st_ble_gattc_reliable_writes_char_pair_t* p_char_pair, uint8_t pair_num, uint8_t auto_flag )
```

This function performs the Reliable Writes procedure described in GATT Specification.

When the data written to the Characteristic has been transmitted, BLE_GATTC_EVENT_CHAR_PART_WRITE_RSP event is notified to the application layer. If the data included in the event is different from the data that GATT Client has sent, host stack automatically cancels the Reliable Writes.

After all of the contents has been sent to the GATT Server, if the auto_flag parameter has been set to BLE_GATTC_EXEC_AUTO, the GATT Server automatically writes the data to the Characteristic. If the auto_flag parameter has been set to BLE_GATTC_EXEC_NOT_AUTO, BLE_GATTC_EVENT_RELIABLE_WRITES_TX_COMP event notifies the application layer in GATT Client that all of the contents has been sent to the GATT Server. Then GATT Client requests for writing the data to the Characteristic to the GATT Server with R_BLE_GATTC_ExecWrite(). When the write has been done, BLE_GATTC_EVENT_RELIABLE_WRITES_COMP event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the GATT Server to be written.						
[in]	p_char_pair	Pair of Characteristic Value and Characteristic Value Handle identifying the Characteristic to be written by Reliable Writes.						
[in]	pair_num	The number of the pairs specified by the p_char_pair parameter. Valid range is 0 < pair_num ≤ BLE_GATTC_RELIABLE_WRITES_MAX_CHAR_PAIR.						
[in]	auto_flag	The flag that indicates whether auto execution or not. <table border="1" data-bbox="1072 1570 1469 1872"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GATTC_EXEC_AUTO(0x01)</td> <td>Auto execution.</td> </tr> <tr> <td>BLE_GATTC_EXEC_NOT_AUTO(0x02)</td> <td>Not auto execution.</td> </tr> </tbody> </table>	macro	description	BLE_GATTC_EXEC_AUTO(0x01)	Auto execution. ble_status_t R_BLE_GATTC_ExecWrite ( uint16_t conn_hdl, uint8_t exe_flag )
```

If the auto execute of Reliable Writes is not specified by [R_BLE_GATTC_ReliableWrites\(\)](#), this function is used to execute a write to Characteristic.

When all of the contents has been sent to the GATT Server, BLE_GATTC_EVENT_RELIABLE_WRITES_TX_COMP event notifies the application layer. After this event has been received, execute the write by this function. The result of the write is notified by BLE_GATTC_EVENT_RELIABLE_WRITES_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the target GATT Server.						
[in]	exe_flag	The flag that indicates whether execution or cancellation. <table border="1"> <thead> <tr> <th>macro</th> <th>description</th> </tr> </thead> <tbody> <tr> <td>BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG(0x00)</td> <td>Execute the write.</td> </tr> <tr> <td>BLE_GATTC_EXECUTE_WRITE_FLAG(0x01)</td> <td>Cancel the write.</td> </tr> </tbody> </table>	macro	description	BLE_GATTC_EXECUTE_WRITE_CANCEL_FLAG(0x00)	Execute the write. ```
ble_status_t R_BLE_L2CAP_RegisterCfPsm ( ble_l2cap_cf_app_cb_t cb, uint16_t psm, uint16_t lwm )
```

This function registers PSM that uses L2CAP CBFC Channel and a callback for L2CAP event.

Only one callback is available per PSM. Configure in each PSM the Low Water Mark of the LE-Frames that the local device can receive.

The result of this API call is returned by a return value.

Parameters

[in]	cb	Callback function for L2CAP event.

p_conn_req_param )
```

This function sends a connection request for L2CAP CBFC Channel.

```
ble_status_t R_BLE_L2CAP_RspCfConn ( st_ble_l2cap_conn_rsp_param_t* p_conn_rsp_param)
```

This function replies to the connection request for L2CAP CBFC Channel from the remote device.

If the num_of_packet field in the p_tx_test_param parameter is other than 0x0000, BLE_VS_EVENT_TX_TEST_TERM event notifies the application layer that the number of packet has been sent.

If R_BLE_VS_EndTest() is called before the specified number of packets completions, BLE_VS_EVENT_TX_TEST_TERM event is not notified to the application layer.

The condition that phy field in the p_tx_test_param parameter is BLE_VS_EH_TEST_PHY_CODED_S_8(0x03) and option field is modulation(bit0:0) & continuous transmission(bit1:1) is not supported.

Parameters

[in]	p_tx_test_param	Tx Test parameters.
------	-----------------	---------------------

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The p_tx_test_param parameter is specified as NULL.

The result is returned from this API.

Vendor Specific API supports the flow control function(TxFlow) for the transmission on L2CAP fixed channel in Basic Mode such as GATT.

Host stack has 10 transmission packet buffers for the transmission.

When the number of the available transmission packet buffers has been less than Low Water Mark, the state of TxFlow transmits into the TxFlow OFF state from the TxFlow ON state that is the initial state and host stack notifies the application layer of timing to stop packet transmission.

When host stack has sent the transmission packets to Controller and the number of the available transmission packet buffers has been more than High Water Mark, the state of TxFlow transmits into the TxFlow ON state from the TxFlow OFF state and host stack notifies the application layer of

timing to restart packet transmission.

It is possible to perform flow control on a fixed channel by using the event notification.

Parameters

[in]	tx_queue_lwm	Low Water Mark. Set 0-9 less than tx_queue_hwm to the parameter. When the number of the available transmission packet buffers has been less than the value specified by the tx_queue_lwm parameter, host stack notifies the application layer of the timing to stop packet transmission.
[in]	tx_queue_hwm	High Water Mark. Set 1-10 more than tx_queue_lwm to the parameter. When the number of the available transmission packet buffers has been more than the value specified by the tx_queue_hwm parameter, host stack notifies the application layer of the timing to restart packet transmission.

Return values

4.3.6 CGC Interface

Interfaces

Detailed Description

Interface for clock generation.

Summary

The CGC interface provides the ability to configure and use all of the CGC module's capabilities. Among the capabilities is the selection of several clock sources to use as the system clock source. Additionally, the system clocks can be divided down to provide a wide range of frequencies for various system and peripheral needs.

Clock stability can be checked and clocks may also be stopped to save power when not needed. The API has a function to return the frequency of the system and system peripheral clocks at run time. There is also a feature to detect when the main oscillator has stopped, with the option of calling a user provided callback function.

The CGC interface is implemented by:

Field Documentation

◆ open

`fsp_err_t(* jpeg_api_t::open) (jpeg_ctrl_t *const p_ctrl, jpeg_cfg_t const *const p_cfg)`

[in]	<code>p_cfg</code>	Pointer to configuration structure. All elements of this structure must be set by user.

◆ inputBufferSet

```
fsp_err_t(* jpeg_api_t::inputBufferSet) (jpeg_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)
```

Assign input data buffer to JPEG codec.

Implemented as

- R_JPEG_InputBufferSet()

Precondition

the JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned.

Parameters

[in]	p_ctrl	Control block set in jpeg_api_t::open call.
[in]	p_buffer	Pointer to the input buffer space

```

Assign output buffer to JPEG codec for storing output data.

Implemented as

- R_JPEG_OutputBufferSet()

Precondition

The JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned. For the decoding process, the HLD driver automatically computes the number of lines of the image to decoded so the output data fits into the given space. If the supplied output buffer is not able to hold the entire frame, the application should call the Output Full Callback function so it can be notified when additional buffer space is needed.

[in]	p_buffer	Pointer to the output buffer space
[in]	buffer_size	Size of the output buffer

4.3.25 Key Matrix Interface

Interfaces

Detailed Description

Interface for key matrix functions.

Summary

The KEYMATRIX interface provides standard Key Matrix functionality including event generation on a rising or falling edge for one or more channels at the same time. The generated event indicates all channels that are active in that instant via a bit mask. This allows the interface to be used with a matrix configuration or a one-to-one hardware implementation that is triggered on either a rising or a falling edge.

4.3.26 Low Power Modes Interface

Interfaces

Detailed Description

Interface for accessing low power modes.

Summary

This section defines the API for the LPM (Low Power Mode) Driver. The LPM Driver provides functions for controlling power consumption by configuring and transitioning to a low power mode. The LPM driver supports configuration of MCU low power modes using the LPM hardware peripheral. The LPM driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCUs.

The LPM interface is implemented by:

When using DTC, this structure corresponds to the descriptor block registers required by the DTC. The following components may be modified by the driver: `p_src`, `p_dest`, `num_blocks`, and `length`.

When using DTC, do NOT reuse this structure to configure multiple transfers. Each transfer must have a unique [transfer_info_t](#).

When using DTC, this structure must not be allocated in a temporary location. Any instance of this structure must remain in scope until the transfer it is used for is closed.

Note

When using DTC, consider placing instances of this structure in a protected section of memory.

Enumeration Type Documentation

◆ **transfer_mode_t**

enum <code>transfer_mode_t</code>	
Transfer mode describes what will happen when a transfer request occurs.	
Enumerator	
<code>TRANSFER_MODE_NORMAL</code>	In normal mode, each transfer request causes a transfer of <code>transfer_size_t</code> from the source pointer to the destination pointer. The transfer length is decremented and the source and address pointers are updated according to <code>transfer_addr_mode_t</code> . After the transfer length reaches 0, transfer requests will not cause any further transfers.
<code>TRANSFER_MODE_REPEAT</code>	Repeat mode is like normal mode, except that when the transfer length reaches 0, the pointer to the repeat area and the transfer length will be reset to their initial values. If DMAC is used, the transfer repeats only <code>transfer_info_t::num_blocks</code> times. After the transfer repeats <code>transfer_info_t::num_blocks</code> times, transfer requests will not cause any further transfers. If DTC is used, the transfer repeats continuously (no limit to the number of repeat transfers).
<code>TRANSFER_MODE_BLOCK</code>	In block mode, each transfer request causes <code>transfer_info_t::length</code> transfers of <code>transfer_size_t</code> . After each individual transfer, the source and destination pointers are updated according to <code>transfer_addr_mode_t</code> . After the block transfer is complete, <code>transfer_info_t::num_blocks</code> is decremented. After the <code>transfer_info_t::num_blocks</code> reaches 0, transfer requests will not cause any further transfers.
<code>TRANSFER_MODE_REPEAT_BLOCK</code>	In addition to block mode features, repeat-block mode supports a ring buffer of blocks and offsets within a block (to split blocks into arrays of their first data, second data, etc.)

◆ **transfer_size_t**

enum transfer_size_t	
Transfer size specifies the size of each individual transfer. Total transfer length = <code>transfer_size_t * transfer_length_t</code>	
Enumerator	
<code>TRANSFER_SIZE_1_BYTE</code>	Each transfer transfers a 8-bit value.
<code>TRANSFER_SIZE_2_BYTE</code>	Each transfer transfers a 16-bit value.
<code>TRANSFER_SIZE_4_BYTE</code>	Each transfer transfers a 32-bit value.

◆ **transfer_addr_mode_t**

enum transfer_addr_mode_t	
Address mode specifies whether to modify (increment or decrement) pointer after each transfer.	
Enumerator	
<code>TRANSFER_ADDR_MODE_FIXED</code>	Address pointer remains fixed after each transfer.
<code>TRANSFER_ADDR_MODE_OFFSET</code>	Offset is added to the address pointer after each transfer.
<code>TRANSFER_ADDR_MODE_INCREMENTED</code>	Address pointer is incremented by associated transfer_size_t after each transfer.
<code>TRANSFER_ADDR_MODE_DECREMENTED</code>	Address pointer is decremented by associated transfer_size_t after each transfer.

◆ **transfer_repeat_area_t**

enum transfer_repeat_area_t	
Repeat area options (source or destination). In TRANSFER_MODE_REPEAT , the selected pointer returns to its original value after transfer_info_t::length transfers. In TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT_BLOCK , the selected pointer returns to its original value after each transfer.	
Enumerator	
TRANSFER_REPEAT_AREA_DESTINATION	Destination area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK or TRANSFER_MODE_REPEAT_BLOCK .
TRANSFER_REPEAT_AREA_SOURCE	Source area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK or TRANSFER_MODE_REPEAT_BLOCK .

◆ **transfer_chain_mode_t**

enum transfer_chain_mode_t	
Chain transfer mode options.	
<i>Note</i> <i>Only applies for DTC.</i>	
Enumerator	
TRANSFER_CHAIN_MODE_DISABLED	Chain mode not used.
TRANSFER_CHAIN_MODE_EACH	Switch to next transfer after a single transfer from this transfer_info_t .
TRANSFER_CHAIN_MODE_END	Complete the entire transfer defined in this transfer_info_t before chaining to next transfer.

◆ **transfer_irq_t**

enum <code>transfer_irq_t</code>	
Interrupt options.	
Enumerator	
TRANSFER_IRQ_END	<p>Interrupt occurs only after last transfer. If this transfer is chained to a subsequent transfer, the interrupt will occur only after subsequent chained transfer(s) are complete.</p> <p>Warning DTC triggers the interrupt of the activation source. Choosing TRANSFER_IRQ_END with DTC will prevent activation source interrupts until the transfer is complete.</p>
TRANSFER_IRQ_EACH	<p>Interrupt occurs after each transfer.</p> <p><i>Note</i> <i>Not available in all HAL drivers. See HAL driver for details.</i></p>

◆ **transfer_start_mode_t**

enum <code>transfer_start_mode_t</code>	
Select whether to start single or repeated transfer with software start.	
Enumerator	
TRANSFER_START_MODE_SINGLE	Software start triggers single transfer.
TRANSFER_START_MODE_REPEAT	Software start transfer continues until transfer is complete.
