| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| DFEj | PCLKHIN | CLK_UHSB |
|  | PCLKLIN | CLK_HSB |
| DFE FIFO | PCLKLIN | CLK_HSB |

Note: $\mathrm{j}=0,1$

### 37.1.4 Interrupt Requests

The DFE and DFE FIFO interrupt requests are listed in the following table.
Table $37.7 \quad$ Interrupt Requests (1/2)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DFE0 |  |  |  |  |  |
| INTDFE0DOUTCND0 | INTDFE0DOUT[0] | CHO output data interrupt | 309 | group0-64 | group0-64 |
|  | INTDFE0CND0[0] | CH0 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND1 | INTDFEODOUT[1] | CH1 output data interrupt | 310 | group0-65 | group0-65 |
|  | INTDFE0CND0[1] | CH1 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND2 | INTDFEODOUT[2] | CH2 output data interrupt | 311 | group0-66 | group0-66 |
|  | INTDFE0CND0[2] | CH2 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND3 | INTDFE0DOUT[3] | CH 3 output data interrupt | 312 | group0-67 | group0-67 |
|  | INTDFE0CND0[3] | CH3 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND4 | INTDFE0DOUT[4] | CH4 output data interrupt | 313 | group0-68 | group0-68 |
|  | INTDFE0CND0[4] | CH4 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND5 | INTDFEODOUT[5] | CH5 output data interrupt | 314 | group0-69 | group0-69 |
|  | INTDFE0CND0[5] | CH5 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND6 | INTDFE0DOUT[6] | CH6 output data interrupt | 315 | group0-70 | group0-70 |
|  | INTDFE0CND0[6] | CH6 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND7 | INTDFE0DOUT[7] | CH 7 output data interrupt | 316 | group0-71 | group0-71 |
|  | INTDFE0CND0[7] | CH7 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND8 | INTDFE0DOUT[8] | CH8 output data interrupt | 317 | group0-72 | group0-72 |
|  | INTDFE0CND0[8] | CH8 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND9 | INTDFEODOUT[9] | CH9 output data interrupt | 318 | group0-73 | group0-73 |
|  | INTDFE0CND0[9] | CH9 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND10 | INTDFE0DOUT[10] | CH10 output data interrupt | 319 | group0-74 | group0-74 |
|  | INTDFE0CND0[10] | CH10 condition match interrupt 0 |  |  |  |
| INTDFE0DOUTCND11 | INTDFEODOUT[11] | CH 11 output data interrupt | 320 | group0-75 | group0-75 |
|  | INTDFE0CND0[11] | CH11 condition match interrupt 0 |  |  |  |
| INTDFE0CND10 | INTDFE0CND1[0] | CH0 condition match interrupt 1 | 322 | group0-76 | group0-76 |
| INTDFE0CND11 | INTDFE0CND1[1] | CH 1 condition match interrupt 1 | 323 | group0-77 | group0-77 |
| INTDFE0CND12 | INTDFE0CND1[2] | CH2 condition match interrupt 1 | 324 | group0-78 | group0-78 |
| INTDFE0CND13 | INTDFE0CND1[3] | CH3 condition match interrupt 1 | 325 | group0-79 | group0-79 |
| INTDFE0ERR | INTDFE0ERR | Error interrupt | 321 | - | - |
| INTDFEOSUBOUT0 | INTDFEOSUBOUT[0] | Subtraction data interrupt 0 | 326 | group0-80 | group0-80 |
| INTDFE0SUBOUT1 | INTDFE0SUBOUT[1] | Subtraction data interrupt 1 | 327 | group0-81 | group0-81 |
| INTDFE0SUBOUT2 | INTDFEOSUBOUT[2] | Subtraction data interrupt 2 | 328 | group0-82 | group0-82 |

Table 37.7 Interrupt Requests (2/2)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DFE1 |  |  |  |  |  |
| INTDFE1DOUTCND0 | INTDFE1DOUT[0] | CHO output data interrupt | 329 | group0-83 | group0-83 |
|  | INTDFE1CND0[0] | CH0 condition match interrupt 0 |  |  |  |
| INTDFE1DOUTCND1 | INTDFE1DOUT[1] | CH 1 output data interrupt | 330 | group0-84 | group0-84 |
|  | INTDFE1CND0[1] | CH1 condition match interrupt 0 |  |  |  |
| INTDFE1DOUTCND2 | INTDFE1DOUT[2] | CH 2 output data interrupt | 331 | group0-85 | group0-85 |
|  | INTDFE1CND0[2] | CH 2 condition match interrupt 0 |  |  |  |
| INTDFE1DOUTCND3 | INTDFE1DOUT[3] | CH3 output data interrupt | 332 | group0-86 | group0-86 |
|  | INTDFE1CND0[3] | CH3 condition match interrupt 0 |  |  |  |
| INTDFE1CND10 | INTDFE1CND1[0] | CH0 condition match interrupt 1 | 334 | - | - |
| INTDFE1CND11 | INTDFE1CND1[1] | CH1 condition match interrupt 1 | 335 | - | - |

| INTDFEFIFOOUTB | INTDFEFIFOOUTB | Buffer-B capture finished interrupt request | 342 | group0-91 | group0-91 |
| INTDFEFIFOERR | INTDFEFIFOERR | Error interrupt | 321 | - | - |
| NOTE |  |  |  |  |  |
| INTDFEFIFOERR is merged with INTDFEOERR |  |  |  |  |  |

### 37.1.5 Reset Sources

The DFE and DFE FIFO reset sources are listed in the following table. DFE and DFE FIFO are initialized by these reset sources.

Table 37.8 Reset Sources

| Unit Name | Register Name | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| DFE0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DFE1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DFE FIFO | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 37.1.6 External Input/Output Signals

$\operatorname{DFEj}(\mathrm{j}=0,1)$ and DFE FIFO have no external input/output signals.

### 37.2 Overview

### 37.2.1 Features

- Incorporates a 12- or 4-channel FIR and IIR digital filter unit in a DFE IP (A 64-tap FIR filter can be selected only with even-numbered channels).
- Filter coefficients and data are stored in the on-chip RAM.
- Incorporates an accumulation circuit (for accumulation processing or decimation processing for filtered data) and a peak-hold circuit (for peak hold processing or comparison processing).
- Subtraction circuit is incorporated for subtraction on output data from two channels.
- Peak-Hold circuit is incorporated for peak holding and comparison
- With the peak-holding function, either upper peaks or lower peaks can be selected.
- On a single arbitrary channel, three different peak values can be detected and held during a single Peak-Hold process.
- Generates an interrupt request if the comparison calculation result is true.
- Inputs converted data from the on-chip A/D converter*1.
- Two types of FIFOs can be used: 6-input 8 -stage buffer and 1 -input 8 -stage buffer.

Note 1. In this section, $A D C H, D S A D C$ and CADC are called SAR-ADC, DS-ADC and C-ADC, respectively.

### 37.2.2 Overall Configuration

Figure 37.1 Overall Configuration of the DFE

The digital filter engine (DFE) is able to execute 16-channel filter processing on a time-division basis. FIR (up to 64 taps) or IIR (up to 6 stages) is selectable as a filter algorithm. When data is transferred from the $\mathrm{A} / \mathrm{D}$ converter via private bus or is written to the software data input register through peripheral bus, the DFE executes FIR/IIR filter processing automatically. In normal mode, all filter processing results are stored in the output data register. In decimation mode, output data is stored in the output data register once every fourth filter processing cycle, for example. When data is stored in the output data register, an interrupt request can be issued. Furthermore, the digital filter processing result can be input again to the filtering circuit. This process is referred to as a cascade input in these specifications.

The DFE can execute subtraction on the values of the output data registers of any two channels. The subtraction result is stored in the register as subtraction output data, similar to the output data. When data is stored in the subtraction output data register, an interrupt can be requested. The subtraction result can also be selected as a cascade input.

### 37.2.3 Overall Configuration of the FIFO Macro

Figure 37.2 Overall Configuration of the FIFO Macro

With the FIFO macro, it is possible to select data from up to 12 DFE0 channels and 4 DFE1 channels for a 6-input 8stage buffer (hereinafter referred to as buffer A) or a 1-input 8 -stage buffer (hereinafter referred to as buffer B), and store the data in the FIFO.

## (1) Buffer A Circuit

- Simultaneously stores six items of output data from DFE channels in the FIFO, in response to the capture trigger output from the timer. The Buffer A circuit has FIFO channels to store output data. The Buffer A circuit can have a maximum number of six FIFO channels
- Issues the buffer A capture end interrupt request after storing the valid data in the FIFO. For details of the interrupt request issue timing, refer to Section 37.5.27.2(1), Buffer A Capture End Interrupt Request.
- Issues the error interrupt request caused by an overflow error if more than 8 -stage data is stored in the FIFO.
(2) Buffer B Circuit
- Automatically stores data in the FIFO each time the data of the target channel is updated.
- Issues the buffer B capture end interrupt request after storing the data in the FIFO four times. For details of the interrupt request issue timing, refer to Section 37.5.27.2(2), Buffer B Capture End Interrupt Request.
- Issues the error interrupt request caused by an overflow error if more than 8 -stage data is stored in the FIFO.

### 37.2.4 Data Format

Figure 37.3 Data Format

### 37.2.5 Filtering Circuit

### 37.2.5.1 FIR Filter

- Number of taps: Selectable from 8, 16, 24, 32, and 64
- Input data and coefficients: 16-bit signed fixed-point (S.15) /16-bit integer (S15)
- Intermediate values: 38-bit signed fixed-point data
- Output data: 32-bit signed fixed-point/32-bit integer
- Product-sum operation accuracy: 32 bits
- Filter processing cycles: 64 taps (no initialization) takes 50 cycles.

### 37.2.5.2 IIR Filter

- Number of secondary biquad stages: Selectable from 1, 2, and 3 (in the case of secondary biquad 2 or 3 stages, the gain adjustment function is selectable).
- Input data: 16-bit signed fixed-point data (S.15)
- Coefficient data format: 16-bit signed fixed-point data (S1.14)
- Intermediate data and output data: 32-bit signed fixed-point data
- Product-sum operation accuracy: 32 bits
- Filter processing cycles: Secondary biquad 3 stage (no initialization) takes 44 cycles.

### 37.2.6 Dispatch Circuit

The dispatch circuit accepts data to be filtered from the A/D converter and peripheral bus. It assigns the accepted data to sixteen channels, then selects data to be filtered and outputs that data to the filter circuit. The data that can be input is specified for each channel. Table 37.9 lists the data that can be input for each channel.

Table 37.9 Input Data for Each Channel

|  |  | SAR-ADC(ADCH) |  |  |  | DS-ADC(DSADC) |  |  |  |  |  | C-ADC(CADC) | Cascade | SW |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AD unit Number |  | 0 | 2 | 1 | 3 | 00 | 10 | 20 | 11 | 12 | 13 | 0 | 0 | 0 |
| DFE0 | CHO | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH 2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH3 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH4 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH5 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH6 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH7 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH8 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH9 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH 10 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
|  | CH11 | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ |
| DFE1 | CHO | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | CH1 | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | CH 2 | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | CH3 | $\times$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\times$ | $\times$ | $\times$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note: $\quad \checkmark$ : Data can be input; $\times$ : Data cannot be input
Please refer to Section ADCH, DSADC about useable AD unit.

### 37.2.7 Accumulation Circuit

The accumulation circuit allows absolute value calculation, accumulation, and decimation processing for filtering results of all channels. Either accumulation or decimation can be specified.

- Absolute value: The absolute value of each filtering result is calculated.
- Accumulation: Accumulation of filtering results can be obtained. The maximum accumulation count is 511 . Filtering results are of the S9.22 format. After accumulation processing for the predetermined number of times has been completed, one accumulation result is sent to the next processing step.
- Decimation: Filtering results are decimated. If the decimation count is set to 4 , for example, the filtering result is output once for every five filter processes. The maximum decimation count is 511.

### 37.2.8 Subtraction Circuit

The subtraction circuit can execute subtraction on the filtering results of any two channels.
The subtraction circuit outputs the subtraction output data when the filtering results of both the minuend and subtrahend channels are updated. The subtraction results are stored in the subtraction output data registers for each channel. When the data of any two channels is both input in the fixed-point format, the format of the subtraction output data can be converted to the floating-point format (IEEE754).
$[$ Subtraction output data $]=[$ Minuend channel filtering result - Subtrahend channel filtering result $]$

### 37.2.9 Peak-Hold (PH) Circuit

The Peak-Hold circuit has the peak-holding function and a comparison function. With the Peak-Hold circuit, it is possible to specify and execute one of the peak-holding and comparison functions; and it is also possible to select both the peak-holding and comparison functions simultaneously.

The peak-hold circuit allows peak hold or comparison calculation for all channels. The peak-hold circuit can be linked to the accumulation circuit. For example, when accumulation/decimation is set with a specified count, peak hold processing or comparison calculation is executed on each specified count. When accumulation/decimation is not set, peak-hold processing or comparison calculation is executed on each filter processing cycle.

- Peak-Hold (PH): The peaks of filter results or the accumulation circuit output results can be held. Either the upper or lower peaks can be selected. A Peak-Hold update notification can be issued when the PeakHold result register of the selected channel is updated.

## NOTE

The table below shows the conditions for updating the Peak-Hold result registers for the upper or lower peaks and the conditions for outputting the Peak-Hold update notification.

| Peak | Function | Number Times of PH | Issue Condition |
| :--- | :--- | :--- | :--- |

Note 1. The first time means when filter processing is executed after PH initialization flag is valid.
Note 2. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 3. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 4. These values are compared in either fixed-point format or integer format regardless of the DFEjCTLBCHn.PFMT bit setting.

- Peak-hold index: Indicates the round of peak-hold processing in which the peak-hold result register was updated to hold its current value.
- Comparison: A filter result or accumulation circuit output result is compared with the predetermined value (=, $<,>, \geq, \leq$ ) and an interrupt can be requested according to the condition matched.

The comparison value can be selected as follows.

| Selectable Values to be Compared | Comparison Selected Exclusively | PH processing and Comparison Selected Simultaneously | PH23 Function |
| :---: | :---: | :---: | :---: |
| Comparison value registers A to D | OK | OK | NG*2 |
| PH result register $+\alpha^{* 1}$ |  | NG*2 | OK |

Note 1. $\quad \alpha$ is the value of the comparison offset value register.
Note 2. Setting the NG conditions is prohibited.

- PH23 function: Expansion of the PH processing. Three peaks can be held for a 1-channel filtering result or accumulation circuit output result. A PH update notification can be separately issued when the PH result register for each peak is updated.

### 37.2.10 Output Circuit

In the output circuit, calculation results are stored in the output data register for each channel. When accumulation or decimation is specified, an interrupt can be requested at the same time data is stored. When fixed-point format data is input, the data format can be converted to the floating-point (IEEE754) format and the data can be stored in the output data register.

### 37.2.11 Intermediate Values Output Circuit

Even number channels have an intermediate value output register, which holds intermediate values (values from filter calculations prior to processing for rounding) from the intermediate value output circuit. When FIR filtering is selected, the values are input in fixed-point format. Conversion to fixed or floating point (IEEE754) format for storage is available.

### 37.2.12 Capture Circuit

The capture circuit stores the values of the output data register in the capture result register upon receiving the output data capturing trigger. The format of the captured data conforms to the format of the output data register of the selected channel.

### 37.2.13 Buffer A Circuit

The buffer A circuit, incorporated in the FIFO macro, selects up to six channels from the DFE0 and DFE1 channels and stores the values of the output data registers in the FIFO, in response to the FIFO capture triggers. The format of the output data stored in buffer A conforms to the format of the output data register of the selected channel.

### 37.2.14 Buffer B Circuit

The buffer B circuit, incorporated in the FIFO macro, selects one channel from the DFE0 and DFE1 channels and automatically stores the values of the output data registers in the FIFO, each time the output data register is updated. The format of the output data stored in buffer B conforms to the format of the output data register of the selected channel.

### 37.2.15 Terms

Table $\mathbf{3 7 . 1 0}$ provides definitions of terms used in this section.
Table 37.10 List of Terms (1/3)

| Term | Definition in this Section |
| :---: | :---: |
| DFE operating clock | 160 MHz clock to be input to the DFE |
| Filtering circuit | A circuit to perform FIR filtering and IIR filtering |
| Data to be processed | Data for which the DFE performs filter processing, including data to be input by the AD and peripheral bus and filter processing result re-entry (cascade) data |
| Software input | Activation of the DFE by writing data to be processed to a register from the CPU or DMA through the peripheral bus |
| Input data register | A register for writing data to be processed, which is provided for 16 channels |
| DFE activation signal | DFE processing start signal to be input to the DFE together with data to be processed |
| AD tag | A tag value to be input to the DFE by the AD together with data to be processed |
| AD data | Data to be processed and input to the DFE by the AD |
| AD input | AD tag or AD data or DFE activation signal to be input by the AD In figures shown in this section, $A D$ input shows $D F E$ activation signal to be input by the $A D$. |
| Channel tag | A tag signal specified by the DFE's control register A, which is provided for each channel |
| Dispatch | Writing data to be processed to an input data register Dispatch means writing data to the input data register of the matched channel through comparison between channel tag and AD tag signal after processing is started by the DFE activation signal. |
| Dispatch circuit | A circuit to output filtering target data to the dispatch processing and filtering circuit |
| Accumulation | Accumulation of filter processing result data in each channel for the count specified in the control register |
| Decimation | Decimation (thinning) of filter processing result data for the count specified in the control register |
| Accumulation circuit | A circuit to perform absolute value calculation, accumulation, and decimation for filter processing result data |
| Subtraction | Subtraction on two arbitrary channels |
| Subtraction circuit | Circuit that performs subtraction on the filtering result data of two channels for subtraction |
| Subtraction result register | Register that holds subtraction result values |
| Subtrahend flag | Subtrahend channel data input enabling bit (SUBF) |
| Minuend flag | Minuend channel data input enabling bit (MINF) |
| Peak-hold processing | Processing to hold the maximum or minimum of output data from the accumulation circuit |
| Peak-hold circuit | A circuit to perform peak-hold processing and comparison processing |
| Peak-hold result register | A register that retains the peak-hold processing result value |
| Peak-hold index register | A register that indicates the number of times from the beginning of peak-hold processing when the peakhold result register value is input to the peak-hold circuit |
| Output circuit | A circuit to write accumulation circuit output data to the output data register and to convert accumulation circuit output data to floating-point format data and write the data to the output data register |
| Output data register | A register used to write data after DFE processing is completed, which is provided for 16 channels |
| Intermediate value output circuit | Circuit that writes the intermediate values output from the filtering circuit to the intermediate value output data register when FIR is selected. |
| Intermediate value output register | Register to which the intermediate value data is written. |
| Capture circuit | Circuit that writes the value of the output data register of the specified channel to the capture result register when a capture trigger is input. |
| Capture result register | Register to which the value of the specified channel output data register is written. |
| Buffer A circuit | Circuit that selects up to six channels from the DFE0 and DFE1 channels and stores the values of the output data registers in the FIFO, in response to the FIFO capture triggers. |
| Buffer B circuit | Circuit that selects one channel from the DFE0 and DFE1 channels and automatically stores the values of the output data registers in the FIFO, each time the output data is updated. |

Table 37.10 List of Terms (2/3)

| Term | Definition in this Section |
| :---: | :---: |
| Input data overwrite error (DIOW) | An error that occurs when new data is written to the input data register while valid data is contained in the input data register (filter processing wait state in the DFE, during filter processing, or during accumulation circuit processing) |
| Output data overwrite error (DOOW) | An error that occurs when new data is written to the output data register while valid data is contained in the output data register (after the DFE has written filter processing result or accumulation processing result to the output data register) |
| Multiplication error | An error that occurs during execution of $8000_{H} \times 8000_{H}$ in the filtering circuit |
| Guard error | A guard bit overflow or underflow error that occurs during execution of accumulation in the filtering circuit |
| Cascade error | An overflow error that occurs when the 32 -bit accumulation circuit output data is rounded to 16-bit data when cascade processing is enabled |
| Absolute value calculation error | An error generated when $80000000_{H}$ is input during calculation of absolute values in the accumulation circuit |
| Timer trigger | Triggers to which timer trigger A/B from the timer (GTM or ATU) were allotted as the function of "PH initialization", "PH Mask Start/End", "Addition/Decimation Initialization/Prohibition" or "Subtraction Start/End". Please see section PIC or ATU. |
| Software trigger | A trigger generated by writing 1 to the software trigger register from the CPU or DMA |
| Trigger flag | There are nine flags: accumulation/decimation initialization flag, accumulation/decimation disable flag, peak-hold initialization flag, peak-hold end flag, peak-hold mask start flag, peak-hold mask end flag, subtraction starting flag, subtraction ending flag, and filter initialization flag, which are generated by the DFE at a timer trigger, software trigger, or trigger setting register (control register in the DFE) |
| Accumulation/decimation initialization flag | A trigger flag that functions as an accumulation initialization flag when accumulation is specified or as a decimation initialization flag when decimation is specified, which is used to initialize the counter in the accumulation circuit. |
| Accumulation/decimation disable flag | A trigger flag that functions as an accumulation disable flag when accumulation is specified or as a decimation disable flag when decimation is specified, which stops the counter in the accumulation circuit and disables accumulation processing and decimation processing without updating output data after execution |
| Peak-hold(PH) initialization flag | A trigger flag that is enabled when peak-hold ( PH ) operation is specified, which is used to initialize the counter in the peak-hold (PH) circuit. |
| Peak-hold(PH) end flag | A trigger flag that is enabled when peak-hold ( PH ) operation is specified, which is a command to terminate peak-hold (PH) processing |
| Peak-hold (PH) mask starting flag | One of the trigger flags. Enabled when PH is specified. Stops a PH process when a PH operation is in progress. |
| Peak-hold (PH) mask ending flag | One of the trigger flags. Enabled when PH is specified. Restarts the PH process that has been stopped by the PH mask starting flag. |
| Filter initialization flag | A trigger flag to performed adding the initialization sequence to the initialization for the address pointer used in filter processing and normal filter processing. |
| Subtraction starting flag | One of the trigger flags. Enabled when the subtraction circuit is enabled, and starts a subtraction process. |
| Subtraction ending flag | One of the trigger flags. Enabled when the subtraction circuit is enabled, and ends a subtraction process. |
| Interrupt request | An interrupt to request activation of the interrupt controller, CPU, or DMA. |
| Buffer A | Buffer A circuit has 6 number of 8 -stage FIFOs. For each of the six inputs, data of different DFE channels can be separately captured. |
| Buffer B | Incorporates one 8-stage FIFO. Data of one DFE channel can be selected. |
| FIFO channels | The name each peculiar to up to 6 FIFO which buffer A circuit has is defined. This is called FIFO channels. |
| FIFO empty | State in which no data is stored in the FIFO buffer. <br> Specifically, the FIFO empty state is entered immediately after the FIFO is reset, and when data having been captured in the FIFO buffer is read from all the stages. |
| FIFO full | State in which data is stored in all of the eight stages of the FIFO buffer. |
| SCH | Subtraction channels used for the subtraction circuit, three channels are supported. |
| CCH | Capture channels used for the capture circuit. Three channels are supported. |

Table 37.10 List of Terms (3/3)

| Term | Definition in this Section |
| :--- | :--- |
| FCH | FIFO channels used for the buffer A circuit six channels are supported. |
| Timer trigger A | Triggers that are input from the timer. In this section, these are called "Timer triggerA", "compare A" or <br> "compare match A". |
| Timer trigger B | Triggers that are input from the timer. In this section, these are called "Timer triggerB", "compare B" or <br> "compare match B". |
| Timer DFE Capture trigger | Triggers that are input from the timer. In this section, these are called "Timer DFE Capture trigger" or <br> "DFE Timer capture trigger". |
| Timer FIFO Capture trigger | A trigger that is input from the timer. |
| PH update notification | Triggers that are output to the timer. In this section, these are called "PH update trigger" or "PH update <br> notification". |

### 37.3 Control Registers

### 37.3.1 List of Registers for DFE Macro

Table 37.11 lists registers and memory addresses of the DFE macro. 8, 16 or 32 -bit write access to all registers is possible. 32-bit read access to all registers is possible. 32-bit write access to the coefficient memory is possible, and upper 16-bit or lower 16-bit or 32-bit write access to the data memory is possible.

### 37.3.3 DFEjCTLACHn - Control Register An(n=0 to 11 for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1)

This register is used to execute filter processing, control interrupt requests, and set channel tag and cascade tag for each channel.

Note: While the setting of DFEjCTLACHn.EN or DFEjSTCHn.VALID is 1 , writing to CATAG, CAEN, TAG, CMD, FMT, IEP, IEE, IEC, IEO, CNSL, CNSLE and AIME is prohibited.

Table 37.13 DFEjCTLACHn Register Contents (1/3)

Table 37.13 DFEjCTLACHn Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | CMD | Filter Processing Select |
|  |  | $0000{ }_{\mathrm{B}}$ : FIR 8TAP |
|  |  | 0001b: FIR 16TAP |
|  |  | 0010 ${ }^{\text {B }}$ : FIR 24TAP |
|  |  | 0011]: FIR 32TAP |
|  |  | $0100{ }_{B}$ : Setting prohibited |
|  |  | $0101_{\mathrm{B}}$ : Setting prohibited |
|  |  | 0110 ${ }^{\text {B }}$ : Setting prohibited |
|  |  | 0111 ${ }_{\mathrm{B}}$ : FIR 64TAP*1 |
|  |  | $1000_{B}$ : IIR secondary biquad 1 stage |
|  |  | 1001 B: IIR secondary biquad 2 stages |
|  |  | $1010_{\mathrm{B}}$ : IIR secondary biquad 3 stages |
|  |  | $1011_{\mathrm{B}}$ to $1100_{\mathrm{B}}$ : Setting prohibited |
|  |  | $1101_{B}$ : IIR secondary biquad 2 stages with a gain adjustment function |
|  |  | $1110_{\mathrm{B}}$ : IIR secondary biquad 3 stages with a gain adjustment function |
|  |  | $1111_{B}$ : Setting prohibited |
|  |  | Note 1. FIR64TAP can be selected only on even-numbered channels. If FIR64TAP is selected on an even-numbered channel $n$, the use of the next odd-numbered channel $n+1$ is prohibited. |
| 11 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | FMT | FIR Input Data Format Select |
|  |  | 0 : Input data format $=16$-bit fixed-point decimal number (value after a reset) |
|  |  | 1: Input data format = 16-bit integer |
|  |  | To execute accumulation processing or floating-point processing, specify 16-bit fixed-point. |
| 7 | IEP | PH End Interrupt Request Enable |
|  |  | 0 : Disables interrupt requests at the end of PH. (Value after a reset) |
|  |  | 1: Enables interrupt requests at the end of PH. |
|  |  | CAUTION: Enabled when PH and comparison are used simultaneously (DFEjTLBCHn.PRCSB = 111 ). |
| 6 | IEE | Error Interrupt Request Enable |
|  |  | 0 : An error interrupt request is disabled: Value after a reset. |
|  |  | 1: An error interrupt request is enabled. |
| 5 | IEC | Condition Match Interrupt Request Enable |
|  |  | 0 : A peak-hold end interrupt request is disabled when peak-hold operation is specified: value after a reset. <br> When comparison calculation is specified, an interrupt request when the comparison calculation result is true is disabled: Value after a reset. |
|  |  | 1: A peak-hold end interrupt request is enabled when peak-hold operation is specified. When a comparison calculation is specified, an interrupt request when the comparison calculation result is true is enabled. |
| 4 | IEO | Output Data Interrupt Request Enable |
|  |  | 0 : An output data interrupt when the result of calculation is written to the output data register (and the intermediate values output register) is disabled: value after a reset. |
|  |  | 1: An output data interrupt when the result of calculation is written to the output data register (and the intermediate values output register) is enabled. |

Table 37.13 DFEjCTLACHn Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 | CNSL | Condition Match Interrupt 0/1 Function Selection <br> 0: Value after a reset <br> INT_DFE_CND0: Selects a comparison match interrupt request. <br> INT_DFE_CND1: Selects a PH end interrupt request. <br> 1: INT_DFE_CND0: Selects a PH end interrupt request. <br> INT_DFE_CND1: Selects a comparison match interrupt request. <br> CAUTION: Enabled when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 11 ${ }_{\mathrm{B}}$ ). |
| 2 | CNSLE | CNSL Enable <br> 0: CNSL bit settings disabled. (Value after a reset) <br> When PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 11 $1_{\mathrm{B}}$ ), the following functions are enabled: <br> INT_DFE_CNDO: Comparison match interrupt request <br> INT_DFE_CND1: PH end interrupt request <br> 1: CNSL bit settings enabled. <br> Note: When either PH or comparison is specified (DFEjTLBCHn.PRCSB $=01_{B}, 10_{B}$ ), <br> INT_DFE_CNDO/1 act as the following functions: <br> INT_DFE_CNDO: Comparison match interrupt request <br> INT_DFE_CND1: No functions <br> CAUTION: Enabled when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 11 ${ }_{\mathrm{B}}$ ). |
| 1 | AIME | Automatic Initialization Enable <br> 0 : Automatic initialization function disabled. (Value after a reset) <br> 1: Automatic initialization function enabled. |
| 0 | EN | Channel Enable <br> 0 : Channel disabled <br> No processing is executed for this channel: Value after a reset. <br> 1: Channel enabled Processing is executed for this channel. |

When the automatic initialization function is enabled (DFEjCTLACHn.AIME $=1$ ), on this channel the automatic initialization flag is enabled upon the rise of this bit $(0 \rightarrow 1)$.

Even when the automatic initialization function is disabled (DFEjCTLACHn.AIME $=0$ ), the rise of this bit $(0 \rightarrow 1)$ is detected, and the automatic initialization flag is also enabled when AIME $=1$ and $\mathrm{EN}=1$ are written simultaneously.

When the filtering request that is input is enabled after the automatic initialization flag is enabled, automatic initialization is executed during the pertinent filtering process.

## CAUTION

If FIR64TAP is selected on an even-numbered channel $n$, it is prohibited to set the EN bit to 1 on the next odd-numbered channel $\mathrm{n}+1$ (even if the bit is set to 1 , no trigger input will be accepted).

### 37.3.4 DFEjCTLBCHn — Control Register Bn(n=0 to 11 for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1)

This register is used to set floating-point conversion, absolute value conversion, accumulation/decimation processing, and peak-hold/comparison processing.

All the bits can be set on even-numbered channels. However, the DFEjCTLBCHn.HOFS bit is not implemented on odd-numbered channels since those channels do not have an intermediate value output register.

| Value after reset: |  |  | $0101000 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 24 | DISB | Peak-Hold Processing Disable <br> 0 : Indicates that peak-hold processing is in progress or peak-hold processing is enabled: DISB is cleared to 0 when the following conditions are satisfied while DISB is 1 : <br> - The peak-hold initialization flag is enabled by a timer trigger or a software trigger. At this time, DISB is automatically cleared to 0 . <br> - 0 is written to DISB by the software. <br> When DISB is 0 , peak-hold processing is started from the data that is input after DFEjCTLBCHn.PRCSB is set to $01_{\mathrm{B}}$ (peak-hold processing executed) and DFEjCTLACHn.EN is set to 1 . <br> 1: Indicates that peak-hold processing is disabled: Value after a reset. DISB is set to 1 when the following conditions are satisfied while DISB is 0 : <br> - Reset input <br> - The peak-hold end flag is enabled by a timer trigger or a software trigger. At this time, DISB is automatically set to 1 . <br> - 1 is written to DISB by setting the register by the software. <br> When DISB is 1 , peak-hold processing is not started until the peak-hold initialization flag is enabled after DFEjCTLBCHn.PRCSB is set to $01_{\text {B }}$ (peak-hold processing executed) and DFEjCTLACHn.EN is set to 1 . |
| 23 | PHPS | Peak-Hold Peak Type Select <br> 0 : The PH processing detects upper-limit peaks (value after a reset). <br> 1: The PH processing detects lower-limit peaks. <br> CAUTION: Enabled when PH is specified (DFEjCTLBCHn.PRCSB $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ). |
| 22 | CPCS | Comparison Value Type Select <br> 0: Value after a reset DFEjCPA to DFEjCPD is selected by DFEjCTLBCHn.SELB1. <br> 1: DFEjPHCHn is used for calculating the comparison target value. For details, see SELB1. <br> CAUTION: Enabled when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 11 ${ }_{\mathrm{B}}$ ). |
| 21, 20 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 17 | PHSLB2 | PH Initial Value Register Select <br> $000_{\mathrm{B}}$ : Value after a reset <br> DFEjPHIA register value is selected for the PH processing initial value. <br> $001_{\mathrm{B}}$ : DFEjPHIB register value is selected for the PH processing initial value. <br> $010_{\mathrm{B}}$ : DFEjPHIC register value is selected for the PH processing initial value. <br> $011_{\mathrm{B}}$ : DFEjPHID register value is selected for the PH processing initial value. <br> $100_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited <br> CAUTION: Enabled when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 11 ${ }_{\mathrm{B}}$ ). |

Table 37.14 DFEjCTLBCHn Register Contents (3/5)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 16 | DISA | Accumulation/Decimation Processing Disable |
|  | 0 Indicates that accumulation/decimation processing is in progress or |  |
|  | accumulation/decimation processing is enabled |  |
|  | DISA is cleared to 0 when the following condition is satisfied while DISA is $1:$ |  |

- The accumulation/decimation initialization flag is enabled by a timer trigger or a software trigger. At this time, DISA is automatically cleared to 0 .
-0 is written to DISA by the software.
When DISA is 0 , accumulation/decimation processing is started from the data that is input after DFEjCTLBCHn.PRCSA is set to $01_{\mathrm{B}}$ (accumulation/decimation processing executed) and DFEjCTLACHn.EN is set to 1.
1: Indicates that accumulation/decimation processing is disabled: Value after a reset. DISA is set to 1 when the following condition is satisfied while DISA is 0 :
- Reset input
- The accumulation/decimation disable flag is enabled by a timer trigger or a software trigger. At this time, DISA is automatically set to 1 .
- 1 is written to DISA by setting the register by the software.

When DISA is 1 , accumulation/decimation processing is not started until the accumulation/decimation initialization flag is enabled after DFEjCTLBCHn.PRCSA is set to $01_{\mathrm{B}}$ (accumulation or decimation processing executed) and DFEjCTLACHn.EN is set to 1.

| 15 PRCSC | Output Data Register Floating-Point Conversion |
| :--- | :--- |
| 0: Floating-point conversion for DFEjDOCHn is not executed: Value after a reset. |  |
| 1: Floating-point conversion for DFEjDOCHn is executed. |  |
| Fixed-point format $(1.31 / 10.22)$ is converted to floating-point (IEEE 754$).$ |  |
| This bit must not be set to 1 if the setting of DFEjCTLACHn.FMT = 1 (integer mode) |  |
| while FIR operation is selected. |  |

## 14 to 12 SELB2

Peak-Hold Initialization Value Register Select
When peak-hold operation is specified exclusively (DFEjCTLBCHn.PRCSB $=01_{\mathrm{B}}$ )
$000_{\mathrm{B}}$ : DFEjPHIA register value is selected for the initial value of peak-hold processing: Value after a reset.
$001_{\mathrm{B}}$ : DFEjPHIB register value is selected for the initial value of peak-hold processing.
$010_{B}$ : DFEjPHIC register value is selected for the initial value of peak-hold processing.
$011_{\mathrm{B}}$ : DFEjPHID register value is selected for the initial value of peak-hold processing.
$100_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited

## Comparison Calculation Select

When comparison is specified exclusively (DFEjCTLBCHn.PRCSB $=10_{\mathrm{B}}$ ) or when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB=11 ${ }_{\mathrm{B}}$ ).
$000_{\mathrm{B}}$ : "Equal to $(==)$ " is selected. Calculation of "equal to $(==)$ " for the comparison target register selected by DFEjCTLBCHn.SELB1 and peak-hold circuit input data is performed: Value after a reset.
$001_{\mathrm{B}}$ : "Equal to or less than ( $\leq$ )" is selected. Calculation of "equal to or less than ( $\leq$ )" for the comparison target register selected by DFEjCTLBCHn.SELB1 and peak-hold circuit input data is performed.
$010_{\mathrm{B}}$ : "Equal to or more than $(\geq)$ " is selected. Calculation of "equal to or more than $(\geq)$ " for the comparison target register selected by DFEjCTLBCHn.SELB1 and peak-hold circuit input data is performed.
$011_{\mathrm{B}}$ : "Less than (<)" is selected. Calculation of "less than (<)" for the comparison target register selected by DFEjCTLBCHn.SELB1 and peak-hold circuit input data is performed.
$100_{\mathrm{B}}$ : "More than $(>)$ " is selected. Calculation of "more than ( $>$ )" for the comparison target register selected by DFEjCTLBCHn.SELB1 and peak-hold circuit input data is performed.
$101_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited

Table 37.14 DFEjCTLBCHn Register Contents (4/5)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11, 10 | SELB1 | Comparison Target Register Select <br> When comparison is specified exclusively (DFEjCTLBCHn.PRCSB $=2 \mathrm{~b} 10$ ) or when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 2b11) and DFEjCTLBCHn.CPCS $=0$. <br> $00_{\mathrm{B}}$ : DFEjCPA register value is selected for the comparison calculation target value. <br> $01_{\mathrm{B}}$ : DFEjCPB register value is selected for the comparison calculation target value. <br> $10_{\mathrm{B}}$ : DFEjCPC register value is selected for the comparison calculation target value. <br> $11_{\mathrm{B}}$ : DFEjCPD register value is selected for the comparison calculation target value. <br> Enabled when PH and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 2b11) and DFEjCTLBCHn.CPCS $=1$ <br> $00_{B}$ : The following value is selected for the comparison operation [Peak-Hold Result Register (DFEjPHCHn) + Comparison Offset Value Setting Register (DFEjCPOFSTn)]: Value after a reset. <br> $01_{B}-11_{\mathrm{B}}$ : Setting prohibited. <br> Note: Comparison offset value $\alpha$ is selected by Comparison offset value $\alpha$ Select (DFEjCTLBCHn.OFSL). |
| 9, 8 | PRCSB | Peak-Hold Circuit Processing Select <br> $00_{\mathrm{B}}$ : Neither peak-hold processing nor comparison calculation processing is executed. <br> $01_{\mathrm{B}}$ : Peak-hold processing is executed. <br> $10_{\mathrm{B}}$ : Comparison calculation processing is executed. <br> $11_{\mathrm{B}}$ : Peak-Hold and comparison are executed simultaneously |
| 7 | HOFS | Intermediate Values Output Register Floating-Point Conversion <br> 0: Floating-point conversion for DFEjHOHCH and DFEjHOLCH is not executed: Value after a reset. <br> 1: Floating-point conversion for DFEjMOHCH and DFEjMOLCH is executed. <br> The setting of this bit is effective while DFEjCTLBCHn.PRCSC $=0$. <br> Fixed-point format is converted to floating-point (IEEE754). <br> This bit must not be set to 1 if the setting of DFEjCTLACHn.FMT = 1 (integer mode) and DFEjCTLBCHn.PRCSC = 1 (output data register floating-point converted) when FIR is selected. <br> Note: This bit is not implemented on odd-numbered channels. |
| 6 | PICS | Peak-Hold Index Register Control Select (not supported by channels 10 to 15) <br> 0 : Peak-hold index updating mode (value after a reset) Following the completion of peak-hold processing, the peak-hold index register is cleared before the start of a next round of peak-hold processing. <br> 1: Peak-hold index-retention mode After the completion of peak-hold processing, the peak-hold index register retains its value until it is read (clearing of the index register proceeds when the next round of peak-hold processing is started). |
| 5, 4 | SELA | Accumulation/Decimation Count Register Select <br> $00_{\mathrm{B}}$ : DFEjACA value is selected for the accumulation/decimation count. <br> $01_{\mathrm{B}}$ : DFEjACB value is selected for the accumulation/decimation count. <br> $10_{\mathrm{B}}$ : DFEjACC value is selected for the accumulation/decimation count. <br> $11_{\mathrm{B}}$ : DFEjACD value is selected for the accumulation/decimation count. |

Table 37.14 DFEjCTLBCHn Register Contents (5/5)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 | PFMT | PH Result Register Floating-Point Conversion Execution |
|  |  | 0 : Does not execute floating-point conversion on DFEjPHCH. |
|  |  | 1: Executes floating-point conversion on DFEjPHCH. |
|  |  | Converts the fixed-point format (S.31/S9.22) to the floating-point format (IEEE754). |
|  |  | When FIR is selected and DFEjCTLACHn.FMT = 1 (integer mode), it is prohibited to set |
|  |  | PFMT to 1. |
|  |  | CAUTION: Enabled when PH is specified (DFEjCTLBCHn.PRCSB $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ). |
| 2 | ABS | Absolute Value Calculation |
|  |  | 0 : Absolute value calculation for the filter result is not performed. |
|  |  | 1: Absolute value calculation for the filter result is performed. |
| 1, 0 | PRCSA | Accumulation Circuit Processing Select |
|  |  | $00_{\mathrm{B}}$ : Neither accumulation processing nor decimation processing is executed. |
|  |  | $01_{\mathrm{B}}$ : Accumulation processing is executed. |
|  |  | $10_{\mathrm{B}}$ : Decimation processing is executed. |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited. |

### 37.3.5 DFEjDOCHn — Output Data Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to 11 for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1)

This register is used to store the calculation results for each channel after DFE processing has been completed.

Table 37.15 DFEjDOCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DO | Output Data |
|  |  | These bits show the DFE processing calculation results. |

Figure 37.4 Format of Output Data Register Value

### 37.3.6 DFEjPHCHn - Peak-Hold Result Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 11 for DFE0, $\mathbf{n}=0$ to 3 for DFE1)

This register is used to store the peak-hold processing result value.

Table 37.16 DFEjPHCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PH | Peak-Hold Result Data |
|  |  | These bits show the peak-hold processing calculation results. |

Figure 37.5 Format of Peak-Hold Result Register Value

### 37.3.7 DFEjPHINDCHn — Peak-Hold Index Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 11 for DFE0, $\mathbf{n}=\mathbf{0}$ to 3 for DFE1)

These registers hold the number of rounds of peak-hold processing that have occurred when the peak-hold result register is updated.

| Value after reset: $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | PHIOW | PHIOF | PHIND |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.17 DFEjPHINDCHn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PHIOW | Peak-Hold Index Overwrite Flag |
|  |  | 0: PHIND has not been overwritten: Value after a reset. This flag becomes 0 when 1 is written to DFEjCLRSTCHn.CLRPHIOW. |
|  |  | 1: PHIND has been overwritten in peak-hold index updating mode. |
|  |  | This flag is valid in peak-hold index updating mode. It is always 0 in peak-hold index retention mode. |
| 14 | PHIOF | Peak-Hold Index Overflow Flag |
|  |  | 0 : The number of rounds of peak-hold processing has not overflowed ( $\leq 16383$ times): Value after a reset. |
|  |  | - If the peak-hold initialization flag is raised in peak-hold index updating mode, peak-hold processing clears it to 0 . |
|  |  | - In peak-hold index-retention mode, the peak-hold initialization flag is raised after the peak-hold index register is read, and processing of the first value for peak-hold processing clears it to 0 . |
|  |  | 1: The number of rounds of peak-hold processing has overflowed (> 16383 times). |
|  |  | The number of rounds of peak-hold processing is counted from the time of input to the peakhold initialization flag to the time of input to the peak-hold end flag. |

Table 37.17 DFEjPHINDCHn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 13 to 0 | PHIND | Peak-Hold Index |
|  |  | $0_{H}$ : Value after a reset |
|  |  | - In peak-hold index-updating mode: Indicates that the first condition for peak-hold updating is not satisfied when the peak-hold initialization flag has been raised. |
|  |  | - In peak-hold index-retention mode: Indicates that the first condition for peak-hold updating is not satisfied when the peak-hold initialization flag has been raised after the peak-hold index register has been read. |
|  |  | $1_{\text {H: }}$ Indicates that the value for the first input to the peak-hold circuit has been written to the peak-hold result register. |
|  |  | $2_{\mathrm{H}}$ : Indicates that the value for the second input to the peak-hold circuit has been written to the peak-hold result register. |
|  |  | : |
|  |  | $3 F F F_{H}$ : Indicates that the value for the 16383 rd input to the peak-hold circuit has been written to the peak-hold result register. |
|  |  | When the condition for peak-hold updating has been satisfied and the value is stored in the peak-hold result register, the DFEjPHIND register captures the number of values to which peak-hold processing has been applied (the value of the peak-hold counter within the digital filter). |
|  |  | After the value of PHIOF becomes " 1 " when the number of rounds of peak-hold processing reaches and exceeds 16384, operation of the peak-hold counter continues and PHIND continues to be updated. |

### 37.3.8 DFEjSTCHn — Status Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 11, for DFE0, $\mathbf{n}=0$ to $\mathbf{3}$ for DFE1)

This register is used to indicate channel status.

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 37.18 DFEjSTCHn Register Contents (1/4)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | Reserved |  |
| When read, the value after reset is returned. When writing, write the value after reset. |  |  |

Table 37.18 DFEjSTCHn Register Contents (2/4)
\(\left.\begin{array}{lll}\hline Bit Position \& Bit Name \& Function <br>
\hline 15 to 13 \& Reserved <br>

\& When read, the value after reset is returned. When writing, write the value after reset.\end{array}\right]\)| Input Data Register Valid |
| :--- |
| 0: Input data register value is invalid. |
| This indicates that there is no data to be processed: Value after a reset. |
| 1: Input data register value is valid. |
| This bit is set to 1 when data to be processed is input to the input data register, and is |
| cleared to 0 when the data has been processed in the accumulation circuit. |

Table 37.18 DFEjSTCHn Register Contents (3/4)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | DOEN | Output Data Register Valid <br> - Even-numbered channels <br> 0 : Indicates that the value of the output data register is invalid: Value after a reset. <br> While DOEN $=1$, writing 1 to DFEjCLRSTCHn.CLRDOEN clears this bit to 0. <br> While DOEN = 1 and the IIR filter is selected, reading the DFEjDOCHn register clears this bit to 0 . <br> While DOEN = 1 and the FIR filter is selected, this bit is cleared in the following conditions. <br> While DFEjCTLBCHn.HOFS $=0$, reading the DFEjDOCHn register or reading both the DFEjHOLCHn and DFEjHOHCHn registers clears this bit to 0 . <br> While DFEjCTLBCHn.HOFS = 1, reading the DFEjDOCHn register or the DFEjHOLCHn register clears this bit to 0 . <br> This is set to 0 when DOEN $=1$ and filter result data is stored in the buffer A circuit or buffer B circuit in the FIFO macro. <br> 1: Indicates that the value of the output data register is valid. <br> This bit is set to 1 when the DFE stores the results of a calculation in the output data register (and the intermediate values output register) while DFEjCTLBCHn.PRCSA = $01_{\mathrm{B}}$ (accumulation) or DFEjCTLBCHn.PRCSA $=10_{\mathrm{B}}$ (decimation). <br> - Odd-numbered channels <br> 0 : Indicates that the output data register value is invalid: Value after a reset. <br> Setting DFEjCLRSTCHn.CDOEN to 1 when DFEjCLRSTCHn. CLRDOEN = 1 clears this bit to 0 . <br> Reading the DFEjDOCHn register when DOEN $=1$ clears this bit to 0 . <br> This is set to 0 when DOEN $=1$ and filter result data is stored in the buffer A circuit or buffer B circuit in the FIFO macro. <br> 1: Indicates that the output data register value is valid. <br> This bit is set to 1 when the DFE writes the calculation result data to the output data register while DFEjCTLBCHn.PRCSA is $01_{B}$ (accumulation) or DFEjCTLBCHn.PRCSA is $10_{\mathrm{B}}$ (decimation). |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CER | Cascade Rounding Error <br> 0 : No cascade rounding error is present: Value after a reset. Setting DFEjCLRSTCHn.CLRCER $=1$ clears this bit to 0 . <br> 1: A cascade rounding error is present. This bit is set to 1 if an overflow occurs when the 32-bit accumulation circuit output data is rounded to 16 -bit data and cascade is specified (DFEjCTLACHn.CAEN $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ). |
| 4 | AER | Absolute Value Calculation Error <br> 0 : No absolute value calculation error is present: Value after a reset. Setting DFEjCLRSTCHn.CLRAER $=1$ clears this bit to 0 . <br> 1: An absolute value calculation error is present. This bit is set to 1 when the accumulation circuit input data is $80000000_{\mathrm{H}}$ and absolute value calculation is specified (DFEjCTLBCH.ABS = 1). |
| 3 | MER | Multiplication Error <br> 0: No multiplication error is present: Value after a reset. Setting DFEjCLRSTCHn.CLRMER $=1$ clears this bit to 0 . <br> 1: A multiplication error is present. This bit is set to 1 when multiplication $8000_{H} \times 8000_{H}$ is performed in the filtering circuit. |

Table 37.18 DFEjSTCHn Register Contents (4/4)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 | GER | Guard Error <br> 0: No guard error is present: Value after a reset. Setting DFEjCLRSTCHn.CLRGER $=1$ clears this bit to 0 . <br> 1: A guard error is present. This bit is set to 1 if an overflow or underflow occurs when the accumulation result is rounded to 32 bits in the filter circuit. |
| 1 | DOOW | Output Data Overwrite Error <br> 0: No output data overwrite error is present: Value after a reset. Setting DFEjCLRSTCHn.CLRDOOW $=1$ clears this bit to 0 . <br> 1: An output data overwrite error is present. This bit is set to 1 when the DFE stores the result of calculation in the output data register (and the intermediate values output register) while the output data register has a valid value (DFEjSTCHn.DOEN = 1) and DFEjCTLBCHn.PRCSA is 01 ${ }_{\mathrm{B}}$ (accumulation) or DFEjCTLBCHn.PRCSA is $10_{\mathrm{B}}$ (decimation). |
| 0 | DIOW | Input Data Overwrite Error <br> 0: No input data overwrite is present: Value after a reset. Setting DFEjCLRSTCHn.CLRDIOW = 1 clears this bit to 0 . <br> 1: An input data overwrite error is present. This bit is set to 1 when the value is stored again while the input data register has a valid value (VALID = 1). |

### 37.3.9 DFEjCLRSTCHn - Clear Status Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 11 for DFE0, $\mathbf{n}=0$ to $\mathbf{3}$ for DFE1)

This register is used to clear the status register. Writing 1 to each clear bit clears the corresponding bits in DFEjSTCHn and DFEjPHINDCHn to 0 .

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 37.19 DFEjCLRSTCHn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | CLRPHIOW | When the PH23 function is enabled |
|  |  | PH index overwrite flag clear |
|  |  | 0 : Value after a reset <br> Does not clear PHIOW in DFEjPHINDCHn, DFEjPH2IND, and DFEjPH3IND. |
|  |  | 1: Clears PHIOW in DFEjPHINDCHn, DFEjPH2IND, and DFEjPH3IND. Clearing PHIOW in DFEjPHINDCHn, DFEjPH2IND, and DFEjPH3IND automatically sets CLRPHIOW to 0 . |
|  |  | When the PH23 function is disabled |
|  |  | PH index overwrite flag clear |
|  |  | 0: Value after a reset <br> Does not clear PHIOW in DFEjPHINDCHn. |
|  |  | 1: Clears PHIOW in DFEjPHINDCHn. <br> Clearing PHIOW in DFEjPHINDCHn automatically sets CLRPHIOW to 0 . |
|  |  | This bit is always read as 0 . |
| 14 to 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | CLRPHE | Enabled when PH and comparison are enabled simultaneously (DFEjCTLBCHn.PRCSB = 11 ${ }_{\mathrm{B}}$ ). |
|  |  | Peak-Hold end bit clear |
|  |  | 0 : Value after a reset. <br> Does not clear DFEjSTCHn.PHE. |
|  |  | 1: Clears DFEjSTCHn.PHE. <br> Clearing DFEjSTCHn.PHE automatically sets CLRPHE to 0 . |
|  |  | This bit is always read as 0 . |

Table 37.19 DFEjCLRSTCHn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9 | CLRCND | Condition Match Bit Clear <br> 0: DFEjSTCHn.CND is not cleared: Value after a reset. <br> 1: DFEjSTCHn.CND is cleared. <br> When DFEjSTCHn.CND is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |
| 8 | CLRDOEN | Output Data Register Enable Bit Clear <br> 0: DFEjSTCHn.DOEN is not cleared: Value after a reset. <br> 1: DFEjSTCHn.DOEN is cleared. <br> When DFEjSTCHn.DOEN is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CLRCER | Cascade Rounding Error Bit Clear <br> 0 : DFEjSTCHn.CER is not cleared: Value after a reset. <br> 1: DFEjSTCHn.CER is cleared. <br> This bit is always read as 0 . |
| 4 | CLRAER | Absolute Value Calculation Error Bit Clear <br> 0: DFEjSTCHn.AER is not cleared: Value after a reset. <br> 1: DFEjSTCHn.AER is cleared. <br> When DFEjSTCHn.AER is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |
| 3 | CLRMER | Multiplication Error Bit Clear <br> 0: DFEjSTCHn.MER is not cleared: Value after a reset. <br> 1: DFEjSTCHn.MER is cleared. <br> When DFEjSTCHn.MER is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |
| 2 | CLRGER | Guard Error Bit Clear <br> 0: DFEjSTCHn.GER is not cleared: Value after a reset. <br> 1: DFEjSTCHn.GER is cleared. <br> When DFEjSTCHn.GER is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |
| 1 | CLRDOOW | Output Data Register Overwrite Error Bit Clear <br> 0: DFEjSTCHn.DOOW is not cleared: Value after a reset. <br> 1: DFEjSTCHn.DOOW is cleared. <br> This bit is always read as 0 . |
| 0 | CLRDIOW | Input Data Register Overwrite Error Bit Clear <br> 0: DFEjSTCHn.DIOW is not cleared: Value after a reset. <br> 1: DFEjSTCHn.DIOW is cleared. <br> When DFEjSTCHn.DIOW is cleared, this bit is automatically cleared to 0 . <br> This bit is always read as 0 . |

### 37.3.10 DFEjERMCHn — Error Mask Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{1 1}$ for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1)

This register is used to mask errors.

Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |

### 37.3.11 DFEjTRGCHn - Trigger Setting Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{1 1}$ for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1)

This register is used to set the generation of trigger flags by using software triggers or timer triggers. It is prohibited to set both the initialization flag and end flag as a software trigger for the peak-hold processing. Furthermore, it is prohibited to set both the initialization flag and the disable flag as a software trigger for the accumulation/decimation processing. Any operation under prohibited settings is not guaranteed.

Table 37.21 DFEjTRGCHn Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 23, 22 | PMFE | Peak-Hold Mask End Flag Trigger Setting |
|  |  | $00_{\mathrm{B}}$ : Value after a reset <br> The peak-hold mask end flag is not generated. |
|  |  | $01_{B}$ : The peak-hold end flag is generated by a timer trigger. (timer triggers 0 to 5) |
|  |  | $10_{\mathrm{B}}$ : The peak-hold end flag is generated by a software trigger. |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited |
|  |  | It is prohibited to set both the Peak-Hold mask start flag and the Peak-Hold mask end flag to a software trigger. (It is prohibited to set DFEjTRGCHn.PMFE $=10_{\mathrm{B}}$ and DFEjTRGCHn.PME $=$ $10_{B}$ ). |
|  |  | When the peak-hold mask end flag is generated by a timer trigger (DFEjTRGCHn.PMFE = $01_{\mathrm{B}}$ ), the peak-hold mask end flag is automatically selected from among compare signals B0 to B19 from the timer. Whichever signal corresponds to (has the same number as) the timer trigger (one of compare signals A0 to A19) selected by the peak-hold mask start flag and peak-hold mask end flag timer trigger select bit (DFEjTMTRGCHn.PMT) is selected. |
| 21, 20 | PME | Peak-Hold Mask Start Flag Trigger Setting |
|  |  | $00{ }_{\mathrm{B}}$ : Value after a reset |
|  |  | The peak-hold mask start flag is not generated. |
|  |  | $01_{\mathrm{B}}$ : The peak-hold start flag is generated by a timer trigger. (timer triggers 0 to 5) |
|  |  | $10_{B}$ : The peak-hold start flag is generated by a software trigger. |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited |

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19, 18 | PFE | Peak-Hold End Flag Trigger Setting <br> $00_{\mathrm{B}}$ : The peak-hold end flag is not generated: Value after a reset. <br> $01_{\mathrm{B}}$ : The peak-hold end flag is generated by a timer trigger. <br> $10_{\mathrm{B}}$ : The peak-hold end flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : Setting prohibited <br> It is prohibited to set both the Peak-Hold initialization flag and the Peak-Hold end flag to a software trigger. (It is prohibited to set DFEjTRGCHn.PFE = 10 ${ }_{\mathrm{B}}$ and DFEjTRGCHn.PE $=10_{\mathrm{B}}$ ). <br> When the peak-hold end flag is generated by a timer trigger (DFEjTRGCHn.PE =01 ${ }_{\mathrm{B}}$ ), the peak-hold end flag is automatically selected from among compare signals B 0 to B 19 from the timer. Whichever signal corresponds to (has the same number as) the timer trigger (one of compare signals A0 to A19) selected by the peak-hold initialization flag and peak-hold end flag timer trigger select bits (DFEjTRGCHn.PT and DFEjTMTRGCHn.PT) is selected. |
| 17, 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15, 14 | AFE | Accumulation/Decimation Disable Flag Trigger Setting <br> $00_{\mathrm{B}}$ : The accumulation/decimation disable flag is not generated: Value after a reset. <br> $01_{\mathrm{B}}$ : The accumulation/decimation disable flag is generated by a timer trigger. <br> $10_{\mathrm{B}}$ : The accumulation/decimation disable flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : Setting prohibited <br> These bits disable both the accumulation/decimation initialization flag and the accumulation/decimation disable flag to be set as a software trigger. (Setting both AE and AFE bits in DFEjTRGCHn to $10_{\mathrm{B}}$ is prohibited.) <br> When the accumulation/decimation disable flag is generated by a timer trigger (DFEjTRGCHn.AFE $=01_{\mathrm{B}}$ ), the accumulation/decimation disable flag is automatically selected from among compare signals B0 to B19 from the timer. Whichever signal corresponds to (has the same number as) the timer trigger (one of compare signals A0 to A19) selected by the accumulation/decimation initialization flag and accumulation/decimation prohibition flag timer trigger select bits (DFEjTRGCHn.AT and DFEjTMTRGCHn.AT) is selected. |
| 13, 12 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 11, 10 | PE | Peak-Hold Initialization Flag Trigger Setting <br> $00_{\mathrm{B}}$ : The peak-hold initialization flag is not generated: Value after a reset. <br> $01_{\mathrm{B}}$ : The peak-hold initialization flag is generated by a timer trigger. (Timer triggers 0 to 3 ) A timer trigger is selected from timer trigger $0-3$ by setting DFEjTRGCHn.PT. <br> $10_{\mathrm{B}}$ : The peak-hold initialization flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : The peak-hold initialization flag is generated by a timer trigger. (Timer triggers 0 to 5 ) A timer trigger is selected from timer trigger $0-5$ by setting DFEjTMTRGCHn.PT. |
| 9, 8 | PT | Peak-Hold Initialization Flag and Peak-Hold End Flag Timer Trigger Select <br> $00_{\mathrm{B}}$ : Timer trigger 0 is selected for generating the peak-hold initialization flag and peak-hold end flag: Value after a reset. <br> $01_{\mathrm{B}}$ : Timer trigger 1 is selected for generating the peak-hold initialization flag and peak-hold end flag. <br> $10_{\mathrm{B}}$ : Timer trigger 2 is selected for generating the peak-hold initialization flag and peak-hold end flag. <br> $11_{\mathrm{B}}$ : Timer trigger 3 is selected for generating the peak-hold initialization flag and peak-hold end flag. <br> These bits are valid when the peak-hold initialization flag trigger setting bit (DFEjTRGCHn.PE) or the peak-hold end flag trigger setting bit (DFEjTRGCHn.PFE) is $01_{\mathrm{B}}$. Timer triggers 0 to 3 can be selected by using PITMTRG0 to PITMTRG3 in DFEjPITRG. |

Table 37.21 DFEjTRGCHn Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | AE | Accumulation/Decimation Initialization Flag Trigger Setting <br> $00_{\mathrm{B}}$ : The accumulation/decimation initialization flag is not generated: Value after a reset. <br> $01_{\mathrm{B}}$ : The accumulation/decimation initialization flag is generated by a timer trigger. <br> (Timer triggers 0 to 3 ) <br> A timer trigger is selected from timer trigger $0-3$ by setting DFEjTRGCHn.AT. <br> $10_{\mathrm{B}}$ : The accumulation/decimation initialization flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : The accumulation/decimation initialization flag is generated by a timer trigger. (Timer triggers 0 to 5) <br> A timer trigger is selected from timer trigger $0-5$ by setting DFEjTMTRGCHn.AT. |
| 5, 4 | AT | Accumulation/Decimation Initialization Flag and Accumulation/Decimation Prohibition Flag Timer Trigger Select <br> $00_{\mathrm{B}}$ : Timer trigger 0 is used for generating the accumulation/decimation initialization flag and accumulation/decimation prohibition flag: Value after a reset. <br> $01_{\mathrm{B}}$ : Timer trigger 1 is used for generating the accumulation/decimation initialization flag and accumulation/decimation prohibition flag. <br> $10_{\mathrm{B}}$ : Timer trigger 2 is used for generating the accumulation/decimation initialization flag and accumulation/decimation prohibition flag. <br> $11_{\mathrm{B}}$ : Timer trigger 3 is used for generating the accumulation/decimation initialization flag and accumulation/decimation prohibition flag. <br> These bits are valid when the accumulation/decimation initialization flag trigger setting bit (DFEjTRGCHn.AE) or the accumulation/decimation prohibition flag trigger setting bit (DFEjTRGCHn.AFE) is $01_{\mathrm{B}}$. Timer triggers 0 to 3 can be selected by using MITMTRG0 to MITMTRG3 in DFEjMITRG. |
| 3, 2 | FE | Filter Initialization Flag Trigger Setting <br> $00_{\mathrm{B}}$ : The filter initialization flag is not generated: Value after a reset. <br> $01_{B}$ : The filter initialization flag is generated by a timer trigger. (Timer triggers 0 to 3 ) A timer trigger is selected from timer trigger $0-3$ by setting DFEjTRGCHn.AT. <br> $10_{\mathrm{B}}$ : The filter initialization flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : The filter initialization flag is generated by a timer trigger (Timer triggers 0 to 5 ) A timer trigger is selected from timer trigger $0-5$ by setting DFEjTMTRGCHn.AT. |
| 1, 0 | FT | Filter Initialization Flag Timer Trigger Select <br> $00_{\mathrm{B}}$ : Timer trigger 0 is used for generating the filter initialization flag: Value after a reset. <br> $01_{\mathrm{B}}$ : Timer trigger 1 is used for generating the filter initialization flag. <br> $10_{\mathrm{B}}$ : Timer trigger 2 is used for generating the filter initialization flag. <br> $11_{\mathrm{B}}$ : Timer trigger 3 is used for generating the filter initialization flag. Timer triggers 0 to 3 can be selected by using FITMTRG0 to FITMTRG3 in DFEjFITRG. |
|  |  | Note: The filter initialization flag can be enabled when DFEjTRGCHn.FE is $01_{\text {B }}$. |

### 37.3.12 DFEjTMTRGCHn - Timer Trigger Setting Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to 11 for DFE0, $\mathbf{n}$ = 0 to 3 for DFE1)

This register is used to select timer triggers. The bits in this register represent a functional expansion of the same bits of DFEjTRGCHn.

This bit is also cleared to 0 if EN in DFEjCTLACHn is set to 0 and there is no input data which is undergoing DFE processing. <br> 1: This bit is set to 1 when a filter initialization flag trigger occurs. |

### 37.3.14 DFEjCPA to DFEjCPD - Comparison Value Setting Register

These registers are used to set a comparison calculation target value when comparison calculation is specified.

Table 37.24 DFEjCPA to DFEjCPD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CP | Comparison Value |
|  |  | These bits set the comparison value when comparison calculation is specified. |

The data format of the comparison value setting registers is as follows.

Figure 37.6 Data Format of Comparison Value Setting Registers

### 37.3.15 DFEjPHIA to DFEjPHID — Peak-Hold Initial Value Setting Register

These registers are used to set the initial peak-hold value when peak-hold calculation is specified.

Table 37.25 DFEjPHIA to DFEjPHID Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PHI | Initial Peak-Hold Value |
|  |  | These bits set the initial peak-hold value when Peak-hold calculation is specified. <br>  <br>  |
|  | Initial value: Negative minimum value $\left(80000000_{\mathrm{H}}\right)$ |  |

The data format of the peak-hold initial value setting registers is as follows.

Figure 37.7 Data Format of Peak-Hold Initial Value Setting Registers

### 37.3.16 DFEjACA to DFEjACD - Accumulation/Decimation Count Setting Register

These registers are used to set accumulation count or decimation count when accumulation/decimation is specified. A value of 0 to 511 can be set in these registers.

| Value after reset: $\quad 0000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 37.26 DFEjACA to DFEjACD Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 0 | AC | In the case of accumulation (DFEjCTLACHn.PRCSA $=01_{\mathrm{B}}$ ) |
|  |  | Accumulation Count Setting Register |
|  |  | $000_{\mathrm{H}}$ : Accumulation processing is not performed*1: Value after a reset. |
|  |  | 001 н: Accumulation is performed once. Two filter processing results are added and output from the accumulation circuit. |
|  |  | 002н: Accumulation is performed twice. Three filter processing results are added and output from the accumulation circuit. |
|  |  | . |
|  |  | $1 \mathrm{FF}_{\mathrm{H}}$ : Accumulation is performed 511 times. 512 filter processing results are added and output from the accumulation circuit. |
|  |  | In the case of decimation (DFEjCTLACHn.PRCSA = 10 ${ }_{\text {B }}$ ) |
|  |  | Decimation Count Setting Register |
|  |  | 000 H: Decimation processing is not performed: Value after a reset. |
|  |  | $001_{\mathrm{H}}$ : Decimation is performed once. Filter processing results are output once every two filter processing results. |
|  |  | 002н: Decimation is performed twice. Filter processing results are output once every three filter processing results. |
|  |  |  |
|  |  | $1 \mathrm{FF}_{\mathrm{H}}$ : Decimation is performed 511 times. Filter processing results are output once every 512 filter processing results. |

Note 1. However, since arithmetic right shift is executed during accumulation, the format of data that is input to the accumulation circuit is (S.31) data format to (S9.22) data format.

### 37.3.17 DFEjDI — Software Input Data Register

This register is used to input data to process (software input) from the CPU or DMA to the DFE through the peripheral bus. A write access to this register activates the DFE

Write access to the TAG[4:0] and DI[15:0] bits should be made at the same time.

Table 37.27 DFEjDI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | TAG | Software Input Tag <br> $00_{H}$ to $1 F_{H}:$ Set the same value as the channel tag (DFEjCTLACHn.TAG) to be allocated. |
| 15 to 0 | DI | Software Input Data <br>  |
|  | Data to be filtered is set with the input data format of the channel to be allocated. The fixed- <br> point (S.31) format or the integer format is applicable. Set data to be filtered with the data <br> format of the channel to be allocated. <br> (If DFEjCTLACHn.FMT $=0$ while FIR is selected, set data in fixed-point format; if <br> DFEjCTLACHn.FMT $=1$, set data to the integer format. While IIR is selected, the fixed-point <br> format is fixed.) |  |

### 37.3.18 DFEjTRG - Software Trigger Register

This register is used to generate a software trigger by writing a value to this register from the CPU or DMA through the peripheral bus.

Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TRGA |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 37.28 DFEjTRG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TRGA | Software Trigger Generation |
|  | $0:$ No software trigger is generated. |  |
|  | 1: A software trigger is generated. |  |
|  |  | Writing 1 to this bit generates a software trigger. |
|  |  | This bit is always read as 0. |

### 37.3.19 DFEjST — DFE Status Register

This register is used to indicate the DFE status. This register consists of a logical OR of each VALID bit and each error bit in DFEjSTCHn. The CPU application may use this register to monitor error channels when the DFE outputs an error interrupt request.

Note 1. DFE0 only. DFE1 is the reserved.
Table 37.29 DFEjST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| $2 \times n+1$ to $2 \times n$ | CHnS | Channel n Status |
|  |  | $00_{\mathrm{B}}:$ Input data register disabled with no errors: Value after a reset |
|  | $01_{\mathrm{B}}$ : Input data register disabled with an error |  |
|  | $10_{\mathrm{B}}$ : Input data register enabled with no errors |  |
|  | $11_{\mathrm{B}}$ : Input data register enabled with an error |  |

### 37.3.20 DFEjEST — DFE Error Status Register

This register indicates the error status on the DFE subtraction channel and the capture channel. The register is intended for an application where the CPU uses the register to monitor the error-generating channel when the DFE issues an error interrupt request.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | CP2S | CP1S | CPOS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | SB2S | SB1S | SB0S |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.30 DFEjEST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 to 16 | CPnS | Capture Channel-n Status |
|  |  | 0: There are no capture errors. Value after a reset |
|  | Capture channel-n has no error. |  |
|  | 1: Capture channel-n has an error. |  |
| 15 to 3 | Reserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | SBnS | Subtraction Channel-n Status |
|  |  | 0: There are no subtraction errors. Value after a reset |
|  |  | Subtraction Channel-n has no error. |
|  |  |  |

### 37.3.21 DFEjPMITRG0 — Peak-Hold Mask-Start/End Timer Trigger Select Register 0

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for peak-hold mask start/end timer triggers 0 to 3 .

Timer triggers 4 and 5 are set using the peak-hold mask start/end timer trigger select register 1 (DFEjPMITRG1).

Table 37.31 DFEjPMITRG0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 28 to 24 | PMITMTRG3 | Peak-Hold Mask Start/End Flag Timer Trigger 3 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 3. $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 3. <br> $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger 3. <br> $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |
| 23 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | PMITMTRG2 | Peak-Hold Mask Start/End Flag Timer Trigger 2 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 2. $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 2. <br> $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger 2. <br> $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |
| 15 to 13 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | PMITMTRG1 | Peak-Hold Mask Start/End Flag Timer Trigger 1 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 1. $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 1. <br> $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger 1. <br> $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Settings prohibited. |
| 7 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 37.31 DFEjPMITRG0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 to 0 | PMITMTRG0 | Peak-Hold Mask Start/End Flag Timer Trigger 0 |
|  |  | $00000_{\mathrm{B}}$ : Value after a reset |
| Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 0. |  |  |
|  | $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 0. |  |
| $\ldots$ |  |  |
|  |  | $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger |
|  | 0. |  |
|  |  | $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |

### 37.3.22 DFEjPMITRG1 — Peak-Hold Mask-Start/End Timer Trigger Select Register 1

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for peak-hold mask start/end timer triggers 4 to 5 .

Table 37.32 DFEjPMITRG1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | PMITMTRG5 | Peak-Hold Mask Start/End Flag Timer Trigger 5 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 5. $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 5. ... <br> 10011 B: Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger 5. <br> $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |
| 7 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | PMITMTRG4 | Peak-Hold Mask Start/End Flag Timer Trigger 4 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer for the peak-hold mask start/end timer trigger 4. $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer for the peak-hold mask start/end timer trigger 4. $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer for the peak-hold mask start/end timer trigger 4. $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |

### 37.3.23 DFEjPITRG — Peak-Hold Initialization/End Timer Trigger Select Register

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for peak-hold initialization/end timer triggers 0 to 3 .

Timer triggers 4 and 5 are set using the peak-hold initialization/end timer trigger select register 1 (DFEjPITRG1).

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 37.3.25 DFEjMITRG - Accumulation/Decimation Initialization/Prohibition Timer Trigger Select Register

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for accumulation/decimation initialization/prohibition timer triggers 0 to 3 .

Timer triggers 4 and 5 are set using accumulation/decimation initialization/prohibition timer trigger select register 1 (DFEjMITRG1).

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 37.3.27 DFEjFITRG — Filter Initialization Timer Trigger Select Register

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for filter initialization timer triggers 0 to 3 .

Timer triggers 4 and 5 are set using the filter initialization timer trigger select register 1 (DFEjFITRG1).

### 37.3.29 DFEjPHUPDCn — Peak-Hold Update Notification Setting Register n ( $\mathbf{n}=\mathbf{0}$ to 3 )

These registers are used to set a peak-hold result register update notification during peak-hold processing. One of the channels 0 to 11 for DFE0, channels 0 to 3 for DFE1, or $\mathrm{PH} 2 / \mathrm{PH} 3$ processing can be independently selected with DFEjPHUPDC0-3. The set update notification is output to the Timer.

Table 37.39 DFEjPHUPDCn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | PHUPDCH | Peak-Hold Result Register Update Notification Channel Select <br> $\mathrm{O}_{\mathrm{H}}$ : Notify that the peak-hold result register has been updated on channel 0: Value after a reset. <br> $1_{\mathrm{H}}$ : Notify that the peak-hold result register has been updated on channel 1. <br> $2_{\mathrm{H}}$ : Notify that the peak-hold result register has been updated on channel 2. <br> $9_{\mathrm{H}}$ : Notify that the peak-hold result register has been updated on channel 9. <br> $A_{H}$ : Notify that the peak-hold result register has been updated on channel 10. <br> $\mathrm{B}_{\mathrm{H}}$ : Notify that the peak-hold result register has been updated on channel 11. <br> $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibited <br> Note: DFE1 is prohibited from $4_{H}$ to $F_{H}$. |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | PH23SL | PH2/PH3 Result Register Update Notification Select <br> 0: Value after a reset <br> Notify when the PH2 result register has been updated. <br> 1: Notify when the PH3 result register has been updated. <br> Note: This bit is enabled when the PH23 function is used. This bit is disabled in other cases. |
| 1 | PH23E | PH2/PH3 Result Register Update Notification Select Enable <br> 0 : Value after a reset <br> It is not a notification target that $\mathrm{PH} 2 / \mathrm{PH} 3$ result register has been updated. <br> It is a notification target that peak-hold result register $\mathrm{n}(\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) has been updated. <br> 1: It is a notification target that $\mathrm{PH} 2 / \mathrm{PH} 3$ result register has been updated. <br> It is not a notification target that peak-hold result register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) has been updated. <br> Note: This bit is enabled when the PH23 function is used. This bit is disabled in other cases. |
| 0 | OEPHUPD | Peak-Hold Result Register Update Notification Enable <br> $0_{\mathrm{B}}$ : Notification of peak-hold result register update in the selected channel is disabled: Value after a reset. <br> $1_{\mathrm{B}}$ : Notification of peak-hold result register update in the selected channel is enabled. |

### 37.3.30 DFEjHOLCHn — Intermediate Value Output Register L n ( $\mathrm{n}=$ even channels)

While FIR operation is selected, these registers hold intermediate values for digital filter processing for the corresponding channels.

The output intermediate values are the results of calculations prior to saturation processing.

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | GURD | Output Value Output Guard |
|  |  | When processing is fixed-point <br> These bits hold the integer portions (bits [36:31]) of intermediate values in processing for calculations by the digital filter. |
|  |  | When conversion to floating point is being executed, $000000_{\mathrm{B}}$ is stored. |
|  |  | For the format of the values, see Figure 37.8, Format of Intermediate Value Output Register Values. |

### 37.3.32 DFEjHOLMCHn — Intermediate Value Output Mirror Register L n ( $\mathrm{n}=$ even channels)

Although they are allocated to different locations, these registers are the same as the intermediate value output registers L (DFEjHOLCHn, $\mathrm{n}=$ even channels).

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | HO |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | HO |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.42 DFEjHOLMCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | HO | Output for Intermediate Values |
|  |  | Intermediate values in calculation for digital filter processing (in the output of FIR results, |
|  | values output prior to saturation processing) |  |
|  | For the specifications of the intermediate values output registers L, see Section 37.3 .30, |  |
|  |  | DFEjHOLCHn - Intermediate Value Output Register $\mathrm{L} \mathbf{n}(\mathbf{n}=$ even channels). |

### 37.3.33 DFEjGAINCHn — IIR Filter Gain Setting Register $\mathbf{n}$ ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{1 1}$ for DFE0, $\mathbf{n}=$ 0 to 3 for DFE1)

This register is used to set the gain coefficient data GAIN2 and GAIN3 which are used when IIR with a gain adjustment function is selected.

Table 37.43 DFEjGAINCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | GAIN3 | Gain 3 Coefficient Data |
|  |  | GAIN3 setting bits are used for IIR secondary biquad 3-stage with a gain adjustment function. |
| 15 to 0 | GAIN2 | Gain 2 Coefficient Data |
|  |  | GAIN2 setting bits are used for IIR secondary biquad 2/3-stage with a gain adjustment |
|  | function. |  |

The data format of the IIR filter gain setting registers is as follows.

Figure 37.9 Data Format of IIR Filter Gain Setting Registers

### 37.3.34 DFEjCPOFSTn - Comparison Offset Value Setting Register n ( $\mathbf{n}=0$ to 2 )

This register is used to set the comparison offset value $\alpha$.

Table 37.44 DFEjCPOFSTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CPOFST | Comparison Offset Value ${ }^{\star 1}$ |
|  |  | These bits set the comparison offset value $\alpha$. |

Note 1. If the Comparison offset value is used, set it in a data format that is the same as the filter operation results. For details on the format of filter operation results, see Section 37.5.8.
When the comparison function is used, assign a negative number ( 2 's complement) to the comparison offset value to make the comparison value equal to [Peak-Hold Result Register (DFEjPHCHn) - Comparison Offset Value Setting Register (DFEjCPOFSTn)].
The data format of the Comparison Offset Value Setting Register is as follows.

Figure 37.10 The Data Format of Comparison Offset Value Setting Register

### 37.3.35 DFEjPH23CCTLO — Peak-Hold 23 Common Control Register 0

This register is used when the PH 23 function is selected. The settings common to PH23 functions are specified using this register.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | CHS |  |  |  | PFMT | - | - | PEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R/W |

Note: When the target channel of the peak-hold 23 is being executed (DFEjPH23CCTLO.PEN $=1$ ), it is prohibited to write to any bit other than the PEN bit.

Table 37.45 DFEjPH23CCTL0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 4 | CHS | Peak-Hold 23 Function Target Channel Select |
|  |  | $0_{H}$ : Value after a reset |
|  |  | Channel 0 is the target of the peak-hold-23 function when the peak-hold processing is executed. |
|  |  | $1_{\mathrm{H}}$ : Channel 1 is the target of the peak-hold- 23 function when the peak-hold processing is executed. |
|  |  | $2_{\mathrm{H}}$ : Channel 2 is the target of the peak-hold- 23 function when the peak-hold processing is executed. |
|  |  | $\ldots$ |
|  |  | $\mathrm{B}_{\mathrm{H}}$ : Channel 11 is the target of the peak-hold-23 function when the peak-hold processing is executed. |
|  |  | $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibited |

Note: DFE1 is prohibited from $4_{H}$ to $F_{H}$.

| 3 | PFMT | Peak-Hold 23 Result Register Floating-Point Conversion <br> 0: Value after a reset <br> Floating-point conversion for neither DFPH20 nor DFPH30 is executed. <br> 1: Floating-point conversion for both DFPH20 and DFPH30 is executed. Fixed-point format (S.31/S9.22) is converted to floating-point (IEEE754). This bit must not be set to 1 if the setting of DFEjCTLACHn.FMT = 1 (integer mode) while FIR operation is selected. |
| :---: | :---: | :---: |
| 2, 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PEN | Peak-Hold 23 Function Enable <br> 0: Value after a reset The peak-hold 23 function is disabled. The peak-hold 23 function is not used. <br> 1: The peak-hold 23 function is enabled. The peak-hold 23 function can be used. |

Note: When 0 is written to DFEjPH23CCTLO.PEN, DFEjSTCHn.PH23ST of the channel set by DFEjPH23CCTLO.CHS is set to $0000_{\mathrm{B}}$.

### 37.3.36 DFEjPH2CTLO - Peak-Hold 2 Control Register 0

This register is used when the peak-hold 23 function is selected. Any setting related to PH2 processing is specified using this register.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - |  |  | - |  | PH2SLB2 |  | PHPS |  | N2SLB |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: When the target channel of the peak-hold 23 is executed (DFEjPH23CCTLO.PEN $=1$ ), it is prohibited to write to this register.

Table 37.46 DFEjPH2CTL0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9, 8 | OFSL | Peak-Hold 2 Processing Comparison Offset Value $\alpha$ Select |
|  |  | $00_{B}$ : Value after a reset |
|  |  | DFEjCPOFST0 register value is selected for the comparison offset value $\alpha$. |
|  |  | $01_{B}$ : DFEjCPOFST1 register value is selected for the comparison offset value $\alpha$. |
|  |  | $10_{\mathrm{B}}$ : DFEjCPOFST2 register value is selected for the comparison offset value $\alpha$. |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 4 | PH2SLB2 | Peak-Hold 2 Initial Value Register Select |
|  |  | $000_{\mathrm{B}}$ : Value after a reset. DFEjPHIA register value is selected for the Peak-Hold 2 processing initial value. |
|  |  | $001_{\mathrm{B}}$ : DFEjPHIB register value is selected for the Peak-Hold 2 processing initial value. |
|  |  | $010_{\mathrm{B}}$ : DFEjPHIC register value is selected for the Peak-Hold 2 processing initial value. |
|  |  | 011 $1_{\mathrm{B}}$ : DFEjPHID register value is selected for the Peak-Hold 2 processing initial value. $100_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited |

Note: When using the peak-hold-23 function, set the peak-hold 2 initial value as follows:

1. When upper-limit peak detection (PHPS $=0$ )

Select the negative minimum value $\left(80000000_{\mathrm{H}}\right)$.
2. When lower-limit peak detection (PHPS = 1)

Select the positive maximum value (7FFF FFFF ${ }_{H}$ ).

| PHPSPeak-Hold 2 Peak Type Select <br> 0: The peak-hold 2 processing detects upper-limit peaks (value after a reset). <br>  <br> $.$1: The peak-hold 2 processing detects lower-limit peaks. |
| :--- |

Table 37.46 DFEjPH2CTLO Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 to 0 | CN2SLB2 | Peak-Hold 2 Comparison Calculation Select |
|  |  | $0000_{B}$ : Value after a reset |
|  |  | "Equal to (==)" is selected. Calculation of "equal to (==)" for the comparison the target data ${ }^{\star 1}$ and the peak-hold circuit input data is performed. |
|  |  | $001_{\mathrm{B}}$ : "Less than or equal to ( $\leq$ )" is selected. Calculation of "less than or equal to ( $\leq$ )" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $010_{\mathrm{B}}$ : "More than or equal to $(\geq)$ " is selected. Calculation of "more than or equal to $(\geq)$ " for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $011_{\mathrm{B}}$ : "Less than (<)" is selected. Calculation of "less than (<)" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $100_{\mathrm{B}}$ : "More than (>)" is selected. Calculation of "more than (>)" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $101_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited |

Note 1. The target data is "Peak-Hold 2 Result Register 0(DFEjPH20) $+\alpha$ (Comparison Offset Value)". $\alpha$ is Comparison Offset Value selected by DFEjPH2CTLO.OFSL.

### 37.3.37 DFEjPH3CTLO - Peak-Hold 3 Control Register 0

This register is used when the peak-hold 23 function is selected. Any setting related to PH3 processing is specified using this register.

| Value after reset: $00000000^{\mathbf{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - |  |  | - |  | PH3SLB2 |  | PHPS |  | 3SLB |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: When the target channel of the peak-hold 23 is being executed (DFEjPH23CCTLO.PEN $=1$ ), it is prohibited to write to this register.

Table 37.47 DFEjPH3CTLO Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9, 8 | OFSL | Peak-Hold 3 Processing Comparison Offset Value $\alpha$ Select |
|  |  | $00_{B}$ : Value after a reset |
|  |  | DFEjCPOFST0 register value is selected for the comparison offset value $\alpha$. |
|  |  | $01_{B}$ : DFEjCPOFST1 register value is selected for the comparison offset value $\alpha$. |
|  |  | $10_{\mathrm{B}}$ : DFEjCPOFST2 register value is selected for the comparison offset value $\alpha$. |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 4 | PH3SLB2 | Peak-Hold 3 Initial Value Register Select |
|  |  | $000_{\mathrm{B}}$ : DFEjPHIA register value is selected for the Peak-Hold 3 processing initial value. Value after a reset. |
|  |  | $001_{\mathrm{B}}$ : DFEjPHIB register value is selected for the Peak-Hold 3 processing initial value. |
|  |  | $010_{\mathrm{B}}$ : DFEjPHIC register value is selected for the Peak-Hold 3 processing initial value. |
|  |  | $011_{\mathrm{B}}$ : DFEjPHID register value is selected for the Peak-Hold 3 processing initial value. $100_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited |

Note: When using the peak-hold-23 function, set the peak-hold 3 initial value as follows:

1. When upper-limit peak detection (PHPS $=0$ )

Select the negative minimum value ( $80000000_{\mathrm{H}}$ ).
2. When lower-limit peak detection (PHPS = 1)

Select the positive maximum value (7FFF FFFF ${ }_{H}$ ).

PHPS

[^14]Table 37.47 DFEjPH3CTLO Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 to 0 | CN3SLB2 | Peak-Hold 3 Comparison Calculation Select |
|  |  | $0000_{B}$ : Value after a reset |
|  |  | "Equal to (==)" is selected. Calculation of "equal to (==)" for the comparison the target data ${ }^{\star 1}$ and the peak-hold circuit input data is performed. |
|  |  | $001_{\mathrm{B}}$ : "Less than or equal to ( $\leq$ )" is selected. Calculation of "less than or equal to ( $\leq$ )" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $010_{\mathrm{B}}$ : "More than or equal to $(\geq)$ " is selected. Calculation of "more than or equal to $(\geq)$ " for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $011_{\mathrm{B}}$ : "Less than (<)" is selected. Calculation of "less than (<)" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $100_{\mathrm{B}}$ : "More than (>)" is selected. Calculation of "more than (>)" for the comparison the target data*1 and the peak-hold circuit input data is performed. |
|  |  | $101_{\mathrm{B}}$ to $111_{\mathrm{B}}$ : Setting prohibited |

Note 1. The target data is "Peak-Hold 3 Result Register 0(DFEjPH30) $+\alpha$ (Comparison Offset Value)". $\alpha$ is Comparison Offset Value selected by DFEjPH3CTLO.OFSL.

### 37.3.38 DFEjPH20 — Peak-Hold 2 Result Register 0

This register is used to store the peak-hold 2 processing result value.

The data format for the peak-hold $2 / 3$ result registers is the same as the data format of DFEjPHCHn.

### 37.3.39 DFEjPH30 — Peak-Hold 3 Result Register 0

This register is used to store the peak-hold 3 processing result value.

| Value after reset: $80000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

|  | $\begin{aligned} & \mathrm{PH} 2 \\ & \text { IOW } \end{aligned}$ | $\begin{aligned} & \mathrm{PH} 2 \\ & \text { IOF } \end{aligned}$ | PH2IND |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.50 DFEjPH2INDO Register Contents (1/2)

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 31 to 16 | - | Reserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 15 | PH2IOW | 0 : Value after a reset |  |
|  |  | PH2IND has not been overwritten: Value after a reset. |  |
|  |  | This flag becomes 0 when 1 is written to DFEjCLRSTCHn.CLRPHIOW. |  |
|  |  | 1: PH2IND has been overwritten in peak-hold index updating mode. |  |
|  |  | CAUTION: | Enabled when the peak-hold 23 function is used, and disabled in all other cases. Peak-Hold 2 Index Overwrite Flag |
|  |  |  | This flag is valid in peak-hold index updating mode. It is always 0 in peak-hold index retention mode. |
| 14 | PH2IOF | 0 : Value after a reset |  |
|  |  | The number of rounds of peak-hold processing has not overflowed ( $\leq 16383$ times). |  |
|  |  | peak-hold processing clears PH2IOF to 0 . |  |
|  |  | - In peak-hold index-retention mode, the peak-hold initialization flag is raised after the peak-hold 2 index register 0 is read, and processing of the first value for peak-hold processing clears PH 2 IOF to 0 . |  |
|  |  | 1: The number of rounds of peak hold processing has overflowed (> 16383 times). |  |
|  |  | CAUTION: | Enabled when the peak-hold 23 function is used, and disabled in all other cases. Peak-Hold 2 Index Overflow Flag |
|  |  |  | The number of rounds of peak-hold processing is counted from the time of input to the peak-hold initialization flag to the time of input to the peak-hold end flag. |

Table 37.50 DFEjPH2IND0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 13 to 0 | PH2IND | Peak-Hold 2 Index <br> $0000_{\mathrm{H}}: ~ V a l u e ~ a f t e r ~ a ~ r e s e t ~$ |
| - In peak-hold index-updating mode: Indicates that the first condition for peak-hold |  |  |
| updating is not satisfied when the peak-hold initialization flag has been raised. |  |  |
| - In peak-hold index-retention mode: Indicates that the first condition for peak-hold |  |  |
| updating is not satisfied when the peak-hold initialization flag has been raised after the |  |  |
| peak-hold 2 index register 0 has been read. |  |  |
| $0001_{\mathrm{H}}$ : Indicates that the value for the first input to the peak-hold circuit has been written |  |  |
| to the peak-hold 2 results register |  |  |

CAUTION: When the peak-hold 23 function is used and the condition for updating peak-hold has been satisfied and the value is stored in the peak-hold 2 results register, the PH2IND register captures the number of values to which peak-hold 2 processing has been applied (the value of the peak-hold counter within the digital filter). After the value of PH2IOF becomes " 1 " when the number of rounds of peak-hold processing reaches and exceeds 16384, operation of the peak-hold counter continues and PH2IND continues to be updated.

### 37.3.41 DFEjPH3INDO — Peak-Hold 3 Index Register 0

When the peak-hold 23 function is used and the peak-hold 3 result register is updated, this register holds for the peakhold processing count.

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.51 DFEjPH3INDO Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | PH3IOW | 0 : Value after a reset |
|  |  |  |
|  |  | This flag becomes 0 when 1 is written to DFEjCLRSTCHn.CLRPHIOW. |
|  |  | 1: PH3IND has been overwritten in peak-hold index updating mode. |
|  |  | CAUTION: Enabled when the peak-hold 23 function is used, and disabled all other cases. This flag is valid in peak-hold index updating mode. It is always 0 in peak-hold index retention mode. |
|  |  |  |
| 14 | PH3IOF | 0 : Value after a reset |
|  |  | The number of rounds of peak-hold processing has not overflowed ( $\leq 16383$ times). <br> - If the peak-hold initialization flag is raised in peak-hold index updating mode, peak-hold processing clears PH3IOF to 0 . |
|  |  | - In peak-hold index-retention mode, the peak-hold initialization flag is raised after the peak-hold 3 index register 0 is read, and processing of the first value for peak-hold processing clears PH 3 IOF to 0 . |
|  |  | 1: The number of rounds of peak hold processing has overflowed (> 16383 times). |
|  |  | CAUTION: Enabled when the peak-hold 23 function is used, and disabled all other cases. Peak-Hold 3 Index Overflow Flag |
|  |  | The number of rounds of peak-hold processing is counted from the time of input to the peak-hold initialization flag to the time of input to the peak-hold end flag. |

Table 37.51 DFEjPH3IND0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 13 to 0 | PH3IND | Peak-Hold 3 Index |
|  |  | $000 \mathrm{H}_{\mathrm{H}}$ : Value after a reset |
|  |  | - In peak-hold index-updating mode: Indicates that the first condition for peak-hold updating is not satisfied when the peak-hold initialization flag has been raised. |
|  |  | - In peak-hold index-retention mode: Indicates that the first condition for peak-hold updating is not satisfied when the peak-hold initialization flag has been raised after the peak-hold 3 index register 0 has been read. |
|  |  | $0001_{\mathrm{H}}$ : Indicates that the value for the first input to the peak-hold circuit has been written to the peak-hold 3 results register |
|  |  | 0002H: Indicates that the value for the second input to the peak-hold circuit has been written to the peak-hold 3 results register |
|  |  | .... ... |
|  |  | $3 F F F_{H}$ : Indicates that the value for the 16383th input to the peak-hold circuit has been written to the peak-hold 3 results register. |

CAUTION: When the peak-hold 23 function is used and the condition for updating peak-hold has been satisfied and the value is stored in the peak-hold 3 results register, the PH3IND register captures the number of values to which peak-hold 3 processing has been applied (the value of the peak-hold counter within the digital filter). After the value of PH3IOF becomes " 1 " when the number of rounds of peak-hold processing reaches and exceeds 16384, operation of the peak-hold counter continues and PH3IND continues to be updated.

### 37.3.42 DFEjSUBCTLCHn — Subtraction Control Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 2)

This register is used when the subtraction function is selected. Set each subtraction channel.
Assign the same data format to both the subtrahend and minuend channels.
It is prohibited that the subtrahend and minuend channels have different data formats.
$[$ Subtraction output data $]=$ Filter results of minuend channel - Filter results of subtrahend channel

Value after reset: $\quad 00000000_{\mathrm{H}}$

Note: When the target channel of the subtrahend or minuend is being executed (DFEjCTLACHn.EN = 1), it is prohibited to write any bit other than the DFEjSUBCTLCHn.SEN.

Table 37.52 DFEjSUBCTLCHn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 26 | CATAG | Tag Value for Reentering Subtraction Result (cascading tag) |
|  |  | $00_{H}$ to $1 \mathrm{~F}_{\mathrm{H}}$ : Subtraction result data of the subtraction circuit is reentered (cascaded) during execution of cascade. <br> A channel tag value (DFEjCTLACHn.TAG) is specified. |
| 25, 24 | CAEN | Cascade Enable |
|  |  | $00_{\mathrm{B}}$ : Value after a reset Cascade is disabled. Subtraction result data of the subtraction circuit is written to the output data register. |
|  |  | 018: Setting prohibited |
|  |  | $10_{\mathrm{B}}$ : Cascade is enabled. Subtraction result data of the subtraction circuit is written to the output data register together with cascade. |
|  |  | $11_{\mathrm{B}}$ : Cascade is enabled. Subtraction result data of the subtraction circuit is not written to the output data register together with cascade. |
| 23 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 8 | MINCH | Minuend Channel Select |
|  |  | $0_{H}$ : Channel 0 is set to the minuend channel. Value after a reset |
|  |  | $1_{\text {H }}$ : Channel 1 is set to the minuend channel. |
|  |  | $2_{\mathrm{H}}$ : Channel 2 is set to the minuend channel. |
|  |  |  |
|  |  | $B_{H}$ : Channel 11 is set to the minuend channel. |
|  |  | $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : : Setting prohibited |

Note: DFE1 is prohibited from $4_{H}$ to $F_{H}$.
CAUTION: It is prohibited to set the same channel to both MINCH and SUBCH.

Table 37.52 DFEjSUBCTLCHn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | SUBCH | Subtrahend Channel Select <br> $0_{H}$ : Channel 0 is set to the subtrahend channel. Value after a reset <br> $1_{\mathrm{H}}$ : Channel 1 is set to the subtrahend channel. <br> $2_{\mathrm{H}}$ : Channel 2 is set to the subtrahend channel. <br> $B_{H}$ : Channel 11 is set to the subtrahend channel. <br> $\mathrm{C}_{\mathrm{H}}$ to $000 \mathrm{~F}_{\mathrm{H}}$ : Setting prohibited <br> Note: DFE1 is prohibited from $4_{H}$ to $F_{H}$. <br> CAUTION: It is prohibited to set the same channel to both MINCH and SUBCH. |
| 3 | SFMT | Subtraction Result Register $n$ Floating-Point Conversion <br> 0: Floating-point conversion for DFEjSUBDOCHn is not executed. Value after a reset <br> 1: Floating-point conversion for DFEjSUBDOCHn is executed. <br> Floating-point conversion for both DFPH20 and DFPH30 is executed. Fixed-point format (S.31/S9.22) is converted to floating-point (IEEE754). This bit must not be set to 1 if the setting of DFEjCTLACHn.FMT = 1 (integer mode) while FIR operation is selected for both the subtrahend and minuend channels. |
| 2 | SIEE | Subtraction Error Interrupt Request Enable <br> 0 : A subtraction error interrupt request is disabled. Value after a reset <br> 1: A subtraction error interrupt request is enabled. |
| 1 | SIEO | Subtraction Output Data Interrupt Request Enable <br> 0 : A subtraction output data interrupt is disabled when the result of subtraction is written to the subtraction output data register. Value after a reset <br> 1: A subtraction error interrupt request is enabled. <br> A subtraction output data interrupt is enabled when the result of subtraction is written to the subtraction output data register. |
| 0 | SEN | Subtraction Channel Enable <br> 0 : Subtraction Channel disabled. <br> No subtraction processing is executed in this channel. Value after a reset <br> 1: Subtraction Channel enabled. <br> The subtraction processing is executed in this channel. |

The subtraction processing of the target subtraction channel is stopped by writing 0 to DFEjSUBCTLCHn.SEN.

### 37.3.43 DFEjSUBDOCHn — Subtraction Result Register n ( $\mathbf{n}=0$ to 2)

This register stores operation results after the completion of subtraction operations for each subtraction channel.

Table 37.53 DFEjSUBDOCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SDO | Subtraction Output Data |
|  |  | Results of subtraction |

The data format for the subtraction result data register is shown below.

Figure 37.11 The Data Format for the Subtraction Result Data Register

### 37.3.44 DFEjSUBSTCHn — Subtraction Status Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 2)

This register indicates the status of subtraction channels.

Table 37.54 DFEjSUBSTCHn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | SDOEN | Subtraction Output Data Register Valid <br> 0 : Indicates that the value of the subtraction output data register is invalid. While SDOEN $=1$, writing 1 to DFEjSUBCLRSTCHn.CLRSDOEN clears SDOEN to 0. While SDOEN $=1$, reading the DFEjSUBDOCHn register clears this bit to 0. Value after a reset <br> 1: Indicates that the value of the subtraction output data register is valid. This bit is set to 1 when the DFE stores the subtraction results in the subtraction output data register. |
| 7 | MINF | Minuend Channel Data Input Enable <br> 0 : Value after a reset Indicates that no filtering result data has been input on the minuend channel. When MINF $=1$ and SUBF $=0$, the DFE performs subtraction upon completion of the filtering of the subtrahend channel. <br> Storing subtraction result data in the subtraction result register clears MINF to 0 . <br> 1: Indicates that filtering result data has been input on the minuend channel. When SUBF $=0$, completion of the filtering of the minuend channel sets MINF to 1. |
| 6 | SUBF | Subtrahend Channel Data Input Enabling Bit <br> 0 : value after a reset Indicates that no filtering result data has been input on the subtrahend channel. When SUBF = 1 and MINF = 0, the DFE performs subtraction upon completion of the filtering of the minuend channel. Storing subtraction result data in the subtraction result register clears SUBF to 0. <br> 1: Indicates that filtering result data has been input on the subtrahend channel. When MINF $=0$, completion of the filtering of the subtrahend channel sets SUBF to 1 |
| 5 | SCER | Subtraction Circuit Cascade Rounding Error <br> 0 : No cascade rounding error is present: value after a reset. When SCER = 1, writing 1 to DFEjSUBCLRSTCHn.CLRSCER clears SCER to 0. <br> 1: A cascade rounding error occurred in the subtraction output data. When DFEjSUBCTLCHn.CAEN $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$, this bit is set to 1 if an overflow occurs when the 32-bit subtraction circuit output data is rounded to 16-bit data. When DFEjSUBCTLCHn.CAEN $=00_{B}$, this bit is set to 1 if the subtraction result is judged as a cascade rounding overflow will be occurred. |
| 4 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 37.54 DFEjSUBSTCHn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 | SGER | Subtraction Guard Error |
|  |  | 0 : Value after a reset No Subtraction guard error is present: |
|  |  | When SGER $=1$, writing 1 to DFEjSUBCLRSTCHn.CLRSGER clears SGER to 0 . <br> 1: A Subtraction guard error is present. |
|  |  | This bit is set to 1 if an overflow occurs when the subtraction result is rounded to 32 bits in the filter circuit. |
| 1 | SDOOW | Subtraction Result Register Overwrite Error |
|  |  | 0: Value after a reset <br> No subtraction result register overwrite error is present. <br> When SDOOW = 1, writing 1 to DFEjSUBCLRSTCHn.CLRSDOOW clears SDOOW to 0. |
|  |  | 1: A subtraction result register overwrite error occurred. When SDOEN $=1$, storing subtraction output data in the subtraction result register sets SDOOW to 1. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.3.45 DFEjSUBCLRSTCHn - Subtraction Clear Status Register n ( $\mathbf{n}=0$ to 2 )

This register is used to clear the subtraction status register. Writing 1 to clearing bits clears the corresponding DFEjSUBSTCHn bits to 0 .

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W* | R | R | R/W* | R | R | R/W* | R/W* | R |

Table 37.55 DFEjSUBCLRSTCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CLRSDOEN | Subtraction Output Data Enable Bit Clear |
|  |  | 0 : DFEjSUBSTCHn.SDOEN is not cleared: value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SDOEN is cleared. <br> When DFEjSUBSTCHn.SDOEN is cleared, this bit is automatically cleared to 0 . |
|  |  | CAUTION: This bit is always read as 0 . |
| 7 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CLRSCER | Subtraction Circuit Cascade Rounding Error Bit Clear |
|  |  | 0: DFEjSUBSTCHn.SCER is not cleared: value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SCER is cleared. <br> When DFEjSUBSTCHn.SCER is cleared, this bit is automatically cleared to 0 . |
|  |  | CAUTION: This bit is always read as 0 . |
| 4 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | CLRSGER | Subtraction Guard Error Bit Clear |
|  |  | 0: DFEjSUBSTCHn.SGER is not cleared: value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SGER is cleared. <br> When DFEjSUBSTCHn.SGER is cleared, this bit is automatically cleared to 0 . |

|  | CAUTION: This bit is always read as 0. |  |
| :--- | :--- | :--- |
| 1 | CLRSDOOW | Subtraction Output Data Register Overwrite Error Bit Clear |
| 0: DFEjSUBSTCHn.SDOOW is not cleared: value after a reset. |  |  |
|  | 1: DFEjSUBSTCHn.SDOOW is cleared. |  |
|  | When DFEjSUBSTCHn.SDOOW is cleared, this bit is automatically cleared to 0. |  |
|  | CAUTION: This bit is always read as 0. |  |
| 0 | Reserved |  |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 37.3.46 DFEjSUBERMCHn — Subtraction Error Mask Register n (n=0 to 2)

This register is used to mask errors of the subtraction channel.

Table 37.56 DFEjSUBERMCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | MSKSCER | Subtraction Circuit Cascade Rounding Error Bit Mask |
|  |  | 0 : DFEjSUBSTCHn.SCER is not masked: Value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SCER is masked. |
|  |  | Note: When the subtraction circuit is enabled (DFEjSUBCTLCHn.SEN = 1) and the cascade function is disabled (DFEjSUBCTLCHn.CAEN $=00_{\mathrm{B}}$ ), set this bit to 1 . |
| 4 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | MSKSGER | Subtraction Guard Error Bit Mask |
|  |  | 0 : DFEjSUBSTCHn.SGER is not masked: value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SGER is masked. |
| 1 | MSKSDOOW | Subtraction Output Data Register Overwrite Error Bit Mask |
|  |  | 0 : DFEjSUBSTCHn.SDOOW is not masked: Value after a reset. |
|  |  | 1: DFEjSUBSTCHn.SDOOW is masked. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.3.47 DFEjSUBTRGCHn — Subtraction Trigger Setting Register n ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{2}$ )

This register is used to generate a trigger flag for subtraction channels $n$, using software and timer triggers. It is prohibited to set both the initialization and ending flags to a software trigger for subtraction processing. If prohibited settings are specified, the integrity of ensuing operations cannot be guaranteed.

| Value after reset: $\quad 00000000 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | SBFE |  | - | - | - | - | - | - | SBE |  | - | - | - | - | SBT |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R/W | R/W |

Table 37.57 DFEjSUBTRGCHn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15,14 | SBFE | Subtraction End Flag Trigger Setting |
|  | $00_{\mathrm{B}}:$ Value after a reset |  |
| Subtraction end flag is not generated. |  |  |
|  | $01_{\mathrm{B}}:$ Subtraction end flag is generated by a timer trigger. |  |
|  | $10_{\mathrm{B}}:$ Subtraction end flag is generated by a software trigger. |  |
|  | $11_{\mathrm{B}}:$ Setting prohibited |  |

CAUTION: It is prohibited to set both the subtraction start flag and the subtraction end flag to a software trigger. (It is prohibited to set DFEjSUBTRGCHn.SBFE $=10_{\mathrm{B}}$ and DFEjSUBTRGCHn.SBE = 10 ${ }^{\text {B }}$ ).
When the subtraction end flag is generated by a timer trigger
(DFEjSUBTRGCHn.SBFE $=01_{\mathrm{B}}$ ), the subtraction end flag is automatically selected from among compare signals B0 to B19 from the timer. Whichever signal corresponds to (has the same number as) the timer trigger (one of compare signals A0 to A19) selected by the subtraction trigger setting register (DFEjSUBTRGCHn.SBT) is selected.

| 13 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| :---: | :---: | :---: |
| 7, 6 | SBE | Subtraction Start Flag Trigger Setting <br> $00_{\mathrm{B}}$ : Value after a reset <br> Subtraction start flag is not generated. <br> $01_{\mathrm{B}}$ : Subtraction start flag is generated by a timer trigger. <br> $10_{\mathrm{B}}$ : Subtraction start flag is generated by a software trigger. <br> $11_{\mathrm{B}}$ : Setting prohibited |
| 5 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 37.57 DFEjSUBTRGCHn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1, 0 | SBT | Subtraction Start Flag and Subtraction End Flag Timer Trigger Select |
|  |  | $00_{B}$ : Value after a reset |
|  |  | Timer trigger 0 is selected for generating the subtraction start flag and subtraction end flag. |
|  |  | $01_{\mathrm{B}}$ : Timer trigger 1 is selected for generating the subtraction start flag and subtraction end flag. |
|  |  | $10_{\mathrm{B}}$ : Timer trigger 2 is selected for generating the subtraction start flag and subtraction end flag. |
|  |  | 118: Setting prohibited |

CAUTION: This bit is enabled when the subtraction start flag trigger setting bits (DFEjSUBTRGCHn.SBE) are 01B. Timer triggers 0 to 2 are selected using DFEjSUBTRG0. SUBTMTRG0 to SUBTMTRG2.

### 37.3.48 DFEjSUBTRHCHn — Subtraction Trigger History Register n (n=0 to 2)

This register is used to monitor the execution history of software triggers, timer triggers, and trigger flags related to subtraction processing.

Table 37.58 DFEjSUBTRHCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SITS | Subtraction Start Flag Trigger History |
|  |  | 0 : Value after a reset |
|  |  | A subtraction start flag trigger has not been generated. |
|  |  | When SITS $=1$, this bit becomes 0 upon completion of the execution of the subtraction start flag. This bit also becomes 0 if DFEjSUBCTLCHn.SBEN is set to 0 and subtraction processing is not being performed on a subtraction channel $n$. |
|  |  | 1: This bit becomes 1 when the subtraction start flag trigger is generated. |
| 0 | SETS | Subtraction End Flag Trigger History |
|  |  | 0: Value after a reset |
|  |  | A subtraction end flag trigger has not been generated. |
|  |  | When SETS = 1, this bit becomes 0 upon completion of the execution of the subtraction end flag. This bit becomes 0 if DFEjSUBCTLCHn.SBEN is set to 0 and subtraction processing is not being performed on a subtraction channel $n$. |
|  |  | 1: This bit becomes 1 when the subtraction end flag trigger is generated. |

### 37.3.49 DFEjSUBTRG0 — Subtraction Start/End Timer Trigger Select Register 0

This register selects which of the 20 timer trigger compare interfaces--compare signals A0/B0 to A19/B19 in the timer-to use for subtraction start/end timer triggers 0 to 2 .

Table 37.59 DFEjSUBTRG0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 16 | SUBTMTRG2 | Subtraction Start/End Flag Timer Trigger 2 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer and the subtraction start/end timer trigger 2. <br> $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer and the subtraction start/end timer trigger 2. <br> $00010_{\mathrm{B}}$ : Uses compare A2/B2 of the Timer and the subtraction start/end timer trigger 2. ... <br> $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer and the subtraction start/end timer trigger 2. $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |
| 15 to 13 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | SUBTMTRG1 | Subtraction Start/End Flag Timer Trigger 1 <br> $00000_{\mathrm{B}}$ : Value after a reset <br> Uses compare A0/B0 of the Timer and the subtraction start/end timer trigger 1. <br> $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer and the subtraction start/end timer trigger 1. <br> $00010_{\mathrm{B}}$ : Uses compare A2/B2 of the Timer and the subtraction start/end timer trigger 1. ... <br> $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer and the subtraction start/end timer trigger 1. $10100_{\mathrm{B}}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |

| 7 to 5 | - | Reserved |
| :---: | :---: | :---: |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | SUBTMTRG0 | Subtraction Start/End Flag Timer Trigger 0 |
|  |  | $00000_{B}$ : Value after a reset |
|  |  | Uses compare A0/B0 of the Timer and the subtraction start/end timer trigger 0. |
|  |  | $00001_{\mathrm{B}}$ : Uses compare A1/B1 of the Timer and the subtraction start/end timer trigger 0. |
|  |  | $00010_{B}$ : Uses compare A2/B2 of the Timer and the subtraction start/end timer trigger 0. |
|  |  | $\ldots$.. |
|  |  | $10011_{\mathrm{B}}$ : Uses compare A19/B19 of the Timer and the subtraction start/end timer trigger 0. |
|  |  | $10100_{B}$ to $11111_{\mathrm{B}}$ : Setting prohibited. |

### 37.3.50 DFEjCAPCTLCHn — Capture Control Register n ( $\mathbf{n}=\mathbf{0}$ to 2)

This register is used when the capture function is selected for a DFE channel.

Note: While the setting of DFEjCAPCTLCHn.CEN is 1 , writing to CAPCH and CIEE is prohibited.
Table 37.60 DFEjCAPCTLCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 4 | CAPCH | Capture-Target Channel Select |
|  |  | $0_{H}$ : Channel 0 is set to the capture channel. Value after a reset |
|  |  | $1_{\mathrm{H}}$ : Channel 1 is set to the capture channel |
|  |  | $2_{\text {H }}$ : Channel 2 is set to the capture channel |
|  |  | $\ldots$ |
|  |  | $\mathrm{B}_{\mathrm{H}}$ : Channel 11 is set to the capture channel |
|  |  | $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibited. |
|  |  | Note: DFE1 is prohibited from $4_{H}$ to $F_{H}$. |
| 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | CIEE | Capture Error Interrupt Request Enable |
|  |  | 0 : Value after a reset <br> A capture error interrupt request is disabled. |
|  |  | 1: A capture error interrupt request is enabled. |
| 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CEN | Capture Channel Enable |
|  |  | 0 : Value after a reset |
|  |  | Capture channel disabled. |
|  |  | No capture processing is executed in this channel. |
|  |  | 1: Capture channel enabled. |
|  |  | The Capture processing is executed in this channel. |

### 37.3.51 DFEjCAPDOCHn — Capture Result Register n ( $\mathrm{n}=0$ to 2)

This register stores the output data register value on the capture-target channel. If the data is read with floating-point conversion format, set the output data register (DFEjDOCHn) of the capture-target channel to floating-point conversion format.

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.62 DFEjCAPSTCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CDOEN | Capture Output Data Register Valid |
|  |  | 0: Value after a reset |
|  |  | Indicates that the value of the capture output data register is invalid. |
|  |  | While CDOEN $=1$, writing 1 to DFEjCAPCLRSTCHn.CLRCDOEN clears this bit to 0 . While CDOEN $=1$, reading the DFEjCAPDOCHn register clears this bit to 0 . |
|  |  | 1: Indicates that the value of the capture output data register is valid. <br> This bit is set to 1 when the DFE stores the capture results in the capture output data register. |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CDOOW | Capture Result Register Overwrite Error |
|  |  | 0 : value after a reset |
|  |  | No capture result register overwrite error. |
|  |  | When CDOOW $=1$, writing 1 to DFEjCAPCLRSTCHn.CLRCDOOW clears CDOOW to 0. |
|  |  | 1: A capture result register overwrite error occurred. |
|  |  | When CDOEN $=1$, storing capture data in the capture result register sets CDOOW to 1 |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.3.53 DFEjCAPCLRSTCHn - Capture Clear Status Register n (n=0 to 2)

This register is used to clear the capture status register. Writing 1 to these bits clears the corresponding DFEjCAPSTCHn bits to 0 .

Table 37.63 DFEjCAPCLRSTCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CLRCDOEN | Capture Result Data Enable Bit Clear |
|  |  | 0: DFEjCAPSTCHn.CDOEN is not cleared: Value after a reset. |
|  | 1: DFEjCAPSTCHn.CDOEN is cleared. |  |
|  |  | When DFEjCAPSTCHn.CDOEN is cleared, this bit is automatically cleared to 0. |

CAUTION: This bit is always read as 0 .

| 7 to 2 | - | Reserved |
| :---: | :---: | :---: |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRCDOOW | Capture Result Data Register Overwrite Error Bit Clear |
|  |  | 0: DFEjCAPSTCHn.CDOOW is not cleared: Value after a reset. |
|  |  | 1: DFEjCAPSTCHn.CDOOW is cleared. <br> When DFEjCAPSTCHn.CDOOW is cleared, this bit is automatically cleared to 0 . |
|  |  | CAUTION: This bit is always read as 0 . |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.3.54 DFEjCAPERMCHn — Capture Error Mask Register n (n=0 to 2)

This register is used to mask errors in the capture channel.

Value after reset: $00000000_{\mathrm{H}}$

Table 37.64 DFEjCAPERMCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | MSKCDOOW | Capture Result Data Register Overwrite Error Bit Mask |
|  |  | 0: DFEjCAPSTCHn.CDOOW is not masked: Value after a reset. |
|  | 1: DFEjCAPSTCHn.CDOOW is masked. |  |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 37.3.55 DFBFACCTL — Buffer A Common Control Register

This is a FIFO macro register. Common settings on buffer A processing are specified using this register.

Note: When DFBFACCTL.AEN is 1 , writing to AUNE, AIEE and AIEO is prohibited.
Table 37.65 DFBFACCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AUNE | Buffer A Data Update Flag Enable |
|  |  | 0 : Value after a reset. |
|  |  | The buffer A data update flag (DFBFADOCHn.AUN) is not used. |
|  |  | For data format, see the buffer A output register. |
|  |  | 1: The buffer A data update flag (DFBFADOCHn.AUN) is used. For data format, see the buffer A output register. |
| 2 | AIEE | Buffer A Error Interrupt Request Enable |
|  |  | 0 : Value after a reset |
|  |  | Buffer A error interrupt request is disabled. |
|  |  | 1: Buffer A error interrupt request is enabled. |
| 1 | AIEO | Buffer A Output Data Interrupt Request Enable |
|  |  | 0 : Value after a reset |
|  |  | Buffer A output data interrupt is disabled when output data from the selected DFE channel is written to the buffer A output data register. |
|  |  | 1: Buffer A output data interrupt is enabled when output data from the selected DFE channel is written to the buffer A output data register. |
| 0 | AEN | Buffer A Enable |
|  |  | 0 : Value after a reset |
|  |  | Buffer A is disabled. |
|  |  | No Buffer A processing is executed. |
|  |  | 1: The Buffer A processing is executed. |

### 37.3.56 DFBFACTLCHn - Buffer A Control Register n (n=0 to 5)

This is a FIFO macro register. Settings for each buffer A channel are specified using this register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | BFACH |  |  |  | - | - | - | - | ADSL | - | - | CHEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R | R | R/W |

Note: When DFBFACCTL.AEN is 1, writing to BFACH, ADSL and CHEN is prohibited.
Table 37.66 DFBFACTLCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 8 | BFACH | Buffer A Capture-target Channel Select |
|  |  | $0_{\mathrm{H}}$ : Channel 0 is set to the buffer A capture-target channel. Value after a reset |
|  |  | $1_{\mathrm{H}}$ : Channel 1 is set to the buffer A capture-target channel |
|  |  | $2_{\text {H: }}$ : Channel 2 is set to the buffer A capture-target channel |
|  |  | $\cdots$ |
|  |  | $\mathrm{B}_{\mathrm{H}}$ : Channel 11 is set to the buffer A capture-target channel |
|  |  | $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibit. |
|  |  | Note: DFE1 is prohibited from $4_{H}$ to $\mathrm{F}_{\mathrm{H}}$. |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADSL | Buffer A DFE Select |
|  |  | 0 : Buffer A channel n is selected from DFE0. |
|  |  | 1: Buffer A channel n is selected from DFE1. |
| 2, 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CHEN | Buffer A Channel n Enable |
|  |  | 0 : Value after a reset |
|  |  | Buffer A channel n disabled |
|  |  | When CHEN $=0$, buffer A channel n data is not stored in FIFO. |
|  |  | 1: Buffer A channel $n$ enabled |
|  |  | When CHEN $=0$, buffer A channel n data is stored in FIFO. |

### 37.3.57 DFBFADOCHn — Buffer A Output Register $\mathbf{n}$ ( $\mathrm{n}=0$ to 5 )

This register is a buffer A output data register that holds the output data from the capture-target channel.
A FIFO data format accords with the data format of capture-target channel.
If the data is read with floating-point conversion format, set the output data register ( DFEjDOCHn ) of the capture-target channel to floating-point conversion format.

- When DFBFACCTL.AUNE $=0$ :

## Value after reset: $00000000_{\mathrm{H}}$

When DFBFACCTL.AUNE is set to 0 , after clear is valid by DFBFACLR.CLRA, the clear value is $00000000_{\mathrm{H}}$.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ADO |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | ADO |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.67 DFBFADOCHn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADO | FIFO Storage Data |
|  |  | The value of the output data register which was stored in an 8-stage FIFO is stored in these |
|  | bits. |  |

The data that is stored in ADO [31:0] is output data (DFEjDOCHn.DO[31:0]).
When DFBFACCTL.AUNE $=0$, the data format of buffer A output register is shown below.

Figure 37.13 The Data Format of Buffer A Output Register (AUNE =0)

- When DFBFACCTL.AUNE $=1$ :

Refer to the subsection with DFBFACCTL.AUNE $=0$ for information about the reset value.
When DFBFACCTL.AUNE is set to 1 , after clear is valid by DFBFACLR.CLRA, the clear value is $00000001_{\mathrm{H}}$.

Table 37.68 DFBFADOCHn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 1 | ADO | FIFO Storage Data |
|  |  | The value of the output data register which was stored in an 8-stage FIFO is stored in these bits. |
|  |  | Note: The data that is stored in ADO [30:0] is output data (DFEjDOCHn.DO[31:1]). |
| 0 | AUN | Buffer A Data Update Flag |
|  |  | 0 : Indicates that the output data from the buffer A capture-target channel stored in the FIFO has been updated. |
|  |  | 1: Value after a reset Indicates that the output data from the buffer A capture-target channel stored in the FIFO has not been updated. |

When DFBFACCTL.AUNE $=1$, the data format of buffer an output register is shown below.

Figure 37.14 The Data Format of Buffer A Output Register (AUNE = 1)

### 37.3.58 DFBFACLR — Buffer A Clear Register

This register clears the buffer A.

Value after reset: $00000000_{\mathrm{H}}$

Table 37.69 BFACLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br>  <br>  <br> 0 |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |
|  |  | Buffer A Clear |
| $0:$ Value after a reset |  |  |
|  | The buffer A FIFO is not cleared. |  |
|  | 1: The buffer A FIFO is cleared. |  |
|  | All bits in the buffer A common status register are initialized. |  |
|  | All of the FIFO channel's Buffer A Data Update Flags (DFBFADOCHn.AUN) are set to 1. |  |
|  | All of the FIFO channel's FIFO Storage Data (DFBFADOCHn.ADO) are set to ALL 0. |  |

Note: Always read as 0 .

### 37.3.59 DFBFACST — Buffer A Common Status Register

This register indicates the status of each buffer A channel.

Value after reset: $\quad 003 \mathrm{~F} 0000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 37.70 DFBFACST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 22 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 16 | EMPAn | FIFO Channel $n$ Empty Status |
|  |  | 0 : Indicates that some data remains on FIFO channel $n$. When EMPAn $=1$, storing data in the FIFO clears this bit to 0 . |
|  |  | 1: Value after a reset <br> Indicates that FIFO channel $n$ is empty. <br> When EMPAn $=0$ and when $1_{B}$ is written in DFBFACLR.CLRA, EMPAn for all FIFO channels are set to $1_{\mathrm{B}}$. |
| 15 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | OVFAn | FIFO Channel n FIFO Overflow Error |
|  |  | 0 : Value after a reset <br> Indicates no FIFO overflow occurred on FIFO channel n. When OVFAn = 1 and when $1_{\mathrm{B}}$ is written in DFBFACLR.CLRA, OVFAn for all FIFO channels are set to 0 . |
|  |  | 1: Indicates a FIFO overflow occurred on FIFO channel $n$. When the FIFO channel n is full and when new data is stored on FIFO channel n , OVFAn is set to $1_{\mathrm{B}}$. |

### 37.3.60 DFBFBCTL — Buffer B Control Register

This is a FIFO macro register. Settings for buffer B processing are specified using this register.

Note: When DFBFBCTL.BEN is 1, writing to BFBCH, BDSL, BIEE, and BIEO is prohibited.
Table 37.71 DFBFBCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 8 | BFBCH | Buffer B Capture-target channel Select |
|  |  | $0_{\mathrm{H}}$ : Channel 0 is set to the buffer B capture-target channel. Value after a reset |
|  |  | $1_{\mathrm{H}}$ : Channel 1 is set to the buffer B capture-target channel |
|  |  | 2 н: Channel 2 is set to the buffer B capture-target channel |
|  |  | $\cdots$ |
|  |  | $B_{H}$ : Channel 11 is set to the buffer $B$ capture-target channel |
|  |  | $\mathrm{C}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibited |
|  |  | Note: DFE1 is prohibited from $4_{H}$ to $\mathrm{F}_{\mathrm{H}}$. |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | BDSL | Buffer B DFE Select |
|  |  | 0 : Buffer $B$ channel n is selected from DFE0. |
|  |  | 1: Buffer $B$ channel $n$ is selected from DFE1. |
| 2 | BIEE | Buffer B Error Interrupt Request Enable |
|  |  | 0: Value after a reset |
|  |  | Buffer B error interrupt request is disabled. |
|  |  | 1: Buffer $B$ error interrupt request is enabled. |
| 1 | BIEO | Buffer B Output Data Interrupt Request Enable |
|  |  | 0: Value after a reset <br> Buffer B output data interrupt is disabled when output data from the selected DFE channel is written to the buffer $B$ output data register. |
|  |  | 1: Buffer B output data interrupt is enabled when output data from the selected DFE channel is written to the buffer B output data register. |
| 0 | BEN | Buffer B Enable |
|  |  | 0: Value after a reset <br> Buffer $B$ is disabled. <br> No Buffer B processing is executed. |
|  |  | 1: Buffer $B$ is enabled. Buffer B processing is executed. |

### 37.3.61 DFBFBDO - Buffer B Output Register

This register is a buffer B output data register that holds the output data from the capture-target channel.
The FIFO data format accords with the data format of the capture-target channel.
If the data is read with floating-point conversion format, set the output data register ( DFEjDOCHn ) of the capture-target channel to floating-point conversion format.

Table 37.72 DFBFBDO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BDO | FIFO Storage Data |
|  |  | The value of the output data register which was stored in an 8-stage FIFO is stored in these <br> bits. |

The data that is stored in BDO [31:0] is the output data (DFEjDOCHn.DO[31:0]).
The data format of the buffer B output register is shown below.

Figure 37.15 The Data Format of Buffer B Output Register

### 37.3.62 DFBFBCLR — Buffer B Clear Register

This register clears the buffer B.

Value after reset: $00000000_{\mathrm{H}}$

Table 37.73 DFBFBCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLRB | Buffer B Clear |
|  | 0: Value after a reset |  |
|  | The buffer B FIFO is not cleared. |  |
|  | 1: The buffer B FIFO is cleared. |  |
|  | All bits in the buffer B common status register are initialized. |  |
|  | Buffer B's FIFO Storage Data (DFBFBDO.BDO) is set to ALL 0. |  |

Note: Always read as 0 .

### 37.3.63 DFBFBST — Buffer B Status Register

This register indicates the status of each buffer B channel.

Value after reset: $00000002_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | EMPB | OVFB |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 37.74 DFBFBST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | EMPB | FIFO Channel $n$ Empty Status |
|  |  | 0 : Indicates that some data remains on FIFO channel $n$. When EMPB $=1$, storing data in the FIFO clears this bit to 0 . |
|  |  | 1: Value after a reset <br> Indicates that FIFO channel $n$ is empty. <br> When EMPB $=0$ and when $1_{B}$ is written in DFBFBCLR.CLRB, EMPB is set to $1_{B}$. |
| 0 | OVFB | FIFO B Overflow Error |
|  |  | 0 : Value after a reset <br> Indicates no FIFO overflow occurred. <br> When OVFB $=1$ and when $1_{B}$ is written in DFBFBCLR.CLRB, OVFB is set to 0 . |
|  |  | 1: Indicates A FIFO overflow occurred. <br> When FIFO B is full and when new data is stored in FIFO B, OVFB is set to $1_{B}$. |

### 37.4 Operation

### 37.4.1 Overview of Operation

### 37.4.1.1 DFE Macro

The DFE imports output data from the Cyclic-ADC, Delta-Sigma ADC or the SAR-ADC (referred to as AD hereafter) and performs filter (FIR or IIR) processing, accumulation/decimation processing, subtraction processing, peakhold/comparison calculation processing, or floating-point conversion processing for the output data.

Figure 37.16 Overview of Operation

- The AD inputs the DFE activation signal, AD tag, and AD conversion data (AD data) to the DFE. The DFE imports the AD data in the internal input data register to execute dispatch processing, request processing, $\mathrm{FIR} / \mathrm{IIR}$ processing, accumulation/decimation processing, subtraction processing, output processing, or peak-hold/comparison processing, and then stores the DFE processing result in the output data register.
- Dispatch processing:

The DFE stores data in the input data register of the relevant channel by using the AD tag from the AD and DFE 's control register values. Before data is stored, the input data register is enabled.

- Request processing:

The DFE arbitrates FIR/IIR processing target data from the input data register of 16 channels and inputs the filter processing target data to the FIR/IIR processing.

- FIR/IIR processing (filter processing):

The DFE performs FIR or IIR filter calculation. Coefficient data and intermediate values in the filter calculation are stored in the memory.

- Subtraction processing:

The DFE executes subtraction on the results of a FIR/IIR between two different channels. After the subtraction, the

DFE stores the results in the subtraction result register. When storing the results, the subtraction result register is enabled, and the macro executes a subtraction data interrupt request.

- Accumulation/decimation processing:

The DFE executes accumulation processing or decimation processing for the FIR or IIR processing result. After the accumulation/decimation processing has been completed, the input data register is disabled.

- Output processing:

The DFE stores the accumulation/decimation processing result in the output data register of the relevant channel. Before the result is stored, the output data register is enabled and an output data interrupt request is issued.

- Peak-Hold/comparison processing:

The DFE executes Peak-Hold and/or comparison processing on the results of accumulation/decimation processing. If the Peak-Hold processing is selected, the macro issues a condition match interrupt request when the Peak-Hold end trigger is enabled. If comparison processing is selected, the DFE executes a condition match interrupt request when the result of the comparison operation is TRUE. If Peak-Hold processing and comparison processing are executed simultaneously, in the Peak-Hold processing the macro issues a Peak-Hold end interrupt request; in the comparison processing, the macro issues a condition match interrupt request when the result of the comparison operation is TRUE.

- Capture processing:

If an output data capture trigger is input to the output data register, the macro stores the value of the output data register in the capture result register.

### 37.4.1.2 FIFO Macro

The FIFO macro selects a DFE macro output data register and stores the data in the FIFO. The FIFO macro selects the required channel from the DFE0 and DFE1, and stores the data in the FIFO.

The macro operates differently between buffer A processing and buffer B processing.

Figure 37.17 Overview of FIFO Macro Operation (buffer A processing)

- Buffer A processing:

The macro stores, in batch, data in the FIFO channel which was enabled by the FIFO capture trigger that was output from the timer. When storing data in the FIFO, the macro issues a buffer A capture end interrupt request. After reading all FIFO channels in which data is stored, the macro issues a buffer A capture end interrupt request if data is stored in the FIFO again. When not reading all FIFO channels in which data is stored, the macro will not issue a buffer A capture end interrupt request even if data is stored in the FIFO again.

Figure 37.18 Overview of FIFO Macro Operation (buffer B processing)

- Buffer B processing:

Each time the value of the DFE output data register is updated, the macro stores the value of the output data register of a selected channel in one FIFO. Repeating this operation until the values from four output data registers have been stored in the FIFO, the macro issues a buffer B capture end interrupt request.
After reading all four data items the macro issues a buffer B capture end interrupt request if four data items are stored in the FIFO again.
When not reading all four stored data items, the macro will not issue a buffer B capture end interrupt request even if four data items are stored in the FIFO again.

### 37.4.2 Operating Procedures

### 37.4.2.1 Channel Start Procedure

The procedure to start the DFE channel is shown below.

Figure 37.19 Channel Starting Procedure

The channel start setup process of the DFE is different for the first time versus the subsequent times.
Please refer to step (2) in Figure $\mathbf{3 7 . 1 9}$ for the first time setup process. Please refer to step (1) in Figure $\mathbf{3 7 . 1 9}$ for the restart process.
(1) For the restart setup process, set the DFE to stop according to Section 37.4.2.2, Channel Stop Procedure.
(2) For the first time setup process, set the registers as shown in Figure 37.19. For the restart process, set the registers as shown in Figure 37.19 as necessary.

- For the coefficient memory and data memory, set values in the channel area to be used via the peripheral bus. For the coefficient memory address assignment, see Section 37.5.3, Section 37.5.4, and Section 37.5.9. For the data memory address assignment, see Section 37.5.3, Section 37.5.5, and Section 37.5.9.
(*) When selecting an IIR with the gain adjustment function, set the gain coefficient in the IIR filter gain setting register (DFEjGAINCHn).
- Set control register B (DFEjCTLBCHn) for accumulation/decimation and $\mathrm{PH} /$ comparison operation.
- If DFEjCTLBCHn.DISA $=0$, after writing DFEjCTLACHn.EN $=1$ in step (13), the macro starts the accumulation/decimation processing on the first input data.
- If DFEjCTLBCHn.DISB $=0$, after writing DFEjCTLACHn.EN $=1$ in step (13), the macro starts the peak-hold processing on the first input data.
(3) Set the registers according to the specific functions to be used, in any order.
(4) When the accumulation circuit is used, set the accumulation /decimation count setting registers (DFEjACA to DFEjACD).
(5) When the Peak-Hold circuit is used, set the following registers as necessary:

| Peak-Hold Initial Value Setting Registers | DFEjPHIA to DFEjPHID |
| :--- | :--- |
| Comparison Value Setting Registers | DFEjCPA to DFEjCPD |
| Peak-Hold Update Notification Setting Register | DFEjPHUPDCn |

When using the PH23 function, set the following registers:

| Peak-Hold 23 Common Control Register 0 | DFEjPH23CCTL |
| :--- | :--- |
| Peak-Hold 2 Control Register 0 | DFEjPH2CTL |
| Peak-Hold 3 Control Register 0 | DFEjPH3CTL |
| Comparison Offset Value Setting Register | DFEjCPOFSTn |

(6) When using the subtraction circuit, set the subtraction control registers (DFEjSUBCTLCHn).
(7) When using the capture circuit, set the capture control registers (DFEjCAPCTLCHn).
(8) When using a trigger flag, the trigger setting register and the timer trigger setting register need to be set. Set the timer trigger setting registers for the pertinent trigger flag functions according to the specific functions to be used.

| Trigger Setting Register | DFEjTRGCHn |
| :--- | :--- |
| Timer Trigger Setting Register | DFEjTMTRGCHn |
| Software Trigger Register | DFEjTRG |
| Peak-Hold Initialization/End Timer Trigger Select Register | DFEjPITRG |
| Peak-Hold Initialization/End Timer Trigger Select Register1 | DFEjPITRG1 |
| Accumulation/Decimation Initialization/Prohibition Timer Trigger Select Register | DFEjMITRG |
| Accumulation/Decimation Initialization/Prohibition Timer Trigger Select Register1 | DFEjMITRG1 |
| Filter Initialization Timer Trigger Select Register | DFEjFITRG |
| Filter Initialization Timer Trigger Select Register 1 | DFEjFITRG1 |
| Peak-Hold Mask-Start/End Timer Trigger Select Register 0 | DFEjPMITRG0 |
| Peak-Hold Mask-Start/End Timer Trigger Select Register 1 | DFEjPMITRG1 |
| Subtraction Trigger Setting Register | DFEjSUBTRGCHn |
| Subtraction Start/End Timer Trigger Select Register 0 | DFEjSUBTRG0 |

(9) When the buffer A circuit is used, set the buffer A common control register (DFBFACCTL) and the buffer A control registers (DFBFACTLCHn).
(10) When the buffer A circuit is used, after the Buffer A circuit is set in step (9), initialize the buffer A circuit by the buffer A clear register (DFBFACLR).
(11) When the buffer B circuit is used, set the buffer B control registers (DFBFBCTL).
(12) When the buffer B circuit is used, after the Buffer B circuit is set in step (11), initialize the buffer B circuit by the buffer B clear register (DFBFBCLR).
(13) When all settings have been completed, use control register A (DFEjCTLACHn) to set filter processing, enable writing to the interrupt request output, enable the channel, and set other necessary parameters. Setting the enable bit (DFEjCTLACHn.EN) for the channel to be used to 1 enables the filter processing on that channel.
(14) When an activation trigger is input from the $A D$, the macro starts the filter processing on the input data from the AD .

### 37.4.2.2 Channel Stop Procedure

The procedure to stop the DFE channel is shown below.
Once the registers have been set and filter processing has started, execute the channel stop procedure as follows. Set the registers according to Section 37.4.2.1, Channel Start Procedure.

When the registers of the Buffer A circuit have been set and the filter processing has started, execute the channel stop procedure for all channels selected by the FIFO channels as follows. Set the registers according to Section 37.4.2.1,
Channel Start Procedure.
When the registers of the Buffer B circuit have been set and the filter processing has started, execute the channel stop procedure for the target channel as follows. Set the registers according to Section 37.4.2.1, Channel Start Procedure.

Figure 37.20 Channel Stop Procedure
(1) Clear the enabling bit (DFEjCTLACHn.EN) for the channel to be stopped.
(2) Wait until the processing on the stopped channel terminates.

When the buffer A circuit is used, after all channels which are target to FIFO channels have stopped, set the Buffer A Enable (DFBFACCTL.AEN) to 0. By setting DFBFACCTL.AEN $=0$, the Buffer A circuit is stopped.
(3) When the buffer B circuit is used, after the target channel of Buffer B has stopped, set the Buffer B Enable (DFBFBCTL.BEN) to 0 . By setting DFBFBCTL. $B E N=0$, Buffer B circuit is stopped.
(4) The text below describes the operations that occur during the stopping of channel processing:

- Writing 0 to the enable bit (DFEjCTLACHn.EN) suppresses any subsequent processing of input data and input triggers.
- Any data that was input before 0 was written to the enable bit (DFEjCTLACHn.EN) continues to be processed after 0 is written.
- After writing 0 to the enable bit (DFEjCTLACHn.EN), use DFEjSTCHn.VALID to confirm the termination of processing after 0 is written.
- Any trigger that was input before 0 is written to the enable bit (DFEjCTLACHn.EN) is disabled if there is no data to be processed.

After the channel is stopped, clear the status bits for that channel, for the subtraction channel, and for the capture channel as necessary.

### 37.4.2.3 Error Processing Procedure

## (1) DFE Macro

The DFE operating procedure for an error is shown below.

Figure 37.21 DFE Macro Operating Procedure for an Error
(1) If an error occurs during the processing, the DFE macro issues an interrupt request.

Possible sources of errors include (1) channels, (2) subtraction channels, and (3) capture channels. For each of these sources, error interrupts and error sources can be masked by the following registers.

| Classification | Error Interrupt Mask | Error Source Mask |
| :--- | :--- | :--- |
| Channel | DFEjCTLACHn.IEE | DFEjERMCHn |
| Subtraction channel | DFEjSUBCTLCHn.SIEE | DFEjSUBERMCHn |
| Capture channel | DFEjCAPCTLCHn.CIEE | DFEjCAPERMCHn |

(2) The macro performs DFE stop processing according to the channel stop processing flow of events.
(3) The macro identifies the channel, the subtraction channel or the capture channel on which error occurred. By reading the DFEjEST register, the channel on which error occurred can be identified.
By reading the DFEjEST register, the subtraction channel or the capture channel on which error occurred can be identified.
(4) The error sources can be identified by checking the status register for the channel, subtraction channel, or capture channel on which the error occurred.
(If an error occurred on channel 0 , for example, the macro reads DFEjSTCH0.)
(5) When an error source is identified, the macro writes to the clear status bits corresponding to the error status, and clears the error bits.
(Note) If an error status is not cleared, and if the error status recurs, no error interrupt will be issued.
(6) The macro starts filter processing according to the channel start processing flow of events.

## (2) FIFO Macro

The FIFO macro operating procedure for an error is shown below.

Figure 37.22 FIFO Macro Operating Procedure for an Error
(1) If an error occurs during processing, the FIFO macro issues an interrupt request.

Possible sources of errors include buffer A and buffer B.
For each of these sources, error interrupt request outputs can be controlled by the following registers.

| Classification | Mask Bit of Error Interrupt Request |
| :--- | :--- |
| Buffer A processing | DFBFACCTL.AIEE |
| Buffer B processing | DFBFBCTL.BIEE |

(2) The macro performs DFE stop processing according to the channel stop processing flow of events.
(3) The macro identifies the source of the error as buffer A or B.

By reading the DFBFACST register, the macro can identify the FIFO channel on which the buffer A error occurred. By reading the DFBFBST register, the macro can determine that the error occurred in buffer B.
(5) When an error source is identified, the macro writes to the clearing register, and initializes buffer A or B.
(6) The macro starts filter processing according to the channel start processing flow of events.

## (3) About register rewrite

When an R/W register is written, the bit value is reflected in the DFE processor immediately. When each function is executed, and when an $\mathrm{R} / \mathrm{W}$ register is changed, the value of an operation result and the status are not guaranteed. Therefore, when an R/W register is changed, it is necessary to stop each function.

Rewrite the following registers when the target channel is stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjCTLACHn | All bits except EN |
| DFEjCTLBCHn | All bits |
| DFEjTRGCHn | All bits |
| DFEjTMTRGCHn | All bits |
| DFEjERMCHn | All bits |
| DFEjPHUPDCn | All bits |
| DFEjGAINCHn | All bits |

Rewrite the following registers when the target channel of the Peak-Hold 23 function is stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjPH23CCTL0 | All bits except PEN |
| DFEjPH2CTLO | All bits |
| DFEjPH3CTLO | All bits |

Rewrite the following registers when the target channel of the subtraction function is stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjSUBCTLCHn | All bits except SEN |
| DFEjSUBTRGCHn | All bits |
| DFEjSUBERMCHn | All bits |

Rewrite the following registers when the capture function is stopped (DFEjCAPCTLCHn.CEN=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjCAPCTLCHn | All bits except CEN |
| DFEjCAPERMCHn | All bits |

Rewrite the following registers when the Buffer A circuit is stopped (DFBFACCTL.AEN=0).

| Register Name | Remarks |
| :--- | :--- |
| DFBFACCTL | All bits except AEN |
| DFBFACTLCHn | All bits |

Rewrite the following register when the Buffer B circuit is stopped (DFBFBCTL.BEN=0).

| Register Name | Remarks |
| :--- | :--- |
| DFBFBCTL | All bits except BEN |

When the following registers are used by multiple channels, rewrite these registers when these channels are stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjCPA - DFEjCPD | All bits |
| DFEjPHIA - DFEjPHID | All bits |
| DFEjACA - DFEjACD | All bits |

Rewrite the following registers when the channels which use timer trigger $n$ are stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjPITRG | All bits |
| DFEjPITRG1 | All bits |
| DFEjPMITRG0 | All bits |
| DFEjMITRG | All bits |
| DFEjMITRG1 | All bits |
| DFEjFITRG | All bits |
| DFEjFITRG1 | All bits |

Rewrite the following register when the target channel of the subtraction function which use timer trigger n are stopped (DFEjCTLACHn.EN=0 \& DFEjSTCHn.VALID=0).

| Register Name | Remarks |
| :--- | :--- |
| DFEjSUBTRGO | All bits |

### 37.5 Details

### 37.5.1 Data Flow

### 37.5.1.1 DFE Macro

Figure 37.23 shows the data flow and the block diagram of the DFE.

Figure 37.23 Data Flow of the DFE Macro

### 37.5.1.2 FIFO Macro

The data flow and the block diagram of the FIFO macro is shown below.

Figure 37.24 Data Flow of the FIFO Macro

### 37.5.2 Address Map

### 37.5.2.1 DFE Macro

Figure 37.25 shows an address map of the DFE.

Figure 37.25 Memory Map of the DFE Macro

### 37.5.2.2 FIFO Macro

An address map of FIFO macro is shown below.

Figure 37.26 Register Map of the FIFO Macro

### 37.5.3 Memory

Coefficients required for filter processing are stored in coefficient memory (CMEM). Data memory holds the input values for the FIR, and the initial and intermediate values for the IIR. Each channel has its own area. When the FIR $64-$ TAP is selected on an even-numbered channel (n), the coefficient memory is allocated as shown in the left part of the figure below. Although data memory areas are available to the next odd-numbered channel ( $\mathrm{n}+1$ ), coefficient memory areas are not available; therefore, use of the next odd-numbered channel $(n+1)$ is prohibited.

Figure 37.27 Usage of Memory (with and without the Selection of a 64-Tap FIR Filter)

### 37.5.4 Format of Coefficient Memory

Figure 37.28 shows the data format of the coefficient memory.

| +3 |  | +2 | +1 +0 | Byte address$000_{\sharp}$ |
| :---: | :---: | :---: | :---: | :---: |
| S | Decimal part (15 bit) | S | Decimal part (15 bit) |  |
| S |  | S |  | 004 ${ }^{\text {H }}$ |
| S |  | S |  | 008 |
| ... |  | ... |  |  |
| S |  | S |  | $0^{03 C_{\text {H }}}$ |
|  | osition of the cimal point | Pos | sition of the cimal point | $107 \mathrm{C}_{\mathrm{H}}$ <br> for FIR64-TAP) |

| +3 |  |  | +1 +0 | Byte address$000_{\mathrm{H}}$ |
| :---: | :---: | :---: | :---: | :---: |
| S | Integer part (15 bit) | S | Integer part (15 bit) |  |
| S |  | S |  | $004_{H}$ |
| S |  | S |  | 008 ${ }_{\text {H }}$ |
| ... |  | ... |  |  |
| S |  | S |  | ${ }_{0} 3^{\text {H }}$ |
|  | $\Delta$ Position of the decimal point |  | $\Delta$ Position of the decimal point | $107 \mathrm{C}_{\mathrm{H}}$ for FIR64-TAP) |

### 37.5.5 Format of Data Memory

Figure 37.30 shows decimal point positions of data in the data memory.

Figure 37.30 Decimal Point Positions in the Data Memory

### 37.5.6 Setting Control Registers

### 37.5.6.1 FIR (Fixed-Point)

The following table shows combinations of calculations and cascades that are selectable in the control register A (DFEjCTLACHn) and the control register B (DFEjCTLBCHn) when the FIR and fixed-point format are specified in the control register A. Don't use the cascade function in channels for which accumulation is selected.

Table 37.75 FIR (Fixed-Point)

| Input Format | Filter | Accumulation or Decimation | Peak-Hold or Comparison | Floating-Point Conversion | Execution (Result) | Cascade (Output)*1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Fixed-point (S1.15) | FIR | Accumulation | Peak-hold | Conversion specified | OK (floating-point) | NG |
|  |  |  |  | Conversion not specified | OK (S9.22) | NG |
|  |  |  | Comparison | Conversion specified | OK (floating-point) | NG |
|  |  |  |  | Conversion not specified | OK (S9.22) | NG |
|  |  |  | Not specified | Conversion specified | OK (floating-point) | NG |
|  |  |  |  | Conversion not specified | OK (S9.22) | NG |
|  |  | Decimation | Peak-hold | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |
|  |  |  | Comparison | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |
|  |  |  | Not specified | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |
|  |  | Not specified | Peak-hold | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |
|  |  |  | Comparison | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |
|  |  |  | Not specified | Conversion specified | OK (floating-point) | OK (S.15) |
|  |  |  |  | Conversion not specified | OK (S.31) | OK (S.15) |

Note 1. This setting is prohibited for NG combinations. For OK combinations, set fixed-point as the input data format of the cascade destination channels.

### 37.5.6.2 FIR (Integer)

The following table shows combinations of calculations and cascades that are selectable in the control register A (DFEjCTLACHn) and the control register B (DFEjCTLBCHn) when the FIR and integer format are specified in the control register A. When integer is specified, only the FIR filter processing can be executed. Do not specify floatingpoint conversion.

Table 37.76 FIR (Integer)

| Input Format | Filter | Accumulation or Decimation | Peak-Hold or Comparison | Floating-Point Conversion | Execution (Result)* ${ }^{* 1}$ | Cascade (Output)*2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Integer (S15) | FIR | Accumulation | Peak-hold | Conversion specified | NG | NG |
|  |  |  |  | Conversion not specified | NG | NG |
|  |  |  | Comparison | Conversion specified | NG | NG |
|  |  |  |  | Conversion not specified | NG | NG |
|  |  |  | Not specified | Conversion specified | NG | NG |
|  |  |  |  | Conversion not specified | NG | NG |
|  |  | Decimation | Peak-hold | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |
|  |  |  | Comparison | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |
|  |  |  | Not specified | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |
|  |  | Not specified | Peak-hold | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |
|  |  |  | Comparison | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |
|  |  |  | Not specified | Conversion specified | NG | OK (S15) |
|  |  |  |  | Conversion not specified | OK (S31) | OK (S15) |

Note 1. The setting is prohibited for NG combinations.
Note 2. The setting is prohibited for NG combinations. For OK combinations, set integer as the input data format of the cascade destination channels.

### 37.5.6.3 IIR (Fixed-Point)

The following table shows combinations of calculations and cascades that are selectable in the control register A (DFEjCTLACHn) and the control register B (DFEjCTLBCHn) when the IIR is specified in the control register A. When the IIR is specified, only fixed-point format filter processing can be executed. When accumulation is specified, specification of the cascade function is prohibited.

Table 37.77 IIR

| Input Format  <br> Fixed-point <br> (S.15) Filter | Accumulation or <br> Decimation | Peak-Hold or <br> Comparison | Floating-Point Conversion | Execution <br> (Result) | Cascade <br> (Output) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Note 1. The setting is prohibited for NG combinations. For OK combinations, set fixed-point as the input data format of the cascade destination channels.

### 37.5.7 Trigger Control

### 37.5.7.1 Timer Trigger Input

The digital filter uses compare $\mathrm{An}(\mathrm{n}=0$ to 19$)$ and compare $\mathrm{Bn}(\mathrm{n}=0$ to 19$)$, for a total of 40 signals as timer triggers through the synchronizer.

To compare An, five timer trigger flags (accumulation/decimation initialization flag, PH initialization flag, PH mask start flag, filter initialization flag, and subtraction starting flag) can be assigned.

To compare Bn, four timer trigger flags (accumulation/decimation disable flag, PH end flag, PH mask end flag, and subtraction end flag) are paired with the timer trigger functions selected for compare An are automatically assigned.

Figure 37.31 Timer Trigger Input

To compare Bn , the signal with the same number as the compare An selected for each flag is automatically assigned as the timer trigger for the corresponding trigger flag.

The table below shows the relationships between the trigger flags assigned to compare An and compare Bn, and the number of timer triggers available for each trigger flag.

| Flag Corresponding to Compare An | Flag Corresponding to Compare Bn | Number of Selectable Timer Triggers |
| :--- | :--- | :--- |
| Accumulation/decimation initialization flag | Accumulation/decimation disable flag | 6 (Timer Trigger 0-5) |
| Peak-Hold initialization flag | Peak-Hold end flag | 6 (Timer Trigger 0-5) |
| Peak-Hold mask start flag | Peak-Hold mask end flag | 6 (Timer Trigger 0-5) |
| Filter initialization flag | - | 6 (Timer Trigger 0-5) |
| Subtraction start flag | Subtraction end flag | 3 (Timer Trigger 0-2) |

Compare Bn signals with the same number as the compare An signals that are selected for the accumulation/decimation initialization flag are automatically allocated to the accumulation/decimation disable flag timer triggers.

## (1) Setting of Accumulation/Decimation Initialization/Disable Flag

For the accumulation/decimation initialization flag and accumulation/decimation disable flag, use of timer triggers 0 to 5 or timer triggers 0 to 3 is enabled with the settings shown below. It is recommended to use timer triggers in the mode where timer triggers 0 to 5 can be used.
(A) Settings for the Mode Where Timer Triggers 0 to 5 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.AFE | $01_{\mathrm{B}}$ | Assigns the accumulation/decimation disabling flag to a timer flag. |
| DFEjTRGCHn.AE | $11_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 5 are used. |
| DFEjTMTRGCHn.AT | $000_{\mathrm{B}}$ to $101_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 5. |
| DFEjMITRG.MITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Set timer triggers 0 to 3.$)$ |
| DFEjMITRG1.MITMTRGn <br> $(\mathrm{n}=4,5)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 4 and 5.$)$ |

(B) Settings for the Mode Where Timer Triggers 0 to 3 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.AFE | $01_{\mathrm{B}}$ | Assigns the accumulation/decimation disabling flag to a timer flag. |
| DFEjTRGCHn.AE | $01_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 3 are used. |
| DFEjTRGCHn.AT | $00_{\mathrm{B}}$ to $11_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 3. |
| DFEjMITRG.MITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. |

## (2) Setting of Peak-Hold Initialization/End Flag

For the Peak-Hold initialization flag and Peak-Hold end flag, use of timer triggers 0 to 5 or timer triggers 0 to 3 is enabled with the settings shown below. It is recommended to use timer triggers in the mode where timer triggers 0 to 5 can be used.
(A) Settings for the Mode Where Timer Triggers 0 to 5 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.PFE | $01_{\mathrm{B}}$ | Assigns the Peak-Hold end flag to a timer flag. |
| DFEjTRGCHn.PE | $11_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 5 are used. |
| DFEjTMTRGCHn.PT | $000_{\mathrm{B}}$ to $101_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 5. |
| DFEjPITRG.PITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. |
| DFEjPITRG1.PITMTRGn <br> $(\mathrm{n}=4,5)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | (Sets timer triggers 0 to 3.) |

(B) Settings for the Mode Where Timer Triggers 0 to 3 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.PFE | $01_{\mathrm{B}}$ | Assigns the Peak-Hold end flag to a timer flag. |
| DFEjTRGCHn.PE | $01_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 3 are used. |
| DFEjTRGCHn.PT | $00_{\mathrm{B}}$ to $11_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 3. |
| DFEjPITRG.PITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 0 to 3.$)$ |

## (3) Setting of Filter Initialization Flag

For the filter initialization flag, use of timer triggers 0 to 5 or timer triggers 0 to 3 is enabled with the settings shown below. It is recommended to use timer triggers in the mode where timer triggers 0 to 5 can be used.
(A) Settings for the Mode Where Timer Triggers 0 to 5 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.FE | $11_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 5 are used. |
| DFEjTMTRGCHn.FT | $000_{\mathrm{B}}$ to $101_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 5. |
| DFEjFITRG.FITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 0 to 3.) |
| DFEjFITRG1.FITMTRGn <br> $(\mathrm{n}=4,5)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 4 and 5.$)$ |

(B) Settings for the Mode Where Timer Triggers 0 to 3 are Used

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.FE | $01_{\mathrm{B}}$ | Selects the mode where timer triggers 0 to 3 are used. |
| DFEjTRGCHn.FT | $00_{\mathrm{B}}$ to $11_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 3. |
| DFEjFITRG.FITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 0 to 3.) |

## (4) Setting of Peak-Hold Mask Start/End Flag

For the Peak-Hold mask start flag and Peak-Hold mask end flag, use of timer triggers 0 to 5 is enabled with the settings shown below.

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjTRGCHn.PMFE | $01_{\mathrm{B}}$ | Assigns the PH mask ending flag to a timer flag. |
| DFEjTRGCHn.PME | $01_{\mathrm{B}}$ | Selects the mode where timer triggers are used. |
| DFEjTMTRGCHn.PMT | $000_{\mathrm{B}}$ to $101_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 5. |
| DFEjPMITRG0.PMITMTRGn <br> $(\mathrm{n}=0,1,2,3)$ | $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 0 to 3.$)$ |
| DFEjPMITRG1.PMITMTRGn <br> $(\mathrm{n}=4,5)$ | $00000_{\mathrm{B}}$ to $1001_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 4 and 5.$)$ |

## (5) Setting of Subtraction Start/End Flag

For the subtraction start flag and subtraction end flag, use of timer triggers 0 to 2 is enabled with the settings shown below.

| Bit Name | Setting | Description |
| :--- | :--- | :--- |
| DFEjSUBTRGCHn.SBFE | $01_{\mathrm{B}}$ | Assigns the subtraction end flag to a timer flag. |
| DFEjSUBTRGCHn.SBE | $01_{\mathrm{B}}$ | Selects the mode where timer triggers are used. |
| DFEjSUBTRGCHn.SBT | $00_{\mathrm{B}}$ to $10_{\mathrm{B}}$ | Selects a timer trigger to be used from timer triggers 0 to 2. |
| DFEjSUBTRG0.SUBTMTRGn <br> $(\mathrm{n}=0,1,2)$ | $00000_{\mathrm{B}}$ to $1001_{\mathrm{B}}$ | Selects a compare An to be assigned to timer trigger n. <br> (Sets timer triggers 0 to 2.$)$ |

### 37.5.7.2 Trigger Flag Functions

When the channel enable bit (DFEjCTRLACHn.EN) is 1, the DFE can generate flags of the following ten functions for each channel by using software triggers, timer triggers that are allocated to the trigger functions, and the trigger setting register (DFEjTRGCHn). (These flags are referred to as trigger flags hereafter.)

The accumulation/decimation processing is set with DFEjCTLBCHn.PRCSA, and the peak-hold processing is set with DFEjCTLBCHn.PRCSB.

Subtraction is set with DFEjSUBCTLCHn.SEN.
Whether accumulation/decimation processing is currently disabled or enabled can be read from DFEjCTLBn.DISA. Similarly, whether peak-hold processing is currently disabled or enabled can be read from DFEjCTLBn.DISB.

Both DFEjCTLBn.DISA and DFEjCTLBn.DISB can be set before the DFE starts processing (channel is disabled $(\mathrm{DFEjCTRLACHn} . \mathrm{EN}=0)$ and there is no data to be processed $(\mathrm{DFEjSTCHn} . \operatorname{VALID}=0)$ ).

For details, see Section 37.3.4, DFEjCTLBCHn - Control Register B n ( $\mathbf{n}=\mathbf{0}$ to 11 for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1).

Table 37.78 Trigger Flags (1/2)

| Flag Name | Description |
| :--- | :--- |
| Accumulation/decimation | When the accumulation/decimation initialization flag is enabled by timer triggers or software triggers <br> specified for each channel while accumulation/decimation processing is in progress or in the <br> enabled or disabled state, the DFE initializes the counter of the accumulation circuit and executes <br> accumulation/decimation processing for the subsequent input data. |
| Accumulation/decimation | When the accumulation/decimation disable flag is enabled by timer triggers or software triggers <br> specified for each channel while accumulation/decimation processing is in progress or in the <br> enabled state, the DFE disables accumulation/decimation processing for the subsequent input data. |
|  | To enable accumulation/decimation processing again, enable the accumulation/decimation <br> initialization flag. |
| Peak-hold initialization flag | When the peak-hold initialization flag is enabled by timer triggers or software triggers specified for <br> each channel while peak-hold processing is in progress or in the enabled or disabled state, the DFE <br> compares the next input data with the peak-hold initialization register value, not with the peak-hold <br> processing result as before, and after that the DFE compares the subsequent data with the peak- <br> hold processing result. |
| When the peak-hold end flag is enabled by timer triggers or software triggers specified for each <br> channel while peak-hold processing is in progress or in the enabled state, the DFE disables peak- |  |
|  | hold processing for the subsequent input data. |
|  | The peak-hold end interrupt can be output when the peak-hold end flag is enabled. |
| To enable peak-hold processing again, enable the peak-hold initialization flag. |  |

## CAUTION

When timer triggers are used for the accumulation/decimation disable flag or peak-hold end flag, timer triggers 0 to 5 are automatically allocated as described in Section 37.5.7.1, Timer Trigger Input.

Page 3844 of 4595

Table 37.78 Trigger Flags (2/2)

| Flag Name | Description |
| :--- | :--- |
| Peak-Hold mask start flag | In any of the states where Peak-Hold processing is in progress, processing is enabled, or <br> processing is disabled, if the Peak-Hold mask starting flag is enabled by the timer trigger or software <br> trigger input set for each channel, Peak-Hold processing is halted on the subsequent input data. To <br> restart Peak-Hold processing, enable the Peak-Hold mask end flag. |
| Peak-Hold mask end flag | In any of the states where Peak-Hold processing is in progress, processing is enabled, or <br> processing is disabled, if the Peak-Hold mask ending flag is enabled by the timer trigger or software <br> trigger input set for each channel, Peak-Hold processing is restarted on the subsequent input data. |
| Subtraction start flag | If the subtraction start flag is enabled by the timer trigger or software trigger input set for each <br> channel, subtraction is initialized and started on the subsequent input data. |
| Subtraction end flag | If the subtraction end flag is enabled by the timer trigger or software trigger input set for each <br> channel, subtraction is disabled on the subsequent input data. To enable subtraction again, enable <br> the subtraction starting flag. |
| If the automatic initialization flag is enabled by writing the channel enable bit (0 $\rightarrow 1$ ), the processing |  |
| below is executed on the subsequent input data. |  |
| - The target register is initialized when filtering process is started. |  |
| - After the address pointer for filtering process is initialized, FIR/IIR processing is executed from the |  |
| initial values (same as the function of the filter initialization flag). |  |

Timer triggers and software triggers can be allocated to trigger flags for each channel.
However, the timer triggers for the accumulation/decimation disable flag, Peak-Hold end flag, and Peak-Hold mask end flag are automatically assigned. Detailed operations of each trigger flag are described in the descriptions of the accumulation circuit, Peak-Hold circuit, and filtering circuit.

Table 37.79 Example of Trigger Flag Settings

|  | Accumulation/ <br> Decimation <br> Initialization Flag | Accumulation/ Decimation Disable Flag | Peak-Hold <br> Initialization Flag | Peak-Hold Disable Flag | Filter Initialization Flag | Peak-Hold Mask <br> Start Flag | Peak-Hold Mask End Flag |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel 0 | Timer trigger 0 (compare A0) | Compare B0 is automatically allocated according to the timer trigger selection. | None | None | Timer trigger 3 | None | None |
| Channel 1 | None | None | Timer trigger 2 (compare A9) | Compare B9 is automatically allocated according to the timer trigger selection. | Software trigger | Timer trigger 4 (compare A15) | Compare B15 is automatically allocated according to the timer trigger selection |
| ... | ... | ... | ... | .. | ... | $\ldots$ | $\ldots$ |
| Channel 9 | Timer trigger 3 (compare A5) | Compare B5 is automatically allocated according to the timer trigger selection. | None | None | None | $\ldots$ | $\ldots$ |
| Channel 10 | Timer trigger 1 | Software trigger | None | None | Timer trigger 0 | None | None |
| $\ldots$ | $\ldots$ | ... | $\ldots$ | $\ldots$ | ... | $\ldots$ | $\ldots$ |
| Channel 15 | None | None | Timer trigger 4 (compare A4) | Compare B4 is automatically allocated according to the timer trigger selection | None | None | None |

Timer triggers and software triggers can be assigned to trigger flags for each subtraction channel. However, the timer triggers for the subtraction end flag are automatically assigned. Detailed operations of the trigger flags are described in the descriptions of the subtraction circuit.

Table 37.80 Example of Subtraction Trigger Flag Settings

|  | Subtraction Starting Flag | Subtraction Ending Flag |
| :--- | :--- | :--- |
| 0SCH | Timer trigger 0 <br> (compare A16) | Compare B16 is automatically assigned when a timer trigger is selected. |
| 1SCH | Timer trigger 1 <br> (compare A17) | Compare B17 is automatically assigned when a timer trigger is selected. |
| 2SCH | Timer trigger 2 <br> (compare A18) | Software trigger |

Trigger flags are valid for data that is input after a software trigger or timer trigger is generated.
If timer trigger 0 is set for the accumulation initialization flag in channel 0 , for example, accumulation processing is initialized for the first input data in channel 0 after a timer trigger is generated.

To process the same data on multiple channels, the trigger flag settings should be the same to keep consistency in the processed data.
For example, when data input from AD0 is specified for channels 0 and 1 and the accumulation initialization flag is used, the same accumulation initialization flag timer trigger should be set for both channels 0 and 1 .

Figure 37.32 Example of Trigger Flag Operation

### 37.5.7.3 Trigger Flag Functions and Processing

The accumulation circuit is set with DFEjCTLBCHn.PRCSA.
The Peak-Hold circuit is set with DFEjCTLBCHn.PRCSB and DFEjPH23CCTL0.PEN.
Table $\mathbf{3 7 . 8 1}$ shows the register settings for the accumulation circuit and Peak-Hold circuit, and the relationships between the output data and interrupts according to the combinations of the trigger flag functions

Table 37.81 Trigger Flag Functions and Processing

| Accumulation Circuit |  | PH Circuit |  | Input Data Processing after Trigger Flag is Enabled |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Register Settings | Trigger Flag <br> Functions | Register <br> Settings | Trigger Flag <br> Functions | Output Data Write | Output Data Interrupt | Condition Match Interrupt | Peak-Hold End Interrupt | Peak-Hold <br> Update Notification |
| PRCSA = 00B <br> (Neither accumulation nor decimation executed) | Both accumulation/ decimation initialization flag and disable flag disabled | PH/ comparison disabled | Both PH initialization flag and disable flag disabled | Provided | Not provided*2 | Not provided | Not provided | Not provided |
|  |  | Comparison executed exclusively |  | Provided | Not provided ${ }^{* 2}$ | Provided | Not provided | Not provided |
|  |  | PH executed exclusively | PH enabled | Provided | Not provided ${ }^{* 2}$ | Not provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Not provided ${ }^{* 2}$ | Not provided*1 | Not provided | Not provided |
|  |  | PH and comparison executed simultaneously | PH enabled | Provided | Not provided ${ }^{* 2}$ | Provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Not provided ${ }^{* 2}$ | Provided | Provided | Not provided |
|  |  | PH23 executed | PH enabled | Provided | Not provided ${ }^{* 2}$ | Provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Not provided ${ }^{* 2}$ | Not provided | Provided | Not provided |
| PRCSA $=01_{B}$ or 10B $_{B}$ (Either accumulation or decimation executed) | Accumulation/ decimation enabled | PH/ comparison disabled | Both PH initialization flag and disable flag disabled | Provided | Provided | Not provided | Not provided | Not provided |
|  |  | Comparison executed exclusively |  | Provided | Provided | Provided | Not provided | Not provided |
|  |  | PH executed exclusively | PH enabled | Provided | Provided | Not provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Provided | Not provided*1 | Not provided | Not provided |
|  |  | PH and comparison executed simultaneously | PH enabled | Provided | Provided | Provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Provided | Provided | Provided | Not provided |
|  |  | PH23 executed | PH enabled | Provided | Provided | Provided | Not provided | Provided |
|  |  |  | PH ended | Provided | Provided | Not provided | Provided | Not provided |
| PRCSA $=01_{B}$ or 10в (Either accumulation or decimation executed) | Accumulation/ decimation disabled | PH/ comparison disabled | Both PH initialization flag and disable flag disabled | Not provided | Not provided | Not provided | Not provided | Not provided |
|  |  | Comparison executed exclusively |  | Not provided | Not provided | Not provided | Not provided | Not provided |
|  |  | PH executed exclusively |  | Not provided | Not provided | Not provided | Not provided | Not provided |
|  |  | PH and comparison executed simultaneously |  | Not provided | Not provided | Not provided | Not provided | Not provided |
|  |  | PH23 executed |  | Not provided | Not provided | Not provided | Not provided | Not provided |

Note 1. The interrupt is output when the peak-hold end flag is enabled.
Note 2. Refer to the Output Circuit Register.

When accumulation/decimation processing and peak-hold/comparison processing are used in the same channel with the accumulation/decimation count specified, peak-hold processing is executed on each specified count.

Page 3848 of 4595

If accumulation/decimation processing is disabled by the trigger flag function, peak-hold/comparison processing is not executed, either. Do not input software triggers or timer triggers for the trigger flag function for peak-hold initialization, peak-hold end trigger flag, peak-hold mask start or peak-hold mask end trigger flag functions to a channel with accumulation/decimation processing disabled.

### 37.5.7.4 Automatic Initialization of the Channel

When the automatic initialization enable bit (DFEjCTLACHn.AIME) is 1 , automatic initialization of the channels is available. When the channel enable bit (DFEjCTLACHn.EN) is modified from 0 to 1 , the automatic initialization flag of the channel is enabled.

The automatic initialization flag of the channel is also enabled when 1 is simultaneously written to the automatic initialization enable bit and the channel enable bit.

When the automatic initialization flag of the channel is enabled, the address pointer of the filtering process of the next input data is initialized, and then FIR/IIR processing with initialization is executed.

Also, the registers are initialized simultaneously with the filtering process, and after the filtering process, the accumulation circuit and PH circuit are returned to the initial state. But the accumulation circuit and the peak-hold circuit is not set valid by the automatic initialization flag.

The registers below are initialized.

| Register Name |  | DFEjDOCHn |
| :--- | :--- | :--- |
| Output data register | Cleared when the channel processing is started. |  |
| Intermediate values output registers L | DFEjHOLCHn | Same as above |
| Intermediate values output registers H | DFEjHOHCHn | Same as above |
| Intermediate values output mirror <br> registers L | DFEjHOLMCHn | Same as above |
| Peak-Hold result register | DFEjPHCHn | Same as above |
| Peak-Hold index register | DFEjPHINDCHn | Same as above |
| Status register <br> Status Register PH23 processing status | DFEjSTCHn.PH23ST | Same as above |
| Peak-Hold 2 Result Register $0^{* 1}$ | DFEjPH20 | Same as above |
| Peak-Hold 3 Result Register $0^{\star 1}$ | DFEjPH30 | Same as above |
| Peak-Hold 2 index register*1 | DFEjPH2IND0 | Same as above |
| Peak-Hold 3 index register*1 | DFEjPH3IND0 | Same as above |

Note 1. Cleared when the PH 23 function is enabled (DFEjPH23CCTL0.PEN $=1$ ) and the PH 23 function is enabled for the pertinent channel (the pertinent channel number is set with DFEjPH23CCTLO.CHS).

When the channel enable bit (DFEjCTLACHn.EN) is modified from 0 to 1 , the automatic initialization flag of the channel is enabled. When the automatic initialization flag of the channel is enabled and processing of the next channel is started, FIR or IIR processing with initialization is executed.

Also, the pertinent registers are initialized simultaneously with the start of the filtering process.
After the filtering process, the accumulator and counter for accumulation in the accumulation circuit are initialized even if accumulation/decimation processing is disabled.

After the accumulation process, the Peak-Hold counter in the PH circuit is initialized even if the PH processing has been finished. Also, the PH circuit retains the state in which comparison is possible between the data that was input to the PH circuit during the PH processing and the value of the PH initial value register.

After that, in the PH processing of the subsequent filtering process after PH processing is enabled, the data that was input to the PH circuit is compared to the value of the PH initial value register. Subsequently, in PH processing, the data that was input to the PH circuit is compared to the value of the PH result register.

Figure 37.33 Operations of the Channel Automatic Initialization Flag

After the automatic initialization flag of the channel is enabled, the automatic initialization flag is maintained until the filtering process of the channel is requested. However, the automatic initialization flag is cleared if the channel enable bit becomes 0 . If 1 is written again to the channel enable bit with the automatic initialization enable bit (DFEjCTLACHn.AIME) being 1, the automatic initialization flag is enabled.

Figure 37.34 Clear Channel Automatic Initialization Flag

### 37.5.8 Input Data Control

This macro accepts the input of the data listed in the table below.
Table 37.82 Classification of Input Data

| Classification | Input Data |
| :--- | :--- |
| AD input | SAR-AD |
|  | Delta-Sigma AD |
|  | Filter Result Data |
|  | Subtraction Result Data |
| Software Input | Software Input Data (DFEjDI.DI) |

### 37.5.8.1 AD Input

The digital filter compares the TAG value (called the channel tag hereafter) set in the TAG bits in DFEjCTLACHn for each channel and the TAG input from the AD, and executes processing in the channel that has the matched tag value. This function allows single piece of AD data to be input to processing on multiple channels.

### 37.5.8.2 Cascade Input

The digital filter has a cascade input function to input the filter processing result or Subtraction result again.
When the filter processing result is input, this cascade input function rounds the 32-bit accumulation circuit output data to 16-bit data, and then executes filter processing again.

When the Subtraction result is input, this cascade input function rounds the 32 -bit subtraction circuit output data to 16bit data, and then executes filter processing again.

In integer mode, when the accumulation circuit output data or subtraction circuit output data is a positive value and the 16 high-order bits contain a valid value, the output data is rounded to a 16 -bit positive maximum value $\left(7 \mathrm{FFF}_{\mathrm{H}}\right)$. When the accumulation circuit output data or subtraction circuit output data is a negative value and the 16 high-order bits contain a valid value, the output data is rounded to a 16 -bit negative minimum value $\left(8000_{\mathrm{H}}\right)$. If rounding of both positive and negative values occurs, the cascade rounding error flag is set to 1 .

In fixed-point mode, the accumulation circuit output data or subtraction circuit output data is added to $00008000_{\mathrm{H}}$ and rounding is executed. As a result of this addition, if an overflow occurs in 32-bit positive value, the added data is rounded to a positive maximum value $\left(7 \mathrm{FFF}_{\mathrm{H}}\right)$ and the cascade rounding error flag is set.

The CAEN bits in the DFEjCTLACHn or DFEjSUBCTLCHn control registers can enable or disable the cascade input function and enable or disable the output data register mask function.

Table 37.83 CAEN Flag Function

| CAEN Bits | Description |
| :--- | :--- |
| $00_{\mathrm{B}}$ | Cascade input is disabled. Calculation results are written to the output data register: Value after a <br> reset. |
| $01_{\mathrm{B}}$ | Setting prohibited |
| $10_{\mathrm{B}}$ | Cascade input is enabled. Calculation results are written to the output data register. |
| $11_{\mathrm{B}}$ | Cascade input is enabled. Calculation results are not written to the output data register. |

## (1) Cascade Input of Filter Processing Results

When a cascade input is enabled, the cascade input destination channel is specified by using the cascade tag value for (cascade tag hereafter). The cascade tag is set by the CATAG bits in DFEjCTLACHn. The DFE compares the cascade tag with the channel tag, and executes cascade input filter processing on the channel where the tags matched. The following figures show operations when the cascade input is enabled.

Figure 37.35 Cascade Input Processing (Normal Processing)

When a cascade input is enabled and decimation is specified, a decimation result becomes the cascade input data. When the decimation count is set to 4 , for example, the data after filter processing of the fourth AD input becomes the cascade input data.

Figure 37.36 Cascade Input Processing (Decimation: 4 Times)

## (2) Cascade Input of Subtraction Results

When the cascade input is enabled, a cascade tag is used for the subtraction channel to specify a cascade input destination channel. The cascade tag for subtraction channels is specified with the DFEjSUBCTLCHn.CATAG. The DFE, comparing the cascade tag for the subtraction channel with the channel tag, performs filtering on the cascade input on a matching channel. The text below describes the operation that occurs when the cascade input is enabled.

The cascade input on the results of the subtraction operation is used for each filtering process on the subtrahend channel and the minuend channel, regardless of the specified number of accumulation/decimation operations.

Figure 37.37 Cascading Input Processing on a Subtraction Channel

### 37.5.8.3 Software Input

The DFE has a function to input DFE processing target data through the peripheral bus by using the CPU or DMA. (This function is referred to as software input function hereafter.) DFE processing can be started by writing filter processing target data and a tag value to the software input data register (DI) from the peripheral bus.

### 37.5.8.4 Dispatch

A channel to be processed is selected by an activation signals of an AD input (Delta-Sigma AD, SAR-AD and CyclicAD ), a cascade input, or a software input and the channel tag, and then the data to be processed is stored in the input data register of each channel. This processing is called dispatch.

After the data to be processed is stored in the input data register, the input data register is enabled until the accumulation circuit processing is completed. If new data is stored in the same channel while the input data register is enabled, the data is overwritten and causes an input data overwrite error (DIOW).

Figure 37.38 Input Data Overwrite (DIOW) Error

When the input data register of each channel is enabled, filter processing target data is arbitrated. The highest priority is given to the processing for channel 0 , the second highest priority is given to the processing for channel 1 , and the lowest priority is given to the processing for channel 11 in the DFE0, for channel 3 in the DFE1. The input data register value of arbitrated channels is input to the filtering circuit where FIR/IIR processing is applied to the input data register value according to the control register value.

If the same data is set for multiple channels, processing is also executed for all of the specified channels in the channel priority order. If the trigger flag function is enabled, it is not applied until the next input data processing.

For example, if the same input data is set for multiple channels, accumulation processing is set, and the same accumulation/decimation disable trigger is set for all the channels, accumulation is not disabled until the next input data processing if there are any channels for which accumulation processing has not been performed when the disable trigger is input.

Figure 37.39 Processing when the Same Input Data is Set for Multiple Channels

### 37.5.9 Filtering Circuit

The filter circuit accepts requests for a single channel selected by the dispatch circuit from among channels 0 to 11 in the DFE0, channel 0 to 3 in the DFE1. When the FIR 64TAP is used on an even-numbered channel, although requests from the channel are accepted, no requests from the next odd-numbered channel are accepted. Once a request is accepted, the selected type of filtering (FIR or IIR) starts. Another request cannot be accepted during execution of filter processing. Upon completion of processing in the accumulation circuit, the DFE accepts a new request. Coefficients required for filtering are stored in the coefficient memory and input data to be used for FIR processing and intermediate data to be used for IIR processing are stored in the data memory. These memory areas are allocated for each channel.

### 37.5.9.1 $\operatorname{FIR}$ (8, 16, 24, 32 Taps)

Figure 37.40 shows the FIR filter configuration.

Figure 37.40 FIR Filter Configuration

Before starting FIR filter processing, set values in the coefficient memory and data memory buffer area.
For example, in the case of a 32 -tap FIR filter, set value from C[0] to C[31] in coefficient memory and set $0000_{\mathrm{H}}$ to circular buffer area (= ring buffer area) in data memory.

Figure 37.41 FIR Memory (FIR 32 TAP)

Figure 37.41 shows the access area of coefficient and data memory in the case of a 32-tap FIR.
When 8-tap/16-tap/24-tap FIR filters is selected, the access area of coefficient memory and data memory is same as 32tap FIR.

When the filter processing initialization flag indicates "enabled", DFE writes $0000_{\mathrm{H}}$ in circular buffer area for the number of taps before filter processing starts. For example, when 32-tap FIR filter is selected, after DFE writes $0000_{H}$ in circular buffer area from $\mathrm{D}[0]$ to $\mathrm{D}[31]$, FIR processing is executed.

### 37.5.9.2 FIR (64 Taps)

When 64-tap FIR filter is selected, set values in the coefficient memory, and data memory buffer area as in 8-tap/16-tap/24-tap/32-tap FIR filter, before filter processing is executed.

Figure 37.42 FIR Memory (when a 64-Tap FIR Filter is selected)

Figure 37.42 shows the access area in coefficient memory and data memory in the case of a 64-tap FIR. 64-tap FIR can be selected in only even number channels. When the filter processing initialization flag indicates "enabled", DFE writes $0000_{\mathrm{H}}$ in circular buffer area from $\mathrm{D}[0]$ to $\mathrm{D}[63]$ before filter processing is executed.

### 37.5.9.3 One-Stage IIR

Figure 37.43 shows the configuration of a one-stage IIR filter.

Figure 37.43 Configuration of a One-Stage IIR Filter

Before starting IIR filter processing, set values in the coefficient memory and data memory buffer area. Set the intermediate value in circular buffer area of the data memory. And set the initial value in initial value buffer area of the data memory.

Figure 37.44 Memory Usage for a One-Stage IIR Filter

Figure 37.44 shows the access area in coefficient memory and data memory in the case of a one-stage IIR.
When the filter processing initialization flag indicates "enabled", DFE initializes data pointer of the circular buffer area to " 0 ". And DFE writes the data of initial value buffer to the target circular buffer before filter processing is executed.

### 37.5.9.4 Two-Stage IIR

Figure 37.45 shows the configuration of a two-stage IIR filter.

Figure 37.45 Configuration of a Two-Stage IIR Filter

The figure below shows an IIR filter configuration of a second-order 2-stage biquad IIR with a gain adjustment function.

The second-order 2-stage biquad IIR with a gain adjustment function can be used when DFEjCTLACHn.CMD $=1101_{\mathrm{B}}$. The value of GAIN2 can be set in the IIR filter gain setting register (DFEjGAINCHn).

Figure 37.46 Configuration of a Two-Stage IIR Filter with Gain Adjustment Function

Before starting IIR filter processing, set values in IIR Filter Gain Setting Register (DFEjGAINCHn), the coefficient memory and data memory buffer area. Set the intermediate value in circular buffer area of the data memory. And set the initial value in initial value buffer area of the data memory.

Figure 37.47 Memory Usage for a Two-Stage IIR Filter

Figure 37.47 shows the access area in the coefficient memory and data memory in the case of a two-stage IIR.
When the filter processing initialization flag indicates "enabled", DFE initializes data pointer of the circular buffer area to " 0 ". And DFE writes data of initial value buffer to the target circular buffer before filter processing is executed.

### 37.5.9.5 Three-Stage IIR

Figure 37.48 shows the configuration of a three-stage IIR filter.

Figure 37.48 Configuration of a Three-Stage IIR Filter

The figure below shows an IIR filter configuration of a second-order 3-stage biquad IIR with a gain adjustment function. The second-order 3-stage biquad IIR with a gain adjustment function can be used when DFEjCTLACHn.CMD $=1110_{\mathrm{B}}$. The values of GAIN2 and GAIN3 can be set in the IIR filter gain setting register (DFEjGAINCHn).

Figure 37.49 Configuration of a Three-Stage IIR with Gain Adjustment Function

Before starting IIR filter processing, set values in IIR Filter Gain Setting Register (DFEjGAINCHn), the coefficient memory and data memory buffer area. Set the intermediate value in circular buffer area of the data memory. And set the initial value in initial value buffer area of the data memory.

Figure 37.50 Memory Usage for a Three-Stage IIR Filter

Figure 37.50 shows the access area in the coefficient memory and data memory in the case of a three-stage IIR.
When the filter processing initialization flag indicates "enabled", DFE initializes data pointer of the circular buffer area to " 0 ". And DFE writes data of initial value buffer to the target circular buffer before filter processing is executed.

### 37.5.9.6 Errors in the Filtering Circuit

If multiplication of $8000_{\mathrm{H}} \times 8000_{\mathrm{H}}$ is performed by the multiplier, a multiplication error occurs and the multiplication error flag is set to 1 .

To prevent an overflow in the multiplication result processing, 3 input adder (54bit) is composed to multiplication data area (48bit) and guard bit area (6bit). To round 54bit of multiplication result to 32bit, DFE accumulates 0000000000 $4000_{\mathrm{H}}$ (when IIR 2.14 is selected, $00000000002000_{\mathrm{H}}$ ) to multiplication result ( 54 bit ). When guard bits contain a valid value after the rounding operation, the error flag is set to 1 . This error is called guard bit error.

When the rounded multiplication result is larger than the 32 -bit positive maximum value ( $7 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ ), the result is rounded to $7 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$ (saturation processing). When the rounded multiplication result is smaller than the 32-bit negative minimum value $\left(80000000_{\mathrm{H}}\right)$, the result is rounded to $80000000_{\mathrm{H}}$ (saturation processing).

### 37.5.10 Accumulation Circuit

The accumulation circuit has a function to execute absolute value conversion, accumulation processing, or decimation processing for the filter processing result data that is output from the filtering circuit. The accumulation circuit then outputs the processing result data to the output circuit and/or the peak-hold circuit. When the cascade function is used, the accumulation circuit sends the accumulation circuit output data to the dispatch circuit.

### 37.5.10.1 Absolute Value Calculation

The filter processing result data that is output from the filtering circuit is converted to an absolute value. When the ABS bit in DFEjCTLBCHn is 1 , absolute value conversion is executed. When the ABS bit is 0 , absolute value conversion is not executed. If the filter processing result data that is output from the filtering circuit is $80000000_{\mathrm{H}}$, an absolute value error is generated. The absolute value conversion result when this occurs is $7 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$.

Absolute value conversion can be performed even if the PRCSA bit is set to $00_{\mathrm{B}}$ in DFEjCTLBCHn.
Accumulation/decimation processing is performed on the absolute value of conversion result.

### 37.5.10.2 Summary of Accumulation Processing

In accumulation processing, the filter processing result data that is input to the accumulation circuit is arithmetically shifted to the right ( 9 bits), and then this filter processing result data is added to the filter processing result data that has been input for each channel.

The data format after the accumulation processing is (10.22). Accumulation processing can be executed up to 511 times. After processing for the specified accumulation count has been completed, accumulation processing is executed again.

When the PRCSA bits in DFEjCTLBCHn are 01B, accumulation processing is executed. Specify the accumulation processing count with the SELA bits in DFEjCTLBCHn by selecting one of the four accumulation/decimation count setting registers (ACA to ACD).

### 37.5.10.3 Operation of Accumulation Processing

The operation of accumulation processing is explained using an example when $\mathrm{ACA}=000_{\mathrm{H}}, \mathrm{ACB}=001_{\mathrm{H}} \mathrm{ACC}=002_{\mathrm{H}}$, and DFEjCTLBCHn.PRCSA $=01_{\text {B }}$.

When the SELA bits in DFEjCTLBCHn are $00_{\mathrm{B}}$, ACA is selected and accumulation processing is executed with an accumulation count value of 0 .

The 9-bit arithmetical right-shift result data (DADD (1)) from the filter processing result data (D (1)) is written to the output data register and an output data interrupt request is issued.

In accumulation processing with an accumulation count value of 0 , one-time filter processing result is right shifted 9bits arithmetically without addition processing and an interrupt request is issued. This processing is repeated continuously.

Figure 37.51 Accumulation Processing (Count Value $=0$ )

When the SELA bits in DFEjCTLBCHn are $01_{\mathrm{B}}$, the ACB register is selected and accumulation processing is executed with a set accumulation count value of 1 .

When the filter processing result data ( $\mathrm{D}(1)$ ) is input to the accumulation circuit, the 9 -bit arithmetical right-shift result data (DADD (1)) from the filter processing result data (D (1)) is written to the accumulator. After that, when the filter processing result data ( $\mathrm{D}(2)$ ) is input to the accumulation circuit, the filter processing result data ( $\mathrm{D}(2)$ ) is right shifted ( 9 bits) arithmetically (DADD (2)) and this data is added to the accumulator value (DADD (1)). The results of the addition (DADD (1) + DADD (2)) are written to the output data register. After this writing has been completed, an output data interrupt request is issued.

When the accumulation count is set to 1, a 9-bit arithmetical right shift is made for two filter processing results and these results are added, and then an interrupt request is issued once. This processing is repeated continuously.

Figure 37.52 Accumulation Processing (Count Value $=1$ )

When the SELA bits in DFEjCTLBCHn are 10B, the ACC register is selected and accumulation processing is executed with a set accumulation count value of 2 .

When the filter processing result data ( $\mathrm{D}(1)$ ) is input to the accumulation circuit, the 9-bit arithmetical right-shift result data (DADD (1)) from the filter processing result data (D (1)) is written to the accumulator. After that, when the filter processing result data ( $\mathrm{D}(2)$ ) is input to the accumulation circuit, the filter processing result data ( $\mathrm{D}(2)$ ) is right shifted ( 9 bits) arithmetically (DADD (2)) and this data is added to the accumulator value (DADD (1)). The results of the addition (DADD (1) + DADD (2)) are written to the accumulator again. Next, when the filter processing result data (D (3)) is input to the accumulation circuit, the filter processing result data ( $\mathrm{D}(3)$ ) is right shifted ( 9 bits) arithmetically (DADD (3)) and this data is added to the accumulator value (DADD (1) + DADD (2)). The results of the addition (DADD (1) + DADD (2) + DADD (3)) are written to the output data register. After this writing has been completed, an output data interrupt request is issued.

When the accumulation count is set to 2, a 9-bit arithmetical right shift is made for three filter process results and these results are added, and then an interrupt request is issued once. This processing is repeated continuously.

Figure 37.53 Accumulation Processing (Set Count Value = 2)

### 37.5.10.4 Operation of Accumulation Processing (with Trigger Flag)

The following describes operation of accumulation processing when the accumulation initialization flag and the accumulation disable flag are enabled. Alternate between input to the accumulation initialization and accumulation disable flags. Operations for accumulation processing are not guaranteed in case of consecutive input to either flag.

When the accumulation initialization flag is enabled by a timer trigger or a software trigger while accumulation is specified ( $\mathrm{PRCSA}=01_{\mathrm{B}}$ in DFEjCTLBCHn), the accumulation counter is initialized and accumulation processing is executed on the first data from the target channel that immediately follows.

When the accumulation initialization flag is enabled and the accumulation count is set to 2, for example, and data (D (3)) is input to the accumulation circuit for the third time, the 9-bit arithmetical right-shift (DADD (3)) from the third data (D (3)) is written to the accumulator. The accumulation result value (DADD (1) + DADD (2)) is overwritten.

The data ( $\mathrm{D}(4)$ ) that is input to the accumulation circuit is added to the data ( $\mathrm{D}(5)$ ) that is input to the accumulation circuit. Three accumulation results ((DADD (3) + DADD (4) + DADD (5)) are written to the output data register after the accumulation initialization flag is enabled, and an output data interrupt request is issued.

Figure 37.54 Accumulation Processing (with the Initialization Flag Enabled)

When the accumulation disable flag is enabled by a timer trigger or a software trigger while accumulation is specified ( $\mathrm{PRCSA}=01_{\mathrm{B}}$ in DFEjCTLBCHn), the DFE's accumulation processing of the target channel that immediately follows is not executed and the internal accumulation disable flag is asserted. No accumulation is performed in the subsequent processing.

Figure 37.55 Accumulation Processing (with the Accumulation Disable Flag Enabled)

To execute accumulation processing again while the accumulation disable flag is asserted, enable the accumulation initialization flag.

Figure 37.56 Accumulation Processing (Disable to Enable)

### 37.5.10.5 Summary of Decimation Processing

In the decimation processing, filter processing result data that is input to the accumulation circuit is decimated. The decimation processing count can be set to up to 511. (Data is output once every 512 times.) After processing for the specified decimation count has been completed, decimation processing is executed again.

When the PRCSA bits in DFEjCTLBCHn are $10_{\mathrm{B}}$, decimation processing is executed. Specify the decimation processing count by setting the SELA bits in DFEjCTLBCHn to one of the four accumulation/decimation count setting registers (ACA to ACD).

### 37.5.10.6 Operation for Decimation Processing

The operation for decimation processing is explained using an example when $\mathrm{ACA}=0_{\mathrm{H}}, \mathrm{ACB}=1_{\mathrm{H}}, \mathrm{ACC}=2_{\mathrm{H}}$, and the PRCSA bits in DFEjCTLBCHn $=10_{\mathrm{B}}$.

When the SELA bits in DFEjCTLBCHn are set to $00_{\mathrm{B}}, \mathrm{ACA}$ is selected and decimation processing is executed with a decimation count value of 0 .

In decimation processing with a decimation count value of 0 , the filter processing result is output as it was input and an interrupt request is issued. This processing is repeated continuously.

Figure 37.57 Decimation Processing (Count Value $=0$ )

When the SELA bits in DFEjCTLBCHn are set to $01_{\mathrm{B}}$, the ACB register is selected and decimation processing is executed with a decimation count value of 1 .

When the filter processing result data ( $\mathrm{D}(1)$ ) is input to the accumulation circuit, the decimation counter is incremented. At this time, the accumulation circuit does not output the input filter processing result data (D (1)) to the output circuit because the decimation counter value differs from the specified decimation count value.

When the filter processing result data (D (2)) is input in to the accumulation circuit, the accumulation circuit outputs the input filter processing result data ( $\mathrm{D}(2)$ ) to the output circuit because the decimation counter value is equal to the specified decimation count value. The output circuit writes the data ( $\mathrm{D}(2)$ ) that is input from the accumulation circuit to the output data register and issues an output data interrupt request.

When the decimation count is set to 1 , an interrupt request is issued once every two filter processing cycles. This processing is repeated continuously.

Figure 37.58 Decimation Processing (Count Value $=1$ )

When the SELA bits in DFEjCTLBCHn are set to $10_{\mathrm{B}}$, the ACC register is selected and decimation processing is executed with a set decimation count value of 2 .

When the filter processing result data ( $\mathrm{D}(1)$ ) is input to the accumulation circuit, the decimation counter is incremented. At this time, the accumulation circuit does not output the input filter processing result data (D (1)) to the output circuit because the decimation counter value differs from the specified decimation count value.

Then, when the filter processing result data ( $\mathrm{D}(2)$ ) is input to the accumulation circuit, the decimation counter is incremented. At this time, the accumulation circuit does not output the input filter processing result data (D (2)) to the output circuit because the decimation counter value differs from the specified decimation count value.

When the filter processing result data (D (3)) is input to the accumulation circuit, the accumulation circuit outputs the input filter processing result data (D (3)) to the output circuit because the decimation counter value is equal to the set decimation count value. The output circuit writes the data (D (3)) that is input from the accumulation circuit to the output data register and issues an output data interrupt request.

When the decimation count is set to 2 , an interrupt request is issued once for every three filter processing cycles. This processing is repeated continuously.

Figure 37.59 Decimation Processing (Count Value $=2$ )

### 37.5.10.7 Operation of Decimation Processing (with Trigger Flag)

The following describes the operation of decimation processing when the decimation initialization flag and the decimation disable flag are enabled. Alternate between input to the decimation initialization and decimation disable flags. Operations for decimation processing are not guaranteed in case of consecutive input to either flag. When the decimation initialization flag is enabled by a timer trigger or a software trigger while decimation is specified (PRCSA = $10_{\mathrm{B}}$ in DFEjCTLBCHn), the decimation counter is initialized and decimation processing is executed on the first data of the target channel that immediately follows.

When the decimation initialization flag is enabled and the decimation count is set to 2 , for example, when data (D (3)) is input to the accumulation circuit for the third time, the third data (D (3)) is not output from the accumulation circuit, but is processed as the first input data. Subsequently, the accumulation circuit does not output data ( D (4)) that is input to the accumulation circuit, but does output data ( $\mathrm{D}(5)$ ) to the output circuit that is input to the accumulation circuit.

Figure 37.60 Decimation Processing (with the Initialization Flag Enabled)

When decimation is specified ( $\mathrm{PRCSA}=10_{\mathrm{B}}$ in DFEjCTLBCHn) and the decimation disable flag is enabled, the internal decimation disable flag is asserted. In the subsequent processing, the decimation counter is disabled. While decimation is disabled, no output data interrupt request is issued.

Figure 37.61 Decimation Processing (with the Decimation Disable Flag Enabled)

To execute the decimation processing again while the internal decimation disable flag is asserted, enable the decimation initialization flag.

Figure 37.62 Decimation Processing (Disable to Enable)

### 37.5.11 Subtraction Circuit

After the end of processing by the filtering circuit, the subtraction circuit performs subtraction processing by using the filtering process result data for any two channels. After subtraction processing, the subtraction result data is stored in the subtraction result register. A subtraction data interrupt request is issued, when the subtraction result data has been stored. A subtraction error interrupt request is also issued, if an error has occurred in the subtraction circuit.

If the cascade function is specified to the subtraction channel, the subtraction circuit output data is input to the dispatch circuit.

The minuend channel and the subtrahend channel must not be set to the same channel
Use the same format as the filtering process result for the minuend channel and the subtrahend channel. Subtraction processing of the filter processing result of different formats is prohibited. In this case, the data will not be guaranteed.

Subtraction is irrelevant to the specification of accumulation/decimation. Be aware that subtraction among accumulation results (S9.22) is not possible if the input data is in a fixed-point format.

The format of the input data uniquely determines the format of the subtraction result.
When the input data is in the fixed-point (S.15) format, the subtraction result is in the S .31 format.
When the input data is in the integer (S.15) format, the subtraction result is in the S31 format.

| Filtering Process Result Format | Floating-point conversion | Execution (Result) | Cascade (Output) |
| :--- | :--- | :--- | :--- |
| S.31 (Fixed-Point) | Conversion specified | OK (floating-point) | OK (S.15) |
|  | Conversion not specified | OK (S.31) | OK (S.15) |
| S31 (Integer) | Conversion specified | NO*1 $^{*}$ | OK (S31) |
|  | Conversion not specified | OK (S15) |  |

Note 1. Setting is prohibited for NO combinations.

### 37.5.11.1 Summary of the Subtraction Circuit

If subtraction is specified (DFEjSUBCTLCHn.SEN = 1), after the end of processing by the filtering circuit, subtraction processing is executed on the basis of the filtering process results for the channels set with the minuend channel selection bit (DFEjSUBCTLCHn.MINCH, hereafter called MINCH) and the subtrahend channel selection bit (DFEjSUBCTLCHn.SUBCH, hereafter called SUBCH).

The subtraction result is stored in the subtraction result data register (DFEjSUBDOCHn.SDO, hereafter called SDO).
If 1 is set to the subtraction data interrupt request enabling bit (DFEjSUBCTLCHn.SIEO), the subtraction data interrupt request is issued when the data is stored in the subtraction result data register.

In subtraction processing, three error flags are used.
(1) "Subtraction result register overwrite error (DFEjSUBSTCHn.SDOOW)" that detects overwrite of the subtraction result data.
(2) "Subtraction circuit cascading rounding error (DFEjSUBSTCHn.SCER)" that detects an overflow that occurs when 32-bit data is rounded to 16-bit data, and when the subtraction result data is used for cascade processing.
(3) "Subtraction guard error (DFEjSUBSTCHn.SGER)" that detects an overflow of the subtraction result data.

If one of these errors occurs, the error interrupt request resulting from the subtraction circuit is issued.
The conceptual image of the subtraction circuit is shown below.

Figure 37.63 Configuration of Subtraction Circuit

### 37.5.11.2 Operation of the Subtraction Circuit

## (1) Operation when Filtering Processing for Minuend Channel Is Executed Earlier

When the filtering process result for the channel set as a minuend is output, the filtering process result is held in the internal FF for storing minuend filtering result (hereafter called MTFF), and the minuend channel data input enabling bit (DFEjSUBSTCHn.MINF, hereafter called MINF) is set to 1 . When the filtering process result for the channel set with SUBCH is output after 1 is set to MINF, the subtraction circuit performs subtraction processing of the data stored in MTFF and the filtering process result of the channel set with SUBCH, and stores the subtraction result in SDO. It also clears MTFF to ALL0, and clears MINF to 0 . If subtraction is specified, this operation is executed repeatedly.

Figure 37.64 Subtraction Processing (When Processing for a Minuend Channel Is Executed Earlier)

## (2) Operation when Filtering Processing for Subtrahend Channel is Executed Earlier

When the filtering process result for the channel set as a subtrahend is output, the filtering process result is held in the internal FF for storing subtrahend filtering result (hereafter called STFF), and the subtrahend channel data input enabling bit (DFEjSUBSTCHn.SUBF, hereafter called SUBF) is set to 1 . When the filtering process result for the channel set with MINCH is output after 1 is set to SUBF, the subtraction circuit performs subtraction processing of the data stored in STFF and the filtering process result of the channel set with MINCH, and stores the subtraction result in SDO. It also clears STFF to ALL0, and clears SUBF to 0 . If subtraction is specified, this operation is executed repeatedly.

Figure 37.65 Subtraction Processing (when Processing for a Subtrahend Channel is Executed Earlier)

## (3) Operation when Filtering Processing Order of Subtrahend and Minuend Channels is Not Constant

The subtraction circuit can perform subtraction processing regardless of the filter input order of the specified MINCH and SUBCH. The following example shows the operation for $\mathrm{MINCH}=$ channel 5 and $\mathrm{SUBCH}=$ channel 4.

Figure 37.66 Subtraction Processing (when Order of Processing for Subtrahend/Minuend Channels is Not Constant)

## (4) Operation when Filtering Processing for One Channel is Executed Continuously

When one channel set as a subtrahend or a minuend is processed continuously, the latest filtering process result is held in STFF or MTFF. When one channel is processed continuously, SUBF or MINF keeps holding 1.

After that, subtraction processing is executed on the basis of the latest filtering process result for both the minuend channel and the subtrahend channel.

Figure 37.67 Subtraction Processing (when Processing for a Subtrahend Channel is Executed Continuously)

## (5) Operation when Filtering Processing for Only One Channel is Executed and Finished

When one channel set as a subtrahend or a minuend is processed continuously and the other does not undergo filtering process, SUBF or MINF keeps holding 1.

Even if a subtraction ending flag is enabled and then subtraction processing ends, STFF, MTFF, SUBF, and MINF keep holding the value.

Figure 37.68 Subtraction Processing (when Processing for Only a Subtrahend Channel is Executed and Finished)

### 37.5.11.3 Operation of Subtraction Circuit (with Subtraction Start Trigger)

To use subtraction processing, it is necessary to start filtering process after enabling the subtraction starting flag when subtraction is specified. Input the subtraction starting trigger by using a timer trigger or a software trigger, and enable the subtraction starting flag.

If the subtraction starting trigger is not input, subtraction processing is not executed during filter processing.
The subtraction circuit performs initialization during subtraction processing for subtrahend or minuend channel just after the subtraction starting flag is enabled. Specifically, the circuit initializes STFF or MTFF, which hold the filtering process result, subtrahend flag SUBF, and minuend flag MINF, and executes subtraction processing using the values as the initial data of subtraction processing.

In the following example, subtraction processing is not executed in filtering process of AD data $\mathrm{AD}(1)$ of CH 6 and AD data $\mathrm{AD}(2)$ of CH 7 . The subtraction starting flag is enabled in filtering process of AD data AD (3) of CH 6 after the subtraction starting trigger is input, and subtraction processing starts.

Figure 37.69 Subtraction Processing (Operation when Subtraction Starting Flag is enabled)

### 37.5.11.4 Operation of Subtraction Circuit (with Subtraction End Trigger)

To stop subtraction processing when subtraction is specified, it is necessary to start filtering process after enabling the subtraction ending flag. Input the subtraction ending trigger by using a timer trigger or a software trigger, and enable the subtraction ending flag.

Subtraction processing stops at the subtrahend or minuend channel just after the subtraction ending flag is enabled. After it stops, STFF, MTFF, which hold the filtering process result, subtrahend flag SUBF, and minuend flag MINF keep holding the value.

The following example shows the case where the subtraction ending trigger is input during filtering process of AD data AD (3) of CH6. The subtraction ending flag is enabled in filtering process of the AD data AD (4) of CH 7 , and subtraction processing of $\mathrm{AD}(4)$ is not executed.

Figure 37.70 Subtraction Processing (Operation when Subtraction Ending Flag is enabled)

### 37.5.11.5 Operation of Subtraction Circuit (Stop by DFEjSUBCTLCHn.SEN)

By writing 0 to the subtraction channel enabling bit (DFEjSUBCTLCHn.SEN), it is possible to stop subtraction processing for the target of subtraction channel.

Before 0 is written to the subtraction channel enabling bit, subtraction processing is executed for the channel that has accepted an activation request or the channel undergoing filtering process. After 0 is written to the subtraction channel enabling bit, even if activation request of minuend/subtrahend channel has accepted, subtraction processing is not executed in this subtraction channel. The subtraction start/end flags which have been kept are discarded from this subtraction channel.

When subtraction processing in this subtraction channel is restarted, set the bit (DFEjSUBCTLCHn.SEN) to 1. The subtraction processing starts from filter processing after 1 is set to the subtraction channel enabling bit.

Figure 37.71 Subtraction Processing (Subtraction Processing Stopped by Clearing Subtraction Channel Enabling Bit (1/2))

In the following example, since the activation request for AD data $\mathrm{AD}(2)$ of CH 7 is already accepted when 0 is written to the subtraction channel enabling bit, subtraction processing for this subtraction channel will be stopped after subtraction processing of $\mathrm{AD}(2)$ is executed.

Figure 37.71 Subtraction Processing (Subtraction Processing Stopped by Clearing Subtraction Channel Enabling Bit (2/2))

### 37.5.12 Peak-Hold Circuit

The peak-hold circuit executes peak-hold processing and comparison processing for data from the accumulation circuit outputs.

According to the setting of DFEjCTLBCHn.PRCSB in the table below, three types of processing can be selected for the peak-hold circuit: (1) Only peak-hold processing executed, (2) Only comparison processing executed, or (3) Both peakhold processing and comparison processing executed.

If $\mathrm{DFEjCTLBCHn} . \mathrm{PRCSB}=11_{\mathrm{B}}$ and $\mathrm{DFEjPH} 23 C C T L 0 . P E N ~=1$ at the same time, the peak-hold 23 function, which is an extended function for PH processing, can be selected.

| Peak-hold Circuit Setting | DFEjCTLBCHn.PRCSB | DFEjPH23CCTL0.PEN |
| :--- | :--- | :--- |
| Peak-hold processing and comparison processing prohibited | $00_{\mathrm{B}}$ | - |
| Only peak-hold executed | $01_{\mathrm{B}}$ | - |
| Only comparison executed | $10_{\mathrm{B}}$ | - |
| Both peak-hold processing and comparison processing executed | $11_{\mathrm{B}}$ | 0 |
| Peak-hold 23 function executed | $11_{\mathrm{B}}$ | $1^{* 1}$ |

Note 1. To enable the peak-hold 23 function, it is necessary to set the target channel in DFEjPH23CCTL0.CHS.

The peak-hold circuit executes peak-hold processing or comparison processing for data that is output from the accumulation circuit. When the accumulation/decimation count is specified, peak-hold processing is executed on each specified count.

In peak-hold processing, peak-hold results are written to the peak-hold result register. A condition match interrupt is generated at the end of peak-hold processing. In comparison processing, accumulation circuit output data is compared with the values of the comparison target register. When the comparison result is true, a condition match interrupt is generated.

### 37.5.12.1 Summary of Peak-Hold Processing

In peak-hold processing, the upper peak or the lower peak can be selected by the peak-hold peak selection bit (DFEjCTLBCHn.PHPS).

When the upper peak is selected, data that is input to the peak-hold circuit is compared with the data that has been input to the peak-hold circuit for each channel, and the larger value is written to the peak-hold result register as a peak-hold result.

When the lower peak is selected, data that is input to the peak-hold circuit is compared with the data that has been input to the peak-hold circuit for each channel, and the smaller value is written to the peak-hold result register as a peak-hold result.

The initial peak-hold value can be selected by using the SELB2 bits in DFEjCTLBCHn. The peak-hold circuit executes peak-hold processing from the time the peak-hold initialization flag is valid until the peak-hold end flag is valid. The peak-hold circuit does not execute peak-hold processing from the time the peak-hold end flag is valid until the peakhold initialization flag is valid. The peak-hold index register indicates how much data has been stored in the peak-hold result register since the start of peak-hold processing.

### 37.5.12.2 Operation of Peak-Hold Processing

Peak-hold processing proceeds when DFEjCTLBCHn.PRCSB $=01_{\mathrm{B}}$ (specifying peak-hold operation).
Peak-hold processing starts from the next input of data following the peak-hold initialization flag becoming valid.
Peak-hold processing ends from the next input of data following the peak-hold end flag becoming valid. After this, the peak-hold initialization flag must again become valid for peak-hold processing to be restarted.

Alternate between input to the peak-hold initialized and end flags. Operations for peak-hold processing are not guaranteed in case of consecutive input to either flag.

Values input to the peak-hold circuit are compared with the peak-hold initialization register or the peak-hold result register. The condition for updating the peak-hold value when (1) the upper peak is selected or (2) the lower peak is selected is shown below. When the condition is satisfied, the value input to the peak-hold circuit is stored in the peakhold result register.

Notifications for peak-hold updating are issued according to the settings of the peak-hold updated notification setting register.

| Peak | Function | Number Times of PH | Issue Condition |
| :---: | :---: | :---: | :---: |
| Upper peaks | PH update notification | First time*1 | PH circuit input data*2 $>$ The value of the peak-hold initial value setting register*3 |
|  |  | After the first time | PH circuit input data*2 $>$ The value of the DFEjPHCHn*4 |
| Lower peaks | PH update notification | First time*1 | PH circuit input data*2 $<$ The value of the peak-hold initial value setting register*3 |
|  |  | After the first time | PH circuit input data*2 ${ }^{\text {< The value of the DFEjPHCHn*4 }}$ |

Note 1. The first time means when filter processing is executed after PH initialization flag is valid.
Note 2. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 3. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 4. These values are compared in either fixed-point format or integer format regardless of the DFEjCTLBCHn.PFMT bit setting.

When the next value is input after the peak-hold initialization flag is valid, and when the value does not satisfy the condition for updating the peak-hold value, the value of the peak-hold initialization register is stored in the peak-hold result register, and the notification of peak-hold updating is not issued.

| Peak | Function | Number Times of PH | Update Condition | Stored Data in DFEjPHCHn |
| :---: | :---: | :---: | :---: | :---: |
| Upper peaks | Peak-Hold Result register | First time*1 | PH circuit input data*2 $>$ The value of the peak-hold initial value setting register*3 | PH circuit input data |
|  |  |  | PH circuit input data*2 $\leq$ The value of the peak-hold initial value setting register*3 | The value of the peak-hold initial value setting register*3 |
|  |  | After the first time | PH circuit input data*2 $>$ The value of the DFEjPHCHn*4 | PH circuit input data |
|  |  |  | PH circuit input data*2 $\leq$ The value of the DFEjPHCHn*4 | Holds the value of DFEjPHCHn |
| Lower peaks | Peak-Hold <br> Result register | First time*1 | PH circuit input data*2 < The value of the peak-hold initial value setting register*3 | PH circuit input data |
|  |  |  | PH circuit input data*2 $\geq$ The value of the peak-hold initial value setting register*3 | The value of the peak-hold initial value setting register*3 |
|  |  | After the first time | PH circuit input data*2 $<$ The value of the DFEjPHCHn ${ }^{* 4}$ | PH circuit input data |
|  |  |  | PH circuit input data*2 $\geq$ The value of the DFEjPHCHn*4 | Holds the value of DFEjPHCHn |

Note 1. The first time means when filter processing is executed after PH initialization flag is valid.
Note 2. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 3. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 4. These values are compared in either fixed-point format or integer format regardless of the DFEjCTLBCHn.PFMT bit setting.

### 37.5.12.3 Operation of Peak-Hold Processing (Trigger Flag is Enabled)

Operations for peak-hold initialization are shown below.
The execution for the peak-hold processing of values from the given ADC starts once the peak-hold initialization flag becomes valid.

Figure 37.72 Operations for Peak-Hold Initialization

Operations for ending peak-hold are shown below. The execution for the peak-hold processing of values from the given ADC does not start when the peak-hold end flag becomes valid.

Figure 37.73 Operations for Ending Peak-Hold Processing

The effective range of peak-hold initialization/end flags in each mode of peak-hold circuit is explained below.
The peak-hold processing is always affected by these flags.
The comparison processing is not affected by these flags except for the peak-hold 23 mode. Comparison is performed without being affected by these flags for all modes except peak-hold 23 .

For the peak-hold stop status in peak-hold 23 mode, neither the peak-hold processing nor the comparison processing is executed.

| Peak-Hold Circuit Setting | Peak-Hold Initialization/End Flag |  |
| :--- | :--- | :--- |
|  | Peak-Hold Processing | Comparison Processing |
| Only peak-hold executed | - | - |
| Only comparison executed | Valid | - |
| Both peak-hold processing and comparison processing executed | - | Valid |
| Peak-hold 23 function executed | Valid | Invalid |

The effective range of Peak-Hold Processing Disable bit (DFEjCTLBCHn.DISB) in each mode of peak-hold circuit is explained below.

The peak-hold processing is always affected by this bit.
The comparison processing is not affected by this bit except for the peak-hold 23 mode. Comparison is performed without being affected by this bit for all modes except peak-hold 23 .

For the peak-hold stop status by this bit in peak-hold 23 mode, neither the peak-hold processing nor the comparison processing is executed.

|  |  | Start/Stop by DISB |
| :--- | :--- | :--- |
| Peak-Hold Circuit Setting | Peak-Hold Processing | Comparison Processing |
| Peak-hold processing and comparison processing prohibited | - | - |
| Only peak-hold executed | Valid | - |
| Only comparison executed | - | Invalid |
| Both peak-hold processing and comparison processing executed | Valid | Invalid |
| Peak-hold 23 function executed | Valid | Valid |

### 37.5.12.4 Operation of Peak-Hold Mask Processing (Trigger Flag is Enable)

The peak-hold mask start/end operation is described below. If the timer trigger set as the peak-hold mask start flag is input, it is held inside the DFE as the peak-hold mask start flag. In the next filtering process, the peak-hold mask start flag is enabled and peak-hold processing stops. Be aware that, during peak-hold mask, peak-hold processing is stopped but the internal peak-hold counter works without stopping.

If the timer trigger set as the peak-hold mask end flag is input, it is held inside the DFE as the peak-hold mask end flag. When peak-hold processing in the next filtering process is executed, the peak-hold mask end flag is enabled and peakhold processing resumes.

Figure 37.74 Peak-hold Masking Operation

To mask peak-hold processing for a specified period from the start of peak-hold processing, make the settings as follows. Before the filter processing where the peak-hold initialization flag is enabled is started, input the timer trigger set as the peak-hold mask start flag. At this time, both the peak-hold initialization flag and the peak-hold mask start flag are held inside the DFE. When filter processing is started with the peak-hold initialization flag and the peak-hold mask start flag held, peak-hold processing is not executed but remains stopped. Then, the peak-hold counter counts it but the peak-hold index register is hold previous value.

To resume peak-hold processing, enable the peak-hold mask end flag. The peak-hold initialization flag is enabled when the filter processing with the peak-hold mask end flag enabled is executed. Therefore, peak-hold processing is executed from this filter processing, and the value of peak-hold circuit input data and the value of peak-hold initial value register are compared with each other. Then, the peak-hold counter is updated, too.

In both examples (1) and (2) below, the peak-hold processing can be masked from the start of peak-hold processing.

Figure 37.75 Peak-Hold Mask Processing for Specified Period from Start of Peak-Hold Processing (1/2)

Figure 37.75 Peak-Hold Mask Processing for Specified Period from Start of Peak-Hold Processing (2/2)

The effective range of peak-hold mask start/end flags in each mode of peak-hold circuit is explained below.
The peak-hold processing is always affected by these flags.
Comparison is performed without being affected by these flags for all modes except peak-hold 23.
For the peak-hold mask status in peak-hold 23 mode, neither the peak-hold processing nor the comparison processing is executed.

| Peak-Hold Circuit Setting | Peak-Hold Mask Start/End Flag |  |
| :--- | :--- | :--- |
|  | Peak-Hold Processing | Comparison Processing |
| Peak-hold processing and comparison processing prohibited | - | - |
| Only peak-hold executed | Valid | - |
| Only comparison executed | - | Invalid |
| Both peak-hold processing and comparison processing executed | Valid | Invalid |
| Peak-hold 23 function executed | Valid | Valid |

### 37.5.12.5 Operation of Comparison Processing

In comparison processing, the peak-hold circuit input data is compared with the values of comparison target registers (CPA to CPD) for each channel. When the comparison result is true, the CND flag (condition match flag) is asserted and a condition match interrupt request is issued. Comparison processing is not affected by trigger flags except for the peak-hold 23 mode.

The following comparison calculations can be performed.

| Comparison | Description |
| :--- | :--- |
| Equal to $(==)$ | "Equal to $(==) "$ calculation is performed between the peak-hold circuit input data and the value <br> selected for comparison. When the comparison result is "equal to", it is true. |
| Equal to or less than $(\leq)$ | "Equal to or less than $(\leq) "$ calculation is performed between the peak-hold circuit input data and the <br> value selected for comparison. When the comparison result is "equal to or less than", it is true. |
| Equal to or more than $(\geq)$ | "Equal to or more than $(\geq) "$ calculation is performed between the peak-hold circuit input data and the <br> value selected for comparison. When the comparison result is "equal to or more than", it is true. |
| Less than $(<)$ | "Less than $(<) "$ calculation is performed between the peak-hold circuit input data and the value <br> selected for comparison. When the comparison result is "less than", it is true. |
| More than $(>)$ | "More than $(>) "$ calculation is performed between the peak-hold circuit input data and the value <br> selected for comparison. When the comparison result is "more than", it is true. |

Once the comparison calculation result is true and the condition match bit (CND in DFEjSTCHn) is set to 1 , the condition match bit remains 1 even if the subsequent comparison calculation result is false. Use the clear status register to clear the condition match bit to 0 .

### 37.5.12.6 Operation of the Peak-Hold Index Register

When peak-hold processing is enabled (by setting DFEjCTLBCHn.PRCSB to $01_{\mathrm{B}}$ ), the peak-hold counter in the digital filter is cleared after the first round of peak-hold processing following input of the peak-hold initialization flag. After that, the peak-hold counter is incremented every time a value is peak-hold processed (whether or not it satisfies the condition for updating the peak-hold value).

Figure 37.76 Operation of the Peak-Hold Counter at the Start of Peak-Hold Processing

Input of the peak-hold end flag leads to the end of peak-hold processing following input of the next value for peak-hold processing. If the peak-hold end flag becomes valid, the peak-hold counter and results register retain their previous values but do not update in response to data from the ADC. The values are retained until the peak-hold initialization flag becomes valid again.

Figure 37.77 Operation of the Peak-Hold Counter at the End of Peak-Hold Processing

If the peak-hold update condition is satisfied, updating the peak-hold result register stores the peak-hold counter value to the PHIND bits of the peak-hold index register when the peak-hold counter is incremented.

Figure 37.78 Peak-Hold Counter and Peak-Hold Index Register

When 16384 rounds of peak-hold processing are completed, the PHIOF bit in the peak-hold index register is set to 1 . At this time, the value of the peak-hold counter becomes 0 . Since the value of the peak-hold counter is stored in the PHIND bits when the input value satisfies the condition for updating the peak-hold value, the value of the PHIND bits becomes 0 if the condition is satisfied, but the previous value is retained if it is not.

Figure 37.79 Setting of the Peak-Hold Index Overflow Bit

### 37.5.12.7 Reading of the Peak-Hold Index Register and Operation

Read the peak-hold index register between the end of peak-hold processing and the next time it starts (i.e. while peakhold processing is disabled).

Operation of the peak-hold index register differs according to whether or not it is read.
Operations in peak-hold index updating and peak-hold retention modes also differ if the peak-hold index register is not read.

## (1) When the Register is Read while Peak-Hold Processing is Disabled

The following applies whether the mode is peak-hold index updating or peak-hold index retention.
The PHIND and PHIOF bits are cleared when the first value for peak-hold processing is handled after peak-hold processing starts. The value of the PHIOW bit does not change.

The value of the peak-hold counter becomes 1, as does the value of the PHIND bits.
The peak-hold result register is not affected by whether reading or not reading peak-hold index register. Refer to Section 37.5.12.2. for the details.

Figure 37.80 Operation of the Peak-Hold Index Register when it is Read

## (2) When the Register is Not Read while Peak-Hold Processing is Disabled

- Peak-hold index update mode (DFEjCTLBCHn.PICS $=0$ ):

The PHIND and PHIOF bits are cleared when the first value for peak-hold processing is handled after peak-hold processing starts and the PHIOW bit is set.

The value of the peak-hold counter becomes 1, as does the value of the PHIND bits.
To clear the PHIOW bit, write 1 to DFEjCLRSTCHn.CLRPHIOW.

Figure 37.81 Operation of the Peak-Hold Index Register When It is Not Read (in Updating Mode)

- Peak-hold index retention mode (DFEjCTLBCHn.PICS $=1$ ):

The values of the PHIND and PHIOF bits are retained the next time peak-hold processing starts. The value of PHIOW does not change.

If the register is read following the next and subsequent times peak-hold processing is ended, starting peak-hold processing again leads to clearing of the PHIND and PHIOF bits (refer to (1) When the Register is Read while Peak-Hold Processing is Disabled).

Figure 37.82 Operation of the Peak-Hold Index Register when it is Not Read (in Retention Mode)

### 37.5.12.8 Operation When Both Peak-Hold Processing and Comparison Processing Are Executed

When the peak-hold circuit processing select bit (DFEjCTLBCHn.PRCSB) is $11_{\mathrm{B}}$ and the peak-hold 23 function enable bit (DFEjPH23CCTL0.PEN) is 0 , peak-hold processing and comparison processing can be executed simultaneously.

In this mode, comparison processing is always executed. Peak-hold processing has a valid processing period based on the peak-hold initialization and end flags, and a peak-hold stop period based on the peak-hold mask start and end flags. In peak-hold processing, the peak-hold end interrupt request is issued in the filter processing where the peak-hold end flag is enabled.

In comparison processing, the condition match interrupt request is issued when the comparison condition is true.

Figure 37.83 Operation when Peak-Hold Processing and Comparison Processing Are Executed Simultaneously (Peak-Hold Initialization/End Flag Enabled)

Figure 37.84 Operation when Peak-Hold Processing and Comparison Processing Are Executed Simultaneously (Peak-Hold Mask Start/End Flag Enabled)

### 37.5.12.9 Summary of Peak-Hold-23 Processing

The peak-hold-23 function is an extended function for peak-hold processing. The peak-hold-23 function allows you to detect the three peak points of the filtering process result.

Peak-hold processing is executed for the channel targeted for the peak-hold-23 function. Transitions from peak-hold-1 processing to peak-hold-2 processing and from peak-hold-2 processing to peak-hold-3 processing are realized in comparison processing. In this way, it is possible to hold the three peak-hold results by switching between peak-hold-1 processing, peak-hold- 2 processing, and peak-hold- 3 processing.

Table 37.84 Overview of Each Processing of Peak-Hold-23 Function

| Category | Peak-hold Processing | Comparison Processing |
| :---: | :---: | :---: |
| Peak-hold-1 processing | The upper/lower peak is detected. <br> - The peak value is held in the peak-hold result register. <br> - When the peak is detected, the notification of Peak-hold updates can be output. | - When the comparison computation result for peak-hold1 processing is true, the transition to peak-hold-2 processing occurs. <br> - The condition match interrupt is not output. |
| Peak-hold-2 processing | - The upper/lower peak is detected. <br> - The peak value is held in the peak-hold-2 result register 0. <br> - When the peak is detected, the notification of peak-hold updates can be output. | - When the comparison computation result for peak-hold2 processing is true, the transition to peak-hold-3 processing occurs. <br> - The condition match interrupt is not output. |
| Peak-hold-3 processing | - The upper/lower peak is detected. <br> - The peak value is held in the peak-hold-3 result register 0. <br> - When the peak is detected, the notification of peak-hold updates can be output. | - When the comparison computation result for peak-hold3 processing is true, the condition match interrupt is output, and peak-hold processing and comparison processing stop. |

### 37.5.12.10 Operation of Peak-Hold-23 Function

With the settings described in Section 37.5.12.14, for the target channel, the peak-hold-23 function becomes available in peak-hold processing.

Peak-hold processing is executed by each of peak-hold-1 processes, peak-hold-2 processes, and peak-hold-3 processes using the data input to the peak-hold circuit. When the comparison computation result is true in each peak-hold processing, the transitions to peak-hold-2 and peak-hold-3 processing occur.

The status of the peak-hold- 23 function can be checked by the peak-hold- 23 function status bits (DFEjSTCHn.PH23ST).

Peak-hold-1 processing starts first for the filter processing where the peak-hold initialization flag has been enabled. When the condition for PH updates is matched during peak-hold-1 processing, the data input to the peak-hold circuit is stored in the peak-hold result register of the channel, and the notification of updates is issued. When the comparison computation result for peak-hold-1 processing is true, the transition to peak-hold-2 processing occurs in the next filtering process.

During peak-hold-2 processing, as with peak-hold-1 processing, the peak value is stored in the peak-hold-2 result register 0 , and the notification of updates is issued. When the comparison condition for peak-hold- 2 processing is true, the transition to peak-hold- 3 processing occurs in the next filtering process.

During peak-hold-3 processing, as with peak-hold-1 processing, the peak value is stored in the peak-hold-3 result register 0 , and the notification of updates is issued. When the comparison condition for peak-hold-3 processing is true, the condition match interrupt request is issued, and both peak-hold processing and comparison processing stop in the next filter process.

During the stop period, peak-hold processing and comparison processing are not executed. The peak-hold end interrupt request is issued in the filter process where the peak-hold end flag has been enabled, and the operation of the peak-hold23 function ends.

When the peak-hold initialization flag is enabled again, peak-hold-1 processing starts in that filter process. Then, this operation is repeated. Operation of the peak-hold- 23 function is shown below.

Figure 37.85 Operation of the Peak-Hold-23 Function

## (1) Settings of Peak-Hold-23 Function

With the following settings, the peak-hold-23 function can be used for the target channel.

| Category | Register Bit Name | Value | Remarks |
| :--- | :--- | :--- | :--- |
| Setting mode | DFEjPH23CCTL0.PEN | 1 | Peak-hold-23 Function is enabled. |
|  | DFEjPH23CCTL0.CHS | Channel number | The target channel of peak-hold-23 function is selected. |

(2) Settings and Operation of Peak-Hold-1 Processing
(a) Settings

The register settings required for peak-hold-1 processing are shown below.
To make the settings for peak-hold processing, it is necessary to select the upper or lower peak and the initial values of peak-hold processing.

To make the settings for comparison processing, it is necessary to select the comparison computation, the comparison offset value setting register, and the comparison offset value.

Make sure that the data format of the comparison offset value $\alpha$ is the same as the format of the filter processing result. By setting the comparison offset value with a two's complement, it is possible to execute the comparison computation with a comparison target value as "Value of peak-hold result register $n-\alpha$ ". The setting of the comparison offset value $\alpha$ is the same as that for peak-hold-2 processing and peak-hold- 3 processing.

| Category | Register Bit Name | Value | Remarks |
| :--- | :--- | :--- | :--- |
| Setting mode | DFEjCTLBCHn.PRCSB | $11_{B}$ | Indispensable setting |
| Peak-hold <br> processing | DFEjCTLBCHn.PHPS | x | Selects the upper or lower peak. |
|  | DFEjCTLBCHn.PHSLB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the PH initial value register. |
|  | DFEjCTLBCHn.CPCS | 1 | Indispensable setting |
|  | DFEjCTLBCHn.SELB1 | $00_{B}$ | Selects the value of PH result register $\mathrm{n}+\alpha$. |
|  | DFEjCTLBCHn.SELB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the comparison computation. |
|  | DFEjCTLBCHn.OFSL | $\mathrm{xx}_{\mathrm{B}}$ | Selects the comparison offset value setting register to use. |
|  | DFEjCPOFSTn.CPOFST | $\mathrm{xxxx} \mathrm{xxxx}_{\mathrm{H}}$ | Sets the comparison offset value; <br> two's complement when $-\alpha$ is set. |

## (b) Operation

In peak-hold processing for the peak-hold-1 process, the notification of peak-hold updates is issued and the data input to the peak-hold circuit is stored in the peak-hold result register. Conditions for peak-hold updates of peak-hold-1 process are as follows.

| Peak | Function |  | Number Times of PH |  | Issue Condition |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Upper peaks | PH update notification |  | First tim |  | PH circuit input data*2 $>$ The value of the peak-hold initial value setting register*3 |  |
|  |  |  | After the first time |  | PH circuit input data* ${ }^{* 2}$ The value of the DFEjPHCHn*4 |  |
| Lower peaks | PH update notification |  | First time*1 |  | PH circuit input data*2 ${ }^{*}$ The value of the peak-hold initial value setting register*3 |  |
|  |  |  | After the first time |  | PH circuit input data*2 < The value of the DFEjPHCHn*4 |  |
| Peak F | Function | Number Times of PH |  | Update Cond |  | Stored Data in DFEjPHCHn |

Note 1. The first time means when filter processing is executed after PH initialization flag is valid.
Note 2. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 3. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 4. These values are compared in either fixed-point format or integer format regardless of the DFEjCTLBCHn.PFMT bit setting.

- Comparison processing of peak-hold-1 processing is used as the condition for the transition to peak-hold-2 processing. In comparison processing, the following comparison computation is performed. In the following comparison processing, a "less-than operation ( $(<)$ " is selected as an example.

[^15](3) Settings and Operation of Peak-Hold-2 Processing
(a) Settings

The register settings required for peak-hold-2 processing are shown below.
To make the settings for peak-hold processing, it is necessary to select the upper or lower peak and the initial values of peak-hold processing.

To make the settings for comparison processing, it is necessary to select the comparison computation, the comparison offset value setting register, and the comparison offset value.

| Category | Register Bit Name | Value | Remarks |
| :--- | :--- | :--- | :--- |
| Peak-hold <br> processing | DFEjPH2CTL0.PHPS | x | Selects the upper or lower peak. |
|  | DFEjPH2CTL0.PH2SLB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the PH initial value register. |
| Comparison <br> processing | DFEjPH2CTL0.CN2SLB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the comparison computation. |
|  | DFEjPH2CTL0.OFSL | $\mathrm{xx}_{\mathrm{B}}$ | Selects the comparison offset value setting register to use. |
|  | DFEjCPOFSTn.CPOFST | $\mathrm{xxxx} \mathrm{xxxx}_{H}$ | Sets the comparison offset value; <br> two's complement when $-\alpha$ is set. |

## (b) Operation

In peak-hold processing of peak-hold-2 process, the notification of peak-hold updates is issued and the data input to the peak-hold circuit is stored in the peak-hold-2 result register 0 . Conditions for peak-hold updates of peak-hold- 2 process are as follows.

| Peak | Function |  | Number Times of PH | Issue Condition |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Upper peaks | S PH update notification |  | The first time of transition to PH 2 processing | PH circuit input data*1 $>$ The value of the peak-hold initial value setting register*2 |  |
|  |  |  | After the first time | PH circuit input data*1 $>$ The value of the DFEjPH20*3 |  |
| Lower peaks | PH update | notification $\begin{aligned} & \text { The firs } \\ & \text { to PH2 }\end{aligned}$ | The first time of transition to PH2 processing | PH circuit input data*1 < The value of the peak-hold initial value setting register*2 |  |
|  |  |  | After the first time | PH circuit input data*1 < The value of the DFEjPH20*3 |  |
| Peak F |  Number Times of <br> Function PH |  | Update Condition |  | Stored Data in DFEjPH20 |
| Upper peaks | Peak-Hold Result register | The first time of transition to PH2 processing | PH circuit input data*1 $>$ The value of the peak-hold initial value setting register*4 |  | PH circuit input data |
|  |  |  | PH circuit input data*1 $\leq$ The value of the peak-hold initial value setting register*4 |  | The value of the peak-hold initial value setting register*4 |
|  |  | After the first time | PH circuit input da DFEjPH20*3 | ata* ${ }^{* 1}$ The value of the | PH circuit input data |
|  |  |  | PH circuit input dat DFEjPH20*3 | ata*1 $\leq$ The value of the | Holds the value of DFEjPH20 |

|  |  |  | PH circuit input da peak-hold initial | ata*1 $\geq$ The value of the value setting register*4 | The value of the peak-hold initial value setting register*4 |
|  |  | After the first time | PH circuit input da DFEjPH20*3 | ata* ${ }^{* 1}$ The value of the | PH circuit input data |
|  |  |  | PH circuit input da DFEjPH20*3 | ata* ${ }^{* 1} \geq$ The value of the | Holds the value of DFEjPH20 |

Note 1. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 2. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 3. These values are compared in either fixed-point format or integer format regardless of the DFEjPH23CCTL0.PFMT bit setting.
Note 4. For detail of the peak-hold initial value setting, refer to Note of DFEjPH2CTLO.PH2SLB2 in Section 37.3.36, DFEjPH2CTLO - Peak-Hold 2 Control Register 0.

- Comparison processing of peak-hold-2 process is used as the condition for the transition to peak-hold-3 processing. In comparison processing, the following comparison computation is performed. In the following comparison processing, a "greater-than operation ( $>$ )" is selected as an example.

[^16]```
value of input data to peak-hold circuit > value of peak-hold-2 result register 0+\alpha.
```

(4) Settings and Operation of Peak-Hold-3 Processing
(a) Settings

The register settings required for peak-hold- 3 processing are shown below.
To make the settings for peak-hold processing, it is necessary to select the upper or lower peak and the initial values of peak-hold processing.

To make the settings for comparison processing, it is necessary to select the comparison computation, the comparison offset value setting register, and the comparison offset value.

| Category | Register Bit Name | Value | Remarks |
| :--- | :--- | :--- | :--- |
| Peak-hold <br> processing | DFEjPH3CTL0.PHPS | x | Selects the upper or lower peak. |
|  | DFEjPH3CTL0.PH3SLB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the PH initial value register. |
| Comparison <br> processing | DFEjPH3CTL0.CN3SLB2 | $\mathrm{xxx}_{\mathrm{B}}$ | Selects the comparison computation. |
|  | DFEjPH3CTL0.OFSL | $\mathrm{xx}_{\mathrm{B}}$ | Selects the comparison offset value setting register to use. |
|  | DFEjCPOFSTn.CPOFST | $\mathrm{xxxx} \mathrm{xxxx}_{H}$ | Sets the comparison offset value; <br> two's complement when $-\alpha$ is set. |

## (b) Operation

In peak-hold processing of peak-hold-3 process, the notification of peak-hold updates are issued and the data input to the peak-hold circuit is stored in the peak-hold-3 result register 0 . Conditions for peak-hold updates of peak-hold- 3 process are as follows.

| Peak | Function |  | Number Times of PH |  | Issue Condition |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Upper peaks | PH update notification |  | The first time of transition to PH3 processing |  | PH circuit input data*1 $>$ The value of the peak-hold initial value setting register*2 |  |
|  |  |  | After the first time |  | PH circuit input data*1 $>$ The value of the DFEjPH30*3 |  |
| Lower peaks | PH update notification |  | The first time of transition to PH3 processing |  | PH circuit input data*1 < The value of the peak-hold initial value setting register*2 |  |
|  |  |  | After the first time |  | PH circuit input data*1 < The value of the DFEjPH30*3 |  |
| Peak F | Function | Number Times of PH |  | Update Condition |  | Stored Data in DFEjPH30 |
| Upper peaks | Peak-Hold <br> Result register | The first time of transition to PH3 processing |  | PH circuit input data*1 $>$ The value of the peak-hold initial value setting register*4 |  | PH circuit input data |
|  |  |  |  | PH circuit input data*1 $\leq$ The value of the peak-hold initial value setting register*4 |  | The value of the peak-hold initial value setting register*4 |
|  |  | After the first time |  | PH circuit input d DFEjPH30*3 | ata*1 $>$ The value of the | PH circuit input data |
|  |  |  |  | PH circuit input d DFEjPH30*3 | ata* ${ }^{\text {} \leq \text { The value of the }}$ | Holds the value of DFEjPH30 |
| Lower peaks | Peak-Hold <br> Result register | The first time of transition to PH3 processing |  | PH circuit input data*1 < The value of the PH circuit input data peak-hold initial value setting register*4 |  |  |
|  |  |  |  | PH circuit input d peak-hold initial | ata*1 $\geq$ The value of the alue setting register*4 | The value of the peak-hold initial value setting register*4 |
|  |  | After the | first time | PH circuit input d DFEjPH30*3 | ata*1 < The value of the | PH circuit input data |
|  |  |  |  | PH circuit input d DFEjPH30*3 | ata*1 $\geq$ The value of the | Holds the value of DFEjPH30 |

Note 1. PH input data is the output data of the filter circuit or accumulation/decimation circuit.
Note 2. The register means one of the DFEjPHIA-DFEjPHID registers.
Note 3. These values are compared in either fixed-point format or integer format regardless of the DFEjPH23CCTL0.PFMT bit setting.
Note 4. For detail of the peak-hold initial value setting, refer to Note of DFEjPH3CTLO.PH3SLB2 in Section 37.3.37, DFEjPH3CTLO - Peak-Hold 3 Control Register 0.

- Comparison processing of peak-hold-3 process is used as the condition for ending peak-hold-3 processing. In comparison processing, the following comparison computation is performed. In the following comparison processing, a "less-than operation ( $<$ )" is selected as an example.

In peak-hold-3 processing, the condition match interrupt request is issued when the comparison computation result is true. In the subsequent filter processing, both peak-hold processing and comparison processing stop.

The peak-hold end interrupt request is issued in the filter process where the peak-hold end flag has been enabled, and the operation of the peak-hold- 23 function for that channel ends.

Comparison processing of peak-hold-3
value of input data to peak-hold circuit < value of peak-hold-3 result register $0+\alpha$.

Page 3905 of 4595

### 37.5.12.11 Operation of the Peak-Hold Index Register When Peak-Hold-23 is Enabled

When the peak-hold-23 function is used, the peak-hold count value is stored in each peak-hold index register for each peak-hold process. The operations of the peak-hold-2 index register 0 (DFEjPH2IND0) and the peak-hold-3 index register 0 (DFEjPH3IND0) are the same as those of the peak-hold index register (DFEjPHINDCHn) of the channel targeted for the peak-hold-23 function.

| Category | Target Register | Remarks |
| :--- | :--- | :--- |
| Peak-hold 1 <br> processing | DFEjPHINDCHn | This register operates only during peak-hold-1 processing. It holds the value and stops <br> when the transition to peak-hold-2 processing occurs. |
| Peak-hold 2 <br> processing | DFEjPH2IND0 | This register operates only during peak-hold-2 processing. It holds the value and stops <br> when the transition to peak-hold-3 processing occurs. |
| Peak-hold 3 <br> processing | DFEjPH3IND0 | This register operates only during peak-hold-3 processing. It holds the value and stops <br> when peak-hold-3 processing ends. |

Figure 37.86 Operation of Peak-Hold Index Register when Peak-Hold-23 Function is used

### 37.5.12.12 Status of Peak-Hold-23 Function

The condition match interrupt request is issued when the comparison computation result is true in peak-hold-3 processing. The peak-hold end interrupt request is issued when the filter processing where a peak-hold end flag that is enabled is executed.

The status of the peak-hold 23 function can be checked by reading the peak-hold 23 function status bit (DFEjSTCHn.PH23ST). For details, see Section 37.3.8, DFEjSTCHn - Status Register $\mathbf{n}$ ( $\mathbf{n}=0$ to 11, for DFE0, $\mathbf{n}=\mathbf{0}$ to $\mathbf{3}$ for DFE1).

When enabling the peak-hold initialization flag again, clear the status bit to $000_{\mathrm{B}}$ in advance if the status bit indicates neither $000_{\mathrm{B}}$ nor $100_{\mathrm{B}}$.

### 37.5.12.13 Operation of Peak-Hold-23 Function (Trigger Flag is enable)

The peak-hold-23 function is affected by the function of peak-hold mask because this is an extended function for peakhold processing. After the peak-hold mask start flag was set valid, the peak-hold-23 processing is kept stopped until the peak-hold mask end flag is set valid.

And the peak-hold- 23 function is affected by the auto initialization flag. After the auto initialization flag which is the peak-hold 23 processing target channel was valid, target registers of the auto initialization are initialized (Target registers are DFEjSTCHn.PH23ST, DFEjPHCHn, DFEjPHINDCHn, DFEjPH20, DFEjPH2IND0, DFEjPH30 and DFEjPH3IND0) .

Then, when the peak-hold processing is invalid, the PH 23 ST bit is set $000_{\mathrm{B}}$. After that, when peak-hold processing is valid, the PH 23 ST bit is set $001_{\mathrm{B}}$.

When the auto initialization flag which is the peak-hold 23 processing target channel is valid, and when the peak-hold initialization flag is valid and when the peak-hold mask start flag is valid, target registers of the auto initialization are initialized. The PH23ST bit keeps $000_{\mathrm{B}}$ until the peak-hold mask is set invalid.

After the peak-hold mask is set invalid, PH 23 ST bit is set $001_{\mathrm{B}}$ and the peak-hold 1 processing is started.

### 37.5.12.14 Setting Example of Peak-Hold-23 Function

The peak-hold- 23 function is used to detect the three peak points of the filtering process result for the channel. The following two cases are assumed.
(1) To Detect the Three Peak Points Starting from the Rising Edge
(2) To Detect the Three Peak Points Starting from the Falling Edge

The following paragraphs describe how to make the settings for each of the two cases.

## (1) To Detect the Three Peak Points Starting from the Rising Edge

This paragraph exemplifies how to set the peak-hold-23 function when you detect the three peak points of filter output values starting from the rising edge.

For the channel targeted for the peak-hold 23 function, make the settings as shown in the example below.
Table 37.85 Setting Example of Peak Detect Starting from the Rising Edge

|  | Category | Register Bit Name | Value | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| Peak-hold-23 common setting | Mode setting | DFEjPH23CCTL0.PEN | 1 |  |
|  |  | DFEjPH23CCTL0.CHS | Channel number | Channel targeted for peak-hold-23 |
|  | Initial value setting | DFEjPHIA.PHI | 8000 0000 ${ }_{\text {H }}$ | Negative minimum |
|  |  | DFEjPHIB.PHI | 7FFF FFFF ${ }_{\text {H }}$ | Positive maximum |
| Peak-hold-1 processing | Mode setting | DFEjCTLBCHn.PRCSB | $11_{B}$ | Indispensable setting |
|  | Peak-hold processing | DFEjCTLBCHn.PHPS | 0 | Upper peak |
|  |  | DFEjCTLBCHn.PHSLB2 | $000{ }_{\text {B }}$ | Selects DFEjPHIA. |
|  | Comparison processing | DFEjCTLBCHn.CPCS | 1 | Indispensable setting <br> Selects the value of peak-hold result register $n+\alpha$. |
|  |  | DFEjCTLBCHn.SELB1 | $00_{B}$ |  |
|  |  | DFEjCTLBCHn.SELB2 | 001 ${ }_{\text {B }}$ | Less than or equal ( $\leq$ ) |
|  |  | DFEjCTLBCHn.OFSL | $00_{B}$ | Selects DFEjCPOFST0. |
|  |  | DFEjCPOFST0.CPOFST | Value of $\alpha 1$ | Two's complement |
| Peak-hold-2 processing | Peak-hold processing | DFEjPH2CTL0.PHPS | 1 | Lower peak |
|  |  | DFEjPH2CTL0.PH2SLB2 | 001 ${ }_{\text {B }}$ | Selects DFEjPHIB. |
|  | Comparison processing | DFEjPH2CTL0.CN2SLB2 | 010 ${ }_{\text {B }}$ | Greater than or equal ( $\geq$ ) |
|  |  | DFEjPH2CTL0.OFSL | 01 ${ }_{\text {B }}$ | Selects DFEjCPOFST1. |
|  |  | DFEjCPOFST1.CPOFST | Value of $\alpha 2$ |  |
| Peak-hold-3 processing | Peak-hold processing | DFEjPH3CTL0.PHPS | 0 | Upper peak |
|  |  | DFEjPH3CTL0.PH3SLB2 | $000{ }_{\text {B }}$ | DFEjPHIA selected |
|  | Comparison processing | DFEjPH3CTL0.CN3SLB2 | 001 ${ }_{\text {B }}$ | Less than or equal ( $\leq$ ) |
|  |  | DFEjPH3CTL0.OFSL | $10_{B}$ | Selects DFEjCPOFST2. |
|  |  | DFEjCPOFST2.CPOFST | Value of $\alpha 3$ | Two's complement |

## (2) To Detect the Three Peak Points Starting from the Falling Edge

This paragraph exemplifies how to set the peak-hold- 23 function when you detect the three peak points of filter output values starting from the rising edge.

For the channel targeted for the peak-hold 23 function, make the settings as shown in the example below.
Table 37.86 Setting Example of Peak Detect Starting from the Falling Edge

|  | Category | Register Bit Name | Value | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| Peak-hold-23 common setting | Mode setting | DFEjPH23CCTL0.PEN | 1 |  |
|  |  | DFEjPH23CCTL0.CHS | Channel number | Channel targeted for peak-hold-23 |
|  | Initial value setting | DFEjPHIA.PHI | 7FFF FFFF ${ }_{\text {H }}$ | Positive maximum |
|  |  | DFEjPHIB.PHI | 8000 0000 ${ }_{\text {H }}$ | Negative minimum |

|  | Comparison processing | DFEjPH3CTL0.CN3SLB2 | 010 ${ }_{\text {B }}$ | Greater than or equal ( $\geq$ ) |
|  |  | DFEjPH3CTL0.OFSL | $10_{B}$ | Selects DFEjCPOFST2. |
|  |  | DFEjCPOFST2.CPOFST | Value of $\alpha 3$ |  |

### 37.5.13 Output Circuit

### 37.5.13.1 Floating-Point Conversion Circuit

This circuit executes IEEE754 floating-point conversion of (S.31) format data that is input to the output circuit and (S9.22) format data after accumulation. Setting the PRCSC bit of the control register B (DFEjCTLBCHn) to 1 converts data to be stored in the output data register to the floating-point format.

### 37.5.13.2 Output Register Circuit

The output register circuit has 32-bit registers for each channel. Input calculation result data or floating-point conversion results are stored in the output register (DFEjDOCHn.DO[31:0]) for each channel.

When the results of calculation with DFEjCTLBCHn.PRCSA $=01_{\mathrm{B}}$ (accumulation) or DFEjCTLBCHn.PRCSA $=10_{\mathrm{B}}$ (decimation) are written to an output register, the DOEN bit in DFEjSTCHn is set and an interrupt request is generated. When filter processing is executed with DFEjCTLBCHn.PRCSA $=00_{\mathrm{B}}$, the filtering results are stored in an output register but the DOEN bit is not set and no interrupt is output.

To execute filter processing without accumulation/decimation and output an interrupt, set the PRCSA bit in DFEjCTLBCHn to $10_{\mathrm{B}}$ (decimation) and set the decimation count to 0 .

The DOEN flag in DFEjSTCHn is automatically cleared to 0 by reading the output register. If another calculation result is written to the output data register with the DOEN flag in DFEjSTCHn set to 1, the value in the output data register is overwritten. At this time, the DOOW bit in DFEjSTCHn is set to 1 .

The DOEN bit in DFEjSTCHn is cleared to 0 by reading DFEjDOCHn (output data register) from the peripheral bus or setting the CLRDOOW bit in DFEjCLRSTCHn to 1 .

### 37.5.13.3 Floating Point Conversion Circuits for the Intermediate Value Output Registers L and H

An intermediate value circuit produces 38 -bit values, which can be processed by floating-point conversion to conform with the IEEE 754 standard in the case of even number channels. If the value of the HOFS bit in control register B (DFEjCTLBCHn) is 1 , the contents of the given intermediate value output register $\mathrm{L} / \mathrm{H}$ pair are converted from 38 - to 32-bit floating-point format. Only even number channels have intermediate value output register L/H.

### 37.5.13.4 Intermediate Value Output Register Circuits

The intermediate values output register circuits for even number channels include 38 -bit registers. They are in service when FIR filtering is selected. Values from the results of calculation to which rounding has not been applied or the results of floating-point conversion are stored in the respective intermediate values output registers L and H .

The values become fixed point if 0 has been written to the HOFS bit in control register B (DFEjCTLBCHn). In this case, for each 38-bit value, the six higher-order bits from 2 to 7 (guard bits) are stored in DFEjHOHCHn , and the highest-order bit (the sign bit) and 31 lower-order bits (the fractional part) are stored in DFEjHOLCHn.

If 1 has been written to the HOFS bit, the values are floating-point converted and the 32 -bit values thus produced are stored in the given DFEjHOLCHn register. The value of the corresponding DFEjHOHCHn register is fixed to 0 .

The timing for updating of the intermediate value register is the same as that for the corresponding output registers.
The intermediate value output registers become invalid if IIR filtering is selected, and their values are fixed to 0 .

### 37.5.14 Capture Circuit

The capture circuit stores the filter results stored in the output circuit in the capture result register in response to a capture trigger generated by the timer.

Filtering results for a maximum of three channels can be stored from the DFE channel.
The data format for the capture result register conforms to the data format for the output data register for a selected channel.

### 37.5.14.1 Summary of Capture Circuit

Capture trigger input from the timer is enabled when a capture-object channel is selected using a capture-object channel selection bit (DFEjCAPCTLCHn.CAPCH) and when 1 is written to the capture channel enabling bit (DFEjCAPCTLCHn.CEN).

In response to a capture trigger from the timer, the capture circuit stores a value of the output data register (DFEjDOCHn) in the corresponding capture result register (DFEjCAPDOCHn).

### 37.5.15 Buffer A Circuit

Buffer A is a 32-bit data buffer which is comprised of 8 -stage FIFO $\times 6$ channels.
By response to a FIFO capture trigger from the timer, the circuit stores a maximum ofthe circuit stores a maximum of six values in the output data register on the selected channel in the FIFO--DFE0 or DFE1--in response to a FIFO capture trigger generated by the timer.

The stored data can be read using the P-bus interface.
The circuit issues the buffer A capture end interrupt request indicating the completion of storing of data in the FIFO. For further details, see Section 37.5.27.2(1), Buffer A Capture End Interrupt Request.

If an overflow error occurs in the FIFO, the circuit issues an error interrupt request of buffer A .

### 37.5.15.1 Summary of Buffer A Circuit

The buffer A circuit is enabled by buffer A enable bit, and capture triggers from the timer are enabled.
The storage of data items in each FIFO channel is enabled by the buffer A channel $n$ enable bits. For each of the FIFO channels, either DFE0 or DFE1 is selected by DFE select bits, and the channel number for the output data register is selected by capture-object channel select bits.

| Register Bit Name | Remarks |
| :--- | :--- |
| DFBFACCTL.AEN | Enables or disables the buffer A circuit. |
| DFBFACCTL.AUNE | Enables or disables the capture result register update flag. |
| DFBFACTLCHn.ADSL | Selects DFE0 or DFE1. |
| DFBFACTLCHn.BFACH | Selects a channel. |
| DFBFACTLCHn.CHEN | Enables or disables the FIFO channel. |
| DFBFACTLCHn.CLRA | Initializes the buffer A circuit. |

The data format for the buffer A result register conforms to the data format for the output data register for a selected channel. By using the buffer A data update flag enable bit, it is possible to assign a buffer A update flag to the LSB of the buffer A result register to indicate that the output data register has been updated. For further details, see Section

### 37.3.57, DFBFADOCHn — Buffer A Output Register n ( $\mathrm{n}=0$ to 5).

Figure 37.87 Buffer A Result Register Data Format Selection

In response to a FIFO capture trigger from the timer, the macro stores in batch the values of the DFE macro output data register in the enabled FIFO.

Figure 37.88 Operation of the Buffer A Circuit

### 37.5.15.2 Operation of Output Data Register Enable Flag and Buffer A Data Update Flag

When the buffer A circuit is selected, the output data register enable flags (DFEjSTCHn.DOEN) on the selected FIFO channels are cleared if data is stored in the FIFO.

When the value of updated output data is stored in the FIFO, the FIFO channel returns the FIFO capture ACK to the DFE macro; the DFE macro clears the DOEN bit on the pertinent channel to 0 .

In this case, the buffer A data update flag (DFBFADOCHn.AUN) becomes 0 .
Storing the same data, not updated, in the FIFO sets the buffer A data update flag to 1.

Figure 37.89 Operation of Output Data Register Enable Flag and Buffer A Data Update Flag

### 37.5.15.3 Initialization of the Buffer A Circuit

By means of the buffer A clear bit (DFBFACLR.CLRA), it is possible to initialize all FIFO channels. In this case, any invalid FIFO channels (DFBFACTLCHn.CHEN $=0$ ) are also initialized.

For details, see Section 37.3.58, DFBFACLR — Buffer A Clear Register.

### 37.5.15.4 Overwriting of FIFO When There is an Overflow

When there is an overflow in a FIFO, no data is overwritten in the FIFO, which rule applies to all FIFOs in the FIFO macro (FIFO channel FIFO and buffer B circuit FIFO). In such a case, any data $t$ to store is discarded

Also, when an overflow occurs, the overflow error bit is set to 1 . In the waveforms shown below, if an overflow occurs on FIFO channel 0 in the buffer A circuit, the FIFO overflow error bit (DFBFACST.OVFA0) is set to 1 .

Figure 37.90 Overwrite Operation during FIFO Overflow

### 37.5.16 Buffer B Circuit

Buffer B is a 32-bit data buffer comprised of an 8 -stage FIFO $\times 1$ channel.
When the value of the output data register on either a selected DFE0 or DFE1 channel is updated, the circuit stores the output data register value on the selected channel in one FIFO.

The stored data can be read by the P-bus interface.
The circuit issues the buffer B capture end interrupt request indicating the completion of storing of data in the FIFO. For further details, see Section 37.5.27.2(2), Buffer B Capture End Interrupt Request.

If an overflow error occurs in the buffer B FIFO, the circuit issues a buffer B interrupt request.

### 37.5.16.1 Summary of Buffer B Circuit

The buffer B circuit is enabled by buffer B enable bit. The circuit stores data in the FIFO when data of the target channel is updated.

Either DFE0 or DFE1 is selected by DFE select bits, and the channel number for the output data register is selected by capture-object channel select bits.

| Register Bit Name | Remarks |
| :--- | :--- |
| DFBFBCTL.BEN | Enables or disables the buffer B circuit. |
| DFBFBCTL.BDSL | Selects DFE0 or DFE1. |
| DFBFBCTL.BFBCH | Selects a channel. |
| DFBFBCLR.CLRB | Initializes the buffer B circuit. |

The data format for the buffer B result register conforms to the data format for the output data register for a selected channel. The circuit stores the output data register value in the FIFO when the output data of the target channel is updated.

Figure 37.91 Operation of Buffer B Circuit

### 37.5.16.2 Operation of Output Data Register Enable Flag

When the buffer B circuit is selected, the output data register enable flag (DFEjSTCHn.DOEN) on the selected channel is cleared when data is stored in the buffer B FIFO.

At this time, the buffer B circuit returns the FIFO capture ACK to the DFE macro, and the DFE macro clears the DOEN bit of the target channel to 0 .

Figure 37.92 Clear Operation of Output Data Register Enabling Flag

### 37.5.16.3 Initialization for Buffer B Circuit

By means of buffer B clear bit (DFBFBCLR.CLRB), it is possible to initialize the buffer B circuit. For details, see

## Section 37.3.62, DFBFBCLR — Buffer B Clear Register.

### 37.5.17 Status Register

The DFE has a status register for each channel. The status register indicates the status shown below. Each flag except PH23ST and VALID can be cleared by using the corresponding clear status register. Only the DOEN flag can be automatically cleared by reading the output data register and the intermediate value output register $\mathrm{L} / \mathrm{H}$ in addition to the clear status register.

Table 37.87 Status Register

| Name | Description |
| :---: | :---: |
| PH23ST | Peak-Hold-23 Processing Status <br> When 0 is written to DFEjPH23CCTLO.PEN, PH23ST whose target channel is DFEjPH23CCTLO.CHS is set to 000 B. $\mathrm{PH} 23 \mathrm{ST}[2: 0]$ is set to $000_{\mathrm{B}}$, when the filter processing is executed after the auto initialization flag which is PH23 processing target channel is valid. <br> $\mathrm{PH} 23 \mathrm{ST}[2: 0]$ is set to $001_{\mathrm{B}}$, when the filter processing whose peak-hold-1 initialization flag is valid is executed. PH23ST[2:0] is set to $010_{B}$, when the comparison calculation result of peak-hold- 1 is true. PH23ST[2:0] is set to 011 ${ }_{\mathrm{B}}$, when the comparison calculation result of peak-hold-2 is true. PH23ST[2:0] is set to $100_{\mathrm{B}}$, when the comparison calculation result of peak-hold-3 is true. |
| VALID | Input Data Register Valid <br> This bit is set to 1 when the input data register contains a valid value. <br> This bit is cleared to 0 by a reset or at completion of accumulation/decimation processing. |
| PHE | Peak-Hold End <br> When peak-hold and comparison are used simultaneously (DFEjCTLBCHn.PRCSB $=11_{\mathrm{B}}$ ), and when the filter processing whose peak-hold end flag is valid is executed, this bit is set to 1. <br> When peak-hold and comparison are not used simultaneously (DFEjCTLBCHn.PRCSB $\neq 11_{\mathrm{B}}$ ), this bit is disabled (fixed $0)$. |
| CND | Condition Match <br> When peak-hold is used (DFEjCTLBCHn.PRCSB $=01_{\mathrm{B}}$ ), and when the filter processing whose peak-hold end flag is valid is executed, this bit is set to 1. <br> When comparison is used (DFEjCTLBCHn.PRCSB =10 ${ }^{\text {}}$ ) or peak-hold and comparison are used simultaneously (DFEjCTLBCHn.PRCSB = 111 ), and when the comparison calculation result is true, This bit is set to 1 . |
| DOEN | Output Data Register Enable <br> Conditions for setting and clearing this flag are described later. |
| DIOW | Input Data Overwrite Error <br> This bit is set to 1 when the input data register is overwritten during processing for the relevant channel. This bit is also set to 1 when the input data register for the process is overwritten by other input data with the same tag. |
| DOOW | Output Data Overwrite Error <br> This bit is set to 1 when another calculation result is written while the output data register contains valid data. |
| MER | Multiplication Error <br> This bit is set to 1 when calculation $8000_{H} \times 8000_{H}$ is performed in the filtering circuit. |
| GER | Guard Error <br> This bit is set to 1 when a rounding error ( 48 bits to 32 bits) occurs in the filtering circuit. |
| CER | Cascade Rounding Error <br> This bit is set to 1 when a rounding error ( 32 bits to 16 bits) occurs during execution of cascade input. |
| AER | Absolute Value Error <br> This bit is set to 1 when absolute value calculation of $80000000_{H}$ is performed during absolute value calculation in the accumulation circuit. |

### 37.5.17.1 Conditions for Setting and Clearing the DOEN Flag

The DOEN flag indicates whether values stored in output registers are valid. The flag is valid when settings are for accumulation or decimation. Its value stays unchanged as 0 for any other settings.

When even number channel is in use as an IIR filter, the output data register and intermediate value output registers (including the intermediate value output mirror register L ) are all in the scope of operations.

When even number channel is in use as an IIR filter, although the values of the intermediate value output registers are fixed to 0 , reading a register still leads to clearing of the DOEN flag. Accordingly, since only the output register is in scope for an IIR filter, reading of the intermediate value output registers (including the intermediate values output mirror register L ) is prohibited.

Odd number channels do not have intermediate value output registers, so only the output data registers are in the scope of operations, regardless of the selected type of filter.

Conditions for setting and clearing of the DOEN flag differ with the channel, selected filter type, and selection or nonselection of floating point conversion for the intermediate values output registers. The conditions are summarized in the tables below.

Conditions for setting of and the timing of storage in the DFEjDOCHn, DFEjHOLCHn (or DFEjHOLMCHn), and DFEjHOHCHn bits do not vary.

In some case there are multiple conditions for clearing. In this case, the overall condition is the logical OR of the multiple conditions.

Table 37.88 Conditions for Setting and Clearing DOEN
Case 1: Even number channel with IIR filtering selected on an Odd number channel

| DOEN Setting Condition | DOEN Clearing Conditions |
| :--- | :--- |
| The result of filter calculations are stored <br> in DFEjDOCHn | 1 is written to DFEjCLRSTCHn.CLRDOEN |
|  | DFEjDOCHn is read |
|  | The data of target channels being stored in FIFO by Buffer A Circuit or Buffer B Circuit |

Case 2: Even number channel with FIR filtering selected, and floating-point conversion of intermediate value is not selected

| DOEN Setting Condition | DOEN Clearing Conditions |
| :--- | :--- |
| The result of filter calculations are stored <br> in DFEjDOCHn, DFEjHOLCHn, and <br> DFEjHOHCHn | 1 is written to DFEjCLRSTCHn.CLRDOEN |
|  | DFEjDOCHn is read |
|  | Both DFEjHOLCHn (or DFEjHOLMCHn) and DFEjHOHCHn is read (the order of reading <br> does not create a problem) |
|  | The data of target channels being stored in FIFO by Buffer A Circuit or Buffer B Circuit |

Case 3: Even number channel with FIR filtering selected, and floating-point conversion of intermediate value is selected

| DOEN Setting Condition | DOEN Clearing Conditions |
| :--- | :--- |
| The result of filter calculations are stored | 1 is written to DFEjCLRSTCHn.CLRDOEN |
| in DFEjDOCHn and DFEjHOLCHn | DFEjDOCHn is read |
|  | DFEjHOLCHn (or DFEjHOLMCHn) is read |
|  | The data of target channels being stored in FIFO by Buffer A Circuit or Buffer B Circuit |

(A) Clearing DOENn in response to reading DFEjDOCHn in cases 1,2 and 3 on the previous page

(B) Clearing DOENn in response to clearing DFEjHOLCHn and DFEjHOHCHn in case 2 on the previous page

(C) Clearing DOENn in response to reading DFEjHOLCHn in case 3 on the previous page

(D) Clearing DOENn in response to reading DFEjHOLMCHn in case 3 on the previous page

(E) Mixture of different per-channel settings

Figure 37.93 Operations for Clearing the DOEN Flag

### 37.5.18 Error Mask Registers

Functions of error mask registers are shown below. Masked error factors are excluded from error interrupt request conditions.

When the multiplication error mask flag is set to 1 in channel 0 , for example, the multiplication error flag is not set to 1 even if a multiplication error occurs in channel 0 . No error interrupt request is output in this case.

Table 37.89 Error Mask Registers

| Flag | Description |
| :--- | :--- |
| MSKDIOW | Input data error (DIOW) mask bit |
| MSKDOOW | Output data error (DOOW) mask bit |
| MSKMER | Multiplication error (MER) mask bit |
| MSKGER | Guard error (GER) mask bit |
| MSKAER | Absolute value error (AER) mask bit |
| MSKCER | Cascade rounding error (CER) mask bit |

### 37.5.19 Subtraction Status Register

For each subtraction channel, there is a subtraction status register. The subtraction status register indicates the status information described below. With the exception of the SUBF and MINF flags, flags are cleared through the use of the corresponding clear status register. In cases exclusively for the SDOEN flag, the flag is cleared automatically when the subtraction result register is read, in addition to the operation of the clear status register.

Table 37.90 Subtraction Status Register

| Name | Description |
| :---: | :---: |
| SUBF | Subtrahend Channel Data Input Enable |
|  | When MINF $=0$, completion of the filtering of the subtrahend channel sets SUBF to 1. |
|  | When SUBF $=1$ and MINF $=0$, performs subtraction upon completion of the filtering of the minuend channel. Storing subtraction result data in the subtraction result register clears SUBF to 0. |
| MINF | Minuend Channel Data Input Enable |
|  | When SUBF $=0$, completion of the filtering of the minuend channel sets MINF to 1 . |
|  | When MINF $=1$ and SUBF $=0$, MINF performs subtraction upon completion of the filtering of the subtrahend channel. |
|  | Storing subtraction result data in the subtraction result register clears MINF to 0 . |
| SDOEN | Subtraction Output Data Register Valid |
|  | This bit is set to 1 when the DFE stores the subtraction results in the subtraction output data register. |
|  | While SDOEN $=1$, reading the DFEjSUBDOCHn register clears this bit to 0 . |
| SDOOW | Subtraction Result Register Overwrite Error |
|  | When SDOEN = 1, storing subtraction output data in the subtraction result register sets SDOOW to 1. |
| SCER | Subtraction Circuit Cascade Rounding Error |
|  | When a cascade rounding error occurs in subtraction output data, this bit is set to 1. |
| SGER | Subtraction Guard Error |
|  | When an overflow error of subtraction result, this bit is set to 1 . |

### 37.5.20 Subtraction Error Mask Registers

The following shows the functions of the subtraction error mask register. Any masked error events are excluded from the error interrupt request conditions.

For example, if the subtraction circuit cascade rounding error mask flag is set on subtraction channel 0 , no subtraction circuit cascade rounding error will be set even when a subtraction circuit cascade rounding error condition arises on subtraction channel 0 . Also, no error interrupt requests will be issued.

Table 37.91 Subtraction Error Mask Register

| Name | Description |
| :--- | :--- |
| MSKSDOOW | Subtraction Result Register Overwrite Error (SDOOW) Mask |
| MSKSCER | Subtraction Circuit Cascade Rounding Error (SCER) Mask |
| MSKSGER | Subtraction Guard Error (SGER) Mask |

### 37.5.21 Capture Status Register

For each capture channel, there is a capture status register. The capture status register indicates the status information described below. Flags are cleared through the use of the corresponding capture clear status register.

Table 37.92 Capture Status Register

| Name | Description |
| :--- | :--- |
| CDOEN | Capture Output Data Register Valid |
|  | This bit is set to 1 when the DFE stores the capture results in the capture output data register. |
|  | While CDOEN = 1, reading the DFEjCAPDOCHn register clears this bit to 0. |
| CDOOW | Capture Result Register Overwrite Error |
|  | When CDOEN = 1, storing capture data in the capture result register sets CDOOW to 1. |

Note: Even if a capture process is executed, the DOEN for the capture-target of output data register is not cleared

### 37.5.22 Capture Error Mask Register

The following shows the functions of the capture error mask register. Any masked error events are excluded from the error interrupt request conditions.

For example, if the capture result register overwrite error mask flag is set on capture channel 0 , no capture result register overwrite error will be set even when a capture result register overwrite error condition arises on capture channel 0 . Also, no error interrupt requests will be issued.

Table 37.93 Capture Error Mask Register

| Name | Description |
| :--- | :--- |
| MSKCDOOW | Capture Result Register Overwrite Error (CDOOW) Mask |

### 37.5.23 Buffer A Status Register

The buffer A status register is provided. The status register indicates the status information described below.
Table 37.94 Buffer A Status Register

| Name | Description |
| :--- | :--- |
| EMPAn | FIFO channel-n empty bit |
|  | Indicates that no data is stored in the FIFO. |
| The bit is cleared to 0 when data is stored in the FIFO. |  |
| The bit is set to 1 when all remaining data in the FIFO is read. |  |
| The bit is set to 1 when 1 is written in DFBFACLR.CLRA. |  |
|  | EMPAn of FIFO channel which is never used indicates 1. |
| OVFAn | FIFO channel $n$ FIFO overflow error bit |
|  | Indicates that a FIFO overflow has occurred. |
|  | The bit is set to 1 when new data is stored when the FIFO is full. |
|  | The bit is cleared to 0 when 1 is written in DFBFACLR.CLRA. |
|  | OVFAn of FIFO channel which is never used indicates 0. |

### 37.5.24 Buffer A Clear Register

Writing 1 to the buffer A clear bit of the buffer A clear register clears the status bits for all FIFO channels and any internal status (FIFO pointer values for buffer A), and resets them to their initial values.

### 37.5.25 Buffer B Status Register

The buffer B status register is provided. The status register indicates the status information described below.
Table 37.95 Buffer B Status Register

| Name | Description |
| :--- | :--- |
| EMPB | Empty bit |
|  | Indicates that not data is stored in the FIFO. |
|  | The bit is cleared to 0 when data is stored in the FIFO. |
|  | The bit is set to 1 when all remaining data in the FIFO is read. |
|  | The bit is set to 1 when 1 is written in DFBFBCLR.CLRB. |
|  | The bit indicates 1 when Buffer B is never used. |
| OVFB | FIFO overflow error bit |
|  | Indicates that a FIFO overflow has occurred. |
|  | The bit is set to 1 when new data is stored when the FIFO is full. |
|  | The bit is cleared to 0 when 1 is written in DFBFBCLR.CLRB. |
|  | The bit indicates 0 when Buffer B is never used. |

### 37.5.26 Buffer B Clear Register

Writing 1 to the buffer B clear bit of the buffer B clear register clears the status bits and any internal status (FIFO pointer values for buffer $B$ ), and resets them to their initial values.

### 37.5.27 Interrupt Requests

### 37.5.27.1 DFE Macro

DFE macro has the interrupt request of the following list.
Table 37.96 List of Interrupt Request for the DFE Macro

| Interrupt Request Function | Number | Remarks |
| :--- | :--- | :--- |
| Output Data Interrupt Request | DFE0: 12 | Can be issued to each channel |
|  | DFE1: 4 |  |
| Condition Match Interrupt Request 0 | DFE0: 12 | Can be issued to each channel |
|  | DFE1: 4 |  |
| Condition Match Interrupt Request 1 | DFE0: 4 | Can be issued to CH0-CH3 channel |
|  | DFE1: 4 |  |
| Subtraction Data Interrupt Request | DFE0: 3 | Can be issued to each subtraction channel |
|  | DFE1: 3 |  |
| Error Interrupt Request | DFE0: 1 | Can be issued for all error sources commonly. |
|  | DFE1: 1 |  |

## (1) Output Data Interrupt Requests

When a calculation result with DFEjCTLBCHn.PRCSA $=01_{\mathrm{B}}$ (accumulation) or DFEjCTLBCHn.PRCSA $=10_{\mathrm{B}}$ (decimation) is written to an output register, an output data interrupt request is output. (When the PRCSA is $00_{\mathrm{B}}$, a calculation result is stored in an output data register but no interrupt is output.)

Interrupt requests corresponding to each channel can be output.
Interrupt request output can be controlled by using the IEO bit in the control register A.
The relationship between the DFEjSTCHn.DOEN bit and an output data interrupt request in addition to the relationship between the DFEjSTCHn.DOEN flag and an output data interrupt request are shown below. For operation of the DFEjSTCHn.DOEN bit, see Section 37.5.17.1, Conditions for Setting and Clearing the DOEN Flag.

If the DOEN flag has been cleared to 0 , an output data interrupt is generated when the result of calculation is stored in the output data register again.

Figure 37.94 Relationship between the DOEN Bit and an Interrupt

When the DOEN bit in DFEjSTCHn is not cleared by the software, an output data interrupt request is not output even if data is rewritten to the output data register. If the output data register value is overwritten, the DOOW bit in DFEjSTCHn is set to 1 .

Figure 37.95 Relationship between the DOEN and DOOW Bits and an Interrupt

## (2) Condition Match Interrupt Request

When the peak-hold end trigger flag is enabled during peak-hold processing, a condition match interrupt request indicating completion of peak-hold processing is output. When comparison calculation result is true during comparison calculation, a condition match interrupt request is output.

Interrupt request output can be controlled by using the IEC flag in the control register A.
There are two types of condition match interrupt requests: INTDFEjCND0 and INTDFEjCND01. The interrupt source (either DFEjSTCHn.CND or DFEjSTCHn.PHE) can be selected individually for each of these requests. As shown below, interrupt sources that can be assigned vary based on the peak-hold circuit settings (combination of DFEjCTLBCHn.PRCSB and DFEjPH23CCTL0.PEN). INTDFEjCND0 is given to all channels, and INTDFEjCND1 is given to channel 0 to 3. See Table 37.97.

Table 37.97 Correspondence between Condition Match Interrupt Requests and Interrupt Sources (1)

| Peak-Hold Circuit Settings | PRCSB | PEN | INTDFEjCND0 | INTDFEjCND1 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Neither peak-hold processing nor comparison <br> calculation processing is executed. | $00_{\mathrm{B}}$ | - | No function | No function |
| Peak-hold processing is executed | $01_{\mathrm{B}}$ | - | CND (peak-hold ended) | No function |
| Comparison processing is executed. | $10_{\mathrm{B}}$ | - | CND (condition matched) | No function |
| Peak-Hold and comparison simultaneously | $11_{\mathrm{B}}$ | 0 | *See Table 37.98. |  |
| Peak-hold-23 is executed. | $11_{\mathrm{B}}$ | 1 |  |  |

When simultaneous execution of peak-hold processing and comparison processing is selected, or when the peak-hold23 function is selected, by setting the DFEjCTLACHn.CNSLE and the DFEjCTLACHn.CNSL as shown below, the interrupt source (either DFEjSTCHn.CND or DFEjSTCHn.PHE) to assign to the INTDFEjCND0/1 can be changed.

Table 37.98 Correspondence between Condition Match Interrupt Requests and Interrupt Sources (2)

| Peak-Hold Circuit Settings | CNSLE | CNSL | INTDFEjCND0 | INTDFEjCND1 |
| :--- | :--- | :--- | :--- | :--- |
| Peak-hold and comparison simultaneously | 0 | - | CND (condition matched) | PHE (peak-hold ended) |
|  | 1 | 0 | CND (condition matched) | PHE (peak-hold ended) |
| Peak-hold-23 is executed. |  | 1 | PHE (peak-hold ended) | CND (condition matched) |
|  | 1 | - | CND (condition matched) | PHE (peak-hold ended) |

Please note that no condition match interrupt request is output after a condition match interrupt request is issued, unless the pertinent interrupt source status is cleared (see Figure 37.96, item (2)).

The condition match bit (DFEjSTCHn.CND) is cleared when 1 is written to DFEjCLRSTCHn.CLRCND. Also, peakhold end bit (DFEjSETCHn.PHE) is cleared when 1 is written to DFEjCLRSTCHn.CLRPHE.

For the condition match interrupt request based on a DFEjSTCHn.CND source, output of an interrupt request can be controlled by means of DFEjCTLACHn.IEC. Also, for the condition match interrupt request based on DFEjSTCHn.PHE, output of an interrupt request can be controlled by means of DFEjCTLACHn.IEP.

Figure 37.96 shows the relationship between the CND bit in the status register (DFEjSTCHn ( $\mathrm{n}=0$ to 11 for DFE0, n $=0$ to 3 for DFE1)) and condition match interrupt request. When the peak-hold end flag is enabled, a condition match interrupt request is issued at the same time.

The DISB bit (peak-hold processing disable bit) in DFEjCTLBCHn disables peak-hold processing in the same way as the peak-hold end flag is enabled, but does not output a condition match interrupt. In addition, even if a peak-hold end trigger is input with peak-hold processing, no condition match interrupt is output.

Figure 37.96 Relationship between CND Bit and Condition Match Interrupt Request

## (3) Subtraction Data Interrupt Request

Upon storing subtraction results in the subtraction result register, the subtraction circuit issues the subtraction data interrupt request.

The interrupt requests can be issued for corresponding subtraction channels, and by using the DFEjSUBCTLCHn.SIEO bits, each interrupt request output can be controlled.

The figure below shows the relationship between the DFEjSUBSTCHn.SDOEN flags and the subtraction data interrupt requests.

Clearing the SDOEN flag to 0 and storing the subtraction results again in the subtraction result register issues a subtraction data interrupt request.

Figure 37.97 Relationship between SDOEN and Subtraction Data Interrupt Request

If the DFEjSUBSTCHn.SDOEN flag is not cleared to 0 , no subtraction data interrupt request is issued even when the subtraction results are stored again in the subtraction result register. In this case, because the subtraction result register is overwritten, the DFEjSUBSTCHn.SDOOW flag is set to 1 .

Figure 37.98 Relationship Between SDOEN, SDOOW and Subtraction Data Interrupt Request

## (4) Capture Data Overwrite Error

Having stored the value of the output data register in the capture result register, the capture circuit sets DFEjCAPSTCHn.CDOEN to 1 ; it does not issue an interrupt request that indicates the storage of data in the capture result register.

If the DFEjCAPSTCHn.CDOEN flag is not cleared to 0 , storing capture data again in the capture result register causes the overwriting of the capture result register; consequently, the DFEjCAPSTCHn.CDOOW flag is set to 1 , enabling an error interrupt to be issued.

For further details on error interrupts, see Section 37.5.27.1(5).

Figure 37.99 Relationship Between CDOEN, CDOOW and Error Interrupt Request

## (5) Error Interrupt Requests

Error interrupt request is composed of the 'OR' for the error sources on all channels, all subtraction channels, and all capture channels. All the DFE macro error sources can be summarized as follows.

Error interrupt request output can be controlled by channel, by subtraction channel, and by capture channel. For the meanings of error sources, see Section 37.5.17 to Section 37.5.22.

Table 37.99 Summary of DFE Macro Error Factors

| Category | Error Status Bit | Remarks |
| :--- | :--- | :--- |
| Channel | DFEjSTCHn.DIOW | Input Data Overwrite Error |
|  | DFEjSTCHn.DOOW | Output Data Overwrite Error |
|  | DFEjSTCHn.MER | Multiplication Error |
|  | DFEjSTCHn.GER | Guard Error |
|  | DFEjSTCHn.CER | Cascade Rounding Error |
|  | DFEjSTCHn.AER | Absolute Value Error |
| Subtraction Channel | DFEjSUBSTCHn.SDOOW | Subtraction Result Register Overwrite Error |
|  | DFEjSUBSTCHn.SCER | Subtraction Circuit Cascade Rounding Error |
|  | DFEjSUBSTCHn.SGER | Subtraction Guard Error |
| Capture Channel | DFEjCAPSTCHn.CDOOW | Capture Result Register Overwrite Error |

For example, in the case of error interrupt requests for channel 0 to channel 7 are enabled and error interrupt requests for channel 8 to channel 11 are masked, if an error occurs in any channel from 0 to 7 , an error interrupt request is output. However, if an error occurs in any channel from 8 to 11 in this state, no error interrupt request is output.

Since error interrupts are composed of the OR of error sources, if an error interrupt request has already been issued, no error interrupts are issued when a new error source occurs. After an error interrupt request is issued, if an error bit occurs again after the error bit is cleared using the clear register, an error interrupt request is issued.

Figure 37.100 Relationship between Error Bit and Error Interrupt

### 37.5.27.2 FIFO Macro

FIFO macro has the interrupt request in the following list.
Table 37.100 List of Interrupt Request of FIFO Macro

| Interrupt Request Function | Number | Remarks |
| :--- | :--- | :--- |
| Buffer A capture end interrupt request | 1 | Can be issued to all FIFO channels commonly |
| Buffer B capture end interrupt request | 1 | Can be issued to buffer B simple substance |
| FIFO Error Interrupt Request | 1 | Can be issued to all error sources commonly |

## (1) Buffer A Capture End Interrupt Request

The output of the buffer A capture end interrupt request can be controlled by setting the AIEO bit of the buffer A common control register (DFBFACCTL) to 1.

When the FIFO data, which is the object of reading in the buffer A output data register (DFBFADOCHn) is updated, the buffer A capture end interrupt request is issued.

If data is stored in the FIFO in the FIFO empty state, for example, the buffer A capture end interrupt request is issued. Also, the buffer A capture end interrupt request is issued when all buffer A output data registers are read on the enabled FIFO channels when multiple data items are stored on each of the FIFO channels.

To issue a buffer A capture end interrupt request again, read all data from the enabled FIFO channels. No buffer A capture end interrupt request will be issued if all of the data is not read on the enabled FIFO channels.

Figure 37.101 FIFO Macro Buffer A Capture End Interrupt Requests

## (2) Buffer B Capture End Interrupt Request

The output of the buffer B capture end interrupt request can be controlled by setting the BIEO bit of the buffer B control register (DFBFBCTL) to 1 .

When data is stored in the buffer B four times, the buffer B capture end interrupt request is issued. To issue a buffer B capture end interrupt request again, read all the four data items. Otherwise, no buffer B capture end request will be issued even if four data items are stored in the buffer B again.

Figure 37.102 FIFO Macro Buffer B Capture End Interrupt Requests

## (3) Error Interrupt Request

The error interrupt request of the FIFO macro indicates that an overflow was detected in the FIFO.
The error interrupt request is the OR of a buffer A FIFO channel overflow error and a buffer B overflow error.
Table 37.101 Summary of FIFO Macro Error Factors

| Category | Error Status Bit | Remarks |
| :--- | :--- | :--- |
| Buffer A Circuit | DFBFACST.OVFAn | FIFO Over Flow Error in Buffer A |
|  | $(\mathrm{n}=0,1, \ldots, 5)$ |  |
| Buffer B Circuit | DFBFBST.OVFB | FIFO Over Flow Error in Buffer B |

The output of the FIFO macro error interrupt request can be controlled by setting the AIEE bit of the buffer A common control register (DFBFACCTL) to 1 . The FIFO macro error interrupt request is issued if a FIFO overflow error occurs on a FIFO channel.

The output of the FIFO macro error interrupt request can be controlled by setting the BIEE bit of the buffer B control register (DFBFBCTL) to 1 . The FIFO macro error interrupt request is issued if a FIFO overflow error occurs in the buffer B FIFO.

The FIFO macro error interrupt request is composed of the OR of error sources. Consequently, if an error interrupt request is issued once and then an error occurs due to another source, no new error interrupts will be issued.

### 37.6 Notes and Restrictions

### 37.6.1 Processing Time

### 37.6.1.1 Processing Time for One Channel

The digital filter executes a one-time FIR or IIR processing at a maximum of $0.7 \mu \mathrm{~s}$. When there is no memory access competition. If memory access competition occurs, the processing time is a maximum of $1.2 \mu \mathrm{~s}$.

### 37.6.1.2 Termination Processing Time

When the EN bit in DFEjCTLACHn is set to 0 , the digital filter executes processing for all the input data that has been accepted and terminates processing. The maximum processing time up to the termination is obtained by "the number of channels for which input data has been accepted (number of channels for which processing has not been done) $\times$ processing time". For example, if five channels have not been processed, the termination processing time is a maximum of $3.5 \mu \mathrm{~s}$.

### 37.6.2 DFE Activation Input Interval

An interval of DFE activation signal inputs should be a minimum of $0.7 \mu$ s if there is no memory access competition or a minimum of $1.2 \mu \mathrm{~s}$ if memory competition occurs.

Figure 37.103 DFE Activation Input Interval (AD Input)

### 37.6.2.1 DFE Processing Time

The following two tables list the DFE processing time, i.e. the cycle from the input of a startup trigger from the AD until the next startup trigger on the same channel is accepted.

Table 37.102 Processing Time of FIR and IIR (with no initialization)

|  |  | Cycle |
| :--- | :--- | :--- |
| FIR (normal case) | 8TAP | 22 cycle |
|  | 16TAP | 26 cycle |
|  | 24TAP | 30 cycle |
|  | 32TAP | 34 cycle |
| IIR (normal case) | Secondary biquad 1 stage | 50 cycle |
|  | Secondary biquad 2 stages | 36 cycle |
|  | Secondary biquad 3 stages | 44 cycle |
| IIR (with gain adjustment | Secondary biquad 2 stages | 42 cycle |
| function) | Secondary biquad 3 stages | 56 cycle |

Table 37.103 Processing Time of FIR and IIR (with Initialization)

|  |  | Time |
| :--- | :--- | :--- |
| FIR (with initialization) | 8TAP | 28 cycle |
|  | 16TAP | 36 cycle |
|  | 24TAP | 44 cycle |
|  | 32TAP | 52 cycle |
| IIR (with initialization) | Secondary biquad 1 stage | 34 cycle |
|  | Secondary biquad 2 stages | 54 cycle |
|  | Secondary biquad 3 stages | 70 cycle |
| IIR (with gain adjustment | Secondary biquad 2 stages | 60 cycle |
| function) | Secondary biquad 3 stages | 82 cycle |

When the coefficient memory or data memory is accessed by the CPU during the DFE processing period, the access increases the total time for processing. Specifically, it takes more time per access.

### 37.6.3 Trigger Input

The following figure shows an example for an input of timer triggers 0 to 3 and a software trigger. When timer trigger 0 is used, for example, it is assumed that the DFE activation signal is input once or more times and timer trigger 0 is input again after the trigger flag function is enabled by the timer trigger 0 input.

Figure 37.104 Example of Trigger Input

Input of a trigger from a timer or from software leads to setting of the corresponding trigger flag and the start of digital filter processing, but repeating input of the same trigger is prohibited.

In the example below, the trigger function by B is not enabled in some cases.

Figure 37.105 Operation When the Same Trigger is Prohibited 1

Before a timer trigger or a software trigger is input and the DFE activation signal is input, the same timer trigger or software trigger must not be input again. An example is shown below. In this case, two consecutive triggers are input at A and B, but are only effective as a single trigger from AD (2).

Figure 37.106 Operation When the Same Trigger is Prohibited 2

### 37.6.4 Channel Tag and AD Tag

If a tag value ( AD tag) that the AD inputs to the digital filter and a tag value (channel tag) that the software sets for the digital filter are different, correct processing is disabled. For example, the AD inputs an AD tag value of $0001_{\mathrm{B}}$ to the digital filter and there is no channel with a digital filter's channel tag value $00001_{\mathrm{B}}$, the DFE does not execute filter processing.

### 37.6.5 Input Data Format and Calculation Restrictions

Restrictions on available calculations are provided for the digital filter. For details, see Section 37.5.6, Setting Control Registers.

### 37.6.6 Restrictions on Cascade Processing

Cascade processing is a function to round 32-bit accumulation circuit output data or 32-bit subtraction circuit output data to 16 -bit data to be input as data of other channels. The following restrictions are provided for cascade processing. Observe these restrictions together with the descriptions in Section 37.5.6, Setting Control Registers.

1. When cascade is enabled, do not set the same value for cascade tag and channel tag on the same channel. Assign a channel that is different from the channel for which cascade is specified as a cascade destination channel. If the same tag value is set, the filter processing result is input to the same channel again and calculation is repeated.
2. When cascade is enabled, the data format of cascade enabled channels must be the same as the data format of cascade destination channels. For example, when the fixed-point input format is specified for cascade enabled channels, the fixed-point input format is also specified for cascade destination channels.
3. Cascade input can be enabled for up to 15 channels on 16 channels. If cascade input is enabled for all channels, calculation is repeated for filter calculation results that are input in cascade.
4. The CAEN bits in the control register A (DFEjCTLACHn) must not be set to $01_{\mathrm{B}}$.
5. When peak-hold processing and comparison processing are enable, peak-hold processing and comparison processing are executed for 32-bit data.
6. No floating-point conversion result can be a cascade input.
7. When enabling the cascade function of two or more channels and selecting a single cascade destination channel, pay attention to the priority of channels. Specify cascade channels so that higher priority is given to cascade destination channels than cascade enabled channels. To enable the cascade function of channel 1 and channel 2 and select the same cascade destination for channel 1 and channel 2, for example, specify channel 0 as a cascade destination channel.
8. When enabling the cascade function of channel $n$ and the cascade function of subtraction channel $0-2$ selecting a single cascade destination channel, it is possible to be output the filter result and subtraction result at the same time. At this time, these are processed in the following priority. Low priority cascade input is not executed to cascade processing. And the cascade input is discarded.

Cascade input of channel $n>$ Cascade input of subtraction channel $0>$ Cascade input of subtraction channel $1>$ Cascade input of subtraction channel 2
9. When the subtraction circuit is enabled, the cascade rounding error is always judged with the subtraction results even if its cascade function is not used. Depending on the result of this judgement, the subtraction circuit cascade rounding error may be occurred. In this case, set the error mask bit (DFEjSUBERMCHn.MSKSCER) to 1 .

### 37.6.7 Operation when the Given Channel is Disabled

### 37.6.7.1 Channel Enable Bits and Invalidation

While the channel enable bit (DFEjCTRLACHn.EN) is set to 0 , filter processing is not activated even if the AD tag value that is input from the AD is equal to the channel tag value.

In addition, timer trigger input of the trigger flag function specified for the channel and software trigger input are not accepted.

When the channel enable bit (DFEjCTRLACHn.EN) is set to 0 from 1 , the data to be processed that was input before this bit was set to 0 is processed.

At this time, if a trigger for the trigger flag function is input before the channel enable bit is set to 0 , the trigger flag function is enabled for the data to be processed.

When the channel enable bit (DFEjCTRLACHn.EN) is 1, input trigger for the trigger flag function is held until AD data is input and the trigger flag function is enabled for the data to be processed (trigger held).

After the channel enable bit (DFEjCTRLACHn.EN) is set to 0 from 1 , the held trigger is cleared if there is no data to be processed.

Figure 37.107 EN Bit and DOEN Bit

Even if the channel enable bit (EN in DFEjCTRLACHn) is cleared to 0 , the status register is not cleared. Clear the status register with the software as necessary.

If the channel enable bit is set to 1 from 0 to restart the DFE processing:

- Accumulation/decimation counter starts at 0 in the same way as the first DFE processing after a reset.
- Comparison with the initial value register value is performed during the first peak-hold processing, and comparison with the peak-hold result register value is performed during the subsequent processing.

### 37.6.8 Restrictions on FIR 64TAP

If FIR64TAP is selected on an even-numbered channel ( n ) ( $\mathrm{DFEjCTRLACHn} . \mathrm{CMD}=0111_{\mathrm{B}}$ ), no triggers or requests are accepted and are nullified on the next odd-numbered channel $(\mathrm{n}+1)$.

### 37.6.9 Restrictions on Memory Access

8-bit or 16-bit write access to the coefficient memory is prohibited. Write data to the coefficient memory in 32 bits. 8 bit write access to data memory 0 and 1 is prohibited.

Upper/lower 16-bit write access to data memory 0 and 1 is enabled.
32-bit write access in batch to data memory 0 and 1 is enabled.
If a prohibited access is made, data may become corrupt. In the case of the coefficient memory, word data ( 32 bits) including a byte-write address may become corrupt. In the case of data memory 0 and data memory 1 , half-word data ( 16 bits) including a byte-write address may become corrupt.

### 37.6.10 Restrictions on Trigger Setting Registers

A software trigger must not be specified for the accumulation/decimation initialization flag and the accumulation/decimation disable flag setting. Operations with prohibited settings are not guaranteed

A software trigger must not be specified for the peak-hold initialization flag and the peak-hold end flag setting. Operations with prohibited settings are not guaranteed.

A software trigger must not be specified for the peak-hold mask start flag and the peak-hold mask end flag setting. Operation with prohibited setting is not guaranteed.

A software trigger must not be specified for the subtraction start flag and the subtraction end flag setting. Operation with prohibited setting is not guaranteed.

### 37.6.11 Setting of Peak-Hold Processing Disable Bit and Accumulation/Decimation Processing Disable Bit

When the EN bit in DFEjCTLACHn and VALID bit in DFEjSTCHn are both 0, the DISB bit (peak-hold processing disable bit) in DFEjCTLBCHn and DISA bit (accumulation/decimation processing disable bit) in DFEjCTLBCHn can be set by software.

When the PRCSB bit in DFEjCTLBCHn is set to $01_{\mathrm{B}}$ (for peak-hold processing) or $11_{\mathrm{B}}$ (for peak-hold processing and comparison processing simultaneously), peak-hold processing becomes invalid by writing 1 to the DISB bit in DFEjCTLBCHn. When the PRCSA bit is set to $01_{\mathrm{B}}$ (for accumulation processing) or $10_{\mathrm{B}}$ (for decimation processing), accumulation/decimation processing becomes invalid by writing 1 to the DISA bit in DFEjCTLBCHn

### 37.6.12 Controlling Control Registers $A$ and $B$

Set control registers A (DFEjCTLACHn) and B (DFEjCTLBCHn) in advance of trigger input. Setting control registers $A$ and $B$ is prohibited during digital filter operations while the value of the DFEjSTCHn.VALID or DFEjCTLACHn.EN1 bit is 1 . If this is done, operations for digital filtering are not guaranteed.

Furthermore, as well as the above restrictions, writing to the intermediate value output register floating point conversion bit (DFEjCTLBCHn.HOFS) is prohibited while the value of the output data register enable bit (DFEjSTCHn.DOEN) is 1. Again, operations for digital filtering are not guaranteed if this is done.

### 37.6.13 Controlling the Peak-Hold Index Registers

A peak-hold index register retains its value even if the given channel is disabled (the DFEjCTRLACHn.EN bit is 0 ).
When Peak-hold circuit is set to peak-hold processing mode (DFEjCTLBCHn.PRCSB $=2 \mathrm{~b} 01$ ), read a peak-hold index register, when the value of the condition matching bit (DFEjSTCHn.CND) is set to 1 after the value of the input data valid bit (DFEjSTCHn.VALID) has been 0 . When Peak-hold circuit is set to peak-hold and comparison simultaneously mode ( $\mathrm{DFEjCTLBCHn} . \mathrm{PRCSB}=2 \mathrm{~b} 11$ ), read a peak-hold index register, when the value of the peak-hold end bit (DFEjSTCHn.PHE) has been 1 after the value of the input data valid bit (DFEjSTCHn.VALID) is set to 0 .

### 37.6.14 Restrictions on the Intermediate Value Output Registers

Reading the intermediate value output registers (including the intermediate value output mirror register L ) is prohibited for channels in use as IIR filters.

### 37.6.15 Restrictions on Subtraction Circuit

It is prohibited to set a minuend channel and a subtrahend channel to the same channel.
Use the same format for the filter results of the minuend and subtrahend channels.
It is prohibited to perform subtraction between the filter results with the different formats. In this case, data integrity is not guaranteed.

### 37.6.16 Restrictions on Buffer A Circuit

### 37.6.16.1 Restrictions on FIFO Channels In Use

Use it for ascending order from FIFO channel 0 consecutively by all means, when valid FIFO channels are less than the max FIFO channels which buffer A circuit has.

For example, set FIFO channel $0,1,2$, and 3 to valid when 4 FIFO channels are used. It is prohibited to set the following settings.

- Setting FIFO channel 2, 3, 4, and 5 to valid (When not using FIFO channel 0 )
- Setting FIFO channel $0,2,3$, and 5 to valid (When not using FIFO channel in ascending order consecutively)

### 37.6.16.2 Notes about Read Regsiters

The output condition of buffer A capture interrupt request is the reading of the Buffer A output registers of all FIFO channels which are set to valid (DFBFACTLCHn.CHEN $=1$ ).

Reading invalid FIFO channels is not included in the output condition for the interrupt request. The read value varies when according to the setting of DFBFACCTL.AUNE when reading invalid FIFO channels.

- The read value is as follows when output data of invalid FIFO channels is read.

When DFBFACCTL.AUNE is set to 0 , read value is 32 h 00000000 .
When DFBFACCTL.AUNE is set to 1 , read value is 32 h 00000001 .

- When valid FIFO channels are set to invalid, Set buffer A circuit is cleared once (Refer to Section 37.4.2.1). So the read value is as follows.

When DFBFACCTL.AUNE is set to 0 , read value is 32 h 00000000 .
When DFBFACCTL.AUNE is set to 1 , read value is 32 h 00000001 .

### 37.6.16.3 Notes about Buffer A Capture Interrupt Request

After an overflow error (DFBFACST.OVFAn $(\mathrm{n}=0,1, \ldots, 5)$ ) has occurred on any of the FIFO channels, the buffer A capture interrupt request is not output even if the data of valid FIFO channels (DFBFACTLCHn.CHEN $=1$ ) is read. When an overflow error has occurred, clear buffer A circuit by using Buffer A clear bit (DFBFACLR.CLRA).

### 37.6.17 Restrictions on Buffer B Circuit

### 37.6.17.1 Notes Concerning the Buffer B Capture Interrupt Request

After an overflow error (DFBFBST.OVFB) has occurred, the buffer B capture interrupt request is not output even if FIFO data is read 4 times. When an overflow error has occurs, clear buffer $B$ circuit by using Buffer $B$ clear bit (DFBFBCLR.CLRB).

### 37.6.17.2 Restrictions on Buffer B Circuit when both Buffer A and Buffer B are in Use

When both Buffer A and Buffer B are used, it is prohibited to set same DFE and same DFE channel for Buffer A and Buffer B. For example, when 10CH of DFE0 is selected for FIFO channel 0 of Buffer A, it is prohibited to select 10CH of DFE0 for buffer B.

### 37.6.18 Note on Using Automatic Channel Initialization

Observe the following when using automatic channel initialization when restarting a channel:
(1) Set the registers according to the channel start procedure described in Section 37.4.2.1.
(2) If the channel is subject to capture by the buffer A circuit or buffer B circuit, set the registers according to the channel start procedure described in Section 37.4.2.1.

If either of the above are not observed, the following problems occur:

- Buffer A circuit:

If the DFBACLR.CLRA bit is not cleared after the buffer A circuit is stopped, the FIFO includes a mixture of the following data because a capture trigger is issued from the timer at the optionally set timing:

1. The filter results from before automatic channel initialization was enabled
2. Data that was cleared by automatic channel initialization
3. The filter results from after automatic channel initialization was enabled

This makes it impossible to judge the point from which data is valid.

- Buffer B circuit:

If the DFBACLR.CLRB bit is not cleared after the buffer B circuit is stopped, the FIFO includes a mixture of the following data because the data in the buffer B circuit is captured after the filter results of the target channel are output:

1. The filter results from before automatic channel initialization was enabled
2. The filter results from after automatic channel initialization was enabled

This makes it impossible to judge the point from which data is valid.

### 37.6.19 Restrictions on Using Peak-Hold Mask Function

When using the peak-hold mask function, be sure to disable the peak-hold mask function while peak-hold processing is enabled. Specifically, be sure to disable the peak-hold mask function by enabling the peak-hold mask end trigger flag before enabling the peak-hold end trigger flag.

### 37.6.20 Restrictions on Using Peak-Hold Function

When processing A and B below in the peak-hold circuit in parallel, allocate processing A to DFEi and processing B to DFEj. (where $\mathrm{i} \neq \mathrm{j}$ )

When processing A and B in parallel in one DFE unit, use two DFE channels for processing A instead of one channel. Execute PH processing on one channel and comparison processing on the other channel.
A) Both peak-hold processing and comparison processing simultaneously
B) Peak-Hold-23 function

## Section 38 Functional Safety

### 38.1 Overview

This section describes the intended safety mechanisms provided to detect the MCU failures with a short detection time. Here, the failures include both the recoverable transient failures such as soft errors of a memory and the unrecoverable permanent failures.

This MCU was developed to meet the requirements for a Safety Element out of Context (SEooC) as described in the ISO26262. In a SEooC development, safety requirements of target device (component) are assumed from market requirements by component manufacturers, and then the device is developed according to these assumed requirements. As this application is targeted for powertrain applications, some special considerations are already included to minimize gaps with powertrain requirements, however this should not restrict use with other applications. If Renesas assumptions are not enough to achieve system safety requirements derived from safety goals, the system safety requirements need to be modified. Contact our sale office for the details regarding the development process and safety organization.

The following lists the intended safety mechanisms provided by this product.
Note 1. The suitability of the safety mechanisms referenced in this chapter will finally be judged during the safety analysis and safety assessment of the MCU. Therefore, the safety documentation shall always be considered as additional requirements for the system or software derived from the results of the safety analysis.

## ECC and EDC

Detect failures of memory and data transfer paths; correct failures.

## Lockstep

Detects failures of the CPU and DTS with a short detection time.

## Memory Protection

Detects erroneous access to the memory and peripheral circuits to protect the data in these elements against erroneous access.

## BIST

Detects failures of the failure detection function itself.

## MISG

Monitors write access to a specific address by the CPU, generates the signatures based on the written data, and automatically compares the generated signatures with each other.

## Error Control Module (ECM)

Monitors various failure detection states in the MCU and defines the operation to be carried out when a failure occurs reaction.

## Voltage Monitor

Monitors power supply voltage to detect over and under voltage.

## Clock Monitor

Monitors the clock operation to detect abnormal operation.

## Data CRC

Generates CRC to verify the data streams protected by CRC.

### 38.2 Reset Sources

Register reset conditions are shown in Table 38.1.
Table 38.1 Reset sources

|  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Reset Source | Power Up <br> Register Name | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module <br> Reset |
| Functinal Safety related <br> registers*1 <br> (ECC and EDC, | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - |  |
| Reset |  |  |  |  |  |  |
| Hardware Redundancy, <br> Memory Protection, and <br> MISG) |  |  |  | - |  |  |

Note 1. Except for BIST registers. For details about BIST register reset conditions, see Section 38.6.2.3, Reset of Registers. For details about register reset conditions of Voltage Monitor, Clock Monitor, ECM, and Data CRC Function, see Section 12, Power Supply Voltage Monitor, Section 14, Clock Monitor, Section 39, Error Control Module (ECM), and Section 40, Data CRC Function B (DCRB).

### 38.3 ECC and EDC

### 38.3.1 Overview

### 38.3.1.1 ECC

This product incorporates ECC for the following memories. The ECC enables detection and correction of errors of the data retained in memory. The ECC also enables detection and correction of errors produced between the ECC encoder and memory; and memory and ECC decoder.

Table 38.2 ECC Overview

| Applicable Memory | Applicable Data Width [bits] | Operation upon Error Detection |  |  |  | Failure Insertion |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Detection/ Correction | Notice to ECM | Error Status | Address Capture |  |
| Code flash | 128 | SEC-DED | Possible | Possible | Possible | Possible |
| Data flash | 32 | SEC-DED | Possible | Possible | Possible | Possible |
| Local RAM (all CPU cores) | 32 | SEC-DED | Possible | Possible | Possible | Possible |
| Cluster RAM | 32 | SEC-DED | Possible | Possible | Possible | Possible |
| Instruction cache (data) | 64 | SED-DED | Possible | Possible | Possible | Possible |
| Instruction cache (tag) | 32 | SED-DED | Possible | Possible | Possible | Possible |
| RAM for DTS | 32 | SEC-DED | Possible | Possible | Possible | Possible |
| RAM for sDMAC (Descriptor) | 32 | SEC-DED | Possible | Possible | Possible | Possible |
| RAM for sDMAC (Data Transfer) | 64 | SEC-DED | Possible | Possible | Possible | Possible |
| Peripheral RAM (32 bits) | 32 | SEC-DED | Possible | Possible*1 | Possible*1 | Possible*1 |
| Peripheral RAM (16 bits) | 16 | SEC-DED | Possible | Possible | Possible | Possible |
| Data transfer path (data) | 32 | SEC-DED | Possible | Possible | N/A | Possible |
| Data transfer path (address) | 32 | SED-DED | Possible | Possible | N/A | Possible |

Note 1. Except for Ethernet RAM.

## Detection/Correction

SEC-DED: 1-bit errors can be detected and corrected, and 2-bit errors can only be detected.
SED-DED: 1-bit errors and 2-bit errors can only be detected.

## Notice to ECM

A detected error can be reported to the ECM.

## Error Status

The status of a detected error is retained.

## Address Capture

The address of a detected error is retained.

## Failure Insertion

An ECC error can be intentionally generated to enable software test of the ECC decoder operation.

### 38.3.1.2 Address Parity

This product incorporates address parity for the following types of memory. The address parity enables detection of errors during address decoding. It also enables detection of errors produced at addresses between the parity encoder and memory.

Table 38.3 Address Parity Overview

| Applicable Memory | Parity Bit | Notice to ECM | Error Status | Address Capture | Failure Insertion |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Code flash | 1 bit | Possible | Possible | Possible | Possible |

### 38.3.1.3 Address Feedback

This product incorporates an address feedback function for the following types of memory. The address feedback function enables detection of address errors inside memory module itself.

Table 38.4 Address Feedback Overview

| Applicable Memory | Notice to ECM | Error Status | Address Capture | Failure Insertion |
| :--- | :--- | :--- | :--- | :--- |
| Local RAM (all CPU cores) | Possible | Possible | Possible | Possible |
| Cluster RAM | Possible | Possible | Possible | Possible |
| Instruction cache (data/tag) | Possible | Possible | Possible | Possible |
| RAM for DTS | Possible | Possible | Possible | Possible |

### 38.3.2 Key Code Protection for ECC Control Registers

### 38.3.2.1 Overview

The product incorporates key code register to protect ECC control registers from unintended access.

### 38.3.2.2 List of Registers

Table 38.5 List of Registers

|  |  |  |  |  | Access |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Module Name | Register Name | Symbol | Address | Access | Protection |
| ECCKC | ECC Control Key Code Protection Register | KCPROT | FFFB 2800 | 32 |  |
| (Peripheral Group0) |  |  |  |  |  |

### 38.3.2.3 KCPROT — ECC Control Key Code Protection Register

This register is used for protection against writing to the ECC control registers due to program malfunction and the like.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 38.6 KCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit*2 |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |

Note 1. Write A5A5A500H to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.
Note 2. Unlocking this protection is one of necessary conditions to enable writing the protected registers. It is also necessary to unlock security protection driven by the ICUM when ICUM function is active. For details, see RH850/E2x-FCC1 ICUMD User's Manual: Hardware Section 9.

### 38.3.3 Code Flash ECC and Address Parity

### 38.3.3.1 Overview

The code flash ECC is summarized in the table below.
Table 38.7 Code Flash ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, this function is enabled; 1-bit error detection and correction and 2-bit error detection are carried out. |
| Address parity | Address parity check can be either enabled or disabled. <br> When enabled, Address parity is checked during address decoding. <br> When disabled, no address parity check is carried out. <br> In the initial state, this function is enabled. |
| Error notification | The occurrence of an ECC error or a parity error is reported to the Error Control Module. <br> ECC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. |

## Address Parity Error:

- Error notification can be either enabled or disabled upon detection of an address parity error.

In the initial state, error notification is enabled upon detection of an address parity error.

## Overflow Error:

- Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error.
In the initial state, error notification is enabled upon detection of an address buffer overflow error.
An ECC 2-bit error, an ECC 1-bit error, an address parity error, and an overflow error are handled as individual sources in ECM.
An ECC 1-bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer.

| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error <br> detection, and address parity error detection. If an error occurs while no error status is set, the <br> corresponding status is set. <br> The error status can be cleared using the clear register. |
| :--- | :--- |
| Address capture | The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address parity error is detected. <br> The error status serves as the enable bit of the capture address. Address buffers are updated if the error <br> status is cleared. |
|  | Multi-stage address buffers are provided for an ECC 1-bit error. <br> ECC 1-bit error: Four stages <br> ECC 2-bit error, address parity error shared: One stage |
| Self-diagnosis | The ROM data and the ECC and address parity bits in Code Flash can be read directly. <br> Self-diagnosis of ECC and address parity is possible by reading data from ECC test area. |

### 38.3.3.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 38.8 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ECCCNT_CFP_PE0CLO_base> | FFC4 $8000_{H}$ | Peripheral Group 0 |
| <ECCCNT_CFP_PE1CLO_base> | FFC4 $8080_{H}$ | Peripheral Group 0 |
| <ECCCNT_CFCCLO_base> | FFC4 $8800_{H}$ | Peripheral Group 0 |
| <ECCCNT_CFS_base> | FFC4 $8 \mathrm{~A} 00_{H}$ | Peripheral Group 0 |
| <MECCCAP_CFL_base> | FFC5 $2400_{H}$ | Peripheral Group 0 |

### 38.3.3.3 List of Registers

Table $38.9 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ECCCNT_CFP_PEn CLO ( $\mathrm{n}=0,1$ ) | ECC Control Register | CFPECCCTL | <ECCCNT_CFP_PEnCLO_base> + 00 H | 8, 16, 32 | KCPROT |
|  | ECC Test Control Register | CFPECCTSTCTL | <ECCCNT_CFP_PEnCLO_base> + 10 H | 8, 16, 32 | KCPROT |
| ECCCNT_CFCCLO | Address Parity Control Register | CFCAPCTL | <ECCCNT_CFCCLO_base> $+00_{\text {H }}$ | 8, 16, 32 | KCPROT |
| ECCCNT_CFS | ECC Control Register | CFSECCCTL | <ECCCNT_CFS_base> + 00 H | 8, 16, 32 | KCPROT |
|  | ECC Test Control Register | CFSECCTSTCTL | <ECCCNT_CFS_base> + 10H | 8, 16, 32 | KCPROT |
| MECCCAP_CFL | Error Notification Control Register | CF_ERRINT | <MECCCAP_CFL_base> + $00_{\text {H }}$ | 8, 16, 32 | KCPROT |
|  | 1-bit Error Status Clear Register | CF_SSTCLR | <MECCCAP_CFL_base> + 10 H | 8, 16, 32 |  |
|  | Fatal Error Status Clear Register | CF_DSTCLR | <MECCCAP_CFL_base> + 14 H | 8, 16, 32 |  |
|  | 1-bit Error Overflow Status Clear Register | CF_OVFCLR | <MECCCAP_CFL_base> + 18H | 8, 16, 32 |  |
|  | 1-bit Error Status Register | CF_SERSTR | <MECCCAP_CFL_base> + $2 \mathrm{O}_{\text {H }}$ | 8, 16, 32 |  |
|  | Fatal Error Status Register | CF_DERSTR | <MECCCAP_CFL_base> + 24 H | 8, 16, 32 |  |
|  | 1-bit Error Overflow Status Register | CF_OVFSTR | <MECCCAP_CFL_base> + 28 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | 1-bit Error Location Information Register | CF_SERINF | <MECCCAP_CFL_base> + 30 H | 32 |  |
|  | 1st 1-bit Error Address Register | CF_00SEADR | <MECCCAP_CFL_base> + 70н | 32 |  |
|  | 2nd 1-bit Error Address Register | CF_01SEADR | <MECCCAP_CFL_base> + 74 H | 32 |  |
|  | 3rd 1-bit Error Address Register | CF_02SEADR | <MECCCAP_CFL_base> + 78 H | 32 |  |
|  | 4th 1-bit Error Address Register | CF_03SEADR | <MECCCAP_CFL_base> + 7 $\mathrm{H}_{\mathrm{H}}$ | 32 |  |
|  | 1st Fatal Error Address Register | CF_00DEADR | <MECCCAP_CFL_base> + FOH | 32 |  |

### 38.3.3.4 CFPECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from Code Flash to PE.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.10 CFPECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction disable bit |
|  |  | When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1-bit error correction to |
| enable/disable. |  |  |
|  | 0: Correction is enabled when 1-bit error is detected |  |
|  | 1: Correction is disabled when 1-bit error is detected |  |
| 0 | ECCDIS disable bit |  |
|  | Sets ECC error detection/correction to enable/disable. |  |
|  | 0: ECC error detection/correction is enabled |  |
|  | 1: ECC error detection/correction is disabled. |  |
|  |  |  |

### 38.3.3.5 CFPECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), address parity and ECC field written in Code Flash can be read from PE instead of data field.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.11 CFPECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects read data from Code Flash to PE. |
|  |  | $0:$ Data field written in Code Flash normally |
|  |  | 1: Address parity and ECC field written in Code Flash for self-diagnosis |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Instruction fetch from the Code Flash access path is not possible while ECC test mode is selected (ECCTST = 1). In ECC test mode including switching, the CPU must run a program from Local RAM or Cluster RAM and must not fetch instructions from Code Flash.

CPU has a data buffer for the Code Flash area. When switching the ECCTST bit, be sure to clear the data buffer. For how to clear the data buffer, see Section 3, CPU System.

When the Code Flash is read in ECC test mode, the ECC and address parity bits of the corresponding address are read. The bit assignment is as follows:

Table 38.12 Bit assignment of read data when ECC test mode is selected

| Bit Position | Function |
| :--- | :--- |
| 127 to 10 | Always 0 |
| 9 | Address parity bit |
| 8 to 0 | ECC bits |

### 38.3.3.6 CFCAPCTL — Address Parity Control Register

This register controls address parity error detection for read data from Code Flash.
This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Value after reset: $\quad 00000000 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | APEDIS | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R |

Table 38.13 CFCAPCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | APEDIS | Address parity error disable bit |
|  |  | Sets address parity error detection to enable/disable. |
|  | $0:$ Address parity error detection is enabled |  |
|  |  | 1: Address parity error detection is disabled |
| 1,0 |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.3.7 CFSECCCTL - ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data to SAXI2FAXI bridge.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.14 CFSECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit |
|  |  | Enables/disables 1-bit error correction when using ECC error detection/correction (ECCDIS = |
|  | $0)$. |  |
|  |  | $0:$ Correct when 1-bit error is detected |
|  | 1: Do not correct when 1-bit error is detected |  |
| 0 | ECCDIS disable bit |  |
|  |  | Enables/disables ECC error detection/correction. |
|  | $0:$ ECC error detection/correction is enabled |  |
|  |  |  |
|  |  |  |

### 38.3.3.8 CFSECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), address parity and ECC field written in Code Flash can be read from SAXI2FAXI bridge instead of data field.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.15 CFSECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects read data from Code Flash to SAXI2FAXI bridge. |
|  |  | $0:$ Data field written in Code Flash normally |
|  |  | 1: Address parity and ECC field written in Code Flash for self-diagnosis |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Instruction fetch from the Code Flash access path is not possible while ECC test mode is selected (ECCTST = 1). In ECC test mode including switching, ICU-M must run a program from Local RAM or Cluster RAM and must not fetch instructions from Code Flash.

When the Code Flash is read in ECC test mode, the ECC and address parity bits of the corresponding address are read. The bit assignment is as follows:

Table 38.16 Bit assignment of read data when ECC test mode is selected

| Bit Position | Function |
| :--- | :--- |
| 127 to 10 | Always 0 |
| 9 | Address parity bit |
| 8 to 0 | ECC bits |

### 38.3.3.9 CF_ERRINT — Error Notification Control Register

This register controls whether error information is reported to the ECM when an address parity error, ECC error and/or overflow error has occurred.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.17 CF_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. |
|  |  | 0: Overflow error report disabled |
|  | 1: Overflow error report enabled |  |
| 6 to 3 | APEIE | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | DEDIE | Controls error reports when address parity error is detected. |
|  |  | 1: Address parity error report disabled parity error report enabled |
| 1 |  | Controls error reports when ECC 2-bit error is detected. |
|  |  | 1: ECC 2-bit error report disabled |
|  |  | Controls error reports when ECC 1-bit error is detected. |
|  |  | 0: ECC 1-bit error report disabled |
|  |  | 1: ECC 1-bit error report enabled |

### 38.3.3.10 CF_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in CF_SERSTR. This is write only register and read value is always " 0 ".

Table 38.18 CF_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SSTCLR03 | Writing 1 to this bit clears SEDF03 in CF_SERSTR. |
| 2 | SSTCLR02 | Writing 1 to this bit clears SEDF02 in CF_SERSTR. |
| 1 | SSTCLR01 | Writing 1 to this bit clears SEDF01 in CF_SERSTR. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in CF_SERSTR. |

### 38.3.3.11 CF_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in CF_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.19 CF_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears APEF00 and DEDF00 in CF_DERSTR. |

### 38.3.3.12 CF_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in CF_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | SERR OVF CLR1 | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.20 CF_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in CF_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in CF_OVFSTR. |

### 38.3.3.13 CF_SERSTR — 1-bit Error Status Register

This register indicates whether an ECC 1-bit error has occurred. The location and address of the error that is detected is stored in CF_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is " 0 ". If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in CF_SSTCLR register.

Table 38.21 CF_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SEDF03 | Indicates that an ECC 1-bit error was detected and error address is stored in CF_03SEADR <br> register. |
| 2 | SEDF02 | Indicates that an ECC 1-bit error was detected and error address is stored in CF_02SEADR <br> register. |
| 1 | SEDF01 | Indicates that an ECC 1-bit error was detected and error address is stored in CF_01SEADR <br> register. |
| 0 | Indicates that an ECC 1-bit error was detected and error address is stored in CF_00SEADR <br> register. |  |

### 38.3.3.14 CF_DERSTR — Fatal Error Status Register

This register indicates whether an address parity error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in CF_00DEADR register when APEF00 and/or DEDF00 flags are set. The APEF00 and/or DEDF00 flag is set only when an address parity error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in CF_DSTCLR register.

Table 38.22 CF_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | APEF00 | Indicates that an address parity error was detected. |
| 1 | DEDF00 | Indicates that an ECC 2-bit error was detected. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.3.15 CF_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether an overflow of the address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in CF_OVFCLR register respectively.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.23 CF_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that ECC 1-bit error s over working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when all ECC 1bit error flags in <br>  |

### 38.3.3.16 CF_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in CF_SERSTR register were detected.

This register is updated whenever CF_SERSTR register is updated.

Table 38.24 CF_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | SEDLINF16 | Indicates that an ECC 1-bit error was detected in read data from Code Flash to SAXI2FAXI. |
| 15 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SEDLINF03 | Indicates that an ECC 1-bit error was detected in read data loaded from Code Flash to PE1. |
| 2 | SEDLINF02 | Indicates that an ECC 1-bit error was detected in read data fetched from Code Flash to PE1. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in read data loaded from Code Flash to PE0. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in read data fetched from Code Flash to PE0. |

### 38.3.3.17 CF_nSEADR — n -th 1-bit Error Address Register ( $\mathrm{n}=00$ to 03)

This register is used to hold the address and the location of the error when the SEDFn flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | SEDL[4:0] |  |  |  |  | - | SEADR0[25:16] |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SEADR0[15:2] |  |  |  |  |  |  |  |  |  |  |  |  |  | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.25 CF_nSEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 2 | SEADR0[25:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| NOTE |  |  |

SEADR0 indicates the address right-shifted by 2 bits rather than the actual address, so it is necessary for users to multiply it by 4 to get address at which the error was detected.

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.26 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 17 | Reserved |
| 16 | Indicates an ECC 1-bit error is detected in loading data from Code Flash by any master except PEs. |
| 15 to 4 | Reserved |
| 3 | Indicates an ECC 1-bit error is detected in loading data from Code Flash by PE1 master. |
| 2 | Indicates an ECC 1-bit error is detected in fetching instructions from Code Flash by PE1 master. |
| 1 | Indicates an ECC 1-bit error is detected in loading data from Code Flash by PE0 master. |
| 0 | Indicates an ECC 1-bit error is detected in fetching instructions from Code Flash by PE0 master. |

### 38.3.3.18 CF_00DEADR - 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither APEF00 nor DEDF00 flag is set and an address parity error and/or ECC 2-bit error was detected.

This register can only be cleared by reset.

| Value after reset: |  |  | $0000000 \mathrm{OH}^{\text {H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | DEDL[4:0] |  |  |  |  | - | DEADRO[25:16] |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | DEADRO[15:2] |  |  |  |  |  |  |  |  |  |  |  |  |  | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.27 CF_OODEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 2 | DEADR0[25:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| NOTE |  |  |

DEADR0 indicates the address right-shifted by 2 bits rather than the actual address, so it is necessary for users to multiply it by 4 to get address at which the error was detected.

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.28 DEDL Information

| DEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 17 | Reserved |
| 16 | Indicates a fatal error is detected in loading data from Code Flash by any master except PEs. |
| 15 to 4 | Reserved |
| 3 | Indicates a fatal error is detected in loading data from Code Flash by PE1 master. |
| 2 | Indicates a fatal error is detected in fetching instructions from Code Flash by PE1 master. |
| 1 | Indicates a fatal error is detected in loading data from Code Flash by PE0 master. |
| 0 | Indicates a fatal error is detected in fetching instructions from Code Flash by PE0 master. |

### 38.3.3.19 Test Function

Through appropriate register settings, the code flash data, ECC bits, and address parity bit can be read out.

## (1) Reading Code Flash

(a) Set the ECCDIS bit in the CFPECCCTL register to 1 to disable ECC error detection and correction.
(b) When ECCDIS=1, neither error detection nor correction proceeds when the code flash is read; the data output from the code flash is read unchanged.

How to exit this test mode:
(a) Set the ECCDIS bit in the CFPECCCTL register to 0 to enable ECC error detection and correction.

## (2) Reading the ECC and address parity bits

(a) Set the ECCDIS bit in the CFPECCCTL register to 1 to disable ECC error detection and correction.
(b) Set the ECCTST bit in the CFPECCTSTCTL register to 1 to set test mode.
(c) When the code flash is read, the ECC and address parity bits are read instead of the code flash data.

How to exit this test mode:
(a) Set the ECCDIS bit in the CFPECCCTL register to 0 to enable ECC error detection and correction.
(b) Set the ECCTST bit in the CFPECCTSTCTL register to 0 to set normal mode.

## (3) Self-diagnosis of ECC and address parity check function

Self-diagnosis of the ECC decoder and address parity checker for the access ports is possible by reading data from ECC test area.

For details about the ECC test area, refer to RH850/E2x Safety Application Note.

### 38.3.4 Data Flash ECC

### 38.3.4.1 Overview

The data flash ECC is summarized in the table below.
Table 38.29 Data Flash ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. <br> When enabled, either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, this function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out. |
| Error notification | Upon occurrence of an ECC error, it is notified to the Error Control Module. <br> ECC Error: <br> - Error notification can be either enabled or disabled upon detection of a 2-bit ECC error. <br> - Error notification can be either enabled or disabled upon detection of a 1-bit ECC error. <br> In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error. <br> An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources in ECM. |
| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. <br> The error status can be cleared using the clear register. |
| Address capture | The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the capture address. <br> If an ECC error occurs while no error status is set, the address at which the associated error has occurred is captured. |
| Self-diagnosis | The ROM data and the ECC bits in Data Flash can be read directly. Desired values can be written to the data and the ECC bits in Data Flash. |

### 38.3.4.2 List of Registers

Table $38.30 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ECCDF <br> (Peripheral Group1) | Data Flash ECC Control Register | DFECCCTL | FFC6 2C00 ${ }_{\text {H }}$ | 16, 32 | DFKCPROT |
|  | Data Flash Error Status Register | DFERSTR | FFC6 2C04H | 32 |  |
|  | Data Flash Error Status Clear Register | DFERSTC | FFC6 2C08H | 8, 16, 32 |  |
|  | Data Flash Error Overflow Status Register | DFOVFSTR | FFC6 2C0C ${ }_{\text {H }}$ | 32 |  |
|  | Data Flash Error Overflow Status Clear Register | DFOVFSTC | FFC6 2C10 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Data Flash Error Notification Control Register | DFERRINT | FFC6 2C14 ${ }_{\text {H }}$ | 8, 16, 32 | DFKCPROT |
|  | Data Flash 1st Error Address Register | DFEADR | FFC6 2C18 ${ }_{\text {H }}$ | 32 |  |
|  | Data Flash Test Control Register | DFTSTCTL | FFC6 2C1C ${ }_{\text {H }}$ | 16, 32 | DFKCPROT |
|  | Data Flash ECC Key Code Protection Register | DFKCPROT | FFC6 2C20 ${ }_{\text {H }}$ | 32 |  |

### 38.3.4.3 DFECCCTL — Data Flash ECC Control Register

DFECCCTL enables or disables ECC error detection and 1-bit error correction for read access.
DFECCCTL register is protected by DFKCPROT register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.31 DFECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction disable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
|  |  |  |
|  |  | enable/disable. Correction is enabled when 1-bit error is detected. |
|  | 1: Correction is disabled when 1-bit error is detected. |  |
| 0 | ECC disable bit |  |
|  | Sets ECC error detection/correction to enable/disable. |  |
|  | $0:$ ECC error detection/correction is enabled. |  |
|  | 1: ECC error detection/correction is disabled. |  |

### 38.3.4.4 DFERSTR — Data Flash Error Status Register

DFERSTR monitors occurrence of errors.
The SEDF bit is set if an ECC 1-bit error is detected while ECC error detection/correction is enabled (ECCDIS $=0$ ), and the DEDF bit is set if an ECC 2-bit error is detected.

Table 38.32 DFERSTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDF | ECC 2-Bit Error Monitor Flag |
|  |  | 0 : An ECC 2-bit error is not generated. |
|  |  | 1: An ECC 2-bit error is generated. |
|  |  | Clearing condition: |
|  |  | ERRCLR bit is set in Data Flash error status clear register. |
|  |  | Setting condition: |
|  |  | ECC 2-bit error is generated. |
| 0 | SEDF | ECC 1-bit error Monitor Flag |
|  |  | 0 : An ECC 1-bit error is not generated. |
|  |  | 1: An ECC 1-bit error is generated. |
|  |  | Clearing condition: |
|  |  | ERRCLR bit is set in Data Flash error status clear register. |
|  |  | Setting condition: |
|  |  | ECC 1-bit error is generated with both SEDF and DEDF being 0. |

### 38.3.4.5 DFERSTC — Data Flash Error Status Clear Register

DFERSTC clears the error flags in the Data Flash error status register. DFERSTC is a write-only register and is always read as 0 .

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.33 DFERSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ERRCLR | SEDF/DEDF Flag Clear |
|  |  | 0: No effect (Setting the ERRCLR bit to 0 does not affect the DEDF and SEDF flags in |
|  | DFERSTR.) |  |
|  |  | 1: The SEDF/DEDF flag in DFERSTR is cleared. |
|  |  |  |

### 38.3.4.6 DFOVFSTR — Data Flash Error Overflow Status Register

DFOVFSTR monitors occurrence of Data Flash error overflow.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | ERR OVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.34 DFOVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ERROVF | Error Overflow Flag |
|  |  | ERROVF is set if the following occur: |
|  |  | - An ECC 1-bit error occurs when DFERSTR.SEDF $=1$ and access address is different from DFEADR. |
|  |  | - An ECC 1-bit error occurs when DFERSTR.DEDF $=1$ |
|  |  | - An ECC 2-bit error occurs when DFERSTR.SEDF $=1$ |
|  |  | - An ECC 2-bit error occurs when DFERSTR.DEDF $=1$ and access address is different from DFEADR. |
|  |  | 0: Did not occur |
|  |  | 1: Occurred |
|  |  | Clearing condition: |
|  |  | Set the ERROVFCLR bit in DFOVFSTC to 1. |

### 38.3.4.7 DFOVFSTC — Data Flash Error Overflow Status Clear Register

DFOVFSTC clears the Data Flash error overflow flag.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.35 DFOVFSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ERROVFCLR | Error Overflow Flag Clear |
|  |  | $0:$ No effect (Setting the ERROVFCLR bit to 0 does not affect the flag in DFOVFSTR.) |
|  |  | 1: The ERROVF flag in the DFOVFSTR register is cleared. |

### 38.3.4.8 DFERRINT — Data Flash Error Notification Control Register

DFERRINT enables or disables generation of the error notification signal upon detection of an ECC 2-bit error or an ECC 1-bit error.

DFERRINT register is protected by DFKCPROT register.

| Value after reset: $\quad 00000007 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | EOVFIE | DEDIE | SEDIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
|  | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 38.36 DFERRINT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | EOVFIE | ECC Error Address Overflow Notification Control |
|  |  | Enables or disables generation of the error notification signal upon detection of an address buffer overflow error. |
|  |  | 0: Error address overflow report disabled |
|  |  | 1: Error address overflow report enabled |
| 1 | DEDIE | ECC 2-bit error Notification Control |
|  |  | Enables or disables generation of the error notification signal upon detection of a 2-bit error when ECC error detection/correction is enabled (ECCDIS $=0$ ). |
|  |  | 0: Disables notification of the ECC 2-bit error. |
|  |  | 1: Enables notification of the ECC 2-bit error. |
| 0 | SEDIE | ECC 1-bit error Notification Control |
|  |  | Enables or disables generation of the error notification signal upon detection of a 1-bit error when ECC error detection/correction is enabled (ECCDIS $=0$ ). |
|  |  | 0: Disables notification of the ECC 1-bit error. |
|  |  | 1: Enables notification of the ECC 1-bit error. |

### 38.3.4.9 DFEADR — Data Flash 1st Error Address Register

DFEADR holds the address if the following occur:

- An ECC 1-bit error occurs when DFERSTR.SEDF $=0$ and DFERSTR.DEDF $=0$
- An ECC 2-bit error occurs when DFERSTR.DEDF $=0$

Value after reset: $00000000_{\mathrm{H}}$

Table 38.37 DFEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved <br>  <br> 20 to 2 |
|  | DFEADR[20:2] | ECC Error Address <br>  <br>  |
|  | DFEADR is a read-only field to monitor the address at which an ECC error has occurred. |  |
|  | This register holds an internal address. Convert it to the actual address by adding the data |  |
| flash base address described in Section 4 Address MAP. |  |  |

### 38.3.4.10 DFTSTCTL — Data Flash Test Control Register

DFTSTCTL is used for ECC testing.
The data of the ECC bit can be read after setting the ECC test mode $($ ECCTST $=1$ ).
DFTSTCTL register is protected by DFKCPROT register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.38 DFTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCTST | ECC Test |
|  |  | By setting ECC test mode bit to " 1 " (ECCTST $=1$ ), CPU can read ECC bit. |

### 38.3.4.11 DFKCPROT — Data Flash ECC Key Code Protection Register

DFKCPROT is used for access protection of other Data Flash ECC registers.
Protected registers:
DFECCCTL

## DFERRINT

DFTSTCTL

Table 38.39 DFKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit*2 |
|  | $0:$ Disable write access to protected registers |  |
|  |  | 1: Enable write access to protected registers |

Note 1. Write A5A5A500H to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

Note 2. Unlocking this protection is one of necessary conditions to enable writing the protected registers. It is also necessary to unlock security protection driven by the ICUM when ICUM function is active. For details, see RH850/E2x-FCC1 ICUMD User's Manual: Hardware Section 9.

### 38.3.4.12 Test Function

Data in the ROM and the ECC bits can be read by setting the data flash test control register (DFTSTCTL).

## (1) Reading the ROM data

(a) Set the ECCDIS bit in the data flash ECC control register to 1 to disable ECC error detection and correction.
(b) When ECCDIS $=1$, neither error detection nor correction proceeds when the data flash is read; the data output from the data flash is read unchanged.

How to exit this test mode:
(a) Set the ECCDIS bit in the data flash ECC control register to 0 to enable ECC error detection and correction.

## (2) Reading the ECC bits

(a) Set the ECCDIS bit in the data flash ECC control register to 1 to disable ECC error detection and correction.
(b) Set the ECCTST bit in the data flash test control register to 1 to set test mode.
(c) When the data flash is read, the 7 lower-order bits of read data are read as ECC data.

How to exit this test mode:
(a) Set the ECCDIS bit in the data flash ECC control register to 0 to enable ECC error detection and correction.
(b) Set the ECCTST bit in the data flash test control register to 0 to set normal mode.

## (3) Self-diagnosis of ECC check function

Self-diagnosis of the ECC decoder is possible by writing incorrect data to the data flash memory beforehand (fault injection) and then reading this data. A 1- or 2-bit ECC error fault can be injected by generating correct ECC bits once and inverting only the appropriate bits. For details on programming of the data flash, refer to the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface.

### 38.3.5 Local RAM ECC and Address Feedback

### 38.3.5.1 Overview

Local RAM ECC is summarized in the table below
Table 38.40 Local RAM ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and | ECC error detection and correction can be either enabled or disabled. |
| correction | When enabled, either of the following settings can be selected: |
|  | - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and |
|  | correction are carried out). |
|  | - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). |
|  | When disabled, neither error detection nor correction is carried out. |
|  | carried out. |

Error notification The occurrence of an ECC error or an address feedback error is reported to the Error Control Module.

## ECC Error:

- Error notification can be either enabled or disabled upon detection of an ECC 2-bit error.
- Error notification can be either enabled or disabled upon detection of an ECC 1-bit error.

In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.

## Address Feedback Error:

- Error notification can be either enabled or disabled upon detection of an address feedback error.

In the initial state, error notification is enabled upon detection of an address feedback error.

## Overflow Error:

- Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error.

In the initial state, error notification is enabled upon detection of an address buffer overflow error. The error notification signal is output with an address feedback error handled as one source. An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources in ECM.
An ECC 1-bit error signal is only issued to the ECM, if the ECC 1-bit error address is not yet stored in the error address buffer.

| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error <br> detection, and address feedback error detection. If an error occurs while no error status is set, the <br> corresponding status is set. The error status can be cleared using the clear register. |
| :--- | :--- |
| Address capture | The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is <br> detected. The error status serves as the enable bit of the address that is captured. <br>  <br> Address buffers are updated if the error status is cleared. <br>  <br>  <br> Multi-stage address buffers are provided for an ECC 1-bit error. <br> ECC 1-bit error: Eight stages (for each CPU) <br> ECC 2-bit error and address feedback error: One stage (for each CPU) |
| Self-diagnosis | Desired values can be written to the RAM data and the ECC bits. <br> The RAM data can be read directly and the ECC bits can be read via Read Buffer Register in ECC Test <br> Mode. <br> Moreover, the error injection to an address feedback checker is possible by setting AFINV. |

ECC of Local RAM is provided for each 32 bits of data and each 32-bit data is called bank 0 to 3 . The relationship between addresses and bank numbers are as follows.

Table 38.41 Relationship between addresses and bank numbers

| 4 lower-order bits of address <br> (Hexadecimal Notation) | $\mathrm{F}_{\mathrm{H}}$ to $\mathrm{C}_{\mathrm{H}}$ | $\mathrm{B}_{\mathrm{H}}$ to $8_{\mathrm{H}}$ | $7_{\mathrm{H}}$ to $4_{\mathrm{H}}$ | $3_{\mathrm{H}}$ to $0_{\mathrm{H}}$ |
| :--- | :--- | :--- | :--- | :--- |
| Bank number | Bank 3 | Bank 2 | Bank 1 | Bank 0 |

### 38.3.5.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.42 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ECCCNT_LR_PE0CL0_base> | FFC4 $9800_{H}$ | Peripheral Group 0 |
| <ECCCNT_LR_PE1CLO_base> | FFC4 $9880_{H}$ | Peripheral Group 0 |
| <MECCCAP_LR_PE0CL0_base> | FFC5 $0000_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_LR_PE1CL0_base> | FFC5 $0100_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_LRA_base> | FFC5 $0800_{\mathrm{H}}$ | Peripheral Group 0 |

### 38.3.5.3 List of Registers

Table 38.43 List of Registers (1/2)

| Module Name <br> ECCCNT_LR_PEnC <br> L0 $(\mathrm{n}=0,1)$ | ECC Control Register | Symbol |  | Address | Access |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |

Table 38.43 List of Registers (2/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 38.3.5.4 LRECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from Local RAM and address feedback error detection for request address to Local RAM.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.44 LRECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEDIS | Address feedback error disable bit <br> Sets address feedback error detection to enable/disable. <br> 0 : Address feedback error detection is enabled <br> 1: Address feedback error detection is disabled |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1-bit error correction to enable/disable. <br> 0 : Correct when 1-bit error is detected <br> 1: Do not correct when 1-bit error is detected |
| 0 | ECCDIS | ECC disable bit <br> Sets ECC error detection/correction to enable/disable. <br> 0 : ECC error detection/correction is enabled <br> 1: ECC error detection/correction is disabled |

### 38.3.5.5 LRECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), either data field or ECC field of Local RAM can be written separately.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.45 LRECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Sets the write mode to Local RAM. |
|  | $0:$ Normal mode |  |
|  |  | 1: Test mode |
|  |  | Either data field or ECC field can be written according to the DATSEL setting in test mode. |
| 0 | DATSEL | Sets the field to write data when ECCTST $=1$. |
|  | $0:$ Data field only |  |
|  |  | 1: ECC field only |
|  |  |  |

### 38.3.5.6 LRAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from Local RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.46 LRAFINV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved <br>  <br> 20 to 4 |
| AFINV[20:4] | When read, the value after reset is returned. When writing, write the value after reset. |  |
| to 0 | - | Specifies bit pattern to inject errors into feedback address. |

### 38.3.5.7 LRTDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Local RAM for self-diagnosis. ECC field in requested address can be stored this register while reading from Local RAM where ECCTST $=1$.

Table 38.47 LRTDATBFECCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 24 | BFECC3[6:0] | ECC field read from the address that is requested in Local RAM bank 3 |
| 23 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | BFECC2[6:0] | ECC field read from the address that is requested in Local RAM bank 2 |
| 15 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 14 to 8 | BFECC1[6:0] | ECC field read from the address that is requested in Local RAM bank 1 |
| 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | BFECC0[6:0] | ECC field read from the address that is requested in Local RAM bank 0 |

### 38.3.5.8 LRO_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error has occurred.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.48 LRO_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. <br> 0 : Overflow error report disabled <br> 1: Overflow error report enabled |
| 6 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEIE | Controls error reports when address feedback error is detected. <br> 0: Address feedback error report disabled <br> 1: Address feedback error report enabled |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when ECC 2-bit error is detected. <br> 0: ECC 2-bit error report disabled <br> 1: ECC 2-bit error report enabled |
| 0 | SEDIE | Controls error reports when ECC 1-bit error is detected. <br> 0: ECC 1-bit error report disabled <br> 1: ECC 1-bit error report enabled |

### 38.3.5.9 LRO_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in LR0_SERSTR. This is a write only register and read value is always " 0 ".

Table 38.49 LRO_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SSTCLR07 | Writing 1 to this bit clears SEDF07 in LR0_SERSTR. |
| 6 | SSTCLR06 | Writing 1 to this bit clears SEDF06 in LR0_SERSTR. |
| 5 | SSTCLR05 | Writing 1 to this bit clears SEDF05 in LR0_SERSTR. |
| 4 | SSTCLR04 | Writing 1 to this bit clears SEDF04 in LR0_SERSTR. |
| 3 | SSTCLRO3 | Writing 1 to this bit clears SEDF03 in LR0_SERSTR. |
| 2 | SSTCLR01 | Writing 1 to this bit clears SEDF02 in LR0_SERSTR. |
| 1 | SSTCLR00 | Writing 1 to this bit clears SEDF01 in LR0_SERSTR. |
| 0 | Writing 1 to this bit clears SEDF00 in LR0_SERSTR. |  |

### 38.3.5.10 LRO_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in LR0_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.50 LRO_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears AFEF00 and DEDF00 in LR0_DERSTR. |

### 38.3.5.11 LRO_OVFCLR - 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in LR0_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | SERR OVF CLR1 | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.51 LRO_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br>  <br> 1 |
| 0 | SERROVFCLR1 | Wread, the value after reset is returned. When writing, write the value after reset. |
|  | SERROVFCLR0 | Writing 1 to this bit clears SERROVF1 in LR0_OVFSTR. |

### 38.3.5.12 LRO_SERSTR - 1-bit Error Status Register

This register indicates whether an ECC 1-bit error has occurred. The location and address of the error that is detected are stored in LR0_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is " 0 ". If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in LR0_SSTCLR register.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.52 LRO_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEDF07 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_07SEADR <br> register. |
| 6 | SEDF06 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_06SEADR <br> register. |
| 5 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_05SEADR <br> register. |  |
| 4 | SEDF05 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_04SEADR <br> register. |
| 3 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_03SEADR <br> register. |  |
| 2 | SEDF02 | Indicates that an ECC 1-bit error was detected and error address is stored in LR0_02SEADR <br> register. |
| 1 | Indicates that an ECC 1-bit error was detected and error address is stored in LRO_01SEADR <br> register. |  |

### 38.3.5.13 LRO_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in LR0_00DEADR register when AFEF00 and/or DEDF00 flag are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in LR0_DSTCLR register.

Table 38.53 LRO_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
| 3 | AFEF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | - | Indicates that an address feedback error was detected. |
| 1 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | - | Indicates that an ECC 2-bit error was detected. |

### 38.3.5.14 LRO_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address, is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in LR0_OVFCLR register respectively.

Table 38.54 LRO_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than the working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when all ECC 1bit error flags in <br> LRO_SERSTR are set. |

### 38.3.5.15 LRO_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in LR0_SERSTR register were detected.

This register is updated whenever LR0_SERSTR register is updated.

Table 38.55 LRO_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
| 4 | SEDLINF04 | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SEDLINF03 | Indicates that an ECC 1-bit error was detected in bank 2 of Local RAM. |
| 2 | SEDLINF02 | Indicates that an ECC 1-bit error was detected in bank 1 of Local RAM. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in bank 0 of Local RAM. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in read data loaded from its own Local RAM <br> speculatively. |

### 38.3.5.16 LRO_nSEADR — n-th 1-bit Error Address Register ( $\mathrm{n}=00$ to 07)

This register is used to hold the address and the location of the error when the SEDFn flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Table 38.56 LRO_nSEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 15 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 to 2 | SEADR0[14:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.57 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 5 | Reserved |
| 4 | Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 3 of Local RAM. |
| 3 | Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 2 of Local RAM. |
| 2 | Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 1 of Local RAM. |
| 1 | Indicates an ECC 1-bit error is detected in storing data to or fetching instructions from bank 0 of Local RAM. |
| 0 | Indicates an ECC 1-bit error is detected in loading data from its own Local RAM. |

### 38.3.5.17 LRO_OODEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error was detected.
This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.58 LRO_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 15 | - | Reserved <br>  <br> 14 to 2 |
| 1,0 | DEADR0[14:2] | Indicates at which address this error was detected. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.59 DEDL Information

| DEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 5 | Reserved |
| 4 | Indicates a fatal error is detected in storing data to or fetching instructions from bank 3 of Local RAM. |
| 3 | Indicates a fatal error is detected in storing data to or fetching instructions from bank 2 of Local RAM. |
| 2 | Indicates a fatal error is detected in storing data to or fetching instructions from bank 1 of Local RAM. |
| 1 | Indicates a fatal error is detected in storing data to or fetching instructions from bank 0 of Local RAM. |
| 0 | Indicates a fatal error is detected in loading data from its own Local RAM. |

### 38.3.5.18 LR1_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM when an ECC error and/or overflow error occurs.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.60 LR1_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. |
|  |  | 0: Overflow error report disabled |
|  | 1: Overflow error report enabled |  |
| 6 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when ECC 2-bit error is detected. |
|  |  | 0: ECC 2-bit error report disabled |
|  |  | Controls error reports when ECC 1-bit error is detected. |
| 0 | 0: ECC 1-bit error report disabled |  |
|  |  | 1: ECC 1-bit error report enabled |
|  |  |  |

### 38.3.5.19 LR1_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in LR1_SERSTR. This is write only register and read value is always " 0 ".

Table 38.61 LR1_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SSTCLR07 | Writing 1 to this bit clears SEDF07 in LR1_SERSTR. |
| 6 | SSTCLR06 | Writing 1 to this bit clears SEDF06 in LR1_SERSTR. |
| 5 | SSTCLR05 | Writing 1 to this bit clears SEDF05 in LR1_SERSTR. |
| 4 | SSTCLR04 | Writing 1 to this bit clears SEDF04 in LR1_SERSTR. |
| 3 | SSTCLR02 | Writing 1 to this bit clears SEDF03 in LR1_SERSTR. |
| 2 | SSTCLR01 | Writing 1 to this bit clears SEDF02 in LR1_SERSTR. |
| 1 | SSTCLR00 | Writing 1 to this bit clears SEDF01 in LR1_SERSTR. |
| 0 |  |  |

### 38.3.5.20 LR1_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in LR1_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.62 LR1_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears DEDF00 in LR1_DERSTR. |

### 38.3.5.21 LR1_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in LR1_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.63 LR1_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in LR1_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in LR1_OVFSTR. |

### 38.3.5.22 LR1_SERSTR - 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in LR1_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is " 0 ". If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in LR1_SSTCLR register.

Table 38.64 LR1_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEDF07 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_07SEADR <br> register. |
| 6 | SEDF06 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_06SEADR <br> register. |
| 5 | SEDF05 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_05SEADR <br> register. |
| 4 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_04SEADR <br> register. |  |
| 3 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_03SEADR <br> register. |  |
| 2 | SEDF03 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_02SEADR <br> register. |
| 1 | Indicates that an ECC 1-bit error was detected and error address is stored in LR1_01SEADR <br> register. |  |
| 0 | SEDF01 | Indicates that an ECC 1-bit error r was detected and error address is stored in LR1_00SEADR <br> register. |

### 38.3.5.23 LR1_DERSTR — Fatal Error Status Register

This register indicates whether an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in LR1_00DEADR register when DEDF00 flag is set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is " 0 ".

This register can be cleared by DSTCLR00 in LR1_DSTCLR register.

Table 38.65 LR1_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
|  | Indicates that an ECC 2-bit error was detected. |  |

### 38.3.5.24 LR1_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address, is detected when the address buffer is fully used. If the newly detected error has the same address with errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in LR1_OVFCLR register respectively.

Table 38.66 LR1_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than the working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when all ECC 1bit error flags in <br> LR1_SERSTR are set. |

### 38.3.5.25 LR1_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in LR1_SERSTR register were detected.

This register is updated whenever LR1_SERSTR register is updated.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.67 LR1_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in read data to PE1 loaded from the other PE's <br> Local RAM speculatively. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in read data to PE0 loaded from the other PE's <br> Local RAM speculatively. |

### 38.3.5.26 LR1_nSEADR — n-th 1-bit Error Address Register (n = 00 to 07)

This register is used to hold the address and the location of the error when SEDFn flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SEDL[4:0] |  |  |  |  | - | - | - | - | - | SEADR0[21:16] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SEADRO[15:2] |  |  |  |  |  |  |  |  |  |  |  |  |  | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.68 LR1_nSEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 22 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 21 to 2 | SEADR0[21:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.69 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 2 | Reserved |
| 1 | Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE1 master. |
| 0 | Indicates an ECC 1-bit error is detected in loading data from the other PE's Local RAM by PE0 master. |

### 38.3.5.27 LR1_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and an ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DEDL[4:0] |  |  |  |  | - | - | - | - | - | DEADRO[21:16] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | DEADR0[15:2] |  |  |  |  |  |  |  |  |  |  |  |  |  | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.70 LR1_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 22 | - | Reserved <br>  <br> 21 to 2 |
| 1,0 | DEADR0[21:2] | Indicates at which address this error was detected. |
|  |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.71 DEDL Information

| DEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 2 | Reserved |
| 1 | Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE1 master. |
| 0 | Indicates a fatal error is detected in loading data from the other PE's Local RAM by PE0 master. |

### 38.3.5.28 Test Function

Through appropriate register settings, desired values can be written as RAM data and to the ECC bits. Also, data in the RAM and the ECC bits can all be read.

## (1) Writing RAM data

(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 0 to select RAM data for access when writing.
(c) When data is written to the Local RAM, only the RAM data can be modified without updating the ECC bits.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (2) Reading RAM data

(a) Set the ECCDIS bit in the ECC Control Register to 1 to disable ECC error detection and correction.
(b) Read the Local RAM. Since neither error detection nor correction proceeds when the Local RAM is read, the RAM data is read unchanged.

How to exit this test mode:
(a) Set the ECCDIS bit in the ECC Control Register to 0 to enable ECC error detection and correction.
(3) Writing to the ECC bits
(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 1 to select the ECC bits for access when writing.
(c) When data is written to the Local RAM, only the ECC bits can be modified without updating the RAM data. At that time, bits[6:0] are written to the ECC bits.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (4) Reading the ECC bits

(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) When the Local RAM is read, the ECC bits are stored in the word corresponding to local RAM ECC read buffer register.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (5) Self-diagnosis of the ECC check function

Desired values can be written to the RAM data, ECC bits by the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, selfdiagnosis of the ECC decoder is possible by reading the Local RAM in normal mode and checking the result of error correction or detection.

## (6) Self-diagnosis of the address feedback check function

Self-diagnosis is enabled by following procedure below.
(a) Set the desired bit(s) of AFINV[20:4] in the Address Feedback Test Control Register to 1 to set test mode.
(b) When the Local RAM is read or written, address feedback error occurs because feedback address XOR-ed with AFINV can be input to address feedback checker.

How to exit this test mode:
(a) Set the AFINV[20:4] bits in the Address Feedback Test Control Register all to 0 to disable test mode (normal mode).

### 38.3.6 Cluster RAM ECC and Address Feedback

### 38.3.6.1 Overview

The Cluster RAM ECC is summarized in the table below.
The ECC protection described below takes into consideration all possible Cluster RAM accesses from PE, H-Bus, System Bus and read access for read-modify-write processing unit of 8-bit and 16-bit data.

Table 38.72 Cluster RAM ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out. |
| Address feedback | Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled. |
| Error notification | The occurrence of an ECC error or an address feedback error is reported to the Error Control Module |

## ECC Error:

- Error notification can be either enabled or disabled upon detection of an ECC 2-bit error.
- Error notification can be either enabled or disabled upon detection of an ECC 1-bit error.

In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is enabled upon detection of an ECC 1-bit error.

## Address Feedback Error:

- Error notification can be either enabled or disabled upon detection of an address feedback error. In the initial state, error notification is enabled upon detection of an address feedback error.

## Overflow Error:

- Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error.
In the initial state, error notification is enabled upon detection of an address buffer overflow error. The error notification signal is output with an address feedback error handled as one source. An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources in ECM.
An ECC 1-bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer.

| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error <br> detection, and address feedback error detection. If an error occurs while no error status is set, the <br> corresponding status is set. <br> The error status can be cleared using the clear register. |
| :--- | :--- |
| Address capture | The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is <br> detected. The error status serves as the enable bit of the address that is captured. Address buffers are <br> updated if the error status is cleared. |
|  | Multi-stage address buffers are provided for a 1-bit data error. |
| - ECC 1-bit error: Eight stages |  |
| - ECC 2-bit error and address feedback error shared: One stage |  |

ECC of Cluster RAM is provided for each 32 bits of data and each 32-bit data is called bank 0 to 3 . The relationship between addresses and bank numbers are as follows.

Table 38.73 Relationship between addresses and bank numbers

| 4 lower-order bits of address <br> (Hexadecimal Notation) | $\mathrm{F}_{\mathrm{H}}$ to $\mathrm{C}_{\mathrm{H}}$ | $\mathrm{B}_{\mathrm{H}}$ to $8_{\mathrm{H}}$ | $7_{\mathrm{H}}$ to $4_{\mathrm{H}}$ | $3_{\mathrm{H}}$ to $0_{\mathrm{H}}$ |
| :--- | :--- | :--- | :--- | :--- |
| Bank number | Bank 3 | Bank 2 | Bank 1 | Bank 0 |

### 38.3.6.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.74 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ECCCNT_CRCCLO_base> | FFC4 $9 \mathrm{CO} 0_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_CRCCL1_base> | FFC4 $9 \mathrm{C} 80_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_CRA_base> | FFC4 $9 E 00_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_CRAM_base> | FFC5 $2000_{\mathrm{H}}$ | Peripheral Group 0 |

### 38.3.6.3 List of Registers

Table 38.75 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { ECCCNT_CRCCLn } \\ & (\mathrm{n}=0,1) \end{aligned}$ | Address Feedback Control Register | CRCAFCTL | <ECCCNT_CRCCLn_base> + 00\% | 8, 16, 32 | KCPROT |

|  | 1st Fatal Error Address Register | CR_00DEADR | <MECCCAP_CRAM_base> + FOH | 32 |  |

### 38.3.6.4 CRCAFCTL — Address Feedback Control Register

This register controls address feedback error detection for the address that is requested to Cluster RAM.
This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Value after reset: 00000004 H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | AFEDIS | - | - | - |

Table 38.76 CRCAFCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEDIS | Address feedback error disable bit |
|  |  | Sets address feedback error detection to enable/disable. |
|  |  | 0 : Address feedback error detection is enabled |
|  |  | 1: Address feedback error detection is disabled |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.6.5 CRCECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST $=1$ ), either data field or ECC field of Cluster RAM can be written separately.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.77 CRCECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects the write mode to Cluster RAM. |
|  |  | $0:$ Normal mode |
|  |  | 1: Test mode |
|  |  | Either data field or ECC field can be written according to DATSEL setting in test mode. |
| 0 | DATSEL | Selects field to write data when ECCTST $=1$. |
|  | $0:$ Data field only |  |
|  |  | 1: ECC field only |
|  |  |  |

### 38.3.6.6 CRCAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from Cluster RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.78 CRCAFINV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | - | Reserved <br>  <br> 18 to 4 |
| When read, the value after reset is returned. When writing, write the value after reset. |  |  |

### 38.3.6.7 CRCTDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Cluster RAM for self-diagnosis. ECC field in the address that is requested can be stored in this register while reading from Cluster RAM where ECCTST $=1$.

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | BFECC3[6:0] |  |  |  |  |  |  | - | BFECC2[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.79 CRCTDATBFECCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 30 to 24 | BFECC3[6:0] | ECC field read from requested address in Cluster RAM bank 3 |
| 23 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | BFECC2[6:0] | ECC field read from requested address in Cluster RAM bank 2 |
| 15 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 14 to 8 | BFECC1[6:0] | ECC field read from requested address in Cluster RAM bank 1 |
| 7 | - | Reserved |
| 6 to 0 | BFECC0[6:0] | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.6.8 CRAECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read from Cluster RAM.
This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 38.80 CRAECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
|  |  |  |
|  |  | enable/disable. |
|  | 0: Correct when 1-bit error is detected |  |
|  | ECCDIS not correct when 1-bit error is detected |  |
| 0 | Sets ECC error detection/correction to enable/disable. |  |
|  | $0:$ ECC error detection/correction is enabled |  |
|  | 1: ECC error detection/correction is disabled |  |
|  |  |  |

### 38.3.6.9 CR_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error occurs.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.81 CR_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error has occurred. <br> 0 : Overflow error report disabled <br> 1: Overflow error report enabled |
| 6 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEIE | Controls error reports when address feedback error is detected. <br> 0: Address feedback error report disabled <br> 1: Address feedback error report enabled |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when ECC 2-bit error is detected. <br> 0: ECC 2-bit error report disabled <br> 1: ECC 2-bit error report enabled |
| 0 | SEDIE | Controls error reports when ECC 1-bit error is detected. <br> 0: ECC 1-bit error report disabled <br> 1: ECC 1-bit error report enabled |

### 38.3.6.10 CR_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in CR_SERSTR. This is write only register and read value is always " 0 ".

Table 38.82 CR_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SSTCLR07 | Writing 1 to this bit clears SEDF07 in CR_SERSTR. |
| 6 | SSTCLR06 | Writing 1 to this bit clears SEDF06 in CR_SERSTR. |
| 5 | SSTCLR05 | Writing 1 to this bit clears SEDF05 in CR_SERSTR. |
| 4 | SSTCLR04 | Writing 1 to this bit clears SEDF04 in CR_SERSTR. |
| 3 | SSTCLR03 | Writing 1 to this bit clears SEDF03 in CR_SERSTR. |
| 2 | SSTCLR01 | Writing 1 to this bit clears SEDF02 in CR_SERSTR. |
| 1 | SSTCLR00 | Writing 1 to this bit clears SEDF01 in CR_SERSTR. |
| 0 | Writing 1 to this bit clears SEDF00 in CR_SERSTR. |  |

### 38.3.6.11 CR_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in CR_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.83 CR_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears AFEF00 and DEDF00 in CR_DERSTR. |

### 38.3.6.12 CR_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in CR_OVFSTR. This is write only register and read value is always "0".

| Value after reset: $00000000^{\mathbf{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 3130 |  | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \hline \text { SERR } \\ & \text { OVF } \\ & \text { CLR1 } \end{aligned}$ | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.84 CR_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in CR_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in CR_OVFSTR. |

### 38.3.6.13 CR_SERSTR - 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in CR_nSEADR register when SEDFn flag is set. The SEDFn flag is set only when a unique ECC 1-bit error, which is different from previous errors stored in 1-bit error address registers, is detected while the SEDFn is " 0 ". If the newly detected error has the same address with errors already stored, this flag is not set.

This register can be cleared by SSTCLRn in CR_SSTCLR register.

Table 38.85 CR_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEDF07 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_07SEADR <br> register. |
| 6 | SEDF06 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_06SEADR <br> register. |
| 5 | SEDF05 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_05SEADR <br> register. |
| 4 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_04SEADR <br> register. |  |
| 3 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_03SEADR <br> register. |  |
| 2 | SEDF03 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_02SEADR <br> register. |
| 1 | Indicates that an ECC 1-bit error was detected and error address is stored in CR_01SEADR <br> register. |  |

### 38.3.6.14 CR_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in CR_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in CR_DSTCLR register.

Table 38.86 CR_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
| 3 | AFEF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | - | Indicates that an address feedback error was detected. |
| 1 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | - | Indicates that an ECC 2-bit error was detected. |

### 38.3.6.15 CR_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in CR_OVFCLR register.

Table 38.87 CR_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when all ECC 1bit error flags in |
|  |  | CR_SERSTR are set. |

### 38.3.6.16 CR_SERINF - 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in CR_SERSTR register were detected.

This register is updated whenever CR_SERSTR register is updated.

Table 38.88 CR_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 | SEDLINF19 | Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 1 during the RMW operation. |
| 18 | SEDLINF18 | Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 1 during the RMW operation. |
| 17 | SEDLINF17 | Indicates that an ECC 1-bit error was detected in upper address of Cluster RAM for cluster 0 during the RMW operation. |
| 16 | SEDLINF16 | Indicates that an ECC 1-bit error was detected in lower address of Cluster RAM for cluster 0 during the RMW operation. |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | SEDLINF11 | Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 1. |
| 10 | SEDLINF10 | Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 1. |
| 9 | SEDLINF09 | Indicates that an ECC 1-bit error was detected in the data read from upper address of Cluster RAM to SAXI2MBI for cluster 0 . |
| 8 | SEDLINF08 | Indicates that an ECC 1-bit error was detected in the data read from lower address of Cluster RAM to SAXI2MBI for cluster 0. |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE1. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in the data read from Cluster RAM to PE0. |

### 38.3.6.17 CR_nSEADR — n-th 1-bit Error Address Register ( $\mathrm{n}=00$ to 07)

This register is used to hold the address and the location of the error when SEDFn flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.89 CR_nSEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 20 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 2 | SEADR0[19:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.90 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 20 | Reserved |
| 19 | Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1: |
|  | Storing sub-word data by any master. |
|  | CAXI operation by any PE master. |
| 18 | Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1: |
|  | Storing sub-word data by any master. |
| CAXI operation by any PE master. |  |
| 17 | Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: |
| Storing sub-word data by any master. |  |
| CAXI operation by any PE master. |  |

$16 \quad$ Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0 : Storing sub-word data by any master. CAXI operation by any PE master.

| 15 to 12 | Reserved |
| :--- | :--- |
| 11 | Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1: |
|  | Loading data by any master except PEs. |
|  | Fetching instructions by any PE master. |

$10 \quad$ Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1: Loading data by any master except PEs.
Fetching instructions by any PE master.

| Indicates an ECC 1-bit error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0: |
| :--- |
| Loading data by any master except PEs. |
| Fetching instructions by any PE master. |

$8 \quad$ Indicates an ECC 1-bit error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0 : Loading data by any master except PEs.
Fetching instructions by any PE master.

| 7 to 2 | Reserved |
| :--- | :--- |
| 1 | Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE1 master. |
| 0 | Indicates an ECC 1-bit error is detected in loading data from Cluster RAMs by PE0 master. |

### 38.3.6.18 CR_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error was detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.91 CR_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 20 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 19 to 2 | DEADR0[19:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.92 DEDL Information

| DEDL[4:0] | Indicated information |
| :---: | :---: |
| 31 to 20 | Reserved |
| 19 | Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1: <br> Storing sub-word data by any master. <br> CAXI operation by any PE master. |
| 18 | Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1: <br> Storing sub-word data by any master. <br> CAXI operation by any PE master. |
| 17 | Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 0 : <br> Storing sub-word data by any master. <br> CAXI operation by any PE master. |
| 16 | Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0 : <br> Storing sub-word data by any master. <br> CAXI operation by any PE master. |
| 15 to 12 | Reserved |
| 11 | Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster 1: <br> Loading data by any master except PEs. <br> Fetching instructions by any PE master. |

| 10 | Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 1: |
| :--- | :--- |
|  | Loading data by any master except PEs. |
|  | Fetching instructions by any PE master. |
| 9 | Indicates a fatal error is detected in the following operation to bank 1 or 3 of Cluster RAM in cluster $0:$ |
| Loading data by any master except PEs. |  |
| Fetching instructions by any PE master. |  |

$8 \quad$ Indicates a fatal error is detected in the following operation to bank 0 or 2 of Cluster RAM in cluster 0 : Loading data by any master except PEs.
Fetching instructions by any PE master.

| 7 to 2 | Reserved |
| :--- | :--- |
| 1 | Indicates a fatal error is detected in loading data from Cluster RAMs by PE1 master. |
| 0 | Indicates a fatal error is detected in loading data from Cluster RAMs by PE0 master. |

### 38.3.6.19 Test Function

## (1) Writing RAM data

(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 0 to select RAM data for access when writing.
(c) When data is written to the cluster RAM, the RAM data is modified without updating the ECC bits.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (2) Reading RAM data

(a) Set the ECCDIS bit in the ECC Control Register to 1 to disable ECC error detection and correction.
(b) Read the Cluster RAM. Since neither error detection nor correction proceeds when the Cluster RAM is read, the RAM data is read unchanged.

How to exit this test mode:
(a) Set the ECCDIS bit in the ECC Control Register to 0 to enable ECC error detection and correction.

## (3) Writing to the ECC bits

(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) Set the corresponding DATSEL bit in the ECC Test Control Register to 1 to select the ECC bits for access when writing.
(c) When data is written to the Cluster RAM, the ECC bits are modified without updating the RAM data. At that time, bits[6:0] are respectively written to the ECC bits.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (4) Reading the ECC bits

(a) Set the ECCTST bit in the ECC Test Control Register to 1 to set test mode.
(b) When the Cluster RAM is read, the ECC bits are stored in the word corresponding to cluster RAM ECC read buffer register.

How to exit this test mode:
(a) Set the ECCTST bit in the ECC Test Control Register to 0 to disable test mode (normal mode).

## (5) Self-diagnosis of the ECC check function

Desired values can be written to the RAM data, ECC bits by using the procedure described in (1) or (3) above. Therefore, a fault can be injected by, for example, inverting appropriate bits of the RAM data and/or ECC bits. After that, self-diagnosis of the ECC decoder is possible by reading the Cluster RAM in normal mode and checking the result of error correction or detection.

## (6) Self-diagnosis of the address feedback check function

Self-diagnosis is enabled by following procedure below.
(a) Set the desired bit(s) of AFINV in the Address Feedback Test Control Register to 1 to set test mode.
(b) When the Cluster RAM is read or written, address feedback error occurs because feedback address XOR-ed with AFINV can be input to address feedback checker.
How to exit this test mode:
(a) Set the AFINV bits in the Address Feedback Test Control Register all to 0 to disable test mode (normal mode).

### 38.3.7 Instruction Cache EDC and Address Feedback

### 38.3.7.1 Overview

The instruction cache EDC is summarized in the table below.
Table 38.93 Instruction Cache EDC

| Item | Description |
| :---: | :---: |
| ECC error detection | ECC error detection can be either enabled or disabled. |
|  | When enabled, the following settings can be selected: <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, error detection is not carried out. <br> In the initial state, the ECC function is enabled; 1-bit error detection, and 2-bit error detection are carried out. |
| Address feedback | Address feedback check can be either enabled or disabled. When enabled, Address feedback error detection is carried out. When disabled, no error detection is carried out. In the initial state, this function is enabled. |
| Error notification | The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. <br> ECC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, notification of both an ECC 2-bit error and an ECC 1-bit error is disabled. <br> Address Feedback Error: <br> - Error notification can be either enabled or disabled upon detection of an address feedback error. <br> In the initial state, error notification is disabled upon detection of an address feedback error. <br> The error notification signal is output with an ECC 2-bit error and an ECC 1-bit error handled as one source. An address feedback error is handled as individual source. <br> An ECC error signal is only issued to the ECM if the ECC error address is not yet stored in the error address buffer. |
| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error detection and address feedback error detection. If an error occurs while no error status is set, the corresponding status is set. <br> The error status can be cleared using the clear register. |
| Address capture | The address is captured when an ECC 2-bit error, an ECC 1-bit error or an address feedback error is detected. The error status serves as the enable bit of the captured address. <br> If an ECC error occurs while no error status is set, the address at which the associated error occurred is captured. |
| Self-diagnosis | A cache instruction is used to write the desired values as RAM data and to the ECC bits. Similarly, data in the RAM and the ECC bits can be read directly. <br> Since cache instructions go through the same encoding or decoding path as a normal cache fill or instruction fetch, errors can be both inserted and confirmed simply by using a cache instruction. <br> Errors can also be injected into an address feedback checker by setting AFINV. |

### 38.3.7.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 38.94 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ECCCNT_IT_PE0CLO_base> | FFC4 $9000_{H}$ | Peripheral Group 0 |
| <ECCCNT_IT_PE1CLO_base> | FFC4 $9080_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_ID_PE0CLO_base> | FFC4 $9400_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_ID_PE1CLO_base> | FFC4 $9480_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_IT_PE0CLO_base> | FFC5 $1000_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_IT_PE1CL0_base> | FFC5 $1100_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_ID_PE0CLO_base> | FFC5 $1800_{\mathrm{H}}$ | Peripheral Group 0 |
| <MECCCAP_ID_PE1CLO_base> | FFC5 $1900_{\mathrm{H}}$ | Peripheral Group 0 |

### 38.3.7.3 List of Registers

Table 38.95 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ECCCNT_IT_PEnCLO$(n=0,1)$ | ECC Control Register | ITECCCTL | <ECCCNT_IT_PEnCLO_base> + 00н | 8, 16, 32 | KCPROT |
|  | Address Feedback Test Control Register | ITAFINV | <ECCCNT_IT_PEnCLO_base> + $2 \mathrm{OH}_{\text {H }}$ | 8, 16, 32 | KCPROT |
| ECCCNT_ID_PEnCLO$(n=0,1)$ | ECC Control Register | IDECCCTL | <ECCCNT_ID_PEnCLO_base> + 00H | 8, 16, 32 | KCPROT |
|  | Address Feedback Test Control Register | IDAFINV | <ECCCNT_ID_PEnCLO_base> + 20 ${ }_{\text {H }}$ | 8, 16, 32 | KCPROT |
| MECCCAP_IT_PEnC$\mathrm{LO}(\mathrm{n}=0,1)$ | Error Notification Control Register | IT_ERRINT | <MECCCAP_IT_PEnCLO_base> + 00 ${ }_{\text {H }}$ | 8, 16, 32 | KCPROT |
|  | 1-bit Error Status Clear Register | IT_SSTCLR | <MECCCAP_IT_PEnCLO_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Fatal Error Status Clear Register | IT_DSTCLR | <MECCCAP_IT_PEnCLO_base> + 14 ${ }_{\text {H }}$ | 8, 16, 32 |  |

|  | 1-bit Error Overflow Status Register | IT_OVFSTR | <MECCCAP_IT_PEnCLO_base> + 28 н | 8, 16, 32 |  |
|  | 1-bit Error Location Information Register | IT_SERINF | <MECCCAP_IT_PEnCLO_base> + 30 н | 32 |  |
|  | 1st 1-bit Error Address Register | IT_00SEADR | <MECCCAP_IT_PEnCLO_base> + 70H | 32 |  |
|  | 1st fatal Error Address Register | IT_O0DEADR | <MECCCAP_IT_PEnCLO_base> + FOH | 32 |  |
| $\begin{aligned} & \text { MECCCAP_ID_PEnC } \\ & \text { LO }(\mathrm{n}=0,1) \end{aligned}$ | Error Notification Control Register | ID_ERRINT | <MECCCAP_ID_PEnCLO_base> + $00_{\text {H }}$ | 8, 16, 32 | KCPROT |
|  | 1-bit Error Status Clear Register | ID_SSTCLR | <MECCCAP_ID_PEnCLO_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Fatal Error Status Clear Register | ID_DSTCLR | <MECCCAP_ID_PEnCLO_base> + 14 ${ }^{\text {H }}$ | 8, 16, 32 |  |
|  | 1-bit Error Overflow Status Clear Register | ID_OVFCLR | <MECCCAP_ID_PEnCLO_base> + 18 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | 1-bit Error Status Register | ID_SERSTR | <MECCCAP_ID_PEnCLO_base> + 20 H | 8, 16, 32 |  |
|  | Fatal Error Status Register | ID_DERSTR | <MECCCAP_ID_PEnCLO_base> + 24 н | 8, 16, 32 |  |
|  | 1-bit Error Overflow Status Register | ID_OVFSTR | <MECCCAP_ID_PEnCLO_base> + 28 ${ }^{\text {H }}$ | 8, 16, 32 |  |
|  | 1-bit Error Location Information Register | ID_SERINF | <MECCCAP_ID_PEnCLO_base> + 30 ${ }_{\text {H }}$ | 32 |  |
|  | 1st 1-bit Error Address Register | ID_00SEADR | <MECCCAP_ID_PEnCLO_base> + 70 ${ }_{\text {H }}$ | 32 |  |
|  | 1st Fatal Error Address Register | ID_00DEADR | <MECCCAP_ID_PEnCLO_base> + FOH | 32 |  |

### 38.3.7.4 ITECCCTL - ECC Control Register

This register controls ECC error detection for data read from cache tag RAM and address feedback error detection for the address that is requested to cache tag RAM.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.96 ITECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEDIS | Address feedback error disable bit |
|  |  | Sets the address feedback error detection to enable/disable. |
|  |  | 0: Address feedback error detection is enabled |
|  | 1: Address feedback error detection is disabled |  |
| 2,1 | ECCDIS | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 |  | ECC disable bit |
|  |  | Sets the ECC error detection to enable/disable. |
|  |  | 1: ECC error detection is enabled |
|  |  |  |

### 38.3.7.5 ITAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from cache tag RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.97 ITAFINV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 5 | AFINV[11:5] | Specifies bit pattern to inject errors into feedback address. |
| 4 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.7.6 IDECCCTL - ECC Control Register

This register controls ECC error detection for data read from cache data RAM and address feedback error detection for the address that is requested to the cache data RAM.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.98 IDECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEDIS | Address feedback error disable bit |
|  |  | Sets the address feedback error detection to enable/disable. |
|  |  | 0: Address feedback error detection is enabled |
|  | 1: Address feedback error detection is disabled |  |
| 2,1 | ECCDIS | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 |  | ECC disable bit |
|  |  | Sets the ECC error detection to enable/disable. |
|  |  | 1: ECC error detection is enabled |
|  |  |  |

### 38.3.7.7 IDAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from the cache data RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.99 IDAFINV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 3 | AFINV[11:3] | Specifies bit pattern to inject errors into feedback address. |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.7.8 IT_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM when an address feedback error, ECC error and/or overflow error occurs.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.100 IT_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEIE | Controls error reports when address feedback error is detected. |
|  |  | 0: Address feedback error report disabled |
|  | 1: Address feedback error report enabled |  |
| 2 | DEDIE | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 |  | Controls error reports when ECC 2-bit error is detected. |
|  | 0: ECC 2-bit error report disabled |  |
|  |  | 1: ECC 2-bit error report enabled |
| 0 | Controls error reports when ECC 1-bit error is detected. |  |
|  | 0: ECC 1-bit error report disabled |  |
|  |  | 1: ECC 1-bit error report enabled |

### 38.3.7.9 IT_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in IT_SERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.101 IT_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in IT_SERSTR. |

### 38.3.7.10 IT_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in IT_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.102 IT_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears AFEF00 and DEDF00 in IT_DERSTR. |

### 38.3.7.11 IT_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in IT_OVFSTR. This is write only register and read value is always "0".

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | SERR OVF CLR1 | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.103 IT_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in IT_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in IT_OVFSTR. |

### 38.3.7.12 IT_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in IT_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is " 0 ".

This register can be cleared by SSTCLR00 in IT_SSTCLR register.

Table 38.104 IT_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDF00 | Indicates that an ECC 1-bit error was detected. |

### 38.3.7.13 IT_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in IT_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in IT_DSTCLR register.

Table 38.105 IT_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
| 3 | AFEF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | - | Indicates that an address feedback error was detected. |
| 1 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | - | Indicates that an ECC 2-bit error was detected. |

### 38.3.7.14 IT_OVFSTR - 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in IT_OVFCLR register.

Table 38.106 IT_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set. |

### 38.3.7.15 IT_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in IT_SERSTR register were detected.

This is up-to-date whenever IT_SERSTR register is updated.

Table 38.107 IT_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SEDLINF03 | Indicates that an ECC 1-bit error was detected in way 3 of cache tag RAM. |
| 2 | SEDLINF02 | Indicates that an ECC 1-bit error was detected in way 2 of cache tag RAM. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in way 1 of cache tag RAM. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in way 0 of cache tag RAM. |

### 38.3.7.16 IT_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SEDL[4:0] |  |  |  |  | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.108 IT_00SEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 5 | SEADR0[11:5] | Indicates at which address this error was detected. |
| 4 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.109 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 4 | Reserved |
| 3 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 3 of cache tag RAM. |
| 2 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 2 of cache tag RAM. |
| 1 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 1 of cache tag RAM. |
| 0 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 0 of cache tag RAM. |

### 38.3.7.17 IT_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 38.110 IT_OODEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved <br>  <br> 11 to 5 |
| When read, the value after reset is returned. When writing, write the value after reset. |  |  |
| to 0 | - | Indicates at which address this error was detected. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.111 DEDL Information

| DEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 4 | Reserved |
| 3 | Indicates a fatal error is detected in storing data to or loading data from way 3 of cache tag RAM. |
| 2 | Indicates a fatal error is detected in storing data to or loading data from way 2 of cache tag RAM. |
| 1 | Indicates a fatal error is detected in storing data to or loading data from way 1 of cache tag RAM. |
| 0 | Indicates a fatal error is detected in storing data to or loading data from way 0 of cache tag RAM. |

### 38.3.7.18 ID_ERRINT — Error Notification Control Register

This register controls whether error information is reported to the ECM when address feedback error, ECC error and/or overflow error occurs.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.112 ID_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEIE | Controls error reports when address feedback error is detected. |
|  |  | 0: Address feedback error report disabled |
|  | 1: Address feedback error report enabled |  |
| 2 | DEDIE | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SEDIE | 0: ECC 2-bit error report disabled |
|  |  | 1: ECC 2-bit error report enabled |
| 0 |  | Controls error reports when ECC 1-bit error is detected. |
|  | 0: ECC 1-bit error report disabled |  |
|  |  | 1: ECC 1-bit error report enabled |
|  |  |  |

### 38.3.7.19 ID_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in ID_SERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.113 ID_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in ID_SERSTR. |

### 38.3.7.20 ID_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in ID_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.114 ID_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears AFEF00 and DEDF00 in ID_DERSTR. |

### 38.3.7.21 ID_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in ID_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | SERR OVF CLR1 | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.115 ID_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br>  <br> 1 |
| 0 | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 38.3.7.22 ID_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in ID_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is " 0 ".

This register can be cleared by SSTCLR00 in ID_SSTCLR register.

Table 38.116 ID_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDF00 | Indicates an ECC 1-bit error is detected. |

### 38.3.7.23 ID_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in ID_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in ID_DSTCLR register.

Table 38.117 ID_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
| 3 | AFEF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | - | Indicates that address feedback error was detected. |
| 1 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | - | Indicates that an ECC 2-bit error was detected. |

### 38.3.7.24 ID_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in ID_OVFCLR register respectively.

## Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.118 ID_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set. |

### 38.3.7.25 ID_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in ID_SERSTR register were detected.

This is up-to-date whenever ID_SERSTR register is updated.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.119 ID_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | SEDLINF03 | Indicates that an ECC 1-bit error was detected in way 3 of the cache data RAM. |
| 2 | SEDLINF02 | Indicates that an ECC 1-bit error was detected in way 2 of the cache data RAM. |
| 1 | SEDLINF01 | Indicates that an ECC 1-bit error was detected in way 1 of the cache data RAM. |
| 0 | SEDLINF00 | Indicates that an ECC 1-bit error was detected in way 0 of the cache data RAM. |

### 38.3.7.26 ID_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Table 38.120 ID_00SEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 3 | SEADR0[11:3] | Indicates at which address this error was detected. |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each SEDL indicates.
Table 38.121 SEDL information

| SEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 4 | Reserved |
| 3 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 3 of cache data RAM. |
| 2 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 2 of cache data RAM. |
| 1 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 1 of cache data RAM. |
| 0 | Indicates an ECC 1-bit error is detected in storing data to or loading data from way 0 of cache data RAM. |

### 38.3.7.27 ID_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | DEADR0[11:3] |  |  |  |  |  |  |  |  | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.122 ID_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 3 | DEADR0[11:3] | Indicates at which address this error was detected. |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.123 DEDL Information

| DEDL[4:0] | Indicated information |
| :--- | :--- |
| 31 to 4 | Reserved |
| 3 | Indicates a fatal error is detected in storing data to or loading data from way 3 of cache data RAM. |
| 2 | Indicates a fatal error is detected in storing data to or loading data from way 2 of cache data RAM. |
| 1 | Indicates a fatal error is detected in storing data to or loading data from way 1 of cache data RAM. |
| 0 | Indicates a fatal error is detected in storing data to or loading data from way 0 of cache data RAM. |

### 38.3.7.2 Test Function

A cache instruction is used to write the desired values as RAM data and to the ECC bits, and read data in the RAM and the ECC bits directly.
Since cache instructions go through the same encoding or decoding path as a normal cache fill or instruction fetch, errors can be both inserted and confirmed simply by using a cache instruction.
For details, refer to the RH850G4MH User's Manual: Software.

### 38.3.8 sDMAC/DTS RAM ECC and Address Feedback

### 38.3.8.1 Overview

sDMAC RAM ECC is summarized in the table below.
Table 38.124 sDMAC RAM ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. <br> When enabled, either of the following settings can be selected: <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out. |
| Error notification | The occurrence of an ECC error is reported to the Error Control Module. <br> ECC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, notification of both a 2-bit error and a 1-bit error is enabled. <br> Overflow Error: <br> - Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error. <br> In the initial state, error notification is enabled upon detection of an address buffer overflow error. <br> An ECC 2-bit error, an ECC 1-bit error and an overflow error are handled as individual sources. An ECC 1bit error signal is only issued to the ECM if the ECC 1-bit error address is not yet stored in the error address buffer. |
| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register. |
| Address capture | The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. The error status serves as the enable bit of the captured address. <br> ECC 1-bit error: One stage <br> ECC 2-bit error: One stage |
| Self-diagnosis | Desired values can be written to the RAM data and the ECC bits in sDMAC RAM in ECC Test Mode. The RAM data and the ECC bits in sDMAC RAM can be also read via Read Buffer Registers in this mode. |

DTS RAM ECC is summarized in the table below.
Table 38.125 DTS RAM ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out. |
| Address feedback | Address feedback check can be either enabled or disabled. <br> When enabled, Address feedback error detection is carried out. <br> When disabled, no error detection is carried out. <br> In the initial state, this function is enabled. |
| Error notification | The occurrence of an ECC error or an address feedback error is reported to the Error Control Module. |

## ECC Error:

- Error notification can be either enabled or disabled upon detection of an ECC 2-bit error.
- Error notification can be either enabled or disabled upon detection of an ECC 1-bit error.

In the initial state, notification of both a 2-bit error and a 1-bit error is enabled.

## Address Feedback Error:

- Error notification can be either enabled or disabled upon detection of an address feedback error.

In the initial state, error notification is enabled upon detection of an address feedback error.

## Overflow Error:

- Error notification can be either enabled or disabled upon detection of an address buffer overflow error for ECC 1-bit error.
In the initial state, error notification is enabled upon detection of an address buffer overflow error.
The error notification signal is output with an ECC 2-bit error and an address feedback error handled as one source, and an ECC 1-bit error and an overflow error are handled as individual sources. An ECC 1-bit error signal is only issued to the ECM, if the ECC 1-bit error address is not yet stored in the error address buffer.

| Error status | A status register is provided that indicates the statuses of ECC 2-bit error detection, ECC 1-bit error <br> detection, and address feedback error detection. If an error occurs while no error status is set, the <br> corresponding status is set. The error status can be cleared using the clear register. |
| :--- | :--- |
| Address capture | The address is captured when an ECC 2-bit error, an ECC 1-bit error, or an address feedback error is <br> detected. The error status serves as the enable bit of the capture address. |
|  | ECC 1-bit error: One stage |
| ECC 2-bit error and address feedback error: One stage |  |

### 38.3.8.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offset from the base addresses.

Table 38.126 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :---: | :---: | :---: |
| <ECCCNT_DTS_base> | FFC4 A000 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_DMDE0_base> | FFC4 A400 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_DMDA0_base> | FFC4 A480 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_DMDE1_base> | FFC4 $\mathrm{A}^{\text {500 }}$ H | Peripheral Group 0 |
| <ECCCNT_DMDA1_base> | FFC4 A580 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <MECCCAP_DTS_base> | FFC5 2600 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <MECCCAP_DMDE0_base> | FFC5 2800 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <MECCCAP_DMDA0_base> | FFC5 2900 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <MECCCAP_DMDE1_base> | FFC5 2A00 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <MECCCAP_DMDA1_base> | FFC5 2B00 ${ }_{\text {H }}$ | Peripheral Group 0 |

### 38.3.8.3 List of Registers

Table 38.127 List of Registers (1/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ECCCNT_DTS | ECC Control Register | DRECCCTL | <ECCCNT_DTS_base> + 00 H | 8,16, 32 | KCPROT |
|  | ECC Test Control Register | DRECCTSTCTL | <ECCCNT_DTS_base> + 10 H | 8,16, 32 | KCPROT |
|  | Address Feedback Test Control Register | DRAFINV | <ECCCNT_DTS_base> + 20, | 8, 16, 32 | KCPROT |
|  | Test Data Input Register | DRECCTSTDINO | <ECCCNT_DTS_base> + 30H | 8,16, 32 | KCPROT |

|  | 1st Fatal Error Address Register | DA_00DEADR | <MECCCAP_DMDAn_base> + FOH | 32 |  |

Note: The initial characters of DTS/sDMAC register symbols indicates the followings.
DR: DTS RAM
DE: Descriptor RAM of sDMAC
DA: Data RAM of sDMAC

### 38.3.8.4 DRECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read from DTS RAM and address feedback error detection for the address that is requested to DTS RAM.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.128 DRECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | AFEDIS | Address feedback error disable bit <br> Sets the address feedback error detection to enable/disable. <br> 0 : Address feedback error detection is enabled <br> 1: Address feedback error detection is disabled |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1-bit error correction to enable/disable. <br> 0 : Correct when 1-bit error is detected <br> 1: Do not correct when 1-bit error is detected |
| 0 | ECCDIS | ECC disable bit <br> Sets the ECC error detection/correction to enable/disable. <br> 0 : ECC error detection/correction is enabled <br> 1: ECC error detection/correction is disabled |

### 38.3.8.5 DRECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be written to data field and ECC field of DTS RAM.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.129 DRECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for DTS RAM. |
|  |  | 0: Normal mode |
|  |  | 1: Test mode |
|  |  | The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to data and ECC |
|  |  | fields of DTS RAM when writing in test mode. |
| 0 |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.8.6 DRAFINV — Address Feedback Test Control Register

This register is used to inject errors into the feedback address from DTS RAM for self-diagnosis. Feedback address XOR-ed with AFINV can be input to address feedback checker.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.130 DRAFINV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved <br>  <br> 11 to 2 |
| 1,0 | AFINV[11:2] | When read, the value after reset is returned. When writing, write the value after reset. |
|  |  | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.8.7 DRECCTSTDINO — Test Data Input Register

This register is used to inject errors into data field of DTS RAM for self-diagnosis. The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to the requested address when write operation to DTS RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.131 DRECCTSTDIN0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for DTS RAM. The data is provided to data field of DTS RAM when |
|  |  | ECCTST $=1$. |

### 38.3.8.8 DRECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of DTS RAM for self-diagnosis. The values of DRECCTSTDIN0 and DRECCTSTEIN registers are written to the requested address when write operation to DTS RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.132 DRECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for DTS RAM. The data is provided to ECC field of DTS RAM when <br> ECCTST $=1$. |

### 38.3.8.9 DRTDATBFDATAF0 — Data Read Buffer Register

This register is used to hold data field read from DTS RAM for self-diagnosis. The data field in the requested address can be stored this register while reading from DTS RAM when ECCTST $=1$.

Table 38.133 DRTDATBFDATAFO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BFDATA[31:0] | Data field read from requested address in DTS RAM |

### 38.3.8.10 DRTDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from DTS RAM for self-diagnosis. ECC field in the requested address can be stored in this register while reading from DTS RAM when ECCTST $=1$.

Table 38.134 DRTDATBFECCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | BFECC0[6:0] | ECC field read from the requested address in DTS RAM |

### 38.3.8.11 DEECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read from Descriptor RAM of sDMAC.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.135 DEECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets the 1-bit error |
|  | correction to enable/disable. |  |
|  | $0:$ Correct when 1-bit error $r$ is detected |  |
|  | 1: Do not correct when 1-bit error is detected |  |
| 0 | ECCDIS | ECC disable bit |
|  |  | Sets the ECC error detection/correction to enable/disable. |
|  |  | 1: ECC error detection/correction is enabled |
|  |  |  |

### 38.3.8.12 DEECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be written to data field and ECC field for Descriptor RAM of sDMAC.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.136 DEECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for Descriptor RAM of sDMAC. |
|  |  | 0: Normal mode |
|  |  | 1: Test mode |
|  |  | The values of DEECCTSTDIN0 and DEECCTSTEIN registers are written to data and ECC |
|  |  | field for Descriptor RAM of sDMAC when writing is in test mode. |

### 38.3.8.13 DEECCTSTDINO - Test Data Input Register

This register is used to inject errors into data field of Descriptor RAM of sDMAC for self-diagnosis. The values of DEECCTSTDIN0 and DEECCTSTEIN registers are written to the requested address when write operation to Descriptor RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.137 DEECCTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify test data for Descriptor RAM of SDMAC. The data is provided to data field of <br> Descriptor RAM when ECCTST $=1$. |

### 38.3.8.14 DEECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of Descriptor RAM of sDMAC for self-diagnosis. The values of DEECCTSTDIN0 and DEECCTSTEIN registers are written to the requested address when write operation to Descriptor RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.138 DEECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for Descriptor RAM of sDMAC. The data is provided to ECC field of <br> Descriptor RAM when ECCTST $=1$. |

### 38.3.8.15 DETDATBFDATAFO — Data Read Buffer Register

This register is used to hold data field read from Descriptor RAM of sDMAC for self-diagnosis. The data field in the requested address can be stored in this register while reading from Descriptor RAM when ECCTST $=1$.

Table 38.139 DETDATBFDATAFO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BFDATA[31:0] | Data field read from the requested address in Descriptor RAM |

### 38.3.8.16 DETDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Descriptor RAM of sDMAC for self-diagnosis. ECC field in the address that is requested can be stored in this register while reading from Descriptor RAM where ECCTST $=1$.

Table 38.140 DETDATBFECCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | BFECC0[6:0] | ECC field read from the address that is requested in Descriptor RAM |

### 38.3.8.17 DAECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for read data from Data RAM of sDMAC.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.141 DAECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), set the 1-bit error correction to |
|  | enable/disable. |  |
|  | $0:$ Correct when 1-bit error is detected |  |
|  | 1: Do not correct when 1-bit error is detected |  |
| 0 | ECCDIS | Sets the ECC error detection/correction to enable/disable. |
|  |  | $0:$ ECC error detection/correction is enabled |
|  |  | 1: ECC error detection/correction is disabled |
|  |  |  |

### 38.3.8.18 DAECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be written to data field and ECC field for Data RAM of sDMAC.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.142 DAECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for Data RAM of sDMAC. |
|  | 0: Normal mode |  |
|  |  | 1: Test mode |
|  |  | The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to |
|  |  | data and ECC field for Data RAM of sDMAC when buffering transfer data in test mode. |

### 38.3.8.19 DAECCTSTDINO — Test Lower Data Input Register

This register is used to inject errors into lower data field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCPROT} . \mathrm{KCE}=1$.

Table 38.143 DAECCTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify test data for Data RAM of SDMAC. The data is provided to lower data field of Data |
|  | RAM when ECCTST $=1$. |  |

### 38.3.8.20 DAECCTSTDIN1 — Test Upper Data Input Register

This register is used to inject errors into upper data field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.144 DAECCTSTDIN1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for Data RAM of SDMAC. The data is provided to upper data field of Data <br>  |

### 38.3.8.21 DAECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of Data RAM of sDMAC for self-diagnosis. The values of DAECCTSTDIN0, DAECCTSTDIN1 and DAECCTSTEIN registers are written to the requested address when write operation to Data RAM occurs in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Value after reset: 00000000 H

Table 38.145 DAECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | ECC[7:0] | Specify the test data for Data RAM of sDMAC. The data is provided to ECC field of Data RAM <br> when ECCTST $=1$. |

### 38.3.8.22 DATDATBFDATAFO — Lower Data Read Buffer Register

This register is used to hold data field read from Data RAM of sDMAC for self-diagnosis. The data field in the requested address can be stored in this register while reading from Data RAM when ECCTST $=1$.

Table 38.146 DATDATBFDATAF0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BFDATA[31:0] | Lower data field read from the requested address in Data RAM |

### 38.3.8.23 DATDATBFDATAF1 — Upper Data Read Buffer Register

This register is used to hold data field read from Data RAM of sDMAC for self-diagnosis. The data field in the requested address can be stored in this register while reading from Data RAM when ECCTST $=1$.

Table 38.147 DATDATBFDATAF1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BFDATA[31:0] | Upper data field read from the requested address in Data RAM |

### 38.3.8.24 DATDATBFECCF — ECC Read Buffer Register

This register is used to hold ECC field read from Data RAM of sDMAC for self-diagnosis. ECC field in the requested address can be stored in this register while reading from Data RAM when ECCTST $=1$.

Table 38.148 DATDATBFECCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | BFECC0[7:0] | ECC field read from the requested address in Data RAM |

### 38.3.8.25 DR_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address feedback error, ECC error and/or overflow error occurs.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.149 DR_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. |
|  |  | 0: Overflow error report disabled |
|  | 1: Overflow error report enabled |  |
| 6 to 4 | Reserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 |  | Controls error reports when address feedback error is detected. |
|  |  | 0: Address feedback error report disabled |
|  |  | 1: Address feedback error report enabled |
| 2 | DEDIE | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 |  | Controls error reports when ECC 2-bit error is detected. |
|  |  | 0: ECC 2-bit error report disabled |
|  |  | Controls error reports when ECC 1-bit error is detected. |
|  |  | 0: ECC 1-bit error report disabled |
| 0 | 1: ECC 1-bit error report enabled |  |

### 38.3.8.26 DR_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in DR_SERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.150 DR_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in DR_SERSTR. |

### 38.3.8.27 DR_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in DR_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.151 DR_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears AFEF00 and DEDF00 in DR_DERSTR. |

### 38.3.8.28 DR_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in DR_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | SERR OVF CLR1 | SERR OVF CLRO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.152 DR_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in DR_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in DR_OVFSTR. |

### 38.3.8.29 DR_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DR_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is " 0 ".

This register can be cleared by SSTCLR00 in DR_SSTCLR register.

Table 38.153 DR_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDF00 | Indicates that ECC 1-bit error was detected. |

### 38.3.8.30 DR_DERSTR — Fatal Error Status Register

This register indicates whether an address feedback error and/or an ECC 2-bit error has occurred. The location and address of the error that is detected are stored in DR_00DEADR register when AFEF00 and/or DEDF00 flags are set. The AFEF00 and/or DEDF00 flag is set only when an address feedback error and/or an ECC 2-bit error is detected while all the flags are " 0 ". Multiple flags are set only when multiple errors occur due to one error cause.

This register can be cleared by DSTCLR00 in DR_DSTCLR register.

Table 38.154 DR_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
| 3 | AFEF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | - | Indicates that address feedback error was detected. |
| 1 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | - | Indicates that ECC 2-bit error was detected. |

### 38.3.8.31 DR_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flag can be cleared by SERROVFCLR0 and SERROVFCLR1 in DR_OVFCLR register respectively.

## Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.155 DR_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC error was detected when SEDF00 was already set. |

### 38.3.8.32 DR_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in DR_SERSTR register were detected.

This register is updated whenever DR_SERSTR register is updated.

Table 38.156 DR_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDLINF00 | Indicates that ECC error was detected in DTS RAM. |

### 38.3.8.33 DR_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.157 DR_OOSEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 2 | SEADR0[11:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 38.158 SEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates an ECC 1bit error is detected in storing data to or loading data from DTS RAM. |

### 38.3.8.34 DR_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when neither AFEF00 nor DEDF00 flag is set and an address feedback error and/or ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.159 DR_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 2 | DEADR0[11:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.160 DEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates a fatal error is detected in storing data to or loading data from DTS RAM. |

### 38.3.8.35 DE_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when ECC error and/or overflow error occurs.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.161 DE_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. |
|  |  | 0: Overflow error report disabled |
|  | 1: Overflow error report enabled |  |
| 6 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when ECC error is detected. |
|  |  | 0: ECC 2-bit error report disabled |
|  |  | 1: ECC 2-bit error report enabled |
| 0 | Controls error reports when ECC error is detected. |  |
|  |  | 0: ECC 1-bit error report disabled |
|  |  | 1: ECC 1-bit error report enabled |

### 38.3.8.36 DE_SSTCLR - 1-bit Error Status Clear Register

This register is used to clear error flags in DE_SERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.162 DE_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in DE_SERSTR. |

### 38.3.8.37 DE_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in DE_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.163 DE_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears DEDF00 in DE_DERSTR. |

### 38.3.8.38 DE_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in DE_OVFSTR. This is write only register and read value is always "0".

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.164 DE_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in DE_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in DE_OVFSTR. |

### 38.3.8.39 DE_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DE_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is " 0 ".

This register can be cleared by SSTCLR00 in DE_SSTCLR register.

Table 38.165 DE_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDF00 | Indicates that ECC 1-bit error was detected. |

### 38.3.8.40 DE_DERSTR — Fatal Error Status Register

This register indicates whether ECC 2-bit error has occurred. The location and the address of the error that is detected are stored in DE_00DEADR register when DEDF00 flag is set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is " 0 ".

This register can be cleared by DSTCLR00 in DE_DSTCLR register.

Table 38.166 DE_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
|  | Indicates that ECC 2-bit error was detected. |  |

### 38.3.8.41 DE_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flags can be cleared by SERROVFCLR0 and SERROVFCLR1 in DE_OVFCLR register.

Table 38.167 DE_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | SERROVF1 | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.8.42 DE_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in DE_SERSTR register were detected.

This register is updated whenever DE_SERSTR register is updated.

Table 38.168 DE_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDLINF00 | Indicates that ECC 1-bit error was detected in Descriptor RAM of sDMAC. |

### 38.3.8.43 DE_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.169 DE_00SEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 2 | SEADR0[11:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 38.170 SEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates an ECC 1bit error is detected in storing data to or loading data from Descriptor RAM of sDMAC. |

### 38.3.8.44 DE_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and an ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.171 DE_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 2 | DEADR0[11:2] | Indicates at which address this error was detected. |
| 1,0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.172 DEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates a fatal error is detected in storing data to or loading data from Descriptor RAM of sDMAC. |

### 38.3.8.45 DA_ERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when ECC error and/or overflow error occurs.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only
when $\mathrm{KCPROT} . \mathrm{KCE}=1$.

Table 38.173 DA_ERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | SEOVFIE | Controls error reports when overflow error occurs. |
|  |  | 0: Overflow error report disabled |
|  | 1: Overflow error report enabled |  |
| 6 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when ECC 2-bit error is detected. |
|  |  | 1: ECC 2-bit error report disabled |
|  |  | Controls error reports when ECC 1-bit error is detected. |
|  |  | 0: ECC 1-bit error report disabled |
|  |  | 1: ECC 1-bit error report enabled |
|  |  |  |

### 38.3.8.46 DA_SSTCLR — 1-bit Error Status Clear Register

This register is used to clear error flags in DA_SERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.174 DA_SSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SSTCLR00 | Writing 1 to this bit clears SEDF00 in DA_SERSTR. |

### 38.3.8.47 DA_DSTCLR — Fatal Error Status Clear Register

This register is used to clear error flags in DA_DERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.175 DA_DSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DSTCLR00 | Writing 1 to this bit clears DEDF00 in DA_DERSTR. |

### 38.3.8.48 DA_OVFCLR — 1-bit Error Overflow Status Clear Register

This register is used to clear error overflow flags in DA_OVFSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |

Table 38.176 DA_OVFCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVFCLR1 | Writing 1 to this bit clears SERROVF1 in DA_OVFSTR. |
| 0 | SERROVFCLR0 | Writing 1 to this bit clears SERROVF0 in DA_OVFSTR. |

### 38.3.8.49 DA_SERSTR — 1-bit Error Status Register

This register indicates whether ECC 1-bit error has occurred. The location and address of the error that is detected are stored in DA_00SEADR register when SEDF00 flag is set. The SEDF00 flag is set only when an ECC 1-bit error is detected while the SEDF00 is " 0 ".

This register can be cleared by SSTCLR00 in DA_SSTCLR register.

Table 38.177 DA_SERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDF00 | Indicates that ECC 1-bit error was detected. |

### 38.3.8.50 DA_DERSTR — Fatal Error Status Register

This register indicates whether ECC 2-bit error has occurred. The location and address of the error that is detected are stored in DA_00DEADR register when DEDF00 flag is set. The DEDF00 flag is set only when an ECC 2-bit error is detected while the DEDF00 is " 0 ".

This register can be cleared by DSTCLR00 in DA_DSTCLR register.

Table 38.178 DA_DERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | DEDF00 | When read, the value after reset is returned. When writing, write the value after reset. |
|  | Indicates that ECC 2-bit error was detected. |  |

### 38.3.8.51 DA_OVFSTR — 1-bit Error Overflow Status Register

This register indicates whether overflow of address buffer or working memory has occurred.
SERROVF0 flag is set when a unique ECC 1-bit error that differs from previous errors in error address is detected when the address buffer is fully used. If the newly detected error has the same address as errors already stored, this flag is not set.

On the other hand, SERROVF1 flag is set when the number of times an ECC 1-bit error occurs at the same time regardless of the same occurrence address exceed the size of internal buffer.

SERROVF0 and SERROVF1 flag can be cleared by SERROVFCLR0 and SERROVFCLR1 in DA_OVFCLR register respectively.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.179 DA_OVFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SERROVF1 | Indicates that more ECC 1-bit errors than the working memory were detected simultaneously. |
| 0 | SERROVF0 | Indicates that a unique ECC 1-bit error was detected when SEDF00 was already set. |

### 38.3.8.52 DA_SERINF — 1-bit Error Location Information Register

This register is used to indicate summary of locations where ECC 1-bit errors stored in DA_SERSTR register were detected.

This register is updated whenever DA_SERSTR register is updated.

Table 38.180 DA_SERINF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SEDLINF00 | Indicates that ECC 1-bit error was detected in Data RAM of sDMAC. |

### 38.3.8.53 DA_00SEADR — 1st 1-bit Error Address Register

This register is used to hold the address and the location of the error when SEDF00 flag is not set and an ECC 1-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

Table 38.181 DA_00SEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | SEDL[4:0] | Indicates where this error was detected. |
| 26 to 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 3 | SEADR0[10:3] | Indicates at which address this error was detected. |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 38.182 SEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates an ECC 1bit error is detected in storing data to or loading data from Data RAM of sDMAC. |

### 38.3.8.54 DA_00DEADR — 1st Fatal Error Address Register

This register is used to hold the address and the location of the error when DEDF00 flag is not set and an ECC 2-bit error is detected.

This register can only be cleared by reset.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | DEADR0[10:3] |  |  |  |  |  |  |  | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.183 DA_00DEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | DEDL[4:0] | Indicates where this error was detected. |
| 26 to 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 3 | DEADR0[10:3] | Indicates at which address this error was detected. |
| 2 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Please refer to the following table to confirm the detailed information which each DEDL indicates.
Table 38.184 DEDL Information

| Values | Function |
| :--- | :--- |
| 31 to 1 | These values are reserved. |
| 0 | Indicates a fatal error is detected in storing data to or loading data from Data RAM of sDMAC. |

### 38.3.8.55 Test Function

## (1) DTS RAM ECC

The ECC of the DTS RAM can be tested by using the following procedure:

1. Make sure that the RAM address to be tested is not modified by any ongoing DTS transfer. It is recommended to disable DTS entirely.
2. Write data to any DTS RAM address.
3. Write $0 x 02$ to the DTS RAM ECC Test Control Register (DRECCTSTCTL). Enable ECC Test Mode and encode ECC from write data.
4. Read data from the same DTS RAM address.
5. Check Data and ECC field by using the Data Read Buffer Register (DRTDATBFDATAF0) and ECC Read Buffer Register (DRTDATBFECCF).
6. Restore DTS RAM data and ECC with 1-bit or 2-bit errors by using the Test Data Input Register (DRECCTSTDIN0) or the Test ECC Input Register (DRECCTSTEIN).
7. Write data to the same DTS RAM address.
8. Write $0 \times 00$ to the DTS RAM ECC Test Control Register (DRECCTSTCTL). Then, Read data from the same DTS RAM address and check if ECC error occurs.
(2) sDMAC Descriptor RAM ECC

The ECC of the sDMAC Descriptor RAM can be tested by using the following procedure:

1. Make sure that the RAM address to be tested is not modified by any ongoing sDMAC transfer. It is recommended to disable sDMAC entirely.
2. Write data to any sDMAC Descriptor RAM address.
3. Write $0 \times 02$ to the sDMAC Descriptor RAM ECC Test Control Register (DEECCTSTCTL). Enable ECC Test Mode and encode ECC from write data.
4. Read data from the same sDMAC Descriptor RAM address.
5. Check Data and ECC field by using the Data Read Buffer Register (DETDATBFDATAF0) and ECC Read Buffer Register (DETDATBFECCF).
6. Restore sDMAC Descriptor RAM data and ECC with 1-bit or 2-bit errors by using the Test Data Input Register (DEECCTSTDIN0) or the Test ECC Input Register (DEECCTSTEIN).
7. Write data to the same sDMAC Descriptor RAM address.
8. Write $0 x 00$ to the sDMAC Descriptor RAM ECC Test Control Register (DEECCTSTCTL). Then, Read data from the same sDMAC Descriptor RAM address and check if ECC error occurs.

## (3) sDMAC Data RAM ECC

The ECC of the sDMAC Data RAM can be tested by using ECC calculation of ERRGEN. For details, see Section 38.3.12.8, Usage of ERRGEN.

### 38.3.9 ECC for Peripheral RAM (32 Bits)

### 38.3.9.1 Overview

This is an ECC module for the RAM of the following peripheral modules:
RS-CAN-FD, FlexRay, Ethernet, GTM and DFE

## (1) RS-CAN-FD, FlexRay, GTM and DFE

## Error Detection and Correction

Seven-bit ECC data is appended to the 32-bit RAM data
This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.
Table 38.185 RS-CANFD, FlexRay, GTM and DFE RAM ECC

| Item | Description |
| :--- | :--- |
| ECC error detection and | ECC error detection and correction can be either enabled or disabled. |
| correction | When enabled, either of the following settings can be selected. |
| - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and |  |
|  | correction are carried out). |
|  | When disabled, neither error detection nor correction is carried out. |
|  | In the initial state, this function is enabled; 2-bit error detection, and 1-bit error detection and correction are |
| carried out. |  |

Page 4113 of 4595

## (2) Ethernet

## Error Detection and Correction

Seven-bit ECC data is appended to the 32-bit RAM data.
This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.
Table 38.186 Ethernet RAM ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection can not be disabled. <br> ECC error correction can be either enabled or disabled. <br> Either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> In the initial state, this function is enabled; 2-bit error detection, and 1-bit error detection and correction are carried out. |
| Error notification | Upon occurrence of an ECC error, it is notified to the Error Control Module. <br> ECC Error: <br> - Error notification can not be disabled upon detection of an ECC 2-bit error. <br> - Error notification can not be disabled upon detection of an ECC 1-bit error. |
| Error Status | None |
| Address Capture | None |
| Self-diagnosis | None |

### 38.3.9.2 List of Registers

## (1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 38.187 List of ECC Modules

| Peripheral Functions |  | ECC Module Names and Register Base Address |  |
| :---: | :---: | :---: | :---: |
|  |  | Module Name | Base Address <base_addr> |
| RS-CAN-FD0 <br> (Peripheral Group3) | Message buffer RAM (MB RAM) | E7RC01 | FFC7 0000 ${ }_{\text {H }}$ |
|  | Acceptance filter list RAM (AFL RAM) | E7RC02 | FFC7 0020 ${ }_{\text {H }}$ |
| FlexRay0 <br> (Peripheral Group9) | Message RAM (MRAM) | E7FR00 | FF05 0000 ${ }_{\text {H }}$ |
|  | Temporary buffer (TBF A) | E7FR01 | FF05 0020 ${ }_{\text {H }}$ |

## (2) List of Registers

Each ECC module has the registers shown in the following table.
Table 38.188 List of Registers

| Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: |
| ECC Control Register | E710CTL *1 | <base_addr> + 00 H | 8, 16 |  |
| ECC Test Mode Control Register | E710TMC *1 | <base_addr> + $04_{\mathrm{H}}$ | 8, 16 |  |
| ECC Redundant Bit Data Control Test Register | E710TRC *1 | <base_addr> + $08{ }_{\text {H }}$ | 32 |  |
| ECC Encoder and Decoder Data Test Register | E710TED *1 | <base_addr> + $0 \mathrm{C}_{\mathrm{H}}$ | 32 |  |
| ECC Error Address Register | E710EAD *1 | <base_addr> + 10 ${ }_{\mathrm{H}}$ | 32 |  |
| Ethernet TX RAM ECC Control Register | ETCTXECCCTL | FF06 0000 ${ }_{\text {H }}$ | 8, 16, 32 |  |
| Ethernet RX RAM ECC Control Register | ETCRXECCCTL | FF06 0004 ${ }_{\text {H }}$ | 8, 16, 32 |  |

Note 1. This function is not implemented in Ethernet.

## (3) Register Map

Table 38.189 Register Map

| Symbol | 31 | 24 | 23 | 16 | 15 | 8 | 7 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| E710CTL | $-\left(00_{H}\right)$ | $-\left(00_{H}\right)$ | $-\left(00_{H}\right)$ | ECCTL[15:8] | ECCTL[7:0] | $00_{H}$ |  |  |
| E710TMC | $-\left(00_{H}\right)$ | ECHORD[7:0] | ECECRD[7:0] | ECERDB[7:0] | $00_{H}$ |  |  |  |
| E710TRC | ECSYND[7:0] | ECTMC[15:8] | ECTMC[7:0] |  |  |  |  |  |
| E710TED | ECEDB[31:24] | ECEDB[23:16] | ECEDB[15:8] | ECEDB[7:0] | $00_{H}$ |  |  |  |
| E710EAD | ECEAD[31:24] | ECEAD[23:16] | ECEAD[15:8] | ECEAD[7:0] | $10_{H}$ |  |  |  |

### 38.3.9.3 E710CTL - ECC Control Register

E710CTL controls the status and modes of the ECC modules.
E710CTL can be read and written to using the 16 -bit or 8 -bit manipulation instruction.

Note 1. This bit is always read as 0 .
Table 38.190 E710CTL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | EMCA[1:0] | Sets Access Control 1 and 0 to ECC Mode Select Bit <br> These bits enable or disable writing to bit 7 . The read value is always 0 . |
| 13, 12 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | ECOVFF | Error Overflow Detection Flag <br> This flag is set when an error of any source other than the same error address occurs while the error flag (ECER2F or ECER1F) is set. <br> One of the following clears this flag: <br> - An internal or external reset <br> - When ECC function is disabled (ECTHM = 1) <br> - Writing 1 to ECER2C and ECER1C |
| 10 | ECER2C | 2-Bit ECC Error Detection Flag Clear <br> Clears the bit 2 (ECER2F) status flag. <br> The read value is always 0 , and writing 0 to ECER2C does not change the state. <br> If writing 1 to ECER2C conflicts with the condition for setting bit 2, the former takes priority. Writing 1 to ECER2C while ECER2F is set clears ECER2F. |
| 9 | ECER1C | 1-Bit ECC Error Detection Flag Clear <br> Clears the bit 1 (ECER1F) status flag. <br> The read value is always 0 , and writing 0 to ECER1C does not change the internal state. <br> If writing 1 to ECER1C conflicts with the condition for setting bit 1, the former takes priority. Writing 1 to ECER1C while ECER1F is set clears ECER1F. |
| 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTHM | ECC Function Disable Select <br> Selects the ECC decoding operation. Write access to ECTHM is enabled when the value of bits 15 and 14 is $01_{\mathrm{B}}$. Therefore, only the 16 -bit manipulation instruction is valid. <br> Setting ECTHM to 1 disables error detection and bit correction. Here, if the data to be output to the peripheral module contains an error, the data is output without bit correction. Setting ECTHM to 1 has no effect on the encoder side. <br> 0 : Enable ECC detection and correction. <br> 1: Disable ECC detection and correction. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 38.190 E710CTL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 5 | EC1ECP | 1-Bit ECC Error Correction Enable <br> 0 : Enable 1-bit error correction upon error detection. <br> 1: Disable 1-bit error correction upon error detection. |
| 4 | EC2EDIC | 2-Bit ECC Error Detection Notification Enable <br> 0 : When a 2-bit error is detected, the ECM is not notified of the error. <br> 1: When a 2-bit error is detected, the ECM is notified of the error. |
| 3 | EC1EDIC | 1-Bit ECC Error Detection Notification Enable <br> 0 : When a 1 -bit error is detected, the ECM is not notified of the error. <br> 1: When a 1-bit error is detected, the ECM is notified of the error. |
| 2 | ECER2F | 2-Bit ECC Error Detection Flag <br> Indicates that errors have been detected at two bits in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. <br> This bit is a read only flag. <br> 0: A 2-bit error has not occurred since this bit was cleared. <br> 1: A 2-bit error has occurred. <br> Clearing conditions <br> (1) Reset is applied. <br> (2) 1 is written to ECER2C. <br> (3) ECC function is disabled (ECTHM = 1) |
| 1 | ECER1F | 1-Bit ECC Error Detection and Correction Flag <br> Indicates that an error has been detected at one bit in bits 0 to 38 of the data read from the RAM during RAM read access while error detection is enabled. Setting this bit generates no interrupt signal. <br> This bit is a read only flag. <br> 0 : A 1-bit error has not occurred. <br> 1: A 1-bit error has occurred. <br> Clearing conditions <br> (1) Reset is applied. <br> (2) 1 is written to ECER1C. <br> (3) ECC function is disabled (ECTHM = 1) |
| 0 | ECEMF | ECC Error Message Flag <br> Indicates that the current read data contains an error. <br> ECEMF is updated every time RAM data is read. Since the RAM value after reset is undefined, if this bit is read before the RAM is initialized, this bit might be set, indicating an error. Therefore, the ECEMF value after reset is undefined. <br> 0 : The current RAM data contains no bit errors. <br> 1: The current RAM data contains bit errors. <br> Clearing conditions <br> (1) ECC function is disabled (ECTHM = 1) <br> (2) Decoding circuit input data contains no 1-bit errors. <br> ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled. |

### 38.3.9.4 E710TMC - ECC Test Mode Control Register

E710TMC is a 16-bit register used to switch the mode to test mode and control the mode.
E710TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

Note 1. This bit is always read as 0 .
Table 38.191 E710TMC Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | ETMA[1:0] | Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits enable or disable writing to bit 7 . The read value is always 0 . |
| 13 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Control Enable <br> ECTMCE enables or disables access to the test registers and test control bits. Write access to ETCMCE is enabled when the value of bits 15 and 14 is $10_{\mathrm{B}}$. <br> 0: Disable access to the test registers and test control bits. <br> 1: Enable access to the test registers and test control bits. |
| 6, 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Control Enable <br> ECTRRS enables the read status of RAM to be generated by reading the E710TED register, and also allows the RAM output data to be read out when the E710TRC:ECERDB[7:0] bits and the E710TED register are read. <br> Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Disable generation of RAM read status for testing when E710TED is read. <br> 1: Enable generation of RAM read status for testing when E710TED is read. <br> When E710TRC:ECERDB[7:0] and E710TED are read, the values of the RAM output data pin are read out. |
| 3 | ECREOS | ECC Redundant Bit Output Data Select <br> ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. <br> Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow encoding result to be output as the ECC redundant bit output. <br> 1: Allow the E710TRC:ECERDB[6:0] value to be output as the ECC redundant bit output. |
| 2 | ECENS | ECC Encoder Input Select <br> ECENS selects either the data value from the peripheral module or the internal test register value (E710TED:ECEDB[31:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). <br> ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the RAM write data from the peripheral module to be input as the ECC encoder input data. <br> 1: Allow the E710TED:ECEDB[31:0] value to be input as the ECC encoder input data. |

Table 38.191 E710TMC Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1 | ECDCS | ECC Decoder Input Select <br> ECDCS selects either the lower 32-bit data value from the RAM or the internal test register value (E710TED:ECEDB[31:0]) as the lower 32-bit data of the input signal to be decoded. <br> Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously). <br> ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the lower 32-bit RAM output data to be input to the data area ( 32 lower-order bits) to the decoder. <br> 1: Allow the E710TED:ECEDB[31:0] value to be input to the data area to the decoder. |
| 0 | ECREIS | ECC Redundant Bit Input Data Select <br> ECREIS selects either the upper 7-bit data value from the RAM (redundant bit area) or the internal test register value (E710TRC:ECERDB[6:0]) as the upper 7-bit data of the input signal to be decoded. <br> Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the upper 7-bit RAM output data to be input to the ECC redundant bit area to the decoder. <br> 1: Allow the E710TRC:ECERDB[6:0] value to be input to the ECC redundant bit area to the decoder. |

### 38.3.9.5 E710TED - ECC Encoder and Decoder Data Test Register

E710TED is a 32-bit data test register for ECC encoding and decoding.
When ECTMCE $=1$, E710TED can be read and written to using the 32-bit manipulation instruction.
When ECTMCE $=0$, E710TED is always read as 0 .
In test mode, the E710TED value can be used as the data input to the encoding circuit and decoding circuit.

Changing ECTMCE from 1 to 0 resets E710TED synchronously.

When E710TMC:ECENS = 1, the ECEDB value is input to the encoding circuit and supplied to the RAM.
When $\mathrm{E} 710 \mathrm{TMC}: \mathrm{ECDCS}=1$, the ECEDB value is input as bits 31 to 0 of the data input to the decoding circuit.
When E710TMC:ECTRRS $=1$, reading ECEDB returns the RAM output data instead of the data written to ECEDB.

### 38.3.9.6 E710TRC - ECC Redundant Bit Data Control Test Register

E710TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECRODM) corresponding to the ECC redundant bit area. Each field can be accessed as the 8 -bit register with the same name. For details of each field, refer to the descriptions of these four registers.

When ECTMCE $=0, \mathrm{E} 710 \mathrm{TRC}$ is always read as 0 .
When $\mathrm{ECTMCE}=1, \mathrm{E} 710 \mathrm{TRC}$ can be read using the 32-bit manipulation instruction.

Changing ECTMCE from 1 to 0 resets E710TRC synchronously.

### 38.3.9.7 ECSYND - ECC Decoder Syndrome Data Register

ECSYND is a read-only register used to confirm the syndrome code generated by the decoding circuit in test mode ( $\mathrm{ECTMCE}=1$ ).

Write access to ECSYND is ignored.

Value after reset: $\quad 00_{H}$

When read, the ECSYND bits return the value of the syndrome code (SYND[6:0]) generated based on the data input to the decoding circuit.

The ECSYND bits are not holding circuits; the register value changes as the input signal changes.
ECSYND is valid only when $\mathrm{ECTMCE}=1$, and is always read as $00_{\mathrm{H}}$ when $\mathrm{ECTMCE}=0$.
Bit 7 is reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.9.8 ECHORD - ECC 7-Bit Redundant Data Holding Test Register

ECHORD holds the 7-bit ECC redundant area (upper 7-bit RAM data) that cannot be confirmed by the peripheral module when the peripheral module accesses the RAM for reading in test mode (ECTMCE $=1$ ).

Value after reset: $\quad 00_{H}$

The ECHORD bits are loaded with the upper 7-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode $($ ECTMCE $=1)$.

The ECHORD bits are also loaded with the data on the input pins EC7TERI38 to EC7TERI32 at the next operating clock pulse when the $\operatorname{ECEDB}[15: 0]$ register is read while $\mathrm{E} 710 \mathrm{TMC}: \mathrm{ECTRRS}=1$.

ECHORD is valid only when $E C T M C E=1$, and is always read as 00 H when $\mathrm{ECTMCE}=0$.
Bit 7 is reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.9.9 ECECRD - ECC Encoder Test Register

ECECRD is a read-only register used to read the 7-bit redundant section generated by the encoding circuit in test mode $($ ECTMCE $=1)$.

Value after reset: $\quad 00_{H}$

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the data that is read is the result of encoding (ECC[6:0]), not the output value.

ECECRD is valid only when $E C T M C E=1$, and is always read as $00_{\mathrm{H}}$ when $\mathrm{ECTMCE}=0$.
Bit 7 is reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.9.10 ECERDB — ECC Redundant Bit Input and Output Substitution Buffer Register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 7-bit ECC redundant data area in test mode $(\mathrm{ECTMCE}=1)$.

ECERDB can be read and written to in ECC test mode $($ ECTMCE $=1)$.

Value after reset: $\quad 00_{H}$

When ECREOS $=1$, the ECERDB value, instead of the seven redundant bits generated by the encoding circuit, is output to the pin and supplied to the RAM.

When ECREIS = 1, the ECERDB value, instead of the upper seven data bits to be input to the decoding circuit, is handled by the decoding circuit.

When ECTRRS $=1$, reading ECERDB returns the signal value supplied to RAM instead of the data written to ECERDB.

Bit 7 is reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.9.11 E710EAD - ECC Error Address Register

E710EAD is a read-only register used to hold the address at which an ECC error has occurred.
If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E710EAD as the address at which the ECC error occurred.

The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. The address can be calculated by adding the base address.

Only one address can be held in E710EAD.

Value after reset: $\quad 00000000_{\mathrm{H}}$

### 38.3.9.12 ETCTXECCCTL— Ethernet TX RAM ECC Control Register

This register controls 1-bit ECC error correction for data read from Ethernet TX RAM.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.192 ETCTXECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-Bit ECC Error Correction Enable |
|  |  | 0: Enable 1-bit error correction upon error detection. |
|  |  | 1: Disable 1-bit error correction upon error detection. |
| 4 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.9.13 ETCRXECCCTL— Ethernet RX RAM ECC Control Register

This register controls 1-bit ECC error correction for data read from Ethernet RX RAM.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.193 ETCRXECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EC1ECP | 1-Bit ECC Error Correction Enable |
|  |  | 0: Enable 1-bit error correction upon error detection. |
|  |  | 1: Disable 1-bit error correction upon error detection. |
| 4 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.9.14 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification

While EC1EDIC is set to $1_{\mathrm{B}}$, when an error is detected in one bit from among bits 0 to 38 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.

- 2-bit Error Notification

While EC2EDIC is set to $1_{\mathrm{B}}$, when an error is detected in two bits from among bits 0 to 38 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

### 38.3.9.15 Test Function

## (1) Writing RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

## (2) Reading RAM Data

(a) Set the ECTHM bit in the E710CTL register to 1 to disable ECC error detection and correction.
(b) Read the peripheral RAM. Since neither error detection nor correction proceeds when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:
(a) Set the ECTHM bit in the E710CTL register to 0 to enable ECC error detection and correction.

## (3) Writing to the ECC Bits

(a) Set the ECTMCE bit in the E710TMC register to 1 to set ECC test mode.
(b) Write the value to be written to the ECC bits to E710TRC.ECERDB[6:0].
(c) Set the ECREOS bit in the E710TMC register to 1 to select writing of the value of the E710TRC.ECERDB[6:0] bits to the ECC bits.
(d) When data is written to the peripheral RAM, the value in the E710TRC.ECERDB[6:0] bits will be written to the ECC bits.

How to exit this test mode:
(a) Set the ECTMCE bit in the E710TMC register to 0 to set normal mode.

## (4) Reading the ECC Bits

(a) Set the ECTMCE bit in the E710TMC register to 1 to set ECC test mode.
(b) When data in the peripheral RAM is read, the ECC bits are stored in the E710TRC.ECHORD[6:0] bits.

How to exit this test mode:
(a) Set the ECTMCE bit in the E710TMC register to 0 to set normal mode.

### 38.3.10 ECC for Peripheral RAM (16 Bits)

### 38.3.10.1 Overview

This is an ECC module for the RAM of the following peripheral module:
DFE

Error Detection and Correction
Six-bit ECC data is appended to the 16-bit RAM data.
This ECC module provides 2-bit ECC error detection and 1-bit ECC error detection and correction.
Table 38.194 DFE RAM ECC

| Item | Description |
| :---: | :---: |
| ECC error detection and correction | ECC error detection and correction can be either enabled or disabled. When enabled, either of the following settings can be selected. <br> - ECC error detection and correction are carried out (2-bit error detection, and 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, this function is enabled; 2-bit error detection, and 1-bit error detection and correction are carried out. |
| Error notification | Upon occurrence of an ECC error, it is notified to the Error Control Module. <br> ECC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, error notification is enabled upon detection of an ECC 2-bit error, and error notification is disabled upon detection of an ECC 1-bit error. <br> An ECC 2-bit error and an ECC 1-bit error are handled as individual source in ECM. All overflow errors of each peripheral module (RS-CANFD, FlexRay, GTM and DFE) are notified to ECM as one factor. <br> An ECC error signal is only issued to the ECM, if the ECC error address is not yet stored in the error address buffer. |
| Error status | A status register is provided, which indicates the statuses of ECC 2-bit error detection and ECC 1-bit error detection. A one-stage buffer is provided for 2-bit error and 1-bit error. <br> The error status can be cleared using the clear register. |
| Address capture | The address is captured when an ECC 2-bit error or an ECC 1-bit error is detected. <br> The error status serves as the enable bit of the capture address. Address buffer is updated if the error status is cleared. <br> One-stage address buffer is provided for an ECC 2-bit error and an ECC 1-bit error. |
| Self-diagnosis | - By setting the test mode, register values can be used as the data to be output to the RAM. When a peripheral module writes to the RAM, the E610TED.ECEDB[15:0] bit value can be written to the RAM data section, and the E610TED.ERDB[5:0] bit value can be written to the ECC redundant bit section. <br> - By setting the test mode, the ECC redundant bit section can be latched when RAM data is read, and the value can be confirmed. <br> - By setting the test mode, the ECC redundant bit (encoding circuit) and syndrome code (decoding circuit), which are generated from the input data, can be confirmed. |

### 38.3.10.2 List of Registers

## (1) List of ECC Modules

The RAMs of the multiple peripheral functions are provided with the ECC modules. The following table shows the peripheral functions provided with the ECC modules, the corresponding ECC module names, and base addresses of the ECC modules.

Table 38.195 List of ECC modules

| Peripheral Functions |  | ECC Module Names and Register Base Addresses |  |
| :---: | :---: | :---: | :---: |
|  |  | Module Name | Base Address <base_addr> |
| DFE0 | Data memory (DMEM0) | E6DF00 | FFC7 8020 ${ }_{\text {H }}$ |
| (Peripheral Group5) | Data memory (DMEM1) | E6DF01 | FFC7 8040 ${ }_{\text {H }}$ |

| (Peripheral Group5) | Data memory (DMEM1) | E6DF11 | FFC7 80A0 ${ }_{\text {H }}$ |

## (2) List of Registers

Each ECC module has the registers shown in the following table.
Table 38.196 List of Registers

| Register Name | Symbol | Address | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- |
| ECC Control Register | E610CTL | <base_addr> + 00 |  |  |
| ECC Test Mode Control Register | E610TMC | <base_addr> + 04 | 8,16 | 8,16 |
| ECC Redundant Bit Data Control Test Register | E610TRC | <base_addr> + 08 |  |  |
| ECC Encoder and Decoder Data Test Register | E610TED | <base_addr> + 0 $C_{H}$ | 32 | 32 |
| ECC Error Address Register | E610EAD | <base_addr> + $10_{H}$ | 32 |  |

## (3) Register Map

Table 38.197 Register Map

| Symbol | 31 | 24 | 23 | 16 | 15 | 8 | 7 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| E610CTL | $-\left(00_{H}\right)$ | $-\left(00_{H}\right)$ |  | ECCTL[15:8] | ECCTL[7:0] | $00 H_{H}$ |  |  |
| E610TMC | $-\left(00_{H}\right)$ | $-\left(00_{H}\right)$ | ECTMC[15:8] | ECTMC[7:0] | $04_{H}$ |  |  |  |
| E610TRC | ECSYND[7:0] | ECHORD[7:0] | ECECRD[7:0] | ECRODM[7:0] | $00_{H}$ |  |  |  |
| E610TED | ECEDB[31:24] | ECEDB[23:16] | ECRIDM[15:8] | ECERDB[7:0] | $0 C_{H}$ |  |  |  |
| E610EAD | ECEAD[31:24] | ECEAD[23:16] | ECEAD[15:8] | ECEAD[7:0] | $10_{H}$ |  |  |  |

### 38.3.10.3 E610CTL - ECC Control Register

E610CTL controls the status and modes of the ECC modules.
E610CTL can be read and written to using the 16-bit or 8-bit manipulation instruction.

Note 1. This bit is always read as 0 .

Table 38.198 E610CTL Register Contents (1/2)
$\left.\left.\begin{array}{lll}\hline \text { Bit Position } & \text { Bit Name } & \text { Function } \\ \hline 15,14 & \text { EMCA[1:0] } & \text { Access Control } 1 \text { and } 0 \text { to ECC Mode Select Bit } \\ & & \text { These bits enable or disable writing to bit } 7 \text {. The read value is always } 0 .\end{array}\right] \begin{array}{ll} & \text { Reserved } \\ \text { When read, the value after reset is returned. When writing, write the value after reset. }\end{array}\right]$

Table 38.198 E610CTL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 4 | EC2EDIC | 2-Bit ECC Error Detection Notification Enable <br> 0 : When a 2-bit error is detected, the ECM is not notified of the error. <br> 1: When a 2-bit error is detected, the ECM is notified of the error. |
| 3 | EC1EDIC | 1-Bit ECC Error Detection Notification Enable <br> 0 : When a 1-bit error is detected, the ECM is not notified of the error. <br> 1: When a 1-bit error is detected, the ECM is notified of the error. |
| 2 | ECER2F | 2-Bit ECC Error Detection Flag <br> Indicates that errors have been detected at two bits in bits 0 to 21 of the data read from the RAM during RAM read access while error detection is enabled. <br> This bit is a read only flag. <br> 0 : A 2-bit error has not occurred since this bit was cleared. <br> 1: A 2-bit error has occurred. <br> Clearing conditions <br> (1) Reset is applied. <br> (2) 1 is written to ECER2C. <br> (3) ECC function is disabled (ECTHM $=1$ ). |
| 1 | ECER1F | 1-Bit ECC Error Detection And Correction Flag <br> Indicates that an error has been detected at one bit in bits 0 to 21 of the data read from the RAM during RAM read access while error detection is enabled. Setting this bit generates no interrupt signal. <br> This bit is a read only flag. <br> 0 : A 1-bit error has not occurred since this bit was cleared. <br> 1: A 1-bit error has occurred. <br> Clearing conditions <br> (1) Reset is applied. <br> (2) 1 is written to ECER1C. <br> (3) ECC function is disabled. |
| 0 | ECEMF | ECC Error Message Flag <br> Indicates that the current read data contains an error. <br> ECEMF is updated every time RAM data is read. Since the RAM value after reset is undefined, if this bit is read before the RAM is initialized, this bit might be set, indicating an error. Therefore, the ECEMF value after reset is undefined. <br> 0 : The current RAM data contains no bit errors. <br> 1: The current RAM data contains bit errors. <br> Clearing conditions <br> (1) ECC function is disabled. <br> (2) Decoding circuit input data contains no 1-bit errors. <br> ECEMF remains set as long as RAM data containing a bit error is output with error detection being enabled. |

### 38.3.10.4 E610TMC - ECC Test Mode Control Register

E610TMC is a 16-bit register used to switch the mode to test mode and control the mode.
E610TMC can be read and written to using the 16-bit or 8-bit manipulation instruction.

Note 1. This bit is always read as 0 .
Table 38.199 E610TMC Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15, 14 | ETMA[1:0] | Sets Access Control 1 and 0 to ECC Test Mode Control Enable Bit These bits enable or disable writing to bit 7 . The read value is always 0 . |
| 13 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ECTMCE | ECC Test Mode Control Enable <br> ECTMCE enables or disables access to the test registers and test control bits. Write access to ETCMCE is enabled when the value of bits 15 and 14 is $10_{\mathrm{B}}$. <br> 0 : Disable access to the test registers and test control bits. <br> 1: Enable access to the test registers and test control bits. |
| 6, 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ECTRRS | ECC RAM Read Test Mode Control Enable <br> ECTRRS enables the read status of RAM to be generated by reading the E610TED register, and also allows the RAM output data to be read out when the E610TED:ECEDB[15:0] and E610TED:ECRIDM[7:0] are read. <br> Write access to ECTRRS is enabled only when ECTMCE is 1 (can be set simultaneously). ECTRRS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Disable generation of RAM read status for testing when E610TED is read. <br> 1: Enable generation of RAM read status for testing when E610TED is read. <br> When E610TED:ECEDB[15:0] and E610TED:ECRIDM[7:0] are read, the values of the RAM output data pin are read out. |
| 3 | ECREOS | ECC Redundant Bit Output Data Select <br> ECREOS selects either the ECC encoder output data or the ECERDB register value to be output as the ECC redundant bit output. <br> Write access to ECREOS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREOS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0: Allow encoding results to be output as the ECC redundant bit output. <br> 1: Allow the E610TED:ECERDB[5:0] value to be output as the ECC redundant bit output. |
| 2 | ECENS | ECC Encoder Input Select <br> ECENS selects either the data value from the peripheral module or the internal test register value (E610TED: ECEDB[15:0]) as the input signal to be encoded. Write access to ECENS is enabled only when ECTMCE is 1 (can be set simultaneously). <br> ECENS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the RAM write data from the peripheral module to be input as the ECC encoder input data. <br> 1: Allow the E610TED:ECEDB[15:0] value to be input as the ECC encoder input data. |

Table 38.199 E610TMC Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1 | ECDCS | ECC Decoder Input Select <br> ECDCS selects either the lower 16-bit data value from the RAM or the internal test register value (E610TED:ECEDB[15:0]) as the lower 32-bit data of the input signal to be decoded. <br> Write access to ECDCS is enabled only when ECTMCE is 1 (can be set simultaneously). <br> ECDCS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the lower 16-bit RAM output data to be input to the data area (lower 16 bits) to the decoder. <br> 1: Allow the E610TED:ECEDB[15:0] value to be input to the data area to the decoder. |
| 0 | ECREIS | ECC Redundant Bit Input Data Select <br> ECREIS selects either the upper 6-bit data value from the RAM (redundant bit area) or the internal test register value (E610TED:ECERDB[5:0]) as the upper 6-bit data of the input signal to be decoded. <br> Write access to ECREIS is enabled only when ECTMCE is 1 (can be set simultaneously). ECREIS is cleared by writing 0 to ECTMCE (can be cleared synchronously). <br> 0 : Allow the upper 6-bit RAM output data to be input to the ECC redundant bit area to the decoder. <br> 1: Allow the E610TED:ECERDB[5:0] value to be input to the ECC redundant bit area to the decoder. |

### 38.3.10.5 E610TED - ECC Encoder and Decoder Data Test Register

E610TED is a 32-bit test register consisting of three fields (ECEDB, ECRIDM, and ECERDB) corresponding to the ECC data area and redundant bit area. Each field can be accessed as the register with the same name. For details of each field, refer to the descriptions of these three registers.

When $\mathrm{ECTMCE}=1$, E610TED can be read and written to using the 32-bit manipulation instruction.
When $\operatorname{ECTMCE}=0, \mathrm{E} 610 \mathrm{TED}$ is always read as 0 .

Changing ECTMCE from 1 to 0 resets E610TED synchronously.

### 38.3.10.6 ECEDB - ECC Encoder and Decoder Data Input and Output Substitution Buffer Register

ECEDB is a 16-bit data buffer register for ECC encoding and decoding.
ECEDB can be read and written to in test mode $(E C T M C E=1)$.
When ECTMCE $=1$, the ECEDB value can be used as the data input to the encoding circuit and decoding circuit.

When E610TMC:ECENS $=1$, the ECEDB value is input to the encoding circuit and supplied to the RAM.
When $\mathrm{E} 610 \mathrm{TMC}: \mathrm{ECDCS}=1$, the ECEDB value is input as the 15 th to 0 th bits of the input data to the decoding circuit. When E610TMC:ECTRRS $=1$, reading ECEDB returns the RAM output data instead of the data written to ECEDB.

### 38.3.10.7 ECRIDM — ECC Redundant Bit Input Data Monitoring Register

ECRIDM is a read-only register used to monitor the upper 6-bit data (redundant bit area) value from the RAM in test mode $(E C T M C E=1)$ when E610TMC:ECTRRS $=1$. With ECRIDM, the RAM output data can be confirmed easily.

When ECTRRS $=0$, ECRIDM is always read as 0 .
Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RIDM[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

### 38.3.10.8 ECERDB - ECC Redundant Bit Input and Output Substitution Buffer Register

ECERDB is a buffer register for the data that substitutes for the input and output data for the 6-bit ECC redundant data area in test mode $(\mathrm{ECTMCE}=1)$.

ECERDB can be read and written to in test mode $($ ECTMCE $=1)$.

Value after reset: $\quad 00 \mathrm{H}$

When ECREOS $=1$, the ECERDB value, instead of the six redundant bits generated by the encoding circuit, is output to the ECC redundant bit output pin and supplied to the RAM.

When ECREIS = 1, the ECERDB value, instead of the upper six data bits to be input to the decoding circuit, is handled by the decoding circuit.

Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.10.9 E610TRC - ECC Redundant Bit Data Control Test Register

E610TRC is a 32-bit test register consisting of four fields (ECSYND, ECHORD, ECECRD, and ECRODM) corresponding to the ECC redundant bit area. Each field can be accessed as the 8 -bit register with the same name. For details of each field, refer to the descriptions of these four registers.

When ECTMCE $=0$, E610TRC is always read as 0 .
When ECTMCE $=1$, E610TRC can be read using the 32-bit manipulation instruction.

| Value after reset: |  |  | $0000000 \mathrm{OH}^{\text {H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | ECSYND |  |  |  |  |  |  |  | ECHORD |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | ECECRD |  |  |  |  |  |  |  | ECRODM |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

### 38.3.10.10 ECSYND - ECC Decoder Syndrome Data Register

ECSYND is a read-only register used to confirm the syndrome code generated by the decoding circuit in test mode ( $\mathrm{ECTMCE}=1$ ).

Write access to ECSYND is ignored.

Value after reset: $\quad 00_{H}$

When read, the ECSYND bits return the value of the syndrome code (SYND[5:0]) generated based on the data input to the decoding circuit.

The ECSYND bits are not holding circuits; the register value changes as the input signal changes.
ECSYND is valid only when $\mathrm{ECTMCE}=1$, and is always read as $00_{\mathrm{H}}$ when $\mathrm{ECTMCE}=0$.
Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.10.11 ECHORD - ECC 6-Bit Redundant Data Holding Test Register

ECHORD holds the 6-bit ECC redundant area (upper 6-bit RAM data) that cannot be confirmed by the peripheral module when the peripheral module accesses the RAM for reading in test mode (ECTMCE $=1$ ).

Value after reset: $\quad 00_{H}$

The ECHORD bits are loaded with the upper 6-bit RAM output data at the next rising edge of the operating clock signal after the peripheral module accesses the RAM for reading data in test mode $(\mathrm{ECTMCE}=1)$.

The ECHORD bits are also loaded with the data on the input pins at the next operating clock pulse when the $\operatorname{ECEDB}[15: 0]$ register is read while E610TMC:ECTRRS $=1$.

ECHORD is valid only when $\operatorname{ECTMCE}=1$, and is always read as 00 H when $\mathrm{ECTMCE}=0$.
Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.10.12 ECECRD - ECC Encoder Test Register

ECECRD is a read-only register used to read the 6-bit redundant section generated by the encoding circuit in test mode $($ ECTMCE $=1)$.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 |  |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - |  |  |  |  |  |

ECECRD is used to confirm the redundant bits generated by the input data from the peripheral module. Here, the data that is read is the result of encoding ( $\mathrm{ECC}[5: 0]$ ), not the value output from the ECC redundant bits.
ECECRD is valid only when $\operatorname{ECTMCE}=1$, and is always read as $00_{\mathrm{H}}$ when $\mathrm{ECTMCE}=0$.
Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.10.13 ECRODM — ECC Redundant Bit Output Data Monitoring Register

ECRODM is a read-only register used to monitor the value of the ECC redundant bit output pin in test mode (ECTMCE $=1$ ).

With ECRODM, the upper 6-bit output data to the RAM can be confirmed easily.

Value after reset: $\quad 00_{H}$

ECRODM is valid only when $\mathrm{ECTMCE}=1$, and is always read as $00_{\mathrm{H}}$ when $\mathrm{ECTMCE}=0$.
Bit 7 and 6 are reserved. When read, the value after reset is returned. When writing, write the value after reset.

### 38.3.10.14 E610EAD - ECC Error Address Register

E610EAD is a read-only register used to hold the address at which an ECC error has occurred.
If an ECC error is detected while ECC error detection is enabled, the RAM address is latched using the detection signal as a trigger, and the address is stored in E610EAD as the address at which the ECC error occurred.

The address is stored upon detection of the first ECC error while no error status is set. However, if a 1-bit error is followed by a 2-bit error, the address of the latter is stored. The address can be calculated by adding the base address.

Only one address can be held in E610EAD.

Value after reset: $\quad 00000000_{\mathrm{H}}$

### 38.3.10.15 Notification to ECM

Detection of errors in two bits can be set for this module and the ECM is notified of detected errors.

- 1-bit Error Notification

While EC1EDIC is set to $1_{\mathrm{B}}$, when an error is detected in one bit from among bits 0 to 21 of data read from RAM, the ECM is notified of the 1-bit error. When ECER1F or ECER2F is already set, however, the ECM will not be notified of the error.

- 2-bit Error Notification

While EC2EDIC is set to $1_{\mathrm{B}}$, when an error is detected in two bits from among bits 0 to 21 of data read from RAM, the ECM is notified of the 2-bit error. When ECER2F is already set, however, the ECM will not be notified of the error.

### 38.3.10.16 Test Function

## (1) Writing RAM Data

Write data to the peripheral RAM. However, the ECC corresponding to the written data will be written to the ECC bits simultaneously. In order to write a specified value to the ECC bits, use the ECC test mode described in (3) below.

## (2) Reading RAM Data

(a) Set the ECTHM bit in the E610CTL register to 1 to disable ECC error detection and correction.
(b) Read the peripheral RAM. Since neither error detection nor correction proceed when the peripheral RAM is read, the RAM data is read unchanged.

How to exit this test mode:
(a) Set the ECTHM bit in the E610CTL register to 0 to enable ECC error detection and correction.

## (3) Writing to the ECC Bits

(a) Set the ECTMCE bit in the E610TMC register to 1 to set ECC test mode.
(b) Write the value to be written to the ECC bits to E610TED.ECERDB[5:0].
(c) Set the ECREOS bit in the E610TMC register to 1 to select writing of the value of the E610TED.ECERDB[5:0] bits to the ECC bits.
(d) When data is written to the peripheral RAM, the value in the E610TED.ECERDB[5:0] bits will be written to the ECC bits.

How to exit this test mode:
(a) Set the ECTMCE bit in the E610TMC register to 0 to set normal mode.

## (4) Reading the ECC Bits

(a) Set the ECTMCE bit in the E610TMC register to 1 to set ECC test mode.
(b) When data in the peripheral RAM is read, the ECC bits are stored in the E610TRC.ECHORD[5:0] bits.

How to exit this test mode:
(a) Set the ECTMCE bit in the E610TMC register to 0 to set normal mode.

### 38.3.11 Safety Mechanism on Data Transfer Path

### 38.3.11.1 Overview

This product provides a function that protects the transaction data and the addresses on each bus. This function applies to Cluster RAM Bus, Local FLASH Bus, Global FLASH Bus, Inter-processor element Bus, Inter-cluster Bus, System Bus, Peripheral Bus and High speed Bus.

ECC protection on bus is summarized in the table below.
Table 38.200 ECC protection on Bus

| Item | Description |
| :---: | :---: |
| Data ECC error detection and correction | ECC error detection and correction on data bus between master and slave can be either enabled or disabled. <br> When enabled, either of the following settings can be selected: <br> - ECC error detection and correction are carried out (2-bit error detection, 1-bit error detection and correction are carried out). <br> - ECC error detection is carried out (2-bit error detection and 1-bit error detection are carried out). <br> When disabled, neither error detection nor correction is carried out. <br> In the initial state, the ECC function is enabled; 1-bit error detection and correction, and 2-bit error detection are carried out. |
| Address ECC error detection | ECC error detection on address bus between master and slave can be either enabled or disabled. In the initial state, 1-bit error detection and 2-bit error detection are carried out. |
| Error notification | The occurrence of a Data ECC error or an Address EDC error is reported to the Error Control Module. <br> Data ECC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, error notification is enabled upon detection of an ECC 2-bit and ECC 1-bit error. <br> Address EDC Error: <br> - Error notification can be either enabled or disabled upon detection of an ECC 2-bit error. <br> - Error notification can be either enabled or disabled upon detection of an ECC 1-bit error. <br> In the initial state, error notification is enabled upon detection of an ECC 2-bit and ECC 1-bit error. <br> The error notification signal is output with an Address ECC 2-bit error, an Address ECC 1-bit error handled as one source, and a Data ECC 2-bit error and a Data ECC 1-bit error are handled as individual sources. |
| Error status | A status register is provided that indicates the status of Data ECC 2-bit error detection, Data ECC 1-bit error detection, Address ECC 2-bit error detection, and Address ECC 1-bit error detection. If an error occurs while no error status is set, the corresponding status is set. The error status can be cleared using the clear register. |
| Self-diagnosis | ERRGEN is available for self-diagnosis of ECC decoder of data transfer path. |

### 38.3.11.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 38.201 Register Base Addresses (1/3)

| Base Address Name | Base Address | Bus Group |
| :---: | :---: | :---: |
| <ECCCNT_A_CCIB0CLO_base> | FFC4 B000 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_CCIB1CLO_base> | FFC4 $\mathrm{B080}_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_SA_PE0CL0_base> | FFC4 $\mathrm{COOO}_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_A_GCFU0ICL0_base> | FFC4 C080 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_GCFUODCLO_base> | FFC4 $\mathrm{C100}_{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_SA_PE1CL0_base> | FFC4 $\mathrm{C} 200^{\mathrm{H}}$ | Peripheral Group 0 |
| <ECCCNT_A_GCFU1ICL0_base> | FFC4 C280 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_GCFU1DCL0_base> | FFC4 C300 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_X2VCLO_base> | FFC4 D000 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_BARR_base> | FFC4 D200 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_IPIR_base> | FFC4 D280 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_MEV_base> | FFC4 D300 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_TPTM_base> | FFC4 D380 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_CRAM_base> | FFC4 D400 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_SG0_base> | FFC4 D480 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_SX2PV_base> | FFC4 D500 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_SX2FX_base> | FFC4 D580 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_FX2SX_base> | FFC4 D600 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_GCFUF_base> | FFC4 D680 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_SX2MB_base> | FFC4 D700 ${ }_{\text {H }}$ | Peripheral Group 0 |
| <ECCCNT_A_V2A1_base> | FFC6 3800 ${ }_{\text {H }}$ | Peripheral Group 1 |
| <ECCCNT_A_V2A2_base> | FFDE $0000_{\mathrm{H}}$ | Peripheral Group 2H |
| <ECCCNT_A_V2A3_base> | FFC7 $\mathrm{2000}_{\mathrm{H}}$ | Peripheral Group 3 |

Note 1. For an access by using a master except for PE, the path from Global FLASH Bus to Code Flash is covered.
Note 2. For an access by using a master except for PE, the path from a master to Global FLASH Bus is covered.
Note 3. An access by specific instructions(CLR1, NOT1, SET1, and CAXI) is targeted. For details, see the RH850G4MH User's Manual: Software.
Note 4. Instruction fetch access from PEn to PEn's Local RAM is covered. ( $\mathrm{n}=0$ to 1 )
Note 5. Instruction fetch access from PEn to Cluster RAM is covered.
Note 6. Data access from PEn to Cluster RAM and PEn's Local RAM is not covered. ( $n=0$ to 1 )
Note 7. This function is implemented in E2x-FCC1 only.

### 38.3.11.4 BUSAECCCTL — ECC Control Register

This register controls ECC error detection for requested address.
This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.
This register can be written only when $\mathrm{KCE}=1$.

Table 38.204 BUSAECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECCDIS | Address ECC disable bit |
|  | Sets ECC error detection to enable/disable. |  |
|  | $0:$ ECC error detection is enabled |  |
|  | 1: ECC error detection is disabled |  |

### 38.3.11.5 BUSAECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.
This register can be written only when $\mathrm{KCE}=1$.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.205 BUSAECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the address ECC decoder. |
|  |  | 0: Normal mode |
|  |  | 1: Test mode |
|  |  | The values of BUSAECCTSTDIN0 and BUSAECCTSTEIN registers are provided to data and |
|  |  | ECC fields of the ECC decoder in test mode. |
| 0 |  | Reserved |
|  |  |  |

### 38.3.11.6 BUSAECCTSTDINO — Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of BUSAECCTSTDIN0 and BUSAECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either

## KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.206 BUSAECCTSTDIN0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify test data for the data ECC decoder. The data is provided to data field of the ECC <br> decoder when ECCTST $=1$. |

### 38.3.11.7 BUSAECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of BUSAECCTSTDIN0 and BUSAECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.207 BUSAECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify test data for ECC decoder. The data is provided to ECC field of the ECC decoder <br> when ECCTST $=1$. |

### 38.3.11.8 BUSDVCECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction.
This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.
This register can be written only when $\mathrm{KCE}=1$.

Table 38.208 BUSDVCECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | Data ECC error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
| enable/disable. |  |  |
|  | $0:$ Correct when 1-bit error is detected |  |
|  | 1: Do not correct when a 1-bit error is detected |  |
| 0 | Data ECC disable bit |  |
|  | Sets ECC error detection/correction to enable/disable. |  |
|  | $0:$ ECC error detection/correction is enabled |  |
|  |  | 1: ECC error detection/correction is disabled |

### 38.3.11.9 BUSDVCECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.209 BUSDVCECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the data ECC decoder. |
|  | 0: Normal mode |  |
|  | 1: Test mode |  |
|  |  | The values of BUSDVCECCTSTDIN0 and BUSDVCECCTSTEIN registers are provided to |
|  | data and ECC fields of one of the ECC decoders along with DATSEL setting in test mode. |  |
| 0 | Selects ECC decoder to replace input data when ECCTST = 1. |  |
|  | $0:$ ECC decoder for lower data |  |
|  |  | 1: ECC decoder for upper data |
|  |  |  |

### 38.3.11.10 BUSDVCECCTSTDIN0 — Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of BUSDVCECCTSTDIN0 and BUSDVCECCTSTEIN registers are input to data and ECC field of the target ECC
decoder in test mode.
This register is protected by the Key Code Protection Register. For details whether this register is protected by either

## KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.210 BUSDVCECCTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the data ECC decoder. The data is provided to data field of the ECC <br> decoder when ECCTST $=1$. |

### 38.3.11.11 BUSDVCECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of BUSDVCECCTSTDIN0 and BUSDVCECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.211 BUSDVCECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for ECC decoder. The data is provided to ECC field of the ECC decoder <br> when ECCTST $=1$. |

### 38.3.11.12 BUSDV1ECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read to VCI2APB bridge.
This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.
This register can be written only when $\mathrm{KCE}=1$.

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 38.212 BUSDV1ECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | Data ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
| enable/disable. |  |  |
|  | $0:$ Correct when 1-bit error is detected |  |
|  | 1: Do not correct when 1-bit error is detected |  |
| 0 | Data ECC disable bit |  |
|  | Sets ECC error detection/correction to enable/disable. |  |
|  | $0:$ ECC error detection/correction is enabled |  |
|  |  | 1: ECC error detection/correction is disabled |

### 38.3.11.13 BUSDV1ECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.213 BUSDV1ECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the data ECC decoder. |
|  |  | 0: Normal mode |
|  |  | 1: Test mode |
|  |  | The values of BUSDV1ECCTSTDIN0 and BUSDV1ECCTSTEIN registers are provided to data |
|  |  | Reserved |
|  |  |  |
| 0 |  |  |

### 38.3.11.14 BUSDV1ECCTSTDIN0 - Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of BUSDV1ECCTSTDIN0 and BUSDV1ECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either

## KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.214 BUSDV1ECCTSTDIN0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the data ECC decoder. The data is provided to data field of the ECC <br> decoder when ECCTST $=1$. |

### 38.3.11.15 BUSDV1ECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of BUSDV1ECCTSTDIN0 and BUSDV1ECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the Key Code Protection Register. For details whether this register is protected by either KCPROT or APECKCPROT, see Table 38.202, List of Registers.

This register can be written only when $\mathrm{KCE}=1$.

Table 38.215 BUSDV1ECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for ECC decoder. The data is provided to ECC field of the ECC decoder <br> when ECCTST $=1$. |

### 38.3.11.16 BUSDEMECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for data read to FAXI2SAXI bridge.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.216 BUSDEMECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | Data ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
|  |  |  |
|  |  | enable/disable. |
|  | 1: Dorrect when 1-bit error is detected |  |
|  | Data ECC disable bit when 1-bit error is detected |  |
| 0 | Sets ECC error detection/correction to enable/disable. |  |
|  | 0: ECC error detection/correction is enabled |  |
|  | 1: ECC error detection/correction is disabled |  |

### 38.3.11.17 BUSDEMECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After ECC test mode (ECCTST = 1) setting, arbitrary data value can be input to ECC decoder.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.217 BUSDEMECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the data ECC decoder. |
|  | 0: Normal mode |  |
|  | 1: Test mode |  |
|  | The values of BUSDEMECCTSTDIN0 and BUSDEMECCTSTEIN registers are provided to |  |
|  | data and ECC field of one of the ECC decoders along with DATSEL setting in test mode. |  |
| 0 | Selects ECC decoder to replace input data under ECCTST = 1. |  |
|  | 0: ECC decoder for lower data |  |
|  | 1: ECC decoder for upper data |  |

### 38.3.11.18 BUSDEMECCTSTDINO — Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of BUSDEMECCTSTDIN0 and BUSDEMECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.218 BUSDEMECCTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the data ECC decoder. The data is provided to data field of the ECC <br> decoder when ECCTST $=1$. |

### 38.3.11.19 BUSDEMECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of BUSDEMECCTSTDIN0 and BUSDEMECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCPROT} . \mathrm{KCE}=1$.

Table 38.219 BUSDEMECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for ECC decoder. The data is provided to ECC field of the ECC decoder <br> when ECCTST $=1$. |

### 38.3.11.20 BUSDDEECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction for internal buffer of sDMAC.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.220 BUSDDEECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | Data ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1-bit error correction to enable/disable. |
|  |  | 0 : Correct when 1-bit error is detected |
|  |  | 1: Do not correct when 1-bit error is detected |
| 0 | ECCDIS | Data ECC disable bit |
|  |  | Sets ECC error detection/correction to enable/disable. |
|  |  | 0: ECC error detection/correction is enabled |
|  |  | 1: ECC error detection/correction is disabled |

### 38.3.11.21 BUSDDEECCTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After setting the ECC test mode (ECCTST = 1), arbitrary data value can be input to ECC decoder.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.221 BUSDDEECCTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the data ECC decoder. |
|  |  | 0: Normal mode |
|  |  | 1: Test mode |
|  |  | The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN |
|  |  | registers are provided to data and ECC fields of the ECC decoder in test mode. |

### 38.3.11.22 BUSDDEECCTSTDIN0 - Test Data Input Register

This register is used to inject errors into lower data field of ECC decoder for self-diagnosis. The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.222 BUSDDEECCTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the data ECC decoder. The data is provided to lower data field of the |
|  |  | ECC decoder when ECCTST $=1$. |

### 38.3.11.23 BUSDDEECCTSTDIN1 — Test Data Input Register

This register is used to inject errors into upper data field of ECC decoder for self-diagnosis. The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.223 BUSDDEECCTSTDIN1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the data ECC decoder. The data is provided to upper data field of the |
|  |  | ECC decoder when ECCTST $=1$. |

### 38.3.11.24 BUSDDEECCTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of BUSDDEECCTSTDIN0, BUSDDEECCTSTDIN1 and BUSDDEECCTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the KCPROT register. When KCPROT. $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCPROT} . \mathrm{KCE}=1$.

Table 38.224 BUSDDEECCTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
| 7 to 0 | ECC[7:0] | When read, the value after reset is returned. When writing, write the value after reset. <br> when ECCTST $=1$. |

### 38.3.11.25 BUSDECCCTL — ECC Control Register

This register controls ECC error detection/correction and 1-bit error correction.
This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.225 BUSDECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SECDIS | Data ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS = 0), this bit sets 1-bit error correction to |
| enable/disable. |  |  |
|  | 0: Correct when 1-bit error is detected |  |
|  | 1: Do not correct when 1-bit error is detected |  |
| 0 | Data ECC disable bit |  |
|  | Sets ECC error detection/correction to enable/disable. |  |
|  | $0:$ ECC error detection/correction is enabled |  |
|  |  | 1: ECC error detection/correction is disabled |
|  |  |  |

### 38.3.11.26 LR_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by the KCPROT register. When KCPROT. $K C E=0$, it cannot be written. It can be written only when $\mathrm{KCPROT} . \mathrm{KCE}=1$.

Table 38.226 LR_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error is detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error is detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error is detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 | Controls error reports when data ECC 1-bit error is detected. |  |
|  |  | 0: Data ECC 1-bit error report disabled |
|  |  | 1: Data ECC 1-bit error report enabled |

### 38.3.11.27 LR_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in LR_BUSASERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.227 LR_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | ASSTCLR16 | Writing 1 to this bit clears ASEDF16 in LR_BUSASERSTR. |
| 15 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ASSTCLR01 | Writing 1 to this bit clears ASEDF01 in LR_BUSASERSTR. |
| 0 | ASSTCLR00 | Writing 1 to this bit clears ASEDF00 in LR_BUSASERSTR. |

### 38.3.11.28 LR_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in LR_BUSADERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.228 LR_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | ADSTCLR16 | Writing 1 to this bit clears ADEDF16 in LR_BUSADERSTR. |
| 15 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ADSTCLR01 | Writing 1 to this bit clears ADEDF01 in LR_BUSADERSTR. |
| 0 | ADSTCLR00 | Writing 1 to this bit clears ADEDF00 in LR_BUSADERSTR. |

### 38.3.11.29 LR_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in LR_BUSDSERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.229 LR_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | WSSTCLR01 | Writing 1 to this bit clears DSEDF01 in LR_BUSDSERSTR. |

### 38.3.11.30 LR_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in LR_BUSDDERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.230 LR_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 38.3.11.31 LR_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, flags of the detected errors are all set.

This register can be cleared by LR_BUSASSTCLR register.

Table 38.231 LR_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | ASEDF16 | Indicates that an address ECC 1-bit error was detected in request address to AXI2VCI bridge <br> in cluster 0. |
| 15 to 2 | - | Reserved <br>  <br> 1 |
| 0 | ASEDF01 | Indicates that an address ECC 1-bit error was detected in request address to PE1. |

### 38.3.11.32 LR_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by LR_BUSADSTCLR register.

Table 38.232 LR_BUSADERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | ADEDF16 | Indicates that an address ECC 2-bit error was detected in request address to AXI2VCI bridge <br> in cluster 0. |
| 15 to 2 | - | Reserved <br>  <br> 1 |
| 0 | ADEDF01 | Indicates that an address ECC 2-bit error was detected in request address to PE1. |

### 38.3.11.33 LR_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by LR_BUSDSSTCLR register.

Table 38.233 LR_BUSDSERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DSEDF01 | Indicates that a data ECC 1-bit error was detected in write data to PE1. |
| 0 | DSEDF00 | Indicates that a data ECC 1-bit error was detected in write data to PE0. |

### 38.3.11.34 LR_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to Local RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by LR_BUSDDSTCLR register.

Table 38.234 LR_BUSDDERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DDEDF01 | Indicates that a data ECC 2-bit error has been detected in write data to PE1. |
| 0 | DDEDF00 | Indicates that a data ECC 2-bit error has been detected in write data to PE0. |

### 38.3.11.35 CR_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.235 CR_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error is detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error is detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error is detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 | DSEDIE | Controls error reports when data ECC 1-bit error is detected. |
|  |  | 0: Data ECC 1-bit error report disabled |
|  |  |  |

### 38.3.11.36 CR_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in CR_BUSASERSTR. This is write only register and read value is always " 0 ".

Table 38.236 CR_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ASSTCLR25 | Writing 1 to this bit clears ASEDF25 in CR_BUSASERSTR. |
| 24 | ASSTCLR24 | Writing 1 to this bit clears ASEDF24 in CR_BUSASERSTR. |
| 23 to 7 | - | Reserved <br>  <br> 6 |
| 5 to 3 | - | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | ASSTCLR02 | Writing 1 to this bit clears ASEDF06 in CR_BUSASERSTR. |
| 1 | ASSTCLR01 | Wherved read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ASSTCLR00 | Writing 1 to this bit clears ASEDF01 in CR_BUSASERSTR. |

### 38.3.11.37 CR_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in CR_BUSADERSTR. This is write only register and read value is always " 0 ".

Table 38.237 CR_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ADSTCLR25 | Writing 1 to this bit clears ADEDF25 in CR_BUSADERSTR. |
| 24 | ADSTCLR24 | Writing 1 to this bit clears ADEDF24 in CR_BUSADERSTR. |
| 23 to 7 | - | Reserved |
| 6 | ADSTCLR06 | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 3 | - | Reserved |
| 2 | ADSTCLR02 | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ADSTCLR01 | Writing 1 to this bit clears ADEDF02 in CR_BUSADERSTR. |
| 0 | ADSTCLR00 | Writing 1 to this bit clears ADEDF00 in CR_BUSADERSTR. |

### 38.3.11.38 CR_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in CR_BUSDSERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.238 CR_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DSSTCLR06 | Writing 1 to this bit clears DSEDF06 in CR_BUSDSERSTR. |
| 5 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | DSSTCLR02 | Writing 1 to this bit clears DSEDF02 in CR_BUSDSERSTR. |
| 1 | DSSTCLR01 | Writing 1 to this bit clears DSEDF01 in CR_BUSDSERSTR. |
| 0 | DSSTCLR00 | Writing 1 to this bit clears DSEDF00 in CR_BUSDSERSTR. |

### 38.3.11.39 CR_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in CR_BUSDDERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.239 CR_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DDSTCLR06 | Writing 1 to this bit clears DDEDF06 in CR_BUSDDERSTR. |
| 5 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | DDSTCLR02 | Writing 1 to this bit clears DDEDF02 in CR_BUSDDERSTR. |
| 1 | DDSTCLR01 | Writing 1 to this bit clears DDEDF01 in CR_BUSDDERSTR. |
| 0 | DDSTCLR00 | Writing 1 to this bit clears DDEDF00 in CR_BUSDDERSTR. |

### 38.3.11.40 CR_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSASSTCLR register.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.240 CR_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ASEDF25 | Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI <br> bridge for cluster 1. |
| 24 | ASEDF24 | Indicates that an address ECC 1-bit error was detected in request address to SAXI2MBI <br> bridge for cluster 0. |
| 23 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | ASEDF06 | Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in <br> cluster 1 from outside. |
| 2 to 3 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |  |
| 1 | ASEDF02 | Indicates that an address ECC 1-bit error was detected in request address to Cluster RAM in <br> cluster 0 from outside. |
| 0 | ASEDF00 | Indicates that an address ECC 1-bit error was detected in request address from PE1 to <br> Cluster RAM in cluster 0. |

### 38.3.11.41 CR_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSADSTCLR register.

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { ADEDF } \\ 06 \end{gathered}$ | - | - | - | $\begin{array}{\|c} \text { ADEDF } \\ 02 \end{array}$ | $\begin{array}{\|c} \text { ADEDF } \\ 01 \end{array}$ | $\begin{gathered} \text { ADEDF } \\ 00 \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.241 CR_BUSADERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ADEDF25 | Indicates that an address ECC 2-bit error was detected in request address to SAXI2MBI <br> bridge for cluster 1. |
| 24 | ADEDF24 | Indicates that an address ECC 2-bit error was detected in request address to SAXI2MBI <br> bridge for cluster 0. |
| 23 to 7 | ADEDF06 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | ADEDF02 | Indicates that an address ECC 2-bit error was detected in request address to Cluster RAM in <br> cluster 1 from outside. |
| 5 to 3 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |  |
| $\mathbf{2}$ | ADEDF01 | Indicates that an address ECC 2-bit error was detected in request address to Cluster RAM in <br> cluster 0 from outside. |
| 0 | Indicates that an address ECC 2-bit error was detected in request address from PE1 to <br> Cluster RAM in cluster 0. |  |

### 38.3.11.42 CR_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSDSSTCLR register.

Table 38.242 CR_BUSDSERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DSEDF06 | Indicates that a data ECC 1-bit error was detected in write data to Cluster RAM in cluster 1 <br> from outside. |
| 5 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | DSEDF02 | Indicates that a data ECC 1-bit error was detected in write data to Cluster RAM in cluster 0 <br> from outside. |
| 1 | DSEDF01 | Indicates that a data ECC 1-bit error was detected in write data from PE1 to Cluster RAM in <br> cluster 0. |
| 0 | DSEDF00 | Indicates that a data ECC 1-bit error was detected in write data from PE0 to Cluster RAM in <br> cluster 0. |

### 38.3.11.43 CR_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to Cluster RAMs. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected errors are all set.

This register can be cleared by CR_BUSDDSTCLR register.

Table 38.243 CR_BUSDDERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DDEDF06 | Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 1 <br> from outside. |
| 5 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | DDEDF02 | Indicates that a data ECC 2-bit error was detected in write data to Cluster RAM in cluster 0 <br> from outside. |
| 1 | DDEDF01 | Indicates that a data ECC 2-bit error was detected in write data from PE1 to Cluster RAM in <br> cluster 0. |
| 0 | DDEDF00 | Indicates that a data ECC 2-bit error was detected in write data from PE0 to Cluster RAM in <br> cluster 0. |

### 38.3.11.44 CF_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address ECC 2-bit error and address ECC 1bit error are detected.

This register is protected by the KCPROT register. When KCPROT.KCE $=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.244 CF_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error is detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error is detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1,0 | Reserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.45 CF_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in CF_BUSASERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.245 CF_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | ASSTCLR24 | Writing 1 to this bit clears ASEDF24 in CF_BUSASERSTR. |
| 23 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ASSTCLR01 | Writing 1 to this bit clears ASEDF01 in CF_BUSASERSTR. |
| 0 | ASSTCLR00 | Writing 1 to this bit clears ASEDF00 in CF_BUSASERSTR. |

### 38.3.11.46 CF_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in CF_BUSADERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.246 CF_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | ADSTCLR24 | Writing 1 to this bit clears ADEDF24 in CF_BUSADERSTR. |
| $\mathbf{2 3}$ to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ADSTCLR01 | Writing 1 to this bit clears ADEDF01 in CF_BUSADERSTR. |
| 0 | ADSTCLR00 | Writing 1 to this bit clears ADEDF00 in CF_BUSADERSTR. |

### 38.3.11.47 CF_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to Code Flash. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the flags of the detected error are all set.

This register can be cleared by CF_BUSASSTCLR register.

Table 38.247 CF_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | ASEDF24 | Indicates that an address ECC 1-bit error was detected in request address to SAXI2FAXI <br> bridge. |
| 23 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ASEDF01 | Indicates that an address ECC 1-bit error was detected in request address to Code Flash bank <br> B in cluster 0. |
| 0 | ASEDF00 | Indicates that an address ECC 1-bit error was detected in request address to Code Flash bank <br> A in cluster 0. |

### 38.3.11.48 CF_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to Code Flash. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by CF_BUSADSTCLR register.

Table 38.248 CF_BUSADERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | ADEDF24 | Indicates that an address ECC 2-bit error was detected in request address to SAXI2FAXI <br> bridge. |
| 23 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ADEDF01 | Indicates that an address ECC 2-bit error was detected in request address to Code Flash bank <br> B in cluster 0. |
| 0 | ADEDF00 | Indicates that an address ECC 2-bit error was detected in request address to Code Flash bank <br> A in cluster 0. |

### 38.3.11.49 PH_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT. $\mathrm{KCE}=1$.

Table 38.249 PH_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error was detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error was detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error was detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 | DSEDIE | 0: Datrols ECror reports when data ECC 1-bit error report disabled |
|  |  | 1: Data ECC 1-bit error report enabled |
|  |  |  |

### 38.3.11.50 PH_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSASERSTR. This is write only register and read value is always " 0 ".

Table 38.250 PH_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ASSTCLR25 | Writing 1 to this bit clears ASEDF25 in PH_BUSASERSTR. |
| 24 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | ASSTCLR20 | Writing 1 to this bit clears ASEDF20 in PH_BUSASERSTR. |
| 19 | ASSTCLR19 | Writing 1 to this bit clears ASEDF19 in PH_BUSASERSTR. |
| 18 | ASSTCLR18 | Writing 1 to this bit clears ASEDF18 in PH_BUSASERSTR. |
| 17 | ASSTCLR16 | Writing 1 to this bit clears ASEDF17 in PH_BUSASERSTR. |
| 16 | - | Writing 1 to this bit clears ASEDF16 in PH_BUSASERSTR. |
| 15 to 0 |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.51 PH_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSADERSTR. This is write only register and read value is always " 0 ".

Table 38.251 PH_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ADSTCLR25 | Writing 1 to this bit clears ADEDF25 in PH_BUSADERSTR. |
| 24 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | ADSTCLR20 | Writing 1 to this bit clears ADEDF20 in PH_BUSADERSTR. |
| 19 | ADSTCLR19 | Writing 1 to this bit clears ADEDF19 in PH_BUSADERSTR. |
| 18 | ADSTCLR18 | Writing 1 to this bit clears ADEDF18 in PH_BUSADERSTR. |
| 17 | ADSTCLR17 | Writing 1 to this bit clears ADEDF17 in PH_BUSADERSTR. |
| 16 | - | Writing 1 to this bit clears ADEDF16 in PH_BUSADERSTR. |
| 15 to 0 |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.52 PH_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSDSERSTR. This is write only register and read value is always " 0 ".

Table 38.252 PH_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | DSSTCLR26 | Writing 1 to this bit clears DSEDF26 in PH_BUSDSERSTR. |
| 25 | DSSTCLR25 | Writing 1 to this bit clears DSEDF25 in PH_BUSDSERSTR. |
| 24 to 20 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 19 | DSSTCLR19 | Writing 1 to this bit clears DSEDF19 in PH_BUSDSERSTR. |
| 18 | DSSTCLR18 | Writing 1 to this bit clears DSEDF18 in PH_BUSDSERSTR. |
| 17 | DSSTCLR17 | Writing 1 to this bit clears DSEDF17 in PH_BUSDSERSTR. |
| 16 | DSSTCLR16 | Writing 1 to this bit clears DSEDF16 in PH_BUSDSERSTR. |
| 15 to 10 | DSSTCLR08 | Reserved |
| 9 | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 8 | Writing 1 to this bit clears DSEDF09 in PH_BUSDSERSTR. |  |
| 7 to 2 | Writing 1 to this bit clears DSEDF08 in PH_BUSDSERSTR. |  |
| 1 | RSSTCLR00 | Wherved <br> 0 |

### 38.3.11.53 PH_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in PH_BUSDDERSTR. This is write only register and read value is always " 0 ".

Table 38.253 PH_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | DDSTCLR26 | Writing 1 to this bit clears DDEDF26 in PH_BUSDDERSTR. |
| 25 | DDSTCLR25 | Writing 1 to this bit clears DDEDF25 in PH_BUSDDERSTR. |
| 24 to 20 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 19 | DDSTCLR19 | Writing 1 to this bit clears DDEDF19 in PH_BUSDDERSTR. |
| 18 | DDSTCLR18 | Writing 1 to this bit clears DDEDF18 in PH_BUSDDERSTR. |
| 17 | DDSTCLR17 | Writing 1 to this bit clears DDEDF17 in PH_BUSDDERSTR. |
| 16 | DDSTCLR09 | Writing 1 to this bit clears DDEDF16 in PH_BUSDDERSTR. |
| 15 to 10 | DDSTCLR08 | Writing 1 to this bit clears DDEDF09 in PH_BUSDDERSTR. |
| 9 | Writing 1 to this bit clears DDEDF08 in PH_BUSDDERSTR. |  |
| 8 | DDSTCLR01 | Weserved |
| 7 to 2 | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 1 | DSTCLR00 | Writing 1 to this bit clears DDEDF01 in PH_BUSDDERSTR. |
| 0 |  |  |

### 38.3.11.54 PH_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by $\mathrm{PH}_{-}$BUSASSTCLR register.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | $\begin{array}{\|c\|} \hline \text { ASEDF } \\ 25 \end{array}$ | - | - | - | - | $\begin{array}{\|c} \text { ASEDF } \\ 20 \end{array}$ | $\begin{array}{\|c} \text { ASEDF } \\ 19 \end{array}$ | $\begin{gathered} \text { ASEDF } \\ 18 \end{gathered}$ | $\begin{gathered} \text { ASEDF } \\ 17 \end{gathered}$ | $\begin{array}{\|c} \text { ASEDF } \\ 16 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.254 PH_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | ASEDF25 | Indicates that an address ECC 1-bit error was detected in request address to VCI2APB bridge <br> for peripheral group 0. |
| 24 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | ASEDF20 | Indicates that an address ECC 1-bit error was detected in request address to AXI2PVCI <br> bridge. |
| 19 | ASEDF19 | Indicates that an address ECC 1-bit error was detected in request address to MEV. |
| 18 | ASEDF17 | Indicates that an address ECC 1-bit error was detected in request address to IPIR. |
| 17 | ASEDF16 | Indicates that an address ECC 1-bit error was detected in request address to BarrierSync. |
| 16 | Indicates that an address ECC 1-bit error was detected in request address to TPTM. |  |
| 15 to 0 | Reserved |  |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 38.3.11.55 PH_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PH_BUSADSTCLR register.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 17 | - | Indicates that a data ECC 2-bit error was detected in write data to BarrierSync. |
| 16 | DDEDF09 | Reserved <br> 15 to 10 |
| 9 | DDEDF08 | Indicates that a data ECC 2-bit error was detected in read data to VCI2AXI bridge in cluster 0. |
| 8 | DDEDF01 | Indicates that a data ECC 2-bit error was detected in write data to VCI2AXI bridge in cluster 0. |
| 7 to 2 | Reserved <br> 1 | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.58 DM_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when data ECC 2-bit error and data ECC 1-bit error are detected.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.258 DM_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error was detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  | 1: Data ECC 2-bit error report enabled |  |
| 0 | DSEDIE | Controls error reports when data ECC 1-bit error was detected. |
|  |  | 0: Data ECC 1-bit error report disabled |
|  |  | 1: Data ECC 1-bit error report enabled |

### 38.3.11.59 DM_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in DM_BUSDSERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.259 DM_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | DSSTCLR08 | Writing 1 to this bit clears DSEDF08 in DM_BUSDSERSTR. |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | DSSTCLR03 | Writing 1 to this bit clears DSEDF03 in DM_BUSDSERSTR. |
| 2 | DSSTCLR02 | Writing 1 to this bit clears DSEDF02 in DM_BUSDSERSTR. |
| 1 | DSSTCLR01 | Writing 1 to this bit clears DSEDF01 in DM_BUSDSERSTR. |
| 0 | DSSTCLR00 | Writing 1 to this bit clears DSEDF00 in DM_BUSDSERSTR. |

### 38.3.11.60 DM_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in DM_BUSDDERSTR. This is write only register and read value is always "0".

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.260 DM_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | DDSTCLR08 | Writing 1 to this bit clears DDEDF08 in DM_BUSDDERSTR. |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | DDSTCLR03 | Writing 1 to this bit clears DDEDF03 in DM_BUSDDERSTR. |
| 2 | DDSTCLR02 | Writing 1 to this bit clears DDEDF02 in DM_BUSDDERSTR. |
| 1 | DDSTCLR01 | Writing 1 to this bit clears DDEDF01 in DM_BUSDDERSTR. |
| 0 | DDSTCLR00 | Writing 1 to this bit clears DDEDF00 in DM_BUSDDERSTR. |

### 38.3.11.61 DM_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to DMA/DTS. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by DM_BUSDSSTCLR register.

Table 38.261 DM_BUSDSERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | DSEDF08 | Indicates that a data ECC 1-bit error was detected in read data to DTS. |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | DSEDF03 | Indicates that a data ECC 1-bit error was detected in internal buffer of sDMAC 1. |
| 2 | DSEDF01 | Indicates that a data ECC 1-bit error was detected in read data to sDMAC 1. |
| 1 | DSEDF00 | Indicates that a data ECC 1-bit error was detected in internal buffer of sDMAC 0. |
| 0 |  | Indicates that a data ECC 1-bit error was detected in read data to sDMAC 0. |

### 38.3.11.62 DM_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to DMA/DTS. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by DM_BUSDDSTCLR register.

Table 38.262 DM_BUSDDERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br>  <br>  <br> 8 |
| 7 to 4 | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 38.3.11.63 EM_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by the KCPROT register. When $\mathrm{KCPROT} . \mathrm{KCE}=0$, it cannot be written. It can be written only when KCPROT.KCE $=1$.

Table 38.263 EM_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error was detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error was detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error was detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 | DSEDIE | Controls error reports when data ECC 1-bit error was detected. |
|  |  | 0: Data ECC 1-bit error report disabled |
|  |  | 1: Data ECC 1-bit error report enabled |

### 38.3.11.64 EM_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in EM_BUSASERSTR. This is write only register and read value is always " 0 ".

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \hline \text { ASSTC } \\ \text { LR03 } \end{array}$ | $\begin{gathered} \text { ASSTC } \\ \text { LR02 } \end{gathered}$ | $\begin{array}{\|c} \hline \text { ASSTC } \\ \text { LR01 } \end{array}$ | $\begin{gathered} \text { ASSTC } \\ \text { LR00 } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | W | W | W | W |

Table 38.264 EM_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | ASSTCLR17 | Writing 1 to this bit clears ASEDF17 in EM_BUSASERSTR. |
| 16 | ASSTCLR16 | Writing 1 to this bit clears ASEDF16 in EM_BUSASERSTR. |
| 15 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ASSTCLR03 | Writing 1 to this bit clears ASEDF03 in EM_BUSASERSTR. |
| 2 | ASSTCLR02 | Writing 1 to this bit clears ASEDF02 in EM_BUSASERSTR. |
| 1 | ASSTCLR01 | Writing 1 to this bit clears ASEDF01 in EM_BUSASERSTR. |
| 0 | ASSTCLR00 | Writing 1 to this bit clears ASEDF00 in EM_BUSASERSTR. |

### 38.3.11.65 EM_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in EM_BUSADERSTR. This is write only register and read value is always " 0 ".

Table 38.265 EM_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| $\mathbf{1 7}$ | ADSTCLR17 | Writing 1 to this bit clears ADEDF17 in EM_BUSADERSTR. |
| 16 | ADSTCLR16 | Writing 1 to this bit clears ADEDF16 in EM_BUSADERSTR. |
| 15 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADSTCLR03 | Writing 1 to this bit clears ADEDF03 in EM_BUSADERSTR. |
| 2 | ADSTCLR02 | Writing 1 to this bit clears ADEDF02 in EM_BUSADERSTR. |
| 1 | ADSTCLR01 | Writing 1 to this bit clears ADEDF01 in EM_BUSADERSTR. |
| 0 | ADSTCLR00 | Writing 1 to this bit clears ADEDF00 in EM_BUSADERSTR. |

### 38.3.11.66 EM_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in EM_BUSDSERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.266 EM_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | DSSTCLR17 | Writing 1 to this bit clears DSEDF17 in EM_BUSDSERSTR. |
| 16 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.67 EM_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in EM_BUSDDERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.267 EM_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | DDSTCLR17 | Writing 1 to this bit clears DDEDF17 in EM_BUSDDERSTR. |
| 16 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.68 EM_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSASSTCLR register.

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { ASEDF } \\ 17 \end{array}$ | $\begin{gathered} \text { ASEDF } \\ 16 \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { ASEDF } \\ 03 \end{array}$ | $\begin{array}{\|c} \text { ASEDF } \\ 02 \end{array}$ | $\begin{array}{\|c} \text { ASEDF } \\ 01 \end{array}$ | $\begin{array}{\|c} \text { ASEDF } \\ 00 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.268 EM_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | ASEDF17 | Indicates that an address ECC 1-bit error was detected in request address to FAXI2SAXI <br> bridge. |
| 16 | ASEDF16 | Indicates that an address ECC 1-bit error was detected in request address to the remap <br> module from a SAXI master. |
| 15 to 4 | ASEDF03 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ASEDF02 | Indicates that an address ECC 1-bit error was detected in request address to the remap <br> module for data read from PE1. |
| 1 | ASEDF01 | Indicates that an address ECC 1-bit error was detected in request address to the remap <br> module for instruction fetch from PE1. |
| 0 | ASEDF00 | Indicates that an address ECC 1-bit error was detected in request address to the remap <br> module for data read from PE0. |

### 38.3.11.69 EM_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSADSTCLR register.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.269 EM_BUSADERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | ADEDF17 | Indicates that an address ECC 2-bit error was detected in request address to FAXI2SAXI bridge. |
| 16 | ADEDF16 | Indicates that an address ECC 2-bit error was detected in request address to the remap module <br> from a SAXI master. |
| 15 to 4 | ADEDF03 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | Indicates that an address ECC 2-bit error was detected in request address to the remap module <br> for data read from PE1. |  |
| 2 | ADEDF01 | Indicates that an address ECC 2-bit error was detected in request address to remap module for <br> instruction fetch from PE1. |
| 1 | Indicates that an address ECC 2-bit error was detected in request address to remap module for <br> data read from PE0. |  |
| 0 | Indicates that an address ECC 2-bit error was detected in request address to remap module for <br> instruction fetch from PE0. |  |

### 38.3.11.70 EM_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSDSSTCLR register.

Table 38.270 EM_BUSDSERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | DSEDF17 | Indicates that a data ECC 1-bit error was detected in read data to FAXI2SAXI bridge. |
| 16 to 0 | - | Reserved <br>  |

### 38.3.11.71 EM_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to emulation. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by EM_BUSDDSTCLR register.

Table 38.271 EM_BUSDDERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br>  <br> 17 |
| 16 to 0 | When read, the value after reset is returned. When writing, write the value after reset. |  |

### 38.3.11.72 APECECCCTL — ECC Control Register

This register controls the ECC error detection/correction and 1-bit error correction.
This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.272 APECECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | AECCDIS | Address ECC disable bit |
|  |  | Sets address ECC error detection to enable/disable. |
|  |  | 0: Address ECC error detection is enabled |
|  |  | 1: Address ECC error detectionis disabled |
| 1 | SECDIS | ECC 1-bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1 -bit error correction to enable/disable. |
|  |  | 0 : Correct when 1-bit error is detected |
|  |  | 1: Do not correct when 1-bit error is detected |
| 0 | ECCDIS | ECC disable bit |
|  |  | Sets ECC error detection/correction to enable/disable. |
|  |  | 0: ECC error detection/correction is enabled |
|  |  | 1: ECC error detection/correction is disabled |

### 38.3.11.73 APECERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error, address/data ECC 1-bit error are detected.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.273 APECERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | ADEDIE | Controls error reports when address ECC 2-bit error is detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 4 | ASEDIE | Controls error reports when address ECC 1-bit error is detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 3,2 | Deserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 |  | Controls error reports when data ECC 2-bit error is detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 |  | Controls error reports when data ECC 1-bit error is detected. |
|  |  | 1: Data ECC 1-bit error report disabled |
|  |  |  |

### 38.3.11.74 APECSTCLR — Error Status Clear Register

This register is used to clear error flag in APEC1STERSTR. This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.274 APECSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STCLR0 | Writing 1 to this bit clears AECDEDF0/AECSEDF0/DEDF0/SEDF0 in APEC1STERSTR. |

### 38.3.11.75 APEC1STERSTR — Error Status Register

This register indicates whether an error has occurred. When all error flags are " 0 " and a new error occurs, error status flag is set.

If address ECC 1-bit error or data ECC 1-bit error is set and the new error is address ECC 2-bit error or data ECC 2-bit error, the new error is set (does not clear the previous error flag).

If multiple causes of errors are detected, the flags of the detected errors are all set (e.g. if data ECC 2-bit error and address ECC 2-bit error are detected at the same access, DEDF0 and AECDEDF0 are both set.).

This register can be cleared by STCLR0 in APECSTCLR register.

Table 38.275 APEC1STERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | AECDEDF0 | Indicates that an address ECC 2-bit error was detected. <br> This is set when address ECC 2-bit error is detected when AECDEDF0 and DEDF0 are both <br> " 0 ". |
| 6 | AECSEDF0 | Indicates that an address ECC 1-bit error was detected. <br>  <br> 5 to 2 |
|  | This is set when address ECC 1-bit error is detected when all error flags are " 0 ". |  |
| 1 | DEDF0 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | Indicates that a data ECC 2-bit error was detected. |  |
|  |  | This is set when data ECC 2-bit error is detected when AECDEDF0 and DEDF0 are both " 0 ". |

### 38.3.11.76 APECTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After ECC test mode (ECCTST = 1) setting, arbitrary data value can be input to ECC decoder.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

When accessing any registers in the same peripheral group, ECCTST is cleared to 0 .

Table 38.276 APECTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the address ECC decoder. |
|  |  | 0 :Normal mode |
|  |  | 1:Test mode |
|  |  | The values of APECTSTDIN0 and APECTSTEIN registers are provided to data and ECC field of the ECC decoder respectively when accessing any registers in the same peripheral group in test mode. |
|  |  | This bit is always read as 0 . |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.77 APECTSTDINO - Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of APECTSTDIN0 and APECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.277 APECTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the address ECC decoder. The data is provided to data field of the <br> ECC decoder when accessing any registers in the same peripheral group when ECCTST $=1$. |

### 38.3.11.78 APECTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of APECTSTDIN0 and APECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.278 APECTSTEIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for the address ECC decoder. The data is provided to ECC field of the |
|  |  | ECC decoder when accessing any registers in the same peripheral group when ECCTST $=1$. |

### 38.3.11.79 APECKCPROT — Key Code Protection Register

This register is used for protection against writing to ECC control registers and Error notification control registers due to program malfunction and the like.

Table 38.279 APECKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit*2 |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |
|  |  |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.
Note 2. Unlocking this protection is one of necessary conditions to enable writing the protected registers. It is also necessary to unlock security protection driven by the ICUM when ICUM function is active. For details, see the RH850/E2x-FCC1 ICUMD User's Manual: Hardware, Section 9.
The security protection covers the following modules:

```
ECCCNT_A_V2An (n = 1, 6,9)
ECCCNT_D_V2AnW (n = 1, 6, 9)
ECCCNT_D_V2AnR (n = 1, 6, 9)
PBnECC (n = 0, 1, 6, 9)
BECCCAP_V2An (n = 1, 6,9)
```

### 38.3.11.80 PHC_BUSERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error and address/data ECC 1-bit error are detected.

This register is protected by the PBnECC.APECKCPROT register. When PBnECC.APECKCPROT.KCE $=0$, it cannot be written. It can be written only when PBnECC.APECKCPROT. $\mathrm{KCE}=1$.

Note: For BECCCAP_V2An of peripheral group2, PB2HECC.APECKCPROT controls access protection.

Table 38.280 PHC_BUSERRINT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ADEDIE | Controls error reports when address ECC 2-bit error is detected. |
|  |  | 0: Address ECC 2-bit error report disabled |
|  | 1: Address ECC 2-bit error report enabled |  |
| 2 | ASEDIE | Controls error reports when address ECC 1-bit error is detected. |
|  |  | 0: Address ECC 1-bit error report disabled |
|  |  | 1: Address ECC 1-bit error report enabled |
| 1 | DDEDIE | Controls error reports when data ECC 2-bit error is detected. |
|  |  | 0: Data ECC 2-bit error report disabled |
|  |  | 1: Data ECC 2-bit error report enabled |
| 0 | DSEDIE | Controls error reports when data ECC 1-bit error is detected. |
|  |  | 0: Data ECC 1-bit error report disabled |
|  |  |  |
|  |  |  |

### 38.3.11.81 PHC_BUSASSTCLR — Address 1-bit Error Status Clear Register

This register is used to clear error flags in PHC_BUSASERSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.281 PHC_BUSASSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ASSTCLR00 | Writing 1 to this bit clears ASEDF00 in PHC_BUSASERSTR. |

### 38.3.11.82 PHC_BUSADSTCLR — Address 2-bit Error Status Clear Register

This register is used to clear error flags in PHC_BUSADERSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.282 PHC_BUSADSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADSTCLR00 | Writing 1 to this bit clears ADEDF00 in PHC_BUSADERSTR. |

### 38.3.11.83 PHC_BUSDSSTCLR — Data 1-bit Error Status Clear Register

This register is used to clear error flags in PHC_BUSDSERSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.283 PHC_BUSDSSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | DSSTCLR01 | Writing 1 to this bit clears DSEDF01 in PHC_BUSDSERSTR. |
|  | DSSTCLR00 | Writing 1 to this bit clears DSEDF00 in PHC_BUSDSERSTR. |

### 38.3.11.84 PHC_BUSDDSTCLR — Data 2-bit Error Status Clear Register

This register is used to clear error flags in PHC_BUSDDERSTR. This is write only register and read value is always "0".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.284 PHC_BUSDDSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DDSTCLR01 | Writing 1 to this bit clears DDEDF01 in PHC_BUSDDERSTR. |
| 0 | DDSTCLR00 | Writing 1 to this bit clears DDEDF00 in PHC_BUSDDERSTR. |

### 38.3.11.85 PHC_BUSASERSTR — Address 1-bit Error Status Register

This register indicates that an address ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PHC_BUSASSTCLR register.

Table 38.285 PHC_BUSASERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br>  <br> 0 |
| ASEDF00 | When read, the value after reset is returned. When writing, write the value after reset. <br> for peripheral group n. |  |

### 38.3.11.86 PHC_BUSADERSTR — Address 2-bit Error Status Register

This register indicates that an address ECC 2-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PHC_BUSADSTCLR register.

Table 38.286 PHC_BUSADERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br>  <br> 0 |
| ADEDF00 | When read, the value after reset is returned. When writing, write the value after reset. <br> for peripheral group n. |  |

### 38.3.11.87 PHC_BUSDSERSTR — Data 1-bit Error Status Register

This register indicates that a data ECC 1-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PHC_BUSDSSTCLR register.

Table 38.287 PHC_BUSDSERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 1 | DSEDF01 | Indicates that a data ECC 1-bit error was detected in read data to VCI2APB bridge for <br> peripheral group n. |
| 0 | Indicates that a data ECC 1-bit error was detected in write data to VCI2APB bridge for <br> peripheral group $n$. |  |

### 38.3.11.88 PHC_BUSDDERSTR — Data 2-bit Error Status Register

This register indicates that a data ECC 2-bit error has occurred in a path related to peripherals. When a new error occurs, status flag corresponding to the error is set if the flag has been cleared. If multiple errors are detected at the same time, the errors that are detected are all set.

This register can be cleared by PHC_BUSDDSTCLR register.

Table 38.288 PHC_BUSDDERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 1 | DDEDF01 | Indicates that a data ECC 2-bit error was detected in read data to VCI2APB bridge for <br> peripheral group n. |
| 0 | Indicates that a data ECC 2-bit error was detected in write data to VCI2APB bridge for <br> peripheral group n. |  |

### 38.3.11.89 HBECECCCTL - ECC Control Register

This register controls the ECC error detection/correction and 1-bit error correction.
This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.289 HBECECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | AECCDIS | Address ECC disable bit (for H-Bus slave) |
|  |  | Sets address ECC error detection to enable/disable. |
|  |  | 0 : Address ECC error detection is enabled |
|  |  | 1: Address ECC error detection is disabled |
|  |  | For H-Bus master, when writing, write the value after reset because this bit is reserved. |
| 1 | SECDIS | ECC 1 bit error correction enable bit |
|  |  | When using ECC error detection/correction (ECCDIS $=0$ ), this bit sets 1-bit error correction to enable/disable. |
|  |  | 0: Correct when 1-bit error is detected |
|  |  | 1: Do not correct when 1-bit error is detected |
| 0 | ECCDIS | ECC disable bit |
|  |  | Sets ECC error detection/correction to enable/disable. |
|  |  | 0 : ECC error detection/correction is enabled |
|  |  | 1: ECC error detection/correction is disabled |

### 38.3.11.90 HBECERRINT — Error Notification Control Register

This register controls whether error information is reported to ECM, when address/data ECC 2-bit error, address/data ECC 1-bit error are detected.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $K C E=1$.

Table 38.290 HBECERRINT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | ADEDIE | Controls error reports when address ECC 2-bit error is detected (for H-Bus slave). <br> 0 : Address ECC 2-bit error report disabled <br> 1: Address ECC 2-bit error report enabled <br> For H-Bus master, when writing, write the value after reset because this bit is reserved. |
| 4 | ASEDIE | Controls error reports when address ECC 1-bit error is detected (for H-Bus slave). <br> 0 : Address ECC 1-bit error report disabled <br> 1: Address ECC 1-bit error report enabled <br> For H-Bus master, when writing, write the value after reset because this bit is reserved. |
| 3, 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDIE | Controls error reports when data ECC 2-bit error is detected. <br> 0: Data ECC 2-bit error report disabled <br> 1: Data ECC 2-bit error report enabled |
| 0 | SEDIE | Controls error reports when data ECC 1-bit error is detected. <br> 0: Data ECC 1-bit error report disabled <br> 1: Data ECC 1-bit error report enabled |

### 38.3.11.91 HBECSTCLR — Error Status Clear Register

This register is used to clear error flag in HBEC1STERSTR.This is write only register and read value is always " 0 ".

Value after reset: $00000000_{\mathrm{H}}$

Table 38.291 HBECSTCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STCLR0 | Writing 1 to this bit clears AECDEDF0/AECSEDF0/DEDF0/SEDF0 in HBEC1STERSTR. |

### 38.3.11.92 HBEC1STERSTR — Error Status Register

This register indicates whether error has occurred. When all error flags are " 0 " and a new error occurs, error status flag is set.

If address ECC 1-bit error or data ECC 1-bit error are set and the new error is address ECC 2-bit error or data ECC 2-bit error, the new error is set (does not clear the previous error flag).

If multiple causes of errors are detected, the errors that are detected are all set (e.g. if data ECC 2-bit error and address ECC 2-bit error are detected at the same access, DEDF0 and AECDEDF0 are both set.).
This register can be cleared by STCLR0 in HBECSTCLR register.

Table 38.292 HBEC1STERSTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | AECDEDF0 | Indicates address ECC 2-bit error was detected (for H-Bus slave). |
|  |  | This is set when address ECC 2-bit error is detected when AECDEDF0 and DEDF0 are all " 0 ". |
|  |  | For H -Bus master, when read, the value after reset is returned because this bit is reserved. |
| 6 | AECSEDF0 | Indicates address ECC 1-bit error was detected (for H-Bus slave). |
|  |  | This is set when address ECC 1-bit error is detected when all error flags are "0". |
|  |  | For H-Bus master, when read, the value after reset is returned because this bit is reserved. |
| 5 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DEDF0 | Indicates data ECC 2-bit error was detected. |
|  |  | This is set when data ECC 2 -bit error is detected when AECDEDF0 and DEDF0 are all " 0 ". |
| 0 | SEDF0 | Indicates data ECC 1-bit error was detected. |
|  |  | This is set when data ECC 1-bit error is detected when all error flags are " 0 ". |

### 38.3.11.93 HBECTSTCTL — ECC Test Control Register

ECC test (self-diagnostics) register. After ECC test mode (ECCTST = 1) setting, arbitrary data value can be input to ECC decoder of H-Bus slave. For H-Bus master, keep the value after reset because this register is reserved.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

When accessing any registers in the same peripheral group, ECCTST is cleared to 0 .

Table 38.293 HBECTSTCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ECCTST | Selects input data for the address ECC decoder. |
|  |  | 0 :Normal mode |
|  |  | 1:Test mode |
|  |  | The values of HBECTSTDIN0 and HBECTSTEIN registers are provided to data and ECC field of the ECC decoder respectively when accessing any registers in the same peripheral group in test mode. |
|  |  | This bit is always read as 0 . |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 38.3.11.94 HBECTSTDINO - Test Data Input Register

This register is used to inject errors into data field of ECC decoder for self-diagnosis. The values of HBECTSTDIN0 and HBECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.294 HBECTSTDINO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATA[31:0] | Specify the test data for the address ECC decoder. The data is provided to data field of the |
|  |  | ECC decoder of H-Bus slave when accessing any registers in the same peripheral group |
|  |  | when ECCTST $=1$. |

### 38.3.11.95 HBECTSTEIN — Test ECC Input Register

This register is used to inject errors into ECC field of ECC decoder for self-diagnosis. The values of HBECTSTDIN0 and HBECTSTEIN registers are input to data and ECC field of the target ECC decoder in test mode.

This register is protected by the key-code protection register. When $\mathrm{KCE}=0$, it cannot be written. It can be written only when $\mathrm{KCE}=1$.

Table 38.295 HBECECCCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECC[6:0] | Specify the test data for the address ECC decoder. The data is provided to ECC field of the <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  FCC decoder H-Bus master, keep the value after reset because this register is reserved. |

### 38.3.11.96 HBECKCPROT — Key Code Protection Register

This register is used for protection against writing to the HBnECC control registers due to program malfunction and the like.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 38.296 HBECKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 38.3.11.97 Test Function

ECC on the write data, the read data and the address are checked by the each ECC decoder. Each ECC decoder has a self-diagnosis function that uses ERRGEN module.

For details, refer to Section 38.3.12.8, Usage of ERRGEN.

### 38.3.12 Error Injection for ECC Function

### 38.3.12.1 Overview

ERRGEN is a utility module for self-diagnosis tests of ECC decoders. ERRGEN can be used to generate a data pairs and ECC including errors in any bit. ERRGEN has the following features.

Table 38.297 Error Injection for ECC Function

| Item | Description |
| :--- | :--- |
| ECC calculation | Provides the correct 7-bit and 8-bit ECC value of arbitrary data. |
| Error injection | Injects various errors into read data include ECC field. <br>  <br>  <br>  <br> - Error injection is only into the 32-bit data and 7-bit ECC fields. <br> Register setA set of registers in odd and even words respectively used to inject errors to 64-bit bus consisting of 2 sets of $32-$ <br> bit data and 7-bit ECC are implemented, and also a register for users to calculate 8-bit ECC field. |

### 38.3.12.2 List of Registers

Table 38.298 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ERRGEN <br> (Peripheral Group0) | Error Data Register | EGDATORGn ( $\mathrm{n}=0-1$ ) | FFC5 $8400_{H}+\mathrm{n} \times 04_{\mathrm{H}}$ | 8, 16, 32 |  |
|  | 7-bit ECC Calculation Register | EGECCCALn ( $\mathrm{n}=0-1$ ) | FFC5 8408 ${ }_{\text {H }}+\mathrm{n} \times \mathbf{0 4}_{\mathrm{H}}$ | 8, 16, 32 |  |
|  | Error Injection Register | EGDATINVn ( $\mathrm{n}=0-1$ ) | FFC5 8410 ${ }_{\text {H }}+\mathrm{n} \times 04_{\mathrm{H}}$ | 8, 16, 32 |  |
|  | Error Injection Register | EGECCINVn ( $\mathrm{n}=0-1$ ) | FFC5 8418 ${ }_{\text {H }}+\mathrm{n} \times 04_{\mathrm{H}}$ | 8, 16, 32 |  |
|  | 8-bit ECC Calculation Register | EGECC8CAL | FFC5 8420 ${ }_{\text {H }}$ | 8, 16, 32 |  |

### 38.3.12.3 EGDATORGn — Error Data Register

This register is used to set original data before the error injection and to obtain the modified data containing injected errors according to the settings of EGDATINVn and EGECCINVn. The read data is the value of this register XOR-ed with EGDATINVn and the read value of ECC is EGECCCALn XOR-ed with EGECCINVn when reading this register.

Table 38.299 EGDATORGn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATORG[31:0] | Write data before injecting errors and read data after errors are injected |

### 38.3.12.4 EGECCCALn - 7-bit ECC Calculation Register

This register is used to obtain a 7-bit ECC value for the arbitrary value written to EGDATORGn. This ECC value is then injected into an ECC decoder on the address channel. ECC value calculated from EGDATORGn can be read when reading this register. The value of this register is updated simultaneously when EGDATORGn is updated.

Table 38.300 EGECCCALn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 to 0 | ECCCAL[6:0] | Read ECC values calculated from EGDATORGn |

### 38.3.12.5 EGDATINVn — Error Injection Register

This register is used to inject errors into the read data signal when reading EGDATORGn. The read data signal is driven by EGDATORGn XOR-ed with this register.

Table 38.301 EGDATINVn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DATINV[31:0] | Bit pattern to invert EGDATORGn value when reading EGDATORGn |

### 38.3.12.6 EGECCINVn — Error Injection Register

This register is used to inject errors into the ECC signal when reading EGDATORGn. The ECC signal is driven by EGECCCALn XOR-ed with this register.

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 31 to 7 | - | Reserved <br>  <br> 6 to 0 |$\quad$ ECCINV[6:0] $\quad$ When read, the value after reset is returned. When writing, write the value after reset..

### 38.3.12.7 EGECC8CAL — 8-bit ECC Calculation Register

This register is used to obtain an ECC values for the arbitrary values written to EGDATORG0 and EGDATORG1. These ECC values are then injected into ECC decoders on Data RAM of sDMAC. ECC values calculated from \{EGDATORG1, EGDATORG0\} can be read when reading this register. The value of this register is updated simultaneously when either EGDATORG0 or EGDATORG1 is updated.

Value after reset: $0000{00003_{H}}^{\text {H }}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 38.303 EGECC8CAL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | ECC8CAL[7:0] | Read ECC values calculated from \{EGDATORG1,EGDATORG0\} |

### 38.3.12.8 Usage of ERRGEN

## (1) Error Injection into Read Data Channel

ERRGEN can be used to run self-diagnosis tests for ECC decoders of some bus masters on read data channel. Selfdiagnosis tests for an ECC decoder on read data channel are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Set any 1 or 2 bits among EGDATINV0, EGDATINV1, EGECCINV0 and EGECCINV1 to 1.
3. Read EGDATORG0 and EGDATORG1 at the same time in double word access from a target bus master.
4. Check ECC error notification asserted from the bus master.

## (2) Error Injection into Write Data Channel

ERRGEN can be used to run self-diagnosis tests for ECC decoders of some bus slaves on write data channel. Selfdiagnosis tests for an ECC decoder on write data channel are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Set any 1 or 2 bits among EGDATINV0, EGDATINV1, EGECCINV0 and EGECCINV1 to 1.
3. Make DTS transfer data from EGDATORG0 and EGDATORG1 to a target bus slave in 64-bit mode.
4. Check ECC error notification asserted from the bus slave.

## (3) Error Injection into Address Channel

This case uses a different feature of ERRGEN, which can calculate ECC value of data. It is necessary for users to know correct ECC value for any data to inject various errors into ECC decoders of bus slaves on address channel. Selfdiagnosis tests for an ECC decoder on address channel are made in the following way.

1. Write arbitrary data to EGDATORGn.
2. Read EGECCCALn to obtain correct ECC value of the data.
3. Invert any 1 or 2 bits among the data and the ECC value.
4. Set the modified data and ECC value to related registers*1 of the Address EDC decoder and enable its test function.
5. Read data from a target bus slave including the ECC decoder.
6. Check ECC error notification asserted from the ECC decoder.

## (4) Error Injection into Data RAM of sDMAC

ERRGEN can also calculate ECC value of 64-bit data. It is necessary for users to learn correct ECC value for any data to inject various errors into ECC decoders on Data RAM of sDMAC. Self-diagnosis tests for an ECC decoder on Data RAM of sDMAC are made in the following way.

1. Write arbitrary data to EGDATORG0 and EGDATORG1.
2. Read EGECC8CAL to obtain correct ECC value of the data.
3. Invert any 1 or 2 bits among the data and the ECC value.
4. Set the modified data and ECC value to related registers*2 of the sDMAC Data RAM ECC module and enable its test function.
5. Make sDMAC including the ECC decoder transfer data from anywhere to anywhere.
6. Check ECC error notification asserted from the ECC decoder.

Note 1: For details, refer to Section 38.3.11, Safety Mechanism on Data Transfer Path.
Note 2: For details, refer to Section 38.3.8, sDMAC/DTS RAM ECC and Address Feedback.

### 38.4 Hardware Redundancy

### 38.4.1 Overview

This product implements the $\mathrm{CPU} 0 / 1$ and DTS with the lockstep function to quickly detect failures without software interaction. The CPU0/1 and DTS execute the function using two different cores; that is, a master core and checker core, and constantly compare the execution results of the two cores. When the results do not match, an error is reported to the ECM. The comparison targets of the CPU's bus outputs are own Local RAM, Cluster RAM, Inter-processor element Bus, Local FLASH Bus, and the tag RAM and data RAM of Instruction cache.

The lockstep function of the CPU0/1 and DTS features of failure insertion, through which errors can be intentionally triggered and thus self-diagnosis of the lockstep operation is possible. For details on CPU0/1's failure insertion, refer to Section 3, CPU System.

Following table shows redundant structure implemented in this product.
Table 38.304 Redundant Blocks

| Block Name | Features | Comparator Error <br> Injection |
| :--- | :--- | :--- |
| CPU0, CPU1 (G4MHPE) | Dual lock step with 2-cycle delay and inverted input for comparator | Yes |
| DTS | Dual lock step with 2-cycle delay and inverted input for comparator | Yes |

### 38.4.2 List of Registers

Table 38.305 List of Registers

|  |  |  |  | Access |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Module Name | Register Name | Symbol | Address | Access | Protection |
| DTS_COMPC <br> (Peripheral <br> Group0)Error Injection Control Register | DTS_COMP_CNTRL | FFC5 8200 | A | 32 | Self |

### 38.4.3 DTS_COMP_CNTRL — Error Injection Control Register

This register can control the output signals on the checker side of the DTS. A DTS comparison error can be generated by setting this register.

Writing to this register should be executed with PROT[31:30] $=01_{\mathrm{B}}$.

### 38.4.4 Usage Note

Reading a register with a value that is undefined after a reset without initializing the register may lead to a CPU comparison error. Accordingly, such registers must be initialized with the desired settings. Even if the branch instruction and the subsequent instruction is issued in parallel, the CPU comparison error might be occurred by undefined register after the reset. It should be applied as specified below until the register which refer by subsequent instruction is initialized in case of branching in the preceding instruction.

- Insert the SYNCI instruction or the RIE instruction following the branch instruction. (It has to be added by assembler language. When C language is used, it could be optimized.)
- Applicable branch instructions: Bcond except BR, JARL, JMP

### 38.5 Memory Protection

### 38.5.1 Overview

This product incorporates the memory protection/guard functions to prevent erroneous access to data in the memory and control registers of the peripheral modules. Figure $\mathbf{3 8 . 1}$ shows the overall memory protection architecture. Each programmable core (bus master) has a Memory Protection Unit (MPU) that defines the software access protection. In addition, each resource (bus slave) has a guard that controls the access by any bus master, including ones that do not have an MPU such as the DMA.

Figure 38.1 Memory Protection Architecture

Note: For details of Code Flash Guard and Data Flash Guard, See RH850/E2x-FCC1 ICUMD User's Manual: Hardware.

## - MPU

All CPU cores and ICU-M protect the memory against unintended access from the CPU cores and ICU-M themselves. Requests to access addresses that are prohibited by the MPU are never issued by the CPU cores or ICUM. For details, refer to Section 3, CPU System and the RH850ICUMD User's Manual: Hardware.

## - Slave Guard

A specific memory is protected against unintended access from any bus master. Slave guard includes the following guard types. The details of each type are given in the following sections.

- PEG

Local RAM and INTC1 are protected against unintended access except from the CPU incorporating the Local RAM and INTC1 themselves. For example, access from the CPU0 to Local RAM in the CPU0 is not rejected by the PEG.

For details, refer to Section 38.5.3, PEG.

- CRG

Cluster RAM is protected against unintended access.

- Peripheral Guard

The control registers in the peripheral circuits and memory are protected against unintended access.
Peripheral Guard includes INTC2 Guard, DTS Guard, sDMAC Guard, IBG, HBG and PBG.
For details, refer to Section 38.5.5, INTC2 Guard to Section 38.5.10, HBG.

For this purpose, each bus access contains the following context information that identifies the bus master in addition to access address.

Table 38.307 Identifiers for Memory Protection

| Identifier | Function |
| :--- | :--- |
| UM | Indicates the operating mode of the CPU or ICU-M when the CPU core accesses an address. |
|  | 0: Supervisor mode |
| 1: User mode |  |
|  | When DTS or sDMAC or MAU |

Note 1. MAU is one of the debug functions to read and write the memory and registers.

### 38.5.2 SPID

### 38.5.2.1 Overview

SPID (System Protection identifier) indicates an identifier of the software task. The value of SPID for CPU cores, DTS/sDMAC and MAU*2 can be set individually in each configuration register. For the other masters, it can be set in SPID module.

SPID module supervises all SPIDs except for some bus masters which have own configuration register. These SPID registers present in SPID module are configurable by software. In addition, the SPID module also supervises SPIDs which all bus masters use through SPID mask registers.
SPID mask registers can be locked by SPID mask lock registers for security purposes. Once SPID mask lock register locks a SPID mask register, it can be cleared by Power Up Reset, System Reset1, System Reset2, and Application Reset.
Table 38.308 shows the initial values of SPID for each bus master.
Table 38.308 Initial Value and Register Location of SPID

| Initial value of SPID | Bus master | Register location |
| :--- | :--- | :--- |
| 0 | CPU0 | CPU0 |
| 1 | CPU1 | CPU1 |
| 2 to 18 | Reserved | - |
| 19 | RHSIF0 | SPID module |
| 20 | Reserved | - |
| 21 | HSSPI0 | SPID module |
| 22 | Reserved | - |
| 23 | FlexRay0 | SPID module |
| 24 | Ethernet | SPID module |
| 25 | Reserved | - |
| 26 | ICU-M | SPID module |
| 27 | sDMAC1 | sDMAC1 |
| 28 | sDMAC0 | sDMAC0 |
| 29 | DTS*1 | DTS |
| 30 | Reserved | - |
| 31 | MAU | MAU |

Note 1. Initial value of SPID for DTS is stored in DTS RAM. Therefore, it is undefined after reset and it becomes 0 after RAM initialization. Please refer to Section 10.3.6, about RAM initialization in detail.
Note 2. MAU is one of the debug functions to read and write the memory and registers.

## Features of SPID:

- SPID of each bus master is configurable by software with high flexibility according to user's system.
- It is possible to assign one SPID to one bus master or assign one SPID to several bus masters.
- It is possible to limit SPID that each bus master uses by SPIDMASK register. Moreover this configuration can be locked.
- The lock function above prevents unauthorized use of SPID for security purpose.

Table 38.309 shows a case which eight SPIDs are allocated only to CPU0 and other SPIDs are allocated to each remained bus master. Table $\mathbf{3 8 . 3 1 0}$ shows a case which some SPIDs are allocated to each CPU and some peripheral bus masters use one same SPID.

The system integrator should define the SPID assignment according to the system.
Table 38.309 Example of SPID setting (Several SPIDs are allocated only to CPU0)

| SPID value | Bus master | Lock/Unlock |
| :--- | :--- | :--- |
| 0 | CPU0 | Unlocked |
| 1 | CPU1 | Locked |
| 2 to 5 | Reserved | - |
| 6 to 12 | CPU0 | Unlocked |
| 13 to 18 | Reserved | - |
| 19 | RHSIF0 | Locked |
| 20 | Reserved | - |
| 21 | HSSPIO | Locked |
| 22 | Reserved | - |
| 23 | FlexRay0 | Locked |
| 24 | Ethernet | Locked |
| 25 | Reserved | - |
| 26 | ICU-M | Locked |
| 27 | sDMAC1 | Locked |
| 28 | sDMAC0 | Locked |
| 29 | DTS | Locked |
| 30 | Reserved | - |
| 31 | MAU | Locked |

Table 38.310 Example of SPID Setting (Several SPIDs are Allocated to Each CPU)

| SPID value | Bus master | Lock/Unlock |
| :--- | :--- | :--- |
| 0 | CPU0 | Unlocked |
| 1 | CPU1 | Unlocked |
| 2 to 5 | Reserved | - |
| 6 to 12 | CPU0 | Unlocked |
| 13 to 19 | CPU1 | Unlocked |
| 20 to 23 | Reserved | - |
| 24 | RHSIF0/HSSPI0/FlexRay0/Ethernet | Locked |
| 25 | Reserved | - |
| 26 | ICU-M | Locked |
| 27 | sDMAC1 | Locked |
| 28 | sDMAC0 | Locked |
| 29 | DTS | Locked |
| 30 | Reserved | - |
| 31 | MAU | Locked |

### 38.5.2.2 List of Registers

Table 38.311 List of SPID Registers (1/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |

### 38.5.2.3 BMnSPID — BusMaster n SPID Register

This register is used to set the SPID of each bus master.

Value after reset: $000000 \mathrm{XX}_{\mathrm{H}}$

Note 1. See Section 38.5.2.1, Overview for the initial value of each SPID.
Table 38.312 BMnSPID Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved <br>  <br> 4 to 0 |

### 38.5.2.4 BMnSPIDMSK — BusMaster $\mathbf{n}$ SPID Mask Register

This register is used to set the SPID that each bus-master can use.
This register is protected by key-code register.

Table 38.313 BMnSPIDMSK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPIDMSK[31:0] | Set inhibition of SPID value which that each bus master can use. |
|  |  | Each bit corresponds to a single SPID value. |
|  | $0:$ The bus-master cannot use this SPID. Setting of this SPID is inhibited. |  |
|  |  | 1: The bus-master can use this SPID. Setting of this SPID is not inhibited. |

### 38.5.2.5 BMnSPIDMSKLOCK — BusMaster $\mathbf{n}$ SPID Mask Lock Register

This register is used to set write-mask to each BMnSPIDMSK.

Table 38.314 BMnSPIDMSKLOCK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | LOCK | Lock of register |
|  | $0:$ Register (BMnSPIDMSK) can be re-written |  |
|  |  | 1: Any further write to the register (BMnSPIDMSK) is ignored. |
|  |  | LOCK can be cleared by Power Up Reset, System Reset1, System Reset2, and Application |
|  |  |  |
|  |  |  |

### 38.5.2.6 SPIDKCPROT — SPID Key Code Protect Register

This register is used to set the key-code lock or unlock of BMnSPIDMSK.

| Value after reset: $\quad 00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 38.315 SPIDKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |

Note 1. Write A5A5A500 H to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 38.5.2.7 Usage

SPID is used for one of the identifiers of the memory protection/guard functions. SPID setting procedure is as follows.

1. Set the SPID key code protection register (SPIDKCPROT) to enable writing to SPID registers.
2. Set the SPID mask register (BMnSPIDMSK) to define the SPID values that the bus master can set according to system FFI.
3. Set the SPID mask lock register (BMnSPIDMSKLOCK) to prohibit changing the SPID mask register setting for security purposes.
4. Set the value allowed by the SPID mask register (BMnSPIDMSK) to the SPID register (BMnSPID) for the next time the bus master is accessed.
5. Set the SPID key code protection register (SPIDKCPROT) to disable writing to SPID registers.
6. Configure the memory protection/guard settings to prevent erroneous access identified by SPID and other Identifiers.

### 38.5.3 PEG

### 38.5.3.1 Overview

Each PE has a guard that controls the access to the Local RAM and INTC1 from other bus masters. Access by bus masters can be controlled via their bus context for four regions through this PE Guard (PEG). Bus masters can only access the Local RAM area and INTC1 register area if permission is granted. PEG can prevent read*1 and write accesses against which the Local RAM area and INTC1 register area should be protected. If PEG detects illegal access, guard error is reported to ECM.

If the guard enable bit (GEN) of all PEGPROTm registers is disabled, all masters can access to both the Local RAM area and INTC1 registers.

If the guard enable bit (GEN) of either PEGPROTm registers is enabled, an access to Local RAM area and INTC1 registers is limited according to that setting.

Note 1. including fetch access.

### 38.5.3.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as an offset from the base addresses.

Table 38.316 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GUARD_PE0CLO_base> | FFC6 ${\mathrm{C} 000_{H}}$ | Peripheral Group 0 |
| <GUARD_PE1CL0_base> | FFC6 $\mathrm{C} 100_{H}$ | Peripheral Group 0 |
| <PEGCAP_M_PE0CL0_base> | FFC6 $\mathrm{C} 800_{H}$ | Peripheral Group 0 |
| <PEGCAP_S_PE0CL0_base> | FFC6 $\mathrm{C} 810_{H}$ | Peripheral Group 0 |
| <PEGCAP_M_PE1CLO_base> | FFC6 $\mathrm{C} 820_{H}$ | Peripheral Group 0 |
| <PEGCAP_S_PE1CL0_base> | FFC6 $\mathrm{C} 830_{H}$ | Peripheral Group 0 |

### 38.5.3.3 List of Registers

Table 38.317 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_PEnCLO$(n=0,1)^{\star 1}$ | Key Code Protection Register | PEGKCPROT | <GUARD_PEnCLO_base> + 00\% | 32 |  |
|  | Channel Protection Control Register | PEGPROTm ( $\mathrm{m}=0$ to 3) | <GUARD_PEnCLO_base> + 40 ${ }_{\text {H }}+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | PEGKCPROT |
|  | Channel SPID Setting Register | PEGSPIDm ( $\mathrm{m}=0$ to 3) | <GUARD_PEnCLO_base> + 44 $+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | PEGKCPROT |
|  | Channel Base Address Setting Register | PEGBADm ( $\mathrm{m}=0$ to 3 ) | <GUARD_PEnCLO_base> + 48 ${ }_{\text {H }}+\mathrm{m} \times 10_{\mathrm{H}}$ | 32 | PEGKCPROT |
|  | Channel Valid Bit Setting Register | PEGADVm (m = 0 to 3) | <GUARD_PEnCLO_base> + 4C $\mathrm{C}_{\mathrm{H}}+\mathrm{m} \times 10_{\text {H }}$ | 32 | PEGKCPROT |
| $\begin{aligned} & \text { PEGCAP_M_PEn } \\ & \text { CLO } \\ & (n=0,1) \end{aligned}$ | Guard Error Clear Register | PEGERRCLR | <PEGCAP_M_PEnCLO_base> +00 H | 8, 16, 32 |  |
|  | Guard Error Status Register | PEGERRSTAT | <PEGCAP_M_PEnCLO_base> + 04H | 8, 32 |  |
|  | Guard Error Address Register | PEGERRADDR | <PEGCAP_M_PEnCLO_base> + 08\% | 32 |  |
|  | Guard Error Access Information Register | PEGERRTYPE | <PEGCAP_M_PEnCLO_base> + 0 $\mathrm{CH}_{\mathrm{H}}$ | 16, 32 |  |
| $\begin{aligned} & \text { PEGCAP_S_PEn } \\ & \text { CLO } \\ & (\mathrm{n}=0,1) \end{aligned}$ | Guard Error Clear Register | PEGERRCLR | <PEGCAP_S_PEnCLO_base> + 00 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Guard Error Status Register | PEGERRSTAT | <PEGCAP_S_PEnCLO_base> + 04H | 8, 32 |  |
|  | Guard Error Address Register | PEGERRADDR | <PEGCAP_S_PEnCLO_base> + 08\% | 32 |  |
|  | Guard Error Access Information Register | PEGERRTYPE | <PEGCAP_S_PEnCLO_base> + $0 \mathrm{CH}_{\mathrm{H}}$ | 16, 32 |  |

[^17]
### 38.5.3.4 PEGKCPROT — Key Code Protection Register

This register is used to unlock/lock key protection of the PE guard register.

Table 38.318 PEGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as 0.*1 |
| 0 | KCE | Key Code Enable bit |
|  | $0:$ Disable write access to protected registers |  |
|  |  | 1: Enable write access to protected registers |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers.
Write A5A5A501 ${ }_{H}$ to this register to enable writing protected registers.

### 38.5.3.5 PEGPROTm — Channel Protection Control Register

Specifies the PE resource access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Table 38.319 PEGPROTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0: During write, PEGSPIDm is used as a judgment condition. |
|  |  | 1: During write, PEGSPIDm is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, PEGSPIDm is used as the judgment condition. |
|  |  | 1: During read, PEGSPIDm is not used as a judgment condition. |

### 38.5.3.6 PEGSPIDm — Channel SPID Setting Register

Specifies the PE resource access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Table 38.320 PEGSPIDm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | PEGSPIDm is a list of bits each representing one SPID value. Multiple SPID values are |
|  | enabled simultaneously by setting multiple bits. |  |
|  | For example, setting PEGSPIDm to $0101_{\mathrm{B}}$ enables access to areas SPID $=0$ and SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.5.3.7 PEGBADm — Channel Base Address Setting Register

This register is used to define area m when the setting of PEGPROTm and PEGSPIDm is valid. PEGBADm specifies base address of area $m$ and PEGADVm specifies valid bits of PEGBADm.

| Value after reset: $\mathrm{FCOO} 0000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | BAD[25:16] |  |  |  |  |  |  |  |  |  |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | BAD[15:12] |  |  |  | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.321 PEGBADm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 12 | BAD[25:12] | Base address |
| 11 to 0 | - | Reserved <br>  |

### 38.5.3.8 PEGADVm — Channel Valid Bit Setting Register

This register is used to define area $m$ when the setting of PEGPROTm and PEGSPIDm is valid. PEGBADm specifies base address of area $m$ and PEGADVm specifies valid bits of PEGBADm.

Table 38.322 PEGADVm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 12 | ADV[25:12] | Valid bits of PEGBADm |
|  |  | When an ADV bit is 1 , the address of each access will be compared with the corresponding BAD bit of PEGBADm. |
|  |  | When all ADV bits are set to $1,4 \mathrm{~KB}$ (the minimum unit) is targeted for protection based on the address specified by PEGBADm. |
|  |  | When all ADV bits are set to 0 , the target of protection is the entire Local RAM. |
| 11 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Example: When PEGBADm[25:12] is set to $1 \mathrm{C}_{0} 0_{\mathrm{H}}$ and $\operatorname{PEGADVm}[25: 12]$ is set to $3 \mathrm{FFE}_{\mathrm{H}}, \mathrm{PE}$ guard protection area m is $\mathrm{FDC} 00000_{\mathrm{H}}$ to $\mathrm{FDC} 00 \mathrm{FFF}_{\mathrm{H}}$ and FDC0 $1000_{\mathrm{H}}$ to $\mathrm{FDC} 01 \mathrm{FFF}_{\mathrm{H}}$.

Commentary: When PEGBADm[25:12] is set to $1 \mathrm{C} 00_{\mathrm{H}}$, the base address is $\mathrm{FDC} 0000_{\mathrm{H}}$ and the configurable range of bits is enclosed in [ ] as shown below.
$111111[01110000000000] 000000000000$
FDC00000
When PEGADVm[25:12] is $3 \mathrm{FFE}_{\mathrm{H}}$, bits set to 0 in that range and the 12 lower-order bits are ignored, so we have

## $111111[0111000000000 \mathrm{X}]$ XXXX XXXX XXXX

which means that the 4 KB ranges (a total of 8 KB ) from
FDC00000 to
FDC00FFF,
and
FDC01000 to
FDC01FFF
will be protected.

### 38.5.3.9 PEGERRCLR — Guard Error Clear Register

This register is used to clear the PEGERRSTAT register. The PEGERRSTAT.OVF and/or PEGERRSTAT.ERR bits are cleared immediately after writing this register. 0 is always returned when reading this register.

Table 38.323 PEGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the PEGERRSTAT.OVF bit |
| 0 | CLRE | Clears the PEGERRSTAT.ERR bit |

### 38.5.3.10 PEGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the PEGERRCLR register. See Section 38.5.3.9, PEGERRCLR - Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | OVF | ERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.324 PEGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.3.11 PEGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when PEGERRSTAT.ERR bit is not set.

Table 38.325 PEGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.3.12 PEGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when PEGERRSTAT.ERR bit is not set.

Table 38.326 PEGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.4 CRG

### 38.5.4.1 Overview

The Cluster RAM is protected by a memory guard. Access to the Cluster RAM can be controlled via the bus context for eight regions by this Cluster RAM Guard (CRG). Bus masters can only access the Cluster RAM area if permission is granted. CRG can prevent read ${ }^{* 1}$ and write accesses against which the Cluster RAM area should be protected. If CRG detects illegal access, guard error notification is signaled to ECM.

If the guard enable bit (GEN) of all CRGPROTm registers is disabled, all masters can access to the Cluster RAM area. If the guard enable bit (GEN) of either CRGPROTm registers is enabled, an access to Cluster RAM area is limited according to that setting.

Note 1. including fetch access.

### 38.5.4.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.327 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GUARD_CRAMCL0_base> | FFC6 D000 |  |
| <GUARD_CRAMCL1_base> | FFC6 D100 | Peripheral Group 0 |
| <CRGCAP_PE0CL0_base> | FFC6 D800 | Peripheral Group 0 |
| <CRGCAP_PE1CL0_base> | FFC6 D810 | Peripheral Group 0 |
| <CRGCAP_CRAMHCLO_base> | FFC6 D900 | Peripheral Group 0 |
| <CRGCAP_CRAMLCL0_base> | FFC6 D910 | Peripheral Group 0 |
| <CRGCAP_SX2MBHCL0_base> | FFC6 D920 | Peripheral Group 0 |
| <CRGCAP_SX2MBLCL0_base> | FFC6 D930 | Peripheral Group 0 |
| <CRGCAP_CRAMHCL1_base> | FFC6 D940 | Peripheral Group 0 |
| <CRGCAP_CRAMLCL1_base> | FFC6 D950 | Peripheral Group 0 |
| <CRGCAP_SX2MBHCL1_base> | FFC6 D960 | Peripheral Group 0 |
| <CRGCAP_SX2MBLCL1_base> | FFC6 D970 | Peripheral Group 0 |

### 38.5.4.3 List of Registers

Table 38.328 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_CRAM $\operatorname{CLn}(\mathrm{n}=0,1)$ | Key Code Protection Register | CRGKCPROT | <GUARD_CRAMCLn_base> + 00 ${ }_{\text {H }}$ | 32 |  |
|  | Channel Protection Control Register | CRGPROTm ( $\mathrm{m}=0-7$ ) | <GUARD_CRAMCLn_base> + $10^{+}+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | CRGKCPROT |
|  | Channel SPID Setting Register | CRGSPIDm ( $\mathrm{m}=0-7$ ) | <GUARD_CRAMCLn_base> + 14 ${ }_{\text {H }}+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | CRGKCPROT |
|  | Channel Base Address Setting Register | CRGBADm ( $\mathrm{m}=0-7$ ) | <GUARD_CRAMCLn_base> + 18 ${ }_{\mathrm{H}}+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | CRGKCPROT |
|  | Channel Valid Bit Setting Register | CRGADVm ( $\mathrm{m}=0-7$ ) | <GUARD_CRAMCLn_base> + 1 $\mathrm{C}_{\mathrm{H}}+\mathrm{m} \times 10_{\mathrm{H}}$ | 8, 16, 32 | CRGKCPROT |
| $\begin{aligned} & \text { CRGCAP_PEn } \\ & \text { CL0 }(\mathrm{n}=0,1) \end{aligned}$ | Guard Error Clear Register | CRGERRCLR | <CRGCAP_PEnCLO_base> + 00 H | 8, 16, 32 |  |
|  | Guard Error Status Register | CRGERRSTAT | <CRGCAP_PEnCLO_base> + 04 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Address Register | CRGERRADDR | <CRGCAP_PEnCLO_base> + 08\% | 32 |  |
|  | Guard Error Access Information Register | CRGERRTYPE | <CRGCAP_PEnCLO_base> + 0 $\mathrm{CH}_{\mathrm{H}}$ | 16, 32 |  |

### 38.5.4.4 CRGKCPROT - Key Code Protection Register

This register is used to unlock/lock key protection of the Cluster RAM guard register.

| Value after reset: |  |  | $0000000 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | w | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 38.329 CRGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 38.5.4.5 CRGPROTm — Channel Protection Control Register

Specifies the Cluster RAM access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

Table 38.330 CRGPROTm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0 : Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0 : During write, CRGSPIDm is used as a judgment condition. |
|  |  | 1: During write, CRGSPIDm is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, CRGSPIDm is used as the judgment condition. |
|  |  | 1: During read, CRGSPIDm is not used as a judgment condition. |

### 38.5.4.6 CRGSPIDm — Channel SPID Setting Register

Specifies the Cluster RAM access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Table 38.331 CRGSPIDm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | CRGSPIDm is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. |
|  |  | For example, setting CRGSPIDm to 0101 ${ }_{\mathrm{B}}$ enables access to areas with SPID $=0$ and SPID $=$ 2. |
|  |  | 0 : Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting <br> 1: Enables reading/writing the area with SPID $=m$ |

### 38.5.4.7 CRGBADm — Channel Base Address Setting Register

This register is used to define area $m$ when the setting of CRGPROTm and CRGSPIDm is valid. CRGBADm specifies base address of area $m$ and CRGADVm specifies valid bits of CRGBADm.

Table 38.332 CRGBADm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 18 to 8 | BAD[18:8] | Base address |
| 7 to 0 | - | Reserved <br>  |

### 38.5.4.8 CRGADVm — Channel Valid Bit Setting Register

This register is used to define area $m$ when the setting of CRGPROTm and CRGSPIDm is valid. CRGBADm specifies base address of area $m$ and CRGADVm specifies valid bits of CRGBADm

Table 38.333 CRGADVm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 19 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 to 8 | ADV[18:8] | Valid bits of CRGBADm |
|  |  | When an ADV bit is 1, the address of each access will be compared with the corresponding BAD bit of CRGBADm. |
|  |  | When all ADV bits are set to 1, 256 bytes (the minimum unit) are targeted for protection based on the address specified by CRGBADm. |
|  |  | When all ADV bits are set to 0 , the target of protection is the whole of the entire Cluster RAM. |
| 7 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Example: When CRGBADm[18:8] is set to $000_{\mathrm{H}}$ and $\mathrm{CRGADVm}[18: 8]$ is set to $7 \mathrm{EF}_{\mathrm{H}}$, Cluster RAM guard protection area $m$ is FE00 $0000_{\mathrm{H}}$ to FE00 $00 \mathrm{FF}_{\mathrm{H}}$ and FE00 $1000_{\mathrm{H}}$ to FE00 $10 \mathrm{FF}_{\mathrm{H}}$.

Commentary: When CRGBADm[18:8] is set to $000_{\mathrm{H}}$, the base address is $\mathrm{FE} 000000_{\mathrm{H}}$ and the configurable range of bits is enclosed in [ ] as shown below.
1111111000000 [000 00000000$] 00000000$
FE 000000
When CRGADVm[18:8] is $7 \mathrm{EF}_{\mathrm{H}}$, bits set to 0 in that range and the 8 lower-order bits are ignored, so we have
$1111111000000[000000 \mathrm{X} 0000]$ XXXX XXXX
which means that the 256-byte ranges (a total of 512 bytes) from
FE000000 to
FE 0000 FF ,
and
FE 001000 to
FE0010FF
will be protected.

### 38.5.4.9 CRGERRCLR — Guard Error Clear Register

This register is used to clear the CRGERRSTAT register. The CRGERRSTAT.OVF and/or CRGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.334 CRGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the CRGERRSTAT.OVF bit |
| 0 | CLRE | Clears the CRGERRSTAT.ERR bit |

### 38.5.4.10 CRGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the CRGERRCLR register. See Section 38.5.4.9,

## CRGERRCLR — Guard Error Clear Register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.335 CRGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.4.11 CRGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when CRGERRSTAT.ERR bit is not set.

Table 38.336 CRGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.4.12 CRGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when CRGERRSTAT.ERR bit is not set.

Table 38.337 CRGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to $\mathbf{1}$ | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.5 INTC2 Guard

### 38.5.5.1 Overview

INTC2 guard is one of the slave guards used to control the access to INTC2 registers. INTC2 guard can protect respectively the read and write access against INTC2 registers of each channel. If INTC2 guard detects illegal access, guard error notification is signaled to ECM.

### 38.5.5.2 List of Registers

Table 38.338 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_INTC2 <br> (Peripheral Group0) | Key Code Protection Register | INTC2GKCPROT | FFC6 4000 ${ }_{\text {H }}$ | 32 |  |
|  | Guard Error Clear Register | INTC2GERRCLR | FFC6 4004 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Status Register | INTC2GERRSTAT | FFC6 4008 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Address Register | INTC2GERRADDR | FFC6 400C ${ }_{\text {H }}$ | 32 |  |
|  | Guard Error Access Information Register | INTC2GERRTYPE | FFC6 4010 ${ }_{\text {H }}$ | 16, 32 |  |
|  | SPID Setting Register | INTC2GMPIDn $(\mathrm{n}=0-7)$ | FFC6 4040 ${ }_{\text {H }}+\mathrm{n} \times 04_{\mathrm{H}}$ | 8, 32 | INTC2GKCPROT |
|  | INTC2 Protection Control Register | INTC2GPROT_GR | FFC6 40F0 ${ }_{\text {H }}$ | 32 | INTC2GKCPROT |
|  | Channel Protection Control Register | INTC2GPROT_m $(\mathrm{m}=032-511)$ | $\begin{aligned} & \text { FFC6 } 4100_{H}+m \times \\ & 04_{\mathrm{H}} \end{aligned}$ | 32 | INTC2GKCPROT |

Table 38.339 Target Register of Protection Control Register

| Symbol | Target Register |
| :--- | :--- |
| INTC2GPROT_m $(\mathrm{m}=032$ to 511$)$ | EICn $(\mathrm{n}=32$ to 511$)$ |
| INTC2GPROT_GR | IMRn $(\mathrm{n}=1$ to 15$)$, EIBDn $(\mathrm{n}=32$ to 511$)$ |

### 38.5.5.3 INTC2GERRCLR — Guard Error Clear Register

This register is used to clear the INTC2GERRSTAT register. The INTC2GERRSTAT.OVF and/or
INTC2GERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.340 INTC2GERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the INTC2GERRSTAT.OVF bit |
| 0 | CLRE | Clears the INTC2GERRSTAT.ERR bit |

### 38.5.5.4 INTC2GERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the INTC2GERRCLR register. See Section 38.5.5.3,
INTC2GERRCLR - Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.341 INTC2GERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.5.5 INTC2GERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when INTC2GERRSTAT.ERR bit is not set.

Table 38.342 INTC2GERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.5.6 INTC2GERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when INTC2GERRSTAT.ERR bit is not set.

Table 38.343 INTC2GERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.5.7 INTC2GKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/INTC2 protection control registers due to program malfunction and the like.

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 38.344 INTC2GKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | 0: Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.

### 38.5.5.8 INTC2GMPIDn — SPID Setting Register

INTC2GMPIDn are used to specify a set of SPIDs, which are referred by INTC2GPROT_m/GR registers. Access protection can be controlled by combination of INTC2GMPIDn registers and INTC2GPROT_m/GR register. For example, masters with $\mathrm{SPID}=1$ or $\mathrm{SPID}=7$ can access to global registers when setting INTC2GPROT_GR.MPID $=00000101_{\mathrm{B}}, \mathrm{INTC} 2 \mathrm{GMPID} 0 . S P I D=01_{\mathrm{H}}$ and INTC2GMPID2.SPID $=07_{\mathrm{H}}$.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.345 INTC2GMPIDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | SPID[4:0] | SPID setting |

### 38.5.5.9 INTC2GPROT_m/GR - Channel/INTC2 Protection Control Register

Specifies the INTC2 slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access.

| Value after reset: |  |  | $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | MPID[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.346 INTC2GPROT_m/GR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | MPID[7:0] | R/W enable setting based on MPID <br> MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. <br> For example, setting MPID to 0101 ${ }_{\mathrm{B}}$ enables access to areas MPID $=0$ and MPID $=2$. <br> 0 : Reading/writing the area with MPID $=m$ depends on the RG and WG bit setting <br> 1: Enables reading/writing the area with MPID $=m$ |
| 15 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting <br> 0 : Disables the guard setting <br> 1: Enables the guard setting |
| 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master <br> 0: Depends on other enable/disable settings <br> 1: Enables R/W |
| 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode <br> 0: R/W disabled <br> 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable <br> 0 : During write, MPID is used as a judgment condition. <br> 1: During write, MPID is not used as a judgment condition. |
| 0 | RG | Read Global Enable <br> 0 : During read, MPID is used as the judgment condition. <br> 1: During read, MPID is not used as a judgment condition. |

### 38.5.6 DTS Guard

### 38.5.6.1 Overview

DTS guard is one of the slave guards used to control the access to the registers for DTS transfer. DTS guard can prevent read and write access to the DTS registers of each channel. If DTS guard detects illegal access, guard error notification is signaled to ECM .

### 38.5.6.2 List of Registers

Table 38.347 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_DTS <br> (Peripheral Group0) | Key Code Protection Register | DTSGKCPROT | FFC6 8000 ${ }_{\text {H }}$ | 32 |  |
|  | Guard Error Clear Register | DTSGERRCLR | FFC6 8004 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Status Register | DTSGERRSTAT | FFC6 8008 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Address Register | DTSGERRADDR | FFC6 800C ${ }_{\text {H }}$ | 32 |  |
|  | Guard Error Access Information Register | DTSGERRTYPE | FFC6 8010 ${ }_{\text {H }}$ | 16, 32 |  |
|  | SPID Setting Register | DTSGMPIDn $(n=0-7)$ | FFC6 8040 ${ }_{\text {H }}+\mathrm{n} \times 04_{\mathrm{H}}$ | 8, 32 | DTSGKCPROT |
|  | DTS Protection Control Register | DTSGPROT_GR | FFC6 80F0 ${ }_{\text {H }}$ | 32 | DTSGKCPROT |
|  | Channel Protection Control Register | DTSGPROT_m $(\mathrm{m}=000-127)$ | $\begin{aligned} & \text { FFC6 } 8100_{H}+\mathrm{m} \times \\ & 04_{\mathrm{H}} \end{aligned}$ | 32 | DTSGKCPROT |

Table 38.348 Target Register of Protection Control Register

| Symbol | Target Register |
| :--- | :--- |
| DTSGPROT_GR | DTSCTL1, DTSCTL2, DTSSTS, DTSER, DTSPR0, DTSPR1, DTSPR2, DTSPR3, DTSPR4, |
|  | DTSPR5, DTSPR6, DTSPR7, DTSnnnCM(nnn = 000 to 127) |
| DTSGPROT_m (m = 000 to 127) | DTSAnnn, DTDAnnn, DTTCnnn, DTTCTnnn, DTRSAnnn, DTRDAnnn, DTRTCnnn, |
|  | DTTCCnnn, DTFSLnnn, DTFSTnnn, DTFSSnnn, DTFSCnnn (nnn = 000 to 127) |

### 38.5.6.3 DTSGERRCLR — Guard Error Clear Register

This register is used to clear the DTSGERRSTAT register. The DTSGERRSTAT.OVF and/or DTSGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.349 DTSGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the DTSGERRSTAT.OVF bit |
| 0 | CLRE | Clears the DTSGERRSTAT.ERR bit |

### 38.5.6.4 DTSGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the DTSGERRCLR register. See Section 38.5.6.3,
DTSGERRCLR - Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.350 DTSGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.6.5 DTSGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when DTSGERRSTAT.ERR bit is not set.

Table 38.351 DTSGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.6.6 DTSGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when DTSGERRSTAT.ERR bit is not set.

Table 38.352 DTSGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.6.7 DTSGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/DTS protection control registers due to program malfunction and the like.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | w | w | W | W | W | W | W | W | W | W | w | W | W | R/W |

Table 38.353 DTSGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.

### 38.5.6.8 DTSGMPIDn — SPID Setting Register

DTSGMPIDn are used to specify a set of SPIDs, which are referred by DTSGPROT_m/_GR registers. Access protection can be controlled by combination of DTSGMPIDn registers and DTSGPROT_m/GR register. For example, masters with $\operatorname{SPID}=1$ or $\operatorname{SPID=7}$ can access to global registers when setting DTSGPROT_GR.MPID $=00000101_{\mathrm{B}}$, DTSGMPID0.SPID $=01_{\mathrm{H}}$ and DTSGMPID2.SPID $=07_{\mathrm{H}}$.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.354 DTSGMPIDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | SPID[4:0] | SPID setting |

### 38.5.6.9 DTSGPROT_m/GR — Channel/DTS Protection Control Register

Specifies the DTS slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access.

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | MPID[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.355 DTSGPROT_m/GR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | MPID[7:0] | R/W enable setting based on MPID <br> MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. <br> For example, setting MPID to $0101_{\mathrm{B}}$ enables access to areas with MPID $=0$ and MPID $=2$. <br> 0 : Reading/writing the area with MPID $=m$ depends on the RG and WG bit setting <br> 1: Enables reading/writing the area with MPID $=m$ |
| 15 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting <br> 0 : Disables the guard setting <br> 1: Enables the guard setting |
| 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master <br> 0: Depends on other enable/disable settings <br> 1: Enables R/W |
| 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode <br> 0: R/W disabled <br> 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable <br> 0 : During write, MPID is used as a judgment condition. <br> 1: During write, MPID is not used as a judgment condition. |
| 0 | RG | Read Global Enable <br> 0 : During read, MPID is used as the judgment condition. <br> 1: During read, MPID is not used as a judgment condition. |

### 38.5.7 sDMAC Guard

### 38.5.7.1 Overview

sDMAC guard is one of the slave guards used to control the access to the registers for sDMAC transfer. sDMAC guard can prevent read and write access to the sDMAC registers of each channel. If sDMAC guard detects illegal access, guard error notification is signaled to ECM.

### 38.5.7.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.356 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GUARD_DMAC0_base> | FFC6 $9000_{H}$ | Peripheral Group 0 |
| <GUARD_DMAC1_base> | FFC6 $9400_{H}$ | Peripheral Group 0 |

### 38.5.7.3 List of Registers

Table 38.357 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_DMACj$(j=0,1)$ | Key Code Protection Register | DMAGKCPROT | <GUARD_DMACj_base> + 00H | 32 |  |
|  | Guard Error Clear Register | DMAGERRCLR | <GUARD_DMACj_base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Guard Error Status Register | DMAGERRSTAT | <GUARD_DMACj_base> + 08\% | 8, 32 |  |
|  | Guard Error Address Register | DMAGERRADDR | <GUARD_DMACj_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | 32 |  |
|  | Guard Error Access Information Register | DMAGERRTYPE | <GUARD_DMACj_base> + 10 ${ }_{\text {H }}$ | 16, 32 |  |
|  | SPID Setting Register | $\begin{aligned} & \text { DMAGMPIDn } \\ & (\mathrm{n}=0-7) \end{aligned}$ | <GUARD_DMACj_base> + 40 ${ }_{\mathrm{H}}+\mathrm{n} \times 0^{+}{ }_{\mathrm{H}}$ | 8, 16, 32 | DMAGKCPROT |
|  | DMA Protection Control Register | DMAGPROT_GR | <GUARD_DMACj_base> + FOH | 8, 16, 32 | DMAGKCPROT |
|  | DMA Descriptor Protection Control Register | DMAGPROT_DP | <GUARD_DMACj_base> + F4 ${ }_{\text {H }}$ | 8, 16, 32 | DMAGKCPROT |
|  | Channel Protection Control Register | $\begin{aligned} & \text { DMAGPROT_m } \\ & (\mathrm{m}=000-015) \end{aligned}$ | <GUARD_DMACj_base> + 100 ${ }_{\mathrm{H}}+\mathrm{m} \times 0^{\text {H }}$ | 8, 16, 32 | DMAGKCPROT |

Table 38.358 Target Register of Protection Control Register

| Symbol | Target Register |
| :--- | :--- |
| DMAGPROT_GR | sDMAC global registers |
| DMAGPROT_DP | Descriptor RAM |
| DMAGPROT_m $(\mathrm{m}=000$ to 015$)$ | sDMAC channel registers |

### 38.5.7.4 DMAGERRCLR — Guard Error Clear Register

This register is used to clear the DMAGERRSTAT register. The DMAGERRSTAT.OVF and/or
DMAGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.359 DMAGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the DMAGERRSTAT.OVF bit |
| 0 | CLRE | Clears the DMAGERRSTAT.ERR bit |

### 38.5.7.5 DMAGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the DMAGERRCLR register. See Section 38.5.7.4,
DMAGERRCLR — Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.360 DMAGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.7.6 DMAGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when DMAGERRSTAT.ERR bit is not set.

Table 38.361 DMAGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.7.7 DMAGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when DMAGERRSTAT.ERR bit is not set.

Table 38.362 DMAGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.7.8 DMAGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/DMA/DMA descriptor protection control registers due to program malfunction and the like.

Table 38.363 DMAGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 38.5.7.9 DMAGMPIDn — SPID Setting Register

DMAGMPIDn are used to specify a set of SPIDs, which are referred by DMAGPROT_m/GR/DP registers. Access protection can be controlled by combination of DMAGMPIDn registers and DMAGPROT_m/GR/DP register. For example, masters with $\mathrm{SPID}=1$ or $\mathrm{SPID}=7$ can access to global registers when setting
DMAGPROT_GR.MPID $=00000101_{\mathrm{B}}$, DMAGMPID0.SPID $=01_{\mathrm{H}}$ and $\mathrm{DMAGMPID} 2 . S P I D=07_{\mathrm{H}}$.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.364 DMAGMPIDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | SPID[4:0] | SPID setting |

### 38.5.7.10 DMAGPROT_m/GR/DP — Channel/DMA/DMA Descriptor Protection Control Register

Specifies the sDMAC slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | MPID[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.365 DMAGPROT_m/GR/DP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 to 16 | MPID[7:0] | R/W enable setting based on MPID |
|  |  | MPID is a list of bits each representing one MPID value. Multiple MPID values are enabled simultaneously by setting multiple bits. |
|  |  | For example, setting MPID to $0101_{\mathrm{B}}$ enables access to areas with MPID $=0$ and MPID $=2$. <br> 0 : Reading/writing the area with MPID $=m$ depends on the RG and WG bit setting <br> 1: Enables reading/writing the area with MPID $=m$ |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0 : During write, MPID is used as a judgment condition. |
|  |  | 1: During write, MPID is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, MPID is used as the judgment condition. |
|  |  | 1: During read, MPID is not used as a judgment condition. |

### 38.5.8 IBG

### 38.5.8.1 Overview

IPIR, MEV, BarrierSync and TPTM connect to Inter-cluster Bus (I-Bus). I-Bus Guard (IBG) is one of the slave guards used to control the access to these I-Bus modules. IBG can prevent read and write access to the registers of each module. If IBG detects illegal access, guard error notification is signaled to ECM.

### 38.5.8.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.366 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GUARD_IPIR_base> | FFC6 A200 |  |
| <GUARD_MEV_base> | FFC6 A400 | $H$ |

### 38.5.8.3 List of Registers

Table 38.367 List of Registers (1/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Guard Error Clear Register | IPIGERRCLR | <GUARD_IPIR_base> + 00 |  |  |

Table 38.367 List of Registers (2/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GUARD_BARR | Guard Error Access Information Register | BRGERRTYPE | <GUARD_BARR_base> + $0 \mathrm{CH}_{\mathrm{H}}$ | 16, 32 |  |
|  | Key Code Protection Register | BRGKCPROT | <GUARD_BARR_base> + 10 ${ }_{\text {H }}$ | 32 |  |
|  | Channel Protection Control Register | $\begin{aligned} & \begin{array}{l} \text { BRGPROTO_n } \\ (n=0-15) \end{array} \end{aligned}$ | <GUARD_BARR_base> $+8 \mathrm{OH}_{\mathrm{H}}+\mathrm{n} \times 8^{\text {H }}$ | 8, 16, 32 | BRGKCPROT |
|  | Channel SPID Setting Register | $\begin{aligned} & \text { BRGPROT1_n } \\ & (\mathrm{n}=0-15) \end{aligned}$ | <GUARD_BARR_base> + 84 $+\mathrm{n} \times 08 \mathrm{H}$ | 8, 16, 32 | BRGKCPROT |

Table 38.368 Target Register of Protection Control Register

| Related Function | Symbol | Target Register |
| :---: | :---: | :---: |
| IPIR | IPIGPROT0_n ( $\mathrm{n}=0$ to 3) | IPInENS, IPInFLGS, IPInFCLRS, IPInREQS, IPInRCLRS *1 |
|  | IPIGPROT0_4 | IPInENm, IPInFLGm, IPInFCLRm, IPInREQm, IPInRCLRm *1 |
| MEV | MEGPROT0_n ( $\mathrm{n}=0$ to 7) | $\operatorname{GOMEV}(4 \mathrm{n})$ to $\operatorname{GOMEV}(4 \mathrm{n}+3)(\mathrm{n}=0$ to 7$)$ |
| BARR | BRGPROT0_n ( $\mathrm{n}=0$ to 15) | BRnINIT, BRnEN, BRnCHKS, BRnSYNCS *2 |
|  | BRGPROT0_16 | BRnCHKm, BRnSYNCm *2 |
| TPTM | TPTGPROT0_n ( $\mathrm{n}=0,1$ ) | TPTMnIRUN, TPTMnIRRUN, TPTMnISTP, TPTMnISTR, TPTMnIIEN, TPTMnIUSTR, TPTMnIDIV, TPTMnFRUN, TPTMnFRRUN, TPTMnFSTP, TPTMnFSTR, TPTMnFDIV, TPTMnICNTO, TPTMnILDO, TPTMnICNT1, TPTMnILD1, TPTMnICNT2, TPTMnILD2, TPTMnICNT3, TPTMnILD3, TPTMnFCNT *3*4 |

Note 1. $n=0$ to 3 : $n$ is the channel number of IPIR. $m=0$ to $1: m$ is PE number.
Note 2. $n=0$ to 15 : $n$ is the channel number of Barrier-Synchronization. $m=0$ to 1 : $m$ is PE number.
Note 3. $\mathrm{n}=0$ to 1 : n is PE number.
Note 4. TPTM Self region registers are protected according to TPTGPROTO_n setting.

### 38.5.8.4 IPIGERRCLR — Guard Error Clear Register

This register is used to clear the IPIGERRSTAT register. The IPIGERRSTAT.OVF and/or IPIGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.369 IPIGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the IPIGERRSTAT.OVF bit |
| 0 | CLRE | Clears the IPIGERRSTAT.ERR bit |

### 38.5.8.5 IPIGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the IPIGERRCLR register. See Section 38.5.8.4, IPIGERRCLR — Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | OVF | ERR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 38.370 IPIGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.8.6 IPIGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when IPIGERRSTAT.ERR bit is not set.

Table 38.371 IPIGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.8.7 IPIGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when IPIGERRSTAT.ERR bit is not set.

Table 38.372 IPIGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.8.8 IPIGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/common protection control registers due to program malfunction and the like.

Table 38.373 IPIGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |
|  |  |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write $A 5 A 5 A 501_{H}$ to this register to enable writing protected registers.

### 38.5.8.9 IPIGPROTO_n/4 - Channel/Common Protection Control Register ( $\mathrm{n}=0$ to 3 )

Specifies the IPIR slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: $\quad 00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.374 IPIGPROTO_n/4 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0: During write, IPIGPROT1_n/4 is used as a judgment condition. |
|  |  | 1: During write, IPIGPROT1_n/4 is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0: During read, IPIGPROT1_n/4 is used as the judgment condition. |
|  |  | 1: During read, IPIGPROT1_n/4 is not used as a judgment condition. |

### 38.5.8.10 IPIGPROT1_n/4 — Channel/Common SPID Setting Register ( $\mathrm{n}=0$ to 3 )

Specifies the IPIR slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | SPID[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SPID[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 38.375 | IPIGPROT1_n/4 Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 0 | SPID[31:0] |  |  | R/W enable setting based on SPID |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | IPIGPROT1_n/4 is a list of bits each representing one SPID value. Multiple SPID values are enabled simultaneously by setting multiple bits. |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | For example, setting IPIGPROT1_n/4 to 0101 ${ }_{\mathrm{B}}$ enables access to areas with SPID $=0$ and SPID $=2$. |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | 0: Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting <br> 1: Enables reading/writing the area with SPID = m |  |  |  |  |  |  |  |  |  |  |  |  |

### 38.5.8.11 MEGERRCLR — Guard Error Clear Register

This register is used to clear the MEGERRSTAT register. The MEGERRSTAT.OVF and/or MEGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.376 MEGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br>  <br> 1 |
| 0 | When read, the value after reset is returned. When writing, write the value after reset. |  |
|  | CLRE | Clears the MEGERRSTAT.OVF bit |

### 38.5.8.12 MEGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the MEGERRCLR register. See Section 38.5.8.11, MEGERRCLR - Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.377 MEGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.8.13 MEGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when MEGERRSTAT.ERR bit is not set.

Table 38.378 MEGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.8.14 MEGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when MEGERRSTAT.ERR bit is not set.

Table 38.379 MEGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard has error occurred |

### 38.5.8.15 MEGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel protection control registers due to program malfunction and the like.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | w | w | W | W | W | W | W | W | W | W | w | W | W | R/W |

Table 38.380 MEGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 38.5.8.16 MEGPROTO_n — Channel Protection Control Register

Specifies the MEV slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: |  |  | $0000000 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.381 MEGPROTO_n Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0 : During write, MEGPROT1_n is used as a judgment condition. |
|  |  | 1: During write, MEGPROT1_n is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, MEGPROT1_n is used as the judgment condition. |
|  |  | 1: During read, MEGPROT1_n is not used as a judgment condition. |

### 38.5.8.17 MEGPROT1_n — Channel SPID Setting Register

Specifies the MEV slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Table 38.382 MEGPROT1_n Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | MEGPROT1_n is a list of bits each representing one SPID value. Multiple SPID values are |
| enabled simultaneously by setting multiple bits. |  |  |
|  | For example, setting MEGPROT1_n to $0101_{\mathrm{B}}$ enables access to areas with SPID $=0$ and |  |
|  | SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.5.8.18 BRGERRCLR — Guard Error Clear Register

This register is used to clear the BRGERRSTAT register. The BRGERRSTAT.OVF and/or BRGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.383 BRGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the BRGERRSTAT.OVF bit |
| 0 | CLRE | Clears the BRGERRSTAT.ERR bit |

### 38.5.8.19 BRGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the BRGERRCLR register. See Section 38.5.8.18,

## BRGERRCLR — Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.384 BRGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.8.2 BRGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when BRGERRSTAT.ERR bit is not set.

Table 38.385 BRGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.8.21 BRGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when BRGERRSTAT.ERR bit is not set.

Table 38.386 BRGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.8.22 BRGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel/common protection control registers due to program malfunction and the like.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | w | W | W | W | W | W | W | R/W |

Table 38.387 BRGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write $A 5 A 5 A 501_{H}$ to this register to enable writing protected registers.

### 38.5.8.23 BRGPROTO_n/16 — Channel/Common Protection Control Register ( $\mathrm{n}=0$ to 15)

Specifies the BarrierSync slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: |  |  | $0000000 \mathrm{O}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.388 BRGPROTO_n/16 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0: Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0 : During write, BRGPROT1_n/16 is used as a judgment condition. |
|  |  | 1: During write, BRGPROT1_n/16 is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, BRGPROT1_n/16 is used as the judgment condition. |
|  |  | 1: During read, BRGPROT1_n/16 is not used as a judgment condition. |

### 38.5.8.24 BRGPROT1_n/16 — Channel/Common SPID Setting Register ( $\mathrm{n}=0$ to 15)

Specifies the BarrierSync slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Table 38.389 BRGPROT1_n/16 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | BRGPROT1_n/16 is a list of bits each representing one SPID value. Multiple SPID values are |
|  |  | enabled simultaneously by setting multiple bits. |
|  | For example, setting BRGPROT1_n $/ 16$ to $0101_{\mathrm{B}}$ enables access to areas with SPID $=0$ and |  |
|  | SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.5.8.25 TPTGERRCLR — Guard Error Clear Register

This register is used to clear the TPTGERRSTAT register. The TPTGERRSTAT.OVF and/or TPTGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.390 TPTGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the TPTGERRSTAT.OVF bit |
| 0 | CLRE | Clears the TPTGERRSTAT.ERR bit |

### 38.5.8.26 TPTGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is notified by an error detection module, etc. The OVF bit is set when a guard error is notified again when the ERR bit is already set. This register is not writable and is cleared when writing the TPTGERRCLR register. See Section 38.5.8.25,
TPTGERRCLR — Guard Error Clear Register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 38.391 TPTGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.8.27 TPTGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when TPTGERRSTAT.ERR bit is not set.

Table 38.392 TPTGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.8.28 TPTGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when TPTGERRSTAT.ERR bit is not set.

Table 38.393 TPTGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.8.29 TPTGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel protection control registers due to program malfunction and the like.

Table 38.394 TPTGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.

### 38.5.8.30 TPTGPROTO_n — Channel Protection Control Register

Specifies the TPTM slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.395 TPTGPROTO_n Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0: During write, TPTGPROT1_n is used as a judgment condition. |
|  |  | 1: During write, TPTGPROT1_n is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0 : During read, TPTGPROT1_n is used as the judgment condition. |
|  |  | 1: During read, TPTGPROT1_n is not used as a judgment condition. |

### 38.5.8.31 TPTGPROT1_n — Channel SPID Setting Register

Specifies the TPTM slave access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID settings.

Table 38.396 TPTGPROT1_n Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | TPTGPROT1_n is a list of bits each representing one SPID value. Multiple SPID values are |
|  |  | enabled simultaneously by setting multiple bits. |
|  | For example, setting TPTGPROT1_n to $0101_{\mathrm{B}}$ enables access to areas with SPID $=0$ and |  |
|  | SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.5.9 PBG

### 38.5.9.1 Overview

The PBG module is divided into several PBG groups, each of which is provided with a maximum of 16 protection channels. A single PBG channel can designate the access against which a single peripheral circuit should be protected. Each PBG group can hold the information of the access that has been rejected.

The following table lists the peripheral circuits to be protected, the corresponding PBG group names, and the PBG channel numbers.

Table 38.397 List of Peripheral Circuit Modules to be Protected (1/5)

| PBG Group | PBG Channel Number | Module to be Protected |
| :---: | :---: | :---: |
| PBG00 | 0 | ECC modules of Peripheral Group 0 (Group A) *3 |
|  | 1 | ECC modules of Peripheral Group 0 (Group B) *4 |
|  | 3 | MISG |
|  | 4 | PFSYSTEM |
|  | 5 | GCFU |
| PBG10 | 0 | ECC module of Data Flash |
|  | 1 | ECC modules of Peripheral Group 1 |
| PBG2L0 | 0 | SCI30 |
|  | 1 | SCI31 |
|  | 2 | SCI32 |
|  | 3 | SCI33 |
|  | 4 | RHSB XBAR0 |
|  | 5 | RHSB XBAR1 |
|  | 6 | ECC modules of Peripheral Group 2L |
| PBG2H0 | 0 | ATU-V (Common, Prescaler) |
|  | 1 | ATU-V (Timer A) |
|  | 2 | ATU-V (Timer B) |
|  | 3 | ATU-V (Timer C) |
|  | 4 | ATU-V (Timer D) |
|  | 5 | ATU-V (Timer E) |
|  | 6 | ATU-V (Timer F) |
|  | 7 | ATU-V (Timer G) |
|  | 8 | ATU-V (Trigger) |

|  | 1 | HSSPI |
|  | 2 | INTIF, DMATRGSEL |
|  | 3 | ECC modules of Peripheral Group 9 |

Note 1. The port group registers are divided into the following two groups and controlled separately.
Group A: Registers except PCRn_m/JPCRn_m registers (see Section 2.4.1, Table 2.11)
Group B: PCRn_m/JPCRn_m
Note 2. For details of the target registers, the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface, Section 4.2,
Registers Related to Write and Erase Protection of Flash Memory.
Note 3. This PBG channel protects the registers related to the following modules:
ECCCNT_* (exept for ECCCNT_A_V2An ( $\mathrm{n}=1$ to 9 ), ECCCNT_D_V2AnW ( $\mathrm{n}=1$ to 9 ), and ECCCNT_D_V2AnR ( $\mathrm{n}=1$ to
9))

PBOECC
DTS_COMPC
Note 4. This PBG channel protects the registers related to the following modules:
MECCCAP_*
BECCCAP_* (exept for BECCCAP_V2An ( $\mathrm{n}=1$ to 9 ))

### 38.5.9.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.398 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <PBG00_base> | FFC6 $\mathrm{B000}_{\mathrm{H}}$ | Peripheral Group 0 |
| <PBG10_base> | FFC6 $3000_{\mathrm{H}}$ | Peripheral Group 1 |
| <PBG2L0_base> | FFDA $0800_{\mathrm{H}}$ | Peripheral Group 2L |
| <PBG2H0_base> | FFDE $1000_{\mathrm{H}}$ | Peripheral Group 2H |
| <PBG2H1_base> | FFDE $1100_{\mathrm{H}}$ | Peripheral Group 2H |
| <PBG30_base> | FFC7 $2 \mathrm{BO}_{\mathrm{H}}$ | Peripheral Group 3 |
| <PBG40_base> | FFC7 $5300_{\mathrm{H}}$ | Peripheral Group 4 |
| <PBG50_base> | FFC7 $\mathrm{B000}_{\mathrm{H}}$ | Peripheral Group 5 |
| <PBG60_base> | FFC8 $1000_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG61_base> | FFC8 $1100_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG62_base> | FFC8 $1200_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG63_base> | FFC8 $1300_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG64_base> | FFC8 $1400_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG65_base> | FFC8 $1500_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG66_base> | FFC8 $1600_{\mathrm{H}}$ | Peripheral Group 6 |
| <PBG70_base> | FFF4 $9000_{\mathrm{H}}$ | Peripheral Group 7 |
| <PBG80_base> | FFF5 $9000_{\mathrm{H}}$ | Peripheral Group 8 |
| <PBG90_base> | FF0A $1300_{\mathrm{H}}$ | Peripheral Group 9 |

### 38.5.9.3 List of Registers

Table 38.399 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PBGn$\begin{aligned} & (n=00,10,2 L 0, \\ & 2 H 0,2 H 1,30,40, \\ & 50,60-66,70,80, \\ & 90) \end{aligned}$ | Guard Error Clear Register | PBGERRCLR | <PBGn_base> + 00H | 8, 16, 32 |  |
|  | Guard Error Status Register | PBGERRSTAT | <PBGn_base> + 04 ${ }_{\text {H }}$ | 8, 32 |  |
|  | Guard Error Address Register | PBGERRADDR | <PBGn_base> + 08\% | 32 |  |
|  | Guard Error Access Information Register | PBGERRTYPE | <PBGn_base> + $0 \mathrm{CH}_{\text {н }}$ | 16, 32 |  |
|  | Key Code Protection Register | PBGKCPROT | <PBGn_base> + 10 H | 32 |  |
|  | Channel Protection Control Register | $\begin{aligned} & \text { PBGPROTO_m } \\ & (m=0-15)^{* 1} \end{aligned}$ | <PBGn_base> + 80 ${ }_{\text {+ }}+\mathrm{m} \times 08_{\mathrm{H}}$ | 8, 16, 32 | PBGKCPROT |
|  | Channel SPID Setting Register | $\begin{aligned} & \text { PBGPROT1_m } \\ & (m=0-15)^{* 1} \end{aligned}$ | <PBGn_base> + 84 + + $\times 08 \mathrm{H}$ | 8, 16, 32 | PBGKCPROT |

Note 1. " $m$ " of PBGPROT0_m and PBGPROT1_m indicates the number of PBG channel. Each channel number is different from each other then please refer to Section 38.5.9.1, Overview.

### 38.5.9.4 PBGERRCLR —Guard Error Clear Register

This register is used to clear the PBGERRSTAT register. The PBGERRSTAT.OVF and/or PBGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.400 PBGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the PBGERRSTAT.OVF bit |
| 0 | CLRE | Clears the PBGERRSTAT.ERR bit |

### 38.5.9.5 PBGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is notified by an error detection module, etc. The OVF bit is set when a guard error is notified again when the ERR bit is already set. This register is not writable and is cleared when writing the PBGERRCLR register. See Section 38.5.9.4, PBGERRCLR —Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.401 PBGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.9.6 PBGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when PBGERRSTAT.ERR bit is not set.

Table 38.402 PBGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.9.7 PBGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when PBGERRSTAT.ERR bit is not set.

Table 38.403 PBGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.9.8 PBGKCPROT — Key Code Protection Register

This register is used to unlock/lock key protection of the P-bus guard register.

| Value after reset: $\quad 00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | w | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 38.404 PBGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers.
Write A5A5A501 to this register to enable writing protected registers.

### 38.5.9.9 PBGPROTO_m — Channel Protection Control Register

Specifies the P-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.405 PBGPROTO_m Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0: Disables the guard setting |
|  |  | 1: Enables the guard setting |

Note: An access by specific instructions (CLR1, NOT1, SET1 and CAXI) is protected by PBG
if either reading or writing is disabled.

### 38.5.9.10 PBGPROT1_m — Channel SPID Setting Register

Specifies the P-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID setting.

Table 38.406 PBGPROT1_m Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | PBGPROT1_m is a list of bits each representing one SPID value. Multiple SPID values are |
|  |  | enabled simultaneously by setting multiple bits. |
|  | For example, setting PBGPROT1_m to $0101_{\mathrm{B}}$ enables access to areas with SPID $=0$ and |  |
|  | SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.5.10 HBG

### 38.5.10.1 Overview

HBG can prevent read and write access against which a peripheral circuit on H -Bus should be protected. If HBG detects illegal access, guard error notification is signaled to ECM.

The following table lists the peripheral circuits to be protected and the corresponding HBG names.
Table 38.407 List of Peripheral Circuit Modules to be Protected

| HBG | Module to be Protected |
| :--- | :--- |
| HBG91 | RHSIF0 |
| HBG93 | FlexRay0 |
| HBG95 | Ethernet |

### 38.5.10.2 Register Base Address

Base addresses of safety modules are listed in the following table. Each register address is given as offsets from the base addresses.

Table 38.408 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <HBG91_base> | FF0D $0300_{\mathrm{H}}$ | Peripheral Group 9 |
| <HBG93_base> | FF0D $0000_{\mathrm{H}}$ | Peripheral Group 9 |
| <HBG95_base> | FF0D $0200_{\mathrm{H}}$ | Peripheral Group 9 |

### 38.5.10.3 List of Registers

Table 38.409 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { HBGn } \\ & (\mathrm{n}=91,93,95) \end{aligned}$ | Guard Error Clear Register | HBGERRCLR | <HBGn_base> + 00 H | 8, 16, 32 |  |
|  | Guard Error Status Register | HBGERRSTAT | <HBGn _base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 |  |
|  | Guard Error Address Register | HBGERRADDR | <HBGn_base> + 08\% | 32 |  |
|  | Guard Error Access Information Register | HBGERRTYPE | <HBGn_base> + $0 \mathrm{O}_{\mathrm{H}}$ | 16, 32 |  |
|  | Key Code Protection Register | HBGKCPROT | <HBGn_base> + 10 H | 32 |  |
|  | Channel Protection Control Register | HBGPROTO | <HBGn_base> + 80 ${ }_{\text {H }}$ | 8, 16, 32 | HBGKCPROT |
|  | Channel SPID Setting Register | HBGPROT1 | <HBGn_base> + 84 ${ }_{\text {H }}$ | 8, 16, 32 | HBGKCPROT |

### 38.5.10.4 HBGERRCLR — Guard Error Clear Register

This register is used to clear the HBGERRSTAT register. The HBGERRSTAT.OVF and/or HBGERRSTAT.ERR bits are cleared immediately after writing this register. Response data is always 0 when reading this register.

Table 38.410 HBGERRCLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CLRO | Clears the HBGERRSTAT.OVF bit |
| 0 | CLRE | Clears the HBGERRSTAT.ERR bit |

### 38.5.10.5 HBGERRSTAT — Guard Error Status Register

This register is used to notify users whether guard errors occurred. The ERR bit is set when a guard error is reported by an error detection module, etc. The OVF bit is set when a guard error is reported again when the ERR bit is already set. This register is not writable and is cleared when writing the HBGERRCLR register. See Section 38.5.10.4,

## HBGERRCLR — Guard Error Clear Register.

Value after reset: $00000000_{\mathrm{H}}$

Table 38.411 HBGERRSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | OVF | Overflow status flag |
| 0 | ERR | Error status flag |

### 38.5.10.6 HBGERRADDR — Guard Error Address Register

This register is used to get an access address when a guard error is occurred. Error address is stored in this register only when HBGERRSTAT.ERR bit is not set.

Table 38.412 HBGERRADDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADDR[31:0] | Access address to the target slave when a guard error has occurred |

### 38.5.10.7 HBGERRTYPE — Guard Error Access Information Register

This register is used to get an access attributes when a guard error is occurred. Error information is stored in this register only when HBGERRSTAT.ERR bit is not set.

Table 38.413 HBGERRTYPE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | SEC | Access attribute of SEC to the target slave when a guard error has occurred |
| 12 | DBG | Access attribute of DBG to the target slave when a guard error has occurred |
| 11 | UM | Access attribute of UM to the target slave when a guard error has occurred |
| 10 to 6 | SPID[4:0] | Access attribute of SPID to the target slave when a guard error has occurred |
| 5 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | WRITE | Access type of read or write to the target slave when a guard error has occurred |

### 38.5.10.8 HBGKCPROT — Key Code Protection Register

This register is used for protection against writing to the channel protection control registers due to program malfunction and the like.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | w | W | W | W | W | W | W | R/W |

Table 38.414 HBGKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 H to this register to enable writing protected registers.

### 38.5.10.9 HBGPROTO - Channel Protection Control Register

Specifies the H-Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the settings other than SPID.

| Value after reset: $\quad 00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | GEN | - | DBG | - | UM | - | - | WG | RG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W | R/W |

Table 38.415 HBGPROTO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | GEN | Enables/disables guard setting |
|  |  | 0 : Disables the guard setting |
|  |  | 1: Enables the guard setting |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | DBG | R/W enable setting for debug master |
|  |  | 0: Depends on other enable/disable settings |
|  |  | 1: Enables R/W |
| 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | UM | R/W disable setting in user mode |
|  |  | 0: R/W disabled |
|  |  | 1: R/W depends on other enable/disable settings |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WG | Write Global Enable |
|  |  | 0 : During write, HBGPROT1_n is used as a judgment condition. |
|  |  | 1: During write, HBGPROT1_n is not used as a judgment condition. |
| 0 | RG | Read Global Enable |
|  |  | 0: During read, HBGPROT1_n is used as the judgment condition. |
|  |  | 1: During read, HBGPROT1_n is not used as a judgment condition. |

### 38.5.10.10 HBGPROT1 — Channel SPID Setting Register

Specifies the H -Bus peripheral access to be protected against. Access prohibited by any of the identifiers is blocked as unauthorized access. This register is used to specify the SPID setting.

Table 38.416 HBGPROT1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SPID[31:0] | R/W enable setting based on SPID |
|  |  | HBGPROT1_n is a list of bits each representing one SPID value. Multiple SPID values are |
| enabled simultaneously by setting multiple bits. |  |  |
|  | For example, setting HBGPROT1_n to $0101_{\mathrm{B}}$ enables access to areas with SPID $=0$ and |  |
|  | SPID $=2$. |  |
|  | $0:$ Reading/writing the area with SPID $=m$ depends on the RG and WG bit setting |  |
|  | 1: Enables reading/writing the area with SPID $=m$ |  |

### 38.6 BIST

### 38.6.1 Overview

This product incorporates Built-In-Self-Test (BIST) function to detect failures of the safety mechanism itself. The BIST consists of Logic BIST (LBIST) and Memory BIST (MBIST). LBIST is considered as the effective hardware safety mechanism to measure latent faults which can reduce software load for error injection tests. LBIST covers over $90 \%$ of the safety mechanisms for LFM. The BIST is executed during the reset sequence of System Reset 1 and System Reset 2 before the CPU starts operation. BIST execution results can be identified by the BIST result register (BSEQ0ST). In addition, by setting System Reset 2 before shutdown, BIST can be performed during the reset sequence in accordance with the setting of the BSEQ0CTL register. When running BIST, the scenario can be selected in accordance with the setting of the BSEQ0SEL register. For LBIST and MBIST, either a power-up BIST using System Reset 1 (set by using flash option byte 3) or a shutdown BIST using System Reset 2 (set by the BSEQ0SEL register) can be selected.

### 38.6.2 Registers

### 38.6.2.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc. Write protected registers can be written by releasing the protection of RESKCPROT. For details of RESKCPROT, see Section 10.2.16, RESKCPROT — Reset Controller Register Key Code Protection Register.

### 38.6.2.2 List of Registers

Table 38.417 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BIST <br> (Peripheral <br> Group6) | Logic BIST Reference Value Register 1 | LBISTREF1 | FF70 E100 ${ }_{\text {H }}$ | 32 |  |
|  | Logic BIST Reference Value Register 2 | LBISTREF2 | FF70 E104 ${ }_{\text {H }}$ | 32 |  |
|  | Memory BIST Reference Value Register 1 | MBISTREF1 | FF70 E108 ${ }_{\text {H }}$ | 32 |  |
|  | Logic BIST Signature Value Register 1 | LBISTSIG1 | FF70 E110 ${ }_{\text {H }}$ | 32 |  |
|  | Logic BIST Signature Value Register 2 | LBISTSIG2 | FF70 E114 ${ }_{\text {H }}$ | 32 |  |
|  | Memory BIST Signature Value Register 1 | MBISTSIG1 | FF70 E118H | 32 |  |
|  | Memory BIST1 FTAG Signature Value Register 0 | MBIST1FTAG0 | FF70 E120 ${ }_{\text {H }}$ | 32 |  |
|  | Memory BIST1 FTAG Signature Value Register 1 | MBIST1FTAG1 | FF70 E124 ${ }_{\text {H }}$ | 32 |  |
|  | Memory BIST1 FTAG Signature Value Register 2 | MBIST1FTAG2 | FF70 E128 ${ }_{\text {H }}$ | 32 |  |
|  | BIST Sequencer Status Register | BSEQ0ST | FF70 E160 ${ }_{\mathrm{H}}$ | 32 |  |
|  | BIST Sequencer Inverted Status Register | BSEQ0STB | FF70 E164 ${ }_{\text {H }}$ | 32 |  |
|  | BIST Result Register | BISTST | FF70 E168 ${ }_{\text {H }}$ | 32 |  |
|  | BIST Scenario Select Register | BSEQ0SEL | FF70 E16C ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL <br> (Peripheral Group6) | BIST Skip Control Register | BSEQ0CTL | FF70 0400 ${ }_{\text {H }}$ | 32 | RESKCPROT*1 |

Note 1. See Section 10.2.16, RESKCPROT — Reset Controller Register Key Code Protection Register.

### 38.6.2.3 Reset of Registers

Register reset conditions are shown in Table 38.418.
Table 38.418 Reset sources

|  | Reset Source |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module <br> Reset | JTAG <br> Reset |
| LBISTREF1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| LBISTREF2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| MBISTREF1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| LBISTSIG1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| LBISTSIG2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| MBISTSIG1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| MBIST1FTAG0 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| MBIST1FTAG1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| MBIST1FTAG2 | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| BSEQ0ST | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| BSEQ0STB | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| BISTST | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| BSEQ0SEL | $\checkmark$ | $\checkmark$ | - | - | - | - |
| BSEQ0CTL | $\checkmark$ | $\checkmark$ | - | - | - | - |

### 38.6.2.4 LBISTREF1 — Logic BIST Reference Value Register 1

This register indicates the reference value of the Logic BIST. This register is automatically updated by the reference value after BIST execution.

Table 38.419 LBISTREF1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | LBISTREF1[19:0] | Reference signature value (expected signature value) |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: 000A 5A5A
BIST is executed: BIST reference value

### 38.6.2.5 LBISTREF2 — Logic BIST Reference Value Register 2

This register indicates the reference value of the Logic BIST. This register is automatically updated by the reference value after BIST execution.

Table 38.420 LBISTREF2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | LBISTREF2[19:0] | Reference signature value (expected signature value) |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: 0005 A5A5 $_{H}$
BIST is executed: BIST reference value

### 38.6.2.6 MBISTREF1 — Memory BIST Reference Value Register 1

This register indicates the reference value of the Memory BIST. This register is automatically updated by the reference value after BIST execution.

Table 38.421 MBISTREF1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | MBISTREF1[19:0] | Reference signature value (expected signature value) |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: 000A A55A ${ }_{H}$
BIST is executed: BIST reference value

### 38.6.2.7 LBISTSIG1 — Logic BIST Signature Value Register 1

This register indicates the signature value of the Logic BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user compares the reference signature of LBISTREF1 against the resulting signature LBISTSIG1. The Logic BIST is passed if these are equal.

Table 38.422 LBISTSIG1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | LBISTSIG1[19:0] | Logic BIST1 result signature value |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

| BIST is skipped: | 0005 A5A5 |
| :--- | :--- |
| BIST is executed without LBIST: | LBISTREF1 |

### 38.6.2.8 LBISTSIG2 — Logic BIST Signature Value Register 2

This register indicates the signature value of the Logic BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of LBISTREF2 against the resulting signature LBISTSIG2. The Logic BIST is passed if these are equal.

Table 38.423 LBISTSIG2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | LBISTSIG2[19:0] | Logic BIST2 result signature value |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: 000A 5A5 $A_{H}$
BIST is executed without LBIST: LBISTREF2
BIST is executed with LBIST: BIST result

### 38.6.2.9 MBISTSIG1 — Memory BIST Signature Value Register 1

This register indicates the signature value of the Memory BIST. This register is automatically updated by the BIST result signature after BIST execution.

The user shall compare the reference signature of MBISTREF1 against the resulting signature MBISTSIG1. The Memory BIST is passed if these are equal.

Table 38.424 MBISTSIG1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 19 to 0 | MBISTSIG1[19:0] | Memory BIST1 result signature |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: 0005 5AA5 ${ }_{H}$
BIST is executed without MBIST: MBISTREF1
BIST is executed with MBIST: BIST result

### 38.6.2.10 MBIST1FTAG0 — Memory BIST1 FTAG Signature Value Register 0

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Table 38.425 MBIST1FTAG0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MBIST1FTAG0[31:0] | The state of self-diagnostic MBIST of Bridge No.n |
|  | $0:$ MBIST status is PASS. |  |
|  | 1: MBIST status is FAIL. |  |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: FFFF FFFF ${ }_{H}$
BIST is executed without MBIST: $00000000_{\mathrm{H}}$
BIST is executed with MBIST: BIST result
Table 38.426 Mapping of MBIST1FTAG0 Register

| Bit Position | Memory Group Assignment |
| :--- | :--- |
| 31 to 13 | Cluster0 RAM |
| 12 to 10 | Instruction Cache RAM(PE1) |
| 9 to 7 | Instruction Cache RAM(PE0) |
| 6,5 | Local RAM(PE0) |
| 4,3 | Local RAM(PE1) |
| 2 | Ethernet RAM |
| 1 to 0 | FlexRay RAM |

### 38.6.2.11 MBIST1FTAG1 - Memory BIST1 FTAG Signature Value Register 1

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Table 38.427 MBIST1FTAG1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MBIST1FTAG1[31:0] | The state of self-diagnostic MBIST of Bridge No.n |
|  | $0:$ MBIST status is PASS. |  |
|  | 1: MBIST status is FAIL. |  |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped: FFFF FFFF ${ }_{H}$
BIST is executed without MBIST: $00000000_{\mathrm{H}}$
BIST is executed with MBIST: BIST result
Table 38.428 Mapping of MBIST1FTAG1 Register

| Bit Position | Memory Group Assignment |
| :--- | :--- |
| 31 to 27 | ICU-M cache RAM |
| 26 to 23 | Reserved |
| 22 to 15 | Cluster1 RAM |
| 14 to 3 | Cluster0 RAM |
| 2 to 1 | Reserved |
| 0 | Cluster0 RAM |

### 38.6.2.12 MBIST1FTAG2 - Memory BIST1 FTAG Signature Value Register 2

This register indicates the Memory BIST status of each RAM group (bridge). This register is automatically updated by the BIST result after BIST execution.

Table 38.429 MBIST1FTAG2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MBIST1FTAG2[31:0] | The state of self-diagnostic MBIST of Bridge No.n |
|  | $0:$ MBIST status is PASS. |  |
|  | 1: MBIST status is FAIL. |  |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.
BIST is skipped: $\quad$ FFFF FFFF $_{H}$
BIST is executed without MBIST: $00000000_{\mathrm{H}}$
BIST is executed with MBIST: BIST result
Table 38.430 Mapping of MBIST1FTAG2 Register

| Bit Position | Memory Group Assignment |
| :--- | :--- |
| 31 to 28 | Reserved |
| 27 to 26 | sDMAC1 RAM |
| 25 to 24 | sDMAC0 RAM |
| 23 | DTS RAM |
| 22 to 21 | RS-CANFD RAM |
| 20 to 19 | DFE1 RAM |
| 18 to 17 | DFE0 RAM |
| 16 to 5 | GTM RAM |
| 4 to 1 | ICU-M Local RAM |
| 0 | Reserved |

### 38.6.2.13 BSEQ0ST - BIST Sequencer Status Register

This register indicates the state of the BIST sequencer. This register is automatically updated by the BIST result after BIST execution.

Table 38.431 BSEQOST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When reading, the value after reset is read. When writing, write the value after reset. |
| 1 | BISTEND | 0: The BIST sequence did not finish within the time limit. |
|  |  | 1: The BIST sequence finished within the time limit. |
| 0 | CMPERR | 0: BIST normal end |
|  |  | 1: BIST abnormal end |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped(except for Debug mode[TRST = 0]): $00000001^{\mathbf{H}}$
BIST is skipped/not executed(Debug mode[TRST = 1]): 0000 0002 ${ }_{\mathrm{H}}$
BIST is executed: BIST result

### 38.6.2.14 BSEQ0STB — BIST Sequencer Inverted Status Register

This register indicates the inverted state of the BIST sequencer. This register is automatically updated by the BIST result after BIST execution.

Table 38.432 BSEQ0STB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> When reading, the value after reset is read. When writing, write the value after reset. |
| 1 | BISTENDB | 0: The BIST sequence finished within the time limit. |
|  |  | 1: The BIST sequence did not finish within the time limit. |
| 0 | CMPERRB | 0: BIST abnormal end |
|  |  | 1: BIST normal end |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.

BIST is skipped(except for Debug mode[TRST = 0]): 0000 0002 ${ }_{\text {H }}$
BIST is skipped/not executed(Debug mode[TRST = 1]): $00000001^{\mathrm{H}}$
BIST is executed: BIST result

### 38.6.2.15 BISTST - BIST Result Register

This register indicates the result of the BIST. This register is automatically updated by the BIST result after BIST execution.

Table 38.433 BISTST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 2 | MBIST1ST | Memory BIST result |
|  |  | $0:$ MBIST1 passed successfully |
|  | 1: MBIST1 has detected an error |  |
| 1 | LBIST2ST | Logic BIST (Reset toggle check) result |
|  |  | $0:$ LBIST2 passed successfully |
|  | 1: LBIST2 has detected an error |  |
| 0 | LBIST1ST | Logic BIST (Data toggle check) result |
|  |  | 0: LBIST1 passed successfully |
|  |  | 1: LBIST1 has detected an error |

Note 1. Value after reset depends on BIST execution condition. For details about BIST execution condition, see Section 38.6.3.1, BIST Execution Condition.
BIST is skipped: $\quad 0000000 \mathrm{~F}_{\mathrm{H}}$
BIST is executed:
MBIST1ST value:
without MBIST: 0
with MBIST: BIST result
LBIST1ST, LBIST2ST value:
without LBIST: 0
with LBIST BIST result

### 38.6.2.16 BSEQ0SEL - BIST Scenario Select Register

This register is used to select the execution scenario of BIST at the next System Reset 2 occurrence.

Table 38.434 BSEQ0SEL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved <br> When reading, the value after reset is read. When writing, write the value after reset. |
| 15 | PARAMSEL | Selects BIST parameters (HWLBISTSEL[1:0], HWTESTSET[1:0]) of BIST which will be executed during next System Reset 2 triggered by software reset. <br> 0: Parameters specified by Flash option byte ${ }^{\star 1}$. (default) <br> 1: Parameters specified by BSEQOSEL registers. |
| 14 to 6 | - | Reserved <br> When reading, the value after reset is read. When writing, write the value after reset. |
| 5 to 4 | HWTESTSET[1:0] | BIST selection <br> $00_{\mathrm{B}}$ : Prohibited <br> 01 ${ }^{\text {B }}$ : LBIST ONLY <br> $10_{\mathrm{B}}$ : MBIST ONLY <br> $11_{\mathrm{B}}$ : LBIST AND MBIST <br> For BIST, four operation settings can be selected by combining HWTESTSET[1:0] and HWLBISTSEL[1:0]. <br> Refer to Table 38.435, BIST scenario use case. |
| 3 to 2 | - | Reserved <br> When reading, the value after reset is read. When writing, write the value after reset. |
| 1, 0 | HWLBISTSEL[1:0] | BIST scenario selection <br> $00_{\mathrm{B}}$ : BIST scenario 1 <br> $01_{\mathrm{B}}$ : BIST scenario 2 <br> $10_{\mathrm{B}}$ : BIST scenario 3 <br> $11_{\mathrm{B}}$ : BIST scenario 4 <br> For BIST, four operation settings can be selected by combining HWTESTSET[1:0] and HWLBISTSEL[1:0]. <br> Refer to Table 38.435, BIST scenario use case. |

[^18]Table 38.435 BIST scenario use case

| HWLBISTSEL <br> $[1: 0]^{* 1}$ | HWTESTSET <br> $[1: 0]^{* 1}$ | Function | Run time*2 | Target ASIL*3 |
| :--- | :--- | :--- | :--- | :--- |
| 00 | 10 | MBIST Execution | 5 ms <br> (MBIST 5 ms$)$ |  |
| 01 | 11 | LBIST and MBIST Execution | 10 ms <br> (LBIST 5 ms, MBIST 5 ms$)$ | ASIL B |
| 10 | 01 | LBIST Execution | 15 ms <br> (LBIST 15 ms$)$ | ASIL D |
| 11 | 11 | LBIST and MBIST Execution | 20 ms <br> (LBIST 15 ms, MBIST 5 ms$)$ | ASIL D |

Note 1. Settings other than above are prohibited.
Note 2. Run time is calculated by the typical frequency of the Internal OSC. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
Note 3. ISO26262 compliance for LFM by LBIST.

### 38.6.2.17 BSEQ0CTL — BIST Skip Control Register

This register is used to control the BIST execution at the next System Reset 2 occurrence.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | HWBI STSEL | HWBIS TEXE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 38.436 BSEQ0CTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When reading, the value after reset is read. When writing, write the value after reset. |
| 1 | HWBISTSEL | Selects flash option byte value or register value for the BIST execution setting. |
|  | 0: BIST is executed according to Flash Option Byte ${ }^{* 1}$ value. |  |
|  | 1: BIST is executed according to HWBISTEXE value. |  |
| 0 | HWBISTEXE | This bit selects if BIST is skipped or not at the next system reset 2. |
|  | $0:$ BIST is skipped at the next system reset 2 |  |
|  |  | 1: BIST is executed at the next system reset 2 |

Note 1. For details, see Section 41, Flash Memory.

### 38.6.3 Functions

### 38.6.3.1 BIST Execution Condition

The BIST is executed during reset sequence of System Reset 1 and System Reset 2. The following tables explain the conditions of BIST execution.

Table 38.437 BIST Execution during System Reset 1

| Conditions |  |  |  |
| :--- | :--- | :--- | :--- |
| Reset Category | TRST pin | HWBIST <br> (Flash option*1 | BIST Execution during Reset Sequence |

Note 1. For details, See Section 41, Flash Memory.
Note 2. Reset is released after the expiration of the selected BIST scenario time.
Note 3. Reset is released without waiting for the selected BIST scenario time.
Note 4. Reset is released after BIST has finished. BIST is executed with preset parameters. For details, See Section 41, Flash Memory.

Table 38.438 BIST Execution during System Reset 2 (ECM, SWDTA, Software Reset)

| Reset Category | TRST pin | HWBISTSEL (Register) |  |
| :---: | :---: | :---: | :---: |
| System Reset 2 | High | 0 | HWBIST (Flash option*1) Value <br> 1: BIST is not executed.*2 <br> 0 : BIST is skipped.*3 |
|  |  | 1 | BSEQ0CTL register HWBISTEXE Value <br> 1: BIST is not executed.*2 <br> 0 : BIST is skipped.*3 |
|  | Low | 0 | HWBIST (Flash option*1) Value <br> 1: BIST is executed.*4 <br> 0 : BIST is skipped. ${ }^{* 3}$ |
|  |  | 1 | BSEQOCTL register HWBISTEXE Value <br> 1: BIST is executed. <br> 0 : BIST is skipped.*3 |

Note 1. For details, See Section 41, Flash Memory.
Note 2. Reset is released after the expiration of the selected BIST scenario time.
Note 3. Reset is released without waiting for the selected BIST scenario time.
Note 4. Reset is released after BIST has finished. BIST is executed with preset parameters. For details, See Section 41, Flash Memory.

### 38.6.3.2 BIST Result Confirmation

After the BIST execution, read and compare the following register values to confirm whether the BIST execution completed normally without failure.

- $\operatorname{BSEQ} 0$ ST $=00000002_{\mathrm{H}}$
- BSEQ0STB = $00000001_{\mathrm{H}}$
- LBISTSIG1 = LBISTREF1
- LBISTSIG2 = LBISTREF2
- MBISTSIG1 $=$ MBISTREF1
- $\operatorname{BISTST}=00000000_{\mathrm{H}}$

### 38.6.4 Operation

By setting System Reset 2 before shutdown, BIST can be performed during the reset sequence in accordance with the setting of the BSEQ0CTL register. When running BIST, the scenario can be selected in accordance with the setting of the BSEQ0SEL register. For LBIST and MBIST, either a power-up BIST using System Reset 1 (set by using flash option byte 3) or a shutdown BIST using System Reset 2 (set by the BSEQ0SEL register) can be selected.

Table 38.439 BIST Scenario Select Condition

| RESET | Source | BIST Scenario Select |
| :--- | :--- | :--- |
| System Reset 1 | External Reset, Standby Reset, VMON reset | Flash option byte*1 |
| System Reset 2 | ECM reset, SWDTA reset, Software reset | BSEQOSEL register (PARAMSEL = 1) |

[^19]
### 38.7 MISG

### 38.7.1 Overview

This MCU incorporates multi-input signature generators (MISG) for self-diagnosis by the CPUs.
The table below shows the overview of the MISG specifications.
Table 38.440 Specification Overview

| Item | Description |
| :--- | :--- |
| Signature generation units | This MCU incorporates the signature generation unit for each CPU core. MISG extracts necessary <br> information from CPU trace and inputs it to the signature generation units in write monitoring mode. |
| Generating polynomials | Two types of polynomials are available to generate a 32-bit signature. |
|  | - MISR1: |
|  | $\mathrm{G}(\mathrm{x})=\mathrm{x}^{32}+\mathrm{x}^{26}+\mathrm{x}^{23}+\mathrm{x}^{22}+\mathrm{x}^{16}+\mathrm{x}^{12}+\mathrm{x}^{11}+\mathrm{x}^{10}+\mathrm{x}^{8}+\mathrm{x}^{7}+\mathrm{x}^{5}+\mathrm{x}^{4}+\mathrm{x}^{2}+\mathrm{x}+1$ |
|  | - MISR2: |
|  | $\mathrm{G}(\mathrm{x})=\mathrm{x}^{32}+\mathrm{x}^{22}+\mathrm{x}^{2}+\mathrm{x}+1$ |
| Signature generation | Signature generation can be enabled or disabled. |
|  | - Signature generation in MISR1 can be enabled or disabled. |
|  | - Signature generation in MISR2 can be enabled or disabled. |

The following two conditions can be selected as conditions for signature generation:

- Writing to the register

A signature is generated by writing to the MISR calculation data register (MISRCDR_*).

- Monitoring write access

A signature is generated if writing to the address area specified for monitoring occurs when writing by using the CPU that is being monitored. The address area is specified by the monitoring area base address register and the monitoring area address mask register.

| Automatic signature | Two signature generation units are selected for comparison of signatures. |
| :--- | :--- |
| comparison | Each signature generation unit has a data counter, and comparison proceeds when the values of the |
| data counters in the MISGs selected as the target for comparison match. Moreover, MISG stops the |  |
|  | generation of signature and the count of the data counters when the values of the data counters in |
| the MISGs match the values of MISR compare data counter register (MISRCMPDCNT), and |  |
| comparison also proceeds after both the counters that are the target for comparison match stop. |  |
|  | The data counter counts the number of write accesses to the MISRCDR_* register or the address |
| area being monitored. |  |

[^20]
### 38.7.2 Block Diagram

### 38.7.2.1 MISG

Figure 38.2 shows a block diagram of the MISG. The MISG consists of the signature generation unit and the signature comparison unit.

Using write monitoring mode as the signature generation condition (Section 38.7.3.1(2), Write Monitoring Mode) is only be possible between the corresponding signature generation unit and the CPU. Therefore, each signature generation unit is given a name corresponding to the CPU number (MISG_PE0, MISG_PE1). MISG_PEm can monitor write access by CPUm. $(\mathrm{m}=0,1)$
When register write mode is the signature generation condition, there is no correspondence between a CPU and the signature generation unit. Any CPU can generate a signature in any signature generation unit.

Figure 38.2 MISG Block Diagram (Multi Core)

### 38.7.2.2 Signature Generation

Figure 38.3 shows the flow of data in signature generation. MISR1 and MISR2 consist of two 32-bit signature generation units (MISR1_*, MISR2_*).

MISR2_* can generate a signature from 32-bits of data being written by the CPU being monitored, or from data being written to MISRCDR_*. Signature generation units stop the signature generation based on a signal from signature compare unit triggered by automatic signature comparison.

$\dagger$ : represents signature generation

Figure 38.3 Signature Generation Units

Figure 38.4 shows the block diagram of signature generation in MISR1_* and the polynomials.

Figure 38.4 Block Diagram of Signature Generation in MISR1_*

Figure 38.5 shows the block diagram of signature generation in MISR2_* and the polynomials.

MISR2_*
$G(x)=x^{32}+x^{22}+x^{2}+x^{1}+1$

Figure 38.5 Block Diagram of Signature Generation in MISR2_*

### 38.7.2.3 Signature Compare Unit

The signature compare unit consists of the signature generation selector part, counter compare part and signature compare part. The signature generation selector part can select the input signals to the signature compare part and the counter compare part from all implemented signature generation units. Furthermore, the signature generation selector part inputs the stop signal for signature generation and the control signal for count up generated by the counter compare part.

Figure 38.6 Block Diagram of MSD

### 38.7.3 Functional Specifications

### 38.7.3.1 Conditions for Signature Generation

The conditions for signature generation in MISR1 and MISR2 can be selected by the setting the MISR control register (MISRCR_*).

Note 1. "*" in MISRCR_* indicates PEm. $(\mathrm{m}=0,1)$

Signature generation conditions for MISRi $(i=1,2)$
Table 38.441 Signature Generation Conditions for MISRi

| MISRCR. <br> MISRiEN | MISRCR. <br> MISEiCND | Signature Generation Conditions |
| :--- | :--- | :--- | | 0 | - | MISRi does not generate a signature. |
| :--- | :--- | :--- |
| 1 | 0 | Register write mode <br> Writing to the MISRCDR_* register leads to MISRi generating a signature. |
| 1 | 1 | Write monitoring mode <br> MISRi generates a signature after the corresponding CPU writes to an address specified for <br> monitoring. |

## (1) Register Write Mode

Writing to the MISR calculation data register (MISRCDR_*) while MISR1 is in register write mode leads to the generation of a 32-bit signature in MISR1 from the value held in the multi-input signature register 1 (MISR1_*) and the data written to MISRCDR_*, and the result is retained in MISR1_*. Similarly, a 32-bit signature is generated in MISR2 from the value held in the multi-input signature register $2\left(\mathrm{MISR}_{2}{ }^{*}\right)$ and the data written to MISRCDR_*, and the result is retained in MISR2_*.

Writing to MISRCDR_* can proceed in 8-, 16-, or 32 -bit units, and bits to which a value is not written are treated as 0 . For example, writing to the 16 lower-order bits of MISRCDR * leads to the generation of a signature with the 16 higher-order bits of write data treated as 0 . Similarly, writing to the 16 higher-order bits of MISRCDR_* leads to the generation of a signature with the 16 lower-order bits of write data treated as 0 .

MISR1 and MISR2 do not identify the bus master that writes to the MISRCDR_*. Writing by any bus master, whether a CPU, DMAC, or debugging master, produces a signature.

Note 1. "*" in MISRCDR_*, MISR1_*, and MISR2_* indicates PEm. $(\mathrm{m}=0,1)$

## (2) Write Monitoring Mode

When the CPU writes to an address area specified for monitoring while MISR1 is in write-monitoring mode, MISR1 generates compressed 32-bit signatures from the value in MISR1_* and 32-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR1_*. The generated signatures are stored in MISR1_*. Similarly, when the CPU writes to an address area specified for monitoring while MISR2 is in write-monitoring mode, MISR2 generates compressed 32-bit signatures from the value in MISR2_* and 32-bit data being written by the CPU, and generates signatures from the 32-bit compressed data and the value that is again held in MISR2_*. The generated signatures are stored in MISR2_*.
The address area specified for monitoring for signature generation is set by the MISR monitoring base address register (MISRBASEADR) and the MISR monitoring address mask register (MISRADRMSK). If the CPU write address is within the address area specified for monitoring, a signature is generated.

Write monitoring mode monitors write access by the corresponding CPU in $8-, 16-, 32-$, or 64 -bit units. When writing proceeds in 8 -, or 16 -bit units, remaining bits to which a value is not written are treated as 0 , and 32 -bit data is always input to MISR1 or MISR2. Write data is allocated to the lower-order side regardless of the destination address. For example, when 16 bits are written to an address of the form $4 \mathrm{~N}+2$, the 16 bits are allocated to the lower-order side and a signature is generated with the 16 higher-order bits treated as 0 .

In case of 64-bit write access, the data is split into two 32-bit data, that is, lower word and upper word, and then they are used to generate a signature in lower to upper order.

The CPU write access destinations that can be monitored by MISR1 and MISR2 are as follows:
Local RAM, Cluster RAM, Peripheral module connected to System bus, I-Bus or P-Bus

Furthermore, CPU instructions which MISR1 and MISR2 can monitor are:

```
ST.B, ST.H, ST.W, ST.DW
SST.B, SST_H, SST_W
PREPARE, PUSHP (Following restriction exists.)
```

The restrictions described below apply to the given store operations.
(1) Instructions that cause the CPU to write data in response to a slave request: Store operations such as CLR1, NOT1, SET1, CAXI, and STC.W are not subject to monitoring.
(2) Instructions for saving units of data larger than 64 bits on the stack (PREPARE and PUSHSP): signature values between the masters may not match when the instruction is suspended because of an interrupt. Therefore, the area to be used with the instructions must not be subject to monitoring or steps must be taken to make sure that the operation is not suspended due to an interrupt.
(3) STV.DW, STV.QW, STV.W, STVZ.H4 (FXU store operation) and CACHE, PREFI are not subject to monitoring.
(4) Register bank function: signature values can be uncertain when context switch occurs. Therefore, the area to be used by the evacuations needs to be out of monitoring.

Write monitoring mode can only be implemented between the specified signature generation unit and the corresponding CPU.

In this product, the following monitoring operations are possible:

- Monitoring of CPUm write access by signature generation unit $\mathrm{m}(\mathrm{m}=0,1)$

Note 1. "*" in MISR1_* and MISR2_* indicates PEm. $(m=0,1)$

### 38.7.3.2 Automatic Signature Comparison

The signature compare part is enabled by MISR1CMPENn bit and MISR2CMPENn bit of the comparator control register (MISRCMPCTL) and it compares signatures selected from two signature generation units by the MISR compare data select register (MISRCMPDSEL) corresponding to the signature compare part. Each signature generation unit contains the data counter and the comparison is done when the count values of the data counters contained in the signature generation unit which are selected as the target for comparison match each other. Moreover, MISG stops the generation of signature and the count of the data counters when the values of the data counters in the MISGs match the values of MISR compare data counter register (MISRCMPDCNT) and comparison is also done after both counters that are the target for comparison match stop.

### 38.7.3.3 Data Counter

The MISR data counter register (MISRDCNT_*) counts the number of write accesses to MISRCDR_* or to the address range specified by BASEADR and ADRMSK. When the CNTSTA bit $=1$ and the CNTTRG bit $=0$ in the data counter control register (MISRDCNTCTL), MISRDCNT_* counts the number of write accesses to MISRCDR_*. When the CNTSTA bit = 1 and the CNTTRG bit = 1 in MISRDCNTCTL, MISRDCNT_* counts the number of write accesses by the corresponding CPU to the address range specified by MISRBASEADR and MISRADRMSK.

MISRDCNT_* can count the number of times either MISR1 or MISR2 or both MISR1 and MISR2 generate signatures by setting the trigger for counting up by MISRDCNT_* as the signature generation condition in MISR1 or MISR2. Note, however, that if the signature generation conditions for MISR1 and MISR2 and the trigger for counting up by the data counter are not consistent, the value of MISRDCNT_* and the signature generation count will not match.

The MISR data counter register (MISRDCNT ${ }^{*}$ ) stops the count base on a signal from the signature compare part triggered by the automatic signature compare function.

## CAUTIONS

1. When the MISR1EN and MISR2EN bits in the MISRCR register are both 0 , counting by MISRDCNTCTL is not incremented even if writing to MISRCDR and the address range specified by MISRBASEADR and MISRADRMSK proceeds.
2. A double word access is treated as two single word accesses and MISRDCNT_* register counts two in write monitoring mode. Signature generation unit (MISG) uses only lower word and stops just in the stop count specified by MISRCMPDCNT register in case a double word access occurs when MISRDCNT_* $=$ MISRCMPDCNT -1.

Note 1. "*" in MISRDCNT_* and MISRCDR_* indicates PEm. $(m=0,1)$

### 38.7.3.4 Error Notification

When the CMPERREN bit in the error notification control register (MISRERRCTL) is set to 1 , the ECM is notified of a MISR compare error (MISR_ERR) when signatures are compared and do not match. At the same time, the error flag in the compare error status register is set. Moreover, MISR compare error is being notified during compare mismatch of signatures. See Section 38.7.5.3, Recommended Clear Flow of Error Flag regarding error flag clear.

There is no generation of interrupt request to INTC.

### 38.7.4 Register Specifications

### 38.7.4.1 Register Map

The table below lists the registers of the signature generation units.
Registers with symbols ending in "_PEm" are those of signature generation unit m (MISG_PEm). (m=0,1)
Note that the endings of the register symbols ("_PEm") are omitted if signature generation unit m does not require identification.

$$
\begin{aligned}
& \text { MISG_PEm_base }=\text { FFFB } 0000_{\mathrm{H}}+\mathrm{m} \times 40_{\mathrm{H}}(\mathrm{~m}=0,1) \\
& \text { MSD_base }=\mathrm{FFFB} 0200_{\mathrm{H}}
\end{aligned}
$$

Table 38.442 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| MISG_PEm $(m=0,1)$ <br> (Peripheral <br> Group0) | Multi Input Signature Register 1 | MISR1 | <MISG_PEm _base> + $00 \mathrm{H}_{\mathrm{H}}$ | 32 |  |

|  | Calculation Data Register | MISRCDR | <MISG_PEm _base> + 10H | 8,16, 32 |  |
|  | Control Register | MISRCR | <MISG_PEm _base> + 18H | 8 |  |
|  | Monitoring Base Address Register | MISRBASEADR | <MISG_PEm_base> + 1 $\mathrm{C}_{\mathrm{H}}$ | 32 |  |
|  | Monitoring Address Mask Register | MISRADRMSK | <MISG_PEm_base> + 20H | 32 |  |
|  | Data Counter Control Register | MISRDCNTCTL | <MISG_PEm_base> + 24 ${ }_{\text {H }}$ | 8 |  |
|  | Data Counter Register | MISRDCNT | <MISG_PEm _base> + 28H | 16 |  |
| MSD <br> (Peripheral <br> Group0) | Comparator Control Register | MISRCMPCTL | <MSD_base> + 00 H | 8 |  |
|  | Compare Error Status Register | MISRCMPERSTR | <MSD_base> + 04H | 8 |  |
|  | Compare Error Status Clear Register | MISRCMPERRSTC | <MSD_base> + 08\% | 8 |  |
|  | Error Notification Control Register | MISRERRCTL | <MSD_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8 |  |
|  | Compare Data Select Register | MISRCMPDSEL | <MSD_base> + 10 H | 8 |  |
|  | Compare Data Counter Register | MISRCMPDCNT | <MSD_base> + 20 H | 16 |  |

### 38.7.4.2 MISR1 — Multi Input Signature Register 1

The Multi-input signature register 1 is a 32 -bit readable/writable register.
Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

Signatures are generated by using the following polynomial:

$$
\mathrm{G}(\mathrm{x})=\mathrm{x}^{32}+\mathrm{x}^{26}+\mathrm{x}^{23}+\mathrm{x}^{22}+\mathrm{x}^{16}+\mathrm{x}^{12}+\mathrm{x}^{11}+\mathrm{x}^{10}+\mathrm{x}^{8}+\mathrm{x}^{7}+\mathrm{x}^{5}+\mathrm{x}^{4}+\mathrm{x}^{2}+\mathrm{x}+1
$$

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.443 MISR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MISR1[31:0] | Multi Input signature register 1 |

### 38.7.4.3 MISR2 — Multi Input Signature Register 2

Multi-input signature register 2 is a 32 -bit readable/writable register.
Once the signature generation condition is met, this register generates a new signature each time the condition is met and retains the generated value. For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

Signatures are generated by using the following polynomial:

$$
\mathrm{G}(\mathrm{x})=\mathrm{x}^{32}+\mathrm{x}^{22}+\mathrm{x}^{2}+\mathrm{x}+1
$$

Value after reset: $\quad 00000000 \mathrm{H}$

Table 38.444 MISR2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MISR2[31:0] | Multi Input signature register 2 |

### 38.7.4.4 MISRCDR — Calculation Data Register

The MISR calculation data register is a 32-bit write-only register.
When signature generation in register write mode is selected, a signature is generated in MISR1 or MISR2 by writing to this register. Data written to this register is the data input to the multi-input signature register 1 (MISR1_*) or the multiinput signature register 2 (MISR2_*). For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

This register can be written in 8-, 16-, or 32-bit units. When writing proceeds in 8- or 16-bit units, remaining bits to which a value is not written are treated as 0 , and 32 -bit data is always input to MISR1_* or MISR2_*.

Table 38.445 MISRCDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MISRCDR[31:0] | Calculation data to MISR1 or MISR2 |
|  |  | New signatures are generated by the CPU writing to this register. |
|  | The signature generating condition is as follows: |  |
|  | MISRCR.MISR1EN $=1$ and MISRCR.MISR1CND $=0$ or |  |
|  | MISRCR.MISR2EN $=1$ and MISRCR.MISR2CND $=0$ |  |
|  |  |  |

### 38.7.4.5 MISRCR — Control Register

MISR control register is an 8-bit readable/writable register.
The MISR1EN and MISR2EN bits are used to enable signature generation in MISR1 and MISR2. When the MISR1EN or MISR2EN bit is 1, MISR1 or MISR2 generates a signature and retains the generated value. When the MISR1EN or MISR2EN bit is 0 , MISR1 or MISR2 does not generate signatures and the values of these registers are not updated.

When the MISR1EN or MISR2EN bit is 1, the MISR1CND or MISR2CND bit selects the signal generation condition for MISR1 or MISR2. Setting the MISR1CND or MISR2CND bit to 0 selects signature generation by MISR1 or MISR2 in register write mode, so writing to MISRCDR_* leads to signature generation. Setting the MISR1CND or MISR2CND bit to 1 selects signature generation by MISR1 or MISR2 in write monitoring mode. Writing by the CPU to the address range specified by the MISRBASEADR and MISRADRMSK registers leads to signature generation. For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

MISR1EN bit and MISR2EN bit are cleared by the signal from the signature compare part of the signature compare unit in automatic signature comparison. The clear timing is the next edge of the bus clock after the counter value set by the MISR data counter register (MISRDCNT_*) and the MISR compare data counter register (MISRCMPDCNT). After the clear, it is possible to set again the MISR1EN or MISR2EN in a state that the MISRDCNT_* matches MISRCMPDCNT however neither the signature nor the counter value is updated.

Table 38.446 MISRCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | MISR2CND | Controls the signature generation condition when MISR2EN is " 1 " <br> 0: Writing to MISRCDR <br> 1: Writing to the address range which is specified by BASEADR and ADRMSK |
| 2 | MISR1CND | Controls the signature generation condition when MISR1EN is " 1 " <br> 0 : Writing to MISRCDR <br> 1: Writing to the address range specified by BASEADR and ADRMSK |
| 1 | MISR2EN | MISR2 enable bit <br> 0 : Do not generate the MISR2 signature <br> 1: Generate the MISR2 signature by writing to MISRCDR and by writing to the address range specified BASEADR and ADRMSK |
| 0 | MISR1EN | MISR1 enable bit <br> 0 : Do not generate the MISR1 signature <br> 1: Generate the MISR1 signature by writing to MISRCDR and by writing to the address range specified BASEADR and ADRMSK |

### 38.7.4.6 MISRBASEADR — Monitoring Base Address Register

MISRBASEADR specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area mask address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

Table 38.447 MISRBASEADR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BASEADR[31:0] | Base address of the monitoring address range |

For the mechanism to judge access to the monitoring area, see Section 38.7.4.7, MISRADRMSK — Monitoring Address Mask Register.

### 38.7.4.7 MISRADRMSK — Monitoring Address Mask Register

MISRADRMSK specifies the CPU write access area to be monitored by MISG when signature generation in write monitoring mode is selected. In combination with the setting of the monitoring area base address register, this register specifies the address range of the monitoring area. For the conditions for signature generation, see Section 38.7.3.1, Conditions for Signature Generation.

Table 38.448 MISRADRMSK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADRMSK[31:0] | Mask address of the monitoring address range |

Figure 38.7 How to Detect Access to the Monitoring Area

### 38.7.4.8 MISRDCNTCTL — Data Counter Control Register

The MISR data counter control register is an 8-bit readable/writable register.
This register controls operation of the MISR data counter register. If the event selected by the CNTTRG bit occurs while the CNTSTA bit is 1 , the data counter is incremented. For operation of the data counter, see Section 38.7.3.3, Data Counter.

Value after reset: $\quad 00_{H}$

Table 38.449 MISRDCNTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CNTTRG | Selects the trigger to count up: |
|  | $0:$ Writing to the MISRCDR |  |
|  |  | 1: Writing to the address range specified by BASEADR and the ADRMSK |
| 0 | CNTSTA | Enables the counter when CNTSTA $=1$ and MISR1EN $=1$ or MISR2EN $=1$ |
|  | $0:$ Stop the data counter |  |
|  |  | 1: Enable the data counter: the count up trigger is selected by CNTTRG |

### 38.7.4.9 MISRDCNT — Data Counter Register

The data counter is a 16-bit readable/writable register.
If the data counter values of two signature generation units selected for comparison match, automatic comparison of the signatures proceeds.

When the CNTTRG bit in the data counter control register is 0 , the data counter is incremented by write access to the MISR calculation data register. When the CNTTRG bit in the data control register is 1 , the data counter is incremented by write access by the corresponding CPU to the address area specified by the MISRBASEADR and MISRADRMSK registers. For operation of the data counter, see Section 38.7.3.3, Data Counter.

Table 38.450 MISRDCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | DCNT[15:0] | The data counter register |

### 38.7.4.10 MISRCMPCTL — Comparator Control Register

MISRCMPCTL is an 8-bit readable/writable register.
This register controls the comparator that compares signatures generated in the signature generation units. For automatic comparison of signatures, see Section 38.7.3.2, Automatic Signature Comparison.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | $\begin{aligned} & \text { MISR2 } \\ & \text { CMPEN0 } \end{aligned}$ | - | - | - | MISR1 CMPEN0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R | R/W |

Table 38.451 MISRCMPCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | MISR2CMPEN0 | Controls comparator for MISR2 signatures specified by MISRCMPDSEL register |
|  |  | 0: Do not compare |
|  | 1: Compare |  |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 |  | Controls comparator for MISR1 signatures specified by MISRCMPDSEL register |
|  |  | 0: Do not compare |
|  |  | 1: Compare |

### 38.7.4.11 MISRCMPERSTR — Compare Error Status Register

The compare error status register is an 8-bit read-only register.
If a mismatch occurs in signature comparison enabled by the comparator control register, the corresponding error flag is set.

The error flag is cleared by writing 1 to the corresponding clear bit in the compare error status clear register. The flag is also cleared by a reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | MISR2ERR0 | - | - | - | MISR1ERR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 38.452 MISRCMPERSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | MISR2ERR0 | Indicates compare errors occurred in MISR2 signatures specified by MISRCMPDSEL register |
|  |  | 0: Signatures matched |
|  | 1: Signatures did not match |  |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 |  | Indicates compare errors occurred in MISR1 signatures specified by MISRCMPDSEL register |
|  |  | 0: Signatures matched |
|  |  | 1: Signatures did not match |

### 38.7.4.12 MISRCMPERRSTC — Compare Error Status Clear Register

The compare error status clear register is an 8-bit write-only register.
When an error flag in the compare error status register is 1 , writing 1 to corresponding clear bit clears the error flag. Read the MISR compare error status register and write 1 to the clear bit for the flag that is 1 .

See Section 38.7.5.3, Recommended Clear Flow of Error Flag regarding error flag clear.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | MISR2CLR0 | - | - | - | MISR1CLR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | w | R | R | R | W |

Table 38.453 MISRCMPERRSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | MISR2CLR0 | MISR2 signature compare error clear bit 0 |
|  |  | 1: Clear the MISR2ERR0 bit of MISRCMPERSTR register |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | MISR1CLR0 | MISR1 signature compare error clear bit 0 |
|  |  | 1: Clear the MISR1ERR0 bit of MISRCMPERSTR register |

### 38.7.4.13 MISRERRCTL — Error Notification Control Register

The error notification control register is an 8-bit readable/writable register.
This register enables or disables error notification when signatures are compared by the automatic signature comparison and do not mach. For the automatic signature comparison and error notification, see Section 38.7.3.2, Automatic Signature Comparison and Section 38.7.3.4, Error Notification.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 38.454 MISRERRCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CMPERREN | Comparison error notice permission bit |
|  |  | $0:$ Do not report the error when the signatures do not match |
|  |  | 1: Report the error when the signatures do not match |

### 38.7.4.14 MISRCMPDSEL — Compare Data Select Register

The compare data select register is an 8-bit readable/writable register.
This register selects the input data of signatures to be compared by the automatic signature comparison. For the automatic signature comparison and error notification, see Section 38.7.3.2, Automatic Signature Comparison and Section 38.7.3.4, Error Notification.

Value after reset: $\quad 03_{H}$

Table 38.455 MISRCMPDSEL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | MISGPESEL[1:0] | Specify the MISG modules whose signatures are to be compared |
|  |  | 111: Select MISG modules for PE1 and PE0 |
|  | Other: Setting prohibited |  |

### 38.7.4.15 MISRCMPDCNT — Compare Data Counter Register

The compare data counter register is a 16-bit readable/writable register.
This register sets the count value that stops the data counter of the signature generation unit in automatic signature comparison. For the automatic signature comparison and error notification, see Section 38.7.3.2, Automatic Signature Comparison and Section 38.7.3.4, Error Notification.

| Value after reset: FFFF $_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 38.7.5 Usage

### 38.7.5.1 Usage Example 1

MISG facilitates diagnosis of the self-diagnostic program. By using the MISG to compress intermediate transitions of the self-diagnostic program, the saving and comparison of all intermediate results becomes unnecessary. Results of self diagnosis including intermediate transitions can be judged by comparing the results of compression by the MISG with the expected results after the program ends.

This has the effect of reducing requirements for memory capacity and time for processing comparisons (substitution by CRCs is also possible).

## Example of settings (when PEm is running the self-diagnostic program)

The descriptions of MISG registers below applies to the registers of signature generation unit 1 (MISG_PEm), which is for PEm.
(1) Initialize the multi-input signature register 1 (MISR1) and multi-input signature register 2 (MISR2).
(2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 1 to select signature generation by MISR1 or MISR2 in write monitoring mode.
(3) Use the MISR monitoring base address register (MISRBASEADR) and MISR monitoring address mask register (MISRADRMSK) to set the address area for monitoring.
(4) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.
(5) Read the MISR control register (MISRCR) and execute "syncp" instruction to confirm MISR enabled.
(6) Run the self-diagnostic program on PEm.
(7) Upon completion of execution of the self-diagnostic program, MISR1 or MISR2 data is compared with the expected value in flash memory.

### 38.7.5.2 Usage Example 2

Use multiple processors to run the same processing (including the self-diagnostic program) to confirm the correctness of results. Comparing results from different hardware raises reliability.

## Example of settings (when PE0 and PE1 are running the same task)

The descriptions of MISG registers below applies to the MISG registers of PE0 and PE1.
(1) Initialize the multi-input signature register 1 (MISR1), multi-input signature register 2 (MISR2), and data counter register (MISRDCNT).
(2) Set the MISR1CND or MISR2CND bit in the MISR control register (MISRCR) to 0 to select signature generation by MISR1 or MISR2 in register write mode.
(3) Set the signature generation unit of PE0 and PE1 as the input of the signature compare part by using the MISR compare data select register (MISRCMPDSEL).
(4) Set the value of data counter for comparing the signatures by using the MISR compare data counter register (MISRCMPDCNT).
(5) Set MISR1CMPEN0 or MISR2CMPEN0 in the MISR comparator control register (MISRCMPCTL) to 1 to enable signature comparison by the comparator.
(6) Set the CMPERREN bit in the MISR error notification control register to 1 to enable error notification to the ECM.
(7) Set the CNTTRG bit in the MISR data counter control register (MISRDCNTCTL) to 0 to set writing to MISRCDR_* as the trigger for counting up by the data counter. Set the CNTSTA bit to 1 to enable operation of the data counter.
(8) Set the MISR1EN or MISR2EN bit in the MISR control register to 1 to enable signature generation in MISR1 or MISR2.
(9) Read the MISR control registers (MISRCR in MISG_PE0 and MISG_PE1) and execute "syncp" instruction to confirm MISR enabled.
(10) Run the self-diagnostic program on all CPUs.
(11) The self-diagnostic program stores intermediate results while the program is running in MISRCDR_* of the signature generation units. The signature comparison part stops the signature generation and the counting of data counter when it matches the value of the MISR compare data counter register (MISRCMPDCNT). Signature comparison is then performed when the data counters of both PE0 and PE1 reach the value of the MISR compare data counter register (MISRCMPDCNT).
(12) Check the comparison status register to see if there were any errors in comparison. See Section 38.7.5.3, Recommended Clear Flow of Error Flag regarding error flag clear.

### 38.7.5.3 Recommended Clear Flow of Error Flag

If the MISR compare error status clear register (MISRCMPERRSTC) clears the MISR compare error status register (MISRCMPERSTR) with signature mismatch and signature comparison enabled, the flag of MISR compare error is set again. Following shows the recommended clear flow of the error flag.
(1) Set the MISRiCMPENn bit in the MISR comparator control register (MISRCMPCTL) to 0 to disable the comparison.
(2) Clear the MISR compare error status register (MISRCMPERSTR) by the MISR compare error status clear register (MISRCMPERRSTC).
(3) Check if the MISR compare error status register (MISRCMPERSTR) is cleared.
(4) Initialize the multi-input signature register 1 (MISR1), multi-input signature register 2 (MISR2), and data counter register (MISRDCNT).

### 38.8 ECM

The ECM monitors various failure detection states in this microcontroller, and defines the operation to be carried out upon failure detection. For the details of the ECM, see Section 39, Error Control Module (ECM).

### 38.9 Voltage Monitor

The Voltage Monitor detects over and under voltage of the voltage domains, E0VCC, VCC and VDD. For the details of the Voltage Monitor, see Section 12, Power Supply Voltage Monitor.

### 38.10 Clock Monitor

The Clock Monitor detects abnormal frequencies of internal clocks related to the safety of the device. For the details of the Clock Monitor, see Section 14, Clock Monitor.

### 38.11 Data CRC Function

The Data CRC Function generates CRC to verify the data streams protected by CRC. For the details of the Data CRC Function, see Section 40, Data CRC Function B (DCRB).

## Section 39 Error Control Module (ECM)

### 39.1 Features

### 39.1.1 Number of Units and Channels

This microcontroller has the following number of ECM unit.
Table $39.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Name | ECM | ECM |

Table 39.2 Number of Units

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Name | ECM | ECM |

Table 39.3 Index

| Index | Meaning |
| :--- | :--- |
| $m$ | Throughout this section, the individual ECM Master and ECM Checker are identified by the index " $m$ " ( $\mathrm{m}=\mathrm{M}, \mathrm{C}$ ). |

### 39.1.2 Register Base Address

ECM base addresses are listed in the following table.
ECM register addresses are given as offsets from the base addresses in general.
Table 39.4 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ECMM_base> | FFCB $0000_{\mathrm{H}}$ | Peripheral Group 6 |
| <ECMC_base> | FFCB $1000_{\mathrm{H}}$ | Peripheral Group 6 |
| <ECM_base> | FFCB $2000_{\mathrm{H}}$ | Peripheral Group 6 |

### 39.1.3 Clock Supply

Clock supply by and to ECM is listed in the following table.
Table 39.5 Clock Supply

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- |
| ECM | PCLK | CLK_LSB |
|  | cntclk $^{\star 1}$ | CLK_WDTICUM |

Note 1. cntclk is used for delay timer and clear mask timer logics

### 39.1.4 Interrupt Requests

ECM interrupt requests are listed in the following table. The interrupt request signal is driven to the high level with a pulse width of one PCLK cycle when the error source status flag of an error source for which interrupt generation is enabled is set.

Table 39.6 Interrupt Requests

| Interrupt Symbol <br> Name | Unit Interrupt Signal | Description | Interrupt <br> Number | sDMA Trigger <br> Number | DTS Trigger |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Number |  |  |  |  |  |

### 39.1.5 Reset Sources

ECMM, ECMC and ECM reset sources are listed in the following table. ECMM, ECMC and ECM are initialized by these reset sources.

## Table 39.7 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | ystem Re |  |  |  |  |  |
| Unit Name | Register Name | Power Up <br> Reset | Stanby Reset | External Reset | VMON Reset | System Reset2 | Application Reset | Module Reset | JTAG <br> Reset |

| ECM Master Registers |  |
| :--- | :--- |
| ECMM | ECM master error set trigger register |
| ECMM | ECM master error clear trigger register |
| ECMM | ECM master error source status register n*1 |

ECM Checker Registers

| ECMC | ECM checker error set trigger register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ECMC | ECM checker error clear trigger register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECMC | ECM checker error source status register $\mathrm{n}^{\star 1}$ | $\checkmark$ | $\checkmark$ | $(-)$ | $X$ | - | - | - | - |

| ECM Common Registers |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ECM | ECM error pulse configuration register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM maskable interrupt configuration register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM FE level interrupt configuration register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM internal reset configuration register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM error mask register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM error source status clear register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM key-code protection register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

| ECM Common Registers |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ECM | ECM pseudo error trigger register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM delay timer control register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM delay timer register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM delay timer compare register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM maskable interrupt delay timer configuration register $\mathrm{n}^{* 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM FE level interrupt delay timer configuration register $\mathrm{n}^{\star 1}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ECM | ECM error output clear invalidation configuration register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
| ECM | ECM pseudo error mask register | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

Note: $\quad \checkmark$ : Register is initialized by reset, —: Register is not initialized by reset, $X$ : Undefind value $(-)$ : When the terminal RESET is asserted during reset sequence including BIST execution by external / internal reset, it will become $X$.
Note 1. $\mathrm{n}=0$ to 9

### 39.1.6 External Input and Output Signals

External Input/output signals of ECM are listed below.
Table 39.8 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| ERROROUT_M | Error output master signal | $\overline{\text { ERROROUT_M }}$ |
| ERROROUT_C | Error output checker signal | $\overline{\text { ERROROUT_C }}$ |
| ERRORIN | Error input signal | $\overline{\text { ERRORIN }}$ |

### 39.2 Overview

### 39.2.1 Specification Overview

ECM (Error Control Module) collects error signals coming from different error sources and monitoring circuits. It also outputs error signals from the error pins ( ERROROUT_M, ERROROUT_C ) and generates interrupts and Error Control Module Reset signals. Table 39.9 shows the specification overview of ECM.

Table 39.9 Specification Overview

| Item | Description |
| :---: | :---: |
| Safety processing | ECM can handle the following processing in response to error signal inputs from individual modules. <br> - Error flag set <br> - El level interrupt generation <br> El level interrupt generation can be controlled (enabled/disabled) for individual errors. <br> - DCLS error interrupt generation <br> DCLS error interrupt generation (El level) can be controlled (enabled/disabled) for individual errors. Count the DCLS error and error message based on the DCLS error happen times are reported. 2bit status register for counting the DCLS error, the max count is 3 . <br> - FE level interrupt generation <br> FE level interrupt generation can be controlled (enabled/disabled) for individual errors. <br> - Internal reset generation <br> System reset 2 or Application reset generation can be controlled (enabled/disabled) for individual errors. <br> - Error pin output Pin output mask can be controlled (enabled/disabled) for individual errors. Output can be toggled in response to a timer input or made at a fixed level. |
| Error status | ECM incorporates error source status registers, which can be used to confirm the error status from the error flag. <br> The error flags are only cleared by a power up reset or Standby Reset (System reset 1). In case of External reset (System reset1), System reset2, Application reset, Module reset and JTAG reset, the error flags are kept and the reset generation source can be confirmed by reading the status register after reset. |
| Debug, self-diagnosis | - Pseudo errors can be generated for debug and self-diagnosis. <br> The operation during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the masking of the error pin output, interrupt, or Error Control Module Reset apply in the same way. <br> - ECM incorporates a loop-back function of the error pin output that is used to diagnose the path to the error output pin. The status of the error output pin is reflected to an internal register and can be confirmed by reading the register. |
| Timeout function | ECM incorporates a function that generates an error signal output or Error Control Module Reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. |
| Port safe state | ERROROUTZ connects to port safe state and ECM can control the state of general purpose I/O to a condition according to user configuration. Configuration state is Hi-Z, Low and High output. For details of function, see Section 2, Pin Function. |
| Register protection | A write-protection with a key code is implemented to protect registers from illegal write access. For details of function, see Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register. |
| ERROROUT clear masking | ECM incorporates a function that can mask software clearance of ERROROUT until the counter which is started from error occurrence reaches the value specified in the Error Output Clear Invalidation Configuration register. If another error occurs during time counting, then the time count is reset and restarted from 0. |
| Others | ECM is duplexed. ECM incorporates the error output pin. |

### 39.2.2 Block Diagram

ECM is redundantly implemented using ECM Master and ECM Checker. See Figure 39.1 Connection of two ECM and Figure 39.2 Connection between ECM Master, ECM Checker and peripherals.

Figure 39.1 Connection of ECM

Figure 39.2 Connection between ECM Master, ECM Checker and Peripherals

## CAUTION

Pay attention to the difference in output voltage between the $\overline{\text { ERROROUT_M }}$ and
ERROROUT_C pins because different power supply systems are used for those pins.
$\overline{\text { ERROROUT_M }}$ pin: SYSVCC (5 V / 3.3 V )
ERROROUT_C pin: EOVCC (5 V) for P01_7, P15_7, P22_5 and P32_3; E1VCC (5 V / 3.3 V) for P11_2; E2VCC (5 V / 3.3 V ) for P12_8

### 39.2.3 Error Input

Table 39.10 shows the error inputs to ECM of E2x-FCC1.
Table 39.11 shows the error inputs to ECM of E2M.
"一": not covered, " $\checkmark$ ": covered, gray hatching: its number is reserve bit.

Note 1. The internal reset generation is enabled in the initial state.
Note 2. Please enable DNF for noise elimination if ERRORIN function is used. There is a possibility that ECMmESSTRn for ERRORIN is set. Therefore please set ECMEMKn for ERRORIN before setting DNF and clear ECMESSTCn for ERRORIN after setting DNF. Then please clear ECMEMKn if needed. About DNF setting flow, refer to Section 2.6.1.2, Peripheral Function DNF.
Note 3. BUS routing checker can detect an unintended routing on internal bus.

Note 1. The internal reset generation is enabled in the initial state.
Note 2. Please enable DNF for noise elimination if ERRORIN function is used. There is a possibility that ECMmESSTRn for ERRORIN is set. Therefore please set ECMEMKn for ERRORIN before setting DNF and clear ECMESSTCn for ERRORIN after setting DNF. Then please clear ECMEMKn if needed. About DNF setting flow, refer to Section 2.6.1.2, Peripheral Function DNF.
Note 3. BUS routing checker can detect an unintended routing on internal bus.

### 39.2.4 Operations for Error Output

After reset release, the $\overline{\text { ERROROUT_M }}$ pin outputs the low (error) level. Follow the procedure described in Section 39.3.3, ECMmECLR - ECM Master/Checker Error Clear Trigger Register ( $\mathbf{m}=\mathbf{M} / \mathrm{C}$ ) , to clear the error before using ECM. As the ERROROUT_C pin is multiplexed with a general-purpose port and other functions, select the ERROROUT_C function before use. For settings, see Section 2, Pin Function.

The error output can be configured for two different modes of operation, non-dynamic or dynamic.
The error output is in synchronization with the occurrence of error source conditions and the error level is output as the pin state regardless of the dynamic mode pulse cycle.

ERROROUTZ connects to port safe state and ECM can control the state of general purpose I/O to a condition according to user configuration. For details of function, see Section 2, Pin Function. ERROROUTZ can be used as only nondynamic mode.

Table 39.12 Operation for Error Output

|  | Operating Mode <br> Error Status <br> ECMmSSE | ECMEPCFG.ECMSLO | Error Output |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Bit |  |  |  |

Note 1. The level of the error output ( $\overline{E R R O R O U T \_M}$ and $\overline{E R R O R O U T \_C}$ ) and ERROROUTZ can be masked by ECMEMKn registers value.

### 39.2.5 $\overline{\text { ERROROUT_M }}$ and $\overline{E R R O R O U T \_C ~ B e h a v i o r ~ a t ~ R e s e t ~}$

Below table explains the behavior of the error output logic and the $\overline{\text { ERROROUT_M }}$ and $\overline{\text { ERROROUT_C }}$ pins at reset. Also the level of the $\overline{\text { ERROROUT_M }^{\prime}}$ and $\overline{\text { ERROROUT_C }}$ signals during and after reset is explained.

Table $39.13 \quad \overline{\text { ERROROUT_M }}$ Behavior at Reset

| Category | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| ERROROUT_M <br> pin level during <br> reset | Low level | Low level | Level according <br> to error status <br> before reset ${ }^{* 1}$ | Level according <br> to error status <br> before reset ${ }^{* 1}$ | Level according <br> to error status <br> before reset | Level according <br> to error status <br> before reset |
| ERROROUT_M <br> pin level after <br> reset | Low level | Low level | Level according <br> to error status <br> before reset | Level according <br> to error status <br> before reset | Level according <br> to error status <br> before reset | Level according <br> to error status <br> before reset |

Note 1. The level of the ERROROUT_M can be changed by clearing ECMEMKn registers at reset. To keep the level, it is necessary to clear the ECMMESSTRn bit which corresponds to ECMEMKn bit of setting which masked error signal output before reset.

Table $39.14 \overline{\text { ERROROUT_C }}$ Behavior at Reset

| Category | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| ERROROUT_C <br> pin level after reset | Hi-Z | Hi-Z | Hi-Z | Level according <br> to error status <br> before reset | Level according <br> to error status <br> before reset |  |

### 39.2.5.1 Dynamic Mode Enable

1. Initialize the related timer OSTM0.
2. Set the error output to high level by setting the ECMmECT $(m=M / C)$ bit in the ECM master/checker error clear trigger register to 1.
3. Set the ECMEPCFG.ECMSL0 bit to 1 for dynamic mode.
4. Start the timer OSTM0.

### 39.2.5.2 Dynamic Mode Disable

1. Set the error output to low level by setting the ECMmEST bit $(m=M / C)$ in the ECM master/checker error set trigger register to 1 .
2. Stop the timer OSTM0.
3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

### 39.2.6 Loop-Back Function

ECM incorporates a loop-back function that is used to check the path to the error output pin. The output level of the error output pin can be checked with the ECMmSSE311 bit ( $\mathrm{m}=\mathrm{M} / \mathrm{C}$ ) in the ECM master/checker error source status register 9.

### 39.2.7 Pseudo Error Generation

ECM incorporates a function that can generate pseudo errors for test or debug purposes. The operation of the ECM during injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for error masks, interrupt, internal reset, or delay timer apply in the same way.

### 39.2.8 Error Status

The error status is indicated by ECM master/checker error source status registers. The error status is only cleared by writing to ECMESSTCn, power up reset or standby reset. In case of reset except for power up reset and standby reset, the error status is kept and the error that triggered the reset can be confirmed by reading the ECM master/checker error source status registers after reset release.

### 39.2.9 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.
By releasing the protection of ECMKCPROT, it can be written. For details, see Section 39.3.11, ECMKCPROT ECM Key Code Protection Register.

### 39.2.10 Timeout Function for Interrupt Processing

The delay timer incorporated in ECM can be started simultaneously with the occurrence of an interrupt request. ECM incorporates a function that generates an error signal output or Error Control Module Reset when the count value of the delay timer matches with the value of the delay timer compare register because the delay timer was not stopped during the interrupt processing. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0 . Configure the duration until an Error Control Module Reset or error output is generated with the settings of the delay timer compare register.

In response to the occurrence of a new error source condition with the setting to start the delay timer while the delay timer is operating, the counter value of the delay timer which is currently operating is not reset. Instead, counting by the timer continues.

### 39.2.11 Masking of "Error Clear Trigger Registers"

The active error output status must be cleared by software via the Error clear trigger registers
(ECMMECLR/ECMCECLR). A minimum activation time of the error output is achieved by the Error output clear invalidation counter. This counter is (re)started each time a new error event is triggered at the ECM. It counts up from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$. Error output clear by software is not possible unless this counter reaches the compare value configured in the ECMEOCCFG register. If Error output clear invalidation counter is still running, Error output clear is masked and Error output clear request by software is ignored.

### 39.2.12 DCLS Error Interrupt (EI Level) and EI Level Interrupt

This module can generate specific interrupts of DCLS error for each CPU. When DCLS error is occurred in the state of setting the ECMMICFG0, DCLS error interrupt and EI level interrupt are generated. The following figure shows the generation logic of DCLS error interrupt and EI level interrupt from ECM. For each PEn ( $\mathrm{n}=0,1$ ), EI level interrupt of CPUn is generated by EI level interrupt from ECM master, ECM checker and other DCLS error interrupt except self's DCLS error interrupt being OR-ed.

Figure 39.3 DCLS Error Interrupt (EI Level) and El Level Interrupt

### 39.3 Register Specification

### 39.3.1 List of Registers

ECM consists of three address areas: ECM master, ECM checker, ECM common.
The following shows the register map of the ECM master and checker registers.
Table 39.15 Address List of ECM Master and Checker Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |

| ECM | ECM Pseudo Error Mask Register | ECMPEM | <ECM_base> + 158 ${ }_{\text {H }}$ | 32 | - |

Note 1. $\mathrm{n}=0$ to 9

The register areas of the ECM registers are common to the redundancy area to be implemented. Writes to the common register areas are conducted simultaneously. The common area for ECM master is read by reading access to the common area. The ECM master register and the ECM checker register represent the address areas which can be written separately.

### 39.3.2 ECMmESET - ECM Master/Checker Error Set Trigger Register (m = M/C)

The ECM Master/Checker Error Set Trigger Register is for setting the error signal from the error pin to the low level. When the ECMmEST bit is set to 1 , the error pin outputs the low level. The output cannot be masked. This registers is also the trigger for the port safe state function. When Error signal output is set, each port state will be changed to a condition according to user's setting. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register for the details of key code protection. This register is always read as $00_{\mathrm{H}}$.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | $\begin{gathered} \text { ECMm } \\ \text { EST } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 39.17 ECMmESET Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECMmEST | Error set trigger bit |
|  | $0:$ Writing 0 is invalid |  |
|  | $1:$ Sets the output level from the error pin to the active (low) level. |  |

## CAUTIONS

Setting or clearing the error output from the $\overline{\text { ERROROUT_M }}$ and ERROROUT_C pin via the ECMmESET or ECMmECLR register will set the ECMmSSE308 bit of the ECMmESSTR9 register (ECM compare error). Therefore, the ECMmESET register has to be set following the sequence below.

1. Set the MSKM bit and MSKC bit of the ECMPEM register to "masked".
2. Set the ECMmEST bit in the ECMmESET register.
3. Wait until ERROROUT_M and ERROROUT_C become low by checking that the ECMmSSE311 bit of the ECMmESSTR9 register is " 0 ".
4. Set the MSKM bit and MSKC bit of the ECMPEM register to "not masked".

### 39.3.3 ECMmECLR - ECM Master/Checker Error Clear Trigger Register ( $m=M / C$ )

The ECM Master/Checker Error Clear Trigger Register is for setting the error signal from the error pin to the high level (toggle). When the ECMmECT bit is set to 1, the error pin outputs the high level (toggle) as long as there are no other sources that set the error pin to the low level. This registers is also the trigger for the port safe state function. When Error signal output is cleared, each port state will be changed to a condition according to user's setting. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register for the details of key code protection. This register is always read as $00_{\mathrm{H}}$.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | $\begin{gathered} \text { ECMm } \\ \text { ECT } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 39.18 ECMmECLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ECMmECT | Error clear trigger bit |
|  | $0:$ Writing 0 is invalid |  |
|  | 1: Sets the output level from the error pin to the inactive (high) level. |  |
|  |  |  |

## CAUTIONS

Clearing of the error pin is only possible if all errors, not masked by ECMEMK registers, are cleared beforehand.
Setting or clearing the error output via the ECMmECLR register will generate an error. Therefore, the following has to be set in advance. The sequence below is executed by either CPU.

1. Set the MSKM bit and MSKC bit of the ECMPEM register to "masked".
2. Set the ECMmECT bit in the ECMmECLR register.
3. Wait until ERROROUT_M and ERROROUT_C become high by reading ECMmSSE311 bit of ECMmESSTR9 register 5 times. After that, check that the ECMmSSE311 bit of the ECMmESSTR9 register is " 1 ". If the ECMmSSE311 bit of the ECMmESSTR9 register is not " 1 ", a new error may have occurred.
4. Set the MSKM bit and MSKC bit of the ECMPEM register to "not masked".

Note: This procedure is used when the ECMEOCCFG register is not set.

NOTE
If the Error Pin Low Time counter is still running, the Error Output clear function is masked and Error Output clear requests are ignored. Error Output clear function is executed, after the Error Pin Low Time Counter has expired and the Error Output clear register is written.

The configuration flow of port safe state mode must be set after error signal is cleared by the ECMmECLR register. For the configuration flow of port safe state mode setting, see Section 2.6.2.3, Configuration Flow.

### 39.3.4 ECMmESSTR0 to ECMmESSTR9 - ECM Master/Checker Error Source Status Register 0 to 9 ( $m=M / C$ )

The ECM Master/Checker Error Source Status Registers 0 to 9 are read-only registers.
This register represents the status of individual internal error sources, and is unrelated to the setting of the error mask.
ECMmSSEs are provided for the each status of individual internal error sources.
ECMmSSE001-ECMmSSE000 are status bits for counting DCLS error from PE1-PE0. To each DCLS error from each CPU, 2bit expanded status register is prepared for counting the DCLS error. If DCLS error occurs when these bits are " $11_{\mathrm{B}}$ ", these bits keep the values.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| NOTE |  |  |

Reserved bit
The read value of ECMmSSE bit listed as reserved in Table 39.10, Table 39.11 is undefined. Please mask these values of reserve bit when user confirms ECMmESSTRn.

### 39.3.5 ECMEPCFG - ECM Error Pulse Configuration Register

The ECM Error Pulse Configuration Register is a read/write register. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ECMSLO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 39.22 ECMEPCFG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value afer reset. |
| 0 | ECMSLO | Error pin operation configuration bit |
|  | Error output operation setting for the error pin |  |
|  | $0:$ Non-dynamic mode |  |
|  | 1: Dynamic mode |  |

In Dynamic mode the timer output OSTM0 determines the output wave of the $\overline{\text { ERROROUT_M }}$ and $\overline{\text { ERROROUT_C }}$ pin in case of no error.

## CAUTION

After setting the dynamic mode, it is recommended not to change to non-dynamic mode again, because this can cause a glitch in the error output.

### 39.3.6 ECMMICFG0 to ECMMICFG9 - ECM Maskable Interrupt Configuration Register 0 to 9

The ECM Maskable Interrupt Configuration Registers 0 to 9 are used to set the generation of the INTECMMI interrupts (EI level interrupts) and the INTECMDCLSMI interrupts (EI level interrupts) when DCLS error occurs. The generation of EI level interrupts in response to errors can be enabled. Writing to these registers are protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 29 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 28 to 27 | ECMMIE308 to | ECM maskable interrupt generation control bit |
|  | ECMMIE307 | ECMMIE308 to ECMMIE307 correspond to error sources 308 to 307. |
|  |  | $0:$ Interrupt generation disabled |
|  |  | 1: Interrupt generation enabled |
| 26 | ECMMIE305 to | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 0 | ECMMIE280 | ECMMIE305 to ECMMIE280 correspond to error sources 305 to 280. |
|  |  | 0: Interrupt generation disabled |
|  |  |  |

Reserved bit
The value of ECMMIE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When read, the value after reset is returned. When writing, write the value after reset.

### 39.3.7 ECMNMICFG0 to ECMNMICFG9 - ECM FE Level Interrupt Configuration Register 0 to 9

The ECM FE Level Interrupt Configuration Registers 0 to 9 are used to set the generation of INTECMNMI interrupts (FE level interrupt). Writing to these registers are protected by ECMKCPROT. Refer to Section 39.3.11,
ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Value after reset: $\quad 00000000_{H}$

| 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 0 | ECMNMIE305 to ECMNMIE280 | ECM FE level interrupt generation control bit ECMNMIE305 to ECMNMIE280 correspond to error sources 305 to 280. <br> 0 : Interrupt generation disabled <br> 1: Interrupt generation enabled |
| NOTE |  |  |

Reserved bit
The value of ECMNMIE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When read, the value after reset is returned. When writing, write the value after reset.

### 39.3.8 ECMIRCFG0 to ECMIRCFG9 - ECM Internal Reset Configuration Register 0 to 9

The ECM Internal Reset Configuration Registers 0 to 9 are used to set the generation of Error Control Module Reset in response to internal errors. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Value after reset: $00010000_{\mathrm{H}}$ (ECMIRCFG0), $0000{00000_{\mathrm{H}} \text { (ECMIRCFG1 to ECMIRCFG9) }}^{\text {(ECF }}$

| NOTE |  |  |

## Reserved bit

The value of ECMIRE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When read, the value after reset is returned. When writing, write the value after reset.

### 39.3.9 ECMEMK0 to ECMEMK9 — ECM Error Mask Register 0 to 9

The ECM Error Mask Registers 0 to 9 are used to mask the individual error sources of the error pin output. This registers is also the trigger for the port safe state function. When Error signal output is not masked, each port state will be changed to a condition according to user's setting. Writing to this register is protected by ECMKCPROT. Refer to
Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

## Value after reset: $\quad 00000000_{H}$

Table 39.34 ECMEMK9 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value to "1". |
| 29 | ECMEMK309 | ECM error output signal mask control bit |
|  |  | ECMEMK309 corresponds to delay timer overflow. |
|  |  | 0: Error signal output is not masked |
|  |  | 1: Error signal output is masked |
| 28 to 27 | ECMEMK308 to ECMEMK307 | ECM error output signal mask control bit |
|  |  | ECMEMK308 to ECMEMK307 correspond to error sources 308 to 307. |
|  |  | 0: Error signal output is not masked |
|  |  | 1: Error signal output is masked |
| 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value to " 1 ". |
| 25 to 0 | ECMEMK305 to | ECM error output signal mask control bit |
|  | ECMEMK280 | ECMEMK305 to ECMEMK280 correspond to error sources 305 to 280. |
|  |  | 0 : Error signal output is not masked |
|  |  | 1: Error signal output is masked |

## NOTES

1. Error mask specification

If an error flag is set but masked, clearing the mask will set the $\overline{\text { ERROROUT_M }}, \overline{E R R O R O U T}$ _C and ERROROUTZ to active low level. This happens independently from the time of the error occurrence. In other words, the flag is evaluated statically.
2. Reserved bit

Please set the value of ECMEMK bit listed as reserved in Table 39.10, Table 39.11 to " 1 ".

### 39.3.10 ECMESSTC0 to ECMESSTC9 - ECM Error Source Status Clear Trigger Register 0 to 9

The ECM Error Source Status Clear Trigger Registers 0 to 9 are a write-only register and can be written in 32-bit units. These registers are used to clear the individual error source status of the ECM master/checker error source status registers 0 to 9 . Both the error status of the ECM master and the ECM checker are cleared simultaneously.

Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key
Code Protection Register.

## Value after reset: $00000000_{\mathrm{H}}$

|  |  | $0:$ Corresponding error status unchanged |
|  | 1: Corresponding error status cleared |  |
| 29 | ECMCLSSE309 | ECM error status clear bit |
|  |  | ECMCLSSE309 corresponds to ECMmSSE309. |
|  | $0:$ Corresponding error status unchanged |  |
|  |  | 1: Corresponding error status cleared |
| 28 to 0 |  | ECM error status clear bit |
|  | ECMCLSSE280 | ECMCLSSE308 to ECMCLSSE280 correspond to ECMmSSE308 to ECMmSSE280. |
|  |  | $0:$ Corresponding error status unchanged |
|  |  | 1: Corresponding error status cleared |

## NOTE

Reserved bit
The value of ECMCLSSE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When writing, write the value after reset.

### 39.3.11 ECMKCPROT - ECM Key Code Protection Register

The ECM Key Code Protection Register is used for protection against writing operation to the configuration registers.

| Value after reset: |  |  | 0000 0000н |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 39.38 ECMKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

### 39.3.12 ECMPE0 to ECMPE9 - ECM Pseudo Error Trigger Register 0 to 9

The ECM Pseudo Error Trigger Registers 0 to 9 are write-only registers. These registers are used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that of a real error source. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT ECM Key Code Protection Register, for the details of key code protection.

## Value after reset: $00000000_{\mathrm{H}}$

## ECMPE0

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 39.41 ECMPE9 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 29 | ECMPE309 | ECM pseudo error trigger bit |
|  |  | ECMPE309 corresponds to delay timer overflow. |
|  |  | 0: Pseudo error is not generated. |
|  |  | 1: Pseudo error is generated. |
| 28 | ECMPE308 | ECM pseudo error trigger bit |
|  |  | ECMPE308 corresponds to error source 308. |
|  |  | 0: Pseudo error is not generated. |
|  |  | 1: Pseudo error is generated. |
| 27, 26 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 25 to 0 | ECMPE305 to ECMPE280 | ECM pseudo error trigger bit |
|  |  | ECMPE305 to ECMPE280 correspond to error sources 305 to 280. |
|  |  | 0: Pseudo error is not generated. |
|  |  | 1: Pseudo error is generated. |

## NOTE

Reserved bit
The value of ECMPE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When writing, write the value after reset.

### 39.3.13 ECMDTMCTL — ECM Delay Timer Control Register

The ECM Delay Timer Control Register is a read/write register. This register is used to control the delay timer. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | DTMSTACNTCL | - | - | DTMSTP | DTMSTA |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | R/W |

Table 39.42 ECMDTMCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | DTMSTACNTCLK | Delay timer start confirmation status. |
|  |  | 0: Delay timer does not start |
|  |  | 1: Delay timer starts. |
| 3, 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | DTMSTP | Delay timer stop bit |
|  |  | By writing " 1 " to this bit, delay timer is stopped (writing 0 is ignored). Simultaneously, DTMSTA bit will be 0 . |
|  |  | 0 : Delay timer is completed or stop request is not in progress. |
|  |  | 1: Stop request for delay timer is in progress. |
| 0 | DTMSTA | Delay timer start bit |
|  |  | Specifies the operation of the delay timer at the occurrence of an error event. |
|  |  | 0 : Delay timer does not start |
|  |  | 1: Delay timer starts |
| NOTES |  |  |

1. ECMDTMCTL register can be accessed via P-Bus but delay timer runs with not P-Bus clock but dedicated counter clock.
Therefore, time lag exists between writing of ECMDTMCTL and enabling of delay timer.
DTMSTACNTCLK can be used to confirm whether delay timer is enabled or not. Reconfirm that DTMSTA has been updated by checking DTMSTACNTCLK after writing to DTMSTA.
2. ECMDTMCTL register can be written only when (DTMSTA, DTMSTACNTCLK) $=(0,0)$ or $(1,1)$. Confirm the values of DTMSTA and DTMSTACNTCLK before writing to ECMDTMCTL.
3. The delay timer needs 3 clocks of cntclk until it stops an overflow certainly.

Please consider to set the sufficient value to ECMDTMCMP[15:0].

### 39.3.14 ECMDTMR — ECM Delay Timer Register

The ECM Delay Timer Register is a read-only register. The ECM delay timer register is initialized by setting the ECMSTA bit of the ECM delay timer control register from 1 (timer in operation) to 0 (timer stopped).

Table 39.43 ECMDTMR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | ECMDTMR[15:0] | Delay timer counter value. |

### 39.3.15 ECMDTMCMP - ECM Delay Timer Compare Register

The ECM Delay Timer Compare Register is a read/write register. The ECMmESSTR9.ECMmSSE309 bit is set when the value of this register matches with the value of the ECM delay timer register. Writing data to this register has to be conducted while the delay timer is stopped. Writing to this register is protected by ECMKCPROT. Refer to Section
39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Table 39.44 ECMDTMCMP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | CMPW | Indicates whether a write to the counter clock region of the ECMDTMCMP register setting is in progress |
|  |  | 0 : Not in progress |
|  |  | 1: In progress. While the bit is set, further setting to the ECMDTMCMP is prohibited. |
| 15 to 0 | ECMDTMCMP[15:0] | Delay timer compare value |
| NOTES |  |  |

1. ECMDTMCMP register is set via P-bus, however actual delay timer exists in a different clock domain. When ECMDTMCMP is configured, the value is copied across clock domains to reflect to the delay timer, which takes a certain time. CMPW indicates whether reflecting the new ECMDTMCMP value across clock domains is in progress.
2. While CMPW is " 1 ", further setting to ECMDTMCMP is ignored.

Please confirm CMPW $=0$, before writing of ECMDTMCMP.

### 39.3.16 ECMMIDTMCFG0 to ECMMIDTMCFG9 - ECM Maskable Interrupt Delay Timer Configuration Register 0 to 9

The ECM Maskable Interrupt Delay Timer Configuration Registers 0 to 9 are used to enable/disable the delay timer start caused by EI level interrupts in response to errors. Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

## NOTE

Reserved bit
The value of ECMMITE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When read, the value after reset is returned. When writing, write the value after reset.

### 39.3.17 ECMNMIDTMCFG0 to ECMNMIDTMCFG9 - ECM FE Level Interrupt Delay Timer Configuration Register 0 to 9

The ECM FE Level Interrupt Delay Timer Registers 0 to 9 are used to set enable/disable of the delay timer start caused by FE level interrupts in response to errors. Writing to this register is protected by ECMKCPROT. Refer to Section
39.3.11, ECMKCPROT - ECM Key Code Protection Register, for the details of key code protection.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 39.50 ECMNMIDTMCFG9 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 28 to 27 | ECMNMITE308 to ECMNMITE307 | ECM delay timer start control bit ECMNMITE308 to ECMNMITE307 correspond to FE level interrupts generated by error sources 308 to 307. <br> 0 : Delay timer start disabled <br> 1: Delay timer start enabled |
| 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 0 | ECMNMITE305 to ECMNMITE280 | ECM delay timer start control bit ECMNMITE305 to ECMNMITE280 correspond to FE level interrupts generated by error sources 305 to 280. <br> 0 : Delay timer start disabled <br> 1: Delay timer start enabled |

## NOTE

Reserved bit
The value of ECMNMITE bit listed as reserved for the given error input numbers in Table 39.10, Table 39.11. When read, the value after reset is returned. When writing, write the value after reset.

### 39.3.18 ECMEOCCFG - ECM Error Output Clear Invalidation Configuration Register

This register is a read/write register and can be written in 32-bit units.
After counter for Error Output clear invalidation exceed the value which is configured to this register, it is possible to clear non-safe status of error output by SW.

Configure to this register only if error output status is safe.
Writing to this register is protected by ECMKCPROT. Refer to Section 39.3.11, ECMKCPROT - ECM Key
Code Protection Register, for the details of key code protection.

Table 39.51 ECMEOCCFG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | EOCIEN | ERROROUT Clear Invalidation Function Enabled <br> 0: Disabled <br> 1: Enabled |
| 30 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | CMPW | Indicates on execution of ECMEOUTCLRT[15:0] register setting to counter clock domain <br> 0 : Not in progress <br> 1: In progress. While the bit is set, further setting to the ECMEOUTCLRT is prohibited. |
| 15 to 0 | ECMEOUTCLRT [15:0] | The number of clock cycles after which it is possible to clear error output by SW. |

## NOTES

1. ECMEOCCFG register is set via P-bus, however actual "output clear invalidation counter" exists in a different clock domain. When ECMEOCCFG is configured, the value is copied across clock domains to reflect to the counter, which takes a certain time.CMPW indicates whether the reflection across clock domains is in progress.
2. While CMPW is " 1 ", writing of ECMEOUTCLRT[15:0] is ignored. Please confirm CMPW $=0$ before writing of ECMEOUTCLRT[15:0].

### 39.3.19 ECMPEM — ECM Pseudo Error Mask Register

This register can mask the pseudo error of "ECM compare error" to support self-diagnosis of the binding components for $\overline{\text { ERROROUT_M }}$ and ERROROUT_C $p i n s$.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 39.52 ECMPEM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | MSKM | 0: Pseudo error of "ECM compare error" for ECM master is NOT masked. |
|  |  | 1: Pseudo error of "ECM compare error" for ECM master is masked. |

## Section 40 Data CRC Function B (DCRB)

This section contains a generic description of Data CRC Function B (DCRB). The first part of this section describes the features specific to this product, such as the number of units and register base addresses. The remainder of the section describes the functions and registers of DCRB.

### 40.1 Features

### 40.1.1 Number of Units

This microcontroller has the following number of DCRB units.
Table 40.1 Number of Units

| Product Name | 373 Pins | 292 Pins |
| :--- | :--- | :--- |
| Number of Units | 3 | 3 |
| Name | DCRBn ( $\mathrm{n}=0$ to 2 ) | DCRBn ( $\mathrm{n}=0$ to 2 ) |

Note: " $n$ " in this section indicates the unit number of the individual DCRB units.
There are 373 pins in E2xFCC1 and E2M.

### 40.1.2 Register Base Addresses

DCRBn base addresses are listed in the following table. DCRBn register addresses are given as offsets from the base addresses in general.

Table 40.2 Register Base Addresses

| Base Address Name | Base Address | Peripheral Group |
| :--- | :--- | :--- |
| <DCRB0_base> | FFF7 $0000_{H}$ | 6 |
| <DCRB1_base> | FFF7 $1000_{H}$ | 6 |
| <DCRB2_base> | FFF7 $2000_{H}$ | 6 |

### 40.1.3 Clock Supply

The clock supply by and to DCRBn is given in the following table.
Table 40.3 Clock Supply

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- |
| DCRBn | PCLK | CLK_LSB |

### 40.1.4 Interrupt Requests

This module has no interrupt requests.

### 40.1.5 Reset Sources

The DCRBn reset sources are shown below. DCRBn is initialized by the following reset sources.
Table 40.4 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| DCRBn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 40.1.6 External Input/Output Signals

This module has no external input/output signals.

### 40.2 Overview

### 40.2.1 Functional Overview

Data CRC Function B can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- Supported CRC polynomials
- 32-bit Ethernet CRC
$04 \mathrm{C} 1 \mathrm{DDB}_{\mathrm{H}}: \mathrm{X}^{32}+\mathrm{X}^{26}+\mathrm{X}^{23}+\mathrm{X}^{22}+\mathrm{X}^{16}+\mathrm{X}^{12}+\mathrm{X}^{11}+\mathrm{X}^{10}+\mathrm{X}^{8}+\mathrm{X}^{7}+\mathrm{X}^{5}+\mathrm{X}^{4}+\mathrm{X}^{2}+\mathrm{X}^{1}+1$
- 16-bit CCITT CRC
$1021_{\mathrm{H}}: \mathrm{X}^{16}+\mathrm{X}^{12}+\mathrm{X}^{5}+1$
- 8-bit SAE J1850 CRC
$1 \mathrm{D}_{\mathrm{H}}: \mathrm{X}^{8}+\mathrm{X}^{4}+\mathrm{X}^{3}+\mathrm{X}^{2}+1$
- 8-bit 0x2F CRC
$2 \mathrm{~F}_{\mathrm{H}}: \mathrm{X}^{8}+\mathrm{X}^{5}+\mathrm{X}^{3}+\mathrm{X}^{2}+\mathrm{X}+1$
- CRC generation to an arbitrary data block length
- After initialization of the DCRB data register, every write access to the DCRB input register generates a new CRC according to the chosen polynomial and the result is stored in the DCRB data register.

### 40.2.2 Block Diagram

The following figure shows the block diagram of Data CRC Function B.

Figure 40.1 Block Diagram of Data CRC Function B

### 40.2.3 Configuration of CRC Calculation

- 32-bit Ethernet

- 16-bit CCITT

16-bit CCITT CRC data (DCRBnCOUT)

- 8-bit SAE J1850

8 bit-SAE J1850 CRC data (DCRBnCOUT)

- 8-bit 0x2F

## 8 bit-0x2F CRC data (DCRBnCOUT)

### 40.3 Registers

### 40.3.1 List of Registers

Table 40.5 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| DCRBn | DCRB Input Register | DCRBnCIN | <DCRBn_base> + 00 $H_{H}$ | 32 | - |
|  | DCRB Data Register | DCRBnCOUT | <DCRBn_base> + 04 ${ }_{H}$ | 32 | - |
|  | DCRB Control Register | DCRBnCTL | <DCRBn_base> + 20 $H_{H}$ | 8 | - |

### 40.3.2 DCRBnCIN — DCRB Input Register

This register holds the input data for CRC calculation. The effective bit width used for CRC calculation must be set by DCRBnCTL.DCRBnISZ[1:0].

When data is written to this register, the CRC code is generated. The CRC calculation is immediately started after the DCRBnCIN register is written. The DCRBnCOUT register must be initialized with the initial value before the first data of the data block is written to the DCRBnCIN register.

The byte order in DCRBnCIN depends on the selected CRC generating function:

- 32-bit Ethernet CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] $=00_{\mathrm{B}}$ )

The byte order is LSB (least significant byte) first. This means that if the CRC input bit width is 8 bits $\left(\operatorname{DCRBnISZ}[1: 0]=10_{\mathrm{B}}\right)$, the input values are in bits 7 to 0 of the DCRBnCIN register and bit 0 (the LSB) is the first bit of the input data.

- 16-bit CCITT CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] $=01_{\mathrm{B}}$ )

The byte order is MSB (most significant byte) first. This means that if the CRC input bit width is 8 bits (DCRBnISZ[1:0] = $10_{\mathrm{B}}$ ), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.

- 8-bit SAE J1850 CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] = $10_{\mathrm{B}}$ )

The byte order is MSB (most significant byte) first. This means that if the CRC input bit width is 8 bits $\left(\operatorname{DCRBnISZ}[1: 0]=10_{\mathrm{B}}\right.$ ), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.

- 8-bit 0x2F CRC polynomial generation (DCRBnCTL.DCRBnPOL[1:0] $=11_{\mathrm{B}}$ )

The byte order is MSB (most significant byte) first. This means that if the CRC input bit width is 8 bits
$\left(\operatorname{DCRBnISZ}[1: 0]=10_{\mathrm{B}}\right.$ ), the input values are in bits 7 to 0 of the DCRBnCIN register and bit 7 (the MSB) is the first bit of the input data.

Table 40.6 DCRBnCIN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DCRBnCIN[31:0] | Input data for CRC calculation. |
|  |  | The valid bits are: |

For 32 bit effective bit width: DCRBnCIN[31:0]
For 16 bit effective bit width: DCRBnCIN[15:0]
For 8 bit effective bit width: $\mathrm{DCRBnCIN}[7: 0]$

### 40.3.3 DCRBnCOUT — DCRB Data Register

This register stores the result of the CRC code generated by the CRC polynomial selected by
DCRBnCTL.DCRBnPOL[1:0].

Table 40.7 DCRBnCOUT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 0 | DCRBnCOUT[31:0] | Result of the CRC code generation. |
|  |  | When the 16 -bit CCITT polynomial is enabled, bits 15 to 0 show the CRC result. Bits 31 to 16 are undefined. |
|  |  | When 8-bit SAE J1850 or 8-bit 0x2F polynomial is enabled, bits 7 to 0 show the CRC result. Bits 31 to 8 are undefined. |
|  |  | When reading from this register, the value is XORed by hardware with the value described below for the chosen polynomial. |
|  |  | 32-bit Ethernet polynomial: FFFF FFFF ${ }_{\text {H }}$ |
|  |  | 16-bit CCITT CRC polynomial: $000{ }_{\text {H }}$ |
|  |  | 8-bit SAE J1850 polynomial: $\mathrm{FF}_{\mathrm{H}}$ |
|  |  | 8-bit $0 \times 2 \mathrm{~F}$ polynomial: $\mathrm{FF}_{\mathrm{H}}$ |
|  |  | Therefore, for the 32-bit Ethernet polynomial, $00000000_{H}$ is read from this register even in the initial state. |

## CAUTION

The read value after reset is 00000000 H since the 32-bit Ethernet CRC polynomial is selected as the CRC generating function after reset and the value is XORed onto FFFF FFFFH by hardware.
This register must be initialized with the start value before the first data of the data block is written to the DCRBnCIN register.

### 40.3.4 DCRBnCTL — DCRB Control Register

This register controls the CRC generation process.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | DCRBnISZ[1:0] |  | - | - | DCRBnPOL[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R/W | R/W |

Table 40.8 DCRBnCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 6 | Reserved |  |
| When read, the value after reset is returned. When writing, write the value after reset. |  |  |

## NOTE

After changing the CRC generating function (DCRBnCTL.DCRBnPOL[1:0]), the DCRBnCOUT register must be initialized.

## CAUTIONS

- The CRC bit width (DCRBnCTL.DCRBnISZ[1:0]) must be set according to the data block bit width. Switching the CRC bit width is not allowed during processing of a data block (a data block consists of N bytes, half words or words). After the final CRC result is read from the DCRBnCOUT register, the bit width can be changed and the DCRBnCOUT register must be initialized with the initial value.
- Switching the CRC polynomial (DCRBnCTL.DCRBnPOL[1:0]) is also not allowed during processing of a data block.

### 40.4 Operation

Data CRC Function B generates a CRC (cyclic redundancy check) of arbitrary data block length. The data can be forwarded to the Data CRC Function in 8-, 16- or 32-bit units. The CRC polynomial can either be selected for 32-bit Ethernet, 16 -bit CCITT, 8-bit SAE J1850 or 8-bit 0x2F polynomial CRC, and the initial starting value must be set at the DCRBnCOUT register before the first write access to the DCRB input register (DCRBnCIN) is performed.

After the last write access to the DCRBnCIN register is performed, the result can be read out from the DCRBnCOUT register after one clock period.

The flow chart below shows the CRC generation procedure.

Figure 40.2 Data CRC Function B Flow Diagram

NOTES

- The initial value to be written to DCRBnCOUT can be chosen by the user.
- When reading from register DCRBnCOUT, the value is XORed by hardware with the value specified in the chosen polynomial.
- Generation of CRC code and storage to DCRBnCOUT are done by hardware.
- All registers are accessible by CPU or by CPU-independent read/write access via DMA/DTS. Independent from access of the DCRB via CPU or DMA/DTS the verification of the CRC code (CRC-check result in DCRBnCOUT) has to be performed by SW.

## Section 41 Flash Memory

This product incorporates Code Flash Memory and Data Flash Memory.

| Product Name | Code Flash Memory |  | Data Flash Memory |  |
| :--- | :--- | :--- | :--- | :--- |
|  | User Area | User Boot Area | Data Area | Exclusively for ICUM |
|  | 8M bytes | 64 K bytes | 192K bytes | 32K bytes |
| RH850/E2M | 8M bytes | $64 K$ bytes | 192K bytes | 32K bytes |

### 41.1 Features

- Code Flash
- Capacity: $\quad 8 \mathrm{MB}$ of User Area and 64 KB of User Boot Area.
- Multi banked configuration in Multi CPU devices.
- Program unit: 512 bytes
- Erase unit: 16 KB for 8 blocks and 64 KB for remaining blocks
- OTP (One Time Programmable) supported for each block.
- Data Flash
- Capacity: 192 KB (dual banked: $96 \mathrm{~KB}+96 \mathrm{~KB}$ )
and 32 Kbytes for data area exclusively for ICUM
- Program unit: 4, $8,16,32$ bytes

DMA can initiate 4 bytes program in multiple time without software overhead. (within one Data Flash*1)

- Erase unit: 64 bytes $\mathrm{x} N(\mathrm{~N}=1,2,3 \ldots)$ (within one Data Flash*1)

Note 1. The 96 KBytes Data Flash bank consists of two 48 KBytes Data Flash (EEP) called EEP0-0 and EEP0-1, or EEP1-0 and EEP1-1. 32 KBytes Data Flash bank for ICUM consists of one 32 KBytes Data Flash called EEP2. These EEPs are treated as different Data Flash.

- Programming method
- Serial programming: Programming of flash memory by external flash memory programmer through serial interface or CAN/CAN-FD interface.
This Mode uses the program to control flash memory rewriting included in a microcomputer (Boot Firmware). Boot Firmware communicate with external flash memory programmer by a serial interface or CAN/CAN-FD interface.
When using CAN/CAN-FD interface, Boot Firmware receives a user program for flash memory rewriting and starts this.
- Self programming: Programming of flash memory by a user program written on Code Flash already.
- Support for security functions to protect against illicit tampering and illicit reading with data in flash memory
- Support for protection functions to protect against erroneous programming / erasure of the flash memory
- ECC support for error detection and correction for both Code Flash and Data Flash
- Reading erased Code Flash results in an ECC error.
- Reading erased Data Flash results in an ECC error with high probability.

Data Flash is complementary read (CR) Flash. The read value of erased CR Flash is undefined.

- Background Operation (BGO) support
- Code Flash Read is possible during programming / erasing of Data Flash.
- One bank Code Flash Read is possible during programming / erasing of the other bank of Code Flash.
- One bank Data Flash Read is possible during programming / erasing of the other bank of Data Flash.
- Dual Operation support
- The bank Data Flash for ICUM programming / erasing is possible during programming / erasing of the other bank of Data Flash.
- Suspend/Resume support for both Code Flash and Data Flash
- Programming / erasing operation can be suspended. Suspended operation can be resumed. It can be used for interruption processing received during self- programming.
- The Settings of this product can be configured in Flash Extra area of Flash Memory.

Flash Extra Areas is divided into Configuration Setting Area, Security Setting Area and Block Protection Area.

- Configuration Setting Area:To store the System Configuration Parameters. (Flash Option Byte, Reset Vector, etc.)
- Security Setting Area: To store the Security Parameters. (ID Codes, Security Setting flag, etc.)
- Block Protection Area: To store the Code Flash Protection Settings. (OTP flag, etc.)
- Interrupt Requests

The flash memory supports an interrupt to indicate completion of processing by the flash sequencer.

Table 41.1 Interrupt Requests

| Interrupt Name | Description | Interrupt <br> Number | sDMA Trigger <br> Number | DTS Trigger <br> Number |
| :--- | :--- | :--- | :--- | :--- |
| INTFACI0ENDNM | Flash sequencer of code flash and data flash for bank A/B <br> processing end interrupt | 33 | - | - |
| INTFACI1ENDNM | Flash sequencer of the data flash for ICUM processing end interrupt | 35 | - | - |
| INTDMAFL0 | DMA request of DMA programming for the data flash bank A/B | - | group0-218 | group0-124 |
| INTDMAFL1 | DMA request of DMA programming for the data flash bank for ICUM | - | group0-219 | group0-125 |

### 41.2 Structure of Memory

Table 41.2 gives information on all of these areas.
Table 41.2 Area on the Flash memory

| Area | Address | Peripheral Group |
| :--- | :--- | :--- |
| User Area (code flash) | See Figure 41.1. Mapping of Code Flash Memory | - |
| User Boot Area (code flash) | See Figure 41.1. Mapping of Code Flash Memory | - |
| Product Info Area (code flash) | See Figure 41.1. Mapping of Code Flash Memory | - |
| ECC test Area (code flash) | See Figure 41.1. Mapping of Code Flash Memory | - |
| Data Area (data flash) | See Figure 41.2. Mapping of Data Flash Memory | 1 |
| Security Setting Area (Flash Extra Area) | See Figure 41.3. Mapping of Flash Extra Area | 1 |
| Configuration Setting Area (Flash Extra Area) | See Figure 41.3. Mapping of Flash Extra Area | 1 |
| Block Protection Area (Flash Extra Area) | See Figure 41.3. Mapping of Flash Extra Area | 1 |

### 41.2.1 Mapping of Code Flash Memory

Figure 41.1 illustrates the mapping of the code flash memory for the $8-\mathrm{MB}(\mathrm{E} 2 \mathrm{x}-\mathrm{FCC} 1$ for E 2 M$)$ device. The user area in the code flash memory of this product is divided into 16 - and 64 -Kbyte blocks, which can be erased individually. A single block of 64-Kbyte user boot area is also incorporated. The user area can be used to store the user program. The user boot area can be used to store a non-rewritable boot program during user program operation, such as a boot program for rewriting code flash memory through a selected user interface. The Product Info Area and ECC test Area store Product information and data to test ECC decoder of code flash. (See Section 41.9.3, Registers Related to Product Information) These areas are not rewritable. The BGO condition is same as User Area (Bank A)/User Boot Area (Bank A).

Figure 41.1 Mapping of Code Flash Memory

### 41.2.2 Mapping of Data Flash Memory

The data area of the data flash memory in this product is divided into 64-byte blocks, with each being a unit for erasure.
Figure 41.2 shows data flash memory map.

Figure 41.2 Mapping of Data Flash Memory

### 41.2.3 Mapping of Flash Extra Area

Flash Extra Area in this product has 3 of areas (Configuration Setting Area, Security Setting Area, and Block Protection Area).

- For Security Setting Area, refer to Section 42.6, Security Settings Area.
- For Configuration Setting Area, refer to Section 41.10, Configuration Setting Area (Option Bytes, Reset Vector).
- For Block Protection Area, refer to Section 42.5.1, Block Protection Function and Section 42.5.2, OTP (One Time Programming) Function.

Each Extra Area supports the exclusive rewriting command (32-byte rewriting or 4-byte rewriting).
Each Extra Area can be set OTP (One Time Programming) by 4bytes unit.
Figure 41.3 shows Extra Area memory map. This area is placed in the data flash memory.
The condition of BGO and Dual Operation is the same as DataFlashBank which was placed.

Figure 41.3 Mapping of Flash Extra Area

### 41.2.4 Examples of the Chip Writing

Set OTP after programming target data, because OTP setting becomes effective without reset.
The figure below is an examples of the chip writing.

Figure 41.4 shows the examples of the chip writing.

Figure 41.4 Examples of the Chip Writing

### 41.3 Operating Modes Associated with Flash Memory

Figure 41.5 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, refer to Section 5, Operating Modes.

Figure 41.5 Mode Transition Associated with Flash Memory

Table 41.3 shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

Table 41.3 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release

| Item | Normal Operating Mode | User Boot Mode | Serial Programming Mode |
| :--- | :--- | :--- | :--- |
| Programmable and erasable <br> area | $\bullet$ User area | $\bullet$ User area | $\bullet$ User area |
|  | $\bullet$ Data area | $\bullet$ Data area | • User boot area |
|  |  | - Data area |  |

### 41.4 Functional Overview

The flash memory of this device can be updated via a serial interface by a dedicated flash memory programmer (serial programming), before being mounted on the target system or on a flash adapter system.

When using CAN-FD/CAN interface for a connection with flash memory programmer, it's possible to forward a user program for rewriting to internal RAM and start.

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions.

Table 41.4 gives an overview of the methods of programming and the corresponding operating modes.
Table 41.4 Methods of Programming

| Method of Programming | Overview of Functionality | Operating Mode |  |
| :--- | :--- | :--- | :--- |
| Serial programming | A dedicated flash-memory programmer allows on-board programming the <br> flash memory after the device is mounted on the target system. | Serial programming mode |  |
|  | A dedicated flash memory programmer and dedicated programming adapter <br> board allow off-board programming of the flash memory, i.e. programming of <br> the device before it is mounted on the target system. |  |  |
| Self-programming | The user program that is written to code flash memory in advance by serial <br> programming executing also allows updating the flash memory. | Normal operating mode, <br> When data flash memory is being programmed with self-programming, the | User boot mode |

When executing self-programming, see the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface which this product targets.

Table 41.5 lists the functions of the on-chip flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the on-chip flash memory by interface operation of flash memory or the user program enables self-programming.

Table 41.5 Basic Functions at a Glance

| Function | Description in Overview | Level of Support <br> ( $\checkmark$ : Supported, $\times$ : Not Supported) |  |
| :---: | :---: | :---: | :---: |
|  |  | Serial Programming | Self-Programming |
| Blank checking | This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure. | $\checkmark$ | $\checkmark$ |
| Block erasure | This is for erasing the contents of a specified block of memory. | $\checkmark$ | $\checkmark$ |
| Programming | This is for writing to a specified address. | $\checkmark$ | $\checkmark$ |
| Reading | Data that have been written to the flash memory are read out. | $\checkmark$ | $\checkmark$ |
| Setting of Security Settings (Setting an ID Codes) | Security Settings (ID codes, Debugger connection prohibited setting, etc.) are set and the security is made effective. An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and etc. <br> Refer to Section 42, Basic Hardware Protection (BHP) for Security settings. | $\checkmark$ | $\checkmark$ |
| Setting of Block Protection | A specified block of code flash memory is set for Customer ID Protection Setting and OTP (one-time programming). (OTP can only be set, that is, it is not possible to release a block's OTP setting). <br> Refer to Section 42, Basic Hardware Protection (BHP) for settings. | $\checkmark$ | $\checkmark$ |
| Setting of Configuration Settings | Configuration Settings (Option bytes, Reset Vector, etc.) are set to change them from the initial values for this product. | $\checkmark$ | $\checkmark$ |
| CAN-FD/CAN Bootstrap | Transfer user program by CAN-FD/CAN interface to internal RAM, and execute the program. | $\checkmark$ | $\times$ |

For details on serial programming, refer to the Renesas Flash Programmer Flash Programming Software User's Manual.

For details on self-programming, refer to the RH850/E2x Flash Memory User's Manual: Hardware Interface which this product targets.

The on-chip flash memory supports various security functions.
Setting of OTP and authentication of the ID code are security functions for use with serial programming and selfprogramming.

In serial programming, authentication of the ID code, and prohibiting connection of a dedicated flash memory programmer are available for use as security functions.

Table 41.6 lists security functions that are supported by the on-chip flash memory and Table 41.7 lists Available Operations and Security Settings. Security Settings is established in the Security Setting Area. For Security Settings, refer to Section 42, Basic Hardware Protection (BHP).

Page 4504 of 4595

Table 41.6 Summary of Security Functions

| Function | Description |
| :--- | :--- |
| OTP | OTP can be individually set for each block of the user area and the user boot area of code <br> flash memory. When the OTP setting is made for an area, programming by serial <br> programming and by self programming is prohibited. Once set, the OTP setting cannot be <br> released. |
| ID authentication | The result of ID authentication can be used to control the connection of a dedicated flash <br> memory programmer for serial programming. The result of ID authentication can also be used <br> to control enabling of code flash memory and data flash memory writing by self-programming. |
| Prohibition of connection of a <br> dedicated flash memory programmer | The connection of a dedicated flash memory programmer for serial programming is prohibited. |

Table 41.7 Available Operations and Security Settings

| Function | All Security Settings and Erasure, Programming, and Read Operations <br> ( $\downarrow$ : Executable, $\times$ : Not Executable, 一: Not Supported) |  | Point for Caution Regarding the Security Setting |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Serial Programming | Self Programming | Serial Programming | Self Programming |
| OTP | - Areas for which OTP is set <br> - Block erasure commands: $\times$ <br> - Programming commands: $\times$ <br> - Read commands: $\checkmark$ <br> - Areas for which OTP is not set <br> - Block erasure commands: $\checkmark$ <br> - Programming commands: $\checkmark$ <br> - Read commands: $\sqrt{ }$ | - Areas for which OTP is set <br> - Block erasure: $\times$ <br> - Programming: $\times$ <br> - Reading: $\checkmark$ <br> - Areas for which OTP is not set <br> - Block erasure: $\checkmark$ <br> - Programming: $\checkmark$ <br> - Reading: $\checkmark$ | The OTP setting cannot be released. | The OTP setting cannot be released. |
| ID authentication | - When the ID codes do not match <br> - Block erasure commands: $\times$ <br> - Programming commands: $\times$ <br> - Read commands: $\times$ <br> - When the ID codes match <br> - Block erasure commands: $\checkmark$ <br> - Programming commands: $\checkmark$ <br> - Read commands: $\checkmark$ | - When the ID codes do not match <br> - Block erasure: $\times^{* 1}$ <br> - Programming: $x^{* 1}$ <br> - Reading: $\checkmark$ <br> - When the ID codes match <br> - Block erasure: $\checkmark$ <br> - Programming: $\checkmark$ <br> - Reading: $\checkmark$ | Serial programming ID authentication is always in effect. | Customer ID authentication enabled when Customer ID Protection setting bit is set. / DataFlash ID authentication enabled when DPROT bit is set. |
| Prohibition of the connection of a dedicated flash memory programmer | - Block erasure commands: $\times$ <br> - Programming commands: $\times$ <br> - Read commands: x | - Block erasure: $\sqrt{ }$ <br> - Programming: $\checkmark$ <br> - Reading: $\sqrt{ }$ | Since execution of the serial programming command is prohibited, initialization of the setting for prohibition is not possible. | If OTP is not set, <br> Initialization of the settings prohibited is possible after ID authentication. |

Note 1. The block where protection setting was accomplished.

The on-chip flash memory supports various protection functions. Table 41.8 lists protection functions that are supported by the on-chip flash memory.

Table 41.8 Summary of Protection Functions

| Function | Description |
| :--- | :--- |
| User boot protection | Programming or erasure of the user boot area by self programming is prohibited. <br> Programming or erasure of the user boot area by serial programming is available. |
| Variable reset vector | The protection settings include control of the reset vector. As shown in Figure 41.6, after <br> programming of a new boot program while leaving the existing boot program in place, <br> changing the reset vector is a safe way to change to the area holding the new boot program. <br> The areas that can be specified by using the reset vector are the user area. |

Figure 41.6 Utilizing the Variable Reset Vector Function to Update the Boot Program

### 41.5 Serial Programming

A dedicated flash memory programmer can be used to handle the flash memory in serial programming mode.

## Serial Programming

The microcontroller is mounted on the system board at the time of serial programming. Providing a connector to the board enables handling of the target microcontroller by the flash memory programmer to proceed.

In one example, the recommended environment for programming the flash memory of the microcontroller with data is the Renesas Flash Programmer Flash Programming Software.

NOTE
For details on Renesas Flash Programmer, see the Renesas Flash Programmer Flash Programming Software User's Manual.

### 41.6 Communication Modes

### 41.6.1 Asynchronous Flash Programming Interface - 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR(TDI): Receive data input
- FPDT(TDO): Transmit data output

### 41.6.2 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR(TDI): Receive data input
- FPDT(TDO): Transmit data output
- $\operatorname{FPCK}(T C K)$ : Serial clock input

The flash memory programmer outputs the serial data clock SCK, and the microcontroller operates as a slave.

### 41.6.3 CAN-FD/CAN Bootstrap

Transfer user program by CAN-FD/CAN interface to internal RAM, and execute the program. (e.g. User customized flash programming software, etc.).

CAN-FD/CAN interface is connected to the flash memory programmer with the following ports.

- CRX: P32_0, Schmitt1 input type
- CTX: P32_1, Push-pull output

Procedure summary of a CAN-FD/CAN bootstrap.
step 1: Select CAN-FD/CAN boot. (Please refer Section 41.6.4, Selection of Communication Method)
step 2: Boot Firmware starts, and CAN-FD/CAN communication with external flash memory programmer is established.
step 3: A user program is forwarded from external flash memory programmer to internal RAM of the microcontroller via CAN-FD/CAN interface. Boot Firmware receives a user program for flash memory rewriting and starts this.
step 4: Processing is moved from a Boot Firmware to a forwarded user program. The transfer program can not return to Boot Firmware.

### 41.6.4 Selection of Communication Method

In this product, communication method can be selected by pulse input to the MD0 pin (up to 5 pulses) after transition to the Serial programming mode. The MD0 pulse is generated by a dedicated flash memory programmer.

Figure 41.7 shows the relation between the number of pulses and communication method.

Figure 41.7 Selection of Communication Method

### 41.7 Self-Programming

### 41.7.1 Outline

This product supports programming of the flash memory by user program itself. The code flash and data flash memory can be programmed by using the commands of flash memory application command interface ( FACI ) for flash memory programming in user's applications. Therefore, update of the user program and programming of constant data fields can be possible.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to the local RAM or the cluster RAM in advance and executed to program the data flash memory.

When the code flash memory is programmed, the background operation facility makes it possible to execute a programming program form the code flash memory of a bank to program the code flash memory of other bank. Furthermore, the programming program can be copied to the local RAM or the cluster RAM in advance and executed to program the code flash memory.

For comprehensive information on flash self-programming, see the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface which this product targets.

Figure 41.8 Concept of Self-Programming

### 41.7.2 Background Operation

Background operations can be used when the combination of the flash memory for programming/erasure and the flash memory for reading is any of those listed below.

Table 41.9 Conditions under which Background Operation is Usable

| Range for Programming / Erasure | Range for Reading |
| :--- | :--- |
| Data Flash Memory | Code Flash Memory |
| One bank of Code Flash Memory | Other bank of Code Flash Memory |
|  | The-bank of Data-Flash Memory for ICUM |
| One-bank of Data Flash Memory | Other bank of Data flash memory |

### 41.7.3 Dual Operation

Dual operations can be used when the combination of the flash memory for programming/erasure and the flash memory for programming / erasing is any of those listed below.

Table 41.10 Conditions under which Dual Operation is Usable

| Range for Programming / Erasure | Range for Programming / Erasure |
| :--- | :--- |
| The-bank of Data Flash Memory for ICUM | Other bank of Data Flash Memory |

### 41.8 Reading Flash Memory

### 41.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode and user boot mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception.
Furthermore, since the values of data cannot be guaranteed when an ECC error has been generated, use blank checking when you need to confirm that an area is in the non-programmed state. See Section 38, Functional Safety for the details on ECC.

### 41.8.2 Parallel Access to the Code Flash memory

The code flash memory is multi banked configuration. One bus master may access one bank and another bus master access other bank without a wait for arbitration of contention for the access path.

When multiple bus masters access the same bank access is arbitrated in round-robin fashion.

Figure 41.9 Operation in Access to Banks A and B (Example)

### 41.8.3 Reading Data Flash Memory

Values read from data flash memory that has been erased but not yet been programming again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

### 41.9 Description of Registers

### 41.9.1 Register Base Address

Register base addresses are listed in the following table.
Register addresses are given as offsets from the base addresses in general.
Table 41.11 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <SYSCTRL_base> | FF70 0000 | Peripheral Group 6 |

### 41.9.2 Registers Related to Write and Erase Protection of Flash Memory

Table 41.12 shows the list of registers related to write and erase protection of flash memory.
Table 41.12 Registers Related to Write and Erase Protection of Flash Memory

| Unit Name | Register Name | Symbol | Address | Access Size |
| :--- | :--- | :--- | :--- | :--- |
| SYSCTRL | FHVE15 Control Register | FHVE15 | <SYSCTRL_base> $+3804_{H}$ | 32 |
| SYSCTRL | FHVE3 Control Register | FHVE3 | <SYSCTRL_base> $+3800_{H}$ | 32 |

Table 41.13 Register Reset Conditions

|  | Reset Source |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Symbol | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| FHVE15 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| FHVE3 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 41.9.2.1 FHVE15 - FHVE15 Control Register

FHVE15 is a readable / writable register for software protection of flash memory against programming and erasure. Set both the FHVE15 and FHVE3 registers in the programmable and erasable state $\left(00000001_{\mathrm{H}}\right)$ to program or erase flash memory.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { FHVE } \\ & \text { 15CNT } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 41.14 FHVE15 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
| 0 | FHVE15CNT | 0: Programming / erasure / DataFlashBlankChecking are disabled. |
|  |  | 1: Programming / erasure / DataFlashBlankChecking are enabled. |

### 41.9.2.2 FHVE3 - FHVE3 Control Register

FHVE3 is a readable / writable register for software protection of flash memory against programming and erasure. Set both FHVE15 and FHVE3 in the programmable and erasable state $\left(00000001_{\mathrm{H}}\right)$ to program or erase flash memory.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 41.15 FHVE3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
| 0 | FHVE3CNT | 0: Programming / erasure / DataFlashBlankChecking are disabled. |
|  |  | 1: Programming / erasure / DataFlashBlankChecking are enabled. |

### 41.9.3 Registers Related to Product Information

In Product Info Area in Figure 41.1, Product information (Product Name) is stored.Table 41.16 shows the list of registers related to product information.

Other addresses in this domain are reservations. Please do not access it.
Table 41.16 List of Registers Related to Product Information

|  | Symbol |  | Value after | Access |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Register Name | R/W | Reset | Address |  |

Table 41.17 Relationship between Product Model Name and Value of PRDNAME

| Product Name | PRDNAME4 | PRDNAME3 | PRDNAME2 | PRDNAME1 |
| :---: | :---: | :---: | :---: | :---: |
| R7F702Z02C | 2020 2020 ${ }_{\text {H }}$ | 2020 2032H | 305A 3230 ${ }_{\text {H }}$ | 3746 3752 ${ }_{\text {H }}$ |
| R7F702Z04C | $20202020^{\text {H }}$ | 2020 2034 ${ }_{\text {H }}$ | 305A 3230 ${ }_{\text {H }}$ | 3746 3752 ${ }_{\text {H }}$ |
| R7F702002A | 2020 2020 ${ }_{\text {H }}$ | 2020 2032H | $30303230^{H}$ | 3746 3752 ${ }_{\text {H }}$ |

Note: For Product Name, refer to Section 1.4, Order Information.

### 41.9.3.1 PRDNAMEn; $\mathrm{n}=1$ to 4 - Product Name Storage Register ( $\mathrm{n}=1$ to 4 )

Table 41.18 List of Registers Related to Product Information

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | PRDNAMEn[31:0] | Product name: |
|  |  | Indicate product model names by using 16-byte ASCII code. |
|  | PRDNAME1[31:0]: Fourth to first bytes of product model name |  |
|  | PRDNAME2[31:0]: Eighth to fifth bytes of product model name |  |
|  | PRDNAME3[31:0]: Twelfth to ninth bytes of the product model name |  |
|  |  | PRDNAME4[31:0]: Sixteenth to thirteenth bytes of the product model name |

### 41.9.3.2 PRDNUM — Product Number / Product Version Storage Register

Table 41.19 List of Registers Related to Product Number / Product Version Storage Register

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
| 19 to 16 | DID_RN[3:0] | Revision Number <br>  <br>  <br>  <br> 15 to 0 |
|  | These bits indicate product revision |  |
|  |  | The value is the same as SDID[31:28] (See Section 46, Boundary Scan). |
|  |  | Product Number |
|  |  | These bits indicate product number. |
|  |  | The value is the same as SDID[27:12] (See Section 46, Boundary Scan). |

### 41.10 Configuration Setting Area (Option Bytes, Reset Vector)

The flash memory has the extended Extra area (option bytes) to store data specified by the user for various purposes. Changes in settings such as initial setting of peripheral functions using option bytes become effective after release from the reset state. (Refer to Section 10.3.4, FACI Reset Transfer.) OTP setting of Configuration setting Area becomes effective without reset. Table 41.20 shows option byte setting area. For setting and reading option bytes, see the Renesas Flash Programmer Flash Programming Software User's Manual, or the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface.

Table 41.20 Setting Area of Reset Vector and Option Bytes

| Name | Address | Initial State of Shipped Product*1 | Write Protection ID*2 | Read Protection ID*3 |
| :---: | :---: | :---: | :---: | :---: |
| OTP Setting of Configuration setting Area*4,*6 | FF32 0040 ${ }_{\text {H }}$ | FFFF FFFFF ${ }_{\text {H }}$ | - | - |
| Reserved | FF32 0044 ${ }_{H}$ to FF32 005C ${ }_{H}$ | FFFF FFFFF ${ }^{* 5}$ | - | - |
| Reset Vector | FF32 0060 ${ }_{\text {H }}$ | 0000 0000 ${ }_{\text {H }}$ | Customer ID | - |
| Reserved | FF32 0064 ${ }_{H}$ to FF32 007C ${ }_{H}$ | FFFF FFFF ${ }^{*}{ }^{* 5}$ | Customer ID | - |
| Option bytes 3 to 0 (OPBT0) | FF32 0080 ${ }_{\text {H }}$ | 3FFF 0010 ${ }_{\text {H }}$ | Customer ID | - |
| Option bytes 7 to 4 (OPBT1) | FF32 0084 ${ }_{\text {H }}$ | FFFF $0000{ }_{\text {H }}$ | Customer ID | - |
| Option bytes 11 to 8 (OPBT2) | FF32 0088 ${ }_{\text {H }}$ | FFFF FFFF ${ }_{\text {H }}$ | Customer ID | - |
| Option bytes 15 to 12 (OPBT3) | FF32 008C ${ }_{\text {H }}$ | $\mathrm{FDFF}^{\text {FFFF }}$ H | Customer ID | - |
| Option bytes 19 to 16 (OPBT4) | FF32 0090 ${ }_{\text {H }}$ | FFFFFFFFF ${ }_{\text {H }}$ | Customer ID | - |
| Option bytes 23 to 20 (OPBT5) | FF32 0094 ${ }_{\text {H }}$ | FFFF EFFF ${ }_{\text {H }}$ | Customer ID | - |

| Option bytes 31 to 28 (OPBT7) | FF32 009C ${ }_{\text {H }}$ | FFFF 899F $_{\text {H }}$ | Customer ID | - |
| Option bytes 35 to 32 (OPBT8) | FF32 00A0 ${ }_{\text {H }}$ | FFFF $^{\text {FFFF }}$ H | Customer ID | - |
| Option bytes 39 to 36 (OPBT9) Reserved | FF32 00A4 ${ }_{\text {H }}$ | FFFF FFF* ${ }_{\mathrm{H}}{ }^{* 5}$ | Customer ID | - |
| Option bytes 43 to 40 (OPBT10) Reserved | FF32 00A8 ${ }_{\text {H }}$ | FFFF FFFF ${ }_{\text {H }}{ }^{* 5}$ | Customer ID | - |
| Option bytes 47 to 44 (OPBT11) Reserved | FF32 00AC ${ }_{\text {H }}$ | FFFF FFFF ${ }_{H}{ }^{* 5}$ | Customer ID | - |
| Option bytes 51 to 48 (OPBT12) Reserved | FF32 00B0 ${ }_{\text {H }}$ | $60000055^{* 5}$ | Customer ID | - |
| Option bytes 55 to 52 (OPBT13) Reserved | FF32 00B4 ${ }_{\text {H }}$ | $60000056^{*}{ }^{* 5}$ | Customer ID | - |
| Option bytes 59 to 56 (OPBT14) Reserved | FF32 00B8 ${ }_{\text {H }}$ | F8DC 0101 ${ }^{* 5}$ | Customer ID | - |
| Option bytes 63 to 60 (OPBT15) Reserved | FF32 00BC ${ }_{\text {H }}$ | 258C 0401H ${ }^{* 5}$ | Customer ID | - |
| Reserved | $\begin{aligned} & \mathrm{FF} 3200 \mathrm{CO}_{\mathrm{H}} \\ & \text { to } \mathrm{FF} 3200 \mathrm{FC}_{\mathrm{H}} \end{aligned}$ | FFFF FFFF ${ }_{H}{ }^{* 5}$ | - | - |

Note 1. This is the initial value of the shipped product. The value can be modified.
Note 2. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to set.
Note 3. When Sub mode is OCD mode, the Customer ID authentication is needed to read.
Note 4. The detail of this function, see Section 42, Basic Hardware Protection.
(Table 42.9 shows Mapping of OTP Setting for extra Area.)
Note 5. It is prohibited to change from a read value.
Note 6. Set OTP after programming target data, because OTP setting becomes effective without reset.

### 41.10.1 Reset Vector PE

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - |  |  | OP | BAS | :16] |  |  |
| Value after reset | 0*1 | $0^{* 1}$ | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | 0*1 | $0^{* 1}$ | 0*1 |

Note 1. This is the initial value of the shipped product. The value can be modified by Configuration Programming.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.21 Reset Vector Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | - | Reserved (The setting value should be 0. .) |
| 22 to 9 | OPT_RBASE[22:9] | These bits indicate the reset vector when there is a reset. <br>  <br> 8 to 0 |
|  | Any place of code flash address can be configured at Normal Operation mode. |  |

### 41.10.2 OPBTO - Option Byte 3 to 0 Bit Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.22 OPBTO Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | OPWDRUN | This bit sets the start mode of WDTB0. <br> 0: WDTB0 software trigger start mode <br> 1: WDTB0 default start mode |
| 30 | OPWDWMS | 0: Window Size of Window Open function is set by WDTB0WS1-0. <br> WDTB0TIT outputs When the counter reaches 75\% of the overflow setting defined by <br> WDTBOMD.WDT0OVF2-0 |

### 41.10.3 OPBT1 - Option Byte 7 to 4 Bit Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.23 OPBT1 Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | WDT_CLK_SEL | WDTB/SWDT counter clock source can be selected by using the option bytes. |
|  |  | 0: CLK_MOSC source is selected |
|  |  | 1: CLK_IOSC source is selected |
| 30 to 16 | - | Reserved (The setting value should be 1.) |
| 15 to 0 | OPWDWWIS | This OPBT[15:0] is WDT Interrupt Output Timing Setting Register |

### 41.10.4 OPBT2 - Option Byte 11 to 8 Bits Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

For details of this OPBT2, see the RH850/E2x SWDT User's Manual.

### 41.10.5 OPBT3 — Option Byte 15 to 12 Bits Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | HWBIS T | - | - | - | TESTS | ET[1:0] | LBIS | EL[1:0] | - | - | - | - | - | - | $\begin{gathered} \text { STMSE } \\ \text { L1 } \end{gathered}$ | $\begin{gathered} \text { STMSE } \\ \text { L0 } \end{gathered}$ |
| Value after resetR/W | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ |
|  | R/W*2 | R/W*2 | $\mathrm{R} / \mathrm{W}^{* 2}$ | $\mathrm{R} / \mathrm{W}^{* 2}$ | R/W*2 | R/W*2 | R/W* | $\mathrm{R} / \mathrm{W}^{* 2}$ | R/W*2 | R/W*2 | $\mathrm{R} / \mathrm{W}^{* 2}$ | $\mathrm{R} / \mathrm{W}^{* 2}$ | $\mathrm{R} / \mathrm{W}^{* 2}$ | R/W*2 | R/W*2 | R/W*2 |

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.24 OPBT3 Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved (The setting value should be 1.) |
| 25 | PE1_DISABLE | PE1_DISABLE bit <br> 0: PE1 enable <br> 1: PE1 disable |
| 24 | STARTUPPE | select whether PE0 start <br> 0 : PE0 not run (when the ICUMD is valid only.) <br> 1: PE0 run |
| 23 to 18 | - | Reserved (The setting value should be 1.) |
| 17 | PE1_FPSIMD_EN | PE1_FP-SIMD Enable bit <br> 0: PE1_FPSIMD disable <br> 1: PE1_FPSIMD enable |
| 16 | PE0_FPSIMD_EN | PEO_FP-SIMD Enable bit <br> 0: PEO_FPSIMD disable <br> 1: PEO_FPSIMD enable |
| 15 | HWBIST | Power-up BIST enable <br> 0 : BIST is skipped <br> 1: BIST is executed |
| 14 to 12 | - | Reserved (The setting value should be 1.) |
| 11,10 | TESTSET[1:0] | Power-up BIST selection <br> $00_{\mathrm{B}}$ : Prohibited <br> 0 1 B : LBIST Only <br> $10_{\mathrm{B}}$ : MBIST Only <br> 1 18: LBIST and MBIST <br> For BIST, four operation settings can be selected by combining TESTSET[1:0] and LBISTSEL[1:0]. <br> Refer to Table 41.25, BIST Scenario Use Case. |

Table 41.24 OPBT3 Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9,8 | LBISTSEL[1:0] | At Power-up BIST scenario selection |
|  |  | $00_{\mathrm{B}}$ : BIST scenario 1 |
|  |  | 018: BIST scenario 2 |
|  |  | $10_{\mathrm{B}}$ : BIST scenario 3 |
|  |  | $11_{\mathrm{B}}$ : BIST scenario 4 |
|  |  | For BIST, four operation settings can be selected by combining TESTSET[1:0] and LBISTSEL[1:0]. |
|  |  | Refer to Table 41.25, BIST Scenario Use Case. |
| 7 to 2 | - | Reserved (The setting value should be 1.) |
| 1, 0 | STMSEL1, STMSEL0 | These bits select operating mode and startup area. |
|  |  | When all of the MD0 and MD1 pins are 0, the following operating mode and startup area are selected depending on the combination of the STMSEL1 and STMSELO. For details, see Section 5, Operating Modes. |

Table 41.25 BIST Scenario Use Case

| LBISTSEL[1:0]*1 | TESTSET[1:0]*1 | Function | Run time**2 $^{\text {Target ASIL*3 }}$ |  |
| :--- | :--- | :--- | :--- | :--- |
| 00 | 10 | MBIST Execution | 5 ms <br> (MBIST 5ms) | - |
| 01 | 11 | LBIST and MBIST Execution | 10 ms <br> $($ LBIST 5 ms, MBIST 5 ms$)$ | ASIL B |
| 10 | 01 | LBIST Execution | 15 ms <br> (LBIST 15ms) | ASIL D |
| 11 | 11 | LBIST and MBIST Execution | 20 ms | ASIL D |

Note 1. Settings other than above are prohibited.
Note 2. Run time is calculated by the typical frequency of the Internal OSC. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
Note 3. ISO26262 compliance for LFM by LBIST.

### 41.10.6 OPBT4 — Option Byte 19 to 16 Bit Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

| Bit | 3130 | $29 \quad 28$ | 27 | 26 | 25 | 24 | $23 \quad 22$ | 2120 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | $1^{* 1} 1^{* 1}$ | $1^{* 1} 1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | 1*1 | $1^{* 1} 1^{* 1}$ | $1^{* 1} 1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ |

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.26 OPBT4 Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | VDDFLTW[1:0] | VMON configurations for VDD |
|  |  | Select the minimum filtering width of digital noise filter.*1 |
|  |  | (The minimum filtering width is given by cycle-count of the clock selected by VDDCLKSEL1, 0.) |
|  |  | VDDFLTW[1:0] Minimum Filtering Width (Cycle) |
|  |  | 0020 cycles |
|  |  | 01 13 cycles |
|  |  | 10 8 cycles |
|  |  | 11 3 cycle |
| 29, 28 | VDDCLKSEL[1:0] | VMON configurations for VDD |
|  |  | Select the clock of the digital noise filter from the following clocks.*1 |
|  |  | VDDCLKSEL[1:0] Clock of the Digital Filter |
|  |  | 00 CLK_HVIOSC frequency / 256 |
|  |  | 01 CLK_HVIOSC frequency / 128 |
|  |  | 10 CLK_HVIOSC frequency / 64 |
|  |  | 11 CLK_HVIOSC frequency / 32 |
|  |  | CAUTION: The frequency of CLK_HVIOSC is typ. $16 \mathrm{MHz}, \min .8 \mathrm{MHz}$. |
| 27 | VDDFLTEN | VMON configurations for VDD |
|  |  | Enable output filter for ERROROUT_M and VMONF.*1 |
|  |  | 0: Disable output filter for ERROROUT_M and VMONF. |
|  |  | 1: Enable output filter for ERROROUT_M and VMONF. |
| 26 | - | Reserved (The setting value should be 1.) |
| 25 | VDDHDE | VMON configurations for VDD |
|  |  | VDD High voltage detection enable.*1 |
|  |  | 0 : Disable VDD high voltage detection |
|  |  | 1: Enable VDD high voltage detection |
| 24 | VDDLDE | VMON configurations for VDD |
|  |  | VDD Low voltage detection enable.*1 |
|  |  | 0 : Disable VDD low voltage detection |
|  |  | 1: Enable VDD low voltage detection |

Table 41.26 OPBT4 Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 23, 22 | VCCFLTW[1:0] | VMON configurations for VCC |
|  |  | Select the minimum filtering width of digital noise filter.*1 |
|  |  | (The minimum filtering width is given by the cycle-count of the clock selected by VCCCLKSEL1, 0.) |
|  |  | VCCFLTW[1:0] Minimum Filtering Width (Cycle) |
|  |  | $00 \quad 20$ cycles |
|  |  | $01 \quad 13$ cycles |
|  |  | 10 8 cycles |
|  |  | 113 cycles |
| 21,20 | VCCCLKSEL[1:0] | VMON configurations for VCC |
|  |  | Select the clock of the digital noise filter from the following clocks.*1 |
|  |  | VCCCLKSEL[1:0] Clock of the Digital Filter |
|  |  | 00 CLK_HVIOSC frequency / 256 |
|  |  | 01 CLK_HVIOSC frequency / 128 |
|  |  | 10 CLK_HVIOSC frequency / 64 |
|  |  | 11 CLK_HVIOSC frequency / 32 |
|  |  | CAUTION: The frequency of CLK_HVIOSC is typ. 16 MHz , min. 8 MHz . |
| 19 | VCCFLTEN | VMON configurations for VCC |
|  |  | Enable output filter for ERROROUT_M and VMONF.*1 |
|  |  | 0: Disable output filter for ERROROUT_M and VMONF. |
|  |  | 1: Enable output filter for ERROROUT_M and VMONF. |
| 18 | - | Reserved (The setting value should be 1.) |
| 17 | VCCHDE | VMON configurations for VCC |
|  |  | VCC High voltage detection enable.*1 |
|  |  | 0 : Disable VCC high voltage detection |
|  |  | 1: Enable VCC high voltage detection |
| 16 | - | Reserved (The setting value should be 1.) |
| 15, 14 | EVCCFLTW[1:0] | VMON configurations for EVCC |
|  |  | Select the minimum filtering width of digital noise filter.*1 |
|  |  | (The minimum filtering width is given by the cycle-count of the clock selected by EVCCCLKSEL1, 0) |
|  |  | EVCCFLTW[1:0] Minimum Filtering Width (Cycle) |
|  |  | $00 \quad 20$ cycles |
|  |  | $01 \quad 13$ cycles |
|  |  | $10 \quad 8$ cycles |
|  |  | 113 cycles |
| 13, 12 | EVCCCLKSEL[1:0] | VMON configurations for EVCC |
|  |  | Select the clock of the digital noise filter from the following clocks.*1 |
|  |  | EVCCCLKSEL[1:0] Clock of the Digital Filter |
|  |  | 00 CLK_HVIOSC frequency / 256 |
|  |  | 01 CLK_HVIOSC frequency / 128 |
|  |  | 10 CLK_HVIOSC frequency / 64 |
|  |  | 11 CLK_HVIOSC frequency / 32 |
|  |  | CAUTION: The frequency of CLK_HVIOSC is typ. $16 \mathrm{MHz}, \mathrm{min} .8 \mathrm{MHz}$. |
| 11 | EVCCFLTEN | VMON configurations for EVCC |
|  |  | Enable output filter for ERROROUT_M and VMONF.*1 |
|  |  | 0: Disable output filter for ERROROUT_M and VMONF. |
|  |  | 1: Enable output filter for ERROROUT_M and VMONF. |

Table 41.26 OPBT4 Contents (3/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 10 | - | Reserved (The setting value should be 1.) |
| 9 | EVCCHDE | VMON configurations for EVCC |
|  |  | EVCC High voltage detection enable.*1 |
|  | $0:$ Disable EVCC high voltage detection |  |
|  | 1: Enable EVCC high voltage detection |  |
| 8 to 0 | - | Reserved (The setting value should be 1.) |

Note 1. For details, see Section 12.2, Primary Detection of Voltage Monitor (VMON).

### 41.10.7 OPBT5 - Option Byte 23 to 20 Bit Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

For details of this OPBT5, see the RH850/E2x ICUMD User's Manual.

### 41.10.8 OPBT6 — Option Byte 27 to 24 Bit Arrangement

Customer ID authentication is needed for write this option byte. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to change the setting.

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | STAC_D | TSRAM 0] | $\begin{gathered} \text { STAC_DPRAM } \\ {[1: 0]} \end{gathered}$ |  | $\begin{gathered} \text { STAC_DFE } \\ {[1: 0]} \end{gathered}$ |  | $\begin{gathered} \text { STAC_FLXA } \\ {[1: 0]} \end{gathered}$ |  | $\begin{gathered} \text { STAC_ETHER } \\ {[1: 0]} \end{gathered}$ |  | $\begin{gathered} \text { STAC_GTM } \\ {[1: 0]} \end{gathered}$ |  |
| Value after reset | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | $1^{* 1}$ | 0*1 | $1^{* 1}$ | 0*1 | $1^{* 1}$ | + |
| R/W | R/W*2 | R/W*2 | R/W*2 | R/W*2 | $\mathrm{R} / \mathrm{W}^{* 2}$ | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | $\mathrm{R} / \mathrm{W}^{* 2}$ | R/W*2 | R/W*2 | R/W*2 |

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.27 OPBT6 Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved (The setting value should be 1.) |
| 11, 10 | STAC_DTSRAM[1:0] | RAM Initialization Mode for DTS RAM*1 <br> X $0_{B}$ : Disabled <br> 0 1B: Prohibited <br> $11_{\mathrm{B}}$ : Enabled |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | $1^{* 1}$ | 1*1 | 1*1 | 1*1 | $1^{* 1}$ | 1*1 | 1*1 | 1*1 | $1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | 1*1 | $1^{* 1}$ | $1^{* 1}$ | 1*1 |
| R/W | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 | R/W*2 |

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 41.29 OPBT8 Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved (The setting value should be 1.) |
| 28 | GTM_RAM _HALF_MODE | GTM MCS RAM mode select <br> 0: GTM MCS_RAM E2x-FCC1 mode <br> 1: GTM MCS_RAM PD mode |
| 27 to 26 | - | Reserved (The setting value should be 1.) |
| 25 | ETN_RMII_SEL | Ether IF MII/RMII select $\begin{aligned} & \text { 0: MII } \\ & \text { 1: RMII } \end{aligned}$ |
| 24 | ATU_GTM_SEL | ATU, GTM select <br> 0: ATU: disable, GTM: enable <br> 1: ATU: enable, GTM: disable |
| 23 to 18 | - | Reserved (The setting value should be 1.) |
| 17 | RHSB_FRQ1 | RHSB1 frequency setting bit $\begin{aligned} & \text { 0: CLK_UHSB }(160 \mathrm{MHz}) \\ & \text { 1: CLK_HSB } \quad(80 \mathrm{MHz}) \end{aligned}$ |
| 16 | RHSB_FRQ0 | RHSB0 frequency setting bit $\begin{aligned} & \text { 0: CLK_UHSB }(160 \mathrm{MHz}) \\ & \text { 1: CLK_HSB } \quad(80 \mathrm{MHz}) \end{aligned}$ |
| 15 to 0 | - | Reserved (The setting value should be 1.) |

### 41.11 Block Protection Area

The flash memory has the extended Extra area to store a data specified by the user for Code Flash OTP Settings and Code Flash Customer ID Protection Settings. These settings become effective without reset.

The detail of this function, see Section 42, Basic Hardware Protection.

Table 41.30 Block Protection Area

| Name | Address | Initial State of Shipped Product. ${ }^{* 1}$ | Write/Erase Protection ID*2 | Read Protection ID*3 |
| :---: | :---: | :---: | :---: | :---: |
| OTP Setting of User/User Boot Area*4 | $\begin{aligned} & \text { FF32 } 2040_{\mathrm{H}} \\ & \text { to FF32 } 2050_{\mathrm{H}} \end{aligned}$ | FFFF FFFF ${ }_{\text {H }}$ | - | - |
| Reserved | FF32 2054 ${ }_{\text {H }}$ to FF32 207C ${ }_{H}$ | FFFF $\mathrm{FFFF}_{\mathrm{H}}{ }^{* 6}$ | - | - |
| Customer ID Protection Setting of User/User Boot Area*5 | $\begin{aligned} & \text { FF32 } 2080_{\mathrm{H}} \\ & \text { to FF32 } 20 \mathrm{C} 0_{\mathrm{H}} \end{aligned}$ | FFFF FFFF ${ }_{\text {H }}$ | Customer ID | - |
| Reserved | $\begin{aligned} & \text { FF32 20C4 } \\ & \text { to FF32 } 20 \mathrm{FC} C_{H} \end{aligned}$ | FFFF $\mathrm{FFFF}_{\mathrm{H}}{ }^{* 6}$ | - | - |

Note 1. This is the initial value of the shipped product. The value can be modified.
Note 2. When all bits of Customer ID are all " 1 " or all " 0 ", the ID authentication is no needed to set.
Note 3. When Sub mode is OCD mode, the Customer ID authentication is needed to read.
Note 4. The detail of this function, see Section 42, Basic Hardware Protection.
Table 42.7 shows Mapping of OTP Setting for User Area and User Boot Area.
Note 5. The detail of this function, see Section 42, Basic Hardware Protection.
Figure 42.2 Block Protection Function Structure and Table 42.6 shows Mapping of Block Protection Setting.
Note 6. It is prohibited to change from a read value.

### 41.12 Usage Notes

(1) Reading areas where programming or erasure was interrupted

When programming or erasure of an area of flash memory is interrupted intentionally or unintentionally, the data stored in the area become undefined. To avoid undefined data that are read out becoming the source of faulty operation, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.
(2) Reading the code flash memory that has been erased but not yet been programming again

Note that reading from an area of code flash memory that has been erased but not yet been programming again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.
(3) Prohibition of additional writing

Writing to a given area twice is not possible. If you want to update data in an area of flash memory after writing to the area has been completed, erase the area first. (Erasure is unnecessary for rewriting of flash extra area.)
(4) Resets during programming and erasure

In the case of an external reset during programming and erasure, wait for at least the minimum value of reset pulse width once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.
(5) Allocation of vectors for interrupts and other exceptions during programming and erasure Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.
(6) Checking the areas where programming or erasure was interrupted

If programming or erasure is interrupted intentionally or unintentionally, the programming or erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming or erasure was interrupted, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to prove that the corresponding area is completely erased before using.
(7) Items prohibited during programming / erasure / blank check

Do not perform the following operations while the flash memory is programmed, erased, or checked for blank.

- Have the operating voltage from the power supply go beyond the allowed range.
- Update the values of FHVE15 and FHVE3.
- Change the operating frequency of peripheral clock.
(8) Flash memory commands prohibited before completion of clock gear-up sequence Various commands during serial programming and self-programming must be executed after clock gear-up sequence is complete. For details of clock gear-up sequence, see Section 15, Clock Controller.
(9) Securing coherency of instruction cache and data buffer

After the code flash memory is programmed or erased, a reset or instruction cache and data buffer clearing are required to secure coherency of the instruction cache and data buffer. For details of instruction cache and data buffer, see Section 3, CPU System.
(10) Setting of OTP.

Set OTP after programming target data, because OTP setting becomes effective without reset.
Please be careful about Configuration Setting Area and Security Settings Area where OTP setting address is smaller than the address of the target.
OTP setting becomes effective in the first place if programming the target data in the order of OTP setting of Security Settings Area, Security Settings Area, OTP setting of Configuration Setting Area, and Configuration Setting Area. Therefore, the target data of Configuration Setting Area and Security Settings Area cannot be written.

## Section 42 Basic Hardware Protection (BHP)

To protect the code flash memory, data flash memory and Flash extra area, this product has several Flash protection functions.

The security function that is used by the ID authentication and setting of Flash Option Byte is described in this section. The ID code and the Flash Option Byte that is described in this section are mapped at Security Settings area and Block Protection Settings area.

In the initial state of the product at shipment, the ID code are set by all-1. These ID should be set at the first programming to Flash Option Byte. For detailed description of the programming to the flash memory, see Section 41, Flash Memory.

### 42.1 Features

ID code

- Table 42.1 shows the ID code that can be set in this product.

The system requires each ID authentication for programming and reading the ID.
Table 42.1 ID Code

| ID Code | Function |
| :--- | :--- |
| OCD ID | Protection for debug connection |
| Serial Programmer ID | Protection to enter the serial programming mode |
| RHSIF ID | Protection for RHSIF Link Partner |
| Customer ID | Protection for Code Flash and Flash extra area |
| Data Flash ID | Protection for Data Flash |
| C-TEST ID | Protection to enter the test mode |

- The setting and function that related each ID code can select the Flash Option Byte. The system requires each ID authentication to re-programming these Flash Option Byte.

## User/User boot/Data area protection by ID authentication

- The system requires 256 bit Customer ID authentication for re-programming to User area by each block.
- The Customer ID authentication is needed to read the User/User boot area when debugger is connected.
- The system requires 256 bit Data Flash ID authentication for re-programming to Data area.
- The Data Flash ID authentication is needed to read the Data area when debugger is connected.

## User/User boot area protection by OTP

- User area on code flash supports OTP (One Time Programmable) functionality for each block.
- Flash extra area protection by OTP
- Dedicated configuration area supports OTP functionality for each 4 Byte unit.

### 42.2 Security Functions in Serial Programming Mode

Two functions are provided as security functions in serial programming mode: ID authentication and prohibition of serial programmer connection. Parallel use of these functions is not allowed.

1. Serial Programmer ID Authentication

The ID codes are checked for authenticity to protect the code flash memory, data flash memory and Flash extra area. Programming, erasure, and reading of the code flash and data flash memory can proceed upon successful ID authentication.
2. Prohibition of Serial Programmer Connection

Issuing commands for programming, erasure, or reading to the code flash memory, data flash memory and Flash extra area can be disabled in serial programming mode.

### 42.3 Security Functions in Debug Interfaces

This product is capable of restricting connection of the debug interfaces to protect against unauthorized access via the debug interfaces. This feature has two security levels.

- Security level 1 :

Debug interface can be uses. At this level, the on-chip debugging (OCD) function is protected by using OCD ID authentication. For OCD to be used, it must be unlocked by using OCD ID authentication.

- Security level 2 :

At this level, the debug interface cannot be used.
These security levels can be changed by Flash Option Byte (JPDBGIF_EN) in Security Setting area of the flash memory.

When ICUMD is enabled, The C\&R authentication is added to security function.
For details, see the RH850/E2x ICUMD User's Manual.

### 42.3.1 Security Levels and State of Restricting the Connection of Debug Interfaces

Table 42.2 show each security level and the corresponding security states and Figure 42.1 shows the conditions for transitions.

Table 42.2 Security Levels and State of Restricting Connection to the Debug Interfaces

| State | Result of OCD ID <br> Authentication | JPDBGIF_EN*1 | Restriction on Debug Interface Connection |
| :--- | :--- | :--- | :--- |
|  | Unlocked | $1_{\mathrm{B}}$ | No restriction on access via the debug interfaces |
|  | Locked | $1_{\mathrm{B}}$ | Restriction on access via the debug interfaces is in place. |
| Security level 2 | - | $0_{\mathrm{B}}$ | Connection to the debug interfaces is prohibited. |

Note 1. For a detailed description of the JPDBGIF_EN bits, see Section 42.6.1, S_OPBTO - OCD ID Related Option Bytes.

Note 1. System Reset 1.
Note 2. System Reset 2.
Note 3. It does not transit after starting on-chip debugging

Figure 42.1 Transitions of Security Level

Conditions for transitions to each security level described in Table 42.2.

- Conditions for transitions to security level 1 (locked as OCD ID authentication result)

1. Startup in the state of security level 1 (unlocked as OCD ID authentication result)

When an external reset* ${ }^{* 1}$ and a reset by TRST\# are applied while the ID code is all 0 s and while the value of the JPDBGIF_EN is $1_{\mathrm{B}}$, startup proceeds with security level 1 (unlocked as OCD ID authentication result).
2. Transition from security level 1 (locked as OCD ID authentication result) to security level 1 (unlocked as OCD ID authentication result)

- Transition to security level 1 (unlocked as OCD ID authentication result) follows a match in OCD ID authentication.
- When an internal reset*2 and a reset by TRST\# is applied after changing the ID code to "all bits 0", startup proceeds at security level 1 (unlocked as OCD ID authentication result).

3. Transition from security level 2 to security level 1 (unlocked as OCD ID authentication result) When an internal reset*2 and a reset by TRST\# is applied after changing the ID code to "all bits 0 " and the value of the JPDBGIF_EN to $1_{\mathrm{B}}$, startup proceeds at security level 1 (unlocked as OCD ID authentication result).

- Conditions for Transitions to Security Level 1 (locked as OCD ID Authentication result)

4. Startup in the state of security level 1 (locked as OCD ID authentication result)

When an external reset*1 and a reset by TRST\# is applied while the ID code is "other than all bits 0 " and the value of the JPDBGIF_EN is $1_{\mathrm{B}}$, startup proceeds at security level 1 (locked OCD ID authentication result).
5. Transition from security level 1 (unlocked as OCD ID authentication result) to security level 1 (locked as OCD ID authentication result)

- A transition to security level 1 (locked as OCD ID authentication result) follows a non-match in OCD ID authentication. ${ }^{* 3}$
- When an internal reset*2 and a reset by TRST\# is applied after changing the ID code to "other than all bits 0 ", startup proceeds at security level 1 (locked as OCD ID authentication result).

6. Transition from security level 2 to security level 1 (locked as OCD ID authentication result)

When an internal reset*2 and a reset by TRST\# is applied after changing the ID code to "other than all bits 0 " and the value of JPDBGIF_EN is $1_{\mathrm{B}}$, startup proceeds at security level 1 (locked as OCD ID authentication result).
7. Retaining security level 1 (locked as OCD ID authentication result)

In case of a non-match in OCD ID authentication, security level 1 (failure in OCD ID authentication) remains in place.

- Transition to security level 2

8. Startup at security level 2

When an external reset*1 and a reset by TRST\# is applied while the value of JPDBGIF_EN is $0_{\mathrm{B}}$, startup proceeds at security level 2.
9. Transition from security level 1 (unlocked as OCD ID authentication result) to security level 2 When an internal reset*2 and a reset by TRST\# is applied after changing the value of the JPDBGIF_EN to $0_{\mathrm{B}}$, startup proceeds at security level 2.
10. Transition from security level 1 (locked as OCD ID authentication result) to security level 2

When an internal reset ${ }^{* 2}$ and a reset by TRST\# is applied after changing the value of the JPDBGIF_EN to $0_{\mathrm{B}}$, startup proceeds at security level 2.

## Note 1. System Reset 1.

Note 2. System Reset 2.
Note 3. It does not transit after starting on-chip debugging.

### 42.3.2 The Case of CAN BootStrap Mode

When the system is in CAN BootStrap Mode, debug interface can be used.
When user program is running, the security level depends on the setting of JPDBGIF_EN.

### 42.4 Security Functions in Connection of RHSIF Link Partner

Three functions are provided as security functions unique to RHSIF ID authentication, and prohibition of RHSIF Link Partner connection.

- RHSIF ID Authentication

ID codes are checked for authenticity to protect RHSIF Link Partner connection.
When ICUMD is enabled, The C\&R authentication is added to security function.
For details, see the RH850/E2x ICUMD User's Manual.

- Access Window setting

User can set the access area from Link Partner that is configured the access window register. The access window register can not set from Link Partner.
The detail of this function, see Section 27, Renesas High-Speed Serial I/F (RHSIF).

### 42.5 Code Flash / Data Flash Protection

Protection based on section password operates for non-secure area and doesn't affect the access from ICUMD. The section password is stored in Security settings area for each of code flash and data flash (Customer ID and Data Flash ID). User can unlock protection by inputting correct section password by software or external debugging tool.

Inputting target registers for software, see the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface.
Customer ID and Data Flash ID, see Section 42.6.11, CUSTOMERIDn — Customer ID ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{7}$ ) and Section 42.6.12, DATAFLASH IDn — Data Flash ID ( $\mathbf{n}=0$ to 7 ).

The ID authentication for read access can be skipped by setting read protection flag in Security settings area for code and data flash respectively. (CFRPF and DFRPF)

Table 42.3 shows access protection to user area of Code flash memory. ID authentication to read access in Normal Operation mode/OCD mode is done via debugger I/F. ID authentication for reading access in serial programming mode is not needed. ID authentication for writing access is always done by SW.

Table 42.4 shows access protection to Data Flash memory. ID authentication to access is same as user area of Code flash memory. But the ID to authenticate becomes Data Flash ID.

Table 42.5 shows access protection to Extra Area (Configuration Setting, Security Setting, Block Protection Setting). ID authentication for reading/writing access is done by SW. Protection ID of Configuration Setting Area, see Section 41.10, Configuration Setting Area (Option Bytes, Reset Vector). Protection ID of Security Setting Area, see Section 42.6, Security Settings Area. Protection ID of Block Protection Area, see Section 41.11, Block Protection Area.

Table 42.3 Access Protection to User Area from PEs

| Mode | Access from PEs | Access Via PEs Debug Master |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Relf-programming | Don't care | Erase/Write <br> Customer ID <br> authentication <br> by SW | Read |

Note: Don't care: there are no access restriction, N/A: not applicable
Note 1. If target ID has been authenticated by debugger I/F, the ID certification by SW is unnecessary.

Table 42.4 Access Protection to Data Flash from PEs

| Mode | Access from PEs |  | Access Via PEs Debug Master |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Sub Mode | Read | Erase/Write | Read | Erase/Write |
|  | OCD mode | Don't care | Data Flash ID <br> authentication <br> by SW | N/A | N/A |

Note: Don't care: there are no access restriction, N/A: not applicable
Note 1. If target ID has been authenticated by debugger I/F, the ID certification by SW is unnecessary.

Table 42.5 Access Protection to Extra Area (Configuration Setting, Security Setting, Block Protection Area) from PEs

| Mode | Sub Mode | Access from Pes |  | Access Via PEs Debug Master |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Read | Erase/Write | Read | Erase/Write |
| Normal Operation Mode / User Boot Mode | Self-programming | ID authentication by SW | ID authentication by SW | N/A | N/A |
|  | OCD mode | ID authentication by $\mathrm{SW}^{* 1}$ | ID authentication by SW* ${ }^{* 1}$ | ID authentication by SW* ${ }^{* 1}$ | ID authentication by SW*1 |
|  | Except above | ID authentication by SW | N/A | N/A | N/A |
| Serial programming mode | - | ID authentication by SW | ID authentication by SW | N/A | N/A |
|  | OCD mode (CAN/CAN-FD) | ID authentication by $\mathrm{SW}^{* 1}$ | ID authentication by $\mathrm{SW}^{* 1}$ | ID authentication by $\mathrm{SW}^{* 1}$ | ID authentication by $\mathrm{SW}^{* 1}$ |

Note: Don't care: there are no access restriction, N/A: not applicable
Note 1. If target ID has been authenticated by debugger I/F, the ID certification by SW is unnecessary.

### 42.5.1 Block Protection Function

- User Area Erase/Write Protection

Code flash can be protected from Erase/Write by Customer ID authentication. This function can be set by 4 bit per Block of code flash. Figure 42.2 shows an example of Block Protection structure. Once set, the OTP setting cannot be released.

- Data Flash Erase/Write Protection

Data Flash can be protected from Erase/Write by Data Flash ID authentication. This function can be set by DPROT. (see Section 42.6.5, S_OPBT4 — Data Flash ID Related Option Bytes)

Figure $42.2 \quad$ Block Protection Function Structure

Table 42.6 Block Protection Setting Mapping*1

| Address | Bit | Protection Area |
| :--- | :--- | :--- |
| FF32 2080 | $[3: 0]$ | User Block 0 |
|  | $[7: 4]$ | User Block 1 |
| FF32 2081 | $[3: 0]$ | User Block 2 |
|  | $[7: 4]$ | User Block 3 |
| FF32 2082 | $[3: 0]$ | User Block 4 |
|  | $[7: 4]$ | User Block 5 |
| FF32 2083 | $[3: 0]$ | User Block 6 |
|  | $[7: 4]$ | User Block 7 |
| $:$ | $:$ | $:$ |
| FF32 20C2 | $[7: 4]$ | User Block 133 |
| FF32 20C3 | $[3: 0]$ | Reserved |
|  | $[7: 4]$ | User Boot |

Note 1. Refer to Section 41.11, Block Protection Area.

### 42.5.2 OTP (One Time Programmable) Function

OTP can be individually set for each block of the user area and the user boot area of code flash memory. When the OTP setting is made for an area (When OTP bit is " 0 "), programming by serial programming and by self programming is prohibited. Once set, the OTP setting cannot be released.

Table 42.7 shows Mapping of OTP setting for User area and User boot area.
Table 42.7 Mapping of OTP Setting (User Area and User Boot Area)*1

| Address | Bit | Protection Area |
| :--- | :--- | :--- |
| FF32 2040 | $[0]$ | User Block 0 |
|  | $[1]$ | User Block 1 |
|  | $[2]$ | User Block 2 |

|  | $[1]$ | FF32 0066[31:0] |
|  | $[2]$ | FF32 0068[31:0] |
| $:$ | $[3]$ | FF32 006C[31:0] |
|  | $:$ | $:$ |
|  | $[23]$ | FF32 00BC[31:0] |

Note 1. Refer to Section 42.6, Security Settings Area.
Note 2. Refer to Section 41.10, Configuration Setting Area.

### 42.5.3 Test Mode Entry Protection

Test mode is used to perform production test or failure analysis by Renesas. The authentication scheme to enter the test mode is configurable by Security settings area.

The password can be select from TESTID (that only Renesas uses) or C-TESTID to enter the test mode by Security settings area. For details, see Section 16.8, in the RH850/E2x ICUMD User's Manual.

### 42.6 Security Settings Area

The flash memory has the extended Extra area (Option Bytes) to store a data specified by the user for security settings. Changes in settings become effective after release from the reset state. (Refer to Section 10.3.4, FACI reset transfer.) OTP Setting of Security Settings Area becomes effective without reset. Table 42.10 shows Security settings area. For setting and reading option bytes, see the Renesas Flash Programmer Flash Programming Software User's Manual, or the RH850/E2x-FCC1 Flash Memory User's Manual: Hardware Interface.

Table 42.10 Security Settings Area

| Name | Address | Initial State of Shipped Product.*1 | Write/Erase Protection ID*3 | Read Protection ID*3*7 |
| :---: | :---: | :---: | :---: | :---: |
| OTP Setting of Security Settings Area*2*8 | $\begin{aligned} & \text { FF30 } 0040_{\mathrm{H}} \\ & \text { to FF30 } 0048_{\mathrm{H}} \end{aligned}$ | FFFF FFFF ${ }_{\text {H }}$ | - | - |

| Reserved | FF30 0160 ${ }_{H}$ to FF30 01DC ${ }_{H}$ | FFFF FFFF ${ }_{H}{ }^{* 5}$ | - | - |
| Reserved*9 | $\begin{aligned} & \text { FF30 01E0 } \\ & \text { to FF30 01FC } \end{aligned}$ | *9 | *9 | *9 |

Note 1. This is the initial value of the shipped product. The value can be modified.
Note 2. The detail of this function, see Section 42, Basic Hardware Protection (BHP).
(Table 42.8 shows Mapping of OTP setting for extra Area.)
Note 3. When all bits of Protection ID are " 1 " or " 0 ", the ID authentication is no needed to set.
Note 4. When CFRPF is set (CFRPF bit is 0 ).
Note 5. It is prohibited to change from a read value.
Note 6. When the all bits are " 1 ", the ID authentication is needed to connect a flash memory programmer.
Note 7. When Sub mode is OCD mode, the Customer ID authentication is needed to read.
Note 8. Set OTP after programming target data, because OTP setting becomes effective without reset.
Note 9. There are OPBT of ICUMD. For details, see the RH850/E2x ICUMD User's Manual. When ICUMD is unused, please do not write it.

### 42.6.1 S_OPBTO — OCD ID Related Option Bytes

OCD ID authentication is needed for write this option byte.
When all bits of OCD ID are " 1 " or " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by Configuration Programming.
Note 2. Only when an FACl command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.11 OCD ID Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | JPDBGIF_EN | Security level 2 setting <br> 0 : Set security level 2 (can't use debug interface) <br> 1: Unset security level 2 (can use debug interface) |
| 30 | DRDY_EN | Switching of the DRDY use for Nexus <br> 0: Not use DRDY(GPIO) <br> 1: Use DRDY |
| 29 to 25 | - | Reserved (The setting value should be 1.) |
| 24 | CPUBTMSK_EN | PEO boot mask enable (when the TRST=H mode only) <br> 0: PE0 boot mask disable <br> 1: PE0 boot mask enable |
| 23 to 21 | - | Reserved (The setting value should be 1.) |
| 20 | DBG_OVCAN_DIS | Debug over Can disable <br> 0: Debug over CAN enable <br> 1: Debug over CAN disable |
| 19 to 5 | - | Reserved (The setting value should be 1.) |
| 4 | PFC_RESO_CFG | Switching RES_OUT pin function <br> 0 : Output to the internal reset signal <br> 1: Output due to the Pin function setting |
| 3 to 1 | - | Reserved (The setting value should be 1.) |
| 0 | OIDDIS | OCD ID Authentication Disable <br> 0 : ID authentication is disabled (Can not entry Debug mode ) <br> 1: ID authentication is enabled |

### 42.6.2 S_OPBT1 — TEST ID /C-TEST ID Related Option Bytes

C-TEST ID authentication is needed for write this option byte.
When all bits of C-TEST ID are " 1 " or " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.12 TEST ID /C-TEST ID Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved (The setting value should be 1.) |
| 16 | TMID | Test Mode Protection ID Selection |
|  |  | 0: C-TEST ID is used in test mode ID authentication |
|  | 1: TESTID is used in test mode ID authentication |  |
| 15 to 1 | - | Reserved (The setting value should be 1.) |
| 0 | TIDDIS | C-TEST ID Authentication Disable |
|  | $0:$ ID authentication is always denied (Can not entry test mode ) |  |
|  |  | 1: ID authentication is enabled |

## NOTE

When TMID is set to " 1 ", test mode entry cannot be denied whether TIDDIS is set to " 0 ". To invalidate the entry of test mode, both TIDDIS and TMID have to be set to " 0 ".

### 42.6.3 S_OPBT2

For details of this S_OPBT2, see the RH850/E2x ICUMD User's Manual.

### 42.6.4 S_OPBT3 - Customer ID Related Option Bytes

Customer ID authentication is needed for write this option byte.
When all bits of Customer ID are " 1 " or " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.13 Customer ID Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved (The setting value should be 1.) |
| 16 | CFRPF | Code Flash Read Protection Flag |
|  |  | Controlling section password authentication for code flash read access at debug mode |
|  | $0:$ Section password authentication for read access is needed |  |
|  |  | 1: Section password authentication for read access is not needed. |
| 15 to 0 | - | Reserved (The setting value should be 1.) |

### 42.6.5 S_OPBT4 — Data Flash ID Related Option Bytes

Data Flash ID authentication is needed for write this option byte.
When all bits of Data Flash ID are " 1 " or " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.14 Data Flash ID Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved (The setting value should be 1.) |
| 16 | DFRPF | Data Flash Read Protection Flag |
|  |  | Controlling section password authentication for data flash read access at debug mode |
|  | 0: Data Flash ID authentication for read access is needed |  |
|  | 1: Data Flash ID authentication for read access is not needed. |  |
| 15 to 1 | - | Reserved (The setting value should be 1.) |
| 0 | DPROT | Data Flash Erase / Write protection Flag. |
|  |  | Controlling section password authentication for data flash Erase / Write access |
|  | 0: Data Flash ID authentication for Erase / Write access is needed |  |
|  | 1: Data Flash ID authentication for Erase / Write access is not needed. |  |

### 42.6.6 S_OPBT5 — Serial Programmer ID Related Option Bytes

Serial Programmer ID authentication is needed for write this option byte.
When all bits of Serial Programmer ID are " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.15 Serial Programmer ID Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved (The setting value should be 1.) |
| 1 | CANBTD | CAN / CAN-FD Boot Strap Disable |
|  |  | $0:$ CAN / CAN-FD Boot Strap of serial programmer command is disabled by boot firmware |
|  |  | 1: CAN / CAN-FD Boot Strap of serial programmer command is enabled |
| 0 | SPD | Serial Programmer Disable |
|  | $0:$ All serial programmer commands is disabled by boot firmware |  |
|  |  | 1: Serial programmer commands is enabled |

### 42.6.7 S_OPBT6 — RHSIF ID Related Option Bytes

RHSIF ID authentication is needed for write this option byte.
When all bits of RHSIF ID are " 1 " or " 0 ", the ID authentication is no needed to change the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting (W) is possible.

Table 42.16 RHSIF Related Option Bytes Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved (The setting value should be 1.) |
| 16 | HSIF_IDAUTH_NEED | RHSIF Link Partner Authentication Setting |
|  |  | 0: RHSIF ID authentication for Link Partner access is not needed |
|  |  | 1: RHSIF ID authentication for Link Partner access is needed. |
| 15 to 0 | - | Reserved (The setting value should be 1.) |

### 42.6.8 S_OPBT7

For details of this S_OPBT7, see the RH850/E2x ICUMD User's Manual.

### 42.6.9 OCDIDn — OCD ID ( $\mathrm{n}=0$ to 7 )

OCD ID authentication is needed for read / write this option byte.
When all bits of OCD ID are " 1 " or " 0 ", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.17 OCD IDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OCD ID | ID Code for debug connection authentication. |
|  |  | Bit mapping table is as follows: |
|  | OCD ID[ 31:0]: OCDID0[31:0] |  |
|  | OCD ID[63:32]: OCDID1[31:0] |  |
|  | OCD ID[95:64]: OCDID2[31:0] |  |
|  | OCD ID[127:96]: OCDID3[31:0] |  |
|  | OCD ID[159:128]: OCDID4[31:0] |  |
|  | OCD ID[191:160]: OCDID5[31:0] |  |
|  | OCD ID[223:192]: OCDID6[31:0] |  |
|  | OCD ID[255:224]: OCDID7[31:0] |  |

### 42.6.10 SPIDn - Serial Programmer ID ( $\mathrm{n}=0$ to 7 )

Serial Programmer ID authentication is needed for read / write this option byte.
When all bits of Serial Programmer ID are " 0 ", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.18 SPIDn Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Serial Programmer ID | ID Code for Serial Programmer authentication. |
|  |  | Bit mapping table is as follows: |
|  | Serial Programmer ID[31:0]: SPID0[31:0] |  |
|  | Serial Programmer ID[63:32]: SPID1[31:0] |  |
|  | Serial Programmer ID[95:64]: SPID2[31:0] |  |
|  | Serial Programmer ID[127:96]: SPID3[31:0] |  |
|  | Serial Programmer ID[159:128]: SPID4[31:0] |  |
|  | Serial Programmer ID[191:160]: SPID5[31:0] |  |
|  | Serial Programmer ID[223:192]: SPID6[31:0] |  |
|  | Serial Programmer ID[255:224]: SPID7[31:0] |  |

### 42.6.11 CUSTOMERIDn — Customer ID ( $\mathrm{n}=0$ to 7 )

Customer ID authentication is needed for read / write this option byte.
When all bits of Customer ID are " 1 " or " 0 ", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.19 CUSTOMERIDn Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Customer ID | ID Code for Code Flash Protection, Configuration setting and etc. |
|  |  | Bit mapping table is as follows: |
|  | Customer ID[31:0]: CUSTOMERID0[31:0] |  |
|  | Customer ID[63:32]: CUSTOMERID1[31:0] |  |
|  | Customer ID[95:64]: CUSTOMERID2[31:0] |  |
|  | Customer ID[127:96]: CUSTOMERID3[31:0] |  |
|  | Customer ID[159:128]: CUSTOMERID4[31:0] |  |
|  | Customer ID[191:160]: CUSTOMERID5[31:0] |  |
|  | Customer ID[223:192]: CUSTOMERID6[31:0] |  |
|  | Customer ID[255:224]: CUSTOMERID7[31:0] |  |

### 42.6.12 DATAFLASH IDn — Data Flash ID ( $\mathrm{n}=0$ to 7)

Data Flash ID authentication is needed for read / write this option byte.
When all bits of Data Flash ID are "1" or "0", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.20 DATAFLASH IDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Data Flash ID | ID Code for Data Flash Protection. |
|  | Bit mapping table is as follows: |  |
|  | Data Flash ID[31:0]: DATAFLASHID0[31:0] |  |
|  | Data Flash ID[63:32]: DATAFLASHID1[31:0] |  |
|  | Data Flash ID[95:64]: DATAFLASHID2[31:0] |  |
|  | Data Flash ID[127:96]: DATAFLASHID3[31:0] |  |
|  | Data Flash ID[159:128]: DATAFLASHID4[31:0] |  |
|  | Data Flash ID[191:160]: DATAFLASHID5[31:0] |  |
|  | Data Flash ID[223:192]: DATAFLASHID6[31:0] |  |
|  | Data Flash ID[255:224]: DATAFLASHID7[31:0] |  |

### 42.6.13 CTESTIDn - C-Test ID ( $\mathrm{n}=0$ to 7 )

C-TEST ID authentication is needed for read / write this option byte.
When all bits of C-TEST ID are " 1 " or " 0 ", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.21 CTESTIDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | C-TEST ID | ID Code for test mode entry authentication. |
|  |  | Bit mapping table is as follows: |
|  | C-TEST ID[31:0]: CTESTID0[31:0] |  |
|  | C-TEST ID[63:32]: CTESTID1[31:0] |  |
|  | C-TEST ID[95:64]: CTESTID2[31:0] |  |
|  | C-TEST ID[127:96]: CTESTID3[31:0] |  |
|  | C-TEST ID[159:128]: CTESTID4[31:0] |  |
|  | C-TEST ID[191:160]: CTESTID5[31:0] |  |
|  | C-TEST ID[223:192]: CTESTID6[31:0] |  |
|  | C-TEST ID[255:224]: CTESTID7[31:0] |  |

### 42.6.14 RHSIFIDn — RHSIF ID ( $\mathrm{n}=0$ to 7 )

RHSIF ID authentication is needed for read / write this setting.
When all bits of RHSIF ID are " 1 " or " 0 ", the ID authentication is no needed to change/read the setting.

Note 1. This is the initial value of the shipped product. The value can be modified by setting the option bytes.
Note 2. Only when an FACI command or serial programming (ex. the Renesas Flash Programmer flash programming software) is used, setting $(\mathrm{W})$ is possible.

Table 42.22 RHSIDIDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RHSIF ID | ID Code for RHSIF Link Partner connection authentication. |
|  |  | Bit mapping table is as follows: |
|  | RHSIF ID[31:0]: HSIFID0[31:0] |  |
|  | RHSIF ID[63:32]: HSIFID1[31:0] |  |
|  | RHSIF ID[95:64]: HSIFID2[31:0] |  |
|  | RHSIF ID[127:96]: HSIFID3[31:0] |  |
|  | RHSIF ID[159:128]: HSIFID4[31:0] |  |
|  | RHSIF ID[191:160]: HSIFID5[31:0] |  |
|  | RHSIF ID[223:192]: HSIFID6[31:0] |  |
|  |  | RHSIF ID[255:224]: HSIFID7[31:0] |

## Section 43 Intelligent Cryptographic Unit/Master (ICUMD)

[^22]
## Section 44 Secure Watchdog Timer (SWDT)

Please refer to the separate volume about SWDT.

## Section 45 Debugging and Calibration

This microcontroller has an on-chip debug function. By using the on-chip debug emulator, programs can be debugged with the microcontroller mounted in the target system.

The debug functions incorporated in this microcontroller conform to IEEE-ISTO 5001 ${ }^{\text {TM }}-2003$, a Nexus debug interface standard.

Production devices support Nexus Class 1 debug functionality. Emulation devices support Nexus Class 3 debug functionality.

For details of Production devices, see Section 1.4, Ordering Information, Table 1.1.
For details of Emulation devices, see Section 1.4, Ordering Information, Table 1.2.

## CAUTION

The debug functions described in this section are supported by the microcontroller but whether these functions can actually be used depends on the debugger. For details on debugging, see the user's manual of the debugger used.

### 45.1 Debug Interface

This microcontroller supports the following debug interfaces:

1. Nexus JTAG Interface
2. Low Pin Debug Interface (4-pin) (LPD4)
3. CAN Debug interface - A CAN port can be selected as the debug communication interface by using the 2 pin protocol version of LPD4.
4. In emulation devices, a 1-lane Aurora trace port is provided.
5. Trigger Input / Output pin ( $\overline{\text { EVTI }} / \overline{\text { EVTO }})$

On-chip debugging can be performed by using these debug interfaces.
Table 45.1 Debug Interface Modes

| Serial programing mode*1 |  | Normal operating mode/user boot mode ${ }^{* 1}$ | Debug ports |  | Option bytes*3 |  |  | Register ${ }^{* 4}$ | JP0 port usage |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2-wire UART/CSI*5 | $\begin{aligned} & \text { CAN/CAN }-1 \\ & \text { FD*5 } \end{aligned}$ |  | TRST | TDI(JP0_0)*2 | $\begin{aligned} & \mathrm{DRDY} \_\mathrm{E} \\ & \mathrm{~N} \end{aligned}$ | JPDBGIF_ EN | $\begin{aligned} & \text { DBG_OV } \\ & \text { CAN_DI } \\ & \text { S } \end{aligned}$ | $\begin{aligned} & \text { DBGOVCANC } \\ & \text { DOC_EN } \\ & \hline \end{aligned}$ |  |
| 1 | 0 | 0 | x | x | x | x | x | x | Serial programming* ${ }^{*}$ |
| 0 | 1 | 0 | 0 | x | x | x | x | x | GPIO*6 |
| 0 | 1 | 0 | 1 | 0 | x | 0 | x | $x$ | GPIO (security level $\left.2^{+3}\right)^{* 6, * 8}$ |
| 0 | 1 | 0 | 1 | 0 | x | 1 | x | x | LPD4 ${ }^{* 6,4}$ |
| 0 | 1 | 0 | 1 | 1 | x | 0 | x | x | GPIO (security level $\left.2^{* 3}\right)^{* 6, * 8}$ |
| 0 | 1 | 0 | 1 | 1 | 1 | 1 | x | x | Nexus (with DRDY $)^{* 6, * 9}$ |
| 0 | 1 | 0 | 1 | 1 | 0 | 1 | x | x | Nexus (without DRDY ) ${ }^{* 6,9}$ |
| 0 | 0 | 1 | 0 | x | x | x | x | x | GPIO |
| 0 | 0 | 1 | 1 | 0 | x | 0 | x | x | GPIO (security level $2^{* 3}$ ) ${ }^{* 8}$ |
| 0 | 0 | 1 | 1 | 0 | x | 1 | x | 0 | LPD4*9 |
| 0 | 0 | 1 | 1 | 1 | x | 0 | x | x | JTAG Boundary Scan (security level $2^{* 3}$ ) |
| 0 | 0 | 1 | 1 | 1 | 1 | 1 | x | 0 | Nexus (with DRDY ) \& JTAG Boundary Scan*9 |
| 0 | 0 | 1 | 1 | 1 | 0 | 1 | x | 0 | Nexus (without DRDY ) \& JTAG Boundary Scan* |
| 0 | 0 | 1 | 1 | x | x | 1 | 0 | 1 | GPIO (Debug Over CAN) |

Note: x = don't care
Note 1. For details, see Section 5, Operating Modes.

Note 2. Latch output at rising edge of $\overline{\text { TRST }}$.
Note 3. For details, see Section 42, Basic Hardware Protection (BHP).
Note 4. For details, see Section 45.8.1.5(1), DBGOVCANC — Debug Over CAN Control Register.
Note 5. For details, see Section 41, Flash Memory.
Note 6. Can be selected externally by using the boot firmware.
Note 7. The function of the port can be switched between 2-wire UART and CSI by using the boot firmware.
Note 8. The operation is not guaranteed if a reset is asserted while data is being output. When GPIO is used, TRST must be " 0 ".
Note 9. When the interface is to be switched, the JP0 port register settings must be their initial values.

### 45.2 Run Control Functions

(1) Debug functions

- Downloading a user-created program
- Reading and writing the memory and registers
- Running a user-created program starting at any address
(2) On-chip break functions

A maximum of 12 breakpoints can be specified at any execution address. Of the 12 breakpoints, a maximum of four breakpoints can be specified for the data access address.

The following break functions are supported:

- Relay break function: Each CPU can be configured to stop execution when another CPU hits a breakpoint.
- Individual break function: Each CPU can be configured to continue execution when another CPU hits a breakpoint.

## CAUTION

Whether the individual break function can be used or not depends on the debugger.
(3) Software break function

Software breakpoints can be specified at any execution address.
(4) Forced break function

Execution of a user-created program can be interrupted forcibly by a debugger.
(5) Peripheral break control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the usercreated program is stopped, for instance upon a breakpoint hit.
(6) Forced reset function

This device (microcontroller) can be forcibly reset by a debugger.
(7) Reset mask function

A reset factor (external reset, software reset, and ECM reset) can be masked.
(8) Event detection function

Events can be detected based on execution address, data access address, data value, data value range, and sequential execution.
(9) Trigger input interface

This microcontroller incorporates an event trigger input interface to acknowledge external events. It can acknowledge an external event in response to an input from the $\overline{\text { EVTI }}$ pin.
(10) Trigger output interface

An event trigger output interface is included in this microcontroller to notify an external debug device of event detection. Output from the $\overline{\text { EVTO }}$ pin reports detection of an event trigger to the outside. Debug trigger registers control trigger output to an external debug device via a request from the CPU. Up to eight debug trigger registers are supported. Each register supports 32 software triggers.

When $\overline{\text { TRST }} / \overline{\text { LPDRST }}$ is low level, output system reset signal from $\overline{\text { EVTO }}$.
(11) Debug interrupt interface function

Execution of a user program can be forcibly suspended by asserting an input signal on the EVTI pin from the outside.
(12) Multi core debug function

The following multi-core debug functions are supported for each CPU: synchronization functions (including reset, execution, and break), synchronous setting, and simultaneous tracing for multiple cores.

### 45.3 Calibration Functions

This microcontroller includes emulation RAM as emulation memory for the on-chip flash memory.
(1) Real-time RAM monitoring (RRM)

The memory can be read during program execution. Because this read access uses debug-dedicated DMA, it has minimal effect on program execution.
(2) Dynamic memory modification (DMM)

The memory can be written during program execution. Because this write access uses debug-dedicated DMA, it has minimal effect on program execution.
(3) Emulation RAM (ERAM) - only in emulation devices

For details, see Section 9, RAM.

### 45.4 Trace Control Functions

This microcontroller provides several trace functions including branch PC trace and data trace for each CPU, and DMA data trace.
(1) Trace RAM - only in emulation devices

This microcontroller has 64 KB of trace RAM. The trace information in the trace RAM is accessible via Nexus and LPD4 debug interfaces.
(2) Trace filter RAM - only in emulation devices

- Advanced data trace filtering allows selection of small 4 byte sections of data which can be individually enabled for data trace.
- Trace filter RAM does not have ECC.
(3) Software trace

This function enables the obtaining of user program execution histories, data changes, etc. The software trace information can be output to the trace RAM or via Aurora debug interface.
(4) Software trace

This function enables the obtaining of user program execution histories, data changes, etc. The software trace information can be output via LPD4 debug interfaces.
(5) Trace over reset

Remaining trace data is output after a reset.
(6) Global timestamp information

The global timestamp information is the absolute time from (absolute time 0 ) when the trace buffer is cleared.
(7) The trace message format in conforms to the Nexus standard.
(8) Windowed instruction trace or data trace

### 45.5 Performance Measurement Function

This microcontroller provides a two-event interval time difference measurement function to measure the time difference between the points at which two events occur.
(1) Two-event interval time difference measurement function

- Provides a function to measure the time difference (maximum time, minimum time, accumulation time) between two events (measurement start event to measurement stop event).
- Provides a function to measure the number of measurements (the number of measurement stop events) for two-event intervals (measurement start event to measurement stop event).
- Provides a threshold value violation detection function for two-event intervals (measurement start event to measurement stop event).
- Measurement clock: Debugging clock or CPU clock
- Measurement counter: 32-bit counter $\times 4$ channels
- Measurement items: Maximum value, minimum value, accumulation value, measurement count (measurement stop event count)
- Count conditions: Number of debugging clock cycles, measurement count (measurement stop event count); number of CPU clock cycles, instruction execution or other events.
- Measurement limitations: When the interval between the measurement start event and the measurement stop event (from measurement start to measurement stop) or between a measurement stop event and the next measurement start event (from measurement stop to measurement start) is short, it may not be possible to correctly detect the measurement start or measurement stop events due to synchronization processing (from the system clock to the debugging clock).
Note that the required interval for detection depends on the system clock and the debugging clock frequencies.
- Measurement of the cache hit rate
- Measurement of the number of CPU cycles when a pipeline stall has occurred

### 45.6 Debug Support Function

(1) Hot plug-in function

Debugging can be started in normal operating mode without external reset input.
(2) Security function

To prevent the contents of the flash memory from being read by an unauthorized person, a 256 -bit ID code must be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code in the microcontroller, the flash memory cannot be accessed.

For details, refer to Section 42, Basic Hardware Protection (BHP).
(3) Halt after reset

The debugger can control the start of CPU0 after internal reset release.
This must be set by using an option byte. For details, see Section 42, Basic Hardware Protection (BHP).
(4) ICUMD debug function

For details, see the RH850/E2x ICUMD User's Manual.
(5) GTM debug function

For details, see Section 31, GTM.
(6) Device ID function

Device ID (device identification) information can be acquired via the debug interface (Nexus).
(7) Reset output pin

The reset output pin ( $\overline{\text { RES_OUT }}$ ) reflects the state of the internal reset condition.
For details, see Section 2, Pin Function.

### 45.7 Peripheral Break Control

The peripheral break function generates a stop request to the peripheral modules of the microcontroller if the usercreated program is stopped, for instance upon a breakpoint hit.

During a peripheral break, the peripheral modules operate as follows:

1. Modules that stop unconditionally regardless of the EPC.SVSTOP setting WDTB0, WDTB1, SWDT0
2. Modules that stop when EPC.SVSTOP $=1$ and EPC_SVSTOPn setting OSTM0, OSTM1, OSTM2, ENCA0, ENCA1, ATU-V, GTM

### 45.8 Debugging-Related Registers

### 45.8.1 Registers equipped according to the product specifications

### 45.8.1.1 Register Base Address

### 45.8.1.5 Product Specification Registers

(1) DBGOVCANC — Debug Over CAN Control Register

This register controls Debug Over CAN.
The setting of an option byte is necessary to enable the setting of this register.
For details, see Section 42, Basic Hardware Protection (BHP).

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 45.6 DBGOVCANC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DOC_EN | This bit is used to enable and disable Debug Over CAN. |
|  | $0:$ Debug Over CAN is disabled. |  |
|  |  | 1: Debug Over CAN is enabled. |

### 45.9 Aurora Trace Interface

### 45.9.1 Overview

Aurora is lightweight link-layer protocol for communicating over high-speed serial lanes.
Nexus introduces this protocol in IEEE-ISTO 5001-2012 (Nexus standard).
This product supports a simplex TX-only interface. Only one lane is used.
Aurora for this product is fully compatible with Nexus standards and Xilinx's Aurora Protocol spec V2.2.
Table 45.7 shows the Aurora reference documents for this product.
Table 45.7 Reference Documents

| Reference Document | Document Name | Reference |
| :--- | :--- | :--- |
| Aurora 8b / 10b protocol specification V2.2 | aurora_8b10b_protocol_spec_sp002.pdf | http://www.xilinx.com/ |
| The Nexus 5001 Forum ${ }^{\text {TM }}$ | ieee_isto_5001_2012_301_Final.pdf | http://www.nexus5001.org. |
| Standard for a Global Embedded Processor |  |  |
| Debug Interface V3.0.1 |  |  |

### 45.9.2 Summary of Specifications

Summarized specifications of Aurora for this product are shown below.
The Aurora interface for this product is compliant with IEEE-ISTO 5001-2012 (Nexus standard). Its specifications are also compliant with the Nexus standards.

Table $45.8 \quad$ Summary of Specifications

| Item | Specifications | Note |
| :--- | :--- | :--- |
| I/F | 1 lane | Simplex Tx only |
| Protocol specifications | Aurora protocol spec V2.2 compatible |  |
| DC balanced order | $8 \mathrm{~b} /$ 10b |  |
| IO level | AC coupling only | Compliant with Nexus standards |
| AC specifications | IEEE-ISTO 5001-2012 compliant |  |
| PLL multiplier ratio | $20: 1$ | Reference CLK = 62.5 MHz |
| Baud rate | 1.25 Gbps |  |
| Data format | Streaming |  |
| Back channel | Sideband (JTAG, LPD) |  |
| Flow control | None |  |
| Error detection and correction | None |  |

### 45.10 Cautions on Using On-Chip Debugger

(1) Handling of devices used for debugging

Do not install a device that was used for debugging on a mass-produced product. This is because the flash memory will be rewritten during system debugging and thus the write/erase count of flash memory cannot be guaranteed.
(2) This product does not support hot plug out for power off (including removal of the connector) of the debug tool during debug mode. Do not turn off the power of the Nexus tool (including removal of the connector) in debug mode.
(3) When ending on-chip debugging, set the TRST pin and external reset pin to low level.
(4) When a debugger is used, the program written to the microcontroller before the OCD emulator is ready to communicate with the microcontroller is executed from the reset vector. To stop the operation of the program, release the $\overline{\text { TRST }}$ before $\overline{\text { RES_IN }}$.

## Section 46 Boundary Scan

This section contains a generic description of the boundary scan.
The first part in this section describes all specific properties of this product, such as the clock supply, reset sources, etc. The remainder of the section describes the functions and registers of the boundary scan.

### 46.1 Features of Boundary Scan

### 46.1.1 Products that Incorporate Boundary Scan

This microcontroller has the JTAG interface and provides the boundary scan function conforming to the IEEE1149.1 standard.

### 46.1.2 Register Base Address

The JTAG interface has no base address because none of the registers can be accessed by the CPU

### 46.1.3 Clock Supply

The boundary scan clock supply is shown in the following table.
Table 46.1 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| Boundary scan | TCK | tck |

### 46.1.4 Interrupt Requests

Interrupt request is none.

### 46.1.5 Reset Sources

The boundary scan reset sources are shown below. Boundary scan is initialized by the following reset sources. For details about register symbols, refer to Table 46.4.

Table 46.2 Reset Sources

| Unit Name | Register <br> Symbol |  |  |  |  |  |  |  | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module Reset | JTAG Reset |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SDIR | - | - | - | - | - | $\checkmark$ |  |  |  |  |  |  |  |
|  | SDID | - | - | - | - | - | - |  |  |  |  |  |  |  |
|  | SDBPR | - | - | - | - | - | - |  |  |  |  |  |  |  |
|  | SDBSR | - | - | - | - | - | - |  |  |  |  |  |  |  |

### 46.1.6 External Input/Output Signals

External input/output signals of boundary scan are listed below.
Table 46.3 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal Name |
| :--- | :--- | :--- |
| Boundary scan |  | Serial data input clock signal |
| TCK | Mode select input signal | TCK |
| TMS | Reset input signal | TMS |
| TRST | Serial data input signal | TRST |
| TDI | Serial data output signal | TDI |
| TDO |  | TDO |

### 46.2 Overview

Boundary scan is a test method defined in the IEEE standard 1149.1 that is used to test the connection between the devices mounted on the printed-circuit board. The boundary scan of the RH850/E2x-FCC1 conforms to IEEE Std 1149.1-2001.

### 46.2.1 Functional Overview

This microcontroller supports the following.

- Five test signals (TCK, TDI, TDO, TMS, and TRST )
- TAP controller
- Instruction register
- Bypass register
- Boundary scan register

The JTAG interface has six instructions.

- BYPASS mode

Test mode conforming to the IEEE 1149.1

- EXTEST mode

Test mode conforming to the IEEE 1149.1

- SAMPLE/PRELOAD mode

Test mode conforming to the IEEE 1149.1

- CLAMP mode

Test mode conforming to the IEEE 1149.1

- HIGHZ mode

Test mode conforming to the IEEE 1149.1

- IDCODE mode

Test mode conforming to the IEEE 1149.1

### 46.2.2 Block Diagram

The following block diagram shows the main components of the boundary scan.

Note: SDBSR: Boundary scan register
SDBPR: Bypass register
SDIR: Instruction register
SDID: ID register
Buf: I/O buffer
MUX: Multiplexer

Figure 46.1 Block Diagram of JTAG Interface

### 46.3 Registers

### 46.3.1 List of Registers

The boundary scan registers are listed in the following table.
Table 46.4 List of Registers

| Module Name | Register Name | Symbol | Address $^{* 1}$ | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| BSCAN | Instruction register | SDIR | - | 8 | - |
|  | ID register | SDID | - | 32 | - |
|  | Bypass register | SDBPR | - | 1 | - |
|  | Boundary scan register | SDBSR | - | $* 2$ | - |

Note 1. This register can be access by TAP controller.
Note 2. The register is a shift register to control external pins, and thus it can't define access size.

The ID register (SDID) information is listed in the following table.
For the ID register of mass produced products, please to each target specification.
Table 46.5 List of ID Register (SDID) Value

| Product Type Name | Description | SDID Value |
| :--- | :--- | :--- |
| E2M 400MHz BGA292 | R7F702002AEABG | 2839 F447 |
| E2M 400MHz BGA373 | R7F702002AEABA | $283 A$ 0447 |
| E2x-FCC1 for E2M BGA292 | R7F702Z02CEDBG | $483 A$ D447 |
| E2x-FCC1 for E2M BGA373 | R7F702Z04CEDBA | $483 D ~ 1447_{\mathrm{H}}$ |

Instructions can be serially transferred from the serial data input pin (TDI) and input to the instruction register (SDIR). The bypass register (SDBPR) is a 1-bit register, to which TDI and TDO are connected in BYPASS mode, CLAMP mode, and HIGHZ mode. The boundary scan register (SDBSR) is connected to TDI and TDO in SAMPLE/PRELOAD mode and EXTEST mode. The ID code register (SDID) is a 32-bit register, from which the ID code is output via TDO in IDCODE mode.

### 46.3.2 Details of Registers

### 46.3.2.1 SDIR — Instruction Register

SDIR is an 8-bit register that holds a boundary scan instruction. SDIR is initialized by a low-level input of TRST or in the TAP Test-Logic-Reset state. Operation is not guaranteed when any reserved instruction is set in this register.

Table 46.6 Boundary Scan Instructions

| SDIR[7:0] | Description |
| :--- | :--- |
| 00000000 | JTAG EXTEST |
| 01000000 | JTAG SAMPLE/PRELOAD |
| 11010000 | JTAG CLAMP |
| 10000000 | JTAG HIGHZ |
| 01010101 | JTAG IDCODE (value after reset) |
| 11111111 | JTAG BYPASS |
| Other than above | Reserved |

### 46.3.2.2 SDID - ID Register

SDID is a 32-bit register with a device specific ID.
SDID can be read via the JTAG interface pin when the IDCODE instruction is set but cannot be written to.

### 46.3.2.3 SDBPR — Bypass Register

SDBPR is a 1-bit register to go through the boundary scan register. When SDIR is set to BYPASS mode, CLAMP mode or HIGHZ mode, SDBPR is connected between TDI and TDO. The value after reset is undefined. SDBPR is not initialized by a reset as described in Section 46.1.5, Reset Sources.

### 46.3.2.4 SDBSR — Boundary Scan Register

SDBSR is a shift register located on the PADs for controlling the external I/O pins. When SDIR is set to SAMPLE/PRELOAD or EXTEST mode, SDBSR is connected between TDI and TDO. The value after reset is undefined. SDBSR is not initialized by a reset as described in Section 46.1.5, Reset Sources.

### 46.4 Operation

### 46.4.1 TAP Controller

The following block diagram shows the TAP controller internal states.

Figure 46.2 TAP Controller Internal States*1

Note 1. Transition is made according to the TMS value at the rising edge of TCK. The TDI value is sampled at the rising edge of TCK and is shifted at the falling edge. TDO is in the high-impedance state in the states other than Shift-DR (DataRegister) and Shift-IR. Asserting TRST causes transition to the test-logic-reset state asynchronously with TCK.

### 46.4.2 Supported Instructions <br> 46.4.2.1 BYPASS

The BYPASS instruction is a standard instruction indispensable to bypass register operation. This instruction shortens the shift path to achieve high-speed serial data transfer of other devices on the printed-circuit board. During execution of this instruction, the test circuit has no effect on the system circuit.

### 46.4.2.2 SAMPLE/PRELOAD

The SAMPLE/PRELOAD instruction is used to input the value to the boundary scan register from the internal circuits of this LSI; to output the value from the scan path; and to load data onto the scan path. During execution of this instruction, the level of the input pin of this LSI is sent to the internal circuits as is, and the value of the internal circuits is output to the outside via the output pin as is. Executing this instruction has no effect on the system circuit of this LSI.

The SAMPLE operation allows taking in the snapshots of the value to be transferred to the internal circuits from the input pin or the value to be transferred to the output pin from the internal circuits to the boundary scan register, and allows reading the snapshots from the scan path. Snapshots can be taken in without preventing the normal operation of this LSI.

The PRELOAD operation allows setting the initial value to the parallel output latch of the boundary scan register from the scan path prior to the EXTEST instruction. If the EXTEST instruction is executed without PRELOAD operation, an undefined value is output from the output pin until the first scan sequence is completed (transfer to the output latch) because the parallel output latch value is always output to the output pin by the EXTEST instruction.

### 46.4.2.3 EXTEST

The EXTEST instruction is used to test the external circuits when this LSI is mounted on the printed circuit board. When this instruction is executed, the output pin is used to output the test data (previously set by the SAMPLE/PRELOAD instruction) from the boundary scan register to the printed-circuit board; whereas the input pin is used to take in the test result from the printed-circuit board to the boundary scan register. When the EXTEST instruction is executed N times for testing, the test data for the Nth execution is scanned in at the $(\mathrm{N}-1)$ th scan-out. If the data is loaded onto the boundary scan register of the output pin in the Capture-DR state of this instruction, it is not used for testing the external circuits (replaced through shift operation).

### 46.4.2.4 CLAMP

When the CLAMP instruction is selected, the output pin outputs the boundary scan register value that has been previously set by the SAMPLE/PRELOAD instruction. While the CLAMP instruction is selected, the boundary scan register retains the previous state regardless of the TAP controller state. The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS instruction is selected.

### 46.4.2.5 HIGHZ

When the HIGHZ instruction is selected, all the output pins go to the high-impedance state. While the HIGHZ instruction is selected, the boundary scan register retains the previous state regardless of the TAP controller state. The bypass register is connected between TDI and TDO and operates in the same manner as when the BYPASS instruction is selected.

### 46.4.2.6 IDCODE

The IDCODE instruction sets the JTAG interface pins to IDCODE mode, which is defined by the JTAG standard. When the JTAG interface is initialized (by asserting $\overline{\text { TRST }}$ or placing TAP in the test-logic-reset state), IDCODE mode is set.

### 46.4.3 Supported Pins

### 46.4.3.1 Supported Pin Information

There are supported pins related to the JTAG interface as follows.

- General purpose I/O pins.
- External reset output pin.
- Non maskable input pin.
- DRDY pin.

There are restrictions related to the JTAG interface as follows.

- NC pins.
- Power supply and GND pins.
- Reference voltage pins of $\mathrm{A} / \mathrm{D}$ converters.
- Analog input pins.
- The pin to be connected to a stabilizing capacitor.
- External reset input pin.
- Debug control pins.
- Mode setting pins.
- Crystal pins.
- Error output pin.

The following table shows the list of pins not subjected to boundary scan.
Table 46.7 Pins Not Subjected to Boundary Scan

| Type | Pin Name |
| :---: | :---: |
| Reference voltage pins of A/D converters. | ADSVREFH, ADSVREFL, A0VREFH, A1VREFH*3, A2VREFH, A3VREFH** |
| Analog input pins.** | ANxxx, CANxxxN, CANxxxP, DSANxxxN, DSANxxxP |
| The pin to be connected to Capacitor. | ADSVCL, RAMSVCL |
| External reset input pin. | RES_IN |
| Debug control pins. | $\frac{\text { CICREFP }^{* 2}, \text { CICREFN }^{* 2}, \text { TODPO }^{* 2}, \text { TODNO }^{* 2} \text {, TCK, TDI, TDO, TMS, }}{\text { AURORES }}{ }^{* 2}$ TRST, |
| Mode setting pins. | MD0, MD1 |
| Crystal pins. | XTAL, EXTAL |
| Error output pin. | ERROROUT_M |

Note 1. See Section 2.6.6, Dedicated Analog Pin Table about detail names of analog input pins.
Note 2. The pin is implemented only E2x-FCC1 (for E2M BGA373, E2M BGA292).
Note 3. The pin is not implemented in BGA292.

### 46.4.3.2 Usage Note

1. Once an instruction is set, it is not modified until another instruction is issued. To issue the same instructions twice in a row, insert an instruction that has no effect on chip operation (such as BYPASS mode) between the instructions.
2. To start the system in boundary scan mode, de-assert TRST while RES_IN is low. Also, be sure to set TMS to low before de-asserting TRST . Furthermore, "CPUBTMSK_EN" of OCD ID Related Option Bytes Register bit setting value must be " 1 " at that time. See Section 42.6.1, S_OPBTO - OCD ID Related Option Bytes about "CPUBTMSK_EN".
3. For details of boundary scan timing constraint, see Section 1.3.1, Power ON / OFF Timing, and Section 1.3.14, JTAG / NEXUS Timing in the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
4. If serial transfer is performed exceeding the number of bits of the register connected between TDI and TDO, the data that is input from TDI is output from TDO as is.
5. If the serial transfer sequence is corrupted, be sure to assert $\overline{\text { TRST }}$. In this case, transfer starts again from the beginning regardless of the point of transfer corruption.
6. Data is output via TDO synchronized with the falling edge of TCK.
7. To facilitate debugging, route $\overline{\text { TRST }}$ on the board in such a way that patterns can be easily cut.
8. No instructions can be accepted in power-off standby mode.
9. When using the boundary scan, the ICUM function must be disable.
10. The switching of NEXUS and boundary scan require the initialize by $\overline{\text { RES_IN }}$ and $\overline{\text { TRST }}$.

    Note 2. E2xFCC1: $(\mathrm{n}=0$ to $8, \mathrm{~m}=0$ to 7 ), E2M: $(\mathrm{n}=0$ to $7, \mathrm{~m}=0$ to 7 )

[^13]:    Note 1. E2xFCC1: $(\mathrm{n}=0$ to $4, \mathrm{~m}=0$ to 15$)$, $\mathrm{E} 2 \mathrm{M}:(\mathrm{n}=0$ to $3, \mathrm{~m}=0$ to 15)
    Note 2. E2xFCC1: $(\mathrm{n}=0$ to $8, \mathrm{~m}=0$ to 7 ), E2M: $(\mathrm{n}=0$ to $7, \mathrm{~m}=0$ to 7 )
    Note 3. E2xFCC1: $(\mathrm{n}=0$ to $6, \mathrm{~m}=0$ to 7 ), E2M: $(\mathrm{n}=0$ to $6, \mathrm{~m}=0$ to 7 )

[^14]:    Peak-Hold 3 Peak Type Select
    0 : The peak-hold 3 processing detects upper-limit peaks (value after a reset)
    1: The peak-hold 3 processing detects lower-limit peaks.

[^15]:    Comparison processing of peak-hold-1
    Value of input data to peak-hold circuit < value of peak-hold result register $n+\alpha$.

[^16]:    Comparison processing of peak-hold-2

[^17]:    Note 1. It is necessary to give read permission even when fetching instructions from its own Local RAM.

[^18]:    Note 1. For details, see Section 41, Flash Memory

[^19]:    Note 1. For details, See Section 41, Flash Memory.

[^20]:    Note 1. "*" in MISRCDR_*, MISR1_*, and MISR2_* indicates PEm. $(m=0,1)$

[^21]:    Note 1. Interrupt is not generated when four or more errors counted.

[^22]:    Please refer to the separate volume about ICUMD (Security function).
