUTO
```

Auto execution.

```
#define BLE_GATTC_EXEC_NOT_AUTO
```

Not auto execution.

```
#define BLE_GATTC_RELIABLE_WRITES_MAX_CHAR_PAIR
```

Length of the Queue used with Prepare Write procedure to write a characteristic whose size is larger than MTU.

Typedefs

```
typedef void(* ble_gattc_app_cb_t) (uint16_t event_type, ble_status_t event_result,
st_ble_gattc_evt_data_t *p_event_data)
```

ble_gattc_app_cb_t is the GATT Client Event callback function type.
More...

Enumerations

```
enum e_r_ble_gattc_evt_t
```

GATT Client Event Identifier. More...

Data Structure Documentation

◆ st_ble_gatt_hdl_range_t

struct st_ble_gatt_hdl_range_t		
Attribute handle range.		
Data Fields		
uint16_t	start_hdl	Start Attribute Handle.
uint16_t	end_hdl	End Attribute Handle.

◆ st_ble_gattc_reliable_writes_char_pair_t

struct st_ble_gattc_reliable_writes_char_pair_t		
This is used in R_BLE_GATTC_ReliableWrites() to specify the pair of Characteristic Value and Characteristic Value Handle.		
Data Fields		

st_ble_gatt_hdl_value_pair_t	write_data	Pair of Characteristic Value and Characteristic Value Handle.
uint16_t	offset	Offset that indicates the location to be written. Normally, set 0 to this parameter. If this parameter sets to a value other than 0, Adjust the offset parameter and the length of the value to be written not to exceed the length of the Characteristic.

◆ st_ble_gattc_conn_evt_t

struct st_ble_gattc_conn_evt_t		
This structure notifies that the link with the GATT Server has been established.		
Data Fields		
st_ble_dev_addr_t *	p_addr	Address of the GATT Server.

◆ st_ble_gattc_disconn_evt_t

struct st_ble_gattc_disconn_evt_t		
This structure notifies that the link with the GATT Server has been disconnected.		
Data Fields		
st_ble_dev_addr_t *	p_addr	Address of the GATT Server.

◆ st_ble_gattc_ex_mtu_rsp_evt_t

struct st_ble_gattc_ex_mtu_rsp_evt_t		
This structure notifies that a MTU Exchange Response PDU has been received from a GATT Server.		
Data Fields		
uint16_t	mtu	MTU size(in bytes) that GATT Server can receive.

◆ st_ble_gattc_serv_16_evt_t

struct st_ble_gattc_serv_16_evt_t		
This structure notifies that a 16-bit UUID Service has been discovered.		
Data Fields		
st_ble_gatt_hdl_range_t	range	Attribute handle range of the 16-bit UUID service.
uint16_t	uuid_16	Service UUID.

◆ st_ble_gattc_serv_128_evt_t

struct st_ble_gattc_serv_128_evt_t		
------------------------------------	--	--

This structure notifies that a 128-bit UUID Service has been discovered.		
Data Fields		
st_ble_gatt_hdl_range_t	range	Attribute handle range of the 128-bit UUID service.
uint8_t	uuid_128[BLE_GATT_128_BIT_UUID_SIZE]	Service UUID.

◆ [st_ble_gattc_inc_serv_16_evt_t](#)

struct st_ble_gattc_inc_serv_16_evt_t		
This structure notifies that a 16-bit UUID Included Service has been discovered.		
Data Fields		
uint16_t	decl_hdl	Service Declaration handle of the 16-bit UUID Included Service.
st_ble_gattc_serv_16_evt_t	service	The contents of the Included Service.

◆ [st_ble_gattc_inc_serv_128_evt_t](#)

struct st_ble_gattc_inc_serv_128_evt_t		
This structure notifies that a 128-bit UUID Included Service has been discovered.		
Data Fields		
uint16_t	decl_hdl	Service Declaration handle of the 128-bit UUID Included Service.
st_ble_gattc_serv_128_evt_t	service	The contents of the Included Service.

◆ [st_ble_gattc_char_16_evt_t](#)

struct st_ble_gattc_char_16_evt_t		
This structure notifies that a 16-bit UUID Characteristic has been discovered.		
Data Fields		
uint16_t	decl_hdl	Attribute handle of Characteristic Declaration.
uint8_t	cproperty	Characteristic Properties. It is a bitwise OR of the following values. Refer to Core Spec [Vol.3] Generic Attribute Profile(GATT) "3.3.1.1 Characteristic Properties" regarding the details of the Characteristic Properties.

		value	description
		0x01	Broadcast property
		0x02	Read property
		0x04	Write Without Response property
		0x08	Write property
		0x10	Notify property
		0x20	Indicate property
		0x40	Authenticated Signed Writes property
		0x80	Extended Properties property
uint16_t	value_hdl	Value Handle of the Characteristic.	
uint16_t	uuid_16	Characteristic UUID.	

◆ **st_ble_gattc_char_128_evt_t**

struct st_ble_gattc_char_128_evt_t						
This structure notifies that a 128-bit UUID Characteristic has been discovered.						
Data Fields						
uint16_t	decl_hdl	Attribute Handle of Characteristic Declaration.				
uint8_t	cproperty	Characteristic Properties. It is a bitwise OR of the following values. Refer to Core Spec [Vol.3] Generic Attribute Profile(GATT) "3.3.1.1 Characteristic Properties" regarding the details of the Characteristic Properties.				
		<table border="1"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x01</td> <td>Broadcast property</td> </tr> </tbody> </table>	value	description	0x01	Broadcast property
value	description					
0x01	Broadcast property					

		0x02	Read property
		0x04	Write Without Response property
		0x08	Write property
		0x10	Notify property
		0x20	Indicate property
		0x40	Authenticated Signed Writes property
		0x80	Extended Properties property
uint16_t	value_hdl	Value Handle of the Characteristic.	
uint8_t	uuid_128[BLE_GATT_128_BIT_UUID_SIZE]	Characteristic UUID.	

◆ st_ble_gattc_char_desc_16_evt_t

struct st_ble_gattc_char_desc_16_evt_t		
This structure notifies that a 16-bit UUID Characteristic Descriptor has been discovered.		
Data Fields		
uint16_t	desc_hdl	Attribute Handle of Characteristic Descriptor.
uint16_t	uuid_16	Characteristic Descriptor UUID.

◆ st_ble_gattc_char_desc_128_evt_t

struct st_ble_gattc_char_desc_128_evt_t		
This structure notifies that a 128-bit UUID Characteristic Descriptor has been discovered.		
Data Fields		
uint16_t	desc_hdl	Attribute Handle of Characteristic Descriptor.
uint8_t	uuid_128[BLE_GATT_128_BIT_UUID_SIZE]	Characteristic Descriptor UUID.

◆ st_ble_gattc_err_rsp_evt_t

struct st_ble_gattc_err_rsp_evt_t		
This structure notifies that a Error Response PDU has been received from a GATT Server.		

Data Fields														
uint8_t	op_code	<p>The op code of the ATT Request that causes the Error Response.</p> <table border="1"> <thead> <tr> <th>op_code</th> </tr> </thead> <tbody> <tr> <td>Exchange MTU Request(0x02)</td> </tr> <tr> <td>Find Information Request(0x04)</td> </tr> <tr> <td>Find By Type Value Request(0x06)</td> </tr> <tr> <td>Read By Type Request(0x08)</td> </tr> <tr> <td>Read Request(0x0A)</td> </tr> <tr> <td>Read Blob Request(0x0C)</td> </tr> <tr> <td>Read Multiple Request(0x0E)</td> </tr> <tr> <td>Read by Group Type Request(0x10)</td> </tr> <tr> <td>Write Request(0x12)</td> </tr> <tr> <td>Prepare Write Request(0x16)</td> </tr> <tr> <td>Execute Write Request(0x18)</td> </tr> </tbody> </table>	op_code	Exchange MTU Request(0x02)	Find Information Request(0x04)	Find By Type Value Request(0x06)	Read By Type Request(0x08)	Read Request(0x0A)	Read Blob Request(0x0C)	Read Multiple Request(0x0E)	Read by Group Type Request(0x10)	Write Request(0x12)	Prepare Write Request(0x16)	Execute Write Request(0x18)

Error Code	description													
BLE_ERR_GATT_INVALID_HANDLE(0x3001)	Invalid attribute handle													
BLE_ERR_GATT_READ_NOT_PERMITTED(0x3002)	The attribute cannot be read.													
BLE_ERR_GATT_WRITE_NOT_PERMITTED(0x3003)	The attribute cannot be written.													
BLE_ERR_GATT_INVALID_PDU	Invalid PDU.													

T_INVALID_PD U(0x3004)	
BLE_ERR_GATT_INSUFFICIENT_AUTHENTICATION(0x3005)	The authentication to access the attribute is insufficient.
BLE_ERR_GATT_REQUEST_NOT_SUPPORTED(0x3006)	The request is not supported.
BLE_ERR_GATT_INVALID_OFFSET(0x3007)	The specified offset is larger than the length of the attribute value.
BLE_ERR_GATT_INSUFFICIENT_AUTHORIZATION(0x3008)	Authorization is required to access the attribute.
BLE_ERR_GATT_PREPARE_WRITE_QUEUE_FULL(0x3009)	The Write Queue in the GATT Server is full.
BLE_ERR_GATT_ATTRIBUTE_NOT_FOUND(0x300A)	The specified attribute is not found.
BLE_ERR_GATT_ATTRIBUTE_NOT_LONG(0x300B)	The attribute cannot be read by Read Blob Request.
BLE_ERR_GATT_INSUFFICIENT_ENCRYPTION_KEY_SIZE(0x300C)	The Encryption Key Size is insufficient.
BLE_ERR_GATT_INVALID_ATTRIBUTE_LENGTH(0x300D)	The length of the specified attribute is invalid.
BLE_ERR_GATT_UNLIKELY_ERROR(0x300E)	Because an error has occurred, the process cannot be advanced.

BLE_ERR_GATT_INSUFFICIENT_ENCRYPTION(0x300F)	Encryption is required to access the attribute.
BLE_ERR_GATT_UNSUPPORTED_GROUP_TYPE(0x3010)	The type of the specified attribute is not supported.
BLE_ERR_GATT_INSUFFICIENT_RESOURCES(0x3011)	The resource to complete the request is insufficient.
0x3080 - 0x309F	Application Error. The upper layer defines the error codes.
0x30E0 - 0x30FF	The error code defined in Common Profile and Service Error Core Specification Supplement(CSS). CSS ver.7 defines the error codes from 0x30FC to 0x30FF.
BLE_ERR_GATT_WRITE_REQUEST_REJECTED(0x30FC)	The Write Request has not been completed due to the reason other than Permission.
BLE_ERR_GATT_INVALID_CCCD_CONFIG(0x30FD)	The CCCD is set to be invalid.
BLE_ERR_GATT_PROC_ALREADY_IN_PROGRESS(0x30FE)	The request is now in progress.
BLE_ERR_GATT_OUT_OF_RANGE	The attribute value is out of

		NGE(0x30FF) range.
--	--	--------------------

◆ **st_ble_gattc_ntf_evt_t**

struct st_ble_gattc_ntf_evt_t		
This structure notifies that a Notification PDU has been received from a GATT Server.		
Data Fields		
st_ble_gatt_hdl_value_pair_t	data	Characteristic that causes the Notification.

◆ **st_ble_gattc_ind_evt_t**

struct st_ble_gattc_ind_evt_t		
This structure notifies that a Indication PDU has been received from a GATT Server.		
Data Fields		
st_ble_gatt_hdl_value_pair_t	data	Characteristic that causes the Indication.

◆ **st_ble_gattc_rd_char_evt_t**

struct st_ble_gattc_rd_char_evt_t		
This structure notifies that read response to R_BLE_GATTC_ReadChar() or R_BLE_GATTC_ReadCharUsingUuid() has been received from a GATT Server.		
Data Fields		
st_ble_gatt_hdl_value_pair_t	read_data	The contents of the Characteristic that has been read.

◆ **st_ble_gattc_wr_char_evt_t**

struct st_ble_gattc_wr_char_evt_t		
This structure notifies that write response to R_BLE_GATTC_WriteChar() has been received from a GATT Server.		
Data Fields		
uint16_t	value_hdl	Value Handle of the Characteristic/Characteristic Descriptor that has been written.

◆ **st_ble_gattc_rd_multi_char_evt_t**

struct st_ble_gattc_rd_multi_char_evt_t		
This structure notifies that read response to R_BLE_GATTC_ReadMultiChar() has been received from a GATT Server.		
Data Fields		
uint16_t	value_hdl_num	The number of Value Handles of the Characteristics that has

		been read.
st_ble_gatt_value_t	multi_char_val	The contents of multiple Characteristics that have been read.

◆ st_ble_gattc_char_part_wr_evt_t

struct st_ble_gattc_char_part_wr_evt_t		
This structure notifies that write response to R_BLE_GATTC_WriteLongChar() or R_BLE_GATTC_ReliableWrites() has been received from a GATT Server.		
Data Fields		
st_ble_gatt_hdl_value_pair_t	write_data	The data to be written to the Characteristic/Long Characteristic/Long Characteristic Descriptor.
uint16_t	offset	Offset that indicates the location to be written.

◆ st_ble_gattc_reliable_writes_comp_evt_t

struct st_ble_gattc_reliable_writes_comp_evt_t								
This structure notifies that a response to R_BLE_GATTC_ExecWrite() has been received from a GATT Server.								
Data Fields								
uint8_t	exe_flag	This field indicates the command of the Execute Write that has been done.						
		<table border="1" style="width: 100%;"> <thead> <tr> <th>value</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>0x00</td> <td>Cancel the write.</td> </tr> <tr> <td>0x01</td> <td>Execute the write.</td> </tr> </tbody> </table>	value	description	0x00	Cancel the write.	0x01	Execute the write.
		value	description					
0x00	Cancel the write.							
0x01	Execute the write.							

◆ st_ble_gattc_rd_multi_req_param_t

struct st_ble_gattc_rd_multi_req_param_t		
This is used in R_BLE_GATTC_ReadMultiChar() to specify multiple Characteristics to be read.		
Data Fields		
uint16_t *	p_hdl_list	List of Value Handles that point the Characteristics to be read.
uint16_t	list_count	The number of Value Handles included in the hdl_list parameter.

◆ st_ble_gattc_evt_data_t

struct st_ble_gattc_evt_data_t

`st_ble_gattc_evt_data_t` is the type of the data notified in a GATT Client Event.

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the GATT Server.
uint16_t	param_len	The size of GATT Client Event parameters.
void *	p_param	GATT Client Event parameters. This parameter differs in each GATT Client Event.

◆ `st_ble_gatt_value_t`

Data Fields		
uint16_t	value_len	Length of the attribute value.
uint8_t *	p_value	Attribute Value.

◆ `st_ble_gatt_hdl_value_pair_t`

Data Fields		
uint16_t	attr_hdl	Attribute Handle.
<code>st_ble_gatt_value_t</code>	value	Attribute Value.

Macro Definition Documentation

◆ `BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG`

<code>#define BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG</code>
GATT Execute Write Cancel Flag.

◆ `BLE_GATTC_EXECUTE_WRITE_EXEC_FLAG`

<code>#define BLE_GATTC_EXECUTE_WRITE_EXEC_FLAG</code>
GATT Execute Write Execute Flag.

Typedef Documentation

◆ ble_gattc_app_cb_t

ble_gattc_app_cb_t

ble_gattc_app_cb_t is the GATT Client Event callback function type.

Parameters

[in]	event_type	The type of GATT Client Event.
[in]	event_result	The result of GATT Client Event
[in]	p_event_data	Data notified by GATT Client Event.

Returns

none

Enumeration Type Documentation

◆ e_r_ble_gattc_evt_t

enum e_r_ble_gattc_evt_t

GATT Client Event Identifier.

Enumerator

BLE_GATTC_EVENT_ERROR_RSP

This event notifies the application layer that a problem has occurred in the GATT Server while processing a request from GATT Client.

When GATT Client has received a Error Response PDU from a GATT Server, BLE_GATTC_EVENT_ERROR_RSP event is notified the application layer.

Event Code: 0x4001**result:**

BLE_SUCCESS(0x0 Success
000)

Event Data:

st_ble_gattc_err_rsp_evt_t BLE_GATTC_EVENT_ERROR_RSP

BLE_GATTC_EVENT_EX_MTU_RSP

This event notifies the application layer that a MTU Exchange Response PDU has been received from a GATT Server.

	<p>Event Code: 0x4003</p> <p>result:</p> <p>BLE_SUCCESS(0x000) Success</p> <p>BLE_ERR_RSP_TIMEOUT(0x0011) 30 seconds or more have passed without receiving a Exchange MTU Response since GATT Client sent a Exchange MTU Request PDU to the GATT Server.</p> <p>Event Data:</p> <p>st_ble_gattc_ex_mtu_rsp_evt_tBLE_GATTC_EVENT_EX_MTU_RSP</p>
BLE_GATTC_EVENT_CHAR_READ_BY_UUID_RSP	<p>When the read of Characteristic specified by UUID has been completed, this event is notified to the application layer.</p> <p>Event Code: 0x4009</p> <p>result:</p> <p>BLE_SUCCESS(0x000) Success</p> <p>BLE_ERR_RSP_TIMEOUT(0x0011) 30 seconds or more have passed without receiving a Exchange MTU Response since GATT Client sent a Exchange MTU Request PDU to the GATT Server.</p> <p>Event Data:</p> <p>st_ble_gattc_rd_char_evt_tBLE_GATTC_EVENT_CHAR_READ_BY_UUID_RSP</p>
BLE_GATTC_EVENT_CHAR_READ_RSP	<p>When the read of Characteristic/Characteristic Descriptor has been completed, this event is notified to the application layer.</p> <p>Event Code: 0x400B</p> <p>result:</p>

	<p>BLE_SUCCESS(0x000) Success</p> <p>BLE_ERR_RSP_TIMEOUT(0x0011) 30 seconds or more have passed without receiving a read response since GATT Client sent a request for read by R_BLE_GATTC_ReadCharUsingUuid() to the GATT Server.</p> <p>Event Data:</p> <p>st_ble_gattc_rd_char_evt_tBLE_GATTC_EVENT_CHAR_READ_RSP</p>
BLE_GATTC_EVENT_CHAR_PART_READ_RSP	<p>After calling R_BLE_GATTC_ReadLongChar(), this event notifies the application layer that the partial contents of Long Characteristic/Long Characteristic Descriptor has been received from the GATT Server.</p> <p>Event Code: 0x400D</p> <p>result:</p> <p>BLE_SUCCESS(0x000) Success</p> <p>BLE_ERR_RSP_TIMEOUT(0x0011) 30 seconds or more have passed without receiving a read response since GATT Client sent a request for read by R_BLE_GATTC_ReadLongChar() to the GATT Server.</p> <p>Event Data:</p> <p>st_ble_gattc_rd_char_evt_tBLE_GATTC_EVENT_CHAR_PART_READ_RSP</p>
BLE_GATTC_EVENT_MULTI_CHAR_READ_RSP	<p>This event notifies the application layer that the read of multiple Characteristics has been completed.</p> <p>Event Code: 0x400F</p>

	<p>result:</p> <p>BLE_SUCCESS(0x000) Success</p> <p>BLE_ERR_RSP_TIMEOUT(0x0011) 30 seconds or more have passed without receiving a read response since GATT Client sent a request for read by R_BLE_GATTC_ReadMultiChar() to the GATT Server.</p> <p>Event Data:</p> <p>st_ble_gattc_rd_multi_char_evt_tBLE_GATTC_EVENT_MULTI_CHAR_READ_RSP</p>

Function Documentation

◆ R_BLE_GATTC_Init()

```
ble_status_t R_BLE_GATTC_Init ( uint8_t cb_num)
```

This function initializes the GATT Client and registers the number of the callbacks for GATT Client event.

Specify the `cb_num` parameter to a value between 1 and `BLE_GATTC_MAX_CB`.

[R_BLE_GATTC_RegisterCb\(\)](#) registers the callback.

The result of this API call is returned by a return value.

Parameters

[in]	<code>cb_num</code>	The number of callbacks to be registered.
------	---------------------	---

Return values

<code>BLE_SUCCESS(0x0000)</code>	Success
<code>BLE_ERR_INVALID_ARG(0x0003)</code>	The <code>cb_num</code> parameter is out of range.

◆ **R_BLE_GATTC_RegisterCb()**

```
ble_status_t R_BLE_GATTC_RegisterCb ( ble_gattc_app_cb_t cb, uint8_t priority )
```

This function registers a callback function for GATT Client event.

The number of the callback that may be registered by this function is the value specified by [R_BLE_GATTC_Init\(\)](#).

The result of this API call is returned by a return value.

Parameters

[in]	cb	Callback function for GATT Client event.
[in]	priority	The priority of the callback function. Valid range is $1 \leq \text{priority} \leq \text{BLE_GATTC_MAX_CB}$. A lower priority number means a higher priority level.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The cb parameter is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The priority parameter is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	Host stack has already registered the maximum number of callbacks.

◆ **R_BLE_GATTC_DeregisterCb()**

```
ble_status_t R_BLE_GATTC_DeregisterCb ( ble_gattc_app_cb_t cb)
```

This function deregisters the callback function for GATT Client event.

The result of this API call is returned by a return value.

Parameters

[in]	cb	The callback function to be deregistered.
------	----	---

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The cb parameter is specified as NULL.
BLE_ERR_NOT_FOUND(0x000D)	The callback has not been registered.

◆ R_BLE_GATTC_ReqExMtu()

```
ble_status_t R_BLE_GATTC_ReqExMtu ( uint16_t conn_hdl, uint16_t mtu )
```

This function sends a MTU Exchange Request PDU to a GATT Server in order to change the current MTU.

MTU Exchange Response is notified by BLE_GATTC_EVENT_EX_MTU_RSP event.

The new MTU is the minimum value of the mtu parameter specified by this function and the mtu field in BLE_GATTC_EVENT_EX_MTU_RSP event. Default MTU size is 23 bytes.

The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the GATT Server to be sent.
[in]	mtu	The maximum size(in bytes) of the GATT PDU that GATT Client can receive. Valid range is 23 <= mtu <= 247.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The mtu parameter is out of range.
BLE_ERR_INVALID_OPERATION(0x0009)	While processing other request, this function was called.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The GATT Server specified by conn_hdl was not found.

◆ **R_BLE_GATTC_DiscAllPrimServ()**

```
ble_status_t R_BLE_GATTC_DiscAllPrimServ ( uint16_t conn_hdl)
```

This function discovers all Primary Services in a GATT Server.

When 16-bit UUID Primary Service has been discovered,
 BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND event is notified to the application layer.
 When 128-bit UUID Primary Service has been discovered,
 BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND event is notified to the application layer.
 When the Primary Service discovery has been completed,
 BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP event is notified to the application layer.

Parameters
