## RH850/E2x-FCC1

User's Manual: Hardware

## Renesas microcontroller RH850 Family

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (http://www.renesas.com).

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

## Notes for CMOS devices

(1) Voltage application waveform at input pin:
(2) Handling of unused input pins:
(3) Precaution against ESD:
(4) Status before initialization:

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.
(5) Power ON/OFF sequence:

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.
(6) Input of signal during power off state:

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

## Table of Contents

Section 1 Overview ..... 86
1.1 Outline ..... 86
1.2 Features ..... 88
1.3 Application Fields ..... 95
1.4 Ordering Information ..... 95
1.5 Differences in the Specifications of FCC Products ..... 96
1.6 Pin Connection Diagram (Top View) ..... 99
1.7 Functional Block Configuration ..... 103
Section 2 Pin Function ..... 105
2.1 Features of Pin Function ..... 106
2.1.1 Port Group ..... 106
2.1.2 Register Base Addresses ..... 108
2.1.3 Clock Supplies ..... 108
2.1.4 Interrupt Requests ..... 108
2.1.5 Reset Sources. ..... 109
2.2 Overview ..... 110
2.2.1 Functional Overview ..... 110
2.2.1.1 Terms ..... 110
2.2.1.2 Overview of Pin Functions ..... 110
2.2.1.3 Pin Data Input/Output ..... 113
2.3 Port Types ..... 115
2.3.1 Pin Configuration ..... 115
2.3.2 Port Control Logic ..... 116
2.4 Registers ..... 117
2.4.1 List of Registers ..... 117
2.4.2 Port Group Unit Register Explanation ..... 119
2.4.2.1 Configuration of PORT ..... 119
2.4.2.2 Configuration of Pin Data Input/Output ..... 129
2.4.2.3 Configuration of Electrical Characteristic. ..... 138
2.4.2.4 Other Registers ..... 146
2.4.3 Pin-Unit Register Explanation ..... 152
2.4.3.1 PCRn_m/JPCRn_m — Port Control Register. ..... 152
2.4.4 Port Setting Procedures ..... 154
2.4.4.1 Batch Setting ..... 155
2.4.4.2 Individual Setting ..... 156
2.4.4.3 Protection Setting ..... 160
2.4.5 Functional Selection ..... 161
2.4.5.1 Register Configuration When Using Alternative Functions ..... 161
2.4.5.2 Alternative Functions That Can Be Used in Direct I/O Control Alternative Mode. ..... 161
2.4.5.3 Register Setting When Using an Analog Input Pin ..... 163
2.4.5.4 Register Setting to Use the LVDS Buffer. ..... 164
2.4.5.5 Setting Flow of LVDS function ..... 165
2.4.5.6 Selecton of Function for JTAG Port ..... 166
2.4.5.7 Setting of the ERROROUT_C loopback ..... 166
2.5 Organization of Port Groups ..... 167
2.5.1 List of Port Functions ..... 167
2.5.2 List of Alternative Functions ..... 167
2.6 Functions ..... 168
2.6.1 Digital Noise Filter ..... 168
2.6.1.1 Example of Noise Elimination ..... 168
2.6.1.2 Peripheral Function DNF ..... 169
2.6.1.3 Edge Detection DNF ..... 174
2.6.2 Port Safe State Mode ..... 186
2.6.2.1 Block Diagram ..... 187
2.6.2.2 Supported Pins ..... 188
2.6.2.3 Configuration Flow ..... 189
2.6.3 Virtual Port Function via RHSB (XBAR) ..... 190
2.6.3.1 Block Diagram ..... 190
2.6.4 Virtual Port Function via HSSPI ..... 191
2.6.4.1 Block Diagram ..... 191
2.6.5 Virtual Port Function via Analog ..... 192
2.6.5.1 Block Diagram ..... 192
2.6.6 Dedicated Analog Pin Table ..... 193
2.6.7 ICUM Select Function ..... 197
2.6.7.1 Block Diagram ..... 197
2.6.8 RES_OUT Function ..... 198
2.6.8.1 Overview ..... 198
2.7 List of Pin Function ..... 200
2.7.1 Overview ..... 200
2.7.2 Details Function ..... 201
2.8 Pins Status ..... 224
2.9 Handling of The Unused Pins ..... 229
2.9.1 Handling of Thermal Area Pins ..... 232
2.9.1.1 The Case of using Emulation/Instrumentation RAM (SYSVCC and EMUVDD are always supplied) ..... 232
2.9.1.2 The Case of using Emulation/Instrumentation RAM and Aurora I/F (EMUVCC and EMUVDD are always supplied) ..... 233
2.9.1.3 The Case of using Emulation/Instrumentation RAM (EMUVCC and EMUVDD are always supplied) ..... 234
2.9.1.4 The Case of Pin Assignment for Mass Production ..... 235
Section 3 CPU System ..... 236
3.1 Overview ..... 236
3.1.1 Block Diagram ..... 236
3.2 CPU ..... 238
3.2.1 Core Functions ..... 238
3.2.1.1 Features ..... 238
3.2.2 Processor Model ..... 238
3.2.2.1 CPU Operating Modes ..... 239
3.2.2.2 Instruction Execution. ..... 245
3.2.2.3 Exceptions and Interrupts ..... 247
3.2.2.4 Coprocessors ..... 249
3.2.2.5 Registers ..... 250
3.2.2.6 Data Types ..... 253
3.2.2.7 Address Space. ..... 260
3.2.2.8 Execution Timing of a Store Instruction ..... 269
3.2.2.9 Memory Ordering ..... 269
3.2.2.10 Acquiring the CPU Number ..... 269
3.2.2.11 System Protection Identifier (SPID) ..... 269
3.2.2.12 Timestamp Counter ..... 270
3.2.2.13 Performance Measurement Function ..... 271
3.2.3 Register Set ..... 272
3.2.3.1 Program Registers ..... 272
3.2.3.2 Basic System Registers ..... 274
3.2.3.3 Interrupt Function Registers ..... 298
3.2.3.4 FPU Function Registers ..... 302
3.2.3.5 FXU Function Registers ..... 309
3.2.3.6 MPU Function Registers ..... 318
3.2.3.7 Cache Operation Function Registers ..... 326
3.2.3.8 Count Function Registers ..... 334
3.2.3.9 Hardware Function Registers ..... 342
3.2.4 Exceptions and Interrupts ..... 346
3.2.4.1 Outline of Exceptions ..... 346
3.2.4.2 Operation when Acknowledging an Exception ..... 357
3.2.4.3 Return from Exception Handling ..... 360
3.2.4.4 Exception Handler Address ..... 362
3.2.4.5 Register Bank Function ..... 372
3.2.4.6 List of Memory Access Exceptions ..... 380
3.2.5 Memory Management ..... 381
3.2.5.1 Memory Protection Unit (MPU) ..... 381
3.2.5.2 Cache ..... 392
3.2.6 Coprocessor ..... 401
3.2.6.1 Floating-Point Operation ..... 401
3.2.6.2 Extended Floating-Point Operation. ..... 418
3.2.7 Hazard Control ..... 431
3.2.7.1 Synchronization Processing ..... 431
3.2.7.2 Guaranteeing the Completion of Store Instruction ..... 433
3.2.7.3 Hazard Management after System Register Update ..... 437
3.2.8 Reset ..... 442
3.2.8.1 Status of Registers After Reset ..... 442
3.2.9 Ensuring Coherency after Code Flash Programming ..... 443
3.2.9.1 Registers ..... 443
3.3 Inter-CPU Overview ..... 446
3.3.1 Features ..... 446
3.3.1.1 Number of Units ..... 446
3.3.1.2 Register Base Addresses ..... 447
3.3.1.3 Clock Supplies ..... 447
3.3.1.4 Interrupt Requests ..... 447
3.3.1.5 Reset Sources ..... 447
3.3.1.6 External Input/Output Signals ..... 448
3.3.2 Processor Element Identifier ..... 449
3.4 Inter-Processor Interrupts ..... 450
3.4.1 Inter-Processor Interrupts Overview ..... 450
3.4.2 Inter-Processor Interrupts Registers ..... 450
3.4.2.1 List of Registers ..... 450
3.4.2.2 Self Region ..... 451
3.4.2.3 IPInENm - IPIRn Inter-PE Interrupt Enable Register m ( $\mathrm{n}=0$ to 3 ) ..... 452
3.4.2.4 IPInFLGm - IPIRn Inter-PE Interrupt Flag Register m ( $\mathrm{n}=0$ to 3 ) ..... 453
3.4.2.5 IPInFCLRm - IPIRn Inter-PE Interrupt Clear Register m ( $\mathrm{n}=0$ to 3) ..... 454
3.4.2.6 IPInREQm — IPIRn Inter-PE Interrupt Request Register m ( $\mathrm{n}=0$ to 3 ) ..... 455
3.4.2.7 IPInRCLRm — IPIRn Inter-PE Interrupt Request Clear Register m ( $\mathrm{n}=0$ to 3 ) ..... 456
3.4.3 Inter-Processor Interrupts Function ..... 457
3.4.3.1 Initial Setting ..... 457
3.4.3.2 Inter-PE Interrupt Request ..... 458
3.4.3.3 Request Mask Function ..... 463
3.4.3.4 Inter-PE Interrupt Requests of Multiple Systems ..... 463
3.4.3.5 Inter-PE Interrupt Request Clear Function ..... 464
3.5 Mutual Exclusion ..... 465
3.5.1 Mutual Exclusion Overview ..... 465
3.5.2 Mutual Exclusion Registers ..... 466
3.5.2.1 List of Registers ..... 466
3.5.2.2 GOMEVn - Mutual Exclusion Variable Register n ( $\mathrm{n}=0$ to 31) ..... 467
3.5.3 Mutual Exclusion Function ..... 468
3.5.3.1 Operation Example Using Mutual Exclusion Variable Register (MEV) ..... 468
3.5.3.2 Shared Data that does not Require Mutual Exclusion Processing ..... 471
3.5.3.3 Operation of the LDL and STC Instructions ..... 472
3.5.3.4 Performing Mutual Exclusion by Using the SET1 Instruction ..... 474
3.5.3.5 Performing Mutual Exclusion by Using the CAXI Instruction ..... 475
3.6 Barrier-Synchronization ..... 476
3.6.1 Barrier-Synchronization Overview ..... 476
3.6.2 Barrier-Synchronization Registers ..... 477
3.6.2.1 List of Registers ..... 477
3.6.2.2 Self Region ..... 477
3.6.2.3 BRnINIT — Barrier-Synchronization n Initialization Register ..... 478
3.6.2.4 BRnEN — Barrier-Synchronization n Barrier Participating PE Setting Register ..... 478
3.6.2.5 BRnCHKm - Barrier-Synchronization n Barrier Check Register m ..... 479
3.6.2.6 BRnSYNCm — Barrier-Synchronization n Barrier Synchronization Completion Register m ..... 480
3.6.3 Barrier-Synchronization Function ..... 481
3.6.3.1 Initial Setting ..... 481
3.6.3.2 Barrier Synchronization ..... 482
3.7 TPTM ..... 483
3.7.1 TPTM Overview ..... 483
3.7.2 TPTM Registers ..... 484
3.7.2.1 List of Registers ..... 484
3.7.2.2 Self Region ..... 486
3.7.2.3 TPTMnIRUN — Counter Start Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 488
3.7.2.4 TPTMnIRRUN — Counter Restart Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... ) 489
3.7.2.5 TPTMnISTP - Counter Stop Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 490
3.7.2.6 TPTMnISTR - Counter Status Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 491
3.7.2.7 TPTMnIIEN — Interrupt Enable Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 492
3.7.2.8 TPTMnIUSTR — Underflow Status Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 493
3.7.2.9 TPTMnIDIV — Divider Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1) ..... 494
3.7.2.10 TPTMnFRUN — Counter Start Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 495
3.7.2.11 TPTMnFRRUN — Counter Restart Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 496
3.7.2.12 TPTMnFSTP - Counter Stop Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 497
3.7.2.13 TPTMnFSTR - Counter Status Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 498
3.7.2.14 TPTMnFDIV — Divider Register of Free-run Timer for PEn ( $n=0$ to 1 ) ..... 499
3.7.2.15 TPTMnICNTm - Counter Channel m Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $1, \mathrm{~m}=0$ to 3 ) ..... 500
3.7.2.16 TPTMnILDm — Load Channel m Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $1, \mathrm{~m}=0$ to 3 ) ..... 501
3.7.2.17 TPTMnFCNT — Counter Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 ) ..... 502
3.7.3 TPTM Function ..... 503
3.7.3.1 Normal Operation ..... 503
3.7.3.2 Operation during a Restart ..... 505
3.7.3.3 Operation during an Underflow ..... 506
3.8 Usage Notes ..... 507
3.8.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation ..... 507
3.8.1.1 When Updated Results in the Control Registers or Memory are Reflected in the Implementation of a Subsequent Instruction ..... 507
3.8.1.2 When the Updated Results in the Control Registers and Memories are Reflected in the Instruction Fetch of a Subsequent Instruction ..... 508
3.8.1.3 Product information of SYNCM ..... 508
3.8.1.4 Product information of Waiting for the Completion of Storage ..... 508
3.8.2 Synchronization of Load Instruction Completion and Subsequent Instruction Generation ..... 509
3.8.3 Accesses to Registers by Bit-Manipulation Instructions ..... 509
3.8.4 Ensuring Coherency after Code Flash Programming ..... 509
3.8.5 Overwriting Context when Acknowledging Multiple Exceptions ..... 509
3.8.6 Usage Notes on Prefetching ..... 510
3.8.7 Product Information of Initial Value for G4MH Register ..... 511
3.8.8 Product Information of SYSERR Factor ..... 512
3.8.9 Product Information of Cache Structure ..... 512
3.8.10 Product Information of Fetch Size ..... 512
3.8.11 Register Initialization ..... 512
Section 4 Address MAP ..... 513
4.1 Address MAP ..... 513
4.2 Address Space Viewed from Each Bus Master. ..... 514
4.2.1 Space in which Instructions can be Fetched ..... 514
4.2.2 Data Space Accessible by CPU0, CPU1 ..... 515
4.2.3 Data Space Accessible by ICUM ..... 516
4.2.4 Data Space Accessible by DMA (sDMAC, DTS) ..... 516
4.2.5 Data Space Accessible by H-Bus Master ..... 516
4.3 Cluster RAM and Retention RAM ..... 518
Section 5 Operating Modes ..... 519
5.1 Features ..... 519
5.1.1 Normal Operation Mode ..... 520
5.1.2 User Boot Mode ..... 520
5.1.3 Serial Programming Mode ..... 520
5.2 Input Pins ..... 521
5.3 Register Description ..... 522
5.3.1 List of Registers ..... 522
5.3.2 MODE — Mode Register ..... 523
5.3.3 FHVE3 - FHVE3 Control Register ..... 524
5.3.4 FHVE15 - FHVE15 Control Register ..... 524
5.4 Mode Error ..... 525
Section 6 Interrupts ..... 526
6.1 Features of Interrupt Units ..... 526
6.1.1 Units and Channels ..... 526
6.1.2 Register Base Address ..... 528
6.1.3 Clock Supply ..... 528
6.1.4 Interrupt Requests ..... 528
6.1.5 Reset Sources ..... 529
6.1.6 External Input/Output Signals ..... 529
6.2 Overview ..... 530
6.2.1 Outline ..... 530
6.2.2 Functional Overview ..... 531
6.2.3 Interrupt Sources ..... 532
6.2.3.1 FE Level Non-Maskable Interrupts ..... 532
6.2.3.2 FE Level Maskable Interrupts ..... 532
6.2.3.3 El Level Maskable Interrupts ..... 532
6.2.4 Block Diagram ..... 533
6.3 Registers ..... 534
6.3.1 List of Registers ..... 534
6.3.2 EIC0 to EIC511 - El Level Interrupt Control Register 0 to 511 ..... 535
6.3.3 IMR0 to IMR15 - EI Level Interrupt Mask Register 0 to 15 ..... 537
6.3.4 EIBD0 to EIBD31 - El Level Interrupt Bind Register 0 to 31 ..... 538
6.3.5 EIBD32 to EIBD511 - El Level Interrupt Bind Register 32 to 511 ..... 539
6.3.6 NMICTL — NMI Interrupt Control Register ..... 540
6.3.7 EXINTCTL - External Interrupt Control Register ..... 541
6.3.8 EXINTSTR — External Interrupt Status Register ..... 542
6.3.9 EXINTSTC - External Interrupt Status Clear Register ..... 543
6.3.10 SINTR0 to SINTR3 - Software Interrupt Register ..... 544
6.3.11 PINTn $+x$ — Peripheral Interrupt Status Register. ..... 545
6.3.12 PINTCLRn $+x$ - Peripheral Interrupt Status Clear Register ..... 546
6.3.13 TPTMSEL — TPTM Interrupt FE EI Select Register ..... 547
6.4 Interrupt Operation ..... 548
6.4.1 Level Interrupts ..... 548
6.4.2 External Interrupts (NMI / IRQ) ..... 548
6.4.3 Inter-Processor Interrupts ..... 548
6.4.4 Broadcast Interrupts ..... 548
6.4.5 Software Interrupts ..... 548
6.4.6 DTS Interrupt Merge Function ..... 548
6.4.7 Priority Level Handling ..... 549
6.5 Interrupt Processing Flow ..... 550
6.5.1 Level Interrupt Processing Flow ..... 550
6.5.2 NMI Processing Flow ..... 551
6.5.3 External Interrupt Processing Flow ..... 552
6.5.4 Broadcast Interrupt Processing Flow ..... 553
6.5.5 Software Interrupt Processing Flow ..... 554
6.5.6 DTS Interrupt Processing Flow ..... 555
6.6 Interrupt Response Times ..... 557
Section 7 sDMA Controller (sDMAC) ..... 558
7.1 Features of sDMAC ..... 558
7.1.1 Number of Units ..... 558
7.1.2 Register Base Addresses ..... 559
7.1.3 Clock Supply ..... 559
7.1.4 Interrupts ..... 559
7.1.5 sDMAC Transfer Requests ..... 562
7.1.6 Reset Sources ..... 562
7.2 Overview. ..... 563
7.2.1 Functional Overview ..... 563
7.2.2 Block Diagram ..... 564
7.3 Registers of sDMAC ..... 566
7.3.1 List of Registers ..... 566
7.3.2 DMAjESTA — DMA Address Error Notification Status Register ..... 568
7.3.3 DMAjISTA — DMA Interrupt Status Register ..... 569
7.3.4 DMAjCHPRI — DMA Channel Request Priority Register ..... 570
7.3.5 DMAjOR — DMA Operation Register ..... 571
7.3.6 DMAjCHRST — DMA Channel Reset Register ..... 572
7.3.7 DMAjCM_n — DMA Channel Master Setting Register. ..... 573
7.3.8 DMAjSAR_n — DMA Source Address Register ..... 574
7.3.9 DMAjDAR_n — DMA Destination Address Register ..... 575
7.3.10 DMAjTSR_n — DMA Transfer Size Register ..... 576
7.3.11 DMAjTSRB_n — DMA Transfer Size Register B ..... 577
7.3.12 DMAjTMR_n — DMA Transfer Mode Register. ..... 578
7.3.13 DMAjCHCR_n — DMA Channel Control Register. ..... 580
7.3.14 DMAjCHSTP_n — DMA Channel Stop Register ..... 582
7.3.15 DMAjCHSTA_n — DMA Channel Status Register ..... 583
7.3.16 DMAjCHFCR_n — DMA Channel Flag Clear Register ..... 585
7.3.17 DMAjGIAI_n — DMA Gather Inner Address Increment Register ..... 587
7.3.18 DMAjGOAI_n — DMA Gather Outer Address Increment Register ..... 587
7.3.19 DMAjSIAI_n — DMA Scatter Inner Address Increment Register ..... 588
7.3.20 DMAjSOAI_n — DMA Scatter Outer Address Increment Register ..... 588
7.3.21 DMAjSGST_n — DMA Scatter Gather Status Register ..... 589
7.3.22 DMAjSGCR_n — DMA Scatter Gather Control Register ..... 590
7.3.23 DMAjRS_n — DMA Resource Select Register ..... 591
7.3.24 DMAjBUFCR_n — DMA Buffer Control Register ..... 593
7.3.25 DMAjDPPTR_n — DMA Descriptor Pointer Register ..... 594
7.3.26 DMAjDPCR_n — DMA Descriptor Control Register ..... 595
7.3.27 Descriptor RAM — Descriptor Memory ..... 595
7.3.28 DMACSELj_m — sDMACj Transfer Request Group Selection Register m ( $\mathrm{m}=0$ to ..... 596
7.4 Operation ..... 598
7.4.1 DMA Transfer Requests ..... 598
7.4.2 DMA Interrupts ..... 603
7.4.3 Channel Priority. ..... 604
7.4.4 Slow Speed Mode ..... 605
7.4.5 Scatter Gather Transfer ..... 605
7.4.6 Descriptors ..... 610
7.4.7 Transfer Flow ..... 623
7.4.8 Performance ..... 626
7.5 Usage Notes ..... 627
7.6 Reliability Function ..... 630
7.6.1 Overview ..... 630
7.6.2 Master Information Inheritance Function ..... 630
7.7 Setting up DMA Transfer ..... 631
7.7.1 Overview of Setting up DMA Transfer ..... 631
7.7.2 Setting up the Transfer Request Group Selection ..... 631
7.7.3 Setting up the Overall DMA Operation ..... 631
7.7.4 Setting up the DMA Channel Setting ..... 632
Section 8 DTS Controller ..... 633
8.1 Features of DTS ..... 633
8.1.1 Number of Units and Channels ..... 633
8.1.2 Register Base Addresses ..... 633
8.1.3 Clock Supplies ..... 634
8.1.4 Interrupt Requests ..... 634
8.1.5 DTS Transfer Requests for DTS ..... 634
8.1.6 Reset Sources ..... 634
8.1.7 External Input/Output Signals ..... 634
8.2 Overview ..... 635
8.2.1 Functional Overview ..... 635
8.2.2 Definition of Terms ..... 636
8.3 Registers ..... 637
8.3.1 List of Registers ..... 637
8.3.2 Description of Global Registers ..... 639
8.3.2.1 DTSCTL1 — DTS Control Register 1 ..... 639
8.3.2.2 DTSCTL2 — DTS Control Register 2 ..... 640
8.3.2.3 DTSSTS — DTS Status Register ..... 641
8.3.2.4 DTSER — DTS Error Register ..... 642
8.3.2.5 DTSPRn — DTS Channel Priority Setting Register ( $\mathrm{n}=0$ to 7 ) ..... 643
8.3.2.6 DTSnnnCM — DTS Channel Master Setting Register (nnn = 000 to 127) ..... 647
8.3.3 Description of DTS Channel Registers ..... 649
8.3.3.1 Transfer Information of DTS (TI) ..... 649
8.3.3.2 Details of DTS Channel Registers ..... 653
8.3.4 Detail DTSSELm ..... 668
8.3.4.1 DTSSELm — DTS Transfer Request Group Selection Register ( $\mathrm{m}=0$ to 15) ..... 668
8.4 Operation ..... 670
8.4.1 Basic Operation of DTS Transfer ..... 670
8.4.1.1 Transfer Mode ..... 670
8.4.1.2 Executing a DTS Cycle ..... 670
8.4.1.3 Updating Transfer Information ..... 671
8.4.1.4 Last Transfer and Address Reload Transfer ..... 672
8.4.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Output ..... 672
8.4.1.6 Continuous Transfer ..... 673
8.4.2 Channel Priority Order ..... 674
8.4.2.1 DTS Channel Arbitration ..... 674
8.4.3 Reload Function ..... 676
8.4.3.1 Overview of the Reload Function ..... 676
8.4.3.2 Operation of Reload Function 1 ..... 676
8.4.3.3 Reload Function 2 ..... 678
8.4.3.4 Timing of Setting DTS Reload Registers ..... 679
8.4.4 Chain Function ..... 680
8.4.4.1 Overview ..... 680
8.4.4.2 Setting Up the Chain Function ..... 681
8.4.5 DTS Operation ..... 682
8.4.5.1 Types of DTS Transfer Requests and Assigning DTS Transfer Requests ..... 682
8.4.5.2 Generating and Accepting a DTS Transfer Request ..... 682
8.4.5.3 Executing DTS Transfer ..... 683
8.4.5.4 DTSRAM Access ..... 683
8.5 Suspension, Resume, and Transfer Abort, and Clearing a DTS Transfer Request ..... 684
8.5.1 Suspend, Resume, and Transfer Abort of a DTS Transfer ..... 684
8.5.2 Masking and Clearing a Hardware DTS Transfer Request by DTSFSL ..... 685
8.5.3 List of Suspend, Resume, and Transfer Abort Functions ..... 685
8.6 Error Control ..... 686
8.6.1 Types of Errors ..... 686
8.6.2 DTS Transfer Error ..... 687
8.6.2.1 Operation of DTS When a DTS Transfer Error Occurs ..... 687
8.6.3 DTSRAM Error ..... 687
8.7 Reliability Functions ..... 688
8.7.1 Overview ..... 688
8.7.2 Master Information Inheritance Function ..... 688
8.7.3 Restriction on Chain Function ..... 689
8.8 Setting up DTS Transfer ..... 690
8.8.1 Overview of Setting up DTS Transfer ..... 690
8.8.2 Setting up the Transfer Request Group Selection ..... 690
8.8.3 Setting up the Overall DTS Operation ..... 691
8.8.4 Configuring the DTS Channel Settings ..... 692
Section 9 RAM ..... 693
9.1 List of On-Chip RAMs ..... 693
9.2 Features ..... 694
9.3 RAM Data Retention ..... 694
9.4 Usage Notes ..... 694
Section 10 Reset Controller ..... 695
10.1 Features ..... 695
10.1.1 Register Base Addresses ..... 696
10.1.2 Input/Output Pins ..... 696
10.2 Register Description ..... 697
10.2.1 Register Protection ..... 697
10.2.2 List of Registers ..... 697
10.2.3 Reset of Registers ..... 698
10.2.4 BOOTCTRL — Boot Control Register ..... 699
10.2.5 RESF — Reset Factor Register ..... 700
10.2.6 RESFC - Reset Factor Clear Register ..... 703
10.2.7 SWSRESA — Software System Reset Assertion Register ..... 705
10.2.8 SWARESA — Software Application Reset Assertion Register ..... 706
10.2.9 RESC — Reset Configuration Register ..... 707
10.2.10 STAC_DTSRAM — RAM Initialization Mode Control Register for DTSRAM ..... 708
10.2.11 STAC_DPRAM — RAM Initialization Mode Control Register for sDMAC Descriptor RAM ..... 709
10.2.12 STAC_DFE — RAM Initialization Mode Control Register for DFE ..... 710
10.2.13 STAC_FLXA — RAM Initialization Mode Control Register for FlexRay ..... 711
10.2.14 STAC_ETHER — RAM Initialization Mode Control Register for Ethernet ..... 712
10.2.15 STAC_GTM — RAM Initialization Mode Control Register for GTM ..... 713
10.2.16 RESKCPROT — Reset Controller Register Key Code Protection Register ..... 714
10.3 Operation ..... 715
10.3.1 Reset Categories ..... 715
10.3.2 Reset Sources ..... 716
10.3.3 Reset Flags ..... 718
10.3.4 FACI Reset Transfer ..... 719
10.3.5 HW BIST ..... 719
10.3.6 RAM Initialization ..... 719
10.3.7 Reset Output (RES_OUT ) ..... 719
10.4 Usage Notes ..... 720
10.4.1 RAM and Register Data Retention when External Reset Is Asserted ..... 720
10.4.2 VMON Reset Assertion ..... 720
Section 11 Power Supply ..... 721
11.1 Features ..... 721
11.2 External Pin List ..... 721
11.3 Example of Power Supply Connection ..... 723
11.3.1 Example of Power Supply Connection ..... 723
11.4 Power Up/Down Timing ..... 725
11.5 Usage Note ..... 725
Section 12 Power Supply Voltage Monitor ..... 727
12.1 Overall Configuration ..... 727
12.1.1 Features ..... 727
12.2 Primary Detection of Voltage Monitor (VMON) ..... 730
12.2.1 Features ..... 730
12.2.2 Register Base Address ..... 730
12.2.3 Clock Supply ..... 730
12.2.4 Interrupt Requests ..... 730
12.2.5 External Input and Output Pins ..... 730
12.2.6 Overview ..... 731
12.2.6.1 Block Diagram ..... 731
12.2.7 Registers ..... 733
12.2.7.1 List of Registers ..... 733
12.2.7.2 VMONF — VMON Factor Register ..... 735
12.2.7.3 VMONFC — VMONF Clear Register ..... 736
12.2.7.4 VMONDIAGME — VMON DIAG Monitor Enable Register ..... 737
12.2.7.5 VMONDIAGMEW — VMONDIAGME Write Register ..... 738
12.2.7.6 VMONDMASK — VMON Detection Output Diagnosis Mask Register ..... 739
12.2.7.7 VMONDIAG — VMON DIAG Mode Setting Register ..... 740
12.2.7.8 VMONDIAGFE — VMON DIAG Filter Enable Register ..... 741
12.2.7.9 VDDDE — VDD Detection Enable Register ..... 742
12.2.7.10 VDDFCR — VDD Monitor Filter Control Register ..... 743
12.2.7.11 VCCDE — VCC Detection Enable Register ..... 744
12.2.7.12 VCCFCR — VCC Monitor Filter Control Register ..... 745
12.2.7.13 EVCCDE - EVCC Detection Enable Register ..... 746
12.2.7.14 EVCCFCR - EVCC Monitor Filter Control Register ..... 747
12.2.7.15 VMONKCPROT — VMON Register Key Code Protection Register ..... 748
12.2.8 Operation ..... 749
12.2.8.1 VMON Basic Function ..... 749
12.2.8.2 VMON Function in BIST (Mask of VMON_VDD_ERROROUT and VMON_VDDREQRESET) ..... 752
12.2.8.3 VMON Diagnosis Function ..... 753
12.2.9 Usage Notes ..... 755
12.2.9.1 Flag Bit (VMONF) ..... 755
12.2.9.2 VCC Primary Low Detection ..... 755
12.2.9.3 External Reset occurs during self-diagnosis. ..... 755
12.3 Delay Monitor (DMON) ..... 756
12.3.1 Features ..... 756
12.3.2 Register Base Addresses ..... 756
12.3.3 Clock Supply ..... 756
12.3.4 Interrupt and DMA/DTS Requests ..... 756
12.3.5 External Input and Output Pins ..... 756
12.3.6 Overview ..... 757
12.3.6.1 Functional Overview ..... 757
12.3.6.2 Block Diagram ..... 757
12.3.7 Registers ..... 758
12.3.7.1 List of Registers ..... 758
12.3.7.2 DMONF - DMON Factor Register ..... 759
12.3.7.3 DMONFC - DMONF Clear Register ..... 760
12.3.7.4 DMONDIAGME — DMON DIAG Monitor Enable Register ..... 761
12.3.7.5 DMONDIAGMEW — DMONDIAGME Write Register ..... 762
12.3.7.6 DMONDIAG — DMON DIAG Mode Setting Register ..... 763
12.3.7.7 DMONDMASK — DMON Detection Output Diagnosis Mask Register ..... 764
12.3.7.8 DMONDE — DMON Detection Enable Register ..... 765
12.3.7.9 DMONFCR — DMON Filter Control Register ..... 766
12.3.7.10 DMONKCPROTO — DMON Register Key Code Protection Register 0 ..... 767
12.3.8 Operation ..... 768
12.3.8.1 DMON Basic Function ..... 768
12.3.8.2 DMON Diagnosis Function ..... 773
12.4 Usage Notes ..... 776
12.4.1 Judgment Method of Reset Factors for Voltage Monitor ..... 776
Section 13 Temperature Sensor ..... 777
13.1 Features ..... 777
13.1.1 Number of Channels ..... 777
13.1.2 Register Base Address ..... 777
13.1.3 Clock Supply ..... 777
13.1.4 Interrupt Requests ..... 777
13.1.5 External Input and Output Pins ..... 777
13.2 Overview ..... 778
13.2.1 Functional Overview ..... 778
13.2.2 Block Diagram ..... 779
13.3 Register ..... 780
13.3.1 List of registers ..... 780
13.3.2 Reset of Registers ..... 780
13.3.3 OTSOOTSTCR - Temperature Measurement Start Control Register ..... 781
13.3.4 OTSOOTENDCR — Temperature Measurement End Control Register ..... 782
13.3.5 OTSOOTCR - Temperature Sensor Control Register ..... 783
13.3.6 OTSOOTFCR - Temperature Sensor Flag Clear Register ..... 784
13.3.7 OTS0OTFR — Temperature Sensor Flag Register ..... 785
13.3.8 OTS0OTSTR — Temperature Status Register ..... 786
13.3.9 OTSOOTDR — Temperature Data Register ..... 788
13.3.10 OTSOHTBRmn - High-Temperature Border mn Register ( $\mathrm{m}=\mathrm{A}$ or $\mathrm{B}, \mathrm{n}=\mathrm{U}$ or L ) ..... 789
13.3.11 OTSOLTBRAn — Low-Temperature Border An Register ( $n=U$ or $L$ ) ..... 790
13.3.12 OTSOTDLR — Temperature Difference Limiting Register ..... 791
13.3.13 OTSOCOEFFRn — Coefficient $n$ Register ( $\mathrm{n}=\mathrm{A}, \mathrm{B}, \mathrm{C}$ ) ..... 792
13.4 Operation ..... 793
13.4.1 Temperature Measurement Sequence ..... 793
13.4.2 Examples of Temperature Measurement Operation ..... 794
13.4.3 Temperature Measurement End Interrupt Request ..... 796
13.4.4 Temperature Alarm Error and Temperature Rise/Drop Interrupt and Temperature Sensor Error Interrupt Requests ..... 797
Section 14 Clock Monitor ..... 799
14.1 Features ..... 799
14.1.1 Number of Channels ..... 799
14.1.2 Register Base Addresses ..... 799
14.1.3 Clock Supply ..... 800
14.1.4 Interrupt Requests ..... 800
14.1.5 External Input and Output Pins ..... 800
14.2 Overview ..... 801
14.2.1 Functional Overview ..... 801
14.2.2 Block Diagram ..... 801
14.3 Register ..... 802
14.3.1 Register Protection ..... 802
14.3.2 List of Registers ..... 802
14.3.3 Resetting the Registers ..... 803
14.3.4 CLMAnCTL — CLMAn Control Register ..... 804
14.3.5 CLMAnCMPL — CLMAn Compare Register L ..... 805
14.3.6 CLMAnCMPH — CLMAn Compare Register H ..... 806
14.3.7 CLMATEST — Clock Monitor Test Register ..... 807
14.3.8 CLMATESTS — Clock Monitor Test Status Register ..... 808
14.3.9 CLMABCE — Clock Monitor Backup Clock Enable Register ..... 809
14.3.10 CLMAKCPROT — Clock Monitor Register Key Code Protection Register ..... 810
14.4 Functional Description ..... 811
14.4.1 Detection of Abnormal Clock Frequencies ..... 811
14.4.2 Error Notification ..... 814
14.4.3 Self-Diagnosis ..... 814
14.5 Operation ..... 815
14.5.1 Procedures to Enable CLMAn ..... 815
14.5.2 Reset Procedure Using CLMATEST.RESCLM ..... 815
14.5.3 Procedures to do Self-Diagnosis ..... 816
Section 15 Clock Controller ..... 818
15.1 Features ..... 818
15.1.1 Register Base Addresses ..... 818
15.1.2 External Input / Output Pins ..... 818
15.2 Overview ..... 819
15.2.1 Types of Clocks ..... 819
15.2.2 Block Diagram. ..... 821
15.3 Register Description ..... 822
15.3.1 Register Protection ..... 822
15.3.2 List of Registers ..... 822
15.3.3 Reset of Registers ..... 822
15.3.4 CLKDODIV — Clock Divider 0 Divisor Register ..... 823
15.3.5 CLKDOSTAT — Clock Divider 0 Status Register ..... 824
15.3.6 CLKDnDIV — Clock Divider Divisor Register ( $n=2$ ). ..... 825
15.3.7 CLKDnSTAT — Clock Divider Status Register ( $\mathrm{n}=2$ ) ..... 826
15.3.8 CKSCOC — Clock Selector 0 Control Register ..... 827
15.3.9 CKSCOS — Clock Selector 0 Status Register ..... 828
15.3.10 CKSCnC — Clock Selector Control Register ( $\mathrm{n}=2$ ) ..... 829
15.3.11 CKSCnS — Clock Selector Status Register ( $\mathrm{n}=2$ ). ..... 830
15.3.12 PLLCLKS — PLL Oscillation Status Register ..... 831
15.3.13 MOSCS - Main Oscillation Status Register ..... 832
15.3.14 OSCMONMD — OSC Monitor Mode Entry Register ..... 833
15.3.15 CLKKCPROTO — Clock Controller Register Key Code Protection Register 0 ..... 834
15.3.16 CLKKCPROT1 — Clock Controller Register Key Code Protection Register 1 ..... 835
15.4 Operation ..... 836
15.4.1 Sequence for Shifting the Clock Gear Up ..... 836
15.4.2 External Clock Output Pins (CK) ..... 837
15.4.3 Main OSC Configuration and Stabilization Sequence ..... 838
15.4.4 OSC Monitor Mode ..... 840
15.5 Usage Notes ..... 842
15.5.1 Main OSC setting ..... 842
15.5.2 Clock Gear Up. ..... 842
15.5.3 FPU Operation Notes ..... 842
15.5.4 Board Design Notes ..... 842
Section 16 Standby Controller ..... 843
16.1 Features ..... 843
16.1.1 Register Base Addresses ..... 843
16.2 Power Down Modes ..... 844
16.2.1 Power Off Standby Mode ..... 844
16.2.2 Emulation/Instrumentation RAM and Aurora Retention Mode (E2x-FCC1 Only) ..... 844
16.2.3 HALT Mode ..... 844
16.2.4 Module Standby ..... 844
16.3 Description of Registers ..... 845
16.3.1 Register Protection ..... 845
16.3.2 List of Registers ..... 845
16.3.3 Reset of Registers ..... 845
16.3.4 MSR_ATU — Module Standby Register for ATU5 ..... 846
16.3.5 MSR_GTM — Module Standby Register for GTM ..... 847
16.3.6 MSR_OSTM — Module Standby Register for OSTM ..... 848
16.3.7 MSR_WDT — Module Standby Register for WDTB ..... 849
16.3.8 MSR_SCI — Module Standby Register for SCI3 ..... 850
16.3.9 MSR_HSSPI — Module Standby Register for HSSPI ..... 851
16.3.10 MSR_RLIN — Module Standby Register for RLIN3 ..... 852
16.3.11 MSR_CSIH — Module Standby Register for CSIH ..... 853
16.3.12 MSR_RHSIF — Module Standby Register for RHSIF ..... 854
16.3.13 MSR_RHSB — Module Standby Register for RHSB ..... 855
16.3.14 MSR_CAN — Module Standby Register for CAN ..... 856
16.3.15 MSR_FLXA — Module Standby Register for FlexRay ..... 857
16.3.16 MSR_ETHER — Module Standby Register for Ethernet controller ..... 858
16.3.17 MSR_RSENT — Module Standby Register for RSENT ..... 859
16.3.18 MSR_PSI5S — Module Standby Register for PSI5S ..... 861
16.3.19 MSR_DFE — Module Standby Register for DFE ..... 862
16.3.20 MSR_DAD — Module Standby Register for DS-ADC ..... 863
16.3.21 MSR_CAD — Module Standby Register for Cyclic-ADC ..... 864
16.3.22 MSR_SAD — Module Standby Register for SAR-ADC ..... 865
16.3.23 MSR ENCA — Module Standby Register for ENCA ..... 866
16.3.24 MSRKCPROT — Module Standby Register Key Code Protection Register ..... 867
Section 17 Clocked Serial Interface H (CSIH) ..... 868
17.1 Features of CSIH ..... 868
17.1.1 Units and Channels ..... 868
17.1.2 Register Base Address ..... 869
17.1.3 Clock Supply ..... 869
17.1.4 Interrupt Requests ..... 870
17.1.5 Reset Sources ..... 871
17.1.6 External Input/Output Signals ..... 872
17.1.7 Data Consistency Check ..... 874
17.1.8 Notes on Pin Combinations ..... 875
17.2 Overview ..... 876
17.2.1 Functional Overview ..... 876
17.2.2 Functional Overview Description ..... 877
17.2.3 Block Diagram ..... 878
17.3 Registers ..... 879
17.3.1 List of Registers ..... 879
17.3.2 CSIHnCTLO — CSIHn Control Register 0 ..... 882
17.3.3 CSIHnCTL1 — CSIHn Control Register 1 ..... 883
17.3.4 CSIHnCTL2 — CSIHn Control Register 2 ..... 886
17.3.5 CSIHnSTR0 - CSIHn Status Register 0 ..... 888
17.3.6 CSIHnSTCRO — CSIHn Status Clear Register 0 ..... 890
17.3.7 CSIHnCFGx — CSIHn Configuration Register x (x=0 to 5) ..... 891
17.3.8 CSIHnTXOW — CSIHn Transmit Data Register 0 for Word Access ..... 896
17.3.9 CSIHnTXOH — CSIHn Transmit Data Register 0 for Half Word Access ..... 898
17.3.10 CSIHnRXOW — CSIHn Receive Data Register 0 for Word Access ..... 899
17.3.11 CSIHnRXOH — CSIHn Receive Data Register 0 for Half Word Access ..... 900
17.3.12 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3) ..... 901
17.3.13 CSIHnEIE — CSIHn Interrupt Control Register ..... 902
17.3.14 CSIHnECTLO - CSIHn Extended Communication Control Register 0 ..... 903
17.3.15 CSIHnECTL1 - CSIHn Extended Communication Control Register 1 ..... 904
17.3.16 CSIHnETXDAm — CSIHn Extended Communication Transmit Data Register m ( $m=0$ to 15) ..... 906
17.3.17 CSIHnERXDAm — CSIHn Extended Communication Receive Data Register m ( $m=0$ to 15) ..... 907
17.3.18 CSIHnESTT - CSIHn Extended Communication Stop Trigger Register ..... 908
17.3.19 CSIHnESTF — CSIHn Extended Communication Status Register ..... 909
17.3.20 List of Cautions ..... 910
17.4 Interrupt Sources ..... 913
17.4.1 Overview ..... 913
17.4.2 Interrupt Delay ..... 914
17.4.3 INTCSIHTIC (Communication Status Interrupt) ..... 915
17.4.3.1 INTCSIHTIC in Direct Access Mode ..... 915
17.4.3.2 INTCSIHTIC in Job Mode ..... 917
17.4.4 INTCSIHTIR (Reception Status Interrupt) ..... 918
17.4.4.1 INTCSIHTIR in Direct Access Mode ..... 918
17.4.5 INTCSIHTIRE (Communication Error Interrupt) ..... 919
17.4.6 INTCSIHTIJC (Job Completion Interrupt) ..... 920
17.5 Operation ..... 921
17.5.1 Operating Modes (Master/Slave) ..... 921
17.5.1.1 Master Mode ..... 921
17.5.1.2 Slave Mode ..... 922
17.5.2 Master/Slave Connections ..... 923
17.5.2.1 One Master and One Slave ..... 923
17.5.2.2 One Master and Multiple Slaves ..... 923
17.5.3 Chip Selection (CS) Features ..... 924
17.5.3.1 Configuration Registers ..... 924
17.5.3.2 CS Example ..... 926
17.5.3.3 Job Concept ..... 927
17.5.4 Details of Chip Select Timing ..... 928
17.5.4.1 Changing the Clock Phase ..... 928
17.5.4.2 Changing the Data Phase ..... 930
17.5.5 Transmission Clock Selection ..... 931
17.5.5.1 Transfer Clock Frequency Calculation ..... 931
17.5.5.2 Transfer Clock Frequency Upper and Lower Limits ..... 932
17.5.6 Data Transfer Modes ..... 932
17.5.6.1 Transmit-Only Mode ..... 932
17.5.6.2 Receive-Only Mode ..... 932
17.5.6.3 Transmit/Receive Mode ..... 932
17.5.6.4 Summary ..... 932
17.5.7 Data Length Selection ..... 933
17.5.7.1 Data Length from 2 to 16 Bits ..... 933
17.5.7.2 Data Length Greater than 16 Bits ..... 934
17.5.8 Serial Data Direction Selection ..... 936
17.5.9 Slave Select (SS) Function ..... 937
17.5.9.1 Communication Timing Using SS Function ..... 937
17.5.9.2 CSIHTSSO Operation ..... 938
17.5.10 Handshake Function ..... 939
17.5.10.1 Slave Mode ..... 939
17.5.10.2 Master Mode ..... 941
17.5.11 Error Detection ..... 942
17.5.11.1 Data Consistency Check ..... 942
17.5.11.2 Parity Check ..... 944
17.5.11.3 Overrun Error ..... 945
17.5.12 Loop-Back Mode ..... 946
17.5.13 Enforced Chip Select Idle Setting ..... 947
17.5.14 Extended Communication Function ..... 948
17.5.14.1 Data Transfer Direction Selection Function ..... 948
17.5.14.2 Extended Communication Stop Function ..... 951
17.5.14.3 Extended Communication Status ..... 952
17.5.14.4 Extended Interrupt Control Function ..... 954
17.6 Operating Procedures ..... 955
17.6.1 Procedures in Direct Access Mode ..... 955
17.6.1.1 Transmit/Receive in Master Mode when Job Mode Is Disabled ..... 955
17.6.1.2 Transmit/Receive in Master Mode when Job Mode is Enabled ..... 957
17.6.2 Procedures in Extended Communication Function Mode ..... 959
17.6.2.1 Trigger to Start Extended Communication ..... 965
17.6.2.2 Storage Address of Received Data in Extended Communication ..... 968
Section 18 Serial Communication Interface 3 (SCI3) ..... 969
18.1 Features of SCI3 ..... 969
18.1.1 Units and Channels ..... 969
18.1.2 Register Base Address ..... 969
18.1.3 Clock Supply ..... 970
18.1.4 Interrupt Requests ..... 970
18.1.5 Reset Sources. ..... 970
18.1.6 External Input / Output Signals ..... 971
18.2 Overview ..... 972
18.2.1 Functional Overview ..... 972
18.2.2 Serial Communication Modes ..... 973
18.2.3 Block Diagram ..... 974
18.3 Registers ..... 975
18.3.1 List of Registers ..... 975
18.3.2 SCI3nRSR — Receive Shift Register ..... 976
18.3.3 SCI3nRDR — Receive Data Register ..... 976
18.3.4 SCI3nTDR — Transmit Data Register ..... 976
18.3.5 SCI3nTSR — Transmit Shift Register ..... 976
18.3.6 SCI3nSMR — Serial Mode Register ..... 977
18.3.7 SCI3nSCR — Serial Control Register ..... 978
18.3.8 SCI3nSSR — Serial Status Register ..... 980
18.3.9 SCI3nSCMR — Serial Transfer Format Register ..... 982
18.3.10 SCI3nSEMR — Serial Extended Mode Register ..... 983
18.3.11 SCI3nBRR — Bit Rate Register ..... 984
18.3.12 SCI3nMDDR — Modulation Duty Register ..... 987
18.4 Operation in Asynchronous Mode ..... 988
18.4.1 Transmission / Reception Format ..... 989
18.4.2 Receive Data Sampling Timing and Reception Margin ..... 990
18.4.3 Clock ..... 991
18.4.4 Double-Speed Operation ..... 991
18.4.5 SCI3 Initialization (Asynchronous Mode) ..... 992
18.4.6 Serial Data Transmission (Asynchronous Mode) ..... 993
18.4.7 Serial Data Reception (Asynchronous Mode) ..... 998
18.5 Multi-Processor Communication Function ..... 1002
18.5.1 Overview and Sample Connection. ..... 1002
18.5.2 Multi-Processor Serial Data Transmission ..... 1003
18.5.3 Multi-Processor Serial Data Reception ..... 1004
18.6 Operation in Clock Synchronous Mode ..... 1008
18.6.1 Clock ..... 1008
18.6.2 SCI3 Initialization (Clock Synchronous Mode) ..... 1009
18.6.3 Serial Data Transmission (Clock Synchronous Mode) ..... 1010
18.6.4 Serial Data Reception (Clock Synchronous Mode) ..... 1013
18.6.5 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode) ..... 1015
18.7 Bit Rate Modulation Function ..... 1017
18.8 Interrupt Sources ..... 1018
18.9 Usage Notes ..... 1020
18.9.1 Break Detection and Processing ..... 1020
18.9.2 Mark State and Production of Breaks ..... 1020
18.9.3 Receive Error Flags and Transmit Operations in Clock Synchronous Mode ..... 1020
18.9.4 Relationship between Writing to SCI3nTDR and the TDRE Flag ..... 1020
18.9.5 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode ..... 1021
18.9.6 External Clock Input in Clock Synchronous Mode ..... 1021
Section 19 LIN/UART Interface (RLIN3) ..... 1022
19.1 Features of RLIN3 ..... 1022
19.1.1 Units and Channels ..... 1022
19.1.2 Register Base Addresses ..... 1023
19.1.3 Clock Supply ..... 1023
19.1.4 Interrupt Requests ..... 1024
19.1.5 Reset Sources ..... 1025
19.1.6 External Input/Output Signals ..... 1025
19.2 Overview ..... 1026
19.2.1 Functional Overview. ..... 1026
19.2.2 Block Diagram ..... 1029
19.2.3 Terms Used in Block Diagram ..... 1029
19.3 Registers ..... 1030
19.3.1 List of Registers ..... 1030
19.3.2 LIN Master Related Registers ..... 1031
19.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 1031
19.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register ..... 1032
19.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register ..... 1033
19.3.2.4 RLN3nLSTC — LIN Self-Test Control Register ..... 1034
19.3.2.5 RLN3nLMD — LIN Mode Register ..... 1035
19.3.2.6 RLN3nLBFC - LIN Break Field Configuration Register ..... 1037
19.3.2.7 RLN3nLSC — LIN Space Configuration Register ..... 1038
19.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register ..... 1039
19.3.2.9 RLN3nLIE - LIN Interrupt Enable Register ..... 1040
19.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register ..... 1042
19.3.2.11 RLN3nLCUC - LIN Control Register ..... 1044
19.3.2.12 RLN3nLTRC — LIN Transmission Control Register ..... 1045
19.3.2.13 RLN3nLMST — LIN Mode Status Register ..... 1046
19.3.2.14 RLN3nLST — LIN Status Register ..... 1047
19.3.2.15 RLN3nLEST — LIN Error Status Register ..... 1049
19.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register ..... 1051
19.3.2.17 RLN3nLIDB — LIN ID Buffer Register ..... 1053
19.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register ..... 1054
19.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register ( $b=1$ to 8) ..... 1055
19.3.3 LIN Slave Related Registers ..... 1056
19.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register ..... 1056
19.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register ..... 1058
19.3.3.3 RLN3nLSTC — LIN Self-Test Control Register ..... 1059
19.3.3.4 RLN3nLMD — LIN Mode Register ..... 1060
19.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register ..... 1061
19.3.3.6 RLN3nLSC — LIN Space Configuration Register ..... 1062
19.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register ..... 1063
19.3.3.8 RLN3nLIE — LIN Interrupt Enable Register ..... 1064
19.3.3.9 RLN3nLEDE - LIN Error Detection Enable Register ..... 1066
19.3.3.10 RLN3nLCUC - LIN Control Register. ..... 1068
19.3.3.11 RLN3nLTRC — LIN Transmission Control Register ..... 1069
19.3.3.12 RLN3nLMST — LIN Mode Status Register ..... 1071
19.3.3.13 RLN3nLST - LIN Status Register ..... 1072
19.3.3.14 RLN3nLEST — LIN Error Status Register ..... 1074
19.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register ..... 1076
19.3.3.16 RLN3nLIDB — LIN ID Buffer Register ..... 1078
19.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register ..... 1079
19.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register ( $b=1$ to 8) ..... 1080
19.3.4 UART Related Registers ..... 1081
19.3.4.1 RLN3nLWBR — UART Wake-Up Baud Rate Select Register ..... 1081
19.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register ..... 1082
19.3.4.3 RLN3nLMD — UART Mode Register ..... 1083
19.3.4.4 RLN3nLBFC — UART Configuration Register ..... 1084
19.3.4.5 RLN3nLSC — UART Space Configuration Register ..... 1086
19.3.4.6 RLN3nLEDE —UART Error Detection Enable Register ..... 1087
19.3.4.7 RLN3nLCUC - UART Control Register ..... 1089
19.3.4.8 RLN3nLTRC — UART Transmission Control Register ..... 1090
19.3.4.9 RLN3nLMST — UART Mode Status Register ..... 1091
19.3.4.10 RLN3nLST — UART Status Register ..... 1092
19.3.4.11 RLN3nLEST — UART Error Status Register ..... 1094
19.3.4.12 RLN3nLDFC — UART Data Field Configuration Register ..... 1096
19.3.4.13 RLN3nLIDB — UART ID Buffer Register ..... 1097
19.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register ..... 1098
19.3.4.15 RLN3nLDBRb — UART Data Buffer b Register ( $b=1$ to 8) ..... 1099
19.3.4.16 RLN3nLUOER — UART Operation Enable Register ..... 1100
19.3.4.17 RLN3nLUOR1 — UART Option Register 1 ..... 1101
19.3.4.18 RLN3nLUTDR — UART Transmission Data Register ..... 1103
19.3.4.19 RLN3nLURDR — UART Reception Data Register ..... 1104
19.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register ..... 1105
19.4 Interrupt Sources ..... 1106
19.5 Operation ..... 1107
19.5.1 Modes ..... 1107
19.5.2 LIN Reset Mode ..... 1109
19.5.3 LIN Mode ..... 1110
19.5.3.1 LIN Master Mode ..... 1113
19.5.3.2 LIN Slave Mode ..... 1117
19.5.3.3 Data Transmission/Reception ..... 1125
19.5.3.4 Transmission/Reception Data Buffering ..... 1127
19.5.3.5 Wake-up Transmission/Reception ..... 1130
19.5.3.6 Status ..... 1132
19.5.3.7 Error Status ..... 1134
19.5.4 UART Mode ..... 1138
19.5.4.1 Transmission ..... 1138
19.5.4.2 Reception ..... 1147
19.5.4.3 Expansion Bits ..... 1149
19.5.4.4 Status ..... 1153
19.5.4.5 Error Status ..... 1154
19.5.5 LIN Self-Test Mode ..... 1155
19.5.5.1 Transitioning to LIN Self-Test Mode ..... 1157
19.5.5.2 Transmission in LIN Master Self-Test Mode. ..... 1158
19.5.5.3 Reception in LIN Master Self-Test Mode ..... 1160
19.5.5.4 Transmission in LIN Slave Self-Test Mode ..... 1162
19.5.5.5 Reception in LIN Slave Self-Test Mode ..... 1164
19.5.5.6 Terminating LIN Self-Test Mode ..... 1166
19.5.6 Baud Rate Generator ..... 1167
19.5.6.1 LIN Master Mode ..... 1168
19.5.6.2 LIN Slave Mode ..... 1169
19.5.6.3 UART Mode ..... 1170
19.5.7 Noise Filter ..... 1171
Section 20 CANFD Interface (RS-CANFD) ..... 1173
20.1 Features of RS-CANFD ..... 1173
20.1.1 Units and Channels ..... 1173
20.1.2 Register Base Address ..... 1175
20.1.3 Clock Supply ..... 1175
20.1.4 Interrupt Requests ..... 1176
20.1.5 Reset Sources ..... 1178
20.1.6 External Input/Output Signals ..... 1178
20.2 Overview ..... 1179
20.2.1 Functional Outline ..... 1179
20.2.2 Interface Modes ..... 1181
20.2.3 CAN FD Protocol ..... 1181
20.2.4 Block Diagram ..... 1182
20.3 Registers (Classical CAN Mode) ..... 1183
20.3.1 List of Registers ..... 1183
20.3.2 Details of Interface Mode-Related Registers ..... 1188
20.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register ..... 1188
20.3.3 Details of Channel-Related Registers ..... 1189
20.3.3.1 RSCANnCmCFG - Channel m Configuration Register ..... 1189
20.3.3.2 RSCANnCmCTR — Channel m Control Register ..... 1191
20.3.3.3 RSCANnCmSTS — Channel m Status Register ..... 1196
20.3.3.4 RSCANnCmERFL — Channel m Error Flag Register ..... 1198
20.3.4 Details of Global-Related Registers ..... 1202
20.3.4.1 RSCANnGCFG - Global Configuration Register ..... 1202
20.3.4.2 RSCANnGCTR — Global Control Register ..... 1205
20.3.4.3 RSCANnGSTS - Global Status Register ..... 1207
20.3.4.4 RSCANnGERFL - Global Error Flag Register. ..... 1208
20.3.4.5 RSCANnGTSC - Global Timestamp Counter Register ..... 1210
20.3.4.6 RSCANnGTINTSTS0 - Global TX Interrupt Status Register 0 ..... 1211
20.3.4.7 RSCANnGTINTSTS1 - Global TX Interrupt Status Register 1 ..... 1214
20.3.4.8 RSCANnGFDCFG - Global FD Configuration Register ..... 1216
20.3.5 Details of Receive Rule-Related Registers ..... 1217
20.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register ..... 1217
20.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0 ..... 1218
20.3.5.3 RSCANnGAFLCFG1 — Receive Rule Configuration Register 1 ..... 1219
20.3.5.4 RSCANnGAFLIDj — Receive Rule ID Register j ..... 1220
20.3.5.5 RSCANnGAFLMj — Receive Rule Mask Register $j$ ..... 1221
20.3.5.6 RSCANnGAFLPO - Receive Rule Pointer 0 Register j ..... 1222
20.3.5.7 RSCANnGAFLP1 $\mathbf{j}$ - Receive Rule Pointer 1 Register j ..... 1224
20.3.6 Details of Receive Buffer-Related Registers ..... 1225
20.3.6.1 RSCANnRMNB — Receive Buffer Number Register ..... 1225
20.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register y ..... 1226
20.3.6.3 RSCANnRMIDq — Receive Buffer ID Register q ..... 1227
20.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register q ..... 1228
20.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register q ..... 1229
20.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register q ..... 1230
20.3.7 Details of Receive FIFO Buffer-Related Registers ..... 1231
20.3.7.1 RSCANnRFCCx - Receive FIFO Buffer Configuration and Control Register x ..... 1231
20.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register x. ..... 1233
20.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register x ..... 1235
20.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register x ..... 1236
20.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register x ..... 1237
20.3.7.6 RSCANnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register x ..... 1238
20.3.7.7 RSCANnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register x ..... 1239
20.3.8 Details of Transmit/Receive FIFO Buffer-Related Registers ..... 1240
20.3.8.1 RSCANnCFCCk — Transmit/Receive FIFO Buffer Configuration and Control Register k ..... 1240
20.3.8.2 RSCANnCFSTSk - Transmit/Receive FIFO Buffer Status Register k ..... 1244
20.3.8.3 RSCANnCFPCTRk — Transmit/Receive FIFO Buffer Pointer Control Register k ..... 1247
20.3.8.4 RSCANnCFIDk - Transmit/Receive FIFO Buffer Access ID Register k ..... 1248
20.3.8.5 RSCANnCFPTRk — Transmit/Receive FIFO Buffer Access Pointer Register k . ..... 1250
20.3.8.6 RSCANnCFDF0_k — Transmit/Receive FIFO Buffer Access Data Field 0 Register k ..... 1252
20.3.8.7 RSCANnCFDF1_k — Transmit/Receive FIFO Buffer Access Data Field 1 Register k ..... 1253
20.3.9 Details of FIFO Staus-Related Registers ..... 1254
20.3.9.1 RSCANnFESTS — FIFO Empty Status Register ..... 1254
20.3.9.2 RSCANnFFSTS — FIFO Full Status Register. ..... 1256
20.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register ..... 1258
20.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register. ..... 1260
20.3.9.5 RSCANnCFRISTS - Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register ..... 1261
20.3.9.6 RSCANnCFTISTS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register ..... 1262
20.3.10 Details of Transmit Buffer-Related Registers ..... 1263
20.3.10.1 RSCANnTMCp - Transmit Buffer Control Register p ..... 1263
20.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register p ..... 1265
20.3.10.3 RSCANnTMIDp - Transmit Buffer ID Register p ..... 1267
20.3.10.4 RSCANnTMPTRp - Transmit Buffer Pointer Register p ..... 1268
20.3.10.5 RSCANnTMDF0_p - Transmit Buffer Data Field 0 Register p ..... 1269
20.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register p ..... 1270
20.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register y ..... 1271
20.3.11 Details of Transmit Buffer Status-Related Registers ..... 1273
20.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register y ..... 1273
20.3.11.2 RSCANnTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register y ..... 1275
20.3.11.3 RSCANnTMTCSTSy — Transmit Buffer Transmit Complete Status Register y ..... 1277
20.3.11.4 RSCANnTMTASTSy — Transmit Buffer Transmit Abort Status Register y ..... 1279
20.3.12 Details of Transmit Queue-Related Registers ..... 1281
20.3.12.1 RSCANnTXQCCm - Transmit Queue Configuration and Control Register m ..... 1281
20.3.12.2 RSCANnTXQSTSm - Transmit Queue Status Register m. ..... 1283
20.3.12.3 RSCANnTXQPCTRm - Transmit Queue Pointer Control Register m ..... 1285
20.3.13 Details of Transmit History-Related Registers ..... 1286
20.3.13.1 RSCANnTHLCCm - Transmit History List Configuration and Control Register m ..... 1286
20.3.13.2 RSCANnTHLSTSm - Transmit History List Status Register m ..... 1288
20.3.13.3 RSCANnTHLPCTRm — Transmit History List Pointer Control Register m ..... 1290
20.3.13.4 RSCANnTHLACCm — Transmit History List Access Register m ..... 1291
20.3.14 Details of Test-Related Registers ..... 1292
20.3.14.1 RSCANnGTSTCFG - Global Test Configuration Register ..... 1292
20.3.14.2 RSCANnGTSTCTR — Global Test Control Register ..... 1294
20.3.14.3 RSCANnGLOCKK — Global Lock Key Register ..... 1295
20.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register r ..... 1296
20.4 Registers (CAN FD Mode) ..... 1297
20.4.1 List of Registers ..... 1297
20.4.2 Details of Interface Mode-Related Registers ..... 1303
20.4.2.1 RSCFDnCFDGRMCFG - Global Interface Mode Select Register ..... 1303
20.4.3 Details of Channel-Related Registers ..... 1304
20.4.3.1 RSCFDnCFDCmNCFG - Channel m Nominal Bit Rate Configuration Register ..... 1304
20.4.3.2 RSCFDnCFDCmCTR — Channel m Control Register ..... 1306
20.4.3.3 RSCFDnCFDCmSTS - Channel m Status Register. ..... 1311
20.4.3.4 RSCFDnCFDCmERFL - Channel m Error Flag Register ..... 1313
20.4.3.5 RSCFDnCFDCmDCFG - Channel m Data Bit Rate Configuration Register. ..... 1317
20.4.3.6 RSCFDnCFDCmFDCFG - Channel m CAN FD Configuration Register ..... 1320
20.4.3.7 RSCFDnCFDCmFDCTR — Channel m CAN FD Control Register ..... 1324
20.4.3.8 RSCFDnCFDCmFDSTS - Channel m CAN FD Status Register ..... 1325
20.4.3.9 RSCFDnCFDCmFDCRC - Channel m CAN FD CRC Register ..... 1327
20.4.4 Details of Global-Related Registers ..... 1328
20.4.4.1 RSCFDnCFDGCFG - Global Configuration Register ..... 1328
20.4.4.2 RSCFDnCFDGCTR — Global Control Register ..... 1331
20.4.4.3 RSCFDnCFDGSTS - Global Status Register ..... 1333
20.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register ..... 1334
20.4.4.5 RSCFDnCFDGTSC - Global Timestamp Counter Register ..... 1336
20.4.4.6 RSCFDnCFDGTINTSTS0 - Global TX Interrupt Status Register 0 ..... 1337
20.4.4.7 RSCFDnCFDGTINTSTS1 - Global TX Interrupt Status Register 1 ..... 1340
20.4.4.8 RSCFDnCFDGFDCFG - Global FD Configuration Register ..... 1342
20.4.5 Details of Receive Rule-Related Registers ..... 1343
20.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register ..... 1343
20.4.5.2 RSCFDnCFDGAFLCFG0 - Receive Rule Configuration Register 0 ..... 1344
20.4.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1 ..... 1345
20.4.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register j ..... 1346
20.4.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register j ..... 1347
20.4.5.6 RSCFDnCFDGAFLP0 j - Receive Rule Pointer 0 Register ..... 1348
20.4.5.7 RSCFDnCFDGAFLP1 $\mathbf{j}$ - Receive Rule Pointer 1 Register j ..... 1350
20.4.6 Details of Receive Buffer-Related Registers ..... 1351
20.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register ..... 1351
20.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register y ..... 1352
20.4.6.3 RSCFDnCFDRMIDq - Receive Buffer ID Register q ..... 1353
20.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register q ..... 1354
20.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register q ..... 1356
20.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register q ..... 1357
20.4.7 Details of Receive FIFO Buffer-Related Registers ..... 1358
20.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register x ..... 1358
20.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register x ..... 1360
20.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register x ..... 1362
20.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register x ..... 1363
20.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register x ..... 1364
20.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register x ..... 1365
20.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register x ..... 1366
20.4.8 Details of Transmit/Receive FIFO Buffer Related Registers ..... 1367
20.4.8.1 RSCFDnCFDCFCCk — Transmit/Receive FIFO Buffer Configuration and Control Register k ..... 1367
20.4.8.2 RSCFDnCFDCFSTSk — Transmit/Receive FIFO Buffer Status Register k ..... 1371
20.4.8.3 RSCFDnCFDCFPCTRk — Transmit/Receive FIFO Buffer Pointer Control Register k ..... 1374
20.4.8.4 RSCFDnCFDCFIDk - Transmit/Receive FIFO Buffer Access ID Register k ..... 1376
20.4.8.5 RSCFDnCFDCFPTRk — Transmit/Receive FIFO Buffer Access Pointer Register k ..... 1378
20.4.8.6 RSCFDnCFDCFFDCSTSk - Transmit/Receive FIFO CAN FD Configuration/ Status Register k ..... 1380
20.4.8.7 RSCFDnCFDCFDFd_k — Transmit/Receive FIFO Buffer Access Data Field d Register k ..... 1382
20.4.9 Details of FIFO Status-Related Registers ..... 1383
20.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register ..... 1383
20.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register ..... 1385
20.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register ..... 1387
20.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register ..... 1389
20.4.9.5 RSCFDnCFDCFRISTS — Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register ..... 1390
20.4.9.6 RSCFDnCFDCFTISTS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register ..... 1391
20.4.10 Details of FIFO DMA-Related Registers ..... 1392
20.4.10.1 RSCFDnCFDCDTCT - DMA Enable Register ..... 1392
20.4.10.2 RSCFDnCFDCDTSTS - DMA Status Register ..... 1394
20.4.11 Details of Transmit Buffer-Related Registers ..... 1396
20.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register p ..... 1396
20.4.11.2 RSCFDnCFDTMSTSp - Transmit Buffer Status Register p ..... 1398
20.4.11.3 RSCFDnCFDTMIDp - Transmit Buffer ID Register p ..... 1400
20.4.11.4 RSCFDnCFDTMPTRp - Transmit Buffer Pointer Register p ..... 1401
20.4.11.5 RSCFDnCFDTMFDCTRp - Transmit Buffer CAN FD Configuration Register p ..... 1403
20.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register p ..... 1404
20.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register y ..... 1405
20.4.12 Details of Transmit Buffer Status-Related Registers ..... 1407
20.4.12.1 RSCFDnCFDTMTRSTSy — Transmit Buffer Transmit Request Status Register y ..... 1407
20.4.12.2 RSCFDnCFDTMTARSTSy — Transmit Buffer Transmit Abort Request Status Register y ..... 1409
20.4.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register y ..... 1411
20.4.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register y ..... 1413
20.4.13 Details of Transmit Queue-Related Registers ..... 1415
20.4.13.1 RSCFDnCFDTXQCCm — Transmit Queue Configuration and Control Register m ..... 1415
20.4.13.2 RSCFDnCFDTXQSTSm - Transmit Queue Status Register m ..... 1417
20.4.13.3 RSCFDnCFDTXQPCTRm - Transmit Queue Pointer Control Register m ..... 1419
20.4.14 Details of Transmit History-Related Registers ..... 1420
20.4.14.1 RSCFDnCFDTHLCCm — Transmit History List Configuration and Control Register m ..... 1420
20.4.14.2 RSCFDnCFDTHLSTSm - Transmit History List Status Register m. ..... 1422
20.4.14.3 RSCFDnCFDTHLPCTRm - Transmit History List Pointer Control Register m .. ..... 1424
20.4.14.4 RSCFDnCFDTHLACCm — Transmit History List Access Register m ..... 1425
20.4.15 Details of Test-Related Registers ..... 1426
20.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register ..... 1426
20.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register ..... 1428
20.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register. ..... 1429
20.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register r ..... 1430
20.5 Interrupt Sources and DMA Trigger ..... 1431
20.5.1 Interrupt Sources ..... 1431
20.5.2 DMA Triger (Only in CAN FD Mode) ..... 1434
20.6 CAN Modes ..... 1435
20.6.1 Global Modes ..... 1435
20.6.1.1 Global Stop Mode ..... 1436
20.6.1.2 Global Reset Mode ..... 1436
20.6.1.3 Global Test Mode. ..... 1437
20.6.1.4 Global Operating Mode ..... 1437
20.6.2 Channel Modes ..... 1438
20.6.2.1 Channel Stop Mode ..... 1439
20.6.2.2 Channel Reset Mode ..... 1439
20.6.2.3 Channel Halt Mode ..... 1440
20.6.2.4 Channel Communication Mode ..... 1440
20.6.2.5 Bus Off State ..... 1441
20.6.3 Initializing Registers by Transition to CAN Mode ..... 1442
20.7 Reception Functions ..... 1444
20.7.1 Data Processing Using the Receive Rule Table ..... 1444
20.7.1.1 Acceptance Filter Processing ..... 1445
20.7.1.2 DLC Filter Processing ..... 1446
20.7.1.3 Routing Processing ..... 1446
20.7.1.4 Label Addition Processing ..... 1446
20.7.1.5 Mirror Function Processing ..... 1446
20.7.1.6 Timestamp ..... 1447
20.8 Transmission Functions ..... 1448
20.8.1 Transmit Priority Determination ..... 1449
20.8.2 Transmission Using Transmit Buffers ..... 1450
20.8.2.1 Transmit Abort Function ..... 1450
20.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function) ..... 1450
20.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode) ..... 1450
20.8.3 Transmission Using FIFO Buffers ..... 1451
20.8.3.1 Interval Transmission Function ..... 1452
20.8.4 Transmission Using Transmit Queues ..... 1454
20.8.5 Transmit Data Padding (Only in CAN FD Mode) ..... 1454
20.8.6 Transmit History Function ..... 1455
20.9 Gateway Function ..... 1457
20.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode) ..... 1457
20.10 Test Function ..... 1458
20.10.1 Standard Test Mode ..... 1458
20.10.2 Listen-Only Mode ..... 1459
20.10.3 Self-Test Mode (Loopback Mode) ..... 1460
20.10.3.1 Self-Test Mode 0 (External Loopback Mode) ..... 1460
20.10.3.2 Self-Test Mode 1 (Internal Loopback Mode) ..... 1461
20.10.4 Restricted Operation Mode (Only in CAN FD Mode) ..... 1461
20.10.5 RAM Test Mode ..... 1462
20.10.6 Inter-Channel Communication Test ..... 1463
20.10.6.1 CRC Error Test ..... 1464
20.11 RS-CANFD Setting Procedure ..... 1465
20.11.1 Initial Settings ..... 1465
20.11.1.1 Clock Setting ..... 1467
20.11.1.2 Bit Timing Setting ..... 1467
20.11.1.3 Communication Speed Setting ..... 1469
20.11.1.4 Receive Rule Setting ..... 1471
20.11.1.5 Buffer Setting ..... 1472
20.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode) ..... 1475
20.11.2 Reception Procedure ..... 1476
20.11.2.1 Receive Buffer Reading Procedure ..... 1476
20.11.2.2 FIFO Buffer Reading Procedure ..... 1478
20.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer ..... 1482
20.11.3 Transmission Procedure ..... 1483
20.11.3.1 Procedure for Transmission from Transmit Buffers ..... 1483
20.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers ..... 1488
20.11.3.3 Procedure for Transmission from the Transmit Queue ..... 1492
20.11.3.4 Transmit History Buffer Reading Procedure ..... 1493
20.11.4 Test Settings ..... 1494
20.11.4.1 Self-Test Mode Setting Procedure ..... 1494
20.11.4.2 Procedure for Releasing the Protection ..... 1494
20.11.4.3 RAM Test Setting Procedure ..... 1496
20.11.4.4 Inter-Channel Communication Test Setting Procedure ..... 1497
20.12 Notes on the RS-CANFD Module ..... 1498
Section 21 FlexRay (FLXA) ..... 1500
21.1 Features of FLXA ..... 1500
21.1.1 Number of Units ..... 1500
21.1.2 Register Base Address ..... 1501
21.1.3 Clock Supply ..... 1501
21.1.4 Interrupt Requests ..... 1502
21.1.5 Reset Sources. ..... 1503
21.1.6 External Input/Output Signals ..... 1503
21.2 Overview ..... 1504
21.2.1 Functional Overview ..... 1504
21.2.2 Block Diagram ..... 1505
21.3 Registers ..... 1510
21.3.1 List of Registers ..... 1510
21.3.2 FlexRay Operation Register ..... 1514
21.3.2.1 FLXAnFROC - FlexRay Operation Control Register ..... 1514
21.3.2.2 FLXAnFROS - FlexRay Operation Status Register ..... 1517
21.3.3 Special Registers ..... 1519
21.3.3.1 FLXAnFRLCK — FlexRay Lock Register ..... 1519
21.3.4 Interrupt Registers ..... 1520
21.3.4.1 FLXAnFREIR — FlexRay Error Interrupt Register ..... 1520
21.3.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register ..... 1525
21.3.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register ..... 1531
21.3.4.4 FLXAnFRSILS — FlexRay Status Interrupt Line Select Register ..... 1533
21.3.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register ..... 1535
21.3.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register ..... 1537
21.3.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register ..... 1539
21.3.4.8 FLXAnFRSIER — FlexRay Status Interrupt Enable Reset Register ..... 1541
21.3.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register ..... 1543
21.3.5 FlexRay Timer Registers ..... 1544
21.3.5.1 FLXAnFRTOC — FlexRay Timer 0 Configuration Register ..... 1544
21.3.5.2 FLXAnFRT1C - FlexRay Timer 1 Configuration Register ..... 1546
21.3.5.3 FLXAnFRT2C - FlexRay Timer 2 Configuration Register ..... 1548
21.3.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1 ..... 1550
21.3.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2 ..... 1553
21.3.6 CC Control Registers ..... 1554
21.3.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1 ..... 1554
21.3.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2 ..... 1561
21.3.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3 ..... 1562
21.3.6.4 FLXAnFRNEMC - FlexRay NEM Configuration Register ..... 1563
21.3.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1 ..... 1564
21.3.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2 ..... 1567
21.3.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register ..... 1569
21.3.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1 ..... 1570
21.3.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2 ..... 1571
21.3.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3 ..... 1572
21.3.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4 ..... 1574
21.3.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5 ..... 1575
21.3.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6 ..... 1577
21.3.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7 ..... 1578
21.3.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8 ..... 1579
21.3.6.16 FLXAnFRGTUC9 - FlexRay GTU Configuration Register 9 ..... 1580
21.3.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10 ..... 1582
21.3.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11 ..... 1583
21.3.7 CC Status Registers ..... 1585
21.3.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register ..... 1585
21.3.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register ..... 1589
21.3.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register ..... 1591
21.3.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register ..... 1592
21.3.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register. ..... 1593
21.3.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register ..... 1594
21.3.7.7 FLXAnFRSFS - FlexRay Sync Frame Status Register ..... 1595
21.3.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register ..... 1598
21.3.7.9 FLXAnFRACS - FlexRay Aggregated Channel Status Register ..... 1601
21.3.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m ( $m=1$ to 15) ..... 1605
21.3.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m ( $m=1$ to 15) ..... 1607
21.3.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m ( $m=1$ to 3 ) ..... 1609
21.3.8 Message Buffer Control Registers ..... 1610
21.3.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register ..... 1610
21.3.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register ..... 1614
21.3.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register ..... 1616
21.3.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register ..... 1617
21.3.9 Message Buffer Status Registers ..... 1618
21.3.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register ..... 1618
21.3.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register ..... 1621
21.3.9.3 FLXAnFRFSR — FlexRay FIFO Status Register ..... 1622
21.3.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register ..... 1624
21.3.9.5 FLXAnFRTXRQi — FlexRay Transmission Request Register i (i=1 to 4) ..... 1628
21.3.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i=1 to 4) ..... 1629
21.3.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i = 1 to 4) ..... 1630
21.3.10 Input Buffer ..... 1631
21.3.10.1 FLXAnFRWRDSx — FlexRay Write Data Section Register x ( $x=1$ to 64) ..... 1631
21.3.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1 ..... 1633
21.3.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2 ..... 1635
21.3.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3 ..... 1636
21.3.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register ..... 1637
21.3.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register ..... 1639
21.3.11 Output Buffer ..... 1641
21.3.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register $x(x=1$ to 64) ..... 1641
21.3.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1 ..... 1642
21.3.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2 ..... 1644
21.3.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3 ..... 1646
21.3.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register ..... 1648
21.3.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register ..... 1654
21.3.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register ..... 1656
21.3.12 Data Transfer Control Register ..... 1658
21.3.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register ..... 1658
21.3.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register ..... 1660
21.3.12.3 FLXAnFRIBA - FlexRay Input Pointer Table Base Address Register ..... 1663
21.3.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register ..... 1664
21.3.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register ..... 1665
21.3.12.6 FLXAnFRIQC - FlexRay Input Queue Control Register ..... 1666
21.3.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register ..... 1667
21.3.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register ..... 1668
21.3.13 Data Transfer Status Register ..... 1669
21.3.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register ..... 1669
21.3.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register ..... 1673
21.3.13.3 FLXAnFRAES — FlexRay Access Error Status Register. ..... 1678
21.3.13.4 FLXAnFRAEA — FlexRay Access Error Address Register ..... 1680
21.3.13.5 FLXAnFRDAi — FlexRay Message Data Available Register i ( $\mathrm{i}=0$ to 3 ) ..... 1681
21.4 Operation ..... 1682
21.4.1 FlexRay Module Operation Control ..... 1682
21.4.1.1 FlexRay Module Enable ..... 1682
21.4.1.2 FlexRay Module Disable ..... 1683
21.4.2 Communication Cycle ..... 1684
21.4.3 Communication Modes ..... 1687
21.4.3.1 Time-triggered Distributed (TT-D) ..... 1687
21.4.4 Clock Synchronization ..... 1688
21.4.4.1 Global Time ..... 1688
21.4.4.2 Local Time ..... 1688
21.4.4.3 Synchronization Process ..... 1688
21.4.5 Error Handling ..... 1690
21.4.5.1 Clock Correction Failed Counter ..... 1690
21.4.5.2 Passive to Active Counter ..... 1691
21.4.5.3 HALT Command ..... 1691
21.4.5.4 FREEZE Command ..... 1691
21.4.6 Communication Controller States ..... 1692
21.4.6.1 Communication Controller State Diagram ..... 1692
21.4.6.2 DEFAULT_CONFIG State ..... 1694
21.4.6.3 CONFIG State ..... 1694
21.4.6.4 READY State ..... 1695
21.4.6.5 WAKEUP State ..... 1696
21.4.6.6 STARTUP State ..... 1701
21.4.6.7 NORMAL_ACTIVE State ..... 1706
21.4.6.8 NORMAL_PASSIVE State ..... 1706
21.4.6.9 HALT State ..... 1707
21.4.7 Network Management ..... 1708
21.4.8 Filtering and Masking ..... 1709
21.4.8.1 Slot Counter Filtering ..... 1709
21.4.8.2 Cycle Counter Filtering ..... 1709
21.4.8.3 Channel ID Filtering ..... 1711
21.4.8.4 FIFO Filtering ..... 1711
21.4.9 Transmit Process ..... 1712
21.4.9.1 Static Segment ..... 1712
21.4.9.2 Dynamic Segment ..... 1712
21.4.9.3 Transmit Buffers ..... 1712
21.4.9.4 Frame Transmission ..... 1713
21.4.9.5 Null Frame Transmission ..... 1714
21.4.10 Receive Process ..... 1715
21.4.10.1 Dedicated Receive Buffers ..... 1715
21.4.10.2 Frame Reception ..... 1715
21.4.10.3 Null Frame Reception ..... 1716
21.4.11 FIFO Function ..... 1717
21.4.11.1 Description ..... 1717
21.4.11.2 Configuration of the FIFO ..... 1718
21.4.11.3 Access to the FIFO ..... 1719
21.4.12 Message Handling ..... 1720
21.4.12.1 Reconfiguration of Message Buffers ..... 1720
21.4.12.2 Host Access to Message RAM ..... 1722
21.4.12.3 FlexRay Protocol Controller Access to Message RAM ..... 1728
21.4.13 Message RAM ..... 1729
21.4.13.1 Header Partition ..... 1731
21.4.13.2 Data Partition ..... 1735
21.4.13.3 Message Data Integrity Check ..... 1736
21.4.13.4 Host Handling of Access Errors ..... 1738
21.4.14 Interrupts ..... 1739
21.4.15 Assignment of FlexRay Configuration Parameters ..... 1740
21.4.16 Usage of Data Transfer. ..... 1742
21.4.16.1 Input Data Transfer ..... 1742
21.4.16.2 Output Data Transfer ..... 1751
21.4.16.3 Data Structure Transfer Scheduling ..... 1759
21.4.16.4 Behavior in Case of Data Transfer Access Error ..... 1760
21.4.16.5 Behaviors in Case of RAM Read Errors ..... 1762
21.4.17 Byte Alignment ..... 1764
21.4.17.1 Little Endian Alignment ..... 1764
21.4.17.2 Big Endian Alignment ..... 1766
Section 22 Renesas High Speed Bus (RHSB) ..... 1767
22.1 Features of RHSB ..... 1767
22.1.1 Number of Units ..... 1767
22.1.2 Register Base Addresses ..... 1768
22.1.3 Clock Supply ..... 1768
22.1.4 Interrupt Requests ..... 1769
22.1.5 Reset Sources. ..... 1770
22.1.6 External Input/Output Signals ..... 1771
22.2 Overview ..... 1772
22.2.1 Functional Overview ..... 1772
22.2.1.1 Downstream Channel Communication Functions ..... 1772
22.2.1.2 Upstream Channel Communication Functions ..... 1773
22.2.1.3 Other Features ..... 1773
22.2.1.4 Caution ..... 1773
22.2.2 Block Diagram ..... 1774
22.3 Registers ..... 1775
22.3.1 List of Registers ..... 1775
22.3.2 Legend ..... 1776
22.3.3 Description of the Registers in the Common Controller ..... 1777
22.3.3.1 RHSBjGC - Global Configuration Register ..... 1777
22.3.3.2 RHSBjMSR — Module Status Register ..... 1779
22.3.4 Downstream (Tx) Registers ..... 1781
22.3.4.1 RHSBjDCR — Downstream Configuration Register ..... 1781
22.3.4.2 RHSBjDCR1 — Downstream Configuration Register for Period 1 ..... 1785
22.3.4.3 RHSBjDEC — Data Element Configuration Register ..... 1786
22.3.4.4 RHSBjSDCi — Slave Device Configuration Register i (i=0) ..... 1788
22.3.4.5 RHSBjDEBAm — Data Element Bit Assignment Register m ( $\mathrm{m}=0$ to 3) ..... 1790
22.3.4.6 RHSBjEBEi - Emergency Bit Enable Register $\mathrm{i}(\mathrm{i}=0,1)$ ..... 1792
22.3.4.7 RHSBjDTC — Downstream Transmission Control Register ..... 1793
22.3.4.8 RHSBjDCD — Downstream Command Data Register ..... 1795
22.3.4.9 RHSBjDDRi - Downstream Data Register i (i=0,1) ..... 1796
22.3.4.10 RHSBjDEDi - Downstream Emergency Data Register i $(i=0,1)$ ..... 1797
22.3.5 Upstream (Rx) Registers ..... 1798
22.3.5.1 RHSBjUCR — Upstream Configuration Register ..... 1798
22.3.5.2 RHSBjUCC — Upstream Channel Configuration Register ..... 1800
22.3.5.3 RHSBjUCS — Upstream Channel Selection Register ..... 1802
22.3.5.4 RHSBjUDR — Upstream Data Read Register ..... 1804
22.3.5.5 RHSBjUDi — Upstream Data Register i $(\mathrm{i}=0,1$ ) ..... 1807
22.3.5.6 RHSBjUSS — Upstream Status Summary Register ..... 1810
22.3.6 Interrupt Registers ..... 1812
22.3.6.1 RHSBjIC — Interrupt Control Register ..... 1812
22.3.6.2 RHSBjIS — Interrupt Status Register ..... 1814
22.4 Operation ..... 1818
22.4.1 Operation Description ..... 1818
22.4.1.1 RESET State. ..... 1818
22.4.1.2 CONFIG State ..... 1818
22.4.1.3 ACTIVE State ..... 1818
22.4.1.4 TEST State ..... 1819
22.4.2 Activation of the RHSB Module (Leaving RESET State) ..... 1819
22.4.3 Deactivation of the RHSB Module (Entering RESET State) ..... 1820
22.4.4 Changing between Operation States (ACTIVE, CONFIG, TEST) ..... 1820
22.4.5 Leaving ACTIVE State without Interrupting Ongoing Transmission ..... 1821
22.5 Operating Procedures ..... 1822
22.5.1 Downstream Communication ..... 1822
22.5.1.1 Downstream Communication Phases ..... 1824
22.5.1.2 Frame Dependent Flagging ..... 1826
22.5.1.3 Downstream Modes ..... 1828
22.5.1.4 Command Frame Insertion Methods in Multi-Period Repetition Mode ..... 1835
22.5.1.5 Physical Frame Format ..... 1837
22.5.1.6 Data Frame Assembling ..... 1838
22.5.1.7 Command Frame Assembling ..... 1841
22.5.1.8 Emergency Function ..... 1842
22.5.1.9 Downstream Bit Rates ..... 1844
22.5.1.10 Data Update and Data Frame Transmission Request ..... 1845
22.5.1.11 Command Frame Transmission Request ..... 1846
22.5.2 Upstream Communication ..... 1847
22.5.2.1 Upstream Modes ..... 1849
22.5.2.2 Individual Slave Configuration ..... 1850
22.5.2.3 Frame Format Types ..... 1850
22.5.2.4 Frame Storing ..... 1851
22.5.2.5 Upstream Bit Rates ..... 1852
22.5.2.6 Update of Decoding Status ..... 1852
22.5.3 Timeout Detection ..... 1853
22.5.3.1 Command Transmission with Remote Data Request. ..... 1855
22.5.3.2 Timeout Detection Details ..... 1855
22.5.4 Test Mode Operation ..... 1856
22.5.4.1 Test Mode Data Generation ..... 1858
22.5.5 Interrupts ..... 1859
22.5.5.1 Downstream Related Interrupts (Transmission) ..... 1859
22.5.5.2 Upstream Related Interrupts (Reception) ..... 1859
22.5.5.3 Interrupt Request Details ..... 1860
22.5.6 DMA Capability ..... 1861
22.5.6.1 DMA Usage for Downstream Data Transmission ..... 1861
22.5.6.2 DMA Usage for Downstream Command Transmission ..... 1863
22.5.6.3 DMA Usage for Upstream Data Reception ..... 1864
22.6 Cross Bar (XBAR) ..... 1865
22.6.1 Overview ..... 1865
22.6.1.1 Number of Units ..... 1865
22.6.1.2 Register Base Addresses ..... 1865
22.6.1.3 Clock Supply ..... 1866
22.6.1.4 Reset Source ..... 1866
22.6.2 Module Configuration ..... 1867
22.6.2.1 RHSB XBAR Configuration ..... 1867
22.6.3 Registers ..... 1871
22.6.3.1 List of Registers ..... 1871
22.6.3.2 RHSBGjCRkH — Microsecond Bus Control Register H (ATU-V) ..... 1872
22.6.3.3 RHSBGjCRkL — Microsecond Bus Control Register L (ATU-V) ..... 1881
22.6.3.4 RHSBGjCROk - Microsecond Bus Control Register Out (ATU-V) ..... 1890
22.6.3.5 RHSBGjCRkH — Microsecond Bus Control Register H (GTM) ..... 1894
22.6.3.6 RHSBGjCRkL — Microsecond Bus Control Register L (GTM) ..... 1903
22.6.3.7 RHSBGjCROk — Microsecond Bus Control Register Out (GTM) ..... 1912
22.6.4 Operation ..... 1916
22.6.4.1 List of Bits that can be Selected in XBAR when Connected with RHSB and ATU-V is Used ..... 1916
22.6.4.2 List of Bits that can be Selected in XBAR when Connected with RHSB and GTM is Used ..... 1922
Section 23 Single Edge Nibble Transmission (RSENT) ..... 1926
23.1 Features of RSENT ..... 1926
23.1.1 Number of Channels ..... 1926
23.1.2 Register Base Addresses ..... 1927
23.1.3 Clock Supply ..... 1928
23.1.4 Interrupts Requests ..... 1928
23.1.5 Reset Source ..... 1929
23.1.6 External Input/Output Signals ..... 1930
23.2 Overview ..... 1932
23.2.1 Functional Overview ..... 1932
23.2.2 Block Diagram ..... 1933
23.3 Registers ..... 1934
23.3.1 List of Registers ..... 1934
23.3.2 RSENTnTSPC — RSENT Timestamp Register ..... 1935
23.3.3 RSENTnTSC — RSENT Timestamp Counter Register ..... 1937
23.3.4 RSENTnCC — RSENT Communication Configuration Register ..... 1938
23.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register ..... 1941
23.3.6 RSENTnIDE - RSENT Interrupt / DMA Enable Register ..... 1943
23.3.7 RSENTnMDC — RSENT Mode Control Register ..... 1945
23.3.8 RSENTnSPCT — RSENT SPC Transmission Register ..... 1946
23.3.9 RSENTnMST — RSENT Mode Status Register ..... 1947
23.3.10 RSENTnCS — RSENT Communication Status Register ..... 1948
23.3.11 RSENTnCSC — RSENT Communication Status Clear Register ..... 1952
23.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register ..... 1954
23.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register ..... 1955
23.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register ..... 1957
23.3.15 RSENTnML — RSENT Message Length Register ..... 1958
23.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register. ..... 1959
23.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register ..... 1960
23.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register ..... 1962
23.3.19 RSENTnMLM — RSENT Message Length Mirror Register ..... 1963
23.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register ..... 1964
23.3.21 RSENTnEFRD0 — RSENT Expanded Fast Channel Receive Data Register 0 ..... 1965
23.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1 ..... 1967
23.4 Operation ..... 1968
23.4.1 Modes of Operation ..... 1968
23.4.1.1 RESET Mode ..... 1969
23.4.1.2 CONFIGURATION Mode ..... 1969
23.4.1.3 OPERATION IDLE Mode ..... 1969
23.4.1.4 OPERATION ACTIVE Mode ..... 1969
23.4.1.5 Register Behavior in Operation Modes ..... 1970
23.4.1.6 Mode Status Change Timing ..... 1971
23.4.2 Clock Configuration ..... 1972
23.4.2.1 Timestamp ..... 1972
23.4.2.2 Communication Clock Configuration ..... 1974
23.4.3 RSENT Operation ..... 1975
23.4.3.1 Changing Operation Modes ..... 1975
23.4.3.2 Message Reception ..... 1977
23.4.4 SPC Function ..... 1992
23.4.4.1 Multiplexing of the RSENTnRX and RSENTnSPCO Pin Functions ..... 1994
23.4.5 Interrupts and Checks ..... 1996
Section 24 Ethernet Controller (ETNC) ..... 1998
24.1 Features of ETNC ..... 1998
24.1.1 Number of Units and Channels ..... 1998
24.1.2 Register Addresses ..... 1999
24.1.3 Clock Supply ..... 1999
24.1.4 Interrupt Requests ..... 1999
24.1.5 Reset Source ..... 1999
24.1.6 External Input/Output Signals ..... 2000
24.2 Overview ..... 2003
24.2.1 Functional Overview. ..... 2003
24.2.2 Block Diagram ..... 2004
24.3 Registers ..... 2005
24.3.1 List of Registers ..... 2005
24.3.2 ETHERC Registers ..... 2007
24.3.2.1 ETNCnECMR - ETHERC Mode Register ..... 2007
24.3.2.2 ETNCnRFLR - Receive Frame Maximum Length Register ..... 2010
24.3.2.3 ETNCnECSR - ETHERC Status Register ..... 2011
24.3.2.4 ETNCnECSIPR - ETHERC Interrupt Enable Register ..... 2013
24.3.2.5 ETNCnPIR — PHY Interface Register ..... 2014
24.3.2.6 ETNCnPSR - PHY Status Register ..... 2015
24.3.2.7 ETNCnRDMLR — Random Number Generation Counter Limit Setting Register 2016
24.3.2.8 ETNCnIPGR - Interpacket Gap Register ..... 2017
24.3.2.9 ETNCnAPR - Automatic PAUSE Frame Register ..... 2018
24.3.2.10 ETNCnMPR - Manual PAUSE Frame Register ..... 2019
24.3.2.11 ETNCnRFCF - Received PAUSE Frame Counter ..... 2020
24.3.2.12 ETNCnTPAUSER — PAUSE Frame Retransmit Count Setting Register ..... 2021
24.3.2.13 ETNCnTPAUSECR — PAUSE Frame Retransmit Counter Register ..... 2022
24.3.2.14 ETNCnBCFRR — Broadcast Frame Receive Count Setting Register ..... 2023
24.3.2.15 ETNCnMAHR — MAC Address Upper Bit Register ..... 2024
24.3.2.16 ETNCnMALR — MAC Address Lower Bit Register ..... 2025
24.3.2.17 ETNCnTROCR — Transmit Retry Over Counter Register ..... 2026
24.3.2.18 ETNCnCDCR — Late Collision Detect Counter Register. ..... 2027
24.3.2.19 ETNCnLCCR — Lost Carrier Counter Register ..... 2028
24.3.2.20 ETNCnCNDCR — Carrier Not Detected Counter Register ..... 2029
24.3.2.21 ETNCnCEFCR — CRC Error Frame Receive Counter Register ..... 2030
24.3.2.22 ETNCnFRECR — Frame Receive Error Counter Register ..... 2031
24.3.2.23 ETNCnTSFRCR - Too-Short Frame Receive Counter Register ..... 2032
24.3.2.24 ETNCnTLFRCR - Too-Long Frame Receive Counter Register ..... 2033
24.3.2.25 ETNCnRFCR — Received Alignment Error Frame Counter Register ..... 2034
24.3.2.26 ETNCnMAFCR — Multicast Address Frame Receive Counter Register ..... 2035
24.3.3 EDMAC Registers ..... 2036
24.3.3.1 ETNCnEDMR — EDMAC Mode Register ..... 2036
24.3.3.2 ETNCnEDTRR — EDMAC Transmit Request Register ..... 2037
24.3.3.3 ETNCnEDRRR - EDMAC Receive Request Register ..... 2038
24.3.3.4 ETNCnTDLAR — Transmit Descriptor List Start Address Register ..... 2039
24.3.3.5 ETNCnRDLAR — Receive Descriptor List Start Address Register ..... 2040
24.3.3.6 ETNCnEESR - ETHERC/EDMAC Status Register ..... 2041
24.3.3.7 ETNCnEESIPR - ETHERC/EDMAC Status Interrupt Enable Register ..... 2045
24.3.3.8 ETNCnTRSCER - ETHERC/EDMAC Transmit/Receive Status Copy Enable Register ..... 2047
24.3.3.9 ETNCnRMFCR — Missed-Frame Counter Register ..... 2048
24.3.3.10 ETNCnTFTR — Transmit FIFO Threshold Register ..... 2049
24.3.3.11 ETNCnFDR — FIFO Depth Register ..... 2050
24.3.3.12 ETNCnRMCR - Receive Method Control Register ..... 2051
24.3.3.13 ETNCnTFUCR - Transmit FIFO Underflow Counter ..... 2052
24.3.3.14 ETNCnRFOCR — Receive FIFO Overflow Counter ..... 2053
24.3.3.15 ETNCnIOSR — Independent Output Signal Setting Register ..... 2054
24.3.3.16 ETNCnFCFTR — Flow Control Start FIFO Threshold Setting Register ..... 2055
24.3.3.17 ETNCnRPADIR — Receive Data Padding Insert Register ..... 2056
24.3.3.18 ETNCnTRIMD - Transmit Interrupt Setting Register ..... 2057
24.3.3.19 ETNCnRBWAR — Receive Buffer Write Address Register ..... 2058
24.3.3.20 ETNCnRDFAR — Receive Descriptor Fetch Address Register ..... 2059
24.3.3.21 ETNCnTBRAR — Transmit Buffer Read Address Register ..... 2060
24.3.3.22 ETNCnTDFAR — Transmit Descriptor Fetch Address Register ..... 2061
24.4 Operation ..... 2062
24.4.1 ETHERC Operation ..... 2062
24.4.1.1 Transmission ..... 2062
24.4.1.2 Reception ..... 2064
24.4.1.3 Frame Timings ..... 2066
24.4.1.4 Accessing MII/RMII Registers ..... 2069
24.4.1.5 Magic Packet Detection ..... 2072
24.4.1.6 Adjusting Transmission Efficiency by Changing the IPG ..... 2073
24.4.1.7 Flow Control ..... 2073
24.4.1.8 Interrupts ..... 2075
24.4.2 EDMAC Operations ..... 2076
24.4.2.1 Descriptor Lists and Data Buffers ..... 2076
24.4.2.2 Transmission ..... 2082
24.4.2.3 Reception ..... 2083
24.4.2.4 Multi-Buffer Frame Transmission ..... 2084
24.4.2.5 Interrupts ..... 2086
24.5 Usage Notes ..... 2087
24.5.1 Operation in Each Communication Mode ..... 2087
24.5.2 Conditions for the LCHNG Flag to Become 1 ..... 2087
24.5.3 Input to the RMII_RX_ER Pin While the RMII is Selected ..... 2087
24.5.4 Stopping the EDMAC during Operations ..... 2087
Section 25 Peripheral Sensor Interface 5 S (PSI5-S) ..... 2088
25.1 Features of PSI5-S ..... 2088
25.1.1 Units and Channels ..... 2088
25.1.2 Register Base Address ..... 2088
25.1.3 Clock Supply ..... 2088
25.1.4 Interrupt Requests ..... 2089
25.1.5 Reset Sources. ..... 2090
25.1.6 External Input/Output Signals ..... 2090
25.2 Outline of Functions ..... 2091
25.2.1 Functional Overview ..... 2091
25.2.1.1 Terms ..... 2092
25.3 Registers ..... 2095
25.3.1 List of Registers ..... 2095
25.3.1.1 Common Register/Config ..... 2095
25.3.2 Common Register/Config ..... 2108
25.3.2.1 PSI5SPUOEB — PSI5-S/UART Operation Enable Register ..... 2108
25.3.2.2 PSI5SPUOMD - PSI5-S/UART Operation Mode Register ..... 2109
25.3.2.3 PSI5SPUOS - PSI5-S/UART Operation Status Register ..... 2110
25.3.2.4 PSI5SPUNFST — PSI5-S/UART Noise Filter Set Register ..... 2111
25.3.2.5 PSI5SPUSWR — PSI5-S/UART Software Reset Register ..... 2112
25.3.2.6 PSI5SPRMBC - PSI5-S Receive MailBox Data Clear Register ..... 2113
25.3.2.7 PSI5SPUCLB - PSI5-S/UART Communication Loop Back Register ..... 2114
25.3.2.8 PSI5SPUPTS — PSI5-S/UART Rx/Tx Parity Set Register ..... 2115
25.3.2.9 PSI5SPUBCE - PSI5-S/UART Baud Rate Clock Enable Register ..... 2116
25.3.2.10 PSI5SPUBPR - PSI5-S/UART Baud Rate Paramater Register ..... 2117
25.3.2.11 PSI5SPTPS - PSI5-S Timestamp Prescaler Register ..... 2118
25.3.2.12 PSI5SPTCAS - PSI5-S Timestamp Counter A Select Register ..... 2119
25.3.2.13 PSI5SPTCBS - PSI5-S Timestamp Counter B Select Register ..... 2120
25.3.2.14 PSI5SPTCAE — PSI5-S Timestamp Counter A Enable Register ..... 2121
25.3.2.15 PSI5SPTCAC - PSI5-S Timestamp Counter A Clear Register ..... 2122
25.3.2.16 PSI5SPTCBE — PSI5-S Timestamp Counter B Enable Register ..... 2123
25.3.2.17 PSI5SPTCBC — PSI5-S Timestamp Counter B Clear Register ..... 2124
25.3.2.18 PSI5SPATCE - PSI5-S All Timestamp Counter Enable Register ..... 2125
25.3.2.19 PSI5SPATCC — PSI5-S All Timestamp Counter Clear Register ..... 2126
25.3.2.20 PSI5SUCRIE — UART Communication Rx Interrupt Enable ..... 2127
25.3.2.21 PSI5SUCTIE - UART Communication Tx Interrupt Enable ..... 2128
25.3.2.22 PSI5SUCDRE — UART Communication DMA Request Enable Register ..... 2129
25.3.3 Common Register/Rx ..... 2130
25.3.3.1 PSI5SUCRD — UART Communication Rx Data Register ..... 2130
25.3.3.2 PSI5SUCRS — UART Communication Rx Status Register ..... 2131
25.3.3.3 PSI5SUCRSC — UART Communication Rx Status Clear Register ..... 2133
25.3.4 Common Register/Tx ..... 2134
25.3.4.1 PSI5SPTFST — PSI5-S Tx Frame Start Register ..... 2134
25.3.4.2 PSI5SPTFNM — PSI5-S Tx Frame Number Register ..... 2135
25.3.4.3 PSI5SPTFD1 - PSI5-S Tx Frame Data1 Register ..... 2136
25.3.4.4 PSI5SPTFD2 - PSI5-S Tx Frame Data2 Register ..... 2137
25.3.4.5 PSI5SPTFS - PSI5-S Tx Frame Status Register ..... 2138
25.3.4.6 PSI5SPTFIS - PSI5-S Tx FIFO Status Register ..... 2139
25.3.4.7 PSI5SUCTD - UART Communication Tx Data Register ..... 2140
25.3.4.8 PSI5SUCTM — UART Communication Tx Monitoring Register ..... 2141
25.3.4.9 PSI5SUCTS - UART Communication Tx Status Register ..... 2142
25.3.4.10 PSI5SUCTSC — UART Communication Tx Status Clear Register ..... 2143
25.3.5 Ch0 Register/Config ..... 2144
25.3.5.1 PSI5SPRCF10 - PSI5-S Receive Config1 Ch0 Register ..... 2144
25.3.5.2 PSI5SPRCF20 - PSI5-S Receive Config2 Ch0 Register ..... 2147
25.3.5.3 PSI5SPWDE0 - PSI5-S WDT Enable Ch0 Register ..... 2149
25.3.5.4 PSI5SPWDP0 — PSI5-S WDT Prescaler Ch0 Register ..... 2150
25.3.5.5 PSI5SPWDEV0 - PSI5-S WDT Expiration Value Ch0 Register ..... 2151
25.3.5.6 PSI5SPCIE0 — PSI5-S CPU Interrupt Enable Ch0 Register ..... 2152
25.3.5.7 PSI5SPDRE0 — PSI5-S DMA Transfer Request Enable Ch0 Register ..... 2154
25.3.6 Ch0 Register/Rx ..... 2155
25.3.6.1 PSI5SPRES0 — PSI5-S Receive Error Status Ch0 Register ..... 2155
25.3.6.2 PSI5SPRESC0 - PSI5-S Receive Error Status Clear Ch0 Register ..... 2156
25.3.6.3 PSI5SPTCDT0 — PSI5-S Timestamp Capture Data Ch0 Register ..... 2157
25.3.6.4 PSI5SPTCDC0 — PSI5-S Timestamp Capture Data Clear Ch0 Register ..... 2158
25.3.7 Ch0 Register/Interrupt ..... 2159
25.3.7.1 PSI5SPCIS0 - PSI5-S CPU Interrupt Status Ch0 Register ..... 2159
25.3.7.2 PSI5SPCISC0 — PSI5-S CPU Interrupt Status Clear Ch0 Register ..... 2162
25.3.8 Ch $n$ Register/Config ( $n: 1$ to 7) ..... 2164
25.3.8.1 PSI5SPRCF1n - PSI5-S Receive Config1 Chn Register (n: 1 to 7) ..... 2164
25.3.8.2 PSI5SPRCF2n - PSI5-S Receive Config2 Chn Register ..... 2167
25.3.8.3 PSI5SPWDEn - PSI5-S WDT Enable Chn Register ..... 2170
25.3.8.4 PSI5SPWDPn — PSI5-S WDT Prescaler Chn Register ..... 2171
25.3.8.5 PSI5SPWDEVn — PSI5-S WDT Expiration Value Chn Register ..... 2172
25.3.8.6 PSI5SPTCDn — PSI5-S Tx Command Data Chn Register ..... 2173
25.3.8.7 PSI5SPCIEn — PSI5-S CPU Interrupt Enable Chn Register ..... 2174
25.3.8.8 PSI5SPDREn — PSI5-S DMA Transfer Request Enable Chn Register ..... 2176
25.3.8.9 PSI5SPSTPn — PSI5-S Sync Trigger Prescaler Chn Register ..... 2177
25.3.8.10 PSI5SPSTEVn — PSI5-S Sync Trigger Expiration Value Chn Register ..... 2178
25.3.8.11 PSI5SPSTSn — PSI5-S Sync Trigger Select Ch n Register ..... 2179
25.3.9 Ch $n$ Register/Rx ( $n$ : 1 to 7 ) ..... 2180
25.3.9.1 PSI5SPRESn — PSI5-S Receive Error Status Chn Register ..... 2180
25.3.9.2 PSI5SPRESCn - PSI5-S Receive Error Status Clear Chn Register ..... 2182
25.3.9.3 PSI5SPTCDTn — PSI5-S Timestamp Capture Data Chn Register ..... 2184
25.3.9.4 PSI5SPTCDCn — PSI5-S Timestamp Capture Data Clear Chn Register ..... 2185
25.3.10 Ch $n$ Register/Tx ( $n$ : 1 to 7) ..... 2186
25.3.10.1 PSI5SPDDTPn — PSI5-S DDSR Type Chn Register ..... 2186
25.3.10.2 PSI5SPDDDn — PSI5-S DDSR Data Chn Register ..... 2187
25.3.10.3 PSI5SPDDSn - PSI5-S DDSR Status Chn Register ..... 2188
25.3.10.4 PSI5SPDDSPn - PSI5-S DDSR Stop Chn Register ..... 2189
25.3.11 Ch $n$ Register/Interrupt ( $n$ : 1 to 7) ..... 2190
25.3.11.1 PSI5SPCISn - PSI5-S CPU Interrupt Status Chn Register ..... 2190
25.3.11.2 PSI5SPCISCn — PSI5-S CPU Interrupt Status Clear Chn Register ..... 2193
25.3.12 Ch 0 Frm m MB Data (m: 1, 2) ..... 2196
25.3.12.1 PSI5SPMB0mS — PSI5-S Receive MailBox Ch0 Frmm Status Register ..... 2196
25.3.12.2 PSI5SPMB0mD — PSI5-S Receive MailBox Ch0 Frmm Data Register ..... 2198
25.3.12.3 PSI5SPMB0mT — PSI5-S Receive MailBox Ch0 Frmm Timestamp Register ..... 2199
25.3.13 Ch $n$ Frm $m$ MB Data ( $n: 1$ to 7 ) ( $m: 1$ to 6 ) ..... 2200
25.3.13.1 PSI5SPMBnmS — PSI5-S Receive MailBox ch n Frm m Status Register ..... 2200
25.3.13.2 PSI5SPMBnmD - PSI5-S Receive MailBox Ch0 Frmm Data Register ..... 2202
25.3.13.3 PSI5SPMBnmT - PSI5-S Receive MailBox Chn Frmm Timestamp Register ..... 2203
25.4 Operation Modes ..... 2204
25.5 Setting Procedures ..... 2206
25.5.1 Common Setting Procedure ..... 2207
25.5.2 PSI5S Mode Setting Procedure ..... 2209
25.5.2.1 PSI5 Frame Reception Setting ..... 2211
25.5.2.2 WDT Setting ..... 2213
25.5.2.3 Timestamp Setting ..... 2214
25.5.2.4 Interrupt Setting ..... 2216
25.5.2.5 DMA Transfer Request Setting ..... 2217
25.5.2.6 Synchronization Pulse Setting Procedure ..... 2218
25.5.2.7 Tx Command Setting Procedure ..... 2219
25.5.3 UART Mode Setting Procedure ..... 2220
25.5.4 Procedure for Transmitting Transceiver Commands ..... 2222
25.5.5 DDSR Transmission Procedure ..... 2224
25.5.6 PSI5 Frame Reception Procedures ..... 2226
25.5.6.1 Normal Reception ..... 2226
25.5.6.2 Abnormal Reception ..... 2228
25.5.6.3 Response Frame from Transceiver Reception ..... 2229
25.5.7 Initialization and Operation Stop Procedures ..... 2231
25.5.7.1 Initialization by Software Reset ..... 2231
25.5.7.2 DDSR Transmission Stop ..... 2232
25.5.7.3 MailBox Initialization ..... 2232
25.5.8 Interrupt Processing Procedures ..... 2233
25.5.8.1 Interrupt Processing in PSI5S Mode ..... 2233
25.5.8.2 Interrupt Processing in UART Mode ..... 2234
25.5.9 DMA Request Processing Procedures ..... 2235
25.5.9.1 DMA Request (Reception) Processing in PSI5S Mode ..... 2235
25.5.9.2 DMA Request (Transmission) Processing in PSI5S Mode ..... 2236
25.5.9.3 DMA Request (Reception) Processing in UART Mode ..... 2236
25.5.9.4 DMA Request (Transmission) Processing in UART Mode ..... 2237
25.5.10 UART Mode Communication Procedures ..... 2238
25.5.10.1 UART Reception ..... 2238
25.5.10.2 UART Transmission ..... 2240
25.5.11 Loopback Test ..... 2243
25.5.11.1 Loopback Test Setting Procedure ..... 2243
25.5.11.2 Loopback Test Procedure ..... 2244
25.5.12 Configuration Mode Entering Procedure ..... 2246
25.6 Operations ..... 2247
25.6.1 Functional Configuration ..... 2247
25.6.1.1 PSI5-S Reception Function ..... 2248
25.6.1.2 PSI5-S Transmission Function ..... 2250
25.6.1.3 Timestamp Generation Function ..... 2252
25.6.1.4 Synchronization Pulse Generation Function ..... 2255
25.6.2 Operations in PSI5S Mode ..... 2256
25.6.2.1 Normal Reception (in Synchronous Mode) ..... 2257
25.6.2.2 Normal Reception (in Asynchronous Mode) ..... 2267
25.6.2.3 Normal Transmission (Command Data) ..... 2270
25.6.2.4 Normal Transmission (ECU-to-Sensor Data) ..... 2271
25.6.2.5 Normal Transmission (ECU-to-Sensor Data Transmission Stopped) ..... 2275
25.6.2.6 Normal Transmission (Transmit Request Arbitration) ..... 2276
25.6.2.7 Abnormal Reception (Reception Error) ..... 2278
25.6.2.8 Abnormal Reception (WDT Error) ..... 2281
25.6.2.9 Abnormal Transmission (Transmission Error) ..... 2289
25.6.2.10 Interrupt Output ..... 2291
25.6.2.11 DMA Request Output ..... 2294
25.6.2.12 Transition to Configuration Mode ..... 2295
25.6.3 Operations in UART Mode ..... 2297
25.6.3.1 Normal Reception ..... 2297
25.6.3.2 Normal Transmission ..... 2298
25.6.3.3 Abnormal Reception (Reception Error) ..... 2299
25.6.3.4 Abnormal Transmission (Transmission Error) ..... 2301
25.6.3.5 Interrupt Output ..... 2302
25.6.3.6 DMA Request Output ..... 2303
25.6.3.7 Transition to Configuration Mode ..... 2303
25.6.4 Clearing Status Signals ..... 2305
25.7 Note ..... 2306
25.7.1 Restrictions ..... 2306
25.7.2 Notes ..... 2306
Section 26 High Speed Serial Peripheral Interface (HS-SPI) ..... 2307
26.1 Features of HS-SPI ..... 2307
26.1.1 Units and Channels ..... 2307
26.1.2 Register Base Address ..... 2307
26.1.3 Clock Supply ..... 2308
26.1.4 Interrupt Requests ..... 2308
26.1.5 Reset Sources ..... 2308
26.1.6 External Input/Output Signals ..... 2308
26.2 Overview ..... 2309
26.2.1 Functional Overview. ..... 2309
26.2.2 Block Diagram ..... 2311
26.3 Registers ..... 2312
26.3.1 List of Registers ..... 2312
26.3.2 HSPInCKEN — Clock Control Register ..... 2313
26.3.3 HSPInSRST — Software Reset Register ..... 2314
26.3.4 HSPInEN - Communication Enabling Register ..... 2315
26.3.5 HSPInMD - Communication Mode Register ..... 2317
26.3.6 HSPInCTL - Communication Control Register ..... 2319
26.3.7 HSPInSSCTL — SSL Polarity Selection Register ..... 2321
26.3.8 HSPInSCKDLY — SPCK Delay Selection Register ..... 2322
26.3.9 HSPInSSNDLY — SSL Negation Delay Selection Register ..... 2323
26.3.10 HSPInNFMDLY — Next Frame Delay Selection Register ..... 2324
26.3.11 HSPInSPLDLY — Sampling Delay Selection Register. ..... 2325
26.3.12 HSPInCDIV - Communication Clock Division Selection Register ..... 2326
26.3.13 HSPInTSAR - Transmission Data Transfer Source Address Setting Register ..... 2327
26.3.14 HSPInRDAR — Reception Data Transfer Destination Address Setting Register ..... 2328
26.3.15 HSPInCFSET - Communication Frame Count Setting Register ..... 2329
26.3.16 HSPInIREN — Interrupt Enabling Register ..... 2330
26.3.17 HSPInIRST — Interrupt Status Register ..... 2332
26.3.18 HSPInIRCL — Interrupt Status Clearing Register ..... 2336
26.3.19 HSPInACTST - Operation Status Register ..... 2338
26.3.20 HSPInCTFM — Current Transmission Frame Count Register ..... 2339
26.3.21 HSPInCRFM — Current Reception Frame Count Register. ..... 2340
26.3.22 HSPInVPEN — Virtual Port Output Enabling Register ..... 2341
26.3.23 HSPInTESTMD - Test Mode Register ..... 2342
26.4 Detailed Functional Descriptions ..... 2344
26.4.1 Overview of the HS-SPI Operation ..... 2344
26.4.1.1 Master Transmission/Reception Mode ..... 2344
26.4.1.2 Master Transmission Operation. ..... 2346
26.4.1.3 Slave Transmission/Reception ..... 2347
26.4.1.4 Slave Transmission ..... 2348
26.4.1.5 Slave Reception ..... 2349
26.4.1.6 Slave Reception (When the Virtual Port Output is Enabled) ..... 2350
26.4.2 Control on the HS-SPI Pins ..... 2351
26.4.3 Data Format ..... 2352
26.4.3.1 Frame Data Format ..... 2352
26.4.3.2 Relationship between the Serial Clock and Serial Data ..... 2355
26.4.3.3 MSB First and LSB First ..... 2357
26.4.4 Parity Bit ..... 2358
26.4.4.1 Even Parity ..... 2358
26.4.4.2 Odd Parity ..... 2358
26.4.4.3 Parity Omission ..... 2358
26.4.5 Buffer Structure ..... 2359
26.4.5.1 Structure of the Transmission Buffer ..... 2359
26.4.5.2 Reception Buffer Structure ..... 2360
26.4.6 Interrupt Requests ..... 2361
26.4.6.1 Interrupt Sources ..... 2361
26.4.6.2 H-Bus Error Interrupt Requests ..... 2362
26.4.6.3 Error Interrupt Requests ..... 2363
26.4.6.4 Communication Start Interrupt Requests. ..... 2364
26.4.6.5 Communication Complete Interrupts ..... 2364
26.4.7 Reception and Transmission during Suspension of Transfer ..... 2365
26.4.8 Operations in cases of Frame Overrun during Transmission ..... 2365
26.4.9 Operation in the cases of Frame Overrun during Reception ..... 2365
26.4.10 Timeouts ..... 2366
26.4.11 Burst Operation ..... 2367
26.4.12 Virtual Port Function. ..... 2368
26.5 Operation ..... 2369
26.5.1 Power-on, Initialization and Stop Processing Flows ..... 2369
26.5.2 Master Mode ..... 2370
26.5.2.1 Transmission and Reception Setting Flows ..... 2370
26.5.2.2 Transmission Setting Flow ..... 2372
26.5.2.3 Loop-back Test Setting Flow ..... 2373
26.5.3 Slave Mode ..... 2374
26.5.3.1 Transmission and Reception Setting Flows ..... 2374
26.5.3.2 Transmission Setting Flow ..... 2375
26.5.3.3 Reception Setting Flow ..... 2376
26.5.3.4 Virtual Port Reception Setting Flow ..... 2377
26.5.3.5 Flow of Loop-back Test Setting ..... 2378
26.5.4 Flow of Re-send Using Communications Start Trigger. ..... 2379
26.5.5 Error Handling Flow ..... 2380
26.5.6 Suspend Communication Procedure ..... 2381
26.5.7 Notes for Suspending Communication ..... 2382
26.5.8 Loop-Back Testing ..... 2383
26.6 Notes ..... 2384
26.6.1 Notes for Suspending Communication ..... 2384
26.6.2 Register Write Protection and Software Resets ..... 2384
26.6.2.1 Write Protection ..... 2384
26.6.2.2 Registers for Software Resets ..... 2384
26.6.2.3 Notes when Using Communications Start Trigger Bit ..... 2384
26.6.3 DMA Function ..... 2385
26.6.3.1 DMA Operation during Suspened Communication ..... 2385
26.6.3.2 DMA Operation in Response to H-Bus Errors ..... 2385
26.6.3.3 Transmission Underruns in Slave Mode ..... 2385
26.6.3.4 DMA Operation When Virtual Port Output Enabled ..... 2385
26.6.4 Data Storage and Address Space ..... 2386
26.6.5 Errors ..... 2388
26.6.5.1 Resume Transfer after an Error Occurs ..... 2388
26.6.5.2 Operations When a Reception Overflow Occurs ..... 2388
26.6.5.3 Transmission Underrun in Slave Mode ..... 2388
Section 27 Renesas High-Speed Serial I/F (RHSIF) ..... 2389
27.1 Feature ..... 2389
27.1.1 Number of Units and Channels ..... 2389
27.1.2 Register Base Address ..... 2389
27.1.3 Clock Supply ..... 2389
27.1.4 Interrupt Requests ..... 2390
27.1.5 Reset Sources. ..... 2390
27.1.6 External Input/Output Signals ..... 2390
27.2 Overview ..... 2391
27.2.1 Functional Overview ..... 2391
27.2.2 Block Diagram ..... 2392
27.2.3 Communication Protocol ..... 2393
27.2.3.1 Protocol Definitions ..... 2393
27.2.3.2 Connection ..... 2393
27.2.3.3 L1 Frame ..... 2394
27.2.3.4 L2 Frame ..... 2397
27.2.3.5 Data Format ..... 2400
27.2.3.6 All Sending and Receiving Frames ..... 2401
27.2.3.7 Number of Transfer Bits in each Frame ..... 2402
27.2.3.8 List of Command and Response ..... 2402
27.2.3.9 Command Pipelining ..... 2402
27.3 Operation ..... 2403
27.3.1 Operation Flow ..... 2403
27.4 Transport Layer (L2) ..... 2404
27.4.1 Overview ..... 2404
27.4.1.1 Functional Overview ..... 2404
27.4.1.2 Block Diagram ..... 2406
27.4.2 Registers ..... 2407
27.4.2.1 List of Registers ..... 2407
27.4.2.2 Legend ..... 2410
27.4.2.3 Detailed Register Descriptions ..... 2411
27.4.3 Operation ..... 2453
27.4.3.1 Initial Settings ..... 2453
27.4.3.2 Non-Stream Command Transmission by Initiator Node ..... 2465
27.4.3.3 Non-Stream Command Reception by Target Node ..... 2470
27.4.3.4 Stream Command Transmission by Initiator Node ..... 2475
27.4.3.5 Stream Command Reception by Target Node ..... 2479
27.4.3.6 CRC Error Handling ..... 2484
27.4.4 Interrupt Specification ..... 2485
27.4.4.1 Interrupt Signals and Corresponding Interrupt Sources ..... 2485
27.4.4.2 Interrupt Signal Status Register ..... 2486
27.5 Datalink Layer (L1) ..... 2487
27.5.1 Overview ..... 2487
27.5.1.1 Functional Overview ..... 2487
27.5.1.2 Block Diagram ..... 2488
27.5.2 Registers ..... 2489
27.5.2.1 List of Registers ..... 2489
27.5.2.2 Legend ..... 2491
27.5.2.3 Detailed Register Description ..... 2492
27.5.3 Operation ..... 2526
27.5.3.1 Initial Settings ..... 2526
27.5.3.2 ICLC Command Control Method ..... 2529
27.5.3.3 Changing Communication Speed Using ICLC Commands ..... 2532
27.5.3.4 Transiting Slave State Using ICLC Commands ..... 2538
27.5.3.5 CTS Commands ..... 2540
27.5.3.6 Sleep Mode ..... 2542
27.5.4 Interrupt Specification ..... 2543
27.5.4.1 Interrupt Source List ..... 2543
27.5.4.2 Error Detect Conditions ..... 2546
27.5.4.3 Operation Upon Error Occurrence ..... 2548
27.5.5 Debug ..... 2548
27.5.6 Usage Note ..... 2549
27.5.6.1 About Fast Mode of Slave ..... 2549
Section 28 Window Watchdog Timer (WDTB) ..... 2550
28.1 Features of WDTB ..... 2550
28.1.1 Units and Channels ..... 2550
28.1.2 Register Base Addresses ..... 2550
28.1.3 Clock Supply ..... 2551
28.1.4 Interrupt Requests ..... 2551
28.1.5 Reset Sources ..... 2551
28.1.6 Correspondence of WDTB and CPU ..... 2551
28.2 Overview ..... 2552
28.2.1 Functional Overview ..... 2552
28.2.2 Block Diagram ..... 2553
28.3 Registers ..... 2554
28.3.1 List of Registers ..... 2554
28.3.2 Detail of Registers ..... 2555
28.3.2.1 WDTBnWDTE — WDTB Enable Register ..... 2555
28.3.2.2 WDTBnMD - WDTB Mode Register ..... 2556
28.3.2.3 WDTBnWOST — WDTB Window Open Start Register ..... 2558
28.3.2.4 WDTBnWIS — WDTB Interrupt Output Timing Setting Register ..... 2559
28.4 Operation ..... 2560
28.4.1 WDTB after Reset Release ..... 2560
28.4.1.1 Start Modes ..... 2560
28.4.1.2 Start Mode Selection (Only for WDTB0) ..... 2560
28.4.1.3 WDTB Settings after Reset Release ..... 2560
28.4.1.4 Default Start Mode Timing (Only for WDTBO) ..... 2561
28.4.1.5 Software Trigger Start Mode Timing (Common to all WDTB) ..... 2562
28.4.2 WDTB Trigger ..... 2563
28.4.3 WDTB Error Detection ..... 2563
28.4.3.1 WDTB Error Mode ..... 2564
28.4.4 WDTB Interrupt Output ..... 2565
28.4.5 Window Function ..... 2567
Section 29 OS Timer (OSTM) ..... 2569
29.1 Features of OSTM ..... 2569
29.1.1 Number of Units ..... 2569
29.1.2 Register Base Addresses ..... 2569
29.1.3 Clock Supply ..... 2569
29.1.4 Interrupts Requests ..... 2570
29.1.5 Reset Sources ..... 2570
29.1.6 Correspondence of OSTM and CPU ..... 2570
29.2 Overview ..... 2571
29.2.1 Function Overview ..... 2571
29.2.2 Block Diagram ..... 2572
29.2.3 Output Modes (only for OSTMO) ..... 2573
29.2.4 Interrupt Requests (OSTMnTINT) ..... 2574
29.3 Registers ..... 2575
29.3.1 List of Registers ..... 2575
29.3.2 Detail of Registers ..... 2576
29.3.2.1 OSTMnCMP — OSTM Compare Register ..... 2576
29.3.2.2 OSTMnCNT — OSTM Counter Register ..... 2577
29.3.2.3 OSTMnTO - OSTM Output Register ..... 2578
29.3.2.4 OSTMnTOE - OSTM Output Enable Register ..... 2579
29.3.2.5 OSTMnTE — OSTM Count Enable Status Register ..... 2580
29.3.2.6 OSTMnTS — OSTM Count Start Trigger Register ..... 2581
29.3.2.7 OSTMnTT — OSTM Count Stop Trigger Register ..... 2582
29.3.2.8 OSTMnCTL — OSTM Control Register ..... 2583
29.4 Operation ..... 2584
29.4.1 Starting and Stopping OSTM ..... 2584
29.4.2 Interval Timer Mode ..... 2586
29.4.2.1 Basic Operation in Interval Timer Mode ..... 2586
29.4.2.2 Operation when OSTMnCMP $=00000000 \mathrm{H}$ ..... 2588
29.4.2.3 Forced Restart Operation in Interval Timer Mode ..... 2589
29.4.3 Free-Run Compare Mode ..... 2590
29.4.3.1 Basic Operation in Free-Run Compare Mode ..... 2590
29.4.3.2 Operation when OSTMnCMP $=00000000_{\mathrm{H}}$ ..... 2592
29.4.3.3 Forced Restart Operation in Free-Run Compare Mode ..... 2593
Section 30 ATU-V ..... 2594
30.1 Features of ATU-V ..... 2594
30.1.1 Units and Channels ..... 2594
30.1.2 Register Base Address ..... 2594
30.1.3 Clock Supply ..... 2594
30.1.4 Interrupts Requests ..... 2595
30.1.5 Reset Sources. ..... 2619
30.1.6 External Input/Output Signals ..... 2619
30.2 Overview ..... 2622
30.2.1 Configuration of ATU-V. ..... 2627
30.2.2 ATU-V Registers ..... 2629
30.3 Common Controller ..... 2695
30.3.1 Overview of Operation ..... 2695
30.3.2 Registers Related to Common Controller ..... 2696
30.3.2.1 ATUENR - ATU Master Enable Register. ..... 2696
30.3.2.2 CBCNT - Clock Bus Control Register ..... 2699
30.3.2.3 NCMR — Noise Cancellation Mode Register ..... 2700
30.3.2.4 Description of Operations for Noise Cancellation ..... 2706
30.4 Prescaler ..... 2710
30.4.1 Overview of Operation ..... 2710
30.4.2 Registers Related to Prescaler ..... 2711
30.4.2.1 PSCRx — Prescaler Registers x ..... 2711
30.4.3 Details of Operation ..... 2712
30.4.3.1 Starting Prescalers ..... 2712
30.4.3.2 Stopping and Restarting Operation ..... 2712
30.5 Timer A ..... 2713
30.5.1 Overview of Operation ..... 2713
30.5.2 Registers Related to Timer A ..... 2715
30.5.2.1 TCR1A - Timer Control Register 1A ..... 2715
30.5.2.2 TCR2A - Timer Control Register 2A ..... 2717
30.5.2.3 TCR2AS1 - Timer Control Register 2AS1 ..... 2718
30.5.2.4 TCR2AS2 - Timer Control Register 2AS2 ..... 2719
30.5.2.5 TCR3A - Timer Control Register 3A ..... 2720
30.5.2.6 TCR4A - Timer Control Register 4A ..... 2721
30.5.2.7 TCR5A - Timer Control Register 5A ..... 2722
30.5.2.8 NCMCR1A - Noise Cancellation Mode Channel Register 1A ..... 2723
30.5.2.9 NCMCR2A - Noise Cancellation Mode Channel Register 2A ..... 2724
30.5.2.10 TIOR1A - Timer I/O Control Register 1 ..... 2725
30.5.2.11 TIOR2A - Timer I/O Control Register 2 ..... 2726
30.5.2.12 TIERA — Timer Interrupt Enable Register A ..... 2728
30.5.2.13 TSRA - Timer Status Register A ..... 2729
30.5.2.14 TSCRA — Timer Status Clear Register A ..... 2730
30.5.2.15 ICRAx — Input Capture Registers Ax. ..... 2731
30.5.2.16 ICRA2x — Input Capture Registers A2x ..... 2732
30.5.2.17 TCNTA - Free-Running Counter A ..... 2733
30.5.2.18 TILRA - Timer Input Signal Level Register. ..... 2734
30.5.2.19 NCNTAx - Noise Canceler Counters Ax ..... 2735
30.5.2.20 NCRAx — Noise Cancel Registers Ax ..... 2737
30.5.3 Details of Operation ..... 2738
30.5.3.1 Operation of Noise Canceler ..... 2738
30.5.3.2 Operation of Free-Running Counter ..... 2738
30.5.3.3 Input Capture ..... 2739
30.5.3.4 Pin Level Capture Operation ..... 2741
30.6 Timer B ..... 2742
30.6.1 Overview of Operation ..... 2742
30.6.2 Timer B Control Registers ..... 2747
30.6.2.1 TCRB - Timer Control Register B ..... 2747
30.6.2.2 TCRBS1 - Timer Control Register BS1 ..... 2749
30.6.2.3 TCRBS2 - Timer Control Register BS2 ..... 2750
30.6.2.4 TIORB - Timer I/O Control Register B ..... 2751
30.6.2.5 TSRB — Timer Status Register B ..... 2753
30.6.2.6 TSCRB - Timer Status Clear Register B ..... 2758
30.6.2.7 TICRB - Timer Interrupt Control Register B ..... 2760
30.6.2.8 TIERB — Timer Interrupt Enable Register B ..... 2762
30.6.2.9 CHSELBR - Channel Select Register B ..... 2763
30.6.2.10 TCNT4CRB — Multiplied-and-Corrected Clock Generating Counter B4 Control Register ..... 2764
30.6.2.11 TCNTB0 - Edge Interval Measuring Counter B0 ..... 2765
30.6.2.12 TCNTB0S1 - Edge Interval Measuring Counter B0S1 ..... 2766
30.6.2.13 TCNTB0S2 - Edge Interval Measuring Counter B0S2 ..... 2767
30.6.2.14 ICRB0 — Input Capture Register B0 DICRB0 — Input Capture Register B0 MIICRB0 - Mirror Input Capture Register B0 ..... 2768
30.6.2.15 ICRB0S1 — Input Capture Register B0S1 ..... 2769
30.6.2.16 ICRB0S2 - Input Capture Register B0S2 ..... 2770
30.6.2.17 RECRB1 to RECRB6 - Record Registers B1 to B6 DRECRB1 — Record Registers B1 ..... 2771
30.6.2.18 RBURB0 to RBURB6 - Record Backup Register B0 to B6 ..... 2772
30.6.2.19 ICRB30 to ICRB37 — Input Capture Registers B30 to B37 ..... 2773
30.6.2.20 OCRB0 - Output Compare Register B0 ..... 2774
30.6.2.21 OCRB0S1 - Output Compare Register B0S1 ..... 2775
30.6.2.22 OCRB0S2 - Output Compare Register B0S2 ..... 2776
30.6.2.23 TCNTB1 - Event Counter B1 ..... 2777
30.6.2.24 TCNTB1S1 - Event Counter B1S1 ..... 2778
30.6.2.25 TCNTB1S2 - Event Counter B1S2 ..... 2779
30.6.2.26 OCRB1 — Output Compare Register B1 ..... 2780
30.6.2.27 OCRB1S1 - Output Compare Register B1S1 ..... 2781
30.6.2.28 OCRB1S2 - Output Compare Register B1S2 ..... 2782
30.6.2.29 OCRB10 - Output Compare Register B10 ..... 2783
30.6.2.30 OCRB10S1 - Output Compare Register B10S1 ..... 2784
30.6.2.31 OCRB10S2 - Output Compare Register B10S2 ..... 2785
30.6.2.32 OCRB11 - Output Compare Register B11 ..... 2786
30.6.2.33 OCRB11S1 - Output Compare Register B11S1 ..... 2787
30.6.2.34 OCRB11S2 - Output Compare Register B11S2 ..... 2788
30.6.2.35 OCRB12 - Output Compare Register B12 ..... 2789
30.6.2.36 OCRB12S1 — Output Compare Register B12S1 ..... 2790
30.6.2.37 OCRB12S2 - Output Compare Register B12S2 ..... 2791
30.6.2.38 ICRB1 - Input Capture Register B1 ..... 2792
30.6.2.39 ICRB1S1 — Input Capture Register B1S1 ..... 2793
30.6.2.40 ICRB1S2 — Input Capture Register B1S2 ..... 2794
30.6.2.41 ICRB2 - Input Capture Register B2 ..... 2795
30.6.2.42 ICRB2S1 — Input Capture Register B2S1 ..... 2796
30.6.2.43 ICRB2S2 - Input Capture Register B2S2 ..... 2797
30.6.2.44 LDB — Load Register B. ..... 2798
30.6.2.45 RLDB — Reload Register B ..... 2799
30.6.2.46 TCNTB2 — Reloadable Counter B2 ..... 2800
30.6.2.47 PIMR1 — Pulse Interval Multiplier Register 1 ..... 2801
30.6.2.48 PIMR2 — Pulse Interval Multiplier Register 2 ..... 2802
30.6.2.49 TCNTB6 - Multiplied Clock Counter B6 ..... 2803
30.6.2.50 ICRB6 — Input Capture Register B6 ..... 2804
30.6.2.51 RARB6 - Multiplication Setting Register B6 ..... 2805
30.6.2.52 TCNTB6M — Frequency-Multiplied Clock Counter B6M ..... 2806
30.6.2.53 OCRB6 - Output Compare Register B6 ..... 2807
30.6.2.54 OCRB7 - Output Compare Register B7 ..... 2808
30.6.2.55 OCRB20 to OCRB43 - Output Compare Registers B20 to 43 ..... 2809
30.6.2.56 TSEQCRB - Timer Sequencer Control Register ..... 2810
30.6.2.57 TSEQRB - Timer Sequencer Register ..... 2811
30.6.2.58 TSEQENB0 to TSEQENB2 - Timer Sequencer Enable Registers 0 to 2 ..... 2812
30.6.2.59 TEPCFB0 to TEPCFB23 - Timer Event Cycle Correction Formula Definition Registers B0 to 23 ..... 2813
30.6.2.60 TCNTB3 - Correction Event Counter B3 ..... 2815
30.6.2.61 OCRB8 — Output Compare Register B8 ..... 2816
30.6.2.62 TEPCFENB0 to TEPCFENB2 - Timer Event Cycle Correction Enable Registers 0 to 2 ..... 2817
30.6.2.63 TEPCVALRB0 — Timer Event Input Cycle Correction Result Retention Register ..... 2818
30.6.2.64 TEPCRECRB1 - Timer Event Input Cycle Correction Result Log Register ..... 2819
30.6.2.65 TCNTB4 — Multiplied-and-Corrected Clock Counter B4 ..... 2820
30.6.2.66 TCNTB5 — Multiplied-and-Corrected Clock Generating Counter B5 ..... 2821
30.6.2.67 TCCLFRB — Correcting Counter Clear Flag Register B ..... 2823
30.6.2.68 TCCLRB - Correcting Counter Clearing Register B ..... 2824
30.6.3 Details of Operation ..... 2825
30.6.3.1 Edge Interval Measuring Function and Edge Input Stopping Function ..... 2825
30.6.3.2 Frequency-Multiplied Clock Generator ..... 2833
30.6.3.3 Frequency-Multiplied Clock Signal Corrector ..... 2837
30.7 Timer C ..... 2844
30.7.1 Overview of Operation ..... 2844
30.7.2 Registers Related to Timer C ..... 2846
30.7.2.1 TSTRC - Timer Start Register C ..... 2846
30.7.2.2 NCCRCx — Noise Canceler Control Register Cx ..... 2847
30.7.2.3 TCRCx - Timer Control Registers Cx ..... 2849
30.7.2.4 TSRCx - Timer Status Registers Cx ..... 2854
30.7.2.5 TSCRCx - Timer Status Clear Register Cx ..... 2857
30.7.2.6 TIORCx - Timer I/O Control Registers Cx ..... 2858
30.7.2.7 TCNTCx - Timer Counters Cx ..... 2861
30.7.2.8 GRCxy - Timer General Registers Cxy ..... 2862
30.7.2.9 NCNTCxy — Noise Canceler Counters Cxy ..... 2864
30.7.2.10 NCRCxy — Noise Canceler Registers Cxy ..... 2866
30.7.2.11 OCRCxy — Output Compare Registers Cxy ..... 2867
30.7.2.12 OCMRCxy — Output Compare Mirror Registers Cxy ..... 2868
30.7.2.13 GMRCxy — Timer General Mirror Registers Cxy ..... 2869
30.7.2.14 TIERCx - Timer Interrupt Enable Registers Cx ..... 2870
30.7.2.15 CUCRCx - Counter Upper-Limit Setting Compare Registers Cx ..... 2871
30.7.2.16 RCR1Cx — Range Comparison Value Setting Register 1Cx ..... 2872
30.7.2.17 RCR2Cx — Range Comparison Value Setting Register 2Cx. ..... 2873
30.7.2.18 NCMCR1C - Noise Cancellation Mode Channel Register 1C ..... 2875
30.7.2.19 NCMCR2C - Noise Cancellation Mode Channel Register 2C ..... 2876
30.7.3 Details of Operation ..... 2877
30.7.3.1 Input Capture Mode (Input Capture Function) ..... 2877
30.7.3.2 Compare Match Mode (Compare Match Function) ..... 2879
30.7.3.3 PWM Function ..... 2882
30.7.3.4 One-Shot Pulse Mode (One-Shot Pulse Function) ..... 2884
30.7.3.5 Counter Upper-Limit Setting Function ..... 2891
30.7.3.6 Range Compare Function ..... 2893
30.8 Timer D ..... 2898
30.8.1 Overview of Operation ..... 2898
30.8.2 Registers Related to Timer D ..... 2903
30.8.2.1 TSTRD — Timer Start Register D ..... 2903
30.8.2.2 TCRDx - Timer Control Registers Dx ..... 2904
30.8.2.3 TCCRLRDx - Timer Compare Control Register Dx ..... 2908
30.8.2.4 TIOR1Dx - Timer I/O Control Registers 1Dx ..... 2910
30.8.2.5 TIOR2Dx - Timer I/O Control Register 2Dx. ..... 2912
30.8.2.6 TCMPEDx - Timer Compare Match Control Register Dx ..... 2914
30.8.2.7 TIORDx - Timer I/O Control Register Dx ..... 2915
30.8.2.8 OSELRDx — Output Select Register Dx ..... 2916
30.8.2.9 ODRDx — Output Value Register Dx ..... 2917
30.8.2.10 DSTRDx — Down Counter Start Register Dx ..... 2918
30.8.2.11 DSR1Dx — Down Counter Status Registers 1Dx ..... 2919
30.8.2.12 DSR2Dx — Down Count Status Register 2Dx ..... 2921
30.8.2.13 DSCRDx — Down Count Status Clear Register Dx ..... 2922
30.8.2.14 DCRDx — Down Counter Control Registers Dx ..... 2923
30.8.2.15 TSRDx - Timer Status Registers Dx ..... 2925
30.8.2.16 TSCRDx — Timer Status Clear Register Dx ..... 2929
30.8.2.17 TOCRDx - Timer Output Control Registers Dx ..... 2932
30.8.2.18 TOCCRDx - Timer Output Channel Control Registers Dx ..... 2933
30.8.2.19 OSBRDx — Timer Offset Base Registers Dx ..... 2935
30.8.2.20 TICTSELDx - Timer Input Capture Trigger Select Register Dx ..... 2936
30.8.2.21 TCNT1Dx - Timer Counter 1Dx ..... 2937
30.8.2.22 TCNT2Dx - Timer Counter 2Dx ..... 2938
30.8.2.23 CUCR1Dx - Counter Upper-Limit Setting Compare Register 1Dx ..... 2939
30.8.2.24 CUCR2Dx - Counter Upper-Limit Setting Compare Register 2Dx ..... 2940
30.8.2.25 OCR1Dxy — Output Compare Registers 1Dxy ..... 2941
30.8.2.26 RCR1Dx - Range Comparison Value Setting Register 1Dx ..... 2942
30.8.2.27 OCR2Dxy — Output Compare Registers 2Dxy ..... 2944
30.8.2.28 RCR2Dx — Range Comparison Value Setting Register 2Dx ..... 2945
30.8.2.29 ICR1Dxy — Input Capture Register 1Dxy ..... 2947
30.8.2.30 ICR2Dxy — Input capture register 2Dxy ..... 2947
30.8.2.31 DCNTDxy - Timer Down Counters Dxy ..... 2948
30.8.2.32 TIER1Dx - Timer Interrupt Enable Register 1Dx ..... 2950
30.8.2.33 TIER2Dx - Timer Interrupt Enable Register 2Dx ..... 2951
30.8.2.34 TIER3Dx - Timer Interrupt Enable Register 3Dx ..... 2952
30.8.2.35 MIGCRDx - MIN Guard Control Register Dx ..... 2953
30.8.2.36 MIGSELDx - MIN Guard Pulse Select Register Dx .....  2954
30.8.2.37 OFMINDxy —Pulse Output Off Minimum Width Setting Register Dxy ..... 2955
30.8.2.38 ONMINDxy —Pulse Output On Minimum Width Setting Register Dxy ..... 2955
30.8.2.39 OTOMINDxy —Pulse Output On-to-On Minimum Width Setting Register Dxy ..... 2956
30.8.2.40 OFMICNTDxy —Pulse Output Off Minimum Width Measurement Counter Dxy. ..... 2956
30.8.2.41 ONMICNTDxy —Pulse Output On Minimum Width Measurement Counter Dxy .....  2957
30.8.2.42 OTOMICNTDxy —Pulse Output On-to-On Minimum Width Measurement Counter Dxy ..... 2957
30.8.2.43 ONCAP1Dxy — Input Capture Register ONCAP1Dxy ..... 2958
30.8.2.44 ONCAP2Dxy — Input Capture Register ONCAP2Dxy ..... 2958
30.8.2.45 OFCAP1Dxy — Input Capture Register OFCAP1Dxy ..... 2959
30.8.2.46 OFCAP2Dxy - Input Capture Register OFCAP2Dxy ..... 2959
30.8.2.47 TSR2Dx - Timer Status Register 2Dx ..... 2960
30.8.2.48 TSCR2Dx - Timer Status Clear Register 2Dx ..... 2961
30.8.2.49 CCAPSELD - Common Input Capture Select Register D ..... 2962
30.8.2.50 CICRD0-7 - Common Input Capture Register D0-7 ..... 2963
30.8.3 Details of Operation ..... 2964
30.8.3.1 Range Comparison Function ..... 2969
30.8.3.2 Counter Upper-Limit Setting Function ..... 2975
30.8.3.3 Capture Function ..... 2977
30.8.3.4 MIN Guard Function ..... 2978
30.9 Timer E ..... 2988
30.9.1 Overview of Operation ..... 2988
30.9.2 Registers Related to Timer E ..... 2990
30.9.2.1 TSTRE - Timer Start Register E ..... 2990
30.9.2.2 SBRLENE — Subblock Reload Enable Register E ..... 2991
30.9.2.3 SSTREx - Subblock Starting Registers Ex ..... 2992
30.9.2.4 PSCREx - Prescaler Registers Ex ..... 2994
30.9.2.5 PSCCRExy — Prescaler Channel Registers Exy ..... 2995
30.9.2.6 TCREx - Timer Control Register Ex ..... 2996
30.9.2.7 RLDCREx — Reload Control Registers Ex ..... 2997
30.9.2.8 POECREx — Output Shutoff Control Register Ex ..... 2998
30.9.2.9 SOLVLEx — Output Shutoff Level Setting Register Ex ..... 2999
30.9.2.10 TSREx - Timer Status Registers Ex ..... 3000
30.9.2.11 TSCREx - Timer Status Clear Registers Ex ..... 3002
30.9.2.12 TIEREx - Timer Interrupt Enable Registers Ex ..... 3004
30.9.2.13 TOCREx - Timer Output Control Registers Ex ..... 3006
30.9.2.14 FCTRGEx - Forced Compare Match Trigger Registers Ex ..... 3007
30.9.2.15 TCNTExy - Timer Counters Exy ..... 3008
30.9.2.16 CYLRExy - Cycle-Setting Registers Exy ..... 3009
30.9.2.17 DTRExy — Duty Cycle Setting Registers Exy ..... 3010
30.9.2.18 CRLDExy — Cycle Reload Registers Exy ..... 3011
30.9.2.19 DRLDExy — Duty Reload Registers Exy ..... 3012
30.9.3 Details of Operation ..... 3013
30.10 Timer F ..... 3018
30.10.1 Overview of Operation ..... 3018
30.10.2 Registers Related to Timer F ..... 3020
30.10.2.1 TSTRF - Timer Start Register F ..... 3020
30.10.2.2 NCMCR1F - Noise Cancellation Mode Channel Register 1F ..... 3021
30.10.2.3 NCMCR2F — Noise Cancellation Mode Channel Register 2F ..... 3023
30.10.2.4 NCCRF — Noise Canceller Control Register F ..... 3024
30.10.2.5 PVFCRF — Private Function Control Register F ..... 3026
30.10.2.6 TCR1Fx - Timer Control Registers 1Fx ..... 3027
30.10.2.7 TCR2Fx - Timer Control Registers 2Fx ..... 3029
30.10.2.8 TIERFx - Timer Interrupt Enable Registers Fx ..... 3030
30.10.2.9 BKCRFx - Backup Control Register Fx ..... 3032
30.10.2.10 TSRFx — Timer Status Registers Fx ..... 3034
30.10.2.11 TSCRFx - Timer Status Clear Register Fx ..... 3036
30.10.2.12 ECNTAFx - Timer Measurement Counters AFx ..... 3038
30.10.2.13 ECNTBFx - Event Counters Fx ..... 3039
30.10.2.14 ECNTCFx - Time Measurement Counters CFx ..... 3040
30.10.2.15 GRAFx - General Registers AFx ..... 3041
30.10.2.16 BGRAFx — Backup General Registers AFx ..... 3042
30.10.2.17 GRBFx - General Registers BFx ..... 3043
30.10.2.18 GRCFx - General Registers CFx ..... 3044
30.10.2.19 BGRCFx - Backup General Registers CFx ..... 3045
30.10.2.20 GRDFx - General Registers DFx ..... 3046
30.10.2.21 BGRDFx — Backup General Registers DFx ..... 3047
30.10.2.22 CDRFx - Capture Output Registers Fx ..... 3048
30.10.2.23 NCNTFAx — Noise Canceler Counters FAx ..... 3049
30.10.2.24 NCNTFBx — Noise Canceler Counters FBx ..... 3051
30.10.2.25 NCRFAx - Noise Cancel Registers FAx ..... 3053
30.10.2.26 NCRFBx — Noise Cancel Registers FBx ..... 3054
30.10.3 Details of Operation ..... 3056
30.10.3.1 Edge Counting in a Given Time ..... 3056
30.10.3.2 Effective Edge Interval Counting ..... 3058
30.10.3.3 Measurement of Time during High/Low Input Levels ..... 3059
30.10.3.4 Measurement of PWM Input Waveform Timing ..... 3061
30.10.3.5 Rotation Speed/Pulse Measurement ..... 3064
30.10.3.6 Up/Down Event Count ..... 3066
30.10.3.7 Four-time Multiplication Event Count ..... 3068
30.10.3.8 Overflow and Underflow ..... 3069
30.10.3.9 Simultaneous Access of Multiple Registers ..... 3070
30.11 Timer G ..... 3071
30.11.1 Overview of Operation ..... 3071
30.11.2 Registers Related to Timer G ..... 3072
30.11.2.1 TSTRG - Timer Start Register G ..... 3072
30.11.2.2 TIERG - Timer Interrupt Enable Register G ..... 3073
30.11.2.3 RLDCRG — Reload Control Register G ..... 3074
30.11.2.4 TCRGx - Timer Control Register Gx ..... 3075
30.11.2.5 TSRGx — Timer Status Registers Gx ..... 3076
30.11.2.6 TSCRGx — Timer Status Clear Register Gx ..... 3078
30.11.2.7 TCNTGx - Timer Counters Gx ..... 3079
30.11.2.8 OCRGx — Compare Match Registers Gx ..... 3080
30.11.2.9 RLDGx — Reload Registers Gx ..... 3081
30.11.3 Details of Operation ..... 3082
30.12 Automatic Switching of DMA and A/D Requests ..... 3084
30.12.1 Operation ..... 3084
30.12.2 Registers Related to Automatic Switching of DMA and AD Requests ..... 3085
30.12.2.1 TRGSRDMA0 - Trigger Status Register DMA0 ..... 3085
30.12.2.2 TRGSELDMA00 - Trigger Select Register DMA00 ..... 3086
30.12.2.3 TRGSELDMA01 - Trigger Select Register DMA01 ..... 3087
30.12.2.4 TRGSELAD — Trigger Select Register AD ..... 3088
30.12.2.5 TRGSRDMA1 - Trigger Status Register DMA1 ..... 3089
30.12.2.6 TRGSELDMA10 — Trigger Select Register DMA10 ..... 3090
30.12.2.7 TRGSELDMA11 — Trigger Select Register DMA11 ..... 3091
30.12.3 Details of Operation ..... 3092
30.12.3.1 Data DMA Trigger ..... 3092
30.12.3.2 Count DMA Trigger ..... 3093
30.12.3.3 SAR-AD Trigger ..... 3094
30.13 Trigger Select Function ..... 3095
30.13.1 Overview of Operation ..... 3095
30.13.2 Registers Related to Trigger Select Function ..... 3095
30.13.2.1 ATUINTSELA - ATU TimerA Interrupt Selection Control Register. ..... 3095
30.13.2.2 ATUINTSELD0 - ATU TimerD Interrupt Selection Control Register 0 ..... 3096
30.13.2.3 ATUINTSELD1 - ATU TimerD Interrupt Selection Control Register 1 ..... 3097
30.13.2.4 ATUINTSELD2 - ATU TimerD Interrupt Selection Control Register 2 ..... 3098
30.13.2.5 ATUINTSELD3 - ATU TimerD Interrupt Selection Control Register 3 ..... 3099
30.13.2.6 ATUINTSELD4 - ATU TimerD Interrupt Selection Control Register 4 ..... 3100
30.13.2.7 ATUDMASELB - ATU TimerB DMA Selection Control Register ..... 3101
30.13.2.8 ATUDMASELCDO - ATU TimerC/TimerD DMA Selection Control Register 0 ..... 3102
30.13.2.9 ATUDMASELCD1 - ATU TimerC/TimerD DMA Selection Control Register 1 ..... 3105
30.13.2.10 ATUDMASELCD2 - ATU TimerC/TimerD DMA Selection Control Register 2 ..... 3108
30.13.2.11 ATUDMASELCD3 - ATU TimerC/TimerD DMA Selection Control Register 3 ..... 3111
30.13.2.12 ATUDMASELCD4 - ATU TimerC/TimerD DMA Selection Control Register 4 ..... 3113
30.13.2.13 ATUDMASELCD5 - ATU TimerC/TimerD DMA Selection Control Register 5 ..... 3116
30.13.2.14 ATUDMASELCD6 - ATU TimerC/TimerD DMA Selection Control Register 6 ..... 3119
30.13.2.15 ATUDMASELCD7 — ATU TimerC/TimerD DMA Selection Control Register 7 ... ..... 3122
30.13.2.16 ATUDMASELE - ATU TimerE DMA Selection Control Register ..... 3124
30.13.2.17 ATUDFEENTQi - ATU to DFE Capture Trigger i Input Enable ..... 3125
30.13.2.18 ATUDFESELi - ATU to DFE Capture Trigger i Input Select ..... 3126
30.13.2.19 ATUDFESELD1T - ATU to DFE Timer FIFO Capture Trigger Select ..... 3128
30.13.2.20 ATUDSSELDSTS - ATU to DSADC Read Gate Trigger Select ..... 3129
30.13.2.21 ATUCASELCATS - ATU to CADC Read Gate Trigger Select ..... 3131
30.13.2.22 ATUP5SSEL — ATU to PSI5S Time Stamp Trigger Select ..... 3132
30.13.3 Details of Operation ..... 3134
30.13.3.1 Interrupt signal communicated to INTC is selected ..... 3134
30.13.3.2 Interrupt signal communicated to sDMA/DTS is selected ..... 3136
30.13.3.3 "Timer DFE Capture trigger $i(i=0$ to 2$)$ " communicated to DFE selected ..... 3140
30.13.3.4 "Timer FIFO Capture trigger" communicated to DFE is selected ..... 3141
30.13.3.5 "read gate" communicated to DSADC is selected ..... 3142
30.13.3.6 "read gate" communicated to CADC is selected ..... 3143
30.13.3.7 "time stamp" and "sync pulse" communicated to PSI5S is selected ..... 3144
30.14 Usage Notes ..... 3145
30.14.1 Input Capture Conflict Operation ..... 3145
30.14.1.1 Conflict between Writing to General Register and Input Capture ..... 3145
30.14.1.2 Conflict between Writing to Counter and Input Capture ..... 3146
30.14.1.3 Conflict between Setting and Clearing of Input Capture Status Flag ..... 3147
30.14.2 Compare Match Conflict Operation ..... 3148
30.14.2.1 Compare Match Signal in Cases of Consecutive Comparison ..... 3148
30.14.2.2 Conflict between Writing to Compare Match General Register and Compare Match ..... 3149
30.14.2.3 Conflict between CYLRExy Write and Cycle Match with TCNTExy ..... 3150
30.14.2.4 Conflict between DTRExy Write and Cycle Match with TCNTExy ..... 3150
30.14.2.5 Conflict between Writing to Counter and Compare Match ..... 3151
30.14.2.6 Conflict between Writing to Counter and Counter Clearing by Compare Match ..... 3152
30.14.2.7 Conflict between Writing to TCNTExy and Counter Clearing by Cycle Match ..... 3153
30.14.2.8 Conflict between Setting and Clearing of Compare Match Status Flag ..... 3154
30.14.2.9 Conflict between Setting of Cycle Match Status Flag and Writing 1 to the Status Clear Register ..... 3155
30.14.2.10 Conflict between Writing 0 to TCNTExy and Cycle Match ..... 3156
30.14.3 Load/Reload Conflict Operation ..... 3157
30.14.3.1 Conflict between Data Transfer and Writing to Transfer Destination Register ..... 3157
30.14.3.2 Conflict between Data Transfer and Writing to Transfer Source Register ..... 3158
30.14.4 Counter Conflict Operation ..... 3159
30.14.4.1 Conflict between Writing to Counter and Count-Up/Count-Down ..... 3159
30.14.4.2 Conflict between Count-Up and Counter Clearing ..... 3159
30.14.4.3 Conflict between Writing to Counter and Overflow ..... 3160
30.14.4.4 Conflict between Setting and Clearing of Overflow Status Flag ..... 3161
30.14.4.5 Conflict between Overflow and Counter Clearing by Compare Match ..... 3162
30.14.5 Noise Canceler Conflict Operation ..... 3163
30.14.5.1 Conflict between Writing to Noise Canceler Counter and Compare Match with Noise Canceler Register ..... 3163
30.14.5.2 Conflict between Writing to Noise Canceler Register and Compare Match with Noise Canceler Counter. ..... 3164
30.14.6 Timer Down Counter Dxy Conflict Operation ..... 3165
30.14.6.1 Conflict between Writing to DCNTDxy Counter and Count-Down ..... 3165
30.14.6.2 Conflict between Writing to DCNTDxy Counter and Underflow ..... 3165
30.14.6.3 Conflict between Writing to DCNTDxy Counter and Compare Match B (Counter Stop Trigger) ..... 3166
30.14.6.4 Conflict between Setting of Underflow Status Flag and Clearing by Writing 1 to Status Clear Register ..... 3167
30.14.6.5 TODxyB Output upon Occurrence of Down Counter Start Trigger When Down Counter Value is $00000000_{\text {H. }}$ ..... 3168
30.14.6.6 TODxyB Output at Simultaneous Occurrence of Start Trigger and Stop Trigger for Down Counter ..... 3168
30.14.6.7 Conflict between Down Counter Start Trigger and Underflow ..... 3168
30.14.7 Coordinated Operation of Timers A, B, and D ..... 3169
30.14.7.1 Conflict Between Counter Clearing of TCNT1Dx and TCNT2Dx and Compare Match ..... 3169
30.14.7.2 Conflict between Writing to TCNT1Dx/TCNT2Dx Counter and Counter Clearing by Timer B ..... 3170
30.14.7.3 Conflict between TCNT1Dx/TCNT2Dx Counter Overflow and Counter Clearing by Timer B ..... 3170
30.14.7.4 Conflict between TCNT1Dx Clearing by Clear Signal from Timer B and Input Capture to OSBRDx ..... 3171
Section 31 Generic Timer Module (GTM) ..... 3172
31.1 GTM Features ..... 3172
31.1.1 IP Version ..... 3172
31.1.2 Number of Sub-Units and Channels ..... 3172
31.1.3 Register/RAM Base Address ..... 3174
31.1.4 Clock Supply ..... 3174
31.1.5 Interrupt Requests ..... 3175
31.1.6 Reset Sources ..... 3179
31.1.7 External Input/Output Signals ..... 3179
31.2 Overview. ..... 3180
31.2.1 Functional Overview. ..... 3180
31.2.2 Block Diagram ..... 3182
31.3 Registers. ..... 3183
31.3.1 List of Registers ..... 3183
31.3.2 GTM_IRQ_SELij — GTM Interrupt Selection Control Register ij ..... 3191
31.3.3 GTM_IRQ_SEL8j — GTM Interrupt Selection Control Register 8j ..... 3192
31.3.4 GTM_IRQ_DPLL_SELj — GTM Interrupt DPLL Selection Register j ..... 3193
31.3.5 GTM_DMA_SELij — GTM DMA Selection Control Register ij ..... 3196
31.3.6 GTM_DMA_SEL8j — GTM DMA Selection Control Register 8j ..... 3197
31.3.7 GTM_DMA_COM_SELj — GTM DMA Common Selection Function Register j ..... 3198
31.3.8 GTM_ADCI_CHSELn — GTM ADCI channel selection register n ..... 3199
31.4 Operation ..... 3200
31.4.1 Peripheral Bus Access ..... 3200
31.4.2 Reset ..... 3204
31.4.3 Interconnections of Interrupt Factors ..... 3205
31.4.4 Outputs to AD ..... 3211
31.4.4.1 Outputs to ADCH ..... 3211
31.4.4.2 Outputs to DSADC ..... 3211
31.4.4.3 Outputs to CADC ..... 3211
31.4.5 Outputs to ENCA. ..... 3212
31.4.6 Outputs to DFE ..... 3212
31.4.7 Outputs to PSI5-S ..... 3212
31.4.8 Peripheral Inputs ..... 3213
31.4.8.1 Inputs from PORT ..... 3213
31.4.8.2 Inputs from ADCH ..... 3213
31.4.8.3 Inputs from DSADC ..... 3213
31.4.8.4 Inputs from CADC ..... 3213
31.4.8.5 Input from ENCA ..... 3213
31.4.8.6 Inputs from DFE ..... 3214
31.4.9 ADC Interface ..... 3214
31.4.10 Safety Mechanism ..... 3216
31.4.11 GTM Debug Function ..... 3216
Section 32 Encoder Timer (ENCA) ..... 3217
32.1 Features of ENCA ..... 3217
32.1.1 Number of Units ..... 3217
32.1.2 Register Base Addresses ..... 3218
32.1.3 Clock Supply ..... 3218
32.1.4 Interrupt Requests ..... 3219
32.1.5 Reset Sources ..... 3220
32.1.6 External Input/Output Signals ..... 3220
32.2 Overview ..... 3221
32.2.1 Functional Overview. ..... 3221
32.2.2 Block Diagram ..... 3222
32.3 Registers ..... 3223
32.3.1 List of Registers ..... 3223
32.3.2 Details of Registers ..... 3224
32.3.2.1 ENCAnCTL - ENCAn Control Register ..... 3224
32.3.2.2 ENCAnIOCO - ENCAn I/O Control Register 0 ..... 3226
32.3.2.3 ENCAnIOC1 — ENCAn I/O Control Register 1 ..... 3227
32.3.2.4 ENCAnFLG - ENCAn Status Flag Register ..... 3229
32.3.2.5 ENCAnFGC - ENCAn Status Flag Clear Register ..... 3230
32.3.2.6 ENCAnCCRO - ENCAn Capture/Compare Register 0 ..... 3231
32.3.2.7 ENCAnCCR1 - ENCAn Capture/Compare Register 1 ..... 3232
32.3.2.8 ENCAnCNT - ENCAn Counter Register ..... 3233
32.3.2.9 ENCAnTE - ENCAn Timer Enable Status Register ..... 3234
32.3.2.10 ENCAnTS — ENCAn Timer Start Trigger Register ..... 3235
32.3.2.11 ENCAnTT — ENCAn Timer Stop Trigger Register ..... 3236
32.3.2.12 ENCAnEMU - ENCAn Emulation Register ..... 3237
32.4 Operation ..... 3238
32.4.1 Timer Counter Operation ..... 3238
32.4.2 Up/Down Control of Timer Counter ..... 3239
32.4.2.1 When the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{\mathrm{B}}$ ..... 3240
32.4.2.2 When the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=01_{\mathrm{B}}$ ..... 3241
32.4.2.3 When the ENCAnUDS1 and ENCAnUDS0 Bits in the ENCAnCTL Register $=10 \mathrm{~B}$ ..... 3242
32.4.2.4 When ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=11_{\mathrm{B}}$ ..... 3243
32.4.3 Timer Counter Clear Control by Encoder Input ..... 3244
32.4.3.1 Clearing Method when ENCAnSCE $=0$ ..... 3244
32.4.3.2 Clearing Method when ENCAnSCE $=1$ ..... 3244
32.4.4 Functions of ENCAnCCRO ..... 3245
32.4.4.1 Compare Function ..... 3245
32.4.4.2 Capture Function ..... 3245
32.4.5 Functions of ENCAnCCR1 ..... 3246
32.4.5.1 Compare Function ..... 3246
32.4.5.2 Capture Function ..... 3247
32.4.5.3 Timer Counter Clearing upon Compare Register Match ..... 3248
32.5 ENCAn Setting Sequences ..... 3249
32.5.1 ENCAn Setting Procedure ..... 3249
32.5.1.1 Initial Setting Procedure for the Counter ..... 3250
32.5.1.2 Initial Setting Procedure for Counter Clearing ..... 3250
32.5.1.3 Setting Procedure for ENCAnCCRO Register ..... 3251
32.5.1.4 Setting Procedure for ENCAnCCR1 Register ..... 3251
32.6 Timing Chart ..... 3252
32.6.1 Overflow Occurrence and Overflow Flag Clear Operation ..... 3252
32.6.2 Underflow Occurrence and Underflow Flag Clear Operation ..... 3253
32.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3254
32.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3255
32.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3256
32.6.6 Overflow Operation Immediately after Startup ..... 3257
32.6.7 Underflow Operation Immediately after Startup ..... 3258
32.6.8 Using the ENCAnLDE Function Immediately after Startup ..... 3259
32.6.9 ENCAnLDE Function (Loading Count Value) ..... 3260
32.6.10 Conflict between ENCAnLDE Function (Loading Count Value) and Rewrite of ENCAnCCRO Register ..... 3262
32.6.11 Conflict between ENCAnLDE Function (Loading Count Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin) ..... 3263
32.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Count Value) and Encoder Clearing ..... 3265
32.6.13 Capture Operation between Count Clocks (ENCAnCCR1) ..... 3266
32.6.14 Capture Operation between Count Clocks (ENCAnCCRO) ..... 3267
32.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0 ..... 3268
32.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1 ..... 3269
32.6.17 Encoder Operation when Compare Match Clear Control is Disabled ..... 3270
32.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, or ENCAnE1 when ENCAnSCE = 1 ..... 3271
32.6.18.1 Accompanying Capture Operation ..... 3271
32.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11в) ..... 3272
32.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 B ) ..... 3273
32.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11в) ..... 3273
32.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 ${ }_{\mathrm{B}}$ ) ..... 3274
32.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$ ..... 3275
Section 33 Peripheral Interconnection (PIC) ..... 3276
33.1 Features of PIC ..... 3276
33.1.1 Number of Units ..... 3276
33.1.2 Register Base Addresses ..... 3276
33.1.3 Clock Supply ..... 3276
33.1.4 Reset Sources ..... 3277
33.1.5 External Input/Output Signals ..... 3277
33.2 Timer Synchronization Function (PIC1) ..... 3278
33.2.1 Overview ..... 3278
33.2.1.1 Functional Overview ..... 3278
33.2.1.2 Block Diagram ..... 3278
33.2.2 Registers ..... 3279
33.2.2.1 List of Registers ..... 3279
33.2.2.2 PIC1SST - Simultaneous Start Trigger Control Register ..... 3279
33.2.2.3 PIC1SSER0 - Simultaneous Start Control Register 0 ..... 3280
33.2.3 Operation ..... 3281
33.2.3.1 Timer Synchronization ..... 3281
33.3 Trigger Selection Function (PIC2) ..... 3282
33.3.1 Overview ..... 3282
33.3.1.1 Functional Overview ..... 3282
33.3.1.2 Block Diagrams ..... 3283
33.3.2 Registers ..... 3285
33.3.2.1 List of Registers ..... 3285
33.3.2.2 PIC2ADCHnTSELj — AD Converter $n$ Trigger Selection Control Register j ( $\mathrm{n}=0$ to $3^{* 1} ; \mathrm{j}=0$ to 4 ) ..... 3291
33.3.2.3 PIC2ADCHnEDGSEL - AD Converter $\mathrm{n}^{* 1}$ Trigger Edge Selection Control Register ( $\mathrm{n}=0$ to $3^{* 1}$ ) ..... 3292
33.3.2.4 PIC2ADTEN5nj - AD Converter Trigger Output Control Register 5nj ( $\mathrm{n}=0$ to $3^{* 1} ; \mathrm{j}=0$ to 4 ) ..... 3293
33.3.2.5 PIC2ADTEN6nj - AD Converter Trigger Output Control Register 6nj ( $\mathrm{n}=0$ to $3^{* 1} ; \mathrm{j}=0$ to 4 ) ..... 3296
33.3.2.6 PIC2ADTEN7nj - AD Converter Trigger Output Control Register 7nj ( $\mathrm{n}=0$ to $3^{\star 1} ; \mathrm{j}=0$ to 4 ) ..... 3298
33.3.2.7 PIC2ADTEN8nj - AD Converter Trigger Output Control Register 8nj ( $\mathrm{n}=0$ to $3^{* 1}$; $\mathrm{j}=0$ to 4 ) ..... 3300
33.3.2.8 PIC2DSADTEN0n0 — DSADC Start Trigger Output Control Register n0 ( $\mathrm{n}=0$ to 5) ..... 3303
33.3.2.9 PIC2DSADTEN0n1 — DSADC Start Trigger Output Control Register n1 ( $\mathrm{n}=0$ to 5) ..... 3304
33.3.2.10 PIC2DSADTEN0n2 — DSADC Start Trigger Output Control Register n2 ( $\mathrm{n}=0$ to 5) ..... 3306
33.3.2.11 PIC2DSADTEN0n3 — DSADC Start Trigger Output Control Register n3 ( $\mathrm{n}=0$ to 5) ..... 3308
33.3.2.12 PIC2DSADTEN1n0 — DSADC Stop Trigger Output Control Register n0 ( $\mathrm{n}=0$ to 5) ..... 3310
33.3.2.13 PIC2DSADTEN1n1 — DSADC Stop Trigger Output Control Register n1 ( $\mathrm{n}=0$ to 5) ..... 3311
33.3.2.14 PIC2DSADTEN1n2 — DSADC Stop Trigger Output Control Register n2 ( $\mathrm{n}=0$ to 5) ..... 3313
33.3.2.15 PIC2DSADTEN1n3 — DSADC Stop Trigger Output Control Register n3 ( $\mathrm{n}=0$ to 5) ..... 3315
33.3.2.16 PIC2DSADCATSELO — DSADC Trigger Selection Control Register 0 ..... 3317
33.3.2.17 PIC2DSADCATSEL1 — DSADC Trigger Selection Control Register 1 ..... 3319
33.3.2.18 PIC2ENCAnTSELj - Encoder Timer n Trigger Selection Control Register j ( $\mathrm{n}=0$ to $1 ; \mathrm{j}=0$ to 1 ). ..... 3321
33.3.2.19 PIC2CADTEN000 — CADC Start Trigger Output Control Register 00 ..... 3323
33.3.2.20 PIC2CADTEN001 — CADC Start Trigger Output Control Register 01 ..... 3324
33.3.2.21 PIC2CADTEN002 — CADC Start Trigger Output Control Register 02 ..... 3326
33.3.2.22 PIC2CADTEN003 - CADC Start Trigger Output Control Register 03 ..... 3328
33.3.2.23 PIC2CADTEN100 — CADC Stop Trigger Output Control Register 00 ..... 3330
33.3.2.24 PIC2CADTEN101 — CADC Stop Trigger Output Control Register 01 ..... 3331
33.3.2.25 PIC2CADTEN102 — CADC Stop Trigger Output Control Register 02 ..... 3333
33.3.2.26 PIC2CADTEN103 - CADC Stop Trigger Output Control Register 03 ..... 3335
33.3.2.27 PIC2CADCATSELO - CADC Trigger Selection Control Register 0 ..... 3337
33.3.2.28 PIC2CADCATSEL1 — CADC Trigger Selection Control Register 1 ..... 3338
33.3.2.29 PIC2ADTCFGx - A/D Converter Trigger Output Configuration Register x (x = 0 to 4) ..... 3339
33.3.2.30 PIC2DSADTCFGx — DSADC Start / Stop Trigger Output Configuration Register x (x = 0 to 2) ..... 3340
33.3.2.31 PIC2CADTCFG0 — CADC Start / Stop Trigger Output Configuration Register 0 ..... 3341
33.3.2.32 PIC2DSADTSENx — DSADC Read Gate Trigger Selection Control Register x ( $\mathrm{x}=0$ to 1 ) ..... 3342
33.3.2.33 PIC2CADTSEN0 - CADC Read Gate Trigger Selection Control Register 0 ..... 3344
33.3.2.34 PIC2DFETSENx — DFE Timer Trigger Selection Control Register x ( $\mathrm{x}=0$ to 11) ..... 3345
33.3.2.35 PIC2DFETEDGSELO — DFE Timer Trigger Edge Selection Control Register 0 ..... 3347
33.3.2.36 PIC2DFETEDGSEL1 — DFE Timer Trigger Edge Selection Control Register 1 ..... 3349
33.3.2.37 PIC2DFETEDGSEL2 — DFE Timer Trigger Edge Selection Control Register 2 ..... 3351
33.3.2.38 PIC2PSI5SENx - PSI5-S Sync Output Control Register $x$ ( $x=0$ to 3) ..... 3352
33.3.2.39 PIC2GTMINENx — GTM Timer Input Module (TIM) Source Select Register x $(x=0,2,4,6,8,10,12,14)$ ..... 3354
33.3.2.40 PIC2GTMINENx — GTM Timer Input Module (TIM) Source Select Register $x$ ( $x=1,3,5,7,9,11,13,15$ ) ..... 3357
33.3.2.41 PIC2ENCATCFG0 — Encoder Timer Trigger Output Configuration Register 0 ..... 3360
33.3.2.42 PIC2ENCATCFG1 - Encoder Timer Trigger Output Configuration Register 1 .....  3361
33.3.2.43 PIC2ENCAISENO — Encoder Input Selection Control Register 0 ..... 3362
33.3.3 Function ..... 3363
33.3.3.1 ADCH Trigger Selection Function ..... 3363
33.3.3.2 DSADC Trigger Selection Function ..... 3365
33.3.3.3 CADC Trigger Selection Function ..... 3367
33.3.3.4 ENCA Trigger Selection Function ..... 3369
33.3.3.5 DFE Trigger Selection Function ..... 3370
33.3.3.6 PSI5-S Timestamp and the Sync Pulse Signal Selection Function ..... 3371
33.3.3.7 GTM Timer Input (TIM) Selection Function ..... 3372
33.3.3.8 ENCA Encoder Input Selection ..... 3373
Section 34 Analog to Digital Converter (ADCH) ..... 3374
34.1 Features ..... 3374
34.1.1 Number of Units and Channels ..... 3374
34.1.2 Register Base Address ..... 3377
34.1.3 Clock Supply ..... 3377
34.1.4 Interrupt Requests ..... 3378
34.1.5 Reset Source ..... 3389
34.1.6 External Input/Output Signals ..... 3390
34.2 Overview ..... 3398
34.2.1 Functional Overview. ..... 3398
34.2.2 Block Diagram ..... 3401
34.3 Registers ..... 3405
34.3.1 List of Registers ..... 3405
34.3.2 ADCH Common Registers ..... 3408
34.3.2.1 ADCHOADSYNSTCR — A/D Synchronization Start Control Register ..... 3408
34.3.2.2 ADCHOADTSYNSTCR — A/D Timer Synchronization Start Control Register ..... 3409
34.3.2.3 ADCHOVMONVDCR1 — Voltage Monitor Voltage Divider Control Register 1 ..... 3410
34.3.2.4 ADCHOVMONVDCR2 — Voltage Monitor Voltage Divider Control Register 2 ..... 3411
34.3.3 ADCH Specific Registers (Virtual Channel, Control, Safety-related) ..... 3412
34.3.3.1 ADCHnVCRj — Virtual Channel Register j ..... 3412
34.3.3.2 ADCHnDRj — Data Register j ..... 3415
34.3.3.3 ADCHnDIRj — Data Supplementary Information Register j ..... 3419
34.3.3.4 ADCHnADHALTR — A/D Halt Register ..... 3420
34.3.3.5 ADCHnADCR1 - A/D Control Register 1 ..... 3421
34.3.3.6 ADCHnMPXCURCR — MPX Current Control Register ..... 3422
34.3.3.7 ADCHnMPXINTER — MPX Interrupt Enable Register ..... 3423
34.3.3.8 ADCHnMPXCURR — MPX Current Register ..... 3424
34.3.3.9 ADCHnMPXOWR — MPX Optional Wait register ..... 3425
34.3.3.10 ADCHnMPXCMDR — MPX Command Information Register ..... 3426
34.3.3.11 ADCHnADCR2 - A/D Control Register 2 ..... 3427
34.3.3.12 ADCHnDFASENTSGER — DFE/ASF Entry Scan Group Enable Register ..... 3428
34.3.3.13 ADCHnADENDP - A/D Conversion Monitor Virtual Channel Pointer ..... 3429
34.3.3.14 ADCHnSFTCR - Safety Control Register ..... 3430
34.3.3.15 ADCHnTDCR — Pin-Level Self-Diagnosis Control Register ..... 3431
34.3.3.16 ADCHnODCR — Wiring-break Detection Control Register ..... 3432
34.3.3.17 ADCHnECR - Error Clear Register ..... 3433
34.3.3.18 ADCHnOWER — Overwrite Error Register ..... 3434
34.3.3.19 ADCHnPER — Parity Error Register ..... 3435
34.3.3.20 ADCHnVCULLMTBR0 to 6 - Virtual Channel Upper/Lower Limit Table Register 0 to 6 ..... 3436
34.3.3.21 ADCHnVCLMINTER1 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 1 ..... 3437
34.3.3.22 ADCHnVCLMINTER2 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 2 ..... 3438
34.3.3.23 ADCHnVCLMSR1 - Virtual Channel Upper/Lower Limit Excess Status Register 1 ..... 3439
34.3.3.24 ADCHnVCLMSR2 — Virtual Channel Upper/Lower Limit Excess Status Register 2 ..... 3440
34.3.3.25 ADCHnVCLMSCR1 — Virtual Channel Upper/Lower Limit Excess Status Clear Register 1 ..... 3441
34.3.3.26 ADCHnVCLMSCR2 — Virtual Channel Upper/Lower Limit Excess Status Clear Register 2 ..... 3442
34.3.4 Scan Group Specific Registers ..... 3443
34.3.4.1 ADCHnSGSTCRx — Scan Group x Start Control Register ..... 3443
34.3.4.2 ADCHnSGSTPCRx — Scan Group x Stop Control Register ..... 3444
34.3.4.3 ADCHnADTSTCRy - A/D Timer y Start Control Register ..... 3445
34.3.4.4 ADCHnADTENDCRy — A/D Timer y End Control Register ..... 3446
34.3.4.5 ADCHnSGCRx - Scan Group x Control Register ..... 3447
34.3.4.6 ADCHnSGVCSPx — Scan Group x Start Virtual Channel Pointer ..... 3449
34.3.4.7 ADCHnSGVCEPx - Scan Group x End Virtual Channel Pointer ..... 3450
34.3.4.8 ADCHnSGMCYCRx — Scan Group x Multicycle Register ..... 3451
34.3.4.9 ADCHnSGSRx - Scan Group x Status Register ..... 3452
34.3.4.10 ADCHnADTIPRy - A/D Timer y Initial Phase Register ..... 3453
34.3.4.11 ADCHnADTPRRy - A/D Timer y Cycle Register ..... 3454
34.3.4.12 ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register ..... 3455
34.3.4.13 ADCHnSGVCOWRx — Scan Group x Virtual Channel Optional Waiting Times Register ..... 3456
34.4 Operation ..... 3457
34.4.1 Setting Procedure ..... 3457
34.4.1.1 Initial Settings ..... 3457
34.4.1.2 Startup Method ..... 3459
34.4.1.3 Terminating Procedure ..... 3460
34.4.1.4 Limitations of Setting Update ..... 3464
34.4.2 Scan Mode ..... 3465
34.4.2.1 Multicycle Scan Mode ..... 3465
34.4.2.2 Continuous Scan Mode ..... 3466
34.4.3 Suspend Method ..... 3467
34.4.3.1 Synchronous Suspend ..... 3468
34.4.3.2 Asynchronous Suspend ..... 3469
34.4.3.3 Synchronous/Asynchronous Mixture Type Suspend ..... 3470
34.4.4 Conversion Class ..... 3471
34.4.4.1 Normal A/D Conversion ..... 3471
34.4.4.2 A/D Converter Self-Diagnosis ..... 3471
34.4.4.3 Example of Addition Mode A/D Conversion Operation ..... 3472
34.4.4.4 Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode ..... 3473
34.4.5 Trigger Functions ..... 3476
34.4.5.1 S/W Trigger ..... 3476
34.4.5.2 H/W Trigger ..... 3478
34.4.5.3 A/D Timer Trigger ..... 3480
34.4.6 Interrupt Request Functions ..... 3481
34.4.6.1 Scan End Interrupt Request ..... 3481
34.4.6.2 A/D Error Interrupt Request ..... 3483
34.4.6.3 Overwrite Error ..... 3484
34.4.6.4 ID Error ..... 3484
34.4.6.5 Parity Error Interrupt Request ..... 3486
34.4.6.6 MPX Interrupt Request ..... 3487
34.4.6.7 Virtual Channel Upper/Lower Limit Error Interrupt ..... 3488
34.4.7 DFE/GTM/ASF Entry Function ..... 3491
34.4.8 Monitoring Function Using the A/D Conversion Monitor Pin ..... 3492
34.4.9 Virtual Channel Upper/Lower Limit Excess Notice to ADC VMON Secondary Error Generator (AVSEG), or to ADC Boundary Flag Generator (ABFG) ..... 3493
34.4.9.1 Setting Registers ..... 3493
34.4.9.2 Table Registers ..... 3494
34.4.9.3 Interface Signals ..... 3495
34.4.9.4 Operating Timing ..... 3496
34.4.10 Wiring-Break Detection Function ..... 3498
34.4.11 Self-Diagnostic Functions ..... 3499
34.4.11.1 Pin-Level Self-Diagnosis ..... 3499
34.4.11.2 A/D Converter Self-Diagnosis ..... 3500
34.4.11.3 Wiring-Break Detection Self-Diagnosis ..... 3501
34.4.11.4 Secondary Power Supply Voltage Monitor Self-Diagnosis ..... 3502
34.4.12 Timing Regulations ..... 3503
34.4.13 Optional Waiting Times Insertion Function of Between Virtual Channels ..... 3504
34.4.13.1 Waiting Times Insertion in Normal A/D Conversion ..... 3504
34.4.13.2 Waiting Time Insertion in Synchronous Suspend Movement ..... 3506
34.4.13.3 Waiting Times Insertion in Asynchronous Suspend Movement ..... 3507
34.4.14 Example of Scan Group Stop ..... 3508
34.4.14.1 Example of All Scan Group Stop (A/D Halt) ..... 3508
34.4.14.2 Example of Scan Group x Stop ..... 3509
34.4.15 Secondary Power Supply Voltage Monitor Function ..... 3511
34.5 Definition of A/D Conversion Accuracy ..... 3514
34.6 Usage Notes ..... 3515
34.6.1 Notes on Using an External Analog Multiplexer ..... 3515
34.6.2 Notes on Using Analog Input Pins ..... 3516
34.6.3 Module Standby Function ..... 3517
34.7 Integer/Floating-Point Conversion Module (IFC) ..... 3518
34.7.1 Overview ..... 3518
34.7.1.1 Function Overview ..... 3518
34.7.1.2 Block Diagram ..... 3518
34.7.2 Registers ..... 3520
34.7.2.1 List of Registers ..... 3520
34.7.2.2 IFC Specific Registers ..... 3521
34.8 ADC Summation Function (ASF) ..... 3522
34.8.1 Overview ..... 3522
34.8.1.1 Function Overview ..... 3522
34.8.1.2 Block Diagram ..... 3522
34.8.2 Registers ..... 3523
34.8.2.1 List of Registers ..... 3523
34.8.2.2 ASF Specific Registers ..... 3525
34.8.3 Operation ..... 3534
34.8.3.1 Example of Accumulation Processing Operation ..... 3536
34.9 ADC VMON Secondary Error Generator (AVSEG) ..... 3540
34.9.1 Overview ..... 3540
34.9.1.1 Function Overview ..... 3540
34.9.1.2 Block Diagram ..... 3541
34.9.2 Registers ..... 3542
34.9.2.1 List of Registers ..... 3542
34.9.2.2 AVSEG Specific Registers ..... 3543
34.9.3 Operation ..... 3551
34.9.3.1 Noise Count Method ..... 3551
34.9.3.2 Upper/Lower Error Pulse Output ..... 3555
34.9.4 Use Method ..... 3556
34.10 ADC Boundary Flag Generator (ABFG) ..... 3557
34.10.1 Overview ..... 3557
34.10.1.1 Function Overview ..... 3557
34.10.1.2 Block Diagram ..... 3558
34.10.2 Registers ..... 3560
34.10.2.1 List of Registers ..... 3560
34.10.2.2 ABFG Specific Registers ..... 3561
34.10.3 Operation ..... 3567
34.10.3.1 Noise Count Method ..... 3567
34.10.3.2 Boundary Flag Output, Boundary Flag Pulse Output ..... 3571
34.10.4 Use Method ..... 3572
34.11 ADC Interrupt Router (AIR) ..... 3574
34.11.1 Overview ..... 3574
34.11.1.1 Function Overview ..... 3574
34.11.1.2 Block Diagram ..... 3574
34.11.2 Registers ..... 3575
34.11.2.1 List of Registers ..... 3575
34.11.2.2 AIR Specific Registers ..... 3576
Section 35 Delta-Sigma Analog to Digital Converter (DSADC) ..... 3586
35.1 Features ..... 3586
35.1.1 Number of Units ..... 3586
35.1.2 Register Base Addresses ..... 3587
35.1.3 Clock Supply ..... 3587
35.1.4 Interrupt Requests ..... 3588
35.1.5 Reset Source ..... 3588
35.1.6 External Input/Output Signals ..... 3589
35.2 Overview ..... 3590
35.2.1 Function Overview ..... 3590
35.2.2 Block Diagram ..... 3592
35.3 Registers ..... 3593
35.3.1 List of Registers ..... 3593
35.4 Delta-Sigma ADC Common Registers ..... 3595
35.4.1 DSADCSYNSTCR — AD Synchronization Start Control Register ..... 3595
35.4.2 DSADCADGCR — AD Global Control Register ..... 3596
35.4.3 DSADCTDCR — Pin Level Self-Diagnosis Control Register ..... 3597
35.5 Delta-Sigma ADC Unit-Specific Registers ..... 3598
35.5.1 DSADCnVCRj — Virtual Channel Register j ..... 3598
35.5.2 DSADCnDIRj — Data Supplementary Information Register j ..... 3602
35.5.3 DSADCnADSTCR — AD Start Control Register ..... 3605
35.5.4 DSADCnADENDCR — AD Stop Control Register ..... 3606
35.5.5 DSADCnCLBSTCR — Calibration Start Control Register ..... 3607
35.5.6 DSADCnCLBEDCR — Calibration Stop Control Register ..... 3608
35.5.7 DSADCnADTCR — AD Conversion Trigger Control Register ..... 3609
35.5.8 DSADCnUCR — Unit Control Register. ..... 3610
35.5.9 DSADCnVCPTRR — Virtual Channel Pointer Contorl Register. ..... 3612
35.5.10 DSADCnADSR — AD Conversion Status Register ..... 3613
35.5.11 DSADCnUDPTRR — Unit Data Pointer Register ..... 3614
35.5.12 DSADCnUDIR — Unit Data Supplementary Information Register ..... 3615
35.5.13 DSADCnTSVAL — Timestamp Register ..... 3616
35.5.14 DSADCnSFTCR — Safety Control Register ..... 3617
35.5.15 DSADCnECR — Error Clear Register ..... 3618
35.5.16 DSADCnER — Error Register ..... 3619
35.5.17 DSADCnTDLVR — Pin Level Self-Diagnosis Level Register ..... 3621
35.5.18 DSADCnULTBR0/1/2/3 — Upper-Limit/Lower-Limit Table Register 0/1/2/3 ..... 3622
35.6 Operation ..... 3623
35.6.1 A/D Conversion Flow ..... 3623
35.6.2 Filter Type Setting ..... 3624
35.6.3 A/D Conversion Time ..... 3625
35.6.4 Starting an A/D Conversion by an External Trigger ..... 3629
35.6.5 Terminating an A/D Conversion by an External Trigger ..... 3630
35.6.6 Starting an A/D Conversion by a Timer Trigger ..... 3630
35.6.7 Terminating an A/D Conversion by a Timer Trigger ..... 3630
35.6.8 Switching Virtual Channels via Start and End Triggers ..... 3631
35.6.9 Calculating Correction Values by Using Calibration ..... 3633
35.6.9.1 Calibration Time ..... 3633
35.6.10 A/D Conversion Result Error Correction Processing ..... 3634
35.6.11 A/D Conversion Monitoring Function Using Monitor Pins ..... 3634
35.6.12 DMA Request Source ..... 3635
35.6.13 AD Error Interrupt Request and AD Parity Error Interrupt Request. ..... 3635
35.6.13.1 Upper-Limit/Lower-Limit Errors ..... 3636
35.6.13.2 Overwrite Error ..... 3636
35.6.13.3 ID Error ..... 3637
35.6.14 Boundary Flag Generating Signal Output Function ..... 3638
35.6.15 Timestamp Function ..... 3639
35.6.16 Wiring-Break Detection Function ..... 3641
35.6.17 Self-Diagnosis ..... 3642
35.6.17.1 Self-Diagnosis of Wiring-Break Detection Function ..... 3642
35.6.17.2 A/D Self-Diagnosis Function ..... 3643
35.6.17.3 Pin Level Self-Diagnosis Function ..... 3643
35.6.18 DFE Control ..... 3645
35.7 Usage Notes ..... 3646
35.7.1 Notes on Using Analog Input Pins ..... 3646
35.7.2 Module Standby Function ..... 3646
Section 36 Cyclic Analog to Digital Converter (CADC) ..... 3647
36.1 Features ..... 3647
36.1.1 Number of Units and Channels ..... 3647
36.1.2 Register Base Addresses ..... 3648
36.1.3 Clock Supply ..... 3648
36.1.4 Interrupt Requests ..... 3648
36.1.5 Reset Sources ..... 3648
36.1.6 External Input/Output Signals ..... 3649

37.1.4 Interrupt Requests ..... 3702
37.1.5 Reset Sources ..... 3704
37.1.6 External Input/Output Signals ..... 3704
37.2 Overview ..... 3705
37.2.1 Features ..... 3705
37.2.2 Overall Configuration ..... 3706
37.2.3 Overall Configuration of the FIFO Macro ..... 3707
37.2.4 Data Format ..... 3708
37.2.5 Filtering Circuit ..... 3709
37.2.5.1 FIR Filter ..... 3709
37.2.5.2 IIR Filter ..... 3709
37.2.6 Dispatch Circuit ..... 3710
37.2.7 Accumulation Circuit ..... 3711
37.2.8 Subtraction Circuit ..... 3711
37.2.9 Peak-Hold (PH) Circuit ..... 3711
37.2.10 Output Circuit ..... 3713
37.2.11 Intermediate Values Output Circuit ..... 3713
37.2.12 Capture Circuit ..... 3713
37.2.13 Buffer A Circuit ..... 3713
37.2.14 Buffer B Circuit ..... 3713
37.2.15 Terms ..... 3714
37.3 Control Registers ..... 3717
37.3.1 List of Registers for DFE Macro ..... 3717
37.3.2 List of Registers for the FIFO Macro ..... 3725
37.3.3 DFEjCTLACHn - Control Register A n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3726
37.3.4 DFEjCTLBCHn - Control Register B n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3729
37.3.5 DFEjDOCHn — Output Data Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3734
37.3.6 DFEjPHCHn — Peak-Hold Result Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3735
37.3.7 DFEjPHINDCHn — Peak-Hold Index Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3736
37.3.8 DFEjSTCHn - Status Register n ( $\mathrm{n}=0$ to 11, for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3738
37.3.9 DFEjCLRSTCHn — Clear Status Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3742
37.3.10 DFEjERMCHn — Error Mask Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3744
37.3.11 DFEjTRGCHn - Trigger Setting Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3745
37.3.12 DFEjTMTRGCHn - Timer Trigger Setting Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3748
37.3.13 DFEjTRHCHn - Trigger History Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3751
37.3.14 DFEjCPA to DFEjCPD - Comparison Value Setting Register ..... 3753
37.3.15 DFEjPHIA to DFEjPHID — Peak-Hold Initial Value Setting Register ..... 3754
37.3.16 DFEjACA to DFEjACD — Accumulation/Decimation Count Setting Register ..... 3755
37.3.17 DFEjDI — Software Input Data Register ..... 3756
37.3.18 DFEjTRG — Software Trigger Register ..... 3757
37.3.19 DFEjST — DFE Status Register ..... 3758
37.3.20 DFEjEST — DFE Error Status Register ..... 3759
37.3.21 DFEjPMITRG0 — Peak-Hold Mask-Start/End Timer Trigger Select Register 0 ..... 3760
37.3.22 DFEjPMITRG1 — Peak-Hold Mask-Start/End Timer Trigger Select Register 1 ..... 3762
37.3.23 DFEjPITRG — Peak-Hold Initialization/End Timer Trigger Select Register ..... 3763
37.3.24 DFEjPITRG1 — Peak-Hold Initialization/End Timer Trigger Select Register 1 ..... 3765
37.3.25 DFEjMITRG - Accumulation/Decimation Initialization/Prohibition Timer Trigger Select Register ..... 3766
37.3.26 DFEjMITRG1 — Accumulation/Decimation Initialization/Prohibition Timer Trigger Select Register 1 ..... 3768
37.3.27 DFEjFITRG — Filter Initialization Timer Trigger Select Register ..... 3769
37.3.28 DFEjFITRG1— Filter Initialization Timer Trigger Select Register 1 ..... 3771
37.3.29 DFEjPHUPDCn — Peak-Hold Update Notification Setting Register n ( $\mathrm{n}=0$ to 3 ) ..... 3772
37.3.30 DFEjHOLCHn — Intermediate Value Output Register Ln ( $\mathrm{n}=$ even channels) ..... 3773
37.3.31 DFEjHOHCHn — Intermediate Value Output Register H n (n = even channels) ..... 3774
37.3.32 DFEjHOLMCHn — Intermediate Value Output Mirror Register L n ( $\mathrm{n}=$ even channels) ..... 3775
37.3.33 DFEjGAINCHn - IIR Filter Gain Setting Register n ( $\mathrm{n}=0$ to 11 for DFE0, $\mathrm{n}=0$ to 3 for DFE1) ..... 3776
37.3.34 DFEjCPOFSTn - Comparison Offset Value Setting Register n ( $\mathrm{n}=0$ to 2 ) ..... 3778
37.3.35 DFEjPH23CCTLO - Peak-Hold 23 Common Control Register 0 ..... 3779
37.3.36 DFEjPH2CTLO — Peak-Hold 2 Control Register 0 ..... 3780
37.3.37 DFEjPH3CTLO — Peak-Hold 3 Control Register 0 ..... 3782
37.3.38 DFEjPH20 — Peak-Hold 2 Result Register 0 ..... 3784
37.3.39 DFEjPH30 — Peak-Hold 3 Result Register 0 ..... 3785
37.3.40 DFEjPH2IND0 — Peak-Hold 2 Index Register 0 ..... 3786
37.3.41 DFEjPH3IND0 — Peak-Hold 3 Index Register 0 ..... 3788
37.3.42 DFEjSUBCTLCHn — Subtraction Control Register n ( $\mathrm{n}=0$ to 2) ..... 3790
37.3.43 DFEjSUBDOCHn — Subtraction Result Register n ( $\mathrm{n}=0$ to 2) ..... 3792
37.3.44 DFEjSUBSTCHn — Subtraction Status Register n ( $\mathrm{n}=0$ to 2) ..... 3793
37.3.45 DFEjSUBCLRSTCHn — Subtraction Clear Status Register n ( $\mathrm{n}=0$ to 2) ..... 3795
37.3.46 DFEjSUBERMCHn — Subtraction Error Mask Register n ( $\mathrm{n}=0$ to 2 ) ..... 3796
37.3.47 DFEjSUBTRGCHn — Subtraction Trigger Setting Register $n(n=0$ to 2 ) ..... 3797
37.3.48 DFEjSUBTRHCHn — Subtraction Trigger History Register n ( $\mathrm{n}=0$ to 2 ) ..... 3799
37.3.49 DFEjSUBTRG0 — Subtraction Start/End Timer Trigger Select Register 0 ..... 3800
37.3.50 DFEjCAPCTLCHn - Capture Control Register $n(n=0$ to 2 ) ..... 3801
37.3.51 DFEjCAPDOCHn — Capture Result Register n ( $\mathrm{n}=0$ to 2 ) ..... 3802
37.3.52 DFEjCAPSTCHn — Capture Status Register n ( $\mathrm{n}=0$ to 2 ) ..... 3803
37.3.53 DFEjCAPCLRSTCHn — Capture Clear Status Register $n(n=0$ to 2 ) ..... 3804
37.3.54 DFEjCAPERMCHn — Capture Error Mask Register n ( $\mathrm{n}=0$ to 2 ) ..... 3805
37.3.55 DFBFACCTL — Buffer A Common Control Register ..... 3806
37.3.56 DFBFACTLCHn — Buffer A Control Register n ( $\mathrm{n}=0$ to 5) ..... 3807
37.3.57 DFBFADOCHn — Buffer A Output Register n ( $\mathrm{n}=0$ to 5) ..... 3808
37.3.58 DFBFACLR — Buffer A Clear Register ..... 3811
37.3.59 DFBFACST — Buffer A Common Status Register ..... 3812
37.3.60 DFBFBCTL — Buffer B Control Register ..... 3813
37.3.61 DFBFBDO — Buffer B Output Register ..... 3814
37.3.62 DFBFBCLR — Buffer B Clear Register ..... 3815
37.3.63 DFBFBST — Buffer B Status Register ..... 3816
37.4 Operation ..... 3817
37.4.1 Overview of Operation ..... 3817
37.4.1.1 DFE Macro ..... 3817
37.4.1.2 FIFO Macro ..... 3819
37.4.2 Operating Procedures ..... 3821
37.4.2.1 Channel Start Procedure ..... 3821
37.4.2.2 Channel Stop Procedure ..... 3824
37.4.2.3 Error Processing Procedure ..... 3826
37.5 Details ..... 3831
37.5.1 Data Flow ..... 3831
37.5.1.1 DFE Macro ..... 3831
37.5.1.2 FIFO Macro ..... 3832
37.5.2 Address Map ..... 3833
37.5.2.1 DFE Macro ..... 3833
37.5.2.2 FIFO Macro ..... 3833
37.5.3 Memory ..... 3834
37.5.4 Format of Coefficient Memory ..... 3835
37.5.5 Format of Data Memory ..... 3836
37.5.6 Setting Control Registers ..... 3837
37.5.6.1 FIR (Fixed-Point) ..... 3837
37.5.6.2 FIR (Integer) ..... 3838
37.5.6.3 IIR (Fixed-Point) ..... 3839
37.5.7 Trigger Control ..... 3840
37.5.7.1 Timer Trigger Input ..... 3840
37.5.7.2 Trigger Flag Functions ..... 3844
37.5.7.3 Trigger Flag Functions and Processing ..... 3848
37.5.7.4 Automatic Initialization of the Channel ..... 3849
37.5.8 Input Data Control ..... 3851
37.5.8.1 AD Input ..... 3851
37.5.8.2 Cascade Input ..... 3851
37.5.8.3 Software Input ..... 3853
37.5.8.4 Dispatch ..... 3853
37.5.9 Filtering Circuit ..... 3855
37.5.9.1 $\operatorname{FIR}(8,16,24,32$ Taps) ..... 3855
37.5.9.2 FIR (64 Taps) ..... 3857
37.5.9.3 One-Stage IIR ..... 3858
37.5.9.4 Two-Stage IIR ..... 3860
37.5.9.5 Three-Stage IIR ..... 3862
37.5.9.6 Errors in the Filtering Circuit ..... 3864
37.5.10 Accumulation Circuit ..... 3864
37.5.10.1 Absolute Value Calculation ..... 3864
37.5.10.2 Summary of Accumulation Processing ..... 3864
37.5.10.3 Operation of Accumulation Processing ..... 3865
37.5.10.4 Operation of Accumulation Processing (with Trigger Flag) ..... 3867
37.5.10.5 Summary of Decimation Processing ..... 3869
37.5.10.6 Operation for Decimation Processing ..... 3869
37.5.10.7 Operation of Decimation Processing (with Trigger Flag) ..... 3871
37.5.11 Subtraction Circuit ..... 3873
37.5.11.1 Summary of the Subtraction Circuit ..... 3874
37.5.11.2 Operation of the Subtraction Circuit ..... 3875
37.5.11.3 Operation of Subtraction Circuit (with Subtraction Start Trigger) ..... 3880
37.5.11.4 Operation of Subtraction Circuit (with Subtraction End Trigger) ..... 3881
37.5.11.5 Operation of Subtraction Circuit (Stop by DFEjSUBCTLCHn.SEN) ..... 3882
37.5.12 Peak-Hold Circuit ..... 3884
37.5.12.1 Summary of Peak-Hold Processing ..... 3884
37.5.12.2 Operation of Peak-Hold Processing ..... 3885
37.5.12.3 Operation of Peak-Hold Processing (Trigger Flag is Enabled) ..... 3887
37.5.12.4 Operation of Peak-Hold Mask Processing (Trigger Flag is Enable) ..... 3889
37.5.12.5 Operation of Comparison Processing ..... 3891
37.5.12.6 Operation of the Peak-Hold Index Register ..... 3892
37.5.12.7 Reading of the Peak-Hold Index Register and Operation ..... 3894
37.5.12.8 Operation When Both Peak-Hold Processing and Comparison Processing Are Executed ..... 3896
37.5.12.9 Summary of Peak-Hold-23 Processing ..... 3898
37.5.12.10 Operation of Peak-Hold-23 Function ..... 3899
37.5.12.11 Operation of the Peak-Hold Index Register When Peak-Hold-23 is Enabled ..... 3906
37.5.12.12 Status of Peak-Hold-23 Function ..... 3906
37.5.12.13 Operation of Peak-Hold-23 Function (Trigger Flag is enable) ..... 3907
37.5.12.14 Setting Example of Peak-Hold-23 Function ..... 3908
37.5.13 Output Circuit ..... 3910
37.5.13.1 Floating-Point Conversion Circuit ..... 3910
37.5.13.2 Output Register Circuit ..... 3910
37.5.13.3 Floating Point Conversion Circuits for the Intermediate Value Output Registers L and H ..... 3910
37.5.13.4 Intermediate Value Output Register Circuits ..... 3910
37.5.14 Capture Circuit ..... 3911
37.5.14.1 Summary of Capture Circuit ..... 3911
37.5.15 Buffer A Circuit ..... 3912
37.5.15.1 Summary of Buffer A Circuit ..... 3912
37.5.15.2 Operation of Output Data Register Enable Flag and Buffer A Data Update Flag ..... 3913
37.5.15.3 Initialization of the Buffer A Circuit ..... 3914
37.5.15.4 Overwriting of FIFO When There is an Overflow ..... 3914
37.5.16 Buffer B Circuit ..... 3915
37.5.16.1 Summary of Buffer B Circuit ..... 3915
37.5.16.2 Operation of Output Data Register Enable Flag ..... 3916
37.5.16.3 Initialization for Buffer B Circuit ..... 3916
37.5.17 Status Register ..... 3917
37.5.17.1 Conditions for Setting and Clearing the DOEN Flag ..... 3918
37.5.18 Error Mask Registers ..... 3920
37.5.19 Subtraction Status Register ..... 3920
37.5.20 Subtraction Error Mask Registers ..... 3921
37.5.21 Capture Status Register ..... 3921
37.5.22 Capture Error Mask Register ..... 3921
37.5.23 Buffer A Status Register ..... 3922
37.5.24 Buffer A Clear Register ..... 3922
37.5.25 Buffer B Status Register ..... 3922
37.5.26 Buffer B Clear Register ..... 3922
37.5.27 Interrupt Requests ..... 3923
37.5.27.1 DFE Macro ..... 3923
37.5.27.2 FIFO Macro ..... 3930
37.6 Notes and Restrictions ..... 3932
37.6.1 Processing Time ..... 3932
37.6.1.1 Processing Time for One Channel ..... 3932
37.6.1.2 Termination Processing Time ..... 3932
37.6.2 DFE Activation Input Interval ..... 3932
37.6.2.1 DFE Processing Time ..... 3933
37.6.3 Trigger Input ..... 3934
37.6.4 Channel Tag and AD Tag ..... 3935
37.6.5 Input Data Format and Calculation Restrictions ..... 3935
37.6.6 Restrictions on Cascade Processing ..... 3935
37.6.7 Operation when the Given Channel is Disabled ..... 3936
37.6.7.1 Channel Enable Bits and Invalidation ..... 3936
37.6.8 Restrictions on FIR 64TAP ..... 3937
37.6.9 Restrictions on Memory Access ..... 3937
37.6.10 Restrictions on Trigger Setting Registers ..... 3937
37.6.11 Setting of Peak-Hold Processing Disable Bit and Accumulation/Decimation Processing Disable Bit ..... 3937
37.6.12 Controlling Control Registers $A$ and $B$ ..... 3937
37.6.13 Controlling the Peak-Hold Index Registers ..... 3938
37.6.14 Restrictions on the Intermediate Value Output Registers ..... 3938
37.6.15 Restrictions on Subtraction Circuit ..... 3938
37.6.16 Restrictions on Buffer A Circuit ..... 3939
37.6.16.1 Restrictions on FIFO Channels In Use ..... 3939
37.6.16.2 Notes about Read Regsiters ..... 3939
37.6.16.3 Notes about Buffer A Capture Interrupt Request ..... 3939
37.6.17 Restrictions on Buffer B Circuit ..... 3940
37.6.17.1 Notes Concerning the Buffer B Capture Interrupt Request ..... 3940
37.6.17.2 Restrictions on Buffer B Circuit when both Buffer A and Buffer B are in Use ..... 3940
37.6.18 Note on Using Automatic Channel Initialization ..... 3940
37.6.19 Restrictions on Using Peak-Hold Mask Function ..... 3940
37.6.20 Restrictions on Using Peak-Hold Function ..... 3941
Section 38 Functional Safety ..... 3942
38.1 Overview ..... 3942
38.2 Reset Sources ..... 3943
38.3 ECC and EDC ..... 3944
38.3.1 Overview ..... 3944
38.3.1.1 ECC ..... 3944
38.3.1.2 Address Parity ..... 3945
38.3.1.3 Address Feedback ..... 3945
38.3.2 Key Code Protection for ECC Control Registers ..... 3946
38.3.2.1 Overview ..... 3946
38.3.2.2 List of Registers ..... 3946
38.3.2.3 KCPROT - ECC Control Key Code Protection Register ..... 3946
38.3.3 Code Flash ECC and Address Parity ..... 3947
38.3.3.1 Overview ..... 3947
38.3.3.2 Register Base Address ..... 3948
38.3.3.3 List of Registers ..... 3949
38.3.3.4 CFPECCCTL - ECC Control Register ..... 3950
38.3.3.5 CFPECCTSTCTL — ECC Test Control Register ..... 3951
38.3.3.6 CFCAPCTL — Address Parity Control Register ..... 3952
38.3.3.7 CFSECCCTL - ECC Control Register ..... 3953
38.3.3.8 CFSECCTSTCTL — ECC Test Control Register ..... 3954
38.3.3.9 CF ERRINT - Error Notification Control Register ..... 3955
38.3.3.10 CF SSTCLR - 1-bit Error Status Clear Register ..... 3956
38.3.3.11 CF_DSTCLR — Fatal Error Status Clear Register ..... 3957
38.3.3.12 CF_OVFCLR - 1-bit Error Overflow Status Clear Register ..... 3958
38.3.3.13 CF_SERSTR - 1-bit Error Status Register ..... 3959
38.3.3.14 CF_DERSTR — Fatal Error Status Register ..... 3960
38.3.3.15 CF_OVFSTR — 1-bit Error Overflow Status Register ..... 3961
38.3.3.16 CF_SERINF - 1-bit Error Location Information Register ..... 3962
38.3.3.17 CF_nSEADR — n-th 1-bit Error Address Register ( $\mathrm{n}=00$ to 03) ..... 3963
38.3.3.18 CF_00DEADR — 1st Fatal Error Address Register ..... 3964
38.3.3.19 Test Function ..... 3965
38.3.4 Data Flash ECC ..... 3966
38.3.4.1 Overview ..... 3966
38.3.4.2 List of Registers ..... 3966
38.3.4.3 DFECCCTL — Data Flash ECC Control Register ..... 3967
38.3.4.4 DFERSTR — Data Flash Error Status Register ..... 3968
38.3.4.5 DFERSTC - Data Flash Error Status Clear Register ..... 3969
38.3.4.6 DFOVFSTR — Data Flash Error Overflow Status Register ..... 3970
38.3.4.7 DFOVFSTC - Data Flash Error Overflow Status Clear Register ..... 3971
38.3.4.8 DFERRINT — Data Flash Error Notification Control Register ..... 3972
38.3.4.9 DFEADR — Data Flash 1st Error Address Register ..... 3973
38.3.4.10 DFTSTCTL — Data Flash Test Control Register ..... 3974
38.3.4.11 DFKCPROT — Data Flash ECC Key Code Protection Register ..... 3975
38.3.4.12 Test Function ..... 3976
38.3.5 Local RAM ECC and Address Feedback ..... 3977
38.3.5.1 Overview ..... 3977
38.3.5.2 Register Base Address ..... 3979
38.3.5.3 List of Registers ..... 3979
38.3.5.4 LRECCCTL - ECC Control Register ..... 3981
38.3.5.5 LRECCTSTCTL — ECC Test Control Register ..... 3982
38.3.5.6 LRAFINV — Address Feedback Test Control Register ..... 3983
38.3.5.7 LRTDATBFECCF - ECC Read Buffer Register ..... 3984
38.3.5.8 LRO_ERRINT - Error Notification Control Register ..... 3985
38.3.5.9 LRO_SSTCLR — 1-bit Error Status Clear Register ..... 3986
38.3.5.10 LRO_DSTCLR — Fatal Error Status Clear Register ..... 3987
38.3.5.11 LRO_OVFCLR — 1-bit Error Overflow Status Clear Register ..... 3988
38.3.5.12 LRO_SERSTR - 1-bit Error Status Register ..... 3989
38.3.5.13 LRO_DERSTR — Fatal Error Status Register ..... 3990
38.3.5.14 LRO_OVFSTR — 1-bit Error Overflow Status Register ..... 3991
38.3.5.15 LRO_SERINF — 1-bit Error Location Information Register ..... 3992
38.3.5.16 LRO_nSEADR — n-th 1-bit Error Address Register ( $\mathrm{n}=00$ to 07) ..... 3993
38.3.5.17 LRO_00DEADR — 1st Fatal Error Address Register ..... 3994
38.3.5.18 LR1_ERRINT — Error Notification Control Register ..... 3995
38.3.5.19 LR1_SSTCLR - 1-bit Error Status Clear Register ..... 3996
38.3.5.20 LR1_DSTCLR — Fatal Error Status Clear Register ..... 3997
38.3.5.21 LR1_OVFCLR — 1-bit Error Overflow Status Clear Register ..... 3998
38.3.5.22 LR1_SERSTR - 1-bit Error Status Register ..... 3999
38.3.5.23 LR1_DERSTR — Fatal Error Status Register ..... 4000
38.3.5.24 LR1_OVFSTR — 1-bit Error Overflow Status Register ..... 4001
38.3.5.25 LR1_SERINF - 1-bit Error Location Information Register ..... 4002
38.3.5.26 LR1_nSEADR — n-th 1-bit Error Address Register ( $\mathrm{n}=00$ to 07) ..... 4003
38.3.5.27 LR1_00DEADR — 1st Fatal Error Address Register ..... 4004
38.3.5.28 Test Function ..... 4005
38.3.6 Cluster RAM ECC and Address Feedback ..... 4007
38.3.6.1 Overview ..... 4007
38.3.6.2 Register Base Address ..... 4008
38.3.6.3 List of Registers ..... 4009
38.3.6.4 CRCAFCTL — Address Feedback Control Register ..... 4010
38.3.6.5 CRCECCTSTCTL - ECC Test Control Register ..... 4011
38.3.6.6 CRCAFINV — Address Feedback Test Control Register ..... 4012
38.3.6.7 CRCTDATBFECCF - ECC Read Buffer Register ..... 4013
38.3.6.8 CRAECCCTL — ECC Control Register. ..... 4014
38.3.6.9 CR_ERRINT — Error Notification Control Register ..... 4015
38.3.6.10 CR_SSTCLR — 1-bit Error Status Clear Register ..... 4016
38.3.6.11 CR_DSTCLR — Fatal Error Status Clear Register ..... 4017
38.3.6.12 CR_OVFCLR - 1-bit Error Overflow Status Clear Register ..... 4018
38.3.6.13 CR_SERSTR - 1-bit Error Status Register ..... 4019
38.3.6.14 CR_DERSTR — Fatal Error Status Register ..... 4020
38.3.6.15 CR_OVFSTR — 1-bit Error Overflow Status Register ..... 4021
38.3.6.16 CR_SERINF - 1-bit Error Location Information Register. ..... 4022
38.3.6.17 CR_nSEADR — n-th 1-bit Error Address Register (n = 00 to 07) ..... 4023
38.3.6.18 CR_00DEADR — 1st Fatal Error Address Register ..... 4025
38.3.6.19 Test Function ..... 4027
38.3.7 Instruction Cache EDC and Address Feedback ..... 4029
38.3.7.1 Overview ..... 4029
38.3.7.2 Register Base Address ..... 4030
38.3.7.3 List of Registers ..... 4031
38.3.7.4 ITECCCTL — ECC Control Register ..... 4032
38.3.7.5 ITAFINV — Address Feedback Test Control Register ..... 4033
38.3.7.6 IDECCCTL — ECC Control Register. ..... 4034
38.3.7.7 IDAFINV — Address Feedback Test Control Register ..... 4035
38.3.7.8 IT_ERRINT - Error Notification Control Register. ..... 4036
38.3.7.9 IT_SSTCLR — 1-bit Error Status Clear Register ..... 4037
38.3.7.10 IT_DSTCLR — Fatal Error Status Clear Register ..... 4038
38.3.7.11 IT_OVFCLR — 1-bit Error Overflow Status Clear Register ..... 4039
38.3.7.12 IT_SERSTR - 1-bit Error Status Register ..... 4040
38.3.7.13 IT_DERSTR — Fatal Error Status Register ..... 4041
38.3.7.14 IT_OVFSTR — 1-bit Error Overflow Status Register ..... 4042
38.3.7.15 IT_SERINF - 1-bit Error Location Information Register. ..... 4043
38.3.7.16 IT_O0SEADR — 1st 1-bit Error Address Register ..... 4044
38.3.7.17 IT_OODEADR — 1st Fatal Error Address Register ..... 4045
38.3.7.18 ID_ERRINT - Error Notification Control Register ..... 4046
38.3.7.19 ID_SSTCLR - 1-bit Error Status Clear Register ..... 4047
38.3.7.20 ID_DSTCLR — Fatal Error Status Clear Register ..... 4048
38.3.7.21 ID_OVFCLR — 1-bit Error Overflow Status Clear Register ..... 4049
38.3.7.22 ID_SERSTR - 1-bit Error Status Register ..... 4050
38.3.7.23 ID_DERSTR — Fatal Error Status Register ..... 4051
38.3.7.24 ID_OVFSTR - 1-bit Error Overflow Status Register ..... 4052
38.3.7.25 ID_SERINF - 1-bit Error Location Information Register ..... 4053
38.3.7.26 ID_00SEADR — 1st 1-bit Error Address Register. ..... 4054
38.3.7.27 ID_00DEADR — 1st Fatal Error Address Register ..... 4055
38.3.7.28 Test Function ..... 4056
38.3.8 sDMAC/DTS RAM ECC and Address Feedback ..... 4057
38.3.8.1 Overview ..... 4057
38.3.8.2 Register Base Address ..... 4059
38.3.8.3 List of Registers ..... 4059
38.3.8.4 DRECCCTL - ECC Control Register ..... 4061
38.3.8.5 DRECCTSTCTL — ECC Test Control Register ..... 4062
38.3.8.6 DRAFINV — Address Feedback Test Control Register ..... 4063
38.3.8.7 DRECCTSTDIN0 - Test Data Input Register ..... 4064
38.3.8.8 DRECCTSTEIN — Test ECC Input Register ..... 4065
38.3.8.9 DRTDATBFDATAF0 — Data Read Buffer Register ..... 4066
38.3.8.10 DRTDATBFECCF - ECC Read Buffer Register ..... 4067
38.3.8.11 DEECCCTL - ECC Control Register ..... 4068
38.3.8.12 DEECCTSTCTL — ECC Test Control Register ..... 4069
38.3.8.13 DEECCTSTDIN0 - Test Data Input Register ..... 4070
38.3.8.14 DEECCTSTEIN - Test ECC Input Register ..... 4071
38.3.8.15 DETDATBFDATAF0 — Data Read Buffer Register ..... 4072
38.3.8.16 DETDATBFECCF - ECC Read Buffer Register ..... 4073
38.3.8.17 DAECCCTL - ECC Control Register ..... 4074
38.3.8.18 DAECCTSTCTL — ECC Test Control Register ..... 4075
38.3.8.19 DAECCTSTDIN0 - Test Lower Data Input Register ..... 4076
38.3.8.20 DAECCTSTDIN1 - Test Upper Data Input Register ..... 4077
38.3.8.21 DAECCTSTEIN - Test ECC Input Register ..... 4078
38.3.8.22 DATDATBFDATAF0 — Lower Data Read Buffer Register ..... 4079
38.3.8.23 DATDATBFDATAF1 — Upper Data Read Buffer Register ..... 4080
38.3.8.24 DATDATBFECCF - ECC Read Buffer Register ..... 4081
38.3.8.25 DR_ERRINT - Error Notification Control Register ..... 4082
38.3.8.26 DR_SSTCLR — 1-bit Error Status Clear Register ..... 4083
38.3.8.27 DR_DSTCLR — Fatal Error Status Clear Register ..... 4084
38.3.8.28 DR_OVFCLR — 1-bit Error Overflow Status Clear Register ..... 4085
38.3.8.29 DR_SERSTR — 1-bit Error Status Register ..... 4086
38.3.8.30 DR_DERSTR — Fatal Error Status Register ..... 4087
38.3.8.31 DR_OVFSTR — 1-bit Error Overflow Status Register ..... 4088
38.3.8.32 DR_SERINF - 1-bit Error Location Information Register. ..... 4089
38.3.8.33 DR_00SEADR - 1st 1-bit Error Address Register ..... 4090
38.3.8.34 DR_00DEADR — 1st Fatal Error Address Register ..... 4091
38.3.8.35 DE_ERRINT — Error Notification Control Register ..... 4092
38.3.8.36 DE_SSTCLR — 1-bit Error Status Clear Register ..... 4093
38.3.8.37 DE_DSTCLR — Fatal Error Status Clear Register ..... 4094
38.3.8.38 DE_OVFCLR - 1-bit Error Overflow Status Clear Register ..... 4095
38.3.8.39 DE_SERSTR - 1-bit Error Status Register ..... 4096
38.3.8.40 DE_DERSTR — Fatal Error Status Register ..... 4097
38.3.8.41 DE_OVFSTR — 1-bit Error Overflow Status Register. ..... 4098
38.3.8.42 DE_SERINF - 1-bit Error Location Information Register ..... 4099
38.3.8.43 DE_00SEADR — 1st 1-bit Error Address Register ..... 4100
38.3.8.44 DE_00DEADR — 1st Fatal Error Address Register ..... 4101
38.3.8.45 DA_ERRINT — Error Notification Control Register ..... 4102
38.3.8.46 DA_SSTCLR — 1-bit Error Status Clear Register ..... 4103
38.3.8.47 DA_DSTCLR — Fatal Error Status Clear Register ..... 4104
38.3.8.48 DA_OVFCLR - 1-bit Error Overflow Status Clear Register ..... 4105
38.3.8.49 DA_SERSTR - 1-bit Error Status Register ..... 4106
38.3.8.50 DA_DERSTR — Fatal Error Status Register ..... 4107
38.3.8.51 DA_OVFSTR — 1-bit Error Overflow Status Register ..... 4108
38.3.8.52 DA_SERINF - 1-bit Error Location Information Register ..... 4109
38.3.8.53 DA_00SEADR - 1st 1-bit Error Address Register ..... 4110
38.3.8.54 DA_00DEADR — 1st Fatal Error Address Register ..... 4111
38.3.8.55 Test Function ..... 4112
38.3.9 ECC for Peripheral RAM (32 Bits) ..... 4113
38.3.9.1 Overview ..... 4113
38.3.9.2 List of Registers ..... 4115
38.3.9.3 E710CTL - ECC Control Register ..... 4117
38.3.9.4 E710TMC - ECC Test Mode Control Register ..... 4119
38.3.9.5 E710TED - ECC Encoder and Decoder Data Test Register ..... 4121
38.3.9.6 E710TRC - ECC Redundant Bit Data Control Test Register ..... 4122
38.3.9.7 ECSYND - ECC Decoder Syndrome Data Register ..... 4123
38.3.9.8 ECHORD - ECC 7-Bit Redundant Data Holding Test Register ..... 4124
38.3.9.9 ECECRD - ECC Encoder Test Register. ..... 4125
38.3.9.10 ECERDB - ECC Redundant Bit Input and Output Substitution Buffer Register. ..... 4126
38.3.9.11 E710EAD - ECC Error Address Register ..... 4127
38.3.9.12 ETCTXECCCTL— Ethernet TX RAM ECC Control Register ..... 4128
38.3.9.13 ETCRXECCCTL— Ethernet RX RAM ECC Control Register ..... 4129
38.3.9.14 Notification to ECM ..... 4130
38.3.9.15 Test Function ..... 4130
38.3.10 ECC for Peripheral RAM (16 Bits) ..... 4131
38.3.10.1 Overview ..... 4131
38.3.10.2 List of Registers ..... 4132
38.3.10.3 E610CTL - ECC Control Register ..... 4133
38.3.10.4 E610TMC - ECC Test Mode Control Register ..... 4135
38.3.10.5 E610TED - ECC Encoder and Decoder Data Test Register ..... 4137
38.3.10.6 ECEDB - ECC Encoder and Decoder Data Input and Output Substitution Buffer Register ..... 4138
38.3.10.7 ECRIDM - ECC Redundant Bit Input Data Monitoring Register ..... 4138
38.3.10.8 ECERDB - ECC Redundant Bit Input and Output Substitution Buffer Register. ..... 4139
38.3.10.9 E610TRC - ECC Redundant Bit Data Control Test Register ..... 4139
38.3.10.10 ECSYND - ECC Decoder Syndrome Data Register ..... 4140
38.3.10.11 ECHORD - ECC 6-Bit Redundant Data Holding Test Register ..... 4140
38.3.10.12 ECECRD - ECC Encoder Test Register. ..... 4141
38.3.10.13 ECRODM — ECC Redundant Bit Output Data Monitoring Register ..... 4141
38.3.10.14 E610EAD - ECC Error Address Register ..... 4142
38.3.10.15 Notification to ECM ..... 4143
38.3.10.16 Test Function ..... 4143
38.3.11 Safety Mechanism on Data Transfer Path ..... 4144
38.3.11.1 Overview ..... 4144
38.3.11.2 Register Base Address ..... 4145
38.3.11.3 List of Registers ..... 4148
38.3.11.4 BUSAECCCTL — ECC Control Register ..... 4156
38.3.11.5 BUSAECCTSTCTL - ECC Test Control Register ..... 4157
38.3.11.6 BUSAECCTSTDINO - Test Data Input Register ..... 4158
38.3.11.7 BUSAECCTSTEIN - Test ECC Input Register ..... 4159
38.3.11.8 BUSDVCECCCTL — ECC Control Register ..... 4160
38.3.11.9 BUSDVCECCTSTCTL — ECC Test Control Register ..... 4161
38.3.11.10 BUSDVCECCTSTDIN0 - Test Data Input Register ..... 4162
38.3.11.11 BUSDVCECCTSTEIN - Test ECC Input Register ..... 4163
38.3.11.12 BUSDV1ECCCTL - ECC Control Register ..... 4164
38.3.11.13 BUSDV1ECCTSTCTL — ECC Test Control Register ..... 4165
38.3.11.14 BUSDV1ECCTSTDIN0 - Test Data Input Register ..... 4166
38.3.11.15 BUSDV1ECCTSTEIN - Test ECC Input Register ..... 4167
38.3.11.16 BUSDEMECCCTL — ECC Control Register ..... 4168
38.3.11.17 BUSDEMECCTSTCTL - ECC Test Control Register ..... 4169
38.3.11.18 BUSDEMECCTSTDIN0 - Test Data Input Register ..... 4170
38.3.11.19 BUSDEMECCTSTEIN — Test ECC Input Register ..... 4171
38.3.11.20 BUSDDEECCCTL - ECC Control Register ..... 4172
38.3.11.21 BUSDDEECCTSTCTL — ECC Test Control Register ..... 4173
38.3.11.22 BUSDDEECCTSTDIN0 - Test Data Input Register ..... 4174
38.3.11.23 BUSDDEECCTSTDIN1 — Test Data Input Register ..... 4175
38.3.11.24 BUSDDEECCTSTEIN - Test ECC Input Register ..... 4176
38.3.11.25 BUSDECCCTL - ECC Control Register ..... 4177
38.3.11.26 LR_BUSERRINT — Error Notification Control Register ..... 4178
38.3.11.27 LR_BUSASSTCLR — Address 1-bit Error Status Clear Register ..... 4179
38.3.11.28 LR_BUSADSTCLR — Address 2-bit Error Status Clear Register. ..... 4180
38.3.11.29 LR_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4181
38.3.11.30 LR_BUSDDSTCLR — Data 2-bit Error Status Clear Register ..... 4182
38.3.11.31 LR_BUSASERSTR — Address 1-bit Error Status Register ..... 4183
38.3.11.32 LR_BUSADERSTR — Address 2-bit Error Status Register ..... 4184
38.3.11.33 LR_BUSDSERSTR — Data 1-bit Error Status Register ..... 4185
38.3.11.34 LR_BUSDDERSTR — Data 2-bit Error Status Register ..... 4186
38.3.11.35 CR_BUSERRINT — Error Notification Control Register ..... 4187
38.3.11.36 CR_BUSASSTCLR — Address 1-bit Error Status Clear Register ..... 4188
38.3.11.37 CR_BUSADSTCLR — Address 2-bit Error Status Clear Register ..... 4189
38.3.11.38 CR_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4190
38.3.11.39 CR_BUSDDSTCLR — Data 2-bit Error Status Clear Register. ..... 4191
38.3.11.40 CR_BUSASERSTR — Address 1-bit Error Status Register ..... 4192
38.3.11.41 CR_BUSADERSTR — Address 2-bit Error Status Register ..... 4193
38.3.11.42 CR_BUSDSERSTR — Data 1-bit Error Status Register. ..... 4194
38.3.11.43 CR_BUSDDERSTR — Data 2-bit Error Status Register. ..... 4195
38.3.11.44 CF_BUSERRINT — Error Notification Control Register ..... 4196
38.3.11.45 CF_BUSASSTCLR — Address 1-bit Error Status Clear Register. ..... 4197
38.3.11.46 CF_BUSADSTCLR — Address 2-bit Error Status Clear Register ..... 4198
38.3.11.47 CF_BUSASERSTR — Address 1-bit Error Status Register ..... 4199
38.3.11.48 CF_BUSADERSTR — Address 2-bit Error Status Register ..... 4200
38.3.11.49 PH_BUSERRINT — Error Notification Control Register ..... 4201
38.3.11.50 PH_BUSASSTCLR — Address 1-bit Error Status Clear Register ..... 4202
38.3.11.51 PH_BUSADSTCLR — Address 2-bit Error Status Clear Register ..... 4203
38.3.11.52 PH_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4204
38.3.11.53 PH_BUSDDSTCLR — Data 2-bit Error Status Clear Register ..... 4205
38.3.11.54 PH_BUSASERSTR — Address 1-bit Error Status Register ..... 4206
38.3.11.55 PH_BUSADERSTR — Address 2-bit Error Status Register ..... 4207
38.3.11.56 PH_BUSDSERSTR — Data 1-bit Error Status Register ..... 4208
38.3.11.57 PH_BUSDDERSTR — Data 2-bit Error Status Register ..... 4209
38.3.11.58 DM_BUSERRINT - Error Notification Control Register ..... 4210
38.3.11.59 DM_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4211
38.3.11.60 DM_BUSDDSTCLR — Data 2-bit Error Status Clear Register ..... 4212
38.3.11.61 DM_BUSDSERSTR — Data 1-bit Error Status Register. ..... 4213
38.3.11.62 DM_BUSDDERSTR — Data 2-bit Error Status Register ..... 4214
38.3.11.63 EM_BUSERRINT — Error Notification Control Register ..... 4215
38.3.11.64 EM_BUSASSTCLR — Address 1-bit Error Status Clear Register ..... 4216
38.3.11.65 EM_BUSADSTCLR — Address 2-bit Error Status Clear Register ..... 4217
38.3.11.66 EM_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4218
38.3.11.67 EM_BUSDDSTCLR — Data 2-bit Error Status Clear Register ..... 4219
38.3.11.68 EM_BUSASERSTR — Address 1-bit Error Status Register ..... 4220
38.3.11.69 EM_BUSADERSTR — Address 2-bit Error Status Register ..... 4221
38.3.11.70 EM_BUSDSERSTR — Data 1-bit Error Status Register ..... 4222
38.3.11.71 EM_BUSDDERSTR — Data 2-bit Error Status Register. ..... 4223
38.3.11.72 APECECCCTL - ECC Control Register ..... 4224
38.3.11.73 APECERRINT - Error Notification Control Register ..... 4225
38.3.11.74 APECSTCLR - Error Status Clear Register ..... 4226
38.3.11.75 APEC1STERSTR — Error Status Register ..... 4227
38.3.11.76 APECTSTCTL — ECC Test Control Register ..... 4228
38.3.11.77 APECTSTDIN0 - Test Data Input Register ..... 4229
38.3.11.78 APECTSTEIN - Test ECC Input Register. ..... 4230
38.3.11.79 APECKCPROT — Key Code Protection Register ..... 4231
38.3.11.80 PHC_BUSERRINT - Error Notification Control Register ..... 4232
38.3.11.81 PHC_BUSASSTCLR — Address 1-bit Error Status Clear Register ..... 4233
38.3.11.82 PHC_BUSADSTCLR — Address 2-bit Error Status Clear Register. ..... 4234
38.3.11.83 PHC_BUSDSSTCLR — Data 1-bit Error Status Clear Register ..... 4235
38.3.11.84 PHC_BUSDDSTCLR — Data 2-bit Error Status Clear Register ..... 4236
38.3.11.85 PHC_BUSASERSTR — Address 1-bit Error Status Register ..... 4237
38.3.11.86 PHC_BUSADERSTR — Address 2-bit Error Status Register ..... 4238
38.3.11.87 PHC_BUSDSERSTR — Data 1-bit Error Status Register. ..... 4239
38.3.11.88 PHC_BUSDDERSTR — Data 2-bit Error Status Register ..... 4240
38.3.11.89 HBECECCCTL - ECC Control Register ..... 4241
38.3.11.90 HBECERRINT - Error Notification Control Register ..... 4242
38.3.11.91 HBECSTCLR - Error Status Clear Register ..... 4243
38.3.11.92 HBEC1STERSTR — Error Status Register ..... 4244
38.3.11.93 HBECTSTCTL - ECC Test Control Register ..... 4245
38.3.11.94 HBECTSTDIN0 - Test Data Input Register ..... 4246
38.3.11.95 HBECTSTEIN — Test ECC Input Register ..... 4247
38.3.11.96 HBECKCPROT — Key Code Protection Register ..... 4248
38.3.11.97 Test Function ..... 4249
38.3.12 Error Injection for ECC Function ..... 4250
38.3.12.1 Overview ..... 4250
38.3.12.2 List of Registers ..... 4250
38.3.12.3 EGDATORGn - Error Data Register. ..... 4251
38.3.12.4 EGECCCALn - 7-bit ECC Calculation Register ..... 4252
38.3.12.5 EGDATINVn - Error Injection Register ..... 4253
38.3.12.6 EGECCINVn - Error Injection Register ..... 4254
38.3.12.7 EGECC8CAL - 8-bit ECC Calculation Register ..... 4255
38.3.12.8 Usage of ERRGEN ..... 4256
38.4 Hardware Redundancy ..... 4258
38.4.1 Overview ..... 4258
38.4.2 List of Registers ..... 4258
38.4.3 DTS_COMP_CNTRL — Error Injection Control Register ..... 4259
38.4.4 Usage Note ..... 4260
38.5 Memory Protection ..... 4261
38.5.1 Overview ..... 4261
38.5.2 SPID ..... 4263
38.5.2.1 Overview ..... 4263
38.5.2.2 List of Registers ..... 4266
38.5.2.3 BMnSPID — BusMaster n SPID Register ..... 4268
38.5.2.4 BMnSPIDMSK — BusMaster n SPID Mask Register ..... 4269
38.5.2.5 BMnSPIDMSKLOCK — BusMaster n SPID Mask Lock Register ..... 4270
38.5.2.6 SPIDKCPROT — SPID Key Code Protect Register ..... 4271
38.5.2.7 Usage ..... 4272
38.5.3 PEG ..... 4273
38.5.3.1 Overview ..... 4273
38.5.3.2 Register Base Address ..... 4273
38.5.3.3 List of Registers ..... 4274
38.5.3.4 PEGKCPROT — Key Code Protection Register ..... 4275
38.5.3.5 PEGPROTm — Channel Protection Control Register ..... 4276
38.5.3.6 PEGSPIDm - Channel SPID Setting Register ..... 4277
38.5.3.7 PEGBADm - Channel Base Address Setting Register ..... 4278
38.5.3.8 PEGADVm - Channel Valid Bit Setting Register ..... 4279
38.5.3.9 PEGERRCLR - Guard Error Clear Register ..... 4280
38.5.3.10 PEGERRSTAT - Guard Error Status Register ..... 4281
38.5.3.11 PEGERRADDR — Guard Error Address Register ..... 4282
38.5.3.12 PEGERRTYPE - Guard Error Access Information Register ..... 4283
38.5.4 CRG ..... 4284
38.5.4.1 Overview ..... 4284
38.5.4.2 Register Base Address ..... 4284
38.5.4.3 List of Registers ..... 4285
38.5.4.4 CRGKCPROT — Key Code Protection Register ..... 4286
38.5.4.5 CRGPROTm - Channel Protection Control Register ..... 4287
38.5.4.6 CRGSPIDm — Channel SPID Setting Register ..... 4288
38.5.4.7 CRGBADm — Channel Base Address Setting Register ..... 4289
38.5.4.8 CRGADVm - Channel Valid Bit Setting Register ..... 4290
38.5.4.9 CRGERRCLR - Guard Error Clear Register ..... 4291
38.5.4.10 CRGERRSTAT - Guard Error Status Register ..... 4292
38.5.4.11 CRGERRADDR — Guard Error Address Register ..... 4293
38.5.4.12 CRGERRTYPE — Guard Error Access Information Register ..... 4294
38.5.5 INTC2 Guard ..... 4295
38.5.5.1 Overview ..... 4295
38.5.5.2 List of Registers ..... 4295
38.5.5.3 INTC2GERRCLR — Guard Error Clear Register ..... 4296
38.5.5.4 INTC2GERRSTAT — Guard Error Status Register ..... 4297
38.5.5.5 INTC2GERRADDR - Guard Error Address Register ..... 4298
38.5.5.6 INTC2GERRTYPE — Guard Error Access Information Register ..... 4299
38.5.5.7 INTC2GKCPROT - Key Code Protection Register ..... 4300
38.5.5.8 INTC2GMPIDn — SPID Setting Register ..... 4301
38.5.5.9 INTC2GPROT_m/GR — Channel/INTC2 Protection Control Register ..... 4302
38.5.6 DTS Guard ..... 4303
38.5.6.1 Overview ..... 4303
38.5.6.2 List of Registers ..... 4303
38.5.6.3 DTSGERRCLR — Guard Error Clear Register ..... 4304
38.5.6.4 DTSGERRSTAT — Guard Error Status Register ..... 4305
38.5.6.5 DTSGERRADDR — Guard Error Address Register ..... 4306
38.5.6.6 DTSGERRTYPE — Guard Error Access Information Register ..... 4307
38.5.6.7 DTSGKCPROT - Key Code Protection Register. ..... 4308
38.5.6.8 DTSGMPIDn — SPID Setting Register ..... 4309
38.5.6.9 DTSGPROT_m/GR — Channel/DTS Protection Control Register ..... 4310
38.5.7 sDMAC Guard ..... 4311
38.5.7.1 Overview ..... 4311
38.5.7.2 Register Base Address ..... 4311
38.5.7.3 List of Registers ..... 4311
38.5.7.4 DMAGERRCLR - Guard Error Clear Register ..... 4312
38.5.7.5 DMAGERRSTAT — Guard Error Status Register ..... 4313
38.5.7.6 DMAGERRADDR - Guard Error Address Register ..... 4314
38.5.7.7 DMAGERRTYPE — Guard Error Access Information Register ..... 4315
38.5.7.8 DMAGKCPROT - Key Code Protection Register ..... 4316
38.5.7.9 DMAGMPIDn — SPID Setting Register ..... 4317
38.5.7.10 DMAGPROT_m/GR/DP — Channel/DMA/DMA Descriptor Protection Control Register ..... 4318
38.5.8 IBG ..... 4319
38.5.8.1 Overview ..... 4319
38.5.8.2 Register Base Address ..... 4319
38.5.8.3 List of Registers ..... 4319
38.5.8.4 IPIGERRCLR — Guard Error Clear Register ..... 4321
38.5.8.5 IPIGERRSTAT - Guard Error Status Register ..... 4322
38.5.8.6 IPIGERRADDR — Guard Error Address Register ..... 4323
38.5.8.7 IPIGERRTYPE — Guard Error Access Information Register ..... 4324
38.5.8.8 IPIGKCPROT — Key Code Protection Register ..... 4325
38.5.8.9 IPIGPROT0_n/4 - Channel/Common Protection Control Register ( $\mathrm{n}=0$ to 3 ) ..... 4326
38.5.8.10 IPIGPROT1_n/4 - Channel/Common SPID Setting Register ( $n=0$ to 3 ) ..... 4327
38.5.8.11 MEGERRCLR — Guard Error Clear Register ..... 4328
38.5.8.12 MEGERRSTAT — Guard Error Status Register ..... 4329
38.5.8.13 MEGERRADDR — Guard Error Address Register ..... 4330
38.5.8.14 MEGERRTYPE — Guard Error Access Information Register ..... 4331
38.5.8.15 MEGKCPROT - Key Code Protection Register ..... 4332
38.5.8.16 MEGPROT0_n — Channel Protection Control Register ..... 4333
38.5.8.17 MEGPROT1_n — Channel SPID Setting Register ..... 4334
38.5.8.18 BRGERRCLR - Guard Error Clear Register ..... 4335
38.5.8.19 BRGERRSTAT - Guard Error Status Register ..... 4336
38.5.8.20 BRGERRADDR — Guard Error Address Register ..... 4337
38.5.8.21 BRGERRTYPE - Guard Error Access Information Register ..... 4338
38.5.8.22 BRGKCPROT — Key Code Protection Register ..... 4339
38.5.8.23 BRGPROT0_n/16 - Channel/Common Protection Control Register ( $\mathrm{n}=0$ to 15) ..... 4340
38.5.8.24 BRGPROT1_n/16 — Channel/Common SPID Setting Register ( $\mathrm{n}=0$ to 15) ..... 4341
38.5.8.25 TPTGERRCLR — Guard Error Clear Register ..... 4342
38.5.8.26 TPTGERRSTAT — Guard Error Status Register ..... 4343
38.5.8.27 TPTGERRADDR — Guard Error Address Register ..... 4344
38.5.8.28 TPTGERRTYPE — Guard Error Access Information Register ..... 4345
38.5.8.29 TPTGKCPROT — Key Code Protection Register ..... 4346
38.5.8.30 TPTGPROT0_n — Channel Protection Control Register ..... 4347
38.5.8.31 TPTGPROT1_n — Channel SPID Setting Register ..... 4348
38.5.9 PBG ..... 4349
38.5.9.1 Overview ..... 4349
38.5.9.2 Register Base Address ..... 4354
38.5.9.3 List of Registers ..... 4354
38.5.9.4 PBGERRCLR —Guard Error Clear Register ..... 4355
38.5.9.5 PBGERRSTAT - Guard Error Status Register ..... 4356
38.5.9.6 PBGERRADDR — Guard Error Address Register ..... 4357
38.5.9.7 PBGERRTYPE — Guard Error Access Information Register ..... 4358
38.5.9.8 PBGKCPROT — Key Code Protection Register ..... 4359
38.5.9.9 PBGPROTO_m — Channel Protection Control Register. ..... 4360
38.5.9.10 PBGPROT1_m — Channel SPID Setting Register ..... 4361
38.5.10 HBG ..... 4362
38.5.10.1 Overview ..... 4362
38.5.10.2 Register Base Address ..... 4362
38.5.10.3 List of Registers ..... 4362
38.5.10.4 HBGERRCLR — Guard Error Clear Register ..... 4363
38.5.10.5 HBGERRSTAT — Guard Error Status Register ..... 4364
38.5.10.6 HBGERRADDR — Guard Error Address Register ..... 4365
38.5.10.7 HBGERRTYPE - Guard Error Access Information Register ..... 4366
38.5.10.8 HBGKCPROT — Key Code Protection Register ..... 4367
38.5.10.9 HBGPROT0 - Channel Protection Control Register. ..... 4368
38.5.10.10 HBGPROT1 - Channel SPID Setting Register ..... 4369
38.6 BIST ..... 4370
38.6.1 Overview ..... 4370
38.6.2 Registers ..... 4370
38.6.2.1 Register Protection ..... 4370
38.6.2.2 List of Registers ..... 4371
38.6.2.3 Reset of Registers ..... 4372
38.6.2.4 LBISTREF1 — Logic BIST Reference Value Register 1 ..... 4373
38.6.2.5 LBISTREF2 — Logic BIST Reference Value Register 2 ..... 4374
38.6.2.6 MBISTREF1 — Memory BIST Reference Value Register 1 ..... 4375
38.6.2.7 LBISTSIG1 — Logic BIST Signature Value Register 1 ..... 4376
38.6.2.8 LBISTSIG2 — Logic BIST Signature Value Register 2 ..... 4377
38.6.2.9 MBISTSIG1 - Memory BIST Signature Value Register 1 ..... 4378
38.6.2.10 MBIST1FTAG0 - Memory BIST1 FTAG Signature Value Register 0 ..... 4379
38.6.2.11 MBIST1FTAG1 - Memory BIST1 FTAG Signature Value Register 1 ..... 4380
38.6.2.12 MBIST1FTAG2 - Memory BIST1 FTAG Signature Value Register 2 ..... 4381
38.6.2.13 BSEQOST - BIST Sequencer Status Register ..... 4382
38.6.2.14 BSEQ0STB - BIST Sequencer Inverted Status Register ..... 4383
38.6.2.15 BISTST - BIST Result Register ..... 4384
38.6.2.16 BSEQ0SEL - BIST Scenario Select Register ..... 4385
38.6.2.17 BSEQ0CTL - BIST Skip Control Register ..... 4387
38.6.3 Functions ..... 4388
38.6.3.1 BIST Execution Condition ..... 4388
38.6.3.2 BIST Result Confirmation ..... 4389
38.6.4 Operation ..... 4389
38.7 MISG ..... 4390
38.7.1 Overview ..... 4390
38.7.2 Block Diagram ..... 4391
38.7.2.1 MISG ..... 4391
38.7.2.2 Signature Generation ..... 4392
38.7.2.3 Signature Compare Unit ..... 4393
38.7.3 Functional Specifications ..... 4394
38.7.3.1 Conditions for Signature Generation ..... 4394
38.7.3.2 Automatic Signature Comparison ..... 4396
38.7.3.3 Data Counter ..... 4396
38.7.3.4 Error Notification ..... 4396
38.7.4 Register Specifications ..... 4397
38.7.4.1 Register Map ..... 4397
38.7.4.2 MISR1 - Multi Input Signature Register 1 ..... 4398
38.7.4.3 MISR2 - Multi Input Signature Register 2 ..... 4399
38.7.4.4 MISRCDR - Calculation Data Register ..... 4400
38.7.4.5 MISRCR - Control Register ..... 4401
38.7.4.6 MISRBASEADR — Monitoring Base Address Register ..... 4402
38.7.4.7 MISRADRMSK - Monitoring Address Mask Register ..... 4403
38.7.4.8 MISRDCNTCTL — Data Counter Control Register ..... 4404
38.7.4.9 MISRDCNT — Data Counter Register ..... 4405
38.7.4.10 MISRCMPCTL - Comparator Control Register ..... 4406
38.7.4.11 MISRCMPERSTR - Compare Error Status Register ..... 4407
38.7.4.12 MISRCMPERRSTC - Compare Error Status Clear Register ..... 4408
38.7.4.13 MISRERRCTL - Error Notification Control Register ..... 4409
38.7.4.14 MISRCMPDSEL — Compare Data Select Register ..... 4410
38.7.4.15 MISRCMPDCNT — Compare Data Counter Register ..... 4411
38.7.5 Usage ..... 4412
38.7.5.1 Usage Example 1 ..... 4412
38.7.5.2 Usage Example 2. ..... 4412
38.7.5.3 Recommended Clear Flow of Error Flag ..... 4413
38.8 ECM ..... 4414
38.9 Voltage Monitor ..... 4414
38.10 Clock Monitor ..... 4414
38.11 Data CRC Function. ..... 4414
Section 39 Error Control Module (ECM) ..... 4415
39.1 Features ..... 4415
39.1.1 Number of Units and Channels ..... 4415
39.1.2 Register Base Address ..... 4415
39.1.3 Clock Supply ..... 4416
39.1.4 Interrupt Requests ..... 4416
39.1.5 Reset Sources. ..... 4417
39.1.6 External Input and Output Signals ..... 4417
39.2 Overview ..... 4418
39.2.1 Specification Overview ..... 4418
39.2.2 Block Diagram ..... 4419
39.2.3 Error Input ..... 4420
39.2.4 Operations for Error Output ..... 4441
39.2.5 $\overline{\text { ERROROUT_M }}$ and ERROROUT_C Behavior at Reset ..... 4442
39.2.5.1 Dynamic Mode Enable ..... 4442
39.2.5.2 Dynamic Mode Disable ..... 4442
39.2.6 Loop-Back Function ..... 4442
39.2.7 Pseudo Error Generation ..... 4443
39.2.8 Error Status ..... 4443
39.2.9 Register Protection ..... 4443
39.2.10 Timeout Function for Interrupt Processing ..... 4443
39.2.11 Masking of "Error Clear Trigger Registers" ..... 4443
39.2.12 DCLS Error Interrupt (EI Level) and El Level Interrupt ..... 4444
39.3 Register Specification ..... 4445
39.3.1 List of Registers ..... 4445
39.3.2 ECMmESET — ECM Master/Checker Error Set Trigger Register ( $m=\mathrm{M} / \mathrm{C}$ ) ..... 4447
39.3.3 ECMmECLR — ECM Master/Checker Error Clear Trigger Register ( $m=\mathrm{M} / \mathrm{C}$ ) ..... 4448
39.3.4 ECMmESSTR0 to ECMmESSTR9 - ECM Master/Checker Error Source Status Register 0 to $9(m=M / C)$ ..... 4449
39.3.5 ECMEPCFG - ECM Error Pulse Configuration Register ..... 4452
39.3.6 ECMMICFG0 to ECMMICFG9 - ECM Maskable Interrupt Configuration Register 0 to 9 ..... 4453

## Section 1 Overview

The RH850/E2x-FCC1, RH850/E2M are products of the single-chip microcontroller RH850 series from Renesas Electronics.

This section gives an overview of the RH850/E2x-FCC1 and RH850/E2M.

### 1.1 Outline

This product is a 32-bit single-chip microcontroller that incorporates multiple CPUs of the RH850 architecture, code flash, data flash, RAM, DMA controllers, high-speed communication interfaces including RHSB (microsecond bus), CAN, FlexRay, Ethernet, RHSIF, LIN, SENT, PSI5-S, three types (sequential conversion type, delta-sigma type and cyclic type) of A/D converters, peripheral functions including digital filter processing, an Advance Timer Unit (ATUV) and GTM that are best suited for high-speed accurate power train control. This product also conforms to the Automotive Safety Integrity Level (ASIL) that is currently in high demand in the automotive field.
(1) Includes multiple RH850 cores

This product contains multi RH850G4MH cores (each CPU is referred to as CPU0 and CPU1 hereafter). CPU0 and CPU1 support RISC-type instruction sets and have significantly improved the instruction execution speed with basic instructions (one clock cycle per instruction) and optimized 10-stage pipeline configurations. Furthermore, this product also supports multiplication instructions using a 32-bit hardware multiplier, saturated product-sum operation instructions, and bit manipulation instructions as instructions best suited for various applications such as automobile power train control.

Two-byte basic instructions and high-level language instructions improve object code efficiency for the C compiler and reduce the program size. Furthermore, this product is suited for advanced real-time control applications by offering a high-speed interrupt response time including the processing time of the on-chip interrupt controller.
(2) On-chip code flash and data flash

This product incorporates an 8-MB code flash allowing high-speed access, which enables each CPU to access this flash memory efficiently. This memory can be reprogrammed while placed in an application system. This can shorten the system development period and significantly improve serviceability after the system is delivered.

This product also has a $224-\mathrm{KB}$ data flash that is available for storing EEPROM data.
(3) A variety of peripheral functions

This product incorporates timers, a Digital Filter Engine (DFE), three types of A/D converters (SAR-ADC, DS-ADC, and Cyclic ADC) and other functions that are best suited for reducing hardware and software control loads in the automobile power train control (e.g. engine, transmission). In addition, this product incorporates standard peripheral functions (UART, CAN, and RHSB) for automotive applications. It also has the global standard on-chip NEXUS JTAG as a debug interface. This allows construction of systems without the need to provide these functions externally, which reduces cost, quantity of components and PCB footprint.
(4) Functional safety support

This product provides with several dedicated functionalities including a Lock-Step Dual Core configuration for the CPU, memory protection with ECC, bus protection with ECC/EDC, peripheral module protection, and voltage/clock monitors to support the functional safety standard (ISO26262) required in automotive applications.

## (5) Security support

This product provides various security features and utilizes the Intelligent Cryptographic Unit/Master (ICUMD) as an on-chip Hardware Security Module (HSM).

### 1.2 Features

CPU0/1 core
CPU0/1 cache memory
Minimum CPU0/1 instruc
execution time
General CPU0/1 register
FP-SIMD
CPU0/1 instruction sets

Memory space
Code flash
Data flash
RAM
Interrupts/exceptions
sDMAC controller

RH850G4MH: 2 units (for high-speed operation and control) 16 KB
2.5 ns (during internal 400 MHz operation)

Thirty-two 32-bit registers
CPU0 and CPU1 have their own respective FP-SIMD units 32 -bit x $1 / 2 / 4$-way operations Thirty-two 128-bit dedicated registers independent from CPU/FPU Supports single-precision (32-bit) only Supports IEEE754 compliant data types and exceptions Exceptions can be enabled/disabled individually Rounding modes: To nearest/Toward 0/Toward $+\infty /$ Toward $-\infty$ Handling of denormalized numbers: Truncation to zero / IEEE754 compliant exception
Signed multiplication ( 32 bits $\times 32$ bits $\rightarrow 64$ bits): 1 to 2 CPU clocks
Saturated operation instructions (with overflow/underflow detection function)
32-bit arithmetic/logical shift instructions: 1 CPU clock
Bit manipulation instructions
Load/store instructions with long/short formats
Signed load instructions
4-GB address space (common to program and data)
Two types of memory area

- User area: 8 MB (common to CPU0, CPU1, ICUMD)
- User boot area: 64 KB high-speed reading through cache enabled

224 KB (common to CPU0, CPU1 and ICUMD)
Local RAM: 32 KB (CPU0/1)
Cluster RAM: 704 KB (common to CPU0 and CPU1) ( 64 KB : Retention RAM)
Cluster Emulation RAM: 1 MB (E2x-FCC1 only)
Global Emulation RAM: 1.5 MB (E2x-FCC1 only)
1 nonmaskable interrupt (NMI pin)
2 FE level interrupts
512 maskable interrupts (high-speed: 32, low-speed: 480)
Simultaneous distribution of interrupt sources to multiple cores (CPU0/CPU1)

- Applicable sources: non-maskable interrupt (NMI pin), FE level interrupts, 32 high-speed maskable interrupts
External interrupt input function (IRQ pins)
Software interrupt function (SINT)
Inter-processor interrupt function (IPIR)
16-level priority specifiable for maskable interrupts
For RH850 G4MH exceptions, see Section 3, CPU system.
32 channels incorporated ( 16 channels $\times 2$ units)
Transfer data length: 1 byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes
Parallel reads and writes (fly-by)
Address mode: dual address mode
Transfer requests: auto request, peripheral hardware request
Bus modes: normal speed mode, slow speed mode
Arbitration modes: fixed priority mode, round-robin mode
Interrupt requests: termination of descriptor step, termination of data transfer, occurrence of address error
Descriptor memory: 8 KB (shared among all channels)
Scatter-gather transfer
Transfer target: On-chip memory, on-chip peripheral modules (excluding the DTS and sDMAC)

| DTS controller | 128 channels incorporated |
| :---: | :---: |
|  | Transfer unit: 8 bits/16 bits/32 bits/64 bits/128 bits |
|  | 64-bit $\times 2$-burst transfer |
|  | Dual-address transfer mode |
|  | Address reloading function |
|  | Chain transfer function |
|  | Three transfer modes: Single transfer, block transfer 1 (specified by number of transfer times), and block transfer 2 (specified by address count) |
|  | Transfer target: On-chip memory, on-chip peripheral modules (excluding the DTS and sDMAC) |
|  | Transfer requests can be set by interrupt sources and software |
| I/O | Output driving ability of specific input/output pins is selectable |
|  | Inversion or non-inversion of output values of specific input/output pins is selectable |
|  | Pull-down or pull-down off of specific input/output pins is selectable |
| Safety functions | Flash memory ECC error detection function |
|  | RAM ECC error detection function |
|  | Peripheral module RAM ECC error detection function (e.g. DTS, CAN, FlexRay, DFE) |
|  | Clock monitor |
|  | Error Control Module (ECM) |
|  | Duplexing of modules (e.g. CPU0/1, ECM, error output pins) |
|  | Automatic Power-on BIST execution after reset |
|  | Shut-down BIST execution selection after System Reset 2 |
| Error Control Module (ECM) | Collects information for each error check system and safety function and indicates error status |
|  | When an error is detected, an error signal can be output from the error pin to an outside |
|  | Interrupts and internal reset signals can be generated upon detection of an error |
|  | Provided with a function to generate a pseudo-error for debugging and self-diagnosis |
| Data CRC function B (DCRB) | The data CRC (Cyclic Redundancy Check) function can verify or generate data streams protected by a CRC with various lengths and different bit widths |
| Multi-Input Signature Generator (MISG) | Monitors write access to specific addresses by the respective CPUs, and generate a 64-bit signature using the write data |
| Window Watchdog Timer | 2 units incorporated |
| (WDTB) | Can generate a signal to the ECM when a counter overflows (timer expires) |
|  | Can generate an interrupt at 75\% of the counter overflow value |
|  | An interrupt request can be generated at any function of the counter value |
|  | A window open period can be set to any function of the counter value |
| Advanced Timer Unit V (ATU- | Timer A: 32-bit input capture $\times 8$ channels |
| V) | Timer B: Angle clock generating timer $\times 1$ channel |
|  | Timer C: 32-bit input capture/output compare $\times 44$ channels |
| (ATU and GTM cannot be used at the same time) | Timer D: 32 -bit one-shot pulse $\times 36$ channels 32 -bit input capture $\times 36$ channels 32 -bit output compare $\times 36$ channels |
|  | Timer E: 24-bit PWM x 36 channels |
|  | Timer F: 32-bit event counter $\times 16$ channels |
|  | Timer G: 32-bit interval timer $\times 10$ channels |
| OS Timer (OSTM) | Three units incorporated <br> - A 32-bit timer assuming use by an OS <br> - Interval timer mode or free-running timer mode selectable <br> - Synchronous start between units available |
| Peripheral Interconnection function (PIC1) | One unit incorporated <br> - Synchronous operation between the OSTM timer and other timer input/outputs can be connected |
| Peripheral Interconnection function (PIC2) | Two units incorporated <br> - Maps peripheral IP outputs to triggers |
| Serial Communication | 4 channels incorporated |
| Interface 3 (SCl3) | - Clock synchronization or start-stop system selectable <br> - Full-duplex communication enabled <br> - Arbitrary bit rate selectable by the on-chip baud rate generator <br> - LSB first or MSB first selectable |

Page 89 of 4595

| Clocked Serial Interface H (CSIH) | 6 channels incorporated <br> - Three-wire serial synchronous data transfer <br> - Master mode or slave mode selectable <br> - Six or four chip select output signals are selectable <br> - Arbitrary bit rate is selectable by the on-chip baud rate generator |
| :---: | :---: |
| CANFD interface (RS-CANFD) | 5 channels incorporated <br> - RS-CAN mode (RS-CAN software compatibility mode) <br> - Conforming to CAN ISO-11898-1 (2003) <br> - Transfer speed up to 1 Mbps <br> - A total of 400 message buffers provided for 5 channels <br> - Reception filtering <br> - CAN-FD mode <br> - Conforming to CAN-FD ISO 11898-1 (2015) <br> - Transfer speed up to 8 Mbps <br> - A total of 400 message buffers provided for 5 channels <br> - Reception filtering |
| FlexRay (FLXA) | 1 unit incorporated <br> - Conforming to Protocol Specification v2.1 <br> - Buffer size: A 8-KB space is divided into up to 128 sections (for transmission, reception, and receive FIFO) <br> - Message filtering: ID filter, channel filter, cycle counter filter <br> - Bit rate: 10 Mbps |
| LIN/UART interface (RLIN3) | 6 channels incorporated <br> - Conforming to LIN Protocol Spec versions 1.3, 2.0, 2.1, 2.2, and SAE J2602 <br> - Three operating modes <br> - LIN Master mode <br> - LIN Slave mode <br> - UART mode (half-duplex, full-duplex) <br> - Arbitrary bit rate is selectable by the on-chip baud rate generator <br> - LIN Self-test mode with internal data loop back |
| Renesas High-Speed | 2 channels incorporated |
| Bus (RHSB) | Communication module supporting Micro-Second Bus channels <br> - Down-stream communication <br> - Up to two slaves selectable and configurable individually <br> - Functions for emergencies |
| Single Edge Nibble <br> Transmission (RSENT) | 17 channels incorporated <br> - Conforming to the SENT (Single Edge Nibble Transmission) protocol specified in the SAE J2716_201604 standard and the SPC (Short PWM Code) extension to the SENT specification <br> - Unidirectional or bidirectional transfer is possible through a single pin <br> - Bidirectional transfer is possible through two pins <br> - Data transfer protected by a CRC is possible |
| High Speed Serial Peripheral Interface (HS-SPI) | 1 channel incorporated <br> - Three-wire serial synchronous data transfer <br> - Master mode or Slave mode selectable <br> - Built in DMA for communication data transfer |
| Peripheral Sensor Interface 5 serial communication module (PSI5-S) | 1 channel incorporated <br> - Support the UART based communication for PSI5 transceiver <br> - Conformance with PSI5 protocol specification V2.2 <br> - Generate a PSI5 message from the UART transfer data <br> - The bit rate of the UART can be set by the built-in baud rate generator |
| RHSIF | 1 channel incorporated <br> - Asynchronous high speed LVDS interface based on IEEE 1596.3-1996 reduced range link <br> - Asynchronous high speed LVDS interface supporting maximum data rates of 80 Mbps and 160 Mbps <br> - Four channels, including one channel with data streaming capability <br> - Bus master interface which is used by a target node to access shared memory |

| Ethernet Controller (ETNC) | 1 channel incorporated <br> - Conformance with the IEEE 802.3 MAC layer standard <br> - PHY interface: MII (Media Independent Interface) and RMII (Reduced Media Independent Interface) <br> - Supports 10 Mbps and 100 Mbps <br> - Supports full-duplex and half-duplex modes <br> - Built-in DMA transfer function |
| :---: | :---: |
| Analog to Digital Converter (ADCH) | 80 channels incorporated <br> - A/D conversion method: Successive approximation <br> - Configuration of analog input pins <br> ADCH0/ADCH1 dedicated inputs: 20/12 <br> ADCH0/ADCH1 shared inputs: 8 <br> ADCH2/ADCH3 dedicated inputs: 20/12 <br> ADCH2/ADCH3 shared inputs: 8 <br> - Resolution: 12-bit/10-bit <br> - Conversion speed: $1.0 \mu \mathrm{~s}$ <br> - Scan groups for five systems for each converter <br> - Two scan modes (multicycle scan mode and continuous scan mode) <br> - ADCH0: Up to 40 virtual channels <br> - ADCH2: Up to 40 virtual channels <br> - ADCH1: Up to 40 virtual channels <br> - ADCH3: Up to 40 virtual channels <br> - Two types of A/D conversion and addition functions incorporated <br> - Converts the converted results to floating-point format <br> - Can enter data directly to the digital filter and the ADC summation function and the Generic Timer Module <br> - Safety functions <br> - Supports an upper/lower-limit-excess-notice-function for the ADC Voltage Monitor Secondary Error Generator or ADC Boundary Flag Generator in each virtual channel |
| Delta-Sigma Analog to Digital Converter (DSADC) | 26 channels incorporated <br> - A/D conversion method: Delta-Sigma modulation method <br> - Configuration of analog input pins DSADC00: 8 single-ended inputs/4 differential inputs DSADC10: 4 single-ended inputs/2 differential inputs DSADC20: 2 single-ended inputs/1 differential inputs DSADC12: 4 single-ended inputs/2 differential inputs DSADC13: 4 single-ended inputs/2 differential inputs DSADC11: 4 single-ended inputs/2 differential inputs <br> - Input type: Single-end input and differential input <br> - Input gain function (PGA): $\times 1, \times 2, \times 4$, or $\times 8$ selectable <br> - Calibration function <br> - Can enter data directly to the digital filter and the Generic Timer Module. <br> - Timestamp function <br> - Supporting a boundary flag generating signal to the ADC Boundary Flag Generator <br> - Safety functions |
| Cyclic Analog to Digital Converter (CADC) | 8 channels incorporated <br> - A/D conversion method: Cyclic conversion method <br> - Configuration of analog input pins <br> CADC00: 8 single-ended inputs /4 differential inputs <br> - Input type: Single-ended input and differential input <br> - Calibration function <br> - Can enter data directly to the digital filter and the Generic Timer Module <br> - Supporting a boundary flag generating signal to the ADC Boundary Flag Generator <br> - Safety functions |
| Power supply | E2x supports both the 5 V and 3.3 V power supplies with the exception of the core supply. The Power on/off sequence has no constraints |

\(\left.\begin{array}{ll}Power supply voltage monitor \& - The power supply voltage monitor is used for monitoring power domains EOVCC, VCC and VDD <br>
\& - The power supply voltage monitor has High-side (HDET) and Low-side (LDET) voltage detectors <br>

that detect if the monitored voltage is higher or lower than the specified voltage\end{array}\right]\)|  | - Power supply voltage monitors have two types of detection functions: Primary detection and |
| :--- | :--- |
|  | Secondary detection |

| Reset controller | 6 reset functions <br> - Power Up Reset <br> - System Reset 1 <br> - System Reset 2 <br> - Application Reset <br> - Module Reset <br> - JTAG Reset <br> External reset output pin: RES_OUT <br> Automatic RAM initialization after reset |
| :---: | :---: |
| Clock monitor | - Up to 7 clock monitors depending on the device configuration <br> - Detects clock disturbances that results in a frequency lower or higher than the target frequency, and sends an error notification to the ECM <br> Supports the self-diagnosis function |
| Temperature sensor | 1 sensor incorporated <br> - Out of range detection of temperature <br> - Operating modes <br> - Single measurement mode <br> - Continuous measurement mode <br> - Interrupt generation <br> - Temperature Measurement End Interrupt (INTOTSOTI) <br> - Temperature Rise/Drop Interrupt (INTOTSOTULI) <br> - Temperature Alarm Error (INTOTSOTABE) <br> - Temperature Sensor Error (INTOTSOTE) |
| Generic Timer Module (GTM) | GTM v3.1.5.1 is a modular timer unit and consists of the following submodules. <br> - Advanced Routing Unit (ARU) |
| (ATU and GTM cannot be used at the same time) | - Broadcast Module (BRC) <br> - Parameter Storage Module (PSM) <br> - Clock Management Unit (CMU) <br> - Cluster Configuration Module (CCM) <br> - Time Base Unit (TBU) <br> - Timer Input Module (TIM) <br> - Timer Output Module (TOM) <br> - ARU-connected Timer Output Module (ATOM) <br> - Dead Time Module (DTM) <br> - Multi Channel Sequencer (MCS) <br> - Memory Configuration (MCFG) (E2x-FCC1 only) <br> - TIMO Input Mapping Module (MAP) <br> - Digital PLL (DPLL) <br> - Sensor Pattern Evaluation (SPE) <br> - Interrupt Concentrator Module (ICM) <br> - Output Compare Unit (CMP) <br> - Monitoring Unit (MON) |

[E2x-FCC1]
373-pin plastic FBGA ( 0.8 mm ball pitch) ( $21 \mathrm{~mm} \times 21 \mathrm{~mm}$ package size)
292-pin plastic FBGA ( 0.8 mm ball pitch) ( $17 \mathrm{~mm} \times 17 \mathrm{~mm}$ package size)
[E2M]
373-pin plastic FBGA ( 0.8 mm ball pitch) ( $21 \mathrm{~mm} \times 21 \mathrm{~mm}$ package size)
292-pin plastic FBGA ( 0.8 mm ball pitch) ( $17 \mathrm{~mm} \times 17 \mathrm{~mm}$ package size)

### 1.3 Application Fields

- Automotive field (including engine control system and transmission control system)

### 1.4 Ordering Information

Table 1.1 Product Name List

|  | Package | On-Chip <br> ROM | Operating <br> Temperature (Tj) | External <br> Oscillator | Maximum Operating <br> Frequency |
| :--- | :--- | :--- | :--- | :--- | :--- |
| R7F702002AEABA (RH850/E2M) | Plastic FBGA-373 <br> $0.8-\mathrm{mm}$ ball pitch <br> $21 \mathrm{~mm} \times 21 \mathrm{~mm}$ | 8 MB | max. $150^{\circ} \mathrm{C}$ | $20 / 40 \mathrm{MHz}$ | 400 MHz |
| R7F702002AEABG (RH850/E2M) | Plastic FBGA-292 <br> $0.8-\mathrm{mm}$ ball pitch | 8 MB | max. $150^{\circ} \mathrm{C}$ | $20 / 40 \mathrm{MHz}$ | 400 MHz |
|  | $17 \mathrm{~mm} \times 17 \mathrm{~mm}$ |  |  |  |  |

FBGA is hereafter referred to as BGA unless the complete abbreviation is required.

The RH850/E2x-FCC1 has 2 variants. Select the proper product according to the table below.

Table $1.2 \quad$ RH850/E2x-FCC1 List

| Frequency | Package |  |
| :--- | :--- | :--- |
|  | FBGA-373 | FBGA-292 |
| 400 MHz | R7F702Z04CEDBA (for E2M) | R7F702Z02CEDBG (for E2M) |

### 1.5 Differences in the Specifications of FCC Products

The table below lists the differences in the specifications of FCC products.

| Product |  |  | RH850/E2x-FCC1 | RH850/E2M |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | For E2M |  |

### 1.7 Functional Block Configuration

Internal Block Diagram

Figure 1.5 Internal Block Diagram (E2x-FCC1)

Figure 1.6 Internal Block Diagram (E2M)

CPU0 and CPU1 each have their own set of CPU peripherals. These CPU peripherals are assigned to the common address: CPU peripheral (self), separately from their respective address. Access by CPU0 to a register of a CPU peripheral (self) is to the register in the CPU peripheral of CPU0; access by CPU1 to a register of a CPU peripheral (self) is to the register in the CPU peripheral of CPU1.

## Section 2 Pin Function

This section contains a generic description of the Pin Function Controller (the unit name is defined as PORT in this section). The first part of this section describes the features specific to RH850/E2x-FCC1 microcontrollers, including register base addresses and input/output signals. The ensuing sections describe the functions and registers of PORT.

## CAUTION

Some pin functions may be absent from other mass-produced products even if the PKG is the same shape as the FCC1. For information regarding which pin functions are and are not present, see the user's manual for the product you are using.

### 2.1 Features of Pin Function

### 2.1.1 Port Group

This product has the following numbers of port groups.
Table $2.1 \quad$ Indices

| Index | Description |
| :--- | :--- |
| n | Throughout this section, each port group is identified by " n " $(\mathrm{n}=00$ to 57 ). |
|  | For example, PMCn indicates the port mode control register of the Pn port. |
| m | Throughout this section, each port pin is identified by the index " m " ( $\mathrm{m}=0$ to 15) |
|  | For example, P00_7 indicates pin 7 of port group 00. |

Table 2.2 Port Groups in This Product

| Product Name |  | E2x-FCC1 |  | E2M |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | BGA373 | BGA292(E2M) | BGA373 | BGA292 |
| Number of Port Groups |  | 22 | 19 | 22 | 19 |
| Port Group Name | P00_m | $\mathrm{m}=0$ to 11 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 11 | $\mathrm{m}=0$ to 7 |
|  | P01_m | $\mathrm{m}=3$ to 7 | $\mathrm{m}=3$ to 7 | $\mathrm{m}=3$ to 7 | $\mathrm{m}=3$ to 7 |
|  | P02_m | $\mathrm{m}=0$ to 11 | $\mathrm{m}=0$ to 11 | $\mathrm{m}=0$ to 11 | $\mathrm{m}=0$ to 11 |
|  | P10_m | $\mathrm{m}=0$ to 14 | $\mathrm{m}=0$ to 8 | $\mathrm{m}=0$ to 14 | $\mathrm{m}=0$ to 8 |
|  | P11_m | $\mathrm{m}=0$ to 10 | $\mathrm{m}=0$ to 10 | $\mathrm{m}=0$ to 10 | $\mathrm{m}=0$ to 10 |
|  | P12_m | $\mathrm{m}=0$ to 9 | $\mathrm{m}=0$ to 9 | $\mathrm{m}=0$ to 9 | $\mathrm{m}=0$ to 9 |
|  | P13_m | $\mathrm{m}=0$ to 14 | $\mathrm{m}=0$ to 3 | $\mathrm{m}=0$ to 14 | $\mathrm{m}=0$ to 3 |
|  | P14_m | $\mathrm{m}=0$ to 12 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 12 | $\mathrm{m}=0$ to 7 |
|  | P15_m | $\mathrm{m}=0$ to 8 | $\mathrm{m}=0$ to 8 | $\mathrm{m}=0$ to 8 | $\mathrm{m}=0$ to 8 |
|  | P20_m | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 |
|  | P21_m | $\mathrm{m}=2$ to 5 | $\mathrm{m}=2$ to 5 | $\mathrm{m}=2$ to 5 | $\mathrm{m}=2$ to 5 |
|  | P22_m | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 |
|  | P23_m | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 |
|  | P24_m | $\mathrm{m}=0$ to 15 | - | $\mathrm{m}=0$ to 15 | - |
|  | P25_m | $\mathrm{m}=0$ to 6 | - | $\mathrm{m}=0$ to 6 | - |
|  | P27_m | $\mathrm{m}=0$ *1 | $\mathrm{m}=0^{* 1}$ | $\mathrm{m}=0{ }^{* 1}$ | $\mathrm{m}=0$ *1 |
|  | P30_m | $\mathrm{m}=0$ to 3 | - | $\mathrm{m}=0$ to 3 | - |
|  | P32_m | $\mathrm{m}=0$ to 6 | $\mathrm{m}=0$ to 6 | $\mathrm{m}=0$ to 6 | $\mathrm{m}=0$ to 6 |
|  | P33_m | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 | $\mathrm{m}=0$ to 13 |
|  | P34_m | $\mathrm{m}=0$ to 4 | $\mathrm{m}=0$ to 4 | $\mathrm{m}=0$ to 4 | $\mathrm{m}=0$ to 4 |
|  | P40_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | JP0_m | $\mathrm{m}=0$ to 3,5 *2 | $\mathrm{m}=0$ to 3,5 *2 | $\mathrm{m}=0$ to 3,5 *2 | $\mathrm{m}=0$ to 3,5 *2 |

Note 1. The P27 port group does not have an input function and can only be used when the Option Byte PFC_RESO_CFG = 1 (See Section 2.6.8, RES_OUT Function for details). In addition, this port can only be used for debugger handshaking.
Note 2. TCK does not support port output; it only has a port input function. If TDI/JPO_0 pin is used as debug interface, JPMO_0 and JPIBC0_0 must be set value after reset (JPMO_0 = 1, JPIBC0_0 = $1)$.

Table 2.3 Virtual Port Groups in This Product

| Product Name |  | E2x-FCC1 |  | E2M |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | BGA373 | BGA292(E2M) | BGA373 | BGA292 |
| Number of Port Groups |  | 11 | 11 | 11 | 11 |
| Port Group Name | P41_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P42_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P43_m | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 | $\mathrm{m}=0$ to 7 |
|  | P50_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P51_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P52_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P53_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P54_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P55_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P56_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |
|  | P57_m | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 | $\mathrm{m}=0$ to 15 |

Note: A virtual port is a port group that is not connected to an external pin; but is instead connected to an internal function. (See
Section 2.6.3, Virtual Port Function via RHSB (XBAR), Section 2.6.4, Virtual Port Function via HSSPI and Section 2.6.5, Virtual Port Function via Analog for details.)

### 2.1.2 Register Base Addresses

The PORT base addresses are shown in the following table. All port register addresses are expressed as offsets of the base address.

Table 2.4 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <PORT0_Base> | FF61 $0000_{\mathrm{H}}$ | Peripheral Group 6 |
| <JPORT0_Base> | FF62 $0000_{\mathrm{H}}$ | Peripheral Group 6 |
| <PORT1_Base> | FFC1 $0000_{\mathrm{H}}$ | Peripheral Group 6 |
| <JPORT1_Base> | FFC2 $0000_{\mathrm{H}}$ | Peripheral Group 6 |

### 2.1.3 Clock Supplies

The PORT clock supplies are shown in the following table.
Table 2.5 Clock Supplies

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| PORT0 | PCLK | CLK_LSB |
| JPORT0 | PCLK | CLK_LSB |
| PORT1 | PCLK | CLK_LSB |
| JPORT1 | PCLK | CLK_LSB |

Note: For details of port unit names refer to Section 2.4, Registers.

### 2.1.4 Interrupt Requests

The PORT interrupt requests from external pins are shown in the following table.
Table $2.6 \quad$ Interrupt Requests

| Interrupt Symbol <br> Name | Unit Interrupt <br> Signal | Outline | Interrupt <br> Number | sDMA Trigger <br> Number | DTS Trigger <br> Number |
| :--- | :--- | :--- | :--- | :--- | :--- |
| INTP00 | IRQ0 | External interrupt 0 | 504 | 206 | 114 |
| INTP01 | IRQ1 | External interrupt 1 | 505 | 207 | 115 |
| INTP02 | IRQ2 | External interrupt 2 | 506 | 208 | 116 |
| INTP03 | IRQ3 | External interrupt 3 | 507 | 209 | 117 |
| INTP04 | IRQ4 | External interrupt 4 | 508 | 210 | 118 |
| INTP05 | IRQ5 | External interrupt 5 | 509 | 211 | 119 |
| INTP06 | IRQ6 | External interrupt 6 | 510 | 212 | 120 |
| INTP07 | IRQ7 | External interrupt 7 | 511 | 213 | 121 |

### 2.1.5 Reset Sources

The PORT reset sources are shown below.
PORT is initialized by the following reset sources.
Table 2.7 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| PORT0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| JPORT0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| PORT1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| JPORT1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 2.2 Overview

This product has various pins for input/output (I/O) functions, known as ports. The ports are organized into port groups. This product also has several control registers to allocate functions other than general-purpose I/O functions to the corresponding pins. See below for definitions of pin, port, and port group.

### 2.2.1 Functional Overview

### 2.2.1.1 Terms

The terms described in this section are defined as follows.

- Port group:

One port can have up to 16 pins, and the number of pins differs according to the port. All pins of a port share the same control registers.

- Port mode/Port:

In port mode, a pin functions as a general-purpose I/O pin.

- Alternative mode:

In alternative mode, a pin functions as an I/O pin of a peripheral function. Multiple peripheral functions may be multiplexed on a single pin, and control registers select the peripheral function to be used.

### 2.2.1.2 Overview of Pin Functions

Pins can operate in the following four different modes:

- Port mode (PMCn.PMCn_m = 0)

The pin operates as a general purpose I/O port in port mode. $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}$ selects input or output.

- S/W I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 0)

The pin is operated by an alternative function in S/W I/O control alternative mode.
The selection between input and output is made by S/W via the PMn.PMn_m control bits.

- Direct I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 1)

The pin is operated by an alternative function in direct I/O control alternative mode.
In contrast to $\mathrm{S} / \mathrm{W} \mathrm{I} / \mathrm{O}$ control alternative mode, input/output is directly controlled by the alternative function in this mode.

- When the input buffer is disabled (PMCn.PMCn_m $=0$, PMn.PMn_m $=1$, PIBCn.PIBCn_m $=0$ )

A shoot-through current does not flow even if the pin level is in the Hi-Z state. Thus the pin does not need to be fixed to a high or low level externally.

Table 2.8 Pin Function Configuration (Outline)

| Unit Name | Bit |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | PMC | PM | PIPC |  |
| Port mode | 0 | 0 | $0 / 1$ | Output mode |
| S/W I/O control alternative mode | 1 | $0 / 1$ | Input mode*1 |  |
| Direct I/O control alternative mode | 1 | 0 | 0 | Output mode |

Note 1. The input buffer should be enabled (PIBCn_m = 1).
Note 2. When used as an input pin in alternative mode, be sure to set PIBCn_m = 0 .

When a pin is operated in alternative mode ( $\mathrm{PMCn} . \mathrm{PMCn}_{-} \mathrm{m}=1$ ), one of many different alternative functions (up to 16) can be selected by the PFCn, PFCEn, PFCAEn, and PFCEAEn registers as shown in the following table.

- S/W I/O control alternative mode (PIPCn.PIPCn_m = 0):

Outputs ( $\mathrm{PMn} \_\mathrm{m}=0$ ): ALT-OUT1 to ALT-OUT16
Inputs ( $\mathrm{PMn} \_\mathrm{m}=1$ ): ALT-IN1 to ALT-IN16

- Direct I/O control alternative mode (PIPCn.PIPCn_m = 1):

Input/Output of ALT-OUT1 to ALT-IN16 is directly selected by the alternative function.

Table $2.9 \quad$ Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)

| Bit |  |  |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PFCEAE*2 | PFCAE*2 | PFCE*2 | PFC*2 | PM* ${ }^{* 1}$ |  |
| 0 | 0 | 0 | 0 | 0 | Alternative output mode 1 (ALT-OUT1) |
|  |  |  |  | 1 | Alternative input mode 1 (ALT-IN1) |
|  |  |  | 1 | 0 | Alternative output mode 2 (ALT-OUT2) |
|  |  |  |  | 1 | Alternative input mode 2 (ALT-IN2) |
|  |  | 1 | 0 | 0 | Alternative output mode 3 (ALT-OUT3) |
|  |  |  |  | 1 | Alternative input mode 3 (ALT-IN3) |
|  |  |  | 1 | 0 | Alternative output mode 4 (ALT-OUT4) |
|  |  |  |  | 1 | Alternative input mode 4 (ALT-IN4) |
|  | 1 | 0 | 0 | 0 | Alternative output mode 5 (ALT-OUT5) |
|  |  |  |  | 1 | Alternative input mode 5 (ALT-IN5) |
|  |  |  | 1 | 0 | Alternative output mode 6 (ALT-OUT6) |
|  |  |  |  | 1 | Alternative input mode 6 (ALT-IN6) |
|  |  | 1 | 0 | 0 | Alternative output mode 7 (ALT-OUT7) |
|  |  |  |  | 1 | Alternative input mode 7 (ALT-IN7) |
|  |  |  | 1 | 0 | Alternative output mode 8 (ALT-OUT8) |
|  |  |  |  | 1 | Alternative input mode 8 (ALT-IN8) |
| 1 | 0 | 0 | 0 | 0 | Alternative output mode 9 (ALT-OUT9) |
|  |  |  |  | 1 | Alternative input mode 9 (ALT-IN9) |
|  |  |  | 1 | 0 | Alternative output mode 10 (ALT-OUT10) |
|  |  |  |  | 1 | Alternative input mode 10 (ALT-IN10) |
|  |  | 1 | 0 | 0 | Alternative output mode 11 (ALT-OUT11) |
|  |  |  |  | 1 | Alternative input mode 11 (ALT-IN11) |
|  |  |  | 1 | 0 | Alternative output mode 12 (ALT-OUT12) |
|  |  |  |  | 1 | Alternative input mode 12 (ALT-IN12) |
|  | 1 | 0 | 0 | 0 | Alternative output mode 13 (ALT-OUT13) |
|  |  |  |  | 1 | Alternative input mode 13 (ALT-IN13) |
|  |  |  | 1 | 0 | Alternative output mode 14 (ALT-OUT14) |
|  |  |  |  | 1 | Alternative input mode 14 (ALT-IN14) |
|  |  | 1 | 0 | 0 | Alternative output mode 15 (ALT-OUT15) |
|  |  |  |  | 1 | Alternative input mode 15 (ALT-IN15) |
|  |  |  | 1 | 0 | Alternative output mode 16 (ALT-OUT16) |
|  |  |  |  | 1 | Alternative input mode 16 (ALT-IN16) |

Note 1. When PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored
Note 2. When the bit is a reserved bit, it is defined as 0 in the above table.

### 2.2.1.3 Pin Data Input/Output

## (1) Output Data

In port mode $\left(P M C n . P M C n \_m=0\right)$, the value of $P n . P n \_m$ is output from the $P n \_m$ pin.

## (2) Input Data

Reading the PPRn register returns either the value of the Pn_m pin, the associated bit of port register Pn.Pn_m, or the data output by an alternative function.

The source of the data read via PPRn depends on the pin mode and the setting of several control bits as shown in the following table.

Table 2.10 Mode Description and PPRn_m Read Values for Each Mode

| Bit |  |  |  |  |  | Mode | PPR Read Value |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| PMC <br> n_m | $\begin{aligned} & \text { PM } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIBC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PIPC } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PODCE } \\ & \text { n_m } \end{aligned}$ | $\begin{aligned} & \text { PODC } \\ & \text { n_m } \end{aligned}$ |  |  |
| 0 | 1 | 0 | X | X | X | Port input, input buffer disabled | Pn.Pn_m bit |
|  |  | 1 |  | X | X | Port input, input buffer enabled | Pn_m pin |
|  | 0 | X |  | 0 | 0 | Port push-pull output | Pn.Pn_m bit*1 |
|  |  |  |  |  | 1 | Port N-ch open drain output |  |
|  |  |  |  | 1 | 0 | Port push-pull output |  |
|  |  |  |  |  | 1 | Port P-ch open drain output |  |
| 1 | 1 | X | 0 | X | X | S/W I/O control alternative input | Pn_m pin |
|  | 0 |  |  | 0 | 0 | S/W I/O control alternative push-pull output | Alternative function internal output signal*1 |
|  |  |  |  |  | 1 | S/W I/O control alternative N-ch open drain output |  |
|  |  |  |  | 1 | 0 | S/W I/O control alternative push-pull output |  |
|  |  |  |  |  | 1 | S/W I/O control alternative P-ch open drain output |  |
|  | X |  | 1 | 0 | 0 | Direct I/O control alternative push-pull enable | I/O port in alternative mode <br> - Input: Pn_m pin <br> - Output: Alternative function Internal output signal*1 |
|  |  |  |  |  | 1 | Direct I/O control alternative N-ch open drain enable |  |
|  |  |  |  | 1 | 0 | Direct I/O control alternative push-pull enable |  |
|  |  |  |  |  | 1 | Direct I/O control alternative P-ch open drain enable |  |

Note 1. When PBDCn_m = 1, the Pn_m pin level is read via the PPRn_m bit.

- PMCn.PMCn_m

This bit selects either port mode $(\operatorname{PMCn} \mathrm{m}=0)$ or alternative function mode $\left(\mathrm{PMCn} \_\mathrm{m}=1\right)$.

- PMn.PMn_m

This bit selects input $\left(\mathrm{PMn} \_\mathrm{m}=1\right)$ or output $\left(\mathrm{PMn} \_\mathrm{m}=0\right)$ in port mode $(\mathrm{PMCn} \mathrm{m}=0)$ and $\mathrm{S} / \mathrm{W} \mathrm{I} / \mathrm{O}$ control alternative mode $(\operatorname{PMCn} \mathrm{m}=1$, PIPCn_m $=0)$.

- PIBCn.PIBCn_m

This bit disables $\left(\operatorname{PIBCn} \_m=0\right)$ or enables $\left(\operatorname{PIBCn} \_m=1\right)$ the input buffer in input port mode $($ PMCn $m=0$ and PMn_m = 1). When the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit; otherwise the Pn_m pin level is returned.

- PIPCn.PIPCn_m

This bit selects either the $\mathrm{S} / \mathrm{W}$ or direct I/O control alternative mode.

- PBDCn.PBDCn_m

Setting this bit to 1 in output mode enables bidirectional mode for the pin. In bidirectional mode, the level on pin Pn_m can be read from PPPn.PPRn_m.

- PODCn.PODCn_m, PODCEn.PODCEn_m

This bit selects either push-pull output (PODCn_m $=0$ ), N -ch open drain output ( $\operatorname{PODCn\_ m}=1$, PODCEn $\mathrm{m}=0$ ) or P-ch open drain output ( $\operatorname{PODCn} \mathrm{m}=1, \operatorname{PODCEn} \mathrm{~m}=1$ ).

## (3) Writing to the Pn Register

The data to be output in port $\mathrm{Pn} \_\mathrm{m}$ in port mode $\left(\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}=0\right)$ is held in port register Pn.
Pn data can be rewritten in the following two different ways:

- Direct write to the Pn register

New data can be directly written to the Pn register.

- Indirect operation on the Pn bit (SET/RESET/NOT)

An indirect operation on Pn is possible by using the following two registers:

- Port set/reset register: PSRn

When PSRn.PSRn_( $\mathrm{m}+16)=1$, the value of PSRn.PSRn_m determines the value
of Pn.Pn_m. Thus Pn_m can be set/reset without a direct write to Pn.

- Port NOT register: PNOTn

Setting PNOTn.PNOTn_m = 1 inverts the Pn.Pn_m bit without a direct write to Pn.

The indirect Pn SET/RESET/NOT operation provides access to single bits (not limited to one bit) of the Pn register while leaving all other Pn bits untouched.

### 2.3 Port Types

### 2.3.1 Pin Configuration

The following figure shows the overall configuration of the pins.

Note 1. The pins of ports P40_m have multiplexed analog input functions and, because these pins are only for input, they do not incorporate output-related functions. These port groups also do not incorporate pull-up and pull-down resistors.

Note 2. For details of the edge-detection DNF function and the relevant pins, see Section 2.6.1, Digital Noise Filter.
Note 3. For details of the port state control function, see Section 2.6.2, Port Safe State Mode.
Note 4. For details of the ICUM function, see Section 2.6.7, ICUM Select Function.

Figure 2.1 Block Diagram of Pin Configuration

### 2.3.2 Port Control Logic

The following figure shows the logical circuitry of the port control functions. The diagram is only a logical reference and does not show the real circuitry.

Note 1. Alternative function signal selected by PFCn_m, PFCEn_m, PFCAEn_m and PFCEAEn_m
Note 2. The output drive strength can be set by PDSCn_m and PUCCn_m.
Note 3. The input buffer type can be set by PISn_m and PISAn_m.
Note 4. There is no LVDS IO buffer and LVDS control logic in pins not assigned LVDS function.

Figure 2.2 Block Diagram of Port Control Logic

### 2.4 Registers

### 2.4.1 List of Registers

The PORT registers are listed in the following table.
For details of the PORT base addresses, see Section 2.1.2, Register Base Addresses.
Table 2.11 List of Registers (1/2)

| Module Name | Register Name | Symbol | Register Access Unit | Address | Access | Access Protection ${ }^{* 1}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | $\begin{array}{\|l\|} \hline \text { Excluding } \\ \text { P21, } 27 \end{array}$ | $\begin{aligned} & \text { P21, } 27 \\ & \text { only }{ }^{* 2, * 3} \end{aligned}$ |
| PORTO | Port register | Pn | Port Group | <PORTO_base> $+0000_{H}+\mathrm{n} \times 40_{\mathrm{H}}$ | 16 | - | PWE |
|  | Port setreset register | PSRn | Port Group | <PORTO_base> $+0004_{H}+\mathrm{n} \times 40_{\mathrm{H}}$ | 32 | - | PWE |
|  | Port NOT register | PNOTn | Port Group | <PORTO_base> $+0008_{+}+\mathrm{n} \times 40_{\mathrm{H}}$ | 16 | - | PWE |
|  | Port pin read register | PPRn | Port Group | <PORTO_base> $+000 \mathrm{C}_{\mathrm{H}}+\mathrm{n} \times 40_{\mathrm{H}}$ | 16 | - | - |
|  | Port mode register | PMn | Port Group | <PORTO_base> $+0010_{H}+\mathrm{n} \times 40_{\mathrm{H}}$ | 16 | - | PWE |
|  | Port mode control register | PMCn | Port Group | <PORTO_base> $+0014 \mathrm{H}+\mathrm{n} \times 40_{\mathrm{H}}$ | 16 | - | PWE |

|  | Port Write enable register | PWE | - | <PORTO_base> + 2F44H | 32 | PKCPROT | PKCPROT |
|  | LVDS control A register | LVDSCTRLA | - | <PORTO_base> + 2F50 ${ }_{\text {H }}$ | 32 | - | - |
|  | LVDS control B register | LVDSCTRLB | - | <PORT0_base> + 2F54H | 32 | - | - |
|  | LVDS control C register | LVDSCTRLC | - | <PORTO_base>+2F58H | 32 | - | - |

Note: n : Port number, m: Port bit number
Note 1. Write protect only.
Note 2. The P21 port group register is protected from all write accesses to prevent accidental register access. This is because in addition to their port function, the P21_* pins are multiplexed with the RHSIF function; however, these functions do not use the same power domain. This means that I/O of the P21 port group must be disabled when RHSIF is used.
Note 3. P27_0 is assigned exclusively to the RES_OUT function. The P27 port group register is therefore protected from all write accesses.

### 2.4.2 Port Group Unit Register Explanation

### 2.4.2.1 Configuration of PORT

(1) PMC/JPMC — Port Mode Control Register Group
(a) PMCn/JPMCO - Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

## CAUTION

PMC21 and PMC27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.12 PMCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMCn_[15:0] | These pins specify the operation mode of the corresponding pin: |
|  | 0: Port mode |  |
|  | 1: Alternative mode |  |

## NOTE

The control bits of the JTAG Port Mode Control Register (JPMC0) are JPMC0_[7:0].

## (b) PMCSRn/JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method for writing data to a bit in the PMCn register.
The 16 higher bits of PMCSRn specify whether the data in the 16 lower bits of PMCSRn are written to PMCn.PMCn_m.

Even when pins being used by multiple programs belong to the same port group, the PMCSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

## CAUTION

PMCSR21 and PMCSR27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMCSRn_[31:16] | These bits specify whether the value of the corresponding lower bit of PMCSRn_m is written to PMCn_m: <br> 0: PMCn_m does not depend on PMCSRn_m. <br> 1: The value of PMCn_m is the same as that of PMCSRn_m. <br> Example: <br> When PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15. <br> When read, $0000_{H}$ is always returned. |
| 15 to 0 | PMCSRn_[15:0] | These bits specify the PMCn_m value when the corresponding upper bit PMCSRn_( $\mathrm{m}+16$ ) is 1: $\begin{aligned} & 0: \text { PMCn_m }=0 \\ & \text { 1: } \text { PMCn_m }=1 \end{aligned}$ <br> When read, the PMCn register value is returned. |
| NOTE |  |  |

The control bits of the JTAG Port Mode Control Set/Reset Register (JPMCSR0) are JPMCSR0_[31:0].

## (2) PIPCn/JPIPC0 — Port IP Control Register

This register specifies whether the I/O direction of the Pn_m pin is controlled by port mode register PMn.PMn_m or by an alternative function.

When the $\mathrm{Pn} \_\mathrm{m}$ pin is operated in alternative mode ( $\mathrm{PMCn} . \mathrm{PMCn} \_\mathrm{m}=1$ ) and the alternative function directly controls the I/O direction of $\mathrm{Pn}_{-} \mathrm{m}$. In this case, PIPCn.PIPCn_m must be set to 1 as well. This hands over I/O control to the alternative function and overrules the $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}$ setting.

## CAUTION

PIPC21 and PIPC27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.14 PIPCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIPCn_[15:0] | These bits specify the I/O control mode: |
|  |  | $0:$ I/O mode is selected by PMn.PMn_m (S/W I/O control alternative mode). |
|  | $1:$ I/O mode is selected by peripheral function (direct I/O control alternative mode). |  |

## NOTE

The control bits of the JTAG Port IP Control Register (JPIPC0) are JPIPC0_[7:0].

## (3) PM/JPM — Port Mode Register Group

(a) PMn/JPM0 — Port Mode Register

The PMn register specifies whether the individual pins of port group $n$ are in input mode or in output mode.

## CAUTION

PM21 and PM27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.15 PMn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PMn_[15:0] | These bits specify input/output mode of the corresponding pin: |
|  |  | 0: Output mode (output enabled) |
|  | 1: Input mode (output disabled) |  |
| NOTE |  |  |

- To use a pin in input port mode (PMCn.PMCn_m = 0 and $P M n . P M n \_m=1$ ), the input buffer must be enabled (PIBCn.PIBCn_m = 1).
- PMn_m specifies the I/O direction in port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m = 1) because PIPCn.PIPCn_m = 0 after reset.
- The control bits of the JTAG Port Mode Register (JPMO) are JPM0_[7:0].

## (b) PMSRn/JPMSR0 — Port Mode Set/Reset Register

This register provides an alternative method for setting a bit in the PMn register.
The 16 higher bits of PMSRn specify whether the data in the 16 lower bits of PMSRn are written to PMn.PMn_m.
Even when pins being used by multiple programs belong to the same port group, the PMSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

## CAUTION

PMSR21 and PMSR27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

| Value after reset: |  |  | Refer to Section 2.5.1, List of Port Functions |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.16 PMSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PMSRn_[31:16] | These bits specify whether the value of the corresponding lower bit of PMSRn_m is written to PMn_m: <br> 0: PMn_m does not depend on PMSRn_m. <br> 1: The value of $P M n \_m$ is the same as that of PMSRn_m. <br> Example: <br> When PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15. <br> When read, $0000_{\mathrm{H}}$ is always returned. |
| 15 to 0 | PMSRn_[15:0] | These bits specify the PMn_m value when the corresponding upper bit PMSRn_( $m+16$ ) is 1 : $\begin{aligned} & \text { 0: } \mathrm{PMn} \mathrm{\_m}=0 \\ & \text { 1: } \mathrm{PMn} \mathrm{\_m}=1 \end{aligned}$ <br> When read, the PMn register value is returned. |
| NOTE |  |  |

The control bits of the JTAG Port Mode Set/Reset Register (JPMSR0) are JPMSR0_[31:0].

## (4) PIBCn/JPIBCO — Port Input Buffer Control Register

When a pin is being used in input port mode (PMCn.PMCn_m = 0 and $\mathrm{PMn} . \mathrm{PMn} \_\mathrm{m}=1$ ), this register enables or disables the input buffer. However, when the pin is used as an input pin in S/W I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m $=0$ ) or direct I/O control alternative mode (PMCn.PMCn_m = 1 and PIPCn.PIPCn_m = 1), set PIBCn.PIBCn_m = 0.

When pins are in bidirectional mode ( $\mathrm{PBDCn} . \operatorname{PBDCn} \_\mathrm{m}=1$ ), the shared output level loop-back function and pin output level-read function can be selected by setting PIBCn.PIBCn_m. Refer to Section 2.4.2.2(1),
PBDCn/JPBDC0 — Port Bidirectional Control Register.

## CAUTION

PIBC21 and PIBC27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.17 PIBCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PIBCn_[15:0] | These bits are used to enable and disable the input buffer in input port mode. |
|  | $0:$ Input buffer is disabled. |  |
|  | 1: Input buffer is enabled. |  |

## NOTES

1. When the input buffer is disabled, a shoot-through current does not flow even if the pin level is in $\mathrm{Hi}-\mathrm{Z}$ state. Thus the pin does not need to be fixed to a high or low level externally.
2. When the input buffer is enabled in alternative mode (PMCn.PMCn_m =1, PMn.PMn_m = 1), there is a possibility that a shoot-through current may flow even if the pin level is Hi-Z state. Then take appropriate measures, such as pull-up/pull-down.
3. The control bits of the JTAG Port Input Buffer Control Register (JPIBCO) are JPIBC0_[7:0].

## (5) PFC — Port Function Control Register Group

(a) PFCn - Port Function Control Register

This register, together with the PFCEn, PFCAEn and PFCEAEn registers, specifies an alternative function of the pins.
Some alternative functions directly control input/output of pin Pn m. For such alternative functions PIPCn.PIPCn m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

## CAUTION

PFC21 and PFC27 are protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.

Table 2.18 PFCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCn_[15:0] | These bits specify an alternative function of a pin. |
|  |  | For detailed information, refer to Table 2.9, Outline of Alternative Mode Selection |
|  |  | (PMCn.PMCn_m $=\mathbf{1}$ ). |

## (b) PFCEn - Port Function Control Expansion Register

This register, together with the PFCn, PFCAEn and PFCEAEn registers, specifies an alternative function of the pins.
Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.
CAUTION
PFCE21 and PFCE27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

|  |  | For detailed information, refer to Table 2.9, Outline of Alternative Mode Selection |
|  |  | (PMCn.PMCn_m =1). |

## (c) PFCAEn - Port Function Control Additional Expansion Register

This register, together with the PFCn, PFCEn and PFCEAEn registers, specifies an alternative function of the pins.
Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.
CAUTION
PFCAE21 and PFCAE27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 2.20 PFCAEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PFCAEn_[15:0] | These bits specify an alternative function of a pin. |
|  |  | For detailed information, refer to Table 2.9, Outline of Alternative Mode Selection |
|  | (PMCn.PMCn_m =1). |  |

## (d) PFCEAEn - Port Function Control Extra Additional Expansion Register

This register, together with the PFCn, PFCEn, and PFCAEn registers, specifies an alternative function of the pins.
Some alternative functions directly control input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

## CAUTION

PFCEAE21 and PFCEAE27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

Table 2.21 PFCEAEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PSCEAEn_[15:0] | These bits specify an alternative function of a pin. For detailed information, refer to Table 2.9, |
|  |  | Outline of Alternative Mode Selection (PMCn.PMCn_m = 1). |

### 2.4.2.2 Configuration of Pin Data Input/Output

## (1) PBDCn/JPBDC0 - Port Bidirectional Control Register

This register enables the input buffer when a pin is used in output mode, and permits bidirectional mode. The Pn_m pin level is read via PPRn.PPRn_m in bidirectional mode.

- Alternative output level loopback function

When the $\mathrm{Pn} \_\mathrm{m}$ pin is used as the alternative output function, the actual pin output level based on the alternative output function can be looped back to the alternative input side by setting PBDCn.PBDCn_m $=1$ and PIBCn.PIBCn_m $=0$. For example, the pin output level based on the first alternative function can be looped back to the same alternative input side. Also the pin output level can be read via PPRn.PPRn m.

- Pin output level read function

When the $\mathrm{Pn} \_\mathrm{m}$ pin is used as the general output port function or the alternative output function, the actual pin output level can be read via PPRn.PPRn_m by setting PBDCn.PBDCn_m $=1$ and PIBCn.PIBCn_m $=1$. Under this setting, the pin output level will never be looped back to the alternative input side even in alternative output mode.

## CAUTION

PBDC21 and PBDC27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

| Value after reset: |  |  | Refer to Section 2.5.1, List of Port Functions |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 2.22 PBDCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PBDCn_[15:0] | These bits enable/disable bidirectional mode of the corresponding pin: |
|  | $0:$ Bidirectional mode is disabled. |  |
|  | 1: Bidirectional mode is enabled. |  |

## NOTE

The control bits of the JTAG Port Bidirectional Control Register (JPBC0) are JPBC0_[7:0].

## (2) PPRn/JPPR0 — Port Pin Read Register

This register reflects an actual Pn_m pin level, a Pn.Pn_m bit value, or an output level of the alternative function. The value to be read depends on various control settings as described in Table 2.10, Mode Description and PPRn_m Read Values for Each Mode.

Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.23 PPRn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PPRn_[15:0] | These bits indicate the Pn_m pin level, Pn.Pn_m value, or alternative function output level. |
| NOTE |  |  |

The control bits of the JTAG Port Pin Read Register (JPPRO) are JPPR0_[7:0].
(3) P/JP — Port Register Group
(a) Pn/JPO — Port Register

This register sets and holds the $\operatorname{Pn} . P n \_m$ data to be output via the related $P n \_m$ port in output port mode (PMCn.PMCn_m = 0 and $P M n . P M n \_m=0$ ).

## CAUTION

P21 and P27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

> Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.24 Pn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | Pn_[15:0] | These bits set the output level of pin $m(m=0$ to 15$):$ |
|  | $0:$ Low level output |  |
|  | 1: High level output |  |

## NOTES

1. Bits of this register can be manipulated by various means. Refer to the subsection, "Writing to the Pn Register" in Section 2.2.1.3, Pin Data Input/Output for details.
2. The control bits of the JTAG Port Register (JP0) are JP0_[7:0].

## (b) PSRn/JPSR0 — Port Set/Reset Register

This register provides an alternative method for setting a bit in the Pn register.
The 16 higher bits of PSRn specify whether the data in the 16 lower bits of PSRn are written to Pn.Pn_m.
Even when pins being used by multiple programs belong to the same port group, the PSRn register allows masking of the unused bits when overwriting so that independent setting of the corresponding bits by each program is possible.

## CAUTION

PSR21and PSR27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.25 PSRn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | PSRn_[31:16] | These bits specify whether the value of the corresponding lower bit of PSRn_m is written to Pn_m: <br> 0: Pn_m does not depend on PSRn_m. <br> 1: The value of Pn_m is the same as that of PSRn_m. <br> Example: <br> When PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15 and output. <br> When read, $0000_{H}$ is always returned. |
| 15 to 0 | PSRn_[15:0] | These bits specify the Pn_m value when the corresponding upper bit PSRn_( $m+16$ ) is 1: $\begin{aligned} & \text { 0: Pn_m = } 0 \\ & \text { 1: } P n \_m=1 \end{aligned}$ <br> When read, the Pn register value is returned. |
| NOTE |  |  |

The control bits of the JTAG Port Set/Reset Register (JPSR0) are JPSR0_[31:0].

## (4) PNOTn/JPNOTO - Port NOT Register

This register enables inverting the $\mathrm{Pn} \_\mathrm{m}$ bit of the port register without directly writing to Pn .

## CAUTION

PNOT21and PNOT27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions.

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.26 PNOTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PNOTn_[15:0] | These bits specify if Pn.Pn_m is inverted or not: |
|  | $0:$ Pn.Pn_m is not inverted $\left(P n \_m \rightarrow P n \_m\right)$. |  |
|  | 1: Pn.Pn_m is inverted $\left(\overline{P n \_m} \rightarrow P n \_m\right)$ |  |

## NOTE

The control bits of the JTAG Port NOT Register (JPNOTO) are JPNOT0_[7:0].

## (5) PINVn/JPINVO — Port Output Level Inversion Register

This register enables inverting the output level from a pin. This is valid when the pin is in output mode regardless of port output mode or alternative output mode. It is not valid when Port safe state or the ICUM function are active.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.27 PINVn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PINVn_[15:0] | These bits specify whether the output level from a pin is inverted or not. |
|  |  | 0: Pin output level is not inverted. |
|  | 1: Pin output level is inverted. |  |
| NOTE |  |  |

The control bits of the JTAG Port Output Level Inversion Register (JPINV0) are JPINV0_[7:0].
(6) PSFS - Port Safe State Register Group
(a) PSFSCn — Port Safe State Control Register

All Port Groups have Port Safe State Function implemented. Each of these Port Groups has its own Port safe state enable bit that is located in the PSFSCn_m register.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

|  | Bit 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.28 PSFSC Register Contents

| Bit Position | Bit Name | Function |  |
| :---: | :---: | :---: | :---: |
| 15 to 0 | PSFSCn_[15:0] | These bits enable/disable Port Safe State Function of pin m (m=0 to 15). |  |
|  |  | PSFSCn_m | Description |
|  |  | 0 | Port Safe State Function is disabled Output control still remains. (Port mode or alternative control mode.) |
|  |  | 1 | Port Safe State Function is enabled. <br> Output control is changed to Port safe state mode. |

## (b) PSFSDn - Port Safe State Data Register

When the Port safe state trigger signal becomes active, the port register ( $\mathrm{Pn}_{-} \mathrm{m}$ ) is disconnected and switched to the Port Safe State Data register (PSFSDn_m), and the Port Safe State Output Enable register (PSFSOEn_m) takes over output enable control.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.29 PSFSD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PSFSDn_[15:0] | These bits set the output level of pin $\mathrm{m}(\mathrm{m}=0$ to 15) in Port safe state mode. |
|  |  | PSFSDn_m $\quad$ Data Bus Width |
|  |  | Low level output in Port safe state mode |

## (c) PSFSOEn - Port Safe State Output Enable Register

When the Port safe state trigger signal becomes active, the port register ( $\mathrm{Pn} \_\mathrm{m}$ ) is disconnected and switched to the Port Safe State Data register (PSFSDn_m), and the Port Safe State Output Enable register (PSFSOEn_m) takes over output enable control.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.30 PSFSOE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PSFSOEn_[15:0] | These bits set the output enable level of pin $\mathrm{m}(\mathrm{m}=0$ to 15) in Port safe state mode. |
|  |  | PSFSOEn_m $\quad$ Data Bus Width  <br> 0 1 <br>   <br>   <br>   |

### 2.4.2.3 Configuration of Electrical Characteristic

(1) PUD/JPUD - Pull-Up/Down Register Group
(a) PUn/JPU0 - Pull-Up Option Register

This register specifies whether an on-chip pull-up resistor is connected to an input pin.

## CAUTION

PU21 and PU27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PUn_15 | PUn_14 | PUn_13 | PUn_12 | PUn_11 | PUn_10 | PUn_9 | PUn_8 | PUn_7 | PUn_6 | PUn_5 | PUn_4 | PUn_3 | PUn_2 | PUn_1 | PUn_0 |

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.31 PUn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- | :--- |
| 15 to 0 | PUn_[15:0] | These bits specify whether an on-chip pull-up resistor is connected to the corresponding pin in |
| combination with the PDn register. For the electrical characteristics for each setting, see the |  |  |

## NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG Pull Up Option Register (JPU0) are JPU0_[7:0]

## (b) PDn/JPD0 — Pull-Down Option Register

This register specifies whether an on-chip pull-down resistor is connected to an input pin.

## CAUTION

PD21 and PD27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.32 PDn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PDn_[15:0] | These bits set pull-down resistor of input port pins in combination with the PUn register. See |
|  |  | Table 2.31, PUn Register Contents. |

## NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG Pull Down Option Register (JPD0) are JPD0_[7:0]
(2) PODC/JPODC — Port Open Drain Control Register Group
(a) PODCn/JPODC0 - Port Open Drain Control Register

This register selects port pin's output buffer function as push-pull type or emulated open drain type.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.33 PODCn Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | PODCn_[15:0] | These bits enable/disable N-ch or P-ch open drain function of pin $m$ ( $m=0$ to 15) in combination with the PODCEn register. |  |  |
|  |  | PODCEn_m | PODCn_m | Description |
|  |  | 0 | 0 | Output buffer operates as push-pull driver |
|  |  | 0 | 1 | Output buffer operates as N -ch open drain driver |
|  |  | 1 | 0 | Output buffer operates as push-pull driver |
|  |  | 1 | 1 | Output buffer operates as P-ch open drain driver |
| NOTE |  |  |  |  |

The control bits of the JTAG Port Open Drain Control Register (JPODC0) are JPODC0_[7:0].

## (b) PODCEn/JPODCE0 - Port Open Drain Control Expansion Register

This register selects port pin's output buffer function as push-pull type or emulated open drain type.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.34 PODCEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PODCEn_[15:0] | These bits select port pin's output buffer function as push-pull type or emulated open drain <br> type in combination with the PODCn register. See Table 2.33, PODCn Register Contents for <br> register setting and port pin's output buffer function. |
| NOTE |  |  |

The control bits of the JTAG Port Open Drain Control Expansion Register (JPODCE0) are JPODCE0_[7:0].

## (3) PDSC/JPDSC — Port Drive Strength Control Register Group

## (a) PDSCn/JPDSC0 - Port Drive Strength Control Register

This register is used to configure the driving ability (driving strength) of output port pins and multiplexed output pin functions in combination with the PUCCn register. Specific driving ability settings may be required, depending on the pin function to be used. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.35 PDSCn Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | PDSCn_[15:0] | These bits set driving ability of output port pins and multiplexed output pin functions in combination with the PUCCn register. For the electrical characteristics for each setting, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware. |  |  |
|  |  | PUCCn_m | PDSCn_m | Output Driving Ability |
|  |  | 0 | 0 | Drive strength 1 (Very Low) |
|  |  | 0 | 1 | Drive strength 2 (Low) |
|  |  | 1 | 0 | Drive strength 3 (Mid) |
|  |  | 1 | 1 | Drive strength 4 (High) |

## NOTE

The control bits of the JTAG Port Drive Strength Control Register (JPDSC0) are JPDSC0_[7:0].

## (b) PUCCn/JPUCCO - Port Universal Control Register

This register is used to configure the driving ability (driving strength) of output port pins and multiplexed output pin functions in combination with the PDSCn register. Specific driving ability settings may be required, depending on the pin function to be used. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.36 PUCCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PUCCn_[15:0] | These bits set driving ability of output port pins and multiplexed output pin functions in <br> combination with the PDSCn register. See Table 2.35, PDSCn Register Contents for register <br> setting and output driving ability. |
| NOTE |  |  |

The control bits of the JTAG Port Universal Control Register (JPUCC0) are JPUCC0_[7:0].

## (4) PIS/JPIS — Port Input Buffer Selection Register Group

(a) PISn/JPIS0 — Port Input Buffer Selection Register

This register and the PISAn register select the port pin's input buffer characteristics. Specific input characteristic settings may be required, depending on the pin function to be used. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## CAUTION

PIS21and PIS27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Value after reset: Refer to Section 2.5.1, List of Port Functions

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 6 |  | 5 | 4 | 32 |  | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \mathrm{PISn} \\ 15 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 14 \end{gathered}$ | $\begin{aligned} & \text { PISn } \\ & 13 \end{aligned}$ | $\begin{gathered} \text { PISn } \\ 12 \end{gathered}$ | $\underset{11}{\mathrm{PISn}}$ | $\begin{gathered} \text { PISn_1 } \\ 0 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 9 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 8 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 7 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 6 \end{gathered}$ | $\underset{5}{\mathrm{PIS}}$ | $\mathrm{PISn}_{4}$ | $\begin{gathered} \mathrm{PISn} \\ 3 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 2 \end{gathered}$ | $\begin{gathered} \mathrm{PISn} \\ 1 \end{gathered}$ | $\begin{gathered} \text { PISn_ } \\ 0 \end{gathered}$ |
| Value after reset | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. Refer to Section 2.5.1, List of Port Functions.

Table 2.37 PISn Register Contents

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 15 to 0 | PISn_[15:0] | These bits select input buffer type of pin $m(m=0$ to 15 ) in combination with the PISAn register. |  |  |
|  |  | PISAn_m | PISn_m | Description |
|  |  | 0 | 0 | Input buffer type is Schmitt 1 |
|  |  | 0 | 1 | Input buffer type is Schmitt MSC (Setting prohibited except for ShmittMSC pins.) |
|  |  | 1 | x | Input buffer type is TTL |

## NOTES

1. The control bits of the JTAG Port Input Buffer Selection Register (JPISO) are JPIS0_[7:0].
2. Schmitt MSC input is supported by P10_2, P10_4, P10_5, P12_0, P12_1, P12_2, P12_3, P12_4, P12_7, P14_4, P15_4, P15_5, P15_6 only. These pins are multiplexed with the function of RHSBnSIx, RHSBnEMRG [ $\mathrm{n}=0,1, \mathrm{x}=$ $0,1]$.
3. TTL input is not supported with P40 port group.
4. For details of selectable input characteristics, refer to the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
5. Input buffer type of TDI, TCK and TMS is selected to TTL type when these pins are used as Nexus, LPD-4 pin and Boundary SCAN interface.

## (b) PISAn/JPISA0 — Port Input Buffer Selection Advanced Register

This register and the PISn register select the port pin's input buffer characteristics. Specific input characteristic settings may be required, depending on the pin function to be used. For details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## CAUTION

PISA21 and PISA27 are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

## Value after reset: Refer to Section 2.5.1, List of Port Functions

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.38 PISAn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | PISAn_[15:0] | These bits set input buffer selection in combination with the PISn register. See Table 2.37, |
|  |  | PISn Register Contents for the register settings and selected input type. |

## NOTES

1. The control bits of the JTAG Port Input Buffer Selection Advanced Register (JPISA0) are JPISA0_[7:0].
2. Schmitt MSC input is supported by P10_2, P10_4, P10_5, P12_0, P12_1, P12_2, P12_3, P12_4, P12_7, P14_4, P15_4, P15_5, P15_6 only. These pins are multiplexed with RHSBnSlx, RHSBnEMRG $[\mathrm{n}=0,1, \mathrm{x}=0,1]$.
3. TTL input is not supported with P40 port group.
4. For details of selectable input characteristics, refer to the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
5. Input buffer type of TDI, TCK and TMS is selected to TTL type when these pins are used as Nexus, LPD-4 pin and Boundary SCAN interface.

### 2.4.2.4 Other Registers

## (1) PKCPROT — Port Keycode Protection Register

This register is used for protection against writing registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

For how to set protection, see Section 2.4.4, Port Setting Procedures.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 2.39 PKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | PKCPROT_[31:1] | These bits enable or disable modification of the PWEE bit. |
|  |  | The value written is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | PWEE | PWE Enable bit |
|  |  | $0:$ Disable write access of PWE register. |
|  | 1: Enable write access of PWE register. |  |

Note 1. Set A5A5 $\mathrm{A} 500_{H}$ with $\{P K C P R O T[31: 1], \mathrm{PWEE}\}$ to disable writing the PWE register. Set A5A5 A501H with \{PKCPROT[31:1], PWEE\} to enable writing PWE register.

## (2) PWE — Port Write Enable Register

This register is used to control which port's protected registers can be written. When PKCPROT.PWEE $=1$, this register can be written. When PKCPROT.PWEE $=0$, this register cannot be written.
For how to set protection, see Section 2.4.4, Port Setting Procedures.

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 0 | PWEP00 | Port Write enable for P00 <br> 0 : Disable write access <br> 1: Enable write access |

Note. Register protection is not supported for virtual port groups.

## (3) LVDSCTRLA — LVDS Control A Register

This register specifies whether to use the LVDS function.
For details, refer to Section 2.4.5.4, Register Setting to Use the LVDS Buffer.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c\|} \hline \text { LVDSC } \\ \text { TRLA_1 } \\ 6 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | LVDSC TRLA_3 | - | - | $\begin{aligned} & \text { LVDSC } \\ & \text { TRLA_0 } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R/W |

Table 2.41 LVDSCTRLA Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | LVDSCTRLA_16 | This bit specify the voltage for the LVDS input function: <br> 0: LVDS input function of P21_2 and P21_3 pin is used in 5 V mode. <br> 1: LVDS input function of P21_2 and P21_3 pin is used in 3 V mode. |
| 15 to 4 | - | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | LVDSCTRLA_3 | These bits specify whether to use the LVDS function: <br> 0: Disable LVDS output function of P21_4 and P21_5 pin. <br> 1: Enable LVDS output function of P21_4 and P21_5 pin. |
| 2, 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | LVDSCTRLA_0 | This bit specify whether to use the LVDS function: <br> 0: Disable LVDS input function of P21_2 and P21_3 pin. <br> 1: Enable LVDS input function of P21_2 and P21_3 pin. |

## (4) LVDSCTRLB — LVDS Control B Register

This register specifies whether to use the LVDS function.
For details, refer to Section 2.4.5.4, Register Setting to Use the LVDS Buffer.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | LVDSC TRLB_5 | LVDSC TRLB_4 | LVDSC TRLB_3 | - | - | $\begin{array}{\|l\|} \hline \text { LVDSC } \\ \text { TRLB_O } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R | R/W |

Table 2.42 LVDSCTRLB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | LVDSCTRLB_5 | This bit specify whether to use the LVDS function: <br> 0 : Disable LVDS output function of P13_0 and P13_1 pin. <br> 1: Enable LVDS output function of P13_0 and P13_1 pin. |
| 4 | LVDSCTRLB_4 | This bit specify whether to use the LVDS function: <br> 0: Disable LVDS input function of P13_0 and P13_1 pin. <br> 1: Enable LVDS input function of P13_0 and P13_1 pin. |
| 3 | LVDSCTRLB_3 | This bit specify whether to use the LVDS function: <br> 0: Disable LVDS output function of P13_2 and P13_3 pin. <br> 1: Enable LVDS output function of P13_2 and P13_3 pin. |
| 2, 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | LVDSCTRLB_0 | This bit specify whether to use the LVDS function: <br> 0: Disable LVDS input function of P14_4 and P14_5 pin. <br> 1: Enable LVDS input function of P14_4 and P14_5 pin. |

## (5) LVDSCTRLC — LVDS Control C Register

This register specifies whether to use the LVDS function.
For details, refer to Section 2.4.5.4, Register Setting to Use the LVDS Buffer.

Table 2.43 LVDSCTRLC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | LVDSCTRLC_3 | This bit specify whether to use the LVDS function: |
|  |  | 0: Disable LVDS output function of P10_2 and P10_3 pin. |
|  |  | 1: Enable LVDS output function of P10_2 and P10_3 pin. |
| 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | LVDSCTRLC_1 | This bit specify whether to use the LVDS function: |
|  |  | 0: Disable LVDS output function of P10_0 and P10_1 pin. |
|  |  | 1: Enable LVDS output function of P10_0 and P10_1 pin. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 2.4.3 Pin-Unit Register Explanation

### 2.4.3.1 PCRn_m/JPCRn_m — Port Control Register

Each register of a port group can be accessed via this register and the PCRn_m register can set all the functions of a single pin. For example, setting bit 6 of the PCRn_m register to 1 sets bit $m$ of the PMCn register to 1 also.

Multiple bits in the PCRn_m register can be batch-set within the ranges described in Section 2.4.4, Port Setting Procedures, Individual Setting.

## CAUTION

These registers are write-protected by PWE.
See Section 2.4.2.4, Other Registers for details.

Note 1. Refer to Section 2.5.1, List of Port Functions.
Table 2.44 PCRn_m Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 30 | PINV | Same function as bit $m$ of the PINVn register |
| 29 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 28 | PODC | Same function as bit $m$ of the PODCn register |
| 27 | PUCC | Same function as bit $m$ of the PODCEn register |
| 26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | PISA | Same function as bit $m$ of the PUCCn register |
| 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | PIS | Same function as bit $m$ of the PISAn register |
| 22 | PU | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | Same function as bit $m$ of the PISn register |  |
| 19 | Same function as bit $m$ of the PUn register |  |

Table 2.44 PCRn_m Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 17 | PBDC | Same function as bit $m$ of the PBDCn register |
| 16 | PIBC | Same function as bit $m$ of the PIBCn register |
| 15 | PSFSOE | Same function as bit $m$ of the PSFSOEn register |
| 14 | PSFSD | Same function as bit $m$ of the PSFSDn register |
| 13 | PSFSC | Same function as bit $m$ of the PSFSCn register |
| 12 | PPR | Same function as bit $m$ of the Pn register |
| 11 to 9 | PMC | Reserved |
| 8 | WIPC read, the value after reset is returned. When writing, write the value after reset. |  |
| 7 | PM | Same function as bit $m$ of the PPRn register |
| 6 | PFCEAE | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | PFCAE | Same function as bit $m$ of the PMCn register |
| 4 | PFCE | Same function as bit $m$ of the PIPCn register |
| 3 | PFC | Same function as bit $m$ of the PMn register |
| 2 | Same function as bit $m$ of the PFCAEn register |  |
| 1 | Same function as bit $m$ of the PFCEn register |  |
| 0 | Same function as bit $m$ of the PFCn register |  |

## NOTE

The control registers of the JTAG Port Control Register (JPCRO) are JPCR0_m (m=0 to 3,5)

### 2.4.4 Port Setting Procedures

Examples of port setting procedures are shown below.
For the procedures for setting the digital noise filter of a port, see Section 2.6.1, Digital Noise Filter.
For the procedures for setting the Port safe state mode, see Section 2.6.2.3, Configuration Flow.

## CAUTION

Even if a port is used in S/W I/O control alternative mode in a batch setting, the PMn_m register should be set at the end of the process in order to prevent output glitches.

In a PCR configuration, do not change the value of the invert value register (PINVn_m) and output value register (Pn_m) at the same time after output enable is active. If these registers are changed, set them again from the start of the register setting flow.

When returning to the "Port initializing" state after port setting has been configured, please set port register again in the inverse order with Port Group Unit register. At that case, it can not be used with Pin Unit register.

NOTE
When writing a reserved bit in virtual port registers, any value can be set-not just the value after reset. For details of reserved bits, refer to Section 2.5.1, List of Port Functions.

### 2.4.4.1 Batch Setting

The following shows an example of collectively setting a port group.

Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation.

Figure 2.3 Port Setting Flow (Batch Setting)

### 2.4.4.2 Individual Setting

The following shows an example of individually setting a port group.
Bits can be set simultaneously within the settable range described below by using the PCRn_m register.

Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation.

Figure 2.4 Port Setting Flow (in Port Mode)

Figure 2.5 Port Setting Flow (in Alternative Mode) (1/3)

Figure 2.5 Port Setting Flow (in Alternative Mode) (2/3)

Note 1. If the PPR bit is read just after the PIBC bit is set, execute the procedure in Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation.

Note 2. In case of port configuration of the following alternative functions, there is a possibility that ECM Error Source Status for $\overline{\text { ERRORIN }}$ is set in ECMmESSTRn, and ERROROUT_M and ERROROUT_C output Low Level. ECM Error Source Status can be cleared by ECMESSTCn. $\overline{E R R O R O U T \_M}$ and ERROROUT_C can be masked by ECMEMKn. Please set ECMEMK7 bit27 before port configuration of the following alternative function. Please clear ECMEMK7 bit27 after port configuration of that function if $\overline{\text { ERRORIN }}$ function is used.

About ECMmESSTRn, ECMEMKn and ECMESSTCn, refer to Section 39, Error Control Module (ECM)

In case of Port configuration by Port Control Register(PCRn_m)
P02_10: ATOM1_6 and ATOM5_2N
P15_6: TIM3_6, ATOM6_6 and ATOM7_6
P21_2: ATOM4_0 and ATOM2_4N
P32_0: LRX2 and ATOM1_5 (It is applicable to only E2xFCC1. Not applicable to E2M)
P32_5: ATOM3_5N

Figure 2.5 Port Setting Flow (in Alternative Mode) (3/3)

### 2.4.4.3 Protection Setting

The following shows an example of setting register protection.

Note 1. Disable the protection sequence of PKCPROT and PWE as needed. (If not needed, this sequence can be skipped.) When PKCPROT is set to A5A5 A500 to disable write access but PWE remains set to 1 , access to the specific Pn group registers remains enabled.

Figure 2.6 Protection Setting Flow

### 2.4.5 Functional Selection

### 2.4.5.1 Register Configuration When Using Alternative Functions

When the pin alternative function is used, set $\mathrm{PMCn} \_\mathrm{m}=1$ and select the relevant alternative function by using the PFCn_m, PFCEn_m, PFCAEn_m and PFCEAEn_m bits.

For several peripheral functions, a single alternative I/O function is allocated to multiple pins. However, input functions should not be enabled on multiple pins at the same time.

### 2.4.5.2 Alternative Functions That Can Be Used in Direct I/O Control Alternative Mode

The following table shows alternative functions that can be used in direct I/O control alternative mode. To use these functions, set PIPCn_m $=1$.

When PIPCn_m = 1, the set PMn_m value is ignored because the peripheral function controls the input and output of the buffer.

In addition, set PIPCn $\mathrm{m}=0$ if you are using an alternative function not listed in following table.
When the LVDS buffer is to be used, PIPCn_m register must not be set 1 .

Table 2.45 List of Alternative Functions That Can Be Used in Direct I/O Control Alternative Mode (Must Set PIPCn_m = 1)

| Category | Pin Name | I/O | Pin Function | Input/Output Control by Peripheral Functions |
| :---: | :---: | :---: | :---: | :---: |
| SCl3n | SCInRxD | I | Receive data input | Input through the pin is enabled when the SCI3nSCR.RE bit is set to enable reception by SCl 3 . |
|  | SCInTxD | 0 | Transmit data output | Output through the pin is enabled when the SCI3nSCR.TE bit is set to enable transmission by SCl3. |
|  | SCInSCK | I/O | Serial clock input/output | The SCI3nSCR.CKE[1:0] bits determine whether the pin is an input or output. <br> - Asynchronous transfer CKE[1:0] = 00: Both input and output through the pin are disabled. $\operatorname{CKE}[1: 0]=01:$ The pin is an output. <br> CKE[1:0] = 1x: Prohibited settings <br> - Synchronous transfer CKE[1:0] = $0 x$ : The pin is an output. |
| CSIHn | CSIHnTSO | 0 | Transmit data output (data integrity verification) | - Output control <br> See "CSIHTSSO Operation for Slave Mode", in Section 17, Clocked Serial Interface H (CSIH). <br> - Input control When the CSIHnCTL1.DCS bit is set to enable checking the consistency of data through CSIH, enabling the input buffer for the pin leads to the actual output level of the pin being looped back within the device. |
|  | CSIHnTSCK | I/O | Serial clock input/output | When the setting of SCIHnCTL2 is for CSIH operation in slave mode, this pin is an input. When the setting is for master mode, it is an output. |
|  | CSIHnTRY | I/O | Handshake signal input/output | When the setting of CSIHnCTL2 is for CSIH operation in slave mode, this pin is an output. When the setting is for master mode, it is an input. |
| ATU-V timer C | TIOCn0 to TIOCn3 | I/O | Input capture trigger input, output compare output | This pin is an output when ATU-V timer C is set to a compare-match operation by the TIOCx register. <br> This pin is an input when the setting is for an input capture operation. |
| HSSPIn | HSSPIn_TXD | 0 | Transmit data output | For details of output control and input control, see "Control of the HSSPI Pins", in Section 26, High Speed Serial Peripheral Interface (HS-SPI). |
|  | HSSPIn_CLK | I/O | Serial clock input/output |  |
|  | HSSPIn_SSLI | I | Slave selection input signal |  |
|  | HSSPIn_SSL | 0 | Slave selection output signal |  |
| Ethernet | MDIO | I/O | PHY chip set I/F data input/output. | Input through the pin is enabled when the ETNCnPIR.MMD and ETNCnPIR.MDI bits are enabled. <br> Output through the pin is enabled when the ETNCnPIR.MMD and ETNCnPIR.MDO bits are enabled. |

[^0]
### 2.4.5.3 Register Setting When Using an Analog Input Pin

It is not necessary to set a port register to select a pin function since ANxxx (SAR-A/D), DSANxxxP, DSANxxxN (DS$\mathrm{A} / \mathrm{D}$ ), CANxxxP and CANxxxN (Cyclic-A/D) for an analog input are always connected to the A/D converter.

However, some analog input ports are multiplexed with general input ports, so to use the ports as analog input ports, set PMCn_m $=0^{* 1}$ and PIBCn_m $=0$ (the value after reset of the port register). This prevents shoot-through current from the input buffer on the digital side during an analog voltage input. The relevant pins of this product are port groups P40_m.

Note 1. Some pins may not be equipped with a PMC40_m bit. For further details, see Section 2.5, Organization of Port Groups.

### 2.4.5.4 Register Setting to Use the LVDS Buffer

When the LVDS buffer is to be used, set the LVDSCTRL[A,B,C] register to enable input/output. Also, set whether the supply voltage of LVDS buffer is 3 V or 5 V .

## CAUTION

Input/output to/from the LVDS buffer actually being enabled/disabled takes at least $10 \mu \mathrm{~s}$ after setting LVDSCTRL[A,B,C].The following pins have LVDS buffer and also port functions, but these cannot be used at the same time. Be sure to set value after reset to each registers*1 as initialization in case LVDS buffer is used. In LVDS input mode, PFCn.PFCn_m, PFCEn.PFCEn_m and PMCn.PMCn_m can be set after IE bit of LVDSCTRL[A, B] is set. In LVDS output mode, PFCn.PFCn_m, PFCEn.PFCEn_m and PMCn.PMCn_m can be set before OE bit of LVDSCTRL[A, $B, C]$ is set. And PMn.PMn_m and PSFSCn.PSFSCn_m can be set after OE bit of LVDSCTRL[A, B, C] is set. Refer to Section 2.4.5.5, Setting Flow of LVDS function for more detail.
Note 1. Set PIBCn.PIBCn_m = 0, PBDCn.PBDCn_m =0, PMn.PMn_m = 1, PMCn.PMCn_m = 0, PIPCn, PIPCn_m = 0, PFCn.PFCn_m $=0$, PFCEn_PFCEn_m $=0$, PFCAEn.PFCAEn_m $=0$, PFCEAEn.PFCEAEn_m $=0$, PDn.PDn_m $=0$, PUn.PUn_m $=0$, PSFSCn.PSFSCn_m $=0$, PSFSDn.PSFSDn_m $=0$, PSFSOEn.PSFSOEn_m $=0$.

The LVDS setting registers are shown in the following table.
Table 2.46 LVDS Enable Register

| Port Register | Register <br> Bit | Power Domain | I/F | Pin Name <br> (A pair of Pch, Nch) | I/O | Control* ${ }^{* 1}$ | Related Function (A pair of Pch, Nch) | E2x-FCC1 |  | E2M |  |

Note 1. OE: Output Enable, IE: Input Enable. VSEL: Supply Voltage Select.

### 2.4.5.5 Setting Flow of LVDS function

The following shows the flow to use LVDS function.

Figure 2.7 LVDS Configuration Flow

### 2.4.5.6 Selecton of Function for JTAG Port

To enable connection of multiple tools to the JTAG port, the operation mode can be defined by a combination of mode pin and option byte settings. For details, see Section 45, Debugging and Calibration.

### 2.4.5.7 Setting of the ERROROUT_C loopback

When the pin level of ERROROUT_C is confirmed by ECM Checker Error Source Status register, set PBDCn_m = 1 to enable the alternative output level loopback function.

See Section 2.4.2.2(1), PBDCn/JPBDC0 — Port Bidirectional Control Register for details.

### 2.5 Organization of Port Groups

### 2.5.1 List of Port Functions

For detailed information on the control registers, refer to Appendix "E02-02_List of Port Functions.xlsx".
In the bitmap field, " $x$ " means an effective bit and "-" means a reserved bit. Reserved areas are always read as the values after reset. The write value also should be the value after reset. The registers of unimplemented pins should not be modified after reset.

### 2.5.2 List of Alternative Functions

For detailed information on the alternative functions of each pin, refer to Appendix "E02-01_List of Alternative Functions.xlsx".

In the file, "-" means a reserved function, and this function should not be selected. The functions of unimplemented ports cannot be selected and the registers of these unimplemented pins should not be modified after reset.

### 2.6 Functions

### 2.6.1 Digital Noise Filter

The Digital Noise Filter (DNF) eliminates digital noise from external input signals. This product includes two types of DNF: a peripheral function DNF and an edge detection DNF.

### 2.6.1.1 Example of Noise Elimination

Figure 2.8 Timing Chart of Digital Noise Elimination shows an example of noise elimination using a peripheral function DNF and an edge detection DNF. In this example, the sampling clock is set to $1 / 2$ of the DNF input clock, the sampling count is set to two(twice), and the current output level is set to low level. " $\circ$ " in the figure means that high level is detected.

In input examples 1,2 , and 3 , the output level changes from low to high because the same level is detected twice in a row through sampling. In input examples 4,5 , and 6 , on the other hand, the same level is not detected twice consecutively. Therefore, these inputs are regarded as noise and the input signal state is eliminated.

Figure 2.8 Timing Chart of Digital Noise Elimination

### 2.6.1.2 Peripheral Function DNF

## (1) Function Overview

This DNF eliminates noise from the input pins for peripheral functions.
The peripheral function DNF has the following functions:

- Eliminates digital noise from input signals and outputs noiseless signals.
- Selects whether to output signals from which digital noise is eliminated or signals containing digital noise.
- Selects the digital noise elimination width from 2, 3, 4, and 5 counts of the sampling clock.
- Selects from the five types of sampling frequency shown below:

$$
1 / 1,1 / 2,1 / 4,1 / 8 \text {, and } 1 / 16 \text { of the DNF input clock. }
$$

- The conditions for noise elimination can be set by each channel via registers.
- The DNF input clock of DNF group number 0,2 and 3 is a low-speed peripheral clock.
- The DNF input clock of DNF group number 1 is a high-speed peripheral clock.

## (2) DNF Register Base Addresses

The following table shows base addresses of DNF.
Table 2.47 Base Addresses of Peripheral Function DNF

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <DNF0_Base> | FFC3 $0000_{H}$ | Peripheral Group 6 |
| <DNF1_Base> | FFC3 $0040_{H}$ | Peripheral Group 6 |
| <DNF2_Base> | FFC3 $0080_{H}$ | Peripheral Group 6 |
| <DNF3_Base> | FFC3 $00 \mathrm{CO} 0_{H}$ | Peripheral Group 6 |

## (3) DNF Clock Supplies

The peripheral function DNF clock supplies are shown in the following table.
Table 2.48 Clock Supplies of Peripheral Function DNF

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| DNF0 | PCLK | CLK_LSB |
| DNF1 | PCLK | CLK_HSB |
| DNF2 | PCLK | CLK_LSB |
| DNF3 | PCLK | CLK_LSB |

## (4) DNF Reset Sources

The peripheral function DNF reset sources are shown below.
The peripheral function DNF is initialized by the following reset sources.
Table 2.49 Reset Sources of Peripheral Function DNF

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| DNF0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DNF1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DNF2 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DNF3 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

## (5) List of Peripheral Function DNF Registers

Table $2.50 \quad$ List of Registers

|  |  |  | Value | Symbol | Address |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Module Name | Register Name | after reset | Access | Access <br> Protection |  |
| DNFn | DNF Control Register | DNFP01nCTLm | <DNFn_base> $+04_{H} \times m$ | $00_{H}$ | 8 |

Note: n: DNF group number, m: channel number

## (6) DNFP01nCTLm - DNF Control Register

This register sets conditions for noise elimination of channel number $m$ in DNF group number $n$.

## Value after reset: $\quad 00_{H}$

Table 2.51 DNFP01nCTLm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | NFEN | This bit enables/disables digital noise elimination. <br> 0 : Digital noise is not eliminated. <br> 1: Digital noise is eliminated. |
| 6, 5 | SLST[1:0] | These bits specify the sampling count for digital noise elimination. <br> 00: Sampling count $=2$ <br> 01: Sampling count $=3$ <br> 10: Sampling count $=4$ <br> 11: Sampling count $=5$ |
| 4, 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | PRS[2:0] | These bits specify the sampling clock division ratio for digital noise elimination. <br> 000: DNF input clock/1 <br> 001: DNF input clock/2 <br> 010: DNF input clock/4 <br> 011: DNF input clock/8 <br> 100: DNF input clock/16 <br> Other than the above: Setting is prohibited. |

## (7) Setting Flow of Peripheral Function DNF

The following shows the procedures to set the peripheral function DNF.

Note 1. Wait for the specific time between $(A)$ and $(B)$ : sampling clock period $\times$ number of samples + DNF input clock period $\times 2$
Note 2. If the input level to a pin varies during $(A)$ and $(B)$, an unexpected signal may be input to the peripheral function. Therefore, the corresponding flag at the peripheral function side or the like should be cleared after (B).

Note 3. Clear the NFEN bit in the DNFP01nCTLm register, and then proceed the setting again in the order from steps (A) or later, if the setting is to be changed while the peripheral function DNF is operating.

Note: In case NFEN bit in DNF010CTL8 is set, there is a possibility that ECMmESSTRn for ERRORIN is set. Therefore please set ECMEMKn for $\overline{\text { ERRORIN }}$ before (A) and clear ECMESSTCn for $\overline{\text { ERRORIN }}$ after (B). Then please clear ECMEMKn if needed.

About ECMmESSTRn, ECMEMKn and ECMESSTCn, refer to Section 39, Error Control Module (ECM)

Figure 2.9 Peripheral Function DNF Setting Flow

## (8) List of Pins on Which a DNF Is Inserted

The following table shows the pins on which a DNF is inserted.
Table 2.52 Pins on Which DNF is Inserted

| DNF Group | DNF <br> Channel <br> Number <br> (m) | DNF Insertion Target Pin |  |  | E2x-FCC1 |  | E2M |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Pin Name | Pin Function | Peripheral Function | $\begin{aligned} & \text { BGA } \\ & 373 \end{aligned}$ | $\begin{aligned} & \text { BGA } \\ & 292 \\ & \text { (E2M) } \end{aligned}$ | $\begin{aligned} & \text { BGA } \\ & 373 \end{aligned}$ | $\begin{aligned} & \text { BGA } \\ & 292 \end{aligned}$ |

### 2.6.1.3 Edge Detection DNF

## (1) Function Overview

This DNF detects the valid edge of a pin input signal. The signals to be used for edge detection can be selected either before or after noise elimination.

The edge detection DNF has the following functions:

- Eliminates digital noise from input signals and outputs noiseless signals.
- Selects whether to output signals from which digital noise is eliminated or signals containing digital noise.
- Selects the digital noise elimination width from 2, 3, 4, and 5 counts of the sampling clock.
- Selects from the five types of sampling frequency shown below: $1 / 1,1 / 2,1 / 4,1 / 8$, and $1 / 16$ of the DNF input clock.
- The conditions for noise elimination can be set for all channels collectively by a register.
- The DNF input clock is a low-speed peripheral clock.

## (2) Edge Detection DNF Register Base Addresses

The following table shows the base addresses of the edge detection DNF. " n " indicates the number of the DNF group.
Table 2.53 Base Addresses of Edge Detection DNF

| Base Address Name | Base Address | Bus Group | E2x-FCC1 |  | E2M |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | BGA373 | $\begin{aligned} & \text { BGA292 } \\ & \text { (E2M) } \end{aligned}$ | BGA373 | BGA292 |
| <EDC00_Base> | FFC3 1000 ${ }_{\text {H }}$ | Peripheral Group 6 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

## (5) List of Edge Detection DNF Registers

Table $2.56 \quad$ List of Registers

| Module Name | Register Name |  |  | Value <br> after <br> reset | Access |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | | Access |
| :--- |
| Protection |

Note: n: DNF group number, m: channel number

## (6) DNFP02nCTL — DNF Control Register

This register sets noise elimination conditions which are commonly used for all channels in DNF group number n.

## Value after reset: $\quad 00_{H}$

Table 2.57 DNFP02nCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6, 5 | SLST[1:0] | These bits specify the sampling count for digital noise elimination. |
|  |  | 00: Sampling count $=2$ |
|  |  | 01: Sampling count $=3$ |
|  |  | 10: Sampling count $=4$ |
|  |  | 11: Sampling count $=5$ |
| 4,3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | PRS[2:0] | These bits specify the sampling clock division ratio for digital noise elimination. |
|  |  | 000: DNF input clock/1 |
|  |  | 001: DNF input clock/2 |
|  |  | 010: DNF input clock/4 |
|  |  | 011: DNF input clock/8 |
|  |  | 100: DNF input clock/16 |
|  |  | Other than the above: Setting is prohibited. |

## (7) DNFP02nEDCm — Edge Detection Control Register

This register controls edge detection of channel number $m$ in DNF group number $n$.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | NFEN | - | - | DMD[1:0] |  | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R/W | R/W | R | R | R |

Table 2.58 DNFP02nEDCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | NFEN | This bit enables/disables digital noise elimination. <br> 0 : Edge is detected for signals containing digital noise. <br> 1: Edge is detected for signals from which digital noise is eliminated |
| 6, 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4, 3 | DMD[1:0] | This bit enables/disables edge detection and sets edge to be detected <br> 00: Edge detection is disabled. <br> 01: Rising edge is detected. <br> 10: Falling edge is detected. <br> 11: Both edges are detected. |
| 2 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

## (8) DNFP02nEDFm — Edge Detection Flag Register

This register has an edge detection flag and a flag clear bit of channel number $m$ in DNF group number $n$.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | EDF | - | - | - | - | - | - | CLED |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 2.59 DNFP02nEDFm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | EDF | This bit holds a result of edge detection based on the edge detection setting for channel |
|  |  | number $m$. This bit is cleared by writing 1 to the CLED bit and continues to hold 1 unless it is |
|  |  | cleared. Its state does not change while 1 is held, even if an edge is detected. |
|  | 1: Valid edge has been detected. |  |
| 6 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLED | Writing 1 to this bit clears the status flag of EDF, bit 7 . In case of contention between the |
|  |  |  |
|  |  |  |

## (9) Setting Flow of Edge Detection DNF

The following shows the procedures to set edge detection DNF.

Note 1. Wait for the specific time between $(A)$ and $(B)$ : sampling clock period $\times$ number of samples + DNF input clock period $\times 2$
Note 2. If the input level to a pin varies during $(A)$ and $(B)$, an unexpected signal may be input to the peripheral function. Therefore, the corresponding flag at edge detection DNF side or the like should be cleared after (B).

Note 3. Set DMD[1:0] bits to $00_{H}$ in the DNFP02nEDCm register, and then proceed the setting again in the order from steps (A) or later, if the setting is to be changed while edge detection DNF is under the operation.

Figure 2.10 Edge Detection DNF Setting Flow
(10) List of Pins on Which an Edge Detection DNF Is Inserted

All port groups are the targets of edge detection DNF insertion. For details, see the following tables.
Table 2.60 DNF Insertion Target Pins (1/5)

| Edge Detection DNF Group | DNF Channel Number m | Pin Name | E2x-FCC1 |  | E2M |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 2.6.2 Port Safe State Mode

All Port Groups have a Port Safe State Function implemented. Each of these Port Groups has its own Port safe state enable bit that is located in the PSFSCn_m register. When Port safe state trigger signal named ERROROUTZ controlled by the Error Control Module becomes active, the port behavior is changed to the following states.

- Case of PSFSCn_m $=0$

The output control still remains. (Port mode or alternative control mode.)

- Case of PSFSCn m=1

The output control is changed to Port Safe State mode. The Port register ( $\mathrm{Pn} \_\mathrm{m}$ ) is disconnected and switched to the Port Safe State Data register (PSFSDn_m), and the Port mode register (PMn_m) is switched to the Port Safe State Output Enable register (PSFSOEn_m) which takes over output enable control.

## NOTES

1. Do not set PSFSOEn_m = 1 if the target port is used in input mode.
2. Do not set PSFSOEn_m = 1 and PSFSDn_m $=1$ if the target port is used in LVDS output mode.
3. The source of Port safe state trigger signal is an error output signal named ERROROUTZ in the Error Control Module (ECM). It can be controlled by the ECMmESET and ECMmECLR registers. Port safe state mode must be set after the error signal is cleared by the ECMmECLR register. For details, refer to Section 39.3.3, ECMmECLR ECM Master/Checker Error Clear Trigger Register (m = M/C).
4. When the Port safe state function is enabled for dynamically toggled pins such as the serial communication, these pins may output unexpected signals as normal communication because the state of target pins is fixed as soon as the error has been detected. But in that case, this function can block abnormal output signals immediately by fixing these ports to Port safe state.

In case output level is set to High or Low by using the Port safe state function, the number of pins which can be applied to this function is restricted to 5 pins or less in each group.
(PSFSCn.PSFSCn_m = 1 and PSFSOEn.PSFSOEn_m = 1)
On the other hand, the number of these pins is not restricted if output level is set to Hi-z.
(PSFSCn.PSFSCn_m = 1 and PSFSOEn.PSFSOEn_m = 0)
For each pin group, refer to Note 3 of Section 1.2.6 Output Voltage Characteristics in RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

### 2.6.2.1 Block Diagram

The following figure shows an overview of the Port Safe State Function.

Note 1. When the Option Byte PFC_RESO_CFG = 1 only. (See Section 2.6.8, RES_OUT Function for details.)
Note 2. The ERRORIN function which is an alternative mode is one of the source of the Port safe state trigger. When a low level is input from $\overline{\text { ERRORIN }}$, the ERROROUTZ signal in ECM is active (output goes low) immediately. Please enable DNF by DNFP010CTL8 for noise elimination if $\overline{E R R O R I N}$ function is used. There is a possibility that ECMmESSTRn for $\overline{\text { ERRORIN }}$ is set. Therefore please set ECMEMKn for $\overline{\text { ERRORIN }}$ before setting DNFP010CTL8 and clear ECMESSTCn for $\overline{\text { ERRORIN }}$ after setting DNFP010CTL8.Then please clear ECMEMKn if needed. About ECMmESSTRn, ECMEMKn and ECMESSTCn, refer to Section 39, Error Control Module (ECM) About DNF setting flow, refer to Section 2.6.1.2(7), Setting Flow of Peripheral Function DNF.

Figure 2.11 Block Diagram of Port Safe State

### 2.6.2.2 Supported Pins

All port groups are the target of the Port Safe State function. (See Section 2.1.1, Port Group for the supported port groups). The following table shows a list of pins not subject to the Port Safe State function.

Table 2.61 Pins Not Subject to Port Safe State Function

| Category | Pin Name |
| :--- | :--- |
| Reference voltage pins of A/D converters | ADSVREFH, ADSVREFL, AOVREFH, A1VREFH ${ }^{* 1}$, A2VREFH, A3VREFH*1 |
| Analog input pins*2 | ANxxx, CANxxxN, CANxxxP, DSANxxxN, DSANxxxP |
| Pins connected to capacitors | ADSVCL, RAMSVCL |
| External reset input pins | $\overline{\text { RES_IN }}$ |
| Non-maskable input pins | NMI |
| Debug control pins | TCK, TDI, TDO, TMS, $\overline{\text { TRST }, ~} \overline{\text { DRDY },}$, |
| Mode setting pins | MD0, MD1 $, ~ C I C R E F P, ~ C I C R E F N, ~ T O D P 0, ~ T O D N 0 ~$ |
| Crystal pins | XTAL, EXTAL |
| Error output pins | $\overline{\text { ERROROUT_M } * 3}$ |

Note 1. These power supply pins are not implemented in BGA292.
Note 2. Some analog input pins are not implemented in BGA292. Refer to the Section 2.6.6, Dedicated Analog Pin Table for details.
Note 3. When Port safe state trigger signal becomes active, the status of $\overline{\text { ERROROUT_M }}$ will be changed to Low output as the Port safe state depends on the ECM setting. Refer to Section 39, Error Control Module (ECM) for details.

### 2.6.2.3 Configuration Flow

The following shows the flow to use Port safe state mode.

Note 1. Refer to Section 39.3.3, ECMmECLR — ECM Master/Checker Error Clear Trigger Register ( $\mathbf{m}=\mathbf{M} / \mathbf{C}$ ).

Figure 2.12 Setting Flow of Port Safe State

### 2.6.3 Virtual Port Function via RHSB (XBAR)

Virtual ports are port groups that are not connected to external pins but are instead connected to internal functions. Port groups P50, P51, P52 and P53 are virtual ports for the XBAR function of RHSB. Configurable output signals are 64 bits in total (each port group has 16 bits x 4 groups), and it is possible to transfer these data serially to other devices via XBAR in the same way as with a port register setting (XBAR function, see Section 22.6, Cross Bar (XBAR)).

- The output data (64 bits) of P50, P51, P52 and P53 is transferring to input of XBAR function.
- Output pins of P50, P51, P52 and P53 are connected to XBAR function instead of IO output buffer.
- The data from XBAR function is transferred to RHSB.

### 2.6.3.1 Block Diagram

The following figure shows the use of coordination with XBAR Function.

Note 1. $n$ : Virtual Port Group number. ( $n=50,51,52,53$ ).
Note 2. Virtual Port can be read the Pn_m value as the same as Port function.

Figure 2.13 Block Diagram of Virtual Port Function via RHSB

### 2.6.4 Virtual Port Function via HSSPI

Virtual ports are port groups that are not connected to external pins but are instead connected to internal functions. Port groups P54, P55, P56 and P57 are virtual port groups for HSSPI I/F. Their function is to transfer the received serial data from HSSPI I/F to GTM/ATU, as the inverted function of delivering the serial data to XBAR described in Section

### 2.6.3, Virtual Port Function via RHSB (XBAR).

About the HSSPI function, see Section 26, High Speed Serial Peripheral Interface (HS-SPI).

- The data (max 64 bits) from HSSPI is transferred to the input pins of P54, P55, P56 and P57.
- The input pins of P54, P55, P56 and P57 are connected to HSSPI instead of the IO input buffer.
- The data from HSSPI is transferred to GTM/ATU via the port function (pin multiplexed table, see Section 2.5.2, List of Alternative Functions).
- The 64 bits of data from HSSPI can be divided into 8 bits per frame.
- For example, the received data is $8 * \mathrm{n}$ bits $(\mathrm{n}=1,2,3, \ldots, 8)$

### 2.6.4.1 Block Diagram

The following figure shows the use of P54, P55, P56 and P57. It may look like the data for GTM/ATU is from P54, P55, P56 and P57, but actually, the data is from HSSPI.

Note 1. $n$ : Virtual Port Group number. $(n=54,55,56,57)$.
Note 2. Virtual Port can read the Pn_m value as the same as Port function.

Figure 2.14 Block Diagram of Virtual Port Function via HSSPI

### 2.6.5 Virtual Port Function via Analog

Virtual ports are port groups that are not connected to external pins but are instead connected to internal functions. The target port groups are P41, P42 and P43 for E2x-FCC1 and E2M. This function is to transfer the received serial data from Analog Boundary Flag generator to GTM/ATU, as the inverted function of delivering the serial data to XBAR described in Section 2.6.3, Virtual Port Function via RHSB (XBAR).

About Analog Boundary Flag generator, see Section 34, Analog to Digital Converter (ADCH), Section 35, Delta-Sigma Analog to Digital Converter (DSADC) and Section 36, Cyclic Analog to Digital Converter (CADC).

- The data (max 40 bits for E2x-FCC1 and E2M.) from Analog Boundary Flag generator is transferring to input pins of P41, P42 and P43.
- Input pins of virtual ports are connected to Analog Boundary Flag generator instead of IO input buffer.
- The data from Analog Boundary Flag generator is transferred to GTM/ATU via port function (pin multiplexed table, see Section 2.5.2, List of Alternative Functions).

### 2.6.5.1 Block Diagram

The following figure shows the use of virtual ports. It may look like the data for GTM/ATU is from a virtual port, but actually, the data is from the analog module.

Note 1. $n$ : Virtual Port Group number. $(n=41,42,43)$ for E2x-FCC1 and E2M.
Note 2. Virtual Port can read the Pn_m value the same as the Port function.

Figure 2.15 Block Diagram of Virtual Port Function via Analog

### 2.6.6 Dedicated Analog Pin Table

The following tables list the dedicated analog pin in each product.
Table 2.62 Dedicated Analog Pin (1/4)

### 2.6.7 ICUM Select Function

For the ICUM select function, ports are controlled by ICUM even if the port is in alternative mode or Port safe state mode. Then no matter what function is selected for the port, the ICUM selection function is always active. The control from ICUM is asynchronous to the clock bus. The priority of the ICUM select function is higher than GPIO control and IP control, but lower than reset.

ICUM select function target pin: P22_11.
For information on how to use the ICUM function, refer to the separate User Manual: Intelligent Cryptographic Unit.

### 2.6.7.1 Block Diagram

Figure 2.16 Block Diagram of ICUM Function

### 2.6.8 RES_OUT Function

### 2.6.8.1 Overview

This product has a $\overline{\text { RES_OUT }}$ pin to handshake with a debugger. The behavior of this signal's output can be selected by using an Option Byte as follows. For detailed information about Option Bytes, refer to the Section 42, Basic Hardware Protection (BHP).

## (1) Option Byte PFC_RESO_CFG = 1

- RES_OUT pin is assign P27 group (P27_0 only) supported with output in order to handshake to debugger only.
- This port setting is configurable as a high/low output with push-pull and open drain modes that are the same as other port. However, all of the P27 registers are protected by a key code register.
- The output signal is low when reset factor (see Section 2.1.5, Reset Sources for details) is asserted. It will hold the low output until port setting is changed by user SW command.
- This pin shows the internal reset state, so can be used as handshake for external devices like debugger.

The following figure shows the use of RES_OUT function.

Figure 2.17 Timing Chart for RES_OUT Function for Each Reset Factor (PFC_RESO_CFG = 1).

## (2) Option Byte PFC_RESO_CFG $=0$

- RES_OUT pin is not assigned to a port group, so the port setting is not configurable.
- The output signal is low when reset factor (see Section 2.1.5, Reset Sources for details.) is asserted. And the terminal state is automatically changed from low to high after internal reset.

The following figure shows the use of RES_OUT function.

Figure 2.18 Timing Chart for RES_OUT Function for Each Reset Factor (PFC_RESO_CFG = 0).

### 2.7 List of Pin Function

### 2.7.1 Overview

Table 2.63 list the functions of each pin. " $\checkmark$ " indicates that the pin support the relevant function and "-" indicates that it does not. Do not use pins that do not support the relevant functions.

### 2.7.2 Details Function

Table 2.63 Pin Function (1/23)

| Category | Function Name | 10 | Function | E2x-FCC1 |  | E2M |  |

Note 1. These functions are multiplexed via virtual ports, so it can only be used in input mode. (See Section 2.5.2, List of Alternative Functions for details). About port group support pins, refer to the Section 2.1.1, Port Group.

### 2.8 Pins Status

See the description of the pin states in Section 10, Reset Controller for the definition of each reset state.
The following table describes the condition definition for pin states, such as Condition A is External Reset State.

Note 1. Field BIST status will be skipped if $\overline{\operatorname{TRST}}=\mathrm{H}$ is set.
Note 2. Debug I/F mode is changed by the latched value of the TDI pin at rising edge of $\overline{\text { TRST }}$.
Note 3. The condition is not changed and keep "condition E", if LPD 4 pin mode is selected.
Note 4. This condition is supported with CAN/CAN-FD debug I/F mode in Serial Programing Mode only.
(About CAN/CAN-FD mode, see Section 5, Operating Modes.)
(About AC timing constraints, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.)
Note 5. Boundary Scan debug I/F mode is not supported in Serial Programing Mode. NEXUS or LPD 4 pin mode can be selected.
Note 6. About reset categories and reset sources, see the Section 10, Reset Controller.

Figure 2.19 Pin Status Conditions

Table 2.64 Pin State in Normal Operation Mode, User Boot Mode and Serial Programing Mode

| Pin Function |  | Pin State |  |  |  |  |  |  |  |

|  |  | TMS/JP0_3 | Z | Z | Z | Z | Z | Z |
|  |  | TRST | I (pull-down) | I (pull-down) | I (pull-down) | I (pull-down) | I (pull-down) | I (pull-down) |
|  |  | DRDY / JP0_5 | Z | Z | Z | Z | Z | Z |

Note: I: Input
O: Output
H: Output High
L: Output Low
Z: High impedance
Pull-up: On-chip pull-up resistor
Pull-down: On-chip pull-down resistor
Note: The port pin's input structures is designed in a way that during reset and after reset, unconnected pins do not tend to oscillate, draw excessive current, or exhibit unintended crosscoupling effects on other port pins.
Note 1. Boundary Scan I/F mode is not support with Serial Programing Mode.
Note 2. This condition is support with CAN/CAN-FD debug I/F mode in Serial Programing Mode only (About CAN/CAN-FD mode, see Section 5, Operating Modes for details.).
Note 3. When the Option Byte PFC_RESO_CFG $=0, \overline{\text { RES_OUT }}$ pin output is changed to high after internal reset release. (See Section 2.6.8, RES_OUT Function for details.)
Note 4. $\overline{\text { DRDY }}$ pin status depends on the NEXUS/JTAG state. WAIT state is high, and IDLE state is low.
Note 5. ERROROUT_M pin status depends on the output signal from Error Control Module. (See Section 39, Error Control Module (ECM) for details.)
Note 6. The condition $M$ is the same as the previous condition just before system reset 2 is asserted.
Note 7. When the status is changed from condition F, DRDY pin depends on the NEXUS/JTAG state. WAIT state is high, and IDLE state is low.
Note 8. When the status is changed from condition E or F or M, TDO and $\overline{D R D Y}$ pins are the same as the previous condition.

### 2.9 Handling of The Unused Pins

Examples of the handling of unused pins are listed in following table.
Table 2.67 Examples of the Handling of Unused Pins (1/3)

| Classification | Pin Name | IO | Examples of Handling of Unused Pins | On-chip Pull-down/Pull-up Resistor |
| :--- | :--- | :--- | :--- | :--- |
| Clock | XTAL | O | This pin can be left open. | None |
|  | EXTAL | I | (This pin will always be used.) | None |
| System control | RES_IN | (This pin will always be used.) | This pin is equipped with an internal pull-down <br> resistor. |  |
|  | RES_OUT | MD0 | This pin can be left open. | None |
|  | Interrupt | NMI | I | (This pin will always be used.) <br> This pin must be connected to VSS via <br> individual resistor. |
| ECM | ERROROUT_M | This pin must be connected to VSS via <br> individual resistor. | This pin is equipped with an internal pull-down <br> resistor. |  |
| General input/ | Pn_m | This pin is equipped with an internal pull-down <br> resistor. |  |  |
| output port | This pin can be left open. | This is equipped with an internal pull-down <br> resistor. |  |  |

Table 2.67 Examples of the Handling of Unused Pins (2/3)

| Classification | Pin Name |  | 10 | Examples of Handling of Unused Pins | On-chip Pull-down/Pull-up Resistor |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Debug | AURORES *1 |  | I | Refer to Section 2.9.1, Handling of Thermal Area Pins. | Refer to Section 2.9.1, Handling of Thermal Area Pins. |
|  | CICREFP*1 |  | 1 | Refer to Section 2.9.1, Handling of Thermal Area Pins. | Refer to Section 2.9.1, Handling of Thermal Area Pins. |
|  | CICREFN*1 |  | 1 | Refer to Section 2.9.1, Handling of Thermal Area Pins. | Refer to Section 2.9.1, Handling of Thermal Area Pins. |
|  | TODP0*1 |  | O | Refer to Section 2.9.1, Handling of Thermal Area Pins. | Refer to Section 2.9.1, Handling of Thermal Area Pins. |
|  | TODN0*1 |  | 0 | Refer to Section 2.9.1, Handling of Thermal Area Pins. | Refer to Section 2.9.1, Handling of Thermal Area Pins. |
|  | TDI/LPDI/JPO_O/FP DR | TDI | 1 | This pin can be left open. If it is connected, this pin must also be connected to VCC via an individual resistor | This pin is equipped with an internal pullup resistor. |
|  |  | LPDI | 1 | This pin can be left open. If it is connected, this pin must also be connected to VCC via an individual resistor | This pin is equipped with an internal pullup resistor. |
|  |  | JP0_0/FPDR | 1 | Do not select the JPO_0/FPDR pin function if the pin is not use in use. | (The pins are equipped with internal pullup or pull-down resistors which can be enabled by register settings.) <br> The internal pull-up resistor is enabled in booting up by the boot firmware. |
|  | $\begin{array}{\|l\|} \hline \text { TDO/LPDO / } \\ \text { JP0_1/FPDT } \end{array}$ | TDO | 0 | This pin can be left open | None |

Note: For the correspondences between the various pins and the power supply or ground, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.
Note: Use a resistor with a value of at least $1 \mathrm{k} \Omega$ for externally pulling pins up or down.
Note: Take care regarding the resistive division effect when using an external resistor to pull up or pull down a pin that is equipped with an internal pull-up or pull-down resistor.
Note 1. The pin is implemented only in E2x-FCC1.

### 2.9.1 Handling of Thermal Area Pins

### 2.9.1.1 The Case of using Emulation/Instrumentation RAM (SYSVCC and EMUVDD are always supplied)

Emulation/Instrumentation RAM is available.
Emulation/Instrumentation RAM can be retained when power-off standby (see Section 16.2.1, Power Off Standby Mode for details).

Aurora I/F is can not be used $(\overline{\text { AURORES }}=\mathrm{VSS})$.

## Section 3 CPU System

### 3.1 Overview

### 3.1.1 Block Diagram

For the block diagram of the CPU system, see Figure 1.5 and Figure 1.6 in Section 1, Overview.
The CPU system consists of the following modules.

## CPU0 (PE0), CPU1 (PE1)

The RH850 G4MH core is included as the main CPU. The CPUs also include a checker core for safety assurance.

## ICUMD

Refer to the E2x ICUMD User's Manual.

## Local RAM

Each PE has a high-speed accessible local RAM.

## Cluster RAM

The cluster RAM is a mass on-chip RAM that all PEs share. Some areas of this RAM function as the retention RAM.

## Code Flash

A mass code flash is included for program storage. PE0, PE1 and ICUMD share the code flash and they are connected with each other via the code flash interface.

## Emulation RAM

This is RAM to emulate the code flash. The programs can be replaced by control from an external tool without rewriting the code flash. It is supported in E2x-FCC1.

## Data Flash

This is a flash memory rewritable by the CPU.

## P-Bus and H -Bus and I-Bus

Peripheral IPs are connected on P-Bus, H-Bus and I-Bus.

E2x-FCC1: The P-Bus consists of 10 groups, Peripheral Group 0 to 9 . The H-Bus consists of 3 groups, H -Bus Group 0 to 2. The I-Bus consists of 4 groups, I-Bus Group 0 to 3 .

E2M: The P-Bus consists of 10 groups, Peripheral Group 0 to 9 .
The H-Bus consists of 3 groups, H -Bus Group 0 to 2.
The I-Bus consists of 4 groups, I-Bus Group 0 to 3 .
Refer to each section on peripheral IPs for information on bus groups.

## INTC1, INTC2

INTC1 is an interrupt controller exclusive to each PE. INTC2 is a common interrupt controller that all PEs can share, which is able to set the destination PE for binding interrupt requests by the registers.

## DMA

Two DMA transfer modules, sDMAC and DTS, are included. DTS includes the checker logic for safety assurance.

### 3.2 CPU

### 3.2.1 Core Functions

### 3.2.1.1 Features

Table 3.1 lists the features of the RH850G4MH core. See the RH850G4MH User's Manual: Software.
Table 3.1 Features of the RH850G4MH Core

| Item | Feature |
| :---: | :---: |
| CPU | - High performance 32-bit architecture for embedded control <br> - 32-bit internal data bus <br> - Thirty-two 32-bit general-purpose registers <br> - RISC-type instruction sets <br> - Long/short type load/store instructions <br> - Three-operand instructions <br> - Instruction sets based on C <br> - CPU operating modes <br> - User mode, supervisor mode <br> - Address space: 4-GB linear space for both data and instructions <br> - Out-of-Order execution |
| Coprocessor | - A floating point operation coprocessor (FPU) <br> - Supports single precision (32-bits) and double precision (64-bits). <br> - Supports IEEE754-compliant data types and exceptions. <br> - Rounding mode: Nearest, 0 direction, $+\infty$ direction, and $-\infty$ direction <br> - Handling of non-normalized numbers: These are truncated to 0 , or an exception is reported to comply with IEEE754. <br> - An extended floating-point operation coprocessor (FXU) <br> - Supports 4 single-precision (32-bit) parallel operations (FP-SIMD) <br> - Supports IEEE754-compatible data types and exceptions <br> - Rounding modes: Nearest, 0 direction, $+\infty$ direction, and $-\infty$ direction <br> - Handling of non-normalized numbers: These are truncated to 0 , or an exception is reported to comply with IEEE754. |
| Exception/Interrupt | - 16-level interrupt priority that can be specified for each channel <br> - Vector selection method that can be selected according to performance requirements and the amount of consumed memory <br> - Direct branch method exception vector (direct vector method) <br> - Address-table-referencing indirect branch method exception vector (table reference method) <br> - Support for high-speed context save and restore processing on interrupt by using dedicated instructions (PUSHSP, POPSP) <br> - Support for high-speed context save on interrupt by using the register bank feature <br> - Support for restoration from the register bank using a dedicated instruction (RESBANK) |
| Memory Management | - Memory protection function (MPU): 24 areas settable. |
| Cache | - Instruction cache 16 KB |

### 3.2.2 Processor Model

This CPU defines a processor model that has basic operation functions, registers, and an exception management function.

This section describes the unique features of the processor model of this CPU

### 3.2.2.1 CPU Operating Modes

This CPU has two operating modes of the supervisor mode (SV) and the user mode (UM). Whether the system is in supervisor mode or user mode is indicated by the UM bit in the PSW register.

- Supervisor mode (PSW.UM = 0): All hardware functions can be managed or used.
- User mode (PSW.UM = 1): The usable hardware functions are restricted.
(1) Definition of CPU Operating Modes
(a) Supervisor Mode (SV)

All hardware functions can be managed or used in this mode. The system always starts up in supervisor mode after a reset.
(b) User Mode (UM)

This operating mode makes up a pair with the supervisor mode. In user mode, address spaces to which access is permitted by the supervisor and the system registers defined as user resources can be used. Supervisor-privileged instructions cannot be executed and result in exceptions.

## Restriction in user mode (PSW.UM = 1)

- Privileged instruction violations due to SV-privileged-instruction operating restrictions
$(\rightarrow$ PIE exceptions)
For details about privileged-instruction operating restrictions, see Section 3.2.2.1(3), CPU Operating Mode and Privileges.

## (2) CPU Operating Mode Transition

The CPU operating mode changes due to three events.

## (a) Change due to Acknowledging an Exception

When an exception is acknowledged in user mode, the CPU operating mode changes to privileged mode.
When an exception is acknowledged in supervisor mode, the CPU operating mode remains as is.
(b) Change due to a Return Instruction

When a return instruction is executed, the PSW value is restored according to the value of the corresponding bit backed up to EIPSW and FEPSW.
(c) Change due to a System Register Instruction

The CPU operating mode changes when an LDSR instruction is used to directly overwrite the PSW operating mode bits.

## CAUTION

The CPU operating mode cannot be changed in user mode because the higher-order 31 to 5 bits of the PSW register cannot be overwritten while the mode can be changed in supervisor mode. This CPU guarantees that if an LDSR instruction is used to update the PSW register, the new setting will be reflected when the subsequent instruction is executed. However, this CPU does not guarantee that the new setting will be reflected in the memory protection by the MPU for instruction fetch of the subsequent instruction. Therefore, for changing the higher-order 31 to 5 bits of the PSW register, it is recommended to use a return instruction. For details, see Section 3.2.7.3, Hazard Management after System Register Update.

## (3) CPU Operating Mode and Privileges

In this CPU, the usable functions can be restricted according to usage permission settings for specific resources and the CPU operating mode. Specific instructions (including instructions that update specific system registers) can only be executed in the defined operating mode. The permissions necessary to execute these specific instructions are called "privileges". In operating modes that do not have privileges, these instructions are not executed and exceptions occur.

This CPU defines the following two types of privileges (usage permission).

- Supervisor (SV) privilege: Privilege necessary for important system resources operation, fatal error processing, and user-mode program execution management
- Coprocessor use permissions: Permissions necessary to use a coprocessor

Figure 3.1 CPU Operating Modes and Privileges

## (a) Supervisor Privilege (SV Privilege)

The privilege necessary to perform the operation for important system resources, fatal error processing, and usermode program execution management is called the supervisor privilege (SV privilege). This privilege is available in supervisor mode. The SV privilege is generally necessary to execute instructions used to perform the operation for important system resources, and these instructions are sometimes called SV privileged instructions.

## (b) Coprocessor Use Permissions

Regardless of the CPU operating mode, it is possible to specify whether coprocessors can be used.
The CU2 to CU0 bits in the PSW register are used by a supervisor to specify whether coprocessors can be used by each program. If the CU 2 to CU0 bits are not set to 1 , a coprocessor unusable exception occurs when the corresponding coprocessor instruction is executed or the system register is accessed.
If no coprocessor is installed, it is not possible to set the corresponding CU bits to 1 . The setting of the CU2 to CU0 bits is valid regardless of the CPU operating mode, and, if the supervisor accesses coprocessor system registers, it is necessary to set the CU2 to CU0 bits to enable coprocessor use.

## (c) Operation when there is a Privilege Violation

When a privileged instruction is executed by someone who does not have the required privilege, or when a system register for which access permission is specified is accessed by someone who does not have the required permission, a PIE exception or UCPOP exception occurs.

The relationship between instructions that can be executed according to operating mode and use permission are shown in Table 3.2, and the relationship between system registers that can be accessed according to operating mode and use permission are shown in Table 3.3.

Table 3.2 Operation when Violating Execution Permission

| Instruction |  | PSW |  |  |  | Whether Instructions can be Executed |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Execution Permission | Classification | UM | CU2 | CU1 | CU0 |  |
| SV privilege | *1 | 0 | - | - | - | Possible |
|  |  | 1 | - | - | - | Not possible (PIE exception occurs) |
| User | Coprocessor 0 instruction | - | - | - | 0 | Not possible (UCPOP exception occurs) |
|  |  | - | - | - | 1 | Possible |
|  | Coprocessor 1 instruction | - | - | 0 | - | Not possible (UCPOP exception occurs) |
|  |  | - | - | 1 | - | Possible |
|  | Coprocessor 2 instruction | - | 0 | - | - | Not possible (UCPOP exception occurs) |
|  |  | - | 1 | - | - | Possible |
|  | Other than above | - | - | - | - | Possible |

Remark: —: 0 or 1
Note 1. Coprocessor instructions with SV privilege are not defined in this CPU.

Table 3.3 Operation When Violating Access Permission to System Registers

| System Register |  | PSW |  |  |  | Whether Instructions can be Executed |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Access Permission | Classification | UM | CU2 | CU1 | CU0 |  |
| SV permission | Coprocessor 0 Permission | 0 | - | - | 0 | Inaccessible (UCPOP exception occurs) |
|  |  | 0 | - | - | 1 | Accessible |
|  |  | 1 | - | - | 0 | Inaccessible (UCPOP exception occurs) |
|  |  | 1 | - | - | 1 | Inaccessible (PIE exception occurs) |
|  | Coprocessor 1 Permission | 0 | - | 0 | - | Inaccessible (UCPOP exception occurs) |
|  |  | 0 | - | 1 | - | Accessible |
|  |  | 1 | - | 0 | - | Inaccessible (UCPOP exception occurs) |
|  |  | 1 | - | 1 | - | Inaccessible (PIE exception occurs) |
|  | Coprocessor 2 Permission | 0 | 0 | - | - | Inaccessible (UCPOP exception occurs) |
|  |  | 0 | 1 | - | - | Accessible |
|  |  | 1 | 0 | - | - | Inaccessible (UCPOP exception occurs) |
|  |  | 1 | 1 | - | - | Inaccessible (PIE exception occurs) |
|  | Other than above | 0 | - | - | - | Accessible |
|  |  | 1 | - | - | - | Inaccessible (PIE exception occurs) |
| UM permission | Coprocessor 0 Permission | - | - | - | 0 | Inaccessible (UCPOP exception occurs) |
|  |  | - | - | - | 1 | Accessible |
|  | Coprocessor 1 Permission | - | - | 0 | - | Inaccessible (UCPOP exception occurs) |
|  |  | - | - | 1 | - | Accessible |
|  | Coprocessor 2 Permission | - | 0 | - | - | Inaccessible (UCPOP exception occurs) |
|  |  | - | 1 | - | - | Accessible |
|  | Other than above | - | - | - | - | Accessible |

Remark: -: 0 or 1

## (4) Halt State by a HALT Instruction

Executing a HALT instruction brings the CPU core to a HALT state.
A HALT state is terminated when a request for a terminating exception is made to the CPU. At this point, if the conditions for acknowledging the terminating exception are met, control is transferred to the exception handler address. Even if they are not met, the HALT state is terminated when the request is made; therefore, operation is resumed from the instruction following the HALT instruction.

## (5) Temporary Halt State by a SNOOZE instruction

A SNOOZE instruction is an instruction to reduce the use of bus bandwidth during a spinlock. After this instruction is completed, the CPU core is brought to a temporary halt state to restrict the execution of the subsequent instructions. Programmers can avoid the unnecessary use of bus bandwidth that results from short-term repetition of a locking process, by inserting this instruction into a spinlock loop.

A temporary halt state is terminated if any of the following conditions is met:

- After the time specified by the SNZCFG register elapsed, the execution of the subsequent instructions is resumed.
- The occurrence of a terminating exception causes control to be transferred to the exception handler address. If the conditions for acknowledging the exception are not met, execution is resumed from the instruction following the SNOOZE instruction. Also, if the exception is acknowledged, the instruction following the SNOOZE instruction is interrupted, and the PC restored indicates the instruction following the SNOOZE instruction.

### 3.2.2.2 Instruction Execution

The instruction execution flow of this CPU is shown below.

Figure 3.2 Instruction Execution Flow

If terminating exceptions can be acknowledged, if an exception is detected during the acquisition of instruction code, or if the execution privilege of the instruction is not satisfied, an exception occurs before the instruction is executed. If a resumable exception occurs while the CPU is executing the operation, it interrupts the execution of the operation and acknowledges the exception. In these cases, the result of instruction operation is, in principle, not reflected in registers or memory and the CPU retains its state that is established before executing the instruction.*1

For a pending exception such as a software exception, the exception is acknowledged after the result of instruction execution has been reflected.

For details of the types of exceptions, refer to Section 3.2.2.3, Exceptions and Interrupts.

Note 1. If an exception is acknowledged during the execution of the following instructions, intermediate results may be applied to memory or general-purpose registers. However, SP/EP is not updated.

- PREPARE, DISPOSE, PUSHSP, POPSP

### 3.2.2.3 Exceptions and Interrupts

Exceptions and interrupts are exceptional events that cause the program under execution to branch to another program. Exceptions and interrupts are triggered by various sources, including interrupts from peripherals and program abnormalities.

For details, see Section 3.2.2.3, Exceptions and Interrupts.

## (1) Types of Exceptions

The exceptions of this CPU are divided into the following three types according to the purpose of the exceptions.

- Terminating exception
- Resumable exception
- Pending exception

## (a) Terminating Exception

A terminating exception is an exception that is acknowledged by interrupting an instruction before the execution of the operation for the instruction. Terminating exceptions include interrupts, etc.

This type of exceptions, such as an interrupt or hardware error, start another program irrelevant to the currently processed program.

## (b) Resumable Exception

A resumable exception is an exception that occurs during the execution of the operation for an instruction and that is acknowledged without the completion of the instruction. It is also referred to as a precise exception because it is precisely acknowledged without the completion of the relevant instruction or the execution of the subsequent instruction.

Unlike a terminating exception, a resumable exception occurs during the execution of an instruction, and cancel the execution of the instruction, and so it allows the instruction to be executed again after exception handling. Therefore, it is possible to perform complex memory management while maintaining the consistency of the logical operation of programs, by executing the same instruction again after appropriate configuration by exception handling.

## (c) Pending Exception

A pending exception is an exception that occurs as a result of the execution of the operation for an instruction, and that is acknowledged after the completion of the instruction. Pending exceptions include software exceptions, etc.

The occurrence of a pending exception is defined as a normal operation of an instruction; therefore, unlike a resumable exception, a pending exception normally completes the instruction that caused it, and never re-executes the instruction. This exception is intended mainly for use in call gates, for example, for calling a management program.

## (2) Exception Level

In this CPU, if an exception with a high degree of urgency occurs while another exception is being processed, the urgent exception will be processed. To make it possible to return to the interrupted exception handling after acknowledging the urgent exception, even if the context had not been saved to the memory, exception causes are managed in the following two hierarchical levels.

- EI level exception
- FE level exception

EI level exceptions are used for processing such as regular user processing, interrupt servicing, and OS processing. FE level exceptions are used to enable interrupts with a high degree of urgency for the system or exceptions from the memory management function that might occur during OS processing to be acknowledged even while an EI level exception is being processed.

### 3.2.2.4 Coprocessors

In this CPU, single-precision and double-precision floating-point unit (FPU) and extended floating-point operation unit (FXU) are incorporated. Note that these coprocessors may not be available depending on the specification of the product.

## (1) Coprocessor Use Permissions

To execute a coprocessor instruction, permission to use the corresponding coprocessor instruction is necessary. Coprocessor use permissions are specified by the PSW.CU2 to PSW.CU0 bits, and, if an attempt is made to execute an instruction for which the corresponding coprocessor use permission is cleared to 0 , a coprocessor unusable exception (UCPOP) occurs.

In the following cases, the values of the PSW.CU2 to CU0 bits are fixed at 0 and cannot be changed.

- Coprocessor functions are not incorporated in the product
- Coprocessor functions are made unavailable according to the functions of the product

## (2) Correspondences between Coprocessor Use Permissions and Coprocessors

This CPU defines coprocessor use permissions to control the availability of the coprocessor for each program during CPU operation. There are three coprocessor use permissions (CU0 to CU2), and their correspondences with the coprocessors are shown in the following table. This CPU does not have a coprocessor function with the coprocessor use permission CU2. The coprocessor use permission CU2 is a function reserved for future CPUs that have compatibility with this CPU.

Table 3.4 Correspondences between Coprocessor Use Permissions and Coprocessors

| Coprocessor Use Permission | Coprocessor | Exception Cause Code |
| :--- | :--- | :--- |
| CU0 | Single-precision FPU | $80_{\mathrm{H}}$ |
|  | Double-precision FPU |  |
| CU1 | FXU | $81_{\mathrm{H}}$ |
| CU2 | Reserved | $82_{\mathrm{H}}$ |

## (3) Coprocessor Unusable Exceptions

A coprocessor unusable exception occurs if an attempt is made to execute a coprocessor instruction or access a system register of the coprocessor without having the corresponding coprocessor use permission (PSW.CUn $=0$ ).

For details about the opcodes of the coprocessor instructions, see the RH850G4MH User's Manual: Software. For details about the system registers of the coprocessors, see Section 3.2.3.4, FPU Function Registers and Section

### 3.2.3.5, FXU Function Registers.

If the register bank function is used, the FPSR register, which is a system register of the FPU, is accessed when the automatic context saving and the RESBANK instruction is executed. In this case, even if the coprocessor use permission is not given (PSW.CU0 $=0$ ), a coprocessor unusable exception does not occur.

## (4) System Registers

Some coprocessor functions have system registers as the part of their functions. The coprocessor use permission is necessary to access the system register of a coprocessor function. For some system registers, the supervisor privilege (SV privilege) is necessary in addition to the coprocessor use permission.

For details about the permissions necessary to access system registers, see Section 3.2.2.5, Registers.

### 3.2.2.5 Registers

This CPU defines program registers (general-purpose registers and the program counter PC) and system registers for controlling the status and storing exception information.

## (1) Program Registers

The program registers include general-purpose registers (r0 to r 31 ) and the program counter (PC).
Table 3.5 Program Registers

| Category | Access Permission | Name |
| :--- | :--- | :--- |
| Program counter | UM | PC |
| General-purpose registers | UM | r0-r31 |

Note: Access to the registers with UM (user mode) access permission is always allowed.
For details about program registers, see Section 3.2.3.1, Program Registers.

## (2) System Registers

System registers are placed in dedicated address spaces defined based on two types of address information: selection ID and register number. Up to 32 selection ID can be defined, and one selection ID includes up to 32 system registers. Therefore, up to 1024 system registers can be defined in the address spaces for system registers. Basically this CPU allocates selection ID as shown below:

Selection ID 0 to 3: Registers related to basic functions
Selection ID 4 and 5: Registers related to the memory management function
Selection ID 10 and 11: Registers related to functions expanded from the legacy architecture
Selection ID 12 and 13: Registers related to this CPU specific hardware functions
Other ID: $\quad$ Reserved for future expansion of CPUs compatible with this CPU

For details about system registers, see the relevant sections in Section 3.2.3, Register Set.

## (3) Register Updating

There are several methods used to update registers. Normally, no particular restrictions apply when updating register by using an instruction. However, when updating registers by using the following instructions, some restrictions might apply, depending on the operating mode.

- LDSR
- STSR

## (a) LDSR and STSR

The LDSR and STSR instructions can access all the system registers.
However, if a system register is accessed without the proper permission, a PIE exception or UCPOP exception might occur. For details about the access permission for each register, see the description of system registers in Section
3.2.3, Register Set. For details about behaviors when a privilege violation occurs, see Section 3.2.2.1(3), CPU Operating Mode and Privileges.

Figure 3.3 shows the flow of executing the LDSR and STSR instructions.

Figure 3.3 Flow of Executing the LDSR and STSR Instructions

## (4) Accessing Undefined Registers

If a system register number without any register assigned is accessed or if an inaccessible register is accessed, the following results occur.

- Undefined registers are handled as having the SV permission. When they are accessed by an LDSR or STSR instruction in user mode (PSW.UM = 1), a PIE exception occurs.
- For a read operation, the read result is undefined. If the read value is used in a program, unexpected behaviors might occur.
- For a write operation, the write operation is ignored.

## (5) Supervisor Lock Setting

If the SVLOCK.SVL bit is set (1), the following system registers cannot be updated even in supervisor mode: SPID, MPM, MPLA, MPUA, MPAT, and MPIDn

However, if the SVLOCK.SVL bit is set (1), an attempt to update the system registers above does not cause a PIE exception.

Also, even if the SVLOCK.SVL bit is set (1), it is possible to read the system registers above.
This function is intended for the safety of systems that incorporate this CPU. It prevents a program running in supervisor mode from abruptly changing memory protection setting due to a programming error, etc., to make illegal memory access possible, and to impair safety.

### 3.2.2.6 Data Types

## (1) Data Formats

This CPU handles data in little endian format. This means that byte 0 of a halfword or a word is always the least significant (rightmost) byte.

The supported data format is as follows.

- Byte (8-bit data)
- Halfword (16-bit data))
- Word (32-bit data)
- Double-word (64-bit data)
- Quad-word (128-bit data)
- Bit (1-bit data)

In this CPU, a memory access of double-word data is divided into two non-atomic memory accesses of word data, and a memory access of quad-word data is divided into four non-atomic memory accesses of word data.

## (a) Byte

A byte is 8 consecutive bits of data that starts from any byte boundary. Numbers from 0 to 7 are assigned to these bits, with bit 0 as the LSB (least significant bit) and bit 7 as the MSB (most significant bit). The byte address is specified as "A".

## (b) Halfword

A halfword is two consecutive bytes (16 bits) of data that starts from any byte boundary. Numbers from 0 to 15 are assigned to these bits, with bit 0 as the LSB and bit 15 as the MSB. The bytes in a halfword are specified using address " $A$ ", so that the two addresses comprise byte data of "A" and "A +1 ".

## (c) Word

A word is four consecutive bytes ( 32 bits) of data that starts from any byte boundary. Numbers from 0 to 31 are assigned to these bits, with bit 0 as the LSB (least significant bit) and bit 31 as the MSB (most significant bit). A word is specified by address "A" and consists of byte data of four addresses: "A", "A + 1 ", "A +2 ", and "A + 3 ".

## (d) Double-word

A double-word is eight consecutive bytes ( 64 bits) that start from any 4-byte boundary. Numbers from 0 to 63 are assigned to these bits, with bit 0 as the LSB and bit 63 as the MSB. A double-word is specified by address "A" and consists of byte data of eight addresses: "A", "A + 1 ", " $A+2 ", " A+3 ", " A+4 ", " A+5 ", " A+6 ", a n d " A+7 "$.

## (e) Quad-word

A quad-word is sixteen consecutive bytes ( 128 bits) that start from any 8-byte boundary. Numbers from 0 to 127 are assigned to these bits, with bit 0 as the LSB and bit 127 as the MSB. A quad-word is specified by address " A " and consists of byte data of sixteen addresses: "A", "A +1 ", $\ldots$, and " $\mathrm{A}+15$ ".

## (f) Bit

A bit is bit data at the nth bit within 8-bit data that starts from any byte boundary. Each bit is specified using its byte address " A " and its bit number " n " $(\mathrm{n}=0$ to 7 ).

## (2) Data Representation

## (a) Integers

Integers are represented as binary values using 2's complement, and are used in one of four lengths: 64 bits, 32 bits, 16 bits, or 8 bits. Regardless of the length of an integer, its place uses bit 0 as the LSB, and this place gets higher as the bit number increases. Because this is a 2's complement representation, the MSB is used as a sign bit.

The integer ranges for various data lengths are as follows.

- Double-word ( 64 bits): -9223372036854775808 to +9223372036854775807
- Word ( 32 bits): $\quad-2147483648$ to +2147483647
- Halfword (16 bits): -32768 to +32767
- Byte ( 8 bits): $\quad-128$ to +127

Although data format of quad-word ( 128 bits ) is defined, data representation of quad-word is not used in this CPU. This is because quad-word data consists of four-word data or two-double-word data, but this CPU does not process quad-word data directly.

## (b) Unsigned Integers

In contrast to "integers" which are data that can take either a positive or negative sign, "unsigned integers" are never negative integers. Like integers, unsigned integers are represented as binary values, and are used in one of four lengths: 64 bits, 32 bits, 16 bits, or 8 bits. Also like integers, the positioning of unsigned integers uses bit 0 as the LSB and gets higher as the bit number increases. However, unsigned integers do not use a sign bit.

The unsigned integer ranges for various data lengths are as follows.

- Double-word (64 bits): 0 to 18446744073709551615
- Word (32 bits): 0 to 4294967295
- Halfword (16 bits): 0 to 65535
- Byte ( 8 bits): 0 to 255

## (c) Bits

Bit data are handled as single-bit data with either of two values: cleared (0) or set (1). There are four types of bitrelated operations (listed below), which target only single-byte data in the memory space.

- Set
- Clear
- Invert
- Test

## (3) Data Alignment

In this CPU, misaligned data allocation is inhibited. When the result of address calculation is a misaligned address, a misalignment exception (MAE) occurs.

Misaligned access indicates the accesses to the data size with the addresses listed below:

- Halfword size: The access to an address that is not at the halfword boundary $($ where LSB of the address $=0)$
- Word size: The access to an address that is not at the word boundary ( where the lowest two bits of the address $=0$ ).
- Double-word size: The access to an address that is not at the double-word boundary ( where the lowest three bits of the address $=0$ ).
- Quad-word size: The access to an address that is not at the quad-word boundary ( where the lowest four bits of the address $=0$ )

For the double-word format only, a misaligned access exception does not occur when data is placed at the word boundary but not at the double-word boundary, and data can be normally accessed in double word.

## CAUTIONS

1. The following instructions might possibly cause misaligned access. For details, see the relevant descriptions in the RH850G4MH User's Manual: Software.

- LD.H, LD.HU, LD.W, LD.DW
- SLD.H, SLD.HU, SLD.W
- ST.H, ST.W, ST.DW
- SST.H, SST.W
- LDL.HU, LDL.W, STC.H, STC.W, CAXI
- LDV.W, LDV.DW, LDV.QW, STV.W, STV.DW, STV.QW
- LDVZ.H4, STVZ.H4

2. The following instructions do not cause misaligned access, because the address is rounded as the instruction specification when a misaligned address is specified.

- PREPARE, DISPOSE
- PUSHSP, POPSP
(a) Byte Access

(b) Halfword Access

(c) Word Access

(d) Double-word Access

Note 1. No misalignment exception (MAE) occurs for LD.DW and ST.DW instructions. For details, see LD.DW and ST.DW in the RH850G4MH User's Manual: Software. An MAE occurs for other double-word access instructions.

Figure 3.4 Example of Data Placement for Misaligned Access (1/2)

Figure 3.4 Example of Data Placement for Misaligned Access (2/2)

### 3.2.2.7 Address Space

This CPU supports a linear address space of up to 4 Gbytes. Both memory and I/O can be mapped to this address space (using the memory mapped I/O method). The CPU outputs a 32-bit address for memory and I/O, in which the highest address number is " $2^{32}-1$ ".

The byte data placed at various addresses is defined with bit 0 as the LSB and bit 7 as the MSB. When the data is comprised of multiple bytes, it is defined so that the byte data at the lowest address is the LSB and the byte data at the highest address is the MSB (i.e., in little endian format).

This manual stipulates that, when representing data comprised of multiple bytes, the right edge must be represented as the lower-order addresses and the left side as the higher-order addresses, as shown below.

Figure 3.5 Address Space Byte Format

## (1) Memory Map

This CPU is 32-bit architecture and supports a linear address space of up to 4 Gbytes. The whole range of this 4-Gbyte address space can be addressed by instruction addressing (instruction fetch access) and data addressing (data access).

A memory map is shown in Figure 3.6.

Figure 3.6 Memory Map (Address Space)

## (2) Instruction Addressing

The instruction address is determined based on the contents of the program counter (PC), and is automatically incremented according to the number of bytes in the executed instruction. When a branch instruction is executed, the addressing shown below is used to set the branch destination address to the PC.

If the result of address calculation exceeds the positive maximum value $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$ by addition, it is wrapped around to $00000000_{\mathrm{H}}$. If the result of address calculation falls below the positive minimum value $00000000_{\mathrm{H}}$ by subtraction, it is wrapped around to FFFF $\mathrm{FFFF}_{\mathrm{H}}$.

## (a) Relative Addressing (PC Relative)

Signed N-bit data (displacement: disp N ) in the instruction code is added to the program counter (PC). In this case, displacement is handled as 2's complement data, and the MSB is a sign bit ( S ). If the displacement is less than 32 bits, the higher-order bits are sign-extended ( N differs from one instruction to another).

The JARL, JR, and Bcond instructions are used with this type of addressing.

Note: This is an example of 22-bit displacement.

Figure 3.7 Relative Addressing

## (b) Register Addressing (Register Indirect)

The contents of the general-purpose register (reg1) or system register (regID) specified by the instruction are transferred to the program counter (PC).

The JMP, CTRET, EIRET, FERET, and DISPOSE instructions are used with this type of addressing.

Figure 3.8 Register Addressing

## (c) Based Addressing

The contents of the general-purpose register (reg1) and the N -bit displacement (dispN) specified by the instruction are added and transferred to the program counter (PC). At this time, the displacement is handled as a 2's complement data, and the MSB is a sign bit ( S ). If the displacement is less than 32 bits, the higher bits are sign-extended ( N differs from one instruction to another).

The JMP instruction is used with this type of addressing.

Figure $3.9 \quad$ Based Addressing

## (d) Other Addressing

A value specified by an instruction is transferred to the program counter (PC). How a value is specified is explained in [Operation] or [Description] of each instruction.

The CALLT, SYSCALL, TRAP, FETRAP, and RIE instructions, and branch in case of an exception are used with this type of addressing.

## (3) Data Addressing

The following methods can be used to access the target registers or memory when executing an instruction.
If the result of address calculation exceeds the positive maximum value $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ by addition, it is wrapped around to $00000000_{\mathrm{H}}$. If the result of address calculation falls below the positive minimum value $00000000_{\mathrm{H}}$ by subtraction, it is wrapped around to FFFF $\mathrm{FFFF}_{\mathrm{H}}$.

## (a) Register Addressing

This addressing method accesses the general-purpose register or system register specified in the general-purpose register field as an operand.
Any instruction that includes the operand reg1, reg2, reg3, or regID is used with this type of addressing.
(b) Immediate Addressing

This address mode uses arbitrary size data as the operation target in the instruction code.
Any instruction that includes the operand imm5, imm16, vector, or cccc is used with this type of addressing.
NOTE
vector: This is immediate data that specifies the exception vector ( $00_{\mathrm{H}}$ to $1 \mathrm{~F}_{\mathrm{H}}$ ), and is an operand used by the TRAP, FETRAP, and SYSCALL instructions. The data width differs from one instruction to another.
cccc: This is 4-bit data that specifies a condition code, and is an operand used in the Bcond instruction, CMOV instruction, SASF instruction, and SETF instruction.

## (c) Based Addressing

There are two types of based addressing, as described below.

### 3.2.2.7.3.c. 1 Type 1

The contents of the general-purpose register (reg1) specified at the addressing specification field in the instruction code are added to the N -bit displacement (dispN) data sign-extended to word length to obtain the operand address, and the target memory is accessed using the operand address. At this time, the displacement is handled as a 2 's complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher bits are signextended ( N differs from one instruction to another).
The LD, ST, LDV and STV instructions are used with this type of addressing.

Note: This is an example of 16 -bit displacement.

Figure 3.10 Based Addressing (Type 1)

### 3.2.2.7.3.c. 2 Type 2

The contents of the element pointer ( r 30 ) are added to the N -bit displacement data (dispN) zero-extended to a word length to obtain the operand address, and target memory is accessed using the operand address. If the displacement is less than 32 bits, the higher bits are zero-extended ( N differs from one instruction to another).

The SLD and SST instructions are used with this type of addressing.

Note: This is an example of 8-bit displacement.

Figure 3.11 Based Addressing (Type 2)

## (d) Bit Addressing

The contents of the general-purpose register (reg1) are added to the N -bit displacement (dispN) data sign-extended to word length to obtain the operand address, and one bit (as specified by 3-bit data "bit \#3") in one byte of the target memory is accessed using the operand address. At this time, the displacement is handled as a 2's complement data, and the MSB is a sign bit (S). If the displacement is less than 32 bits, the higher bits are sign-extended ( N differs from one instruction to another).

The CLR1, SET1, NOT1, and TST1 instructions are used with this type of addressing.

Note: n: Bit position specified by 3-bit data (bit \#3) ( $\mathrm{n}=0$ to 7 )
This is an example of 16 -bit displacement.

Figure 3.12 Bit Addressing

## (e) Post Index Increment/Decrement Addressing

The contents of the general-purpose register (reg1) are used as an operand address to access the target memory, and then the general-purpose register (reg1) is updated. There are two types of the general-purpose register updating, by incrementing or decrementing.

If the result of incrementing the general-purpose register (reg1) value exceeds the positive maximum value FFFF $\mathrm{FFFF}_{\mathrm{H}}$, the result wraps around to $00000000_{\mathrm{H}}$, and, if the result of decrementing the general-purpose register value is less than the positive minimum value $00000000_{\mathrm{H}}$, the result wraps around to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$.

### 3.2.2.7.3.e. 1 Type 1

The general-purpose register (reg1) is updated by adding a constant that depends on the type of accessed data (the size of the accessed data) to the contents of the general-purpose register (reg1). If the type of accessed data is a byte, 1 is added, if the type is a halfword, 2 is added, if the type is a word, 4 is added, and if the type is a double-word, 8 is added.

Figure 3.13 Post Index Increment/Decrement Addressing (Type 1)

### 3.2.2.7.3.e. 2 Type 2

The general-purpose register (reg1) is updated by subtracting a constant that depends on the size of the accessed data from the contents of the general-purpose register (reg1). If the size of accessed data is a byte, 1 is subtracted, if the size is a halfword, 2 is subtracted, if the size is a word, 4 is subtracted, and if the size is a double-word, 8 is subtracted.

Figure 3.14 Post Index Increment/Decrement Addressing (Type 2)

## (f) Other Addressing

The target memory is accessed using a value specified by an instruction as the operand address. How a value is specified is explained in [Operation] or [Description] of each instruction.

The SWITCH, CALLT, SYSCALL, PREPARE, DISPOSE, PUSHSP, and POPSP instructions are used with this type of addressing.

### 3.2.2.8 Execution Timing of a Store Instruction

Completion of writing by a store instruction may differ depending on the type of the memory to be accessed. For details, see Section 3.2.7.2, Guaranteeing the Completion of Store Instruction.

### 3.2.2.9 Memory Ordering

This CPU guarantees that memories are accessed in the programmed order. However, in the system that incorporates multiple bus masters such as the bus system with DMA or multi-core, the order of accesses to memories needs to be considered. For these cases, see Section 3.2.7.1, Synchronization Processing.

### 3.2.2.10 Acquiring the CPU Number

This CPU provides a method for identifying CPUs in a multi-processor system.
In the multi-processor configuration, you can identify which CPU core is running a program by referencing the PEID register. A unique number within a multi-processor system is assigned to the PEID register according to the specification of the product.

### 3.2.2.11 System Protection Identifier (SPID)

In this CPU, memory resources and peripheral devices are managed by system protection groups. By specifying the group to which the program being executed belongs, you can assign accessible memory resources and peripheral devices to the program.

The program being executed belongs to the group specified by the SPID, and whether the memory resources and peripheral devices are accessible is decided using the SPID. A value can be set to the SPID register by the supervisor.

## CAUTION

According to the value of the SPID, how operations are assigned to memory resources and peripheral devices is determined by the specifications of the product.

### 3.2.2.12 Timestamp Counter

This CPU has a 64-bit timestamp counter. It can measure long time, and so can be used as specific information for time identification.

Since the timestamp counter is allocated to system registers, it can be accessed quickly by using a LDSR/STSR instruction.

If an overflow occurs during counting operation, no exception will occur.

## (1) How to Operate the Timestamp Counter

The value of the timestamp counter is initialized to 0 by a reset. Therefore, if you want to retain the value of the counter across a reset, then before the reset, save the value of the counter in a memory that is not initialized by the reset, restore the value to the counter after the reset, and restart counting.

The counter is 64-bit width, so the counter consists of two 32-bit system registers, TSCOUNTL and TSCOUNTH. Both registers need to be accessed by using LDSR/STSR instructions.

When the counter is not running (the value of the TSCTRL.CEN bit is 0 ), no special care is needed to access the two registers.

However, if the counter is running (the value of the TSCTRL.CEN bit is 1 ), it is not recommended to update the counter by using LDSR instructions. In this case, the timing of update of the counter is not guaranteed. It is recommended to update the counter when it is not running.

Also, when reading the value of the counter by using STSR instructions while it is running, it is recommended to follow the procedure below.

## TSCNTRD:

| STSR | $1, r 21,11$ | -- Read the upper side of the counter |
| :--- | :--- | :--- |
| STSR | $0, r 20,11$ | -- Read the lower side of the counter |
| STSR | $1, r 22,11$ | -- Read again the upper side of the counter |
| CMP | r21, r22 | -- Compare the two values read from the upper side of the counter |
| BNE | TSCNTRD | -- If they are not identical, a carry has occurred. Read again. |

Even if the CPU core is not in operation after the execution of a HALT or SNOOZE instruction, the timestamp counter continues counting.

### 3.2.2.13 Performance Measurement Function

This CPU has the performance measurement function. The performance measurement function can measure the performance of programs executed, the effects of interrupts generated during operation, etc. by counting the occurrence of the event specified by the PMCTRLn.CND bit.

The system registers used by the performance measurement function can be accessed only in supervisor mode after a reset. However, it can be accessed in user mode by changing the setting of the PMUMCTRL register.

The performance measurement function itself works in user mode regardless of the setting of the PMUMCTRL register. Even if all performance measurement channels are made inaccessible in user mode by using the PMUMCTRL register, configuration in supervisor mode allows performance measurement during operation in user mode.

This CPU has four channels of system register set for the performance measurement function.

### 3.2.3 Register Set

This chapter describes the program register and system register mounted on this CPU.

### 3.2.3.1 Program Registers

Program registers includes general-purpose registers (r0 to r31) and the program counter ( PC ) . r0 always retains 0 . The values of the general-purpose registers r 1 to r 31 after a reset are undefined. The value of the PC after a reset is the value of RBASE register.

Table $3.6 \quad$ Program Registers

| Program Register | Name | Function | Description |
| :--- | :--- | :--- | :--- |
| General-purpose <br> registers | r0 | Zero register | Always retains 0 |
|  | r1 | Assembler reserved register | Used as working register for generating addresses |
|  | r2 | Register for address and data variables <br> (used when the real-time OS used does not use this register) |  |
|  | r3 | Stack pointer (SP) | Used for generating a stack frame when a function is called |
|  | r4 | Global pointer (GP) | Used for accessing a global variable in the data area |
|  | r6 to r29 | Register for addresses and data variables |  |
|  | r30 | Element pointer (EP) | Used as a base pointer for generating addresses when <br> accessing memory |
| Program counter | PC | Retains instruction addresses during execution of programs |  |

Note: For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the manual of each software development environment.

## (1) General-purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables.

Of the general-purpose registers, r 0 to $\mathrm{r} 5, \mathrm{r} 30$, and r 31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.
(a) r0, r3, and r30

These registers are implicitly used by instructions.
r 0 is a register that always retains 0 . It is used for operations that use 0 , addressing with base address being 0 , etc.
r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.
r 30 is used as a base pointer when the SLD instruction or SST instruction accesses memory.
(b) r1, r4, r5, and r31

These registers are implicitly used by the assembler and C compiler.
When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.
(c) r 2

This register is used by a real-time OS in some cases. If the real-time OS that is being used is not using $\mathrm{r} 2, \mathrm{r} 2$ can be used as a register for address variables or data variables.

## (2) PC — Program Counter

The PC retains the address of the instruction being executed.

Table 3.7 PC Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | PC31 to PC1 | These bits indicate the address of the instruction being executed. | R/W | Reset |
| 0 | PC0 | This bit is fixed to 0. Branching to an odd number address is disabled. | R/W | $* 1$ |

Note 1. For details, see Section 4, Address MAP.

### 3.2.3.2 Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.
The basic system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.8 Basic System Registers

| Register No. (regID, selID) | Symbol | Function | Access <br> Permission |
| :---: | :---: | :---: | :---: |
| SRO, 0 | EIPC | Status save registers when acknowledging El level exception | SV |
| SR1, 0 | EIPSW | Status save registers when acknowledging El level exception | SV |
| SR2, 0 | FEPC | Status save registers when acknowledging FE level exception | SV |
| SR3, 0 | FEPSW | Status save registers when acknowledging FE level exception | SV |
| SR5, 0 | PSW | Program status word | *1 |
| SR6, 0 | FPSR | (See Section 3.2.3.4, FPU Function Registers) | CUO and SV |
| SR7, 0 | FPEPC | (See Section 3.2.3.4, FPU Function Registers) | CU0 and SV |
| SR8, 0 | FPST | (See Section 3.2.3.4, FPU Function Registers) | CU0 |
| SR9, 0 | FPCC | (See Section 3.2.3.4, FPU Function Registers) | cuo |
| SR10, 0 | FPCFG | (See Section 3.2.3.4, FPU Function Registers) | CU0 |
| SR13, 0 | ElIC | El level exception cause | SV |
| SR14, 0 | FEIC | FE level exception cause | SV |
| SR16, 0 | CTPC | CALLT execution status save register | UM |
| SR17, 0 | CTPSW | CALLT execution status save register | UM |
| SR20, 0 | CTBP | CALLT base pointer | UM |
| SR21, 0 | SNZCFG | SNOOZE control register | SV |
| SR28, 0 | EIWR | El level exception working register | SV |
| SR29, 0 | FEWR | FE level exception working register | SV |
| SRO, 1 | SPID | System protection identifier | SV |
| SR1, 1 | SPIDLIST | List of system protection identifiers that can be specified in SPID | SV |
| SR2, 1 | RBASE | Reset vector base address | SV |
| SR3, 1 | EBASE | Exception handler vector address | SV |
| SR4, 1 | INTBP | Base address of the interrupt handler "address" table | SV |
| SR5, 1 | MCTL | CPU control | SV |
| SR6, 1 | PID | Processor ID | SV |
| SR8, 1 | SVLOCK | Supervisor lock | SV |
| SR11, 1 | SCCFG | SYSCALL operation setting | SV |
| SR12, 1 | SCBP | SYSCALL base pointer | SV |
| SRO, 2 | PEID | Processor element identifier | SV |
| SR1, 2 | BMID | Bus master identifier | SV |
| SR6, 2 | MEA | Memory error address | SV |
| SR8, 2 | MEI | Memory error information | SV |
| SR15, 2 | RBCR0 | Register bank control 0 | SV |
| SR16, 2 | RBCR1 | Register bank control 1 | SV |
| SR17, 2 | RBNR | Register bank number | SV |
| SR18, 2 | RBIP | Register bank initial pointer | SV |

Note 1. The access permission differs depending on the bit. For details, see Section 3.2.3.2(5), PSW — Program Status Word.

## (1) EIPC — Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see Section 3.2.4.1(3), Types of

## Exceptions).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

Table $3.9 \quad$ EIPC Register Contents

| Bit | Name | Description | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | EIPC31 to | These bits indicate the PC saved when an El level exception is <br> acknowledged. | Reset |

## (2) EIPSW - Status Save Register when Acknowledging EI Level Exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.
Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3.10 EIPSW Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an El level exception is acknowledged. | R/W | 0 |
| 29 to 19 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 18 to 16 | CU2 to CU0 | These bits store the PSW.CU2-0 field setting when an El level exception is acknowledged.*1 | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an El level exception is acknowledged. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an El level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an El level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an El level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an El level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an El level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an El level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an El level exception is acknowledged. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when an El level exception is acknowledged. | R/W | 0 |

Note 1. CU2 is reserved for future CPUs that are to be made compatible with this CPU. It is always set to 0 in this CPU.

## (3) FEPC - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see Section 3.2.4.1(3), Types of Exceptions). Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

Table 3.11 FEPC Register Contents

| Bit | Name | Description | Value after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | FEPC31 to | These bits indicate the PC saved when an FE level exception is <br> acknowledged. | Reset |

## (4) FEPSW - Status Save Register when Acknowledging FE Level Exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.
Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Table 3.12 FEPSW Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 30 | UM | This bit stores the PSW.UM bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 29 to 19 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 18 to 16 | CU2 to CU0 | These bits store the PSW.CU2-0 field setting when an FE level exception is acknowledged ${ }^{\star 1}$. | R/W | 0 |
| 15 | EBV | This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit stores the PSW.NP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 6 | EP | This bit stores the PSW.EP bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 5 | ID | This bit stores the PSW.ID bit setting when an FE level exception is acknowledged. | R/W | 1 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when an FE level exception is acknowledged. | R/W | 0 |
| 0 | z | This bit stores the PSW.Z bit setting when an FE level exception is acknowledged. | R/W | 0 |

Note 1. CU2 is reserved for future CPUs that are to be made compatible with this CPU. It is always set to 0 in this CPU.

## (5) PSW — Program Status Word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

## CAUTIONS

1. When the LDSR instruction is used to change the contents of this register, the changed contents become valid from the subsequent instruction. For details, see Section 3.2.7.3, Hazard Management after System Register Update.
2. The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.13 for the access permission for each bit.

Table 3.13 Access Permission for PSW Register

| Bit |  | Access Permission when Reading | Access Permission when Writing |
| :---: | :---: | :---: | :---: |
| 30 | UM | UM | SV** |
| 18 to 16 | CU2 to CU0 |  | SV*1 |
| 15 | EBV |  | SV*1 |
| 7 | NP |  | SV*1 |
| 6 | EP |  | SV*1 |
| 5 | ID |  | SV*1 |
| 4 | SAT |  | UM |
| 3 | CY |  | UM |
| 2 | OV |  | UM |
| 1 | S |  | UM |
| 0 | Z |  | UM |

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1 . In this case, writing is ignored.

Table 3.14 PSW Register Contents (1/2)

|  |  |  | Description | Value after <br> Bit | Name |
| :--- | :--- | :--- | :--- | :--- | :--- |

Table 3.14 PSW Register Contents (2/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 15 | EBV | This bit indicates the reset vector and exception vector operation. See Section 3.2.3.2(16), RBASE — Reset Vector Base Address and Section 3.2.3.2(17), EBASE - Exception Handler Vector Address. | R/W | 0 |
| 14 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | NP | This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see Table 3.95, Exception Cause List. | R/W | 0 |

|  |  | 0 : The acknowledgement of $F E$ level exception is enabled. <br> 1: The acknowledgement of FE level exception is disabled. |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 6 | EP | This bit indicates that an exception other than an interrupt is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. <br> 0 : An exception other than an interrupt is not being serviced. <br> 1: An exception other than an interrupt is being serviced. | R/W | 0 |
| 5 | ID | This bit disables the acknowledgement of El level exception. When an El level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of El level exception. As for the exceptions which the ID bit disables the acknowledgment, see Table 3.95, Exception Cause List. This bit is also used to disable El level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. <br> The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. <br> 0 : The acknowledgement of El level exception is enabled. <br> 1: The acknowledgement of El level exception is disabled. | R/W | 1 |
| 4 | SAT*2 | This bit indicates that a saturation arithmetic operation instruction resulted in overflow and saturation processing is applied to the result. This is a cumulative flag, that is, it is set (1) once a saturation occurs and not cleared $(0)$ by subsequent instructions with unsaturated results. This bit is cleared by the LDSR instruction. Note that execution of an arithmetic operation instruction neither set nor clear this flag. <br> 0 : The result was not saturated <br> 1: The result was saturated | R/W | 0 |
| 3 | CY | This bit indicates whether a carry or borrow has occurred in the operation result. | R/W | 0 |

0: Carry and borrow have not occurred.
1: Carry or borrow has occurred.

| 2 | $\mathrm{OV}^{* 2}$ | This bit indicates whether or not an overflow has occurred during an <br> operation. <br> 0: Overflow has not occurred. <br> 1: Overflow has occurred. | $\mathrm{R} / \mathrm{W}$ | 0 |
| :--- | :--- | :--- | :--- | :--- |

Note 1. The coprocessor use permission CU2 is reserved for future CPUs that are to be made compatible with this CPU.
Note 2. Saturation processing is applied to the operation result in accordance with the contents of the OV and S flags. The SAT flag is set (1) only when the OV flag is set (1) in the saturation arithmetic operation.

| Operation Result Status | Flag Status |  |  | Operation Result after Saturation <br> Processing |
| :--- | :--- | :--- | :--- | :--- |
|  | SAT | OV | S | 7FFF FFFF |
| H |  |  |  |  |

## (6) ElIC - El Level Exception Cause

The EIIC register retains the cause of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause (see Table 3.95, Exception Cause List).

Table 3.15 EIIC Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 0 | EIIC31 to EIIC0 | These bits store the exception cause code when an El level exception occurs. | R/W | 0 |
|  |  | The EIIC15-0 field stores the exception cause codes shown in Table 3.95. |  |  |
|  |  | The EIIC31-16 field stores detailed exception cause codes defined individually |  |  |
|  | for each exception. If there is no particular definition, these bits are set to 0. |  |  |  |

## (7) FEIC - FE Level Exception Cause

The FEIC register retains the cause of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception cause (see Table 3.95, Exception Cause List).

Table 3.16 FEIC Register Contents

| Bit | Name | Description | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | FEIC31 to | These bits store the exception cause code when an FE level exception | R/W | 0 |
|  | FEIC0 | occurs. The FEIC15-0 field stores the exception cause codes shown in Table |  |  |
|  |  | 3.95. The FEIC31-16 field stores detailed exception cause codes defined <br> individually for each exception. If there is no particular definition, these bits are <br> set to 0. |  |  |

## (8) CTPC — Status Save Register when Executing CALLT

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC.

Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

Table 3.17 CTPC Register Contents

| Bit | Name | Description | Value after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | CTPC31 to <br> CTPC1 | These bits indicate the PC of the instruction after the CALLT instruction. | R/W | Undefined |  |
| 0 | CTPC0 | This bit indicates the PC of the instruction after the CALLT instruction. <br> Always set this bit to 0. Even if it is set to 1, the value transferred to the PC <br> when the CTRET instruction is executed is 0. | R/W | Undefined |  |
|  |  |  |  |  |  |

## (9) CTPSW - Status Save Register when Executing CALLT

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

Table 3.18 CTPSW Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 | SAT | This bit stores the PSW.SAT bit setting when the CALLT instruction is executed. | R/W | 0 |
| 3 | CY | This bit stores the PSW.CY bit setting when the CALLT instruction is executed. | R/W | 0 |
| 2 | OV | This bit stores the PSW.OV bit setting when the CALLT instruction is executed. | R/W | 0 |
| 1 | S | This bit stores the PSW.S bit setting when the CALLT instruction is executed. | R/W | 0 |
| 0 | Z | This bit stores the PSW.Z bit setting when the CALLT instruction is executed. | R/W | 0 |

## (10) CTBP — CALLT Base Pointer

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses
Be sure to set the CTBP register to a halfword address.

Table 3.19 CTBP Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 1 | CTBP31 to CTBP1 | These bits indicate the base pointer address of the CALLT instruction. These bits indicate the start address of the table used by the CALLT instruction. | R/W | 0 |
| 0 | CTBP0 | This bit indicates the base pointer address of the CALLT instruction. <br> This bit indicates the start address of the table used by the CALLT instruction. Always set this bit to 0 . | R | 0 |

## (11) SNZCFG - SNOOZE Configuration

The SNZCFG register is used to configure the operation of the SNOOZE instruction.

Value after reset $00000020_{\mathrm{H}}$

Table 3.20 SNZCFG Register Contents

| Bit | Name | Description | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0. ) | Reset |

## (12) EIWR — El Level Exception Working Register

The EIWR register is used as a working register when an EI level exception has occurred.

Table 3.21 EIWR Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | EIWR31 to | These bits constitute a working register that can be used for any purpose <br> during the processing of an El level exception. Use this register for purposes <br> such as storing the values of general-purpose registers. | R/W | Undefined |
|  | EIWR0 |  |  |  |

## (13) FEWR — FE Level Exception Working Register

The FEWR register is used as a working register when an FE level exception has occurred.

Value after reset Undefined

Table 3.22 FEWR Register Contents

| Bit | Name | Description | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | FEWR31 to | These bits constitute a working register that can be used for any purpose <br> during the processing of an FE level exception. Use this register for purposes <br> such as storing the values of general-purpose registers. | R/W | Undefined |
|  | FEWR0 |  |  |  |

## (14) SPID — System Protection Identifier

The SPID register holds the system protection identifier of the CPU.

Table 3.23 SPID Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | SPID | These bits indicate the system protection identifier. <br> The system protection identifier is a variable ID that is used for access protection in a product which consists of two or more bus masters including this CPU. For its uses and constraints on its value, see Section 3.8.7, Product Information of Initial Value for G4MH Register. <br> Within this CPU, the SPID is used to check for area matching by the MPU. It allows the system specifications defined for the product to be reflected in the MPU's protection feature. The settable system protection identifiers are given by the SPIDLIST register. If an attempt is made to set an illegal system protection identifier, the SPID register is not updated and retains the original value. | R/W | *1 |

[^1]
## (15) SPIDLIST — Legitimate System Protection Identifier List

The SPIDLIST register contains a list of system protection identifiers that can be set to the SPID register.
The bits corresponding to the settable system protection identifiers are set to 1 . The bits corresponding to illegal system protection identifiers are cleared to 0 . These values are set outside the CPU as system specifications and cannot be altered by this CPU.

| SPIDLIST |  | S | S | S |  | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S | S |  |  | S | S | S | S | S | S | Value after reset <br> *1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SPIDLIST | 31 | L | L | 28 |  | 27 | 26 | 25 | - | 23 | 2 | 21 | 20 | 19 | 18 | L | 16 | 15 | 14 | 13 | 12 | 11 | 10 |  | L |  |  | 5 | 4 | L | 2 | 1 | L |  |

Table 3.24 SPIDLIST Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | SL31 | This bit indicates whether or not 31 can be set as a system protection identifier. | R | *1 |
| 30 | SL30 | This bit indicates whether or not 30 can be set as a system protection identifier. | R | *1 |
| 29 | SL29 | This bit indicates whether or not 29 can be set as a system protection identifier. | R | *1 |
| 28 | SL28 | This bit indicates whether or not 28 can be set as a system protection identifier. | R | *1 |
| 27 | SL27 | This bit indicates whether or not 27 can be set as a system protection identifier. | R | *1 |
| 26 | SL26 | This bit indicates whether or not 26 can be set as a system protection identifier. | R | *1 |
| 25 | SL25 | This bit indicates whether or not 25 can be set as a system protection identifier. | R | *1 |
| 24 | SL24 | This bit indicates whether or not 24 can be set as a system protection identifier. | R | *1 |
| 23 | SL23 | This bit indicates whether or not 23 can be set as a system protection identifier. | R | *1 |
| 22 | SL22 | This bit indicates whether or not 22 can be set as a system protection identifier. | R | *1 |
| 21 | SL21 | This bit indicates whether or not 21 can be set as a system protection identifier. | R | *1 |
| 20 | SL20 | This bit indicates whether or not 20 can be set as a system protection identifier. | R | *1 |
| 19 | SL19 | This bit indicates whether or not 19 can be set as a system protection identifier. | R | *1 |
| 18 | SL18 | This bit indicates whether or not 18 can be set as a system protection identifier. | R | *1 |
| 17 | SL17 | This bit indicates whether or not 17 can be set as a system protection identifier. | R | *1 |
| 16 | SL16 | This bit indicates whether or not 16 can be set as a system protection identifier. | R | *1 |
| 15 | SL15 | This bit indicates whether or not 15 can be set as a system protection identifier. | R | *1 |
| 14 | SL14 | This bit indicates whether or not 14 can be set as a system protection identifier. | R | *1 |
| 13 | SL13 | This bit indicates whether or not 13 can be set as a system protection identifier. | R | *1 |
| 12 | SL12 | This bit indicates whether or not 12 can be set as a system protection identifier. | R | *1 |
| 11 | SL11 | This bit indicates whether or not 11 can be set as a system protection identifier. | R | *1 |
| 10 | SL10 | This bit indicates whether or not 10 can be set as a system protection identifier. | R | *1 |
| 9 | SL9 | This bit indicates whether or not 9 can be set as a system protection identifier. | R | *1 |
| 8 | SL8 | This bit indicates whether or not 8 can be set as a system protection identifier. | R | *1 |
| 7 | SL7 | This bit indicates whether or not 7 can be set as a system protection identifier. | R | *1 |
| 6 | SL6 | This bit indicates whether or not 6 can be set as a system protection identifier. | R | *1 |
| 5 | SL5 | This bit indicates whether or not 5 can be set as a system protection identifier. | R | *1 |
| 4 | SL4 | This bit indicates whether or not 4 can be set as a system protection identifier. | R | *1 |
| 3 | SL3 | This bit indicates whether or not 3 can be set as a system protection identifier. | R | *1 |
| 2 | SL2 | This bit indicates whether or not 2 can be set as a system protection identifier. | R | *1 |
| 1 | SL1 | This bit indicates whether or not 1 can be set as a system protection identifier. | R | *1 |
| 0 | SL0 | This bit indicates whether or not 0 can be set as a system protection identifier. | R | *1 |

Note 1. See Section 3.8.7, Product Information of Initial Value for G4MH Register.

## (16) RBASE — Reset Vector Base Address

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0 , this register indicates the exception handler vector address and the selection method of exception handler address.

Table 3.25 RBASE Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | RBASE31 to RBASE9 | These bits indicate the reset vector when there is a reset. When PSW.EBV = 0 , this address is also used as the exception vector. <br> The RBASE8 to RBASE0 bits are not assigned as names because these bits are always 0 . | R | *1 |
| 8 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | DV | When the DV bit is set, the exception handler address for interrupt is determined by using the direct vector method. For details, see Section 3.2.4.4(1)(b), Table Reference Method. This bit is valid when PSW.EBV $=0$. | R | *1 |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt processing is reduced. See Section 3.2.4.4(1)(a), Direct Vector Method. This bit is valid when PSW.EBV $=0$. | R | *1 |

Note 1. See Section 3.8.7, Product Information of Initial Value for G4MH Register.

## (17) EBASE - Exception Handler Vector Address

This register indicates the exception handler vector address and the selection method of exception handler address. This register is valid when the PSW.EBV bit is 1 .

Table 3.26 EBASE Register Contents

| Bit | Name | Description | R/W | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 9 | EBASE31 to <br> EBASE9 | The exception handler routine address is changed to the address resulting <br> from adding the offset address of each exception to the base address <br> specified for this register. <br> The EBASE8 to EBASE0 bits are not assigned as names because these bits <br> are always 0. | R/W | Undefined <br> 8 to 2 | - |
| 1 | DV | (Reserved for future expansion. Be sure to set to 0. ) <br> When the DV bit is set, the exception handler address for interrupt is <br> determined by using the direct vector method. For details, see Section <br> 3.2.4.4(1)(b), Table Reference Method. | R/W | Undefined |  |
| 0 | RINT | When the RINT bit is set, the exception handler address for interrupt <br> processing is reduced. See Section 3.2.4.4(1)(a), Direct Vector Method. | R/W | Undefined |  |

## (18) INTBP — Base Address of the Interrupt Handler Address Table

This register indicates the base address of the table when the table reference method is selected as the interrupt handler address selection method.

Table $3.27 \quad$ INTBP Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | INTBP31 to INTBP9 | These bits indicate the base pointer address for an interrupt when the table reference method is used. | R/W | Undefined |
|  |  | The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified by the table reference method (EIINTn) is acknowledged. |  |  |
|  |  | The INTBP8 to INTBP0 bits are not assigned as names because these bits are always 0 . |  |  |
| 8 to 0 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

(19) MCTL — Machine Control

The MCTL register is used to control the CPU.

Table 3.28 MCTL Register Contents

| Bit | Name | Description | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | R |
| 0 | UIC | This bit is used to control the interrupt enable/disable operation in user mode. <br> When this bit is set to 1, executing the EI/DI instruction in user mode become <br> possible. | R/W | 0 |

## (20) PID — Processor ID

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

## CAUTION

The PID register indicates information used to identify the incorporated CPU core and CPU core configuration. Usage such that the software behavior varies dynamically according to the PID register information is not assumed.

Value after reset Defined for each processor

Table 3.29 PID Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | PID | Architecture Identifier | R | *1 |
|  |  | This identifier indicates the architecture of the processor. |  |  |
| 23 to 8 |  | Function Identifier | R | *1 |
|  |  | This identifier indicates the functions of the processor. |  |  |
|  |  | These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). <br> Bit 23 to19: Reserved <br> Bit 18: Register bank <br> Bit 17 to12: Reserved <br> Bit 11: Extended floating-point operation function <br> Bit 10: Double-precision floating-point operation function <br> Bit 9: Single-precision floating-point operation function <br> Bit 8: Memory protection unit (MPU) function <br> NOTE: If a double-precision floating-point operation function is implemented (when bit 10 is 1 ), a single-precision floating-point operation function is also always implemented (bit 9 is 1 ). |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
| 7 to 0 |  | Version Identifier | R | *1 |
|  |  | This identifier indicates the version of the processor. |  |  |

Note 1. For details, see Section 3.8.7, Product Information of Initial Value for G4MH Register.

## (21) SVLOCK - Supervisor Lock

The SVLOCK register is used to restrict the CPU operation in supervisor mode.

Table 3.30 SVLOCK Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | Reset |
| 0 | SVL | This bit specifies whether to restrict the CPU operation in supervisor mode. | R/W | 0 |
|  |  | 0: Does not restrict the CPU operation in supervisor mode. |  |  |
|  | 1: Restrict the CPU operation in supervisor mode. |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |
|  |  |  |  |  |

If the SVL bit is set to 1 , the following system registers*1
cannot be updated even when the CPU is in supervisor mode:
SPID, MPM, MPLA, MPUA, MPAT, MPIDn
For details, see Section 3.2.2.5(5), Supervisor Lock Setting.
Note 1. The target system registers are those registers that are associated with memory accessing. This register prevents these registers from being rewritten carelessly and unintentional memory access from being performed outside the CPU.

## (22) SCCFG — SYSCALL Operation Setting

This register is used to set operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Table 3.31 SCCFG Register Contents

| Bit | Name | Description | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0. ) | Reset | R |

## (23) SCBP — SYSCALL Base Pointer

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

Value after reset $00000000_{\mathrm{H}}$

Table 3.32 SCBP Register Contents

| Bit | Name | Description | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | SCBP31 to <br> SCBP2 | These bits indicate the base pointer address of the SYSCALL instruction. <br> These bits indicate the start address of the table used by the SYSCALL <br> instruction. | R/W | 0 |
| 1,0 | SCBP1, <br> SCBP0 | These bits indicate the base pointer address of the SYSCALL instruction. | R | 0 |

## (24) PEID - Processor Element Identifier

Table 3.33 PEID Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 3 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R/W | Reset |
| 2 to 0 | PEID | These bits indicate the processor element identifier. | $R$ | 0 |

Note 1. The processor element identifier of the CPU which is defined by the product specification is read. Writing to these bits is not possible. For details, see Section 3.8.7, Product Information of Initial Value for G4MH Register.

## (25) BMID — Bus Master Identifier

Table 3.34 BMID Register Contents

|  |  |  |  | Value after <br> Bit |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | Name | (Rescription | R/W | Reset | Red for future expansion. Be sure to set to 0.$)$ |
| :--- |
| 4 to 0 |

Note 1. The bus master identifier of the CPU which is defined by the product specification is read. Writing to these bits is not possible. For details, see Section 3.8.7, Product Information of Initial Value for G4MH Register.
(26) MEA — Memory Error Address

Table 3.35 MEA Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MEA | These bits holds the address in which an MAE (misalignment) or MPU <br> violation occurred. | R/W | Undefined |

## (27) MEI — Memory Error Information

The MEI register holds the information about the instruction that caused a misalignment exception (MAE) or memory protection exception (MDP). The information can be used as hint information for the emulation by software.

Table 3.36 MEI Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 28 | LEN | These bits indicate the code size of the instruction that causes the exception. <br> 0 : Non-instruction factor <br> 2: 16 bits <br> 4: 32 bits <br> 6: 48 bits <br> 8 :64 bits <br> Values other than those listed above are reserved for future use and never stored here. <br> For details, see Table 3.37. | R/W | Undefined |
| 27 to 21 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 20 to 16 | REG | These bits indicate the source register number or destination register number of the instruction that caused the exception. <br> For details, see Table 3.37. | R/W | Undefined |
| 15 to 12 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 11 to 9 | DS | These bits indicate the data type of the instruction that caused the exception*1. <br> 0 : Byte (8 bits) <br> 1: Halfword (16 bits) <br> 2: Word (32 bits) <br> 3: Double-word ( 64 bits) <br> 4: Quad-word (128 bits) <br> Values other than those listed above are reserved for future use and never stored here. <br> For details, see Table 3.37. | R/W | Undefined |
| 8 | U | This bit indicates the sign extension method of the instruction that caused the exception. <br> 0 : Signed <br> 1: Unsigned <br> For details, see Table 3.37. | R/W | Undefined |
| 7 to 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 to 1 | ITYPE | These bits indicate the instruction that caused the exception. For details, see Table 3.37. | R/W | Undefined |
| 0 | RW | This bit indicates whether the operation performed by the instruction that caused the exception is a read (Load-memory) or a write (Store-memory). <br> 0 : Read (Load-memory) <br> 1: Write (Store-memory) <br> For details, see Table 3.37. | R/W | Undefined |

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.37 Instructions Causing Exceptions and Values of MEI Register (1/2)

| Instruction | LEN | REG | DS | U | RW | ITYPE |

| LDVZ.H4 (disp16) | 6 (48 bits) | dst | 3 (Double-word) | 0 (Signed) | 0 (Read) | $11111^{\text {B }}$ |
| STVZ.H4 (disp16) | 6 (48 bits) | src | 3 (Double-word) | 0 (Signed) | 1 (Write) | $\mathbf{1 1 1 1 1 ~}_{\text {B }}$ |

Remarks: dst: Destination register number; src: Source register number
Note 1. Specific to this CPU.
Note 2. This exception occurs when the instruction executes a read access.
Note 3. When the destination is $\mathrm{r} 3,0$ is stored.
Note 4. When an exception occurs during a table reference that is triggered by an interrupt for which the table reference method is selected,
Note 5. In instruction format (1), "4 (32 bits)" is set.
Note 6. In instruction format (2), the value is selected as follows according to the value of the ff field in the instruction code:

$$
\begin{aligned}
& \mathrm{ff}=00_{\mathrm{B}}: 4(32 \text { bits }) \\
& \mathrm{ff}=01_{\mathrm{B}}: 6(48 \text { bits }) \\
& \mathrm{ff}=10_{\mathrm{B}}: 6(48 \text { bits }) \\
& \mathrm{ff}=11_{\mathrm{B}}: 8(64 \text { bits })
\end{aligned}
$$

## (28) RBCRO — Register Bank Control 0

Table $3.38 \quad$ RBCRO Register Contents

|  |  |  |  | Value after <br> Bit |
| :--- | :--- | :--- | :--- | :--- |
| 31 to $\mathbf{1 7}$ | - | Name | (Reserved for future expansion. Be sure to set to 0.) | R/W | Reset | R |
| :--- |
| 16 |

List of Registers to be Saved

| Target Register | Save Mode 0 | Save Mode 1 |
| :--- | :--- | :--- |
| PC | $\checkmark$ | $\checkmark$ |
| PSW | $\checkmark$ | $\checkmark$ |
| EIIC | $\checkmark$ | $\checkmark$ |
| FPSR | $\checkmark$ | $\checkmark$ |
| r1-r19 | $\checkmark$ | $\checkmark$ |
| r20-r29 | - | $\checkmark$ |
| r30 | $\checkmark$ | $\checkmark$ |
| r31 | - | $\checkmark$ |
| $\checkmark:$ Saved |  |  |

15 to $0 \quad$ BE15 to BE0 $\quad$ These bits specify the priority level of the interrupt on which the register bank R/W 0 is to be used.

0 : Do not use the register bank on an interrupt of the level corresponding to this bit.
1: Use the register bank on an interrupt of the level corresponding to this bit.

The bit positions correspond to the priority levels of the interrupts as follows:

| Bit | Priority Level |
| :--- | :--- |
| 0 | Level 0 (highest priority) |
| 1 | Level 1 |

| 14 | Level 14 |
| :--- | :--- |
| 15 | Level 15 (lowest priority) |

The register bank is used when an interrupt (EIINTn) of a level is accepted while the bit corresponding to that level is set (1).

## (29) RBCR1 — Register Bank Control 1

Value after reset 0000 FFFF $_{H}$

Table 3.39 RBCR1 Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31to 16 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 15 to 0 | NC15 to NC0 | These bits specify the values to be set to the PSW.ID bit when an interrupt (EIINTn) of the priority level corresponding to the bit position is accepted. | R/W | $\mathrm{FFFF}_{\mathrm{H}}$ |

0 : PSW.ID is set to 0 when an interrupt of the priority level corresponding to the bit position is accepted.
1: PSW.ID is set to 1 when an interrupt of the priority level corresponding to the bit position is accepted (initial value).

This setting, however, is enabled only when the interrupt handler address selection method is set to the table reference method and the use of the register banks is enabled.

The bit positions correspond to the priority levels of the interrupts as follows:

| Bit | Priority Level |
| :--- | :--- |
| 0 | Level 0 (highest priority) |
| 1 | Level 1 |
| $\quad:$ |  |
| 14 | Level 14 |
| 15 | Level 15 (Lowest priority) |

## (30) RBNR — Register Bank Number

Table 3.40 RBNR Register Contents

| Bit | Name | Description | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0. ) | 0 |  |
| 4 to 0 | BN | These bits indicate the number of the register bank to be used next. <br> The value in these bits is incremented by 1 when an interrupt (ElINTn) that <br> uses a register bank is accepted. If an interrupt that uses a register bank <br> occurs when the value of BN is greater than 15, the interrupt is not accepted <br> and held pending, and a SYSERR exception is generated. | R/W | 0 |
|  |  | The value of BN is decremented by 1 when a RESBANK instruction is <br> executed. If the RESBANK instruction is executed when the value of BN is 0, <br> the instruction is not executed and a SYSERR exception is generated. In this <br> case, BN is not updated and its value remains the same. <br> If an attempt is made to write a value of 16 or greater to these bits, the value <br> of BN becomes 16. |  |  |

## (31) RBIP — Register Bank Initial Pointer

Table 3.41 RBIP Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 4 | RBIP31 to RBIP4 | These bits indicate the initial pointer to the register bank. <br> The values of RBCRO.MD and RBNR.BN together with this value determine the memory address to which the next register bank to be used is allocated as follows. <br> - Save mode 0 (RBCRO.MD = 0): RBIP - RBNR.BN $\times$ 60 $_{H}$ <br> - Save mode 1 (RBCRO.MD = 1): RBIP - RBNR.BN $\times 90_{\mathrm{H}}$ | R/W | Undefined |
| 3 to 0 | - | (Reserved for future expansion. Be sure to set to 0 .) | R | 0 |

### 3.2.3.3 Interrupt Function Registers

## (1) Interrupt Function System Registers

Interrupt function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.42 Interrupt Function System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR10, 2 | ISPR | Priority of interrupt being serviced | SV |
| SR12, 2 | ICSR | Interrupt control status | SV |
| SR13, 2 | INTCFG | Interrupt function setting | SV |
| SR14, 2 | PLMR | Interrupt priority masking | SV |

## (a) ISPR — Priority of Interrupt being Serviced

The ISPR register holds the priority levels of the EIINTn interrupts that are being processed by the CPU so that priority sealing can be performed based on interrupt priorities when multiple interrupts occurred.

Table 3.43 ISPR Register Contents

| Bit | Name | Description | Ralue after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 16 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | $R$ | $R$ |

0 : An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged.
1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core.

The bit positions correspond to the priority levels of the interrupts as follows:

| Bit | Priority |
| :--- | :--- |
| 0 | Priority 0 (highest) |
| 1 | Priority 1 $\quad:$ |
|  | $\quad$ Priority 14 |
| 14 | Priority 15 (lowest) |
| 15 |  |

> When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1 . If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15 to ISP0 bits that are set ( 0 is the highest priority) is cleared to $0^{* 2}$. While a bit in this register is set to 1 , same or lower priority interrupts (EIINTn) are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged.
> For details, see Section $3.2 .4 .1(5)$, Interrupt Exception Priority and Priority Masking.
> When performing software-based priority control using the PLMR register, be sure to clear this register by using the INTCFG.ISPC bit.

## Note 1. For details, see Section 3.2.4.1(5), Interrupt Exception Priority and Priority Masking.

Note 2. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.
Note 3. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register.

## (b) ICSR - Interrupt Control Status

This register indicates the interrupt control status in the CPU.

Table 3.44 ICSR Register Contents

| Bit | Name | Description | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0. ) | $R$ | 0 |
| 0 | PMEI | This bit indicates that an interrupt (EIINTn) with the priority level masked by <br> the PLMR register exists. For details, see Section 3.2.4.1(5), Interrupt <br> Exception Priority and Priority Masking. | R | 0 |

## (c) INTCFG - Interrupt Function Setting

This register is used to specify settings related to the CPU's internal interrupt function.

Table 3.45 INTCFG Register Contents

|  |  |  | Vescription | Value after |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | (Reserved for future expansion. Be sure to set to 0.) | Reset |  |
| 31 to 1 | - | This bit changes how the ISPR register is written. | R | 0 |
| 0 | ISPC | 0: The ISPR register is automatically updated. Updates triggered by the | R/W | 0 |
|  |  |  |  |  |

0 : The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored.
1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed.

If this bit is cleared to 0 , the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, the bits are not updated by an LDSR instruction executed by the program. If this bit is set to 1 , the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program.
In normal cases, the ISPC bit should be cleared. When performing softwarebased priority control, however, set this bit (1).
For details, see Section 3.2.4.1(5)(b), Interrupt Priority Mask.

## (d) PLMR — Interrupt Priority Level Mask

This register masks the interrupts (EIINTn) whose priority level is not higher than the level specified by these bits.

Value after reset 0000 0010 ${ }_{H}$

Table 3.46 PLMR Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.$)$ | R | 0 |
| 4 to 0 | PLM | These bits are used to mask the interrupts (EIINTh) whose priority level is not <br> higher than the level specified by these bits. <br> When an interrupt (EIINT $n$ ) is masked by this register, it is not accepted. | R/W | $10_{H}$ |
|  |  |  |  |  |

The correspondence between the value of the PLM bit and the highest priority of interrupts to be masked is shown below.

| Value of PLM Bit | Highest Priority of Interrupts to be Masked |
| :--- | :--- |
| 0 | Priority 0 (highest priority) |
| 1 | Priority 1 |
| 14 | Priority 14 |
| 15 | Priority 15 (lowest priority) |
| 16 or greater | No mask |

Since the highest priority level of an interrupt that is defined for this CPU is 0 , if 0 is specified in the PLM bit, all interrupts (EIINTn) are masked by this register. Since the lowest priority level that is defined for this CPU is 15 , no interrupts are masked by this register if 16 or greater value is specified in the PLM bit.
If the value of PLMR is altered by the LDSR instruction, the new PLMR value is reflected in the instructions following that LDSR instruction.

### 3.2.3.4 FPU Function Registers

## (1) Floating-Point Registers

The FPU uses the CPU general-purpose registers (r0 to r 31 ). There are no register files used only for floating-point operations.

- Single-precision floating-point instruction:

Thirty-two 32-bit registers can be specified. These general-purpose registers correspond to r0 to r31.

- Double-precision floating-point instruction:

Sixteen 64-bit registers can be specified. Paired general-purpose registers are used as register pairs ( $\{\mathrm{r} 1, \mathrm{r} 0\},\{\mathrm{r} 3, \mathrm{r} 2\}$ $\ldots\{r 31, \mathrm{r} 30\})$. Each register pair is specified in the instruction format with an even numbered register. Because r 0 is a zero register (always holds 0 ), in principle $\{\mathrm{r} 1, \mathrm{r} 0\}$ cannot be used by a double-precision floating-point instruction.

## (2) Floating-Point Function System Registers

The FPU can use the following system registers to control floating-point operations. Floating-point function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

- FPSR: This register is used to control and monitor exceptions. It also holds the result of compare operations, and sets the FPU operation mode. Its bits are used to set condition code, subnormal number flush enable, rounding mode control, cause, exception enable, and preservation.
- FPEPC: This register stores the program counter value for the instruction where a floating-point operation exception has occurred.
- FPST: This register reflects the contents of the FPSR register bits related to the operation status.
- FPCC: This register reflects the contents of the FPSR.CC (7:0) bits.
- FPCFG: This register reflects the contents of the FPSR register bits related to the operation settings.

Table 3.47 FPU System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access |
| :--- | :--- | :--- | :--- |
| SR6, 0 | FPSR | Floating-point operation configuration/status | Permission |

## (a) FPSR — Floating-point Configuration/Status

This register indicates the execution status of floating-point operations and any exceptions that occur. For details about exception, see Section 3.2.6.1(5), Floating-Point Operation Exceptions.

Note 1. See the descriptions of each bit.
Table 3.48 FPSR Register Contents (1/2)

| Bit | Name | Description |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | CC7 to CC0 | These are the CC (condition) bits. They store the results of floating-point comparison instructions. The CC7 to CC0 bits are not affected by any instructions except the comparison instruction and LDSR instruction. <br> 0 : Comparison result is false <br> 1: Comparison result is true |  |  |  | R/W | Undefined |
| 23 | FN | This bit enables flush-to-nearest mode. When the FN bit is set to 1 , if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. For details, see Section 3.2.6.1(9), Flush to Nearest. |  |  |  | R/W | 0 |
| 22 | IF | This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see Section 3.2.6.1(8), Flushing Subnormal Numbers. |  |  |  | R/W | 0 |
| 21 | - | (Reserved for future expansion. Be sure to set to 1.) |  |  |  | R | 1 |
| 20 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 19, 18 | RM | These are the rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. |  |  |  | R/W | 00 |
|  |  | RM Bits |  |  |  |  |  |
|  |  | 19 | 18 | Mnemonic | Description |  |  |
|  |  | 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy. |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value equal to or less than the accurate result with infinite accuracy. |  |  |

Table 3.48 FPSR Register Contents (2/2)

| Bit | Name | Description |  |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 17 | FS | This bit enables values that could not be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception ( E ). An input operand that is a subnormal number is flushed to 0 with the same sign. Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode. |  |  |  |  | R/W | 1 |
|  |  | Operation Result that is a Subnormal Number | Rounding Mode and Value after Flushing |  |  |  |  |  |
|  |  |  | RN*1 | RZ | RP | RM |  |  |
|  |  | Positive | +0 | +0 | $+2^{\text {Emin }}$ | +0 |  |  |
|  |  | Negative | -0 | -0 | -0 | $-2^{\text {Emin }}$ |  |  |
|  |  | Note 1. If the rounding mode is RN and the FPSR.FN bit is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.1(9), Flush to Nearest. |  |  |  |  |  |  |
| 16 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |  | R | 0 |
| 15 to 10 | $\begin{aligned} & \text { XC } \\ & \text { (E,V,Z,O,U,I) } \end{aligned}$ | These are the cause bits. For details, see Section 3.2.3.4.2.a.1, Cause Bits (XC). |  |  |  |  | R/W | Undefined |
| 9 to 5 | $\begin{aligned} & \text { XE } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the enable bits. For details, see Section 3.2.3.4.2.a.2, Enable Bits (XE). |  |  |  |  | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & \text { (V,Z,O,U,I) } \end{aligned}$ | These are the preservation bits. For details, see Section 3.2.3.4.2.a.3, Preservation Bits (XP). |  |  |  |  | R/W | Undefined |

### 3.2.3.4.2.a. 1 Cause Bits (XC)

Bits 15 to 10 in the FPSR register are cause bits, which indicate the occurrence and cause of a floating- point operation exception. If an exception defined by IEEE754 is generated, when an enable bit is set to 1 corresponding to the exception, a cause bit is set, and the exception then occurs. When two or more exceptions occur during a single instruction, each corresponding bit is set to 1 .

If two or more exceptions are detected, as long as the enable bit corresponding to one of the exceptions is set to 1 , the exception occurs. In this case, the cause bits of all the detected exceptions, including exceptions whose enable bits are cleared to 0 , are set to 1 .
The cause bits are rewritten by a floating-point instruction (except the TRFSR instruction) where the floating-point operation exception occurred. The E bit is set to 1 when software emulation is required, otherwise it is cleared to 0 . Other bits are set to 1 or cleared to 0 depending on whether or not an IEEE754-defined exception has occurred.
When a floating-point operation exception has occurred, the operation result is not stored, and only the cause bits are affected.

When the cause bits are set to 1 by an LDSR instruction, a floating-point operation exception does not occur.

### 3.2.3.4.2.a.2 Enable Bits (XE)

Bits 9 to 5 in the FPSR register are the enable bits, which enable floating-point operation exceptions. When an IEEE754-defined exception occurs, a floating-point operation exception occurs if the enable bit corresponding to the exception has been set to 1 .

There are no enable bits corresponding to an unimplemented operation exception (E). An unimplemented operation exception (E) always occurs as a floating-point operation exception.

If the corresponding enable bit has not been set to 1 , no exception occurs and the default result defined by IEEE754 is stored.

### 3.2.3.4.2.a. 3 Preservation Bits (XP)

Bits 4 to 0 in the FPSR register are preservation bits. These bits store and indicate the detected exception after reset. An exception defined by IEEE754 occurs, and if a floating-point operation exception is not generated, the preservation bit is set to 1 , otherwise it does not change. The preservation bits are not cleared to 0 by the floatingpoint operation. However, these bits can be set and cleared by software when an LDSR instruction is used to write a new value to the FPSR register.

There are no preservation bits corresponding to unimplemented operation exceptions (E). An unimplemented operation exception (E) always occurs as a floating-point operation exception.

## NOTE

For details about the exception types and how they relate to particular bits, see Figure 3.37, Cause, Enable, and Preservation Bits of FPSR Register.

## (b) FPEPC — Floating-point Exception Program Counter

When an exception that is enabled by an enable bit occurs, the program counter (PC) of the instruction that caused the exception is stored.

Table 3.49 FPEPC Register Contents

| Bit | Name | Description | Ralue after |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 1 | FPEPC31 to <br> FPEPC1 | These bits store the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. | R/W | Undefined |  |
| 0 | FPEPC0 | This bit stores the program counter (PC) of the floating-point instruction that <br> caused the exception when a floating-point operation exception that is <br> enabled by an enable bit occurs. | $R$ | 0 |  |

## (c) FPST — Floating-point Operation Status

This register reflects the contents of the FPSR register bits related to the operation status.

| FPST | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 | 0 | E | Cause bits (XC) |  |  | U | 1 | 0 | 0 | IF | Preservation bits (XP) |  |  |  | 1 | Value after reset Undefined |

Table 3.50 FPST Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 14 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 13 to 8 | $\begin{aligned} & \mathrm{XC} \\ & (\mathrm{E}, \mathrm{~V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are cause bits. For details, see Section 3.2.3.4.2.a.1, Cause Bits (XC). Values written to these bits are reflected in FPSR.XC bits. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | IF | This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see Section 3.2.6.1(8), Flushing Subnormal Numbers. Value written to this bit is reflected in FPSR.IF bit. | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are preservation bits. For details, see Section 3.2.3.4.2.a.3, Preservation Bits (XP). Values written to these bits are reflected in FPSR.XP bits. | R/W | Undefined |

## (d) FPCC — Floating-point Operation Comparison Result

This register reflects the contents of the FPSR.CC7 to FPSR.CC0 bits.

Table 3.51 FPCC Register Contents

| Bit | Name | Description | Ralue after |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | Reset |

## (e) FPCFG - Floating-point Operation Configuration

This register reflects the contents of the FPSR register bits related to the operation settings.

| FPCFG | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 | 0 | 0 | 0 | 0 | 0 |  |  | 0 | 0 | 0 | V | E | - |  | 1 | Value after reset 0000 0000H |

Table 3.52 FPCFG Register Contents

| Bit | Name | Description |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 10 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 9, 8 | RM | These are rounding mode control bits. The RM bits define the rounding mode that the FPU uses for all floating-point instructions. Values written to these bits are reflected in RM bits of FPSR. |  |  |  | R/W | 0 |
|  |  | RM Bits |  |  |  |  |  |
|  |  | 9 | 8 | Mnemonic | Description |  |  |
|  |  | 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy. |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value equal to or less than the accurate result with infinite accuracy. |  |  |
| 7 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 4 to 0 | $\begin{aligned} & \text { XE } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the enable bits. For details, see Section 3.2.3.4.2.a.2, Enable Bits (XE). Values written to these bits are reflected in the FPSR.XE bits. |  |  |  | R/W | 0 |

### 3.2.3.5 FXU Function Registers

## (1) Vector Registers

32 vector registers (wr0-wr31) are provided as data registers dedicated to the extended floating-point operation unit (FXU). All of these registers can be used to store data variables. The data width of these registers is 128 bits. The values of the vector registers wr0 to wr31 after reset are undefined.

As shown in Figure 3.15 and Table 3.53, one vector register consists of 4 arithmetic ways. One single-precision floating-point data is stored in one arithmetic way. This allows four single-precision floating-point operations to be performed with one extended floating-point operation instruction.

| WR[0] | w3 | w2 | w1 | wo |
| :---: | :---: | :---: | :---: | :---: |
| WR[1] | w3 | w2 | w1 | wo |
| WR[2] | w3 | w2 | w1 | wo |
| WR[3] | w3 | w2 | w1 | wo |
| WR[4] | w3 | w2 | w1 | wo |
| WR[5] | w3 | w2 | w1 | w0 |
| WR[6] | w3 | w2 | w1 | wo |
| $\cdots$ |  |  |  |  |
| WR[31] | w3 | w2 | w1 | wo |

Figure 3.15 Vector Register Configuration

Table 3.53 Way Configuration of Vector Registers

| Name | Bits | Function |
| :--- | :--- | :--- |
| W0 | $[31: 0]$ | Way 0 data |
| W1 | $[63: 32]$ | Way 1 data |
| W2 | $[95: 64]$ | Way 2 data |
| W3 | $[127: 96]$ | Way 3 data |

## (2) Extended Floating-point Function System Registers

The FXU can use the following system registers to control arithmetic operations. Extended floating-point function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

- FXSR: This register is used to control and monitor the extended floating-point operation exceptions. It is also used to set the operation mode of the FXU. It has bits for subnormal flush enabling, rounding mode control, exception cause, exception enabling and preservation.
- FXST: This register reflects the contents of the FXSR register bits related to the operation status.
- FXINFO: This register holds the information about the configuration of the FXU.
- FXCFG: This register reflects the contents of the FXSR register bits related to the operation settings.
- FXXC: This register holds the XC (cause) bits of extended floating-point operation exceptions for each arithmetic way.
- FXXP: This register holds the XP (preservation) bits of extended floating-point operation exceptions for each arithmetic way.

Table 3.54 List of Extended Floating-point Function System Registers

| Register Number <br> (regID, sellD) | Name | Function | Access |
| :--- | :--- | :--- | :--- |
| SR6, 10 | FXSR | Extended floating-point operation configuration/status | Permission |

## (a) FXSR — Extended Floating-point Operation Configuration/Status

The FXSR register indicates the execution status of extended floating-point operations and occurrence of exceptions.

| FXSR | 310 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 9 | 18 | 17 | 16 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | FN | IF | 1 | 0 | RM |  | FS | 0 |  |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  |  |  | ause | (XC |  |  |  |  | ble |  |  |  | - |  | U |  | Value after reset |
|  | E | V | Z | 0 | U | 1 | V | Z | 0 | U | 1 | V | Z | 0 | U | 1 | *1 |

Note 1. See the descriptions of each bit.
Table 3.55 FXSR Register Contents (1/2)

| Bit | Name | Description |  |  |  |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |  |  |  | R | 0 |
| 23 | FN | This bit enables flush-to-nearest mode. When the FN bit is set to 1 , if the rounding mode is RN and the operation result is a subnormal number, the number is flushed to the nearest number. For details, see Section 3.2.6.2(9), Flush to Nearest. |  |  |  |  |  |  | R/W | 0 |
| 22 | IF | This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see Section 3.2.6.2(8), Flushing Subnormal Numbers. |  |  |  |  |  |  | R/W | 0 |
| 21 | - | (Reserved for future expansion. Be sure to set to 1.) |  |  |  |  |  |  | R | 1 |
| 20 | - | (Reserved for future expansion. Be sure to set to 0 .) |  |  |  |  |  |  | R | 0 |
| 19, 18 | RM | These are the rounding mode control bits. The RM bits define the rounding mode that the FXU uses for all extended floating-point instructions. |  |  |  |  |  |  | R/W | 00 |
|  |  | RM Bits |  | Mnemonic | Description |  |  |  |  |  |
|  |  | 19 | 18 |  |  |  |  |  |  |  |
|  |  | 0 | 0 | RN |  | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |  |  |
|  |  | 0 | 1 | RZ |  | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy. |  |  |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy. |  |  |  |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value equal to or less than the accurate result with infinite accuracy. |  |  |  |  |  |
| 17 | FS | This bit enables values that could not be normalized (subnormal numbers) to be flushed. If the FS bit is set, input operands and operation results that are subnormal numbers are flushed without causing an unimplemented operation exception ( E ). An input operand that is a subnormal number is flushed to 0 with the same sign. Operation results that are subnormal numbers either become 0 or the minimum normalized number, depending on the rounding mode. |  |  |  |  |  |  | R/W | 1 |
|  |  | Operation Result that is a Subnormal Number |  |  | Rounding Mode and Value after Flushing |  |  |  |  |  |
|  |  |  |  |  | $\mathrm{RN}^{* 1}$ | RZ | RP | RM |  |  |
|  |  | Positive |  |  | +0 | +0 | $+2^{\text {Emin }}$ | +0 |  |  |
|  |  | Negative |  |  | -0 | -0 | -0 | $-2^{\text {Emin }}$ |  |  |
|  |  | Note 1. If the rounding mode is RN and the FXSR.FN bit is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.2(9), Flush to Nearest. |  |  |  |  |  |  |  |  |

Table 3.55 FXSR Register Contents (2/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 16 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 15 to 10 | $\begin{aligned} & \text { XC } \\ & (\mathrm{E}, \mathrm{~V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the cause bits. For details, see Section 3.2.3.5.2.a.1, Cause Bits (XC). | R/W | Undefined |
| 9 to 5 | $\begin{aligned} & \text { XE } \\ & \text { (V,Z,O,U,I) } \\ & \hline \end{aligned}$ | These are the enable bits. For details, see Section 3.2.3.5.2.a.2, Enable Bits (XE). | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & \text { (V,Z,O,U,I) } \end{aligned}$ | These are the preservation bits. For details, see Section 3.2.3.5.2.a.3, Preservation Bits (XP). | R/W | Undefined |

### 3.2.3.5.2.a. 1 Cause Bits (XC)

Bits 15 to 10 in the FXSR register are cause bits, which indicate the occurrence and cause of an extended floatingpoint operation exception. The FXSR.XC bits hold the OR of the detection results of extended floating-point operation exceptions that occurred in the arithmetic ways. If an exception defined by IEEE754 is generated, when an enable bit is set to 1 corresponding to the exception, a cause bit is set, and the exception then occurs. When two or more exceptions occur during a single instruction, each corresponding bit is set to 1 .

If two or more exceptions are detected, as long as the enable bit corresponding to one of the exceptions is set to 1 , the exception occurs. In this case, the cause bits of all the detected exceptions, including exceptions whose enable bits are cleared to 0 , are set to 1 .
The cause bits are rewritten by the extended floating-point operation instruction that caused the extended floatingpoint operation exception. The E bit is set to 1 when software emulation is required, otherwise it is cleared to 0 . Other bits are set to 1 or cleared to 0 depending on whether or not an IEEE754-defined exception has occurred.

When an extended floating-point operation exception has occurred, the operation result is not stored, and only the cause bits are affected.

When the cause bits are set to 1 by an LDSR instruction, no extended floating-point operation exception occurs.

### 3.2.3.5.2.a. 2 Enable Bits (XE)

Bits 9 to 5 in the FXSR register are the enable bits, which enable extended floating-point operation exceptions. When an IEEE754-defined exception occurs, an extended floating-point operation exception occurs if the enable bit corresponding to the exception has been set to 1 .

There are no enable bits corresponding to an unimplemented operation exception (E). An unimplemented operation exception (E) always occurs as an extended floating-point operation exception.

The FXSR.XE bits cannot be set on an arithmetic way basis. The same setting is used for the all arithmetic ways.
If the corresponding enable bit has not been set to 1 , no exception occurs and the default result defined by IEEE754 is stored.

### 3.2.3.5.2.a.3 Preservation Bits (XP)

Bits 4 to 0 in the FXSR register are preservation bits and accumulate and indicate the exceptions that have been detected since a reset. An exception defined by IEEE754 occurs, and if an extended floating-point operation exception is not generated, the preservation bit is set to 1 , otherwise it does not change. The preservation bits are not cleared to 0 by the extended floating-point operation. However, these bits can be set and cleared by software when an LDSR instruction is used to write a new value to the FXSR register.

There are no preservation bits corresponding to unimplemented operation exceptions (E). An unimplemented operation exception (E) always occurs as an extended floating-point operation exception.

NOTE
For details about the exception types and how they relate to particular bits, see Figure 3.38, Relationship among the Cause and Enable Bits of the FXSR and FXXC Registers and Figure 3.39, Relationship among the Preservation and Enable Bits of the FXSR and FXXP Registers.

## (b) FXST - Extended Floating-point Operation Status

This register reflects the contents of the FXSR register bits related to the operation status.

| FXST | 310 | 300 | 290 | 280 | 270 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 | 0 | E | V | Z | $\begin{gathered} \mathrm{s}(\mathrm{Xc} \\ 0 \end{gathered}$ | U | 1 | 0 | 0 | IF | V | Z | O | (XP | 1 | Value after reset Undefined |

Table 3.56 FXST Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 14 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 13 to 8 | $\begin{aligned} & X C \\ & (E, V, Z, O, U, I) \end{aligned}$ | These are cause bits. For details, see Section 3.2.3.5.2.a.1, Cause Bits (XC). Values written to these bits are reflected in FXSR.XC bits. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0 .) | R | 0 |
| 5 | IF | This bit accumulates and indicates information about the flushing of input operands. For details about flushing subnormal numbers, see Section 3.2.6.2 (8), Flushing Subnormal Numbers. Value written to this bit is reflected in FXSR.IF bit. | R/W | 0 |
| 4 to 0 | $\begin{aligned} & \text { XP } \\ & (\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are preservation bits. For details, see Section 3.2.3.5.2.a.3, Preservation Bits (XP). Values written to these bits are reflected in FXSR.XP bits. | R/W | Undefined |

(c) FXINFO - FXU Configuration Information

This register holds the information about the configuration of the FXU.

| FXINFO | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table $3.58 \quad$ FXCFG Register Contents

| Bit | Name | Description |  |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 10 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 9, 8 | RM | These are the rounding mode control bits. The RM bits define the rounding mode that the FXU uses for all extended floating-point instructions. Values written to these bits are reflected in the RM bits of the FXSR register. |  |  |  | R/W | 0 |
|  |  |  | Bits |  |  |  |  |
|  |  | 9 | 8 | Mnemonic | Description |  |  |
|  |  | 0 | 0 | RN | Rounds the result to the nearest representable value. If the value is exactly in-between the two nearest representable values, the result is rounded toward the value whose least significant bit is 0 . |  |  |
|  |  | 0 | 1 | RZ | Rounds the result toward 0 . The result is the nearest to the value that does not exceed the absolute value of the result with infinite accuracy.。 |  |  |
|  |  | 1 | 0 | RP | Rounds the result toward $+\infty$. The result is nearest to a value equal to or greater than the accurate result with infinite accuracy. |  |  |
|  |  | 1 | 1 | RM | Rounds the result toward $-\infty$. The result is nearest to a value equal to or less than the accurate result with infinite accuracy. |  |  |
| 7 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  | R | 0 |
| 4 to 0 | $\begin{aligned} & \mathrm{XE} \\ & (\mathrm{~V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}, \mathrm{I}) \end{aligned}$ | These are the enable bits. For details, see Section 3.2.3.5.2.a.2, Enable Bits (XE). <br> Values written to these bits are reflected in FXSR.XE bits. |  |  |  | R/W | 0 |

## (e) FXXC - XC (Cause) Bits for Each Arithmetic Way

This register holds the XC (cause) bits of extended floating-point operation exceptions for each arithmetic way. Any attempts to write this register will not affect the value of the XC bits of the FXSR register.

Table 3.59 FXXC Register Contents

|  |  |  |  | Value after <br> Bit | Name |
| :--- | :--- | :--- | :--- | :--- | :--- |

## (f) FXXP - XP (Preservation) Bits for Each Arithmetic Way

This register holds the XP (preservation) bits of extended floating-point operation exceptions for each arithmetic way. Any attempts to write this register will not affect the value of the XP bits of the FXSR register.

|  | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |  |

Table 3.60 FXXP Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 29 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 28 to 24 | $\begin{aligned} & \text { XP3 } \\ & \text { (V3,Z3,O3,U3,I3) } \end{aligned}$ | These bits hold the preservation bits associated with arithmetic way 3. | R/W | Undefined |
| 23 to 21 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 20 to 16 | $\begin{aligned} & \text { XP2 } \\ & \text { (V2,Z2,O2,U2,I2) } \end{aligned}$ | These bits hold the preservation bits associated with arithmetic way 2. | R/W | Undefined |
| 15 to 13 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 12 to 8 | $\begin{aligned} & \text { XP1 } \\ & \text { (V1,Z1,O1,U1,I1) } \end{aligned}$ | These bits hold the preservation bits associated with arithmetic way 1. | R/W | Undefined |
| 7 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | $\begin{aligned} & \text { XPO } \\ & \text { (V0,Z0,O0,U0,I0) } \end{aligned}$ | These bits hold the preservation bits associated with arithmetic way 0. | R/W | Undefined |

### 3.2.3.6 MPU Function Registers

## (1) MPU Function System Registers

MPU function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.61 MPU Function System Registers

| Register No. (regID, selID) | Symbol | Function | Access <br> Permission |
| :---: | :---: | :---: | :---: |
| SRO, 5 | MPM | Memory protection operation mode setting | SV |
| SR2, 5 | MPCFG | MPU configuration | SV |
| SR8, 5 | MCA | Memory protection setting check address | SV |
| SR9, 5 | MCS | Memory protection setting check size | SV |
| SR10, 5 | MCC | Memory protection setting check command | SV |
| SR11, 5 | MCR | Memory protection setting check result | SV |
| SR12, 5 | MCI | Memory protection setting check SPID | SV |
| SR16, 5 | MPIDX | Index of memory protection setting registers to be accessed | SV |
| SR20, 5 | MPLA | Protection area minimum address | SV |
| SR21, 5 | MPUA | Protection area maximum address | SV |
| SR22, 5 | MPAT | Protection area attribute | SV |
| SR24, 5 | MPID0 | SPID which can access protection area | SV |
| SR25, 5 | MPID1 | SPID which can access protection area | SV |
| SR26, 5 | MPID2 | SPID which can access protection area | SV |
| SR27, 5 | MPID3 | SPID which can access protection area | SV |
| SR28, 5 | MPID4 | SPID which can access protection area | SV |
| SR29, 5 | MPID5 | SPID which can access protection area | SV |
| SR30, 5 | MPID6 | SPID which can access protection area | SV |
| SR31, 5 | MPID7 | SPID which can access protection area | SV |

## (a) MPM - Memory Protection Operation Mode

The memory protection operation mode register is used to define the basic operation mode of the memory protection function.

Table 3.62 MPM Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | SVP | In SV mode (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 <br> 0: Enable all accesses in SV mode. <br> 1: Restrict access according to the SX, SW, and SR bits in SV mode.*2 | R/W | 0 |
| 0 | MPE | This bit is used to specify whether to enable or disable MPU function. <br> 0: Disable <br> 1: Enable | R/W | 0 |

Note 1. When the SVP bit is set to 1 by an LDSR instruction, the setting is effective from the operand access by the subsequent instruction. On the other hand, since the instruction fetch access is executed independently from the setting of the SVP bit, it is not possible to identify the timing when the new setting is applied to the instruction fetch access. In this case, make settings of the protection area in advance so that the program which sets the SVP bit itself will not be blocked.
Note 2. If the SVP bit is set to 1, the MDP or MIP exception handler cannot be executed if it is not permitted to access to the necessary memory areas. Be sure to make settings of the protection area in advance so that the necessary memory areas can be accessed by the exception handler.

## (b) MPCFG - MPU Configuration

This register holds the information about the configuration of the MPU.

Table 3.63 MPCFG Register Contents

| Bit | Name | Description | (Reserved for future expansion. Be sure to set to 0. ) | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 20 | - | These bits indicate the version of the MPU architecture specifications. <br> A value of 1 is read for this CPU. | R | 1 |  |
| 19 to 16 | ARCH | (Reserved for future expansion. Be sure to set to 0. ) | 0 |  |  |
| 15 to 5 | - | NMPUE | These bits indicate the number of MPU entries implemented in this CPU <br> minus 1. A value of 23 is read since this CPU incorporates 24 MPU <br> entries. | R | 23 |
| 4 to 0 |  |  |  | 0 |  |

## (c) MCA - Memory Protection Setting Check Address

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

Table 3.64 MCA Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 0 | MCA31 to | These bits are used to specify the starting address of the memory area | R/W | Undefined |
|  | MCA0 | which subjects to a memory protection setting check in bytes. |  |  |

## (d) MCS - Memory Protection Setting Check Size

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

Table 3.65 MCS Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 0 | MCS31 to | These bits are used to specify the size of the memory area in bytes which <br> subjects to a memory protection setting check. Because the specified size <br> is assumed to represent an unsigned integer, it is not possible to check an <br> area in the direction in which the address value decreases relative to the | Reset |  |
|  |  | MCA register value. |  |  |

## (e) MCC - Memory Protection Setting Check Command

This command register is used to start a memory protection setting check.

Table 3.66 MCC Register Contents

## (f) MCR - Memory Protection Setting Check Result

This register is used to store the results of a memory protection setting check.
When the MCC register is written, the value of the MPIDn registers ( $\mathrm{n}=0$ to 7 ), the WMPIDn bits ( $\mathrm{n}=0$ to 7 ) (for write permission) and the RMPIDn bits ( $\mathrm{n}=0$ to 7) (for execution and read permission) of each MPAT register are checked to verify that the SPID specified by the MCI register matches the SPID for which the access is permitted.

However, if the WG bit or RG bit of the MPAT register is set to 1 , it is assumed that the SPID specified by the MCI register matches the SPID for which write or execution and read access is permitted regardless of the SPID matching result above.

If an SPID match is found, protection attributes of the protection area which includes the address area specified by the MCA and MCS registers are stored in the corresponding attribute bits of the MCR register. If multiple protection areas include the specified address area, and if an access is permitted by any of the protection areas, 1 , which indicates the access is permitted, is stored in the corresponding attribute bits of the MCR register.

If no SPID match is found or no protection area including the specified address area exists, 0 , which indicates the access is not permitted, is stored in each attribute bit of the MCR register.

## CAUTION

If the specified area to be checked crosses 00000000 н or 7FFF FFFFH, it is judged as an area setting error, and the MCR.OV bit is set to 1 . This means that the MCR.OV bit must be read to confirm that the result is not invalid ( $\mathrm{OV}=0$ ) before referencing the check result of each attribute bit. When the MCR.OV bit is set to 1 , all attribute bits are cleared to 0 unless the MPM.SVP bit is 0 . If the MPM.SVP bit is 0 , the MCR.SXE, SWE and SRE bits are set to 1 , even if the MCR.OV bit is set to 1 . Even when no SPID match is found, the MCR.OV bit is set to 1 if the area setting is wrong.

| MCR | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |
|  | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
|  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | OV | 0 | 0 | SXE | SWE | SRE | UXE | UWE | URE | Undefined |

Table 3.67 MCR Register Contents (1/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | OV | If the specified area includes $00000000_{\mathrm{H}}$ or 7 FFF FFFF $_{\mathrm{H}}, 1$ is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 7, 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | SXE | If the specified area is contained within one protection area and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 4 | SWE | If the specified area is contained within one protection area and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 3 | SRE | If the specified area is contained within one protection area and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |
| 2 | UXE | If the specified area is contained within one protection area and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit. | R/W | Undefined |

Table 3.67 MCR Register Contents (2/2)

| Bit | Name | Description | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | UWE | If the specified area is contained within one protection area and reading from <br> that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is <br> stored in this bit. | R/W | Undefined |
| 0 | URE | If the specified area is contained within one protection area and reading from <br> that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is <br> stored in this bit. | R/W | Undefined |

## (g) MCI — Memory Protection Setting Check SPID

This register is used to specify the SPID for which a memory protection settings check is to be performed.

Table 3.68 MCI Register Contents

| Bit | Name | Description | R/W | Value after <br> Reset |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0. ) | $R$ | 0 |
| 4 to 0 | SPID | These bits specify the SPID for which a memory protection settings check is to <br> be performed. | Undefined |  |

## (h) MPIDX — Index of Memory Protection Setting Registers to be Accessed

This register is used to specify the index of memory protection setting registers to be accessed.

Table 3.69 MPIDX Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 4 to 0 | IDX | These bits specify the index of the MPLA, MPUA, and MPAT registers to be accessed by the LDSR or STSR instruction. | R/W | 0 |
|  |  | The result of changing the value of this register is reflected in the instruction immediately following. |  |  |
|  |  | This CPU provides 24 channels of protection areas, so that IDX may be set to a value from 0 to 23 . If a value from 24 to 31 is set to IDX and the MPLA, MPUA, or MPAT register is accessed by the LDSR or STSR instruction, it is handled as an undefined register. |  |  |

## (i) MPLA - Protection Area Minimum Address

This register indicates the minimum address of a protection area. The value written into this register with the LDSR instruction is set as the minimum address of area $n(n=0$ to 23 ) specified in the MPIDX register. The value read from this register with the STSR instruction is the minimum address of area $n$ specified in the MPIDX register. It is impossible to manipulate the minimum address of area $n$ without using the MPIDX register and this register.
This CPU provides 24 channels of protection areas, so that the MPLA register can be used specifying a value from 0 to 23 in the MPIDX register. If a value from 24 to 31 is specified in the MPIDX register, the register is handled as an undefined register.

Table 3.70 MPLA Register Contents

|  |  |  |  | Value after |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |

## (j) MPUA - Protection Area Maximum Address

This register indicates the maximum address of a protection area. The value written into this register with the LDSR instruction is set as the maximum address of area $n(n=0$ to 23$)$ specified in the MPIDX register. The value read from this register with the STSR instruction is the maximum address of area $n$ specified in the MPIDX register. It is impossible to manipulate the maximum address of area $n$ without using the MPIDX register and this register.

This CPU provides 24 channels of protection areas, so that the MPUA register can be used specifying a value from 0 to 23 in the MPIDX register. If a value from 24 to 31 is specified in the MPIDX register, the register is handled as an undefined register.

Table 3.71 MPUA Register Contents

| Bit | Name | Description | Value after <br> Reset |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 to 2 | MPUA31 to | These bits specify the maximum address of area $n(n=0$ to 23) specified by <br> mPUA2 <br> the MPIDX register. <br> The specified maximum address is included in the range of area matching. <br> Bits 1 and 0 of the maximum address are handled as 1. | R/W | Undefined |
|  |  | (Reserved for future expansion. Be sure to set to 0.$)$ | R/W | 0 |
| 1,0 | - |  |  |  |

## (k) MPAT — Protection Area Attribute

This register indicates the attribute of a protection area. The value written into this register with the LDSR instruction is set as the protection attribute of area $n(n=0$ to 23$)$ specified in the MPIDX register. The value read from this register with the STSR instruction is the protection attribute of area $n$ specified by the MPIDX register. It is impossible to manipulate the attribute of area $n$ without using the MPIDX register and this register.
This CPU provides 24 channels of protection areas, so that the MPAT register can be used specifying a value from 0 to 23 in the MPIDX register. When a value from 24 to 31 is specified in the MPIDX register, the register is handled as an undefined register.

For details on how to set these bits, see Section 3.2.5.1(2), Protection Area Settings.

Table 3.72 MPAT Register Contents (1/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 24 | WMPID7 to WMPID0 | This bit indicates the write permission for the SPID specified in the MPIDn ( $n=$ 0 to 7) register. <br> 0 : Writing by the SPID specified by the MPIDn register is disabled. <br> 1: Writing by the SPID specified by the MPIDn register is enabled. | R/W | Undefined |
| 23 to 16 | RMPID7 to RMPID0 | This bit indicates the execution and read permissions for the SPID specified in the MPIDn ( $\mathrm{n}=0$ to 7 ) register. <br> 0 : Execution and reading by the SPID specified by the MPIDn register is disabled. <br> 1: Execution and reading by the SPID specified by the MPIDn register is enabled. | R/W | Undefined |
| 15 | WG | This bit indicates the write permission for any SPID. <br> 0 : Writing is enabled by the settings of the MPIDn register and WMPIDn bit ( $\mathrm{n}=0$ to 7 ). <br> 1: Writing by any SPID is enabled regardless of the settings of the MPIDn register and WMPIDn bit ( $\mathrm{n}=0$ to 7 ). | R/W | Undefined |
| 14 | RG | This bit indicates the execution and read permissions for any SPID. <br> 0 : Execution and reading is enabled by the settings of the MPIDn register and RMPIDn bit ( $\mathrm{n}=0$ to 7 ). <br> 1: Execution and reading by any SPID is enabled regardless of the settings of the MPIDn register and RMPIDn bit ( $\mathrm{n}=0$ to 7 ). | R/W | Undefined |
| 13 to 8 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 7 | E | This bit indicates whether area $\mathrm{n}(\mathrm{n}=0$ to 23 ) specified by the MPIDX register is enabled or disabled. <br> 0 : Area n is disabled. <br> 1: Area n is enabled. | R/W | 0 |
| 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5 | SX | This bit indicates the execution permission in the supervisor mode for area n ( $\mathrm{n}=0$ to 23) specified by the MPIDX register.*1 <br> 0 : Execution is disabled. <br> 1: Execution is enabled. | R/W | Undefined |
| 4 | SW | This bit indicates the write permission in the supervisor mode for area n ( $\mathrm{n}=0$ to 23) specified by the MPIDX register. ${ }^{* 1}$ <br> 0 : Writing is disabled. <br> 1: Writing is enabled. | R/W | Undefined |

Table 3.72 MPAT Register Contents (2/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 3 | SR | This bit indicates the read permission in the supervisor mode for area n ( $\mathrm{n}=0$ to 23) specified by the MPIDX register.*1,*2 <br> 0 : Reading is disabled. <br> 1: Reading is enabled. | R/W | Undefined |
| 2 | UX | This bit indicates the execution permission in the user mode for area $n(n=0$ to 23) specified by the MPIDX register. <br> 0 : Execution is disabled. <br> 1: Execution is enabled. | R/W | Undefined |
| 1 | UW | This bit indicates the write permission in the user mode for area $n$ ( $n=0$ to 23) specified by the MPIDX register. <br> 0 : Writing is disabled. <br> 1: Writing is enabled. | R/W | Undefined |
| 0 | UR | This bit indicates the read permission in the user mode for area $n(n=0$ to 23 ) specified by the MPIDX register.*2 <br> 0 : Reading is disabled. <br> 1: Reading is enabled. | R/W | Undefined |

Note 1. If access is restricted in SV mode, the MDP or MIP exception handler might not be executed depending on the settings. Be sure to make settings of the protection area in advance so that the necessary memory areas can be accessed by the exception handler.
Note 2. For the CALLT, SWITCH, and SYSCALL instructions and interrupts in table reference method, an MDP exception occurs if reading the address where the table is stored is not permitted. Permission for the SYSCAL instruction and interrupts in table reference method are judged after the operation mode of the CPU is transitioned to the supervisor mode. Therefore, when the MPM.SVP bit is set (1), the SR bit need to be set (1) as well.

## (I) MPIDn -SPID which can Access Protection Area

This register specifies the SPID which can access protection area. The accessibility for the specified SPID is determined in conjunction with the WMPIDn and RMPIDn bits ( $\mathrm{n}=0$ to 7 ) which are specified via the MPAT register.

This CPU has 8 MPID registers.

Value after reset Undefined

Table 3.73 MPIDn Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 5 | - | (Reserved for future expansion. Be sure to set to 0. ) | R | 0 |
| 4 to 0 | SPID | These bits specify the SPID which can access protection area. | R/W | Undefined |

### 3.2.3.7 Cache Operation Function Registers

## (1) Cache Control Function System Registers

Cache control function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.74 Cache Control Function System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR16, 4 | ICTAGL | Instruction cache tag Lo access | SV |
| SR17, 4 | ICTAGH | Instruction cache tag Hi access | SV |
| SR18, 4 | ICDATL | Instruction cache data Lo access | SV |
| SR19, 4 | ICDATH | Instruction cache data Hi access | SV |
| SR24, 4 | ICCTRL | Instruction cache control | SV |
| SR26, 4 | ICCFG | Instruction cache configuration | SV |
| SR28, 4 | ICERR | Instruction cache error | SV |

## (a) ICTAGL - Instruction Cache Tag Lo Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the tag RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the tag RAM for the instruction cache are stored.

Table $3.75 \quad$ ICTAGL Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 11 | LPN | These bits hold address bits 27 to 11 . Bits 31 to 28 must always be set to 0 . Bits 27 to 11 are held if the cache size is 8 Kbytes. <br> Bits 27 to 12 are held and bit 11 is always set to 0 if the cache size is 16 Kbytes.** | R/W | Undefined |
| 10 to 6 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 5, 4 | LRU | These bits indicate LRU information of specified cache line. LRU information cannot be freely changed to any value by the CIST instruction. | R/W | Undefined |
| 3 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 2 | L | This bit holds the lock information.*2 <br> 0 : The cache line is not locked. <br> 1: The cache line is locked. | R/W | Undefined |
| 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | V | This bit holds valid/invalid information of specified cache line.*2 <br> 0 : The cache line is disabled. <br> 1: The cache line is enabled. | R/W | Undefined |

Note 1. Bit 11 cannot be written with any value by an LDSR instruction if the cache size is 16 Kbytes. It is always set to 0 .
Note 2. If a tag RAM is set by a CIST instruction, the settings of other bits are valid only when the V bit is enabled.
When the V bit is disabled, the cache line is always judged as a cache miss regardless of the value in the LPN bit. Also, when the V bit is disabled, even if the cache line is locked by the setting of the $L$ bit, the cache line becomes the target to be replaced.

## (b) ICTAGH — Instruction Cache Tag Hi Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the tag RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the tag RAM for the instruction cache are stored.

Table 3.76 ICTAGH Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 | WD | This bit specifies whether the data RAM of the cache is updated during execution of the CIST instruction. <br> 0 : Data RAM of the cache is not updated. <br> 1: Data RAM of the cache is updated. | R/W | 0 |
| 30 | PD | This bit specifies the data to be written to the ECC of the data RAM when the WD bit is set to 1 and the CIST instruction is executed. <br> 0 : ECC automatically generated from the write data is written to the ECC of the data RAM. <br> 1: Values in the DATAECC field are written to the ECC of the data RAM. | R/W | 0 |
| 29 | WT | This bit specifies whether the tag RAM of the cache is updated during execution of the CIST instruction. When this bit is set to 1 , the V bit and L bit of the cache line are also updated. <br> 0 : Tag RAM of the cache is not updated. <br> 1: Tag RAM of the cache is updated. | R/W | 0 |
| 28 | PT | This bit specifies the data to be written to the ECC of the tag RAM when the WT bit is set to 1 and the CIST instruction is executed. <br> 0 : ECC automatically generated from the write data is written to the ECC of the tag RAM. <br> 1: Values in the TAGECC field are written to the ECC of the tag RAM. | R/W | 0 |
| 27 to 24 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 23 to 16 | DATAECC | These bits hold ECC for data RAM. | R/W | Undefined |
| 15 to 8 | TAGECC | These bits hold ECC for tag RAM. Bit 15 is fixed to 0. | R/W | Undefined |
| 7 to 0 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |

## (c) ICDATL - Instruction Cache Data Lo Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the data RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the data RAM for the instruction cache are stored.

Table 3.77 ICDATL Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 0 | DATAL | These bits hold the lower-order 32 bits of the 64-bit instruction data*1 in the block in the specified cache line. The bits to be held is specified by offset of the index.*2 | R/W | Undefined |
|  |  | Offset of index $=00$ : Bits 31 to $0 * 3$ |  |  |
|  |  | Offset of index $=01$ : Bits 95 to 64*3 |  |  |
|  |  | Offset of index $=10$ : Bits 159 to 128*3 |  |  |
|  |  | Offset of index = 11: Bits 223 to 192*3 |  |  |

Note 1. Data alignment of the instruction data in the block in the cache line is different from the data alignment of memory. For details, see Section 3.2.5.2(10), Configuration of Instruction Cache.
Note 2. For details on how to specify Offset, see Section 3.2.5.2(6), Cache Index Specification Method.
Note 3. For details on the bit position, see Figure 3.31 in Section 3.2.5.2(10), Configuration of Instruction Cache.

## (d) ICDATH - Instruction Cache Data Hi Access

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of the CIST instruction, values that are stored to the data RAM for the instruction cache are stored. During execution of the CILD instruction, values read from the data RAM for the instruction cache are stored.

Table 3.78 ICDATH Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 0 | DATAH | These bits hold the upper-order 32 bits of the 64-bit instruction data*1 in the block in the specified cache line. The bits to be held is specified by offset of the index.*2 | R/W | Undefined |
|  |  | Offset of index $=00$ : Bits 63 to $32{ }^{* 3}$ |  |  |
|  |  | Offset of index $=01$ : Bits 127 to $96 * 3$ |  |  |
|  |  | Offset of index = 10: Bits 191 to 160*3 |  |  |
|  |  | Offset of index $=11$ : Bits 255 to $224{ }^{* 3}$ |  |  |

Note 1. Data alignment of the instruction data in the block in the cache line is different from the data alignment of memory. For details, see Section 3.2.5.2(10), Configuration of Instruction Cache.
Note 2. For details on how to specify Offset, see Section 3.2.5.2(6), Cache Index Specification Method.
Note 3. For details on the bit position, see Figure 3.31 in Section 3.2.5.2(10), Configuration of Instruction Cache.
(e) ICCTRL - Instruction Cache Control

This register is used to control the instruction cache.

Table $3.79 \quad$ ICCTRL Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 17 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 16 | - | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 15 to 9 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | ICHCLR | When this bit is set to 1 , the entire instruction cache is cleared. This clears the $V$ and $L$ bits (to 0 ) and initializes the LRU information. This bit is always read as 0 . | R/W | 0 |
| 7 to 3 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 2 | ICHEIV | When this bit is set to 1 , the instruction cache is automatically set as invalid (the ICHEN bit is cleared to 0 ) whenever a cache error*2 occurs. | R/W | 0 |
| 1 | ICHEMK | When this bit is set to 1 , it masks notification of cache error exceptions for the CPU after a cache error*2 has occurred. | R/W | 1 |
| 0 | ICHEN | This bit indicates valid/invalid status of instruction cache. <br> 0 : Instruction cache is invalid <br> 1: Instruction cache is valid | R/W | *1 |

Note 1. The value after reset is determined by the hardware specifications. For details, see Section 3.8.7, Product Information of Initial Value for G4MH Register.
Note 2. For details on the cache error, see Section 3.2.5.2(10), Configuration of Instruction Cache.

## (f) ICCFG - Instruction Cache Configuration

This register indicates the instruction cache configuration.

Table 3.80 ICCFG Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 15 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 14 to 8 | ICHSIZE | These bits indicate the size (in Kbytes) of the instruction cache. <br> 000 1000: 8 Kbytes <br> 001 0000: 16 Kbytes <br> Other than above: Setting prohibited | R | *1 |
| 7 to 4 | ICHLINE | These bits indicate the number of lines for each way in the instruction cache. <br> 0010: 64 lines <br> 0100: 128 lines <br> Other than above: Setting prohibited | R | *1 |
| 3 to 0 | ICHWAY | These bits indicate the number of ways in the instruction cache. <br> 0100: 4 ways <br> Other than above: Setting prohibited | R | *1 |

Note 1. The value after reset is determined by the hardware specifications. For details, see Section 3.8.7, Product Information of Initial Value for G4MH Register.

## (g) ICERR - Instruction Cache Error

This register is used to store cache error information for the instruction cache.
After the ICHERR bit is set to 1 , any subsequent cache error information that is generated is not stored until this setting is explicitly cleared to 0 . However, information on error status (ESAFE, ESMH, ESPBSE, ESTE1, ESTE2, ESDC, and ESDE) is accumulated.

Table 3.81 ICERR Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| 31 | CISTW | This bit is set to indicate that the destination way specified for a CISTI <br> instruction was in error. Although the entry information is overwritten so that <br> writing is completed, the V bit will be cleared the next time the cache line is <br> read (i.e. reading will be judged to have missed the cache). However, setting <br> of this bit is not accompanied by an exception for the CPU. | R/W | Undefined |
|  |  | Error status: Address feedback error | R/W |  |
| 30 | ESAFE | EsMH | ESPBSE status: Multi hit | Error status: WAY error |

Note 1. Bits 12 and 11 cannot be written with any value by an LDSR instruction if the cache size is 8 Kbytes. They are always set to 0.

Note 2. Bit 12 cannot be written with any value by an LDSR instruction if the cache size is 16 Kbytes. It is always set to 0 .

Note 3. While the error exception notification mask bit for each error cause is cleared (to 0 ), if the corresponding error occurs, the ICHERR, ICHERQ, ICHED/ICHET, ICHEIX, and ICHEWY bits are updated and the corresponding error status bit is set (to 1). While the error exception notification mask bit is set (to 1 ), if the corresponding error occurs, only the corresponding error status bit is set (to 1 ).

### 3.2.3.8 Count Function Registers

## (1) Count Function System Registers

Count function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.82 Count Function System Registers

| Register No. <br> (regID, sellD) | Symbol | Function | Access |
| :--- | :--- | :--- | :--- |
| SR0, 11 | TSCOUNTL | Timestamp count L register | Permission |

Note 1. Only reads are permitted in user mode. A PIE exception will occur if an attempt is made to write in user mode. Reads and writes are permitted in supervisor mode.
Note 2. Accessing in user mode becomes possible by configuring the PMUMCTRL register.

## (a) TSCOUNTL — Timestamp Count L

This register, together with the timestamp count H register, implements a 64-bit counter. This register serves as the lower-order 32 bits of the 64-bit counter.

This register can be read only in user mode. A PIE exception will occur if an attempt is made to write this register in user mode. This register can be read and written in supervisor mode.

Value after reset $00000000_{\mathrm{H}}$

Table 3.83 TSCOUNTL Register Contents

Note 1. To use this register for making up an accurate 64 -bit counter, see Section 3.2.2.12, Timestamp Counter.

## (b) TSCOUNTH - Timestamp Count H

This register, together with the timestamp count L register, implements a 64 -bit counter. This register serves as the higher-order 32 bits of the 64-bit counter.
This register can be read only in user mode. A PIE exception will occur if an attempt is made to write this register in user mode. This register can be read and written in supervisor mode.

Value after reset $00000000_{\mathrm{H}}$

Table 3.84 TSCOUNTH Register Contents

[^2]
## (c) TSCTRL - Timestamp Count Control

This register is used to control the 64-bit timestamp counter which is implemented by combining the TSCOUNTH and TSCOUNTL registers.

Table 3.85 TSCTRL Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | OVF | This bit serves as the overflow flag. This bit is set to 1 when an overflow occurs in the TSCOUNTH register as the result of its count operation. <br> This bit is not automatically cleared to 0 . To reset the overflow state, write a 0 into this bit. <br> Since this bit can be written with a 1 , it can be an overflow condition regardless of the count operation. Although it does not affect the counter operation, care must be taken not to take that condition for an overflow. | R/W | 0 |
| 0 | CEN | This bit enables or disables the count operation of the 64-bit timestamp counter which is implemented by combining the TSCOUNTH and TSCOUNTL registers. <br> 0 : Disables count operation. <br> 1: Enables count operation. <br> If this bit is written with a 1 when it is set to 0 , the counter starts counting immediately. If this bit is written with a 0 when it is set to 1 , the counter stops counting immediately. If this bit is 0 , the values of the TSCOUNTH and TSCOUNTL registers are preserved. There is no factor that will automatically change the value of this bit. | R/W | 0 |

## (d) PMUMCTRL — Performance Counter User Mode Control

This register specifies the accessibility to system registers of the performance measurement function in user mode. The accessibility of the system registers is specified for each of the corresponding channels of the performance measurement function.

When the access in user mode is disabled, any attempt to access one of these system registers generates a PIE exception. When the access in user mode is enabled, the system registers can be read and written.
The performance measurement function itself runs in user mode regardless of the settings of this register. Even when all channels are disabled by this register for accesses in user mode, it is possible to measure the performance in user mode if the settings are done in supervisor mode.

Table 3.86 PMUMCTRL Register Contents

| Bit | Name | Description | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 31 to 4 | - | (Reserved for future expansion. Be sure to set to 0.) | R/W | Reset |

## (e) PMCOUNTn - Performance Count

This register counts the number of occurrences of various events, which are specified by the PMCTRLn register. This CPU has 4 channels ( $n=0$ to 3 ) of performance count registers.

Table 3.87 PMCOUNTn Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 0 | PMCNT31 to PMCNTO | These bits form a 32-bit counter register. | R/W | 0 |
|  |  | The counter counts the number of occurrences of the event that is specified by the PMCTRLn.CND bit. |  |  |
|  |  | When this register counts up from FFFF FFFF $_{\text {H }}$, the PMCTRLn.OVF bit is set to 1 and the register wraps around to $00000000_{\mathrm{H}}$. |  |  |
|  |  | This register is accessible at an arbitrary timing regardless of whether counting is enabled or disabled. In addition, it is possible to start counting at an arbitrary count by loading that value in this register before starting to count. |  |  |

## (f) PMCTRLn - Performance Count Control

This register controls the counting operation of the PMCOUNTn register. This CPU has 4 channels ( $n=0$ to 3 ) of performance count control registers.

Table 3.88 PMCTRLn Register Contents (1/2)

| Bit | Name | Description |  |  | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 16 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  | R | 0 |
| 15 to 8 | CND | These bits specify the number of the event of which occurrences is to be counted. The PMCOUNTn register is not updated if the CEN bit is set (to1) specifying an invalid event number. |  |  | R/W | 0 |
|  |  | Number | Details of Event | Speculative Operation ${ }^{\star 1}$ |  |  |
|  |  | $00_{\text {H }}$ | Number of all clock cycles*2 | None |  |  |
|  |  | $10_{\mathrm{H}}$ | Number of executions of all instructions ${ }^{* 3}$ | None |  |  |
|  |  | 18H | Number of instructions that cause branch ${ }^{* 4}$ | None |  |  |
|  |  | $19_{\text {H }}$ | Number of executions of conditional branch instructions (Bcond/Loop)*5 | None |  |  |
|  |  | $1 A_{H}$ | Number of branch prediction misses of conditional branch instructions (Bcond/Loop)*5 | None |  |  |
|  |  | $20^{\text {H }}$ | Number of EIINTn acceptances*6 | None |  |  |
|  |  | 21H | Number of FEINT acceptances | None |  |  |
|  |  | 22H | Number of terminating type exception acceptances*6 (including EIINTn and FEINT) | None |  |  |
|  |  | $23^{\text {H }}$ | Number of resumable and pending type exception acceptances | None |  |  |
|  |  | 28H | Number of clock cycles during no interrupt is processed (period during which the ISPR register holds $0000 \mathrm{H}^{* 7}$ ) | None |  |  |
|  |  | $29_{\text {H }}$ | Number of clock cycles during no interrupt is processed and interrupts are disabled (period during which the ISPR register holds $0000{ }^{* * 7}$ and PSW.ID $=1$ ) | None |  |  |
|  |  | $30_{\text {H }}$ | Number of instruction fetch requests*8 | Yes |  |  |
|  |  | $31_{H}$ | Number of instruction cache hits*9 | Yes |  |  |
|  |  | $40_{\mathrm{H}}$ | Number of stall cycles during which instructions are not issued to the instruction execution unit ${ }^{* 10}$ | Yes |  |  |
|  |  | $50_{\text {H }}$ | Number of instruction fetch requests to Flash ROM*11 | Yes |  |  |
|  |  | 51H | Number of data read requests to Flash ROM ${ }^{* 12}$ | Yes |  |  |
| 7 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) |  |  |  |  |
| 1 | OVF | This bit serves as the overflow flag. This bit is set to 1 when an overflow occurs in the PMCOUNTn register as the result of its count operation. <br> This bit is not automatically cleared to 0 . To reset the overflow state, write a 0 into this bit. <br> Since this bit can be written with a 1 , it can be an overflow condition regardless of the count operation. Although it does not affect the counter operation, care must be taken not to take that condition for an overflow. |  |  |  |  |
|  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |

Table 3.88 PMCTRLn Register Contents (2/2)

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 0 | CEN | This bit enables or disables the count operation of the PMCOUNTn register. <br> 0 : Disables count operation. <br> 1: Enables count operation. <br> If this bit is written with a 1 when it is set to 0 , the counter starts counting immediately. If this bit is written with a 0 when it is set to 1 , the counter stops counting immediately. If this bit is 0 , the values of the PMCOUNTn register is preserved. There is no factor that will automatically change the value of this bit. | R/W | 0 |

Note 1. For the events for which speculative operation column is "Yes", events whose execution results are cancelled are also counted.
Note 2. All clock cycles from the start of counting until the end, including the period during which no instruction is executed, are counted.

Note 3. The LDSR instruction which starts counting is not included but the LDSR instruction which stops counting is included in this number.

Note 4. Applicable instructions are JR, JMP, Bcond (only if condition is met), JARL, LOOP (only if condition is met), CALLT, DISPOSE, SWITCH, SYSCALL, CTRET, EIRET and FERET instructions. Other instructions with branch processing are not counted. Bcond and LOOP instructions are not counted if condition is not met.

Note 5. It is possible to obtain the branch prediction miss rate (hit rate) by measuring the numbers of executions of conditional branch instructions and branch prediction misses. Note that the unconditional branch (BR) of the Bcond instruction is counted in "Number of executions of conditional branch instructions" (CND = 19 ${ }_{\mathrm{H}}$ ), but it is not counted in "Number of branch prediction misses of conditional branch instructions" (CND = 1 $A_{H}$ ).
Note 6. In EIINTn with table reference method, an exception which is detected during reading of the table or automatically saving the context to the register bank is not included in this number.
Note 7. Since this event presumes that the ISPR register is automatically updated on the acceptance of and returning from interrupt, it cannot be measured correctly if it is used with the INTCFG.ISPC bit set to 1.

Note 8. This CPU acquires the instruction code in 64-bit units. Every 64-bit acquisition is counted as a request for a single instruction fetching. Note that this is not the number of instructions. Instruction fetching by the CACHE instruction is not counted.
Note 9. In this CPU, a cache hit indicates the number of requests for a single instruction fetching but not the number of instructions. Cache operation by the CACHE instruction is not counted.

Note 10. Instruction issue stall occurs when issuing of an instruction (starting execution of an instruction) is stalled if the CPU satisfies any of the following conditions.

- At execution of an STSR instruction that reads the PSW register, issue of the instruction is stalled until completion of all preceding instructions.
- At execution of a SYNCP, SYNCM, or SYNCI instruction, issue of the instruction is stalled until waiting conditions for the instruction are cleared. For details on the waiting conditions, see Section 3.2.7.1, Synchronization Processing.
- At execution of an LDSR instruction or STSR instruction that manipulates the cache control function system registers, issue of the instruction is stalled until completion of all preceding CACHE instructions.
- At execution of an LDSR instruction or STSR instruction that manipulates the FPU system registers, issue of the instruction is stalled until completion of all preceding FPU instructions.
- At execution of an LDSR instruction or STSR instruction that manipulates the FXU system registers, issue of the instruction is stalled until completion of all preceding FXU instructions.
- If an LDSR instruction updates the system register which guarantees reflection of its update to the subsequent instruction, issue of the instruction is stalled until the update of the system register is completed. For details, see Section 3.2.7.3, Hazard Management after System Register Update.
- If execution of an STSR instruction is started after execution of an LDSR instruction is started, issue of the STSR instruction is stalled until completion of the LDSR instruction. (This applies even if the system register numbers of the LDSR and STSR instructions do not match).
- When a HALT instruction is executed, issue of the subsequent instruction is stalled until conditions for releasing the halt state are generated.
- When a SNOOZE instruction is executed, issue of the subsequent instruction is stalled until conditions for releasing the snooze state are generated.
- When any of the following instructions that includes branching is executed, issue of the subsequent instruction is stalled until completion of the branching and cancellation of execution of the subsequent instruction. SYSCALL, CALLT, EIRET, FERET, CTRET, TRAP, FETRAP, SYNCI
- When any of the following exceptions is detected, issue of the subsequent instruction is stalled until acknowledgement of the exception is completed and cancellation of execution of the subsequent instruction.
MIP, SYSERR (resumable), RIE, UCPOP, PIE
Note 11. Actual Flash ROM access requests are counted. If an instruction fetch request hits the instruction cache, it is not counted. Instruction fetch requests to Flash ROM by the CACHE and PREF instructions are counted. Instruction pre-fetching to Flash ROM is also counted.

Note 12. Actual Flash ROM access requests are counted. If a data read request hits the ROM data buffer, it is not counted. Prefetching to Flash ROM is counted. Note that the number of data read requests to Flash ROM is different from the number of Flash ROM accesses by instructions.

Note 13. Since the number of instruction fetch request ( $30_{\mathrm{H}}$ ) and the number of instruction cache hits (31H) include the speculative instruction fetching, the number of hits divided by the number of requests may not be the accurate instruction cache hit rate of this CPU. The instruction cache hit rate of this CPU can be calculated by the number of instruction fetch requests and the number of instruction fetch requests to Flash ROM $\left(50_{H}\right)$. In this case, the number of instruction fetch request reduced by the number of instruction fetch requests to Flash ROM will be the number of instruction cache hits. However, even in this case, the number of instruction cache hits includes the speculative instruction fetching. Pre-fetching by the PREF instruction is counted as the number of instruction fetch requests, though accessing non-cacheable area is not counted as the number of instruction fetch requests to Flash ROM.

### 3.2.3.9 Hardware Function Registers

(1) Hardware Function System Registers

Hardware function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.89 Hardware Function System Registers

| Register No. <br> (regID, selID) | Symbol | Function | Access <br> Permission |
| :--- | :--- | :--- | :--- |
| SR 0, 12 | LSTEST0 | Lock-step function self-diagnosis register 0 | SV |
| SR1, 12 | LSTEST1 | Lock-step function self-diagnosis register 1 | SV |
| SR5, 12 | IFCR | Instruction fetch control register | SV |
| SR8, 12 | BRPCTRL0 | Branch prediction function control register | SV |
| SR24, 13 | RDBCR | ROM data buffer control register | SV |

## (a) LSTESTO - Lock-step Function Self-diagnosis Register 0

This register is for the self-diagnosis of the lock-step function. It can be used for the self-diagnosis of the lock-step function in combination with the LSTEST1 register. For details of the lock-step function and its availability, see
Section 38, Functional Safety.

Table $3.90 \quad$ LSTEST0 Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 0 | LSTEST0 31 to | [Write] | R/W | 0 |
|  | LSTEST0 0 | Write any value to bits of the LSTEST0 register. |  |  |
|  |  | [Read] | Value in LSTEST0 is read by the master CPU of the lock-stepped CPU. |  |
|  |  | Value in LSTEST1 is read by the checker CPU of the lock-stepped CPU. |  |  |

## (b) LSTEST1 — Lock-step Function Self-diagnosis Register 1

This register is for the self-diagnosis of the lock-step function. It can be used for the self-diagnosis of the lock-step function in combination with the LSTEST1 register. For details of the lock-step function and its availability, see
Section 38, Functional Safety.

Value after reset $00000000_{\mathrm{H}}$

Table 3.91 LSTEST1 Register Contents

|  |  |  | Value after |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Bit | Name | Description | R/W | Reset |
| 31 to 0 | LSTEST1 31 to | [Write] | R/W | 0 |
|  | LSTEST1 0 | Write any value to bits of the LSTEST1 register. |  |  |
|  |  | [Read] |  |  |
|  |  | Value in LSTEST1 is read by the master CPU of the lock-stepped CPU. |  |  |
|  |  | Value in LSTEST0 is read by the checker CPU of the lock-stepped CPU. |  |  |

## (c) IFCR - Instruction Fetch Control Register

This register controls the instruction fetching function.

Table 3.92 IFCR Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 1 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 0 | PLEN | This bit specifies whether the instruction fetch preload function is enabled or disabled. <br> 0: Disabled <br> 1: Enabled*1 | R/W*2 | 1 |

Note 1. Instruction fetch preload is executed only when the instruction cache is enabled and the fetching is to the cacheable area.
Note 2. Instruction fetch access and a system register access are independent from each other. Therefore, the settings of this register can be changed even the preload function is running. In this case, the preload function currently running normally completes with the old settings and the new settings are applied from the next operations of the preload function. If you want to suppress preloading before, during, and after changing of the register settings, we recommend execution of instructions by which the register settings are changed in the non-cacheable area.

## (d) BRPCTRLO - Branch Prediction Function Control Register

This register controls the branch prediction function.

Table $3.93 \quad$ BRPCTRLO Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | BRPCLR | Setting this bit to 1 clears the buffers related to branch prediction function. This bit is always read as 0 . | $\mathrm{R} / \mathrm{W}^{* 2}$ | 0 |
| 0 | BRPEN | This bit specifies whether the branch prediction function*1 is enabled or disabled. <br> 0 : Disabled <br> 1: Enabled | $\mathrm{R} / \mathrm{W}^{* 2}$ | 1 |

Note 1. When this function is enabled, the address of the branch destination of the branch instruction is predicted based on the prediction function incorporated in the product, and instructions are fetched from the predicted address. If this function is disabled, branch prediction is not performed and instructions are fetched from the next instruction address. Branch prediction is performed only when the instruction cache is enabled and fetching is to the cacheable area.
Note 2. Branch prediction and a system register access are independent from each other. Therefore, the settings of this register can be changed even the branch prediction function is running. In this case, the branch prediction function currently running normally completes with the old settings and the new settings are applied from the next operations of the branch prediction function. If you want to suppress branch prediction before, during, and after changing of the register settings, we recommend execution of instructions by which the register settings are changed in the non-cacheable area.

## (e) RDBCR — ROM Data Buffer Control Register

This register controls the ROM data buffer.

Table 3.94 RDBCR Register Contents

| Bit | Name | Description | R/W | Value after Reset |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 9 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 8 | - | (Reserved for future expansion. Be sure to set to 1.) | R | 1 |
| 7 to 2 | - | (Reserved for future expansion. Be sure to set to 0.) | R | 0 |
| 1 | RDBCLR | Setting this bit (to 1) clears the ROM data buffer and initializes the LRU information in the ROM data buffer. <br> If this bit is set (to 1 ) during load processing or when a bus request issued by the prefetch function is present, the load data is not registered in the ROM data buffer. <br> This bit is always read as 0 . | $\mathrm{R} / \mathrm{W}^{* 1}$ | 0 |
| 0 | RDBEN | This bit specifies whether the ROM data buffer is enabled or disabled. <br> 0 : ROM data buffer is disabled. <br> 1: ROM data buffer is enabled. | $\mathrm{R} / \mathrm{W}^{* 1}$ | 1 |

Note 1. Any change in the value of this register is processed independently of any load instructions that use the ROM data buffer. To have the change in the value of this register exactly reflected, it is recommended that this register be manipulated after all load operations are completed.

### 3.2.4 Exceptions and Interrupts

An exception is a particular event that forces branching of operation from the current program to another program.
The program at the branch destination of a given exception is called an "exception handler".

## CAUTION

This CPU handles interrupts as types of exception.

### 3.2.4.1 Outline of Exceptions

This section describes the elements that assign properties to exceptions, and shows how exceptions work.

## (1) Exception Cause List

This CPU supports the following exceptions.
Table 3.95 Exception Cause List

| Exception | Name | Source | Type*1 | Saved <br> Resource | Return/ Restoration | Exception Cause Code*2 | Priority Order*3 |  | Acknowledgment Condition (PSW) |  | Update (PSW) |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Priority Level | Priority | ID | NP | UM | ID | NP | EP | EBV |
| RESET | Reset | Reset input | Terminating | - | - | None | 1 | - | x | x | 0 | 1 | 0 | 0 | 0 |
| MDP | Memory protection exception (access privilege) | Memory protection violation due to an interrupt using the table reference method | Terminating | FE | Yes | $95_{\mathrm{H}}$ | 2*7 | - | x | x | 0 | 1 | 1 | 1 | s |
| FENMI | FENMI interrupt | Interrupt input terminal | Terminating | FE | No | $\mathrm{EO}_{\mathrm{H}}$ | 4 | 1 | x | x | 0 | 1 | 1 | 0 | s |
| FEINT | FEINT interrupt | Interrupt input terminal | Terminating | FE | Yes | $\mathrm{FO}_{\mathrm{H}-\mathrm{FF}}^{\mathrm{H}}$ | 4 | 2 | x | 0 | 0 | 1 | 1 | 0 | s |
| SYSERR | System error | Error due to context saving to the register bank | Terminating | FE | No | $1 \mathrm{C}_{\mathrm{H}}$ | 4 | 3 | x | x | 0 | 1 | 1 | 1 | s |
| EIINTO-2047 | User interrupt | Interrupt input terminal | Terminating | El | Yes | 1000н-17FFн*5 | 5 | *10 | 0 | 0 | 0 | *9 | s | 0 | s |
| MIP | Memory protection exception (execution privilege) | Memory protection violation due to instruction fetching | Resumable | FE | Yes | $90^{\text {H }}$ | 7 | 1 | x | x | 0 | 1 | 1 | 1 | s |
| SYSERR | System error | Error due to instruction fetching | Resumable | FE | No | $10_{\text {H- }} 1 \mathrm{FH}^{* 4}$ | 7 | 2 | X | x | 0 | 1 | 1 | 1 | S |
| UCPOP | Coprocessor unusable exception | Execution of a coprocessor instruction/access permission violation | Resumable | FE | Yes | 80 н-82н* | 7 | 3 | x | X | 0 | 1 | 1 | 1 | s |
| RIE | Reserved instruction exception | Execution of a reserved instruction | Resumable | FE | Yes | $60_{H}$ | 7 | 4 | x | x | 0 | 1 | 1 | 1 | s |
| PIE | Privilege instruction exception | Execution of a privileged instruction/access permission violation | Resumable | FE | Yes | $\mathrm{AO}_{\mathrm{H}}$ | 7 | 5 | x | x | 0 | 1 | 1 | 1 | s |
| SYSERR | System error | Error prior to context restoration from the register bank | Resumable | FE | No | $1 \mathrm{D}_{\text {H }}$ | 7 | 6 | x | x | 0 | 1 | 1 | 1 | s |
| MAE | Misalignment exception | Misaligned access occurrence | Resumable | FE | Yes | $\mathrm{CO}_{\mathrm{H}}$ | 8 | 1 | x | x | 0 | 1 | 1 | 1 | s |
| MDP | Memory protection exception (access privilege) | Memory protection violation due to operand access | Resumable | FE | Yes | 91\% | 8 | 2 | x | x | 0 | 1 | 1 | 1 | s |
| FPE | FPU exception (precise) | Execution of an FPU instruction | Resumable | EI | Yes | 71 ${ }_{\text {H }}$ | 8 | 3 | x | x | 0 | 1 | s | 1 | s |
| FXE | FXU exception (precise) | Execution of an FXU instruction | Resumable | El | Yes | $75_{\mathrm{H}}$ | 8 | 4 | x | x | 0 | 1 | s | 1 | s |
| SYSCALL | System call | Execution of the SYSCALL instruction | Pending | EI | Yes | 8000 - $^{\text {-80FF }}$ H | 9 | *8 | x | x | 0 | 1 | s | 1 | s |
| FETRAP | FE level trap | Execution of the FETRAP instruction | Pending | FE | Yes | $31{ }_{\text {н- }}{ }^{\text {F }}$ H | 9 |  | x | X | 0 | 1 | 1 | 1 | s |
| TRAP0 | El level trap 0 | Execution of the TRAP instruction | Pending | El | Yes |  | 9 |  | x | x | 0 | 1 | s | 1 | s |
| TRAP1 | El level trap 1 | Execution of the TRAP instruction | Pending | EI | Yes | 50н-5F ${ }_{\text {H }}$ | 9 |  | x | x | 0 | 1 | s | 1 | s |

[^3]Note 1. For details, see Section 3.2.4.1(3), Types of Exceptions.
 code is $0000_{\mathrm{H}}$ unless it is specifically described in the individual functional descriptions.
The acknowledgment priority for exceptions is checked by the priority level, and then priority. A smaller value has a higher priority. For details, see Section 3.2.4.1(4), Exception Acknowledgment Conditions and Priority Order.
Note 4. For details, see Section 3.2.4.1(2), Overview of Exception Causes.
$1000^{H}-17 \mathrm{FF}_{\mathrm{H}}$ (channels 0 to 2047) are selected according to the channel.
$80_{\mathrm{H}}-82_{\mathrm{H}}$ correspond to the coprocessor use permissions (CUO-CU2), respectively.
The case in which an MDP exception occurs during the processing (table read or automatic context saving onto the register bank) which is performed after a table reference method interrupt (EIINTn) is selected as the result of priority determination. The occurrence of this type of exceptions takes precedence over that of the terminating-type exceptions except the reset. For details, see Section 3.2.4.1(2), Overview of Exception Causes.
Occurs in an exclusive manner as it is caused by the execution of an instruction. There is no priority difference within the same priority level.
There are cases in which the PSW.ID bit is set to 0 on interrupts of table reference method in which the register bank is used. For details, see Section 3.2.4.5(2), Automatic Context Saving.
Note 5.
Note 6.
Note 7.
Note 8.
Note 9.

Note 10.

## (2) Overview of Exception Causes

The following is an overview of the exception causes handled by the CPU.

## (a) RESET

RESET is generated when inputting a reset signal. For details, see Section 3.2.8, Reset.
(b) FENMI, FEINT, and EIINT

These are interrupts generated by interrupt signals from the interrupt controller to activate a certain program. For details about the interrupt functions, see Section 3.2.3.3, Interrupt Function Registers and the specifications of the interrupt controller incorporated in your product.
(c) SYSERR

This is a system error exception.
An error occurring during automatic context saving using the register bank function is notified as a terminating-type SYSERR exception. In this case, as with the case of acknowledging an interrupt, the PC of the instruction that is interrupted when the exception occurred is loaded in the FEPC and the PSW at that time in the FEPSW, respectively. An error occurring during the restoration of the context with the RESBANK instruction is notified as a resumabletype SYSERR exception. In this case, the PC of the RESBANK instruction is loaded in the FEPC and the PSW at that time in the FEPSW, respectively.

An error that occurs at an instruction fetch access is notified as a resumable-type SYSERR exception. In this case, the PC of the instruction to be fetched is loaded in the FEPC and the PSW at that time in the FEPSW, respectively.

Table 3.96 lists the exception cause codes that are loaded in the lower-order 16 bits of the FEIC register when SYSERR exceptions occur. The higher-order 16 bits of the exception cause code are padded with 0 s.

Table 3.96 Lower-order 16 Bits of the Exception Cause Codes Associated with the SYSERR Exception

| Exception Cause Code | Cause |
| :--- | :--- |
| $11_{\mathrm{H}}$ | A response error occurred in a bus slave at the time of instruction fetching. ${ }^{* 1}$ |
| $13_{\mathrm{H}}$ | An error within the scope of safety functions, such as an ECC error or parity error, occurred at <br> the time of instruction fetching. ${ }^{* 1, * 2}$ |
| $1 C_{H}$ | An error occurred when automatically saving context to the register bank. |
| $1 D_{H}$ | An error occurred at the time of context restoration from the register bank (during the <br> execution of the RESBANK instruction). |

Note 1. For details, see Section 3.8.8, Product Information of SYSERR Factor.
Note 2. When an ECC or parity error is found in fetching from the instruction cache, it is handled as a cache miss so a SYSERR exception does not occur.

All the causes that generate a SYSERR exception for this CPU are listed in Table 3.96. An error that is detected externally to the CPU does not generate a SYSERR exception.
(d) FPE

These are exceptions that occur when a floating-point instruction is being executed. For details, see Section 3.2.6.1, Floating-Point Operation.
(e) FXE

These are exceptions that occur when an extended floating-point instruction is being executed. For details, see
Section 3.2.6.2, Extended Floating-Point Operation.

## (f) <br> MIP and MDP

These are exceptions that occur when the MPU detects a violation. Detecting an exception is performed when the address at which the instruction will access the memory is calculated. For details, see Section 3.2.5.1, Memory Protection Unit (MPU).

There are cases in which an MDP exception is detected during a table read or automatic context saving onto the register bank when a table reference method interrupt (EIINTn) is selected as the result of determining the priority level of the terminating-type exception. In such a case, the execution of the instruction is interrupted and an MDP exception (terminating-type) is generated as with an ordinary interrupt. In this case, the PC of the instruction that is interrupted is saved in the FEPC and the PSW that is established before the interrupt is accepted is saved in the FEPSW, respectively. For the table reference method, see Section 3.2.4.4, Exception Handler Address.
(g) RIE

This is a reserved instruction exception. This exception occurs when an attempt is made to execute the opcode of an instruction other than an instruction whose operation is defined. The operation is the same as the RIE instruction. For details, see the RH850G4MH User's Manual: Software.
(h) PIE

This is a privilege instruction exception. This exception occurs when an attempt is made to execute an instruction that does not have the required privilege. For details, see Section 3.2.2.1(3), CPU Operating Mode and Privileges, Section 3.2.2.2, Instruction Execution, and Section 3.2.2.5(3)(a), LDSR and STSR.
(i) UCPOP

This is an exception that occurs when an attempt is made to execute a coprocessor instruction when the coprocessor in question is not usable. For details, see Section 3.2.2.4, Coprocessors.

## (j) MAE

This is an exception that occurs when the result of address calculation is a misaligned address. For details, see
Section 3.2.2.6(3), Data Alignment

## (k) TRAP, FETRAP, and SYSCALL

These are exceptions that occur according to the result of instruction execution. For details, see the RH850G4MH User's Manual: Software.

## (3) Types of Exceptions

This CPU divides exceptions into the following three types according how they are executed.

- Terminating exceptions
- Resumable exceptions
- Pending exceptions

## (a) Terminating Exceptions

In the case of an exception of this type, the exception is acknowledged by interrupting the current instruction before its operation is executed. These exceptions include interrupts, etc.

In the case of interrupts, their occurrence is not dependent upon the result of executing the current instruction, that is, generation is not related to that instruction. When an interrupt occurs, the PSW.EP bit is cleared to 0 , unlike other exceptions. Consequently, termination of the exception handler routine is reported to the external interrupt controller when the return instruction is executed. Be sure to execute a return instruction from an interrupt while the PSW.EP bit is cleared to 0 .

## CAUTIONS

1. The PSW.EP bit is cleared to 0 only when an interrupt (EIINTn, FEINT, or FENMI) is acknowledged. It is set to 1 when any other exception occurs.
If a return instruction from the exception handler routine that has been started by an interrupt is executed while the PSW.EP bit is set to 1, the resources on the external interrupt controller might not be released, causing malfunctioning.
2. A terminating exception may be accepted during the execution of an instruction that performs multiple memory accesses. In this case, although the execution of the instruction is terminated, the result of memory accesses that have been already completed are not canceled. For example, memory is updated by the PREPARE instruction and the general-purpose registers are updated by the DISPOSE instruction. However, it is guaranteed that the PC and SP retain the original values required to re-execute the instruction. For details, see the RH850G4MH User's Manual: Software. The relevant instructions are listed below.

- PREPARE, DISPOSE, PUSHSP, POPSP, RESBANK

3. For the instructions that perform load-access and branch, a terminating exception may be accepted after the loadaccess is completed. However, it is guaranteed that the PC and the system registers (such as CTPC) that are updated on completion of the instruction retain the original values required to re-execute the instruction. For details, see the RH850G4MH User's Manual: Software. The relevant instructions are listed below.

- CALLT, SYSCALL, SWITCH

## (b) Resumable Exceptions

A resumable exception is the one that occurs during the operation of an instruction and that is accepted without the completion of that instruction. It is also called a precise exception because it is accepted precisely without the completion of the instruction that was being executed and without the execution of the subsequent instructions. The occurrence of this exception suppresses the update of the general-purpose and system registers. In addition, since the return PC of the exception points to the very instruction that caused the exception, it is possible to resume the execution at the point before the exception occurred.

The return PC of a resumable exception is the PC of the instruction which caused the exception (current PC).

## (c) Pending Exceptions

This is an exception acknowledged after the execution of an instruction finishes as a result of executing the instruction operation. Pending exceptions include software exceptions. Because pending exceptions occur as a result of normal instruction execution, the processing resumes with the instruction following the instruction that caused the pending exceptions when processing control is returned. The original processing can be normally continued after the exception handling.

The return PC of a pending exception is the PC of the next instruction (next PC).

## (4) Exception Acknowledgment Conditions and Priority Order

This CPU acknowledges only one exception at specific timing based on the exception acknowledgment conditions and priority order. The exception to be acknowledged is determined based on the exception acknowledgment conditions and priority order, as shown in Figure 3.16 below.

Figure 3.16 Exception Acknowledgment Conditions and Priority Order

In Table 3.95, an exception with " 0 " in the acknowledgment condition column can be acknowledged when the corresponding bit is " 0 ". This kind of exception is not accepted when the corresponding bit is " 1 ". When it changes to " 0 " and the acknowledgment conditions are met, acknowledgment of the exception becomes possible. If no value is specified for a bit, it is not an acknowledgment condition. If multiple bits are specified as conditions, all the conditions must be met simultaneously.

Some exceptions are provided with dedicated mask functions that are unique to their functionality. The decision on the acceptability of the exceptions based on the individually defined mask function is made before the decision on the acknowledgement (acceptance) conditions listed in Table 3.95. For details, see the description of the cause of the individual exceptions.

If more than two exceptions satisfy the acknowledgment conditions simultaneously, one exception is selected according to the priority order. The priority order is determined in multiple stages; priority level, and then priority. A smaller number has a higher priority.

When this CPU accepts an exception, it returns an acceptance response to the requesting module.
If a terminating-type exception is not accepted, the request for that exception is not made pending by this CPU. To keep the exception request pending for acceptance, the module such as the interrupt controller that issued the terminatingtype exception request to the CPU makes the exception request pending.

Any exceptions that occur at the same time as a reset are not accepted. For details, see Section 3.2.4.2(1), Special Operations.

For details about acknowledgment conditions, priority level, and priority, see Table 3.95.

## (5) Interrupt Exception Priority and Priority Masking

An interrupt (EIINTn) can be masked for each exception priority or interrupt priority by setting registers. This function allows the software implementation of an interrupt ceiling with a more flexible software structure and no maintenance.
Figure 3.17 shows an overview of the functions of interrupt exception priority and priority masking.

Figure 3.17 Interrupt Exception Priority and Priority Masking

## (a) Interrupt Priority

This CPU supports a maximum of 16 priority levels for interrupts (EIINTn). For the details on the procedure to set interrupt priority, see Section 6, Interrupts.

## (b) Interrupt Priority Mask

EIINT $n$ might be masked at different priorities by the ISPR register and PLMR register. These registers should be used as follows.

For the ISPR register, the bit corresponding to the priority is set to 1 when the hardware acknowledges an interrupt, and interrupts with the same or lower priority are masked. When the EIRET instruction corresponding to the interrupt is executed, the corresponding bit of the ISPR register is cleared to 0 to clear the mask.

This automatic interrupt ceiling makes multiple interrupts servicing easy without using software control.
The PLMR register allows you to mask specific interrupt priorities with software. Use it to raise the priority level of the interrupt ceiling temporarily in a program. The mask setting specified by the ISPR register and the mask setting of PLMR might overlap, and an interrupt is masked if it is masked with one or the other of them. Normally, use the PLMR register to raise the ceiling value from the ceiling value of the ISPR register.

The function of the INTCFG register allows you to disable automatic update of the ISPR register upon acknowledgment of and return from an interrupt. To perform interrupt ceiling control by using software without using the function of the ISPR register, set the ISPC bit in the INTCFG register to 1, clear the ISPR register, and then control the ceiling value with software by using the PLMR register.

Also, when you are using the PLMR register, you can check if any interrupt is masked with the PLMR register by using the ICSR register.

## (6) Return and Restoration

When exception handling has been performed, it might affect the original program that was interrupted by the acknowledged exception. This effect is indicated from two perspectives: "Return" and "Restoration".

- Return: Indicates whether or not the original program can be re-executed from where it was interrupted.
- Restoration: Indicates whether or not the processor statuses (status of processor resources such as general-purpose registers and system registers) can be restored as they were when the original program was interrupted.

An exception that cannot be returned or restored from ("No" in Table 3.95) might cause the return PC to be lost, making it impossible to return from the exception to the original processing by using a return instruction. An exception whose trigger cannot be selected is an unreturnable or unrestorable exception.

For an unrestorable exception, it is possible to return to the original program flow. However, because the state before the occurrence of the exception cannot be restored at that point, care must be taken in continuing subsequent program operation.

## (7) Context Saving

To save the current program sequence when an exception occurs, appropriately save the following resources according to the function definitions. There are resources that are automatically saved by hardware and resources that need to be saved by software.

- Program counter (PC)
- Program status word (PSW)
- Exception cause code (EIIC, FEIC)
- Work system register (EIWR, FEWR)

The resource to use as the saving destination is determined according to the exception type. Saved resource determination is described below.

For exceptions that use the register bank function, specific resources are automatically saved. For details, see Section 3.2.4.5, Register Bank Function.

## (a) Context Saving

Exceptions with certain acknowledgment conditions might not be acknowledged at the start of exception handling, based on the pending bits (PSW.ID and NP bits) that are automatically set when another exception is acknowledged.

To enable multiple exception processing which makes exceptions of the same level acceptable again, the return registers and certain information about the corresponding exception causes must be saved, such as to a stack. This information that must be saved is called the "context".

In principle, it is necessary to make sure that no exceptions of the same level can occur before saving the context.
The working system registers that can be used in the work of saving contexts and those for which the values are saved to enable the handling of multiple exceptions as required are referred to as the basic context registers.

These basic context registers are provided for each exception level. For this reason, it is possible to precisely return from the current exception since its context will not be overwritten when an exception of a different level occurs before saving the current context.

Table $3.97 \quad$ Basic Context Registers

| Exception Level | Basic Context Registers |
| :--- | :--- |
| El level | EIPC, EIPSW, EIIC, EIWR |
| FE level | FEPC, FEPSW, FEIC, FEWR |

See Section 3.2.2.3(2), Exception Level.

### 3.2.4.2 Operation when Acknowledging an Exception

Check whether each exception that is reported during instruction execution is acknowledged according to the priority. The procedure for exception-specific acknowledgment operation is shown below.
$<1>\quad$ Check whether the acknowledgment conditions are satisfied and whether exceptions are acknowledged according to their priority.
$<2>\quad$ Calculate the exception handler address according to the current PSW value*1
$<3>\quad$ For FE level exceptions, the following processing is performed.

- Saving the PC to FEPC
- Saving the PSW to FEPSW
- Storing the exception cause code in FEIC
- Updating the PSW*2
- Store the exception handler address calculated in (2) in the PC, and then pass control to the exception handler.
$<4>\quad$ For EI level exceptions, the following processing is performed.
- Saving the PC to EIPC
- Saving the PSW to EIPSW
- Storing the exception cause code in EIIC
- Updating the PSW*2
- Store the exception handler address calculated in (2) in the PC, and then pass control to the exception handler.
- When the exception is an interrupt that uses the register bank, save the context automatically ${ }^{\text {Note } 3}$.

Note 1. For details, see Section 3.2.4.4, Exception Handler Address.
Note 2. For the values to be updated, see Table 3.95.
Note 3. For details on register banks, see Section 3.2.4.5, Register Bank Function.

Figure 3.18 shows the steps $<1>$ to $<4>$.

Figure 3.18 Operation When Acknowledging an Exception

## (1) Special Operations

## (a) EP Bit of PSW Register

If an interrupt is acknowledged, the PSW.EP bit is cleared to 0 . If an exception other than an interrupt is acknowledged, the PSW.EP bit is set to 1 .

The operation of the CPU when executing the EIRET and FERET instructions depends on the state of the EP bit. If the EP bit is cleared to 0 , the CPU notifies the external interrupt controller of the termination of the exception processing routine. This function is necessary to properly control the request flag in the interrupt controller and other resources upon return from the interrupt. When the EP bit is cleared to 0 , and the EIRET instruction is executed, the bit with the highest priority ( 0 is the highest) among the bits set to 1 in ISPR.ISP15 to ISPR.ISP0 is cleared to 0 .

To return from an interrupt, be sure to execute the return instruction with the EP bit cleared to 0 .
(b) Coprocessor Unusable Exception

For coprocessor unusable exceptions, the opcodes that cause the exception depend on the status of the CU bit of the PSW register.

When a coprocessor is not included in the product or it is not usable, if an attempt is made to execute a coprocessor instruction corresponding to the coprocessor, a coprocessor unusable exception (UCPOP) immediately occurs. If an LDSR or STSR instruction attempts to access a system register of the coprocessor, a coprocessor unusable exception (UCPOP) immediately occurs too.

For details, see Section 3.2.2.4(3), Coprocessor Unusable Exceptions.
(c) Reserved Instruction Exception

If an opcode that is reserved for future function extension and for which no instruction is defined is executed, a reserved instruction exception (RIE) occurs.

The opcode that always generates a reserved instruction exception is defined as the RIE instruction.

## (d) Reset

Reset is performed in the same way as exception handling, but it is not regarded as EI level exception or FE level exception. The reset operation is the same that of an exception without acknowledgment conditions, but the value of each register is changed to the value after reset. In addition, returning to the original program from the reset is not possible.

All exceptions that have occurred at the same time as CPU initialization are canceled and not acknowledged even after CPU initialization.

For details, see Section 3.2.8, Reset.

### 3.2.4.3 Return from Exception Handling

To return from exception handling, execute the return instruction (EIRET or FERET) corresponding to the relevant exception level.

When a context has been saved, such as to a stack, the context must be restored before executing the return instruction. When execution is returned from an unrestorable exception, the status before the exception occurs in the original program cannot be restored. Consequently, the execution result might differ from that when the exception does not occur.

The EIRET instruction is used to return from EI level exception handling and the FERET instruction is used to return from FE level exception handling.

When the EIRET or FERET instruction is executed, the CPU performs the following processing and then passes control to the return PC address.
$<1>\quad$ If the PSW.EP bit is set to 0 , the CPU notifies the interrupt controller of the termination of the exception routine.
$<2>\quad$ When the EIRET instruction is executed while PSW.EP $=0$ and INTCFG.ISPC $=0$, the CPU updates the ISPR register.

When the FERET instruction is executed, the CPU does not update the ISPR register.
$<3>\quad$ When the EIRET instruction is executed, return PC and PSW are loaded from the EIPC and EIPSW registers. When the FERET instruction is executed, return PC and PSW are loaded from the FEPC and FEPSW registers.
$<4>\quad$ Control is passed to the address indicated by the return PC that were loaded.

Figure 3.19 shows the flow for returning from exception handling using the EIRET or FERET instruction.

Figure 3.19 Return Instruction-Based Exception Return Flow

### 3.2.4.4 Exception Handler Address

For this CPU, the exception handler address used for execution during reset input, exception acknowledgment, or interrupt acknowledgment can be changed according to the settings.

## (1) Resets, Exceptions, and Interrupts

The exception handler address for resets and exceptions is determined by using the direct vector method, in which the reference point of the exception handler address can be changed by using the PSW.EBV bit, RBASE register, and EBASE register. For interrupts, the direct vector method and table reference method can be specified. If the table reference method is selected, execution can branch to the address indicated by the exception handler table allocated in the memory.

## (a) Direct Vector Method

This CPU uses the result of adding the offset address shown in Table 3.98 to the base address indicated by the RBASE or EBASE register as the exception handler address.

Whether to use the RBASE or EBASE register as the base address is selected according to the PSW.EBV bit. If the PSW.EBV bit is set to 1 , the EBASE register value is used as the base address. If the bit is cleared to 0 , the RBASE register value is used as the base address.

However, reset input always refers to the RBASE register.
In addition, user interrupts (EIINTn) refer to the RINT bit of the selected base register, and reduce the offset address according to the value of the bit. If the RBASE.RINT bit or EBASE.RINT bit is set to 1 , all user interrupts are handled using an offset address of $100_{\mathrm{H}}$. If the bit is cleared to 0 , the offset address is determined according to Table 3.98 .

Figure 3.20 shows the flow of generating a handler address for the direct vector method.

Note 1. Report of the acceptance to the interrupt controller and the update of the EIPC, EIPSW, EIIC and ISPR are performed at this timing.

Figure 3.20 Flow of Generating a Handler Address of the Direct Vector Method
(1) Example of use when RBASE = EBASE
(2) Example of use when RBASE $\neq$ EBASE

Note: INTPRx is the same as EIINTn (priority x ) in Table 3.98.

Figure 3.21 Direct Vector Method

The table below shows how base register is selected and offset address for each exception. The value of the PSW register used to determine the exception handler address is the value after being updated due to the acknowledgment of an exception.

Table 3.98 Selection of Base Register/Offset Address

|  | PSW.EB | PSW.EBV = 1 | RINT $=0$ | RINT = 1 |
| :---: | :---: | :---: | :---: | :---: |
|  | Base Register |  | Offset Address |  |
| RESET | RBASE | None*1 | $0^{000}{ }_{H}$ | $000{ }_{H}$ |
| SYSERR |  | EBASE | 010 ${ }^{\text {H }}$ | $0^{010}{ }_{H}$ |
| (R.F.U.) |  |  | 020 ${ }_{\text {H }}$ | $0^{020}{ }_{H}$ |
| FETRAP |  |  | 030 ${ }_{\text {H }}$ | $0^{030}{ }_{H}$ |
| TRAP0 |  |  | $040_{H}$ | $0^{040}{ }_{H}$ |
| TRAP1 |  |  | 050 ${ }_{\text {H }}$ | 050 ${ }_{\text {H }}$ |
| RIE |  |  | 060 ${ }^{\text {H }}$ | $060{ }_{H}$ |
| FPE/FXE |  |  | $070_{\mathrm{H}}$ | 070 ${ }_{\text {H }}$ |
| UCPOP |  |  | 080 ${ }_{\text {H }}$ | 080 ${ }_{\text {H }}$ |
| MIP/MDP |  |  | 090 ${ }_{\text {H }}$ | $090{ }_{H}$ |
| PIE |  |  | $\mathrm{OAO}_{\mathrm{H}}$ | $\mathrm{OAO}_{\mathrm{H}}$ |
| (R.F.U.) |  |  | $\mathrm{OBO}_{\mathrm{H}}$ | $\mathrm{OBO}_{\mathrm{H}}$ |
| MAE |  |  | $\mathrm{OCO}_{\mathrm{H}}$ | $\mathrm{OCO}_{\mathrm{H}}$ |
| (R.F.U.) |  |  | $\mathrm{ODO}_{\mathrm{H}}$ | $\mathrm{ODO}_{\mathrm{H}}$ |
| FENMI |  |  | $0 \mathrm{EO} \mathrm{H}_{\mathrm{H}}$ | $\mathrm{OEO}_{\mathrm{H}}$ |
| FEINT |  |  | $\mathrm{OFO}_{\mathrm{H}}$ | $\mathrm{OFO}_{\mathrm{H}}$ |
| EIINTn (priority 0) |  |  | $10 \mathrm{H}_{\mathrm{H}}$ | $100_{\mathrm{H}}$ |
| EIINTn (priority 1) |  |  | $110_{\mathrm{H}}$ |  |
| EIINTn (priority 2) |  |  | $12 \mathrm{H}_{\mathrm{H}}$ |  |
| EIINTn (priority 3) |  |  | $130_{\text {H }}$ |  |
| EIINTn (priority 4) |  |  | 140 ${ }_{\text {H }}$ |  |
| EIINTn (priority 5) |  |  | 150 H |  |
| EIINTn (priority6) |  |  | $160_{\mathrm{H}}$ |  |
| EIINTn (priority 7) |  |  | $170_{\mathrm{H}}$ |  |
| EIINTn (priority 8) |  |  | $180_{\mathrm{H}}$ |  |
| ElINTn (priority 9) |  |  | $19 \mathrm{H}_{\mathrm{H}}$ |  |
| EIINTn (priority 10) |  |  | $1 \mathrm{AOH}_{\mathrm{H}}$ |  |
| EIINTn (priority 11) |  |  | $1 \mathrm{BO}_{\mathrm{H}}$ |  |
| EIINTn (priority 12) |  |  | $1 \mathrm{CO}_{\mathrm{H}}$ |  |
| EIINTn (priority 13) |  |  | $1 \mathrm{DO}_{\mathrm{H}}$ |  |
| EIINTn (priority 14) |  |  | $1 \mathrm{EO}_{\mathrm{H}}$ |  |
| ElINTn (priority 15) |  |  | $1 \mathrm{FO}_{\mathrm{H}}$ |  |

Note 1. An exception generated to update EBV to 0.

The user interrupt offset address reduction function is used to reduce the memory size required by the exception handler for specific operating modes of the system. The main purpose of this is to minimize the amount of memory consumed in operating modes that use only the minimum functionality, for example, during system maintenance and diagnosis.

## (b) Table Reference Method

In the direct vector method, there is one user-interrupt exception handler for each interrupt priority, and userinterrupts with the same priority branch to the same interrupt handler, but some users might want to use code areas that differ from the start time for each interrupt handler.

This CPU defines a table reference method to accommodate to such uses.
Figure 3.22 shows the flow of generating a handler address for the table reference method.

Note 1. For automatic context saving onto the register bank, the operation condition judgment is necessary. For details, see Figure 3.24 .

Note 2. This CPU updates the EIPC and EIPSW at this timing.
Note 3. Detection of an MDP exception is performed every time an individual context is saved. An MDP exception occurs when an MDP violation is detected when saving an individual context rather than after all context saving is completed.

Note 4. The PC of the instruction interrupted by the interrupt and the value of the PSW at that time are saved to the FEPC and the FEPSW respectively. These values are the same as the values saved to the EIPC and the EIPSW at the timing of Note 2. Therefore, when returning from the exception handler, it is possible to return exactly to the interrupted instruction. In addition, because no acceptance response has been reported to the interrupt controller, unless canceling the interrupt request in the exception handler, the interrupt request will remain held and interrupt acceptance processing will start again.

Note 5. Report of the acceptance to the interrupt controller and the update of the EIIC and ISPR are perfomed at this timing.

Figure 3.22 Flow of Generating a Handler Address of Table Reference Method
$<1>\quad$ In any of the following cases, the exception handler address is determined by using the direct vector method.

- When the interrupt channel setting is not the table reference method
- When PSW.EBV $=0$ and RBASE.DV $=1$
- When PSW.EBV $=1$ and EBASE.DV $=1$
$<2>$ In cases other than $<1>$, calculate the table read position.
Exception handler address read position $=$ INTBP register + channel number $\times 4$ bytes
$<3>\quad$ Read word data starting at the exception handler address read position calculated in $<2>$.
$<4>\quad$ Use the word data read in $<3>$ as the exception handler address.
$<5>\quad$ The acceptance of the interrupt is established when the exception handler address has been got. In addition to the exception acceptance processing shown in Figure 3.18, the CPU returns an acceptance response to the interrupt controller and updates the ISPR.

## CAUTIONS

1. For details about the interrupt channel settings, see Section 6, Interrupts.
2. There are cases in which a memory protection exception (MDP) occurs while reading word data from the exception handler address read position depending on the memory protection settings. In such a case, the acceptance of the interrupt is temporarily cancelled. Since no acceptance response is returned to the interrupt controller, the interrupt request is held pending and is become acceptable again when execution is returned from the memory protection exception processing.
3. If a memory protection exception occurs during a word data read from the exception handler address read position, the PC of the instruction that is interrupted by the interrupt is saved in the FEPC. Since the acceptance of the interrupt is cancelled, the value of the PSW established when the interrupt occurred (which should have been saved in the EIPSW) is saved in the FEPSW.

Exception handler address read positions corresponding to interrupt channels and the placement of the interrupt handler address table in memory are shown below.

Table 3.99 Exception Handler Address Read Position

| Type | Exception Handler Address Read Position |
| :--- | :--- |
| EIINT interrupt channel 0 | INTBP $+0 \times 4$ |
| EIINT interrupt channel 1 | INTBP $+1 \times 4$ |
| $:$ | $:$ |
| EIINT interrupt channel 2046 | INTBP $+2046 \times 4$ |
| EIINT interrupt channel 2047 | INTBP $+2047 \times 4$ |

Figure 3.23 Placement of the Interrupt Handler Address Table in Memory

For details about the exception handler address selection method settings for each interrupt channel, see Section 6, Interrupts.

## (2) System Calls

For system call exceptions, the referenced table entry is selected according to the value of the vector specified by the SYSCALL instruction and the value of the SCCFG.SIZE bit, and the exception handler address is calculated according to the contents of the table entry and the SCBP register value.

As an example, if table size n is specified by SCCFG.SIZE, the table entry is selected as shown below. Note that if the vector specified by the SYSCALL instruction (vector 8 ) is greater than table size $n$, the table entry referenced by vector $\mathrm{n}+1$ to 255 is table entry 0 .

Table 3.100 System Calls

| Vector | Exception Cause Code | Referenced Table Entry |
| :--- | :--- | :--- |
| 0 | $00008000_{\mathrm{H}}$ | Table entry 0 |
| 1 | $00008001_{\mathrm{H}}$ | Table entry 1 |
| 2 | $00008002_{\mathrm{H}}$ | Table entry 2 |
| $($ Omitted $)$ | $:$ | Table entry $\mathrm{n}-1$ |
| $\mathrm{n}-1$ | $00008000_{\mathrm{H}}+(\mathrm{n}-1)_{\mathrm{H}}$ | Table entry n |
| n | $00008000_{\mathrm{H}}+\mathrm{n}_{\mathrm{H}}$ | Table entry 0 |
| $\mathrm{n}+1$ | $00008000_{\mathrm{H}}+(\mathrm{n}+1)_{\mathrm{H}}$ | $:$ |
| $($ Omitted $)$ | $:$ | Table entry 0 |
| 254 | $000080 \mathrm{FE}_{\mathrm{H}}$ | Table entry 0 |
| 255 | $000080 \mathrm{FF}_{\mathrm{H}}$ |  |

## CAUTION

Because table entry 0 is selected if a vector that exceeds the table size specified by SCCFG.SIZE is specified, allocate the error processing routine at table entry0.

### 3.2.4.5 Register Bank Function

This CPU provides the register bank function that automatically saves the context when it accepts an interrupts (EIINTn). Since the saving of the context proceeds in parallel with the interrupt acceptance processing, this function enables the CPU to make high-speed interrupt response.

## (1) Outline of the Register Bank Function

The register bank function that this CPU provides has the following features:

- Automatically saves the context upon acceptance of an interrupt (EIINTn) meeting some conditions (see Section

### 3.2.4.5(2), Automatic Context Saving.)

- The destination of the context saving is not dedicated memory but an area of ordinary memory installed in this CPU (specified by the RBIP register).
- The context to be saved can be selected from two groups (specified by the RBCR0.MD bit).
- Supports a maximum of 16 levels of multiple interrupts (the RBNR.BN bits indicate the number of accepted interrupts).
- The context is restored from the register bank by executing the RESBANK instruction (no automatic restoration function).

## (2) Automatic Context Saving

Automatic context saving is carried out when the following conditions are satisfied for an interrupt request (EIINTn) notified:

- Table reference method is specified for the interrupt request*1.
- The use of the register bank is specified by the RBCR0.BE[i] bit which is associated with the priority ( $i$ ) of the interrupt request (the automatic context saving onto the register bank is enabled).
- The RBNR.BN bits have a value no greater than 15 (the number of register banks in use is not greater than 15 ).

Note 1. See Section 6, Interrupts for the procedure to specify the table reference method.

Automatic context saving is not carried out if the table reference method is not specified for the interrupt request (EIINTn) or the use of the register bank is not specified by the RBCR0.BE[i] bit associated with the interrupt priority (i).

In addition, no automatic context saving is carried out if the value of the RBNR.BN bits are greater than 15 . In such a case, it is assumed that an unexpected interrupt acceptance processing is being performed and a terminating-type SYSERR exception is notified for error processing.

Figure 3.24 shows the flow of checking the conditions for automatic context saving.

Note: For details of operations other than the condition judgement, see Figure 3.20 and Figure 3.22.

Figure 3.24 Flow of Checking the Conditions for Automatic Context Saving

## (a) Automatic Context Saving

Shown below is the processing of automatic context saving onto the register bank.

Figure 3.25 Processing of Automatic Context Saving

1. Calculate the start address of register bank $n$ on which the context is to be saved based on the value of the register bank initial pointer (RBIP) and the value ( $n$ ) of the BN bits of the register bank number register (RBNR) established upon acceptance of the interrupt. The size (BANK_SIZE) of the register bank differs depending on the save mode that is selected.

Start address:

$$
\text { RBIP }-n \times \text { BANK_SIZE }
$$

BANK_SIZE:
Save mode 0: $60_{\mathrm{H}}$
Save mode 1: $90_{\mathrm{H}}$
2. Save the target registers onto the register bank $n$ specified by the RBNR.BN bits according to the save mode specified by the RBCR0.MD bit*1. Table $\mathbf{3 . 1 0 1}$ shows a list of the registers to save, their addresses, and save order.
3. Increment the value of the RBNR.BN bits by 1. This terminates the register bank saving processing*2 and initiates the execution of the interrupt handler*3.

Note 1. MDP exceptions (terminating-type) might be caused by memory accesses made during the register bank saving processing. The other types of interrupts and exceptions cannot be accepted.
Note 2. The saving of the registers into the memory area specified as the register bank does not have always been completed. To ensure the completion of register saving, this CPU can employ a procedure similar to the one with the ordinary store instruction. For details, see Section 3.2.7.2, Guaranteeing the Completion of Store Instruction.
Note 3. Exceptions of higher priorities can be accepted after the saving onto the register bank is finished.

Table 3.101 List of Registers to Save, Addresses, Save Order, and Restore Order

Note 1. Register saving and restoration start sequentially at sequence number 1.
Note 2. The target registers to be saved in save mode $0(R B C R O M D=0)$ are the registers up to $r 30$ with a save sequence number of 24.

Note 3. The restoration sequence numbers shown on the left side are for save mode 0 and those shown on the right side are for save mode 1.
Note 4. In save mode 0, the next bank $(n+1)$ starts from this address.
Note 5. In save mode 1, no register is saved in this address. This address is not used.
Note 6. In save mode 1, the next bank $(\mathrm{n}+1)$ starts from this address.

## (b) Suppressing the Update of the PSW.ID Bit

When an interrupt (EIINTn) is accepted in the normal state, the PSW.ID bit is set to 1 and interrupts of the same EI level cannot be accepted unless the acceptance of interrupts is enabled explicitly with the EI instruction.

For interrupts that make use of the register bank (satisfying the automatic context saving conditions), on the other hand, by clearing the RBCR1.NC[ $i]$ bit associated with the interrupt priority $(i)$ to 0 , the PSW.ID bit keeps its value 0 without being set to 1 when an interrupt is accepted. This makes it possible to accept interrupts of higher priorities without software intervention after the end of automatic context saving. Since necessary registers are automatically saved, the CPU can return to the original interrupt processing precisely.

## (3) Context Restoration

The context automatically saved onto the register bank need to be restored before returning from the interrupt processing to the original program. Although the context saving onto the register bank is automatically done, its restoration needs to be accomplished explicitly by software executing the RESBANK instruction.

## (a) Conditions for Executing the RESBANK Instruction

The RESBANK instruction must be executed to restore the context from the register bank. The RESBANK instruction is a supervisor-privileged instruction. A PIE exception will occur if it is executed in user mode.

A resumable-type SYSERR exception will occur if the RESBANK instruction is executed when the value of the RBNR.BN bits are 0 . A 0 in the RBNR.BN bits means that no context has automatically been saved onto the register bank. Accordingly, an invalid value will be restored if the RESBANK instruction is executed in such case.

The above-mentioned operating conditions are summarized in Figure 3.26.

Note 1. The process for detecting MIP and other exceptions that are not caused directly by the RESBANK instruction is omitted.

Figure 3.26 Flow of Checking the Conditions for Executing the RESBANK Instruction

## (b) Context Restoration

The figure below shows the processing of the RESBANK instruction for restoring the context from the register bank.

Figure 3.27 Processing of Context Restoration

1. Calculate the start address of register bank $n-1$ from which the context is to be restored based on the value of the register bank initial pointer (RBIP) and the value ( n ) of the BN bits of the register bank number register (RBNR) established upon acceptance of the interrupt. Unlike in the case of saving the context, the start address to be referenced when restoring the context is the lower-limit side of the register bank addresses. The size (BANK_SIZE) of the register bank differs depending on the save mode that is selected.

Start address:

$$
\text { RBIP }-\mathrm{n} \times \text { BANK_SIZE }
$$

BANK_SIZE :
Save mode $0: 60_{\mathrm{H}}$
Save mode 1: $90_{\mathrm{H}}$
2. Restore the context from the register bank $n-1$ in the target registers according to the save mode specified by the RBCR0.MD bit*1. Table 3.101 shows a list of the registers to restore, their addresses, and restore order.
3. Decrement the value of the RBNR.BN bits by $1^{* 2}$. This terminates the register bank restoration processing and completes the execution of the RESBANK instruction*3.

Note 1. The CPU can accept terminating-type exceptions while restoring the context from the register bank. MDP exceptions (resumable-type) might be caused by memory accesses made during the register bank restoration processing.
Note 2. When the CPU accepts an exception before the value of RBNR.BN is updated, it stops the execution of the RESBANK instruction even if the restoration of all registers is not yet completed. In this case, though there are some registers of which restoration has been completed, the CPU cannot know what registers have been restored. Since the return PC of the exception is the PC of this RESBANK instruction, the CPU can re-execute
precisely the RESBANK instruction if none of the resources related to the RESBANK instruction are altered during the exception processing.

Note 3. After the RESBANK instruction is executed, execute the EIRET instruction to return from the interrupt handler.

### 3.2.4.6 List of Memory Access Exceptions

Table 3.102 shows a list of instructions and exceptions that make memory accesses and the exceptions that can be detected. Exceptions identified by the symbol " $\checkmark$ " can be detected during the memory accesses that are made during the processing of the listed instructions and exceptions. Exceptions identified by the symbol $\times$ are not detected.

Table 3.102 List of Memory Access Exceptions

| Instruction/Exception | MAE | MDP | Instruction/Exception | MAE | MDP |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SLD.B | $\times$ | $\checkmark$ | TST1 | $\times$ | $\checkmark$ |
| SLD.BU | $\times$ | $\checkmark$ | PREPARE | $\times$ | $\checkmark$ |
| SLD.H | $\checkmark$ | $\checkmark$ | DISPOSE | $\times$ | $\checkmark$ |
| SLD.HU | $\checkmark$ | $\checkmark$ | PUSHSP | $\times$ | $\checkmark$ |
| SLD.W | $\checkmark$ | $\checkmark$ | POPSP | $\times$ | $\checkmark$ |
| SST.B | $\times$ | $\checkmark$ | SWITCH | x | $\checkmark$ |
| SST.H | $\checkmark$ | $\checkmark$ | CALLT | $\times$ | $\checkmark$ |
| SST.W | $\checkmark$ | $\checkmark$ | SYSCALL | $\times$ | $\checkmark$ |
| LD.B | $\times$ | $\checkmark$ | LDV.W | $\checkmark$ | $\checkmark$ |
| LD.BU | $\times$ | $\checkmark$ | LDV.DW | $\checkmark$ | $\checkmark$ |
| LD.H | $\checkmark$ | $\checkmark$ | LDV.QW | $\checkmark$ | $\checkmark$ |
| LD.HU | $\checkmark$ | $\checkmark$ | STV.W | $\checkmark$ | $\checkmark$ |
| LD.W | $\checkmark$ | $\checkmark$ | STV.DW | $\checkmark$ | $\checkmark$ |
| LD.DW | $\checkmark$ | $\checkmark$ | STV.QW | $\checkmark$ | $\checkmark$ |
| ST.B | $\times$ | $\checkmark$ | LDVZ.H4 | $\checkmark$ | $\checkmark$ |
| ST.H | $\checkmark$ | $\checkmark$ | STVZ.H4 | $\checkmark$ | $\checkmark$ |
| ST.W | $\checkmark$ | $\checkmark$ | CACHE (CHBII) | $\times$ | $\checkmark$ |
| ST.DW | $\checkmark$ | $\checkmark$ | CACHE (CIBII) | $\times$ | $\times$ |
| LDL.BU | $\times$ | $\checkmark$ | CACHE (CFALI) | $\times$ | $\checkmark$ |
| LDL.HU | $\checkmark$ | $\checkmark$ | CACHE (CISTI) | $\times$ | $\times$ |
| LDL.W | $\checkmark$ | $\checkmark$ | CACHE (CILDI) | $\times$ | $\times$ |
| STC.B | $\times$ | $\checkmark$ | CACHE (other commands) | $\times$ | $\times$ |
| STC.H | $\checkmark$ | $\checkmark$ | PREF (PREFI) | $\times$ | $x^{* 1}$ |
| STC.W | $\checkmark$ | $\checkmark$ | PREF (other commands) | $\times$ | $\times$ |
| CAXI | $\checkmark$ | $\checkmark$ | Table reference type EIINTn | $\times$ | $\checkmark * 2$ |
| SET1 | $\times$ | $\checkmark$ | Register bank saving processing | $\times$ | $\checkmark$ *2 |
| CLR1 | $\times$ | $\checkmark$ | RESBANK | $\times$ | $\checkmark$ |
| NOT1 | $\times$ | $\checkmark$ |  |  |  |

Note 1. When a violation is detected during the execution of the PREF instruction, no MDP exception is generated but the memory access is suppressed. Read access is not performed.
Note 2. Both of table read accesses due to table reference method interrupts and write accesses for automatically saving the context onto the register bank occur independently of the execution of an instruction. This CPU handles any MDP exception that is caused by these accesses as a terminating-type exception. The exception cause code of this MDP exception differs from that of resumable-type MDP exceptions. For details see Table 3.95.

### 3.2.5 Memory Management

This CPU provides the following functions for managing memory.

- Memory protection unit (MPU)
- Instruction cache function
- Mutual exclusion function
- Special instructions for synchronization processing
- Guaranteeing the completion of store instructions

### 3.2.5.1 Memory Protection Unit (MPU)

Memory protection functions are provided in an MPU (memory protection unit) to maintain a smooth system by detecting and preventing unauthorized use of system resources by unreliable programs, runaway events, etc.

## (1) Features

## (a) Memory Access Control

Multiple protection areas can be assigned to the address space. Consequently, unauthorized program execution or data manipulation by user programs can be detected and prevented. The upper and lower limit addresses of each area can be specified so that the address space can be used precisely and efficiently.
(b) Access Management for Each CPU Operation Mode

In this CPU, several status bits are used to control access to resources, and these bits are used in combination to perform protection that is appropriate, according to each program's level of reliability.

## (c) Protection with the System Protection Identifier (SPID)

This CPU can use the system protection identifier (SPID) to check for area matching. The usage and limitations on settings of the SPID register depend on the system specifications of the product in which this CPU is mounted.
Reflecting such system specifications in the control of memory access can enable the efficient management of access.

## (2) Protection Area Settings

## (a) Protection Area Attribute Settings

Set the respective protection areas appropriately. For details about registers, see Section 3.2.3, Register Set.

### 3.2.5.1.2.a. 1 E bit

This sets the target protection area setup as enabled or disabled. When disabled, all settings are disabled. Make sure valid setting values have been stored for other protection area settings (MPUA, MPLA, and MPAT) at the time when this bit is set to 1 .

### 3.2.5.1.2.a. 2 UX, UR, and UW bits

These bits indicate the access privileges for the target protection area during user mode. A 1 in these bits indicates the presence of the corresponding access privilege.

### 3.2.5.1.2.a. 3 SX, SR, and SW bits

These bits indicate the access privileges for the target protection area during supervisor mode. These bits, in addition to the E bit, are valid only when the MPM.SVP bit has been set to 1 . If the MPM.SVP bit has been cleared to 0 , even when the E bit is set to 1 , protection is not performed while in supervisor mode, regardless of the values of the SX, SR, and SW bits, and the entire address space becomes access-enabled.

### 3.2.5.1.2.a. 4 WG and WMPIDn bits and MPIDn registers ( $\mathbf{n}=0$ to 7 )

These bits indicate how to reference the system protection identifier (SPID) during the check for the permission to write to a protection area.

When the WG bit is set (to 1 ), the access permission for all write accesses is judged only by the settings of the UW or SW bit regardless of the value of the SPID that is set.

When the WG bit is cleared (to 0 ), if the value of the SPID register matches any of the values specified in the MPIDn registers and if the WMPIDn bit corresponding to the matching MPIDn register is set (to 1 ), the access permission is judged according to the settings of the UW or SW bit. If the value of the SPID register matches none of the values specified in the MPIDn registers or if the WMPIDn bit corresponding to the matching MPIDn register is cleared (to 0 ), the access permission is judged to be "write-disabled" regardless of the settings of the UW or SW bit.

In addition, when the values of multiple MPIDn registers match the value of the SPID register, writing is possible if any of the corresponding WMPIDn bit is set (to 1 ).

### 3.2.5.1.2.a. 5 RG bit, RMPIDn bit, and MPIDn registers ( $\mathrm{n}=0$ to 7 )

These bits indicate how to reference the system protection identifier (SPID) during the check for the permission to read from a protection area.

When the RG bit is set (to 1), the access permission for all read accesses is judged only by the settings of the UX and UR bits or the SX and SR bits regardless of the value of the SPID that is set. When the RG bit is cleared (to 0 ), if the value of the SPID register matches any of the values specified in the MPIDn registers and if the RMPIDn bit corresponding to the matching MPIDn register is set (to 1), the access permission is judged according to the settings of the UX and UR bits or the SX and SR bits. If the value of the SPID register matches none of the values specified in the MPIDn registers or if the RMPIDn bit corresponding to the matching MPIDn register is cleared (to 0 ), the access permission is judged to be "read-disabled" regardless of the settings of the UX and UR bits or the SX and SR bits.

In addition, when the values of multiple MPIDn registers match the value of the SPID register, reading is possible if any of the corresponding RMPIDn bit is set (to 1 ).

## (3) Caution Points for Protection Area Setup

## (a) Crossing Protection Area Boundaries

When the specified protection areas overlap, the access control settings for the overlapping parts are set to "allow most".

In other words, when multiple protection areas have been specified, if access is enabled for either of the protection areas, access is judged to be enabled.

## (b) Invalid Protection Area Settings

Protection area settings are invalid in the following case.

- When value set to lower-limit address is larger than value set to upper-limit address

## CAUTION

Addresses are handled as unsigned integers ( $\mathrm{OH}_{\mathrm{H}}$ to FFFF FFFFн).
For example, the following settings alone cannot make the target area accessible (MPAT is omitted):
MPLAO $=$ FFFF FF80,$~ M P U A O ~=000000 F C_{H}$
This setting should be divided into the following two protection area settings.
MPLA0 = FFFF FF80н, MPUA0 $=$ FFFF FFFC ${ }_{\mathrm{H}}$
MPLA1 $=00000000 \mathrm{H}$, MPUA1 $=000000 \mathrm{FC} \mathrm{H}_{\mathrm{H}}$
MPLA0 refers to the MPLA register for the protection area 0 . The same holds true for the other registers.

## (c) Lower- and Upper-Limit Addresses Referenced during Protection Violation Checks

Table 3.103 lists the lower-limit addresses that are compared with MPLA and the upper-limit addresses that are compared with MPUA during the protection violation check.

Table 3.103 Lower- and Upper-limit Addresses Referenced during the Protection Violation Check

| Instruction/Event | Access size | Lower-Limit Address | Upper-Limit Address |
| :---: | :---: | :---: | :---: |
| ```SLD, SST, LD, ST, LDL, STC, LDV, STV``` | Byte | Address calculated according to the addressing specified in the instruction | Same as lower-limit address |
|  | Half word |  | Lower-limit address + 1 |
|  | Word |  | Lower-limit address + 3 |
|  | Double word** |  | Lower-limit address + 7 |
|  | Quad word*1 |  | Lower-limit address + 15 |
| CAXI | Word | Value of reg1 | Lower-limit address + 3 |
| SET1, NOT1, CLR1, TST1 | Byte | Address calculated according to the addressing specified in the instruction | Same as lower-limit address |
| PREPARE, DISPOSE, PUSHSP, POPSP | Word*2 | Address calculated from the value of the SP and the number of accesses | Lower-limit address + 3 |
| SWITCH, CALLT | Half word | Address calculated according to the addressing specified in the instruction | Lower-limit address + 1 |
| SYSCALL | Word | Address calculated according to the default addressing | Lower-limit address + 3 |
| CACHE (CHBII, CFALI), PREF | Cache line size*3 | reg1 value rounded by cache line size | Lower-limit address + Cache line size - 1 |
| Table reference EIINTn | Word | Address from which the exception handler address is read when table reference method is selected | Lower-limit address + 3 |
| Automatic context saving onto a register bank | Word*2 | Address calculated from the values of the RBIP and the RBNR.BN bit | Lower-limit address + 3 |
| RESBANK | Word*2 | Address calculated from the values of the RBIP and the RBNR.BN bit | Lower-limit address + 3 |
| Memory protection configuration check function | Value of MCS | Value of MCA | Value of MCA + MCS - 1 |
| Instruction fetch | Instruction fetch size*4 | PC rounded by the instruction fetch size | Lower-limit address + Instruction fetch size - 1 |

Note 1. Since the minimum protection area unit is word-size, there are cases in which the lower- or upper-limit address specified for a double or quad word access does not fall within the address range designated by a single protection area setting. If either one of the lower- and upper-limit addresses does not fall within the specified address range, a protection violation is detected and an MDP exception is generated. See Section 3.2.5.1(3)(d), Memory Access Spanning Contiguous Protection Areas for the operation for two contiguous protection area settings.
Note 2. The instruction accesses contiguous multi-byte area, however, memory accesses for a single register are carried out on word-size basis. Memory protection is effected on each of these word-size accesses. For this reason, there are cases in which a data protection violation is detected when some of word-size memory access are executed and there still are memory accesses that are yet to be executed. In these cases, an MDP exception occurs during the processing of the instruction, and the instruction is aborted. Memory or registers are updated by the completed processing of the instruction.
Note 3. For the cache line size, see Section 3.8.9, Product Information of Cache Structure.
Note 4. For the instruction fetch size, see Section 3.8.10, Product Information of Fetch Size.

## (d) Memory Access Spanning Contiguous Protection Areas

With respect to the memory protection against an operand access, it is necessary that the associated memory access is encompassed entirely in a single access enabled area. No accesses that span over two or more areas are allowed even when the access enabled areas are allocated in contiguous spaces. In this CPU, since the minimum protection area unit is word-size and misaligned accesses cannot be executed, memory accesses spanning over areas can occur during double word size memory accesses (LD.DW, ST.DW, LDV.DW, and STV.DW) or quad-word memory access (LDV.QW, STV.QW).

On the other hand, the memory accesses associated with the instructions PREPARE, DISPOSE, PUSHSP, POPSP, and RESBANK and the memory accesses associated with the automatic context saving onto a register bank may span over two or more access enabled areas since they are handled as repetitions of two or more word size accesses.

With respect to the memory protection against an instruction fetch, if a fetch access spans over protection areas, the instruction codes that are fetched are given the result of judging the memory protection which is made with the word size as a delimiter. Since only a specific part of the instruction codes that are fetched is required to execute the instruction, even if an instruction fetch which spans over enabled and disabled areas is made, the instruction code in the enabled area can be executed. If the instruction code in the disabled area is used, an MIP exception will occur.

Since the instruction codes are allocated on a half word basis, for an instruction whose instruction length is the word size or longer, there are cases in which the instruction itself spans over protection areas. In such a case, the instruction may be executed if both areas are enabled. If one area is disabled, however, the instruction cannot be executed even if the other area is enabled.

Table 3.104 below shows the examples of operand accesses which span over protection areas. Table 3.105 below shows the examples of instruction fetches which span over protection areas. In the following examples, the LD.DW, DISPOSE instructions and the instruction fetch start to access address $000000 \mathrm{FC} \mathrm{H}_{\mathrm{H}}$ and proceed in the direction of increasing addresses. The PREPARE instruction starts to access address $00000100_{\mathrm{H}}$ and proceeds in the direction of decreasing addresses. The memory protection setting check function checks the area that begins from $000000 \mathrm{FC}_{\mathrm{H}}$ and goes beyond the boundary of the protection area. In the examples, following two protection areas are set.

Protection area setting 0: MPLA $0=00000000_{\mathrm{H}}$, MPUA0 $=000000 \mathrm{FC}_{\mathrm{H}}$
Protection area setting 1: MPLA1 $=00000100_{\mathrm{H}}$, MPUA1 $=000001 \mathrm{FC}_{\mathrm{H}}$

Table 3.104 Examples of Operand Memory Accesses Spanning Over Contiguous Protection Areas

| Protection Setting |  | Operation |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Setting 0 | Setting 1 | LD.DW, etc. | PREPARE, etc. (save context) | DISPOSE, etc. (restore context) | Memory Protection Setting Check |
| Disabled | Disabled | MDP | MDP | MDP | Prohibited (0)*5 |
| Disabled | Enabled | MDP | MDP*1 | MDP*3 | Prohibited (0)*5 |
| Enabled | Disabled | MDP | MDP*2 | MDP*4 | Prohibited (0)*5 |
| Enabled | Enabled | MDP | Access executed | Access executed | Prohibited (0)*5 |

Note 1. Accesses made to addresses in the protection area setting 1 are enabled and update the memory. When an access is made to an address in the protection area setting 0 , an MDP exception occurs and the execution of the instruction is aborted. The MEA register holds the address at which the first data protection violation is detected.
Note 2. Since the address at which accessing is to start is disabled, an MDP exception occurs without the execution of any memory access.
Note 3. Since the address at which accessing is to start is disabled, an MDP exception occurs without the execution of any memory access.
Note 4. Accesses made to addresses in the protection area setting 0 are enabled and update the registers. When an access is made to an address in the protection area setting 1, an MDP exception occurs and the execution of the instruction is aborted. The MEA register holds the address at which the first data protection violation is detected.
Note 5. The memory protection setting check function sets "Prohibited (0)" to the corresponding bits of the MCR register unless the target area falls within a single protection area.

Table 3.105 Examples of Instruction Fetch Memory Accesses Spanning Over Contiguous Protection Areas

| Protection Setting |  | Operation |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | $\begin{array}{l}\text { Execute Instructions } \\ \text { Covered by Only Setting } \\ \text { Setting 0 }\end{array}$ | Setting 1 | $\begin{array}{l}\text { Execute Instructions } \\ \text { Covered by Only Setting } \\ 1\end{array}$ | $\begin{array}{l}\text { Execute Instructions } \\ \text { Spanning Over Settings } \\ 0\end{array}$ | \(\left.$$
\begin{array}{l}\text { and } 1\end{array}
$$ \begin{array}{l}Manipulate Instruction <br>

Cache with CACHE <br>
Instruction/Prefetching <br>
by the PREF Instruction\end{array}\right]\)

Note 1. An MDP exception occurs when a memory protection violation is detected for the CACHE instruction which manipulates the instruction cache using the address specification method.
Note 2. An MDP exception does not occur, and prefetching is disabled when a PREF instruction leads to a violation of memory protection.

## (e) Memory Access which Spans Over Address 0000 0000 ${ }_{H}$

Table 3.106 summarizes the operations that are performed when a memory access which spans over addresses $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$ to $00000000_{\mathrm{H}}$ is made with the protection setting such that all the address spaces are enabled by the following single protection area setting:

Protection area setting 0: MPLA $0=00000000_{\mathrm{H}}$, MPUA0 $=$ FFFF $\mathrm{FFFC}_{\mathrm{H}}$
Table 3.106 Operations of Memory Access That Span Over Address 0000 0000 H

| Instruction/Event | Operation |
| :--- | :--- |
| LD.DW, ST.DW | MDP exception |
| PREPARE, DISPOSE, PUSHSP, POPSP, RESBANK, Automatic context saving onto a | Access executed |
| register bank |  |

For instructions and events other than those mentioned above, no memory access which spans over address $00000000_{\mathrm{H}}$ is generated by a single instruction or event.

## (4) Access Control

In this CPU, accesses are controlled appropriately according to the settings described in Section 3.2.5.1(2), Protection Area Settings. In any of the cases listed below, the CPU ensures logical integrity by limiting actual access, detecting violations before instruction execution is completed, and setting up exceptions.

- When about to execute an instruction at an address outside the executable area
- When about to execute an instruction that reads from an address outside the read-accessible area
- When about to execute an instruction that writes to an address outside the write-accessible area

The specifics of access control are as follows.

- The result of the access which is judged as prohibited is not reflected in memory or I/O devices.
- The result of the access which is judged as enabled is reflected in memory or I/O devices.

## CAUTIONS

1. Even when access is enabled, there might be cases where access is blocked by another function that prohibits it.
2. In some cases, access judged to be prohibited may be executed for a memory. The cases are as listed below.

- Reading local RAM
- Reading of code flash memory by instruction prefetching of the instruction cache

Since execution of the instructions that read from the local RAM or execute the prefetched instruction is inhibited by an exception, such access does not affect the execution of instructions. However, when a debugger is monitoring access to the local RAM or code flash memory, it may observe access judged to be prohibited.

## (5) Violations and Exceptions

In this CPU, violations are detected during instruction fetch access or operand access according to the protection area settings, and an exception is generated.

- Execution protection violation (during instruction fetch access)
- Data protection violation (during operand access)

## (a) Execution Protection Violation (MIP Exception)

This violation is detected when an instruction is executed. An execution protection violation is detected when attempting to execute an instruction that has been placed in a non-executable area.

When an execution protection violation is detected, an MIP exception always occurs.
(b) Data Protection Violation (MDP Exception)

This violation is detected during operand access. A data protection violation is detected when a memory access instruction, etc. attempts to access data from an access-prohibited area.

When a data protection violation is detected, an MDP exception always occurs.

## (c) Exception Cause Code and Exception Address

When an execution protection violation or data protection violation has been detected, the exception cause code is determined as shown in Table 3.107. The determined exception cause code is set to the FEIC register.

The MEA register is used to store either the PC of the instruction that detected the execution protection violation or the access address used when the data protection violation occurred. The MEA register is shared by MIP and MDP exceptions since these exceptions do not occur simultaneously. Also, when a data protection violation occurs, the information of the instruction or event that caused the violation is stored in the MEI register.

Table 3.107 Exception Cause Code of Memory Protection Violation

| Exception | Operation Mode When Violation Occurred | Bit Number and Bit Name |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 31-25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15-0 |
|  |  | - | MS | BL | RMW | SX | SW | SR | UX | UW | UR | - |
| MIP | User mode | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | $90_{\mathrm{H}}$ |
|  | Supervisor mode | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | $90_{\text {H }}$ |
| MDP | User mode | 0 | *5 | *4 | *3 | 0 | 0 | 0 | 0 | *2 | *1 | 91 ${ }_{\text {H }}$ |
|  | Supervisor mode | 0 |  |  |  | 0 | *2 | *1 | 0 | 0 | 0 | 91 ${ }^{* *}$ |

Remarks: UR: A violation is detected during a read operation in user mode (PSW.UM = 1).
UW: A violation is detected during a write operation in user mode (PSW.UM = 1).
UX: A violation is detected during instruction execution in user mode (PSW.UM = 1).
SR: $\quad$ A violation is detected during a read operation in supervisor mode (PSW.UM $=0$ ).
SW: A violation is detected during a write operation in supervisor mode (PSW.UM $=0$ ).
SX: A violation is detected during instruction execution in supervisor mode (PSW.UM = 0).
RMW: Set to 1 when the instruction causing the violation contains a read-modify-write operation (SET1, NOT1, CLR1, or CAXI).
BL: Set to 1 when the instruction causing the violation performs a block transfer (PREPARE, DISPOSE, PUSHSP, or POPSP).
MS: Set to 1 when the instruction causing the violation performs a misaligned access.
Note 1. When a read violation is caused by an instruction that includes a read operation, either the SR or UR bit is set to 1.
Note 2. When a write violation is caused by an instruction that includes a write operation, either the SW or UW bit is set to 1.
Note 3. This bit is set to 1 when a violation is caused by the SET1, NOT1, CLR1, or CAXI instruction.
Note 4. This bit is set to 1 when a violation is caused by the PREPARE, DISPOSE, PUSHSP, or POPSP instruction.

Note 5. This bit is set to 1 when the instruction causing the violation performs a misaligned access.
Note 6. These bits are loaded with $95_{\mathrm{H}}$ for a data protection violation that is detected during a table read initiated by table reference EIINTn or automatic context saving onto a register bank. These are executed only in supervisor mode.

## (6) Memory Protection Setting Check Function

For the programs, such as OS, that provide services, this CPU provides a memory protection setting check function to enable implementation of a service protection function that checks in advance whether or not the address area to be used for the requested operations is within an area that is accessible by the source that requested the service. By using this function, when verifying the validity of the user-supplied parameters for a system service, the OS can complete the verification in a shorter time than by repeating reading and checking the area settings by software.

## (a) Check Details

The memory protection setting check function checks what access permission settings are made for the specified address area according to the protection area settings that are stored in the MPU.

If the address area specified by the MCA and MCS registers is contained within one protection area (specified by a pair of the MPLA and MPUA registers) and the instruction execution (instruction fetch)/write access/read access for the SPID specified by the MCI register is permitted in supervisor mode/user mode, the corresponding bit in the MCR register is set (to 1 ).
If the specified address area is not contained within one protection area or an access for the specified SPID is not permitted in an operation mode, the corresponding bit in the MCR register is cleared (to 0 ).

This check operation is realized by executing the same memory protection judgement procedure that is applied to the operand access or instruction fetch access to the specified address area and SPID. Therefore, when the checked address area is accessed by a load instruction, store instruction or instruction fetch, the access is judged as permitted or a memory protection exception occurs according to the check result.

## CAUTIONS

1. For the memory protection setting check function to judge the access as permitted, it is necessary that the specified address area is contained within one protection area. For example, when two contiguous protection areas are set as access permitted (see Section 3.2.5.1(3)(d), Memory Access Spanning Contiguous Protection Areas), the memory protection setting check result for the address area spanning over the contiguous protection areas becomes "access prohibited (0)". Therefore, if there are such memory protection settings, there may be a difference between the actual access result by PREPARE instruction, instruction fetch, etc. and the result of memory protection setting check function.
2. The memory protection check function makes the same judgement as the memory protection judgement that is applied to the actual memory accesses. For example, if the MPM.MPE bit is cleared (to 0), all check results are always set to "access permitted (1)". If the MPM.SVP bit is cleared (to 0 ), the bits MCR.SXE, SWE, and SRE are always set to "access permitted (1)". Or if the MPM.MPE bit is set (to 1) (MPM.SVP is assumed to be cleared) and the MPAT.E bit of all protection area settings is cleared (to 0), the MCR.UXE, UWE, and URE bits are always set to "access prohibited (0)".

## (b) Checking Procedure

Set the base address (lower limit) of the target address area to the MCA register, the size of the target area to the MCS register, and the system protection identifier (SPID) of the source requesting the service to the MCI register, then use the LDSR instruction (r0 specification is recommended) to access the MCC register and execute a check. The results can be read from the MCR register by the STSR instruction.

## CAUTION

If the specified area to be checked crosses 00000000 н or 7 FFF FFFFH, it is judged as an area setting error, and the MCR.OV bit is set to 1 . This means that the MCR.OV bit must be checked before accessing the check results. Do not use the check result until it is confirmed that the result is not invalid ( $O V=0$ ).

## (c) Sample Code

It is assumed that the memory protection setting check function will be used for the following operations.

```
_service_protection:
    MOV ADDRESS, r10 // Store the start address of the area to be checked to r10
    MOV SIZE, r11 // Store the size of the area to be checked to r11
    MOV SPID, r12 // Store the system protection identifier to r12
    DI
    LDSR r10, sr8, 5 // Set the address to MCA
    LDSR r11, sr9, 5 // Set the size to MCS
    LDSR r12, sr12, 5 // Set the system protection identifier to MCI
    LDSR r0, sr10, 5 // Start checking with MCC
    STSR sr11, r13, 5 // Get the results from MCR
    EI
    ANDI 0x0100, r13, r0
    BNZ _overflow // Processing of invalid input when OV = 1
    BR _result_check // Otherwise, result is checked
```

## (d) Method of Calculating Address Areas

The address area to be checked is treated as follows and compared with the memory protection setting.
Lower-limit address of the area: MCA setting
Upper-limit address of the area: Value calculated from MCA + (MCS - 1)
In addition, when MCS is set to $00000000_{\mathrm{H}}$, the value of "MCS - 1" is treated as FFFF FFFF H . Moreover, if the result of calculating an upper address exceeds $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$, it will be calculated as a 33-bit value, but the most significant bit, which represents an overflow, is discarded.

When MCA is $00000000_{\mathrm{H}}$ and MCS is $00000000_{\mathrm{H}}$, the upper-limit address is FFFF $\mathrm{FFFF}_{\mathrm{H}}$. When MCA is FFFF $\mathrm{FFFF}_{\mathrm{H}}$ and MCS is $00000002_{\mathrm{H}}$, the upper-limit address is $00000001_{\mathrm{H}}$.

## (e) Checking Results of the Memory Protection Setting Checking Function

Table 3.108 lists the results of the memory protection setting checking function for various settings.
Table 3.108 List of Checking Results of Memory Protection Setting Checking Function

| MPM Setting |  | Check Setting (MCA, MCS, MCI) |  | Operation in the Various Types of Protected Area |  |  |  |  | Final Result of Checking (in the MCR) ${ }^{* 2}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Protection Setting | Result of Checking for One Protected Area*1 |  |  |  |  |
| MPE | SVP |  |  | Address | $\mathrm{MCI}, \mathrm{MPIDn}$ | E | Address | xMPIDn*3 | SXE, SWE, SRE | UXE, UWE, URE | OV | SXE, SWE, <br> SRE | UXE, UWE, URE |
| 0 | - | - | - | - | - | - | - | - | 0 | All bits are set to 1 | All bits are set to 1 |
| 1 | 0 | Spanning 0000 0000 H | - | - | - | - | - | - | 1 | All bits are set to 1 | All bits are set to 0 |
|  |  | Spanning 7FFF FFFFH | - | - | - | - | - | - | 1 | All bits are set to 1 | All bits are set to 0 |
|  |  | Other than above | *4 | *4 | *4 | *4 | All bits are set to 1 | * 4 | 0 | All bits are set to 1 | *4 |
|  | 1 | Spanning 0000 0000H | - | - | - | - | - | - | 1 | All bits are set to 0 | All bits are set to 0 |
|  |  | Spanning 7FFF FFFFF | - | - | - | - | - | - | 1 | All bits are set to 0 | All bits are set to 0 |
|  |  | Other than above | Mismatch | - | - | - | All bits are set to 0 | All bits are set to 0 | 0 | All bits are set to 0 | All bits are set to 0 |
|  |  |  | Match | 0 | - | - | All bits are set to 0 | All bits are set to 0 | 0 | Results for each of the areas | Results for each of the areas |
|  |  |  |  | 1 | Not included | - | All bits are set to 0 | All bits are set to 0 | 0 | Results for each of the areas | Results for each of the areas |
|  |  |  |  |  | - | Disabled | All bits are set to 0 | All bits are set to 0 | 0 | Results for each of the areas | Results for each of the areas |
|  |  |  |  |  | Included | Enabled | Results corresponding to the setting | Results corresponding to the setting | 0 | Results for each of the areas | Results for each of the areas |

Note 1. For the MPM and other settings, this indicates the result produced by a single protection-setting area, but it cannot be directly monitored.
Note 2. The values to be stored in each bit of the MCR are the overall results for all areas covered by the given protection setting. "Results for each of the areas" will be enabled if the result of checking for even one area is enabled. However, for the value of the OV bit or all bits being set to 1 or 0 , the result is as defined regardless of the result of each protection setting area.
Note 3. This indicates the result of enabling when the WG or RG bit is set (to 1), or the collective results of enabling or disabling by the individual WMPIDn and RMPIDn bits.
Note 4. When the MPM.MPE bit is set (to 1 ) and the MPM.SVP bit is cleared (0), access to all memory in supervisor mode is enabled. On the other hand, the judgment in user mode is different. The results obtained in accord with the settings for checking and protection are stored in the same way as the results when both the MPM.MPE and MPM.SVP bits are set (to 1).

### 3.2.5.2 Cache

This section describes the function to control the cache memory that is installed in this CPU.
In normal operation, the cache memory is used implicitly in instruction fetching by the CPU. However, if the setting is to be changed or the state of the cache memory is directly manipulated by the CACHE instruction, consistency with the normal operation of CPU must be maintained. In many cases, the hardware makes adjustments so that inconsistencies between the normal operation of the CPU and the manipulation of the cache do not arise. However, to make sure that the results of cache manipulation are the intended state, take care that the manipulation does not affect the implicit operation.

For a detailed description of the cache memory that is installed in the individual products, see Section 3.8.9, Product Information of Cache Structure.

## (1) Features

A 16-KB and parity-based way select (PBS) 4-way set associative instruction cache is placed between the CPU and the code flash. The instruction cache and the code flash are connected to each other via a 256-bit dedicated bus to minimize penalties caused by a cache miss. A data buffer is also mounted between the CPU and the code flash to achieve highspeed data access. The $256-\mathrm{MB}$ area from $00000000_{\mathrm{H}}$ to 0 FFF $\mathrm{FFFF}_{\mathrm{H}}$ in the address space is intended for the instruction cache and data buffer.

Figure 3.28 Instruction Cache and Data Buffer

## (2) Cache Operation Registers

Figure 3.29 shows the system registers for cache operation. The supervisor privilege is required for the operation.
$\square$
Figure 3.29 Cache Operation Registers

## (3) Change Cache Use Mode

## (a) Change Use Mode of Instruction Cache

The instruction cache use mode can be changed by using the ICCTRL.ICHEN bit. To enable an instruction cache, set the ICHEN bit to 1 .

To disable the instruction cache, clear the ICHEN bit to 0 .
Completion of the LDSR instruction that sets ICHEN might not coincide with completion of the instruction cache setting change. As in the following sample code, by executing the SYNCI instruction after the LDSR instruction, it is ensured that the change of the instruction cache setting takes effect after the SYNCI instruction.

[^4]
## (4) Cache Operations Using CACHE Instruction

The CACHE instruction manipulates the specified data in the cache memory.
Such data manipulation by the CACHE instruction starts after updating of the cache memory by all preceding memory access has been completed. Consequently, the result of preceding memory access is guaranteed to be the target for operations using the CACHE instruction. Additionally, a suitable synchronization operation is needed following execution of the CACHE instruction to ensure that the results are reflected in subsequent instructions.

The CACHE instruction can manipulate the cache memory even when the cache is disabled.

## (a) Specification Method for Target of CACHE Instruction

There are basically two ways to specify the target for operations.

- Directly specify the address to be accessed:

In this CPU, this is called the address specification method. In this case, the cache line containing the specified address is subject to operation.

- Directly specify the cache memory's way number and line number:

In this CPU, this is called the index specification method. In this case, no hit judgment for the cache is performed, and the operation is performed on the specified cache index. For details about the cache index specification method, see Section 3.2.5.2(6), Cache Index Specification Method.

## (b) Operations Performed using the CACHE Instruction

The operations performed on the cache memory are divided into the following. For details about each operation, see the RH850G4MH User's Manual: Software.

### 3.2.5.2.4.b. 1 Cache Hit Block Invalidate / Cache Indexed Block Invalidate (CHBI / CIBI)

This disables the specified cache line. When using the address specification method, the cache line is disabled only when there is a hit. When using the index method, specified cache line is disabled. If the specified cache line is locked, it is unlocked. This operation can be used in cases such as when the entire memory cache is initialized by software.

Disabling a cache line refers to the process of clearing the cache information corresponding to the ICTAGL.V and ICTAGL.L bits (to 0).

### 3.2.5.2.4.b. 2 Cache Fetch and Lock (CFAL)

This stores the data at the specified address to the cache memory. At this time, the cache line where the data is stored is locked. This prevents the cache line from being replaced. If the target cache line has already been stored in the cache memory, it is simply locked. If the target cache line has already been stored in the cache memory and is locked, this operation does nothing.

This operation can be used to improve execution efficiency by reducing variations in instruction execution time that occur due to cache misses in the specified memory area.

Cache lines are locked only when they are enabled. Although enabling and locking of a cache line are carried out simultaneously during the execution of the CFAL instruction, no cache line is locked when only locking is configured using the CIST instruction. For details, see Section 3.2.3.7(1)(a), ICTAGL — Instruction Cache
Tag Lo Access.

## CAUTION

In the instruction cache supported by this CPU, if all the cache lines at the same index in the target way group are locked, the cache lines are not replaced. Care must be taken with respect to the cache lock specifications and the number of cache ways when monopolizing the cache memory efficiently using this operation. For the way group, see Section 3.2.5.2(10), Configuration of Instruction Cache.
For details, see Section 3.8.9, Product Information of Cache Structure.

### 3.2.5.2.4.b. 3 Cache Indexed Load / Cache Indexed Store (CILD / CIST)

This operation is used to directly access the cache memory. Values can be written and read, via a system register, at a position in the cache memory specified by using an index. Because cache data and cache tags can be accessed directly, this operation can be used for purposes such as software debugging.

## (5) Cache Operation by the PREF Instruction

The PREF instruction is provided to realize efficient cache access by advising the CPU that an address is likely to be used in the near future. Getting the CPU to prefetch data into the cache memory before using the data can reduce the read wait time caused by a cache miss.

Assuming support by compilers and other tools, the PREF instruction can be executed regardless of the CPU operating mode. Execution of the PREF instruction does not cause an exception generated by the MPU, and has no effect on logical operations, just like the NOP instruction.

## CAUTION

Because a data read request by the PREF instruction is rather speculative, it might not be executed depending on the system conditions. No cache fill is performed if all the cache lines at the same index in the target way group are locked. If an area outside the cacheable area is specified, the read itself is not carried out.

## (6) Cache Index Specification Method

For a cache instruction that uses the index specification method, explicitly specify the cache memory subject to operation in the format shown in Figure 3.30, instead of specifying an address. The bit positions of each field depend on the size of the cache memory incorporated in the CPU core. Information about the incorporated cache memory and size can be read from the ICCFG register.

Remarks: Way: Specify the way within the cache.
Index: Specify the cache index.
Offset: Specify the offset within the cache line.
Note: Always set 0 to the bits other than the WAY, Index and Offset bits.

Figure 3.30 Cache Index Specification Method

NOTE
The Offset field indicates the byte position within the cache line. This setting is not required (i.e., ignored) in normal index specification operations. For a CILD/CIST operation, it is used to specify a position within the cache line because the ICDATH/ICDATL register is shorter than the cache line length.

## (7) Execution Privilege of the CACHE/PREF Instruction

Because the CACHE instruction directly manipulates the contents of the cache memory, privileges are specified according to the type of operation. When the CACHE instruction is executed without the privilege required for the CACHE operation, a privilege instruction exception (PIE) occurs.

On the other hand, the PREF instruction provides information for speculative execution, so it can be executed in any mode.

The privileges required by the different operations performed by the CACHE instruction are shown below.

## (a) Operations allowed with the user privilege

Among address specification method operations, operations without a cache lock (CHBI) can be executed in any operation mode.
(b) Operations requiring the supervisor privilege

Among address specification method operations, operations with a cache lock (CFAL) require the supervisor privilege.

In addition, index specification method operations also require the supervisor privilege.

## (8) Memory Protection for the CACHE and PREF Instructions

The memory protection judgment for the CACHE and PREF instructions proceeds in accord with the operating mode when the instruction is executed. These instructions are handled as read access. When memory protection is enabled and the MPAT.SR or UR bit is set (to 1 ), the instruction can be executed according to the operating mode.

The CACHE instructions using the address specification mode are subject to the memory protection provided by the MPU. If a protection violation is detected, the cache operation is not executed and an MDP exception occurs.

On the other hand, since the CACHE instructions using the index specification method specify the position of data in the instruction cache but not the memory address, they are not subject to the memory protection. No matter what value is specified for the index, an MDP exception does not occur.

If a protection violation for a PREF instruction is detected, the prefetching is not performed and an MDP exception does not occur.

For both CACHE and PREF instructions, if operation is undefined for the specified opcode, cache operation and memory access are not performed at all, so they are not subject to the memory protection.

Table 3.109 shows the correspondence between operations and access permissions.
Table 3.109 Relationship between Cache Operations and Permissions

| Instruction | Address/Index | Instruction Execution Privilege | Access Permission |
| :--- | :--- | :--- | :--- |
| CHBII | Address | UM | Read |
| CIBII | Index | SV | - |
| CFALI | Address | SV | Read |
| CISTI | Index | SV | - |
| CILDI | Index | SV | - |
| PREF | Address | UM | Read |

## (9) Example of Using the CACHE Instruction to Manipulate Cache Memory

This section gives an example of cache memory manipulation by the CACHE instruction, with setting up selfmodifying code as the intention.

In the following example, an instruction code is generated in memory that is being cached in the instruction cache, and the instruction cache is disabled. Regarding whether memory that supports such cache memory manipulation is present, see Section 3.8.9, Product Information of Cache Structure.

```
ST.W r20, 0[r10]
// Write the target data to memory
SYNCM // Wait for the completion of memory writing
CACHE 0x00, [r10] // CHBII: Disable caching of the target area by the instruction cache
SYNCI
JMP [r12]
/ / Branch to the target area and execute the updated instruction code
```

## (10) Configuration of Instruction Cache

This section describes the configuration of instruction cache mounted for this CPU. For more information, see Section

### 3.8.9, Product Information of Cache Structure.

This CPU supports an instruction cache in the following configuration.

- Four ways
- 256-bit cache line size (unit of filling)
- 256-Mbyte target area for caching
- ECC protection
- Cache error notification

## (a) Four ways

Since the instruction cache mounted for this CPU is configured with four ways, the capacity of each way is onequarter of the capacity of the whole cache.

The four ways are divided into two way groups; way 0 and way 1 belong to way group A, and way 2 and way 3 belong to way group B. As for the access address, if the parity of the bits to be stored in the tag is 0 , way group $A$ is used, whereas way group $B$ is used if the parity is 1 .

When storing data in a new cache line, the LRU (least recently used) method determines the destination way for storage from within the given way group.
(b) Cache line size

The cache line size (unit of filling) is the amount of data that is stored in one line of the cache, and is 256 bits in the instruction cache for this CPU.

## (c) Allocation of cache data

Data from memory are allocated to the cache memory in the way shown in Figure 3.31.

Figure 3.31 Allocation of Data to the Cache

## (d) Cacheable area

The cacheable area for the instruction cache of this CPU is the $256 \mathrm{Mbytes}^{\text {from }} 00000000_{\mathrm{H}}$ to $0 \mathrm{FFF} \mathrm{FFFF}_{\mathrm{H}}$. Although instructions can be fetched from locations beyond the above area, they are never stored in the instruction cache in that case.
(e) ECC protection

The data RAM and the tag RAM of the instruction cache for this CPU are protected by ECCs. Upon detection of an ECC error in either area of RAM, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

For details on the ECC protection, refer to Section 38, Functional Safety.

## (f) Cache error notification

The instruction cache for this CPU detects the following five types of errors. A cache error is detected at the time of read operation by the instruction fetching or the CACHE instruction using the address specification method. In addition to the read operation, an address-feedback error is also detected at the time of write operation by cache fill. This CPU provides external notification of these errors. For the operation in cases of these errors occurring, refer to

## Section 38, Functional Safety.

- ECC error of data RAM
- ECC error of tag RAM
- Multi-hit error
- Way error
- Address-feedback error

A multi-hit error is detected when access to an address hits two ways in a way group at the same time. Upon detection of a multi-hit error, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

A way error is detected when the parity in a way group does not match the parity of data stored in the tag RAM. Upon detection of a way error, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds.

An address-feedback error is detected when the address for access to the RAM does not match the feedback address. When the error is detected at the time of cache reading, the target line is disabled, and the CPU provides external notification of the occurrence of the error at the same time as re-fetching proceeds. When the error is detected at the time of cache writing, the target line is disabled, and the CPU provides external notification of the occurrence of the error.

## (11) Data Buffer Function

The four-line buffer with 256 bits per line is mounted as a data buffer. 256-bit data read from the code flash is stored in the data buffer in 256-bit units. When the data buffer hit occurs, the data is read out from the data buffer, so the code flash is not accessed again.

### 3.2.6 Coprocessor

### 3.2.6.1 Floating-Point Operation

The floating-point unit (FPU) operates as the CPU coprocessor, and executes floating-point instructions.
Either single-precision (32-bit) or double-precision (64-bit) data can be used. In addition, the conversion between a floating point type and an integer type is possible.

The FPU of this CPU conforms to ANSI/IEEE standard 754-2008 (IEEE Standard for Floating-Point Arithmetic).

## (1) Configuration of Floating-Point Operation Function

## (a) Not implemented

If the floating-point operation function is not implemented, all the floating-point instructions cannot be used. If an attempt is made to execute such an instruction, a coprocessor unusable exception occurs. In addition, all the floatingpoint system registers become inaccessible, and if an attempt is made to access any of the registers using LDSR/STSR instruction, a coprocessor unusable exception occurs.
(b) Implementing only single precision

If only the floating-point operation function with single precision is implemented, only floating-point instructions classified as single precision*1 can be used. If an attempt is made to execute a floating-point instruction classified as double precision*2, a coprocessor unusable exception occurs. All the floating-point system registers supply the function described in Section 3.2.3.4, FPU Function Registers.

Note 1. The single-precision floating-point instruction is the instruction described as (Single) in the description of each instruction in the RH850G4MH User's Manual: Software.

Note 2. The double-precision floating-point instruction is the instruction described as (Double) in the description of each instruction in the RH850G4MH User's Manual: Software.
(c) Implementing single precision and double precision

All the floating-point instructions can be used when floating-point instructions of single precision and double precision are implemented. All the floating-point system registers supply the functions described in Section

### 3.2.3.4, FPU Function Registers.

## (2) Data Types

## (a) Floating-point format

The FPU supports 32-bit (single precision) and 64-bit (double precision) IEEE754 floating-point operations.
The single-precision floating-point format consists of a 24-bit signed fraction ( $\mathrm{s}+\mathrm{f}$ ) and an 8-bit exponent (e), as shown in Figure 3.32.

Figure 3.32 Single-Precision Floating-Point Format

The double-precision floating-point format consists of a 53-bit signed fraction ( $\mathrm{s}+\mathrm{f}$ ) and an 11-bit exponent (e), as shown in Figure 3.33.

| 63 | 62 | 5251 |  |
| :---: | :---: | :---: | :---: |
| s |  |  |  |
| Sign |  |  |  |$\quad$| e |
| :---: |
| Exponent |$\quad$| f |
| :---: |
| Fraction |

Figure 3.33 Double-precision Floating-Point Format

A numerical value in the floating-point format includes the following three areas.

- Sign bit: s
- Exponent: $\mathrm{e}=\mathrm{E}+$ bias value
- Fraction: $f=. b_{1} b_{2} \ldots b_{P-1}$ (value lower than the first decimal place)

The bias value for the single-precision format is 127. For double-precision format, the bias value is 1023 .
The range of the exponent value E when unbiased covers all integers from Emin to Emax, along with two reserved values, Emin -1 ( $\pm 0$ or subnormal number), and Emax +1 ( $\pm \infty$ or NaN: not-a-number). A numeric value other than 0 is represented in one format, depending on the single-precision and double- precision formats.

The numeric value (v) represented in this format can be calculated by the expression shown in Table 3.110.
Table 3.110 Calculation Expression of Floating-Point Value

| Type | Calculation Expression |  |
| :--- | :--- | :--- |
| NaN (not-a-number) | If $E=E m a x+1$ and $f \neq 0$ | then $v=N a N$ regardless of $s$ |
| $\pm \infty$ (infinite number) | If $E=E m a x+1$ and $f=0$ | then $v=(-1)^{s} \infty$ |
| Normalized number | If $E m i n \leq E \leq E m a x$ | then $v=(-1)^{s} 2^{E}(1 . f)$ |
| Subnormal number | If $E=E m i n ~-1$ and $f \neq 0$ | then $v=(-1)^{s} 2^{\text {Emin }}(0 . f)$ |
| $\pm 0$ (zero) | If $E=E m i n ~-1$ and $f=0$ | then $v=(-1)^{s} 0$ |

- NaN (not-a-number)

IEEE754 defines a floating-point value called NaN (not-a-number). Because this value is not a numerical value, it does not have any "greater than" or "less than" relationships to other values.
If v is NaN in all of the floating-point formats, it might be either SignalingNaN (S-NaN) or QuietNaN (Q-NaN), depending on the value of the most significant bit of " f ". If the most significant bit of " f " is set, v is QuietNaN; if the most significant bit is cleared, it is SignalingNaN.

Table 3.111 shows the value of each parameter defined in floating-point formats.
Table 3.111 Floating-Point Formats and Parameter Values

| Parameter | Format |  |
| :--- | :--- | :--- |
|  | Single Precision | Double Precision |
| Emin | +127 | +1023 |
| Bias value of exponent | -126 | -1022 |
| Length of exponent (number of bits) | +127 | +1023 |
| Integer bits | 8 | 11 |
| Length of fraction (number of bits) | Cannot be seen | Cannot be seen |
| Length of format (number of bits) | 23 | 52 |

Table 3.112 shows the minimum and maximum values that can be represented in floating-point formats.
Table 3.112 Floating-Point Minimum and Maximum Values

| Type | Value |
| :--- | :--- |
| Minimum value of single-precision floating point | $1.40129846 \mathrm{e}-45$ |
| Minimum value of single-precision floating point (normal) | $1.17549435 \mathrm{e}-38$ |
| Maximum value of single-precision floating point | $3.40282347 \mathrm{e}+38$ |
| Minimum value of double-precision floating point | $4.9406564584124654 \mathrm{e}-324$ |
| Minimum value of double-precision floating point (normal) | $2.2250738585072014 \mathrm{e}-308$ |
| Maximum value of double-precision floating point | $1.7976931348623157 \mathrm{e}+308$ |

## (b) Fixed-point formats

The value of a fixed point is held in the format of 2's complement. Figure 3.34 shows a 32 -bit fixed- point format and Figure 3.35 shows a 64-bit fixed-point format. No signed bits exist in the unsigned fixed-point format, and all bits represent the integer value.

| 31 | 30 |
| :---: | :---: |
| s |  |
| Sign | i |
| 1 | Integer |

Figure 3.34 32-bit Fixed-Point Format

| 63 | 62 | 0 |
| :---: | :---: | :---: |
| sign | i | 0 |
| 1 | Integer |  |

Figure 3.35 64-bit Fixed-Point Format

## (c) Expanded floating-point format

This CPU supports the 16-bit (half-precision) IEEE754 floating-point format as a floating-point format for storing data. The half-precision floating-point format is used to decrease the amount of data; it is not supported for arithmetic operations. Instructions are available for converting single-precision floating-point format data into half-precision floating-point data and vice-versa. The half-precision floating-point format consists of an 11-bit signed fraction (s + f) and a 5-bit exponent (e), as shown in Figure 3.36.

| 15 | 14 | 109 |  |
| :---: | :---: | :---: | :---: |$\quad 0$

Figure 3.36 Half-Precision Floating-Point Format

Like other floating-point formats, the numeric values represented in this format can be calculated by using the expressions shown in Table 3.110. The values of the parameters defined by the half-precision floating-point format are shown in Table 3.113.

Table 3.113 Half-Precision Floating-Point Format and Parameter Values

| Parameter | Half Precision |
| :--- | :--- |
| Emax | +15 |
| Emin | -14 |
| Bias value of exponent | +15 |
| Length of exponent (number of bits) | 5 |
| Integer bits | Cannot be seen |
| Length of fraction (number of bits) | 10 |
| Length of format (number of bits) | 16 |

Table 3.114 shows the minimum and maximum values that can be represented in the half-precision floating-point format.

Table 3.114 Half-Precision Floating-Point Minimum and Maximum Values

| Type | Value |
| :--- | :--- |
| Minimum value of half-precision floating point | $5.96046 \mathrm{e}-8$ |
| Maximum value of half-precision floating point (normal) | $6.10352 \mathrm{e}-5$ |
| Maximum value of half-precision floating point | 65504 |

## (3) Register Set

For details about the register set, see Section 3.2.3.4, FPU Function Registers.

## (4) Floating-Point Instructions

Floating-point instructions are divided into single-precision instructions (single) and double-precision instructions (double).

For details about the floating-point instructions, see the RH850G4MH User's Manual: Software.

## (5) Floating-Point Operation Exceptions

This section describes how the FPU processes floating-point operation exceptions.

## (a) Types of exceptions

When floating-point operations or processing of operation results cannot be done using the ordinary method, a floating-point operation exception occurs.

One of the following two operations is performed when a floating-point operation exception has occurred.

- When exceptions are enabled

The cause bit is set in the floating-point configuration/status register (FPSR), and processing (by software) is passed to the exception handler routine.

- When exceptions are prohibited

The preservation bit is set in the floating-point configuration/status register (FPSR), an appropriate value (initial value) is stored in the FPU destination register, then execution is continued.

The FPU uses cause bits, enable bits, and preservation bits (status flags) to support the following five types of IEEE754-defined exception causes.

- Inexact operation (I)
- Overflow (O)
- Underflow (U)
- Division by zero (Z)
- Invalid operation (V)

The sixth type of exception cause is unimplemented operation (E), which causes an exception when a floating-point operation cannot be executed. This exception requires processing by software. An unimplemented operation exception (E) occurs when exceptions are always enabled, rather than by using properties, enable bits, or preservation bits.

Figure 3.37 shows the FPSR register bits that are used to support exceptions.

Figure 3.37 Cause, Enable, and Preservation Bits of FPSR Register

The five exceptions (V, Z, O, U, and I) defined by IEEE754 are enabled when the corresponding enable bits are set. When an exception occurs, if the corresponding enable bit has been set, the FPU sets the corresponding cause bit. If the exception can be acknowledged, processing is passed to the exception handler routine. If exceptions are prohibited, the exception corresponding preservation bit is set, and processing is not passed to the exception handler routine.

## (b) Exception handling

When a floating-point operation exception occurs, the cause bits of the FPSR register indicate the cause of the floating-point operation exception.

### 3.2.6.1.5.b. 1 Status flag

A corresponding preservation bit is available for each IEEE754-defined exception. The preservation bit is set when the corresponding exception is prohibited but the exception condition has been detected. The preservation bit is set or reset whenever new values are written to the FPSR register by the LDSR instruction.

If an exception is prohibited by an enable bit, predetermined processing is performed by the FPU. This processing provides an initial value as the result, rather than a floating-point operation result. This initial value is determined according to the type of exception. For an overflow exception or underflow exception, the initial value also differs depending on the current rounding mode. Table $\mathbf{3 . 1 1 5}$ shows the initial values provided for each of the FPU IEEE754-defined exceptions.

Table 3.115 FPU Initial Values for IEEE754-Defined Exceptions

| Area | Description | Rounding Mode | Initial Value |
| :---: | :---: | :---: | :---: |
| V | Invalid operation | - | Quiet not-a-number (Q-NaN) |
| Z | Division by zero | - | Correctly signed $\infty$ |
| O | Overflow | RN | $\infty$ with sign of intermediate result |
|  |  | RZ | Maximum normalized number with sign of intermediate result |
|  |  | RP | Negative overflow: Maximum negative normalized number Positive overflow: $+\infty$ |
|  |  | RM | Positive overflow: Maximum positive normalized number Negative overflow: $-\infty$ |
| U | Underflow*1 | RN*2 | 0 with sign of intermediate result |
|  |  | RZ | 0 with sign of intermediate result |
|  |  | RP | Positive underflow: Minimum positive normalized number Negative underflow: 0 |
|  |  | RM | Negative underflow: Minimum negative normalized number Positive underflow: 0 |
| I | Inexact operation | - | Rounded result |
| Note 1. | If the FPSR.FS bit is cleared, an unimplemented operation exception ( $E$ ) will occur if an underflow occurs in the rounded result; an underflow exception (U) will not occur. If the FS bit of the FPSR register is set, the flushed result is used as the initial value. |  |  |
| Note 2. | If the rounding mode is RN and the FN bit of the FPSR register is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.1(9), Flush to Nearest. |  |  |

## (6) Exception Details

The following describes the conditions under which each of the FPU exceptions occurs and the FPU responses.

## (a) Inexact exception (I)

In the following cases, the FPU detects an inexact exception.

- When the precision of the rounded result is dropped
- When the rounded result overflows while overflow exceptions are prohibited
- When the rounded result underflows while underflow exceptions are prohibited
- When the operand that is a subnormal number is flushed, neither an invalid operation exception (V) nor a division by zero exception $(Z)$ is detected, and the other operands are not $\mathrm{Q}-\mathrm{NaN}$

## CAUTION

If the FS bit of the FPSR register is cleared and the operation result underflows, an unimplemented operation exception (E) occurs. In such cases, the underflow exception is not detected, so the inexact exception is not detected either.

### 3.2.6.1.6.a. 1 If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and an inexact exception occurs.

### 3.2.6.1.6.a.2 If exception is not enabled

If no other exception occurs, the rounded result or the result that underflows or overflows is stored in the destination register.

## (b) Invalid operation exception (V)

An invalid operation exception occurs when either or both of the operands are invalid.

- Arithmetic operation with S-NaN included in operands. The conditional move instruction (CMOV), absolute value (ABS), and arithmetic negation (NEG) are not handled as arithmetic operations, but minimum value (MIN) and maximum value (MAX) are handled as arithmetic operations.
- Multiplication: $\quad \pm 0 \times \pm \infty$ or $\pm \infty \times \pm 0$
- Fused-multiply-add: $( \pm 0 \times \pm \infty)+\mathrm{c}$ or $( \pm \infty \times \pm 0)+\mathrm{c}$. But only if c is not Q-NaN.
- Addition/subtraction or multiply-add operation*1:

Addition of infinite values with different signs or subtraction of infinite values with the same sign

- Division: $\quad \pm 0 \div \pm 0$ or $\pm \infty \div \pm \infty$
- Square root: When operand is less than 0
- Conversion to integer when source is outside of integer range.
- Comparison: With condition codes 8 to 15 , if the operand is unordered (see the RH850G4MH User's Manual: Software)

Note 1. When the multiplication result is infinite or when adding or subtracting between infinities.

### 3.2.6.1.6.b. 1 If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and an invalid operation exception occurs.

### 3.2.6.1.6.b. 2 If exception is not enabled

If no other exception occurs, and the destination is a floating-point format, $\mathrm{Q}-\mathrm{NaN}$ is stored in the destination register. If the destination has an integer format, see the operation result description of each instruction for the value to be stored in the destination register.

## (c) Division by zero exception (Z)

A division by zero exception occurs when a divisor is 0 and a dividend is a finite number other than 0 .

### 3.2.6.1.6.c. 1 If exception is enabled

The contents of the destination register are not changed, contents of the source register are saved, and a division by zero exception occurs.

### 3.2.6.1.6.c. 2 If exception is not enabled

If no other exception occurs, a correctly signed infinite number $( \pm \infty)$ is stored in the destination register.

## (d) Overflow exception (O)

An overflow exception is detected if the exponent range is infinite and if the result of the rounded floating point is greater than maximum finite number in the destination format.

### 3.2.6.1.6.d. 1 If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an overflow exception occurs.

### 3.2.6.1.6.d.2 If exception is not enabled

If no other exception occurs, the initial value that is determined by the rounding mode and the sign of the intermediate result is stored in the destination register (see Table 3.115, FPU Initial Values for IEEE754Defined Exceptions).

## (e) Underflow exception (U)

If the operation result is $-2^{\mathrm{Emin}}$ to $+2^{\mathrm{Emin}}$ (but not zero), an underflow exception is detected.
Although IEEE754 defines several methods for detecting an underflow, the same method should be used to detect underflows, regardless of the processing to be performed.

The following two methods can be used to detect an underflow for binary floating point numbers.

- The result calculated after rounding and using an infinite exponent range is not zero and is within $\pm 2^{\text {Emin }}$.
- The result calculated before rounding and using an infinite exponent range and precision is not zero and is within $\pm 2^{\text {Emin. }}$.

In this CPU, an underflow is detected before rounding. Or the rounded result is one of the following, an inexact result is detected.

- When a given result differs from the result calculated when the exponent range and precision are infinite

In this CPU, the behavior when an inexact result is detected differs as follows depending on whether underflow exceptions are enabled or disabled:

### 3.2.6.1.6.e. 1 If exception is enabled

When the FS bit of the FPSR register has been set, if underflow exceptions are enabled, an underflow exception (U) occurs. When the FS bit of the FPSR register has been set, if underflow exceptions are not enabled but inexact exceptions are enabled, an inexact exception (I) occurs.

### 3.2.6.1.6.e. 2 If exception is not enabled

If the FS bit of the FPSR register has been set, the initial value determined according to the rounding mode and intermediate result value is stored in the destination register (see Table 3.115, FPU Initial Values for IEEE754Defined Exceptions).

## CAUTION

If the FS bit of the FPSR register has not been set, an unimplemented operation exception (E) occurs regardless of whether or not exceptions are enabled. Because an unimplemented operation exception (E) must occur, an underflow exception (U) does not occur.

## (f) Unimplemented operation exception (E)

The E bit is set and an unimplemented operation exception (E) occurs when an abnormal operand or abnormal result that cannot be correctly processed by hardware has been detected. The operand and destination register contents do not change.

If the FS bit of the FPSR register has been set, an unimplemented operation exception (E) will not occur.
If the FS bit of the FPSR register has been cleared, an unimplemented operation exception (E) will occur under the following conditions (except for CMOVF.D, CMOVF.S, CMPF.D, CMPF.S, CVTF.HS, ABSF.D, ABSF.S, MAXF.D, MAXF.S, MINF.D, MINF.S, NEGF.D, and NEGF.S instructions).

- When the operand is a subnormal number
- When the operation result is a subnormal number, or an underflow has occurred

CAUTION
If the FS bit of the FPSR register is set to 1, an unimplemented operation exception (E) will not occur under any circumstances.

## (7) Saving and Returning Status

When a floating-point operation exception occurs, the PC and PSW are saved to the EIPC and EIPSW registers respectively, and the exception cause code is saved to the EIIC register.

The exception cause code of the floating-point operation exception is $71_{\mathrm{H}}$.
When an EI level exception is acknowledged while processing a floating-point operation exception, an EIPC register override occurs, which prevents the returning to the instruction that caused the floating- point operation exception to occur. When acknowledgment of EI level exceptions is required, the contents of the EIPC, EIPSW, and EIIC registers must be saved, such as to a stack.

When a floating-point instruction is used in a floating-point operation exception handler routine, the FPSR and FPEPC registers will be overridden if another floating-point operation exception occurs. In such cases, the FPSR and FPEPC registers should be saved at the start of the floating-point operation exception handler processing, and should be returned at the end of the handler processing.

The cause bits of the FPSR register hold the results from only one enabled exception. In any case, the previous results are held until the next enabled exception occurs.

## (8) Flushing Subnormal Numbers

This CPU can process subnormal numbers-very small numbers that are lower than the minimum normalized number-in one of the following two ways:

- Normalize the operand or operation result and continue executing arithmetic processing
- Generate an unimplemented operation exception (E) and execute exception handling

Executing software-based exception handling will obtain a more accurate result, but the amount of time required to obtain the result will vary depending on the input value. In control systems that require a real-time performance, therefore, this is usually unacceptable. In this case, it is important to obtain the result within a certain amount time rather than focus on accuracy.
(a) Normalize the subnormal numbers and continue executing arithmetic processing

By setting the FS bit of the FPSR register to 1 , this CPU can normalize the operand or operation result to a specific value and continue executing arithmetic processing if a subnormal number is input as the operand or obtained as the operation result. At this time, extremely small differences in values might not appear in the operation result.

For the operand and operation result, the values to which subnormal numbers are flushed when the FS bit is set (1) are shown in Table 3.116 and Table 3.117 below.

Table 3.116 Rounding Mode and Flush Value of Input Operand

| Sign of Subnormal Operand | Rounding Mode and Value to Which Input Operand Is Flushed |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | RN | RZ | RP | RM |
|  |  |  |  |  |
| - |  |  |  |  |

Table 3.117 Rounding Mode and Flush Value of Operation Result

| Sign of Subnormal Operand <br> Result | Rounding Mode and Value to Which Operation Result Is Flushed |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | $R^{* 1}$ | $R Z$ | $R P$ | $R M$ |
| + | +0 | +0 | $+2^{\text {Emin }}$ | +0 |
| - | -0 | -0 | -0 | $-2^{\text {Emin }}$ |

Note 1. If the rounding mode is RN and the FN bit of the FPSR register is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.1(9), Flush to Nearest.

Whether an input operand that is a subnormal number has been flushed or not can be checked by referencing the IF bit of the FPSR register. Whether an operation result that is a subnormal number has been flushed or not can be checked by referencing the U bit of the FPSR register.

## CAUTIONS

1. In control systems that require a real-time performance, it is recommended to always set the FS bit of the FPSR register to 1.
2. If the FS bit of the FPSR register is set to 1 , an unimplemented operation exception (E) will not occur under any circumstances.
3. Whether the operation result is a subnormal number is judged by using the value before rounding.
4. The IF bit of the FPSR register also accumulates and indicates information about flushing instructions that have caused a floating-point operation exception.

## (b) Generate an unimplemented operation exception (E) and execute exception handling

By clearing the FS bit of the FPSR register to 0 , an unimplemented operation exception (E) will occur if a subnormal number is input as the operand or obtained as the operation result. When an unimplemented operation exception occurs, software-based progressive underflow processing is performed in the floating-point operation exception handling routine, enabling a more accurate result to be obtained. In this case, however, a real-time processing performance might not be realized due to the software processing load.
(c) Instructions that can handle subnormal numbers

The following instructions can be executed without causing an unimplemented operation exception (E) even if an operand that is a subnormal number is input while the FS bit of the FPSR register is 0 .

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS)
(d) Instructions that are not affected by flushing subnormal numbers

For the following instructions, flushing does not occur even an operand that is a subnormal number is input while the FS bit of the FPSR register is 1 .

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS)

## (9) Flush to Nearest

This CPU provides flush-to-nearest mode, a feature for flushing to the nearest number with higher accuracy when a flushing operation results subnormal number. Flush-to-nearest mode is enabled when the rounding mode is RN and the FN bit of the FPSR register is set (1). When this mode is used, the FPU determines the value to which to flush the subnormal number based on the number of the operation result and not just the sign. This feature has no effect in rounding modes other than RN or on the result of flushing an input operand.

Table 3.118 Rounding Mode and Value to Which Operation Result is Flushed

| Value of Subnormal Operation Result | Rounding Mode and Value to Which Operation Result Is Flushed |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | RN |  | RZ | RP | RM |
|  | $\mathrm{FN}=1$ | $\mathrm{FN}=0$ |  |  |  |
| $+2^{\text {Emin-1 }} \leq$ Operation result $<+2^{\text {Emin }}$ | $+2^{\text {Emin }}$ | +0 | +0 | $+2^{\text {Emin }}$ | +0 |
| $+0<$ Operation result $<+2^{\text {Emin-1 }}$ | +0 |  |  |  |  |
| $-2^{\text {Emin-1 }}<$ Operation result $<-0$ | -0 | -0 | -0 | -0 | $-2^{\text {Emin }}$ |
| $-2^{\text {Emin }}<\text { Operation result } \leq-2^{\text {Emin-1 }}$ | $-2^{\text {Emin }}$ |  |  |  |  |

CAUTION
Whether the operation result is a subnormal number is judged by using the value before rounding.

## (10) Limitation on the Floating-Point Operation Result

There is a limitation on the floating-point operation result of this CPU.

## (a) Operation instruction result when the input data is NaN (not-a-number)

When the input data is NaN (not-a-number), the operation instruction result will be as shown in Table 3.119.
Table 3.119 Operation Result when Input data is NaN
\(\left.\begin{array}{l|l|l}\hline Input Data*3 \& Single-precision Operation Result \& Double-precision Operation Result <br>
\hline SNaN and QNaN mixed \& 7FFF FFFF_{H} \& 7FFF FFFF_FFFF FFFF <br>

H\end{array}\right]\)| 7FFF FFFF_FFFF FFFFF |
| :--- |
| Only SNaN |
| Only QNaN |
| SNFF FFFF |

Note 1. If the input data contains $\mathrm{QNaN}, \mathrm{QNaN}$ in the input data is selected as the operation result by the priority of reg2, reg1, and reg3.
Note 2. In this case, input data contains real numbers only, and the operation result is invalid.
Note 3. When the operand of an ABSF.S, ABSF.D, NEGF.S, or NEGF.D instruction is NaN, the result of the operation will be the value obtained by the operation on the sign bit alone.
Note 4. When one of the operands of an MAXF.S, MAXF.D, MINF.S, and MINF.D instruction is QNaN, the result of the operation will be whichever operand is a real number.

## (b) Results of conversion instructions when the operand is NaN (not-a-number)

When the operand is NaN (not-a-number), the results of conversion are as shown in Table 3.120.
Table 3.120 Results of Conversion when the Operand is NaN (not-a-number)

| Input Data | Output Format | Results of Conversion |
| :---: | :---: | :---: |
| Half-precision SNaN | Single precision | 7FFF FFFF ${ }_{\text {H }}$ |
| Half-precision QNaN | Single precision | The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the output value are 0 . |
| Single-precision SNaN | Word (signed) | $8000000 \mathrm{H}_{\mathrm{H}}$ |
|  | Word (unsigned) | 0000 0000 ${ }_{\text {H }}$ |
|  | Long (signed) | $80000000 \_00000000_{\mathrm{H}}$ |
|  | Long (unsigned) | 0000 0000_0000 0000 ${ }_{\text {H }}$ |
|  | Half precision | $7 \mathrm{FFF}_{\mathrm{H}}$ |
|  | Double precision | 7FFF FFFF_FFFF FFFF ${ }_{\text {H }}$ |
| Single-precision QNaN | Word (signed) | $80000000_{\mathrm{H}}$ |
|  | Word (unsigned) | $00000000_{\mathrm{H}}$ |
|  | Long (signed) | 8000 0000_0000 0000 ${ }_{\text {H }}$ |
|  | Long (unsigned) | 0000 0000_0000 0000H |
|  | Half precision | The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the operand are truncated. |
|  | Double precision | The QNaN value with the same sign. Bits 28 to 0 in the fractional part of the output value are 0 . |
| Double-precision SNaN | Word (signed) | $80000000_{\mathrm{H}}$ |
|  | Word (unsigned) | $0000000 \mathrm{H}_{\mathrm{H}}$ |
|  | Long (signed) | $80000000 \_0000$ 0000 ${ }_{\text {H }}$ |
|  | Long (unsigned) | 0000 0000_0000 0000 ${ }_{\text {H }}$ |
|  | Single precision | 7FFF FFFF ${ }_{\text {H }}$ |
| Double-precision QNaN | Word (signed) | $8000000 \mathrm{H}_{\mathrm{H}}$ |
|  | Word (unsigned) | $0000000 \mathrm{H}_{\mathrm{H}}$ |
|  | Long (signed) | 8000 0000_0000 0000 ${ }_{\text {H }}$ |
|  | Long (unsigned) | 0000 0000_0000 0000 ${ }_{\text {H }}$ |
|  | Single precision | The QNaN value with the same sign. Bits 28 to 0 in the fractional part of the operand are truncated. |

(c) When $\mathbf{0}$ comparison is performed by MAXF and MINF

When both reg1 and reg2 are either +0 or -0 , the operation will be as follows.
MINF.S, MINF.D: The value of reg1 is stored in reg3.
MAXF.S, MAXF.D: The value of reg2 is stored in reg3.
(d) In the case of the precision instruction (RECIPF)

The operation results of RECIPF.S and RECIPF.D are the same as the operation results of $1 / \mathrm{x}$ by DIVF.S and DIVF.D.

### 3.2.6.2 Extended Floating-Point Operation

The extended floating-point operation unit (FXU) operates as a coprocessor of the CPU, and executes an extended floating-point operation instruction.

The execution of one extended floating-point operation instruction allows the execution of four single-precision floating-point (vector data) operations. This is an operation generally referred to as an SIMD (Single Instruction Multiple Data) operation.

Also, conversion is possible between a floating-point type and an integer type. In extended floating-point operation by this CPU, the floating-point is handled according to the ANSI/IEEE standard 754-2008 "IEEE Standard for Floatingpoint Arithmetic".

The FXU consists of an extended floating-point operation block and vector registers where vector data is stored. There are 32 vector registers and the data width is 128 bits.

An extended floating-point operation instruction is executed by the extended floating-point operation block. The extended floating-point operation block performs 32-bit x 4 vector data operation on 128-bit vector registers. This is an operation method generally referred to as SIMD execution.

## (1) Configuration of Extended Floating-Point Operation Function

## (a) Not implemented

If the extended floating-point operation function is not implemented, any extended floating-point operation instruction cannot be used, and any attempt to execute an extended floating-point operation instruction will result in a coprocessor unusable exception. Also, any extended floating-point system register cannot be accessed, and any attempt to manipulate an extended floating-point system register by means of the LDSR/STSR instruction will result in a coprocessor unusable exception.
(b) Implemented

If the extended floating-point operation function is implemented, any extended floating-point operation instruction can be used. Also, all vector registers and extended floating-point system registers provide the functions described in

## Section 3.2.3.5, FXU Function Registers.

## (2) Data Types

The FXU supports the single-precision floating-point formats specified by IEEE 754. For details of the single-precision floating-point formats, see Section 3.2.6.1(2), Data Types.

The FXU does not support the double-precision floating-point formats.
(3) Register Set

For details of the register set, see Section 3.2.3.5, FXU Function Registers.

## (4) Extended Floating-Point Operation Instructions

Extended floating-point operation instructions consist of extended floating-point vector operation instructions and extended floating-point vector manipulation instructions. For details of the extended floating-point operation instructions, see the RH850G4MH User's Manual: Software.

## (5) Extended Floating-Point Operation Exceptions

This section describes how the FXU handles extended floating-point operation exceptions.

## (a) Types of Exceptions

When it becomes impossible to perform floating-point operation or handle operation results on any operation way during the execution of an extended floating-point operation instruction, an extended floating-point operation exception occurs.

One of the following two operations is performed when an extended floating-point operation exception has occurred.

- When exceptions are enabled

The exception cause of each operation way is set in the FXXC register, and the logical OR of the extended floating-point operation exception that has occurred on each operation way is saved into the cause bits of the extended floating-point configuration/status register FXSR.
Control (software control) is transferred to the exception handler routine.

- When exceptions are disabled

The exception cause of each operation way is set in the FXXP register, and the logical OR of the extended floating-point operation exception that has occurred on each operation way is saved into the preservation bits of the extended floating-point configuration/status register FXSR.
An appropriate value (initial value) is stored in the destination register for an instruction that has caused an exception, and execution is continued.

The FXU uses cause bits, enable bits, and preservation bits (status flags) to support the following five types of IEEE754-defined exception causes.

- Inexact operation (I)
- Overflow (O)
- Underflow (U)
- Division by zero (Z)
- Invalid operation (V)

The sixth type of exception cause is unimplemented operation (E), which causes an exception when an extended floating-point operation cannot be executed. This exception requires processing by software. An unimplemented operation exception (E) occurs when exceptions are always enabled, rather than by using properties, enable bits, or preservation bits.

Figure 3.38 shows the relationship among the enable bits and the cause bits of the FXSR register and the cause bits of the FXXC register; these bits are used to support exceptions. Figure 3.39 shows the relationship among the enable bits and the preservation bits of the FXSR register and the preservation bits of the FXXP register.

Figure 3.38 Relationship among the Cause and Enable Bits of the FXSR and FXXC Registers

Figure 3.39 Relationship among the Preservation and Enable Bits of the FXSR and FXXP Registers

The five exceptions ( $\mathrm{V}, \mathrm{Z}, \mathrm{O}, \mathrm{U}$, and I) defined by IEEE754 are enabled when the corresponding enable bits are set. All operation ways share the enable bits of the FXSR register, but detection of an exception is performed for each operation way. Therefore, different exceptions may be detected on multiple operation ways. In this case, one extended floating-point operation exception occurs.

If an exception has been detected on an operation way with its corresponding enable bit set, the FXU sets the cause bit of the operation way in the FXXC register. Also, it obtains the logical OR of the cause bits of all operation ways and sets the corresponding cause bits in the FXSR register. If the exception can be acknowledged, control is transferred to the exception handler routine.

If exceptions are prohibited, the preservation bit of that operation way in the FXXP register is set. Also, the logical OR of the preservation bits of all operation ways is obtained to set the corresponding preservation bits in the FXSR register. In this case, control is not transferred to the exception handler routine.

## (b) Exception handling

When an extended floating-point operation exception occurs, the cause bits of the FXSR register indicate the cause of the extended floating-point operation exception.

### 3.2.6.2.5.b. 1 Status flag

A corresponding preservation bit is available for each IEEE754-defined exception. The preservation bit is set when the corresponding exception is prohibited but the exception condition has been detected. The preservation bit is set or reset whenever new values are written to the FXSR register by the LDSR instruction.

If an exception is prohibited by an enable bit, predetermined processing is performed by the FXU. This processing provides an initial value as the result, rather than a floating-point operation result. This initial value is determined according to the type of exception. For an overflow exception or underflow exception, the initial value also differs depending on the current rounding mode. Table 3.121 shows the initial values provided for each of the IEEE754defined exceptions.

Note that initial values are stored only for operation ways where an exception has been detected. If different exceptions have been detected on multiple operation ways, the initial value corresponding to each exception is stored in the destination of each operation way.

Table 3.121 FXU Initial Values for IEEE754 Defined Exceptions

| Area | Description | Rounding Mode | Initial Value |
| :---: | :---: | :---: | :---: |
| V | Invalid operation | - | Quiet not-a-number (Q-NaN) |
| Z | Division by zero | - | Correctly signed $\infty$ |
| O | Overflow | RN | $\infty$ with sign of intermediate result |
|  |  | RZ | Maximum normalized number with sign of intermediate result |
|  |  | RP | Negative overflow: Maximum negative normalized number Positive overflow: $+\infty$ |
|  |  | RM | Positive overflow: Maximum positive normalized number Negative overflow: $-\infty$ |
| U | Underflow*1 | RN*2 | 0 with sign of intermediate result |
|  |  | RZ | 0 with sign of intermediate result |
|  |  | RP | Positive underflow: Minimum positive normalized number Negative underflow: 0 |
|  |  | RM | Negative underflow: Minimum negative normalized number Positive underflow: 0 |
| 1 | Inexact operation | - | Rounded result |

Note 1. If the FXSR.FS bit is cleared, an underflow in the rounded result will cause an unimplemented operation exception (E); therefore, in this case, an underflow exception $(\mathrm{U})$ will not occur. If the FXSR.FS bit is set, the flushed result is used as the initial value.
Note 2. If the rounding mode is RN and FXSR.FN is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.1(9), Flush to Nearest.

## (6) Exception Details

The following describes the conditions under which each extended floating-point operation exception occurs and how the FXU handles it.

## (a) Inexact exception (I)

If any of the following conditions is detected on any operation way, the FXU detects an inexact exception.

- When the precision of the rounded result is dropped
- When the rounded result overflows while overflow exceptions are prohibited
- When the rounded result underflows while underflow exceptions are prohibited
- When the operand that is a subnormal number is flushed, neither an invalid operation exception (V) nor a division by zero exception $(\mathrm{Z})$ is detected, and the other operands are not $\mathrm{Q}-\mathrm{NaN}$

## CAUTION

If the FXSR.FS bit is cleared and the operation result underflows, an unimplemented operation exception (E) occurs. In such cases, the underflow exception is not detected, so the inexact exception is not detected either.

### 3.2.6.2.6.a. 1 If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an inexact exception occurs.

### 3.2.6.2.6.a.2 If exception is not enabled

If no other exception occurs, the rounded result or the result that underflows or overflows is stored in the destination register.

## (b) Invalid operation exception (V)

If either or both of the operands are invalid on any operation way, an invalid operation exception is detected.

- Arithmetic operation with S-NaN included in operands. The conditional move instruction (CMOV), absolute value (ABS), and arithmetic negation (NEG) are not handled as arithmetic operations, but minimum value (MIN) and maximum value (MAX) are handled as arithmetic operations.
- Multiplication: $\pm 0 \times \pm \infty$ or $\pm \infty \times \pm 0$
- Fused-multiply-add: $( \pm 0 \times \pm \infty)+\mathrm{c}$ or $( \pm \infty \times \pm 0)+\mathrm{c}$. But only if c is not Q-NaN.
- Addition/subtraction or multiply-add operation*1:

Addition of infinite values with different signs or subtraction of infinite values with the same sign.

- Division: $\quad \pm 0 \div \pm 0$ or $\pm \infty \div \pm \infty$
- Square root: When operand is less than 0 .
- Conversion to integer when source is outside of integer range.
- Comparison: With condition codes 8 to 15 , if the operand is unordered (see the RH850G4MH User's Manual: Software)

Note 1. When the multiplication result is infinite or when adding or subtracting between infinities.

### 3.2.6.2.6.b. 1 If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an invalid operation exception occurs.

### 3.2.6.2.6.b. 2 If exception is not enabled

If no other exception occurs, and the destination is a floating-point format, $\mathrm{Q}-\mathrm{NaN}$ is stored in the destination register. If the destination has an integer format, see the operation result description of each instruction for the value to be stored in the destination register.

## (c) Division by zero exception (Z)

A division by zero exception occurs if, on any operation way, a divisor is 0 and a dividend is a finite number other than 0 .

### 3.2.6.2.6.c. 1 If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and a division by zero exception occurs.

### 3.2.6.2.6.c. 2 If exception is not enabled

If no other exception occurs, a correctly signed infinite number $( \pm \infty)$ is stored in the destination register.

## (d) Overflow exception (O)

An overflow exception is detected if, on any operation way, the exponent range is infinite and if the result of the rounded floating-point is greater than maximum finite number in the destination format.

### 3.2.6.2.6.d.1 If exception is enabled

The contents of the destination register are not changed, the contents of the source register are saved, and an overflow exception occurs.

### 3.2.6.2.6.d. 2 If exception is not enabled

If no other exception occurs, the initial value that is determined by the rounding mode and the sign of the intermediate result is stored in the destination register (see Table 3.121, FXU Initial Values for IEEE754
Defined Exceptions).

## (e) Underflow exception (U)

If, on any operation way, the operation result is $-2^{\mathrm{Emin}}$ to $+2^{\mathrm{Emin}}$ (but not zero), an underflow exception is detected.
Although IEEE754 defines several methods for detecting an underflow, the same method should be used to detect underflows, regardless of the processing to be performed.

The following two methods can be used to detect an underflow for binary floating-point numbers.

- The result calculated after rounding and using an infinite exponent range is not zero and is within $\pm 2^{\text {Emin }}$
- The result calculated before rounding and using an infinite exponent range and precision is not zero and is within $\pm 2^{\text {Emin }}$.

In this CPU, an underflow is detected before rounding.
Also, if the rounded result is one of the following, an inexact result is detected.

- When a given result differs from the result calculated when the exponent range and precision are infinite

In this CPU, the behavior when an inexact result is detected differs as follows depending on whether underflow exceptions are enabled or disabled.

### 3.2.6.2.6.e. 1 If exception is enabled

When the FXSR.FS bit has been set, if underflow exceptions are enabled, an underflow exception (U) occurs. When the FXSR.FS bit has been set, if underflow exceptions are not enabled but inexact exceptions are enabled, an inexact exception (I) occurs.

### 3.2.6.2.6.e. 2 If exception is not enabled

If the FXSR.FS bit has been set, the initial value determined according to the rounding mode and intermediate result value is stored in the destination register (see Table 3.121 FXU Initial Values for IEEE754 Defined Exceptions).

## CAUTION

If the FXSR.FS bit has not been set, an unimplemented operation exception (E) occurs regardless of whether or not exceptions are enabled. Because an unimplemented operation exception (E) must occur, an underflow exception (U) does not occur.

## (f) Unimplemented operation exception (E)

The E bit is set and an unimplemented operation exception (E) occurs when, on any operation way, an abnormal operand or abnormal result that cannot be correctly processed by hardware has been detected. The operand and destination register contents do not change.

If the FXSR.FS bit has been set, an unimplemented operation exception (E) will not occur.
If the FXSR.FS has been cleared, an unimplemented operation exception (E) will occur under the following conditions (except for ABSF. S4, CMOVF. W4, CMPF.S4, CVTF.HS4, MAXF.S4, MAXRF.S4, MINF.S4, MINRF.S4, and NEGF.S4 instructions).

- When the operand is a subnormal number
- When the operation result is a subnormal number, or an underflow has occurred

CAUTION
If the FXSR.FS bit has not been set, an unimplemented operation exception (E) occurs regardless of whether or not exceptions are enabled. Because an unimplemented operation exception (E) must occur, an underflow exception (U) does not occur.

## (7) Saving and Restoring Status

When an extended floating-point operation exception occurs, the PC and PSW are saved to the EIPC and EIPSW registers respectively, and the exception cause code is saved to the EIIC register.

The exception cause code of the extended floating-point operation exception is $75_{\mathrm{H}}$.
When an EI level exception is acknowledged while processing an extended floating-point operation exception, an EIPC register override occurs, which prevents the returning to the instruction that caused the extended floating-point operation exception to occur. Therefore, when acknowledgment of EI level exceptions is required, the contents of the EIPC, EIPSW, and EIIC registers must be saved in advance into a stack or the like.

When an extended floating-point operation instruction is used in an extended floating-point operation exception handler routine, the FXSR and FXXC registers will be overridden if another floating-point operation exception occurs. In such cases, the FXSR and FXXC registers should be saved at the start of the extended floating-point operation exception handler processing, and should be restored at the end of the handler processing.
The cause bits of the FXSR register hold the results from only one enabled exception. In any case, the previous results are held until the next enabled exception occurs.

## (8) Flushing Subnormal Numbers

This CPU can process subnormal numbers-very small numbers that are lower than the minimum normalized number-in one of the following two ways:

- Normalize the operand or operation result and continue executing arithmetic processing
- Generate an unimplemented operation exception (E) and execute exception handling

Executing software-based exception handling will obtain a more accurate result, but the amount of time required to obtain the result will vary depending on the input value. In control systems that require a real-time performance, therefore, this is usually unacceptable. In this case, it is important to obtain the result within a certain amount of time rather than focus on accuracy.

## (a) Normalize the subnormal numbers and continue executing arithmetic processing

By setting the FS bit of the FXSR register to 1, this CPU can normalize the operand or operation result to a specific value and continue executing arithmetic processing even if a subnormal number is input as the operand or obtained as the operation result. At this time, extremely small differences in values might not appear in the operation result.

For the operand and operation result, the values to which subnormal numbers are flushed when the FS bit is set to 1 are shown in Table 3.122 and Table 3.123 below.

Table 3.122 Rounding Mode and Flush Value of Input Operand

| Sign of Subnormal Operand | Rounding Mode and Value to Which Input Operand is Flushed |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | RN |  |  |  |
|  |  | RZ | RN |  |
| - |  | -0 |  |  |

Table 3.123 Rounding Mode and Flush Value of Operation result

| Sign of Subnormal Operation Result | Rounding Mode and Value to Which Operation Result is Flushed |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | $\mathrm{RN}^{* 1}$ | RZ | $\mathrm{RN}^{* 1}$ | RM |
| + | +0 | +0 | $+2^{\mathrm{Emin}}$ | +0 |
| - | -0 | -0 | -0 | $-2^{\mathrm{Emin}}$ |

Note 1. If the rounding mode is RN and FXSR.FN is set, flushing will occur in the direction of higher accuracy. For details, see Section 3.2.6.1(9), Flush to Nearest.

Whether an input operand that is a subnormal number has been flushed or not can be checked by referencing the IF bit of the FXSR register. Whether an operation result that is a subnormal number has been flushed or not can be checked by referencing the $U$ bit of the FXSR register.

## CAUTIONS

1. In control systems that require a real-time performance, it is recommended to always set the FS bit of the FXSR register to 1.
2. If the FS bit of the FXSR register is set to 1 , an unimplemented operation exception ( $E$ ) will not occur under any circumstances.
3. Whether the operation result is a subnormal number is judged by using the value before rounding.
4. The IF bit of the FXSR register also accumulates and indicates information about flushing instructions that have caused an extended floating-point operation exception.

## (b) Generate an unimplemented operation exception (E) and execute exception handling

Clearing the FS bit of the FXSR register to 0 will cause an unimplemented operation exception (E) if a subnormal number is input as the operand or obtained as the operation result. When an unimplemented operation exception occurs, software-based progressive underflow processing is performed in the floating-point operation exception handling routine, enabling a more accurate result to be obtained. In this case, however, a real-time processing performance might not be ensured depending on the software processing load.
(c) Instructions that can handle subnormal numbers

The following instructions can be executed without causing an unimplemented operation exception (E) even if an operand that is a subnormal number is input while the FS bit of the FXSR register is 0 .

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS4)
(d) Instructions that are not affected by flushing subnormal numbers

For the following instructions, flushing does not occur even if an operand that is a subnormal number is input while the FS bit of the FXSR register is 1.

- Conditional move instruction (CMOV), absolute value (ABS), arithmetic negation (NEG)
- Minimum value (MIN), maximum value (MAX), compare (CMPF)
- Conversion from half-precision to single-precision (CVTF.HS4)

## (9) Flush to Nearest

This CPU provides flush-to-nearest mode, a feature for flushing to the nearest number with higher accuracy when a flushing operation results subnormal number. Flush-to-nearest mode is enabled when the rounding mode is RN and FXSR.FN is set to 1 . When this mode is used, the FXU determines the value to which to flush the subnormal number based on the number of the operation result and not just the sign. This feature has no effect in rounding modes other than RN or on the result of flushing an input operand.

Table 3.124 Rounding Mode and Value to Which Operation Result is Flushed

| Value of Subnormal Operation Result | Rounding Mode and Value to Which Operation Result is Flushed |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | RN |  | RZ | RP | RM |
|  | $\mathrm{FN}=1$ | $\mathrm{FN}=0$ |  |  |  |
| $+2^{\text {Emin-1 }} \leq$ Operation result $<+2^{\text {Emin }}$ | $+2^{\text {Emin }}$ | +0 | +0 | $+2^{\text {Emin }}$ | +0 |
| $+0<$ Operation result $<+2^{\text {Emin-1 }}$ | +0 |  |  |  |  |
| $-2^{\text {Emin-1 }}<$ Operation result $<-0$ | -0 | -0 | -0 | -0 | $-2^{\text {Emin }}$ |
| $-2^{\text {Emin }}<$ Operation result $\leq-2^{\text {Emin-1 }}$ | $-2^{\text {Emin }}$ |  |  |  |  |

## CAUTION

Whether the operation result is a subnormal number is judged by using the value before rounding.

## (10) Limitation on the Floating-Point Operation Result

There is a limitation on the floating-point operation result of this CPU.
(a) Operation instruction result when the input data is NaN (not-a-number)

When the input data is NaN (not-a-number), the operation instruction result will be as shown in Table 3.125.
Table 3.125 Operation Result when Input data is NaN

| Input Data*3 | Operation Result |
| :--- | :--- |
| SNaN and QNaN mixed | $7 F F F F F F F_{H}$ |
| Only SNaN | $7 F F F$ FFFF |
| Only QNaN | $* 1, * 4$ |
| SNaN and real number | $7 F F F$ FFFF |
| QNaN and real number | ${ }^{* 1, * 4}$ |
| Other than above*2 | $7 F F F F F F F_{H}$ |

Note 1. If the input data contains $\mathrm{QNaN}, \mathrm{QNaN}$ in the input data is selected as the operation result by the priority of wreg2, wreg1, and wreg3.
Note 2. In this case, input data contains real numbers only, and the operation result is invalid.
Note 3. When the operand of an ABSF.S4 or NEGF.S4 instruction is NaN , the result of the operation will be the value obtained by the operation on the sign bit alone.
Note 4. When one of the operands of a MAXF.S4, MAXRF.S4, MINF.S4, and MINRF.S4 instruction is QNaN, the result of the operation will be whichever operand is a real number.
(b) Results of conversion instructions when the operand is NaN (not-a-number)

When the operand is NaN (not-a-number), the results of conversion are as shown in Table 3.126.
Table 3.126 Results of Conversion when the Operand is NaN (not-a-number)

| Input Data | Output Format | Results of Conversion |
| :--- | :--- | :--- |
| Half-precision SNaN | Single precision | 7FFF FFFF |
| Half-precision QNaN | Single precision | The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the <br> output value are 0. |
| Single-precision SNaN | Word (signed) | $80000000_{\mathrm{H}}$ |
|  | Word (unsigned) | $00000000_{\mathrm{H}}$ |
|  | Half precision | $7 \mathrm{FFF}_{\mathrm{H}}$ |
| Single-precision QNaN | Word (signed) | $80000000_{\mathrm{H}}$ |
|  | Word (unsigned) | $00000000_{\mathrm{H}}$ <br>  Half precision |
|  | The QNaN value with the same sign. Bits 12 to 0 in the fractional part of the <br> operand are truncated. |  |

## (c) When $\mathbf{O}$ comparison is performed by MAXF and MINF

When wreg 1 and wreg 2 elements are either +0 or -0 , the operation will be as follows.
MINF.S4: The values of wreg1 elements are stored in wreg3 elements.
MAXF.S4: The values of wreg2 elements are stored in wreg3 elements.
MINRF.S4: The values of wreg1 and wreg2 even elements are stored in wreg3 elements.
MAXRF.S4: The values of wreg1 and wreg2 odd elements are stored in wreg3 elements.
(d) In the case of the precision instruction (RECIPF)

The operation result of RECIPF.S4 is the same as the operation result of $1 / \mathrm{x}$ by DIVF.S.

### 3.2.7 Hazard Control

### 3.2.7.1 Synchronization Processing

In order to increase the processing performance, this CPU executes subsequent instructions without waiting for completion of the processing of preceding instructions, as long as there is no dependence relationship between a preceding instruction and a subsequent instruction. For example, when a store instruction is to update the value of a control register of a peripheral device which operates more slowly than the CPU, even when updating of the register is not completed while the bus system is still handling processing to store the value, the execution of a subsequent instruction will proceed. For this reason, if a subsequent instruction should certainly be made to wait for completion of processing of a preceding instruction by software, procedures for synchronization processing are required.

Moreover, when a single CPU is executing multiple load and store instructions, the results of execution are guaranteed to be in the order of the instructions of the program. However, in order to guarantee the order of data accesses among multiple bus masters outside a mutual exclusion control section, synchronization processing should be performed before the subsequent data access.For details of synchronization processing, refer to Section 3.8.1, Synchronization of
Store Instruction Completion and Subsequent Instruction Generation and Section 3.8.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation.

This CPU provides four instructions dedicated for synchronization processing.
In addition, since a wait for the result of preceding load processing depends on general-purpose registers and handled automatically by hardware, no synchronization processing is required by software.

## (1) SYNCP

The SYNCP instruction is a special instruction for pipeline synchronization processing, which makes pipelines wait for the result of executing a preceding instruction is reflected before starting to execute a subsequent instruction. Though the SYNCP instruction causes a wait for the results of executing all preceding load processing (up to storing of the loaded values in general-purpose registers), it does not cause waiting for the results of executing store processing (updating of the destination memory locations for storage and of memory-mapped control registers). For how to be sure that the results of executing store processing are reflected for subsequent instructions, see Section 3.2.7.2,
Guaranteeing the Completion of Store Instruction.

## (2) SYNCM

The SYNCM instruction is a special instruction for memory-access synchronization processing, and causes a wait for the results of executing all preceding load processing (up to storage of the loaded values in general-purpose registers) and for the results of executing all preceding store processing (updating of the destination memory locations for storage and memory-mapped control registers). However, for those bus systems and peripheral devices for which storage is speculatively completed (resulting in delays in the completion of writing to the memory and control registers), the SYNCM instruction does not guarantee completion of the execution of store instructions. For how to be sure that the results of executing store processing are reflected for subsequent instructions in such cases, see Section 3.2.7.2, Guaranteeing the Completion of Store Instruction.

## (3) SYNCI

The SYNCI instruction is a special instruction for the synchronization of instruction fetching. It causes subsequent instructions that have already been fetched into the pipeline but not executed to be discarded, and restarts instruction fetching from the earliest of the discarded instructions to have been fetched. This instruction is used when the result of a preceding instruction must be reflected in processing by subsequently fetched instructions. Though the SYNCI instruction causes a wait for the results of executing all preceding load processing (up to storing of the loaded values in

Page 431 of 4595
general-purpose registers), it does not cause waiting for the results of executing store processing (updating of the destination memory locations for storage and of memory-mapped control registers). If a cache instruction has been issued, this instruction also causes a wait for the completion of the instruction cache operation.

The SYNCI instruction should be executed after changes to the CPU operating mode or reflection of changes to the memory protection settings if this will be required in subsequent instruction fetching. For details, see Section

### 3.2.7.3(1), Updating the Settings Related to Instruction Fetching.

When reflecting the results of executing store instructions in subsequent instruction fetching is required, due to changes to self-modifying code or switching between areas of the code-flash memory, execute a dummy read before the SYNCI instruction. This causes a wait for the results of executing store instructions, resulting in these being reflected in subsequent instruction fetching. For details, see Section 3.2.7.2, Guaranteeing the Completion of Store Instruction.

## (4) SYNCE

The SYNCE instruction of this CPU does not perform processing related to synchronization.
The effects of the four synchronization processing instructions are summarized in Table 3.127.
Table 3.127 Effects of Synchronization Processing Instructions

| Synchronization <br> Processing <br> Instruction | Guaranteed Synchronization Processing |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | Subsequent <br> Instructions | Cache Operations*1 |  |  | Load Instructions | Instructions for Other |
| :--- |
| SYNCP |

Note 1. This indicates the execution of cache instructions. The LDSR instruction to update the function registers for cache operations is included among the instructions for other operations.
Note 2. This CPU speculatively fetches instructions, so even if the next instruction from the SYNCI instruction has already been fetched, it is fetched again.
Note 3. This indicates the processing up to the storing of loaded data in general-purpose registers
Note 4. This indicates the processing up to updating of the destination memory locations and memory-mapped control registers for storage. However, updating may not be guaranteed. This depends on the specification of the destination for writing. For details, see Section 3.2.7.2, Guaranteeing the Completion of Store Instruction.

### 3.2.7.2 Guaranteeing the Completion of Store Instruction

Instructions for storage may appear to be completed faster than those for loading given the same address. However, the data for storage may not actually have been stored when the instruction has been completed. For example, in the synchronization of multiple cores or the manipulation of peripheral devices, processing related to the stored values should only proceed after storage in the target locations is confirmed. This should be checked by software after the execution of instructions for storage.

This CPU provides two approaches to waiting for the progress of storage at different stages.

## (1) Using the SYNCM Instruction to Wait for the Completion of Storage

Executing the SYNCM instruction causes operations to wait until the results of preceding store instructions will be correctly read by subsequent reading. This guarantees confirmed execution when an instruction stored in the memory is to be executed or data are to be transferred to the other CPU core or by DMA via the memory.

In the following example, after waiting for the execution of the two store instructions that proceed the SYNCM instruction, the processing for which waiting was required proceeds in "Operations" below. Processing to branch to an address where an instruction code is stored, for notification of the other CPU, and so on, falls into the category of "Operations".

| ST.W | r21, $0[r 1]$ | $/ /$ | Store data 1 |
| :--- | :--- | :--- | :--- |
| ST.W | $\mathrm{r} 22,4[r 1]$ | $/ /$ | Store data 2 |
| SYNCM |  |  | // |
| Operation |  | Wait for completion of the store instructions |  |
| Orocessing after waiting for completion of the store instructions |  |  |  |

However, the SYNCM instruction does not guarantee that the results of preceding store instructions will have already been reflected at the destinations. For example, when storing a value in a register of a peripheral device, the register of the peripheral device may not have been updated when waiting due to the SYNCM instruction has finished, and the resulting may be operation that is not as desired. In such cases, use dummy reading to cause the wait. This is described in Section 3.2.7.2(2), Using Dummy Reading to Wait for the Completion of Storage.

In addition, since the SYNCM instruction requires hardware operations to wait in response to its execution, it is only effective in access to bus slaves where the CPU can recognize the progress of processing for storage. If a bus slave is capable of arbitrating requests from multiple bus masters, or is connected to the bus via a bus bridge, the CPU is unable to recognize the progress of storage, so using the SYNCM instruction to cause the wait may not be effective.

The bus slaves (address groups) that support using the SYNCM instruction to wait for the completion of storage in this CPU are listed in Table 3.128.

Table 3.128 Bus Slaves that Support Using the SYNCM Instruction to Wait for the Completion of Storage in This CPU

| Bus Slaves | Description |
| :--- | :--- |
| L1RAM (given CPU) | Waiting for the updating of memory is also possible.*1 |
| L1RAM (other CPU) | A configuration of two CPU cores can be assumed for this device. |
|  | For configurations with three or more cores, refer to Section 3.8.1.3, Product information of |
|  | SYNCM. |
| L2RAM | A configuration of two CPU cores with a single shared L2RAM can be assumed for this device. |
|  | For configurations with three or more cores or having multiple L2RAMs, refer to Section |
|  | 3.8.1.3, Product information of SYNCM. |
| INTC1 | This is the dedicated interrupt controller for connection with the CPU. |
| Others | Depends on the specifications of the connected bus or slave. For details, refer to Section |
|  | 3.8 .1 .3, Product information of SYNCM. |

Note 1. For details, Section 3.2.7.2(2), Using Dummy Reading to Wait for the Completion of Storage.

The instructions for which the SYNCM instruction causes a wait are all preceding instructions for storing and loading. Multiple instructions for storing and loading running at the same time raises the possibility of the wait being longer than is necessary.

One SYNCM instruction per store instruction is not required. Following consecutive storage in a specific bus slave in units of memory type, peripheral device, and so on, a single SYNCM instruction after the last store instruction leads to a wait for the completion of all preceding store instructions. In the above example, one SYNCM instruction is executed after the execution of two store instructions.

## (2) Using Dummy Reading to Wait for the Completion of Storage

Executing a load instruction for the same address immediately after a store instruction can also be used to wait for the completion of a store instruction. This approach is unlike using the SYNCM instruction to cause waiting, since it involves actually waiting for the result of the store instruction to be reflected. On the other hand, this approach may require more cycles than using the SYNCM instruction.

Specifying r 0 as the destination for storage of the value loaded by the dummy read enables discarding of the loaded values when they are unnecessary, without destroying the other register values. The following is an example of code for this.

| ST.W | $r 21,0[r 1]$ | $/ /$ | Store data 1 |
| :--- | :--- | :--- | :--- |
| ST.W | $r 22,4[r 1]$ | $/ /$ | Store data 2 |
| LD.W | $4[r 1], r 0$ | $/ /$ | Load data from the target for access (dummy read). |
| SYNCP |  | $/ /$ | Wait for loading to be completed. |
| Operation |  | $/ /$ | Processing after waiting for completion of the store instructions |

Unlike using the SYNCM instruction, this approach combines functions of the CPUs to cause the wait. Since it does not require dedicated hardware, it may be used with many bus slaves.

On the other hand, if a cache for temporarily storing data is present in the bus system along the path to the destination, a value to be stored will be read by a subsequent load instruction even if it has not yet reached its destination, so this method cannot guarantee the completion of store instructions in such cases. Also, depending on the specifications of peripheral devices, a predetermined time after a change to a setting by a store instruction may have to elapse before the desired value can be read. In addition to this approach, such cases require processing to wait for the predetermined time.

Though this CPU does not include such cache functions or peripheral functions with limits on the time to elapse before reading, the situation depends on the product. For details, refer to Section 3.8.1.4, Product information of Waiting for the Completion of Storage.

As with using the SYNCM instruction, in using dummy reading, following consecutive storage in a particular bus slave, only a single load instruction following the final store instruction is effective in waiting for the execution of all preceding store instructions to be complete.

Table 3.129 lists the bus slaves for which using dummy reading to wait is effective.
Table 3.129 Bus Slaves for which Using Dummy Reading to Wait is Effective

| Bus Slaves | Description |
| :--- | :--- |
| L1RAM (other CPU) |  |
| L2RAM |  |
| INTC1 | Depends on the specifications of the connected bus or slave. For details, refer to Section |
| Others | 3.8 .1 .4, Product information of Waiting for the Completion of Storage. |

In the case of access to the L1RAM of a given CPU, for the sake of the efficiency of processing, execution of the load instruction may be completed before the memory is actually updated. On the other hand, it is possible to execute a SYNCM instruction to cause the wait for completion of the updating of memory. Therefore, use the SYNCM instruction to cause the wait for the completion of instructions for storage in the L1RAM of a given CPU.

When reflecting the results of executing store instructions in subsequent instruction fetching is required, due to changes to self-modifying code or switching between areas of the code-flash memory, execute a SYNCI instruction rather than a SYNCP instruction after the dummy read. This causes a wait for the results of executing store instructions, resulting in these being reflected in subsequent instruction fetching. The following shows an example of code for this.

| ST.W | r21, $0[r 1]$ | $/ /$ | A change relating to instruction fetching |
| :--- | :--- | :--- | :--- |
| LD.W | $0[r 1], r 0$ | $/ /$ | Load data from the target for access (dummy read). <br> SYNCI |
| fetching |  |  |  |

### 3.2.7.3 Hazard Management after System Register Update

If an LDSR instruction is executed to update the setting of a system register before an STSR instruction is executed to read the system register or before a CALLT instruction or the like, which uses the system register, is executed, then the new setting must be reflected in order to perform the desired operation.

This CPU guarantees that if an LDSR instruction is used to update system registers shown in Table 3.130, the new register setting will be applied when the subsequent instruction is executed. However, it does not guarantee that the new setting will be applied in instruction fetching. In this case, synchronization process is required. Also, the execution of an EI or DI instruction is treated in the same way as the update of PSW by an LDSR instruction; that is, it is guaranteed that the values updated by an EI or DI instruction is applied to the subsequent instruction.

Table 3.130 System Registers that Guarantee Reflection of their Updates by LDSR Instruction to the Subsequent Instruction

| selld*1 | System Register*2 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | EIPC | EIPSW | FEPC | FEPSW | PSW | FPSR | FPEPC | FPST |
|  | FPCC | FPCFG | EIIC | FEIC | CTPC | CTPSW | CTBP | SNZCFG |
|  | EIWR | FEWR |  |  |  |  |  |  |
| 1 | SPID | SPIDLIST | RBASE | EBASE | INTBP*3 | MCTL | PID | SVLOCK |
|  | SCCFG | SCBP |  |  |  |  |  |  |
| 2 | PEID | BMID | MEA | MEI | ISPR*3 | ICSR | INTCFG*3 | PLMR*3 |
|  | RBCR0*4 | RBCR1*4 | RBNR*4 | RBIP*4 |  |  |  |  |
| 5 | MPM | MPCFG | MCA | MCS | MCC | MCR | MCI | MPIDX*5 |
| 10 | FXSR | FXST | FXINFO | FXCFG | FXXC | FXXP |  |  |
| 13 | RDBCR |  |  |  |  |  |  |  |

Note 1. In the representation of LDSR and STSR instructions, selection ID are represented as selID.
Note 2. This table includes a register whose value cannot be updated and a register that has a bit whose value cannot be updated.
Note 3. If these registers, which control the acceptance of interrupts, are updated, interrupts will be accepted with the new register settings if interrupt requests are present at the time of executing the subsequent instruction.
Note 4. If these registers, which control the register bank function, are updated, interrupts will be accepted with the new register settings if interrupt requests are present at the time of executing the subsequent instruction. However, when the RESBANK instruction is executed after updating the RBCRO.MD, a synchronization process is required.
Note 5. If an LDSR instruction is executed to update the MPLA, MPUA, or MPAT register immediately after another LDSR instruction is executed to update the MPIDX register, it is guaranteed that the new setting of MPIDX is reflected in the subsequent instructions. In order to read the MPLA, MPUA, or MPAT register by using a STSR instruction after the update of the MPIDX register, a synchronization process is required.

If the settings related to instruction fetch or a system register that is not shown in Table $\mathbf{3 . 1 3 0}$ is updated, the new register setting can be reflected by performing any of the following synchronization processes immediately after the LDSR instruction. The appropriate synchronization process should be decided according to details of the new register setting and the subsequent operation.
For SYNCI or SYNCP instruction, that are used for synchronization process, see Section 3.2.7.1, Synchronization Processing.

## (1) Updating the Settings Related to Instruction Fetching

To effectively supply instruction codes read from the memory to the instruction execution unit, operations of instruction fetching are independent from those of the instruction execution unit and are speculative. This means that the progress of reading the subsequent instruction code by instruction fetching is not known on completion of the system register update. In other words, the result from which instruction fetching is applied to the new setting of the system register is not known. Therefore, an explicit synchronization process is required for updates of the system registers which are related to instruction fetching. This process is also necessary for updates of the system registers listed in Table $\mathbf{3 . 1 3 0}$ in order to ensure that the updates are reflected in instruction fetching.

The system registers related to instruction fetching are listed below:

| CPU operating mode: | PSW.UM, PSW.CU1, PSW.CU0 |
| :--- | :--- |
| Access protection: | SPID |
| Memory protection: | MPU function registers |
| Instruction cache: | Cache operation function registers |
| Instruction fetch: | Instruction fetch control registers |

If the settings of the system registers listed above are updated, by executing the SYNCI, EIRET, or FERET instruction, the new settings are surely reflected when the subsequent instruction is fetched. Here, these instructions are called "Instruction fetch synchronization instructions". For usage of the EIRET and FERET instructions, see Section

### 3.2.7.3(7), Use of EIRET and FERET Instructions in Synchronization Process.

For fetching the instruction fetch synchronization instructions themselves, whether the updates of the system registers are reflected or not cannot be decided. In these cases, the following cares must be taken.

## (a) Updating PSW.UM

When an LDSR instruction is used to update PSW, especially by setting PSW.UM (to 1), which in response enables memory protection function, be sure that fetching of the SYNCI instruction, which is used for synchronizing the instruction fetch, does not cause a memory protection violation. Also note that setting PSW.UM disables execution of some instructions and updating of some system registers.

On the other hand, when an EIRET or FERET instruction is executed, the value in EIPSW or FEPSW is transferred to PSW as the operation of the instruction. This means that fetching of the instruction takes place before updating of PSW.UM by the instruction itself. For these reasons, updating of PSW.UM by an EIRET or FERET instruction is recommended.
(b) Updating PSW.CU1 and PSW.CU0

After PSW.CU1 or PSW.CU0 is updated, if a FXU or FPU instruction is executed without synchronization process, a coprocessor unusable exception (UCPOP) may not be properly detected. To avoid this, execute a SYNCI instruction for synchronization after updating these bits. Unlike updating of PSW.UM, updating of PSW.CU1 or PSW.CU2 and detection of a coprocessor unusable exception can be surely synchronized by a SYNCI instruction.

For updating PSW.CU1 or PSW.CU2 and PSW.UM at the same time, use of an EIRET or FERET instruction described in Section 3.2.7.3(1)(a), Updating PSW.UM is recommended.

## (c) Updating SPID

SPID is referenced by memory protection function and the bus system outside the CPU. If an ID without access permission to the memory resources or peripheral devices is set to SPID, instruction fetching does not take place correctly. Be sure to set an appropriate ID to SPID. To ensure that the bus system references any updates on SPID, the instruction cache must be disabled once.

## (d) Updating MPU Function Registers

Updating the settings of memory protection by manipulating the MPU function registers is detailed in Section 3.2.7.3(2), Updating the Memory Protection Settings of MPU.

For reflecting the updated settings in fetching of the subsequent instruction, execute either of the SYNCI, EIRET, and FERET instructions. Note, however, that whether the instruction fetch synchronization instruction itself is fetched with the new protection settings or not is not known. In this case, the following operations are required.
i) Enable memory protection in user mode only and update the settings in supervisor mode.
ii) Update the settings of memory protection in the area where execution of instructions are allowed.
iii) Surely set execution of instructions for the memory area including those for instruction fetch synchronization instruction to be enabled

For updating PSW.UM with operation i) above, use of an EIRET or FERET instruction described in Section 3.2.7.3(1)(a), Updating PSW.UM is recommended.
(e) Updating Cache Operation Function Registers

Updating these registers by an instruction does not require certain synchronization process. However, if you want to make sure that the disabled state of the instruction cache is reflected in fetching of the subsequent instruction, execute an instruction fetch synchronization instruction after the update of the cache operation function registers.

## (f) Updating Instruction Fetch Control Registers

Updating these registers by an instruction does not require certain synchronization process.

## (2) Updating the Memory Protection Settings of MPU

The system registers of MPU that are shown in Table 3.130 guarantee that their latest settings are reflected in the subsequent instruction, but this does not apply to other system registers (MPIDX, MPLA, MPUA, MPAT, and MPIDn ( $\mathrm{n}=0$ to 7 ) that configure the settings of protection areas.

In order to read settings updated by an LDSR instruction by using the subsequent STSR instruction, the synchronization process described in Section 3.2.7.3(4), Updating Register Bank Function-Related System Registers is required.

For reflecting the updated memory protection settings in the instruction fetch, see Section 3.2.7.3(1), Updating the Settings Related to Instruction Fetching.

For reflecting the updated memory protection setting in the instruction that makes operand accesses, execute a SYNCI or SYNCP instruction after the update. This ensures that the new protection setting is reflected in the operand accesses by the subsequent instructions.

The EIRET and FERET instructions can be used instead of the SYNCI and SYNCP instructions. Especially, for the case of updating memory protection settings related to instruction fetch as well as making operand accesses, use of an EIRET or FERET instruction is recommended.

## (3) Updating Interrupt-Related System Registers

As shown in Table 3.130, when the system registers related to interrupts (ISPR, INTCFG, PLMR) are updated, it is guaranteed that the updates are reflected when the subsequent instruction is executed.

However, when updating the setting of INTCFG to stop automatic update of ISPR, for example, if an interrupt is generated after INTCFG is updated and before an LDSR instruction that updates ISPR is executed, only the update in INTCFG is reflected in the interrupt handling. As the update of ISPR is not reflected, the desired interrupt handling cannot be performed.

To avoid this, when updating the system registers related to interrupts, it is recommended to disable interrupts by setting PSW.ID to 1 .

We also recommend that updating of PSW.EBV and EBASE, which specify vector address of an interrupt handler, are executed while interrupts are disabled. For details, see Section 3.2.7.3(8), Updating PSW.EBV and EBASE.

## (4) Updating Register Bank Function-Related System Registers

As shown in Table 3.130, when the system registers related to the register bank function (RBCR0, RBCR1, RBNR, RBIP) are updated, it is guaranteed that the updates are reflected when the subsequent instruction is executed. For example, if an interrupt is generated after an LDSR instruction that updates RBIP is executed, the automatic context saving to the register bank is executed using the updated value of RBIP.

However, when updating the settings of RBCR0 and RBCR1, for example, if an interrupt is generated after RBCR0 is updated and before an LDSR instruction that updates RBCR1 is executed, only the update in RBCR0 is reflected in the automatic context saving to the register bank. As the update of RBCR1 is not reflected, the desired processing cannot be performed.

To avoid this, when updating the system registers related to the register bank function, it is recommended to disable interrupts by setting PSW.ID to 1 .

For RBCR0 only, synchronization process by the SYNCI instruction is necessary to surely reflect the new setting of the register to the subsequent RESBANK instruction. The following shows an example of code for this.

|  |  |  |  |
| :--- | :--- | :--- | :--- |
| DI |  |  |  |
| LDSR | 15, 20 | Disable interrupt |  |
| SYNCI |  | Update RBCRO |  |
| RESBANK |  | Synchronization of instruction fetching |  |

## (5) Reading a System Register by Using an STSR Instruction

After executing an LDSR instruction to update a system register, execute a SYNCP instruction before executing an STSR instruction for read operation. Since the SYNCP instruction waits until the execution of the preceding LDSR instruction is completed, it is ensured that the new register setting is read.

For the system registers shown in Table 3.130, the new register settings are read without synchronization process by SYNCP instruction.

## (6) Referencing a System Register by the Subsequent Instruction

After executing an LDSR instruction to update a system register, execute a SYNCP instruction before executing an instruction to refer to the system register. Since the SYNCP instruction waits until the execution of the preceding LDSR instruction is completed, it is ensured that the new register setting is reflected.

## (7) Use of EIRET and FERET Instructions in Synchronization Process

The EIRET and FERET instructions are defined as return instructions from the exception handler of their corresponding exception levels. These instructions can set any PC and PSW at the same time and therefore usable as instructions for synchronization process in this CPU.

To use an EIRET instruction for synchronization process, set appropriate values to EIPC and EIPSW and execute the instruction. To use an FERET instruction for synchronization process, set appropriate values to FEPC and FEPSW and execute the instruction.

Set values to EIPC and FEPC that is the PCs after these instructions are executed. Set values to EIPSW and FEPSW that is the PSW after these instructions are executed.

Note that these instructions are supervisor privileged instructions. That means, the state of PSW.UM can be changed only from 0 (clear) to 1 (set), supervisor mode to user mode.

For details on the EIRET and FERET instructions, see the RH850G4MH User's Manual: Software.

## (8) Updating PSW.EBV and EBASE

EBASE is a register that indicates the vector address of the exception handler. This is enabled when PSW.EBV is set (to 1 ). The recommended updating procedure is as follows.

1) Set PSW.ID to 1
2) Clear PSW.EBV to 0 (updating at the same time with PSW.ID is possible)
3) Update EBASE
4) Set PSW.EBV to 1
5) Clear PSW.ID to 0 (updating at the same time with PSW.EBV is possible)

For updating PSW.UM in the procedure above as well, use of an EIRET or FERET instruction described in Section 3.2.7.3(1)(a), Updating PSW.UM is recommended.

### 3.2.8 Reset

### 3.2.8.1 Status of Registers After Reset

If a reset signal is input by a method defined by the hardware specifications, the program registers and system registers are placed in the status shown by the value after reset of each register in Section 3.2.3, Register Set, and program execution is started. Set the contents of each register to an appropriate value in the program.

The CPU executes a reset to start execution of a program from the reset address specified by Section 3.2.4.4, Exception Handler Address.

Note that because the PSW.ID bit is set to 1 immediately after a reset, conditional EI level exceptions will not be acknowledged. To acknowledge conditional EI level exceptions, clear the PSW.ID bit to 0 .

### 3.2.9 Ensuring Coherency after Code Flash Programming

The CPU has an efficient instruction cache and data buffer for the code flash area.
Therefore, after using self-programming to program the code flash memory, clear the instruction cache and data buffer to ensure coherency. The instruction cache and data buffer can be cleared by using the ICCTRL register and the RDBCRregister, respectively. The entire CPU's instruction cache and data buffer can also be cleared at the same time by using the TM_CC register. For details on the ICCTRL and RDBCR register, see Section 3.2.3.7, Cache Operation Function Registers and Section 3.2.3.9, Hardware Function Registers. For details on the TM_CC register, see Section 3.2.9.1, Registers.

### 3.2.9.1 Registers

## (1) Register Base Address

The GCFU base address is listed in the following table. The GCFU register addresses are given as offsets from the base addresses.

Table 3.131 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GCFU_base> | FFFB $1400_{\mathrm{H}}$ | Peripheral Group 0 |

## (2) Clock Supply

Clock supply by and to GCFU is listed in the following table.
Table 3.132 Clock Supply

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- |
| GCFU | PCLK | CLK_HBUS |

## (3) List of Registers

Table 3.133 List of Registers

| Module Name | Register Name | Symbol | Address | Access |
| :--- | :--- | :--- | :--- | :--- |
| GCFU | Cache Clear Operation Register | TM_CC | <GCFU_base> +08 |  |

## (4) TM_CC - Cache Clear Operation Register

The TM_CC register is used to issue requests for clearing of the unit (instruction cache or data buffer) that holds data from the code flash.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | ICCLR | DCCLR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 3.134 TM_CC Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . |
|  |  | The write value should always be 0 . |
| 1 | ICCLR | Instruction Cache Clear Request |
|  |  | Writing 1 to this bit issues an instruction cache clear request. Writing 0 is ignored. The read value is 1 when this bit is read before completion of the cache clear request, and 0 when it is read after completion of the cache clear request. |
|  |  | Note: If 1 has been written to this bit and then 1 is written again before completion of the cache clear request, the second write is ignored. (The cache clear request is not executed by the second write.) |
|  |  | If 1 has been written to this bit and then 0 is written before completion of the cache clear request, the cache clear request is not canceled. |
|  |  | To execute cache clear requests continuously, be sure to check that execution of the preceding cache clear request has been completed (by reading this bit and checking that the readout value is 0 ) before executing the next cache clear request. |
|  |  | 0 : Indicates that an instruction cache clear request is not currently being processed, or processing of a cache clear request has been completed (when read). |
|  |  | 1: Issues an instruction cache clear request (when written). Indicates that an instruction cache clear request is currently being processed (when read). |

Table 3.134 TM_CC Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 0 | DCCLR | Data Buffer Clear Request |
|  |  | Writing 1 to this bit issues a data buffer clear request. |
|  |  | Writing 0 is ignored. |
|  |  | The read value is 1 when this bit is read before completion of the data buffer clear request, and 0 when it is read after completion of the data buffer clear request. |
|  |  | Note: If 1 has been written to this bit and then 1 is written again before completion of the data buffer clear request, the second write is ignored. (The data buffer clear request is not executed by the second write.) |
|  |  | If 1 has been written to this bit and then 0 is written before completion of the data buffer clear request, the data buffer clear request is not canceled. |
|  |  | To execute data buffer clear requests continuously, be sure to check that execution of the preceding data buffer clear request has been completed (by reading this bit and checking that the readout value is 0 ) before executing the next data buffer clear request. |
|  |  | 0 : Indicates that a data buffer clear request is not currently being processed, or processing of a data buffer clear request has been completed (when read). |
|  |  | 1: Issues a data buffer clear request (when written). Indicates that a data buffer clear request is currently being processed (when read). |

### 3.3 Inter-CPU Overview

This subsection contains a Barrier-Synchronization (BARR), Inter-Processor Interrupts (IPIR), Mutual Exclusion (MEV) and Time Protection Timer (TPTM). The first part of this subsection describes this product's specific properties, such as the number of units, register base addresses, etc. The remainder of the subsection shows the functions and registers.

### 3.3.1 Features

### 3.3.1.1 Number of Units

Table 3.135 Number of Units

| Product Name |  | RH850/E2x-FCC1 |  |
| :---: | :---: | :---: | :---: |
|  |  | 373 pins | 292 pins |
| BARR | Number of units | 1 | 1 |
|  | Name of unit | BARR |  |
| IPIR | Number of units | 1 | 1 |
|  | Number of channels for each CPU | 4 | 4 |
|  | Name of unit | IPIR |  |
| MEV | Number of units | 1 | 1 |
|  | Number of registers in aunit | 32 | 32 |
|  | Name of unit | MEV |  |
| TPTM | Number of units | 1 | 1 |
|  | Number of channels for each CPU | 4 interval timers <br> 1 free-run timer | 4 interval timers <br> 1 free-run timer |
|  | Name of unit | TPTM |  |
| Product Name |  | RH850/E2M |  |
|  |  | 373 pins | 292 pins |
| BARR | Number of units | 1 | 1 |
|  | Name of unit | BARR |  |
| IPIR | Number of units | 1 | 1 |
|  | Number of channels for each CPU | 4 | 4 |

### 3.3.1.2 Register Base Addresses

Table 3.136 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <BARR_base> | FFFB $8000_{H}$ | I-Bus Group2 |
| <IPIR_base> | FFFB $9000_{H}$ | I-Bus Group1 |
| <MEV_base> | FFFB A000 | I-Bus Group0 |
| <TPTM_base> | FFFB $\mathrm{BOOO}_{\mathrm{H}}$ | I-Bus Group3 |

### 3.3.1.3 Clock Supplies

The clock supplies are listed in the following table.
Table 3.137 Clock Supplies

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| BARR | cpu_clk | CLK_CPU |
| IPIR | cpu_clk | CLK_CPU |
| MEV | cpu_clk | CLK_CPU |
| TPTM | cpu_clk | CLK_CPU |

### 3.3.1.4 Interrupt Requests

The interrupt requests are listed in the following table.
Table 3.138 Interrupt Requests

|  |  |  | sDMA Trigger | DTS Trigger |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Interrupt Symbol Name | Unit Interrupt Signal | Description | Interrupt Number | sDumber <br> Number |  |
| INTIPIR0 | ipir_int_ch0 | IPIR CH0 interrupt | EIINT0 | - | - |
| INTIPIR1 | ipir_int_ch1 | IPIR CH1 interrupt | EIINT1 | - | - |
| INTIPIR2 | ipir_int_ch2 | IPIR CH2 interrupt | EIINT2 | - | - |
| INTIPIR3 | ipir_int_ch3 | IPIR CH3 interrupt | EIINT3 | - | - |
| FEINT1 or INTTPTM*1 | TPTM_IRQ | TPTM interval interrupt | FEINT1 or EIINT31*1 | - | - |

Note 1. This interrupt can be selected for use as FEINT1 or EIINT31. See Section 6.3.13, TPTMSEL — TPTM Interrupt FE EI Select Register.

### 3.3.1.5 Reset Sources

The reset sources are shown below. These modules are initialized by the following reset sources.
Table 3.139 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| BARR | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| IPIR | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| MEV | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| TPTM | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 3.3.1.6 External Input/Output Signals

This module has no external input/output signals.

### 3.3.2 Processor Element Identifier

The PEID, the ID number of a processor element, can be read from the PEID register. Which CPU core performs a specific program can be known by referring to the PEID. The following shows the PEIDs of this product.

For the PEID register, see Section 3.2.3.2, Basic System Registers.

| CPU Core | PEID |
| :--- | :--- |
| CPU0 (PE0) | $000_{B}$ |
| CPU1 (PE1) | $001_{B}$ |

### 3.4 Inter-Processor Interrupts

### 3.4.1 Inter-Processor Interrupts Overview

Inter Processor Interrupt Register (IPIR) is a function that controls fast interrupt requests between PEs. Use of IPIR achieves faster processing of inter-PE interrupts than setting a request flag for the INTC2 interrupt channel by using software.

IPIR has the following features.

- Support of inter-PE interrupt function of 4 channels
- Level detection of interrupts. Edge detection is not supported.
- Accessible from all clusters and all PEs
- Identification of interrupt request source PE is possible.
- Unintended inter-PE interrupts can be prevented by masking interrupt requests.
- SET1, CLR1, and NOT1 can be executed as atomic operation instructions to IPIR.
- Read-modify-write operations using the LD instruction and the ST instruction are also possible, but not as atomic operations.

### 3.4.2 Inter-Processor Interrupts Registers

### 3.4.2.1 List of Registers

Table 3.140 List of Registers

| Module Name | Register Name | Register Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| IPIR | IPIRn*2 Inter-PE Interrupt Enable SelfRegister*1 | IPInENS | <IPIR_base> $+000_{H}+020_{H} \times \mathrm{n}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Flag SelfRegister*1 | IPInFLGS | <IPIR_base> $+004_{H}+020_{H} \times \mathrm{n}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Clear SelfRegister*1 | IPInFCLRS | <IPIR_base> $+008_{H}+020_{H} \times \mathrm{n}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Request SelfRegister*1 | IPInREQS | <IPIR_base> + 010 ${ }_{\text {H }}+020_{H} \times \mathrm{n}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Request Clear Self-Register*1 | IPInRCLRS | <IPIR_base> $+014_{H}+020_{H} \times \mathrm{n}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Enable Register $\mathrm{m}^{* 3}$ | IPInENm | <IPIR_base> $+800_{H}+020_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Flag Register $\mathrm{m}^{* 3}$ | IPInFLGm | <IPIR_base> $+804_{H}+020_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Clear Register $\mathrm{m}^{* 3}$ | IPInFCLRm | <IPIR_base> $+808_{H}+020_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |
|  | IPIRn ${ }^{* 2}$ Inter-PE Interrupt Request Register m*3 | IPInREQm | <IPIR_base> $+810_{H}+020_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |
|  | IPIRn*2 Inter-PE Interrupt Request Clear Register m*3 | IPInRCLRm | <IPIR_base> $+814_{H}+020_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses the IPIOREQS register, PE1 can also access the IPIOREQ1 register.
Note 2. $n=0$ to 3 . $n$ is the channel number of IPIR.
Note 3. $m=0$ to $1 . m$ is the PEID.

### 3.4.2.2 Self Region

The self region contains the following five types of registers.

- IPInENS - IPIRn Inter-PE Interrupt Enable Self-Register
- IPInFLGS — IPIRn Inter-PE Interrupt Flag Self-Register
- IPInFCLRS - IPIRn Inter-PE Interrupt Clear Self-Register
- IPInREQS - IPIRn Inter-PE Interrupt Request Self-Register
- IPInRCLRS — IPIRn Inter-PE Interrupt Request Clear Self-Register

The self-registers are virtual registers that do not physically exist. Access from each PE to self-registers is routed to the actual register corresponding to the access source PE. Table $\mathbf{3 . 1 4 1}$ lists the access source PEs and routing destination registers. For the functions of each register bit, refer to the specifications of the routing destination register. When the masters except PEx access the self-registers, the registers return $0_{\mathrm{B}}$, and write access is ignored.

It is basically assumed that the IPIR registers are accessed from PEs via self region when PEs use the IPIR function. This allows PEs to use the same code because it is not necessary to specify different register addresses for each PE.

It is also possible to directly access registers by specifying the address of the actual register without using the selfregisters. In this case, the purpose is assumed to be to check the status of registers for another PE, or to reference the individual registers by a debugging tool.

Table 3.141 Self Region Register Routing List

| Self Register | Access Source PE |  |
| :--- | :--- | :--- |
|  | PE0 | PE1 |
| IPInENS | IPInEN0 | IPInEN1 |
| IPInFLGS | IPInFLG0 | IPInFLG1 |
| IPInFCLRS | IPInFCLR0 | IPInFCLR1 |
| IPInREQS | IPInREQ0 | IPInREQ1 |
| IPInRCLRS | IPInRCLR0 | IPInRCLR1 |

### 3.4.2.3 IPInENm - IPIRn Inter-PE Interrupt Enable Register m ( $\mathrm{n}=0$ to 3 )

The IPIRn Inter-PE Interrupt Enable Register m (IPInENm) is an 8-bit read/write register that sets the transmitting PE allowed to issue inter-PE interrupt requests to PEm.

This register is used to enable inter-PE interrupt requests of PE (PEx) by the receiving PE (PEm) itself.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | EN |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3.142 IPInENm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | EN | Inter-PE Interrupt Enable. |
|  |  | Write 1 to the $x$-th bit to enable the issuance of inter-PE interrupt requests from PEx to PEm. |
|  | Write 0 to the x-th bit to disable the issuance of inter-PE interrupt requests from PEx to PEm. |  |
|  | Bit 0: PE0 |  |
|  | Bit 1: PE1 |  |

### 3.4.2.4 IPInFLGm — IPIRn Inter-PE Interrupt Flag Register m ( $\mathrm{n}=0$ to 3 )

The IPIRn Inter-PE Interrupt Flag Register m (IPInFLGm) is an 8-bit read only register that indicates the transmittingPE that issued an inter-PE interrupt request to PEm.

This register is used to distinguish the requesting PE by PEm when PEm has received an inter-PE interrupt request.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | FLG |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 3.143 IPInFLGm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | FLG | Inter-PE Interrupt Request Flag. |
|  |  | This register indicates the status of Inter-PE Interrupt request from other PEs. |
|  |  | The $x$-th bit is automatically updated according to the IPInREQx[m] change while the value of the $\operatorname{IPInENm}[x]$ bit is 1 . The $x$-th bit is not set if $\operatorname{PPInENm}[x]$ is 0 , even if $\operatorname{IPInREQx[m]~is~set.~}$ |
|  |  | The $x$-th bit is also cleared when the IPInFCLRm[x] bit is set. |
|  |  | Bit 0: PE0 |
|  |  | Bit 1: PE1 |

### 3.4.2.5 IPInFCLRm — IPIRn Inter-PE Interrupt Clear Register m ( $\mathbf{n}=\mathbf{0}$ to 3 )

The Inter-PE Interrupt Clear Register m (IPInFCLRn) is an 8-bit write only register that clears inter-PE interrupt requests to PEm .

This register is used to clear the request flag by PEm after receiving the Inter-PE interrupt request from another PE.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | FCLR |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

Table 3.144 IPInFCLRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | FCLR | Inter-PE Interrupt Request Flag Clear |
|  |  | IPInFLGm[x] can be cleared by writing 1 to this bit. Writing 0 is ignored. |
|  | Bit 0: PE0 |  |
|  | Bit 1: PE1 |  |

### 3.4.2.6 IPInREQm — IPIRn Inter-PE Interrupt Request Register m ( $\mathrm{n}=0$ to 3 )

The Inter-PE Interrupt Request Register $m$ is an 8 -bit read/write register that controls Inter-PE interrupt request from PEm to other PEs.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | REQ |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 3.145 IPInREQm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | REQ | When 1 is written to the $x$-th bit while the value of the IPInENx[m] bit is 1 : |
|  |  | The value of the $x$-th bit becomes 1. |
|  |  | The high level is output to the inter-PE interrupt request for PEx, and IPInFLGx[m] is automatically set to 1 . |
|  |  | When 1 is written to the $x$-th bit while the value of the IPInENx[m] bit is 0 : |
|  |  | The value of the $x$-th bit becomes 1. |
|  |  | There are no other operations. |
|  |  | When 0 is written to the x -th bit: |
|  |  | Writing 0 is ignored. |
|  |  | When read: |
|  |  | The register value is read out. |
|  |  | Bit 0: PE0 |
|  |  | Bit 1: PE1 |

### 3.4.2.7 IPInRCLRm — IPIRn Inter-PE Interrupt Request Clear Register m ( $\mathbf{n}=\mathbf{0}$ to 3 )

The Inter-PE Interrupt Request Clear Register m (IPInRCLRm) is an 8-bit write only register that clears inter-PE interrupt requests for other PEs by PEm.

This register is assumed to be used to clear inter-PE interrupt requests that are set unintentionally while IPInENm is 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | RCLR |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

Table 3.146 IPInRCLRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | RCLR | Inter-PE Interrupt Request Clear |
|  |  | Writing 1 to the $x$-th bit clears the IPInREQm $[x]$ bit. If the value of the IPInENx[m] bit is 1, the |
|  |  | IPInFLGx[m] bit is also cleared at the same time. |
|  |  | The transmitting PE allowed to issue inter-PE interrupt requests by the IPInENm register can |
|  | also cancel an inter-PE interrupt request by using this bit, but the receiving PE may in some |  |
|  | cases accept the inter-PE interrupt request while the cancellation processing takes place. |  |
|  |  | Writing 0 is ignored. This bit always returns 0 when read. |
|  | Bit $0:$ PE0 |  |
|  | Bit $1:$ PE1 |  |
|  |  |  |

### 3.4.3 Inter-Processor Interrupts Function

This product has only PE0 and PE1, but this subsection includes examples of PE0 to PE7.

### 3.4.3.1 Initial Setting

Initial setting of authorized PEs by the IPInENm register must be made before IPIR is used. An example of initial setting is given below.

## (1) Initial Setting by Receiving PE

Figure 3.40 shows an example of the initial setting of IPIR channel 0 by PE1, which is a receiving PE. In this figure, bits PE4 to 7 of each register are omitted.

First, if IPIR has already been used and the values of bits IPIOREQ0 to 7[1] and the value of the IPI0FLG1 register have changed from the initial values, PE1 writes $\mathrm{FF}_{\mathrm{H}} * 1$ to the IPI0FCLRS (= IPI0FCLR1) register to clear bits IPI0REQ0 to $7[1]$ and the IPIOFLG1 register. If the values of bits IPIOREQ0 to 7[1] and the IPI0FLG1 register are the initial values, for example after hardware reset, this clearing operation is not required.

Next, PE1 writes $01_{\mathrm{H}}$ to the IPI0ENS (= IPI0EN1) register to accept interrupt requests from PE0 to PE1. Like for the clear register, upon completion of setting of the enable register, PE1 can accept interrupt requests from PE0.

Note 1. As this product has only PE0 and PE1, PE1 writes 03 H to IPIOFCLRS register to clear.

Figure 3.40 Example of Initial Setting of IPIR Channel 0 by Receiving PE (PE1)

## (2) Initial Setting by Control PE

An example of initial setting from a PE other than a receiving PE is shown below. In this section, the PE that performs the initial setting is called the control PE for the sake of convenience. Figure 3.41 shows an example of the initial setting of IPIR channel 0 by PE3, which is the control PE. In this figure, bits PE4 to 7 of each register are omitted.

First, if IPIR has already been used and the values of bits IPI0REQ0 to 7[1] and the value of the IPI0FLG1 register have changed from the initial values, PE3 writes $\mathrm{FF}_{\mathrm{H}}$ to the IPI0FCLR1 register to clear bits IPI0REQ0 to 7[1] and the IPI0FLG1 register. If the values of bits IPIOREQ0 to 7[1] and the IPI0FLG1 register are the initial values, for example after hardware reset, this clearing operation is not required.

Next, PE3 writes $01_{\mathrm{H}}$ to the IPI0EN1 register to accept interrupt requests from PE0 to PE1. Like for the clear register, upon completion of setting of the enable register, PE1 can accept interrupt requests from PE0.

Figure 3.41 Example of Initial Configuration of IPIR Channel 0 by Control PE (PE3)

### 3.4.3.2 Inter-PE Interrupt Request

Figure 3.42 shows an example of the operation when PE0 sends an inter-PE interrupt request to PE1 using IPIR channel 0. In this figure, bits PE4 to 7 of each register are omitted. In this example, the initial setting is set to IPI0EN1 in advance to enable inter-PE interrupt requests from PE0. For an operation example of the initial setting, see Section 3.4.3.1, Initial Setting. The following describes an example of accessing the registers through the self-register.

First, PE0, which is the transmitting PE, reads the IPIOREQS (=IPIOREQ0) register and checks that the value of the IPI0REQS[1] (=IPI0REQ0[1]) bit is $0_{\mathrm{B}}$. If the value of the IPI0REQS[1] (=IPI0REQ0[1]) bit is $1_{\mathrm{B}}$, this means that the previous inter-PE interrupt request from PE0 to PE1 has not been accepted by PE1, and thus a new inter-PE interrupt request cannot be issued. If it is confirmed that the value of the IPI0REQS[1] (=IPI0REQ0[1]) bit is $0_{\mathrm{B}}$ and thus an inter-PE interrupt request from PE0 to PE1 is enabled, PE0 sets the IPI0REQS[1] (=IPI0REQ0[1]) bit to $1_{\mathrm{B}}$ to issue an inter-PE interrupt request from PE1. Because inter-PE interrupts from PE0 to PE1 are enabled by the IPI0EN1 register, when PE0 sets the IPIOREQS[1] (= IPI0REQ0[1]) bit to $1_{\mathrm{B}}$, the IPI0FLG1[1] bit is automatically set to $1_{\mathrm{B}}$, and an interPE interrupt request signal is output to PE1 from IPIR.

Figure 3.43 shows an example of the operation when PE1 receives an inter-PE interrupt request from PE0 using IPIR channel 0 . When PE1, which is the receiving PE, receives an inter-PE interrupt request signal, it reads the IPI0FLGS (= IPI0FLG1) register, and because the value of the IPI0FLGS[0] ( $=$ IPI0FLG1[0]) bit is $1_{\mathrm{B}}$, it recognizes that the inter-PE interrupt request has been sent from PE0. But if the request side clears the request, the value of it is $0_{B}$. After verifying the source of the inter-PE interrupt, PE1 sets the IPI0FCLRS[0] (=IPI0FCLR1[0]) bit to $1_{\mathrm{B}}$, and the processing transitions to the inter-PE interrupt processing. The IPI0REQS[1] (= IPI0REQ0[1]) bit and the IPI0FLGS (= IPI0FLG1) bit are automatically cleared when the IPI0FCLRS[0] ( $=$ IPI0FCLR1[0]) bit is set to $1_{\mathrm{B}}$ by PE1.

Figure 3.44 shows the operation flow from initial setting of IPIR by the receiving PE (PE1), to sending of an inter-PE interrupt request by the transmitting PE (PE1), and completion of reception of that inter-PE interrupt request by the receiving PE (PE1).

Note that if a new inter-PE interrupt request is generated to the same receiving PE before the source register is cleared by the receiving PE with the clear register, the bit corresponding to the new transmitting PE in the source register will be set to $1_{\mathrm{B}}$, but the inter-PE interrupt request signal being retained high, the second and subsequent inter-PE interrupt requests will not be output. Therefore, the processing when multiple sources occur when the receiving PE has received an inter-PE interrupt request must be controlled by software.

The transmitting PE can detect whether the preceding inter-PE interrupt request was successfully received by the receiving PE, by checking the value of the request register. To monitor the request register with a polling loop, it is recommended to curb the bus load by executing the snooze instruction within the polling loop in order to avoid the bus system occupation for extended periods of time.

Figure 3.42 Example of Inter-PE Interrupt Transmission Operation

Figure 3.43 Example of Inter-PE Interrupt Reception Operation

Figure 3.44 Operation Flow of Inter-PE Interrupt

## (1) Sample Code

(a) Transmission Processing

Figure 3.45 shows a sample flowchart of the inter-PE interrupt request transmission processing using IPIR channel 0.

Figure 3.45 Flowchart of Inter-PE Interrupt Request Transmission Processing

## (b) Reception Processing

Figure 3.46 shows a sample flowchart of the inter-PE interrupt request reception processing using IPIR channel 0 . To prevent source flag loss, the source flag \& source clear register configuration is used.

Figure 3.46 Flowchart of Inter-PE Interrupt Request Transmission Processing

### 3.4.3.3 Request Mask Function

Inter-PE interrupt requests disabled by the IPInENm register setting are ignored. Figure 3.47 shows an example of the operation when an inter-PE interrupt is requested from a disabled PE. In this figure, bits PE4 to 7 of each register are omitted. In this example, the initial setting is set to IPIOEN1 in advance to prohibit inter-PE interrupt requests from PE2 to PE1. For an operation example of the initial setting, see Section 3.4.3.1, Initial Setting.

Even if PE2 sets IPIOREQS[1] (= IPI0REQ2[1]) to $1_{\mathrm{B}}$ to request PE1 to issue an inter-PE interrupt, inter-PE interrupts from PE2 to PE1 are prohibited, so the IPInFLG1[2] bit remains $0_{\mathrm{B}}$ and no interrupt request signal is output.

If the transmitting PE disabled by the IPInENm register setting unintentionally writes $1_{\mathrm{B}}$ to the IPIOREQm register, the IPIOREQm register can be cleared by using the IPInRCLRm register. For details, see Section 3.4.3.5, Inter-PE Interrupt Request Clear Function.

Figure 3.47 Request Mask Operation Example

### 2.4.3.4 Inter-PE Interrupt Requests of Multiple Systems

If the combination of the transmitting PE and receiving PE differs, multiple inter-PE interrupt requests can be output simultaneously on one channel of IPIR. For example it is possible to output inter-PE interrupt request A (PE0 to PE1) and inter-PE interrupt request B (PE1 to PE0) on channel 1 of IPIR simultaneously. Each register operates independently when the combination of the transmitting PE and receiving PE differs, so multiple inter-PE interrupt requests can be output simultaneously.

### 3.4.3.5 Inter-PE Interrupt Request Clear Function

The IPInREQm $[\mathrm{x}]$ bit can be cleared by setting the IPInRCLRm $[\mathrm{x}]$ bit to $1_{\mathrm{B}}$, allowing you to cancel inter-PE interrupt requests from the transmitting PE. If inter-PE interrupt requests from the transmitting PE are enabled by the $\operatorname{IPInENx}[\mathrm{m}]$ bit, the IPInFLGx[m] bit is also cleared at the same time as the IPInREQm[x] bit is cleared. However, the receiving PE may in some cases accept the inter-PE interrupt while the cancellation processing takes place.

Figure 3.48 shows an example of the operation to clear inter-PE interrupt requests from PE0 and PE2 to PE1. When PE0 writes $1_{\mathrm{B}}$ to the IPIORCLRS[1] (= IPIORCLR0[1]) bit, the IPIOREQ0[1] bit is cleared. Moreover, because inter-PE interrupt requests from PE0 to PE1 are enabled by the IPI0EN1 register setting, IPI0FLG1[0] is also cleared.

When PE2 writes $1_{\mathrm{B}}$ to the IPIORCLRS[1] (= IPIORCLR2[1]) bit, the IPIOREQ2[1] bit is cleared. Here, inter-PE interrupt requests from PE2 to PE1 are disabled by the IPI0EN1 register setting, so the IPIORCLR2 register does not affect the value of the IPI0FLG1 register.

Figure 3.48 Example of Inter-PE Interrupt Request Clear Function Operation

### 3.5 Mutual Exclusion

This CPU provides instructions that enable shared resources to be controlled mutually exclusively from multiple programs when the system is operating in a multi- processing environment.
When using mutual exclusion, mutual exclusion variables have to be defined in the memory and all programs must operate in accordance with the appropriate instruction flow.

## CAUTION

Embedded CPUs in a single-processor configuration use a programming model in which data coherence is maintained by disabling the acknowledgment of maskable interrupts. This is a very easy and sure method of maintaining data coherence, but naturally in a multi-processor, multiple programs might be executing and attempting to use the data at the same time. In this case it is not possible to maintain data coherence simply by disabling maskable interrupt acknowledgment.

### 3.5.1 Mutual Exclusion Overview

The local RAM, cluster RAM, and the mutual exclusion variable register (MEV) are available as resources for exclusive control. As atomic operation instructions, the instructions of LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the local RAM and cluster RAM, and the instructions of CAXI, SET1, CLR1, and NOT1 can be performed for the mutual exclusion variable register (MEV). These registers are also accessible by the LD and ST instructions but are not regarded as atomic operation.

These MEV registers support exclusive control for variables shared between PEs (common resources).

- Thirty-two 32-bit MEV registers are included.
- 1-, 8-, 16-, and 32-bit accesses are available for each MEV.
- Accesses from all CPU can be made.
- Atomic operation instructions of CAXI, SET1, CLR1, and NOT1 can be performed.

### 3.5.2 Mutual Exclusion Registers

### 3.5.2.1 List of Registers

Table 3.147 List of Registers

| Module Name | Symbol | Register Name | Address | Access | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| MEV | GOMEV0 | Mutual Exclusive Variable Register 0 | <MEV_base> + $00{ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV1 | Mutual Exclusion Variable Register 1 | <MEV_base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | GOMEV2 | Mutual Exclusion Variable Register 2 | <MEV_base> + 08H | 8, 16, 32 | - |
|  | G0MEV3 | Mutual Exclusion Variable Register 3 | <MEV_base> + 0C H | 8, 16, 32 | - |
|  | G0MEV4 | Mutual Exclusion Variable Register 4 | <MEV_base> + 10 H | 8, 16, 32 | - |
|  | G0MEV5 | Mutual Exclusion Variable Register 5 | <MEV_base> + 14 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV6 | Mutual Exclusion Variable Register 6 | <MEV_base> + 18H | 8, 16, 32 | - |
|  | G0MEV7 | Mutual Exclusion Variable Register 7 | <MEV_base> + $1 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | G0MEV8 | Mutual Exclusion Variable Register 8 | <MEV_base> + $20_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV9 | Mutual Exclusion Variable Register 9 | <MEV_base> + $24_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV10 | Mutual Exclusion Variable Register 10 | <MEV_base> + $28{ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV11 | Mutual Exclusion Variable Register 11 | <MEV_base> + 2C H | 8, 16, 32 | - |
|  | G0MEV12 | Mutual Exclusion Variable Register 12 | <MEV_base> + 30 H | 8, 16, 32 | - |
|  | G0MEV13 | Mutual Exclusion Variable Register 13 | <MEV_base> + $34_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV14 | Mutual Exclusion Variable Register 14 | <MEV_base> + $38{ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV15 | Mutual Exclusion Variable Register 15 | <MEV_base> + 3C H | 8, 16, 32 | - |
|  | G0MEV16 | Mutual Exclusion Variable Register 16 | <MEV_base> + 40 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV17 | Mutual Exclusion Variable Register 17 | <MEV_base> + 44 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV18 | Mutual Exclusion Variable Register 18 | <MEV_base> + 48\% | 8, 16, 32 | - |
|  | G0MEV19 | Mutual Exclusion Variable Register 19 | <MEV_base> + 4C $\mathrm{C}_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV20 | Mutual Exclusion Variable Register 20 | <MEV_base> + 50 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV21 | Mutual Exclusion Variable Register 21 | <MEV_base> + $54_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV22 | Mutual Exclusion Variable Register 22 | <MEV_base> + 58 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV23 | Mutual Exclusion Variable Register 23 | <MEV_base> + 5C H | 8, 16, 32 | - |
|  | G0MEV24 | Mutual Exclusion Variable Register 24 | <MEV_base> + 60 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV25 | Mutual Exclusion Variable Register 25 | <MEV_base> + 64 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV26 | Mutual Exclusion Variable Register 26 | <MEV_base> + 68 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV27 | Mutual Exclusion Variable Register 27 | <MEV_base> + 6C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV28 | Mutual Exclusion Variable Register 28 | <MEV_base> + 70 H | 8, 16, 32 | - |
|  | G0MEV29 | Mutual Exclusion Variable Register 29 | <MEV_base> + 74 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV30 | Mutual Exclusion Variable Register 30 | <MEV_base> + 78 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | G0MEV31 | Mutual Exclusion Variable Register 31 | <MEV_base> + 7C H | 8, 16, 32 | - |

### 3.5.2.2 GOMEVn — Mutual Exclusion Variable Register $\mathbf{n}$ ( $\mathrm{n}=0$ to 31)

The Mutual Exclusive variable Register $n$ (G0MEVn) is a 32-bit read/write register that can be used as a mutual exclusive resource.

Table 3.148 GOMEVn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | GOMEVn[31:0] | Mutual Exclusive Variable. |
|  |  | These bits can be read and written from all PEs. |

### 3.5.3 Mutual Exclusion Function

### 3.5.3.1 Operation Example Using Mutual Exclusion Variable Register (MEV)

An example of a flow chart that does mutual exclusion of a shared resource by spin lock with MEV is given in the following figure. When the value of MEV is $1_{\mathrm{B}}$ in this example, a shared resource shows that it is lock status. It is recommended that reading or writing to MEV be carried out by atomic operation because MEV itself is also a shared resource.

Figure 3.49 Spin Lock Examples of Lock Step Using MEV

A CAXI operation can be used for atomic operation which extends over more than one data column in G4MH. The sample code which does lock acquisition/release using MEV below is indicated. "lock_adr" is equivalent to the address of MEV by this example.

## Lock Acquisition

```
MOV lock_adr, r20
Lock: MOV 1, r21
    CAXI [r20], r0, r21
    BZ Lock_succes
    SNOOZE
    BR Lock
Lock_succes:
```

## Lock Release

```
MOV lock_adr, r20
ST.W r0, 0[r20]
```

Figure 3.50 shows an operation example that does mutual exclusion of a shared resource between PE0 and PE1. The lock status of a shared resource is indicated by the value of MEV that corresponds to each PE, and MEV has lock status at $1_{B}$ by this example.

Figure 3.50 MEV Usage Sample

### 3.5.3.2 Shared Data that does not Require Mutual Exclusion Processing

This CPU maintains data access coherence for the following types of data access even in a multi-processor environment.

- Access in which the data is aligned to the size that matches the data type (aligned access)
- LD, ST, SLD, SST, LDL, STC, and bit manipulation instructions (TST1)
- Access by using a bit manipulation instruction (SET1, CLR1, or NOT1) (read-modify-write)
- Access by using the CAXI instruction (read-modify-write)

NOTE
Whether an instruction is atomically executed or not depends on the data format. Please refer to Section 3.2.2.6, Data Types.

With some exceptions, mutual exclusion is achieved by using these types of data access. In other words, it is guaranteed that while one CPU is executing the instructions that perform the above data accesses, another CPU is not accessing the data. This is known as an instruction being executed atomically or an instruction guaranteeing the atomicity.
Note that the atomic execution of an instruction means that a data access bus transaction completes with no disruption; it does not necessarily mean that a series of transactions has been completed

## CAUTION

The extent to which coherency is guaranteed might be limited, depending on the hardware specifications. For example, for some memories, coherency might not be guaranteed even if aligned access is used. For details, see Section 3.5.1, Mutual Exclusion Overview and Section 3.8.3, Accesses to Registers by Bit-Manipulation Instructions.

### 3.5.3.3 Operation of the LDL and STC Instructions

The LDL and STC instructions can be used to obtain atomic read-modify-write operations for accurate processing in the updating of memory by multicore systems. The LDL and STC instructions operate as follows. For the operation of the LDL and STC instructions, refer to the RH850G4MH User's Manual: Software.

## (1) Link

Only one link (LLbit) can be created. The link includes information on the address for which it was created, and control is applied according to whether an STC instruction succeeds or fails at this address and whether the link is lost. The link also includes the data size information when it the link is created and therefore any STC instruction which has a data size different from that of the LDL instruction that created a link always fails, and the link is deleted.

## (2) Link generation

The CPU is capable of generating a link to the local RAM and the cluster RAM. Executing the LDL instruction on the target RAM for the operation leads to the link address being registered, the link flag being set, and a link being generated in response to reading by the instruction.
(a) The local RAM for the given processor
(b) The cluster RAM

The CPU is capable of generating a link to either (a) or (b).

## (3) Success in storing

After a link has been generated, storing will only proceed in response to executing an STC instruction corresponding to the generated link.

## (4) Failure in storing

If a link is lost, storing does not proceed even when an STC instruction for the corresponding address is processed.
Storing also does not proceed when an STC instruction that does not correspond to the link is processed.

## (5) Condition for successful storing

If the following condition is met, the STC instruction is judged to be for the address corresponding to the link.

- The address and size for the LDL instruction that generated the link matches that for the STC instruction.

## (6) Loss of the link

A link is lost when certain event or address conditions are satisfied. Table $\mathbf{3 . 1 4 9}$ shows the link loss conditions. A link is lost if any of the conditions shown in this table satisfied.

Table 3.149 Link Loss Conditions

| Event Condition | Remark |
| :---: | :---: |
| Store operation to a 32-byte-aligned address range that includes the address of the existing link*1 | The following operations by both the CPU for which the link was generated and another bus master correspond. <br> - ST, SST, STC, and STV instructions <br> - SET1, NOT1, CLR1, and CAXI instructions <br> - PREPARE and PUSHSP instructions |
| Execution of STC instruction for a location corresponding to the existing link | The corresponding link (for (1) or (2) above) will be lost whether the result of the instruction was success or fail. |
| Execution of LDL instruction for a location corresponding to the existing link | The link generated in response to the preceding LDL instruction will be lost, and the link in response to the following LDL instruction is generated. |
| Execution of CLL instruction |  |
| Exception acknowledgment |  |
| Execution of EIRET instruction |  |
| Execution of FERET instruction |  |
| Bus access error of LDL |  |
| Note 1. In the local RAM, if the store instructio the program flow which does not need reading the Lock variable using the program flow does not need the Link | except STC/CAXI instruction is executed, the Link is not always lost. Therefore, use hat these instructions cause the Link Loss. For example, in the sample code (7), after instruction, by executing the STC instruction only if nobody has the Lock, the ss caused by the store instruction for the Lock Release. |

## (7) Sample Code

The sample code of a spinlock executed by using the LDL.W and STC.W instructions is shown below.

## Lock Acquisition

| MOV | lock_adr, r20 |
| :--- | :--- |
| Lock: |  |
| LDL.W |  |
| CMP | ro, r20], r21 |
| BNZ | Lock_wait |
| MOV | 1, r21 |
| STC.W | r21, [r20] |
| CMP | r0, r21 |
| BNZ | Lock_success |
| Lock_wait: |  |
| SNOOZE |  |
| BR |  |
| Lock_success: |  |

## Lock Release

ST.W r0, 0 [r20]

### 3.5.3.4 Performing Mutual Exclusion by Using the SET1 Instruction

The SET1 instruction can be used to perform mutual exclusion over multiple data arrays. By executing the SET1 instruction on the same bit in the memory and then checking the PSW.Z flag, which indicates the execution result, it can be determined whether lock acquisition succeeded or failed.

## CAUTIONS

1. Depending on the hardware specifications, the system performance might drop if exclusive control is executed frequently by using the SET1 instruction, because this causes the bus to be occupied for a long time. It is therefore recommended to execute exclusive control by using the LDL/STC instructions as much as possible.
2. When performing mutual exclusion by using the SET1 instruction, to prevent the problem of excessive bus occupancy described in Caution 1 above, execute the SNOOZE instruction before attempting to acquire a lock again after lock acquisition has failed, and adjust the lock acquisition loop execution interval.

## (1) Sample Code

The sample code of a spinlock executed by using the SET1 instruction is shown below.

## Lock Acquisition

| MOV | lock_adr, r20 |
| :---: | :--- |
| Lock: | SET1 |
| BZ | Lock_success |
| SNOOZE |  |
| BR | Lock |
| Lock_success: |  |

## Lock Release

$$
\text { CLR1 } 0,0[r 20]
$$

### 3.5.3.5 Performing Mutual Exclusion by Using the CAXI Instruction

The CAXI instruction can be used to perform mutual exclusion over multiple data arrays. By executing the CAXI instruction on the same word in the memory and then checking the destination register, it can be determined whether lock acquisition succeeded or failed.

## CAUTIONS

1. Depending on the hardware specifications, the system performance might drop if exclusive control is executed frequently by using the CAXI instruction, because this causes the bus to be occupied for a long time. It is therefore recommended to execute exclusive control by using the LDL/STC instructions as much as possible.
2. When performing mutual exclusion by using the CAXI instruction, to prevent the problem of excessive bus occupancy described in Caution 1 above, execute the SNOOZE instruction before attempting to acquire a lock again after lock acquisition has failed, and adjust the lock acquisition loop execution interval.

## (1) Sample Code

The sample code of a spinlock executed by using the CAXI instruction is shown below.

## Lock Acquisition

|  | MOV | lock_adr, r20 |
| :--- | :--- | :--- |
| Lock: | MOV | 1, r21 |
|  | CAXI | $[r 20]$, r0, r21 |
| BZ | Lock_success |  |
| SNOOZE |  |  |
| BR | Lock |  |
| Lock_success: |  |  |

## Lock Release

ST.W r0, $0[r 20]$

### 3.6 Barrier-Synchronization

### 3.6.1 Barrier-Synchronization Overview

When parallel processing is performed using a multicore processor, it may be necessary to make the cores wait until the data required for the next processing is ready, at which point the processing can proceed to the next processing. Typically, control that sets up a barrier that prevents the next process from starting before all the applicable cores complete the predetermined processing is called barrier synchronization. It is possible to implement barrier synchronization just using software, but this may degrade system processing performance due to the concentration of barrier arrival notifications from the various cores and memory access from the various cores for verification purposes.

Barrier synchronization registers enable easy barrier synchronization by detecting whether all the applicable cores have completed the required processing through the reception of completion notifications from the various PEs, while also providing a barrier synchronization support function that automatically clears completion notifications from the various PEs in preparation for the next barrier synchronization. This function makes it possible to reduce the number of memory accesses for barrier synchronization, thereby minimizing the negative impact of barrier synchronization on processing performance. This function can also be used for barrier synchronization between PEs forming a cluster.

The barrier synchronization register has the following features.

- The 16 -ch barrier synchronization registers are provided.
- Barrier synchronization can be implemented using the same code for all the cores.
- Accessible from all clusters and all PEs within the system

### 3.6.2 Barrier-Synchronization Registers

### 3.6.2.1 List of Registers

Table 3.150 List of Registers

| Module Name | Register Name | Register Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BARR | Barrier-Synchronization $\mathrm{n}^{* 2}$ Barrier Participating PE Setting Register | BRnEN | <BARR_base> $+004_{H}+010_{H} \times \mathrm{n}$ | 8 | - |
|  | Barrier-Synchronization $\mathrm{n}^{* 2}$ Initialization Register | BRnINIT | <BARR_base> $+000_{H}+010_{H} \times \mathrm{n}$ | 8 | - |
|  | Barrier-Synchronization $\mathrm{n}^{* 2}$ Barrier Check Register Self** | BRnCHKS | <BARR_base> $+100_{H}+010_{H} \times \mathrm{n}$ | 8 | - |
|  | Barrier-Synchronization $\mathrm{n}^{\star 2}$ Barrier Synchronization Completion Register Self*1 | BRnSYNCS | <BARR_base> $+104_{H}+010_{H} \times \mathrm{n}$ | 8 | - |
|  | Barrier-Synchronization $\mathrm{n}^{* 2}$ Barrier Check Register m*3 | BRnCHKm | <BARR_base> $+800_{H}+010_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |
|  | Barrier-Synchronization $\mathrm{n}^{* 2}$ Barrier Synchronization Completion Register $\mathrm{m}^{* 3}$ | BRnSYNCm | <BARR_base> $+804_{H}+010_{H} \times \mathrm{n}+100_{\mathrm{H}} \times \mathrm{m}$ | 8 | - |

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses BR0CHKS register, PE1 can access BR0CHK1 register.
Note 2. $\mathrm{n}=0$ to $15 . \mathrm{n}$ is the Barrier-Synchronization channel number.
Note 3. $m=0$ to $1 . m$ is the value of PEID.

### 3.6.2.2 Self Region

The self region contains the following two types of registers.

- BRnCHKS - Barrier-Synchronization n - Barrier Check Self-Register
- BRnSYNCS — Barrier-Synchronization n - Barrier Synchronization Completion Self-Register

The self registers are virtual registers that do not physically exist. Access from each PE to self registers is routed to the actual register corresponding to the access source PE. Table $\mathbf{3 . 1 5 1}$ lists the access source PEs and routing destination registers. For the functions of each register bit, refer to the specifications of the routing destination register. When masters except PEx access the self registers, the register returns 0 , and write access is ignored.
It is basically assumed that the barrier synchronization registers are accessed from PEs via self region when PEs use the barrier synchronization function. This allows PEs to use same code because it is not necessary to specify different register address for each PE.

It is also possible to directly access registers by specifying the address of the actual register without using the self register. In this case, the purpose is assumed to check the status of registers for another PE, or referencing of individual registers by a debugging tool.

Table 3.151 Self Region Register Routing List

| Self Register | Access Source PE |  |
| :--- | :--- | :--- |
|  | PE0 | PE1 |
| BRnCHKS | BRnCHK0 | BRnCHK1 |
| BRnSYNCS | BRnSYNC0 | BRnSYNC1 |

### 3.6.2.3 BRnINIT — Barrier-Synchronization n Initialization Register

The Barrier-Synchronization $n$ Initialization Register (BRnINIT) is an 8-bit write only register that initializes the Barrier-Synchronization channel $\mathrm{n}(\mathrm{n}=0$ to 15$)$. This register clears the BRnCHKm register and BRnSYNCm register of channel n .

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | BRINIT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 3.152 BRnINIT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BRINIT | Barrier-Synchronization n initialize |
|  |  | Writing 1 to this bit clears registers BRnCHKO to 1 and registers BRnSYNC0 to 1 of the same channel. |
|  |  | This bit always returns 0 when read. |

### 3.6.2.4 BRnEN — Barrier-Synchronization n Barrier Participating PE Setting Register

The Barrier-Synchronization n Barrier Participating PE Setting Register (BRnEN) is an 8-bit read/write register that enables Barrier-Synchronization Participation in channel $n$ for PEs.

Value after reset: $\quad 00_{H}$

Table 3.153 BRnEN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 to 0 | BREN[1:0] | Barrier-Synchronization Participation enable for channel $n$ |
|  |  | Writing 1 to the $x$-th bit enables the barrier synchronization support function for PEx. Writing 0 |
|  | to the $x$-th bit disables the barrier synchronization support function for PEx. |  |
|  | Bit 0: PE0 |  |
|  | Bit 1: PE1 |  |

### 3.6.2.5 BRnCHKm — Barrier-Synchronization n Barrier Check Register m

The Barrier-Synchronization n Barrier Check Register ( BRnCHKm ) is an 8 -bit read/write register that is used for PEm to notify that PEm has arrived at the barrier of channel n. The PE that has arrived at the barrier is to write the BRCHK bit of this register.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | BRCHK |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 3.154 BRnCHKm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BRCHK | Barrier Check Bit of channel $n$ |
|  |  | This bit can be updated by both software and hardware. |
|  |  | Software: |
|  |  | When the BRnCHKm register is written, the value of this bit becoming 1 regardless of the writing value. |
|  |  | This bit can be set even if the BRnEN.BRENm bit is 0 , but it does not affect the barrier synchronization of channel $n$. |
|  |  | Hardware: |
|  |  | This bit is cleared by the hardware when the barrier-synchronization is established at the condition that all the BRnCHKm.BRCHK bits of participating PEs, which are enabled by the BRnEN register, are set. At the same time, the BRnSYNCm.BRSYNC bits of all participating PEs are set. |
|  |  | This bit is cleared by writing 1 to the BRnINIT.BRINIT bit. |

## NOTE

If all bits of the BRnEN register are 0 (no PE participates the barrier synchronization), BRCHK bit cannot be set.

### 3.6.2.6 BRnSYNCm — Barrier-Synchronization n Barrier Synchronization Completion Register m

The Barrier-Synchronization n Barrier Synchronization Completion Register is an 8-bit read/write register that indicates that all the PEs that participate in the barrier of channel $n$ have arrived at the barrier of channel $n$.

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 3 |  | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | BRSYNC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/ |

Table 3.155 BRnSYNCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BRSYNC | Barrier synchronization completion |
|  |  | This bit can be updated by both software and hardware. |
|  |  | Software: |
|  |  | When the BRnSYNCm register is written, this bit is updated with the write data. |
|  |  | Hardware: <br> If the BRnEN.BRENm bit is 1 , this bit is automatically set when the barriersynchronization is established at the condition that all the BRnCHKm.BRCHK bits of participating PEs, which are enabled by the BRnEN register, are set. If the $B R n E N$.BRENm bit is 0 , this bit is not updated by the hardware. |
|  |  | This bit is cleared by writing 1 to the BRnINIT.BRINIT bit. |

### 3.6.3 Barrier-Synchronization Function

This product has only PE0 and PE1, but this subsection includes examples of PE0 to PE3.

### 3.6.3.1 Initial Setting

Before the barrier synchronization register is used, initial settings must be made in the BRnEN register. Figure 3.51 shows an example of the initial setting of synchronization register channel 0 by PE0.

First, to clear the setting of the previous operation, the BR0EN register is cleared by write operation. After clearing of the BR0EN register, write 07H to the BR0EN register to participate PE0, PE1 and PE2 in barrier synchronization. Lastly, PE0 writes $1_{\mathrm{B}}$ to the BROINIT register to clear registers BR0CHK0 to 3 and registers BR0SYNC0 to 3 . Upon completion of setting of the participating PE setting register and initialization, barrier synchronization using the barrier synchronization register is possible.

Figure 3.51 Example of Initial Setting of Barrier Synchronization Register

### 3.6.3.2 Barrier Synchronization

Figure 3.52 shows an example of the operation executing barrier synchronization of PE0, PE1, and PE2 using barrier synchronization register channel 0 . In this example, PE0, PE1, and PE2 are set by the BR0EN register in advance to participate in barrier synchronization by the initial setting processing described in Section 3.4.3.1, Initial Setting.

When PE0, PE1, and PE2, which are set to participate in barrier synchronization by the BR0EN register, arrive at the barrier, they each write data to the BR0CHKS register, setting it to $1_{\mathrm{B}}$. Note that the BR0CHKS register is set to $1_{\mathrm{B}}$ when it is written to, regardless of the write value. Each of the PEs, upon arriving at the barrier, polls the BR0SYNCS register and waits for all the other PEs participating in barrier synchronization to arrive at the barrier. When all the PEs participating in barrier synchronization arrive at the barrier and the values of registers BR0CHK0 to 2 have all become $1_{\mathrm{B}}$, registers BR0CHK0 to 3 are automatically cleared, and $1_{\mathrm{B}}$ is automatically set to registers BR0SYNC0 to 2 (= BR0SYNCS). When a PE that arrives at the barrier detects that the BR0SYNCS register has been set to $1_{\mathrm{B}}$, it considers that all the PEs participating in barrier synchronization have arrived at the barrier, and it clears the respective BR0SYNCS registers to $0_{\mathrm{B}}$ to allow transition to the next processing. When the values of registers BR0CHK0 to 2 have all become $1_{\mathrm{B}}$, registers BR0CHK0 to 3 are automatically cleared, so each PE is able to move on to the next cycle as soon as the BR0SYNCS register is cleared.

Figure 3.52 Example of Operation of Barrier Synchronization Using Barrier Synchronization Register

### 3.7 TPTM

### 3.7.1 TPTM Overview

Time Protection Timer (TPTM) is sets of CPU dedicated timers used to achieve high performance and functionality of timing protection. One timer set is assigned to each CPU respectively.

TPTM has the following features.

- Interval timer $\times 4 \mathrm{ch}$ (down counter)
- Free-run timer $\times 1$ ch (up counter)
- Start, Stop and Restart of counter for both of the interval timers and the free-run timer.
- Divided counter of the timers can be configured for the interval timers and the free-run timer respectively.
- Simultaneous count control for the interval timers.
- Underflow interrupt for the interval timers.

### 3.7.2 TPTM Registers

### 3.7.2.1 List of Registers

Table 3.156 List of Registers (1/2)

| Module Name | Register Name | Register Symbol | Address | Access | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TPTM self*1 | Counter Start Register of Interval Timer Self | TPTMSIRUN | <TPTM_base> + 000 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Counter Restart Register of Interval Timer Self | TPTMSIRRUN | <TPTM_base> + 004 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Counter Stop Register of Interval Timer Self | TPTMSISTP | <TPTM_base> + 008 ${ }_{\text {H }}$ | 8, 16, 32 | - |

|  | Counter Channel 3 Register of Interval Timer for PEn | TPTMnICNT3 | $\begin{aligned} & \text { <TPTM_base> + } 198_{H}+ \\ & \left(100_{H} \times n\right) \end{aligned}$ | 32 | - |
|  | Load Channel 3 Register of Interval Timer for PEn | TPTMnILD3 | $\begin{aligned} & <\text { TPTM_base> + 19C }{ }_{H}+ \\ & \left(100_{H} \times n\right) \end{aligned}$ | 32 | - |
|  | Counter Register of Free-run Timer for PEn | TPTMnFCNT | $\begin{aligned} & \text { <TPTM_base> + } 1 \mathrm{AO}_{H}+ \\ & \left(100_{H} \times \mathrm{n}\right) \end{aligned}$ | 32 | - |

Note 1. When PE accesses the self register, PE can access the corresponding register for each PE. For example, when PE1 accesses TPTMSIRUN register, PE1 can access the TPTM1IRUN register.
Note 2. $\mathrm{n}=0$ to $1 . \mathrm{n}$ is the PEID number.

### 3.7.2.2 Self Region

The self region contains the following registers.

- TPTMSIRUN - Counter Start Register of Interval Timer
- TPTMSIRRUN - Counter Restart Register of Interval Timer
- TPTMSISTP - Counter Stop Register of Interval Timer
- TPTMSISTR — Counter Status Register of Interval Timer
- TPTMSIIEN - Interrupt Enable Register of Interval Timer
- TPTMSIUSTR — Underflow Status Register of Interval Timer
- TPTMSIDIV - Divider Register of Interval Timer
- TPTMSFRUN - Counter Start Register of Free-run Timer
- TPTMSFRRUN - Counter Restart Register of Free-run Timer
- TPTMSFSTP — Counter Stop Register of Free-run Timer
- TPTMSFSTR — Counter Status Register of Interval Timer
- TPTMSFDIV — Divider Register of Free-run Timer
- TPTMSICNT0 - Counter Channel 0 Register of Interval Timer
- TPTMSILD0 - Load Channel 0 Register of Interval Timer
- TPTMSICNT1 - Counter Channel 1 Register of Interval Timer
- TPTMSILD1 — Load Channel 1 Register of Interval Timer
- TPTMSICNT2 - Counter Channel 2 Register of Interval Timer
- TPTMSILD2 - Load Channel 2 Register of Interval Timer
- TPTMSICNT3 - Counter Channel 3 Register of Interval Timer
- TPTMSILD3 - Load Channel 3 Register of Interval Timer
- TPTMSFCNT - Counter Register of Free-run Timer

Table 3.157 Self Region Register Routing List

| Self Region Register | Access source PE |  |
| :--- | :--- | :--- |
|  | PE0 | PE1 |
| TPTMSIRUN | TPTM0IRUN | TPTM1IRUN |
| TPTMSIRRUN | TPTM0IRRUN | TPTM1IRRUN |
| TPTMSISTP | TPTM0ISTP | TPTM1ISTP |
| TPTMSISTR | TPTM0ISTR | TPTM1ISTR |
| TPTMSIIEN | TPTM0IIEN | TPTM1IIEN |
| TPTMSIUSTR | TPTM0IUSTR | TPTM1IUSTR |
| TPTMSIDIV | TPTM0IDIV | TPTM1IDIV |
| TPTMSFRUN | TPTM0FRUN | TPTM1FRUN |
| TPTMSFRRUN | TPTM0FRRUN | TPTM1FRRUN |
| TPTMSFSTP | TPTM0FSTP | TPTM1FSTP |
| TPTMSFSTR | TPTM0FSTR | TPTM1FSTR |
| TPTMSFDIV | TPTM0FDIV | TPTM1FDIV |
| TPTMSICNT0 | TPTM0ICNT0 | TPTM1ICNT0 |
| TPTMSILD0 | TPTM0ILD0 | TPTM1ILD0 |
| TPTMSICNT1 | TPTM0ICNT1 | TPTM1ICNT1 |
| TPTMSILD1 | TPTM0ILD1 | TPTM1ILD1 |
| TPTMSICNT2 | TPTM0ICNT2 | TPTM1ICNT2 |
| TPTMSILD2 | TPTM0ILD2 | TPTM1ILD2 |
| TPTMSICNT3 | TPTM0ICNT3 | TPTM1ICNT3 |
| TPTMSILD3 | TPTM0ILD3 | TPTM1ILD3 |
| TPTMSFCNT | TPTM0FCNT | TPTM1FCNT |

### 3.7.2.3 TPTMnIRUN — Counter Start Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: $00000000_{\mathrm{H}}$

Table 3.158 TPTMnIRUN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | IRUN3 | Start command bit of interval timer channel 3 |
|  |  | 0: No action |
|  | 1: Start counter |  |

When writing 1 to the bit, the value of TPTMnILD3 is loaded in TPTMnICNT3.
This bit is always read as 0 .

| IRUN2 | Start command bit of interval timer channel 2 |
| :--- | :--- |
| $0:$ No action |  |
|  | 1: Start counter |
|  | When writing 1 to the bit, the value of TPTMnILD2 is loaded in TPTMnICNT2. |
|  | This bit is always read as 0. |
| 1 | Start command bit of interval timer channel 1 |
|  | 0: No action |
|  | 1: Start counter |

When writing 1 to the bit, the value of TPTMnILD1 is loaded in TPTMnICNT1.
This bit is always read as 0 .
$0 \quad$ IRUN0 Start command bit of interval timer channel 0

0 : No action
1: Start counter
When writing 1 to the bit, the value of TPTMnILD0 is loaded in TPTMnICNTO.
This bit is always read as 0 .

### 3.7.2.4 TPTMnIRRUN — Counter Restart Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Table 3.159 TPTMnIRRUN Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | IRRUN3 | Restart command bit of interval timer channel 3 <br> 0 : No action <br> 1: Restart counter <br> When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT3. <br> This bit is always read as 0 . |
| 2 | IRRUN2 | Restart command bit of interval timer channel 2 <br> 0 : No action <br> 1: Restart counter <br> When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT2. <br> This bit is always read as 0 . |
| 1 | IRRUN1 | Restart command bit of interval timer channel 1 <br> 0 : No action <br> 1: Restart counter <br> When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT1. <br> This bit is always read as 0 . |
| 0 | IRRUN0 | Restart command bit of interval timer channel 0 <br> 0 : No action <br> 1: Restart counter <br> When writing 1 to the bit, the counter is restarted from current value of TPTMnICNT0. <br> This bit is always read as 0 . |

### 3.7.2.5 TPTMnISTP — Counter Stop Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 3.160 TPTMnISTP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ISTP3 | Stop command bit of interval timer channel 3 <br> 0 : No action <br> 1: Stop counter <br> When writing 1 to the bit, the counter is stopped at the value of TPTMnICNT3. <br> This bit is always read as 0 . |
| 2 | ISTP2 | Stop command bit of interval timer channel 2 <br> 0 : No action <br> 1: Stop counter <br> When writing 1 to the bit, the counter is stopped at the value of TPTMnICNT2. <br> This bit is always read as 0 . |
| 1 | ISTP1 | Stop command bit of interval timer channel 1 <br> 0 : No action <br> 1: Stop counter <br> When writing 1 to the bit, the counter is stopped at the value of TPTMnICNT1. <br> This bit is always read as 0 . |
| 0 | ISTP0 | Stop command bit of interval timer channel 0 <br> 0 : No action <br> 1: Stop counter <br> When writing 1 to the bit, the counter is stopped at the value of TPTMnICNTO. <br> This bit is always read as 0 . |

### 3.7.2.6 TPTMnISTR — Counter Status Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 3.161 TPTMnISTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ISTR3 | Status bit of interval timer channel 3 |
|  |  | 0 : Counter is stopped. |
|  |  | 1: Counter is running. |
| 2 | ISTR2 | Status bit of interval timer channel 2 |
|  |  | 0 : Counter is stopped. |
|  |  | 1: Counter is running. |
| 1 | ISTR1 | Status bit of interval timer channel 1 |
|  |  | 0 : Counter is stopped. |
|  |  | 1: Counter is running. |
| 0 | ISTR0 | Status bit of interval timer channel 0 |
|  |  | 0 : Counter is stopped. |
|  |  | 1: Counter is running. |

### 3.7.2.7 TPTMnIIEN — Interrupt Enable Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1)

This register controls enabling/disabling of interrupt request by TPTM_IRQ[n].
When underflow occurs in interval timer channel $m$ in TPTMn, TPTMnIUSTR.IUSTRm bit is set whether IIENm bit is set or not. If IIENm bit is set, TPTM_IRQ[n] is asserted.

Note that TPTM_IRQ[n] will be asserted immediately after IIENm bit is set if TPTMnIUSTR.IUSTRm holds 1 .

Table 3.162 TPTMnIIEN Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | IIEN3 | Interrupt enable bit of interval timer channel 3 |
|  |  | 0 : Disable. |
|  |  | 1: Enable. |
| 2 | IIEN2 | Interrupt enable bit of interval timer channel 2 |
|  |  | 0 : Disable. |
|  |  | 1: Enable. |
| 1 | IIEN1 | Interrupt enable bit of interval timer channel 1 |
|  |  | 0 : Disable. |
|  |  | 1: Enable. |
| 0 | IIEN0 | Interrupt enable bit of interval timer channel 0 |
|  |  | 0: Disable. |
|  |  | 1: Enable. |

### 3.7.2.8 TPTMnIUSTR — Underflow Status Register of Interval Timer for PEn ( $\mathrm{n}=0$ to 1 )

This register indicates the status of underflow occurrence of interval timers in TPTMn.

Table 3.163 TPTMnIUSTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | IUSTR3 | Underflow flag bit of interval timer channel 3 <br> 0 : Underflow did not occur. <br> 1: Underflow occurred. <br> When writing 0 to the bit, IUSTR3 is cleared. Writing 1 to the bit is ignored. |
| 2 | IUSTR2 | Underflow flag bit of interval timer channel 2 <br> 0 : Underflow did not occur. <br> 1: Underflow occurred. <br> When writing 0 to the bit, IUSTR2 is cleared. Writing 1 to the bit is ignored. |
| 1 | IUSTR1 | Underflow flag bit of interval timer channel 1 <br> 0 : Underflow did not occur. <br> 1: Underflow occurred. <br> When writing 0 to the bit, IUSTR1 is cleared. Writing 1 to the bit is ignored. |
| 0 | IUSTR0 | Underflow flag bit of interval timer channel 0 <br> 0 : Underflow did not occur. <br> 1: Underflow occurred. <br> When writing 0 to the bit, IUSTR0 is cleared. Writing 1 to the bit is ignored. |

### 3.7.2.9 TPTMnIDIV — Divider Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Table 3.164 TPTMnIDIV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | IDIV[7:0] | Clock dividing setting of interval timer for all channels <br> Counter clock ratio is specified by the following expression. <br> count_clock = clk_cpu / (IDIV[7:0] + 1) |

## CAUTIONS

1. To avoid unintended timer behavior, the TPTMnIDIV register should be written while all channels of TPTMnICNTm are in stop state.
2. It is prohibited to access this register by bit-manipulation instruction.

### 3.7.2.10 TPTMnFRUN — Counter Start Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 3.165 TPTMnFRUN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FRUN | Start command bit of free-run timer |
|  | $0:$ No action |  |
|  | 1: Start counter |  |
|  |  | When writing 1 to the bit during the counter stopping, the value of $00000000_{H}$ is loaded in |
|  |  | TPTMnFCNT and the counter is started. |
|  | When writing 1 to the bit during the counter working, the value of $00000000_{\mathrm{H}}$ is loaded in |  |
|  |  | TPTMnFCNT and the counter is re-started. |
|  |  | This bit is always read as 0. |

### 3.7.2.11 TPTMnFRRUN — Counter Restart Register of Free-run Timer for PEn ( $\mathrm{n}=\mathbf{0}$ to $\mathbf{1}$ )

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 3.166 TPTMnFRRUN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FRRUN | Restart command bit of free-run timer |
|  | $0:$ No action |  |
|  | 1: Restart counter |  |
|  |  | When writing 1 to the bit, the counter is restarted from current value of TPTMnFCNT. |
|  |  | This bit is always read as 0. |

### 3.7.2.12 TPTMnFSTP — Counter Stop Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: $00000000_{\mathrm{H}}$

Table 3.167 TPTMnFSTP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FSTP | Stop command bit of free-run timer |
|  | $0:$ No action |  |
|  |  | 1: Stop counter |
|  |  | When writing 1 to the bit, the counter is stopped at the value of TPTMnFCNT. |
|  |  |  |
|  |  |  |

### 3.7.2.13 TPTMnFSTR — Counter Status Register of Free-run Timer for PEn ( $\mathbf{n}=\mathbf{0}$ to $\mathbf{1}$ )

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 3.168 TPTMnFSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FSTR | Status bit of Free- run timer |
|  | $0:$ Counter is stopped. |  |
|  | $1:$ Counter is running. |  |

### 3.7.2.14 TPTMnFDIV — Divider Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to 1 )

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - |  |  |  | FDIV[7:0] |  |  |  |  | |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 3.169 TPTMnFDIV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | FDIV[7:0] | Clock dividing setting of free-run timer <br> Counter clock ratio is specified by the following expression. <br> count_clock = clk_cpu / (FDIV[7:0] + 1) |

## CAUTIONS

1. To avoid unintended timer behavior, the TPTMnFDIV register should be written while TPTMnFCNT is in stop state.
2. It is prohibited to access this register by bit-manipulation instruction.

### 3.7.2.15 TPTMnICNTm — Counter Channel m Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $1, \mathrm{~m}=0$ to 3 )

| Value after reset: |  |  | Undefined |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | ICNT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset Undefined |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | ICNT[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset Undefined |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 3.170 TPTMnICNTm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICNT[31:0] | Counter value of interval timer channel $m$ for PEn |
|  |  | When writing $1_{\mathrm{B}}$ to TPTMnIRUN.IRUNm, the value of TPTMnILDm is loaded in this register <br> and this register starts to count down from this value. |
|  |  | Also, when an underflow of this register occurs, the value of TPTMnILDm is reloaded in this <br> register and this register continues to count down from this value. |

## CAUTION

To avoid unintended timer behavior, the TPTMnICNTm register should be written while in stop state.

### 3.7.2.16 TPTMnILDm — Load Channel m Register of Interval Timer for PEn ( $\mathrm{n}=0$ to $1, \mathrm{~m}=0$ to 3 )

Table 3.171 TPTMnILDm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ILD[31:0] | Load data value of interval timer channel $m$ for PEn |
|  |  | At the timing of writing 1 to TPTMnIRUNm, the value of this register is loaded in |
|  | TPTMnICNTm. |  |
|  | Also, when an underflow of TPTMnICNTm occurs, the value of this register is reloaded in |  |
|  | TPTMnICNTm. |  |

## CAUTION

To avoid unintended timer behavior, the TPTMnILDm register should be written while TPTMnCNTm of corresponding channel is in stop state.

### 3.7.2.17 TPTMnFCNT — Counter Register of Free-run Timer for PEn ( $\mathrm{n}=0$ to $\mathbf{1}$ )

Value after reset: Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | FCNT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset Undefined |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | FCNT[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset Undefined |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 3.172 TPTMnFCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FCNT[31:0] | Counter value of free-run timer for PEn |
|  |  | When writing $1_{\mathrm{B}}$ to TPTMnFRUN.FRUN, the value of $0000 \_0000_{\mathrm{H}}$ is loaded in this register and <br> this register starts to count up from this value. |
|  |  | Also, when an overflow of this register occurs, the value of $0000^{2} 0000_{\mathrm{H}}$ is reloaded in this |
| register and this register continues to count up from this value. |  |  |

## CAUTION

To avoid unintended timer behavior, the TPTMnFCNT register should be written while in stop state.

### 3.7.3 TPTM Function

## CAUTION

If interruption is used as El level instead of FE level, set the TPTMSEL register before TPTM starts.
It is prohibited to change the setting value of the TPTMSEL register after TPTM start.

### 3.7.3.1 Normal Operation

The normal operation flow is shown in Figure 3.53.

Figure 3.53 Flow of Normal Operation

It shows the timing chart of normal operation of interval timer in case that counter clock ratio is a $1 / 2$ period of CPU_CLK and load data value is $00000004_{\mathrm{H}}$ in Figure 3.54.

Figure 3.54 Normal Operation (TPTMnIDIV $=00000001_{\mathrm{H}}$, TPTMnILD $=00000004 \mathrm{H}$ )

### 3.7.3.2 Operation during a Restart

The flow of operation during a restart is shown in Figure 3.55.

Figure 3.55 Flow of Operation during a Restart

TPTMnICNTm starts countdown at the next cycle after setting TPTMnIRUN.
TPTMnICNTm stops countdown at the next cycle after setting TPTMnISTP during countdown.
TPTMnICNTm restarts countdown from the current counter value at the next cycle after setting TPTMnIRRUN during countdown stop.

The timing chart of interval timer operation at the time of restart when the counter clock ratio is $1 / 2$ period of CPU_CLK and load data value is $00000004_{\mathrm{H}}$ is shown in Figure 3.54.

Figure 3.56 Operation during a Restart (TPTMnIDIV $=0000$ 0001н, TPTMnILD $=0000$ 0004н)

### 3.7.3.3 Operation during an Underflow

When TPTMnIIEN.IIENm is $1_{\mathrm{B}}$, an interrupt is enabled, TPTMnIUSTR.IUSTRm is set and TPTM_IRQ is asserted at the next cycle after TPTMnCNTm becomes $00000000_{\mathrm{H}}$.

When CPU has finished interrupt processing of TPTM, it needs to clear TPTMnIUSTR.IUSTRm.

## Cycles of TPTMn Interrupt

The cycles of TPTMn Interrupt are as follows.

- TPTMn Interrupt generation cycle $=$ TPTMnCNTm $\times$ Counter-Clock cycle*
*Counter-Clock cycle $=$ CPU_CLK $\times($ TPTMnIDIV +1$)$

When TPTMnIIEN.IIENm is 0 , an interrupt is disabled, TPTMnIUSTR.IUSTRm is set but TPTM_IRQ is not asserted at the next cycle after TPTMnCNTm becomes $00000000_{\mathrm{H}}$. In this case, TPTM_IRQ is asserted if TPTMnIIEN.IIENm is set before TPTMnIUSTR.IUSTRm is cleared.

### 3.8 Usage Notes

### 3.8.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation

When a control register is updated by a store instruction, there is a time lag from execution of the store instruction by the CPU to actual updating of the control register. Therefore, appropriate processing for synchronization is required to ensure that control registers reflect updated values before execution of subsequent instructions. The processing for synchronization is shown below.

For details on the procedure regarding updating of the system registers by the LDSR instruction and synchronization with subsequent instructions, refer to Section 3.2.7.3, Hazard Management after System Register Update.

### 3.8.1.1 When Updated Results in the Control Registers or Memory are Reflected in the Implementation of a Subsequent Instruction

Example 1) An interrupt may be enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.
(1) Store instruction to update a control register (ST.W, etc.)
(2) Dummy reading of the above-mentioned control register (LD.W, etc.)*1
(3) SYNCP
(4) Subsequent instruction (EI, etc.)

Example 2) Implement the same processing even when the access required after waiting to secure the updating of a given control register (register A) is to another control register (register B). This includes the following cases: the interlinked operation of different peripheral modules and when releasing the interrupt mask in INTC after making peripheral module settings.

However, this processing is unnecessary if control registers A and B are in the same peripheral group.
For the correspondence between the peripheral groups and the peripheral modules/registers, see each section.
(1) Store instruction to update control register A (ST.W, etc.)
(2) Dummy reading of the above-mentioned control register (LD.W, etc.)*1
(3) SYNCP
(4) Store/Load instruction to access control register B (ST.W, LD.W, etc.)

The same processing is also required when access to control registers and memory within the scope of protection starts after waiting for the completion of settings for safety functions such as memory protection, ECC checking, and so on.

Moreover, the same processing is also required when guarantee the completion of store accesses to memory.
Note 1. Dummy reading of any register of the same peripheral group can be used instead.

### 3.8.1.2 When the Updated Results in the Control Registers and Memories are Reflected in the Instruction Fetch of a Subsequent Instruction

1. If you wish to write an instruction to the RAM and then branch to the RAM to execute the written instruction, do this as follows.
(1) Store instruction to update a memory (ST.W, etc.)
(2) Dummy reading of the above-mentioned memory (LD.W, etc.)
(3) SYNCI
(4) Subsequent instruction (branch instruction, etc.)
2. When branching to a target memory after waiting for the completion of updating the control registers for memory protection and ECC, do this as follows.
(1) Store instruction to update a control register (ST.W, etc.)
(2) Dummy reading of the control register (LD.W, etc.)
(3) SYNCI
(4) Subsequent instruction (branch instruction, etc.)

### 3.8.1.3 Product information of SYNCM

Table 3.173 shows the correspondence between the module names given in the RH850G4MH User's Manual: Software and the module names in this product information document.

Table 3.173 Module Name Correspondence in this Product Information Document

| Module Name | Module Name of This Product Information Document |
| :--- | :--- |
| L1RAM (given CPU) | Local RAM (own core) |
| L1RAM (other CPU) | Local RAM (other core) |
| L2RAM | Cluster0/1 RAM |
| INTC1 | INTC1 |
| Others | There is no module corresponding to "Others" in this product |

### 3.8.1.4 Product information of Waiting for the Completion of Storage

Table 3.174 Bus Slaves for which Using Dummy Reading to Wait is Effective

| Bus Slaves | Description |
| :--- | :--- |
| L1RAM (given CPU) | Local RAM (own core) |
| L1RAM (other CPU) | Local RAM (other core) |
| L2RAM | Cluster0/1 RAM |
| INTC1 | INTC1 |
| Others | All peripheral module |

### 3.8.2 Synchronization of Load Instruction Completion and Subsequent Instruction Generation

When a control register and memory is accessed by a load instruction, the order of data accesses does not guarantee the same order of program. Therefore, appropriate processing for synchronization is required to ensure the completion of a load instruction for the subsequent data access instructions. However, the synchronization processing is not necessary for accesses to some target data space. For details on target data space, refer to Section 4.2.2, Data Space
Accessible by CPU0, CPU1. The processing for load synchronization is shown below.
Example) It is necessary to wait for the completion of a load access to an address A before an access to other address B, proceed as follows in this case.
(1) Load instruction to refer Address A (LD.W, etc.)
(2) SYNCP
(3) Store/Load instruction to access Address B (ST.W, LD.W, etc.)

### 3.8.3 Accesses to Registers by Bit-Manipulation Instructions

Processing of a bit-manipulation instruction takes the form of atomic reading, modification, and writing of an eight-bit unit. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. However, take care in the cases of registers that contain multiple flag bits, since the read-modify-write cycle may also clear flags other than those which were for clearing.

Write access to H-Bus group registers by using bit-manipulation instructions is not atomic. Access by other masters may interrupt the read-modify-write processing of these instructions.

### 3.8.4 Ensuring Coherency after Code Flash Programming

For PE0 and PE1, see Section 3.2.9, Ensuring Coherency after Code Flash Programming.
For ICUMD, see the E2x ICUMD User's Manual.

### 3.8.5 Overwriting Context when Acknowledging Multiple Exceptions

Exceptions may be acknowledged regardless of the states of the ID or NP bits of the PSW register. This depends on the type of exception. When multiple exceptions occur, the contents of the system registers which hold the context information are overwritten. Regarding the conditions for acknowledging exceptions from each source and the possibility of return and recovery, see Section 3.2.4, Exceptions and Interrupts.

### 3.8.6 Usage Notes on Prefetching

CPU executes speculative instruction fetching from locations after the current value of the program counter to maintain the throughput of instruction fetches. Reading from memory due to such prefetching may proceed even from locations to which instruction codes have not been assigned (Note 1. in Figure 3.57). Note the following and keep in mind that the CPU does not execute values read in such cases.

The following notes apply to instruction fetching from memory in general.

- Occurrence of ECC errors due to values in memory being undefined

This prefetching may lead to an ECC error in case of reading from the code flash memory after it has been erased or from the Local RAM or Cluster RAM before initialization. When instruction codes are assigned to memory, initialize said area with values as desired (Note 1. in Figure 3.57).

- Detection of illegal access by the CRG

The CRG may detect such prefetching as illegal access. To prevent prefetching being detected as an illegal access, do not allow any region of overlap area with said areas (Note 1. in Figure 3.57) and areas to which access is prohibited by the CRG. Reading from an area protected by the MPU does not cause a memory protection exception.

- Access to Access Prohibited Area

Assign instruction codes to memory without allowing any overlap between said area (Note 1. in Figure 3.57) and an access-prohibited area.

- Speculative read operation by Prefetch

Depending on the decode result of prefetch instruction, the CPU may issue speculative read request to Local RAM (own core), Local RAM (other core), Cluster RAM or Code Flash. The lockstep error described in Section 38.4.4, Usage Note may be occured by speculative read request. If it is unnecessary as a result of branch instruction, the data is discarded.

Note 1. Area from final address of instruction code to final address +64 bytes. Even if instruction codes are not placed in this area, requests for prefetching may lead to reading from memory at the time of branching.

Figure 3.57 Areas that Require Attention Regarding Prefetching

### 3.8.7 Product Information of Initial Value for G4MH Register

The G4MH register's initial values of the product dependent are shown below.

| Register No. | Symbol | Initial value |
| :--- | :--- | :--- |
| SR0,1 | SPID | ${ }^{* 1}$ |
| SR1,1 | SPIDLIST | FFFF FFFF |
| SR2,1 | RBASE | ${ }^{* 2}$ |
| SR6,1 | PID | ${ }^{* 3}$ |
| SR0,2 | PEID | ${ }^{* 4}$ |
| SR1,2 | BMID | ${ }^{* 5}$ |
| SR24,4 | ICCTRL | $00010003_{H}$ |
| SR26,4 | ICCFG | $* 6$ |

Note 1. The initial values of SPID register are listed below.
$\begin{array}{ll}\text { CPU0: } & 00000000_{\mathrm{H}} \\ \text { CPU1: } & 00000001_{\mathrm{H}}\end{array}$
Note 2. See Section 4, Address MAP about RBASE register's bit to 31 from 9. Initial value of RBASE.DV bit is 0 and Initial value of RBASE.RINT bit is 0 .
Note 3. The initial values of PID register are listed below.

| E2x-FCC1 | 0604 OFOO $_{H}(C P U 0 / C P U 1)$ |
| :--- | :--- |
| E2M | $06040 F 00_{H}(C P U 0 / C P U 1)$ |

Note 4. The initial values of PEID register are listed below.

| CPU0: | $00000000_{\mathrm{H}}$ |
| :--- | :--- |
| CPU1: | $00000001_{\mathrm{H}}$ |

Note 5. The initial values of BMID register are listed below.

| CPU0: | $00000000_{\mathrm{H}}$ |
| :--- | :--- |
| CPU1: | $00000001_{\mathrm{H}}$ |

Note 6. The initial values of ICCFG register are listed below.

| E2x-FCC1 | $0000{1044_{H}}^{\text {E2M }}$ |
| :--- | :--- |
|  | $00001044_{\mathrm{H}}$ |

### 3.8.8 Product Information of SYSERR Factor

The product-dependent SYSERR causes are shown below. Refer to Section 3.2.4, Exceptions and Interrupts for details on SYSERR.

| Exception Cause Code*1 | Cause |
| :--- | :--- |
| $11_{\mathrm{H}}$ | When any of the following errors occurs in instruction fetch |
|  | - ADDRESS ECC error in Local RAM, Cluster RAM and Code Flash |
|  | - Guard error in PEG, CRG and security guard.*2 |
|  | - Address Feedback error in LRAM and Cluster RAM |
|  | - An unimplemented area is fetch accessed |
| $13_{\mathrm{H}}$ | When any of the following errors occurs in instruction fetch |
|  | - Uncorrectable DATA ECC error in Local RAM, Cluster RAM and Code Flash (including cases where 1-bit |
|  | correction is prohibited) |
|  | - Address parity error in Code Flash. |

Note 1. Refer to Section 3.2.4, Exceptions and Interrupts about another exception cause code (excluding 11 ${ }_{\mathrm{H}}$ and $13_{\mathrm{H}}$ ).
Note 2. Guard error caused by security setting. Refer to the E2x ICUMD User's Manual for details on Security guard.

### 3.8.9 Product Information of Cache Structure

The product-dependent cache strucuter are shown below.

| Cache structure | E2x-FCC1 | E2M |
| :--- | :--- | :--- |
| Tootal Size | 16 KB | 16 KB |
| Number of Way | 4-way | 4-way |
| Number of Line | 128 line | 128 line |

### 3.8.10 Product Information of Fetch Size

These product's $\mathrm{CPU}(\mathrm{G} 4 \mathrm{MH})$ fetch size is 64 -Bit.

### 3.8.11 Register Initialization

The CPU in this product has general purpose registers and system registers which value after reset are undefined. In case of lockstep core, initial value of the master core and checker core after reset may be different. Therefore, these registers must be initialized at first. The registers which need the initialization are shown in Table 3.175.
For Usage of Lockstep Error, see Section 38.4.4, Usage Note.
Table 3.175 Registers needed to be initialized

| Type | Registers |
| :--- | :--- |
| General purpose register | r1 to r31 |
| Basic system register | EIPC, FEPC, CTPC, EIWR, FEWR, EBASE, INTBP, MEA, MEI, RBIP |
| FPU system register *1 | FPSR, FPEPC, FPST, FPCC |
| MPU function register | MCA, MCS, MCR, MCI, MPLA, MPUA, MPAT, MPID0 to MPID7 |
| FXU Function Registers *2 | wr0 to wr31, FXSR, FXST, FXXC, FXXP |
| Cache operation function register | ICTAGL, ICTAGH, ICDATL, ICDATH, ICERR |

Note 1. When the PSW.CU0 is set to 1, initialize the above registers.
Note 2. When the PSW.CU1 is set to 1, initialize the above registers.

## Section 4 Address MAP

### 4.1 Address MAP

Table 4.1 shows the address space of the RH850/E2x-FCC1 and E2M.
When making an access to register space, access the addresses shown in each peripheral IPs section. Do not access an address that is not specified in Table 4.1 and an area where any access is prohibited. If an unspecified address or reserved area is accessed, operation is not guaranteed.

Table 4.1 Address MAP of RH850/E2x-FCC1 and E2M

| Address | Address Space Type | Size |
| :---: | :---: | :---: |
| $00000000^{\text {H }}$ to 007F FFFF ${ }_{\text {H }}$ | Code flash (User area) | 8 MB |
| $00800^{0000}{ }_{H}$ to 07FF FFFF ${ }_{\text {H }}$ | Access prohibited area |  |
|  | Code flash (User boot area) | 64 KB |
| $08010000{ }_{\text {H }}$ to $0802 \mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $08030000_{\text {H }}$ to $08033 \mathrm{FFF}_{\mathrm{H}}$ | Code flash (Product Info Area) | 16 KB |
| $08034000^{\text {H }}$ to 0803 7FFF ${ }_{\text {H }}$ | Code flash (ECC test Area) | 16 KB |
| $0803 \mathrm{8000}_{\text {H }}$ to 0FFFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| $10000000_{\mathrm{H}}$ to 1 FFFF $\mathrm{FFFF}_{\mathrm{H}}$ | H-Bus area | 256 MB |
| $20000000_{\mathrm{H}}$ to FD9F $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FDA0 0000 ${ }^{\text {H }}$ to FDA0 $7 \mathrm{FFF}_{\mathrm{H}}$ | Local RAM (CPU1) | 32 KB |
| FDA0 $8000{ }_{H}$ to FDBF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FDC0 $0000{ }_{H}$ to FDC0 $7 \mathrm{FFF}_{\mathrm{H}}$ | Local RAM (CPU0) | 32 KB |
| FDC0 $8000_{\mathrm{H}}$ to FDDF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FDE0 $0000_{\text {H }}$ to FDE0 $7 \mathrm{FFF}_{\mathrm{H}}$ | Local RAM (self) | 32 KB |
| $\mathrm{FDEO}^{8000}{ }_{\mathrm{H}}$ to FDFF FFFF ${ }_{\mathrm{H}}$ | Access prohibited area |  |
| FE00 $0000{ }_{\text {H }}$ to FE0A $\mathrm{FFFF}_{\mathrm{H}}$ | Cluster RAM | 704 KB |
| FE0B $0000{ }_{\text {H }}$ to FEFF FFFFF | Access prohibited area |  |
| FF00 $0000_{\mathrm{H}}$ to FFFB $7 \mathrm{FFFF}_{\mathrm{H}}$ <br> (FF20 0000 ${ }_{H}$ to FF23 $^{7 \text { 7FFF }_{H} \text { ) }}$ <br> (FF30 0000 ${ }_{\boldsymbol{H}}$ to FF3F FFFF ${ }_{H}$ ) | P-Bus area <br> (Data Flash) <br> (Flash Extra Area) | $\begin{aligned} & 15.72 \mathrm{MB} \\ & 224 \mathrm{~KB} \\ & 1 \mathrm{MB} \end{aligned}$ |
| FFFB 8000 ${ }_{\text {H }}$ to FFFB $\mathrm{EFFF}_{\mathrm{H}}$ | I-Bus area | 28 KB |
| FFFB F000 ${ }_{\text {H }}$ to FFFB $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |
| FFFC $0000_{\mathrm{H}}$ to FFFC $3 \mathrm{FFF}_{\mathrm{H}}$ | CPU peripheral area (self) | 16 KB |
| FFFC $4000_{\mathrm{H}}$ to FFFC $7 \mathrm{FFF}_{\mathrm{H}}$ | CPU peripheral area (CPU0) | 16 KB |
| FFFCC $8000_{\text {H }}$ to FFFCC BFFF $_{\text {H }}$ | CPU peripheral area (CPU1) | 16 KB |
| FFFCC $\mathrm{COOO}_{\mathrm{H}}$ to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ | Access prohibited area |  |

See Section 3, CPU System for details about each area.
See Section 41.2.3, Mapping of Flash Extra Area for details about Flash Extra Area.
See Section 41.2.4, Examples of the Chip Writing for details about OTP setting.
See RH850/E2x Safety Application Note for details about ECC test Area in Code flash.

### 4.2 Address Space Viewed from Each Bus Master

Figure 4.1 shows address spaces of RH850/E2x-FCC1 and E2M viewed from each bus master.

### 4.2.1 Space in which Instructions can be Fetched

1. Instructions of CPU0, CPU1 and ICUM can be fetched from the code flash, local RAM and Cluster RAM.
2. The reset vector (RBASE initial value) of CPU0 and CPU1:

- When starting up from the user boot area, its head address is $08000000_{\mathrm{H}}$.
- When starting up from the user area of RH850/E2x-FCC1 and E2M, its head address is selectable from 00000000 to 007F FFFF H by Option byte. For details, see Section 41, Flash Memory.

3. The reset vector (RBASE initial value) of ICUM:

- See the E2x ICUMD User's Manual.

### 4.2.2 Data Space Accessible by CPU0, CPU1

All spaces are accessible.
NOTE
The data accesses inside the following target data space are operated in the same order as the program.

- Code Flash
- H-Bus area Group 0, 1, 2
- P-Bus area Group $0,1,2 \mathrm{H} / 2 \mathrm{~L}, 3,4,5,6,7,8,9$
- I-Bus area 0, 1, 2, 3
- CPU peripheral area (self, CPU0, CPU1)
- Cluster RAM Cluster 0, 1*1

Note 1. The data accesses between Cluster0 RAM and Cluster1 RAM are also operated in the same order as the program.

The load accesses inside the following target data space may be operated before the completion of the preceding access (load or store). In order to guarantee the order of accesses, synchronization processing by software for the preceding access is necessary.

- Local RAM (self, CPU0, CPU1)

For the data accesses between different target spaces, the order of data accesses is not guaranteed as the program order.

In order to guarantee the order of accesses, synchronization processing by software for the preceding access is necessary.

For details of synchronization processing, refer to Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation and Section 3.8.2, Synchronization of Load Instruction Completion and Subsequent Instruction Generation.

### 4.2.3 Data Space Accessible by ICUM

See the E2x ICUMD User's Manual.

### 4.2.4 Data Space Accessible by DMA (sDMAC, DTS)

See Figure 4.1 for the accessible spaces from the DMA.

### 4.2.5 Data Space Accessible by H-Bus Master

See Figure 4.1 for the accessible spaces from the H-Bus Master.
NOTE
H-Bus Master can't access to each H-Bus Slave (except RHSIF). See table below about detail of HBUS access.

| H-Bus Slave | RHSIF |  | ETNC |
| :--- | :--- | :--- | :--- |
| H-Bus Master | RHSIF | FLXA | $\checkmark$ |
| RHSIF | $\checkmark$ | $\checkmark$ | - |
| FLXA | - | - | - |
| HS-SPI | - | - | - |
| ETNC | - | - |  |

Note: For usage assignment of instruction codes, see Section 3.8.6, Usage Notes on Prefeching.

Figure 4.1 Address Space of RH850/E2x-FCC1 and E2M Viewed from Each Bus Master

### 4.3 Cluster RAM and Retention RAM

The cluster RAM of RH850/E2x-FCC1 and E2M is divided into two, Cluster0 and Cluster1. Different clusters can be accessed concurrently. The upper 64 Kbytes of Cluster 1 is the retention RAM that retains data even during poweroff standby state.
$\square$
Figure 4.2 Cluster RAM of RH850/E2x-FCC1 and E2M

## Section 5 Operating Modes

### 5.1 Features

This LSI has multiple operating modes, which can be selected with the three pins (MD1, MD0 and TRST) and the settings of option bytes STMSEL1 / STMSEL0. For the procedures to set STMSEL1 / STMSEL0, see Section 41, Flash Memory. Table 5.1 lists the operating modes. The values of MD0, MD1 and TRST are latched at the rising edge of RES_IN to determine the operating mode. These pins are continually monitored during operation to detect mode errors.

Table 5.1 Mode List

| Value Set to Pin |  |  | Value Set in Option Byte |  | Mode | Startup Area | Types of Debug Interface* ${ }^{* 1, * 4}$ | Flash Writer Interface | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| MD1 | MDO | TRST | STMS <br> EL1 | $\begin{aligned} & \text { STMS } \\ & \text { ELO } \end{aligned}$ |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 | Normal operation mode | User area*2 | Nexus/LPD | - | BIST is available |
| 0 | 0 | 0 | 0 | 1 | User boot mode | User boot area | Nexus/LPD | - | BIST is available |
| 0 | 0 | 0 | 1 | X | Serial programing mode | Boot firmware | Nexus/LPD *6 | CSI | Serial programming is available |
| 0 | 0 | $1 * 5, * 8$ | X | 0 | Normal operation mode | User area*2 | Nexus/LPD/ Boundary scan*7 | - | CPU will not run ${ }^{* 5}$ BIST is not available ${ }^{*} 8$ |
| 0 | 0 | $1 \times 5, * 8$ | X | 1 | User boot mode | User boot area | Nexus/LPD/ Boundary scan*7 | - | CPU will not run ${ }^{* 5}$ BIST is not available ${ }^{* 8}$ |
| 0 | 1 | X | X | X | Serial programing mode | Boot firmware | Nexus/LPD*6 | RS-CANFD / RSCAN, CSI, 2-wire UART*3 | Serial programming is available |

Note 1. For the correspondence between the pin function and pin state in each debug interface. See Section 2, Pin Function.
Note 2. Reset vector address can be set by Option Bytes for the ROM area. See Section 41, Flash Memory.
Note 3. Method for changing the serial communication mode is shown in Section 41, Flash Memory. CSI is the "Clocked Serial Interface".

Note 4. Nexus/LPD for debug is determined by the TDI level when TRST is released. Nexus shall be selected when Boundary scan runs.

Note 5. CPU will not run after reset release in this mode when TRST = 1. This mode is for the purpose of On-Chip debug or when using a boundary scan. Option bytes can be used to disable the CPU from running after reset. See Section 42, Basic Hardware Protection (BHP) and Section 41, Flash Memory for details.

Note 6. When RS-CAN or RS-CANFD boot is selected.
Note 7. Boundary scan can be run when the CPU and ICUM are not running. Boundary scan is selected by using JTAG instructions. TDI shall be set 1 when TRST is released for running Boundary scan.

Note 8. BIST will not run when TRST $=1$.

### 5.1.1 Normal Operation Mode

This mode is the default mode for execution of application software. The Boundary scan, Power-Up BIST, Shutdown BIST and the On-chip Debug capabilities also use this mode. After reset release, instruction fetch is carried out from the user area. For the reset vector of each CPU, see Section 41, Flash Memory.

The CPU will not autonomously run when TRST = 1. A debugger must be used to cause the CPU to run.

### 5.1.2 User Boot Mode

This mode is basically the same as Normal Operation Mode except for the fetch area.
This mode is used to provide an alternative boot location for application software.
After release from the reset state, instruction fetch is carried out from the user boot area.

### 5.1.3 Serial Programming Mode

This mode is initiated by an external programming device. Use it to store application code or application data in the flash memories of the device. After reset release, the MCU boots up from the on-chip boot firmware and establishes a connection in the specified transmission method. For details, see Section 41, Flash Memory.

### 5.2 Input Pins

Table 5.2 shows the pin information for mode setting. The states of all the mode pins are latched in the Mode Register.
Table 5.2 Pin Information for Mode Setting

| Pin Name | I/O | Function |
| :--- | :--- | :--- |
| MD1 | Input | Operating mode select pin |
| MD0 | Input | Operating mode select pin |
| $\overline{\text { TRST }}$ | Input | Shared pin used as Nexus/JTAG reset pin and operating mode select pin |

### 5.3 Register Description

### 5.3.1 List of Registers

The following table lists the operating mode registers.
Table 5.3 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| SYSCTRL | Mode Register | MODE | FF70 0000 |  |  |
| SYSCTRL | FHVE3 Control Register | FHVE3 | FF70 3800 | 32 |  |
| SYSCTRL | FHVE15 Control Register | FHVE15 | FF70 3804 | 32 |  |

Table 5.4 Register Reset Condition

|  |  | Reset Source |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| MODE | ALL Registers | $\checkmark$ | $\checkmark * 1$ | - | - | - | - |

Note 1. VMON Reset is excluded.

### 5.3.2 MODE — Mode Register

This register indicates the Operating Mode of the device.
The states of the mode pins and mode select option bytes are latched in this register when the external reset or standby reset is released.

| Value after reset: $000 \times 000 \mathrm{x}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { STM } \\ & \text { SEL1 } \end{aligned}$ | $\begin{aligned} & \text { STM } \\ & \text { SELO } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | X | X |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | MD1 | MD0 | TRST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x | x | x |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 5.5 Mode Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | STMSEL1 | STMSEL1 <br> This bit indicates the status of the Option byte STMSEL1 <br> 0 : Low-level detected <br> 1: High-level detected |
| 16 | STMSELO | STMSELO <br> This bit indicates the status of the Option byte STMSELO <br> 0 : Low-level detected <br> 1: High-level detected |
| 15 to 3 | - | Reserved. <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | MD1 | MD 1 <br> This bit indicates the level of the signal latched for Mode Pin MD 1 <br> 0 : Low-level detected <br> 1: High-level detected |
| 1 | MD0 | MD 0 <br> This bit indicates the level of the signal latched for Mode Pin MD 0 <br> 0 : Low-level detected <br> 1: High-level detected |
| 0 | TRST | TRST <br> This bit indicates the level of the signal latched for Mode Pin TRST <br> 0 : Low-level detected <br> 1: High-level detected |

### 5.3.3 FHVE3 - FHVE3 Control Register

Please refer to Section 41, Flash Memory for details on this register.

### 5.3.4 FHVE15 - FHVE15 Control Register

Please refer to Section 41, Flash Memory for details on this register.

### 5.4 Mode Error

This LSI has the ability to notify the ECM when it detects an unintended activation of a different mode or unintended de-activation of the currently selected mode. The MD1, MD0 and TRST pins are monitored, along with the STMSEL0 and STMSEL1 bits to detect unintended changes. If these values change when they are not expected to change, a mode check error occurs.

The unintended modes are as follows. For details, see Section 39, Error Control Module (ECM).
Detectable unintended modes are shown in Table 5.6.
Table $5.6 \quad$ List of Detectable Mode Errors

| User Intended Mode | Detectable Mode Error |
| :--- | :--- |
| Normal Operation Mode | Unintended deactivation of Normal Operation Mode |
|  | Unintended activation of User Boot Mode |
| User Boot Mode | Unintended activation of Normal Operation Mode |
|  | Unintended deactivation of User Boot Mode |
| Normal Operation Mode / User Boot Mode | Unintended activation of Serial Programming Mode |
|  | Unintended activation of Production Test Mode |
| Other than On chip debug mode | Unintended Debug Enabled |
| any mode | The detection of differences between the latched value and from Flash. |
| NOTE |  |

Although it is possible to change the setting of MDO or $\overline{\text { TRST }}$ (e.g. for the purpose of selecting communication method) after RES_IN is released, a mode error is also detected when MDO or TRST is changed after RES_IN is released in serial programming mode. MD1 shall be fixed to "0" in user mode.

Mode check error functions work only when the settings of the external terminals and STMSEL1, STMSEL0 correspond with Normal operation mode or User boot mode under the condition of $\overline{\operatorname{TRST}}=0$.

## Section 6 Interrupts

This section describes the interrupt units.

### 6.1 Features of Interrupt Units

### 6.1.1 Units and Channels

This microcontroller has the following number of interrupt units.
Table $6.1 \quad$ Number of Units (INTC1)

| Product Name | RH850/E2x-FCC1 |  |
| :---: | :---: | :---: |
|  | 373 Pins | 292 Pins |
| Number of Units per PE | 1 | 1 |
| Unit Name | INTC1 |  |
|  | RH850/E2M |  |
| Product Name | 373 Pins | 292 Pins |
| Number of Units per PE | 1 | 1 |
| Unit Name |  | C1 |

Table 6.2 Number of Units (INTC2)

| Product Name | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Unit Name | 1 |  |

### 6.1.2 Register Base Address

The register base addresses of the interrupt units are listed in Table 6.5.
The address of each register in this section is specified as an offset from one of these base addresses.
Table 6.5 Register Base Address

| Base Address Name | SELF $/$ PE* $^{*}$ | Base Address | Bus Group |
| :--- | :--- | :--- | :--- |
| <INTC1_base> | INTC1 of SELF | FFFC $0000_{\mathrm{H}}$ | - |
| <INTC1_base> | INTC1 of PE0 | FFFC $4000_{\mathrm{H}}$ | CPU Peripheral 0 |
| <INTC1_base> | INTC1 of PE1 | FFFC $8000_{\mathrm{H}}$ | CPU Peripheral 1 |
| <INTC2_base> | - | FFF8 $0000_{\mathrm{H}}$ | Peripheral Group 0 |
| <INTIF_base> | - | FF09 $0000_{\mathrm{H}}$ | Peripheral Group 9 |
| <EINT_base> | - | FFC0 $0000_{\mathrm{H}}$ | Peripheral Group 6 |

### 6.1.3 Clock Supply

Clock supplies for each interrupt unit are shown in the following table.
Table 6.6 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| INTC1 | clk | CLK_CPU |
| INTC2 | pe_clk | CLK_CPU |
|  | bus_clk | CLK_HBUS |
| INTIF | pclk | CLK_HBUS |
| EINT | clk_lsb | CLK_LSB |

### 6.1.4 Interrupt Requests

The INTC2 interrupt requests are listed in the following table.
Table 6.7 Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| INTBRDC0 | INT_BRDC0 | Broadcast notification 0 | 4 | - | - |
| INTBRDC1 | INT_BRDC1 | Broadcast notification 1 | 5 | - | - |
| INTBRDC2 | INT_BRDC2 | Broadcast notification 2 | 6 | - | - |
| INTBRDC3 | INT_BRDC3 | Broadcast notification 3 | 7 | - | - |
| INTEINTSW0 | intreq_sint[0] | Software interrupt 0 | 14 | - | - |
| INTEINTSW1 | intreq_sint[1] | Software interrupt 1 | 15 | - | - |
| INTEINTSW2 | intreq_sint[2] | Software interrupt 2 | 16 | - | - |
| INTEINTSW3 | intreq_sint[3] | Software interrupt 3 | 17 | - | - |

### 6.1.5 Reset Sources

The reset sources for initialization of the interrupt units are shown in Table 6.8.
Table 6.8 Reset Sources

| Unit Name | Register Name | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| INTC1 | All registers*1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| INTC2 | All registers*1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| INTIF | All registers*1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| EINT | All registers*1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

Note 1. See Table 6.12.

### 6.1.6 External Input/Output Signals

External input/output signals of the interrupt units are listed below.
Table 6.9 External Input/Output Signals

| Unit Signal Name | Direction | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- | :--- |
| EINT |  |  | Input |
|  |  |  |  |
| IRQ0 | External pin IRQ0 | IRQ0 |  |
| IRQ1 | Input | External pin IRQ1 | External pin IRQ2 |
| IRQ2 | Input | External pin IRQ3 | IRQ1 |
| IRQ3 | Input | External pin IRQ4 | IRQ3 |
| IRQ4 | Input | External pin IRQ5 | IRQ4 |
| IRQ5 | Input | External pin IRQ6 | IRQ5 |
| IRQ6 | Input | External pin IRQ7 | IRQ6 |
| IRQ7 | Input | Non-maskable interrupt | IRQ7 |
| FENMI |  |  | NMI |

### 6.2 Overview

### 6.2.1 Outline

## INTC features

- Interrupt sources:
- Non-maskable interrupt (FENMI): 1 channel for each CPU
- FE level interrupt (FEINT0 to 1): 2 channels for each CPU
- Low latency EI level interrupt (maskable) EIINT0 to 31:
- 32 channels for each CPU
- Inter-processor interrupts: 4 channels shared on channels 0 to 3
- Broadcast interrupts: 4 channels shared on channels 4 to 7
- Low speed interrupts (maskable) (EIINT32 to 511):
- 480 channels shared by all CPUs
- Interrupt priority levels:
- Up to 16 interrupt priority levels can be set by the interrupt control registers.
- Interrupt detection method:
- The detection method of FEINT and EIINT interrupts are individually set to edge detection or level detection.
- Register banks:
- For details about register banks, see Section 3.2.4.5, Register Bank Function.

## INTC consists of INTC1 and INTC2

- INTC1
- All CPUs have their own interrupt controller, INTC1. Each CPU accesses the INTC1 that corresponds to that CPU. INTC1 controls low-latency interrupts and has the following functions:
- Priority setting
- Interrupt mask setting
- INTC2
- INTC2 is a common interrupt controller that all the CPUs share. INTC2 controls low-speed interrupts and has the following functions:
- Priority setting
- Interrupt mask setting
- CPU binding setting
- Broadcast interrupt setting

## Others

- INTIF
- Peripheral interrupt / TPTM interrupt control function
- EINT
- External interrupt / Software interrupt / NMI control function

### 6.2.2 Functional Overview

The act of branching from a currently running program to a different program in response to an event is called an exception. This microcontroller supports the following types of exceptions. Exceptions are described in detail in

## Section 3.2.4, Exceptions and Interrupts.

The following three exceptions are called interrupts, and are described in this section:

- FE level Non-Maskable Interrupt (FENMI)

An FENMI interrupt is acknowledged even if another FE level interrupt, FEINT, has been generated.

- An FENMI interrupt is acknowledged even if the CPU system register PSW.NP $=1$.
- Return from an FENMI interrupt is not possible and recovery is disabled, when multiple interrupts occur.
- FE level maskable interrupt (FEINT)

An FEINT interrupt can be acknowledged only if an FE level non-maskable interrupt, FENMI, has not been generated.

- An FEINT can be acknowledged if the CPU system register PSW.NP $=0$.
- Return is enabled and recovery is enabled.
- EI level maskable interrupt (EIINT)

An EIINT interrupt can be acknowledged only if an FE level interrupt, FENMI or FEINT, has not been generated.

- An EIINT can be acknowledged if the CPU system registers PSW.NP $=0$ and PSW.ID $=0$, and when the following two conditions are satisfied:
$>$ The interrupt priority level is higher than the priority level of the acknowledgment status, which is set to the CPU system register ISPR.
$>$ The interrupt priority level is higher than the priority level, which is set to the CPU system register PLMR.
- Return is enabled and recovery is enabled.
- Interrupt masking can be specified for each interrupt channel.
- One of 16 interrupt priority levels can be specified for each interrupt channel.

For details about the PSW register, see Section 3.2.3.2(5), PSW — Program Status Word.

### 6.2.3 Interrupt Sources

### 6.2.3.1 FE Level Non-Maskable Interrupts

See Section 3.2.4, Exceptions and Interrupts for details about the priority order, return PC, status registers and return instructions.

Table $6.10 \quad$ Non-Maskable Interrupt Requests

| Interrupt | Interrupt Request |  |  |  | Detection <br> Type | Exception Cause <br> Code | Onit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | Priority Order | Symbol | Name | Cause | Port | $* 1$ |
| :--- | :--- | :--- | :--- | :--- |

Note 1. See Section 3.2.4, Exceptions and Interrupts.

### 6.2.3.2 FE Level Maskable Interrupts

See Section 3.2.4, Exceptions and Interrupts for details about the priority order, return PC, status registers and return instructions.

Table 6.11 FE Level Interrupt Requests

| Interrupt | Interrupt Request |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Symbol | Cause | Unit | Priority Order | Detection Type | Cause <br> Code | Offset <br> Address |
|  | PE0 |  |  |  |  |  |
| FEINTO | FE level interrupt from the ECM | ECM | *1 | Edge | $\mathrm{FO}_{\mathrm{H}}$ | $\mathrm{FO}_{\mathrm{H}}$ |
| FEINT1 | Interrupt from Time Protection Timer for PE0*2 | Time Protection Timer | *1 | Level | F1 ${ }_{\text {H }}$ | $\mathrm{FO}_{\mathrm{H}}$ |
|  | PE1 |  |  |  |  |  |
| FEINTO | FE level interrupt from the ECM | ECM | *1 | Edge | $\mathrm{FO}_{\mathrm{H}}$ | $\mathrm{FO}_{\mathrm{H}}$ |
| FEINT1 | Interrupt from Time Protection Timer for PE1*2 | Time Protection Timer | *1 | Level | F1 ${ }_{\text {H }}$ | $\mathrm{FO}_{\mathrm{H}}$ |

Note 1. See Section 3.2.4, Exceptions and Interrupts.
Note 2. $\quad$ This interrupt can be used as an EIINT. See Section 6.3.13, TPTMSEL - TPTM Interrupt FE El Select Register.

### 6.2.3.3 El Level Maskable Interrupts

See Section 3.2.4, Exceptions and Interrupts for details about the priority order, return PC and return instructions.

See Section 6.3.2, EIC0 to EIC511 - EI Level Interrupt Control Register 0 to 511 for details about the control registers.

For details, refer to Appendix file "Interrupt_table.xlsx".

### 6.2.4 Block Diagram

The block diagram of the interrupt units is shown in Figure 6.1.

Figure 6.1 Block Diagram of Interrupt Units

### 6.3 Registers

### 6.3.1 List of Registers

Table 6.12 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protect |
| :---: | :---: | :---: | :---: | :---: | :---: |
| INTC1 | El Level Interrupt Control Register*1 | EICn ( $\mathrm{n}=0$ to 31) | <INTC1_base> + 0000 ${ }_{\text {H }}+02_{H} \times \mathrm{n}$ | 8, 16 | - |
|  | El Level Interrupt Mask Register*1 | IMR0 | <INTC1_base> + 00FOH | 8, 16, 32 | - |
|  | El Level Interrupt Bind Register*1 | EIBDn ( $\mathrm{n}=0$ to 31) | <INTC1_base> $+0100_{H}+04_{\mathrm{H}} \times \mathrm{n}$ | 32 | - |
| INTC2 | El Level Interrupt Control Register*1 | EICn ( $\mathrm{n}=32$ to 511) | <INTC2_base> $+0000_{H}+02_{\mathrm{H}} \times \mathrm{n}$ | 8, 16 | - |
|  | El Level Interrupt Mask Register*1 | $\operatorname{IMRn}(\mathrm{n}=1$ to 15) | <INTC2_base> $+1000_{H}+04_{H} \times \mathrm{n}$ | 8, 16, 32 | - |
|  | El Level Interrupt Bind Register*1 | EIBDn ( $\mathrm{n}=32$ to 511) | <INTC2_base> $+2000_{H}+04_{H} \times \mathrm{n}$ | 32 | - |
| INTIF | Peripheral Interrupt Status Register | PINTn ( $\mathrm{n}=0$ to 7) | <INTIF_base> $+00_{H}+04_{H} \times \mathrm{n}$ | 32 | - |
|  | Peripheral Interrupt Status Clear Register | PINTCLRn ( $\mathrm{n}=0$ to 7) | <INTIF_base> $+20_{H}+04_{H} \times \mathrm{n}$ | 32 | - |
|  | TPTM Interrupt FE EI Select Register | TPTMSEL | <INTIF_base> + $\mathrm{CO}_{\mathrm{H}}$ | 8, 16, 32 | - |
| EINT | NMI Interrupt Control Register | NMICTL | <EINT_base> | 8 | - |
|  | External Interrupt Control Register | EXINTCTL | <EINT_base> + 10 ${ }_{\text {H }}$ | 8, 16 | - |
|  | External Interrupt Status Register | EXINTSTR | <EINT_base> + $14_{\text {H }}$ | 8 | - |
|  | External Interrupt Status Clear Register | EXINTSTC | <EINT_base> + 18 H $^{\text {l }}$ | 8 | - |
|  | Software Interrupt Register 0 | SINTR0 | <EINT_base> + $2 \mathrm{O}_{\mathrm{H}}$ | 8 | - |
|  | Software Interrupt Register 1 | SINTR1 | <EINT_base> + $24_{\text {H }}$ | 8 | - |
|  | Software Interrupt Register 2 | SINTR2 | <EINT_base> + $288_{\text {H }}$ | 8 | - |
|  | Software Interrupt Register 3 | SINTR3 | <EINT_base> + 2 $\mathrm{C}_{\mathrm{H}}$ | 8 | - |

Note 1. It is recommended to execute a DI instruction to avoid incorrect detection of interrupts when the settings of these registers are changed.

### 6.3.2 EIC0 to EIC511 - EI Level Interrupt Control Register 0 to 511

These registers define control of EI level interrupts. There is one register for each EI interrupt source. For a complete list of interrupt sources, see Appendix file "Interrupt_table.xlsx".

## CAUTION

If the EIRFn bit is set to 0 immediately after a peripheral module generates the corresponding interrupt request upon detection of an edge (before an interrupt is acknowledged by the CPU), the request may be lost. If the EIRFn bit is set to 1 immediately after an interrupt is acknowledged by the CPU, a new interrupt request will be generated.
This also applies to bit manipulation instructions (set1, clr1, not1) described in Section 3.8.3, Accesses to Registers by Bit-Manipulation Instructions.
Accessing only the lower byte of this register (including EIMKn) by a bit-manipulation instruction does not modify the EIRFn bit.

| Value after reset: $0008 \mathrm{FH}_{\mathrm{H}}$ (edge detection), 808FH (level detection)*1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | EICTn | - | - | EIRFn | - | - | - | - | EIMKn | EITBn | - | - |  | EIP | 3:0] |  |
| Value after reset | 0/1*1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R/W | R | R | R | R | R/W | R/W | R | R | R/W | R/W | R/W | R/W |
| Note 1. I |  |  | upt d <br> upt d | ection ection | edg <br> leve |  |  |  |  |  |  |  |  |  |  |  |

Table 6.13 EIC0 to EIC511 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | EICTn | This bit indicates the type of interrupt detection. This bit is read only. <br> 0 : Detection by edge <br> 1: Detection by level <br> When writing in 8 -bit or 16 -bit units, write the value after a reset. |
| 14, 13 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 12 | EIRFn | Interrupt Request Flag <br> Operation varies depending on the interrupt input interface. <br> 0 : No interrupt request (Initial value) <br> 1: Interrupt request present <br> - Edge detection This flag is automatically cleared to 0 when an interrupt request from its own channel is acknowledged by the CPU core. <br> - Level detection This bit cannot be set or cleared by the software. This is a read-only bit. |
| 11 to 8 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |

Table 6.13 EIC0 to EIC511 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | EIMKn | Interrupt Mask <br> If this bit is set to 1 , interrupt requests set by the interrupt request flag (EIRFn) are masked to inhibit interrupt requests from the channel to the CPU core. The presence of unprocessed interrupts is not reported and the PMEI bit in ICSR is not set for the channel for which this bit is set to 1 . Even when interrupt processing is disabled by the setting of this bit, the input of an interrupt signal is not masked and the interrupt request flag is set. The state of this bit is also reflected in the Interrupt Mask Register (IMR). <br> When the interrupt request from the channel is masked with EIMKn $=1$, the EIRFn still reflects the interrupt request for the channel and can be polled in software. When the EIMKn bit is cleared, interrupt requests from the channel are issued to the CPU core for subsequent processing. The state of the EIMKn bit is also reflected in the corresponding IMRm register. <br> 0 : Interrupt processing is enabled. <br> 1: Interrupt processing is disabled. (Initial value) |
| 6 | EITBn | Interrupt Vector Method Select <br> 0 : Direct vector method <br> 1: Table reference method |
| 5, 4 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 3 to 0 | EIPn | These bits specify 16 interrupt priority levels ( 0 : highest priority, 15: lowest priority). <br> If two or more El level interrupt requests are generated simultaneously, the source with a higher priority specified by these bits is selected and is sent to the CPU core. If the priorities specified by these bits are equal, the source with the lower default priority channel number is selected. |

Note: $\mathrm{n}=0$ to 511
The values for the given channel numbers listed as reserved in Appendix file "Interrupt_table.xlsx" must not be set to anything other than their values after a reset.

## NOTE

When a channel n is defined as broadcast interrupt (EIBDn.CST $=1$ ), EIMKn and EIRFn bits of the EICn register of the channel must be set to 0 after an initial configuration of the channel. In the period when the EIINTn interrupt is enabled, it is prohibited to mask ( $E I M K n=1$ ) an interrupt processing of the channel. When it is necessary to mask a broadcast interrupt, EIC4 to EIC7 registers in INTC1 of each PE can be used to mask the corresponding broadcast interrupt.

### 6.3.3 IMR0 to IMR15 - EI Level Interrupt Mask Register 0 to 15

These registers are an aggregation of the EIMK bits from the EIC registers. The setting of the EIMK bit in the EIC register is reflected in this register. Also the setting of a bit in this register is reflected in the EIMK bit of the corresponding EIC register.

Table 6.14 IMRO to IMR15 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | EIMK $(m \times 32+31)$ to | These are interrupt mask bits for El level maskable interrupt (INT) channels 0 to 511. |
|  | EIMK $(m \times 32+0)$ | $0:$ Interrupt processing enabled |
|  |  | 1: Interrupt processing disabled |

Note: $m=0$ to 15
The value of the EIMK bits for the given channel numbers listed as reserved in Appendix file "Interrupt_table.xlsx" must be set to 1.

NOTE
When writing to the EIMK bit by writing the IMR1 to 15 registers, only access from the PE set in the EIBDn.PEID ( $\mathrm{n}=32$ to 511) register in the corresponding channel is possible. The EIMK bit is not updated when writing from a different PE.

### 6.3.4 EIBD0 to EIBD31 - El Level Interrupt Bind Register 0 to 31

These registers are provided for each EI level interrupt source to define binding between interrupt sources and PEs. For details on each of the interrupt sources, see Appendix file "Interrupt_table.xlsx".

Table 6.15 EIBD0 to EIBD31 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | PEID[2:0] | These bits specify the interrupt bind (request) destination. |
|  |  | These bits are fixed in EIBD0 to EIBD31 and cannot be modified. |
|  | $000:$ Interrupt is bound to PE0. |  |
|  | $001:$ Interrupt is bound to PE1. |  |

Note 1. The values for the given channel numbers listed as reserved in Appendix file "Interrupt_table.xlsx" must not be set to anything other than their values after a reset.

NOTE
Changing the corresponding EIBDn register during the processing of an EIINT request is prohibited.
Note: $\quad \mathrm{n}=0$ to 31

### 6.3.5 EIBD32 to EIBD511 - El Level Interrupt Bind Register 32 to 511

These registers are provided for each EI level interrupt source to define a binding between interrupt sources 32 to 511 and CPU cores. For a list of interrupt sources, see Appendix file "Interrupt_table.xlsx".

Table 6.16 EIBD32 to EIBD511 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | CST | Broadcast interrupt enable. |
| 30 to 26 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0. |
| 25 to 24 | BCP[1:0] | When the CST bit is 1 , these bits specify a broadcast interrupt port number setting. <br>  <br> 23 to 3 |
|  | When the CST bit is 0, these bits do not specify anything. |  |

Note: The values for the given channel numbers listed as reserved in Appendix file "Interrupt_table.xlsx" must not be set to anything other than their valies after a reset.

NOTE
Changing the corresponding EIBDn register during the processing of an EIINT request is prohibited.
Note: $n=32$ to 511

### 6.3.6 NMICTL — NMI Interrupt Control Register

NMICTL is an 8-bit register used to define the active edge for the NMI interrupt input. The active edge can be either rising or falling.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | NMIS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 6.17 NMICTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | NMIS | NMI Interrupt Detecting Method Select |
|  |  | This bit selects the method of detecting an NMI interrupt signal from either falling edge or |
|  | rising edge. |  |
|  | 0: An interrupt request is detected by the NMI input falling edge. |  |
|  | 1: An interrupt request is detected by the NMI input rising edge. |  |
|  |  |  |

### 6.3.7 EXINTCTL — External Interrupt Control Register

EXINTCTL is a 16-bit register. This register defines the detection method for external interrupt input pins IRQ0 to IRQ7. Detection methods are edge (rising or falling) or level (low or high).

Table 6.18 EXINTCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 14 | IRQ7S | External Interrupt Detecting Method Select |
| 13 to 12 | IRQ6S | These bits select the method of detecting an IRQ7 to IRQ0 interrupt signal from either low |
| 11 to 10 | IRQ5S | level, high level, falling edge, or rising edge. |
| 9 to 8 | IRQ4S |  |
| 7 to 6 | IRQ3S interrupt request is detected by the IRQn input low level.*1 | 01: An interrupt request is detected by the IRQn input high level.*1 |

Note 1. When level detection is selected, the active level should be retained until an interrupt request is acknowledged.

### 6.3.8 EXINTSTR — External Interrupt Status Register

EXINTSTR is an 8-bit register. This register indicates the presence of external interrupt requests IRQ0 to IRQ7. When an "edge" is specified as the detection method, interrupt requests retained in this register can be cleared by the EXINTSTC register.

## Value after reset: $\quad 00 \mathrm{H}$

Table 6.19 EXINTSTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | IRQ7F | External Interrupt Requests <br> These bits indicate the IRQ7 to IRQ0 interrupt request status. <br> - When level detection is selected <br> 0 : No IRQn interrupt request is present. <br> 1: IRQn interrupt request is present. <br> [Clearing condition] <br> The IRQn input is not at the level corresponding to the conditions specified in IRQnS in EXINTCTL <br> [Setting condition] <br> The IRQn input is at the level corresponding to the conditions specified in IRQnS in EXINTCTL <br> - When edge detection is selected <br> 0 : No IRQn interrupt request has been detected <br> 1: IRQn interrupt request has been detected <br> [Clearing condition] <br> Writing 1 to the IRQnC bit in EXINTSTC <br> [Setting condition] <br> An edge corresponding to the conditions specified in IRQnS in EXINTCTL is generated |
| 6 | IRQ6F |  |
| 5 | IRQ5F |  |
| 4 | IRQ4F |  |
| 3 | IRQ3F |  |
| 2 | IRQ2F |  |
| 1 | IRQ1F |  |
| 0 | IRQ0F |  |

Note: $\mathrm{n}=0$ to 7

### 6.3.9 EXINTSTC - External Interrupt Status Clear Register

EXINTSTC is an 8-bit register used to clear IRQnF in EXINTSTR when edge detection is selected as the method of detecting IRQn. Writing 1 to IRQnC clears the corresponding IRQnF bit in EXINTSTR.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IRQ7C | IRQ6C | IRQ5C | IRQ4C | IRQ3C | IRQ2C | IRQ1C | IRQ0C |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W |

Table 6.20 EXINTSTC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | IRQ7C | External Interrupt Request Clear |
| 6 | IRQ6C | These bits clear the interrupt request status when the edge detection is selected for detecting |
| 5 | IRQ5C | When level detection is selected |
| 4 | IRQ4C | These bits have no function. |
| 3 | IRQ3C | - When edge detection is selected |
| 2 | IRQ2C | Writing 1 clears the corresponding IRQnF bit in the EXINTSTR register. |
| 1 | IRQ1C |  |
| 0 | IRQ0C |  |

Note: $n=0$ to 7

### 6.3.10 SINTR0 to SINTR3 — Software Interrupt Register

SINTR0 to SINTR3 are 8-bit registers used to control software interrupts 0 to 3 (SINT0 to SINT3).
Writing $01_{\mathrm{H}}$ to these registers increments the value of the counter; writing $00_{\mathrm{H}}$ decrements it. When the value of the counter for any of these registers is 1 or more, the corresponding interrupt from among software interrupts 0 to 3 (SINT0 to SINT3) is generated. When reading the value from any of these registers, the read value is the current value of the counter.

Value after reset: $\quad 00_{H}$

Table 6.21 SINTR0 to SINTR3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | SINTCn[7:0] | Software Interrupt Request |
|  |  | This bit generates a software interrupt. |
|  | [Reading operation] |  |
|  | The number of SINTn interrupt request counts is read out. |  |
|  | [Writing operation] |  |
|  | Writing $01_{\mathrm{H}}:$ Increments the counter. ${ }^{* 1}$ |  |
|  | Writing $00_{\mathrm{H}:}$ : Decrements the counter. ${ }^{* 2}$ |  |
|  |  |  |

Note 1. When $01_{\mathrm{H}}$ is written to the register while the value of the counter is $\mathrm{FF}_{\mathrm{H}}$, the counter is not incremented and its value remains $\mathrm{FF}_{\mathrm{H}}$
Note 2. When $00_{\mathrm{H}}$ is written to the register while the value of the counter is $00_{\mathrm{H}}$, the counter is not decremented and its value remains $00_{\mathrm{H}}$.

### 6.3.11 PINTn + x — Peripheral Interrupt Status Register

All 128 DTS interrupt flags are divided between 8 registers PINT0 to PINT7. Each register contains 32 interrupt flags. Only one bit in each register PINT0 to PINT7 can be set. If multiple DTS channels within the same PINTn register request an interrupt, only the bit of the lowest DTS channel in that register is set.

Value after reset: $00000000_{\mathrm{H}}$

- PINT $n+x(n=0$ to $3, x=0)$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 6.25 PINTCLRn $+x$ Register Contents ( $\mathrm{n}=0$ to $3, \mathrm{x}=4$ )

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | INTCTCLR | These bits clear the DTS ch $(0+32 \times n)$ to $(31+32 \times n)$ transfer count match interrupt status. |
|  | These bits should be written with the value corresponding to the PINT $(\mathrm{n}+\mathrm{x})$ register inside an <br> interrupt handler routine. |  |

### 6.3.13 TPTMSEL — TPTM Interrupt FE EI Select Register

This register selects how TPTM interrupts are mapped in each CPU core.

Value after reset: $00000000_{\mathrm{H}}$

Table 6.26 TPTMSEL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> These bits are always read as 0. The write value should always be 0. <br> 1 |
|  | TPTMSEL1 | This bit selects whether the FEINT or the EIINT is the TPTM interrupt of PE1. |
|  |  |  |
|  | 0: the TPTM interrupt of PE1 is connected to FEINT. |  |
| 1: the TPTM interrupt of PE1 is connected to EIINT |  |  |

### 6.4 Interrupt Operation

### 6.4.1 Level Interrupts

For the operation of level interrupts, see Section 6.5.1, Level Interrupt Processing Flow.

### 6.4.2 External Interrupts (NMI / IRQ)

NMI and IRQ interrupts are input from external devices. Detection methods for these interrupts can be chosen from four methods (two methods for NMI and all four methods for IRQ).

### 6.4.3 Inter-Processor Interrupts

For the operation of Inter-Processor Interrupts, see Section 3.4, Inter-Processor Interrupts.

### 6.4.4 Broadcast Interrupts

INTC2 has a function for broadcast interrupts. With this function, the EIINTn request input is transferred to EIINT4-7 of each CPU's INTC1 as a broadcast notification 0-3 with no priority judgement.

The interrupt detection type of the EIINTn must be edge detection if the broadcast function is used. The broadcast function cannot be activated (EIBDn.CST cannot be set) if the interrupt detection type of the EIINTn is configured as level detection.

When EIBDn.CST is set, EIINTn is used as the broadcast interrupt source.
EIBDn. $\mathrm{BCP}[1: 0]$ determines which port of the broadcast interrupt (EIINT4-7) is triggered. It is prohibited to assign more than one interrupt channel to the same broadcast interrupt (EIINT4-7).

For the operation of broadcast interrupts, see Section 6.3.5, EIBD32 to EIBD511 - EI Level Interrupt Bind Register 32 to 511 and Section 6.5.4, Broadcast Interrupt Processing Flow.

### 6.4.5 Software Interrupts

For the operation of software interrupts, see Section 6.3.10, SINTR0 to SINTR3 - Software Interrupt Register and Section 6.4.7, Priority Level Handling.

### 6.4.6 DTS Interrupt Merge Function

Up to 128 transfer end interrupts and up to 128 transfer count match interrupts are aggregated into one type of interrupt in units of 32 interrupts. 128 bits from all DTS channels are combined into 8 registers, PINT0 to PINT7. If multiple DTS channels within the same status register (PINT0 to PINT7) request an interrupt, only the bit of the lowest DTS channel in that register is set. For additional information see Section 6.3.11, PINTn $+\mathbf{x}$ - Peripheral Interrupt Status Register and Section 6.3.12, PINTCLRn + x — Peripheral Interrupt Status Clear Register.

### 6.4.7 Priority Level Handling

There is no priority control for FENMI because it has one channel.
FE-level maskable interrupt priority is determined within FEINT0-1. The channel with the lowest number is given priority over other channels.

EI-level maskable interrupt priority is determined within EIINT0-31 and EIINT32-511 in each PE. Priority is determined by 16 interrupt priority levels specified for each interrupt channel (EICn.EIP3-0). In channels with same priority level, the channel with the lowest number is given priority over other channels.

### 6.5 Interrupt Processing Flow

### 6.5.1 Level Interrupt Processing Flow

Note 1. See Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details about synchronization after setting registers.

Note: See Section 6.5.3, External Interrupt Processing Flow for details about external interrupts.
See Section 6.5.6, DTS Interrupt Processing Flow for details about DTS interrupts.
See Section 3.4, Inter-Processor Interrupts for details about inter-processor interrupts.

Figure 6.2 Example of the Level Interrupt Processing Flow

### 6.5.2 NMI Processing Flow

- Select the NMI detection method (falling edge or rising edge) by setting the NMICTL register.
- After an NMI has been detected, an interrupt request is sent to the INTC.
- NMI interrupts are acknowledged as the highest priority even when another FE level interrupts have been generated. NMI interrupts cannot be masked by the PSW.NP in the CPU system register. Recovery or return from an NMI interrupt is not possible.

Note 1. See Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details about synchronization after setting registers.

Note 2. The system registers (FEPC and FEPSW) are overwritten upon NMI acknowledgment. For branching to user processing after NMI acknowledgment, set the FEPC and FEPSW registers according to the needs of the application and execute an FERET instruction.

Figure 6.3 Example of the NMI Processing Flow

### 6.5.3 External Interrupt Processing Flow

- Select the IRQ detection method (edge detection or level detection) by setting the EXINTCTL register.
- After detection of an IRQ, an interrupt request is issued to the INTC.
- If level detection is selected, confirm that the IRQn pin is negated before returning from the interrupt service routine by the return instruction.
- If edge detection is selected, clear the interrupt request before returning from an interrupt service routine by the return instruction. To clear an interrupt request, write to the corresponding bit of the EXINTSTC register.

Note 1. Clear the external interrupt status as required.
Note 2. See Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details about synchronization after setting registers.

Figure 6.4 Example of the External Interrupt Processing Flow

### 6.5.4 Broadcast Interrupt Processing Flow

Note 1. See Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details about synchronization after setting registers

Figure 6.5 Example for the Broadcast Interrupt

NOTE
When using the broadcast function, the EIINTn ( $n=32$ to 511) interrupts are not generated individually upon the occurrence of each interrupt factor. Interrupts are generated in EIINT4-7 as broadcast interrupts.

### 6.5.5 Software Interrupt Processing Flow

- Software interrupt requests are controlled by writing $00_{\mathrm{H}}$ or $01_{\mathrm{H}}$ to the counter registers (SINTR0 to SINTR3).
- Writing $00_{\mathrm{H}}$ leads to the counter's value being decremented by 1 .
- Writing $01_{\mathrm{H}}$ leads to the counter's value being incremented by 1 .
- If the incremented counter value is 1 or above, an interrupt request for the INTC is generated.
- Before returning from the interrupt service routine, decrement the SINTRn counter by 1 . If SINTRn is $00_{\mathrm{H}}$ after issuing the instruction to return from the interrupt, wait for the writing of $01_{\mathrm{H}}$ to SINTRn.

Figure 6.6 Example of the Software Interrupt Processing Flow

### 6.5.6 DTS Interrupt Processing Flow

- When only one interrupt request is generated out of the bundled 32 interrupt sources:
- The bit corresponding to the interrupt request in the PINTn register is set to 1 and an interrupt request is output.
- On completion of interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the interrupt request before issuing the return from interrupt instruction, then wait for the next one.
- When multiple interrupt sources are generated out of the bundled 32 interrupt sources:
- Only the bit of the DTS channel with the lowest number is set in the PINTn register and the request is generated.
- On completion of interrupt processing (before returning from the interrupt service routine), write 1 to the corresponding bit in the interrupt clear register (PINTCLRn) to clear the interrupt request.
- After clearing the interrupt request bit of the first DTS channel, the bit corresponding to the next lowest DTS channel requesting an interrupt is set and the interrupt request is output.
- These steps are repeated until all interrupt sources bundled into the same 32-bit register are cleared.

Note 1. See Section 3.8.1, Synchronization of Store Instruction Completion and Subsequent Instruction Generation for details about synchronization after setting registers

Note 2. Use this data to clear the DTS interrupt status. It is necessary to set the data from the first read of the PINTn register after a DTS interrupt is detected.

Figure 6.7 Example of the DTS Interrupt Processing Flow

### 6.6 Interrupt Response Times

Table 6.27 Interrupt Response Times (Min)

| Target | Interrupt Request Source |  | Number of Cycles for Processing |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | INTC Connection | Operating Clock | Synchronization | INTC2 | INTC1 | In PE0/PE1 |
| PE0/PE1 | Directly input to INTC1 | CLK_CPU | $1 \times 1 \phi$ | - | $\begin{aligned} & 2 \times 1 \phi \\ & <1 \times \mid \phi> \end{aligned}$ | See the description under "In PE0/PE1" below. |
|  |  | CLK_LSB | $1 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_LSB (Peripheral Group 2L) | $1 \times \mathrm{L} \phi+2 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_HSB | - |  |  |  |
|  |  | CLK_HBUS | $1 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_UHSB | - |  |  |  |
|  | Input via INTC2 | CLK_CPU | - | $\left\{\begin{array}{l} 3 \times P \phi+2 \times I \phi \\ <2 \times P \phi+2 \times I \phi> \end{array}\right.$ | - |  |
|  |  | CLK_LSB | $1 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_LSB (Peripheral Group 2L) | $1 \times \mathrm{L} \phi+2 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_HSB | $1 \times \mathrm{H} \phi+2 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_HSB (Peripheral Group 2H) | $1 \times \mathrm{U} \phi+3 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_HBUS | $1 \times \mathrm{P} \phi$ |  |  |  |
|  |  | CLK_UHSB | $1 \times U \phi+3 \times P \phi$ |  |  |  |

Note: The numbers in < > indicate the number of cycles in the case of level detection.
Note: I $\phi$ : CPU clock (CLK_CPU)
P $\phi$ : HBUS clock (CLK_HBUS)
$H \phi$ : Peripheral high speed clock (CLK_HSB)
L $\phi$ : Peripheral low speed clock (CLK_LSB)

## Section 7 sDMA Controller (sDMAC)

This section contains a generic description of the sDMA Controller (sDMAC).
The first part of this section describes this product's specific properties, such as the number of units and register base addresses.

The remainder of the section describes the functions and registers of the sDMAC.

### 7.1 Features of sDMAC

### 7.1.1 Number of Units

This microcontroller has the following number of sDMAC units.
Table $7.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Number of <br> Channels per Unit | 16 | 16 |
| Unit Name | SDMACj $(\mathrm{j}=0,1)$ | SDMACj $(\mathrm{j}=0,1)$ |

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  | 2 | 2 |
| Number of <br> Channels per Unit | 16 | 16 |
| Unit Name | SDMACj $(\mathrm{j}=0,1)$ | SDMACj $(\mathrm{j}=0,1)$ |

Table $7.2 \quad$ Index

| Index | Meaning |
| :--- | :--- |
| j | The individual units are identified by the index "j" $(\mathrm{j}=0$ to 1$)$. |
| n | The individual channels are identified by the index " n " ( $\mathrm{n}=0$ to 15 ). |
| m | The individual trigger group selection registers are identified by the index " m " ( $\mathrm{m}=0$ to 15). |

### 7.1.2 Register Base Addresses

sDMAC register addresses are given as offsets from the base addresses.
sDMAC base addresses are listed in the following table.
Table 7.3 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <SDMAC0_base> | FFF9 $0000_{\mathrm{H}}$ | Peripheral Group 0 |
| <SDMAC1_base> | FFF9 $8000_{\mathrm{H}}$ | Peripheral Group 0 |
| <DMATRGSEL_base> | FF09 $0100_{\mathrm{H}}$ | Peripheral Group 9 |

### 7.1.3 Clock Supply

The sDMAC clock supplies are shown in the following table.
Table $7.4 \quad$ sDMAC Clock Supply

| Unit Name | Clock Name in the Unit | Supply Clock Name | Description |
| :--- | :--- | :--- | :--- |
| SDMACj | SCLK | CLK_HBUS | System interconnect clock |
|  | PCLK | CLK_HBUS | Register access clock |
| DMATRGSEL | PCLK | CLK_HBUS | Register access clock |

### 7.1.4 Interrupts

sDMAC interrupt requests are listed in the following table.
Table 7.5 Interrupt Requests (1/3)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :---: | :---: | :---: | :---: |
| INTSDMACOCHO | SDMAC0.intreq_ch[0] | sDMAC0 channel 0 transfer end interrupt <br> sDMACO channel 0 descriptor step end interrupt <br> sDMAC0 channel 0 address error interrupt | 45 |
| INTSDMACOCH1 | SDMAC0.intreq_ch[1] | sDMAC0 channel 1 transfer end interrupt sDMAC0 channel 1 descriptor step end interrupt sDMAC0 channel 1 address error interrupt | 46 |
| INTSDMACOCH2 | SDMAC0.intreq_ch[2] | sDMAC0 channel 2 transfer end interrupt <br> sDMACO channel 2 descriptor step end interrupt <br> sDMAC0 channel 2 address error interrupt | 47 |
| INTSDMACOCH3 | SDMAC0.intreq_ch[3] | sDMACO channel 3 transfer end interrupt <br> sDMACO channel 3 descriptor step end interrupt <br> sDMACO channel 3 address error interrupt | 48 |
| INTSDMACOCH4 | SDMAC0.intreq_ch[4] | sDMAC0 channel 4 transfer end interrupt <br> sDMACO channel 4 descriptor step end interrupt <br> sDMAC0 channel 4 address error interrupt | 49 |
| INTSDMACOCH5 | SDMAC0.intreq_ch[5] | sDMAC0 channel 5 transfer end interrupt sDMACO channel 5 descriptor step end interrupt sDMAC0 channel 5 address error interrupt | 50 |
| INTSDMAC0CH6 | SDMAC0.intreq_ch[6] | sDMAC0 channel 6 transfer end interrupt <br> sDMACO channel 6 descriptor step end interrupt <br> sDMAC0 channel 6 address error interrupt | 51 |
| INTSDMACOCH7 | SDMAC0.intreq_ch[7] | sDMAC0 channel 7 transfer end interrupt <br> sDMACO channel 7 descriptor step end interrupt <br> sDMAC0 channel 7 address error interrupt | 52 |
| INTSDMACOCH8 | SDMAC0.intreq_ch[8] | sDMAC0 channel 8 transfer end interrupt <br> sDMACO channel 8 descriptor step end interrupt <br> sDMAC0 channel 8 address error interrupt | 53 |

Table 7.5 Interrupt Requests (2/3)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :---: | :---: | :---: | :---: |
| INTSDMACOCH9 | SDMAC0.intreq_ch[9] | sDMACO channel 9 transfer end interrupt sDMACO channel 9 descriptor step end interrupt sDMAC0 channel 9 address error interrupt | 54 |
| INTSDMACOCH10 | SDMAC0.intreq_ch[10] | sDMACO channel 10 transfer end interrupt <br> sDMACO channel 10 descriptor step end interrupt <br> sDMACO channel 10 address error interrupt | 55 |
| INTSDMAC0CH11 | SDMAC0.intreq_ch[11] | sDMAC0 channel 11 transfer end interrupt <br> sDMACO channel 11 descriptor step end interrupt <br> sDMACO channel 11 address error interrupt | 56 |
| INTSDMAC0CH12 | SDMAC0.intreq_ch[12] | sDMACO channel 12 transfer end interrupt <br> sDMACO channel 12 descriptor step end interrupt <br> sDMACO channel 12 address error interrupt | 57 |
| INTSDMACOCH13 | SDMAC0.intreq_ch[13] | sDMACO channel 13 transfer end interrupt <br> sDMACO channel 13 descriptor step end interrupt <br> sDMAC0 channel 13 address error interrupt | 58 |
| INTSDMACOCH14 | SDMAC0.intreq_ch[14] | sDMACO channel 14 transfer end interrupt sDMACO channel 14 descriptor step end interrupt sDMACO channel 14 address error interrupt | 59 |
| INTSDMAC0CH15 | SDMAC0.intreq_ch[15] | sDMACO channel 15 transfer end interrupt <br> sDMACO channel 15 descriptor step end interrupt <br> sDMACO channel 15 address error interrupt | 60 |
| INTSDMACERR | SDMAC0.intreq_aerr SDMAC1.intreq_aerr | sDMAC0 address error interrupt <br> sDMAC1 address error interrupt | 29 |
| INTSDMAC1CH0 | SDMAC1.intreq_ch[0] | sDMAC1 channel 0 transfer end interrupt <br> sDMAC1 channel 0 descriptor step end interrupt <br> sDMAC1 channel 0 address error interrupt | 61 |
| INTSDMAC1CH1 | SDMAC1.intreq_ch[1] | sDMAC1 channel 1 transfer end interrupt <br> sDMAC1 channel 1 descriptor step end interrupt <br> sDMAC1 channel 1 address error interrupt | 62 |
| INTSDMAC1CH2 | SDMAC1.intreq_ch[2] | sDMAC1 channel 2 transfer end interrupt <br> sDMAC1 channel 2 descriptor step end interrupt <br> sDMAC1 channel 2 address error interrupt | 63 |
| INTSDMAC1CH3 | SDMAC1.intreq_ch[3] | sDMAC1 channel 3 transfer end interrupt <br> sDMAC1 channel 3 descriptor step end interrupt <br> sDMAC1 channel 3 address error interrupt | 64 |
| INTSDMAC1CH4 | SDMAC1.intreq_ch[4] | sDMAC1 channel 4 transfer end interrupt <br> sDMAC1 channel 4 descriptor step end interrupt <br> sDMAC1 channel 4 address error interrupt | 65 |
| INTSDMAC1CH5 | SDMAC1.intreq_ch[5] | sDMAC1 channel 5 transfer end interrupt <br> sDMAC1 channel 5 descriptor step end interrupt <br> sDMAC1 channel 5 address error interrupt | 66 |
| INTSDMAC1CH6 | SDMAC1.intreq_ch[6] | sDMAC1 channel 6 transfer end interrupt <br> sDMAC1 channel 6 descriptor step end interrupt <br> sDMAC1 channel 6 address error interrupt | 67 |
| INTSDMAC1CH7 | SDMAC1.intreq_ch[7] | sDMAC1 channel 7 transfer end interrupt <br> sDMAC1 channel 7 descriptor step end interrupt <br> sDMAC1 channel 7 address error interrupt | 68 |
| INTSDMAC1CH8 | SDMAC1.intreq_ch[8] | sDMAC1 channel 8 transfer end interrupt <br> sDMAC1 channel 8 descriptor step end interrupt <br> sDMAC1 channel 8 address error interrupt | 69 |
| INTSDMAC1CH9 | SDMAC1.intreq_ch[9] | sDMAC1 channel 9 transfer end interrupt <br> sDMAC1 channel 9 descriptor step end interrupt <br> sDMAC1 channel 9 address error interrupt | 70 |
| INTSDMAC1CH10 | SDMAC1.intreq_ch[10] | sDMAC1 channel 10 transfer end interrupt <br> sDMAC1 channel 10 descriptor step end interrupt <br> sDMAC1 channel 10 address error interrupt | 71 |

Table 7.5 Interrupt Requests (3/3)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :---: | :---: | :---: | :---: |
| INTSDMAC1CH11 | SDMAC1.intreq_ch[11] | sDMAC1 channel 11 transfer end interrupt sDMAC1 channel 11 descriptor step end interrupt sDMAC1 channel 11 address error interrupt | 72 |
| INTSDMAC1CH12 | SDMAC1.intreq_ch[12] | sDMAC1 channel 12 transfer end interrupt sDMAC1 channel 12 descriptor step end interrupt sDMAC1 channel 12 address error interrupt | 73 |
| INTSDMAC1CH13 | SDMAC1.intreq_ch[13] | sDMAC1 channel 13 transfer end interrupt sDMAC1 channel 13 descriptor step end interrupt sDMAC1 channel 13 address error interrupt | 74 |
| INTSDMAC1CH14 | SDMAC1.intreq_ch[14] | sDMAC1 channel 14 transfer end interrupt sDMAC1 channel 14 descriptor step end interrupt sDMAC1 channel 14 address error interrupt | 75 |
| NTSDMAC1CH15 | SDMAC1.intreq_ch[15] | sDMAC1 channel 15 transfer end interrupt sDMAC1 channel 15 descriptor step end interrupt sDMAC1 channel 15 address error interrupt | 76 |

### 7.1.5 sDMAC Transfer Requests

The sDMAC transfer request table lists all sDMAC transfer request factors that can be selected by the DMAjRS_n registers and groups that can be selected by the DMACSELj_m registers.

For details about the sDMAC transfer request table lists, refer to Appendix file
"sDMAC_Transfer_request_Table.xlsx".

### 7.1.6 Reset Sources

sDMAC reset sources are listed in the following table. The sDMAC is initialized by these reset sources.
Table 7.6 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Unit Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module Reset | JTAG Reset |  |
| SDMACj |  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DMATRGSEL |  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 7.2 Overview

The sDMAC can be used in place of the CPU to perform high-speed data transfer between on-chip memories.

### 7.2.1 Functional Overview

The sDMAC has the following features:

- 16 channels
- 4-Gbyte physical address space
- Source and destination addresses are 32 bits wide
- Connected to the System Bus directly. If a conflict occurs with another bus master in the System Bus, the transfer is arbitrated by round-robin arbitration.
- Physical bus data width: 64 bits
- Transfer data length: 1 byte, 2 bytes, 4 bytes, 8 bytes, 16 bytes, 32 bytes, 64 bytes
- The maximum transfer size: 4,294,967,295 bytes ( $2^{32}-1$ bytes)
- Parallel reads and writes (fly-by)
- Address mode: Dual address mode
- Transfer requests:

Two request modes are available. Requests can be triggered by an auto request (a transfer request always occurs) or a peripheral hardware request.

- Bus mode:

Each channel can be set to either normal speed mode or slow speed mode.

- Mode for arbitration between transfer channels:

The arbitration mode can be set to either fixed priority arbitration mode or round-robin arbitration mode.

- Interrupt requests:

CPU interrupts from the sDMAC are triggered by three factors: termination of the descriptor step, termination of a data transfer and occurrence of an address error.

- Functions of the descriptor:

A descriptor contains register settings (source address register, destination address register, transfer size register, transfer mode register and scatter gather registers) and can be chained to the next descriptor. The descriptor memory size is 4 KB . This descriptor memory is shared by all channels.

- Scatter-gather transfer:

Inner and outer loops for transfers with inner and outer address increments are supported. Scattering at the destination interface and gathering at the source interface can be enabled independently and in parallel.

- Inner and outer address increments are 32 bits wide
- sDMAC has a data RAM as a pending transfer data buffer.

The data RAM size is 2 KB and a DMA channel can use 64 bits $\times 16$ lines for its own transactions.

### 7.2.2 Block Diagram

The following is a block diagram of sDMAC.

Figure 7.1 Block Diagram of sDMAC

The following block diagram shows sDMAC transfer request source selection by the DMACSELj_m registers.

Figure 7.2 Block Diagram of sDMAC Transfer Request Selection

### 7.3 Registers of sDMAC

### 7.3.1 List of Registers

sDMAC registers are listed in the following table.
For details about <SDMACj_base>, see Section 7.1.2, Register Base Address.
Table 7.7 List of Registers (1/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Global Registers |  |  |  |  |  |
| SDMACj | DMA Address Error Notification Status Register | DMAjESTA | <SDMACj_base> + 0010 ${ }_{\text {H }}$ | 32 | - |
|  | DMA Interrupt Status Register | DMAjISTA | <SDMACj_base> + 0020 ${ }_{\text {H }}$ | 32 | - |
|  | DMA Channel Request Priority Register | DMAjCHPRI | <SDMACj_base> + 0040 ${ }_{\text {H }}$ | 32 | - |
|  | DMA Operation Register | DMAjOR | <SDMACj_base> + 0060 ${ }_{\text {H }}$ | 16 | - |
|  | DMA Channel Reset Register | DMAjCHRST | <SDMACj_base> + 0080 ${ }_{\text {H }}$ | 32 | - |
|  | DMA Channel Master Setting Register | DMAjCM_n | <SDMACj_base> + $\left(\mathrm{n} \times 4_{\mathrm{H}}\right)+100_{\mathrm{H}}$ | 32 | - |
| Channel Registers |  |  |  |  |  |
| SDMACj | DMA Source Address Register | DMAjSAR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2000_{\mathrm{H}}$ | 32 | - |
|  | DMA Destination Address Register | DMAjDAR_n | <SDMACj_base> + $\left.\mathrm{n} \times 80_{\mathrm{H}}\right)+2004_{\mathrm{H}}$ | 32 | - |
|  | DMA Transfer Size Register | DMAjTSR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2008_{\mathrm{H}}$ | 32 | - |
|  | DMA Transfer Size Register B | DMAjTSRB_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+200 \mathrm{C}_{\mathrm{H}}$ | 32 | - |
|  | DMA Transfer Mode Register | DMAjTMR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2010_{\mathrm{H}}$ | 32 | - |
|  | DMA Channel Control Register | DMAjCHCR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2014_{\mathrm{H}}$ | 16 | - |
|  | DMA Channel Stop Register | DMAjCHSTP_n | <SDMACj_base> + $(\mathrm{n} \times 80 \mathrm{H})+2016_{\mathrm{H}}$ | 16 | - |
|  | DMA Channel Status Register | DMAjCHSTA_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2018_{\mathrm{H}}$ | 32 | - |
|  | DMA Channel Flag Clear Register | DMAjCHFCR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{H}\right)+201 \mathrm{C}_{\mathrm{H}}$ | 32 | - |
|  | DMA Gather Inner Address Increment Register | DMAjGIAI_n | <SDMACj_base> + $\left.\mathrm{n} \times 80_{\mathrm{H}}\right)+2020_{\mathrm{H}}$ | 32 | - |
|  | DMA Gather Outer Address Increment Register | DMAjGOAI_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2024_{\mathrm{H}}$ | 32 | - |
|  | DMA Scatter Inner Address Increment Register | DMAjSIAI_n | <SDMACj_base> + $\left.\mathrm{n} \times 80_{\mathrm{H}}\right)+2028_{\mathrm{H}}$ | 32 | - |
|  | DMA Scatter Outer Address Increment Register | DMAjSOAI_n | <SDMACj_base> + $\left.\mathrm{n} \times 80_{\mathrm{H}}\right)+202 \mathrm{C}_{\mathrm{H}}$ | 32 | - |
|  | DMA Scatter Gather Status Register | DMAjSGST_n | <SDMACj_base> + $\left.\mathrm{n} \times 80_{\mathrm{H}}\right)+2038_{\text {H }}$ | 32 | - |
|  | DMA Scatter Gather Control Register | DMAjSGCR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+203 \mathrm{C}_{\mathrm{H}}$ | 32 | - |
|  | DMA Resource Select Register | DMAjRS_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2040_{\mathrm{H}}$ | 32 | - |
|  | DMA Buffer Control Register | DMAjBUFCR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2048_{\mathrm{H}}$ | 32 | - |
|  | DMA Descriptor Pointer Register | DMAjDPPTR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2050_{\mathrm{H}}$ | 32 | - |
|  | DMA Descriptor Control Register | DMAjDPCR_n | <SDMACj_base> + $\left(\mathrm{n} \times 80_{\mathrm{H}}\right)+2054_{\mathrm{H}}$ | 32 | - |
| Descriptor memory |  |  |  |  |  |
| SDMACj | Descriptor Memory | Descriptor RAM | $\begin{aligned} & \text { <SDMACj_base> + 4000 } \text { to } \\ & \text { <SDMACj_base> + 4FFCC } \end{aligned}$ | 32 | - |

Table 7.7 List of Registers (2/2)

| Module Name | Register Name | Symbol | Address | Access | Access <br> Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Transfer trigger selection |  |  |  |  |  |
| DMATRGSEL | sDMACj Transfer Request Group <br> Selection Register $m$ | DMACSELj_m | <DMATRGSEL_base> $+\left(j \times 40_{H}\right)+$ <br> $(m \times 4 H)$ | $8,16,32$ | - |

### 7.3.2 DMAjESTA — DMA Address Error Notification Status Register

DMAjESTA is a 32-bit read-only register that indicates the address error notification (INTSDMACERR) status of each channel. Causes of address errors are shown in Section 7.5(1), Address Errors. Specification of the error notification routes is shown in Section 7.4.2, DMA Interrupts.

Table 7.8 DMAjESTA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 15 to 0 | AEN[15:0] | Channel address error notification INTSDMACERR status |
|  |  | These bits reflect the CAE bit status of the channels whose CAEE bit is set to 1. |
|  | AEN[n]: |  |
|  | $0:$ Channel n address error notification does not occur |  |
|  |  | $1:$ Channel n address error notification occurs |

### 7.3.3 DMAjISTA — DMA Interrupt Status Register

DMAjISTA is a 32-bit read-only register that indicates the interrupt signal status of each channel. Interrupt routes are shown in Section 7.4.2, DMA Interrupts.

Table 7.9 DMAjISTA Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 15 to 0 | INT[15:0] | Channel interrupt status |
|  |  | INT[n]: |
|  |  | 0 : Channel n interrupt does not occur |
|  |  | 1: Channel n Interrupt occurs |

### 7.3.4 DMAjCHPRI — DMA Channel Request Priority Register

DMAjCHPRI is a 32 -bit read/write register that specifies the channel request priority count timing.
See Section 7.4.3(3), Channel Request Priority for details.

## Value after reset: $\quad 00000010 \mathrm{H}$

Table 7.10 DMAjCHPRI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | PRICNT[15:0] | Channel Request Priority Count value |
|  | This bit is used to control the timing of the channel request priority function. |  |

### 7.3.5 DMAjOR — DMA Operation Register

DMAjOR is a 16-bit read/write register that controls master enable and specifies the priority level of all DMA channels.

Value after reset: $\quad 0000_{H}$

Table 7.11 DMAjOR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 10 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 9, 8 | PR[1:0] | Priority Mode <br> Select the priority level between channels when there are transfer requests for multiple channels simultaneously. $\text { 00: } \mathrm{CH} 0>\mathrm{CH} 1>\ldots>\mathrm{CH} 14>\mathrm{CH} 15$ <br> 11: Round-robin mode <br> Other than above: Setting prohibited |
| 7 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DME | DMA Master Enable <br> Enables or disables DMA transfers on all channels. If the DME bit and the DE bit in DMAjCHCR_n are set to 1, DMA transfer is enabled. At this time, the TE bits in DMAjCHSTA_n and the CAE bits in DMAjCHSTA_n must be all 0 . If this bit is cleared during transfer, transfers on all channels are terminated. <br> 0: Disable DMA transfers on all channels <br> 1: Enable DMA transfers on all channels |

### 7.3.6 DMAjCHRST — DMA Channel Reset Register

DMAjCHRST register is a 32-bit write-only register that initializes each channel.
When this register is set, the specified channel state is initialized completely and the following registers are initialized.
DMAjSAR_n, DMAjDAR_n, DMAjTSR_n, DMAjTSRB_n, DMAjTMR_n, DMAjCHCR_n, DMAjCHSTP_n, DMAjCHSTA_n, DMAjGIAI_n, DMAjGOAI_n, DMAjSIAI_n, DMAjSOAI_n, DMAjSGCR_n, DMAjRS_n, DMAjBUFCR_n, DMAjDPPTR_n, DMAjDPCR_n

Table 7.12 DMAjCHRST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 15 to 0 | CLR[15:0] | All registers in the channel can be cleared by writing to these bits. |
|  | CLR[0] |  |
| $0:$ Ignored |  |  |
| $1:$ Channel 0 registers are cleared |  |  |
|  | CLR[1] |  |
| $0:$ Ignored |  |  |
| $1:$ Channel 1 registers are cleared |  |  |
|  | $\ldots$ |  |
|  | CLR[15] |  |
|  | $0:$ Ignored |  |
| $1:$ Channel 15 registers are cleared |  |  |
|  | Before writing to this register, confirm that channel BUSY is 0. |  |

### 7.3.7 DMAjCM_n — DMA Channel Master Setting Register

DMAjCM_n is a 32-bit read/write register that configures the DMA master information.

Note: This value is $1 C_{H}(s D M A C 0)$ or $1 B_{H}(s D M A C 1)$.
Table 7.13 DMAjCM_n Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | SPID | Channel master SPID setting |
|  |  | Specifies the SPID information of the master assigned to the channel. |
|  |  | Value after reset of DMA0CM_n: $1 \mathrm{C}_{\mathrm{H}}$ |
|  |  | Value after reset of DMA1CM_n: $1 \mathrm{~B}_{\mathrm{H}}$ |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | UM | Channel master UM setting |
|  |  | Specifies the UM information of the master assigned to the channel. |
|  |  | 0: Supervisor mode |
|  |  | 1: User mode |

### 7.3.8 DMAjSAR_n — DMA Source Address Register

DMAjSAR_n is a 32-bit read/write register that specifies the source address of DMA transfer. During DMA transfer, this register indicates the next source address.

When the selected source address mode is "increment" (SM bit in DMAjTMR_n register is $01_{\mathrm{B}}$ ), the source address can be specified on a byte boundary. Otherwise the source address must be specified on the transaction size boundary (STS bit in DMAjTMR_n register).

### 7.3.9 DMAjDAR_n — DMA Destination Address Register

DMAjDAR_n is a 32-bit read/write register that specifies the destination address of DMA transfer. During DMA transfer, this register indicates the next destination address.

When the selected destination address mode is "increment" (DM bit in DMAjTMR_n register is $01_{\mathrm{B}}$ ), the destination address can be specified on a byte boundary. Otherwise the destination address must be specified on the transaction size boundary (DTS bit in DMAjTMR_n register).

### 7.3.10 DMAjTSR_n — DMA Transfer Size Register

DMAjTSR_n is a 32-bit read/write register that specifies the DMA transfer size. The total size of DMA transfer is 1 byte when the setting is $00000001_{\mathrm{H}}$ and $4,294,967,295$ bytes ( $2^{32}-1$ bytes) when $F F F F F_{F F F}$ is set. When the setting is $00000000_{\mathrm{H}}$, transfer does not occur, and TE is set immediately. During DMA transfer, DMAjTSR_n indicates the remaining transfer size.

In DMA transfer, the size of the read transfer and write transfer may differ. This is because the DMAC uses flyby DMA transfer via the data RAM. DMAjTSR_n indicates the read transfer size.

### 7.3.11 DMAjTSRB_n — DMA Transfer Size Register B

DMAjTSRB_n is a 32-bit read-only register that indicates the DMA transfer size. During DMA transfer, this register indicates the remaining transfer size (in bytes). When DMAjTSR_n is written, the same value is set in this register.

In DMA transfer, the size of the read transfer and write transfer may differ. This is because the DMAC uses flyby DMA transfer via data RAM. DMAjTSRB_n indicates the write transfer size. The DMAjTSR_n value is copied to the DMAjTSRB_n register when DMA transfer starts.

### 7.3.12 DMAjTMR_n — DMA Transfer Mode Register

DMAjTMR_n is a 32-bit read/write register that specifies the DMA transfer mode.

Value after reset: $\quad 00000000_{\mathrm{H}}$

### 7.3.13 DMAjCHCR_n — DMA Channel Control Register

DMAjCHCR_n is a 16 -bit read/write register that controls DMA transfer.

Value after reset: $\quad 0000_{\mathrm{H}}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | DPE | DPB | - | - | - | CAEE | CAIE | DSIE | IE | DE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 7.15 DMAjCHCR_n Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | DPE | Descriptor enable bit |
|  |  | Specifies whether the descriptor is enabled. |
|  |  | 0: Disabled |
|  |  | Descriptor operation is disabled. |
|  |  | 1: Enabled |
|  |  | Descriptor operation is enabled. |
|  |  | When the DMAjDPPTR_n.CF bit is set to 1, after reading the register setting from the descriptor memory, DMA transfer is continued. Clearing the DPE bit by setting the DMAjCHFCR_n.DPEC bit to 1 terminates the descriptor chain operation. |
| 8 | DPB | Descriptor start bit |
|  |  | Specifies the configuration to be loaded at the beginning of the descriptor. After reading the descriptor, this bit is cleared. While DE $=1$, DPB must not be set to 1 . |
|  |  | 0 : Start the DMA transfer via a register setting. |
|  |  | 1: Start DMA transfer after the channel configuration is copied from the descriptor memory. The configurations to copy from the Descriptor memory are specified in the DMAjDPCR_n register. |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | CAEE | Channel address error notification INTSDMACERR enable |
|  |  | Specifies whether a channel can issue a notification upon the occurrence of an address error. When the CAEE bit and the DMAjCHSTA_n.CAE bit are set to 1, a channel (sDMAC_CH0 to sDMAC_CH15) can issue notifications about address errors. (INTSDMACERR) For details, see Section 7.4.2, DMA Interrupts. |
|  |  | 0 : Address error notification disabled |
|  |  | 1: Address error notification enabled |
| 3 | CAIE | Channel address error interrupt INTSDMACjCHn enable |
|  |  | Specifies whether a channel can generate an interrupt request upon occurrence of an address error. When the CAIE bit and DMAjCHSTA_n.CAE bit are set to 1, a channel will generate an interrupt request (INTSDMACjCHn) upon the occurrence of an address error. For details, see Section 7.4.2, DMA Interrupts. |
|  |  | $0:$ Interrupt request disabled |
|  |  | 1: Interrupt request enabled |
| 2 | DSIE | Descriptor step end interrupt master enable |
|  |  | Specifies whether a channel can generate an interrupt at the end of a descriptor step. When the DMAjDPPTR_n.DIE bit and DSIE bit are set to 1, a channel will generate an interrupt request (INTSDMACjCHn) upon completion of a descriptor step. See Section 7.5, Usage Notes for details about DMA transfer interrupts. |
|  |  | 0 : Interrupt request is disabled |
|  |  | 1: Interrupt request is enabled |

Table 7.15 DMAjCHCR_n Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | IE | Transfer end interrupt enable |
|  | Specifies whether or not a channel can generate an interrupt at the end of DMA transfer. |  |
|  | Setting this bit to 1 will allow a channel to generate an interrupt request (INTSDMACjCHn) |  |
|  | when the DMAjCHSTA_n.TE bit is set to 1 . See Section 7.5 , Usage Notes for details about |  |
|  | DMA transfer interrupts. |  |
|  | $0:$ Interrupt request is disabled. |  |
|  | 1: Interrupt request is enabled. |  |
| 0 | DMA Enable |  |
|  | Enables or disables DMA transfer for the corresponding channel. Clearing the DE bit to 0 by |  |
|  | setting the DMAjCHFCR_n.DEC bit to 1 terminates DMA transfer. The DE bit is also cleared |  |
|  | automatically when an ongoing DMA transfer is finished or an ECC error of the descriptor |  |
|  | RAM occurs. See Section 7.5, Usage Notes for details about DMA transfer interrupts. |  |
|  | $0:$ DMA transfer disabled |  |
|  | 1: DMA transfer enabled |  |
|  |  |  |

### 7.3.14 DMAjCHSTP_n — DMA Channel Stop Register

DMAjCHSTP_n is a 16 -bit read/write register that controls the stop condition for DMA transfer.

Value after reset: $\quad 0000_{H}$

Table 7.16 DMAjCHSTP_n Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STP | DMA transmission stop |
|  |  | When this bit is set to 1, packet requests stop immediately. When this bit is set to 0 after |
|  | transmission has been stopped, the stopped transmission is resumed. |  |
|  | $0:$ No operation |  |
|  | 1: DMA transfer stop |  |

### 7.3.15 DMAjCHSTA_n — DMA Channel Status Register

DMAjCHSTA_n register is a 32-bit read-only register that shows the DMA transfer status.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | OVF | DRQ | - | - | - | - | - | - | - | - | CAE | DSE | TE | BUSY |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 7.17 DMAjCHSTA_n Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 13 | OVF | Hardware transfer request overflow flag |
|  |  | Indicates that a hardware trigger was asserted before a pending hardware transfer request has been acknowledged. To clear the OVF bit, write 1 to the DMAjCHFCR_n.OVFC bit. |
|  |  | 0: No hardware transfer request overflow |
|  |  | 1: Hardware transfer request overflow occurred |
| 12 | DRQ | Hardware request status |
|  |  | If this bit is set, it means that a hardware transfer request exists or is retained. |
|  |  | - This bit shows whether a hardware transfer request is retained. When the transfer specified by DMAjRS_n.TL bits is completed, this bit is automatically cleared. This bit can be cleared by writing 1 to the DMAjCHFCR_n.DRQC bit. |
|  |  | This bit changes regardless of the value of the DMAjTMR_n.TRS bit when a hardware DMA transfer request is generated. |
|  |  | 0 : There is no hardware transfer request |
|  |  | 1: There is a hardware transfer request |
| 11 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |

Table 7.17 DMAjCHSTA_n Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 | CAE | Address error flag <br> Indicates that an address error interrupt occurred in the DMA transfer. The following conditions can set this bit: <br> The transfer source or transfer destination is an invalid space. <br> A GUARD error occurred upon access to a source or a destination address. <br> Channel register setting is prohibited. <br> See section 7.5(1), Address Errors for detail about address errors. <br> If this bit is set, DMA transfer is not enabled for the channel even if the DE bit is set to 1 . To clear the CAE bit, write 1 to the DMAjCHFCR_n.CAEC bit. <br> 0 : Address error interrupt did not occur in the DMA transfer <br> 1: Address error interrupt occurred in the DMA transfer |
| 2 | DSE | Descriptor step end flag <br> When the DMAjCHCR_n.DSIE bit is set to 1 and the DMAjDPPTR_n.DIE bit is set to 1 , the DSE bit is set to 1 at the end of DMA transfer. To clear the DSE bit, write 1 to the DMAjCHFCR_n.DSEC bit. <br> 0: DMA transfer is in progress or has finished <br> 1: The descriptor step has finished |
| 1 | TE | Transfer end flag <br> The TE bit is set to 1 when data transfer ends (DMAjTSR_n becomes 0 ). When the descriptor is enabled, the TE bit is set to 1 at the end of all descriptor steps. <br> The TE bit is not set to 1 in the following cases: <br> - DMA transfer ends due to a DMA address error before DMAjTSR_n becomes 0 . <br> - DMA transfer is terminated by clearing the DE bit and DME bit in DMAjOR. <br> To clear the TE bit, write 1 to the DMAjCHFCR_n.TEC bit. If the DMAjCHCR_n.DE bit is set to 1 while TE bit is set to 1 , DMA transfer will not be enabled. <br> 0: DMA transfer is in progress or DMA transfer has finished <br> 1: DMA transfer ended at the specified count $(T S R=0)$ |
| 0 | BUSY | Channel Busy flag <br> This bit indicates that the channel is busy. When transfer is started, the BUSY bit is set to 1 . After the DMAjCHCR_n.DE bit is cleared or the DMAjCHSTP_n.STP bit is set, the BUSY bit is cleared after receiving the response of all packets. <br> 0 : Channel status is idle. <br> 1: Channel status is busy. |

### 7.3.16 DMAjCHFCR_n — DMA Channel Flag Clear Register

DMAjCHFCR_n is a 32-bit write-only register that clears the DMA channel status flags.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | W | W | R | R | W | R | R | R | R | R | W | W | W | W |

Table 7.18 DMAjCHFCR_n Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 13 | OVFC | Hardware transfer request overflow flag clear |
|  |  | When the OVFC bit is set to 1, the DMAjCHSTA_n.OVF bit is cleared. |
|  |  | 0: No operation |
|  |  | 1: DMAjCHSTA_n.OVF bit is cleared. |
| 12 | DRQC | Hardware transfer request clear |
|  |  | When the DRQC bit is set to 1, the DMAjCHSTA_n.DRQ bit is cleared. |
|  |  | 0: No operation |
|  |  | 1: DMAjCHSTA_n.DRQ bit is cleared. |
| 11 to 10 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 9 | DPEC | Descriptor enable clear |
|  |  | When the DPEC bit is set to 1 , the DMAjCHCR_n.DPE bit is cleared. The DMAjCHCR_n.DPE bit is the enable condition of the descriptor operation. To suspend DMA transfer at the end of a descriptor step, clear the DPE bit by using this bit. |
|  |  | 0: No operation |
|  |  | 1: DMAjCHCR_n.DPE bit is cleared |
| 8 to 4 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 3 | CAEC | Address error flag clear |
|  |  | When the CAEC bit is set to 1 , the DMAjCHSTA_n.CAE bit is cleared. The DMAjCHSTA_n.CAE bit is the stop condition of DMA transfer. To end DMA transfer, clear the DMAjCHCR_n.DE bit before clearing the DMAjCHSTA_n.CAE bit. |
|  |  | 0: No operation |
|  |  | 1: DMAjCHSTA_n.CAE bit is cleared |
| 2 | DSEC | Descriptor step end flag clear |
|  |  | When the DSEC bit is set to 1 , the DMAjCHSTA_n.DSE bit is cleared. |
|  |  | 0: No operation |
|  |  | 1: DMAjCHSTA_n.DSE bit is cleared |

Table 7.18 DMAjCHFCR_n Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | TEC | Transfer end flag clear |
|  |  | When the TEC bit is set to 1, the DMAjCHSTA_n.TE bit is cleared. The DMAjCHSTA_n.TE bit |
| is the stop condition of DMA transfer. To end DMA transfer, clear the DMAjCHCR_n.DE bit |  |  |
| before clearing the DMAjCHSTA_n.TE bit. |  |  |
|  | $0:$ No operation |  |
|  | 1: DMAjCHSTA_n.TE bit is cleared |  |
| 0 | DEC | DMA enable clear |
|  |  | When the DEC bit is set to 1, the DMAjCHCR_n.DE bit is cleared. The DMAjCHCR_n.DE bit is |
|  | the enable condition of DMA transfer. To suspend DMA transfer, clear the DE bit by using this |  |
|  | bit. See Section 7.5, Usage Notes for details about DMA transfer suspension. |  |
|  | $0:$ No operation |  |
|  | 1: DMAjCHCR_n.DE bit is cleared |  |

### 7.3.17 DMAjGIAI_n — DMA Gather Inner Address Increment Register

DMAjGIAI_n is a 32-bit read/write register that specifies the source address increment for the inner loop of a gather transfer.

### 7.3.18 DMAjGOAI_n — DMA Gather Outer Address Increment Register

DMAjGOAI_n is a 32-bit read/write register that specifies the source address increment for the outer loop of a gather transfer.

### 7.3.19 DMAjSIAI_n — DMA Scatter Inner Address Increment Register

DMAjSIAI_n is a 32-bit read/write register that specifies the destination address increment for the inner loop of a scatter transfer.

### 7.3.20 DMAjSOAI_n — DMA Scatter Outer Address Increment Register

DMAjSOAI_n is a 32-bit read/write register that specifies the destination address increment for the outer loop of a scatter transfer.

### 7.3.21 DMAjSGST_n — DMA Scatter Gather Status Register

DMAjSGST_n is a 32-bit read only register that indicates the count of inner scatter and gather loops. The detailed operation of scatter/gather is explained in Section 7.4.5, Scatter Gather Transfer.

Table 7.19 DMAjSGST_n Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> When read, the value after reset is returned. |
| 29 to 16 | SICNT[13:0] | Indicates the current repeat count of the scatter inner DMA loop. |
| 15,14 | - | Reserved <br> When read, the value after reset is returned. |
| 13 to 0 | GICNT[13:0] | Indicates the current repeat count of the gather inner DMA loop. |

### 7.3.22 DMAjSGCR_n — DMA Scatter Gather Control Register

DMAjSGCR_n is a 32-bit read/write register that controls scattering on the source side and gathering on the destination side. The operation of scatter/gather is explained in detail in Section 7.4.5, Scatter Gather Transfer.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 7.3.23 DMAjRS_n — DMA Resource Select Register

DMAjRS_n is a 32-bit read/write register that specifies the source and control settings for hardware transfer requests. The operation of hardware transfer requests is explained in detail in Section 7.4.1, DMA Transfer Requests.

Table 7.21 DMAjRS_n Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | TC[15:0] | Transfer count per hardware request <br> Specify the number of DMA transfers in hardware request mode. This bit is valid only when the DMAjRS_n.TL bit is set to 000 or 001. In this case, setting 0 is prohibited. |
| 15 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 14 to 12 | TL[2:0] | Transfer limit per hardware request <br> Specifies the limit of transfers generated by a hardware request. <br> 000: Transaction size indicated by DMAjTMR_n.STS * DMAjRS_n.TC (Setting prohibited when PLE = 1) <br> 001: Transaction size indicated by DMAjTMR_n.DTS * DMAjRS_n.TC (Setting prohibited when PLE =0) <br> 010: Transfer size indicated by DMAjTSR_n.TSR <br> 011: Until the DSE flag is asserted. (Transfer also ends when the TE flag is asserted.) <br> 100: Until the TE flag is asserted <br> Other than above: Setting prohibited |
| 11 | FPT | First pre-load trigger <br> Specifies the trigger to start the first pre-load transfer. If transfer data is not prepared before DE is set, this bit should be set to 1 . <br> When the pre-load function is disabled (PLE = 0), this setting is ignored. <br> 0 : First pre-load start when DE is set to 1 <br> 1: First pre-load start when hardware request is asserted |
| 10 | PLE | Pre-load enable <br> When the pre-load function is enabled, the DMAC loads transfer data from the source memory before a hardware request is asserted. <br> 0 : Disable <br> 1: Enable |
| 9 | DRQI | DMA request initialization when descriptor settings are loaded <br> Specifies whether to initialize the DRQ bits when this register setting is loaded from the descriptor memory. When DRQI is set to 1, the remaining DRQ bits are cleared. The DRQ bits are also cleared when a different source (RS) is loaded. For details, see Section 7.4.6(4)(h), Example 8: Hardware Request Operation with Different Request Source Settings. <br> 0 : DRQ initialize disabled <br> 1: DRQ initialize enabled |

| 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | RS[7:0] | DMA request source <br> See the DMA request resources of on-chip peripheral modules. |

### 7.3.24 DMAjBUFCR_n — DMA Buffer Control Register

DMAjBUFCR_n is a 32 -bit read/write register that controls the upper limit of the data RAM buffer. This register specifies the upper limit of the RAM buffer available to a channel for data prefetching. This setting should not be changed unless it is necessary to limit the amount of prefetched data.

| Value after reset: $\quad 00000080 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 7.22 DMAjBUFCR_n Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | ULB[7:0] | Upper limit of buffer |
|  |  | This register controls the upper limit of a channel's data buffer. |
|  |  | A power-of-two setting is recommended. Setting ULB to less than the transaction size (DMAjTMR_n.STS, DMAjTMR_n.DTS) is prohibited. |
|  |  | The maximum value is 128 (bytes). |

### 7.3.25 DMAjDPPTR_n — DMA Descriptor Pointer Register

DMAjDPPTR_n is a 32-bit read/write register that specifies the address of the next register setting in the descriptor memory. The operation of descriptors is explained in detail in Section 7.4.6, Descriptors.

Table 7.23 DMAjDPPTR_n Register Contents

### 7.3.26 DMAjDPCR_n — DMA Descriptor Control Register

DMAjDPCR_n is a 32-bit read/write register that specifies which channel settings will be updated with the contents of the descriptor memory. The operation of descriptors is explained in details in Section 7.4.6, Descriptors.

Table 7.24 DMAjDPCR_n Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 0 | UPF[10:0] | Update flag of Descriptor |
|  |  | These bits specify the registers to be updated by a descriptor operation. The DMAjDPPTR_n register is always updated. |
|  |  | UPF[0]: Enable/disable updating the DMAjSAR_n register |
|  |  | UPF[1]: Enable/disable updating the DMAjDAR_n register |

|  |  | UPF[10]: Enable/disable updating the DMAjBUFCR_n register |

### 7.3.27 Descriptor RAM — Descriptor Memory

See Section 7.4.6, Descriptor for details about the descriptor memory.

### 7.3.28 DMACSELj_m — sDMACj Transfer Request Group Selection Register m ( $m=0$ to 15)

DMACSELj_m is a 32-bit read/write register that specifies the sDMACj transfer request group for each channel.

| Value after reset: |  |  | DMACSELO_m: 0000 0000H DMACSEL1_m: 5555 5555 |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Bit Name | Function |
| :--- | :--- |
| SELn | $0_{B}:$ Select DMA transfer request group 0 |
|  | $1_{\mathrm{B}}:$ Select DMA transfer request group 1 |

### 7.4 Operation

### 7.4.1 DMA Transfer Requests

The DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request source (TRS) bit in the DMA transfer mode register (DMAjTMR_n) determines whether a hardware DMA transfer request or a software DMA transfer request is used. How to set up DMA transfer requests is described in Section 7.7, Setting up DMA Transfer.

## (1) Auto-Request Mode

When the TRS bit in the DMAjTMR_n register is set to 0 , a software DMA transfer request can be generated. When the DE bit in DMAjCHCR_n and the DME bit in DMAjOR are set to 1 for the target channel, the transfer begins providing the CAE bit in DMAjCHSTA_n is 0 .

## (2) Hardware-Request Mode

When the TRS bit in the DMAjTMR_n register is set to 1 , if DMA transfer is enabled ( $\mathrm{DE}=1, \mathrm{DME}=1, \mathrm{TE}=0, \mathrm{CAE}$ $=0$ ), a transfer is performed upon the input of a transfer request signal.
In the case of a hardware DMA transfer request for the DMAC, one out of 256 hardware DMA transfer sources is selected and assigned to each channel of the DMAC in the DMA request control module. This assignment is configured by the resource select (RS) bit in the DMAjRS_n register.
Examples of using hardware request mode are shown below.

## (a) Example 1: Hardware Request Operation to Transfer Data from a Peripheral Module

Figure 7.3 and Figure 7.4 show examples of a peripheral module requesting sDMAC transfer from peripheral memory to on-chip memory. When the hardware transfer request triggers a load data transfer ( DMAjRS _n.PLE $=0$ ), the DMAjRS_n.TL bit determines the load data transfer limit per hardware transfer request. Store data transfers are executed in auto request mode in this case.

Figure 7.3 Transferring Data from Peripheral Module in Hardware-Request Mode

Figure 7.4 Timing Chart for Transferring Data from Peripheral Module

## (b) Example 2: Hardware Request Operation to Transfer Data to a Peripheral Module

Figure 7.5, Figure 7.6, Figure 7.7, and Figure 7.8 show examples of a peripheral module requesting sDMAC transfer from on-chip memory to peripheral module memory. When the pre-load function is enabled (DMAjRS_n.PLE = 1), a hardware transfer request triggers a store data transfer. The DMAjRS_n.TL bit determines the store data transfer limit per hardware transfer request. Load data transfers are executed in auto request mode in this case.

In case the pre-load transfer is triggered before the load data is prepared in the source memory, the pre-load limit can be controlled by setting the ULB bit in DMAjBUFCR_n register as shown in Figure 7.8.

Figure 7.5 Transferring Data to a Peripheral Module in Hardware Request Mode

Figure 7.6 Timing Chart for Pre-Load Function in Hardware Request Mode

Figure $7.7 \quad$ Timing Chart of Transferring Data to Peripheral Module

Figure 7.8 Timing Chart of Transferring Data with Buffer Control Operation

### 7.4.2 DMA Interrupts

The routing of sDMAC interrupts is shown in Figure 7.9. sDMAC interrupts can be masked by the DMA channel registers.

A channel interrupt request is raised by sDMAC if any of these status bits is set (OR function):

- Transfer end (TE),
- Descriptor step end (DSE)
- Channel address error (CAE).
- Address error notifications are also routed to the CPU by another path.

The status of channel interrupt requests and address errors is indicated in global registers DMAjISTA and DMAjESTA.

Figure 7.9 Interrupt Routing in sDMAC

### 7.4.3 Channel Priority

When sDMAC receives transfer requests from multiple channels, it transfers data according to a predetermined priority. One of two modes (fixed mode or round-robin mode) can be selected (DMAjOR.PR[1:0]).

## (1) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

$$
\mathrm{CH} 0>\mathrm{CH} 1>\ldots>\mathrm{CH} 14>\mathrm{CH} 15
$$

## (2) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (1 to 64 byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer has just finished rotates to the bottom of the priority. The priority of roundrobin mode is $\mathrm{CH} 0>\mathrm{CH} 1>\ldots>\mathrm{CH} 14>\mathrm{CH} 15$ immediately after reset.

## (3) Channel Request Priority

To increase the priority of the specified channel, use the PRI bits in the DMA transfer mode register (DMAjTMR_n). This function is given priority over the PR bits in the DMA operation register (DMAjOR). If a channel request is not accepted, the channel priority counter increases by the count set by the PRICNT bits in the DMA channel request priority register (DMAjCHPRI). The PRICNT bits in the DMA channel request priority register (DMAjCHPRI) are counted up by SCLK. When this priority counter reaches the maximum value ( $=7$ ), the highest priority request is accepted. However, if more than one channel has high priority, the requests are arbitrated according to the setting of the PR bits in DMAjOR.

Figure 7.10 shows the channel request priorities.

Figure 7.10 Channel Request Priorities

### 7.4.4 Slow Speed Mode

In slow speed mode, there is a configurable delay between consecutive DMA transfers. The delay (number of clock cycles) is specified by the SLM bit in the DMAjTMR_n register. Slow speed mode can be selected independently for each DMA channel. When one DMA channel operating in slow speed mode is waiting between DMA transfers, another DMA channel operating in slow speed mode can perform DMA transfer.

Figure 7.11 Slow Speed Mode

### 7.4.5 Scatter Gather Transfer

The DMAC supports gathering on the source side and scattering on the destination side.
The gather flow is shown in Figure 7.12. It is enabled if the GEN bit in DMAjSGCR_n for the given DMA channel is set to 1 . The gather flow supports an inner and an outer loop. The number of iterations of the inner loop is specified by the GIRPT bit in DMAjSGCR_n register. The total of inner and outer loop transfers equals the number of TSR bytes. So the number of iterations of the outer loop is indirectly defined by the TSR register. The inner loop always transfers a data unit the size of an STS byte from the source to the data RAM and the SAR register is updated in the same way as transfers with gathering disabled. Additionally, the source address (SAR bits in DMAjSAR_n register) is increased by the inner address increment (GIAI bits in DMAjGIAI_n register). This procedure is repeated until the value of TSR bits in DMAjTSR_n or the value of GICNT bits in DMAjSGST_n register reaches zero, which concludes the inner loop. Before the inner loop is repeated, the source address (SAR bits in DMAjSAR_n register) is increased by the outer address increment (GOAI bits in DMAjGOAI_n register) and the GICNT bits in DMAjSGST_n register are restored with the value of GIRPT bits in DMAjSGCR_n register. The outer loop is repeated until the value of TSR bits in DMAjTSR_n register reaches zero. Figure $\mathbf{7 . 1 4}$ shows an example with gathering and scattering enabled. If a transaction error occurs while the gather flow is active, the gather flow restarts at the beginning after the error condition is cleared.

Figure 7.12 Gather Flow at Source Side If GEN = 1

The scatter flow is shown in Figure 7.13. It is enabled if the SEN bit in DMAjSGCR_n for the given DMA channel is set to 1 . The scatter flow also supports an inner and outer loop. Additionally, zero filling is supported in the inner loop. The number of iterations of the inner loop is specified by the SIRPT register. The total of inner and outer loop transfers equals the number of TSRB bytes. So the number of iterations of the outer loop is indirectly defined by the TSRB register. The inner loop always transfers one data unit of size specified by DTS bits in DMAjTMR_n from the data RAM to the destination address and the DAR bits in DMAjDAR_n register is updated in the same way as for transfers with scattering disabled. If zero filling is disabled by setting ZF bit in DMAjSGCR_n $=0$, the destination address (DAR bits in DMAjDAR_n register) is additionally increased by the inner address increment (SIAI bits in DMAjSIAI_n register), resulting in the destination address for the next data unit (the value of DAR bits in DMAjDAR_n register plus the value of SIAI bits in DMAjSIAI_n register). If zero filling is enabled by setting ZF bit in DMAjSGCR_n register = 1, value zero with data units specified by SIAI bits in DMAjSIAI_n register are written to the destination address and the DAR bits in DMAjDAR_n register is updated. This procedure also uses internal register ZFTSR to calculate the remaining zero fill transfer size. This procedure is repeated until the value of TSRW bits in DMAjTSRB_n register or the value of SICNT bits in DMAjSGST_n register reaches zero, which concludes the inner loop. Before the inner loop is repeated, the destination address (DAR bits in DMAjDAR_n register) is increased by the outer address increment (SOAI bits in DMAjSOAI_n register) if zero fill is disabled and the SICNT bits in DMAjSGST_n register is restored with the value of SIRPT bits in DMAjSGCR_n register. The outer loop is repeated until the value of TSRW bits in DMAjTSRB_n reaches zero. Figure 7.14 shows an example with gathering and scattering enabled. If a transaction error occurs while the scatter flow is active, the scatter flow restarts at the beginning after the error condition is cleared.

Figure 7.13 Scatter Flow at Destination Side If SEN $=1$

Figure 7.14 Examples That Show the Operation of Scatter and Gather Flows

The scatter gather features can be used to realize re-sorting. Transposing a column vector from a source memory address to a row vector at the destination memory address is realized by using gathering at the source side. The inner loop (GIRPT bits in DMAjSGCR_n register) is set to the number of samples in the vector. The data unit size (STS bits or DTS bits in DMAjTMR_n register) is set to the size of one vector element. The inner address offset (GIAI bits in DMAjGIAI_n register) is set to $\mathrm{k}^{*}$ STS, where k is the width of the source matrix in the number of elements and STS is
the value of STS bits in DMAjTMR_n register. The same principle can be used to transpose a row vector to a column vector. Here, scattering is used instead of gathering. Gathering and scattering can also be used to read every m-th source address and write it to every n-th destination address. Since gathering and scattering can be enabled independently, any combination is possible. At the destination side, zero filling can be used to set the words between the write addresses to zero.

Finally, the outer loop feature for both gathering and scattering allows the realization of inner and outer DMA loops.

### 7.4.6 Descriptors

A descriptor contains all the necessary register bits that describe a single transfer task on a channel. A channel can execute multiple descriptors in a chain by reloading the register settings from the descriptor memory. Descriptor operations are enabled by setting DPE bit to $1_{\mathrm{B}}$ in DMAjCHCR_n. When the DMA transfer defined by the current register setting is finished, the next descriptor is loaded from the descriptor memory. The address of the descriptor to load is defined by the DMAjDPPTR_n.PTR bits. The new descriptor also updates the DMAjDPPTR_n register. This enables an arbitrary chain of descriptors.
Updating of the register list by descriptor operations is shown in Table 7.26.
The bit format in the descriptor memory matches the bit format in the corresponding DMA channel registers.
The DMAjSAR_n, DMAjDAR_n and DMAjTSR_n registers are updated during DMA transfer. If the DMAjSAR_n and DMAjDAR_n registers are not updated, the next DMA transfer is started from the final value of the previous DMA transfer. The DMAjTSR_n register is set to 0 after DMA transfer, so DMAjTSR_n register must be updated.

Table 7.26 Register List of Channels to Be Updated

| No. | Name | Abbreviation | Bit | DMADPCR.UPF bit |
| :--- | :--- | :--- | :--- | :--- |
| 1 | DMA source address register | DMAjSAR_n | All bits | UPF[0] |
| 2 | DMA destination address register | DMAjDAR_n | All bits | UPF[1] |
| 3 | DMA transfer size register | DMAjTSR_n | All bits | UPF[2] |
| 4 | DMA transfer mode register | DMAjTMR_n | All bits | UPF[3] |
| 5 | DMA gather inner address increment register | DMAjGIAI_n | All bits | UPF[4] |
| 6 | DMA gather outer address increment register | DMAjGOAI_n | All bits | UPF[5] |
| 7 | DMA scatter inner address increment register | DMAjSIAI_n | All bits | UPF[6] |
| 8 | DMA scatter outer address increment register | DMAjSOAI_n | All bits | UPF[7] |
| 9 | DMA scatter gather control register | DMAjSGCR_n | All bits | UPF[8] |
| 10 | DMA resource select register | DMAjRS_n | All bits | UPF[9] |
| 11 | DMA buffer control register | DMAjBUFCR_n | All bits | UPF[10] |

Set as follows for each channel that should use the descriptor function:

- Specify the register to be updated in the UPF bits of the DMAjDPCR_n register.
- Set the DMA transfer setting in the descriptor memory.
- If DMA transfer should start when a configuration is copied from the descriptor memory to DMA channel registers
- set the DMAjDPPTR_n.PTR bits to the first transfer configuration in the descriptor memory
- set DMAjCHCR_n.DPB to 1
- If DMA transfer should start according to a register setting and continue with the descriptor function.
- configure the channel registers
- set the DMAjDPPTR_n.PTR bits to the address of the next transfer configuration in the descriptor memory
- set DMAjDPPTR_n.CF to 1
- set DMAjCHCR_n.DPB to 0

The descriptor memory is shared by all DMA channels. Therefore is it important to avoid overlaps of areas used by different DMA channels in common descriptor memory.

## (1) Configuration of Descriptor Memory

A DMA transfer configuration can start from any address in the descriptor memory. Register configurations that are not updated should not be written.

Examples of configurations in descriptor memory are shown in the figure below.

Figure 7.15 Built-in Descriptor Memory Configuration

## (2) Flow of Setting Updating by Descriptor Operation

Updating a configuration by using the descriptor function is specified by the UPF bits in the DMAjDPCR_n register. If a register is updated by a descriptor operation, the PTR bit in DMAjDPPTR_n is incremented. Finally the DMAjDPPTR_n register is updated. Therefore, the DMAjDPPPTR_n register setting must be always written into the descriptor memory.

This flow is automatically processed by hardware.

Figure 7.16 Flow of Setting Updating by Descriptor Operation

## (3) Descriptor Operational Flow

Figure 7.17 shows the descriptor operational flow.
When the first transfer setting is written in the descriptor memory, the DPB bit in the DMAjCHCR_n register is set to 1 . When a DSE interrupt is issued after a step of DMA transfer completion, the DSIE bit in the DMAjCHCR_n register and the DIE bit in DMAjDPPTR_n in the descriptor memory are set to 1 . A DSE interrupt can be issued at the optional timing by using this setting. When DSE bit in DMAjCHSTA_n register is set already at the time of a step of DMA transfer completion, the next transfer setting is not read from the descriptor memory. There is a possibility that the next setting is not written in the descriptor memory because the first DSE interrupt has not been processed. The descriptor can be continued by clearing the first DSE interrupt. When the DPE bit in DMAjCHCR_n register is set to 0 or the CF bit in DMAjDPPTR_n register in the Descriptor memory is set to 0 after a step of DMA transfer completion, TE interrupt is issued, and Descriptor is ended.

Figure 7.17 Descriptor Operational Flow

## (4) Example of descriptor usage

Figure 7.18 to Figure 7.25 show examples of using descriptors operations.
(a) Example 1: Normal Descriptor Operations

The DMAC transfers descriptors in the listed order and generates an interrupt after all of the transfers are complete.

Figure 7.18 Normal Descriptor Operations (Example 1)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. |
|  |  | Write to the DPCR register. |
|  |  | Descriptors 0 to 3 are written to the descriptor memory. |
|  |  | Descriptor[0].DPPTR <br> CF = 1, DIE = 0, PTR = Descriptor 1 pointer |
|  |  | Descriptor[1].DPPTR $\text { CF = 1, DIE = 0, PTR = Descriptor } 2 \text { pointer }$ |
|  |  | Descriptor[2].DPPTR CF = 1, DIE = 0, PTR = Descriptor 3 pointer |
|  |  | Descriptor[3].DPPTR CF = 0, DIE = 0, PTR = Any value |
|  |  | The first descriptor pointer is written to the DPPTR register. |
|  |  | DPPTR.PTR = 0 |
|  |  | Start the descriptor operation (write to CHCR) |
|  |  | Descriptor enable (CHCR.DPE = 1) |
|  |  | TE interrupt enable (CHCR.IE = 1) |
|  |  | DSE interrupt disable (CHCR.DSIE $=0$ ) |
|  |  | To start the transfer after reading descriptor memory (CHCR.DPB = 1) |
| 2 | TE clear | Check the interrupt status (read CHSTA) |
|  |  | Disable DMA transfer (CHCR.DE = 0) |
|  |  | Clear the transfer end flag (CHFCR.TEC = 1) |

## (b) Example 2: Specific Order Operations

The DMAC transfers descriptors in the specified order and generates an interrupt after all of the transfers are complete.

Descriptor $0 \rightarrow$ Descriptor $1 \rightarrow$ Descriptor $3 \rightarrow$ Descriptor 2

Figure 7.19 Specific Order Operation (Example 2)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. |
|  |  | Write to the DPCR register. |
|  |  | Descriptors 0 to 3 are written to the descriptor memory. |
|  |  | Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer |
|  |  | Descriptor[1].DPPTR CF = 1, DIE = 0, PTR = Descriptor 3 pointer |
|  |  | Descriptor[2].DPPTR CF = 0, DIE = 0, PTR = Any value |
|  |  | Descriptor[3].DPPTR CF = 1, DIE = 0, PTR = Descriptor 2 pointer |
|  |  | The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 |
|  |  | Start the descriptor operation (write to CHCR) |
|  |  | Descriptor enable (CHCR.DPE = 1) |
|  |  | TE interrupt enable (CHCR.IE = 1) |
|  |  | DSE interrupt disable (CHCR.DSIE $=0$ ) |
|  |  | After reading descriptor memory (CHCR.DPB = 1) |
| 2 | TE clear | Check the interrupt status (read CHSTA) |
|  |  | Disable DMA transfer. (CHCR.DE = 0) |
|  |  | Clear the transfer end flag. (CHFCR.TEC = 1) |

## (c) Example 3: Descriptor Step End Interrupt

The DMAC transfers the descriptors in order, and generates an interrupt after the specified descriptor is complete.

Figure 7.20 Descriptor Step End Interrupt (Example 3)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. <br> Write to the DPCR register. <br> Descriptors 0 to 3 are written to the descriptor memory. <br> Descriptor[0].DPPTR <br> $C F=1$, DIE $=0$, PTR $=$ Descriptor 1 pointer <br> Descriptor[1].DPPTR $\text { CF = 1, DIE = 1, PTR = Descriptor } 2 \text { pointer }$ <br> Descriptor[2].DPPTR <br> CF = 1, DIE = 0, PTR = Descriptor 3 pointer <br> Descriptor[3].DPPTR $C F=0, \text { DIE }=0, \text { PTR }=\text { Any value }$ <br> The first descriptor pointer is written to the DPPTR register. <br> DPPTR.PTR = 0 <br> Start the descriptor operation (write to CHCR) <br> Descriptor enable (CHCR.DPE = 1) <br> TE interrupt enable (CHCR.IE = 1) <br> DSE interrupt enable (CHCR.DSIE = 1) <br> After reading descriptor memory (CHCR.DPB = 1) |

| 3 | TE clear | Check the interrupt status (read CHSTA) <br> Disable DMA transfer (CHCR.DE = 0) <br> Clear the transfer end flag (CHFCR.TEC = 1) |

## (d) Example 4: Double Buffer Operation

Example of double buffer operation using DSE interrupt.

Figure 7.21 Double Buffer Operation (Example 4)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. <br> Write to the DPCR register. <br> Descriptor 0 to 1 is written in Descriptor Memory <br> Descriptor[0].DPPTR <br> CF = 1, DIE = 1, PTR = Descriptor 1 pointer <br> Descriptor[1].DPPTR <br> CF = 1, DIE = 1, PTR = Descriptor 0 pointer <br> The first descriptor pointer is written to the DPPTR register. <br> DPPTR.PTR = 0 <br> Start the descriptor operation (write to CHCR) <br> Descriptor enable (CHCR.DPE =1) <br> TE interrupt enable (CHCR.IE = 1) <br> DSE interrupt enable (CHCR.DSIE = 1) <br> After reading descriptor memory (CHCR.DPB =1) |
| 2, 3 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 4 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear continuation flag. (Descriptor[0].DPPTR.CF = 0) <br> Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 5 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 6 | TE clear | Check the interrupt status (read CHSTA) <br> Disable DMA transfer. (CHCR.DE = 0) <br> Clear the transfer end flag. (CHFCR.TEC = 1) |

## (e) Example 5: Double Buffer Operation with Interrupt Processing Delay

When the next DSE interrupt occurs without clearing the DSE interrupt and without reading the next setting from descriptor memory, transmission is suspended. When the DSE interrupt is cleared after writing the next setting to the descriptor memory, transmission resumes.

Figure 7.22 Double Buffer Operation with Interrupt Processing Delay (Example 5)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. <br> Write to the DPCR register. <br> Descriptor 0 to 1 is written in Descriptor Memory <br> Descriptor[0].DPPTR <br> CF = 1, DIE = 1, PTR = Descriptor 1 pointer <br> Descriptor[1].DPPTR <br> CF = 1, DIE = 1, PTR = Descriptor 0 pointer <br> The first descriptor pointer is written to the DPPTR register. <br> DPPTR.PTR $=0$ <br> Start the descriptor operation (write to CHCR) <br> Descriptor enable (CHCR.DPE = 1) <br> TE interrupt enable (CHCR.IE = 1) <br> DSE interrupt enable (CHCR.DSIE = 1) <br> After reading descriptor memory (CHCR.DPB =1) |
| 2 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear Descriptor step end flag. (CHFCR.DSEC $=1$ ) |
| 3 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear continuation flag. (Descriptor[1].DPPTR.CF = 0) <br> Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 4 | DSE clear | Check the interrupt status (read CHSTA) <br> Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 5 | TE clear | Check the interrupt status (read CHSTA) <br> Disable DMA transfer. (CHCR.DE $=0$ ) <br> Clear the transfer end flag. (CHFCR.TEC = 1) |

## (f) Example 6: Repeat Operation

The continuation flag remains set and DMA transfer is repeated.

Figure 7.23 Repeat Operation (Example 6)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. |
|  |  | Write to the DPCR register. |
|  |  | Descriptors 0 to 2 are written to the descriptor memory. |
|  |  | Descriptor[0].DPPTR CF = 1, DIE = 1, PTR = Descriptor 1 pointer |
|  |  | Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 2 pointer |
|  |  | Descriptor[2].DPPTR CF = 1, DIE = 1, PTR = Descriptor 0 pointer |
|  |  | The first descriptor pointer is written to the DPPTR register. |
|  |  | DPPTR.PTR $=0$ |
|  |  | Start the descriptor operation (write to CHCR) |
|  |  | Descriptor enable (CHCR.DPE = 1) |
|  |  | TE interrupt enable ( $\mathrm{CHCR} . \mathrm{IE}=0$ ) |
|  |  | DSE interrupt disable (CHCR.DSIE $=0$ ) |
|  |  | After reading descriptor memory (CHCR.DPB = 1) |

## (g) Example 7: Hardware Request Operation

When hardware transfer request mode is set, the descriptor operation is executed by a hardware request.

Figure 7.24 Hardware Request Operation (Example 7)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. |
|  |  | Write to the DPCR register. |
|  |  | Descriptors 0 to 3 are written to the descriptor memory. |
|  |  | Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer |
|  |  | Descriptor[1].DPPTR CF = 1, DIE = 1, PTR = Descriptor 2 pointer |
|  |  | Descriptor[2].DPPTR $C F=0$, DIE $=0$, PTR $=$ Any value |
|  |  | The first descriptor pointer is written to the DPPTR register. |
|  |  | DPPTR.PTR = 0 |
|  |  | Setting hardware transfer request in each Descriptor $n(n=0 \sim 2)$ |
|  |  | Hardware request mode (Descriptor[n].DMAjTMR_n.TRS = 1) |
|  |  | Transfer limit by DSE is asserted (Descriptor[n].DMAjRS_n.TL = 3'b011) |
|  |  | Start the descriptor operation (write to CHCR) |
|  |  | Descriptor enable (CHCR.DPE = 1) |
|  |  | TE interrupt enable (CHCR.IE = 0) |
|  |  | DSE interrupt disable (CHCR.DSIE $=0$ ) |
|  |  | After reading descriptor memory (CHCR.DPB = 1) |
| 2 | DSE clear | Check the interrupt status (read CHSTA) |
|  |  | Clear Descriptor step end flag. (CHFCR.DSEC = 1) |
| 3 | TE clear | Check the interrupt status (read CHSTA) |
|  |  | Disable DMA transfer. (CHCR.DE = 0) |
|  |  | Clear the transfer end flag. (CHFCR.TEC = 1) |

## (h) Example 8: Hardware Request Operation with Different Request Source Settings

If a hardware request source setting is different in chained descriptors, the generated DMA request is automatically cleared when the descriptor memory setting is loaded.

Figure 7.25 Hardware Request Operation with Different Request Source Settings (Example 8)

| No. | Handling | Detail |
| :---: | :---: | :---: |
| 1 | Initial setting | Specify the register to be updated. |
|  |  | Write to the DPCR register. |
|  |  | Descriptors 0 to 3 are written to the descriptor memory. |
|  |  | Descriptor[0].DPPTR CF = 1, DIE = 0, PTR = Descriptor 1 pointer |
|  |  | Descriptor[1].DPPTR CF = 0, DIE = 0, PTR = Any value |
|  |  | The first descriptor pointer is written to the DPPTR register. DPPTR.PTR = 0 |
|  |  | Setting hardware transfer request in each Descriptor $\begin{aligned} & \text { Descriptor[0].DMAjTMR_n } \\ & \text { TRS = } 1 \end{aligned}$ |
|  |  | Descriptor[0].DMAjRS_n <br> RS = 100 (hardware request resource channel) |
|  |  | Descriptor[1].DMAjTMR_n $\text { TRS = } 1$ |
|  |  | Descriptor[1].DMAjRS_n <br> RS = 101 (hardware request resource channel) |
|  |  | Start the descriptor operation (write to CHCR) |
|  |  | Descriptor enable (CHCR.DPE = 1) |
|  |  | TE interrupt enable (CHCR.IE $=0$ ) |
|  |  | DSE interrupt disable (CHCR.DSIE $=0$ ) |
|  |  | After reading descriptor memory (CHCR.DPB = 1) |
| 3 | TE clear | Check the interrupt status (read CHSTA) |
|  |  | Disable DMA transfer. (CHCR.DE = 0) |
|  |  | Clear the transfer end flag. ( CHFCR. TEC $=1$ ) |

## (5) Stopping a Descriptor Operation

Three methods can be used to stop a descriptor operation.
Method 1: Descriptor updating is stopped after completion of the specific DMA transfer.
The specific CF bit in DMAjDPPTR_n in the descriptor memory is set to 0 .
The TE interrupt is issued after the end of the specified DMA transfer.
Method 2: Descriptor updating is stopped after the current DMA transfer is complete.
The DPE bit in the DMAjCHCR_n register is set to 0 by writing 1 to the DPEC bit in the DMAjCHFCR_n register. The TE interrupt is issued after the end of the current DMA transfer even if the CF bit is set to 1 . It is not recommended to use the CF bit of the DMAjDPPTR_n register to stop DMA transfer. This bit is updated by the descriptor function.

Method 3: Immediate stop without completing the current DMA transfer.
See Section 7.5(2), DMA Transfer Suspension and Section 7.5(3), Stopping and Restarting DMA Transfer.

### 7.4.7 Transfer Flow

Write the transfer condition settings to the DMA source address register (DMAjSAR_n), DMA destination address register (DMAjDAR_n), DMA transfer size register (DMAjTSR_n), DMA transfer mode register (DMAjTMR_n), DMA Channel control register (DMAjCHCR_n), DMA resource select register (DMAjRS_n) and DMA operation register (DMAjOR) . The DMAC transfers data in following order.

## (1) Auto Request Mode

- A transfer request occurs and the DMAC confirms whether transfer is enabled ( $\mathrm{DE}=1, \mathrm{DME}=1, \mathrm{TE}=0, \mathrm{CAE}=0$ ). Transfer starts automatically.
- If a transfer request is generated, one transfer unit (specified by STS [3:0] or DTS[3:0]) will be transferred. DMAjTSR_n will be decremented by the transfer unit every time DMA transfer completes.
- When the specified number of transfers are complete (the value of DMAjTSR_n and DMAjTSRB_n is 0 ), transfer ends normally. At this time if the IE bit of DMAjCHSTA_n is set to 1 , a TE interrupt will be issued to the CPU.
- Transfer is terminated if an address error occurs in DMA transfer. In addition, transfer is terminated even if the DE bit of DMAjCHCR_n or the DME bit of DMAjOR is set to 0 .

Figure 7.26 Transfer Flow in Auto Request Mode

## (2) Hardware Request Mode

- Figure 7.27 shows the flow in hardware request mode.
- A hardware request can be received when the DMAC confirms whether transfer is enabled $(\mathrm{DE}=1, \mathrm{DME}=1, \mathrm{TE}=$ $0, \mathrm{CAE}=0$ ).
- If PLE is set to 1 and FPT is set to 0 , pre-loading data from the source memory to the data RAM of sDMAC starts automatically. DMAjTSR_n will be decremented by the transfer unit every time pre-load transfer completes. If FPT is set to 1 , pre-loading occurs after the first hardware transfer request is generated and the internal status register (FPS) is set to 0 .
- When a hardware transfer request is generated, one transfer unit (specified by TL[2:0]) will be transferred. DMAjTSRB_n will be incremented by the transfer unit every time transfer completes.
- When the specified number of transfers are complete (the value of DMAjTSR_n and DMAjTSRB_n is 0 ), transfer ends normally. At this time if the IE bit of DMAjCHSTA_n is set to 1 , a TE interrupt will be issued to the CPU
- Transfer is terminated if an address error occurs in DMA transfer. In addition, transfer is terminated even if the DE bit of DMAjCHCR_n or the DME bit of DMAjOR is set to 0 .

Figure 7.27 Transfer Flow in Hardware Request Mode

### 7.4.8 Performance

The DMA controller operates on a CLK_HBUS. Read and write transaction requests are issued in parallel on both system interconnect read and write interfaces to enable flyby transfers. Transaction requests are issued without waiting for a reply. So multiple outstanding requests can be in flight on the bus. This is used to hide latencies on the path from the DMA to the slave. The DMA supports 16 outstanding transactions per system interconnect interface ( 16 reads and 16 writes).

All channels operate in parallel. Arbitration on the read/write interfaces is performed as defined in the operation register DMAjOR. The bus data width is 64 bits ( 8 bytes). If the unit transfer size (STS/DTS) is larger than 8 bytes, the transaction requests multiple replies in sequence (also called "burst"). The maximum burst size is 8 , resulting in a maximum transfer unit size of 64 bytes.

The maximum number of outstanding requests in each DMA channel changes depending on the unit transfer size (STS/DTS). Each DMA channel can use 128 bytes in data RAM as outstanding transfer data buffer. If the unit transfer size (STS/DTS) in a DMA channel is 16 bytes or more, the number of outstanding requests in the DMA channel is 8 or less and the maximum number of outstanding request is 16 or less. Each DMA channel can issue a new transaction request every three clock cycles at best. The frequency at which each DMA channel issues a new transaction request changes depending on the number of outstanding requests in the DMA channel or the number of channels using DMA transfer. If the unit transfer size (STS/DTS) in a DMA channel is 64 bytes, the number of outstanding requests in the DMA channel is 2 . In this case, if DMA transfer is operated with one DMA channel and a transaction request is issued twice, a subsequent read transaction request is not issued before previous read and write transaction requests are processed, and the DMA channel cannot issue a new transaction request every three clock cycles.

To utilize the read and write data channels every cycle, two approaches can be used:

- Use three DMA channels. Each channel transfers one third of the required data. The DMAC issues a new request transaction every cycle on the read and write interfaces in parallel.
- Use one DMA channel with a STS/DTS value of 8 bytes. The read/write transaction requests are issued every three cycles.

Both approaches fully utilize the read and write data channels if the data RAM is sufficiently utilized.

### 7.5 Usage Notes

Pay attention to the following notes when using the DMAC.

## (1) Address Errors

When a DMA address error occurs, set the register of the erroneous channel again after DMA transfer suspend shown in Section 7.5(2), DMA Transfer Suspension and then start transfer. Address errors are caused by the factors indicated in Table 7.27.

Table 7.27 Address Error Factors

| Factor | Description |
| :--- | :--- |
| DMA transfer error | The transfer source or transfer destination is invalid space. |
|  | The transfer source or transfer destination is a GUARD error. |
| Prohibited setting error | DMA source transaction size setting is prohibited. (DMATMR.STS $>0110: 64$ bytes) |
|  | DMA destination transaction size setting is prohibited. (DMATMR.DTS >0110: 64 bytes) |
|  | DMA transfer count is zero in hardware request mode (DMARS.TC $=0$ when DMARS.TL $=000,001$ ) |

## (2) DMA Transfer Suspension

When suspension DMA transfer, clear the DE bit in the DMA channel control register (DMAjCHCR_n) by using the DEC bit in the DMA channel flag clear register (DMAjCHFCR_n) to disable DMA transfer. After receiving the entire response packet, clear the BUSY bit in the DMA channel status register (DMAjCHSTA_n) to 0 . There is a possibility that a TE/DSE interrupt may occur to asynchronous timing after suspention transfer, so it is necessary to assume the following case and take appropriate measures:

- After DMA transfer is suspended, the TE/DSE bit is set to 1 and the BUSY bit is cleared. If the IE/DSIE bit is set to 1 at that time, the DMA interrupt is asserted.

NOTE
If DMA transfer is initialized while the last transfer is executing, this causes a TE/DSE generation delay. In this case, perform a dummy read.

Figure 7.28 shows a processing example when DMA transfer is suspended.

Figure 7.28 Example of DMAC Transfer Suspention Processing

## (3) Stopping and Restarting DMA Transfer

To stop DMA transfer temporarily, write 1 to the STP bit in the DMA channel stop register (DMAjCHSTP_n). Writing to the STP bit stops DMA transfer requests immediately. After receiving the entire response packet, the BUSY bit is cleared to 0 . When restarting, set the STP bit to 0 .

Figure 7.29 shows a processing example when stopping and restarting DMA transfer.

Figure 7.29 Example of DMA Transfer Stop and Restart Processing

## (4) Impact of Transfer Unit Size on Addresses and Offsets

The general recommendation is to set the base addresses (SAR, DAR) and address increments (GIAI, GOAI, SIAI, SOAI) to a multiple of the related transfer unit size (STS, DTS). If this recommendation is not followed, byte transfers are used instead. This reduces the performance significantly.

### 7.6 Reliability Function

### 7.6.1 Overview

In this product, the DMAC is a resource used by multiple masters (CPU0 or CPU1). In order for the DMAC to support a multi-core configuration, the following reliability functions are offered.

- Register access protection function

Refer to Section 38, Functional Safety.

- Master information inheritance function

### 7.6.2 Master Information Inheritance Function

In this product, DMA access inherits master information is set by DMAjCM_n register.
The master information that is output from the DMAC is as shown in Table 7.28 for access guard.
Table 7.28 Master Information That Is Output from DMAC

| Meaning | Value that is output from DMAC |
| :--- | :--- |
| UM | Same as the UM bit value in the channel master setting register |
| SEC | Non secure |
| SPID | Same as the SPID bit value in the channel master setting register |

### 7.7 Setting up DMA Transfer

### 7.7.1 Overview of Setting up DMA Transfer

Table 7.29 Overview of Setting up DMA Transfer

| No. | Description | Register |  | Necessity of the Setting |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Transfer request group selection setting | DMACSELj_m | DMA transfer request group selection register m | Mandatory (if using hardware transfer request mode) |
| 2 | Overall DMA operation setting | DMAjCM_n | DMA channel master setting register | Mandatory |
| 3 | Channel setting | DMAjSAR_n | DMA source address register | Mandatory |
| 4 |  | DMAjDAR_n | DMA destination address register | Mandatory |
| 5 |  | DMAjTSR_n | DMA transfer size register | Mandatory |
| 6 |  | DMAjTMR_n | DMA transfer mode register | Mandatory |
| 7 |  | DMAjRS_n | DMA resource select register | Mandatory (if using hardware transfer request mode) |
| 8 | Status clear | DMAjCHFCR_n | DMA channel flag clear register | Mandatory |
| 9 | Channel operation enable | DMAjCHCR_n | DMA channel control register | Mandatory |
| NOTE |  |  |  |  |

If a transfer request is used to change the transfer request group, it is necessary to set up the registers from the beginning without configuring an overall DMA operation setting.

### 7.7.2 Setting up the Transfer Request Group Selection

Set up the transfer request group selection before using the sDMAC. The following registers must be set up to configure a transfer request group.

- sDMACj Transfer Request Group Selection Register m (DMACSELj_m) ( $\mathrm{j}=0$ to $1, \mathrm{~m}=0$ to 15 )

This register configures the transfer request group selection

### 7.7.3 Setting up the Overall DMA Operation

Set up the overall DMA operation before you start using DMA.

The following register must be set up to configure the overall DMA operation.
DMAC channel master setting register (DMAjCM_n)
This register configures the channel assignment. (For details, see Section 7.6, Reliability Function.)

If the DMAC channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

### 7.7.4 Setting up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC channel.
To configure the DMA channel setting, the master allowed to access each channel needs to set up the channel registers.

Follow the procedure below to set up the DMAC channel setting and use the DMAC.
(1) Disabling the DMAC channel operation

If the channel operation enable bit (DE) in the DMA channel control register (DMAjCHCR_n) is set, channel setting up registers must not to be set up. Wait for the previous DMA transfer to finish or be supended, and then disable the DMAC channel operation.
(2) Setting up the transfer information

When setting up the transfer information for the DMAC, the following registers need to be set up.

- DMA source address register (DMAjSAR_n)
- DMA destination address register (DMAjDAR_n)
- DMA transfer size register (DMAjTSR_n)
- DMA transfer mode register (DMAjTMR_n)
(3) Setting up the DMA transfer request

While setting the transfer information, set the DMA transfer request select (TRS) bit in the DMA transfer mode register (DMAjTMR_n) to define whether a hardware or software DMA transfer request is used.
The hardware and software DMA transfer request cannot be used for the same channel at the same time.
If the hardware DMA transfer request is used, select one source to be used as the hardware DMA transfer request out of the 256 available hardware DMA transfer sources using the resource selection (RS) bit in the DMA resource select register (DMAjRS_n).
The DMA channel may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DMACHSTA_n.DRQ) and overflow flag
(DMACHSTA_n.OVF) by using the DMA channel flag clear register (DMAjCHFCR_n) before enabling channel operation.
If the software DMA transfer request is used, disable the hardware DMA transfer request select (TRS) bit in the DMA transfer mode register (DMAjTMR_n).
(4) Clearing the transfer status

The DMA channel status register (DMAjCHSTA_n) may retain the result of the previous DMA transfer. Clear the flags in the DMA transfer status register using the DMA channel flag clear register (DMAjCHFCR_n).
(5) Enabling the DMAC channel operation

Set the DMA channel operation enable bit (DE) in the DMA channel control register (DMAjCHCR_n) to enable the channel operation. After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

## Section 8 DTS Controller

This section provides a generic description of the Data Transfer Service (DTS) controller. The first part of this section contains information about product properties such as number of units and register base addresses. The second part of this section describes functions and registers of DTS.

### 8.1 Features of DTS

### 8.1.1 Number of Units and Channels

This product has the following number of DTS units.
Table $8.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pin |
| Number of Units | 1 | 1 |
| Number of Channels | 128 | 128 |
| Name | DTSCNT | DTSCNT |

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Number of Channels | 128 | 128 |

Table 8.2 Definition of Indexes

| Index | Meaning |
| :--- | :--- |
| $n n n$ | The channel number is identified by the index "nnn". ( $n n n=0$ to 127 ) |
| $m$ | The individual trigger group selection registers are identified by the index " $m$ " $(m=0$ to 15$)$. |

### 8.1.2 Register Base Addresses

The DTS base addresses are listed in Table 8.3.
The DTS register addresses are specified as offsets from the base addresses.
Table 8.3 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <DTS_base> | FFF8 $8000_{\mathrm{H}}$ | Peripheral Group 0 |
| <DMATRGSEL_base> | FF09 $0100_{\mathrm{H}}$ | Peripheral Group 9 |

### 8.1.3 Clock Supplies

The DTS clock supplies are shown in the following table.
Table 8.4 Clock Supplies

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| DTSCNT | clk | CLK_HBUS |
| DMATRGSEL | PCLK | CLK_HBUS |

### 8.1.4 Interrupt Requests

The DTS interrupt requests are listed in the following table.
Table 8.5 Interrupt Requests

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number |
| :--- | :--- | :--- | :--- |
| INTDTS31TO0 | INTDTS[31:0] | DTS ch31-0 transfer end | 37 |
| INTDTS63TO32 | INTDTS[63:32] | DTS ch63-32 transfer end | 38 |
| INTDTS95TO64 | INTDTS[95:64] | DTS ch95-64 transfer end | 39 |
| INTDTS127TO96 | INTDTS[127:96] | DTS ch127-96 transfer end | 40 |
| INTDTSCT31TO0 | INTDTSCT[31:0] | DTS ch31-0 transfer count match | 41 |
| INTDTSCT63TO32 | INTDTSCT[63:32] | DTS ch63-32 transfer count match | 42 |
| INTDTSCT95TO64 | INTDTSCT[95:64] | DTS ch95-64 transfer count match | 43 |
| INTDTSCT127TO96 | INTDTSCT[127:96] | DTS ch127-96 transfer count match | 44 |
| INTDTSERR | DTSERR | DTS transfer error | 30 |

### 8.1.5 DTS Transfer Requests for DTS

The DTS transfer request table lists all DTS transfer request factors for DTS. The DTS transfer request group for DTS can be selected by the DTSSELm register.

### 8.1.6 Reset Sources

DTS reset sources are listed in the following table. DTS is initialized by the following reset sources.
Table 8.6 Reset Sources

| Unit Name | Register Name | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Power Up <br> Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| DTSCNT | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DTSSEL | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 8.1.7 External Input/Output Signals

This module has no signals mapped to external input/output pins.

### 8.2 Overview

### 8.2.1 Functional Overview

The Data Transfer Service (DTS) is a DMA controller used to access data without going through the CPU.
DTS stores transfer information in a dedicated RAM (DTSRAM).
Table 8.7 shows the configuration of DTS.
Table 8.7 Configuration of DTS

| Module Name | Number of Units | Number of Channels |
| :--- | :--- | :--- |
| DTSCNT | 1 | 128 ch |

Functions of DTSFSL are arbitration of incoming the DTS requests, triggering the DTS controller and monitoring ongoing DTS transfers. DTSFSL can handle 128 DTS transfer sources.

The address space that can be used for DTS transfer is a 4 GB address space represented by a 32 -bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DTS, refer to Section 4, Address Map.

The DTS is connected to System Bus directly. If a conflict occurs with another bus master in System Bus, the transfer is arbitrated by round-robin arbitration.

### 8.2.2 Definition of Terms

Table 8.8 shows the terms used in this section.
Table $8.8 \quad$ List of Term Definitions

| Term | Meaning |
| :--- | :--- |
| DTS transfer | A term for data transfer carried out by the DTS controller |
| DTS cycle | A series of actions that consist of reading an amount of data specified by the transfer size <br> $(8 / 16 / 32 / 64 / 128$ bits) from the address specified by the source address and writing it to the <br> address specified by the destination address. The first half of the DTS cycle (reading part) is <br> called a read cycle, and the second half (writing part) is called a write cycle. |
| Hardware DTS transfer source | A trigger for a DTS transfer request issued by an internal peripheral device |
| Hardware DTS transfer request | A DTS transfer request issued by a hardware DTS transfer source |
| Software DTS transfer request | A DTS transfer request issued by writing to a register via software |
| DTS transfer request | A trigger to start DTS transfer with DTS |
| Transfer information (TI) | The information required for DTS transfer, including the source address, destination address, <br> transfer data size, and transfer count. The transfer information for DTS is referred to as TI. |
| DTSRAM | RAM used by DTS to store the transfer information |
| Single transfer | A DTS transfer consisting of one DTS cycle started by one DTS transfer request |
| Block transfer 1 | A DTS transfer consisting of the number of DTS cycles specified by the transfer count in the <br> transfer information, started by one DTS transfer request |
| Block transfer 2 | A DTS transfer consisting of the number of DTS cycles specified by the address reload count <br> in the transfer information, started by one DTS transfer request |
| Block transfer | A general term for both block transfer 1 and block transfer 2 |

### 8.3 Registers

### 8.3.1 List of Registers

Table $8.9 \quad$ List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DTSCNT | DTS Control Register 1 | DTSCTL1 | <DTS_base> + 0010 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Control Register 2 | DTSCTL2 | <DTS_base> + 0014H | 32 | - |
|  | DTS Status Register | DTSSTS | <DTS_base> + 0018 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Error Register | DTSER | <DTS_base> + 0024 | 32 | - |
|  | DTS Channel Priority Setting Register 0 | DTSPR0 | <DTS_base> + 0060 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 1 | DTSPR1 | <DTS_base> + 0064 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 2 | DTSPR2 | <DTS_base> + 0068 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 3 | DTSPR3 | <DTS_base> + 006C ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 4 | DTSPR4 | <DTS_base> + 0070 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 5 | DTSPR5 | <DTS_base> + 0074 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 6 | DTSPR6 | <DTS_base> + 0078 ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Priority Setting Register 7 | DTSPR7 | <DTS_base> + 007C ${ }_{\text {H }}$ | 32 | - |
|  | DTS Channel Master Setting Register*1 | DTSnnnCM | <DTS_base> + " $0200_{\mathrm{H}}+4_{\mathrm{H}} \times$ [DTS channel number] $\left(0200_{H}\right.$ to $\left.03 \mathrm{FC}_{\mathrm{H}}\right)$ " | 32 | - |
|  | DTS Source Address Register | DTSAnnn | <DTS_base> $+1000_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 | - |
|  | DTS Destination Address Register | DTDAnnn | ```<DTS_base> + 1004H}+4\mp@subsup{0}{H}{}\times\mathrm{ [channel number]``` | 32 | - |
|  | DTS Transfer Count Register | DTTCnnn | <DTS_base> $+1008_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 | - |
|  | DTS Transfer Control Register | DTTCTnnn | $\text { <DTS_base> + 100C }{ }_{H}+40_{H} \times \text { [channel }$ number] | 32 | - |
|  | DTS Reload Source Address Register | DTRSAnnn | <DTS_base> + $1010_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 | - |
|  | DTS Reload Destination Address Register | DTRDAnnn | ```<DTS_base> + 1014H + 40H }\times\mathrm{ [channel number]``` | 32 | - |
|  | DTS Reload Transfer Count Register | DTRTCnnn | <DTS_base> $+1018_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 | - |
|  | DTS Transfer Count Compare Register | DTTCCnnn | <DTS_base> + 101C ${ }_{H}+40_{H} \times$ [channel number] | 32 | - |
|  | DTSFSL Operation Setting Register | DTFSLnnn | ```<DTS_base> + 1020H}+4\mp@subsup{O}{H}{}\times\mathrm{ [channel number]``` | 32 |  |
|  | DTSFSL Transfer Status Register | DTFSTnnn | <DTS_base> + 1024 ${ }_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 |  |
|  | DTSFSL Transfer Request Set Register | DTFSSnnn | <DTS_base> + $1028_{H}+40_{H} \times$ [channel number] | 32 |  |
|  | DTSFSL Transfer Status Clear Register | DTFSCnnn | <DTS_base> $+102 \mathrm{C}_{\mathrm{H}}+40_{\mathrm{H}} \times$ [channel number] | 32 |  |
| DMATRGSEL | DTS Transfer Request Group Selection Register | DTSSELm*2 | <DMATRGSEL_base> $+10{ }_{H}+(\mathrm{m} \times 4 \mathrm{H})$ | 8, 16, 32 |  |

Page 637 of 4595

Note 1. The [channel number] in the offset address is a number from 0 to 127 . The " $n n n$ " in the register symbols is a 3-digit number from 000 to 127.
Note 2. m index

### 8.3.2 Description of Global Registers

### 8.3.2.1 DTSCTL1 — DTS Control Register 1

DTS Control Register 1 (DTSCTL1) is a 32-bit read/write register that controls the DTS global suspension setting.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { DTSUS } \\ \mathrm{T} \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 8.10 DTSCTL1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DTSUST | DTS suspend |
|  |  | This bit shows whether DTS transfers are suspended. If this bit is set to 1, a DTS suspend is |
|  | requested. |  |
|  | $0:$ DTS is not suspended |  |
|  | 1: DTS is suspended or DTS suspension is requested |  |
|  |  |  |

### 8.3.2.2 DTSCTL2 — DTS Control Register 2

DTS Control Register 2 (DTSCTL2) is a 32-bit write only register that controls DTS transfer abort.

Value after reset: $00000000_{\mathrm{H}}$

Table 8.11 DTSCTL2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved. |
|  |  | When writing, write the value after reset. |
| 0 | DTSTIT | DTS transfer abort request |
|  | Setting this bit to 1 while DTS transfer is suspended aborts the suspended DTS transfer. |  |
|  | Writing to this bit while DTS transfer is in progress is ignored. |  |
|  | When the suspended DTS transfer is aborted, the DTSSTS.DTSACT bit is cleared. |  |
|  | This bit is write only. |  |

### 8.3.2.3 DTSSTS — DTS Status Register

The DTS Status Register (DTSSTS) is a 32-bit read only register that indicates the DTS status.

Table 8.12 DTSSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved. |
|  |  | When read, the value after reset is returned. |
| 8 | DTSCYC | DTS cycle execution state |
|  |  | This bit shows whether a DTS cycle is in progress in DTS. |
|  |  | 0: DTS cycle is not in progress. |
|  |  | 1: DTS cycle is in progress. |
| 7 to 1 | DTSACH | DTS transfer channel |
|  |  | If there is a channel in DTS executing a DTS transfer, the channel number is shown. |
|  |  | If there is no channel in DTS executing a DTS transfer, the channel number of the last DTS transfer is shown. |
| 0 | DTSACT | DTS transfer status |
|  |  | This bit shows whether there is a channel in DTS executing a DTS transfer. |
|  |  | 0: There is no channel in DTS executing DTS transfer. |
|  |  | 1: There is a channel in DTS executing DTS transfer. |
|  |  | If DTS is in the suspended state while there is a channel executing DTS transfer, this bit remains 1. |
|  |  | If a DTS transfer abort request is made using the DTSCTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0 . |
|  |  | When a DTS transfer error occurs and the DTS transfer is aborted, this bit is cleared. |

### 8.3.2.4 DTSER — DTS Error Register

The DTS Error Register (DTSER) is 32-bit read only register that indicates the error status of DTS.

Table 8.13 DTSER Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved. |
|  |  | When read, the value after reset is returned. |
| 14 to 8 | DTSERCH | DTS error channel |
|  |  | These bits show the DTS channel number of the smallest channel number that has a DTS transfer error. |
|  |  | These bits are read-only and cannot be cleared. |
| 7 to 2 | - | Reserved. |
|  |  | When read, the value after reset is returned. |
| 1 | DTSERWR | DTS transfer error cycle |
|  |  | This bit indicates that a DTS transfer error occurred on the channel indicated by DTSERCH[6$0]$ in the read cycle or the write cycle. |
|  |  | These bits are read-only and cannot be cleared. |
|  |  | 0: A DTS transfer error occurred in the read cycle. |
|  |  | 1: A DTS transfer error occurred in the write cycle. |
| 0 | DTSER | DTS transfer error flag |
|  |  | This bit shows whether a DTS transfer error is detected in DTS. |
|  |  | 0: A DTS transfer error was not detected in all DTS channels. |
|  |  | 1: A DTS transfer error was detected in one of the DTS channels. |

Note: In order to clear DTSER, a DTS transfer error of all DTS channels need to be cleared.

### 8.3.2.5 DTSPRn — DTS Channel Priority Setting Register ( $\mathrm{n}=0$ to 7)

The DTS Channel Priority Setting Register (DTSPRn) is a 32-bit read/write register that defines the priorities for each DTS channel. The priorities are configured from 0 to 3 , with 0 being the highest.

## - DTSPR0

Value after reset: $\quad 00000000 \mathrm{H}$

Table 8.14 DTSPRO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DTSnPR[1:0] | DTS channel $n$ priority setting |
|  | $(n=0$ to 15$)$ | These bits configure the priority level of each DTS channel used for DTS channel arbitration. |
|  |  | 00 is the highest priority, and 11 is the lowest. |

- DTSPR1

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 8.15 DTSPR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DTSnPR[1:0] | DTS channel $n$ priority setting |
|  | $(n=16$ to 31) | These bits configure the priority level of each DTS channel used for DTS channel arbitration. |
|  | 00 is the highest priority, and 11 is the lowest. |  |

## - DTSPR2

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | DTS47PR[1:0] |  | DTS46PR[1:0] |  | DTS45PR[1:0] |  | DTS44PR[1:0] |  | DTS43PR[1:0] |  | DTS42PR[1:0] |  | DTS41PR[1:0] |  | DTS40PR[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | DTS39PR[1:0] |  | DTS38PR[1:0] |  | DTS37PR[1:0] |  | DTS36PR[1:0] |  | DTS35PR[1:0] |  | DTS34PR[1:0] |  | DTS33PR[1:0] |  | DTS32PR[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 8.16 DTSPR2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DTSnPR[1:0] | DTS channel $n$ priority setting |
|  | $(n=32$ to 47) | These bits configure the priority level of each DTS channel used for DTS channel arbitration. |
|  | 00 is the highest priority, and 11 is the lowest |  |

- DTSPR3

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DTS63PR[1:0] |  | DTS62PR[1:0] |  | DTS61PR[1:0] |  | DTS60PR[1:0] |  | DTS59PR[1:0] |  | DTS58PR[1:0] |  | DTS57PR[1:0] |  | DTS56PR[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 8.21 DTSPR7 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DTSnPR[1:0] | DTS channel $n$ priority setting |
|  | $(\mathrm{n}=112$ to 127) | These bits configure the priority level of each DTS channel used for DTS channel arbitration. |
|  |  | 00 is the highest priority, and 11 is the lowest. |

### 8.3.2.6 DTSnnnCM — DTS Channel Master Setting Register (nnn = 000 to 127)

The DTS Channel Master Setting Register (DTSnnnCM) is a 32-bit read/write register that defines the channel master configuration for each DTS channel. The contents of this register is used for the master information inheritance function. For more information about the function, see Section 8.7, Reliability Functions.

This register is placed in the DTSRAM and the lower 16-bit field of this register is shared with the DTS transfer count compare register (DTTCCnnn), one of DTS channel register. If this register is written, DTTCCnnn register is updated as well.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.22 DTSnnnCM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CHAIN_RESTRICT | Chain function restriction setting <br> 0 : The chain function is not restricted. A chain from any channel is possible. <br> 1: The chain function is restricted. A chain is permitted only when SPID set by CHAIN_SPID[4:0] is the same as DTSnnnCM.SPID[4:0] of the current channel in the chain and UM set by CHAIN_UM is the same as DTSnnnCM.UM of the current channel in the chain. |
| 30 to 26 | CHAIN_SPID[4:0] | Chain permission SPID setting <br> These bits specify the SPID information that permits the chain function. |
| 25 | CHAIN_UM | Chain permission UM setting <br> This bit specifies the UM information that permits the chain function. |
| 24 to 23 | - | Reserved <br> When read, the value returned is undefined. The write value should be 0 . |
| 22 to 18 | SPID[4:0] | Channel master SPID setting <br> These bits specify the SPID information used by the master assigned to the channel. |
| 17 | UM | Channel master UM setting <br> This bit specifies the UM information of the master assigned to the channel. |
| 16 | - | Reserved <br> When read, the value returned is undefined. The write value should be 0 . |
| 15 to 0 | CMC[15:0] | Transfer count compare <br> In terms of contents, this field is the same as bits[15:0] in Section 8.3.3.2(8), DTTCCnnn DTS Transfer Count Compare Register. |

Note: DTS000CM to DTS127CM configure the channel master information of DTS channels 0 to 127 respectively. For information about the functions this register provides, see Section 8.7, Reliability Functions.
The lowest 16 bits of this register are shared with the DTS Transfer Count Compare Register, one of DTS channel registers.

When writing to this register, the DTS Transfer Count Compare Register is updated as well
Bits 24-23 and 16 of this register are reserved, but these bits are readable and writable. It is recommended to write 0 to these bits and to ignore the value read from these bits.

### 8.3.3 Description of DTS Channel Registers

### 8.3.3.1 Transfer Information of DTS (TI)

(1) Structure of TI

The transfer information of DTS is called TI. One TI consists of 8 sets which are called TI-A, TI-B, TI-C, TI-D, TI-E, TI-F, TI-G, and TI-H. Each set consists of a 32-bit word. Eight sets of TI are assigned to each channel.

The following figure shows the structure of TI.

Figure 8.1 Structure of TI

## (2) Organization of TI in DTSRAM

The user can indirectly access DTSRAM through the DTS channel registers for each channel and DTS channel master setting registers.

Therefore, direct access to TI structures in DTSRAM is usually not required.
As an exception, when an ECC error occurs while DTSRAM is being accessed, the address at which error occurred is stored in the DTSRAM 1st 1-bit Error Address Register (DR_00SEADR) or the DTSRAM 1st Fatal Error Address Register (DR_00DEADR). It is helpful to understand the address organization of TI in DTSRAM to distinguish which channel/TI has generated the error.

Figure 8.2 shows the address organization of TI in DTSRAM.

Figure 8.2 Organization of TI in DTSRAM

## (3) How to Access TI

TI-A can be accessed through the DTS Source Address Register (DTSAnnn) for each channel.
TI-B can be accessed through the DTS Destination Address Register (DTDAnnn) for each channel.
TI-C can be accessed through the DTS Transfer Count Register (DTTCnnn) for each channel.
TI-D can be accessed through the DTS Transfer Control Register (DTTCTnnn) for each channel.
TI-E can be accessed through the DTS Reload Source Address Register (DTRSAnnn) for each channel.
TI-F can be accessed through the DTS Reload Destination Address Register (DTRDAnnn) for each channel.
TI-G can be accessed through the DTS Reload Transfer Count Register (DTRTCnnn) for each channel.
TI-H can be accessed through either the global Channel Master Setting Register (DTSnnnCM) or the channel specific Transfer Count Compare Register (DTTCCnnn).

## (4) Cautions on Accessing TI

The value of the DTS Channel Master Setting Register and the value of the DTS Transfer Count Compare Register are both stored in TI-H.

Accessing the DTS Channel Master Setting Register (DTSnnnCM) is performed via a 32-bit access to the entire TI-H.
When writing to the DTS Channel Master Setting Register, the lower 16 bits (DTS transfer count compare or CMC) are also updated. When reading from the DTS Channel Master Setting Register, the lower 16 bits represent the CMC value.

When reading from the DTS Transfer Count Compare Register (DTTCCnnn), hardware performs a 32-bit read access from TI-H but only the lower 16 bits are used for the result of the register read. When writing to the DTS Transfer Count Compare Register (DTTCCnnn), hardware performs a read-modify-write access to TI-H.

Since the contents of TI after reset are undefined, writing to the DTS Transfer Count Compare Register (DTTCCnnn) before writing to the DTS Channel Master Setting Register can result in an ECC error due to the read part of the read-modify-write access.

Some bits of TI-H are reserved. It is recommended to write 0 to these bits and to ignore the value read from these bits.
After reset, the values of TI in DTSRAM are undefined. The first access to TI after reset should be a write access. Otherwise an ECC error will occur.

- DTS Source Address Register (DTSAnnn)
- DTS Destination Address Register (DTDAnnn)
- DTS Transfer Count Register (DTTCnnn)
- DTS Transfer Control Register (DTTCTnnn)
- DTS Reload Source Address Register (DTRSAnnn)
- DTS Reload Destination Address Register (DTRDAnnn)
- DTS Reload Transfer Count Register (DTRTCnnn)
- Channel master setting registers (DTSnnnCM)

After reset a write access to the DTS Transfer Count Compare Register (DTTCCnnn) must follow a write access to the DTS Channel Master Setting Register (DTSnnnCM).

When accessing TI contents while a DTS transfer is in progress, the following implications should be considered.

- TI of the channel should not be updated by the CPU during the ongoing transfer. Otherwise a mismatch between the DTS transfer and the contents of TI may occur.
- If a TI access is requested from the CPU while a TI fetch or TI write back is being executed, the TI access is executed after the completion of the TI fetch or TI write back.
- If a TI fetch or TI write back is requested while a TI access request from the CPU is being processed, the TI fetch or TI write back is executed after the completion of the TI access.

### 8.3.3.2 Details of DTS Channel Registers

The "nnn" in the register symbols indicates the DTS channel number ( $\mathrm{nnn}=000$ to 127 ).

## (1) DTSAnnn - DTS Source Address Register

The DTS Source Address Register (DTSAnnn) is a 32-bit read/write register that specifies the DTS transfer source address of each channel.

| Value after reset: |  |  | $00000000_{H}{ }^{* 1}$ RAM initialization is executed. <br> Undefined ${ }^{* 1}$ RAM initialization is not executed. |  |  |  |  |  |  | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 |  |  |  |  |  |  |  |
|  | SA[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset |  |  |  |  |  |  |  | Unde | ed ${ }^{* 1}$ |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SA[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset Undefined*1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.23 DTSAnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | SA[31:0] | Source address |
|  |  | These bits specify the DTS transfer source address. |
|  |  | This register is updated at the timing of TI writeback and retains the DTS transfer source |
|  | address for the next DTS transfer. |  |

## NOTE

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

| Data Size | SA3 | SA2 | SA1 | SA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | $0 / 1$ |
| 16 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | 0 |
| 32 bits | $0 / 1$ | $0 / 1$ | 0 | 0 |
| 64 bits | $0 / 1$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

## (2) DTDAnnn — DTS Destination Address Register

The DTS Destination Address Register (DTDAnnn) is a 32-bit read/write register that specifies the DTS transfer destination address of each channel.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.24 DTDAnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | DA[31:0] | Destination address |
|  |  | These bits specify the DTS transfer destination address. <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br> NOTES <br>  |
|  |  |  |

1. If a DTS transfer error occurs in the read cycle of a DTS transfer, the write cycle is not executed, but the destination address is updated.
2. DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

| Data Size | DA3 | DA2 | DA1 | DA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bit | $0 / 1$ | $0 / 1$ | $0 / 1$ | $0 / 1$ |
| 16 bit | $0 / 1$ | $0 / 1$ | $0 / 1$ | 0 |
| 32 bit | $0 / 1$ | $0 / 1$ | 0 | 0 |
| 64 bit | $0 / 1$ | 0 | 0 | 0 |
| 128 bit | 0 | 0 | 0 | 0 |

## (3) DTTCnnn - DTS Transfer Count Register

The DTS Transfer Count Register (DTTCnnn) is a 32-bit read/write register that specifies the DTS transfer count of each channel.

| Value after reset: $0000000 H^{* 1}$ RAM initialization is execute |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | ARC[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | Undefined*1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TRC[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset |  |  |  |  |  |  |  | Undefined*1 |  |  |  |  |  |  |  |  |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.25 DTTCnnn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | ARC[15:0] | Address reload count <br> These bits specify the transfer count for the address reload function. The number is used for both reload function 2 and block transfer 2 . When reload function 2 or block transfer 2 is used, ARC[15:0] are decremented by one for every DTS cycle and updated at the timing of TI writeback. When neither reload function 2 nor block transfer 2 is used, ARC[15:0] are not updated. <br> If $\operatorname{ARC}[15: 0]$ are $0000_{\mathrm{H}}$, address reload is not performed and $\operatorname{ARC}[15: 0]$ are not updated. |
| 15 to 0 | TRC[15:0] | Transfer count <br> These bits configure the transfer count. TRC[15:0] are decremented by one whenever a DTS cycle is executed. These bits are updated at the timing of TI writeback. If the reload function is not used, the value at completion $\left(0000_{\mathrm{H}}\right)$ is retained after the completion of the last transfer. If $0000_{H}$ is set, DTS transfer is not executed even if a DTS transfer request is accepted. |
|  |  | TRC[15:0] Operation |
|  |  | $0000_{\mathrm{H}} \quad$ Transfer is disabled or complete. |
|  |  | $0001_{\mathrm{H}} \quad$ The number of transfers or remaining transfers is 1. |
|  |  | : : |
|  |  | FFFF $_{H} \quad$ The number of transfers or remaining transfers is 65535. |

## NOTE

If a transfer error occurs in the read cycle of DTS transfer, the write cycle is not executed, but the transfer count and address reload count are updated.

## (4) DTTCTnnn - DTS Transfer Control Register

The DTS Transfer Control Register (DTTCTnnn) is a 32-bit read/write register that defines DTS transfer configuration of the channel.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table $8.26 \quad$ DTTCTnnn Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | - | Reserved |
|  |  | When read, the value returned is undefined. The write value should be 0 . |
| 27 | ESE | Setting of DTS error transfer disable |
|  |  | This bit specifies whether to abort DTS transfer when a DTS transfer error occurs. |
|  |  | If this bit is cleared to 0 , DTS transfer continues when a DTS transfer error occurs. |
|  |  | If this bit is set to 1 , DTS transfer is aborted when a DTS transfer error occurs. |
|  |  | 0: DTS transfer continues when a DTS transfer error occurs. |
|  |  | 1: DTS transfer is aborted when a DTS transfer error occurs. |
| 26 to 25 | - | Reserved |
|  |  | When read, the value returned is undefined. The write value should be 0 . |
| 24 to 18 | CHNSEL[6:0] | Next channel to chain |
|  |  | These bits specify the next channel to chain. |
|  |  | The next channel must be another channel in DTS. |
|  |  | Setting the same channel for the next channel is not allowed. (Correct operation is not guaranteed in this case.) |
| 17 to 16 | CHNE[1:0] | Chain enable |
|  |  | This bit selects the chain function. |
|  |  | 00: Disabled |
|  |  | 01: Chain at the last transfer <br> A chain request is generated at the completion of the DTS cycle at which the remaining transfer count is 1 . |
|  |  | 10: (Setting prohibited) |
|  |  | 11: Always chain |
|  |  | A chain request is generated at the completion of every DTS cycle. |
| 15 | CCE | Transfer count match interrupt enable |
|  |  | If this bit is set, a transfer count match interrupt is generated at the completion of the DTS cycle in which the Transfer Count Compare Register and remaining transfer count have the same value. |

Table 8.26 DTTCTnnn Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 14 | TCE | Transfer completion interrupt enable <br> If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer. |
| 13 | - | Reserved <br> When read, the value returned is undefined. The write value should be 0 . |
| 12, 11 | RLD2M[1:0] | Reload function 2 setting <br> These bits configure reload function 2. <br> 00: Reload function 2 is disabled. <br> 01: Reload function 2 is enabled. The source address and address reload count are reloaded at the completion of the DTS cycle in which the address reload count is 1 . <br> 10: Reload function 2 is enabled. The destination address and address reload count are reloaded at the completion of the DTS cycle in which address reload count is 1 . <br> 11: Reload function 2 is enabled. The source address, destination address, and address reload count are reloaded at the completion of the DTS cycle in which address reload count is 1. |
| 10 to 9 | RLD1M[1:0] | Reload function 1 setting <br> These bits configure reload function 1. <br> 00: Reload function 1 is disabled. <br> 01: Reload function 1 is enabled. <br> The source address and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1 . (If reload function 2 is enabled, the address reload count is also reloaded.) <br> 10: Reload function 1 is enabled. The destination address and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1 . (If reload function 2 is enabled, the address reload count is also reloaded.) <br> 11: Reload function 1 is enabled. The source address, destination address, and transfer count are reloaded at the completion of the DTS cycle in which remaining transfer count is 1 . (If reload function 2 is enabled, the address reload count is also reloaded.) |
| 8 to 7 | DACM[1:0] | Destination address count direction <br> These bits specify the count direction of the destination address. |
|  |  | DACM1 DACM0 Direction of Count |
|  |  | 0 0 Increment |
|  |  | 0 1 Decrement |
|  |  | 100 Fixed |
|  |  | 1 1 Prohibited (Operation not guaranteed) |
| 6 to 5 | SACM[1:0] | Source address count direction <br> These bits specify the count direction of the source address. |
|  |  | SACM1 SACM0 Direction of Count |
|  |  | 0 0 Increment |
|  |  | $\begin{array}{lll}0 & 1 & \text { Decrement }\end{array}$ |
|  |  | 10 Fixed |
|  |  | 1 1 Prohibited (Operation not guaranteed) |

Table 8.26 DTTCTnnn Register Contents (3/3)

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 to 2 | DS[2:0] | Transfer data size |  |  |  |
|  |  | These bits specify the transfer data size. |  |  |  |
|  |  | DS2 | DS1 | DS0 | Transfer Data Size |
|  |  | 0 | 0 | 0 | 8 bits |
|  |  | 0 | 0 | 1 | 16 bits |
|  |  | 0 | 1 | 0 | 32 bits |
|  |  | 0 | 1 | 1 | 64 bits |
|  |  | 1 | 0 | 0 | 128 bits |
|  |  | Other than the above |  |  | Prohibited (Operation |
| 1 to 0 | TRM[1:0] | Transfer mode |  |  |  |
|  |  | These bits specify the DTS transfer mode. |  |  |  |
|  |  | 00: Single transfer |  |  |  |
|  |  | 01: Block transfer 1 (The number of transfers is specified by the transfer count.) |  |  |  |
|  |  | 10: Block transfer 2 (The number of transfers is specified by the address reload count.) |  |  |  |
|  |  | 11: Prohibited (Operation not guaranteed) |  |  |  |

## NOTES

1. If prohibited settings are used for some of the bits, the correct operation is not guaranteed.
2. Some bits in this register are unused, but these bits are readable and writable. It is recommended to write 0 to these bits and to ignore the value read from these bits.

## (5) DTRSAnnn — DTS Reload Source Address Register

The DTS Reload Source Address Register (DTRSAnnn) is a 32-bit read/write register that specifies the DTS reload source address of each channel.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.27 DTRSAnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RSA[31:0] | Reload source address <br>  <br>  <br>  <br> These bits specify the source address to be reloaded when reload function 1 or reload function <br> 2 is used. |
| NOTE |  |  |

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

| Data Size | RSA3 | RSA2 | RSA1 | RSA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | $0 / 1$ |
| 16 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | 0 |
| 32 bits | $0 / 1$ | $0 / 1$ | 0 | 0 |
| 64 bits | $0 / 1$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

## (6) DTRDAnnn — DTS Reload Destination Address Register

The DTS Reload Destination Address Register (DTRDAnnn) is a 32-bit read/write register that specifies the DTS reload destination address of each channel.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.28 DTRDAnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDA[31:0] | Reload destination address <br> These bits specify the destination address to be reloaded when reload function 1 or reload <br> function 2 is used. |
| NOTE |  |  |

DTS transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size are as follows. The correct operation is not guaranteed if any other setting is specified.

| Data Size | RDA3 | RDA2 | RDA1 | RDA0 |
| :--- | :--- | :--- | :--- | :--- |
| 8 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | $0 / 1$ |
| 16 bits | $0 / 1$ | $0 / 1$ | $0 / 1$ | 0 |
| 32 bits | $0 / 1$ | $0 / 1$ | 0 | 0 |
| 64 bits | $0 / 1$ | 0 | 0 | 0 |
| 128 bits | 0 | 0 | 0 | 0 |

## (7) DTRTCnnn - DTS Reload Transfer Count Register

The DTS Reload Transfer Count Register (DTRTCnnn) is a 32-bit read/write register that specifies the DTS reload transfer count of each channel.

Note 1. The value after reset is dependent on the setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.29 DTRTCnnn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | RARC[15:0] | Reload address reload count |
|  |  | These bits specify the value to be reloaded to the address reload count when reload function 2 is used. |
| 15 to 0 | RTRC[15:0] | Reload transfer count |
|  |  | These bits specify the value to be reloaded to the transfer count when reload function 1 is used. |
|  |  | RTRC[15:0] Operation |
|  |  | $0000_{\mathrm{H}}$ No DTS transfer |
|  |  | $0001_{\mathrm{H}}{ }^{\text {c }}$ transfer |
|  |  | : : |
|  |  |  |

## (8) DTTCCnnn — DTS Transfer Count Compare Register

The DTS Transfer Count Compare Register (DTTCCnnn) is a 32-bit read/write register which configures the transfer count to be compared to transfer count register.

Note 1. The value after reset is dependent on setting of RAM initialization. See Section 10.3.6, RAM Initialization for details.

Table 8.30 DTTCCnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | CMC[15:0] | Transfer count compare |
|  |  | These bits configure the transfer count to be compared to the Transfer Count Register. |
|  | If the transfer count match interrupt enable (DTTCTnnn.CCE) bit is 1, the transfer count match |  |
| interrupt is generated at the completion of the DTS cycle in which remaining transfer count is |  |  |
|  | the same as the value in this register. |  |
|  | If CMC[15:0] is 0000H, comparison with the transfer count is disabled. In this case, the |  |
|  | transfer count match interrupt is not generated. |  |
|  |  |  |
|  |  |  |
|  |  |  |

Note: This register must be accessed after the DTS channel master setting register is set up. If this register is accessed without setting up the DTS channel master setting register after reset, an ECC error may occur.

## (9) DTFSLnnn - DTSFSL Operation Setting Register

The DTSFSL Operation Setting Register (DTFSLnnn) is a 32-bit read/write register that controls the DTS transfer request of each channel.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | REQEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 8.31 DTFSLnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | REQEN | DTS transfer request enable |
|  |  | This bit specifies whether a DTS transfer request of each channel is used as a candidate for |
|  | DTS channel arbitration. |  |
|  | $0:$ The DTS transfer request is not used as a candidate for DTS channel arbitration. |  |
|  | 1: The DTS transfer request is used as a candidate for DTS channel arbitration. |  |
|  |  |  |
|  |  | If this bit is 0, the request of the channel is not a candidate of DTS channel arbitration inside |
|  | DTSFSL. DTS transfer request from the channel is not generated consequently, even if |  |
|  | DTSFSL holds a request. |  |

## (10) DTFSTnnn — DTSFSL Transfer Status Register

The DTSFSL Transfer Status Register (DTFSTnnn) is a 32-bit read-only register that indicates the status of each channel.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | ERWR | - | - | - | ER | - | CC | TC | - | - | - | DRQ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 8.32 DTFSTnnn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 11 | ERWR | DTS transfer error cycle |
|  |  | When transfer error flag (ER) is set, this bit is also updated. This bit indicates whether a DTS transfer error has occurred in the read cycle or write cycle. |
|  |  | If the ER bit is already set, this bit is not updated when another DTS transfer error occurs. |
|  |  | This bit is also cleared when the ER bit is cleared. |
|  |  | 0: A DTS transfer error occurred in the read cycle. |
|  |  | 1: A DTS transfer error occurred in the write cycle |
| 10 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 7 | ER | Transfer error flag |
|  |  | This bit is set when a DTS transfer error occurs. If this bit is 1 and the DTTCTnnn.ESE bit is set, a DTS transfer is not executed when a DTS transfer request occurs. |
|  |  | This bit is cleared by writing 1 to the DTFSCnnn.ERC bit. |
|  |  | 0: No DTS transfer error has occurred |
|  |  | 1: A DTS transfer error has occurred |
| 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 5 | CC | Transfer count match flag |
|  |  | This bit is set at the completion of the DTS transfer in which the remaining transfer count is the same as the value set in the transfer compare register. |
|  |  | This bit is cleared by writing 1 to the DTFSCnnn.CCC bit. |
|  |  | 0 : No compare match with the Transfer Count Compare Register has occurred. <br> 1: A compare match with the Transfer Count Compare Register has occurred. |
| 4 | TC | Transfer completion flag |
|  |  | This bit is set at the completion of the last transfer and shows whether DTS transfer is complete. |
|  |  | This bit is cleared by writing 1 to the DTFSCnnn.TCC bit. |
|  |  | 0 : DTS transfer is not complete |
|  |  | 1: DTS transfer is complete |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |

Table 8.32 DTFSTnnn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | DRQ | DTS transfer request flag |
|  |  | This bit shows whether a DTS transfer request of this channel is being held. |
|  | This bit is set when DTS transfer request is detected, or when the DTFSSnnn.DRQS bit is |  |
|  | written by software. |  |
|  | This bit is automatically cleared when DTS accepts a transfer request while DTSFSL is |  |
|  | requesting DTS transfer for the channel in question. This bit also can be cleared by writing to |  |
|  | the DTFSCnnn.DRQC bit. |  |
|  | 0: A DTS transfer request was not detected. |  |
|  | 1: A DTS transfer request was detected and is being held in DTSFSL. |  |
|  |  |  |

## (11) DTFSSnnn — DTSFSL Transfer Request Set Register

The DTSFSL Transfer Request Set Register (DTFSSnnn) is 32-bit write-only register that sets the DRQ bit in the DTFSTnnn register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 8.33 DTFSSnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | DRQS | DTS transfer request set |
|  |  | Writing 1 to this bit will generate a DTS transfer request. |

## (12) DTFSCnnn — DTSFSL Transfer Status Clear Register

The DTSFSL Transfer Status Clear Register (DTFSCnnn) is 32-bit write-only register that clears the status flag bits in the DTFSTnnn register.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 8.34 DTFSCnnn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When writing, write the value after reset. |
| 7 | ERC | Transfer error flag (ER) clear <br> The DTFSTnnn.ER bit can be cleared by writing 1 to this bit. |
| 6 | - | Reserved <br> When writing, write the value after reset. |
| 5 | CCC | Transfer count match flag (CC) clear |
| 4 |  | The DTFSTnnn.CC bit can be cleared by writing 1 to this bit. |
| 3 to 1 |  | Transfer completion flag (TC) clear |
|  |  | The DTFSTnnn.TC bit can be cleared by writing 1 to this bit. |
| 0 | DRQC | Reserved |
|  |  | When writing, write the value after reset. |

### 8.3.4 Detail DTSSELm

### 8.3.4.1 DTSSELm — DTS Transfer Request Group Selection Register ( $m=0$ to 15)

DTSSELm register is 32-bit read/write register. The DTSSELm register specifies the DTS transfer request group for each channel.

Table 8.35 DTSSELm Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 29,28 | SEL7[1:0] | These bits select the DTS transfer request group for DTS channel $8 \times \mathrm{m}+7$. |
| 27,26 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 25,24 | SEL6[1:0] | These bits select the DTS transfer request group for DTS channel $8 \times \mathrm{m}+6$. |
| 23,22 | - | Reserved <br> 21,20 |
| 19,18 | SEL5[1:0] | Then read, the value after reset is returned. When writing, write the value after reset. |

Table 8.35 DTSSELm Register Contents (2/2)

| Bit Name | Function |
| :--- | :--- |
| SELn[1:0] | $00_{\mathrm{B}}:$ Select DTS transfer request group 0 |
|  | $01_{\mathrm{B}}:$ Select DTS transfer request group 1 |
|  | $10_{\mathrm{B}}:$ Select DTS transfer request group 2 |
|  | $11_{\mathrm{B}}:$ Select DTS transfer request group 3 |

Figure 8.3 shows DTS transfer request group selection.

Figure 8.3 DTS Transfer Request Group Selection

### 8.4 Operation

### 8.4.1 Basic Operation of DTS Transfer

### 8.4.1.1 Transfer Mode

DTS has three transfer modes.
(1) Single Transfer

One DTS cycle is executed when a DTS transfer request is accepted.

## (2) Block Transfer 1

The number of DTS cycles specified by the TRC bits in the DTS Transfer Count Register are executed when a DTS transfer request is accepted.

## (3) Block Transfer 2

The number of DTS cycles specified by the ARC bits in the DTS Transfer Count Register are executed when a DTS transfer request is accepted. If the address reload count (ARC) is larger than the value of the transfer count (TRC), the number of DTS cycles is defined as the value of TRC.

### 8.4.1.2 Executing a DTS Cycle

DTS always executes the write cycle after the read cycle is complete. For example, if the transfer data size is 128 bits, the write cycle is executed after the read cycle for the 128 -bit data is finished. The write cycle never starts before the read cycle is completed.

### 8.4.1.3 Updating Transfer Information

When a DTS cycle is executed, the DTS updates the transfer information as follows.

## (1) Source Address and Destination Address

Transfer information (TI) will be updated as described in Table 8.36 according to the settings of the DTS Transfer Control Register (DTTCTnnn) such as the source address count direction, the destination address count direction, and the transfer data size.

Table $8.36 \quad$ Updating the Source Address and the Destination Address

| Direction of Count | Transfer Data Size | Address after Update |
| :---: | :---: | :---: |
| Increment | 8 bit | (address before update) $+00000001_{\mathrm{H}}$ |
|  | 16 bit | (address before update) $+00000002_{H}$ |
|  | 32 bit | (address before update) $+00000004_{\mathrm{H}}$ |
|  | 64 bit | $\left(\right.$ address before update) $+00000008_{\mathrm{H}}$ |
|  | 128 bit | (address before update) $+00000010_{\mathrm{H}}$ |
| Decrement | 8 bit | (address before update) - 0000 0001 H |
|  | 16 bit | (address before update) - $00000002_{\mathrm{H}}$ |
|  | 32 bit | (address before update) - $00000004_{\mathrm{H}}$ |
|  | 64 bit | (address before update) - $00000008_{\mathrm{H}}$ |
|  | 128 bit | (address before update) - $00000010_{\mathrm{H}}$ |
| Fixed | - | Same as the address before update. |

When the reload function is used, a specific update rule is applied other than the one described in Table 8.36 for the last transfer and the address reload transfer. For details, see Section 8.4.3, Reload Function.

## (2) Transfer Count/Address Reload Count

The transfer count is decremented by one for every DTS cycle.
The address reload count is decremented by one for every DTS cycle when reload function 2 or block transfer 2 is used. When neither reload function 2 nor block transfer 2 is used, it is not updated.

If the reload function is used, a specific update rule is applied for the last transfer and the address reload transfer.
For details, see Section 8.4.3, Reload Function.

## (3) Other Transfer Information

Other transfer information is not updated during execution of a DTS cycle.

### 8.4.1.4 Last Transfer and Address Reload Transfer

The last transfer means the DTS cycle executed when the value in the Transfer Count Register, which shows the remaining number of transfers, is 1 . The last transfer differs in operation compared to the other DTS cycles as follows.

- The transfer completion flag (DTFSTnnn.TC) is set when the last transfer is complete.
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When reload function 1 is enabled, reload function 1 is executed at the timing of the last transfer. For details, see

## Section 8.4.3, Reload Function.

Address reload transfer means the DTS cycle executed when reload function 2 is enabled and the address reload count is 1 . Reload function 2 is executed after address reload transfer. For details, see Section 8.4.3, Reload Function.

### 8.4.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Output

DTS can output a transfer completion interrupt and a transfer count match interrupt to outside DTS.

## (1) Transfer Completion Interrupt Output

When the transfer completion interrupt output enable bit (DTTCTn.TCE) is set in the Transfer Control Register, DTS requests a DTS transfer completion interrupt when the last transfer is complete.

## (2) Transfer Count Match Interrupt Output

When the transfer count match interrupt enable bit (DTTCTn.CCE) is set in the Transfer Control Register, DTS requests a DTS transfer count match interrupt at the completion of the DTS cycle in which the Transfer Count Compare Register and the transfer count have the same value.

Figure 8.4 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

Figure 8.4 Transfer Completion Interrupt and Transfer Count Match Interrupt

### 8.4.1.6 Continuous Transfer

DTS does not have a configuration that supports continuous transfer.
DTS does not start DTS transfer when a DTS transfer request is generated while the transfer count is 0 .
If the reload function 1 is used and the transfer count with the value other than 0 is reloaded to the transfer count bits (TRC[15:0]) in the DTS Transfer Count Register (DTTCnnn) when the last transfer is complete, the DTS can start the transfer after the next DTS transfer request is accepted.

### 8.4.2 Channel Priority Order

This subsection explains arbitration between multiple DTS channels.

### 8.4.2.1 DTS Channel Arbitration

If there are DTS transfer requests from multiple DTS channels, DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using the DTS channel priority setting registers.

If there are DTS transfer requests from multiple DTS channels, arbitration is executed as follows.
The channel with the higher priority level in the setting of the DTS channel priority setting register has priority.
If two channels have the same priority level specified in the DTS channel priority setting register, the channel with the smaller channel number has priority.

DTSFSL sends DTS a DTS transfer request for the channel selected by arbitration. DTS executes DTS transfer when it accepts the DTS transfer request.

DTS transfer does not allow arbitration between DTS channels in the middle of a block transfer. If a higher priority DTS transfer request is issued during a lower priority block transfer, the higher priority DTS transfer has to wait until the current block transfer is complete*1.

Note 1. Completion of block transfer means either the last transfer or the last transfer for block transfer 1 or the address reload transfer for block transfer 2 is finished.

When the DTS is executing the block transfer 1 or the block transfer 2, a DTS cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer is completed.

Figure 8.5 DTS Channel Arbitration

Cycle numbers shown in Figure 8.5 are for explanation purposes only. They do not indicate the actual number of cycles necessary for executing DTS transfer.

In Figure 8.5, DTS transfer requests for channels 0,1 , and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1 , which is 3 . In addition, if two channels have the same priority, the channel with the smaller channel number has higher priority. Consequently, the priority order for
arbitration is "channel $0>$ channel $2>$ channel 1 ", and a DTS cycle for channel 0 starts because its priority is the highest. As a result of arbitration between channels 1 and 2 at cycle 4, a DTS cycle for channel 2 starts. A DTS cycle for channel 1 starts at Cycle 7, and continuous cycles follow until Cycle 15 because channel 1 uses block transfer. At Cycle 11, a DTS transfer request for channel 0 is generated. The DTS cycle for channel 1 is still ongoing and no arbitration is executed until the block transfer of channel 1 is complete.

At cycle 15, the block transfer of channel 1 is complete. At cycle 16, a DTS cycle for channel 0 starts.

### 8.4.3 Reload Function

### 8.4.3.1 Overview of the Reload Function

The reload function updates a portion of the transfer information, more specifically, the source address, destination address, transfer count and address reload count, to predefined values during DTS transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

### 8.4.3.2 Operation of Reload Function 1

When reload function 1 is enabled, the actions described in Table 8.37 are executed at the timing of the last transfer according to the reload function 1 settings.

Table 8.37 Operation of Reload Function 1

| Reload Function 1 Setting | Register | Action at the Last Transfer |
| :---: | :---: | :---: |
| $00$ <br> (Reload function 1 disabled.) | Source address | Not reloaded. |
|  | Destination address | Not reloaded. |
|  | Transfer count | Not reloaded. |
|  | Address reload count | Not reloaded. |
| 01 <br> (Reload function 1 enabled. Reloading source address and transfer count.) | Source address | The reload source address is copied to this. |
|  | Destination address | Not reloaded. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If reload function 2 is disabled: Not reloaded. <br> If reload function 2 is enabled: The reload address reload count is copied to this. |
| 10 <br> (Reload function 1 enabled. <br> Reloading destination address and transfer count.) | Source address | Not reloaded. |
|  | Destination address | The reload destination address is copied to this. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If reload function 2 is disabled: Not reloaded. <br> If reload function 2 is enabled: The reload address reload count is copied to this. |
| 11 <br> (Reload function 1 enabled. Reloading source address, destination address, and transfer count.) | Source address | The reload source address is copied to this. |
|  | Destination address | The reload destination address is copied to this. |
|  | Transfer count | The reload transfer count is copied to this. |
|  | Address reload count | If reload function 2 is disabled: Not reloaded. <br> If reload function 2 is enabled: The reload address reload count is copied to this. |

Figure 8.6 shows the operation of reload function 1.

Figure 8.6 Operation of Reload Function 1

### 8.4.3.3 Reload Function 2

When reload function 2 is enabled, the actions described in Table 8.38 are executed at the timing of address reload transfer according to the reload function 2 settings.

Table 8.38 Operation of Reload Function 2

| Reload Function 2 Setting | Register | Action at Address Reload Transfer |
| :---: | :---: | :---: |
| $00$ <br> (Reload function 2 disabled.) | Source address | Not reloaded. |
|  | Destination address | Not reloaded. |
|  | Address reload count | Not reloaded. |
| 01 (Reload function 2 enabled. Reloading source address.) | Source address | The reload source address is copied to this. |
|  | Destination address | Not reloaded. |
|  | Address reload count | The reload address reload count is copied to this. |
| $10$ <br> (Reload function 2 enabled. Reloading destination address.) | Source address | Not reloaded. |
|  | Destination address | The reload destination address is copied to this. |
|  | Address reload count | The reload address reload count is copied to this. |
| 11 <br> (Reload function 2 enabled. Reloading source address and destination address.) | Source address | The reload source address is copied to this. |
|  | Destination address | The reload destination address is copied to this. |
|  | Address reload count | The reload address reload count is copied to this. |

Figure 8.7 shows the operation of reload function 2.

Figure 8.7 Operation of Reload Function 2

Figure 8.8 shows the operation when both reload function 1 and reload function 2 are used simultaneously.

Figure 8.8 Operation When Combining Reload Function 1 and Reload Function 2

### 8.4.3.4 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information and reload transfer count information differs depending on the transfer mode.

In the single transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DTS cycle. Therefore, if the reload function is used for a single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

For a block transfer, TI is fetched only at the beginning of the block transfer. The TI is used for the reload function at the last transfer or the address reload transfer. Therefore, when using the reload function for a block transfer, the reload contents in the TI must be set up before the beginning of the block transfer. If the reload contents is updated during the block transfer, those new settings cannot be reflected to the TI nor the next transfer.

### 8.4.4 Chain Function

### 8.4.4.1 Overview

DTS provides a function called chain function. When using the chain function, the completion of the DTS cycle or the last transfer for one channel can trigger a DTS transfer request for another channel. The DTS transfer request initiated by the chain function is called a chain request. You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DTS cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 8.9 shows the operation of the "always chain" option.

Figure 8.9 Operation of "Always Chain" Option

Figure 8.10 shows the operation of the "chain at the last transfer" option.

Figure 8.10 Operation of "Chain at the Last Transfer" Option

### 8.4.4.2 Setting Up the Chain Function

When using the chain function, it has to be enabled by the chain enable (DTTCTnnn.CHNE) and the next channel in the chain has to be specified in the chain selection (DTTCTnnn.CHNSEL) of the DTS Transfer Control Register.
If the reliability functions are required, the chain restriction (DTSnnnCM.CHAIN_RESTRICT, CHAIN_SPID[4:0], CHAIN_UM) also has to be specified in DTS Channel Master Setting Register.
For detailed information about reliability function, see Section 8.7, Reliability Functions for details.

### 8.4.5 DTS Operation

### 8.4.5.1 Types of DTS Transfer Requests and Assigning DTS Transfer Requests

DTS starts DTS transfer by accepting a hardware DTS transfer request or software DTS transfer request.
A transfer request for DTS is retained in the transfer request pending bit of DTSFSL for each channel.
For DTSFSL, both a hardware DTS transfer request and a software DTS transfer request are retained in the same transfer request pending bit. When executing DTS transfer, DTS does not care whether the DTS transfer request is a hardware DTS transfer request or software DTS transfer request.

### 8.4.5.2 Generating and Accepting a DTS Transfer Request

DTS only supports edge detection for hardware DTS transfer requests.
When DTSFSL detects a hardware DTS transfer source ${ }^{* 1}$ input, DTSFSL sets the transfer request pending bit and retains the hardware DTS transfer source as a DTS transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register is set, DTSFSL notifies DTS of the DTS transfer request.

Software can also generate a DTS transfer request by setting the transfer request pending bit (DTFSTnnn.DRQ) using the DTSFSL transfer request set register (DTFSSnnn).

DTSFSL can retain only one DTS transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DTS transfer source input for the same channel occurs, DTSFSL ignores the new hardware DTS transfer source input.

The transfer request pending bit is automatically cleared when DTS accepts the DTS transfer request. DTSFSL clears the transfer request pending bit automatically when DTS accepts the DTS transfer request regardless of the type of DTS transfer to be executed by DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer status clear register (DTFSCnnn). If the transfer request pending bit of a channel is cleared before DTS accepts the DTS transfer request, DTS transfer of the channel is not executed.

Note 1. For details, refer to Appendix file "DTS_Transfer_request_Table.xlsx".

### 8.4.5.3 Executing DTS Transfer

When DTS accepts a DTS transfer request for a channel, DTS executes DTS transfer on the channel. If there are DTS transfer requests from multiple channels, DTSFSL arbitrates the DTS channels and selects the channel for the DTS transfer request.

While DTS is executing DTS transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DTS transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DTS transfer is complete or aborted because of a DTS transfer error or a register write and no channel is currently executing DTS transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

### 8.4.5.4 DTSRAM Access

DTS accesses the DTSRAM when DTS transfer starts and finishes.
The DTS action of reading transfer information from the DTSRAM when DTS transfer starts is called TI fetch.
The DTS action of updating the transfer information on the DTSRAM when DTS transfer finishes is called TI writeback.

A single transfer performs a TI fetch at the beginning of a DTS cycle and a TI writeback at the end of a DTS cycle.
A block transfer performs a TI fetch at the beginning of the first DTS cycle and a TI writeback at the end of the DTS cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of a single transfer, the transfer information in DTSRAM is updated during each DTS cycle. In the case of block transfer, the transfer information in DTSRAM is updated after completion of the block transfer. If software reads the transfer information from DTSRAM during execution of a block transfer, the information represents the beginning of the block transfer.

### 8.5 Suspension, Resume, and Transfer Abort, and Clearing a DTS Transfer Request

### 8.5.1 Suspend, Resume, and Transfer Abort of a DTS Transfer

A DTS transfer being executed by DTS can be suspended by setting the DTS suspend bit (DTSCTL1.DTSUST) in DTS control register 1. If a DTS cycle is in progress, the DTS transfer is suspended after the DTS cycle is finished. If the current DTS cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DTS transfer is suspended after a TI writeback and completion of the DTS cycle

If the type of the current DTS cycle is other than the above, DTS transfer is suspended after the completion of the DTS cycle without a TI writeback. To resume DTS transfer after suspension, the DTS suspend bit in DTS control register 1 has to be cleared.

To abort DTS transfer by DTS, first suspend DTS as described above and then set the DTS transfer abort request bit (DTSCTL2.DTSTIT) in DTS control register 2. If a transfer is aborted, no TI writeback is executed. In addition, aborting a DTS transfer does not change the value of the DTS suspend bit (DTSCTL1.DTSUST). If it is desired to have the DTS accept another DTS transfer request after the abort, clear the DTS suspend bit.

Figure 8.11 shows an example of suspension, resume, and transfer abort of a DTS transfer.
In Figure 8.11, channels 0,1 , and 2 are executing block transfer. At time tick 1, a DTS transfer request for channel 1 is accepted and DTS transfer starts. At time tick 2, DTS transfer requests for channels 0 and 2 are generated. At time tick 3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DTS transfer request for channel 0 is accepted, and DTS transfer of channel 0 starts because channel 0 has a higher priority than channel 2 . At time tick 4, the last transfer of channel 0 is complete, and DTS transfer of channel 2 starts. At time tick 5, DTS is put into the suspended state, and the DTS transfer of channel 2 is suspended. At time tick 6 , DTS transfer requests for channels 0 and 1 are generated. At time tick 7, the suspended state for DTS is cleared, and the DTS transfer of channel 2, which was suspended in the middle of a block transfer, is resumed. If DTS transfer is suspended in the middle of a block transfer, no DTS channel arbitration is executed when it is resumed. At time tick 8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DTS transfer request for channel 0 is accepted and the DTS transfer starts because channel 0 has a higher priority than channel 2 . At time tick 9, DTS is put into the suspended state, and at time tick 10, the suspended DTS transfer of channel 0 is aborted. When the suspended state of DTS is cleared at time tick 11, DTS transfer of channel 1 starts because there is no currently ongoing DTS transfer and channel 1 is the only channel with a DTS transfer request.

Figure 8.11 Example of Suspension, Resume, and Transfer Abort of a DTS Transfer

### 8.5.2 Masking and Clearing a Hardware DTS Transfer Request by DTSFSL

A DTS transfer request from a channel to DTS can be temporarily disabled (masked) by clearing the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register. In this case, the masked channel is excluded from DTSFSL arbitration.

A DTS transfer request held in DTSFSL can be cleared by setting the transfer request clear bit (DTFSCnnn.DRQC) in the DTSFSL transfer request clear register.

DTSFSL monitors hardware transfer source requests regardless of the state of DTS and the transfer request enable bit (DTFSLnnn.REQEN). DTSFSL sets a DTS transfer request for a channel when it detects a hardware transfer source request. When resuming or starting DTS transfer, a hardware DTS transfer request held in DTSFSL should be cleared as required.

### 8.5.3 List of Suspend, Resume, and Transfer Abort Functions

Table 8.39 List of Suspend, Resume, and Transfer Abort Functions

| Function | How to Execute the Function | Operation | Possibility of DTS Transfer Abort |
| :--- | :--- | :--- | :--- |
| Suspension and resume of DTS | Setting and clearing | All channels of DTS transfer is | Possible (by setting |
|  | DTSCTL1.DTSUST. | suspended. |  |
|  |  |  | DTSCTL2.DTSTIT during |
| suspension) |  |  |  |

### 8.6 Error Control

### 8.6.1 Types of Errors

DTS can generate the following types of errors:

- DTS Transfer Error

This error is generated when an error is detected in the read cycle or write cycle in a DTS cycle or when an error is detected by checking the ECC in the read cycle.
This error can be generated in all DTS channels during execution of DTS transfer.

- DTSRAM ECC Error

This error is generated when an ECC error is detected in the DTSRAM read access by DTS.
This error can be generated in the TI fetch during execution of DTS transfer for DTS or while software is accessing the DTS channel registers.

- DTSRAM Address Feedback Error

This error is generated when an Address Feedback error is detected in the DTSRAM read or write access by DTS. This error can be generated in the TI fetch or TI writeback during execution of DTS transfer for DTS or while software is accessing the DTS channel registers. See Section 38, Functional Safety for details.

### 8.6.2 DTS Transfer Error

### 8.6.2.1 Operation of DTS When a DTS Transfer Error Occurs

When a DTS transfer error occurs in DTS, the transfer error flag (DTFSTnnn.ER) in the DTS transfer status register of the channel on which the DTS transfer error occurred is set. The transfer error cycle flag (DTSFSTnnn.ERWR) in the DTS transfer status register of the channel on which the DTS transfer error occurred shows whether the error occurred in the read cycle or the write cycle. The DTS Error register (DTSER) shows the smallest number of DTS channels on which the DTS transfer error occurred.

If a DTS transfer error occurs in a single transfer, a TI writeback is executed to finish the DTS cycle.
If a DTS transfer error occurs in the middle of a block transfer and the DTS error transfer disable bit (DTTCTnnn.ESE) is set, the remaining DTS cycles in the block transfer are not executed, but a TI writeback is executed to finish the DTS cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If a DTS transfer error occurs in the middle of a block transfer and the DTS error transfer disable bit (DTTCTnnn.ESE) is cleared, the block transfer continues regardless of the DTS transfer error.

If a DTS transfer error occurs during the read cycle of a DTS cycle, the write cycle is not executed. If a DTS transfer error occurs during the write cycle of a DTS cycle, the validity of the write is not guaranteed.

Regardless of whether a DTS transfer error occurs in the read cycle or write cycle of a DTS cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI writeback.

Even if the transfer error flag (DTFSTnnn.ER) in the DTS transfer status register of the channel is set, a TI fetch is executed when DTS accepts a DTS transfer request for the channel. If, as a result of the TI fetch, the DTS error transfer disable bit (DTTCTnnn.ESE) is found to be set, a DTS cycle and a TI writeback are not executed. If the DTS error transfer disable bit (DTTCTnnn.ESE) is cleared, DTS transfer is executed.

### 8.6.3 DTSRAM Error

There are three types of DTSRAM errors detected in DTSRAM read access: an ECC correctable error, an ECC uncorrectable error and an address feedback error. There is one type of DTSRAM error detected in DTSRAM write access: an address feedback error.

If an ECC correctable 1-bit error is detected during a TI fetch, error corrected data is used, and DTS transfer continues. If an ECC correctable 1-bit error is detected during DTS channel register access from software, error corrected data is returned as read data.

If an ECC uncorrectable error or an address feedback error is detected during a TI fetch, handling of the DTS transfer request is terminated without executing a DTS cycle and TI writeback. If an address feedback error is detected during a TI writeback, the validity of the TI writeback is not guaranteed. If an ECC uncorrectable error or address feedback error is detected during a DTS channel register read from software, a peripheral bus error is reported. If an address feedback error is detected during a DTS channel register write from software, a peripheral bus error is not reported, but the validity of the write access is not guaranteed. In addition to an ECC 2-bit error, an ECC 1-bit error is treated as uncorrectable if 1-bit error correction is disabled in ECC.

### 8.7 Reliability Functions

### 8.7.1 Overview

In this product, DTS provides the following reliability functions to support multi-core configurations (multiple master PEs).

- Register access protection function

## See Section 38, Functional Safety

- Master information inheritance function
- SPID setting restriction

See Section 38, Functional Safety

- Restriction on chain function

### 8.7.2 Master Information Inheritance Function

The master information inheritance function uses the contents of the channel master setting registers as the sideband information of the data transfer interface.

DTS outputs the sideband information of data transfer for the access guard.
Table 8.40 shows the sideband information that DTS outputs.
Table 8.40 Sideband Information That Is Output from DTS

| Meaning | Value Output from DTS |
| :--- | :--- |
| UM | Same as the UM bit value in the channel master setting register |
| SEC | Non secure |
| SPID | Same as the SPID bit value in the channel master setting register, |

### 8.7.3 Restriction on Chain Function

The channel configuration of the chain function can be restricted. When chain function restriction is enabled, only a pre-allowed channel in master information can be set as the next channel.

The chain function is not restricted if the CHAIN_RESTRICT bit of the DTS Channel Master Setting Register (DTSnnnCM) is cleared. In this case, DTS channel can specify any other channel to be included in the chain function.

The chain function is restricted if the CHAIN_RESTRICT bit of the DTS Channel Master Setting Register (DTSnnnCM) is set. In this case, only the channels in which CHAIN_SPID[4:0] and CHAIN_UM match can be included into the chain function by DTS channel.

When a chain is executed, DTS compares the channel master settings of the previous and next channels to decide if the chain is permissible.

Figure 8.12 Chain Judgement Flow

### 8.8 Setting up DTS Transfer

### 8.8.1 Overview of Setting up DTS Transfer

Table 8.41 Overview of Setting up DTS Transfer

| Description | Register |  | Necessity of the Setting |
| :--- | :--- | :--- | :--- |
| Transfer request group <br> selection setting | DTSSELm | DTS transfer request group <br> selection | Mandatory(if using a hardware transfer request) |
|  | DTSPRn | DTS channel priority setting | Mandatory (if DTS is used) |
|  | DTSnnnCM | DTS channel master setting | Mandatory (if DTS is used) |
| Channel setting | DTSAnnn | DTS source address | Mandatory |
|  | DTDAnnn | DTS destination address | Mandatory |
|  | DTTCnnn | DTS transfer count | Mandatory |
|  | DTTCTnnn | DTS transfer control | Mandatory |
|  | DTRSAnnn | DTS reload source address | Mandatory if the reload function is used |
|  | DTRDAnnn | DTS reload destination address |  |
|  | DTRTCnnn | DTS reload transfer count |  |
|  | DTTCCnnn | DTS transfer count compare | Mandatory if the transfer count match interrupt is |
| used |  |  |  |

### 8.8.2 Setting up the Transfer Request Group Selection

Set up the transfer request group selection before using DTS. The following registers must be set up to configure the transfer request group.

- DTS Transfer Request group selection Register (DTSSELm) ( $\mathrm{m}=0$ to 15 )

This register configures the transfer request group selection.

### 8.8.3 Setting up the Overall DTS Operation

Set up the overall DTS operation before using DTS.
The following registers must be set up to configure the overall DTS operation.

- DTS channel priority setting registers (DTSPRn, $\mathrm{n}=0$ to 7 )

These registers configure the priority level of each DTS channel used for DTS channel arbitration.

- DTS channel master setting registers (DTSnnnCM)

These registers configure channel assignment. (For details, see Section 8.7, Reliability Functions.)
NOTE
It is important to properly configure the DTS channel master setting registers. Otherwise DTS transfer will not operate as expected.

It is recommended to clear following errors detected while setting up DTS:

- The DTSFSL Transfer Status Register (DTFSTnnn)

NOTE
Channel number information of the channel with error can be obtained by reading the DTS Error Register (DTSER).

### 8.8.4 Configuring the DTS Channel Settings

The DTS channel settings define the transfer information and transfer source for a DTS channel.
The following procedure shows how to configure the DTS channel settings.
(1) Disable transfer requests by DTSFSL.

Clear the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register of the DTS channel being configured. This procedure is not mandatory but recommended in order to prevent DTS transfer requests during DTS channel configuration. It is also recommended to check the DTS status register (DTSSTS) and confirm that DTS transfer is not ongoing on the DTS channel being configured.
(2) Configure the transfer information (TI).

The following registers need to be set up to configure DTS channel transfer information.

- DTS Source Address Register (DTSAnnn)
- DTS Destination Address Register (DTDAnnn)
- DTS Transfer Count Register (DTTCnnn)
- DTS Transfer Control Register (DTTCTnnn)
- DTS Reload Source Address Register (DTRSAnnn)
- DTS Reload Destination Address Register (DTRDAnnn)
- DTS Reload Transfer Count Register (DTRTCnnn)
- DTS Transfer Count Compare Register (DTTCCnnn)
(3) Set the DTS transfer request.

DTS does not distinguish between hardware and software DTS transfer requests (no specific setting). Both hardware and software DTS transfer requests are retained in the same transfer request pending bit (DTFSTnnn.DRQ).

DTSFSL may retain a DTS transfer request that came before the transfer information is set up. If necessary, DTS transfer requests (DTFSTnnn.DRQ) retained in DTSFSL can be cleared by using the DTFSL transfer status clear register (DTFSCnnn).
(4) Enable transfer requests by DTSFSL.

Set the transfer request enable bit (DTFSLnnn.REQEN) in the DTSFSL operation setting register to enable DTS transfer requests for the DTS channel.

After the transfer request enable bit for DTSFSL is set, DTS can accept a DTS transfer request and start DTS transfer.

## Section 9 RAM

This section describes the RAM mounted on RH850/E2x-FCC1 and E2M.

### 9.1 List of On-Chip RAMs

Table 9.1 shows the list of On-Chip RAMs.
Table 9.1 List of On-Chip RAMs

|  |  | RH850/E2x-FCC1 | RH850/E2M |
| :--- | :--- | :--- | :--- |
| Local RAM per CPU | 32 KB | 32 KB |  |
| Cluster0 <br> RAM | Total Size <br> (Retention RAM included) | 512 KB | 512 KB |
| Retention RAM <br> (Included in Cluster0 RAM) | No | No |  |
| Cluster1 <br> RAM | Total Size <br> (Retention RAM included) | 192 KB | 192 KB |
| Retention RAM <br> (Included in Cluster1 RAM) | 64 KB | 64 KB |  |
| Cluster ERAM* | 1 MB | No |  |
| Global ERAM*1 | 1.5 MB | No |  |
| Instrumentation RAM*1 | 64 KB | No |  |

Note 1. All data are retained in Emulation/Instrumentation RAM and Aurora Retention Mode (E2x-FCC1 Only).

### 9.2 Features

## Access:

The CPU0, CPU1, DMA and H-Bus Master can access the Local RAM (CPU0/CPU1), the Cluster 0/1 RAM, the Cluster ERAM, the Global ERAM and the Instrumentation RAM. The access latency from CPU0 to the Local RAM for CPU0 is the same as the access to the Local RAM (self). The access latency from CPU1 to the Local RAM for CPU1 is the same as the access to the Local RAM (self). The access latency from CPU0 or CPU1 to Cluster0 RAM is faster than the access latency to Cluster1 RAM, because CPU0 and CPU1 are in Cluster0.

## RAM Retention:

In RH850/E2x-FCC1, all data in the Cluster ERAM, Global ERAM and Instrumentation RAM are retained in Emulation/Instrumentation RAM and Aurora Retention Mode (E2x-FCC1 Only).

In RH850/E2x-FCC1 and E2M, 64 Kbytes of data in the Cluster1 RAM are retained in power-off standby mode.
For details, see Section 16, Standby Controller.

## ECC:

The Local RAM(CPU0/CPU1) and Cluster RAM include the ECC.
The Local RAM(CPU0/CPU1) and Cluster RAM also include the address feedback function. For details, see Section

## 38, Functional Safety.

### 9.3 RAM Data Retention

Simultaneous occurrence of write and reset in the RAM space that retains data is not written as undefined data in power-off standby mode.

### 9.4 Usage Notes

When ECC error detection/correction is enabled for the Local RAM and Cluster RAM, initialize the RAM using a write instruction with the maximum bit length of its access size before using the RAM.

For the maximum bit length of the RAM access size, see the applicable data width in Section 38, Functional Safety.

If the RAM is accessed before its initialization, an ECC error may be detected. Also, if initialization with the maximum bit length is not performed (e.g. if a 32 -bit RAM is initialized by an 8 -bit or 16-bit access), an ECC error may be detected.

## Section 10 Reset Controller

### 10.1 Features

The Reset Controller controls all factors that affect the reset behavior of the device.
The device has several kinds of reset categories depending on the areas that are reset. Each of the reset categories is triggered by one or multiple reset sources.

The relationship between reset categories and their sources is shown in Table 10.1.
Table 10.1 Reset Categories and Reset Sources

| Reset Category | Source |
| :---: | :---: |
| Power Up Reset | - Power Up Reset ${ }^{* 1}$ (by SYSVCC Voltage level) <br> - Debugger Reset (forcible reset by a debugger) <br> For details, see Section 45, Debugging and Calibration. |
| System Reset 1 | - Standby Reset (exiting power off standby mode using $\overline{\text { RES_IN }}$ ) <br> - External Reset (by RES_IN ) <br> - VMON Reset (by Voltage monitor and Delay monitor) |
| System Reset 2 | - Software Reset (by SWSRESA, SWSRESA_ICUM) <br> - ECM Reset (if RESC0 = 0) <br> - SWDT Reset (if RESC1 = 0) |
| Application Reset | - Software Reset (by SWARESA, SWARESA_ICUM) <br> - ECM Reset (if RESC0 = 1) <br> - SWDT Reset (if RESC1 = 1) <br> NOTE: This reset is basically identical to System Reset 2 with the following exceptions: Clock configuration is preserved, except that of external clock output. Initial setting of peripheral functions using the option byte is not changed. HW BIST is not executed. |
| Module Reset | - Software Module Reset Assertion Register for ICU-M (SWMRESA_ICUM) <br> - ICU-M WDTA Reset <br> For details, see Section 43, Intelligent Cryptographic Unit/Master (ICUMD). |
| JTAG Reset | JTAG Reset (by TRST $)$ |

Note 1. External Reset ( RES_IN ) must be asserted low at power up and power down. For the timing details, see the RH850/E2xFCC1 Electrical Characteristics, User's Manual: Hardware.

### 10.1.1 Register Base Addresses

Reset base addresses are listed in the following table.
Reset register addresses are given as offsets from the base addresses in general.
Table 10.2 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <RESET_base> | FF70 $0000_{\mathrm{H}}$ | Peripheral Group 6 |
| <BOOT_base> | FFFB $0000_{\mathrm{H}}$ | Peripheral Group 0 |

### 10.1.2 Input/Output Pins

I/O pins related to reset are shown in Table 10.3.
Table 10.3 I/O Pins

| Pin Function Name | Direction | Description |
| :--- | :--- | :--- |
| RES_IN | Input | Reset Input |
| TRST | Input | JTAG Reset Input |
| RES_OUT | Output | Reset Output |

### 10.2 Register Description

### 10.2.1 Register Protection

Write-protected registers are protected from inadvertent write access due to erroneous program execution, etc. Writeprotected registers can be written by releasing the protection of RESKCPROT.

### 10.2.2 List of Registers

The registers related to reset are listed in Table 10.4.
Table 10.4 List of Registers

| Unit Name | Register Name | Symbol | Address | Access size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PFSYSTEM | Boot Control Register | BOOTCTRL | <BOOT_base> + 2000 H | 32 |  |
| SYSCTRL | Reset Factor Register | RESF | $<$ RESET_base $^{\text {+ }}$ + 0480 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | Reset Factor Clear Register | RESFC | <RESET_base> + 0484 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | Software System Reset Assertion Register | SWSRESA | <RESET_base> + 0500 ${ }_{\text {H }}$ | 32 | RESKCPROT |
| SYSCTRL | Software Application Reset Assertion Register | SWARESA | <RESET_base> + 0504 ${ }_{\text {H }}$ | 32 | RESKCPROT |
| SYSCTRL | Reset Configuration Register | RESC | <RESET_base> + 0580 ${ }_{\text {H }}$ | 32 | RESKCPROT |
| SYSCTRL | RAM Initialization Mode Control Register for DTS RAM | STAC_DTS RAM | <RESET_base> + 0880 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | RAM Initialization Mode Control Register for sDMAC Descriptor RAM | $\begin{aligned} & \text { STAC_DPR } \\ & \text { AM } \end{aligned}$ | <RESET_base> + 0888 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | RAM Initialization Mode Control Register for DFE | STAC_DFE | <RESET_base> + 088C ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | RAM Initialization Mode Control Register for FlexRay | $\begin{aligned} & \text { STAC_FLX } \\ & \text { A } \end{aligned}$ | <RESET_base> + 0894 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | RAM Initialization Mode Control Register for Ethernet | $\begin{aligned} & \text { STAC_ETH } \\ & \text { ER } \end{aligned}$ | <RESET_base> + 0898 ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | RAM Initialization Mode Control Register for GTM | STAC_GTM | <RESET_base> + 089C ${ }_{\text {H }}$ | 32 |  |
| SYSCTRL | Reset Controller Register Key Code Protection Register | RESKCPR OT | <RESET_base> + 0 FFOH | 32 |  |

### 10.2.3 Reset of Registers

The register reset conditions are shown in Table 10.5.
Table 10.5 Register Reset Conditions

| Register Name | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
|  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
|  | $\checkmark * 1$ | $\checkmark * 1$ | - | - | - | - |
|  | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
|  | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
|  | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |
|  | $\checkmark$ | $\checkmark$ | - | - | - | - |

| RESKCPROT | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |  |

[^5]
### 10.2.4 BOOTCTRL — Boot Control Register

This register controls the startup of each PE. At the time of reset (System Reset 1/2, and Application Reset) release, the PEs are started according to the initial setting of this register, which is defined by a FLASH option byte. After reset release, PEs can be started selectively by asserting the corresponding bit of this register. Only 1 can be written to these bits. Writing 0 is ignored. For details on value of the FLASH option byte, see Section 41, Flash Memory.

Table 10.6 BOOTCTRL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | BC1 | Boot Control 1 |
|  |  | This bit triggers the startup of the PE1 |
|  |  | (When OPBT3 PE1_DISABLE = 1, PE1 is inactive regardless of the value of this bit) |
|  |  | 0 : Inactive |
|  |  | 1: Active |
| 0 | BCO | Boot Control 0 |
|  |  | This bit triggers the startup of the PE0 |
|  |  | (When OPBT3 STARTUPPE=1 or $\mathrm{BC} 0=1$, PE0 is active.) |
|  |  | 0 : Inactive |
|  |  | 1: Active |

### 10.2.5 RESF — Reset Factor Register

This register indicates whether a Reset has occurred since each flag was last cleared.

Table 10.7 RESF Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 17 | ICUMARESF0 | ICU-M Software Application Reset Flag |
|  |  | This flag is a status flag controlled by ICU-M. For details, see Section 43, Intelligent Cryptographic Unit/Master (ICUMD). |
|  |  | This flag is cleared to 0 by Power Up Reset** ${ }^{* 1}$, Standby Reset and VMON Reset. |
|  |  | 0: No reset has occurred |
|  |  | 1: Reset has occurred |
| 16 | ICUMSRESF0 | ICU-M Software System Reset Flag |
|  |  | This flag is a status flag controlled by ICU-M. For details, see Section 43, Intelligent Cryptographic Unit/Master (ICUMD). |
|  |  | This flag is cleared to 0 by Power Up Reset* ${ }^{* 1}$, Standby Reset and VMON Reset. |
|  |  | 0: No reset has occurred |
|  |  | 1: Reset has occurred |
| 15 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | HWBISTF | HW BIST Execution Flag |
|  |  | This flag will always be asserted after a preceding Power-Up or System Reset if the HW BIST is enabled. In this case, the corresponding Power-Up or System Reset Flag is asserted as well. |
|  |  | 0: HW BIST was not executed |
|  |  | 1: HW BIST was executed |
| 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | ARESF2 | ECM Application Reset Flag |
|  |  | This flag is cleared to 0 by Power Up Reset* ${ }^{* 1}$, Standby Reset and VMON Reset. |
|  |  | 0: No reset has occurred |
|  |  | 1: Reset has occurred |
| 9 | ARESF1 | SWDT Application Reset Flag |
|  |  | This flag is cleared to 0 by Power Up Reset ${ }^{\star 1}$, Standby Reset and VMON Reset. |
|  |  | 0: No reset has occurred |
|  |  | 1: Reset has occurred |

Table 10.7 RESF Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | ARESF0 | Software Application Reset Flag <br> This flag is cleared to 0 by Power Up Reset ${ }^{\star 1}$, Standby Reset and VMON Reset. <br> 0 : No reset has occurred <br> 1: Reset has occurred |
| 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | SRES2F2 | ECM System Reset Flag <br> This flag is cleared to 0 by Power Up Reset ${ }^{\star 1}$, Standby Reset and VMON Reset. <br> 0: No reset has occurred <br> 1: Reset has occurred |
| 5 | SRES2F1 | SWDT System Reset Flag <br> This flag is cleared to 0 by Power Up Reset ${ }^{\star 1}$, Standby Reset and VMON Reset. <br> 0 : No reset has occurred <br> 1: Reset has occurred |

| 3 | SRES1F2 | VMON Reset Flag <br> This flag is cleared to 0 by Power Up Reset ${ }^{\star 1}$ and Standby Reset. <br> 0 : No reset has occurred <br> 1: Reset has occurred |
| 2 | SRES1F1 | External Reset Flag*2 <br> 0 : No reset has occurred <br> 1: Reset has occurred |
| 1 | SRES1F0 | Standby Reset Flag <br> This flag is cleared to 0 by Power Up Reset.*1 <br> 0 : No reset has occurred <br> 1: Reset has occurred |
| 0 | PRESF0 | Power Up Reset Flag <br> 0: No reset has occurred <br> 1: Reset has occurred <br> This bit is used to judge Power Up <br> Retention RAM data can not be guaranteed with this bit |

Note 1. A Power up reset caused by a debugger also clears this flag.
Note 2. SRES1F1 is a high priority flag. Do not use ARESF2-0 and SRES2F2-0 for judgment when SRES1F1=1 at the time of reset factor judgment.
Note 3. HWBISTF is also set at the condition of "BIST not executed" by setting TRST pin to High. Please refer to Table 38.437 and Table 38.438 about the condition.

Table 10.8 Reset Factor Register Value in Usecase

### 10.2.7 SWSRESA — Software System Reset Assertion Register

This register is used to generate a System Reset 2.

## Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 10.10 SWSRESA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SWSRESAO_0 | System Reset 2 Trigger |
|  | This bit is read as 0. |  |
|  | $0:$ No function |  |
|  | 1: Generate System Reset 2 |  |

### 10.2.8 SWARESA — Software Application Reset Assertion Register

This register is used to generate an Application Reset.

```
Value after reset: \(\quad 00000000_{\mathrm{H}}\)
```

Table 10.11 SWARESA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SWARESAO_0 | Application Reset Trigger |
|  | This bit is read as 0. |  |
|  | $0:$ No function |  |
|  | 1: Generate Application Reset |  |

### 10.2.9 RESC — Reset Configuration Register

This register contains configuration settings for the behavior of the device during reset.

```
Value after reset: \(\quad 00000000_{\mathrm{H}}\)
```

Table 10.12 RESC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | RESC1 | SWDT Reset Configuration |
|  |  | 0: SWDT Reset Generates a System Reset 2 |
|  | 1: SWDT Reset Generates an Application Reset |  |
| 0 | RESC0 | ECM Reset Configuration |
|  |  | 0: ECM Reset Generates a System Reset 2 |
|  | 1: ECM Reset Generates an Application Reset |  |

### 10.2.10 STAC_DTSRAM — RAM Initialization Mode Control Register for DTSRAM

This register is used to control initialization of the DTS RAM. For an Application Reset, initialization of DTSRAM is executed according to this register.

Table 10.13 STAC_DTSRAM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | RZEROMD[1:0] | RAM Initialization Mode for DTS RAM |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{XO}_{\mathrm{B}}$ : Disabled |
|  |  | $01_{\mathrm{B}}$ : Setting is prohibited |
|  |  | $11_{\mathrm{B}}$ : Enabled |

### 10.2.11 STAC_DPRAM — RAM Initialization Mode Control Register for sDMAC Descriptor RAM

This register is used to control initialization of the sDMAC Descriptor RAM. For an Application Reset, initialization of sDMAC Descriptor RAM is executed according to this register.

Table 10.14 STAC_DPRAM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | RZEROMD[1:0] | RAM Initialization Mode for sDMAC Descriptor RAM |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{XO}_{\mathrm{B}}$ : Disabled |
|  |  | 01 ${ }_{B}$ : Setting is prohibited |
|  |  | 11 $\mathrm{B}_{\mathrm{B}}$ : Enabled |

### 10.2.12 STAC_DFE — RAM Initialization Mode Control Register for DFE

This register is used to control initialization of the RAM for DFE. For an Application Reset, initialization of RAM for DFE is executed according to this register.

Table 10.15 STAC_DFE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | RZEROMD[1:0] | RAM Initialization Mode for DFE |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{XO}_{\mathrm{B}}:$ Disabled |
|  | $01_{\mathrm{B}}:$ Setting is prohibited |  |
|  | $11_{\mathrm{B}}:$ Enabled |  |

### 10.2.13 STAC_FLXA — RAM Initialization Mode Control Register for FlexRay

This register is used to control initialization of the RAM for FlexRay. For an Application Reset, initialization of RAM for FlexRay is executed according to this register.

Table 10.16 STAC_FLXA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | RZEROMD[1:0] | RAM Initialization Mode for FlexRay |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{XO}_{\mathrm{B}}:$ Disabled |
|  | $01_{\mathrm{B}}:$ Setting is prohibited |  |
|  | $11_{\mathrm{B}}:$ Enabled |  |

### 10.2.14 STAC_ETHER — RAM Initialization Mode Control Register for Ethernet

This register is used to control initialization of the RAM for Ethernet. For an Application Reset, initialization of RAM for Ethernet is executed according to this register.

Table 10.17 STAC_ETHER Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | RZEROMD[1:0] | RAM Initialization Mode for Ethernet |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{X0}_{\mathrm{B}}$ : Disabled |
|  |  | $01_{B}$ : Setting is prohibited |
|  |  | 1118: Enabled |

### 10.2.15 STAC_GTM — RAM Initialization Mode Control Register for GTM

This register is used to control initialization of the RAM for GTM. For an Application Reset, initialization of RAM for GTM is executed according to this register.

Table 10.18 STAC_GTM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1,0 | RZEROMD[1:0] | RAM Initialization Mode for GTM |
|  |  | The value after reset can be set by using the flash option byte. |
|  |  | $\mathrm{XO}_{\mathrm{B}}:$ Disabled |
|  | $01_{\mathrm{B}}:$ Setting is prohibited |  |
|  | $11_{\mathrm{B}}:$ Enabled |  |
|  |  |  |

### 10.2.16 RESKCPROT — Reset Controller Register Key Code Protection Register

The RESKCPROT register is used to protect against writing to the registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31: 16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15: 1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | w | W | W | W | W | w | W | W | W | W | W | W | R/W |

Table 10.19 RESKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing to protected registers. Write $\mathrm{A}^{2} \mathrm{~A} 5 \mathrm{~A} 501_{\mathrm{H}}$ to this register to enable writing to protected registers.

### 10.3 Operation

### 10.3.1 Reset Categories

The following are the reset categories of this product.
Each reset category has multiple reset sources (described in the next section). The reset source for each category has a different impact on the system. See the description of resets in the product specifications to determine the exact response of each block to each reset.

## Power Up Reset

The Power Up Reset indicates a partial (beginning) power up of the device with SYSVCC. The device begins to function only when a valid SYSVCC is applied while no other power is being supplied. An internal circuit monitors SYSVCC and generates this Power Up Reset signal when SYSVCC transitions to being valid or transitions to being invalid. The external reset pin (RES_IN) must be asserted low during this power up process (when Power Up Reset is negated internally), and during the power down process (when Power Up Reset is asserted internally). Power up Reset can also be triggered by the debugger. All blocks and resources on the device are affected by this reset.

## System Reset 1

The System Reset 1 indicates a full power up of the device with all power supplies being applied (excluding EMUVDD and EMUVCC for E2x-FCC1). It also indicates when the external reset (RES_IN) is asserted, even though all of the power supplies remain valid. Internal voltage monitors of all of the supplies can also cause this reset.

For timing details, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware. Almost all blocks and resources of this device are affected by this reset. The sources of this reset are as follows:

- Standby Reset
- External Reset
- Voltage Monitor \& Delay monitor Reset (VMON Reset)

## System Reset 2

System Reset 2 indicates a possible catastrophic software problem that requires a fresh boot of the device.
The sources of this reset are as follows:

- Software Reset by writing the associated register
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)
- Secure Watchdog Timer Reset (The Reset Category is configured by the Reset Configuration Register)

## Application Reset

Application Reset is used for fast initialization of the application. This reset is basically identical to System Reset 2 with the following exceptions: Clock configuration is preserved except that of external clock output; the initial setting of peripheral functions using the option byte is not changed; and HW BIST is not executed. This enables fast initialization. Application Reset sources are as follows:

- Software Reset by writing the associated register
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)
- Secure Watchdog Timer Reset (The Reset Category is configured by the Reset Configuration Register)

## Module Reset

This is a Software Module Reset for ICUM. For details, see Section 43, Intelligent Cryptographic Unit/Master (ICUMD).

## JTAG Reset

JTAG Reset is used for initialization of debug module. For details, see Section 46, Boundary Scan.

### 10.3.2 Reset Sources

## Power Up Reset

A power up reset occurs when the SYSVCC power supply becomes valid (within specified limits). An internal power on clear (POC) circuit continuously monitors the voltage level of SYSVCC and asserts an internal power on reset to logic that is powered by SYSVCC. The RESF.PRESF0 bit will be set when this reset occurs.

For details on the POC specifications see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## Debugger Reset

This device (microcontroller) can be forcibly reset by a debugger.
For details, see Section 45, Debugging and Calibration.

## Standby Reset

A standby reset occurs when returning from power off standby mode to normal operation mode (or user boot mode or serial programming mode). The RESF.SRES1F0 bit will be set when this condition occurs.

For details on standby functionality, see Section 16, Standby Controller.

## External Reset (by RES_IN )

A dedicated Reset Input pin ( RES_IN ) is available for initialization.
In case of an open reset input, the device will be initialized via the internal pull-down of the Reset Input Buffer. In the case of Power-up and Power-down, RES_IN should be low. For details on the required RES_IN low period, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

To activate a reset, RES_IN must be asserted low for a time longer than the noise filter. For details on the required RES_IN low pulse width, see the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## VMON Reset

The VMON reset can be asserted as soon as one of the supply voltages is outside the operating range. The execution of the VMON reset can be masked. For details, see Section 12, Power Supply Voltage Monitor. The VMON reset operation is independent from External Reset.

## ECM Reset

All failures that can be detected by the Error Control Module (ECM) generate dedicated internal resets or interrupts. The failure signals and system behavior can be configured in the ECM (see Section 39, Error Control Module (ECM)). Optionally, the device failures can be configured to be used as a Reset Source.

The ECM Reset can generate a System Reset 2 or an Application Reset. The behavior can be configured by the Reset Configuration Register.

## SWDT Reset

The Secure Watchdog Timer (SWDT) module can generate a SWDT reset. For details, see Section 44, Secure Watchdog Timer (SWDT).

## Software Reset

The device supports multiple software resets that can trigger the reset of dedicated Reset Domains:

- Software System Reset Assertion Register (SWSRESA) triggers a System Reset 2
- Software Application Reset Assertion Register (SWARESA) triggers an Application Reset

Each software reset can be triggered when software writes to the associated Reset Assertion Register.
Each Reset Assertion Register is protected against unintended access by configuring the Key Code protection register. For details, see Section 38, Functional Safety.

## JTAG Reset

A dedicated Reset Input pin ( $\overline{\text { TRST }}$ ) is available for initialization of the Boundary Scan and debug function.
The Boundary Scan and Debug function are described in Section 45, Debugging and Calibration and Section 46, Boundary Scan.

The JTAG Reset is active low.

### 10.3.3 Reset Flags

Any reset root cause can be identified by SW in the Reset Factor Register (RESF). Each reset source will be indicated by one bit when it occurs. The status can be read out after the reset has been executed.

The method for determining the reset factors is shown in Figure 10.1.

Note 1. SRES1F1 is a high priority flag. Do not use ARESF2-0 and SRES2F2-0 for judgment when SRES1F1 $=1$ at the time of reset factor judgment.

Note 2. See Section 12, Power Supply Voltage Monitor.

Figure 10.1 Flowchart of Reset Factor Result

### 10.3.4 FACI Reset Transfer

Transfer of Configuration settings, Block Protection settings, Security settings (Option Bytes) from FLASH memory are executed by System Reset 1 and System Reset 2.

These data become effective with completion of FACI transfer.
If FACI reset transfer Error is detected in Normal operation mode or in User boot mode, the device will be kept in reset state and will not start up.

FACI reset transfer Error is an error factor of the ECM.

### 10.3.5 HW BIST

HW BIST is executed by System Reset 1 and System Reset 2.
For System Reset 2, HW BIST execution can be disabled. For details, see Section 38.6, BIST.

### 10.3.6 RAM Initialization

RAM data can be initialized (to all 0 ) according to the setting of a Flash option byte. This initialization, if enabled by the flash option byte, will occur for a system reset 1 , a system reset 2 , and an application reset (if the value of the STAC register is not changed by using a flash option byte). For an Application Reset and Module Reset, RAM initialization can also be controlled by STAC register. for the Module Reset of ICUM, only RAM data of ICUM can be initialized (to all 0 ) depending on a STAC register of ICU-M.

A separate flash option byte exists for each major RAM block, so that each block is independently controlled.

## Target RAM

- DTS RAM
- sDMAC Descriptor RAM
- DFE RAM
- FlexRay RAM
- Ethernet RAM
- GTM RAM

Local RAM and Cluster RAM are initialized by using a software write instruction.

### 10.3.7 Reset Output ( $\overline{\text { RES_OUT }}$ )

A dedicated Reset Output pin RES_OUT is available for indicating when the microcontroller is in reset and for controlling the reset of external devices. It will be asserted by all reset categories (except Module Reset and JTAG Reset).

For the RES_OUT function, refer to Section 2.6.8, RES_OUT Function.

### 10.4 Usage Notes

### 10.4.1 RAM and Register Data Retention when External Reset Is Asserted

The data of RAM and registers*1 will not be retained if the operating modes differ when an external reset is asserted or released by a change of the value set to the corresponding external terminal (e.g. MD0, TRST).

Note 1. Registers that are not initialized by External Reset.
Table 10.20 RAM and Register Data Retention when External Reset Is Asserted

| Release Timing | Assert Timing |  |  |
| :--- | :--- | :--- | :--- |
|  | Normal Operation Mode | User Boot Mode | Serial Programming Mode |
| Normal Operation Mode | Retained | Retained | Not retained |
| User Boot Mode | Retained | Retained | Not retained |
| Serial Programming Mode | Not retained | Not retained | Retained |

Note: The data of MBIST target RAM is not retained in BIST. For details about MBIST target, see Section 38.6.2.10, MBIST1FTAG0, Section 38.6.2.11, MBIST1FTAG1, and Section 38.6.2.12, MBIST1FTAG2.

### 10.4.2 VMON Reset Assertion

The data of RAM and registers*1 will not be retained when the VMON reset is asserted.
Note 1. Registers are not initialized by VMON Reset.

## Section 11 Power Supply

### 11.1 Features

This section describes the external voltage connection and internal voltage distribution.

### 11.2 External Pin List

Table 11.1 shows the list of external pins.
Table 11.1 List of External Pins

| Power Supply Name | Power Related Pin Name | Power Combination Condition |  | Usage |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Operational Voltage Range (3 supply) | Operational Voltage Range (VDD \& 5 V ) |  |
| EOVCC |  | 4.5 V to 5.5 V | 4.5 V to 5.5 V | Port IOs |
| E1VCC |  | 3.0 V to 3.6 V or 4.5 V to 5.5 V |  | The same power source can be used with each power supply that uses the same voltage range. <br> Refer to Figure 11.1 |
| E2VCC |  | 3.0 V to 3.6 V or 4.5 V to 5.5 V |  |  |
|  |  |  |  | See the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware for the supported functions with each voltage range. |
| LVDVCC |  | 3.0 V to 3.6 V or 4.5 V to 5.5 V | 4.5 V to 5.5 V | RHSIF LVDS outputs. |
|  |  |  |  | The power source of LVDVCC should be the same with EOVCC while the GPIO shared with RHSIF is used. <br> Refer to Figure 11.2. |
| SYSVCC |  | 3.0 V to 3.6 V | 4.5 V to 5.5 V | System logics, retention RAM |
| VCC |  | 3.0 V to 3.6 V | 4.5 V to 5.5 V | Oscillator, PLL, Flash programming |
|  | RAMSVCL | - | - | Stabilizing capacitance for retained RAM |
| EMUVCC*1 |  | 3.0 V to 3.6 V | 3.0 V to 3.6 V | ERAM / Instrumentation RAM, Aurora |
| EMUVDD*1 |  | 1.2 V to 1.3 V | 1.2 V to $1.3 \mathrm{~V}^{* 2}$ | ERAM / Instrumentation RAM, Aurora |
| VDD |  | 1.2 V to 1.35 V | 1.2 V to 1.35 V | Core logics |
| AOVCC |  | 4.5 V to 5.5 V | 4.5 V to 5.5 V | SAR-ADC*3 |
| A1VCC |  | 4. 5 V to 5.5 V | 4.5 V to 5.5 V | *3 |
| A2VCC |  | 4.5 V to 5.5 V | 4.5 V to 5.5 V | *3 |
| A3VCC |  | 4.5 V to 5.5 V | 4.5 V to 5.5 V | *3 |
|  | AOVREFH | 4.5 V to 5.5 V | 4.5 V to 5.5 V | Reference voltage for SAR-ADC |
|  | A1VREFH | 4.5 V to 5.5 V | 4.5 V to 5.5 V |  |
|  | A2VREFH | 4.5 V to 5.5 V | 4.5 V to 5.5 V |  |
|  | A3VREFH | 4.5 V to 5.5 V | 4.5 V to 5.5 V |  |
| ADSVCC |  | 4.5 V to 5.5 V | 4.5 V to 5.5 V | DS-ADC, and Cyclic-ADC*3 |
|  | ADSVREFH | 4.5 V to 5.5 V | 4.5 V to 5.5 V | Reference voltage for power for DS-ADC, and CyclicADC |
|  | ADSVCL | - | - | Stabilizing capacitance for DS-ADC operation |

Note 1. Only E2x-FCC1 supports EMUVCC, EMUVDD.
Note 2. Only when using Aurora. EMUVDD max $=1.35 \mathrm{~V}$ when not using Aurora.
Note 3. The same power source shall be used with each A0VCC, A1VCC, A2VCC, A3VCC, and ADSVCC power supply. See the application note separately issued.

### 11.3 Example of Power Supply Connection

### 11.3.1 Example of Power Supply Connection

Figure 11.1 Combinations of power connection about EnVCC ( $\mathrm{n}=0$ to 2 )

The power source connection policy for EnVCC ( $\mathrm{n}=0$ to 2 ):
In the case of VDD and 5 V , the power source shall be connected as in Case 1.
In the case of 3 power supplies, the power source shall be connected as in Cases 2 to 4 .

Figure 11.2 Combinations of the power connection about EOVCC and LVDVCC

The power source connection policy about LVDVCC that concerns E0VCC.
i) Case to use GPIO shared with LVDS of RHSIF

The power source of LVDVCC should be the same as the source of EOVCC if the user uses the GPIO shared with the LVDS of RHSIF. The combinations of the power connection are restricted as Case 1 in Figure 11.2.
ii) Case NOT to use GPIO shared with the LVDS of RHSIF

The power source of LVDVCC can be set independently of the source of E0VCC (Case 2 or Case 3).

### 11.4 Power Up/Down Timing

See details in the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

### 11.5 Usage Note

The handling of the power supply pins is described in this section.
For the handling of unused pins, see Section 2, Pin Function
Table 11.2 List of External Pins

| Power Supply Name | Power Related Pin Name | Required Setting | Recommended Handling |
| :---: | :---: | :---: | :---: |
| EnVCC ( $\mathrm{n}=0$ to 2) |  |  | Connect an external capacitor to suit the conditions of usage. |
| SYSVCC |  | Decoupling capacitor: $0.1 \mu \mathrm{~F} \pm 30 \%$ |  |
| VCC |  | Stabilizing capacitor for power: $10 \mu \mathrm{~F} \pm 30 \%$ or higher | Decoupling capacitor for each pin |
|  | RAMSVCL | Stabilizing capacitor for power: $0.22 \mu \mathrm{~F} \pm 30 \%$ | See the application note separately issued. |
| EMUVCC*1 |  | When Aurora IF is used. <br> Low pass filter: <br> Cut off frequency is lower than 100 kHz including the inductor and the $2.2 \mu \mathrm{~F} \pm 20 \%$ or higher capacitor. <br> When Aurora IF is not used. <br> Decoupling capacitor: <br> $0.1 \mu \mathrm{~F} \pm 30 \%$ | Refer to Figure 11.3 as an example. |
| EMUVDD*1 |  | When Aurora IF is used. <br> Decoupling capacitors: $0.1 \mu \mathrm{~F} \pm 30 \% \text { and } 0.01 \mu \mathrm{~F} \pm 30 \%$ <br> When Aurora IF is not used. <br> Decoupling capacitors: <br> $0.1 \mu \mathrm{~F} \pm 30 \%$ | Refer to Figure 11.3 as an example. |
| VDD |  | Decoupling capacitors: <br> $0.1 \mu \mathrm{~F} \pm 20 \%$ and $10 \mu \mathrm{~F} \pm 20 \%$ | See the application note separately issued. |
| LVDVCC |  |  | See the application note separately issued. |
| AnVCC ( $\mathrm{n}=0$ to 3) |  |  | See the application note separately issued. |
|  | AnVREFH ( $\mathrm{n}=0$ to 3) |  | See the application note separately issued. |
| ADSVCC |  |  | See the application note separately issued. |
|  | ADSVREFH |  | See the application note separately issued. |
|  | ADSVCL |  | See the application note separately issued |

Note 1. Only E2xFCC1 supports EMUVCC, EMUVDD.

Figure 11.3 Filtering and Bypass Condenser Sample Design for EMUVCC and EMUVDD in case when Aurora IF is used

## Section 12 Power Supply Voltage Monitor

### 12.1 Overall Configuration

### 12.1.1 Features

- The power supply voltage monitor is used for monitoring the domains E0VCC (hereafter called EVCC in this section), VCC and VDD.
The power supply voltage monitor has H -side (HDET) and L-side (LDET) voltage detectors, which detect if the monitored voltage is higher or lower than the specified voltage. See Figure $\mathbf{1 2 . 1}$ and Figure $\mathbf{1 2 . 2}$ for the detection level.
- The power supply voltage monitor has two types of detection functions: Primary detection and Secondary detection
- Primary detection is conducted by Voltage Monitor. For details, refer to Section 12.2, Primary Detection of Voltage Monitor.
- Secondary detection is conducted by SAR-ADC. For details, refer to Section 34, Analog to Digital Converter (ADCH)
- Delay Monitor (DMON) assists VMON which detects the L-side voltage of VDD. For details, refer to Section 12.2.9.2, VCC Primary Low Detection.
- Delay Monitor (DMON) assists the power supply voltage monitor (VMON) to detect the low level voltage of VDD. For details, refer to Section 12.3, Delay Monitor (DMON).
- Primary power supply voltage monitor can be set ON/OFF for the VMON reset high level and low level detection of VDD, with a high level of VCC and EVCC. Low level detection of VCC and EVCC always raises VMON reset.
- Primary detection voltage value is fixed, secondary detection voltage value can be set by the SAR-ADC.
- If the Secondary power supply voltage monitor detects voltage failures, it notifies the error to the ECM. In this case, it is possible to generate an interrupt or reset by setting the ECM. For details, refer to Section 39, Error Control Module (ECM).
Figure 12.3 shows the construction of the notification with primary and secondary voltage monitor.

Figure 12.1 VMON Detection Level (VDD)

Figure 12.2 VMON Detection Level (EVCC / VCC)

Figure 12.3 Block Diagram of Power Supply Voltage Monitor (Overall)

### 12.2 Primary Detection of Voltage Monitor (VMON)

### 12.2.1 Features

- Violation of the operating range of each voltage is indicated by:
- Error output pin ( ERROROUT_M )
- Each power supply voltage high and low-voltage flags
- VMON Reset
- Diagnostic function:
- VMON function is testable.
- High and low-voltage errors can be generated without influencing the voltage itself.
- VMON error test is done by changing the reference voltage.
- The signal path to the ERROROUT_M pin can optionally be masked.

### 12.2.2 Register Base Address

The voltage Monitor base address is given in the following table.
Voltage Monitor register addresses are given as offsets from the base addresses in general.
Table 12.1 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <VMON_base> | FF70 $1800_{\mathrm{H}}$ | Peripheral Group 6 |

### 12.2.3 Clock Supply

The clock supply to VMON is shown in Table 12.2.
Table 12.2
Clock Supply

| Unit Name | Unit Clock Name | Clock Name |
| :--- | :--- | :--- |
| VMON | Digital noise filter clock | CLK_HVIOSC |
|  | Register access clock | CLK_LSB |

### 12.2.4 Interrupt Requests

This module has no interrupt requests.

### 12.2.5 External Input and Output Pins

The I/O pin related to reset is given in Table 12.3.
Table 12.3 I/O Pin

| Pin Function Name | Direction | Description |
| :--- | :--- | :--- |
| ERROROUT_M | Output | VMON error detection output, ECM error output |

### 12.2.6 Overview

### 12.2.6.1 Block Diagram

Figure 12.4, Figure 12.5 and Figure 12.6 show the block diagram of the power supply voltage monitor.

Figure 12.4 Block Diagram of the Power Supply Voltage Monitor (VDD)

Figure 12.5 Block Diagram of the Power Supply Voltage Monitor (VCC)

Figure 12.6 Block Diagram of the Power Supply Voltage Monitor (EVCC)

### 12.2.7 Registers

### 12.2.7.1 List of Registers

The list of registers related to VMON is shown in Table 12.4.
Table 12.4 List of Registers

| Unit Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| VMON | VMON Factor Register | VMONF | <VMON_base>+ $000{ }_{\text {H }}$ | 8 | - |
| VMON | VMONF Clear Register | VMONFC | <VMON_base>+ 004 ${ }_{\text {H }}$ | 8 | VMONKCPROT |

| VMONKCPROT | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - | - |

Note 1. VMON Reset is excluded.
Note 2. Standby reset only

### 12.2.7.2 VMONF — VMON Factor Register

VMONF register indicates that an error is detected by VMON. Each flag of VMONF can be cleared individually by writing " 1 " to the corresponding bit in VMONFC.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | EVCCHVF | EVCCLVF | VCCHVF | VCCLVF | VDDHVF | VDDLVF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 12.6 VMONF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 5 | EVCCHVF | EVCC high voltage detection flag |
|  |  | 0: No high EVCC voltage violation detected |
|  |  | 1: High EVCC voltage violation occurred |
| 4 | EVCCLVF | EVCC low voltage detection flag |
|  |  | 0: No low EVCC voltage violation detected |
|  |  | 1: low EVCC voltage violation occurred |
| 3 | VCCHVF high voltage detection flag |  |
|  |  | 0: No high VCC voltage violation detected |
|  |  | 1: High VCC voltage violation occurred |
| 2 | VCC low voltage detection flag |  |
|  |  | 0: No low VCC voltage violation detected |
|  |  | 1: low VCC voltage violation occurred |
| 1 |  | VDD high voltage detection flag |
|  |  | 0: No high VDD voltage violation detected |
|  |  | 1: High VDD voltage violation occurred |
| 0 |  | VDD low voltage detection flag |
|  |  | 0: No low VDD voltage violation detected |
|  |  | 1: low VDD voltage violation occurred |

### 12.2.7.3 VMONFC — VMONF Clear Register

VMONFC is a register to clear the VMONF register. The read value of this register is always $00_{\mathrm{H}}$.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | EVCCHVFC | EVCCLVFC | VCCHVFC | VCCLVFC | VDDHVFC | VDDLVFC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | W | W | W | W | W | W |

Table 12.7 VMONFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 6 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 5 | EVCCHVFC | Clear EVCC high voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears EVCCHVF |
| 4 | EVCCLVFC | Clear EVCC low voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears EVCCLVF |
| 3 | VCCHVFC | Clear VCC high voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears VCCHVF |
| 2 | VCCLVFC | Clear VCC low voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears VCCLVF |
| 1 | VDDHVFC | Clear VDD high voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears VDDHVF |
| 0 | VDDLVFC | Clear VDD low voltage detection flag |
|  |  | 0 : Writing 0 has no effect |
|  |  | 1: Writing 1 clears VDDLVF |

### 12.2.7.4 VMONDIAGME — VMON DIAG Monitor Enable Register

VMONDIAGME is a read only register to control the VMON DIAG function.
This register reflects the settings written to VMONDIAGMEW.

Value after reset: $\quad 0 \mathrm{OH}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | VMONDIAGME |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 12.8 VMONDIAGME Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | VMONDIAGME | Permit DIAG function |
|  |  | 0: DIAG function of the Voltage Monitor can be enabled |
|  |  | 1: DIAG function of the Voltage Monitor cannot be enabled |

### 12.2.7.5 VMONDIAGMEW — VMONDIAGME Write Register

VMONDIAGMEW is a register to set values of VMONDIAGME. Writing is permitted only once after Standby Reset or External Reset are released. Subsequent write operations are ignored. The read value of this register is always $00_{\mathrm{H}}$.

Value after reset: $\quad 00_{H}$

Table 12.9 VMONDIAGMEW Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | VMONDIAGMEW | The data written in this bit is set to VMONDIAGME. |

### 12.2.7.6 VMONDMASK — VMON Detection Output Diagnosis Mask Register

VMONDMASK is a register to mask VMON_ERROROUT and VMON Reset when VMONDIAGME $=0$.
The VMONDMASK setting is ignored if VMONDIAGME.VMONDIAGME $=1$.
Writing to VMONDMASK is permitted during the period from External Reset release until writing to VMONDIAGMEW.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | EVCCRESMD | VCCRESMD | VDDRESMD | - | EVCCERRMD | VCCERRMD | VDDERRMD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

Table 12.10 VMONDMASK Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | EVCCRESMD | This bit masks VMON_EVCC_REQ_RESET when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VMON_EVCC_REQ_RESET is not masked. <br> 1: VMON_EVCC_REQ_RESET is masked. |
| 5 | VCCRESMD | This bit masks VMON_VCC_REQ_RESET when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VMON_VCC_REQ_RESET is not masked. <br> 1: VMON_VCC_REQ_RESET is masked. |
| 4 | VDDRESMD | This bit masks VMON_VDD_REQ_RESET when VMONDIAGME.VMONDIAGME $=0$. <br> 0: VMON_VDD_REQ_RESET is not masked. <br> 1: VMON_VDD_REQ_RESET is masked. |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | EVCCERRMD | This bit masks VMON_EVCC_ERROROUT when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VMON_EVCC_ERROROUT is not masked. <br> 1: VMON_EVCC_ERROROUT is masked. |
| 1 | VCCERRMD | This bit masks VMON_VCC_ERROROUT when VMONDIAGME.VMONDIAGME $=0$. <br> 0: VMON_VCC_ERROROUT is not masked. <br> 1: VMON_VCC_ERROROUT is masked. |
| 0 | VDDERRMD | This bit masks VMON_VDD_ERROROUT when VMONDIAGME.VMONDIAGME $=0$. <br> 0: VMON_VDD_ERROROUT is not masked. <br> 1: VMON_VDD_ERROROUT is masked. |

### 12.2.7.7 VMONDIAG — VMON DIAG Mode Setting Register

VMONDIAG forces VMON comparators to output an error. This register is valid only when VMONDIAGME $=0$. VMONDIAG's setting is ignored if VMONDIAGME.VMONDIAGME $=1$.

Writing to VMONDIAG is permitted during the period from External Reset release until writing to VMONDIAGMEW.

Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | EVCCDIAGH | EVCCDIAGL | VCCDIAGH | VCCDIAGL | VDDDIAGH | VDDDIAGL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 12.11 VMONDIAG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EVCCDIAGH | This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : EVCC for high voltage monitors normally. <br> 1: EVCC for high voltage will detect violation condition because detection level changes. |
| 4 | EVCCDIAGL | This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0: EVCC for low voltage monitors normally. <br> 1: EVCC for low voltage will detect violation condition because detection level changes. |
| 3 | VCCDIAGH | This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VCC for high voltage monitors normally. <br> 1: VCC for high voltage will detect violation condition because detection level changes. |
| 2 | VCCDIAGL | This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VCC for low voltage monitors normally. <br> 1: VCC for low voltage will detect violation condition because detection level changes. |
| 1 | VDDDIAGH | This bit can change the detection level of high voltage detector to low level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VDD for high voltage monitors normally. <br> 1: VDD for high voltage will detect violation condition because detection level changes. |
| 0 | VDDDIAGL | This bit can change the detection level of low voltage detector to high level intentionally when VMONDIAGME.VMONDIAGME $=0$. <br> 0 : VDD for low voltage monitors normally. <br> 1: VDD for low voltage will detect violation condition because detection level changes. |

### 12.2.7.8 VMONDIAGFE — VMON DIAG Filter Enable Register

VMONDIAGFE specifies whether the output filter for ERROROUT is enabled.
This register is valid only when VMONDIAGME $=0$. The setting of this register is ignored if
VMONDIAGME.VMONDIAGME $=1$.
Writing to VMONDIAGFE is permitted during the period from External Reset release until writing to VMONDIAGMEW.

VMON reset does not occur when each bit is set to 0 .

Value after reset: $\quad 07 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | $\begin{gathered} \text { EVCC } \\ \text { DIAGFLTEN } \end{gathered}$ | $\begin{gathered} \text { VCC } \\ \text { DIAGFLTEN } \end{gathered}$ | $\begin{aligned} & \text { VDD } \\ & \text { DIAGFLTEN } \end{aligned}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 12.12 VMONDIAGFE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | EVCCDIAGFLTEN | Enable output filter for VMON_EVCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. |
|  |  | 0: Disable output filter for VMON_EVCC_ERROROUT |
|  |  | 1: Enable output filter for VMON_EVCC_ERROROUT |
| 1 | VCCDIAGFLTEN | Enable output filter for VMON_VCC_ERROROUT when VMONDIAGME.VMONDIAGME = 0. |
|  |  | $0:$ Disable output filter for VMON_VCC_ERROROUT |
|  |  | 1: Enable output filter for VMON_VCC_ERROROUT |
| 0 |  | Enable output filter for VMON_VDD_ERROROUT when VMONDIAGME.VMONDIAGME = 0. |
|  |  | 0: Disable output filter for VMON_VDD_ERROROUT |
|  |  | 1: Enable output filter for VMON_VDD_ERROROUT |

### 12.2.7.9 VDDDE — VDD Detection Enable Register

VDDDE is a register to control VMON reset, VMON signal mask and VMON signal filter.
Bits 3, 1, 0 are set by the flash option byte when Standby Reset or External Reset is released.
Writing to VDDDE is permitted during the period from External Reset release until writing to VMONDIAGMEW.

Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 12.2.7.10 VDDFCR — VDD Monitor Filter Control Register

VDDFCR is a register to adjust the filtering width of VDD Monitor digital noise filter.
This register is set by the flash option byte when Standby Reset or External Reset is released.

## Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | $3 \quad 2$ |  | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | X | X | X | X |
| R/W | R | R | R | R | R | R | R | R |

Table 12.14 VDDFCR Register Contents

Wait specified time $=10 \mathrm{us}+$ Digital noise filter width.
For example, VDDFLTW[1:0] $=00 \mathrm{~b}$ VDDCLKSEL[1:0] $=00 \mathrm{~b}$
Wait specified time $=10 \mathrm{us}+20$ cycle $* 256 * 62.5 \mathrm{~ns}=330 \mathrm{us}$

### 12.2.7.11 VCCDE — VCC Detection Enable Register

VCCDE is a register to control VMON reset, VMON signal mask and VMON signal filter.
Bits 3, 1 are set by the flash option byte when Standby Reset or External Reset is released.
Writing to VCCDE is permitted during the period from External Reset release until writing to VMONDIAGMEW.

Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | VCCCIRREN1 | Permit VMON reset by VCC high voltage detection. <br> VCCCIRREN1,0 <br> $11_{\mathrm{B}}$ : VMON reset by VCC high voltage detection is permitted <br> Other value: VMON reset by VCC high voltage detection is not permitted |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | VCCCIRRENO | Refer to bit 7 (VCCCIRREN1). |
| 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | VCCFLTEN | Enable output filter for $\overline{\text { ERROROUT_M }}$ and VMONF. <br> 0: Disable output filter for $\overline{\text { ERROROUT_M }}$ and VMONF. <br> 1: Enable output filter for $\overline{\text { ERROROUT_M }}$ and VMONF. |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | VCCHDE | VCC high voltage detection enable <br> 0: Disable VCC high voltage detection <br> 1: Enable VCC high voltage detection |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

### 12.2.7.12 VCCFCR — VCC Monitor Filter Control Register

VCCFCR is a register to adjust the filtering width of the VCC Monitor digital noise filter.
This register is set by the flash option byte when Standby Reset or External Reset is released.

## Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | VCCFLTW[1:0] |  | VCCCLKSEL[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | X | X | X | X |
| R/W | R | R | R | R | R | R | R | R |

Table 12.16 VCCFCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 3, 2 | VCCFLTW[1:0] | These bits select the minimum filtering width of digital noise filter. |
|  |  | (The minimum filtering width is given by the cycle-count of the clock selected by VCCCLKSEL1, 0.) |
|  |  | VCCFLTW[1:0] Minimum Filtering Width (Cycle) |
|  |  | 0020 cycles |
|  |  | 0113 cycles |
|  |  | 10 8 cycles |
|  |  | 11 3 cycles |
| 1, 0 | VCCCLKSEL[1:0] | These bits select the clock of the digital noise filter from the following clocks. |
|  |  | VCCCLKSEL[1:0] Clock of the Digital Filter |
|  |  | 00 CLK_HVIOSC frequency / 256 |
|  |  | 01 CLK_HVIOSC frequency / 128 |
|  |  | 10 CLK_HVIOSC frequency / 64 |
|  |  | 11 CLK_HVIOSC frequency / 32 |
|  |  | CAUTION: The frequency of CLK_HVIOSC is typ. 16 MHz , min. 8 MHz . |

Wait specified time $=10$ us + Digital noise filter width.
For example, VCCFLTW[1:0] $=00 \mathrm{~b}$ VCCCLKSEL[1:0] $=00 \mathrm{~b}$
Wait specified time $=10$ us +20 cycle $* 256 * 62.5 \mathrm{~ns}=330$ us

### 12.2.7.13 EVCCDE — EVCC Detection Enable Register

EVCCDE is register to control VMON reset, VMON signal mask and VMON signal filter.
Bits 3 and 1 are set by the flash option byte when Standby Reset or External Reset is released.
Writing to EVCCDE is permitted during the period from External Reset release until writing to VMONDIAGMEW.

## Value after reset: $\quad 0 X_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 3 |  | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | X | 0 | X | 0 |
| R/W | R/W | R | R/W | R | R | R | R | R |

Table 12.17 EVCCDE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | EVCCCIRREN1 | Permit VMON reset by EVCC high voltage detection. <br> EVCCCIRREN1,0 <br> $11_{\mathrm{B}}$ : VMON reset by EVCC high voltage detection is permitted <br> Other value: VMON reset by EVCC high voltage detection is not permitted |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | EVCCCIRREN0 | Refer to bit 7 (EVCCCIRREN1). |
| 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | EVCCFLTEN | Enable output filter for $\overline{\text { ERROROUT_M }}$ and VMONF. <br> 0: Disable output filter for ERROROUT_M and VMONF. <br> 1: Enable output filter for $\overline{\text { ERROROUT_M }}$ and VMONF. |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | EVCCHDE | EVCC high voltage detection enable <br> 0: Disable EVCC high voltage detection <br> 1: Enable EVCC high voltage detection |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

### 12.2.7.14 EVCCFCR — EVCC Monitor Filter Control Register

EVCCFCR is a register to adjust the filtering width of the EVCC Monitor digital noise filter.
This register is set by the flash option byte when Standby Reset or External Reset is released.

Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | X | X | X | X |
| R/W | R | R | R | R | R | R | R | R |

Table 12.18 EVCCFCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 3, 2 | EVCCFLTW[1:0] | These bits select the minimum filtering width of digital noise filter. |
|  |  | (The minimum filtering width is given by the cycle-count of the clock selected by EVCCCLKSEL1, 0) |
|  |  | EVCCFLTW[1:0] Minimum Filtering Width (Cycle) |
|  |  | $00 \quad 20$ cycles |
|  |  | 01 13 cycles |
|  |  | 10 8 cycles |
|  |  | 11 3 cycles |
| 1, 0 | EVCCCLKSEL[1:0] | These bits select the clock of the digital noise filter from the following clocks. |
|  |  | EVCCCLKSEL[1:0] Clock of the Digital Filter |
|  |  | 00 CLK_HVIOSC frequency / 256 |
|  |  | 01 CLK_HVIOSC frequency / 128 |
|  |  | 10 CLK_HVIOSC frequency / 64 |
|  |  | 11 CLK_HVIOSC frequency / 32 |
|  |  | CAUTION: The frequency of CLK_HVIOSC is typ. $16 \mathrm{MHz}, \min 8 \mathrm{MHz}$. |

Wait specified time $=10 \mathrm{us}+$ Digital noise filter width.
For example, EVCCFLTW[1:0] = 00b EVCCCLKSEL[1:0] = 00b
Wait specified time $=10 \mathrm{us}+20$ cycle $* 256 * 62.5 \mathrm{~ns}=330 \mathrm{us}$

### 12.2.7.15 VMONKCPROT — VMON Register Key Code Protection Register

The VMONKCPROT register is used for protection against writing operation to the registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunctions and the like.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 12.19 VMONKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing to protected registers. Write A5A5A501 to this register to enable writing to protected registers.

### 12.2.8 Operation

### 12.2.8.1 VMON Basic Function

VMON watches VDD, VCC and EVCC voltage.
VMON has a high and low voltage detection circuit. If it detects a voltage error, it records the error to the VMONF register and notifies the error to the outside via the $\overline{\text { ERROROUT_M }}$ pin. It also generates internal reset (VMON reset) triggered by detection of voltage error.

## (1) VMON detection flag

VMONF.VDDHF is set to " 1 " when VDD becomes higher than high voltage detection level of VMON.
VMONF.VCCHF is set to " 1 " when VCC becomes higher than high voltage detection level of VMON.
VMONF.EVCCHF is set to " 1 " when EVCC becomes higher than high voltage detection level of VMON.

Similarly, VMONF.VDDLF is set to " 1 " when VDD becomes lower than low voltage detection level of VMON.
VMONF.VCCLF is set to " 1 " when VCC becomes lower than low voltage detection level of VMON.
VMONF.EVCCLF is set to " 1 " when EVCC becomes lower than low voltage detection level of VMON.

These flags can be cleared to " 0 " by writing in the corresponding bit of VMONFC.
These flags are also cleared by Standby Reset (not cleared by other resets). Figure 12.7 shows an operation example of VMONF.

## (2) $\overline{\text { ERROROUT_M }}$ pin

While monitor voltage is higher than the high voltage detection level or lower than the low voltage detection level of VMON, the $\overline{\text { ERROROUT_M }}$ pin outputs a low level.

If VMON does not detect voltage error and ECM does not detect error, ERROROUT_M pin outputs a high level.
To avoid unwanted operation of the VMON circuit caused by instable power supply at power up, $\overline{\text { ERROROUT_M }}$ is fixed to low during the External Reset period and Standby Reset period.
$\overline{\text { ERROROUT_M }}$ outputs the error detection result during other reset periods.

The status of $\overline{\text { ERROROUT_M }}$ is readable from ECM. For details, refer to Section 39, Error Control Module (ECM).
Figure 12.7 shows an operation example of $\overline{\text { ERROROUT_M }}$.

Figure 12.7 Example of VMONF and $\overline{E R R O R O U T \_M ~ O p e r a t i o n ~(V D D) ~}$

## (3) VMON reset

If VDD voltage becomes higher than high voltage detection level of VMON when " $101_{\mathrm{H}}$ " or " $111_{\mathrm{H}}$ " were set to VDDDE.VDDCIRREN[2:0] in advance, VMON reset occurs.
If VDD voltage becomes lower than low voltage detection level of VMON when " $110_{\mathrm{H}}$ " or " $111_{\mathrm{H}}$ " were set to VDDDE.VDDCIRREN[2:0] in advance, VMON reset occurs.

If VCC voltage or EVCC voltage becomes higher than high voltage detection level of VMON when " $11_{\mathrm{H}}$ " was set to VCCDE.VCCCIRREN1, $0^{* 1}$ or EVCCDE.EVCCIRREN1, $0^{* 1}$ in advance respectively, VMON reset occurs.
VMON reset is released after the specified time has been passed since VMON detects the normal voltage. Figure 12.8 shows an operation example of VMON reset.

Note 1. LDET of VCC / EVCC will always generate the VMON RESET at the time of low voltage detection, except during diagnosis.

NOTE
Notes on before enabling VMON after reset release. Before the self-diagnosis is completed, VMON operation is out of guarantee, but the actual operation at normal case is as follows. According to the initial value of the register, when LDET of VCC and EVCC is detected, VMON reset occurs, and when HDET of VCC and EVCC is detected, VMON reset doesn't occurs.

Figure 12.8 Example of VMON Reset Operation (VDD)

## (4) Digital Noise Filter

The output signal of the voltage detector passes through a digital noise filter to remove unintended glitches. See the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware for further information on the filter characteristics.

The digital noise filter clock and the cycle are controlled by setting of the following registers. (These register are read only and set by flash option byte.)

- VDDFCR
- VCCFCR
- EVCCFCR

The relation of filter enable is shown in Figure 12.4, Figure 12.5 and Figure 12.6

### 12.2.8.2 VMON Function in BIST (Mask of VMON_VDD_ERROROUT and VMON_VDDREQRESET)

It is possible to mask VMON_ERROROUT output and VMON reset by VDDDE.VDDFBISTME when BIST is carried out after VMON Reset.

In this case, VMON_VDD_ERROROUT is fixed at a high level, and VMON_VDD_REQRESET does not occur.

When VDDDE.VDDFBISTME is set to " 1 ", VMON_VDD_ERROROUT and VMON_VDD_REQRESET are not masked when BIST is carried out after VMON Reset.

NOTE
VMON_VDD_ERROROUT output and VMON_VDD_REQRESET are always masked when BIST is carried out after Standby Reset or External Reset.

VMON_VDD_ERROROUT output and VMON_VDD_REQRESET are never masked when BIST is carried out after System Reset 2.

### 12.2.8.3 VMON Diagnosis Function

(1) Change of VMON detection level for the error injection

When VMONDIAGME.VMONDIAGME is " 0 ", VDD detection level can be changed by VMONDIAG.VDDDIAGH or VMONDIAG.VDDDIAGL.

When VMONDIAGME.VMONDIAGME is " 0 ", VCC detection level can be changed by VMONDIAG.VCCDIAGH or VMONDIAG.VCCDIAGL.

When VMONDIAGME.VMONDIAGME is " 0 ", EVCC detection level can be changed by VMONDIAG.EVCCDIAGH or VMONDIAG.EVCCDIAGL.

VMON error detection signal can be intentionally generated by setting these registers even when each power supply voltage is in the operating range.

NOTE
During self-diagnosis, VMON detection by abnormal voltage can not be operated. As ERROROUT is injected with error in VMON Diagnosis Function, it can not detect VMON by abnormal voltage and ERROROUT output high level.

## (2) Mask of VMON_ERROROUT and VMON reset

When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.VDDERRMD is set to " 1 ", VMON_VDD_ERROROUT can be masked.

When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.VCCERRMD is set to " 1 ", VMON_VCC_ERROROUT can be masked.

When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.EVCCERRMD is set to " 1 ", VMON_EVCC_ERROROUT can be masked.
If above three settings are done, $\overline{\text { ERROROUT_M }}$ is dependent on the setting of ECM and DMON during diagnosis. When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.VDDRESMD is set to " 1 ", VMON_VDD_REQ_RESET can be masked.

When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.VCCRESMD is set to " 1 ", VMON_VCC_REQ_RESET can be masked.

When VMONDIAGME.VMONDIAGME is " 0 " and VMONDMASK.EVCCRESMD is set to " 1 ", VMON_EVCC_REQ_RESET can be masked.

## (3) Flow of VMON diagnosis application

VMONDIAGME.VMONDIAGME is initialized to " 0 " by Standby Reset or External Reset. Therefore, VMON diagnosis function is enabled at start-up after these resets.

The user's application controls the diagnostic function by VMONDMASK, VMONDIAG and VMONDIAGFE.
Figure 12.9 shows an example of the diagnosis application.
After diagnosis application is finished, write " 1 " to VMONDIAGME.VMONDIAGME and disable VMON diagnosis function immediately.

This function protects each flag against erroneous operation when each power supply is out of the operating range.

Note 1. The processing must produce periods of waiting at least $30 \mu \mathrm{~s}$.

Figure 12.9 Example of the Flowchart of VMON Diagnosis Application

Wait specified time $=10 \mathrm{us}+$ Digital noise filter width.
Please refer VDDFCR and VCCFCR and EVCCFCR for "Wait specified time"

### 12.2.9 Usage Notes

### 12.2.9.1 Flag Bit (VMONF)

Setting 1 to VMONF by error detection is prior to clearing VMONF by VMONFC.
These functions protect each flag against erroneous operation when each power supply is out of the operating range.

When Monitor voltages are recovered to the operating range, the MCU needs to be initialized by External Reset or VMON reset, or the MCU may still continue erroneous operation and then unintended flag clearing may occur.

### 12.2.9.2 VCC Primary Low Detection

Because of internal circuit guard of this LSI, VMON Reset might occur in a shorter time than the filter width when VCC voltage is lower than the lowest level of VCC primary low detection range*1.

In that case, VCCLVF will not be set by the VCC primary low detection.
Note 1. VCC primary low detection level has some width. For details, refer to the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

### 12.2.9.3 External Reset occurs during self-diagnosis

If the External Reset conflicts with the VCC and EVCC low voltage detection of self-diagnosis, Standby Reset will occur.

### 12.3 Delay Monitor (DMON)

### 12.3.1 Features

DMON can detect abnormalities in the delay time of transistor devices by using an on-chip delay monitor while the microcontroller is operating. DMON can only monitor the delay time on the VDD domain. It detects an error if the monitored delay time is lower than the threshold according to the fabrication process conditions.

DMON assists the power supply voltage monitor (VMON), which detects the low level voltage of VDD.
When DMON detects a delay error within the ranges of VMON detection, it notifies VMON about the error detection to operate VMON reset normally.

### 12.3.2 Register Base Addresses

The Delay Monitor base address is given in the following table.
Delay Monitor register addresses are given as offsets from the base addresses in general.
Table 12.20 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <DMON_base> | FF70 $1 \mathrm{COO} 0_{H}$ | Peripheral Group 6 |

### 12.3.3 Clock Supply

The clock supply to DMON is shown in the following table.
Table 12.21 Clock Supply

| Unit Name | Clock Name | Symbol |
| :--- | :--- | :--- |
| DMON | Main OSC | CLK_MOSC |
|  | Peripheral low speed clock | CLK_LSB |

### 12.3.4 Interrupt and DMA/DTS Requests

This module has no interrupt and DMA/DTS requests.

### 12.3.5 External Input and Output Pins

This module has no external input/output pins.

### 12.3.6 Overview

### 12.3.6.1 Functional Overview

The On-Chip delay monitor measures the delay time related to the power supply voltage. It converts analog delay time into digital codes (DCODE) and outputs the DCODE into a comparator. The DCODE is compared with the threshold, which is a fixed value. When the DCODE becomes lower than the threshold, an error output signal
(DMON_ERROROUT) and a reset request signal (DMON_REQRESET) are generated to notify the VMON.

### 12.3.6.2 Block Diagram

Figure 12.10 Block Diagram of Delay Monitor

### 12.3.7 Registers

### 12.3.7.1 List of Registers

The register list related to DMON is shown in Table 12.22.
Table 12.22 List of Registers (DMON)

| Unit <br> Name | Register Name | Symbol | Address | Access <br> Size | Access Protection |
| :--- | :--- | :--- | :--- | :--- | :--- |
| DMON | DMON Factor Register | DMONF | <DMON_base> + 000 | 32 |  |
| DMON | DMONF Clear Register | DMONFC | <DMON_base> + 004 | 32 | DMONKCPROT0 |
| DMON | DMON DIAG Monitor Enable Register | DMONDIAGME | <DMON_base> + 008 | 32 |  |
| DMON | DMONDIAGME Write Register*1 | DMONDIAGMEW | <DMON_base> + 00C $H_{H}$ | 32 | DMONKCPROT0 |
| DMON | DMON Detection Output Diagnosis Mask | DMONDMASK | <DMON_base> + 010 | 32 |  |
| DMON | DMON DIAG Mode Setting Register | DMONDIAG | <DMON_base> + 014 | 32 |  |
| DMON | DMON Detection Enable Register | DMONDE | <DMON_base> + 018 | 32 | DMONKCPROT0 |
| DMON | DMON Filter Control Register | DMONFCR | <DMON_base> + 01C | 32 |  |
| DMON | DMON Register Key Code Protection | DMONKCPROT0 | <DMON_base> + 300 | 32 |  |

Note 1. Writing is permitted only once after System Reset 1/2.

Register reset conditions are shown in Table 12.23.
Table 12.23 Register Reset Conditions for DMON

| Register Name | Reset Source |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

### 12.3.7.2 DMONF — DMON Factor Register

The DMONF register indicates that an error is detected by DMON. Each flag of DMONF can be cleared individually by writing " 1 " to the corresponding bit in DMONFC.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 12.24 DMONF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | DMONLVF | Lower limit delay detection flag |
|  |  | $0:$ No lower limit delay error detected |
|  | 1: Lower limit delay error occurred |  |

### 12.3.7.3 DMONFC - DMONF Clear Register

DMONFC is a register to clear the DMONF register. The read value of this register is always $00000000_{\mathrm{H}}$.

Value after reset: $00000000_{\mathrm{H}}$

Table 12.25 DMONFC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | DMONLVFC | Clear lower limit delay detection flag |
|  | $0:$ Writing 0 has no effect |  |
|  | $1:$ Writing 1 clears DMONLVF |  |

### 12.3.7.4 DMONDIAGME — DMON DIAG Monitor Enable Register

DMONDIAGME is a read only register to control the DIAG function.
This register reflects the settings written to DMONDIAGMEW.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 12.26 DMONDIAGME Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | DMONDIAGME | Permit DIAG function |
|  |  | $0:$ DIAG function of the DMON can be enabled |
|  |  | 1: DIAG function of the DMON cannot be enabled |

### 12.3.7.5 DMONDIAGMEW — DMONDIAGME Write Register

DMONDIAGMEW is a register to set values of DMONDIAGME. Writing is permitted only once after System Reset $1 / 2$ is released. Subsequent write operations are ignored. The read value of this register is always $00000000_{\mathrm{H}}$.

Table 12.27 DMONDIAGMEW Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br>  <br> 0 |
| When writing, write the value after reset. |  |  |

### 12.3.7.6 DMONDIAG — DMON DIAG Mode Setting Register

The DMONDIAG register is used for controlling the diagnostic function of DMON.
This register is valid only when DMONDIAGME.DMONDIAGME $=0$. The setting of DMONDIAG is ignored if DMONDIAGME.DMONDIAGME $=1$.

Value after reset: $\quad 00000000_{H}$

Table 12.28 DMONDIAG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DMONDIAGL | This bit is used for error injection of diagnosis function when DMONDIAGME $=0$. |
|  | $0:$ Normal operation. |  |
|  | 1: Execute error injection. |  |

### 12.3.7.7 DMONDMASK — DMON Detection Output Diagnosis Mask Register

DMONDMASK is a register to mask DMON_REQRESET and DMON_ERROROUT when
DMONDIAGME.DMONDIAGME $=0$. DMONDMASK setting is ignored if DMONDIAGME.DMONDIAGME $=1$.

Table 12.29 DMONDMASK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | DMONRESMD | This bit masks DMON_REQRESET when DMONDIAGME.DMONDIAGME $=0$. |
|  |  | 0: DMON_REQRESET is not masked. |
|  | 1: DMON_REQRESET is masked. |  |

### 12.3.7.8 DMONDE — DMON Detection Enable Register

DMONDE is a register to control DMON detection, the DMON signal mask and DMON signal filter.
Writing in DMONDE is permitted during the period before writing in DMONDIAGMEW after System Reset $1 / 2$ is released. Writing in this register is ignored after writing in DMONDIAGMEW.

| Value after reset: $\quad 00000000 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | DMON CIRRE N1 | - | $\begin{gathered} \hline \text { DMON } \\ \text { CIRRE } \\ \text { N0 } \end{gathered}$ | - | DMONF LTEN | - | - | DMON LDE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R/W | R | R/W | R | R | R/W |

Table 12.30 DMONDE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | DMONCIRREN1 | Permit DMON_REQRESET notification. |
|  |  | DMONCIRREN1, 0 |
|  |  | $00_{\mathrm{B}}, 01_{\mathrm{B}}, 10_{\mathrm{B}}$ : DMON_REQRESET is not permitted |
|  |  | $11_{\mathrm{B}}$ : DMON_REQRESET is permitted |
| 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | DMONCIRREN0 | Refer to bit 7 (DMONCIRREN1). |
| 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | DMONFLTEN | Enable output filter for DMON_ERROROUT and DMON Error Detection Flag |
|  |  | 0: Disable output filter for DMON_ERROROUT and DMON Error Detection Flag |
|  |  | 1: Enable output filter for DMON_ERROROUT and DMON Error Detection Flag |
| 2 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | DMONLDE | DMON Low delay detection enable |
|  |  | 0: Disable DMON lower limit delay detection |
|  |  | 1: Enable DMON lower limit delay detection |

### 12.3.7.9 DMONFCR — DMON Filter Control Register

DMONFCR is a register to adjust the filtering width of the DMON digital noise filter.
Writing in DMONFCR is permitted during the period before writing in DMONDIAGMEW after System Reset $1 / 2$ is released. Writing in this register is ignored after writing in DMONDIAGMEW.

Table 12.31 DMONFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | DMONFLTW | These bits select the minimum filtering width of the digital noise filter. |
|  | The minimum filtering width is given as a number of sampling times. |  |
|  | $000: 1$ sampling times |  |
| $001: 2$ sampling times |  |  |
| $010: 4$ sampling times |  |  |
| $011: 8$ sampling times |  |  |
|  | $100: 16$ sampling times |  |
|  | $101: 32$ sampling times |  |
|  | $110: 64$ sampling times |  |
|  | $111: 128$ sampling times |  |
|  | CAUTION: The sampling period is $4 \mu \mathrm{~s}$. |  |

### 12.3.7.10 DMONKCPROTO — DMON Register Key Code Protection Register 0

The DMONKCPROT0 register is used for protection against writing operation to the registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

Table 12.32 DMONKCPROT0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  |  | 1: Enable write access to protected registers |
|  |  |  |

Note 1. Write A5A5A500 to this register to disable writng to protected registers. Write A5A5A501 to this register to enable writing to protected registers.

### 12.3.8 Operation

### 12.3.8.1 DMON Basic Function

DMON monitors the delay time depending on the VDD supply voltage.
If it detects a delay error, it records the error to DMONF register. It also generates DMON_ERROROUT and DMON_REQRESET triggered by detection of the lower limit delay, and notifies the error to VMON.

Figure 12.11 shows the flowchart of starting up DMON. DMON begins to operate after VMON starts up and the Clock Monitor confirms that Main OSC clock is normally operating. The user must invoke DMON after starting up VMON and checking Clock Monitor to see whether or not Main OSC clock is operating normally. After DMON starts up, the system clock needs to be changed to PLL and the clock gear up is carried out.

The timing chart of DMON operation is shown in Figure 12.12.
When Power Up Reset or System Reset $1 / 2$ is asserted, DMON is also initialized by these resets. After restart from the reset, the start-up sequence needs to be executed again.

Figure 12.11 Flowchart of DMON Start-Up

Figure 12.12 Timing Chart of the DMON Function

DMON generates the sampling period from Main OSC clock (CLK_MOSC). If the frequency of Main OSC is faster than the spec, the DCODE will become smaller than the expected value due to shortening of the sampling period. Therefore, there is a possibility that DMON detects the delay error before the error detection of clock monitor for Main OSC and the MCU is initialized by VMON reset. If the user distinguishes between the failure of Main OSC and the reset factor caused by DMON error after the MCU restarts from VMON reset, the user needs to confirm the DMON error flag and check the frequency of Main OSC by clock monitor (CLMA1). Figure $\mathbf{1 2 . 1 3}$ shows an example of a flowchart to identify the reset factor.

Figure 12.13 Example of Flowchart to Identify the Failure of Main OSC

## (1) DMON Error Detection Flag

DMON sets " 1 " to DMONF.DMONLVF when the DCODE becomes lower than the low detection threshold level.

The flag can be cleared to " 0 " by writing to the corresponding bit of DMONFC.
The flag is also cleared by power up reset and standby reset (not cleared by other resets). Figure $\mathbf{1 2 . 1 4}$ shows an operation example of DMONF.

Figure 12.14 DMON Error Detection Flag

## (2) DMON_REQRESET Output

If the DCODE value becomes lower than the DCODE threshold level when DMONDE.DMONCIRREN is set to " $11_{\mathrm{B}}$ ", DMON notifies VMON that the DMON_REQRESET has occurred. After that, VMON reset occurs and the MCU including DMON is initialized. DMON continues to hold the DMON_REQRESET state until DMON is initialized by VMON reset. Figure $\mathbf{1 2 . 1 5}$ shows an operation example of DMON_REQRESET.

Figure 12.15 DMON_REQRESET Operation

## (3) Digital Noise Filter

The output signal of the DMON comparators passes through a digital noise filter to remove unintended glitches. Whether to use filtered output or to bypass the filter is selectable by DMONDE.DMONFLTEN.

The digital noise filter period can be changed by the DMONFCR register.

### 12.3.8.2 DMON Diagnosis Function

(1) Change of DMON detection level for error injection

When DMONDIAGME.DMONDIAGME is set to " 0 ", the Lower limit delay threshold level can be changed by DMONDIAG.DMONDIAGL.

The DMON error detection signal can be intentionally generated by setting this register when VMON did not detect a voltage error and the clock monitor CLMA1 did not detect frequency abnormalities.

## (2) Mask of DMON_ERROROUT and DMON_REQRESET

When DMONDIAGME.DMONDIAGME is set to " 0 " and DMONDMASK.DMONERRMD is set to " 1 ", DMON_ERROROUT can be masked.

When DMONDIAGME.DMONDIAGME is set to " 0 " and DMONDMASK.DMONRESMD is set to " 1 ", DMON_REQRESETcan be masked.

## (3) Flow of DMON diagnosis application

DMONDIAGME.DMONDIAGME is initialized to " 0 " by Power Up Reset or System Reset $1 / 2$. Therefore, the DMON diagnosis function is enabled at start-up after these resets.

The user's application controls the diagnostic function by DMONDMASK and DMONDIAG. Figure $\mathbf{1 2 . 1 6}$ shows the example of the diagnosis application.

After diagnosis application is finished, write " 1 " to DMONDIAGMEW.DMONDIAGMEW and disable the DMON diagnosis function immediately.

This function protects each flag against erroneous operation when each power supply is out of the operating range.

Note 1. The diagnosis test wait time is changed by the filter setting. It is shown in Table 12.33.

Figure 12.16 Example of Flowchart of DMON Diagnosis Application

Table 12.33 Wait Times of Diagnosis Test

| DMONFCR.DMONFLTW | Wait time |
| :--- | :--- |
| 000 | 12 us |
| 001 | 16 us |
| 010 | 24 us |
| 011 | 40 us |
| 100 | 72 us |
| 101 | 136 us |
| 110 | 264 us |
| 111 | 520 us |

### 12.4 Usage Notes

### 12.4.1 Judgment Method of Reset Factors for Voltage Monitor

If RESF.SRES1F2 bit is " 1 ", this product is woken up
Check the VMONF and DMONF for the detection power.
The judgment method of the reset factors is shown in Figure 12.17.

Note: If high voltage or low voltage of multiple power supplies is detected, the corresponding flag is set.

Figure 12.17 Flowchart of Reset Factor Judgment

## Section 13 Temperature Sensor

### 13.1 Features

### 13.1.1 Number of Channels

Table $13.1 \quad$ Number of Channels

| Temperature Sensor |  |  |
| :--- | :--- | :--- |
| Number of Channels | 1 |  |
| Name | OTS0 |  |

### 13.1.2 Register Base Address

Table 13.2 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <OTSO_base> | FF70 $\mathrm{AOOO}_{\mathrm{H}}$ | Peripheral Group 6 |

### 13.1.3 Clock Supply

The clocks supplied to the temperature sensor are listed in the following table.
Table 13.3 Clock Supply

| Unit Name | Unit Clock Name | Clock Name |
| :--- | :--- | :--- |
| OTS0 | Operation clock | CLK_LSB |
|  | Register access clock | CLK_LSB |

### 13.1.4 Interrupt Requests

The temperature sensor interrupt requests are listed in the following table.
Table 13.4 Interrupt Requests

| Unit Interrupt Name | Unit Interrupt Signal Outline | Interrupt Number |
| :--- | :--- | :--- |
| INTOTSOTE | Temperature sensor error interrupt | 501 |
| INTOTSOTI | Temperature measurement end interrupt | 502 |
| INTOTSOTULI | Triggered if the state machine changes the state due to a temperature rise or <br> drop in the guaranteed temperature range | $503^{\star 1}$ |
| INTOTSOTABE | Abnormal temperature error interrupt | $503^{\star 1}$ |

Note 1. INTOTSOTULI and INTOTSOTABE are merged.

### 13.1.5 External Input and Output Pins

This module has no external input/output pin.

### 13.2 Overview

### 13.2.1 Functional Overview

The following describes the features of the temperature sensor.

- Temperature data register

A temperature data register stores a temperature measurement value.

- Temperature measurement mode

Single measurement mode: Used to measure temperature only once.
Continuous measurement mode: Used to measure temperature continuously.

- Supporting temperature measurement end interrupt

Each time temperature measurement ends, the temperature sensor can generate an interrupt request (INTOTSOTI) to be sent to the INTC.

- Supporting temperature alarm error interrupt and temperature rise/drop interrupt

Six temperature threshold values (high-temperature border $\mathrm{AU}>$ high-temperature border $\mathrm{AL}>$ high-temperature border $\mathrm{BU}>$ high-temperature border $\mathrm{BL}>$ low-temperature border $\mathrm{AU}>$ low-temperature border AL ) should be set in advance. Furthermore, the temperature sensor has four temperature states (high temperature A, high temperature B, normal temperature, and low temperature A). The temperature state is updated at each temperature measurement according to six temperature threshold values. The following describes the conditions for generating a temperature alarm error interrupt and a temperature rise/drop interrupt.

- A temperature alarm error interrupt (INTOTSOTABE) is output at a transition from a state other than high temperature A to high temperature A or at a transition from a state other than low temperature A to low temperature A .
- A temperature rise/drop interrupt (INTOTSOTULI) is output at a transition from high temperature A to high temperature $B$ or normal temperature, or at a transition from high temperature $B$ to normal temperature, that is, when the temperature drops.
- A temperature rise/drop interrupt (INTOTSOTULI) is output at a transition from low temperature A to high temperature B or normal temperature, or at a transition from normal temperature to high temperature B , that is, when the temperature rises.
Temperature status can be monitored by reading the temperature status register.
- Diagnosis function

When temperature is measured in continuous measurement mode, if the difference between the measured value and the previously measured value is larger than the specified temperature difference limit value, a temperature sensor error interrupt (INTOTSOTE) is output.

- Reducing errors by temperature correction

Three temperature correction coefficients are stored during device manufacturing in coefficient registers A to C.

### 13.2.2 Block Diagram

Figure 13.1 shows a block diagram of the temperature sensor.

Figure 13.1 Temperature Sensor Block Diagram

### 13.3 Register

### 13.3.1 List of registers

The following table lists the registers of the temperature sensor.
<OTSn_base> is defined in Section 13.1.2, Register Base Address.
Table 13.5 List of Registers

| Unit Name | Register Name | Symbol | Address | Access Size |
| :---: | :---: | :---: | :---: | :---: |
| OTSn | Temperature Measurement Start Control Register | OTSnOTSTCR | <OTSn_base> + $00_{\text {H }}$ | 8 |
| OTSn | Temperature Measurement End Control register | OTSnOTENDCR | <OTSn_base> + 04 ${ }_{\text {H }}$ | 8 |
| OTSn | Temperature Sensor Control Register | OTSnOTCR | <OTSn_base> + 08H | 8 |
| OTSn | Temperature Sensor Flag Clear Register | OTSnOTFCR | <OTSn_base> + 0C ${ }_{\text {H }}$ | 8 |
| OTSn | Temperature Sensor Flag Register | OTSnOTFR | <OTSn_base> + 10 H | 8 |
| OTSn | Temperature Status Register | OTSnOTSTR | <OTSn_base> + $14_{\text {H }}$ | 8 |
| OTSn | Temperature Data Register | OTSnOTDR | <OTSn_base> + 18 H $^{\text {l }}$ | 16 |
| OTSn | High-Temperature Border AU Register | OTSnHTBRAU | <OTSn_base> + 1 $\mathrm{C}_{\text {H }}$ | 16 |
| OTSn | High-Temperature Border AL Register | OTSnHTBRAL | <OTSn_base> + $2 \mathrm{O}_{\mathrm{H}}$ | 16 |
| OTSn | High-Temperature Border BU Register | OTSnHTBRBU | <OTSn_base> + $24_{\text {H }}$ | 16 |
| OTSn | High-Temperature Border BL Register | OTSnHTBRBL | <OTSn_base> + $288_{\text {H }}$ | 16 |
| OTSn | Low-Temperature Border AU Register | OTSnLTBRAU | <OTSn_base> + 2C H | 16 |
| OTSn | Low-Temperature Border AL Register | OTSnLTBRAL | <OTSn_base> + $30_{\text {H }}$ | 16 |
| OTSn | Temperature Difference Limiting Register | OTSnTDLR | <OTSn_base> + $34_{\text {H }}$ | 16 |
| OTSn | Coefficient A Register | OTSnCOEFFRA | <OTSn_base> + 38 ${ }_{\text {H }}$ | 16 |
| OTSn | Coefficient B Register | OTSnCOEFFRB | <OTSn_base> + 3C ${ }_{\text {H }}$ | 16 |
| OTSn | Coefficient C Register | OTSnCOEFFRC | <OTSn_base> + 40 ${ }_{\text {H }}$ | 16 |

Note: $\quad(\mathrm{n}=0)$

### 13.3.2 Reset of Registers

Table 13.6 Register Reset Conditions

|  | Reset Source |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Register Name | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 13.3.3 OTS0OTSTCR - Temperature Measurement Start Control Register

OTS0OTSTCR is an 8-bit write-only control register to start the temperature sensor.

Value after reset: $\quad 00_{H}$

Table 13.7 OTS0OTSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved <br>  |
| When read, the value after reset is returned. When writing, write the value after reset. |  |  |
|  | OTST | Temperature Measurement Start <br>  |
|  | Condition for starting temperature measurement by OTST. |  |
|  | Write 1 to OTST when OTACT $=0$ |  |

### 13.3.4 OTSOOTENDCR - Temperature Measurement End Control Register

OTS0OTENDCR is an 8 -bit write-only control register to terminate the temperature sensor.

Value after reset: $\quad 00_{H}$

Table 13.8 OTSOOTENDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | OTEND | Temperature Measurement End <br> Condition for terminating temperature measurement by OTEND. <br>  |
|  | Write 1 to OTEND and then wait for 2 cycles of the OTS clock. |  |

### 13.3.5 OTS0OTCR - Temperature Sensor Control Register

OTS0OTCR is an 8-bit readable/writable register to control the temperature sensor.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | OTEE | OTULIE | OTABEE | SDE | OTMD |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 13.9 OTS0OTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | OTEE | Temperature Sensor Error Enable |
|  |  | 0 : Disabled |
|  |  | 1: Enabled |
|  |  | When OTMD $=0$ (single measurement mode) or SDE $=0$ (diagnosis disabled), no temperature sensor error is generated regardless of the OTEE setting. |
| 3 | OTULIE | Temperature Rise/Drop Interrupt Enable |
|  |  | 0 : Disabled |
|  |  | 1: Enabled |
| 2 | OTABEE | Temperature Alarm Error Enable |
|  |  | 0 : Disabled |
|  |  | 1: Enabled |
| 1 | SDE | Diagnosis Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
|  |  | When OTMD $=0$ (single measurement mode), diagnosis is not performed regardless of the SDE setting. |
| 0 | OTMD | Temperature Measurement Mode |
|  |  | 0 : Single temperature measurement mode |
|  |  | 1: Continuous temperature measurement mode |

## CAUTION

To prevent malfunction, set OTSOOTCR while the OTACT bit in OTSOOTFR is 0 .

### 13.3.6 OTSOOTFCR - Temperature Sensor Flag Clear Register

OTS0OTFCR is an 8-bit write-only register to clear the OTS0OTFR register.

## Value after reset: $\quad 00_{H}$

Table 13.10 OTS0OTFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | SDERC | Diagnosis Error Clear <br>  <br>  <br>  <br>  <br> 1 |
|  | Writing 0: Does not clear the diagnosis error. |  |
|  |  | Weserved 1: Clears the diagnosis error. |
| 0 | OTFC | When read, the value after reset is returned. When writing, write the value after reset. |
|  |  | Writing 0: Does not clear the temperature measurement end flag. |
|  |  |  |

### 13.3.7 OTS0OTFR - Temperature Sensor Flag Register

OTS0OTFR is an 8-bit read-only register to indicate temperature sensor flags.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | SDER | OTACT | OTF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 13.11 OTS0OTFR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 2 | SDER | Diagnosis Error |
|  |  | Setting condition |
|  | A diagnosis error occurred. |  |
|  | Clearing condition |  |
|  | Write SDERC to 1 in OTS0OTFCR |  |
| 1 | OTACT | Temperature Sensor Status |
|  | $0:$ The temperature sensor is in the idle state. |  |
|  |  | 1: The temperature sensor is operating. |
| 0 | Temperature Measurement End Flag |  |
|  |  | Setting condition |
|  | A temperature measurement value is written to OTS0OTDR |  |
|  |  | Clearing condition |
|  |  | Write OTFC to 1 in OTS0OTFCR. |
|  |  |  |

## CAUTION

SDER is updated when a temperature measurement value is written to OTSOOTDR.

### 13.3.8 OTSOOTSTR - Temperature Status Register

OTS0OTSTR is an 8-bit read-only register to indicate temperature sensor status.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TSTAT[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 13.12 OTS0OTSTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 1 to 0 | TSTAT[1:0] | Temperature Status |
|  | 00: Normal temperature (value after reset ) |  |
|  | 01: High temperature B |  |
|  | 10: High temperature A |  |
|  | 11: Low temperature $A$ |  |
|  | When temperature is measured, temperature status is determined by the temperature |  |
|  | measurement value and the status is reflected in TSTAT[1:0]. Figure 13.2 shows the status |  |
|  | transitions of TSTAT, and Table 13.13 shows the temperature alarm error and temperature |  |
|  | rise/drop interrupt generating conditions. |  |

## CAUTION

The TSTAT[1:0] bits are updated when a temperature measurement value is written to OTSOOTDR.

Figure 13.2 Temperature Status and Transition States

Table 13.13 Conditions for Generating Temperature Alarm Error and Temperature Rise/Drop Interrupts

|  |  | After Status Transition |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | High temp. A | High temp. B | Normal temp. | Low temp. A |
| Before status transition | High temp. A | N/A | INTOTSOTULI | INTOTSOTULI | INTOTSOTABE |
|  | High temp. B | INTOTSOTABE | N/A | INTOTSOTULI | INTOTSOTABE |
|  | Normal temp. | INTOTSOTABE | INTOTSOTULI | N/A | INTOTSOTABE |
|  | Low temp. A | INTOTSOTABE | INTOTSOTULI | INTOTSOTULI | N/A |

[Legend]
INTOTSOTABE: Occurrence of temperature alarm error
INTOTSOTULI: Occurrence of temperature rise or drop interrupt
N/A: Neither INTOTSOTABE nor INTOTSOTULI occurs.

### 13.3.9 OTS0OTDR - Temperature Data Register

OTS0OTDR is a 16-bit read-only register that stores a temperature measurement value.

Value after reset: $\quad 0000_{H}$

Decimal point position
Note 1. OTD[15]: Sign bit (always 0 )

Table 13.14 OTS0OTDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | OTD | Temperature Data Value |
|  |  | These bits specify a value for temperature data. |
|  | OTD[15] is always 0. |  |
| NOTE |  |  |

When the CPU reads the register while the temperature sensor module is updating the register, the value before updating will be read. Figure 13.4 show the updating of this register.

### 13.3.10 OTSOHTBRmn - High-Temperature Border mn Register ( $m=A$ or $B, n=U$ or $L$ )

OTS0HTBRmn is a 16-bit readable/writable register to specify the temperature border of high temperature m .

Table 13.15 OTSOHTBRmn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | HTBmn | High-Temperature Border mn |
|  |  | These bits specify the high-temperature border mn. Specify it so that the following condition is |
|  | met. |  |
|  | OTSOHTBRAU $>$ OTSOHTBRAL $>$ OTSOHTBRBU $>$ OTSOHTBRBL $>$ OTSOLTBRAU $>$ |  |
|  | OTSOLTBRAL |  |
|  | The HTBmn format is the same as the OTS0OTDR format. HTBmn[15] is always 0. |  |
|  | For details, see Section 13.3.8, OTS0OTSTR — Temperature Status Register. |  |
| CAUTION |  |  |

To prevent malfunction, set OTSOHTBRmn while the OTACT bit in OTSOOTFR is 0.

### 13.3.11 OTSOLTBRAn — Low-Temperature Border An Register (n = U or L)

OTSOLTBRAn is a 16-bit readable/writable register to specify the temperature border of low temperature A.

Value after reset: $\quad 0000_{H}$

Table 13.16 OTSOLTBRAn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 0 | LTBAn | Low-Temperature Border An |
|  |  | These bits specify the low-temperature border An. Specify it so that the following condition is met. |
|  |  | OTSOHTBRAU > OTSOHTBRAL > OTSOHTBRBU > OTSOHTBRBL > OTSOLTBRAU > OTSOLTBRAL |
|  |  | The LTBAn format is the same as the OTS0OTDR format. LTBAn[15] is always 0 . |
|  |  | For details, see Section 13.3.8, OTS0OTSTR - Temperature Status Register. |
| CAUTION |  |  |

To prevent malfunction, set OTSOLTBRAn while the OTACT bit in OTSOOTFR is 0 .

### 13.3.12 OTSOTDLR — Temperature Difference Limiting Register

OTS0TDLR is a 16-bit readable/writable register to specify the temperature difference limit value for self-diagnosis.

Value after reset: $\quad 7 \mathrm{FFF}_{\mathrm{H}}$

Note 1. TDL[15]: Sign bit (always 0)

Table 13.17 OTSOTDLR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 0 | TDL | Temperature Difference Limit Value |
|  |  | These bits specify a value for limiting the temperature difference between present temperature measurement value and previous temperature measurement value in continuous measurement mode. When the following condition is met, SDER (diagnosis error) is set to 1. |
|  |  | OTSOTDLR < \| present temperature measurement value - previous temperature measurement value | |
|  |  | To calculate from the temperature, calculate back from the formula described in the OTSOCOEFFRn register ( $T[K]=A X^{2}+B X+C$ ). For details, see Section 13.3.13, OTSOCOEFFRn - Coefficient $\mathbf{n}$ Register ( $\mathbf{n}=\mathrm{A}, \mathrm{B}, \mathrm{C}$ ). |
|  |  | The TDL format is the same as the OTS0OTDR format. TDL[15] is always 0 . For details, see Section 13.3.8, OTS0OTSTR - Temperature Status Register. |

## CAUTION

To prevent malfunction, set OTSOTDLR while the OTACT bit in OTSOOTFR is 0 .

### 13.3.13 OTSOCOEFFRn - Coefficient n Register (n = A, B, C)

OTS0COEFFRn is a 16-bit read-only register to store coefficients for correction calculation.
Coefficients are stored in OTS0COEFFRn during device manufacturing.

Value after reset: The value after reset will be stored at delivery inspection for each device.

Note 1. COEFFn[15]: Sign bit (always 0)
Table 13.18 OTSOCOEFFRn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | COEFFn | Coefficient values for correction calculation |
|  |  | These bits specify the values of the coefficients. |
|  | COEFFn[15] is always 0. |  |

- Reducing errors by temperature correction

Three temperature correction coefficients are stored during device manufacturing in coefficient registers A to C.
Errors in temperature measurement values can be reduced by making a correction by using the temperature correction calculation formula that uses the temperature correction coefficients. However, temperature corrections must be made by the CPU. By using this process, the Temperature Border setting can be improved.

- Correction calculation formula: $\mathrm{T}[\mathrm{K}]=\mathrm{AX}^{2}+\mathrm{BX}+\mathrm{C}$
- T: Temperature value after correction
- X: Temperature value before correction (OTS0OTDR)
- A to C: Coefficients A to C (OTS0COEFFRn $\mathrm{n}=\mathrm{A}, \mathrm{B}, \mathrm{C})$

For example
OTS0OTDR $=36 \mathrm{DA}_{\mathrm{H}}, \mathrm{OTS} 0 \mathrm{COEFFRA}=2106_{\mathrm{H}}, \mathrm{OTS} 0 \mathrm{COEFFRB}=2 \mathrm{D} 87_{\mathrm{H}}, \mathrm{OTS} 0 \mathrm{COEFFC}=0040_{\mathrm{H}}$
$\mathrm{X}=$ OTS0OTDR $/\left(2^{\wedge} 15\right)=0.428528$
$\mathrm{A}=\mathrm{OTS} 0 \operatorname{COEFFRA} /\left(2^{\wedge} 4\right)=528.375$
$\mathrm{B}=\mathrm{OTS} 0 \mathrm{COEFFRB} /\left(2^{\wedge} 4\right)=728.4375$
$\mathrm{C}=\operatorname{OTS} 0 \operatorname{COEFFRC} /\left(2^{\wedge} 4\right)=4$
$\mathrm{T}\left[{ }^{\circ} \mathrm{C}\right]=\mathrm{T}[\mathrm{K}]-273.15=\mathrm{AX} 2+\mathrm{BX}+\mathrm{C}-273.15=140.035^{\circ} \mathrm{C}$

### 13.4 Operation

### 13.4.1 Temperature Measurement Sequence

The temperature sensor is equipped with a Single measurement mode and a Continuous measurement mode.
The measurement start trigger and measurement end trigger of each mode is shown below.
Table 13.19 Measurement Start/End Trigger

| Measurement Mode | Measurement Start Trigger | Measurement End Trigger |
| :--- | :--- | :--- |
| Single measurement mode | Write $1_{\mathrm{B}}$ in OTSOOTSTCR.OTST. | 1) Automatic stop after one temperature measurement <br> ends |
| OTS0OTCR.OTMD $=0$ |  | 2) Write $1_{\mathrm{B}}$ in OTS0OTENDCR.OTEND.*1*2 |

Note 1. If the temperature measurement has been stopped by the OTSOOTENDCR.OTEND, data during the measurement will be discarded.

Note 2. If the temperature measurement has been stopped by the OTSOOTENDCR.OTEND before the first measurement has been completed, the measurement operation will not output the measurement result at all.

The time until the temperature data is output requires 512 states ( 9.984 ms .) of the OTS clock to convert the measured temperature to digital data.

There is a measurement stabilization period of 3 OTS clock states before the temperature is sampled after the measurement process is started by writing to the OTS0OTSSTCR.OTST bit.

In Single measurement mode, to update the temperature measurement result requires 515 OTS clock states, including the measurement preparation period, until the temperature measurement operation ends.

In Continuous measurement mode, 515 of the OTS clock states, including the 3-state measurement stabilization period, are required only for the first temperature measurement, the second and subsequent updates of the temperature measurement result require 512 states, and the measurement operation is repeated until 1 is written to
OTENDCR.OTEND.

### 13.4.2 Examples of Temperature Measurement Operation

The following figure shows the temperature measurement operation in single measurement mode.

Figure 13.3 Example of Temperature Measurement Operation (Single Measurement Mode)

NOTE
If " 1 " is written to OTENDCR.OTEND at the time of internal cycle 511 or 512 , request INTOTSOTI is issued and OTS0OTFR.OTF is set after updating the temperature measurement result as with the case of automatic stop after the temperature measurement.

DSOUT is the operation clock of the temperature sensor obtained by dividing CLK_LSB.
The period of DSOUT is $19.5 \mu \mathrm{~s}$ (When CLK_LSB 40 MHz )

The following figure shows temperature measurement operation in continuous measurement mode. There is no internal stabilization time in the second and subsequent temperature measurements.

Figure 13.4 Example of Temperature Measurement Operation (Continuous Measurement Mode)

### 13.4.3 Temperature Measurement End Interrupt Request

The temperature sensor can generate a temperature measurement end interrupt request (INTOTSOTI) to be sent to the INTC. At this time, the OTS0OTFR.OTF is set.

The table below shows the assertion condition and negated conditions of INTOTSOTI and OTS0OTFR.OTF.
Table 13.20 Temperature Measurement End Conditions

| Measurement End Notification <br> Signal | Assert Conditions | Negated Conditions | Enable Control |
| :--- | :--- | :--- | :--- |
| Temperature measurement end <br> interrupt (INTOTSOTI) | Each time temperature <br> measurement ends | After the assertion, one cycle after <br> the register access clock | No enable control bit. |
| Temperature measurement end <br> flag (OTS0OTFR.OTF) | Each time temperature <br> measurement ends | 1) Reading of the OTS0OTDR <br> register | No enable control bit. |
|  |  | 2) Write 1 B in OTS0OTFCR.OTFC |  |

For the OTS0OTFR.OTF bit, if the assertion conditions and negated conditions conflict, negated condition takes precedence.

If the temperature measurement has been stopped by the OTS0OTENDCR.OTEND, neither the INTOTSOTI nor the OTS0OTFR.OTF will occur.

However, after writing " 1 " to the OTSOOTENDCR.OTEND, when the measurement is within 2 OTS clock cycles of being completed, the measurement result is updated and the INTOTSOTI and OTS0OTFR.OTF are asserted.

Figure 13.5 Example of Occurrence of a Temperature Measurement End Interrupt

### 13.4.4 Temperature Alarm Error and Temperature Rise/Drop Interrupt and Temperature Sensor Error Interrupt Requests

The temperature sensor can generate a temperature rise or drop interrupt request (INTOTSOTULI), a temperature sensor error interrupt request (INTOTSOTE) and a temperature alarm error (INTOTSOTABE) to be sent to the INTC. Setting OTULIE in OTS0OTCR to 1 enables INTOTSOTULI. Setting OTULIE to 0 disables INTOTSOTULI. Setting OTEE in OTSOOTCR to 1 enables INTOTSOTE. Setting OTEE to 0 disables INTOTSOTE. Setting OTABEE in OTS0OTCR to 1 enables INTOTSOTABE. Setting OTABEE to 0 disables INTOTSOTABE.

The table below shows the assert conditions and negated conditions of INTOTSOTULI and INTOTSOTABE.
Table 13.21 Temperature Sensor Interrupts

| Temperature State Transition Notification Signal | Assert Conditions | Negated Conditions | Enable Control |
| :---: | :---: | :---: | :---: |
| Temperature rise or drop interrupt (INTOTSOTULI) | Temperature state transition from a state other than the high temperature $B$ to high temperature B . | After the assertion, one cycle after the register access clock | OTS0OTCR.OTULIE |
|  | Temperature state transition from a state other than the normal temperature to normal temperature. |  |  |
| Temperature alarm error (INTOTSOTABE) | Temperature state transition from a state other than the high temperature $A$ to high temperature A. | After the assertion, one cycle after the register access clock | OTSOOTCR.OTABEE |
|  | Temperature state transition from a state other than the low temperature A to low temperature A . |  |  |
| Temperature sensor error interrupt (INTOTSOTE) | After the OTDR register is updated, when the difference between the temperature measurements exceeds a set value TDL. | After the assertion, one cycle after the register access clock | OTSOOTCR.OTEE and OTS0OTCR.SDE |
| Diagnostic error flag (OTS0OTFR.SDER) | After the OTDR register is updated, when the difference between the temperature measurements exceeds a set value TDL. | Write 1B in OTS0OTFCR.SDERC | OTS0OTCR.SDE |

OTE

Figure 13.6 Example of Occurrence of a Temperature Alarm Error, a Temperature Rise/Drop Interrupt and a Temperature Sensor Error Interrupt

## Section 14 Clock Monitor

### 14.1 Features

This section contains a generic description of clock monitor A (CLMA).
The first part of this section indicates all this product's specific properties, such as the number of channels and register base addresses.

The remainder of the section describes the functions and registers of CLMA.

### 14.1.1 Number of Channels

Table 14.1 Number of Channels

| Clock Monitor | 7 |
| :--- | :--- |
| Number of Channels | CLMAn ( $\mathrm{n}=0$ to 6 ) |
| Name |  |

Note: CLMA4 is for the ICU-M. For details, refer to the relevant document.

### 14.1.2 Register Base Addresses

Table 14.2 Register Base Addresses

| Base Address Name | Base Address | Bus group |
| :--- | :--- | :--- |
| <CLMAC_base> | FF70 $2000_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA0_base> | FF70 $2100_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA1_base> | FF70 $2200_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA2_base> | FF70 $2300_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA3_base> | FF70 $2400_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA5_base> | FF70 $2500_{\mathrm{H}}$ | Peripheral Group 6 |
| <CLMA6_base> | FF70 $2600_{\mathrm{H}}$ | Peripheral Group 6 |

### 14.1.3 Clock Supply

The clocks monitored by CLMA and the CLMA sampling clocks are indicated below.
For each clock frequency, see Section 15, Clock Controller.
Table 14.3 Clock Supply

| Unit Name | CLMATMON (monitored clock) | CLMATSMP (sampling clock) | Register access clock |
| :--- | :--- | :--- | :--- |
| CLMA0 | CLK_IOSC | CLK_MOSC / 8 | CLK_LSB |
| CLMA1 | CLK_MOSC | CLK_IOSC / 400 | CLK_LSB |
| CLMA2 | CLK_LSB | CLK_MOSC / 8 | CLK_LSB |
| CLMA3 | CLK_UHSB | CLK_MOSC / 8 | CLK_LSB |
| CLMA5 | CLK_CPU (PE0) / 4 | CLK_MOSC / 8 | CLK_LSB |
| CLMA6 | CLK_CPU (PE1) / 4 | CLK_MOSC / 8 | CLK_LSB |

### 14.1.4 Interrupt Requests

This module has no interrupt requests.

### 14.1.5 External Input and Output Pins

This module has no external input/output pins.

### 14.2 Overview

This product incorporates the clock monitors (CLMA) to monitor the clock operation by detecting the abnormal frequency of the clock to be monitored. The clock monitors provide the following functions.

- Monitors to see if the frequency of the clock to be monitored is within the specified range based on the sampling clock.
- Issues an error notice to the ECM upon detection of the abnormal state of the clock.

### 14.2.1 Functional Overview

Clock monitor CLMA detects frequency abnormalities in the monitored clock. It uses sampling clock CLMATSMP to monitor whether the frequency of input clock CLMATMON is within a specific range.

Upon detection of an abnormal clock, it outputs a reset request signal.

### 14.2.2 Block Diagram

Figure 14.1 shows the block diagram of each clock monitor.

Figure 14.1 Block Diagram of Each Clock Monitor

### 14.3 Register

### 14.3.1 Register Protection

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc.
By releasing the protection of CLMAKCPROT, they can be written. For details, see Section 38, Functional Safety.

### 14.3.2 List of Registers

The following table lists the CLMA registers.
<CLMAC_base $>$ and $<$ CLMAn_base $>$ are defined in Section 14.1.2, Register Base Addresses.
Table 14.4 List of Registers

| Unit <br> Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CLMAn | CLMAn Control Register | CLMAnCTL | $\begin{aligned} & \text { <CLMAn_base> + } \\ & 000_{\mathrm{H}} \end{aligned}$ | 8 | CLMAKCPROT |
| CLMAn | CLMAn Compare Register L | CLMAnCMPL | $\begin{aligned} & \text { <CLMAn_base> + } \\ & 008_{\mathrm{H}} \end{aligned}$ | 16 | - |
| CLMAn | CLMAn Compare Register H | CLMAnCMPH | $\begin{aligned} & \text { <CLMAn_base> + } \\ & 00 \mathrm{C}_{H} \end{aligned}$ | 16 | - |
| CLMAC | Clock Monitor Test Register | CLMATEST | $\begin{aligned} & \text { <CLMAC_base> + } \\ & 000_{\mathrm{H}} \end{aligned}$ | 32 | CLMAKCPROT |
| CLMAC | Clock Monitor Test Status Register | CLMATESTS | $\begin{aligned} & \text { <CLMAC_base> + } \\ & 004_{H} \end{aligned}$ | 32 | - |
| CLMAC | Clock Monitor Backup Clock Enable Register | CLMABCE | $\begin{aligned} & \text { <CLMAC_base> + } \\ & 008_{\mathrm{H}} \end{aligned}$ | 8 | CLMAKCPROT |
| CLMAC | Clock Monitor Register Key Code Protection Register | CLMAKCPROT | $\begin{aligned} & \text { <CLMAC_base> + } \\ & \text { F00 } \end{aligned}$ | 32 | - |

Note: ( $\mathrm{n}=0$ to 3,5 to 6 )

### 14.3.3 Resetting the Registers

Table 14.5 Register Reset Conditions

|  | Reset Source |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  | Application |  |  |
| Register Name | Power Up Reset | System Reset 1 | System Reset 2 | Reset | Module Reset | JTAG Reset |
| All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

Each clock monitor (CLMAn) can also be reset by CLMATEST.RESCLM. In this case, it is necessary to perform a special procedure and reconfigure the CLMAn parameters before the clock frequency is changed by the register for the operating clock.

For details about this special procedure, see Section 14.5.2, Reset Procedure Using CLMATEST.RESCLM.
Table 14.6 Individual Reset Conditions

| Channel Name | CLMATEST.RESCLM Reset Target |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CLMAOTESEN = 1 | CLMA1TESEN $=1$ | CLMA2TESEN $=1$ | CLMA3TESEN $=1$ | CLMA5TESEN $=1$ | CLMA6TESEN $=1$ |
| CLMA0CTL | $\checkmark$ | - | - | - | - | - |
| CLMA0CMPL | $\checkmark$ | - | - | - | - | - |
| CLMAOCMPH | $\checkmark$ | - | - | - | - | - |
| CLMA1CTL | - | $\checkmark$ | - | - | - | - |
| CLMA1CMPL | - | $\checkmark$ | - | - | - | - |
| CLMA1CMPH | - | $\checkmark$ | - | - | - | - |

| CLMA6CTL | - | - | - | - | - | $\checkmark$ |
| CLMA6CMPL | - | - | - | - | - | $\checkmark$ |
| CLMA6CMPH | - | - | - | - | - | $\checkmark$ |
| CLMATEST | - | - | - | - | - | - |
| CLMATESTS | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| CLMAKCPROT | - | - | - | - | - | - |

### 14.3.4 CLMAnCTL — CLMAn Control Register

This register enables the clock monitor CLMAn.

## Value after reset: $\quad 00_{H}$

Table 14.7 CLMAnCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLMAnCLME | Enables or disables the clock monitor: |
|  | $0:$ Disables CLMAn. |  |
|  | 1: Enables CLMAn. |  |
|  |  | This bit can only be cleared by a reset |

### 14.3.5 CLMAnCMPL — CLMAn Compare Register L

This register specifies the lower limit of the monitored clock frequency.
Write access is permitted only when CLMAn is disabled (CLMAnCTL.CLMAnCLME $=0$ ).

Value after reset: $\quad 0001 \mathrm{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | CLMAnCMPL[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 14.8 CLMAnCMPL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CLMAnCMPL[11:0] | Specify the lower threshold. |
|  |  | When CLMA is used, these bits must be set appropriately. |
|  |  | CLMA0: $25 \mathrm{~F}_{\mathrm{H}}$ |
|  |  | CLMA1: $4 \mathrm{BB}_{\mathrm{H}}$ |
|  |  | CLMA2: $\mathrm{FE}_{\mathrm{H}}$ |
|  |  | CLMA3: $3 \mathrm{FB}_{\mathrm{H}}$ |
|  |  | CLMA5: $27 \mathrm{D}_{\mathrm{H}}(400 \mathrm{MHz}), 17 \mathrm{E}_{\mathrm{H}}(240 \mathrm{MHz})$ |
|  |  | CLMA6: $27 \mathrm{D}_{\mathrm{H}}(400 \mathrm{MHz}), 17 \mathrm{E}_{\mathrm{H}}(240 \mathrm{MHz})$ |
|  |  | The above is an example of setting when using EXTAL. |
|  |  | (Clock condition EXTAL $+0 \% /-0.5 \%$, Internal OSC $\pm 5 \%$, PLL $\pm 0.05 \%$ (Long term jitter)) |
|  |  | When CLMA is not used, these bits must retain their values after a reset. |

### 14.3.6 CLMAnCMPH — CLMAn Compare Register H

This register specifies the upper limit of monitored clock frequency.
Write access is permitted only when the CLMAn is disabled (CLMAnCTL.CLMAnCLME $=0$ ).

Value after reset: $\quad 03 F_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | CLMAnCMPH[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 14.9 CLMAnCMPH Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | CLMAnCMPH[11:0] | Specify the upper threshold. |
|  |  | When CLMA is used, these bits must be set appropriately.. |
|  |  | CLMA0: 2 A5 ${ }_{\text {H }}$ |
|  |  | CLMA1: $545{ }_{\text {H }}$ |
|  |  | CLMA2: $102_{\text {H }}$ |
|  |  | CLMA3: $40 \mathrm{~A}_{\text {H }}$ |
|  |  | CLMA5: $286_{\mathrm{H}}(400 \mathrm{MHz}), 182_{\mathrm{H}}(240 \mathrm{MHz})$ |
|  |  | CLMA6: $286_{\text {H }}\left(400 \mathrm{MHz}\right.$ ), 182 ${ }_{\text {H }}(240 \mathrm{MHz})$ |
|  |  | The above is an example of setting when using EXTAL. |
|  |  | (Clock condition EXTAL +0\%/-0.5\%, Internal OSC $\pm 5 \%$, PLL $\pm 0.05 \%$ (Long term jitter)) |
|  |  | When CLMA is not used, these bits must retain their values after a reset. |

### 14.3.7 CLMATEST — Clock Monitor Test Register

This register is used for the self-test of the clock monitors. Each Clock Monitor can be tested individually.

| Value after reset: $\quad 00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 3130 |  | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

|  | - | - | - | - | - | - | - | $\begin{aligned} & \text { CLMA6 } \\ & \text { TESEN } \end{aligned}$ | $\begin{aligned} & \text { CLMA5 } \\ & \text { TESEN } \end{aligned}$ | $\begin{aligned} & \text { CLMA3 } \\ & \text { TESEN } \end{aligned}$ | $\begin{array}{\|l\|} \hline \text { CLMA2 } \\ \text { TESEN } \end{array}$ | $\begin{aligned} & \text { CLMA1 } \\ & \text { TESEN } \end{aligned}$ | $\begin{aligned} & \text { CLMAO } \\ & \text { TESEN } \end{aligned}$ | ERR <br> MSK | MONCL KMSK | RES CLM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 14.10 CLMATEST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CLMA6TESEN | CLMA6 self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 7 | CLMA5TESEN | CLMA5 self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 6 | CLMA3TESEN | CLMA3 self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 5 | CLMA2TESEN | CLMA2 self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 4 | CLMA1TESEN | CLMA1 self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 3 | CLMAOTESEN | CLMAO self-test enable/disable <br> 0 : Test disabled. <br> 1: Test enabled. |
| 2 | ERRMSK*1 | Masks an error notification to the ECM when CLMAn detects an error. When the ERRMSK is set for a certain CLMAn, the associated CLMAn does not issue an error notification to the ECM even if it detects an error. <br> 0: Does not mask an error notification to the ECM. <br> 1: Masks an error notification to the ECM. |
| 1 | MONCLKMSK*1 | Fixes the level of the clock input to the CLMAn that should be monitored, to the low level. <br> 0: Does not fix the clock input to the CLMAn that should be monitored to the low level. <br> 1: Fixes the clock input to the CLMAn that should be monitored to the low level. |
| 0 | RESCLM*1 | Initializes CLMAn forcibly. <br> 0: Does not initialize CLMAn. <br> 1: Initializes CLMAn. |

Note 1. These bits are valid for CLMAn that is in self-diagnosis mode by setting "1" to CLMAnTESEN.

### 14.3.8 CLMATESTS — Clock Monitor Test Status Register

This register is used for the self-test of the clock monitors. It monitors the error detection flags that are otherwise forwarded to the ECM module. Once error is detected, this register keeps the status until CLMAn is reset.

Table 14.11 CLMATESTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 5 | CLMA6ERRS | CLMA6 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |
| 4 | CLMA5ERRS | CLMA5 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |
| 3 | CLMA3ERRS | CLMA3 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |
| 2 | CLMA2ERRS | CLMA2 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |
| 1 | CLMA1ERRS | CLMA1 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |
| 0 | CLMAOERRS | CLMA0 error status |
|  |  | 0 : No error detected |
|  |  | 1: Error detected |

### 14.3.9 CLMABCE — Clock Monitor Backup Clock Enable Register

This register is a backup clock switching control register.
When CLMA1 or CLMA5 detects an error, the selector to select the startup clock source (CLK_IOSC) or PLL Clock will be switched to choose the startup clock source (CLK_IOSC).
For switching points, see Section 15, Clock Controller.

Value after reset: $\quad 0 \mathrm{O}_{\mathrm{H}}$

Table 14.12 CLMABCE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLMABCE | Backup clock switching control |
|  |  | $0:$ Disable the backup clock function |
|  | 1: Enable the backup clock function |  |

### 14.3.10 CLMAKCPROT — Clock Monitor Register Key Code Protection Register

The CLMAKCPROT register is used for protection against writing operation to the registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 14.13 CLMAKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write A5A5 $\mathrm{A} 500_{\mathrm{H}}$ to this register to disable writing to protected registers. Write A5A5 A501 ${ }_{\text {H }}$ to this register to enable writing to protected registers.

### 14.4 Functional Description

The Clock Monitor CLMAn is used to verify whether the frequency of a clock (CLMATMON) is within the specified range.

### 14.4.1 Detection of Abnormal Clock Frequencies

## Detection Method

(1) CLMAn counts the rising edges of the monitored clock CLMATMON within 16 cycles of the sampling clock CLMATSMP and then compares the count with the configured thresholds:

- CLMAnCMPL.CLMAnCMPL[11:0] defines the lower threshold.
- CLMAnCMPH.CLMAnCMPH[11:0] defines the upper threshold.
(2) When the frequency of CLMATMON is too low*1, the count falls below CLMAnCMPL.CLMAnCMPL.
(3) When the frequency of CLMATMON is too high, the count exceeds CLMAnCMPH.CLMAnCMPH.

Note 1. If the monitored clock stops completely, an error may not be detected.

Figure 14.2 Example: fclmatmon is Lower than the Specified Limit.

Figure 14.3 Example: fclmatmon is Higher than the Specified Limit.

NOTE
Even if the fclmatmon exceeds or falls below the specified limits during a sampling period, the count value may be within the valid range.
Abnormal fclmatmon is detected in the next sampling period.

## Calculation of thresholds

For the compare registers CLMAnCMPL and CLMAnCMPH, specify the minimum and maximum number of CLMATMON clock cycles to occur within 16 cycles of the sampling clock CLMATSMP that defines the normal range of CLMATMON.
The number of CLMATMON clock cycles to occur within 16 cycles of CLMATSMP is denoted by N .

$$
\begin{aligned}
\frac{16}{f_{\text {CLMATSMP }}} & =\frac{N}{f_{\text {CLMATMON }}} \\
N & =\frac{f_{\text {CLMATMON }}}{f_{\text {CLMATSMP }}} \times 16
\end{aligned}
$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$
\begin{aligned}
\text { Lower threshold } & =N_{\min } \\
& =\frac{f_{\text {CLMATMON }(\min )}}{f_{\text {CLMATSMP }(\max )}} \times 16-1 \\
\text { Upper threshold } & =N_{\max } \\
& =\frac{f_{\text {CLMATMON }(\max )}}{f_{C L M A T S M P(\min )}} \times 16+1
\end{aligned}
$$

## <Example>

For $\mathrm{f}_{\text {CLMATSMP }}=250 \mathrm{kHz}( \pm 5 \%)$ and $\mathrm{f}_{\text {CLMATMON }}=20 \mathrm{MHz}( \pm 0.1 \%)$, the recommended threshold values are the following:

$$
\begin{aligned}
N_{\min } & =19.98 / 0.2625 \times 16-1 \\
& =1216.83 \\
\text { CLMAnCMPL } & =1216=04 C 0_{H} \\
& =20.02 / 0.2375 \times 16+1 \\
N_{\max } & =1348.72 \\
& =1349=0545_{H}
\end{aligned}
$$

<Minimum thresholds>
The following restrictions must be taken into account:

- CLMAnCMPL $\geq 0001_{\mathrm{H}}$
- CLMAnCMPH $\geq$ CLMAnCMPL $+0003_{H}$

### 14.4.2 Error Notification

When the frequency of the monitored clock (CLMATMON) becomes too low or too high and an error is detected, CLMAn sends an error notification to ECM. In addition, the error notification is not canceled until CLMAn is reset.

When CLMA1 or CLMA5 detects an error, the selector to select the startup clock source (CLK_IOSC) or PLL Clock will be switched to choose the startup clock source (CLK_IOSC).
After the clock source is switched to CLK_IOSC when CLMA1 or CLMA5 detect an error, the clock source cannot be switched with the selection of CKSC0C.

## NOTES

1. When CLK_IOSC is selected due to the back-up clock function, CLMA2 to CLMA6 will begin to detect errors.
2. Even if the monitor clock stops completely, the clock source may not be switched to startup clock source (CLK_IOSC). In addition, reset or interrupt may not occur from the ECM.

### 14.4.3 Self-Diagnosis

This LSI implements a self-diagnosis function for the clock monitors. It allows isolating the clock monitor from the system and executing functional test patterns via software. Each clock monitor can be tested individually. For performing these tests, the clock monitor inputs can be controlled by dedicated control registers, while its outputs can be observed in status registers.

Two registers are implemented for the self-diagnosis of the clock monitors, the Clock Monitor Test Register (CLMATEST) and the Clock Monitor Test Status Register (CLMATESTS). Refer to the corresponding register descriptions for details.

### 14.5 Operation

### 14.5.1 Procedures to Enable CLMAn

[Procedure]
(1) Enable write access of protected registers by setting CLMAKCPROT $=$ A5A5 A501 ${ }_{\mathrm{H}}$ according to CLMA targets.
(2) Set the minimum and maximum number of clock cycles to CLMAnCMPL and CLMAnCMPH.
(3) Set enable/disable of back up clock switching to the CLMABCE register.
(4) Enable CLMAn by setting $01_{\mathrm{H}}$ to CLMAnCTL.CLMAnCLME.
(5) Disable write access of protected registers by setting CLMAKCPROT.KCE $=$ A5A5 A500 ${ }_{H}$ according to CLMA targets.

## CAUTION

- CLMAn ( $\mathrm{n}=0,1$ ) operation must be started after users check stable state of MainOSC by referring to MOSCS.MOSCSTAB = 1 .
- CLMAn ( $\mathrm{n}=2$ to 6 ) operation must be started after users check that the clock gear-up procedure has been finished.
- When Startup BIST is not executed by flash option at the reset of Power Up Reset, Standby Reset and VMON Reset with using crystal resonator, as soon as CPU boot up and wait until MOSCS.MOSCSTAB = 1, it is necessary to initialize CLMAn ( $\mathrm{n}=0,2$ to 6 ) according to the procedure of Section 14.5.2, Reset Procedure Using
CLMATEST.RESCLM and then clear all CLMAn ( $\mathrm{n}=0,2$ to 6 ) related error flags presented in ECM master/checker error source status registers. For details of these error registers and how to clear them, please see Section 39, Error Control Module (ECM).

### 14.5.2 Reset Procedure Using CLMATEST.RESCLM

Each clock monitor (CLMA0/1/2/3/5/6) can also be reset by CLMATEST.RESCLM. In this case, it is necessary to perform the following procedure and reconfigure the CLMAn parameters before the clock frequency is changed by the register for the operating clock.
[Procedure]
Example: Resetting CLMA0

1. CLMATEST.CLMA0TESEN $=1$
2. CLMATEST.ERRMSK $=1$
3. CLMATEST.MONCLKMSK $=1$
4. CLMATEST.RESCLM $=1$
5. CLMATEST.RESCLM $=0$
6. CLMATEST.MONCLKMSK $=0$
7. CLMATEST.ERRMSK $=0$
8. CLMATEST.CLMA0TESEN $=0$
(write data: $00000008_{\mathrm{H}}$ )
(write data: $0000000 \mathrm{C}_{\mathrm{H}}$ )
(write data: $0000000 \mathrm{E}_{\mathrm{H}}$ )
(write data: $0000000 \mathrm{~F}_{\mathrm{H}}$ )
(write data: $0000000 \mathrm{E}_{\mathrm{H}}$ )
(write data: $0000000 \mathrm{C}_{\mathrm{H}}$ )
(write data: $00000008_{\mathrm{H}}$ )
(write data: $00000000_{\mathrm{H}}$ )

### 14.5.3 Procedures to do Self-Diagnosis

Self-diagnosis of the clock monitor is available as described below. In the description, the clock monitor to be selfdiagnosed is operating.

Figure 14.4 Flow Chart of Self-Diagnosis

Figure 14.5 Self-Diagnosis of the Clock Monitor

## Section 15 Clock Controller

The clock controller generates several clocks that are supplied to peripherals and to external pins for use by other devices. The clock controller consists of a main oscillator circuit (Main OSC), an internal oscillator, a Phase Locked Loop circuit (PLL), clock dividers and clock selectors. PLL uses the Main OSC as a reference clock. Use of Main OSC is mandatory.

### 15.1 Features

- Crystal resonator circuit (Main OSC), used as a PLL reference clock
- Internal oscillator, used as the startup and backup clock
- PLL circuit to generate high speed internal clocks by multiplying the Main OSC input
- Software configurable external clock output
- Clock controller can generate clock pulses from internal oscillator, main oscillator and PLL
- MainOsc Configuration is variable by OPBT7. Please refer to Section 15.4.3, Main OSC Configuration and Stabilization Sequence and Section 15.4.4, OSC Monitor Mode

### 15.1.1 Register Base Addresses

The clock controller base address is shown in the following table.
Clock controller register addresses are given as offsets from the base addresses in general.
Table 15.1 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <CLK_base> | FF70 $3000_{\mathrm{H}}$ | Peripheral Group 6 |

### 15.1.2 External Input / Output Pins

Table 15.2 shows the pins related to the clock controller.
Table 15.2 Pins Related to the Clock Controller

| Pin Function Name | Direction | Function |
| :--- | :--- | :--- |
| EXTAL | Input | Main OSC crystal resonator / external clock input |
| XTAL | Output | Main OSC crystal resonator |
| CK | Output | External clock out (divider 2) |

### 15.2 Overview

### 15.2.1 Types of Clocks

The clock sources are listed in Table 15.3, and the clock frequencies based on different clock sources are listed in
Table 15.4 and Table 15.5.
Table 15.3 List of Clock Sources

| Clock Name | Symbol | Clock Frequency (MHz) | Remarks |
| :--- | :--- | :--- | :--- |
| EXTAL, XTAL | EXTAL, XTAL | $20 / 40$ | The frequency of EXTAL can be selected <br> by using an option byte.*1 <br> Main OSC crystal resonator or <br> external clock input |
| MainOSC | CLK_MOSC | 20 | CLK_MOSC is the 20MHz clock after <br> selected by using an option byte.* |
| Internal OSC | CLK_IOSC | 100 | WDTB / SWDT counter clock source can <br> be selected by using an option byte. ${ }^{* 1}$ |
| WDTB/SWDT counter clock | CLK_WDT | 0.25 | Clock source: <br> CLK_MOSC*2 or CLK_IOSC |
| ICU-M (WDTA) counter clock / | CLK_WDTICUM | 0.25 | Clock source: <br> CLK_IOSC |
| ECM counter clock |  | CLK_HVIOSC | 16 | | Clock source: |
| :--- |
| HVIOSC (VMON filter clock) |

Note 1. See Section 41, Flash Memory for target values.
Note 2. WDTB auto-start by CLK_MOSC is prohibited if BIST is not executed.

Table 15.4 Clock Frequencies with PLL as the Clock Source

| Clock Name |  | Clock Frequency Mode (MHz) |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Symbol | 400 MHz Mode | 240 MHz Mode | Remarks |

Note 1. See Section 41, Flash Memory for target values.

Table 15.5 Clock Frequencies with Internal OSC as the Clock Source

| Clock Name | Symbol | Clock Frequency Mode (MHz) |  | Remarks |
| :---: | :---: | :---: | :---: | :---: |
|  |  | 400 MHz Mode | 240 MHz Mode |  |
| CPU clock | CLK_CPU | 100 | 100 | If the source clock is CLK_IOSC, then the CPU clock is 100 MHz in all modes, but the peripheral clocks are different in each mode. This is because the division ratio between the CPU clock and peripheral clocks is fixed in each mode. |
| System Bus clock | CLK_SBUS | 50 | 33.33 |  |
| H-Bus clock | CLK_HBUS | 25 | 33.33 |  |
| Peripheral ultra high speed clock | CLK_UHSB | 40 | 66.67 |  |
| Peripheral high speed clock | CLK_HSB | 20 | 33.33 |  |
| Peripheral low speed clock | CLK_LSB | 10 | 16.67 |  |
| RHSB clock | CLK_RHSB | 20/40 | 33.33/66.67 | The RHSB clock source can be selected by using the option bytes. ${ }^{* 1}$ <br> Clock source: <br> CLK_HSB or CLK_UHSB |

Note 1. Refer to Section 41, Flash Memory for the target values

### 15.2.2 Block Diagram

A block diagram of the clock controller is shown in Figure 15.1.

Figure 15.1 Block Diagram of Clock Controller

### 15.3 Register Description

### 15.3.1 Register Protection

Write protection prevents inadvertent changing of register content due to erroneous software execution.
The CLKKCPROT0 and CLKKCPROT1 registers have to be written first in order to unlock protected registers and allow changing the register content.

### 15.3.2 List of Registers

The following table lists the clock controller registers.
Table 15.6 List of Clock Controller Registers

| Unit Name | Register Name | Symbol | Address | Access <br> Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SYSCTRL | Clock Divider 0 Divisor Register | CLKD0DIV | <CLK_base> + 000 ${ }_{\text {H }}$ | 32 | CLKKCPROT0 |
| SYSCTRL | Clock Divider 0 Status Register | CLKDOSTAT | <CLK_base> + 004H | 32 | - |
| SYSCTRL | Clock Divider 2 Divisor Register | CLKD2DIV | <CLK_base> + 010 ${ }_{\text {H }}$ | 32 | CLKKCPROT0 |
| SYSCTRL | Clock Divider 2 Status Register | CLKD2STAT | <CLK_base> + 014 H | 32 | - |
| SYSCTRL | Clock Selector 0 Control Register | CKSCOC | <CLK_base> + 100 H | 32 | CLKKCPROT0 |
| SYSCTRL | Clock Selector 0 Status Register | CKSC0S | <CLK_base> + 108 ${ }_{\text {H }}$ | 32 | - |
| SYSCTRL | Clock Selector 2 Control Register | CKSC2C | <CLK_base> + 180 ${ }_{\text {H }}$ | 32 | CLKKCPROT0 |
| SYSCTRL | Clock Selector 2 Status Register | CKSC2S | <CLK_base> + 188 ${ }_{\text {H }}$ | 32 | - |
| SYSCTRL | PLL Oscillation Status Register | PLLCLKS | <CLK_base> + $200{ }_{\text {H }}$ | 32 | - |
| SYSCTRL | Main Oscillation Status Register | MOSCS | <CLK_base> + 400 ${ }_{\text {H }}$ | 32 | - |
| SYSCTRL | OSC Monitor Mode Entry Register | OSCMONMD | <CLK_base> + 404 ${ }_{\text {H }}$ | 32 | CLKKCPROT1 |

### 15.3.4 CLKDODIV — Clock Divider 0 Divisor Register

This register defines the division ratio of the clock divider 0 used for system clock generation.
This register must not be written with a new value while CLKD0SYNC is deasserted.

## Value after reset: $\quad 00000002 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 15.8 CLKDODIV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CLKDODIV[2:0] | These bits select the frequency division ratio of divider 0. |
|  | $001_{\mathrm{B}}$ : No division |  |
|  | $010_{\mathrm{B}}$ : Divided by 2 |  |
|  |  | Settings other than the above are prohibited. |
|  |  |  |

### 15.3.5 CLKDOSTAT - Clock Divider 0 Status Register

This register indicates the status of clock divider 0 used for system clock generation.

Value after reset: $\quad 00000^{0003_{H}}$

Table 15.9 CLKDOSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 1 | CLKDOSYNC | Divider clock synchronized |
|  |  | $0:$ The system and peripheral clock do not correspond to the division ratio setting in |
|  |  | CLKDODIV. |
|  |  | 1: The system and peripheral clock correspond to the division ratio setting in CLKD0DIV. |
| 0 | Reserved |  |
|  |  | When read, the value after reset is returned. |

### 15.3.6 CLKDnDIV — Clock Divider Divisor Register ( $\mathrm{n}=2$ )

This register defines the division ratio of clock divider $n(n=2)$ used for the external clock.
This register must not be written with a new value while CLKDnSYNC is deasserted.

Value after reset: $\quad 0000$ 0000H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | CLKDnDIV[4:0] |  |  |  |  | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R |

Table 15.10 CLKDnDIV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 1 | CLKDnDIV[4:0] | Division ratio |
|  |  | $0:$ The external clock is stopped. |
|  |  | Other bits: For the settings, see Table 15.11. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 15.11 Mapping of CLKDnDIV Settings to Output Frequencies

|  |  |  |  | Output Frequency [MHz] (Each Clock Source) |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| CLKDnDIV[4] | CLKDnDIV[3] | CLKDnDIV[2] | CLKDnDIV[1] | CLKDnDIV[0] | CLK_MOSC | CLK_LSB |
| 0 | 0 | 1 | 0 | 1 | 2.00 | 4.00 |
| 0 | 0 | 1 | 1 | 0 | 1.67 | 3.33 |
| 0 | 0 | 1 | 1 | 1 | 1.43 | 2.86 |
| 0 | 1 | 0 | 0 | 0 | 1.25 | 2.50 |
| 0 | 1 | 0 | 0 | 1 | 1.11 | 2.22 |
| 0 | 1 | 0 | 1 | 0 | 1.00 | 2.00 |
| 0 | 1 | 0 | 1 | 1 | 0.91 | 1.82 |
| 0 | 1 | 1 | 0 | 0 | 0.83 | 1.67 |
| 0 | 1 | 1 | 0 | 1 | 0.77 | 1.54 |
| 0 | 1 | 1 | 1 | 0 | 0.71 | 1.43 |
| 0 | 1 | 1 | 1 | 1 | 0.67 | 1.33 |
| 1 | 0 | 0 | 0 | 0 | 0.63 | 1.25 |
| 1 | 0 | 0 | 0 | 1 | 0.59 | 1.18 |
| 1 | 0 | 0 | 1 | 0 | 0.56 | 1.11 |
| 1 | 0 | 0 | 1 | 1 | 0.53 | 1.05 |
| 1 | 0 | 1 | 0 | 0 | 0.50 | 1.00 |

Note: Settings other than above are prohibited.

### 15.3.7 CLKDnSTAT - Clock Divider Status Register ( $\mathrm{n}=2$ )

This register indicates the status of clock divider $\mathrm{n}(\mathrm{n}=2)$ used for the external clock.

Value after reset: $\quad 0000000 \mathbf{2 H}_{\mathrm{H}}$

Table 15.12 CLKDnSTAT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 1 | CLKDnSYNC | Divider clock synchronized |
|  |  | $0:$ The external clock does not correspond to the division ratio setting in CLKDnDIV. |
|  | 1: The external clock corresponds to the division ratio setting in CLKDnDIV. |  |
| 0 | CLKDnCLKACT | Divider clock active |
|  | $0:$ The external clock is inactive (CLKDnDIV[4:0] = 00000 $\left.{ }_{\mathrm{B}}\right)$ |  |
|  |  | 1: The external clock is active |

### 15.3.8 CKSCOC - Clock Selector 0 Control Register

This register selects the clock that drives the system and peripheral clock trees.
This register must not be written with a new value while CKSC0S shows a different ID.

## Value after reset: $\quad 00000002 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 15.13 CKSCOC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CKSC0[2:0] | Clock source control |
|  |  | These bits select the ID of a clock source for the system and peripheral clock. |
|  | ID $=001_{\mathrm{B}}$ : PLL |  |
|  | ID $=010_{\mathrm{B}}$ : Internal OSC |  |
|  | Other than the above: Setting prohibited. |  |

### 15.3.9 CKSCOS - Clock Selector 0 Status Register

This register indicates the status of clock selector 0 .

Value after reset: $\quad 0000000 \mathbf{2 H}_{\mathrm{H}}$

Table 15.14 CKSCOS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 2 to 0 | CLKACT0[2:0] | Clock source status |
|  |  | Indicates the ID of the selected clock source of the system and peripheral clock. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. |
|  |  | ID $=001_{\mathrm{B}}$ : PLL |
|  |  | ID $=010_{\mathrm{B}}$ : Internal OSC |

### 15.3.10 CKSCnC - Clock Selector Control Register ( $\mathrm{n}=2$ )

This register selects the clock that drives the CK clock .
This register must not be written with a new value while CKSCnS shows a different ID.

Value after reset: $\quad 00000003_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | CKSCn[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 15.15 CKSCnC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CKSCn[2:0] | Clock source control |
|  |  | These bits select the ID of a clock source for the external clock. |
|  | ID $=011_{\mathrm{B}}:$ CLK_MOSC |  |
|  | ID $=10 \mathrm{D}_{\mathrm{B}}:$ CLK_LSB |  |
|  | Other than above: Setting prohibited. |  |

### 15.3.11 CKSCnS — Clock Selector Status Register ( $\mathrm{n}=2$ )

This register indicates the status of clock selector n .

Value after reset: $00000^{0003_{H}}$

Table 15.16 CKSCnS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 2 to 0 | CLKACTn[2:0] | Clock source status |
|  |  | Indicates the ID of the selected clock source of the external clock. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. |
|  |  | ID $=011_{\mathrm{B}}:$ CLK_MOSC |
|  |  | ID $=100 \mathrm{~B}$ : CLK_LSB |

### 15.3.12 PLLCLKS — PLL Oscillation Status Register

This register indicates the PLL oscillation status.

Value after reset: $00000000_{\mathrm{H}}$

Note 1. Depends on the read timing after the CPU starts operation.
Table 15.17 PLLCLKS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 1 | CLKSTAB | PLL clock stable state |
|  | $0:$ PLL is unstable. |  |
|  | $1:$ PLL is stable. |  |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. |

### 15.3.13 MOSCS - Main Oscillation Status Register

This register indicates the main oscillator status.

Value after reset: $0000000 \mathrm{x}_{\mathrm{H}}$

Note 1. Depends on the read timing after the CPU starts operation.
Table 15.18 MOSCS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | MOSCSTAB | Main OSC clock stable state |
|  | 0: Main OSC clock is unstable. |  |
|  | 1: Main OSC clock is stable. |  |

### 15.3.14 OSCMONMD — OSC Monitor Mode Entry Register

This register enables OSC monitor mode.
Writing to this register is enabled when CKSC0C.CKSC0[2:0] $=2_{\mathrm{H}}$.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 15.19 OSCMONMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | OSCMONMD | OSC Monitor mode entry bit |
|  | $0:$ Disable OSC monitor mode |  |
|  | 1: Enable OSC monitor mode |  |

### 15.3.15 CLKKCPROTO — Clock Controller Register Key Code Protection Register 0

The CLKKCPROT0 register is used to protect against writing to registers that may have a material effect on the system, so that the application system is not incorrectly stopped by a program malfunction, etc.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 15.20 CLKKCPROTO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | 0: Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write A5A5 $\mathrm{A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5 A501H to this register to enable writing protected registers.

### 15.3.16 CLKKCPROT1 — Clock Controller Register Key Code Protection Register 1

The CLKKCPROT1 register is used to protect against writing to registers that may have a material effect on the system, so that the application system is not incorrectly stopped by a program malfunction, etc.

Table 15.21 CLKKCPROT1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{* 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | 0: Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write A5A5 $\mathrm{A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5 A501H to this register to enable writing protected registers.

### 15.4 Operation

### 15.4.1 Sequence for Shifting the Clock Gear Up

To switch the clock signals, follow the procedure shown in Figure 15.2.

Note 1. After reset release, verify that the PLL operation is stable before executing the sequence to shift the clock gear up. PLLCLKS $=02_{\mathrm{H}}$ indicates that the PLL is stable.

Note 2. The CKSCOC and CLKDODIV registers are protected by the CLKKCPROT0 register. Disable key code protection when setting these register.

Note 3. Wait cycles are required because of transient voltage fluctuations produced by switching clock sources and division ratios. These fluctuations may vary depending on the environment. This time is determined by the specifications of the regulator.

Note 4. Verify that the CLKDOSYNC bit in CLKDOSTAT is 1 after changing the division ratio of divider 0.

Figure 15.2 Example of Shifting Clock Gear Up

### 15.4.2 External Clock Output Pins (CK)

The device provides an external clock that can be used as clock supply for other external circuits. For details, see
Section 15.3.6, CLKDnDIV — Clock Divider Divisor Register ( $n=2$ ), Section 15.3.7, CLKDnSTAT — Clock Divider Status Register ( $\mathrm{n}=2$ ), Section 15.3.10, CKSCnC — Clock Selector Control Register ( n $=2$ ), and Section 15.3.11, CKSCnS - Clock Selector Status Register ( $\mathrm{n}=2$ ).

- Clock signals can be output from the external pin CK.
- Output clock frequencies can be divided by the divider by configuring register settings.
- The source of the external clock can be configured as CLK_MOSC or CLK_LSB.
- It is recommended that the external clock be configured after clock gearup is complete.

## NOTES

1. Stop the external clock before changing the clock source.
2. CLK_LSB becomes the backup clock if changing to a backup clock was triggered by an error detected in CLMA.

### 15.4.3 Main OSC Configuration and Stabilization Sequence

The block diagram of MainOSC setting and the sequence of MainOSC stabilization are shown in Figure 15.3 and
Figure 15.4, respectively.

Figure 15.3 Block Diagram of MainOSC Configuration

Figure 15.4 Sequence of MainOSC Stabilization

### 15.4.4 OSC Monitor Mode

This mode is used for characterization of the main oscillator crystal.
OSC monitor mode is enabled if the OSCMONMD.OSCMONMD bit is set to 1 .

Steps required to prevent the system from stopping when in OSC monitor mode:

- Disable auto start of WDTB and SWDT.
- Wait six cycles (CLK_LSB) to transition to OSC monitor mode.
- Be sure to execute the HALT instruction in each CPU after transitioning to OSC monitor mode.
- Return from OSC monitor mode should be done by External Reset.

The recommended characterization flow is shown in Figure 15.6.

Figure 15.5 Block Diagram of OSC Monitor Mode

Figure 15.6 Recommended Characterization Flow

Table 15.22 OSC Monitor Mode Pins

| Signal Name | Option Byte*1 | OSC Monitor Mode |  | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Setting Pins | I/O |  |
| STOP | - | P14_2 | Input | MOSC enable/disable <br> 0 : MOSC is enabled. <br> 1: MOSC is stopped. |
| EXCLK | MOSC_EXCLKINPUTZ | Oscillator | Input | External clock input/Oscillator selection <br> 0: MOSC outputs the clock from EXTAL as is, without going through AMP. (External clock) <br> 1: Normal oscillation (Oscillator) |
| FREQ_SEL | MOSC_40MHz | - | Input | Frequency selection $\begin{aligned} & \text { 0: } 20 \mathrm{MHz} \\ & \text { 1: } 40 \mathrm{MHz} \end{aligned}$ |
| CAPSEL[3:0] | MOSC_CAP_SEL[3:0] | $\begin{aligned} & \text { P22_5, P22_6, } \\ & \text { P22_9, P22_11 } \end{aligned}$ | Input | This bit controls the OSC internal capacitance.*2 |
| SHTSTBY_A | MOSC_SHTSTBY_A | P14_1 | Input | Amplitude (x_A: unstable / x_B: stable) |
| SHTSTBY_B | MOSC_SHTSTBY_B |  |  | This bit controls OSC drivability during oscillation |
| AMPSEL_A[2:0] | MOSC_AMP_SEL_A[2:0] | P22_0, P22_2, | Input |  |
| AMPSEL_B[2:0] | MOSC_AMP_SEL_B[2:0] | P22_3 |  |  |
| RDSEL_A[2:0] | MOSC_RD_SEL_A[2:0] | P14_7, P15_0, | Input | Damping resistor configuration. |
| RDSEL_B[2:0] | MOSC_RD_SEL_B[2:0] | P15_4 |  | (x_A: Unstable / x_B: Stable) <br> This bit controls the damping resistor.*2 |
| OSCOUT | - | P20_3 | Output | MainOSC clock output |

Note 1. For details on the option byte, see Section 41, Flash Memory.
Note 2. For details, see Section 1.3.4, Clock Timing in the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

### 15.5 Usage Notes

### 15.5.1 Main OSC setting

In the initial state of the product to be shipped, Option Bytes are fixed.
In case of the mismatch between the EXTAL/XTAL parameter condition and Main OSC Option Bytes setting relationship, Option Bytes should be written in Serial programming mode to be matched against the EXTAL/XTAL parameter condition.

### 15.5.2 Clock Gear Up

The operational settings for each peripheral function should be configured after clock gearup is complete.
(Except for when each function has a specified usage.)
The operation of each peripheral function is guaranteed only in the clock gear up state.
(Except when permitted by each peripheral function)
It must be set according to the procedure in Figure 15.2.
It is recommended to set the external clock output after clock gearup because CLK_MOSC is not stable and CLK_LSB has a different frequency.

### 15.5.3 FPU Operation Notes

Operations that require the FPU or FPSIMD should not be used when the division ratio is being changed. Increased current fluctuation as a result of using the FPU or FPSIMD can make the division ratio change unstable.

### 15.5.4 Board Design Notes

Other signal lines should not cross over EXTAL and XTAL because induction may prevent proper oscillation. See
Figure 15.7.

Figure 15.7 Board Design Notes

## Section 16 Standby Controller

### 16.1 Features

This product supports various power-down modes such as power off standby mode, Emulation/Instrumentation RAM and Aurora retention mode (E2x-FCC1 Only), HALT mode, and module standby mode.

The power consumption of the LSI can be reduced by applying a suitable power-down mode for the application.

### 16.1.1 Register Base Addresses

Standby controller base address is listed in the following table.
Standby controller register addresses are given as offsets from the base addresses in general.
Table 16.1 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <MSTB_base> | FF70 $1000_{H}$ | Peripheral Group 6 |

### 16.2 Power Down Modes

### 16.2.1 Power Off Standby Mode

In Power Off Standby Mode, only the retention RAM of the Global (Cluster) RAM is powered. All clocks are stopped. All power supplies except SYSVCC can be turned off.

Power Off Standby Mode is entered by asserting the RES_IN pin low, and then turning off all power supplies except SYSVCC.

Power Off Standby Mode is exited by turning all the power supplies on, waiting for the required time for clock stabilization and then negating RES_IN. See the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware for timing details.

If the EMUVDD is supplied, the data in Emulation/Instrumentation RAM is also retained. For RAM retention targets, see the section about RAM.

### 16.2.2 Emulation/Instrumentation RAM and Aurora Retention Mode (E2x-FCC1 Only)

In Emulation/Instrumentation RAM and Aurora Retention Mode, only the Emulation/Instrumentation RAM and Aurora configuration data is retained. All power supplies except EMUVCC and EMUVDD can be turned off.

Emulation/Instrumentation RAM and Aurora Retention Mode is entered by asserting the RES_IN pin low, and then turning off all power supplies except EMUVCC and EMUVDD.

Emulation/Instrumentation RAM and Aurora Retention Mode is exited by turning all the power supplies on, waiting for the required time for clock stabilization and then negating RES_IN.

See the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware for timing details.

### 16.2.3 HALT Mode

When the HALT instruction is executed, the CPU transits to HALT mode and stops instruction execution.
Each CPU (PE0, PE1) can be controlled individually.
The CPU returns from this state by the occurrence of an all resets (except Module Reset and JTAG Reset), interrupt or exception.

### 16.2.4 Module Standby

This function stops the clocks for the selected peripherals to reduce power consumption. After reset (see Table 16.2, Table 16.3) is released, All the peripheral modules except for WDTB, $\Delta \Sigma-\mathrm{ADC}$ and Cyclic-ADC enter the module standby mode.

Set the bit of the target register to 0 to release the module standby mode
Set the bit of the target register to 1 to set the module standby mode

## NOTES

1. It is recommended to set WDTB module stanby before clock gear-up (if WDTB has not been auto-started or has not triggered by software yet)
2. These registers should only be written one time after reset. Operation is not guaranteed for subsequent writes.

### 16.3 Description of Registers

### 16.3.1 Register Protection

Write-protected registers are protected from inadvertent write access due to erroneous program execution, etc.
Write-protected registers can be written by releasing the protection of MSRKCPROT.

### 16.3.2 List of Registers

The following table lists the standby controller registers.
Table 16.2 List of Registers

| Unit Name | Register Name | Symbol | Address | Access size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| MSTB | Module Standby Register for ATU5 | MSR_ATU*1 | <MSTB_base> + 000 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for GTM | MSR_GTM ${ }^{* 1}$ | <MSTB_base> + 000 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for OSTM | MSR_OSTM | <MSTB_base> + 010 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for WDTB | MSR_WDT | <MSTB_base> + 020 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for SCI3 | MSR_SCI | <MSTB_base> + 030 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for HSSPI | MSR_HSSPI | <MSTB_base> + 040 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for RLIN3 | MSR_RLIN | <MSTB_base> + 050 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for CSIH | MSR_CSIH | <MSTB_base> + 060 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for RHSIF | MSR_RHSIF | <MSTB_base> + 070 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for RHSB | MSR_RHSB | <MSTB_base> + 080 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for CAN | MSR_CAN | <MSTB_base> + 090 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for FlexRay | MSR_FLXA | $<\mathrm{MSTB}^{\text {- }}$ base> $+0 \mathrm{AO}_{\mathrm{H}}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for Ethernet controller | MSR_ETHER | <MSTB_base> + 0B0 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for RSENT | MSR_RSENT | <MSTB_base> + 0 $\mathrm{CO}_{\mathrm{H}}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for PSI5S | MSR_PSI5S | $<\mathrm{MSTB}_{\text {- }}$ base> +0 EO H | 32 | MSRKCPROT |
| MSTB | Module Standby Register for DFE | MSR_DFE | <MSTB_base> + 100 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for DS-ADC | MSR_DAD | <MSTB_base> + 110 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for CyclicADC | MSR_CAD | <MSTB_base> + 120 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for SAR-ADC | MSR_SAD | <MSTB_base> + 130 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register for ENCA | MSR_ENCA | <MSTB_base> + 140 ${ }_{\text {H }}$ | 32 | MSRKCPROT |
| MSTB | Module Standby Register Key Code Protection Register | MSRKCPROT | <MSTB_base> + 700 ${ }_{\text {H }}$ | 32 | - |

Note 1. MSR_ATU, MSR_GTM switch in OPBT. See Section 41, Flash Memory.

### 16.3.3 Reset of Registers

Table 16.3 Register Reset Conditions

|  | Reset Source |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 16.3.4 MSR_ATU — Module Standby Register for ATU5

This register is used to control the Stop Mode of the ATU5.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { MS } \\ & \text { ATU } \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.4 MSR_ATU Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_ATU | Setting this bit to 1 stops clock supply to ATU5. |
|  | $0:$ Put ATU5 in operating mode. |  |
|  |  | 1: Put ATU5 in standby mode (stop clocks to ATU5). |

### 16.3.5 MSR_GTM — Module Standby Register for GTM

This register is used to control the Stop Mode of the GTM.

## Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \mathrm{MS} \\ & \mathrm{GTM} \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.5 MSR_GTM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_GTM | Setting this bit to 1 stops clock supply to GTM. |
|  |  | $0:$ Put GTM in operating mode. |
|  |  | 1: Put GTM in standby mode (stop clocks to GTM). |

### 16.3.6 MSR_OSTM — Module Standby Register for OSTM

This register is used to control the Stop Mode of the OSTM.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { MS } \\ \text { OSTM } 2 \end{gathered}$ | $\begin{array}{\|c\|} \text { MS } \\ \text { OSTM } \end{array}$ | $\begin{aligned} & \text { MS } \\ & \text { OSTMO } \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 16.6 MSR_OSTM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 2 | MS_OSTM2 | Setting this bit to 1 stops clock supply to OSTM2. |
|  | 0: Put OSTM2 in operating mode. |  |
|  | 1: Put OSTM2 in standby mode (stop clocks to OSTM2). |  |
| 1 | MS_OSTM1 | Setting this bit to 1 stops clock supply to OSTM1. |
|  | $0:$ Put OSTM1 in operating mode. |  |
|  |  | 1: Put OSTM1 in standby mode (stop clocks to OSTM1). |
| 0 | MS_OSTM0 | Setting this bit to 1 stops clock supply to OSTM0. |
|  | $0:$ Put OSTM0 in operating mode. |  |
|  |  | 1: Put OSTM0 in standby mode (stop clocks to OSTM0). |

### 16.3.7 MSR_WDT — Module Standby Register for WDTB

This register is used to control the Stop Mode of the WDTB.

Value after reset: $00000000_{\mathrm{H}}$

Table 16.7 MSR_WDT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 1 | MS_WDT1 | Setting this bit to 1 stops clock supply to WDTB1. |
|  | $0:$ Put WDTB1 in operating mode. |  |
|  |  | 1: Put WDTB1 in standby mode (stop clocks to WDTB1). |
| 0 | MS_WDT0 | Setting this bit to 1 stops clock supply to WDTB0. |
|  | $0:$ Put WDTB0 in operating mode. |  |
|  |  | 1: Put WDTB0 in standby mode (stop clocks to WDTB0). |

### 16.3.8 MSR_SCI — Module Standby Register for SCl3

This register is used to control the Stop Mode of the SCI3.

Value after reset: FFFF FFFFH

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { MS } \\ & \text { SCl } 33 \end{aligned}$ | $\begin{aligned} & \mathrm{MS} \\ & \mathrm{SCl} 32 \end{aligned}$ | $\begin{aligned} & \text { MS } \\ & \text { SCl } 31 \end{aligned}$ | $\begin{aligned} & \mathrm{MS} \\ & \mathrm{SCl} 30 \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 16.8 MSR_SCI Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved <br> When reading, the value after reset is returned. When writing, write the value after reset. |
| 3 | MS_SCI33 | Setting this bit to 1 stops clock supply to SCI 33 . <br> 0 : Put SCI3 in operating mode. <br> 1: Put SCI3 in standby mode (stop clocks to SCI33). |
| 2 | MS_SCI32 | Setting this bit to 1 stops clock supply to SCI 32 . <br> 0 : Put SCl2 in operating mode. <br> 1: Put SCI2 in standby mode (stop clocks to SCI32). |
| 1 | MS_SCI31 | Setting this bit to 1 stops clock supply to SCI31. <br> 0 : Put SCl1 in operating mode. <br> 1: Put SCI1 in standby mode (stop clocks to SCI31). |
| 0 | MS_SCI30 | Setting this bit to 1 stops clock supply to SCI30. <br> 0 : Put SCIO in operating mode. <br> 1: Put SCIO in standby mode (stop clocks to SCI30). |

### 16.3.9 MSR_HSSPI — Module Standby Register for HSSPI

This register is used to control the Stop Mode of the HSSPI.

## Value after reset: FFFF FFFF ${ }_{H}$

Table 16.9 MSR_HSSPI Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_HSSPIO | Setting this bit to 1 stops clock supply to HSSPIO. |
|  | $0:$ Put HSSPIO in operating mode. |  |
|  |  | 1: Put HSSPIO in standby mode (stop clocks to HSSPIO). |

### 16.3.10 MSR_RLIN — Module Standby Register for RLIN3

This register is used to control the Stop Mode of the RLIN3.

| Value after reset: FFFF FFFFF $_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | MS RLIN5 | MS RLIN4 | MS <br> RLIN3 | $\begin{aligned} & \text { MS } \\ & \text { RLIN2 } \end{aligned}$ | MS RLIN1 | MS <br> RLINO |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.10 MSR_RLIN Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 5 | MS_RLIN5 | Setting this bit to 1 stops clock supply to RLIN5. |
|  |  | 0: Put RLIN5 in operating mode. |
|  |  | 1: Put RLIN5 in standby mode (stop clocks to RLIN5). |
| 4 | MS_RLIN4 | Setting this bit to 1 stops clock supply to RLIN4. |
|  |  | 0 : Put RLIN4 in operating mode. |
|  |  | 1: Put RLIN4 in standby mode (stop clocks to RLIN4). |
| 3 | MS_RLIN3 | Setting this bit to 1 stops clock supply to RLIN3. |
|  |  | 0 : Put RLIN3 in operating mode. |
|  |  | 1: Put RLIN3 in standby mode (stop clocks to RLIN3). |
| 2 | MS_RLIN2 | Setting this bit to 1 stops clock supply to RLIN2. |
|  |  | 0: Put RLIN2 in operating mode. |
|  |  | 1: Put RLIN2 in standby mode (stop clocks to RLIN2). |
| 1 | MS_RLIN1 | Setting this bit to 1 stops clock supply to RLIN1. |
|  |  | 0 : Put RLIN1 in operating mode. |
|  |  | 1: Put RLIN1 in standby mode (stop clocks to RLIN1). |
| 0 | MS_RLIN0 | Setting this bit to 1 stops clock supply to RLIN0. |
|  |  | 0 : Put RLIN0 in operating mode. |
|  |  | 1: Put RLINO in standby mode (stop clocks to RLIN0). |

### 16.3.11 MSR_CSIH — Module Standby Register for CSIH

This register is used to control the Stop Mode of the CSIH.

| Value after reset: FFFF FFFF ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | $\underset{\mathrm{CSIH5}}{\mathrm{MS}}$ | $\begin{aligned} & \mathrm{MS} \\ & \text { CSIH4 } \end{aligned}$ | $\begin{array}{\|l\|} \hline \mathrm{MS} \\ \mathrm{CSIH} 3 \end{array}$ | $\begin{aligned} & \text { MS } \\ & \text { CSIH2 } \end{aligned}$ | $\begin{gathered} \mathrm{MS} \\ \mathrm{CSIH} 1 \end{gathered}$ | $\begin{aligned} & \text { MS_ } \\ & \text { CSIH0 } \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 16.11 MSR_CSIH Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 5 | MS_CSIH5 | Setting this bit to 1 stops clock supply to CSIH5. |
|  |  | 0: Put CSIH5 in operating mode. |
|  |  | 1: Put CSIH5 in standby mode (stop clocks to CSIH5). |
| 4 | MS_CSIH4 | Setting this bit to 1 stops clock supply to CSIH4. |
|  |  | 0: Put CSIH4 in operating mode. |
|  |  | 1: Put CSIH4 in standby mode (stop clocks to CSIH4). |
| 3 | MS_CSIH3 | Setting this bit to 1 stops clock supply to CSIH3. |
|  |  | 0 : Put CSIH3 in operating mode. |
|  |  | 1: Put CSIH3 in standby mode (stop clocks to CSIH3). |
| 2 | MS_CSIH2 | Setting this bit to 1 stops clock supply to CSIH2. |
|  |  | 0: Put CSIH2 in operating mode. |
|  |  | 1: Put CSIH2 in standby mode (stop clocks to CSIH2). |
| 1 | MS_CSIH1 | Setting this bit to 1 stops clock supply to CSIH1. |
|  |  | 0 : Put CSIH1 in operating mode. |
|  |  | 1: Put CSIH1 in standby mode (stop clocks to CSIH1). |
| 0 | MS_CSIH0 | Setting this bit to 1 stops clock supply to CSIH0. |
|  |  | 0 : Put CSIH0 in operating mode. |
|  |  | 1: Put CSIH0 in standby mode (stop clocks to CSIHO). |

### 16.3.12 MSR_RHSIF — Module Standby Register for RHSIF

This register is used to control the Stop Mode of the RHSIF.

Value after reset: $\quad$ FFFF FFFF $_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 16.12 MSR_RHSIF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_RHSIF0*1, $^{* 1,}$ | Setting this bit to 1 stops clock supply to RHSIF0. |
|  |  | $0:$ Put RHSIF0 in operating mode. |
|  |  | 1: Put RHSIF0 in standby mode (stop clocks to RHSIF0). |

Note 1. Access to RHSIF is required waiting period of at least 12 cycles in the CPU clock after standby release.

### 16.3.13 MSR_RHSB — Module Standby Register for RHSB

This register is used to control the Stop Mode of the RHSB.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { MS } \\ \text { RHS } \end{array}$ | $\underset{\mathrm{RHS}}{\mathrm{MS}}$ |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 16.13 MSR_RHSB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 1 | MS_RHSB1 | Setting this bit to 1 stops clock supply to RHSB1. |
|  | $0:$ Put RHSB1 in operating mode. |  |
|  |  | 1: Put RHSB1 in standby mode (stop clocks to RHSB1). |
| 0 | MS_RHSB0 | Setting this bit to 1 stops clock supply to RHSB0. |
|  | $0:$ Put RHSB0 in operating mode. |  |
|  |  | 1: Put RHSB0 in standby mode (stop clocks to RHSB0). |

### 16.3.14 MSR_CAN — Module Standby Register for CAN

This register is used to control the Stop Mode of the CAN.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\left\lvert\, \begin{gathered} \text { MS } \\ \text { RSCFD } \end{gathered}\right.$ $0$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.14 MSR_CAN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_RSCFD0 | Setting this bit to 1 stops clock supply to RSCFD0. |
|  |  | $0:$ Put RSCFD0 in operating mode. |
|  |  | 1: Put RSCFD0 in standby mode (stop clocks to RSCFD0). |

### 16.3.15 MSR_FLXA — Module Standby Register for FlexRay

This register is used to control the Stop Mode of the FlexRay.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.15 MSR_FLXA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_FLXA0 | Setting this bit to 1 stops clock supply to FLXA0. |
|  | $0:$ Put FLXA0 in operating mode. |  |
|  |  | 1: Put FLXA0 in standby mode (stop clocks to FLXA0). |

### 16.3.16 MSR_ETHER — Module Standby Register for Ethernet controller

This register is used to control the Stop Mode of the Ethernet controller.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { MS_ET } \\ \text { HER } \end{gathered}$ |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.16 MSR_ETHER Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_ETHER | Setting this bit to 1 stops clock supply to Ethernet controller. |
|  |  | $0:$ Put ETHER in operating mode. |
|  |  | 1: Put ETHER in standby mode (stop clocks to Ethernet controller). |

### 16.3.17 MSR_RSENT — Module Standby Register for RSENT

This register is used to control the Stop Mode of the RSENT.

| Value after reset: |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | MS RS ENT16 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\stackrel{\mathrm{MS}}{\mathrm{PSI} \mathrm{~S}}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.18 MSR_PSI5S Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_PSI5S | Setting this bit to 1 stops clock supply to PSI5S. |
|  |  | $0:$ Put PSI5S in operating mode. |
|  |  | 1: Put PSI5S in standby mode (stop clocks to PSI5S). |

### 16.3.19 MSR_DFE — Module Standby Register for DFE

This register is used to control the Stop Mode of the DFE.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \mathrm{MS} \\ & \mathrm{DFE} \end{aligned}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 16.19 MSR_DFE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_DFE | Setting this bit to 1 stops clock supply to DFE. |
|  | $0:$ Put DFE in operating mode. |  |
|  |  | 1: Put DFE in standby mode (stop clocks to DFE). |
|  |  |  |

### 16.3.20 MSR_DAD — Module Standby Register for DS-ADC

This register is used to control the Stop Mode of the $\Delta \Sigma$-ADC.

Table 16.20 MSR_DAD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 2 | MS_DAD13_11 | Setting this bit to 1 stops clock supply to units DSADC13 and DSADC11. |
|  |  | 0: Put units DSADC13 and DSADC11 of $\triangle \Sigma A D$ in operating mode. |
|  |  | 1: Put units DSADC13 and DSADC11 of $\triangle \Sigma A D$ in standby mode (stop clocks to units |
|  | DSADC13 and DSADC11 of $\triangle \Sigma A D)$. |  |

### 16.3.21 MSR_CAD — Module Standby Register for Cyclic-ADC

This register is used to control the Stop Mode of the Cyclic-ADC.

Value after reset: $00000000_{\mathrm{H}}$

Table 16.21 MSR_CAD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 0 | MS_CAD | Setting this bit to 1 stops clock supply to Cyclic-ADC. |
|  | $0:$ Put Cyclic-ADC in operating mode. |  |
|  |  | 1: Put Cyclic-ADC in standby mode (stop clocks to Cyclic-ADC). |

### 16.3.22 MSR_SAD - Module Standby Register for SAR-ADC

This register is used to control the Stop Mode of the SAR-ADC.

Value after reset: FFFF FFFFH

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { MS } \\ & \text { SAD3 } \end{aligned}$ | $\begin{aligned} & \mathrm{MS} \\ & \mathrm{SAD2} \end{aligned}$ | $\begin{aligned} & \text { MS_ } \\ & \text { SAD1 } \end{aligned}$ | $\underset{\text { MS }}{\text { SADO }}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 16.22 MSR_SAD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 3 | MS_SAD3 | Setting this bit to 1 stops clock supply to ADCH3. |
|  |  | 0: Put ADCH3 in operating mode. |
|  | 1: Put ADCH3 in standby mode (stop clocks to ADCH3). |  |
| 2 | MS_SAD2 | Setting this bit to 1 stops clock supply to ADCH2. |
|  |  | 0: Put ADCH2 in operating mode. |
|  |  | 1: Put ADCH2 in standby mode (stop clocks to ADCH2). |
| 1 | MS_SAD1 | Setting this bit to 1 stops clock supply to ADCH1. |
|  | 0: Put ADCH1 in operating mode. |  |
|  |  | 1: Put ADCH1 in standby mode (stop clocks to ADCH1). |
| 0 | MS_SAD0 | Setting this bit to 1 stops clock supply to ADCH0. |
|  | 0: Put ADCH0 in operating mode. |  |
|  |  | 1: Put ADCH0 in standby mode (stop clocks to ADCH0). |
|  |  |  |

### 16.3.23 MSR_ENCA — Module Standby Register for ENCA

This register is used to control the Stop Mode of the ENCA.

Value after reset: $\quad$ FFFF FFFF $H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c\|} \text { MS } \\ \text { ENCA } \end{array}$ | $\underset{\text { ENCA }}{\mathrm{MS}}$ |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 16.23 MSR_ENCA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When reading, the value after reset is returned. When writing, write the value after reset. |
| 1 | MS_ENCA1 | Setting this bit to 1 stops clock supply to ENCA1. |
|  | $0:$ Put ENCA1 in operating mode. |  |
|  |  | 1: Put ENCA1 in standby mode (stop clocks to ENCA1). |
| 0 | MS_ENCA0 | Setting this bit to 1 stops clock supply to ENCA0. |
|  | $0:$ Put ENCA0 in operating mode. |  |
|  |  | 1: Put ENCA0 in standby mode (stop clocks to ENCA0). |

### 16.3.24 MSRKCPROT — Module Standby Register Key Code Protection Register

The MSRKCPROT register is used to protect against writing to the registers that may have a material effect on the system so that the application system is not incorrectly stopped due to program malfunction and the like.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | KCPROT[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | KCPROT[15:1] |  |  |  |  |  |  |  |  |  |  |  |  |  |  | KCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | w | W | w | W | W | W | W | W | W | W | W | W | W | W | R/W |

Table 16.24 MSRKCPROT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | KCPROT[31:1] | Enable or disable modification of the KCE bit. |
|  |  | The written value is not retained. These bits are always read as $0 .{ }^{\star 1}$ |
| 0 | KCE | Key Code Enable bit |
|  |  | $0:$ Disable write access to protected registers |
|  | 1: Enable write access to protected registers |  |

Note 1. Write $\mathrm{A} 5 \mathrm{~A} 5 \mathrm{~A} 500_{\mathrm{H}}$ to this register to disable writing protected registers. Write A5A5A501 to this register to enable writing protected registers.

## Section 17 Clocked Serial Interface H (CSIH)

### 17.1 Features of CSIH

### 17.1.1 Units and Channels

This microcontroller has the following number of CSIH channels.
Table 17.1 Number of Channels (For E2x-FCC1)

| Product Name | RH850/E2x-FCC1 |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
|  | 373 pins | 292 pins |  |  |
|  | 6 | 6 |  |  |
| Unit Name | CSIHn (n = 0 to 5$)$ |  |  |  |

Table 17.2 Number of Channels (For E2M)

|  | RH850/E2M |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
| Product Name | 373 pins | 292 pins |  |  |
| Number of Channels | 6 | 6 |  |  |
| Unit Name |  |  |  |  |

Table 17.3 Index

| Index | Description |
| :--- | :--- |
| m | A variable used for explanation is identified by the index " m ": for example, CSIHnETXDAm and CSIHnERXDAm <br> are a non-specified baud rate setting register of CSIHn. |
| n | Throughout this section, the individual CSIH units are identified by the index " n " (" n " is channel numbers.): for <br> example, CSIHnCTLO is the CSIHn control register 0. |
| x | CSIHn has a maximum of 6 chip select signals. Throughout this section, the individual chip select signals are <br> identified by the index " x ": that is, CSx denotes a non-specified chip select signal. |
| y | A variable used for explanation is identified by the index " y ": for example, CSIHnBRSy is the baud rate setting <br> register of CSIHn. |

The numbers of chip select signals for each of the CSIH units are listed in the following table.
Table 17.4 Number of Chip Select Signals

| Unit Name | Chip Select Index |
| :--- | :--- |
| CSIH0 | CSx $(x=0$ to 5$)$ |
| CSIH1 | CSx $(x=0$ to 3$)$ |
| CSIH2 | CSx $(x=0$ to 3$)$ |
| CSIH3 | CSx $(x=0$ to 3$)$ |
| CSIH4 | CSx $(x=0$ to 3$)$ |
| CSIH5 | CSx $(x=0$ to 3$)$ |

### 17.1.2 Register Base Address

CSIH base addresses are listed in the following table.
CSIH register addresses are given as offsets from the base addresses.
Table 17.5 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <CSIH0_base> | FFD8 $0000_{\mathrm{H}}$ | Peripheral Group 4 |
| <CSIH1_base> | FFD8 $2000_{\mathrm{H}}$ | Peripheral Group 4 |
| <CSIH2_base> | FFD8 $4000_{\mathrm{H}}$ | Peripheral Group 4 |
| <CSIH3_base> | FFD8 $6000_{\mathrm{H}}$ | Peripheral Group 4 |
| <CSIH4_base> | FFD8 $8000_{\mathrm{H}}$ | Peripheral Group 3 |
| <CSIH5_base> | FFD8 $\mathbf{~} 000_{\mathrm{H}}$ | Peripheral Group 3 |

### 17.1.3 Clock Supply

The CSIH clock supply is shown in the following table.
Table 17.6 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| CSIHn | PCLK | CLK_HSB |

### 17.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.
Table 17.7 Interrupt Requests

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CSIH0 |  |  |  |  |  |
| INTCSIHOTIC | INTCSIHTIC | Communication status interrupt | 343 | group0 93 | group0 93 |
| INTCSIHOTIR | INTCSIHTIR | Receive status interrupt | 344 | group0 92 | group0 92 |
| INTCSIHOTIRE | INTCSIHTIRE | Communication error interrupt | 345 | - | - |
| INTCSIHOTIJC | INTCSIHTIJC | Job completion interrupt | 346 | group0 94 | group0 94 |
| CSIH1 |  |  |  |  |  |
| INTCSIH1TIC | INTCSIHTIC | Communication status interrupt | 347 | group0 96 | group0 96 |
| INTCSIH1TIR | INTCSIHTIR | Receive status interrupt | 348 | group0 95 | group0 95 |
| INTCSIH1TIRE | INTCSIHTIRE | Communication error interrupt | 349 | - | - |
| INTCSIH1TIJC | INTCSIHTIJC | Job completion interrupt | 350 | group0 97 | group0 97 |
| CSIH2 |  |  |  |  |  |
| INTCSIH2TIC | INTCSIHTIC | Communication status interrupt | 351 | group0 99 | group0 99 |
| INTCSIH2TIR | INTCSIHTIR | Receive status interrupt | 352 | group0 98 | group0 98 |
| INTCSIH2TIRE | INTCSIHTIRE | Communication error interrupt | 353 | - | - |
| INTCSIH2TIJC | INTCSIHTIJC | Job completion interrupt | 354 | group0 100 | group0 100 |
| CSIH3 |  |  |  |  |  |
| INTCSIH3TIC | INTCSIHTIC | Communication status interrupt | 355 | group0 102 | group0 102 |
| INTCSIH3TIR | INTCSIHTIR | Receive status interrupt | 356 | group0 101 | group0 101 |
| INTCSIH3TIRE | INTCSIHTIRE | Communication error interrupt | 357 | - | - |
| INTCSIH3TIJC | INTCSIHTIJC | Job completion interrupt | 358 | group0 103 | group0 103 |
| CSIH4 |  |  |  |  |  |
| INTCSIH4TIC | INTCSIHTIC | Communication status interrupt | 359 | group0 105 | group0 105 |
| INTCSIH4TIR | INTCSIHTIR | Receive status interrupt | 360 | group0 104 | group0 104 |
| INTCSIH4TIRE | INTCSIHTIRE | Communication error interrupt | 361 | - | - |
| INTCSIH4TIJC | INTCSIHTIJC | Job completion interrupt | 362 | group0 106 | group0 106 |
| CSIH5 |  |  |  |  |  |
| INTCSIH5TIC | INTCSIHTIC | Communication status interrupt | 363 | group0 108 | group0 108 |
| INTCSIH5TIR | INTCSIHTIR | Receive status interrupt | 364 | group0 107 | group0 107 |
| INTCSIH5TIRE | INTCSIHTIRE | Communication error interrupt | 365 | - | - |
| INTCSIH5TIJC | INTCSIHTIJC | Job completion interrupt | 366 | group0 109 | group0 109 |

### 17.1.5 Reset Sources

CSIH reset sources are listed in the following table. CSIH is initialized by these reset sources.
Table 17.8 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| CSIHn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 17.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.
Table 17.9 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| CSIH0 |  |  |
| CSIHTSCK | Serial clock signal | CSIHOTSCK |
| CSIHTSI | Serial data input signal | CSIHOTSI |
| CSIHTSSI | Slave select input signal | CSIHOTSSI |
| CSIHTRYI | Ready/busy input signal | CSIHOTRY |
| CSIHTSO | Serial data output signal | CSIHOTSO |
| CSIHTRYO | Ready/busy output signal | CSIHOTRY |
| CSIHTCSS[5:0]*1 | Chip select signal | CSIH0TCSS[5:0]*1 |
| CSIH1 |  |  |
| CSIHTSCK | Serial clock signal | CSIH1TSCK |
| CSIHTSI | Serial data input signal | CSIH1TSI |
| CSIHTSSI | Slave select input signal | CSIH1TSSI |
| CSIHTRYI | Ready/busy input signal | CSIH1TRY |
| CSIHTSO | Serial data output signal | CSIH1TSO |
| CSIHTRYO | Ready/busy output signal | CSIH1TRY |
| CSIHTCSS[3:0]** | Chip select signal | CSIH1TCSS[3:0]*1 |
| CSIH2 |  |  |
| CSIHTSCK | Serial clock signal | CSIH2TSCK |
| CSIHTSI | Serial data input signal | CSIH2TSI |
| CSIHTSSI | Slave select input signal | CSIH2TSSI |
| CSIHTRYI | Ready/busy input signal | CSIH2TRY |
| CSIHTSO | Serial data output signal | CSIH2TSO |
| CSIHTRYO | Ready/busy output signal | CSIH2TRY |
| CSIHTCSS[3:0]*1 | Chip select signal | CSIH2TCSS[3:0]*1 |
| CSIH3 |  |  |
| CSIHTSCK | Serial clock signal | CSIH3TSCK |
| CSIHTSI | Serial data input signal | CSIH3TSI |
| CSIHTSSI | Slave select input signal | CSIH3TSSI |
| CSIHTRYI | Ready/busy input signal | CSIH3TRY |
| CSIHTSO | Serial data output signal | CSIH3TSO |
| CSIHTRYO | Ready/busy output signal | CSIH3TRY |
| CSIHTCSS[3:0]** | Chip select signal | CSIH3TCSS[3:0]*1 |
| CSIH4 |  |  |
| CSIHTSCK | Serial clock signal | CSIH4TSCK |
| CSIHTSI | Serial data input signal | CSIH4TSI |
| CSIHTSSI | Slave select input signal | CSIH4TSSI |
| CSIHTRYI | Ready/busy input signal | CSIH4TRY |
| CSIHTSO | Serial data output signal | CSIH4TSO |
| CSIHTRYO | Ready/busy output signal | CSIH4TRY |
| CSIHTCSS[3:0]*1 | Chip select signal | CSIH4TCSS[3:0]*1 |

Table 17.9 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| CSIH5 | Serial clock signal |  |
| CSIHTSCK | Serial data input signal | CSIH5TSCK |
| CSIHTSI | Slave select input signal | CSIH5TSI |
| CSIHTSSI | Ready/busy input signal | CSIH5TRY |
| CSIHTRYI | Serial data output signal | CSIH5TSO |
| CSIHTSO | Ready/busy output signal | CSIH5TRY |
| CSIHTRYO | Chip select signal | CSIH5TCSS[3:0]*1 |
| CSIHTCSS[3:0]*1 |  |  |

Note 1. For the number of chip select signals, see Table 17.4.

## CAUTION

This AC specification is only applied to the specific pin groups. For details, refer to Appendix file "Limited_conditions_for_AC_specification.xlsx".

### 17.1.7 Data Consistency Check

The ports and the alternative functions for data consistency check of CSIHnSO (CSIHTSO) output are shown in the following table. See Section 17.5.11, Error Detection for details on data consistency checking.

Table 17.10 Port Pins for Data Consistency Checking

| Unit Signal Name | Port Pin Name | Alternative Function |
| :---: | :---: | :---: |
| CSIH0 |  |  |
| CSIHTSO | P11_9 | ALT_OUT1 |
|  | P20_6 | ALT_OUT1 |
|  | P20_7 | ALT_OUT1 |
|  | P22_4 | ALT_OUT1 |
|  | P22_7 | ALT_OUT1 |
|  | P22_8 | ALT_OUT1 |
| CSIH1 |  |  |
| CSIHTSO | P10_1 | ALT_OUT1 |
|  | P10_2 | ALT_OUT1 |
|  | P10_3 | ALT_OUT1 |
|  | P10_6 | ALT_OUT6 |
|  | P11_7 | ALT_OUT2 |
|  | P12_5 | ALT_OUT6 |
|  | P12_6 | ALT_OUT1 |
|  | P12_7 | ALT_OUT1 |
| CSIH2 |  |  |
| CSIHTSO | P14_1 | ALT_OUT4 |
|  | P15_3 | ALT_OUT1 |
|  | P15_5 | ALT_OUT1 |
|  | P15_7 | ALT_OUT1 |
|  | P15_8 | ALT_OUT1 |
|  | P34_3 | ALT_OUT1 |
|  | P34_4 | ALT_OUT1 |
| CSIH3 |  |  |
| CSIHTSO | P01_5 | ALT_OUT1 |
|  | P01_6 | ALT_OUT1 |
|  | P02_5 | ALT_OUT1 |
|  | P02_6 | ALT_OUT1 |
|  | P10_6 | ALT_OUT1 |
|  | P10_8 | ALT_OUT1 |
| CSIH4 |  |  |
| CSIHTSO | P22_2 | ALT_OUT1 |
|  | P22_3 | ALT_OUT1 |
|  | P33_10 | ALT_OUT1 |
|  | P33_12 | ALT_OUT1 |
| CSIH5 |  |  |
| CSIHTSO | P14_10 | ALT_OUT1 |
|  | P14_11 | ALT_OUT1 |
|  | P23_2 | ALT_OUT1 |
|  | P23_6 | ALT_OUT1 |

### 17.1.8 Notes on Pin Combinations

CSIH uses multiple pins for one channel and the pins should be used in groups as shown in the following table.
Table 17.11 Pin combinations of CSIH

|  | Group | $\begin{aligned} & \text { CSIHn } \\ & \text { TSCK } \end{aligned}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { TSI } \end{aligned}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { TSO } \end{aligned}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { TSSI } \end{aligned}$ | CSIHn TRY | $\begin{aligned} & \mathrm{CSIHn} \\ & \text { TCSSO } \end{aligned}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { TCSS1 } \end{aligned}$ | $\begin{array}{\|l\|l\|l\|l\|l\|} \hline \text { CSIHn } \\ \text { TCSS2 } \end{array}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { TCSS3 } \end{aligned}$ | $\begin{array}{\|l\|l\|l\|l\|l\|} \hline \text { CSIHn } \\ \text { TCSS4 } \end{array}$ | $\begin{array}{\|l\|l\|l\|} \hline \text { CSIHn } \\ \text { TCSS5 } \end{array}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 17.2 Overview

### 17.2.1 Functional Overview

- Three-wire serial synchronous data transfer well known as SPI
- Either master mode or slave mode can be selected
- Multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) are possible since there are six configurable chip select output signals
- Slave select input signal ( $\overline{\text { CSIHTSSI }}$ ) is usable
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, whereas it is determined by the input clock in slave mode.
- Maximum transfer clock frequency:
- Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/8)
- Slave mode: 4.0 MHz (however, it must be equal to or lower than PCLK/20)
- Clock phase and data phase are selectable
- Data transfer with MSB first or LSB first is selectable
- Transfer data length is selectable from 2 to 16 bits in 1-bit units
- Built-in EDL (extended data length) function for transferring more than 16 bits of data
- Three selectable transfer modes:
- transmit-only mode
- receive-only mode
- transmit/receive mode
- Built-in handshake function
- Built-in error detection (data consistency check, parity, and overrun)
- Support of job concept
- Four different interrupt request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIRE, INTCSIHTIJC)
- Three different DMA request signals (INTCSIHTIC, INTCSIHTIR, INTCSIHTIJC)
- Built-in LBM (loop back mode) function for self-test
- Enforced chip select idle setting
- Built-in JOB enable control bit for AUTOSAR
- CSIH has an extended communication function that can perform 8, 16, 32-bit SPI communication.
- Extended communication data registers can use up to 16 stages.

### 17.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring:

- CSIHTSSI : Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[5:0]: Chip select signals

Data transmission is bit-wise and serial, and performed synchronously with the transmission clock.
The following table shows the most important registers for setting up the CSIH.
Table 17.12 Main Registers of CSIH

| Register | Function |
| :--- | :--- |
| CSIHnCTL0 | Enables/disables serial clock, and permits/prohibits data transmission and data reception. Defines <br> end-of-job behavior and enables/disables (bypass) buffering. |
| CSIHnCTL1 | Controls options like interrupt timing, extended data length, job feature, loop-back mode, handshake, <br> etc. such as |
| CSIHnCTL2 | Selects master or slave mode, and the transfer clock frequency of the built-in baud rate generator <br> (BRG) in master mode. |
| CSIHnBRSy | Specifies the transfer clock frequency for each chip select signal. |
| CSIHnCFGx | Configures the communication protocol for each chip select signal. |

### 17.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

## Figure 17.1 CSIH Block Diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.
NOTE
This section describes the following modes:

- The "operating mode" is either master mode or and slave mode. In this context, only a master can control and communicate with several slaves (for details, see Section 17.5.1, Operating Modes (Master/Slave)).
- The "job mode" is related to the AUTOSAR job concept (for details, see Section 17.5.3.3, Job Concept).
- The "data transfer mode" specifies the type of communication - transmit-only, receive-only, or transmit/receive (for details, see Section 17.5.6, Data Transfer Modes).

### 17.3 Registers

### 17.3.1 List of Registers

CSIH registers are listed in the following table.
For details about <CSIHn_base>, see Section 17.1.2, Register Base Address.
Table 17.13 List of Registers (1/3)

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CSIHn | CSIHn Control Register 0 | CSIHnCTLO | <CSIHn_base> + 0000 ${ }_{\text {H }}$ | 8 | - |
|  | CSIHn Control Register 1 | CSIHnCTL1 | <CSIHn_base> + 0010 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Control Register 2 | CSIHnCTL2 | <CSIHn_base> + 0014 ${ }_{\text {H }}$ | 16 | - |
|  | CSIHn Status Register 0 | CSIHnSTR0 | <CSIHn_base> + 0004 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Status Clear Register 0 | CSIHnSTCR0 | <CSIHn_base> + 0008H | 16 | - |
|  | CSIHn Configuration Register 0 | CSIHnCFG0 | <CSIHn_base> + 1044 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Configuration Register 1 | CSIHnCFG1 | <CSIHn_base> + 1048 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Configuration Register 2 | CSIHnCFG2 | <CSIHn_base> + 104C H | 32 | - |
|  | CSIHn Configuration Register 3 | CSIHnCFG3 | <CSIHn_base> + 1050 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Configuration Register 4 | CSIHnCFG4 | <CSIHn_base> + 1054 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Configuration Register 5 | CSIHnCFG5 | <CSIHn_base> + 1058H | 32 | - |
|  | CSIHn Transmit Data Register 0 for Word Access | CSIHnTXOW | <CSIHn_base> + 1008H | 32 | - |
|  | CSIHn Transmit Data Register 0 for Half Word Access | CSIHnTXOH | <CSIHn_base> + 100C H | 16 | - |
|  | CSIHn Receive Data Register 0 for Word Access | CSIHnRXOW | <CSIHn_base> + 1010 ${ }_{\text {H }}$ | 32 | - |
|  | CSIHn Receive Data Register 0 for Half Word Access | CSIHnRXOH | <CSIHn_base> + 1014 ${ }_{\text {H }}$ | 16 | - |
|  | CSIHn Baud Rate Setting Register 0 | CSIHnBRS0 | <CSIHn_base> + 1068 ${ }_{\text {H }}$ | 16 | - |
|  | CSIHn Baud Rate Setting Register 1 | CSIHnBRS1 | <CSIHn_base> + 106C H | 16 | - |
|  | CSIHn Baud Rate Setting Register 2 | CSIHnBRS2 | <CSIHn_base> + 1070 ${ }_{\text {H }}$ | 16 | - |
|  | CSIHn Baud Rate Setting Register 3 | CSIHnBRS3 | <CSIHn_base> + 1074 ${ }_{\text {H }}$ | 16 | - |
|  | CSIHn Interrupt Control Register | CSIHnEIE | <CSIHn_base> + 1100 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Control Register 0 | CSIHnECTLO | <CSIHn_base> + 1104 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Control Register 1 | CSIHnECTL1 | <CSIHn_base> + 1108 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 0 | CSIHnETXDA0 | <CSIHn_base> + 110C H | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 1 | CSIHnETXDA1 | <CSIHn_base> + 1110 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 2 | CSIHnETXDA2 | <CSIHn_base> + 1114 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 3 | CSIHnETXDA3 | <CSIHn_base> + 1118 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 4 | CSIHnETXDA4 | <CSIHn_base> + 111 $\mathrm{C}_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 5 | CSIHnETXDA5 | <CSIHn_base> + 1120 H | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 6 | CSIHnETXDA6 | <CSIHn_base> + 1124 ${ }_{\text {H }}$ | 8,16,32 | - |

Table 17.13 List of Registers (2/3)

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CSIHn | CSIHn Extended Communication Transmit Data Register 7 | CSIHnETXDA7 | <CSIHn_base> + 1128 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 8 | CSIHnETXDA8 | <CSIHn_base> + 112C ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 9 | CSIHnETXDA9 | <CSIHn_base> + 1130 ${ }_{\text {H }}$ | 8,16,32 | - |
|  | CSIHn Extended Communication Transmit Data Register 10 | CSIHnETXDA10 | <CSIHn_base> + 1134 ${ }_{\text {H }}$ | 8,16,32 | - |

### 17.3.2 CSIHnCTLO - CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory allocated for transmission and/or reception. It forces the stop of communication at the end of the current job.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CSIHnPWR | CSIHnTXE | CSIHnRXE | - | - | - | CSIHnJOBE | CSIHnMBS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | $R$ | $R$ | $R$ | $R / W$ | $R / W$ |

Table 17.14 CSIHnCTLO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | CSIHnPWR | Controls the operation clock. <br> 0: Stops operation clock. <br> 1: Supplies operation clock. <br> Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops. <br> If CSIHnPWR is cleared to 0 during communication, ongoing communication is immediately aborted. In this case, the communication setting must be reconfigured. |
| 6 | CSIHnTXE | Permits or prohibits transmission. <br> 0 : Prohibits transmission. <br> 1: Permits transmission. |
| 5 | CSIHnRXE | Permits or prohibits reception. <br> 0 : Prohibits reception. <br> 1: Permits reception. |
| 4 to 2 | - | Reserved <br> When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 1 | CSIHnJOBE | Stops communication at the end of the current job (communication ends if data is written to the transmission buffer when CSIHnTXOW.CSIHnEOJ = 1 (job completion)). <br> 0 : Communication stop is not requested. <br> 1: Stops communication. <br> This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1 , the read value is always 0 . |
| 0 | CSIHnMBS | Enables direct access mode. <br> 0: CSIH transmit/receive operation is prohibited. <br> 1: Direct access mode Write 1 in CSIHnMBS bit for transmission/reception via the CSIH. |

## CAUTIONS

1. Do not modify any of CSIHnTXE, CSIHnRXE, CSIHnJOBE, and CSIHnMBS bits while CSIHnPWR $=0$. Do not modify the CSIHnMBS bit when CSIHnPWR $=1$.
The CSIHnTXE, CSIHnRXE, and CSIHnMBS bits can be modified when the CSIHnPWR bit is changed from 0 to 1 . To change the CSIHnMBS bit, do so at the same time as when the CSIHnPWR bit is changed from 0 to 1 .
2. Do not modify CSIHnTXE, CSIHnRXE, or CSIHnMBS while data transmission is pending or going on, i.e. if CSIHnSTRO.CSIHnTSF $=1$.

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Table 17.15 CSIHnCTL1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | - | Reserved |
|  |  | When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 17 | CSIHnCKR | CSIHTSCK Clock Inversion Function |
|  |  | 0 : The default level of CSIHTSCK is high |
|  |  | 1: The default level of CSIHTSCK is low |
|  |  | For details, see Section 17.3.7, CSIHnCFGx - CSIHn Configuration Register $\mathbf{x}$. |
|  |  | CAUTION: Clear the CSIHnCKPx bit in CSIHnCFGx to 0 when this bit is used without the chip select function. |
| 16 | CSIHnSLIT | Selects the timing of interrupt INTCSIHTIC. |
|  |  | 0 : Normal interrupt timing (interrupt is generated after the transfer) |
|  |  | 1: As soon as the contents of the CSIHnTXOW/H register are transferred to the shift register, an interrupt is generated . |
|  |  | For details, see Section 17.4.3, INTCSIHTIC (Communication Status Interrupt). |
| 15 to 14 | - | Reserved |
|  |  | When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 13 to 8 | CSIHnCSLx | Selects the active output level of chip select signal x (CSIHTCSSx). |
|  |  | 0 : Chip select is active low. |
|  |  | 1: Chip select is active high. |
|  |  | For details, see Section 17.5.3, Chip Selection (CS) Features. |
| 7 | CSIHnEDLE | Enables/disables extended data length (EDL) mode. |
|  |  | 0 : Disables extended data length mode. |
|  |  | 1: Enables extended data length mode. |
|  |  | For details, see Section 17.5.7.2, Data Length Greater than 16 Bits. |

Table 17.15 CSIHnCTL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 6 | CSIHnJE | Enables/disables job mode. <br> 0 : Disables job mode. <br> 1: Enables job mode. <br> For details, see Section 17.5.3.3, Job Concept. <br> The CSIHnCTLO.CSIHnJOBE, and CSIHnTXOW.CSIHnEOJ bits are enabled only when CSIHnJE $=1$. <br> Setting this bit in slave mode is prohibited. <br> When CSIHnJE $=0$, interrupt INTCSIHTIC is generated after one unit of data transmission is completed. <br> When CSIHnJE = 1, interrupt INTCSIHTIC is also generated after one unit of data transmission is completed. <br> In the case of CSIHnTXOW.CSIHnEOJ = 1 and CSIHnCTLO.CSIHnJOBE = 1, however, interrupt INTCSIHTIJC is generated instead of INTCSIHTIC. |
| 5 | CSIHnDCS | Enables/disables data consistency check. <br> 0: Disables data consistency check. <br> 1: Enables data consistency check. <br> For details, see Section 17.5.11.1, Data Consistency Check. |
| 4 | CSIHnCSRI | Defines chip select signal behavior after last data transfer. <br> 0 : Chip select signal retains the active level. <br> 1: Chip select signal returns to the inactive level. <br> The last data is determined at the interrupt timing when CSIHnCTL1.CSIHnSLIT is1. |
| 3 | CSIHnLBM | Controls loop-back mode (LBM). <br> 0: Deactivates loop-back mode. <br> 1: Activates loop-back mode. <br> For details, see Section 17.5.12, Loop-Back Mode. |
| 2 | CSIHnSIT | Selects interrupt delay mode. <br> 0 : No delay is generated. <br> 1: Half clock delay is generated for all interrupts. <br> This bit is only valid in master mode. In slave mode, no delay is generated. <br> For details, see Section 17.4.2, Interrupt Delay. |
| 1 | CSIHnHSE | Enables/disables the handshake function. <br> 0 : Disables the handshake function. <br> 1: Enables the handshake function. <br> For details, see Section 17.5.10, Handshake Function. |
| 0 | CSIHnSSE | Enables/disables the slave select function. <br> 0 : Input signal $\overline{\text { CSIHTSSI }}$ is disabled. <br> 1: Input signal $\overline{\text { CSIHTSSI }}$ is recognized. <br> If the slave select function is not used, this bit must be set to 0 (see also Section 17.5.2, Master/Slave Connections). |

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.
Table 17.16 Operation of the Slave Select Function during Reception

| CSIHnCTLO. | CSIHnCTL1. |  |  |
| :--- | :--- | :--- | :--- |
| CSIHnRXE | CSIHnSSE | CSIHTSSI | Receive Operation |
| 0 | - | - | Reception is prohibited |
| 1 | 0 | - | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

Table 17.17 Operation of the Slave Select Function during Transmission

| CSIHnCTL0. | CSIHnCTL1. |  |  |
| :--- | :--- | :--- | :--- |
| CSIHnTXE | CSIHnSSE | CSIHTSSI | Transmit Operation |
| 0 | - | - | Transmission is prohibited |
| 1 | 0 | - | Possible |
| 1 | 1 | 0 | Possible |
| 1 | 1 | 1 | Disabled |

## CAUTION

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.4 CSIHnCTL2 - CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.
For details, see Section 17.5.5, Transmission Clock Selection.

Table 17.18 CSIHnCTL2 Register Contents

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 15 to 13 | CSIHnPRS[2:0] | These bits select the operation mode and the reference clock value. |  |  |  |
|  |  | CSIHnPRS2 | CSIHnPRS1 | CSIHnPRSO | Selection of Reference Clock (PRSOUT) |
|  |  | 0 | 0 | 0 | PCLK (Master mode) |
|  |  | 0 | 0 | 1 | PCLK/2 (Master mode) |
|  |  | 0 | 1 | 0 | PCLK/4 (Master mode) |
|  |  | 0 | 1 | 1 | PCLK/8 (Master mode) |
|  |  | 1 | 0 | 0 | PCLK/16 (Master mode) |
|  |  | 1 | 0 | 1 | PCLK/32 (Master mode) |
|  |  | 1 | 1 | 0 | PCLK/64 (Master mode) |
|  |  | 1 | 1 | 1 | External clock via CSIHTSCK(in) (Slave mode) |
|  |  | CAUTION: Max baud rate configuration is as follows. <br> - Master mode is PCLK/8. <br> - Slave mode is PCLK/20. |  |  |  |
| 12 to 0 | - | Reserved |  |  |  |

In master mode, the following bits are used to set the transfer clock frequency:
CSIHnCTL2.CSIHnPRS[2:0], CSIHnCFGx.CSIHnBRSSx[1:0], CSIHnBRSy.CSIHnBRS[11:0]
In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits are selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSSx[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

| CSIHnCFGx. |  |
| :--- | :--- |
| CSIHnBRSSx[1:0] | Transfer Clock Frequency Setting Bit to be Selected |
| 00 | CSIHnBRS0.CSIHnBRS[11:0] |
| 01 | CSIHnBRS1.CSIHnBRS[11:0] |
| 10 | CSIHnBRS2.CSIHnBRS[11:0] |
| 11 | CSIHnBRS3.CSIHnBRS[11:0] |

The following table shows the relationship between the transfer clock frequency and the transfer clock frequency setting (CSIHnBRSy[11:0]) selected by the CSIHnBRSSx[1:0] bits when the bit value of the CSIHnPRS[2:0] bits is $\alpha$.

| CSIHnBRSy[11:0] | Transfer clock frequency |
| :--- | :--- |
| 0 | BRG stopped |
| 1 | PCLK $/\left(2^{\alpha} \times 1 \times 2\right)$ |
| 2 | PCLK $/\left(2^{\alpha} \times 2 \times 2\right)$ |
| 3 | PCLK $/\left(2^{\alpha} \times 3 \times 2\right)$ |
| 4 | PCLK $/\left(2^{\alpha} \times 4 \times 2\right)$ |
| $\ldots$ | $\ldots$ |
| 4095 | PCLK $/\left(2^{\alpha} \times 4095 \times 2\right)$ |

## CAUTION

Changing the contents of this register is only permitted when CSIHnCTLO.CSIHnPWR $=0$.
When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Table 17.19 CSIHnSTRO Register Contents (1/2)

| Bit Position | Bit Name | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 31 to 8 | - | Reserved |  |  |
| 7 | CSIHnTSF | Transfer Status Flag <br> 0 : Idle state <br> 1: Communication is in progress or being prepared. <br> The timing to set or clear this bit is as follows: |  |  |
|  |  | Master Mode | Timing to Set | Timing to Clear |
|  |  | Transmit-only mode | Data is written to a transmit register (CSIHnTXOW/CSIHnTXOH) | Within a half clock cycle of the last serial clock edge |
|  |  | Receive-only mode |  |  |
|  |  | Slave Mode | Timing to Set | Timing to Clear |
|  |  | Transmit-only mode | Data is written to a transmit register | Within a half clock cycle of |
|  |  | Transmit/receive mode |  |  |
|  |  | Receive-only mode | Input timing of CSIHTSCK |  |
| 6 to 4 | - | Reserved |  |  |
|  |  | When read, the value after reset is read. |  |  |
| 3 | CSIHnDCE | Data Consistency Check Error Flag <br> 0: No data consistency error is detected. <br> 1: Data consistency error is detected. <br> This bit is cleared by writing 1 to CSIHnSTCRO.CSIHnDCEC. <br> When this bit is set to 1 and cleared to 0 simultaneously, setting to 1 is prioritized. <br> This bit is initialized when CSIHnCTLO.CSIHnPWR is changed from 0 to 1 or from 1 to 0 . |  |  |
| 2 | - | Reserved |  |  |
| 1 | CSIHnPE | Parity Error Flag <br> 0: No parity error <br> 1: Parity error is <br> This bit is cleared by <br> When this bit is set <br> This bit is initialized | cted. <br> d. <br> 1 to CSIHnSTCRO.CSIHnPEC <br> d cleared to 0 simultaneously, CSIHnCTLO.CSIHnPWR chang | is prioritized. 1 or from 1 to 0. |

Table 17.19 CSIHnSTR0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | CSIHnOVE | Overrun Error Flag |
|  | $0:$ No overrun error is detected. |  |
|  | $1:$ Overrun error is detected. |  |
|  | For details, see Section 17.5 .11 .2, Parity Check. |  |
|  | This bit is cleared by writing 1 to CSIHnSTCRO.CSIHnOVEC. |  |
|  | When this bit is set to 1 and cleared to 0 simultaneously, setting to 1 is prioritized. |  |
|  | This bit is initialized when CSIHnCTLO.CSIHnPWR changes from 0 to 1 or from 1 to 0. |  |

Table 17.20 Behaviors in Various Direct Access Modes

| Bit Name | Bit Position | Direct Access Mode |
| :--- | :--- | :--- |
| CSIHnTSF | 7 | 0: Idle state <br> 1: Communication is in progress or being prepared |
| CSIHnDCE | 3 | 0: No error is detected. <br> 1: An error is detected. |
| CSIHnPE | 1 | 0: No error is detected. <br> 1: An error is detected. |
| CSIHnOVE | 0 | 0: No error is detected. <br> 1: An error is detected. |

## CAUTION

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.6 CSIHnSTCRO - CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Table 17.21 CSIHnSTCR0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 4 | - | Reserved |
|  |  | When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 3 | CSIHnDCEC | Controls the data consistency error flag clear command. |
|  |  | 0 : No operation. The read value is always 0. |
|  |  | 1: Clears the data consistency error flag (CSIHnSTR0.CSIHnDCE). |
| 2 | - | Reserved |
|  |  | When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 1 | CSIHnPEC | Controls the parity error flag clear command. |
|  |  | 0 : No operation. The read value is always 0 . |
|  |  | 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE). |
| 0 | CSIHnOVEC | Controls the overrun error flag clear command. |
|  |  | 0: No operation. The read value is always 0 . |
|  |  | 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE). |

## CAUTION

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.7 CSIHnCFGx — CSIHn Configuration Register $x(x=0$ to 5)

These eight registers configure the prescaler, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase and data phase, idle enforcement configuration, idle time, hold time, inter-data time, and setup for each chip select signal, CSIHTCSSx.

## Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSO[1:0]: parity usage
- CSIHnDLS0[3:0]: data length selection
- CSIHnDIR0: data direction
- CSIHnCKP0, CSIHnDAP0: clock phase and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG5 registers to 0 .

Value after reset: $00000000_{\mathrm{H}}$

## CAUTION

Rewrite is possible only when CSIHnCTLO.CSIHnPWR = 0 (for write access with the same value, rewrite is possible when CSIHnCTLO.CSIHnPWR = 1).

Table 17.22 CSIHnCFGx Register Contents (1/4)

| Bit Position | Bit Name | Function |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 31, 30 | CSIHnBRSSx[1:0] | These bits select the baud rate setting register (CSIHnBRSy). |  |  |  |
|  |  | CSIHn BRSSx1 | $\begin{aligned} & \text { CSIHn } \\ & \text { BRSSx0 } \end{aligned}$ | Baud Rate Setting Register Selection |  |
|  |  | 0 | 0 | The transfer clock frequency is set according to the CSIHnBRS0 setting. |  |
|  |  | 0 | 1 | The transfer clock frequency is set according to the CSIHnBRS1 setting. |  |
|  |  | 1 | 0 | The transfer clock frequency is set according to the CSIHnBRS2 setting. |  |
|  |  | 1 | 1 | The transfer clock frequency is set according to the CSIHnBRS3 setting. |  |
|  |  | The maximum value for setting the transfer clock frequency, in accordance with the CSIHnCTL2.CSIHnPRS[2:0] setting, must be as follows: |  |  |  |
| 29, 28 | CSIHnPSx[1:0] | Selects the parity for transmitting or receiving chip select signal x . |  |  |  |
|  |  | $\begin{aligned} & \text { CSIHn } \\ & \text { PSx1 } \end{aligned}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { PSx0 } \end{aligned}$ | Transmission | Reception |
|  |  | $0$ | $0$ | Does not transmit any parity bit. | Does not wait for reception of the parity bit. |
|  |  | 0 | 1 | Adds a parity bit fixed to 0 . | Waits for reception of the parity bit but does not evaluate it. |
|  |  | 1 | 0 | Adds an odd parity bit. | Waits for the odd parity bit. |
|  |  | 1 | 1 | Adds an even parity bit. | Waits for the even parity bit. |
| 27 to 24 | CSIHnDLSx[3:0] | Selects the data length for chip select signal x . |  |  |  |
|  |  | CSIHnDLSx[3:0] Data Length |  |  |  |
|  |  | 0000 ${ }_{\text {B }}$ |  | 16 bits |  |
|  |  | 0001в |  | 1 bit |  |
|  |  | $0010_{B}$ |  | 2 bits |  |
|  |  | $\ldots$ |  |  |  |
|  |  | 1111 ${ }^{\text {B }}$ |  | 15 bits |  |
|  |  | CAUTION: When CSIHnTXOW.CSIHnEDL $=1$, the setting of this bit has no effect. When CSIHnTXOW.CSIHnEDL $=0$ (the data length is 16 bits), the setting of this bit is valid. Setting " 1 bit" is only enabled if the previous transmit data was 16 bits with CSIHnEDL $=1$. |  |  |  |
| 23 to 20 | - | Reserved |  |  |  |
| 19 | CSIHnRCBx | Selects the recessive configuration for broadcasting for chip select signal x. <br> 0 : Dominant (higher priority) <br> 1: Recessive (lower priority) <br> For details, see Section 17.5.3.1, Configuration Registers. |  |  |  |
| 18 | CSIHnDIRx | Selects the serial data direction of chip select signal $x$. <br> 0: Data is transmitted/received with MSB first. <br> 1: Data is transmitted/received with LSB first. <br> For details, see Section 17.5.8, Serial Data Direction Selection. |  |  |  |

Table 17.22 CSIHnCFGx Register Contents (2/4)

Table 17.22 CSIHnCFGx Register Contents (3/4)

Table 17.22 CSIHnCFGx Register Contents (4/4)

## CAUTION

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.8 CSIHnTXOW — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

## CAUTION

When CSIHOCTLO.CSIHOTXE $=$ CSIHOCTLO.CSIHORXE $=0$ in direct access mode, write access to this register is prohibited.

| Value after reset: $\quad \mathrm{X} 0 \times X \mathrm{XXXX} \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | $\begin{gathered} \text { CSIHn } \\ \text { EOJ } \end{gathered}$ | $\begin{aligned} & \text { CSIHn } \\ & \text { EDL } \end{aligned}$ | - | - | - | - | - | - | - | $\begin{aligned} & \text { CSIHn } \\ & \text { CS5 } \end{aligned}$ | $\begin{array}{\|c} \hline \text { CSIHn } \\ \text { CS4 } \end{array}$ | $\begin{gathered} \text { CSIHn } \\ \text { CS3 } \end{gathered}$ | $\begin{gathered} \text { CSIHn } \\ \text { CS2 } \end{gathered}$ | $\begin{array}{\|c} \text { CSIHn } \\ \text { CS1 } \end{array}$ | $\begin{array}{\|c} \text { CSIHn } \\ \text { CSO } \end{array}$ |
| Value after reset | 0 | - | - | 0 | 0 | 0 | 0 | 0 | - | - | - | - | - | - | - | - |
| R/W | R | R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | CSIHnTX[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 17.23 CSIHnTXOW Register Contents (1/2)

| Bit Position | Bit name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved <br> When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 30 | CSIHnEOJ | Specifies the end of a job. <br> 0 : Indicates that it is not end-of-job data. The job continues. <br> 1: Indicates end-of-job data. <br> CAUTION: This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE $=1$ ). This bit must be set to 0 in slave mode. |
| 29 | CSIHnEDL | Specifies whether the associated data requires the extended data length (EDL) option. <br> 0 : Normal operation <br> 1: Enables the extended data length. <br> The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. <br> If CSIHnCTL1.CSIHnEDLE $=1$ and CSIHnTX0W.CSIHnEDL $=1$, the subsequent data must have the same CS selection. If CS is modified for the subsequent data, the correct operation is not assured. <br> CAUTION: This bit is only available if CSIHnCTL1.CSIHnEDLE $=1$. |
| 28 to 24 | - | Reserved <br> When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 23, 22 | - | Reserved <br> When read, the value returned is undefined. The write value should be 1 . |

Table 17.23 CSIHnTXOW Register Contents (2/2)

| Bit Position | Bit name | Function |
| :---: | :---: | :---: |
| 21 to 16 | $\begin{aligned} & \text { CSIHnCSx } \\ & (x=5 \text { to } 0) \end{aligned}$ | Activates one or more chip select signals. <br> 0 : Activates chip select signals x for the associated transmission. <br> 1: Deactivates chip select signals $x$ for the associated transmission. <br> Setting bits 23 to $16=\mathrm{FF}_{\mathrm{H}}$ is prohibited. <br> CAUTION: If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx $=0$ (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the bits 23 to 16 are $\mathrm{FE}_{\mathrm{H}}$. |
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |
| CAUTION |  |  |
| When setting this register, see Table 17.35, Notes on Setting Registers. |  |  |

### 17.3.9 CSIHnTXOH — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.
The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after reset.

## CAUTION

When CSIHOCTLO.CSIHOTXE $=$ CSIHOCTLO.CSIHORXE $=0$ in direct access mode, write access to this register is prohibited.

Table 17.24 CSIHnTXOH Register Contents

| Bit Position | Bit name | Function |  |
| :--- | :--- | :--- | :---: |
| 15 to 0 | CSIHnTX[15:0] | Stores the transmission data. |  |
| CAUTION |  |  |  |
| When setting this register, see Table 17.35, Notes on Setting Registers. |  |  |  |

### 17.3.10 CSIHnRXOW — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

## CAUTION

This register can be read while CSIHnCTLO.CSIHnPWR $=1$.
This register is initialized when CSIHnCTLO.CSIHnPWR changes from 0 to 1 or from 1 to 0 .

Table 17.25 CSIHnRXOW Register Contents

| Bit Position | Bit name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 25 | CSIHnRPE | Indicates whether a reception data parity error was detected. |
|  |  | 0: No parity error was detected on the associated reception data. |
|  |  | 1: A parity error was detected on the associated reception data. |

Read this register at least one serial clock cycle before an interrupt is generated.

## CAUTION

## When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.11 CSIHnRXOH — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

## CAUTION

This register can be read while CSIHnCTLO.CSIHnPWR $=1$.
This register is initialized when CSIHnCTLO.CSIHnPWR changes from 0 to 1 or from 1 to 0 .

## Value after reset: Undefined

Table 17.26 CSIHnRXOH Register Contents

| Bit Position | Bit name | Function |
| :--- | :--- | :--- |
| 15 to 0 | CSIHnRX[15:0] | Stores the received data. |
| CAUTION |  |  |

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.12 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y=0 to 3)

This register sets the transfer clock frequency for each chip select signal.
With CSIHnCFG0 to 5.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency setting, see Section 17.5.5,

## Transmission Clock Selection.

| Value after reset: $0000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | CSIHnBRS[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 17.27 CSIHnBRSy Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is read. When writing to these bits, write the value after reset. |
| 11 to 0 | CSIHnBRS[11:0] | 0: BRG stopped |
|  |  | 1: PCLK / $\left(2^{\alpha} \times 1 \times 2\right)$ |
|  |  | 2: PCLK / $\left(2^{\alpha} \times 2 \times 2\right)$ |
|  |  | 3: PCLK / ( $\left.2^{\alpha} \times 3 \times 2\right)$ |
|  |  | 4: PCLK / $\left(2^{\alpha} \times 4 \times 2\right)$ |
|  |  | . |
|  |  |  |
|  |  | 4095: PCLK / ( $\left.2^{\alpha} \times 4095 \times 2\right)$ |
|  |  | $\alpha$ is the value of CSIHnCTL2.CSIHnPRS[2:0]. |

## CAUTION

When setting this register, see Table 17.35, Notes on Setting Registers.

### 17.3.13 CSIHnEIE - CSIHn Interrupt Control Register

This register controls enabling or disabling the interrupt of CSIH.

Table 17.28 CSIHnEIE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved <br> When read, the value after reset is read. |
| 3 | CSIHnEIJE | This bit enables or disables the INTCSIHTIJC interrupt. |
|  |  | 0: Disable the INTCSIHTIJC interrupt. |
|  | 1: Enable the INTCSIHTIJC interrupt. |  |
| 2 | CSIHnEIEE | This bit enables or disables the INTCSIHTIRE interrupt. |
|  |  | 0: Disable the INTCSIHTIRE interrupt. |
|  |  | 1: Enable the INTCSIHTIRE interrupt. |
| 1 | CSIHnEIRE | This bit enables or disables the INTCSIHTIR interrupt. |
|  |  | 0: Disable the INTCSIHTIR interrupt. |
|  |  | 1: Enable the INTCSIHTIR interrupt. |
| 0 | CSIHnEICE | This bit enables or disables the INTCSIHTIC interrupt. |
|  |  | 0: Disable the INTCSIHTIC interrupt. |
|  |  | 1: Enable the INTCSIHTIC interrupt. |

## CAUTIONS

1. Even when the extended communication function is disabled (CSIHnECTLO.CSIHnEEN $=0$ ), enabling or disabling the interrupt of CSIH is effective. When all interrupts of CSIH are used, specify settings to enable all interrupt outputs (CSIHnEIE[3:0] = 11118).
2. Specify settings to enable or disable interrupt output while communication is not performed. If the settings are specified during communication, the interrupt output operation is not guaranteed.

### 17.3.14 CSIHnECTLO — CSIHn Extended Communication Control Register 0

This register is used to control the operation of the extended communication function.

Table 17.29 CSIHnECTLO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 7 | CSIHnEEN | This bit enables or disables the extended communication function. |
|  |  | 0: Disable the extended communication function. |
|  | 1: Enable the extended communication function. |  |
| 6 to 0 | - | Reserved |
|  |  | When read, the value after reset is read. |

### 17.3.15 CSIHnECTL1 — CSIHn Extended Communication Control Register 1

This register is used to control the operation of the extended communication function.

Table 17.30 CSIHnECTL1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | CSIHnEDIR | This bit specifies the data transfer direction when the extended communication function is <br> enabled. |

> 0: MSB-first
> 1: LSB-first

| 30 |  | Reserved <br> When read, the value after reset is read. |
| :--- | :--- | :--- |
| 29 to 28 | CSIHnEDS[1:0] | These bits specify the communication data size when the extended communication function is |
| enabled. |  |  |
|  | $00: 8$ bits |  |
|  |  |  |
|  |  |  |
|  | $10: 16$ bits |  |
|  | $11:$ Setting prohibited |  |

27 to 24 CSIHnETC[3:0] These bits specify the number of communications when the extended communication function is enabled.

0000: 1 extended communications
0001: 2 extended communications
0010: 3 extended communications
0011: 4 extended communications
0100: 5 extended communications
0101: 6 extended communications
0110: 7 extended communications
0111: 8 extended communications
1000: 9 extended communications
1001: 10 extended communications
1010: 11 extended communications
1011: 12 extended communications
1100: 13 extended communications
1101: 14 extended communications
1110: 15 extended communications
1111: 16 extended communications

Table 17.30 CSIHnECTL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 23 to 16 | CSIHnECS[7:0] | When CSIH is in master mode, these bits specify whether to activate the CSx when the extended communication function is enabled. ( $x=0$ to 5 ) |
|  |  | 0 : Activate the CSx. |
|  |  | 1: Deactivate the CSx. |
|  |  | It is prohibited to perform communication with these bits set to $\mathrm{FF}_{\mathrm{H}}$. |
|  |  | When CSIH is in slave mode, set these bits set to $\mathrm{FE}_{\text {H }}$. |
|  |  | Individual bits correspond to slaves as follows: |
|  |  | CSIHnECS7: Setting prohibited |
|  |  | CSIHnECS6: Setting prohibited |
|  |  | CSIHnECS5: CS5 |
|  |  | CSIHnECS4: CS4 |
|  |  | CSIHnECS3: CS3 |
|  |  | CSIHnECS2: CS2 |
|  |  | CSIHnECS1: CS1 |
|  |  | CSIHnECS0: CS0 |
| 15 to 0 | - | Reserved |
|  |  | When read, the value after reset is read. |

### 17.3.16 CSIHnETXDAm - CSIHn Extended Communication Transmit Data Register m ( $m=0$ to 15)

This register is used to control the operation of the extended communication function.

Table 17.31 CSIHnETXDAm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CSIHnETXDAm[31:0] | These bits retain the data transmitted by the extended communication function. |

## CAUTION

Access to this register must be done in the same bit mode as the transfer data size.
When the communication data size is 8 bits, access to this register must be 8-bit access.
When the communication data size is 16 bits, access to this register must be 16-bit access.
When the communication data size is 32 bits, access to this register must be 32-bit access.

### 17.3.17 CSIHnERXDAm - CSIHn Extended Communication Receive Data Register m (m = 0 to 15)

This register is used to control the operation of the extended communication function.

Table 17.32 CSIHnERXDAm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CSIHnERXDAm[31:0] | These bits retain the data received by the extended communication function. |

## CAUTIONS

1. Access to this register must be done in the same bit mode as the transfer data size.

When the communication data size is 8 bits, access to this register must be 8-bit access.
When the communication data size is 16 bits, access to this register must be 16-bit access.
When the communication data size is 32 bits, access to this register must be 32-bit access.
2. When transfer completion interrupt "INTCSIHTIJC" occurs, these registers (reception data) must be read only once.

### 17.3.18 CSIHnESTT — CSIHn Extended Communication Stop Trigger Register

This register is used to control the operation of the extended communication function.
Value after reset: $00000000_{\mathrm{H}}$

Table 17.33 CSIHnESTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved <br>  <br> 0 |
| CSIHnESTRG | When read, the value after reset is read. |  |
|  | This bit stops the extended communication of CSIHn. |  |
|  | Writing 1 to this bit stops the communication. |  |
|  | Writing 0 to this bit is ignored. |  |
|  | The value read from this bit is always 0. |  |

For details about the stop trigger register, see Section 17.5.14.2, Extended Communication Stop Function.

### 17.3.19 CSIHnESTF - CSIHn Extended Communication Status Register

This register is used to control the operation of the extended communication function.

Table 17.34 CSIHnESTF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 7 | CSIHnETSF | This bit is a flag that indicates the status of the extended communication. |
|  |  | 0: Extended communication stopped |
|  | 1: Extended communication in progress |  |

|  | This bit is cleared to 0 when CSIHnECTLO.CSIHnEEN changes from 1 to 0. |  |
| :--- | :--- | :--- |
| 6 to 5 | - | Reserved <br> When read, the value after reset is read. |
| 4 to 0 | CSIHnETCF[4:0] | These bits are the flags to indicate the transfer count in extended communication. |
|  | Flags that indicate the remaining number of 32-bit communications: |  |

0 : 0 communications remaining
1: 1 communication remaining
2: 2 communications remaining
3: 3 communications remaining
4: 4 communications remaining
5: 5 communications remaining
6: 6 communications remaining
7: 7 communications remaining
8: 8 communications remaining
9: 9 communications remaining
10: 10 communications remaining
11: 11 communications remaining
12: 12 communications remaining
13: 13 communications remaining
14: 14 communications remaining
15: 15 communications remaining
16: 16 communications remaining

This bit is cleared to $0000_{B}$ when CSIHnECTLO.CSIHnEEN changes from 1 to 0 .

### 17.3.20 List of Cautions

Table 17.35 Notes on Setting Registers

| Register Name | Bit Name | Cautions |
| :---: | :---: | :---: |
| CSIHnCTLO | CSIHnPWR | If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, it is necessary to restart the communication. |
| CSIHnCTLO | CSIHnTXE CSIHnRXE | Do not modify any of these bits while CSIHnCTLO.CSIHnPWR $=0$. (These bits can be modified at the same time as the CSIHnCTLO.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted. |
| CSIHnCTLO | CSIHnJOBE | Do not modify this bit while CSIHnCTLO.CSIHnPWR $=0$. This bit is only valid when CSIHnCTL1.CSIHnJE $=1$. Setting this bit is prohibited in slave mode. |
| CSIHnCTLO | CSIHnMBS | Do not modify this bit while CSIHnCTLO.CSIHnPWR $=0$. (This bit can be modified at the same time as the CSIHnCTLO.CSIHnPWR bit.) <br> Modification of this bit is only permitted while CSIHnSTR0.CSIHnTSF $=0$. |
| CSIHnCTL1 | CSIHnCKR | Modification of this bit is only permitted while CSIHnCTLO.CSIHnPWR $=0$. When CS is not used, use this bit instead of CSIHnCFGx.CSIHnCKPx and set CSIHnCFGx.CSIHnCKPx to 0 . <br> This bit must be used in slave mode. |
| CSIHnCTL1 | CSIHnSLIT <br> CSIHnCSL[5:0] <br> CSIHnEDLE <br> CSIHnDCS <br> CSIHnCSRI <br> CSIHnHSE | Modification of these bits is only permitted while CSIHnCTLO.CSIHnPWR $=0$. |
| CSIHnCTL1 | CSIHnJE CSIHnLBM | Modification of these bits is only permitted while CSIHnCTLO.CSIHnPWR $=0$. Setting of these bits are prohibited in slave mode. |
| CSIHnCTL1 | CSIHnSSE | Modification of this bit is only permitted while CSIHnCTLO.CSIHnPWR $=0$. Setting this bit to 1 is prohibited in master mode. |
| CSIHnCTL1 | CSIHnSIT | Modification of this bit is only permitted while CSIHnCTLO.CSIHnPWR $=0$. This bit is only valid in master mode. In slave mode, no delay is generated. |
| CSIHnCTL2 | CSIHnPRS[2:0] | Modification of these bits are only permitted while CSIHnCTLO.CSIHnPWR $=0$. <br> Setting of the maximum transfer clock frequency is as follows. <br> Master mode: 10.0 MHz (however, it must be equal to or lower than PCLK/8) <br> Slave mode: 4.0 MHz (however, it must be equal to or lower than PCLK/20) |
| CSIHnSTR0 | CSIHnTSF | Writing to this bit is prohibited, and only reading is permitted. |
| CSIHnSTR0 | CSIHnDCE <br> CSIHnPE <br> CSIHnOVE | These bits are initialized when CSIHnCTLO.CSIHnPWR $=0 \rightarrow 1$ or CSIHnCTLO.CSIHnPWR $=1 \rightarrow 0$. <br> Writing to these bits are prohibited, and only reading is permitted. |
| $\begin{aligned} & \text { CSIHnCFGx } \\ & x=0 \text { to } 5 \end{aligned}$ | CSIHnBRSSx[1:0] <br> CSIHnRCBx <br> CSIHnIDLx <br> CSIHnIDx[2:0] <br> CSIHnHDx[3:0] <br> CSIHnINx[3:0] <br> CSIHnSPx[3:0] | Modification of these bits are only permitted while CSIHnCTLO.CSIHnPWR $=0$. These bits must be set to 0 in slave mode. |
| $\begin{aligned} & \text { CSIHnCFGx } \\ & x=0 \text { to } 5 \end{aligned}$ | CSIHnPSx[1:0] <br> CSIHnDLSx[3:0] <br> CSIHnDIRx <br> CSIHnDAPx | Modification of these bits are only permitted while CSIHnCTLO.CSIHnPWR $=0$. <br> In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG5 must be set to 0 . |

Table 17.35 Notes on Setting Registers

| Register Name | Bit Name | Cautions |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { CSIHnCFGx } \\ & x=0 \text { to } 5 \end{aligned}$ | CSIHnCKPx | Modification of these bits are only permitted while CSIHnCTLO.CSIHnPWR $=0$. <br> Set these bits to 0 as CSIHnCTL1.CSIHnCKR must be used in slave mode. <br> If CS is not used, use the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear these bits to 0 . |
| CSIHnTXOW | CSIHnEOJ | This bit is only valid when CSIHnCTL1.CSIHnJE $=1$. <br> While CSIHnCTL1.CSIHnJE $=0$, values of this bit is ignored even if 1 is read. Set this bit to 0 in slave mode. |
| CSIHnTXOW | CSIHnEDL | This bit is only valid when CSIHnCTL1.CSIHnEDLE $=1$. <br> While CSIHnCTL1.CSIHnEDLE $=0$, the value of this bit is ignored even if 1 is read. |
| CSIHnTXOW | CSIHnCS[5:0] | In master mode, setting bits 23 to $16=" F_{H}$ " is prohibited. In slave mode, set these bits to " $F E_{H}$ ". |
| CSIHnTXOW CSIHnTXOH |  | While CSIHnCTLO.CSIHnTXE = CSIHnCTLO.CSIHnRXE $=0$, writing to these bits are prohibited in direct access mode. |
| CSIHnRXOW CSIHnRXOH |  | These bits are initialized when CSIHnCTLO.CSIHnPWR $=0 \rightarrow 1$ or CSIHnCTLO.CSIHnPWR $=1 \rightarrow 0$. |
| CSIHnBRSy $y=0 \text { to } 3$ |  | Modification of these bits is only permitted while CSIHnCTLO.CSIHnPWR $=0$. <br> The maximum baud rates are determined in combination with the setting of the CSIHnCTL2.PRS[2:0] bits and are as follows. <br> Master mode: PCLK/8 <br> Slave mode: PCLK/20 |

Table 17.36 Precautions on Extended Communication Function

### 17.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHTIC (communication status interrupt)
- INTCSIHTIR (reception status interrupt)
- INTCSIHTIRE (communication error interrupt)
- INTCSIHTIJC (job completion interrupt)

### 17.4.1 Overview

The communication error interrupt INTCSIHTIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and - in case of the job completion interrupt INTCSIHTIJC also the operating mode.

The job completion interrupt INTCSIHTIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE $=1$ ). It is not available in slave mode.

All of the interrupt requests are controlled by the CSIHnEIE register.
To enable each of the interrupt request must be set to 1 each bit of the CSIHnEIE register.
The following table gives an overview.

Table 17.37 Interrupt Generation

| Memory Mode | Interrupt | Interrupt Source |  |
| :---: | :---: | :---: | :---: |
|  |  | Job Mode Disabled CSIHnCTL1.CSIHnJE $=0$ | Job Mode Enabled CSIHnCTL1.CSIHnJE = 1 |
| Direct access | INTCSIHTIC | One data transfer | One data transfer except the state of job abort*1 |
|  | INTCSIHTIR | Data received and CSIHnCTLO.CSIHnRXE $=1$ | Data received and CSIHnCTLO.CSIHnRXE $=1$ |
|  | INTCSIHTIRE | Error detected | Error detected |
|  | INTCSIHTIJC*2 | Not applicable | Job abort*1 |

Note 1. Job abort condition: CSIHnTXOW.CSIHnEOJ $=1$ and CSIHnCTLO.CSIHnJOBE $=1$
Note 2. INTCSIHTIJC is not available in slave mode.

### 17.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT $=1$. (The setting of the CSIHnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT $=1$ (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0$ (clock phase and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] $=1000_{\text {B }}$ (data length 8 bits).

Figure 17.2 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the present chip select signal (CSIHTCSSx).

### 17.4.3 INTCSIHTIC (Communication Status Interrupt)

Depending on the job mode, this interrupt is generated according to the conditions shown in the following table.
Table 17.38 INTCSIHTIC Interrupt Generation

| Memory Mode | Cause of Interrupt |  |
| :--- | :--- | :--- |
|  | Job Mode Disabled <br> CSIHnCTL1.CSIHnJE $=0$ | Job Mode Enabled <br> CSIHnCTL1.CSIHnJE $=1$ |
|  | Generated after every data transfer. | Generated after every data transfer, except when the <br> communication was aborted. |

### 17.4.3.1 INTCSIHTIC in Direct Access Mode

The examples below show the INTCSIHTIC behavior in direct access mode.
The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase
$($ CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0)$
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000 ${ }_{\mathrm{B}}$ )
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Enable the INTCSIHTIC (CSIHnEIE.CSIHnEICE = 1)

Figure 17.3 Generation of INTCSIHTIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is sent with
CSIHnTXOW.CSIHnEOJ $=1$ and communication stop is requested (CSIHnCTL0.CSIHnJOBE $=1$ ), then INTCSIHTIC is replaced by the job completion interrupt INTCSIHTIJC.

INTCSIHTIC can also be set up to occur as soon as the CSIHnTX0W/H register becomes empty and available for storing the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT $=1$.

The effect is illustrated in the figure below.

Figure 17.4 Immediate Generation of INTCSIHTIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.
NOTE
This mode allows faster data transfer but is only available in direct access mode.

### 17.4.3.2 INTCSIHTIC in Job Mode

The example below shows the INTCSIHTIC behavior in job mode.
The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase
$($ CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0)$
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] $=1000_{\mathrm{B}}$ )
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT $=0$ )
- Enable the INTCSIHTIC (CSIHnEIE.CSIHnEICE = 1)

Figure 17.5 Generation of INTCSIHTIC in Job Mode

The rules for generating INTCSIHTIC in job mode are shown in the following table.
Table 17.39 Generation of INTCSIHTIC in Job Mode

| CSIHnTXOW.CSIHnEOJ | INTCSIHTIC |
| :--- | :--- |
| 0 | Generated |
| 1 | CSIHnCTLO.CSIHnJOBE $=0:$ Generated |
|  | CSIHnCTLO.CSIHnJOBE $=1:$ Not generated, replaced by interrupt INTCSIHTIJC |

### 17.4.4 INTCSIHTIR (Reception Status Interrupt)

This interrupt is generated according to the conditions below.
Table 17.40 INTCSIHTIR Interrupt Generation

|  |  |  |
| :--- | :--- | :--- |
|  | Job Mode Disabled <br> CSIHnCTL1.CSIHnJE $=0$ | Cause of Interrupt |
| Memory Mode | Generated after every data transfer. | Job Mode Enabled <br> CSIHnCTL1.CSIHnJE = 1 |
| Direct access |  |  |

### 17.4.4.1 INTCSIHTIR in Direct Access Mode

The example below shows the INTCSIHTIR behavior in direct access mode.
The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock phase and data phase
$($ CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0)$
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] $=1000_{\mathrm{B}}$ )
- Enable the INTCSIHTIR (CSIHnEIE.CSIHnEIRE = 1)

Figure 17.6 Generation of INTCSIHTIR in Direct Access Mode

### 17.4.5 INTCSIHTIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.
For details about interrupt generation timing, see Section 17.5.11, Error Detection.
Table 17.41 Data Error Types

| Error Type | Communication Status after Error Interrupt | Note |
| :--- | :--- | :--- |
| Parity error | Communication continues even if an interrupt is <br> generated. | - |
| Data consistency error | Communication continues even if an interrupt is <br> generated. | - |
| Overrun error | Communication continues even if an interrupt is | This error interrupt is only generated when <br> generated. |
|  | CSIHnCTL1.CSIHnHSE $=0$ (without handshake) in <br> slave mode. |  |

The type of error that caused the generation of INTCSIHTIRE is flagged in register CSIHnSTR0.
Additionally a parity error flag and a data consistency error flag are attached to the received data in CSIHnRX0W.
For details about the various error types, see Section 17.5.11, Error Detection.

### 17.4.6 INTCSIHTIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs. For details, see Section 17.5.3.3, Job Concept. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE $=1$. When CSIHnCTL1.CSIHnJE $=0$, INTCSIHTIJC is not generated.
this interrupt is generated according to the condition shown in the following table.
Table 17.42 INTCSIHTIJC Interrupt Generation

|  | Job Mode Disabled | Job Mode Enabled |
| :--- | :--- | :--- |
| Memory Mode | CSIHnCTL1.CSIHnJE =0 | CSIHnCTL1.CSIHnJE =1 |

Note 1. Job abort condition: CSIHnTXOW.CSIHnEOJ = 1 and CSIHnCTLO.CSIHnJOBE $=1$

### 17.5 Operation

### 17.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in, the master or slave mode determines the source of the serial clock.

### 17.5.1.1 Master Mode

In master mode, the serial transmission clock is generated by the internal baud rate generator (BRG) and supplied to the slave(s) via CSIHTSCK signal.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to values other than $111_{\mathrm{B}}$. In master mode, the BRG frequency can be specified by setting the CSIHnCTL2.CSIHnPRS[2:0] bits in combination with the CSIHnBRSy.CSIHnBRS[11:0] bits.

## (1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details, see Section 17.5.3, Chip Selection (CS) Features.

## (2) Clock defaults

The default level of CSIHTSCK depends on the clock inversion function bit of the CSIHTSCK, and is high when CSIHnCTL1.CSIHnCKR $=0$ and is low when CSIHnCTL1.CSIHnCKR $=1$.

The example below shows the communication in master mode for 8-bit data, CSIHnCTL1.CSIHnCKR $=0$, CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0$, and MSB first.

Figure 17.7 Transmission/Reception in Master Mode

### 17.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Normal transmit/receive operation is started as soon as a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to $111_{\mathrm{B}}$.
In slave mode, the transmission protocol setting by the CSIHnCFG0 registers are enabled (setting of the CSIHnCFG1CSIHnCFG7 register is disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock phase and data phase

NOTE
When using slave mode, disable the baud rate generator (BRG) by setting the CSIHnBRSy.CSIHnBRS[11:0] bits to 000 H .

Figure 17.8 Transmission/Reception in Slave Mode

### 17.5.2 Master/Slave Connections

### 17.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

Figure 17.9 Direct Master/Slave Connection

### 17.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text { CSIHTSSI }}$ of the slave.

The $\overline{\text { CSIHTSSI }}$ signal can be enabled/disabled by using the CSIHnCTL1.CSIHnSSE bit.

Figure 17.10 Connections between One Master and Multiple Slaves

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its CSIHTSSI signal is low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIHnCTLO.CSIHnTXE $=1$ ), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

### 17.5.3 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or more slaves for communication.

### 17.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be sent or received.
(CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first.
(CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none.
(CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase.
(CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Individual selection of the baud rate generator prescaler for each chip select signal
(CSIHnCFGx.CSIHnBRSSx[1:0])
- Chip select priority: Categorizes chip select signals into "dominant" and "recessive". The priority applies if two or more chip select signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called "Recessive Configuration for Broadcasting" (RCB).

## CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
- Setup time Tsetup: The time from when the CS signal becomes active to the start of data output. (CSIHnCFGx.CSIHnSPx[3:0])
- Inter-data time Tinter: The time between one data and the next data while the same CS signal is active. (CSIHnCFGx.CSIHnINx[3:0])
- Hold time Thold: The time during which the CS signal remains active until CS is switched. (CSIHnCFGx.CSIHnHDx [3:0])
- Idle time Tidle: Inactive time after terminating a CS signal or after every data transfer to the same CSx. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When CSIHnCFGx.CSIHnIDLx bit is set to 1, IDLE time is inserted for every transfer regardless of CS signal.

Figure $\mathbf{1 7 . 1 1}$ provides an example of when the default active low setting is specified for the CSIHTCSS1 and CSIHTCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit $=0$, CSIHnCTL1.CSIHnCSL2 bit $=0$ ). The active level can be specified individually for each CS.

Figure 17.11 Chip Select Timings

Note that each CS signal can have a different value for the setup time,, inter-data time, hold time, and idle time.
A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

### 17.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.
The first communication uses CS0 to communicate with one slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to "recessive: low priority" and the priority of CS1 to "dominant: high priority". Consequently, the second communication is conducted using the CS1 settings, which are set as dominant.

Figure 17.12 Chip Select and RCB Example

### 17.5.3.3 Job Concept

In CSIH, a job consists of the number of data targeted for transfer.

## Job Mode Enable

The job mode can only be enabled in master mode. The job mode is enabled and disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR $=0$.

Figure 17.13 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ $=1$.
Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until the data for which the CSIHnEOJ bit is set is transmitted. After this data is sent, the communication is stopped and the job completion interrupt INTCSIHTIJC is generated.

### 17.5.4 Details of Chip Select Timing

### 17.5.4.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx can be changed while communication is stopped. The minimum value of an idle time is one transmission clock (CSIHTSCK(out)) cycle.

If the idle time is set to 0.5 transmission clock cycles (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data is sent with different CSIHnCFGx.CSIHnCKPx configuration, the idle time is automatically extended to one CSIHTSCK (out) cycle.

Figure 17.14 Clock Phase Timing with PCLK/8, Thold0 $=$ Tsetup1 $=0.5$ CSIHTSCK, Tidle0 $=0.5 C S I H T S C K$, CSIHnCFG0.CSIHnCKP0 $=0($ CSIHTCSS0 $) \rightarrow$ CSIHnCFG1.CSIHnCKP1 $=1$ (CSIHTCSS1)

Figure 17.15 Clock Phase Timing with PCLK/8, Thold0 = Tsetup1 = 0.5CSIHTSCK, Tidle0 = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 $=0$ (CSIHTCSS0) $\rightarrow$ CSIHnCFG1.CSIHnCKP1 $=1$ (CSIHTCSS1)

Figure 17.16 Clock Phase Timing with PCLK/8, Thold0 $=$ Tsetup1 $=0.5$ CSIHTSCK, Tidle0 $=0.5 C S I H T S C K$, CSIHnCFG0.CSIHnCKP0 $=0$ (CSIHTCSS0) $\rightarrow$ CSIHnCFG2.CSIHnCKP2 $=0$ (CSIHTCSS2)

### 17.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.
The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup periods is as follows:
Hold time is the period from the last edge of the serial clock (CSIHTSCK) until the signals on CSIHTCSS[5:0] change to the inactive level.

Setup time is the period from when the signals on CSIHTCSS[5:0] change to the active level to when the transmission data (CSIHTSO) is output.

Therefore, there is a gap of 0.5 CSIHTSCK cycles until the edge of the serial clock signal (CSIHTSCK) is output according to the CSIHnCFGx.CSIHnDAPx setting.

Figure 17.17 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 $=0$ and CSIHnCFG2.CSIHnCKP2 $=0$, CSIHnCFG2.CSIHnDAP2 $=0$

Figure 17.18 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 $=0$ and CSIHnCFG2.CSIHnCKP2 $=0$, CSIHnCFG2.CSIHnDAP2 $=1$

### 17.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0]
- CSIHnCFGx.CSIHnBRSSx[1:0]

The transfer clock frequency of transmission clock CSIHTSCK is determined by the setting of the CSIHnCTL2.CSIHnPRS[2:0] bits and the setting of the CSIHnBRSy.CSIHnBRS[11:0] bits, but any one of CSIHnBRS3 to CSIHnBRS0 can be selected for each chip select signal by using the CSIHnCFGx.CSIHnBRSSx[1:0] bits.

The following figure shows a block diagram of the baud rate generator.

Figure 17.19 Baud Rate Generator Block Diagram

By setting CSIHnBRSy.CSIHnBRS[11:0] to $000_{\mathrm{H}}$, the baud rate generator is disabled and all CSIHTSCK are stopped.

### 17.5.5.1 Transfer Clock Frequency Calculation

The transfer clock frequency in master mode is calculated as:
Transfer clock frequency $(\operatorname{CSIHTSCK})=\operatorname{PCLK} /($ division ratio of PCLK $)=\operatorname{PCLK} /\left(2^{\alpha} \times \mathrm{k} \times 2\right)$, where:

$$
\alpha=\text { CSIHnCTL2.CSIHnPRS[2:0] }=0 \text { to } 6
$$

$\mathrm{k}=$ CSIHnBRS0.CSIHnBRS[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] $=00_{\mathrm{B}}$ )
CSIHnBRS1.CSIHnBRS[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = 01 ${ }_{\mathrm{B}}$ )
CSIHnBRS2.CSIHnBRS[11:0] $=1$ to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = $10_{\mathrm{B}}$ )
CSIHnBRS3.CSIHnBRS[11:0] = 1 to 4095 (when CSIHnCFGx.CSIHnBRSSx[1:0] = $11_{\mathrm{B}}$ )

### 17.5.5.2 Transfer Clock Frequency Upper and Lower Limits

When setting the transfer clock frequency, please note the following.

- The minimum transfer clock frequency in master mode and slave mode is PCLK/524160.
- The maximum transfer clock frequency is as follows:
- In master mode: 10.0 MHz (however, it must be up to PCLK/8)
- In slave mode: 4.0 MHz (however, it must be up to PCLK/20)

### 17.5.6 Data Transfer Modes

### 17.5.6.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE $=1$ and CSIHnCTL0.CSIHnRXE $=0$ puts the CSIH in transmit-only mode .

- In case of direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.

### 17.5.6.2 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE $=0$ and CSIHnCTL0.CSIHnRXE $=1$ puts the CSIH in receive-only mode.

- In case of direct access mode, reception starts when dummy data is written to the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

### 17.5.6.3 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE $=1$ and CSIHnCTL0.CSIHnRXE $=1$ puts the CSIH in transmit/receive mode.

- In case of direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.

### 17.5.6.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 17.43 Start of Data Transfer

|  |  | Transfer Mode |  |
| :--- | :--- | :--- | :--- |
| Operating Mode | Transmit-Only <br> Transmit/Receive | Receive-Only |  |
| Direct access | Master | Writing to the CSIHnTXOW register or the <br> CSIHnTXOH register | Writing to the CSIHnTXOW register or the <br> CSIHnTXOH register |
|  | Slave | Clock reception from master | Incoming clock from master |

### 17.5.7 Data Length Selection

### 17.5.7.1 Data Length from 2 to 16 Bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx $=0$ ).

Data length $=16$ bits $\left(\right.$ CSIHnCFGx.CSIHnDLSx[3:0] $\left.=0000_{\mathrm{B}}\right)$ :

Figure 17.20 16 Bit Data Length, MSB First

Data length $=14$ bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110 ${ }_{B}$ ):

Figure 17.2114 Bit Data Length, MSB First

### 17.5.7.2 Data Length Greater than 16 Bits

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) function can be used.
EDL function is enabled by setting the CSIHnCTL1.CSIHnEDLE bit to 1 .
EDL function works as follows:

- The data has to be broken into 16-bit blocks plus remainder. For example, data of 42 bits would be broken into two 16-bit blocks plus 10 bits.
- The bit length of the remainder is set as "data length" in CSIHnCFGx.CSIHnDLSx[3:0].
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1 . In this case, the data written to CSIHnTX0W is sent as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL $=0$ ) has been sent.

## Example

Example of transmitting 40-bit data $\left(123456789 A_{H}\right)$ to CS0:
40 bits are split into two blocks of 16-bit blocks and 8 bits.

- Initialize to CSIHnCFG0.CSIHnDLS0[3:0] $=8$.
- To transmit $123456789 \mathrm{~A}_{\mathrm{H}}$ with MSB first, write the following sequence to CSIHnTX0W:
- 20FE 1234 ${ }_{\text {H }}($ CSIHnTX0W.CSIHnEDL = 1)
- 20FE 5678 (CSIHnTX0W.CSIHnEDL = 1)
$-00 \mathrm{FE} 009 \mathrm{~A}_{\mathrm{H}}(\mathrm{CSIHnTX} 0 \mathrm{~W} . \mathrm{CSIHnEDL}=0)$

The following figure illustrates the timing.

Figure 17.22 EDL Timing Diagram

## NOTES

1. 1-bit data length is allowed only when using the EDL mode.
2. If parity is enabled, the parity bit is added after the last bit.
3. When data is sent using extended data length (EDL) function, use the same chip select signal.
4. Example for configuring the data direction:

- Data to be sent:123456H
- MSB first:

Set CSIHnCFGx.CSIHnDIRx $=0$
Write CSIHnTXOW = 20FE 1234 $($ EDL bit $=1)$
Write CSIHnTXOW = 00FE 0056 $($ EDL bit $=0)$

- LSB first:

Set CSIHnCFGx.CSIHnDIRx $=1$
Write CSIHnTXOW = 20FE 3456 $($ EDL bit $=1)$
Write CSIHnTXOW = 00FE 0012 $\quad($ EDL bit $=0)$
5. Operation is not guaranteed if CSIHnTXOW.CSIHnEOJ and CSIHnTXOW.CSIHnEDL are simultaneously set to "1" while CSIHnCTL1.CSIHnJE $=1$ and CSIHnCTL1.CSIHnEDLE $=1$.
6. EDL mode cannot be used in receive-only mode of slave mode.
(CSIHnCTL2.CSIHnPRS[2:0] = 111в, CSIHnCTLO.CSIHnTXE = 0, CSIHnCTLO.CSIHnRXE = 1)

### 17.5.8 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal using the CSIHnDIRx bit in the CSIHnCFGx register.
The examples below show communication for a data length of 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000 ${ }_{B}$ ).

Figure 17.23 Serial Data Direction Select Function - MSB First (CSIHnDIRx =0)

Figure 17.24 Serial Data Direction Select Function - LSB First (CSIHnDIRx $=1$ )

### 17.5.9 Slave Select (SS) Function

The Slave Select (SS) function enables communication between one master and multiple slaves.
In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave. Communication by a device in slave mode is enabled when the slave input select signal ( $\overline{\text { CSIHTSSI }}$ ) is at the low level.
See the Section 17.5.2, Master/Slave Connections, for examples of connections using the SS function.

### 17.5.9.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.
In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

Figure 17.25 Transmission/Reception Timing of Communication Using SS Function
(1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111 $1_{\text {B }}$. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0 .
(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] $=1000_{\mathrm{B}}$ ). The data direction is MSB first $($ CSIHnCFG0.CSIHnDIR0 $=0)$.
(3) The transmit/receive mode is set (CSIHnCTL0.CSIHnTXE $=1$, CSIHnCTL0.CSIHnRXE $=1$, and CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.
(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register during direct access mode.
(5) As long as signal $\overline{\text { CSIHTSSI }}$ is at the high level, transmission/reception is not started, even if an external transmission clock CSIHTSCK is input. Input to CSIHTSI is ignored.
(6) $\overline{\text { CSIHTSSI }}$ falling to low level indicates that CSIHTSO is enabled and ready for transmission.
(7) As soon as the external clock signal CSIHTSCK is detected, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.
(8) Interrupt INTCSIHTIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

### 17.5.9.2 CSIHTSSO Operation

| CSIHnPWR | CSIHnTXE | CSIHnRXE | CSIHnSSE | CSIHTSSO |
| :--- | :--- | :--- | :--- | :--- |
| 0 | - | - | - | H |
| 1 | - | - | 0 | H |
|  | 0 |  | 1 | H |
|  | 1 |  |  | Reversed value of $\overline{\text { CSIHTSSI level }}$ |

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin when using the SS function.
The CSIHTSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).
The CSIHTSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

Figure 17.26 Operation of CSIHTSSO

CAUTION
If $\overline{\text { CSIHTSSI }}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF $=1$ ), current communication is not guaranteed.

### 17.5.10 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by the CSIHnCTL1.CSIHnHSE bit. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The busy timing depends on the data phase selection bit CSIHnCFGx.CSIHnDAPx.

### 17.5.10.1 Slave Mode

If CSIHnCTL1.CSIHnHSE $=1$, a low-level CSIHTRYO signal is output when the slave becomes busy. This can happen in two cases:

1. When the next data to be sent is not ready:

When the slave is in transmit-only mode or transmit/receive mode (CSIHnCTLO.CSIHnTXE $=1$ ) and is in the states listed below, the CSIHTRYO outputs the busy state (low level).

Table 17.44 Memory Mode and Slave Transfer State

| Memory Mode | Slave Transfer State |
| :--- | :--- |
| Direct access mode | When there is no more data to be sent |

2. When receive register is full:

When slave is set in receive-only mode or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), and new data cannot be copied from a shift register to CSIHnRX0W/H because the previously received data is still in the CSIHnRX0W/H register (CSIHnRX0W/H is full).
When CSIHnCTL0.CSIHnRXE is 1 and is in any of the following states, CSIHTRYO outputs busy state (low level).

Table 17.45 Memory Mode and Slave Reception State

| Memory Mode | Slave Reception State |
| :--- | :--- |
| Direct access mode | When CSIHnRXOW or CSIHnRXOH is full |

The following examples assume an eight-bit data length.

Figure 17.27 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx $=0$ )

Figure 17.28 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 1)

### 17.5.10.2 Master Mode

When the master detects CSIHTRYI $=0$ while CSIHnCTL1.CSIHnHSE $=1$, the subsequent transfers are put on hold, and the master goes into wait status. It suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

Figure 17.29 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx $=0$ )

The CSIHTRYI signal must be pulled down by the slave before the next transfer starts. If this is done while data transfer is in progress, the serial clock from the master is suspended after the transfer is complete.

The master resumes the communication as soon as CSIHTRYI becomes high (the slave is "ready").

Figure 17.30 Master's Reaction on CSIHTRYI (CSIHnCFGx.CSIHnDAPx $=1$ )

## CAUTIONS

1. If multiple slaves are connected, the master must only detect the CSIHTRYI signal of the slave it has selected for communication.
2. Even when the CSIHTRYI pin of the master detects a CSIHTRYO signal from the slave during data transfer, the communication is not put on hold but continues until the data transfer is completed.

### 17.5.11 Error Detection

CSIH can detect five error types:

- Data consistency error (transmission data)
- Parity error (received data)
- Overrun error (received data)

Check for parity, data consistency can be enabled/disabled individually.
If any of these errors is detected, the interrupt request INTCSIHTIRE is generated and the corresponding flags are set.

### 17.5.11.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit (when checking data consistency, make sure that PIPCn.PIPCn_m = 1 and PIBCn.PIBCn_m $=0$ ). It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE $=0$ ).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back via the CSIHTDCS signal into the corresponding shift register.

After completion of the transmission, the sent data is compared with the original transmission data.
Mismatch is considered as a data consistency error and:

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

Figure 17.31 Block Diagram of Data Consistency Check Function

### 17.5.11.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).
The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].
Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] $=1$.
The parity bit is checked after a reception is complete. If a parity error occurs, the following happen::

- Interrupt INTCSIHTIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.
The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is $05_{\mathrm{H}}$ and $35_{\mathrm{H}}$.
- Data direction is LSB first.
- Parity type is odd.

Figure 17.32 Parity Check Example

The parity bit of the first data is 1 . There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0 . This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

### 17.5.11.3 Overrun Error

An overrun error may occur in direct access mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE $=0$ ).

There are one conditions for overrun errors.

## Condition for Errors 1

- In slave mode, when CSIHnCTL1.CSIHnHSE $=0$ (handshake function disabled):
- In direct access mode, when reception is completed while the previously received data is remains in the CSIHnRX0W/H register.

## (1) Direct Access

In direct access modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

Figure 17.33 Overrun Error Detection in Direct Access Modes

NOTE
An overrun error can be avoided in slave mode by using handshake function. When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

### 17.5.12 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.
When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defined by the CSIHnCTL1.CSIH0CSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, CSIHTSI, and CSIHTCSSx are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to reset level (High) regardless of the value of the CSIHnCFGx.CSIHnCKPx. The rest of CSIH works as in normal operation.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. Any connected device remains unaffected by the loop-back test.

Table 17.46 Pin Output Level in Loop-Back Mode

| Pin Name | Output level |
| :--- | :--- |
| CSIHTSCK(out) | High level |
| CSIHTCSS[5:0] | Inactive level |
| CSIHTSO | Low level (not dependent on the previous value) |
| Interrupt | Normal function |
| CSIHTRYO | Normal function (Low level) |

Figure 17.34 Normal Operation

Figure 17.35 Loop-Back Mode Operation

### 17.5.13 Enforced Chip Select Idle Setting

It is possible to insert an idle state between two consecutive data transfers by setting CSIHnCFGx.CSIHnIDLx.

1. When CSIHnCFGx.CSIHnIDLx $=0$

If the next CSIHTCSSx is the same as the previous one, an idle state is not inserted and an inter-data time is inserted.
If the next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx $=1$

An idle state is always inserted even if a next CSIHTCSSx is not different from the previous one.

Figure 17.36 Enforced Chip Select Setting Idle Example

### 17.5.14 Extended Communication Function

CSIH has an extended communication function that can perform 8-bit, 16-bit, or 32-bit CSI (SPI) communication by using up to 16 stages of extended communication data registers.

When the CSIHnECTL0.CSIHnEEN bit is set to 1 , the extended communication function is enabled and can perform extended communication based on a specified data size. A data transfer direction can be specified(LSB-first or MSBfirst), and the extended communication can be stopped.

When the CSIHnECTL0.CSIHnEEN bit is 0 , the extended communication function is disabled and CSIH operates in the same way as the original function.

### 17.5.14.1 Data Transfer Direction Selection Function

CSIH enables the selection of the data transfer direction by using the CSIHnECTL1.CSIHnEDIR bit when the extended communication function is enabled.

The figures listed in the following table show the data transfer operations with MSB-first transfer or LSB-first transfer selected as the data transfer direction.

Table 17.47 Selection of Data Transfer Direction

|  |  | Register Setting |  |
| :--- | :--- | :--- | :--- |
| Figure No. | Content | CSIHnECTL1. <br> CSIHnEDS[1:0] | CSIHnECTRL1. <br> CSIHnEDIR |
| Figure 17.37 | Data size of 32 bits, MSB-first transfer | $10_{\mathrm{B}}$ | 0 |
| Figure $\mathbf{1 7 . 3 8}$ | Data size of 32 bits, LSB-first transfer | $10_{\mathrm{B}}$ | 1 |
| Figure $\mathbf{1 7 . 3 9}$ | Data size of 8 or 16 bits, MSB-first transfer | $00_{\mathrm{B}}$ or $01_{\mathrm{B}}$ | 0 |
| Figure $\mathbf{1 7 . 4 0}$ | Data size of 8 or 16 bits, LSB-first transfer | $00_{\mathrm{B}}$ or $01_{\mathrm{B}}$ | 1 |

NOTE
To select the transfer direction when the extended communication function is enabled, use the CSIHnECTL1.CSIHnEDIR bit for the extended communication function, and set the CSIHnCFGx.CSIHnDIRx bit (which is used to select the transfer direction for communication by CSIH) to 0 (MSB-first). If a transfer direction is selected for both the extended communication function and CSIH, the actual transfer direction is not guaranteed.

Figure 17.37 Operations with Data Size Set to 32 Bits and Transfer Direction Set to MSB-First

Figure 17.38 Operations with Data Size Set to 32 Bits and Transfer Direction Set to LSB-First

Figure 17.39 Operations with Data Size Set to 8 or 16 Bits and Transfer Direction Set to MSB-First

Figure 17.40 Operations with Data Size Set to 8 or 16 Bits and Transfer Direction Set to LSB-First

### 17.5.14.2 Extended Communication Stop Function

CSIH enables the stopping of extended communication by using the stop trigger bit (CSIHnESTT.CSIHnESTRG).

Figure 17.41 Stopping Extended Communication

- When communication is stopped, the CSIHnESTF.CSIHnETCF[4:0] bits indicate the remaining number of data transfers.
- Stopped communication cannot be resumed. Therefore, to complete the communication, perform the operating procedure to start the communication.

### 17.5.14.3 Extended Communication Status

CSIH enables checking of the status of extended communication. The CSIHnESTF.CSIHnETSF bit indicates whether communication is in progress or stopped, and the CSIHnESTF.CSIHnETCF[4:0] bits indicate the remaining number of communications.

The figures below show examples of communication status according to the condition of communication.
Table 17.48 Examples of Communication Status

| Figure No. | Content | Register Transmit/Receive Mode Setting |  | Register Setting |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

Figure 17.43 Receive-only or Transmit/Receive Mode Status of Communication with Data Size Set to 8 or 16 Bits and Transfer Count Set to 4

Figure 17.44 Transmit-only Mode Status of Communication with Data Size Set to 32 Bits and Transfer Count Set to 3

Figure 17.45 Transmit-only Mode Status of Communication with Data Size Set to 8 or 16 Bits and Transfer Count Set to 4

### 17.5.14.4 Extended Interrupt Control Function

When the extended communication function is enabled, the INTCSIHTIRE interrupt signal from CSIH is output without change. The INTCSIHTIC interrupt and INTCSIHTIR interrupt signals are output after they are fixed to the 0 level by the extended communication function. The INTCSIHTIJC interrupt signal is output only once when the specified number of communications ends.

The following figure shows the interrupt output for the extended communication with transfer count set to 2 $\left(\mathrm{CSIHnECTL1.CSIHnETC}[3: 0]=0001_{\mathrm{B}}\right)$.

Figure 17.46 Interrupts Output with the Extended Communication Function Enabled

NOTE
When extended communication is stopped halfway by using the stop trigger bit (CSIHnESTT.CSIHnESTRG), the INTCSIHTIJC interrupt is not output. To determine whether the communication is in progress or stopped, check the extended communication status flag (CSIHnESTF.CSIHnETSF).

Note that it can be specified whether to enable individual interrupt outputs by using the CSIHnECTLO.CSIHnEIJE, CSIHnECTL0.CSIHnEIEE, CSIHnECTL0.CSIHnEIRE, and CSIHnECTL0.CSIH0EICE bits. When the output of an interrupt is disabled, the corresponding interrupt request is set to the Low level.

### 17.6 Operating Procedures

### 17.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

### 17.6.1.1 Transmit/Receive in Master Mode when Job Mode Is Disabled

The procedures below are based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_{B}$ ).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx $=0$ ).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0$ )
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT $=0$ )
- Direct access mode $($ CSIHnCTLO.CSIHnMBS $=1)$

Figure 17.47 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE $=0$

## Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR $=1$ (enables the clock), CSIHnTXE $=1$ (permits transmission), CSIHnRXE $=1$ (permits reception), and CSIHnMBS $=1$ (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After data transmission/reception, the interrupts INTCSIHTIC and INTCSIHTIR are generated:

- INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
- INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.

6. No more write action is required after completion of data 8 . Data 9 (the last data) has been written in advance. However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9 .
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTLO.CSIHnPWR to 0 to minimize power consumption of CSIHn.

### 17.6.1.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = $1000_{B}$ ).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx $=0$ ).
- Normal clock phase and data phase (CSIHnCFGx.CSIHnCKPx $=0$, CSIHnCFGx.CSIHnDAPx $=0)$
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHTIC interrupt timing (CSIHnCTL1.CSIHnSLIT $=0$ )
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each transmitting three data.

Figure 17.48 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE $=1$

## Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR $=1$ (enables the clock), CSIHnTXE $=1$ (permits transmission), CSIHnRXE $=1$ (permits the reception), and CSIHnMBS $=1$ (selects direct access mode).
3. Write the first data to be sent to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between the data.
5. After every data transmission/reception, the interrupt requests INTCSIHTIC and INTCSIHTIR are generated.

- INTCSIHTIC indicates that the next data can be written to CSIHnTX0W.
- INTCSIHTIR indicates that the reception register CSIHnRX0W must be read.

6. Setting CSIHnTX0W.CSIHnEOJ $=1$ indicates that the last data of the current job is sent. After that, the next job may begin.
7. By setting CSIHnCTL0.CSIHnJOBE $=1$, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request INTCSIHTIC is replaced by INTCSIHTIJC.

INTCSIHTIR is generated as usual.
The interrupt request INTCSIHTIJC indicates that the communication was forcibly stopped at the end of the current job.
The interrupt request INTCSIHTIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not sent.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTLO.CSIHnPWR to 0 to minimize power consumption of the CSIHn.
To start another transmission without stopping communication, perform steps 3 and later.

### 17.6.2 Procedures in Extended Communication Function Mode

The extended communication function of CSIH performs CSI (SPI) communication by using the registers dedicated to extended communication. It is possible to select a communication data size from 8,16 , and 32 bits by using the CSIHnECTL1.CSIH0EDS[1:0] bits. Also, it is possible to specify the number of extended communications in the range of 1 to 16 by using the CSIHnECTL1.CSIH0ETC[3:0] bits.

The following describes the operating procedure to use the extended communication function.
NOTE
When the extended communication function is enabled, do not write data to the transmit data registers (CSIHnTXOW[31:0] and CSIHnTXOH[15:0]) of CSIH. If data is written to any of these registers, the content of the communication using the extended communication function is not guaranteed.

Table 17.49 Procedure to Perform Communication Using the Extended Communication Function

| Figure No. | Content | CSIH Register Setting |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | CSIHnCTL2. CSIHnPRS[2:0] | CSIHnCTLO. CSIHnTXE | CSIHnCTLO. CSIHnRXE |
| Figure 17.49 | Transmission or transmission/reception in master or slave mode | - (Optional) | 1 | 0 or 1 |
| Figure 17.50 | Reception in master mode | Other than 111 ${ }_{\text {B }}$ | 0 | 1 |
| Figure 17.51 | Reception in slave mode | $111_{B}$ | 0 | 1 |
| Figure 17.52 | Transmission or transmission/reception in master mode (more than 17 times) | Other than 111 ${ }_{\text {B }}$ | 0 or 1 | 0 or 1 |
| Figure 17.53 | Transmission or transmission/reception in slave mode (more than 17 times) | $111_{B}$ | 0 or 1 | 0 or 1 |

Note: For transmission or reception, read the extended receive data registers (CSHInERXDATA0-15[31:0]) after the INTCSIHTIJC interrupt is output.
After the INTCSIHTIJC interrupt is output, the next communication can be performed. If the settings of CSIHnEDS[1:0], CSIHnETC[3:0], CSIHnECS[7:0], and/or CSIHnEDIR are not changed for the next communication, write data to the extended transmit data registers (CSIHnETXDATA0-15[31:0]).

Figure 17.49 Operating Procedure for Transmission or Transmission/Reception

Note: Read the extended receive data registers (CSHInERXDATA0-15[31:0]) after the INTCSIHTIJC interrupt is output. Note that it is possible to write any dummy data to extended transmit data register 0 (CSIHnETXDA0[31:0]).
After the INTCSIHTIJC interrupt is output, the next communication can be performed. If the settings of CSIHnETC[3:0], CSIHnECS[7:0], and/or CSIHnEDIR are not changed for the next communication, write dummy data to the extended transmit data register 0 (CSIHnETXDATA0[31:0]).

Figure 17.50 Operating Procedure for Reception in Master Mode

Note: Read the extended receive data registers (CSHInERXDATA0-15[31:0]) after the INTCSIHTIJC interrupt is output. After the INTCSIHTIJC interrupt is output, the next communication can be performed. If the settings of CSIHnEDS[1:0], CSIHnETC[3:0], and/or CSIHnEDIR are not changed for the next communication, no further operation is necessary.

Figure 17.51 Operating Procedure for Reception in Slave Mode

Figure 17.52 Transmission or Transmission/Reception in Master Mode (more than 17 times)

Figure 17.53 Transmission or Transmission/Reception in Slave Mode (more than 17 times)

### 17.6.2.1 Trigger to Start Extended Communication

For transmission or transmission/reception, CSIH starts communication when the last communication data to be transmitted is written. (In slave mode, CSIH starts communication when the communication clock is input from the master mode after the last data is written).

As examples, Table 17.50 lists the transfer start timings for the 8 -bit, 16-bit, or 32-bit communication with the data transfer count set to 16, and Table $\mathbf{1 7 . 5 1}$ lists the transfer start timings for the 8-bit, 16-bit, or 32-bit communication with the data transfer count set to 4 .

Table 17.50 Timings When CSIH Starts Transfer (Transfer Count: 16)

| Address | Transmit Data Array | Register Name |
| :---: | :---: | :---: |
| <CSIHn_base> + 110C ${ }_{\text {H }}$ | 8-bit transmit data 0_0 | CSIHnETXDA0 |
| <CSIHn_base> + 110D ${ }_{\text {H }}$ | 8-bit transmit data 0_1 |  |
| <CSIHn_base> + 110E ${ }_{\text {H }}$ | 8-bit transmit data 0_2 |  |
| <CSIHn_base> + $110 \mathrm{~F}_{\mathrm{H}}$ | 8-bit transmit data 0_3 |  |
| <CSIHn_base> + 1110 ${ }_{\text {H }}$ | 8-bit transmit data 1_0 | CSIHnETXDA1 |
| <CSIHn_base> + 1111 ${ }_{\text {H }}$ | 8-bit transmit data 1_1 |  |
| <CSIHn_base> + 1112 ${ }_{\text {H }}$ | 8-bit transmit data 1_2 |  |
| <CSIHn_base> + 1113 ${ }_{\text {H }}$ | 8-bit transmit data 1_3 |  |
| <CSIHn_base> + 1114 ${ }_{\text {H }}$ | 8-bit transmit data 2_0 | CSIHnETXDA2 |

| <CSIHn_base> + 111 $\mathrm{B}_{\mathrm{H}}$ | 8-bit transmit data 3_3 |  |

-> For the communication of " 32 bits $\times 4$ " data, transfer starts when the data (<CSIHn_base> + $111 B_{H}$ ) shown on the left is written.

| - | . | - |
| :---: | :---: | :---: |
| - | - | - |
| * | - | - |
| <CSIHn_base> + 1128 ${ }_{\text {H }}$ | 8-bit transmit data 7_0 | CSIHnETXDA7 |
| <CSIHn_base> + 1129 ${ }_{\text {H }}$ | 8-bit transmit data 7_1 |  |
| <CSIHn_base> + 112A ${ }_{H}$ | 8-bit transmit data 7_2 |  |
| <CSIHn_base> + 112B ${ }_{\text {H }}$ | 8-bit transmit data 7_3 |  |
| - | - | - |
| - | - | - |
| - | - | - |
| <CSIHn_base> + 1148 ${ }_{\text {H }}$ | 8-bit transmit data 15_0 | CSIHnETXDA15 |
| <CSIHn_base> + 1149 ${ }_{\text {H }}$ | 8-bit transmit data 15_1 |  |
| <CSIHn_base> + 114A ${ }_{\text {H }}$ | 8-bit transmit data 15_2 |  |
| <CSIHn_base> + 114B ${ }_{\text {H }}$ | 8-bit transmit data 15_3 |  |

The CSIHnETXDA0-15[31:0] registers can be accessed in units of 8,16 , or 32 bits.
For the communication of " 8 bits x 4 " data described above, transfer is started by an 8 -bit access to the address " $<$ CSIHn_base $>+110 \mathrm{~F}_{\mathrm{H}}$," 16 -bit access to the address " $<$ CSIHn_base $>+110 \mathrm{E}_{\mathrm{H}}$," or 32 -bit access to the address
" $<$ CSIHn_base $>+110$ C $_{\text {H }}$."

NOTE
For transmission or transmission/reception, CSIH starts communication when the last transmit data is written (to the extended transmit data register that has the highest address [among the "CSIHnETXDA0-15[31:0] registers] based on the specified transfer count). Therefore, the last transmit data must always be written at the end of writing. If the last transmit data is not written at the end of writing, values previously set in the CSIHnETXDA0-15[31:0] registers might be transmitted. Because transmission by CSI communication conflicts with writing of transmit data, it is not guaranteed which of previously set data and newly written data will be transmitted.

### 17.6.2.2 Storage Address of Received Data in Extended Communication

The storage address of the received data is determined by the communication data size.
Table 17.52 lists the storage address for the 8 -bit, 16 -bit, or 32 -bit transfer reception data.
Table 17.52 Storage Address of Reception Data

| Address | Register Name | Data Size 8 bits | Data Size 16 bits | Data Size 32 bits |

## Section 18 Serial Communication Interface 3 (SCl3)

### 18.1 Features of SCl 3

### 18.1.1 Units and Channels

This product contains the serial communication interface for the number of channels shown below.
Table 18.1 Number of Channels (For E2x-FCC1)

| Product Name | RH850/E2x-FCC1 |  |
| :---: | :---: | :---: |
|  | 373 Pins | 292 Pins |
| Number of Channels | 4 | 4 |
| Name |  | ( $\mathrm{n}=0$ to 3 ) |

Table 18.2 Number of Channels (For E2M)

|  | RH850/E2M |  |  |
| :--- | :--- | :--- | :--- |
| Product Name | 373 Pins | 292 Pins |  |
| Number of Channels | 4 | 4 |  |
| Name |  |  |  |

## Meaning of " $n$ "

In this section, each channel of the serial communication interface 3 is identified by " n " ( n n " is channel numbers.). For example, a serial mode register is written as SCI3nSMR.

### 18.1.2 Register Base Address

The base addresses $<$ SCI3n_base $>$ of each SCI3 are listed in Table 18.3.
Table 18.3 Register Base Address

| SCl3n Channel | SCl3n_base Address | Bus Group |
| :--- | :--- | :--- |
| <SCl30_base> | FFD9 $0000_{\mathrm{H}}$ | Peripheral Group 2L |
| <SCl31_base> | FFD9 $1000_{\mathrm{H}}$ | Peripheral Group 2L |
| <SCl32_base> | FFD9 $2000_{\mathrm{H}}$ | Peripheral Group 2L |
| <SCl33_base> | FFD9 $3000_{\mathrm{H}}$ | Peripheral Group 2L |

### 18.1.3 Clock Supply

Clock supply by and to SC13 is listed in the following table.
Table 18.4 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| SCI3n | PCLK | CLK_LSB |

### 18.1.4 Interrupt Requests

Table 18.5 Interrupt Requests

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |

| SCI3TxD | SCl33 transmit data output | SCI3TxD |
| CAUTION |  |  |

This AC specification is only applied to the specific pin groups. For details, refer to Appendix file "Limited_conditions_for_AC_specification.xisx".

### 18.2 Overview

### 18.2.1 Functional Overview

The serial communication interface 3 (SCI3: Serial Communication Interface 3) can handle two methods of serial communications: asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communication LSIs such as Universal Asynchronous Receiver / Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). Asynchronous mode is equipped with a serial communications function between multiple processors (multi-processor communications function).

SCI3 has following features:

- The serial data communication mode can be configured for asynchronous communications or clock synchronous communications.
- Full-duplex communications are available. The independent transmitter unit and receiver unit allow simultaneous trans-mission and reception. Both the transmitter and the receiver have a double-buffered structure, enabling continuous data transmission and reception.
- An arbitrary bit rate is selectable with the on-chip baud rate generator. An external clock is also selectable as a transmission/reception clock source.
- LSB-first or MSB-first transfer is selectable (except for asynchronous 7-bit data).
- Interrupt sources: 4 types consisting of transmit-end, transmit-data-empty, receive-data-full, and receive-error. Transmit-data-empty and receive-data-full interrupt sources can activate the sDMA or DTS.
- Module standby can be set for each channel (for details of module standby, see Section 16, Standby Controller).
- The bit rate modulation function can reduce errors averagely (even in a high bit rate) by correcting the output of the on-chip baud rate generator (except for the maximum speed in clock synchronous mode).
- The pin level of serial input data can be checked.

### 18.2.2 Serial Communication Modes

Asynchronous mode

- Data length: 7 bits or 8 bits selectable
- Stop bit length: 1 bit or 2 bits selectable
- Parity: Even parity, odd parity, or none selectable
- Receive error detection: Parity error, overrun error, and framing error
- Break detection: A break can be detected by reading a register when a framing error occurs.

## Clock synchronous mode

- Data length: 8 bits
- Receive error detection: Overrun error

### 18.2.3 Block Diagram

Figure 18.1 SCI3 Block Diagram

### 18.3 Registers

### 18.3.1 List of Registers

SCI 3 n register addresses are given as offsets from the base address $<$ SCI3n_base>.
The SCI3 has the registers listed in Table 18.8. Some registers have limitations in read / write by the CPU.
Table 18.8 List of Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| SCl3n | Receive Shift Register | SCI3nRSR | - | - | - |
|  | Serial Mode Register | SCI3nSMR | <SCl3n_base> + 0000 ${ }_{\text {H }}$ | 8 | - |
|  | Bit Rate Register / Modulation Duty Register | SCI3nBRR / SCI3nMDDR | <SCI3n_base> + 0004 ${ }_{\text {H }}$ | 8 | - |
|  | Serial Control Register | SCl3nSCR | <SCI3n_base> + 0008 ${ }_{\text {H }}$ | 8 | - |
|  | Transmit Data Register | SCI3nTDR | <SCI3n_base> $+000 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
|  | Transmit Shift Register | SCI3nTSR | - | - | - |
|  | Serial Status Register | SCl3nSSR | <SCl3n_base> + 0010 ${ }_{\text {H }}$ | 8 | - |
|  | Receive Data Register | SCI3nRDR | <SCI3n_base> + 0014 ${ }_{\text {H }}$ | 8 | - |
|  | Serial Transfer Format Register | SCI3nSCMR | <SCI3n_ base> + 0018 ${ }_{\text {H }}$ | 8 | - |
|  | Serial Extended Mode Register | SCI3nSEMR | <SCI3n_base> + 001 H $_{\text {H }}$ | 8 | - |

## CAUTION

- SCI3nBRR and SCl3nMDDR are allocated to the same address (relative address 4). The SCI3nMDDRS bit in SCI3nSEMR is used to switch these registers.
- Relative addresses $4 \mathrm{k}+1,4 \mathrm{k}+2$, and $4 \mathrm{k}+3(\mathrm{k}=0$ to 7$)$ are reserved areas. These areas are always read as 0 . Writing is invalid.

### 18.3.2 SCI3nRSR — Receive Shift Register

SCI3nRSR is a shift register which is used to receive serial data input from the SCInRxD pin and convert it to parallel data. When one frame of data has been received, it is automatically transferred to SCI3nRDR. SCI3nRSR cannot be directly accessed by the CPU.

### 18.3.3 SCI3nRDR — Receive Data Register

SCI3nRDR is an 8 -bit register to store receive data. The value of $\operatorname{SCI} 3 n R D R$ after a reset is $00_{\mathrm{H}}$. When one frame of data has been received, it is transferred from SCI3nRSR to this register allowing SCI3nRSR to receive the next data. SCI3nRSR and SCI3nRDR function as a double-buffer in this way, allowing continuous receive operations. Be sure to check that the RDRF flag in SCI3nSSR is set to 1 before reading SCI3nRDR. SCI3nRDR cannot be written from the CPU.

When the data length is 7 bits, received data is stored in bits 0 to 6 . Bit 7 is fixed to 0 .
At this time, the fixed value of bit 7 is not affected by the SINV bit in the SCI3nSCMR register.

### 18.3.4 SCI3nTDR — Transmit Data Register

SCI3nTDR is an 8-bit register to store transmit data. The value of SCI3nTDR after a reset is $\mathrm{FF}_{\mathrm{H}}$. When SCI3nTSR empty is detected, the transmit data written to SCI3nTDR is transferred to SCI3nTSR and transmission starts. The double-buffered structure of SCI3nTDR and SCI3nTSR allows continuous serial transmission. If the next transmit data has been written to SCI3nTDR when one frame of data is sent, the transmit data is transferred to SCI3nTSR to continue transmission. SCI3nTDR can always be read and written by the CPU. Be sure to check that the TDRE flag in SCI3nSSR is set to 1 before writing transmit data to SCI3nTDR.

### 18.3.5 SCI3nTSR — Transmit Shift Register

SCI3nTSR is a shift register to transmit serial data. To perform serial data transmission, transmit data written to SCI3nTDR is automatically transferred SCI3nTSR, and is then sent to the SCInTxD pin. SCI3nTSR cannot be directly accessed by the CPU.

### 18.3.6 SCl3nSMR — Serial Mode Register

SCI3nSMR is a register used to select the transfer format and the clock source for the on-chip baud rate generator.

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CM | CHR | PE | PM | STOP | MP | CKS[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $\mathrm{R} / \mathrm{W}^{* 1}$ | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 | R/W*1 | R/W*1 | R/W*1 | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 |

Table 18.9 SCI3nSMR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | CM | Communication Mode <br> 0: Asynchronous mode <br> 1: Clock synchronous mode |
| 6 | CHR | Character Length (Valid only in asynchronous mode) <br> 0 : Selects 8 bits as the data length. <br> 1: Selects 7 bits as the data length. It is fixed to LSB-first and the MSB (bit 7) in SCI3nTDR is not sent in transmission. <br> In clock synchronous mode, the data length is fixed to 8 bits. |
| 5 | PE | Parity Enable (Valid only in asynchronous mode) <br> When this bit is set to 1 , a parity bit is added to transmit data and the parity bit is checked in reception. <br> Regardless of the setting of this bit, no parity bit is added or checked in the multi-processor format. |
| 4 | PM | Parity Mode (Valid only when $\mathrm{PE}=1$ in asynchronous mode) <br> 0 : Selects even parity. <br> 1: Selects odd parity. <br> When even parity is set, parity bit is added so that the total number of 1 bits in the transmit/receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit is added so that the total number of 1 bits in the transmit / receive character plus the parity bit is odd. |
| 3 | STOP | Stop Bit Length (Valid only in asynchronous mode) <br> 0: 1 stop bit for transmission <br> 1: 2 stop bits for transmission <br> In reception, only the first stop bit is checked regardless of the setting of this bit. If the second stop bit is 0 , it is treated as the start bit of the next transmission frame. |
| 2 | MP | Multi-Processor Mode (Valid only in asynchronous mode) <br> When this bit is set to 1 , the multi-processor communication function is enabled. In multiprocessor mode, settings of the PE and PM bits are invalid. |
| 1, 0 | CKS[1:0] | Clock Select 1, 0 <br> These bits select the clock source for the on-chip baud rate generator. <br> 00: PCLK clock $(\mathrm{m}=0)$ <br> 01: PCLK / 4 clock ( $m=1$ ) <br> 10: PCLK / 16 clock $(m=2)$ <br> 11: PCLK / 64 clock $(m=3)$ <br> For the relation between the setting of these bits and the baud rate, see Section 18.3.11, SCl3nBRR - Bit Rate Register. The character $m$ is the decimal notation of the value of $m$ in Section 18.3.11, SCI3nBRR - Bit Rate Register. |

### 18.3.7 SCI3nSCR — Serial Control Register

$\mathrm{SCI} 3 n S C R$ is a register used for the transmission / reception control, interrupt control, and transmission/reception clock source selection listed below. For interrupt requests, see Section 18.8, Interrupt Sources.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TIE | RIE | TE | RE | MPIE | TEIE | CKE[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 | R/W | R/W | R/W*2 | $\mathrm{R} / \mathrm{W}^{* 2}$ |

Note 1. While the CM bit in SCI3nSMR is 1 , a value of 1 can be written only when $T E=0$ and $R E=0$. After the TE or RE bit is set to 1 , only 0 can be written to TE and RE. While the CM bit in SCI3nSMR is 0 , writing is enabled at any timing.
Note 2. Writable only when $\mathrm{TE}=0$ and $\mathrm{RE}=0$. Also, writable at the same time when $\mathrm{TE}=0$ and $\mathrm{RE}=0$ are written.
Table 18.10 SCI3nSCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | TIE | Transmit Interrupt Enable |
|  |  | When this bit is set to 1 , TXI interrupt request is enabled. |
|  | TXI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the |  |
| flag to 0, or clearing the TIE bit. |  |  |

Table 18.10 SCI3nSCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 | TEIE | Transmit End Interrupt Enable |
|  |  | When this bit is set to 1 , TEI interrupt request is enabled. TEI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0 to clear the TEND flag to 0 , or clearing the TEIE bit. |
| 1, 0 | CKE[1:0] | Clock Enable 1, 0 |
|  |  | These bits select the clock source and the SCInSCK pin function. |
|  |  | For asynchronous mode |
|  |  | 00: On-chip baud rate generator (The SCInSCK pin functions as an input / output port.) |
|  |  | 01: On-chip baud rate generator (The clock with the same frequency as the bit rate is output from the SCInSCK pin.) |
|  |  | 1X: Setting prohibited |
|  |  | For clock synchronous mode |
|  |  | 0X: Internal clock (The SCInSCK pin functions as a clock output pin.) |
|  |  | 1X: External clock (The SCInSCK pin functions as a clock input pin.) |

Note: X: Don't care

NOTE
When writing to any bit other than the MPIE bit of this register, use a store instruction such that the value of the MPIE bit becomes 0 .

Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the MPIE bit to 1 .

### 18.3.8 SCI3nSSR — Serial Status Register

SCI3nSSR consists of SCI3 status flags and multi-processor transmit/receive bits.
The TDRE, RDRF, ORER, PER, and FER flags can be cleared only.

Value after reset: $\quad 84 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | $2 \quad 1$ |  | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Value after reset | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R | R | R/W |

Table 18.11 SCI3nSSR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | TDRE | Transmit Data Register Empty <br> Indicates whether or not transmit data exists in SCI3nTDR. <br> [Setting conditions] <br> - When the TE bit in SCI3nSCR is 0 <br> - When the data in SCI3nTDR has been transferred to SCI3nTSR so that new data can be written to $\mathrm{SCl} 3 n T D R$ <br> [Clearing condition] <br> - Writing 0 to TDRE after reading TDRE $=1$ <br> - When transmit data is written to TDR while TE $=1$ |
| 6 | RDRF | Receive Data Register Full <br> Indicates whether or not receive data exists in SCI3nRDR <br> [Setting condition] <br> - When reception finishes successfully and the receive data is transferred from SCI3nRSR to SCI3nRDR <br> [Clearing conditions] <br> - Writing 0 to RDRF after reading RDRF $=1$ <br> - When data is read from SCI3nRDR Even when the RE bit in SCI3nSCR is cleared, the RDRF flag is not affected and the previous value is retained. <br> - Note that completing the reception of the next data with the RDRF flag set to 1 will cause an overrun error, resulting in the loss of the receive data. |
| 5 | ORER | Overrun Error <br> Indicates that an overrun error has occurred during reception and the reception ended abnormally. <br> [Setting condition] <br> - When the next data is received while RDRF $=1$ <br> In SCl3nRDR, data received prior to the overrun error is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1 , subsequent serial reception cannot be continued. In clock synchronous mode, serial transmission also cannot be continued. <br> [Clearing condition] <br> - Writing 0 to ORER after reading ORER = 1 <br> Even when the RE bit in SCI3nSCR is cleared, the ORER flag is not affected and the previous value is retained. |

Table 18.11 SCI3nSSR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 4 | FER | Framing Error <br> Indicates that a framing error has occurred during reception in asynchronous mode and the reception ended abnormally. <br> [Setting condition] <br> - When the stop bit is 0 <br> In 2-stop-bit mode, only whether the first stop bit is 1 is checked but the second stop bit is not checked. Although the receive data that existed when a framing error has occurred is transferred to SCl3nRDR, the RDRF flag is not set. In addition, while the FER flag is set to 1 , the subsequent receive data is not transferred to $\mathrm{SCI} 3 n R D R$. <br> [Clearing condition] <br> - Writing 0 to FER after reading FER $=1$ <br> Even when the RE bit in SCI3nSCR is cleared to 0 , the FER flag is not affected and the previous value is retained. |
| 3 | PER | Parity Error <br> Indicates that a parity error has occurred during reception in asynchronous mode and the reception ended abnormally. <br> [Setting condition] <br> - When a parity error is detected during reception <br> Although the receive data that existed when a parity error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the PER flag is set to 1 , the subsequent receive data is not transferred to SCI3nRDR. <br> [Clearing condition] <br> - Writing 0 to PER after reading PER = 1 <br> Even when the RE bit in SCI3nSCR is cleared to 0 , the PER flag is not affected and the previous value is retained. |
| 2 | TEND | Transmit End <br> [Setting conditions] <br> - When the TE bit in SCI3nSCR is 0 <br> - When the TDRE flag is 1 while the last bit of a transmit character is being transmitted <br> [Clearing condition] <br> - Writing 0 to the TDRE flag after reading TDRE = 1 <br> - When transmit data is written to $\mathrm{SCI} 3 n T D R$ while $\mathrm{TE}=1$ |
| 1 | MPB | Multi-Processor Bit <br> Holds the value of the multi-processor bit in the receive frame. |
| 0 | MPBT | Multi-Processor Bit Transfer <br> Sets the value of the multi-processor bit to be added to the transmit frame. |

### 18.3.9 SCI3nSCMR — Serial Transfer Format Register

SCI3nSCMR is a register to select transfer format which can be commonly configured for both asynchronous mode and clock synchronous mode.

Value after reset: $\quad$ F2 H

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SDIR | SINV | - | - |
| Value after reset | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ | $\mathrm{R} / \mathrm{W}^{* 1}$ | R | R |

Note 1. Writable only when $T E=0$ and $R E=0$.
Table 18.12 SCI3nSCMR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | These bits are always read as 1 . When writing, write the value after reset. |
| 3 | SDIR | Serial Data Transfer Direction (Valid in asynchronous mode and clock synchronous mode) |
|  |  | This bit is used to select the direction of serial / parallel conversion. |
|  |  | 0: Transfer with LSB-first |
|  |  | 1: Transfer with MSB-first |
|  |  | This bit is valid only when the transfer format is 8-bit data. For 7-bit data, LSB-first transfer is used. |
| 2 | SINV | Serial Data Invert (Valid in asynchronous mode and clock synchronous mode) |
|  |  | This bit is used to invert the transfer data logic level. The SINV bit does not affect the logic level of the parity bit. To invert the parity bit, invert the PM bit in SCI3nSMR. |
|  |  | 0 : SCl3nTDR data is transmitted as it is, and receive data is stored in $\mathrm{SCl} 3 n \mathrm{RDR}$ as it is. |
|  |  | 1: SCI3nTDR data is inverted and transmitted, and receive data is inverted and stored in SCI3nRDR. |
| 1 | - | Reserved |
|  |  | These bits are always read as 1 . When writing, write the value after reset. |
| 0 | - | Reserved |
|  |  | These bits are always read as 0 . When writing, write the value after reset. |

### 18.3.10 SCI3nSEMR — Serial Extended Mode Register

SCI3nSEMR is a register to select a 1-bit period.

Value after reset: $\quad 04_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | BRME | MDDRS | - | - | ABCS | RXDMON | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/W*1 | R/W*1 | R | R | R/W*1 | R | R | R |

Table 18.13 SCI3nSEMR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | BRME | Bit Rate Modulation Enable <br> When this bit is set to 1, the bit rate modulation function is enabled. |
| 6 | MDDRS | Modulation Duty Register Select |
|  |  | This bit is used to select an accessible register. |
|  | 0: SCI3nBRR is accessible. |  |
|  | 1: SCI3nMDDR is accessible. |  |
| 5,4 | ABCS | Reserved |
|  |  | These bits are always read as 0. When writing, write the value after reset. |

### 18.3.11 SCI3nBRR — Bit Rate Register

SCI3nBRR is an 8-bit register to adjust the bit rate. Since each SCI3 channel has an independent baud rate generator, different bit rates can be set for each channel. Table 18.15 shows the relationship between the setting $(\mathrm{N})$ in SCI3nBRR and the bit rate (B) in normal asynchronous mode, clock synchronous mode. SCI3nBRR is allocated at the same address as SCI3nMDDR and is selected when MDDRS in SCI3nSEMR is 0 . This register is writable only when $\mathrm{TE}=0$ and $\mathrm{RE}=0$.

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 18.14 SCI3nBRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | BRR | Baud rate generator setting $(0 \leq N \leq 255)$ |

Table 18.15 Relationship between Setting N in SCl3nBRR and Bit Rate B

| Mode | ABCS <br> Setting | Bit Rate | Mean Error |
| :--- | :--- | :--- | :--- |
| Asynchronous | 0 | $B=\frac{\phi \times 10^{6}}{64 \times 2^{2 m-1} \times(N+1)}$ | Error $(\%)=\left\{\frac{\phi \times 10^{6}}{B \times 64 \times 2^{2 m-1} \times(N+1)}-1\right\} \times 100$ |
|  | 1 | $B=\frac{\phi \times 10^{6}}{32 \times 2^{2 m-1} \times(N+1)}$ | Error $(\%)=\left\{\frac{\phi \times 10^{6}}{B \times 32 \times 2^{2 m-1} \times(N+1)}-1\right\} \times 100$ |
| Clock synchronous | - | $B=\frac{\phi \times 10^{6}}{8 \times 2^{2 m-1} \times(N+1)}$ | - |

Note: B: Bit rate (bit/s)
N : SCI3nBRR setting for baud rate generator $(0 \leq \mathrm{N} \leq 255)$
$\phi$ : Operating frequency PCLK (MHz)
m : Determined by the $\mathrm{SCI} 3 n \mathrm{SMR}$ setting as shown in the following table.

| SCI3nSMR Setting |  |  |
| :--- | :--- | :--- |
| CKS1 | CKS0 |  |
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 2 |
| 1 | 1 | 3 |

Table 18.16 lists sample N settings of the SCI3nBRR register in asynchronous mode. Table 18.17 shows the maximum configurable bit rates.

Table 18.16 Examples of BRR Settings for Bit Rates (Asynchronous Mode)

| Bit Rate (bit/s) | Operating Frequency $\phi=40(\mathrm{MHz})$ |  |  |  |  |  |  |  |

### 18.3.12 SCI3nMDDR — Modulation Duty Register

SCI3nMDDR is a register to correct the bit rate adjusted by SCI3nBRR. The value of SCI3nMDDR after a reset is $\mathrm{FF}_{\mathrm{H}}$. When the BRME bit in SCI3nSEMR is set to 1, the bit rate generated by the on-chip baud rate generator is corrected to SCI3nMDDR / 256 on average. Table 18.21 shows the relationship between the SCI3nMDDR setting and the bit rate B. SCI3nMDDR is allocated at the same address as SCI3nBRR and is selected when MDDRS in SCI3nSEMR is 1. This register is writable only when $\mathrm{TE}=0$ and $\mathrm{RE}=0$. Bit 7 is fixed to 1 .

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 18.20 SCI3nMDDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | MDDR | Baud rate generator setting value $(128 \leq$ MDDR $\leq 255)$ |

Table 18.21 Relationship between SCI3nMDDR Setting and Bit Rate B when Bit Rate Modulation Function Is Used

| Mode | ABCS <br> Setting | Bit Rate | Mean Error |
| :---: | :---: | :---: | :---: |
| Asynchronous | 0 | $B=\frac{\phi \times 10^{6}}{64 \times 2^{2 m-1} \times(256 / M D D R) \times(N+1)}$ | $\begin{aligned} & \operatorname{Error}(\%)=\left\{\frac{\phi \times 10^{6}}{\mathrm{~B} \times 64 \times 2^{2 \mathrm{~m}-1} \times(256 / M D D R) \times(\mathrm{N}+1)}-1\right\} \end{aligned}$ |
|  | 1 | $B=\frac{\phi \times 10^{6}}{32 \times 2^{2 m-1} \times(256 / M D D R) \times(N+1)}$ | $\begin{aligned} & \operatorname{Error}(\%)=\left\{\frac{\phi \times 10^{6}}{\mathrm{~B} \times 32 \times 2^{2 m-1} \times(256 / M D D R) \times(\mathrm{N}+1)}-1\right\} \end{aligned}$ |
| Clock synchronous | - | $B=\frac{\phi \times 10^{6}}{8 \times 2^{2 m-1} \times(256 / M D D R) \times(N+1)}$ | - |

Note: B: Bit rate (bit/s)
$\mathrm{N}: \mathrm{SCl} 3 n \mathrm{BRR}$ setting of baud rate generator $(0 \leq \mathrm{N} \leq 255)$
$\phi$ : Operating frequency PCLK (MHz)
m: See Table 18.15.
MDDR: SCI3nMDDR setting ( $128 \leq$ MDDR $\leq 255$ )

### 18.4 Operation in Asynchronous Mode

Figure 18.2 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communication line is usually held in the mark state (high level). The SCI3 monitors the communication line, and when the SCI3 detects the space state (low level), it recognizes a start bit and starts serial communications. Inside the SCI3, the transmitter and the receiver are independent, enabling full-duplex communications. Both the transmitter and the receiver have a double-buffered structure so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

Figure 18.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, Two Stop Bits)

### 18.4.1 Transmission / Reception Format

Table 18.22 lists the transmission/reception formats that can be configured in asynchronous mode. Any of 12 transmission / reception formats can be selected according to the SCI3nSMR setting. For details of the multi-processor bit, see Section 18.5, Multi-Processor Communication Function.

Table 18.22 Serial Transmission / Reception Formats (Asynchronous Mode)

| SMR Setting |  |  |  | Serial Transmission/Reception Format and Frame Length |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CHR | PE | MP | STOP |  |  | 3 | 4 |  |  |  | 8 |  | 10 | 11 | 12 |
| 0 | 0 | 0 | 0 | S |  |  |  |  | data |  |  |  | STOP |  |  |
| 0 | 0 | 0 | 1 | S |  |  |  |  | data |  |  |  | STOP | STOP |  |
| 0 | 1 | 0 | 0 | S |  |  |  |  | data |  |  |  | P | STOP |  |
| 0 | 1 | 0 | 1 | S |  |  |  |  | data |  |  |  | P | STOP | STOP |
| 1 | 0 | 0 | 0 | s |  |  |  | it da |  |  |  | STOP |  |  |  |
| 1 | 0 | 0 | 1 | S |  |  |  | it da |  |  |  | STOP | STOP |  |  |
| 1 | 1 | 0 | 0 | S |  |  |  | bit da |  |  |  | P | STOP |  |  |
| 1 | 1 | 0 | 1 | S |  |  |  | bit da |  |  |  | P | STOP | STOP |  |
| 0 | - | 1 | 0 | S |  |  |  |  | data |  |  |  | MPB | STOP |  |
| 0 | - | 1 | 1 | S |  |  |  |  | data |  |  |  | MPB | STOP | STOP |
| 1 | - | 1 | 0 | S |  |  |  | bit da |  |  |  | MPB | STOP |  |  |
| 1 | - | 1 | 1 | S |  |  |  | bit da |  |  |  | MPB | STOP | STOP |  |

Note: S: Start bit; STOP: Stop bit; P: Parity bit; MPB: Multi-processor bit

### 18.4.2 Receive Data Sampling Timing and Reception Margin

In asynchronous mode, the SCI3 operates on a reference clock with a frequency of 16 times ( 8 times for the doublespeed mode) the bit rate. In reception, the SCI3 samples the beginning of the start bit (low level) using the reference clock and performs internal synchronization. As shown in Figure 18.3, data is latched at the middle of each bit by sampling receive data at the rising edge of the eighth pulse (fourth pulse for the double-speed mode) of the reference clock.

Thus the reception margin in asynchronous mode is determined by formula (1) below.
$M=\left|\left(0.5-\frac{1}{2 N}\right)-(L-0.5) F-\frac{|D-0.5|}{N} \quad(1+F)\right| \times 100[\%] \quad$..formula (1)
M: Reception margin
N : Ratio of bit rate to clock $(\mathrm{N}=16$ when ABCS in $\operatorname{SCI} 3 \mathrm{nSEMR}=0, \mathrm{~N}=8$ when ABCS in $\operatorname{SCI} 3 \mathrm{nSEMR}=1)$
D: Duty cycle of clock $(\mathrm{D}=0.5$ to 1.0$)$
L: Frame length $(\mathrm{L}=9$ to 12$)$
F : Absolute value of clock frequency deviation

Assuming that F (absolute value of clock frequency deviation) $=0, \mathrm{D}$ (duty cycle of clock) $=0.5$, and $\mathrm{N}=16$ in formula (1), the reception margin is obtained by the formula below.

$$
M=\left\{0.5-\quad \frac{1}{(2 \times 16)}\right\} \times 100[\%]=46.875 \%
$$

However, this is only the calculated value, and a margin of $20 \%$ to $30 \%$ should be allowed in system design. When the bit rate modulation function is used, the reference clock frequency is corrected on average.

Figure 18.3 Receive Data Sampling Timing in Asynchronous Mode

### 18.4.3 Clock

An internal clock generated by the on-chip baud rate generator can be set as the SCI3's transmission / reception clock according to the settings of the CM bit in SCI3nSMR and the CKE1 and CKE0 bits in SCI3nSCR. When the SCI3 is operated on an internal clock, the clock can be output from the SCInSCK pin. For details of clock synchronous mode, see Section 18.6, Operation in Clock Synchronous Mode.

In asynchronous mode, the frequency of the clock output is equal to the bit rate and the phase is such that the rising edge of the clock comes at the center of the transmit data, as shown in Figure 18.4.

Figure 18.4 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode)

### 18.4.4 Double-Speed Operation

In addition to the operation described in Section 18.4.3, Clock, double-speed operation is enabled by the setting of the ABCS bit in SCI3nSEMR. In double-speed operation, the same operation on a clock with a frequency of 16 times the bit rate in normal operation can be conducted on a clock with a frequency of 8 times the bit rate, meaning that the SCI3 operates on a double transfer rate using the same reference clock.

Double-speed operation can be configured with either an internal clock generated by the on-chip baud rate generator.

### 18.4.5 SCI3 Initialization (Asynchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR and then initialize the SCI3 according to the sample flowchart in Figure 18.5. Before changing the operating mode or transfer format, be sure to clear the TE and RE bits to 0 . Note that clearing the TE bit to 0 sets the TDRE flag to 1 , but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

[1] Set the clock selection in SCI3nSCR. Be sure to clear the TE, RE, TIE, TEIE, MPIE, and RIE bits to 0 .
When the clock output is selected in asynchronous mode, the clock is output immediately after SCl3nSCR settings are made.
[2] Set the transfer format in SCI3nSMR and SCI3nSCMR.
[3] Clear the MDDRS bit in SCI3nSEMR, and set a value corresponding to the bit rate for $B R R$.
[4] Set the BRME and MDDRS bits in SCI3nSEMR to 1 , and set a bit rate error correction value in SCI3nMDDR.
[5] Set the TE or RE bit in SCI3nSCR to 1. Also set the TIE, TEIE, MPIE, and RIE bits.
Setting the TE and RE bits makes the SCInTxD and $\operatorname{SCInRxD}$ pins available.
Set the TE or RE bit in SCI3nSCR to 1 . When setting simultaneous serial data transmission and reception, set both the TE and RE bits simultaneously with one instruction.

Note: After reset, $\mathrm{TE}=\mathrm{RE}=\mathrm{MDDRS}=0$

Figure 18.5 Sample Flowchart for SCI3 Initialization

### 18.4.6 Serial Data Transmission (Asynchronous Mode)

Figure 18.6 shows an example of operation for data transmission in asynchronous mode. In data transmission, the SCI3 operates as described below.

1. When the TE bit is set to 1 , the High level (Preamble) for one frame is output.
2. When writing transmit data to SCI3nTDR at a trigger of TXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a TXI interrupt request for starting data transfer. Set the TIE bit to 0 when a TXI interrupt request is not used.
3. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0 . The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR. When transmit data is written to SCI3nTDR while Preamble is output, the transmit data is transferred from SCI3nTDR to SCI3nTSR after Preamble is output.
4. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR and the TDRE flag is set to 1. If the TIE bit in SCI3nSCR is set to 1 at this time, a TXI interrupt request is generated.
5. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this TXI interrupt processing routine before transmission of the previously transferred data is completed. When an TEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1 .
6. Data is sent from the SCInTxD pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
7. The TDRE flag is checked when the stop bit is output.
8. When the TDRE flag is 0 , the next transmit data is transferred from SCI3nTDR to SCI3nTSR, and reperforms transmission from the procedure No. 4 .
9. When the TDRE flag is 1 , the TEND flag in SCI3nSSR is set to 1 , the stop bit is sent, and then 1 is output to enter the mark state. If the TEIE bit in SCI3nSCR is set to 1 at this time, a TEI interrupt request is generated.
Figure 18.8 shows a sample flowchart for data transmission. Figure 18.9 shows a sample flowchart for stopping the SCI3 after data transmission.

It is unnecessary to clear the TE bit to 0 as long as communication format change, bit rate change, or transmission interruption are not required. Note that communication efficiency may be decreased by Preamble operation when the TE bit is set from 0 to 1 in each transmission.

Figure 18.6 Example of Operation for Transmission in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

## CAUTION

Do not clear the TDRE flag by writing SCI3nSSR register while the TE bit is set to 1 . If the TDRE flag is cleared by register operation before writing data to SCI3nTDR, the register value of SCI3nTDR is transferred to SCI3nTSR at the next transmission start timing and its data value is transmitted. Thus, unintended data may be transferred.

The purpose of Preamble output:
When the TE bit is changed from 0 to 1, the High level (Preamble) for one frame is output so that SCI3 can communicate normally after the transmission is aborted and resumed as follows. Even if the receiver becomes uncertain due to the transmission abortion by the transmitter, the resumed transmission starts after the period of one frame, and the receiver can detect the start bit of the next frame.

Figure 18.7 Example of Preamble Output

Figure 18.8 Example of Serial Transmission Flowchart

[5] Confirmation of transmission end: Read the TEND flag in SCI3nSSR to confirm that no data is being transmitted.
[6] To output a break at the end of transmission, set the port corresponding to the SCInTxD pin to port output mode to output the low level (clear the P, PM, and PMC bits to 0), and then clear the TE and RE bits in SCl3nSCR to 0 .

Note: Clearing the TE bit in SCI3nSCR initializes the SCI3 transmitter and places the SCInTxD pin in the highimpedance state. To retain the serial communications line, switch the $S C I n T x D$ pin to port output mode to output the required level before clearing the TE bit to 0 .

Figure 18.9 Example Flowchart for Stopping the SCI3 after Serial Transmission

### 18.4.7 Serial Data Reception (Asynchronous Mode)

Figure 18.10 shows an example of the operation for data reception in asynchronous mode. In data reception, the SCI3 operates as described below.

1. SCI3 monitors the communications line and upon detection of a start bit, it performs internal synchronization, stores receive data in SCI3nRSR, and checks the parity bit and the stop bit.
2. When an overrun error occurs (the next data has been received with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1 . If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1 .
3. When a parity error is detected, the PER flag in SCI3nSSR is set to 1 and receive data is transferred to RDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated.
4. When a framing error (when the stop bit is 0 ) is detected, the FER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated.
5. When reception finishes successfully, the RDRF flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this RXI interrupt processing routine before reception of the next receive data is completed. Reading the SCI3nRDR automatically clears the RDRF flag to 0 .

Figure 18.10 Example of Operation for Reception in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

Table $\mathbf{1 8 . 2 3}$ lists the states of the SCI3nSSR status flags and receive data handling when a receive error is detected. When a receive error is detected, the RDRF flag retains the status before receiving the data. Subsequent data reception is disabled while a receive error flag is set to 1 . Accordingly, clear the ORER, FER, PER, and RDRF flags before continuing data reception. Figure $\mathbf{1 8 . 1 1}$ or Figure $\mathbf{1 8 . 1 2}$ shows sample flowchart for data reception.

Table 18.23 SCI3nSSR Status Flags and Receive Data Handling

| SCI3nSSR Status Flags |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| RDRF $^{* 1}$ | ORER | FER |  | Receive Data | Receive Status |
| 1 | 0 | 0 | 0 | Transferred to SCI3nRDR | Successful reception |
| 0 | 0 | 1 | 0 | Transferred to SCI3nRDR | Framing error |
| 0 | 0 | 0 | 1 | Transferred to SCI3nRDR | Parity error |
| 0 | 0 | 1 | 1 | Transferred to SCI3nRDR | Framing error + parity error |
| $1^{* 1}$ | 1 | 0 | 0 | Lost | Overrun error |
| $1^{* 1}$ | 1 | 1 | 0 | Lost | Overrun error + framing error |
| $1^{* 1}$ | 1 | 0 | 1 | Lost | Overrun error + parity error |
| $1^{* 1}$ | 1 | 1 | 1 | Lost | Overrun error + framing error + parity <br> error |

Note: " + " indicates that two or more receive statuses occur simultaneously in a single reception operation.
Note 1. In the case of an overrun error, the RDRF flag retains the state before the data reception.

Note: Clearing the RE bit in $S C I 3 n S C R$ initializes the $S C I 3$ and places the $S C \operatorname{InRxD}$ pin in the high-impedance state. To retain the serial communications line, do not clear the RE bit to 0 .

Figure 18.11 Example of Serial Reception Flowchart (1)

Note: In the case of a framing error, a break can be detected by reading the value of the RXDMON bit in SCI3nSEMR.
After error processing, be sure to clear the ORER, PER, and FER flags to 0 . Reception cannot be resumed if any of these flags is set to 1 .

Figure 18.12 Example of Serial Reception Flowchart (2)

### 18.5 Multi-Processor Communication Function

### 18.5.1 Overview and Sample Connection

Using the multi-processor communication function allows data transmission and reception by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish the ID transmission cycle from the data transmission cycle. When the multi-processor bit is set to 1 , it indicates the ID transmission cycle. When the multiprocessor bit is set to 0 , it indicates the data transmission cycle. Figure 18.13 shows an example of communication between processors by using the multi-processor format. First, a transmitting station sends communication data in which the multi-processor bit ( $=1$ ) is added to the ID code of the receiving station. Next, the transmitting station sends communication data in which the multi-processor bit $(=0)$ is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1 , the receiving station compares the received ID with the ID of the receiving station itself. When these IDs match, the receiving station receives communication data that is subsequently transmitted. If these IDs do not match, the receiving station skips communication data until it receives communication data in which the multi-processor bit is set to 1 .

To support this function, the SCI3 provides the MPIE bit in SCI3nSCR. When the MPIE bit is set to 1 , transfer of receive data from SCI3nRSR to SCI3nRDR, detection of a receive error, and setting the RDRF, FER, and ORER flags in SCI3nSSR are disabled until data in which the multi-processor bit is set to 1 is received. Upon receiving a character in which the multi-processor bit is set to 1 , the MPB bit in SCI3nSSR is set to 1 and the MPIE bit is automatically cleared to 0 , thus returning to a normal reception operation. When the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. While the MPIE bit is cleared to 0 , reception operation is conducted regardless of the multi-processor bit value. The multi-processor bit is stored in the MPB bit in SCI3nSSR.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock that is used for multi-processor communications is also the same as the clock used in the normal asynchronous mode.

Figure 18.13 Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AAн to Receiving Station A)

### 18.5.2 Multi-Processor Serial Data Transmission

Figure 18.14 shows a sample flowchart of multi-processor data processing. In the ID transmission cycle, send the ID with the MPBT bit in SCI3nSSR set to 1. In the data transmission cycle, send data with the MPBT bit in SCI3nSSR cleared to 0 . Other operations are the same as operations in asynchronous mode.

Figure 18.14 Example of Multi-Processor Serial Transmission Flowchart

### 18.5.3 Multi-Processor Serial Data Reception

Figure 18.16 to Figure 18.18 shows sample flowcharts of multi-processor data reception. When the MPIE bit in SCI3nSCR is set to 1 , reading the communication data is skipped until communication data in which the multiprocessor bit is set to 1 is received. When communication data in which the multi-processor bit is set to 1 is received, the receive data is transferred to SCI3nRDR. At this time, an RXI interrupt request is generated. Other operations are the same as operations in asynchronous mode. Figure $\mathbf{1 8 . 1 5}$ shows an example of operation for reception.

## CAUTION

Do not write data to $\mathrm{SCl} 3 n S C R$ when communication data in which the multi-processor bit is set to 1 is received. The MPIE bit may not become the desired state.

Figure 18.15 Example of SCI3 Reception (8-Bit Data, Multi-Processor Bit, One Stop Bit)

Figure 18.16 Example of Multi-Processor Serial Reception Flowchart (1)
[7] Check the reception status:
Read the ORER, PER, and FER flags in

[7] [10] Continuation of reception:
To continue reception, perform the processing in steps [7], [8], and [9] before receiving the stop bit Yes of the next frame. Repeat this procedure.
[8] Check the SCl3 status:
Read SCI3nSSR to confirm that the RDRF flag has been set to 1 .
[9] Read the receive data in SCI3nRDR to clear the RDRF flag to 0 .
SCI3nSSR to determine whether any error has occurred.

Continue to Figure 18.18
[11] Continuation of multi-processor serial reception:
Continue ID reception.
[11]

Continue to Figure 18.16

Note: Clearing the RE bit in SCI3nSCR initializes SCI3 and places the SCInRxD pin in the high-impedance state. To retain the serial communication line, do not clear the RE bit to 0 .

Figure 18.17 Example of Multi-Processor Serial Reception Flowchart (2)

Note: In the case of a framing error, a break can be detected by reading the value of the RXDMON bit in SCI3nSEMR. After error processing, be sure to clear the ORER, PER, and FER flags to 0 . Reception cannot be resumed if any of these flags is set to 1 .

Figure 18.18 Example of Multi-Processor Serial Reception Flowchart (3)

### 18.6 Operation in Clock Synchronous Mode

Figure 18.19 shows the data format for clock synchronous serial data communication. In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In data transmission with the synchronization clock output, the SCI3 outputs data from one falling edge to the next falling edge of the synchronization clock. In data transmission with the synchronization clock input, the SCI3 outputs the first data (bit 0 ) after starting transfer immediately after clearing the TDRE bit in SCI3nSSR to 0 , and then outputs the next bit data after 2 to $3 \phi$ clock cycles from the falling edge of the synchronization clock. In data reception, the SCI3 receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last-bit output state. In clock synchronous mode, neither parity bit nor multi-processor bit can be added. The transmitter and the receiver are independent in the SCI3, enabling full-duplex communication by using a common clock. Both the transmitter and the receiver have a double-buffered structure so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

Figure 18.19 Data Format in Clock Synchronous Mode (LSB-First)

### 18.6.1 Clock

An internal clock generated by the on-chip baud rate generator or an external synchronous clock that is input from the SCInSCK pin can be selected by the setting of the CKE1 and CKE0 bits in SCI3nSCR. When operating the SCI3 on the internal clock, a synchronous clock is output from the SCInSCK pin. Eight pulses of the synchronous clock are output during transfer of one character, and the clock is held high while no data is transferred.

### 18.6.2 SCI3 Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR to 0 and then initialize the SCI3 according to the sample flowchart in Figure 18.20. To switch the operation between transmission, reception, and transmission / reception, clear the TE and RE bits to 0 and then set these bits to the desired value. Before changing the transfer format, be sure to clear the TE and RE bits to 0 . Note that clearing the TE bit to 0 sets the TDRE flag to 1 , but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

Figure 18.20 Example of SCI3 Initialization Flowchart

### 18.6.3 Serial Data Transmission (Clock Synchronous Mode)

Figure 18.21 shows an example of the operation for serial transmission in clock synchronous mode. In serial data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0 . The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR, starting output of the first bit when the synchronization clock is input. To write transmit data to SCI3nTDR at a trigger of TXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a TXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR, and the TDRE flag is set to 1 . When the TIE bit in SCI3nSCR is set to 1 at this time, a TXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this TXI interrupt processing routine before the transmission of the previously transferred data is completed. When a TEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1 .
3. 8-bit data is output from the SCInTxD pin in synchronization with the output clock (when clock output mode has been specified) or in synchronization with the input clock (when external clock has been specified).
4. The SCI3 checks the TDRE flag when the last bit is output.
5. When the TDRE flag is 0 , the next transmit data is transferred from SCI3nTDR to SCI3nTSR, and serial transmission of the next frame starts.
6. When the TDRE flag is 1 , the TEND flag in SCI3nSSR is set to 1 and the SCInSCK pin retains the output state of the last bit. If the TEIE bit in SCI3nSCR is set to 1 at this time, a TEI interrupt request is generated. The SCInSCK pin is held high.
 stopping the SCI3 after data transmission. Transmission will not start even if the TDRE flag is cleared while a receive error flag (ORER) is set to 1 . Be sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit to 0 does not clear the receive error flags.

Figure 18.21 Example of Operation for Transmission in Clock Synchronous Mode

Figure 18.22 Example of Serial Transmission Flowchart

[5] Confirmation of transmission end: Read the TEND flag in SCI3nSSR to confirm that no data is being transmitted.

Note: Clearing the TE and RE bits in SCI3nSCR to 0 initializes SCI3 and places the SCInTxD and SCInRxD pins in the high-impedance state. To retain the serial communications line, switch the SCInTxD pin to port output mode to output the required level before clearing the TE bit to 0 . Do not clear the RE bit to 0 .

Figure 18.23 Example Flowchart for Stopping the SCl3 after Serial Transmission

### 18.6.4 Serial Data Reception (Clock Synchronous Mode)

Figure 18.24 shows an example of SCI3 operation for serial reception in clock synchronous mode. In serial data reception, the SCI3 operates as described below.

1. The SCI3 performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores receive data in SCI3nRSR.
2. When an overrun error occurs (the reception of the next data is completed with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an ERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1 .
3. When data has been successfully received, the RDRF flag in SCI3nSSR is set to 1 and the receive data is transferred to SCI3nRDR. When the RIE bit in SCI3nSCR is set to 1 at this time, an RXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this RXI interrupt processing routine before reception of the next data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0 .

Figure 18.24 Example of SCI3 Operation for Reception

Subsequent transmission and reception are disabled with a receive error flag set to 1 . Therefore, be sure to clear the ORER, FER, PER, and RDRF flags before continuing reception. Figure 18.25 shows an example of flowchart for data reception.

Note: Clearing the TE and RE bits in SCI3nSCR to 0 initializes $S C I 3$ and places the $\operatorname{SCInTxD}$ and $\operatorname{SCInRxD}$ pins in the high-impedance state. To retain the serial communications line, switch the SCInTxD pin to port output mode to output the required level before clearing the TE bit to 0 . Do not clear the RE bit to 0 .

After error processing, be sure to clear the ORER, PER, and FER flags to 0 . Receive cannot be resumed if either of these flags is set to 1 .

Figure 18.25 Example of Serial Reception Flowchart

### 18.6.5 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 18.26 shows a sample flowchart for simultaneous data transmit and receive operations. After the SCI3 is initialized, perform the following procedure for simultaneous data transmit and receive operations.

1. To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI3 has finished transmission and the TDRE and TEND flags are set to 1 . Then clear the TE bit to 0 and then set the TE and RE bits to 1 with a single instruction.
2. To switch from receive mode to simultaneous transmit and receive mode, check that the SCI3 has finished reception and clear the RE bit to 0 . Then check that the RDRF and error flags (ORER, FER, and PER) are cleared to 0 and then set the TE and RE bits to 1 with a single instruction.

[1] [1] SCl3 initialization:
The $S C \ln T x D$ and $S C \ln R x D$ pins automatically becomes the transmit data output pin and the receive data input pin respectively.
[2] Check SCl 3 status and write transmit data:
[3] Read SCI3nSSR to confirm that the TDRE flag has been set to 1 , and write transmit data in $\mathrm{SCl} 3 n T D R$ to clear the TDRE flag to 0 .
[4] Checking reception status: Read the ORER flag in SCI3nSSR to determine whether an error is present.
[5] Receive error processing:
Perform the specified error processing.
After the error processing, be sure to clear the ORER flag to 0 .
[6] Check SCI3 status:
[7] Read SCI3nSSR to confirm that the RDRF flag has been set to 1 , and read receive data in SCI3nRDR to clear the RDRF flag to 0 .

[8] Transmission/reception function:
To continue transmission and reception, repeat the procedure in [2] to [7].

Note: Clearing the TE and RE bits in SCI3nSCR to 0 initializes SCl 3 and places the SCInTxD and SCInRxD pins in the high-impedance state. To retain the serial communications line, switch the SCInTxD pin to port output mode to output the required level before clearing the TE bit to 0 . Do not clear the RE bit to 0 .

Figure 18.26 Example of Simultaneous Serial Transmission and Reception Flowchart

### 18.7 Bit Rate Modulation Function

The bit rate modulation function corrects a bit rate by averagely enabling the internal clocks specified by the CKS1 and CKS0 bits in SCI3nSMR for the number specified by SCI3nMDDR out of 256 clocks.

Figure 18.27 shows an example of asynchronous mode in which $\phi$ clock is selected with the CKS1 and CKS0 bits, SCI3nBRR is set to 0 , and SCI3nMDDR is set to 160 . In this example, the reference clock cycle is corrected to $256 / 160$ on average and the bit rate is corrected to $160 / 256$. Note that the pulse widths of the internal reference clock expand or contract for the amount of the selected internal clocks because there is a deviation in the enabling of the internal clocks.

Do not use this function with the maximum speed settings (CKS1 and CKS0 bits $=0$ in SCI3nSMR, CKE1 bit $=0$ in SCI3nSCR, and SCI3nBRR $=0$ ) for clock synchronous mode.
(1) When bit rate modulation is not used

(2) When bit rate modulation is used to correct the bit rate to $160 / 256$

Figure 18.27 Example of Internal Reference Clock when the Bit Rate Modulation Function is Used

### 18.8 Interrupt Sources

Table 18.24 lists interrupt sources. Each interrupt source outputs an individual interrupt request signal. These interrupt sources can be enabled independently with the enable bit in SCI3nSCR.

A TXI interrupt request is generated when the TDRE flag in SCI3nSSR is set to 1 .
A TEI interrupt request is generated when the TEND flag in SCI3nSSR is set to 1 .
A TXI interrupt request can activate the DMA to handle data transfer. The TDRE flag is automatically cleared to 0 when data is transferred using the DMA.

## CAUTION

The TDRE flag and TEND flag cannot be cleared to 0 when the TE bit in SCI3nSCR is 0 . Do not set the TEIE bit in SCl3nSCR to 1 when the TE bit is set to 0 because the TEND flag is a level interrupt request flag of TEI interrupt.

An RXI interrupt request is generated when the RDRF flag in SCI3nSSR is set to 1 .
An ERI interrupt is generated when any of the ORER, PER, and FER flags in SCI3nSSR is set to 1 .
An RXI interrupt request can activate the DMA to handle data transfer. The RDRF flag is automatically cleared to 0 when data is transferred using the DMA.

A TEI interrupt request is generated when the TEND flag is set to 1 with the TEIE bit set to 1 .

## CAUTION

If a TEl interrupt request and a TXI interrupt request are generated at the same time, the TXI interrupt request is accepted first. Note that clearing the TDRE flag to 0 at this time in the TXI interrupt processing routine also clears the TEND flag to 0 automatically, disabling the branch to the TEI interrupt processing routine.

Table 18.24 SCI3 Interrupt Sources

| Name | Interrupt Source | Interrupt Flag | sDMA / DTS Activation |
| :--- | :--- | :--- | :--- |
| ERI / TEI | Receive error / Transmit end | ORER, FER, PER / TEND | Not possible |
| RXI | Receive data full | RDRF | Possible |
| TXI | Transmit data empty | TDRE | Possible |

Figure 18.28 Relationship between the SCI3 Interrupt Signals, Interrupt Controller (INTC) and sDMAC / DTS

### 18.9 Usage Notes

### 18.9.1 Break Detection and Processing

A break can be detected by reading the RXDMON bit in SCI3nSEMR when detecting a framing error. Since all inputs from the SCInRxD pin are 0 in the break state, the FER flag is set to 1 and the PER flag may also be set to 1 . The SCI3 continues data reception even after it receives a break. For this reason, note that FER flag is set to 1 again even after the FER flag is cleared to 0 .

### 18.9.2 Mark State and Production of Breaks

While the TE bit is 0 (transmission/reception disabled), the SCInTxD pin can output any level by switching the SCInTxD pin to a general output port. This allows the SCInTxD pin to be in mark state or break output during data transmission.

### 18.9.3 Receive Error Flags and Transmit Operations in Clock Synchronous Mode

During the clock synchronous simultaneous data transmit / receive operation, transmission cannot be started when a receive error flag (ORER) is set to 1 , even if the TDRE flag is cleared to 0 . Be sure to clear the receive error flags to 0 before starting transmission. Note that the receive error flags cannot be cleared to 0 even by clearing the RE bit to 0 .

### 18.9.4 Relationship between Writing to SCI3nTDR and the TDRE Flag

The TDRE flag in SCI3nSSR is a status flag indicating that transmit data in SCI3nTDR has been transferred to SCI3nTSR. The TDRE flag is set to 1 when the SCI3 transfers data from SCI3nTDR to SCI3nTSR.

Data can be written to SCI3nTDR regardless of the status of the TDRE flag. However, writing new data to SCI3nTDR while the TDRE flag is 0 will cause the data stored in SCI3nTDR to be lost because it has not been transferred to SCI3nTSR. Therefore, make sure to check that the TDRE flag is set to 1 before writing transmit data to SCI3nTDR.

### 18.9.5 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

When using an external synchronization clock, clear the TDRE flag to 0 and then input a transmission clock (Figure 18.29). Also in continuous transmission mode, clear the TDRE flag to 0 and then input a transmission clock for the next frame.

Figure 18.29 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

### 18.9.6 External Clock Input in Clock Synchronous Mode

In clock synchronous mode, set at least two cycles of the external SCInSCK clock input for the widths at both high and low levels, and at least six cycles as the period.

## Section 19 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).
The first part of this section describes all this product specific properties, such as the number of units, register base addresses, etc.

The remainder of the section describes the functions and registers of RLIN3.

### 19.1 Features of RLIN3

### 19.1.1 Units and Channels

This microcontroller has the following number of RLIN3 units.
Each RLIN3 unit has one channel interface. "Number of channels" is used with the same meaning as "number of units" in this section.

Table 19.1 Number of Channels (For E2x-FCC1)

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Channels | 6 | 6 |
| Name |  | RLIN3n $(\mathrm{n}=0$ to 5$)$ |

Table 19.2 Number of Channels (For E2M)

| Product Name | RH850/E2M |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
|  | 373 Pins | 292 Pins |  |  |
|  | 6 | 6 |  |  |
| Name | RLIN3n (n = 0 to 5) |  |  |  |

Note: The channel names are same as those of the corresponding units.
Table 19.3
Indices

| Index | Meaning |
| :--- | :--- |
| n | Throughout this section, the individual RLIN3 units are identified by the index " n " (" n " is channel numbers.); for <br> example, the LIN control register of RLIN3n is described as RLIN3nLCUC. |
| b | Throughout this section, the individual transmit/receive data buffers of RLIN3n are identified by the index "b" (b = 1 <br> to 8); for example, the data buffer register of the index " b " is described as RLN3nLDBRb. |

### 19.1.2 Register Base Addresses

RLIN3 base addresses are listed in the following table.
RLIN3 register addresses are given as offsets from the base addresses.
Table 19.4 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <RLIN30_base> | FFD2 0000 H | Peripheral Group 3 |
| <RLIN31_base> | FFD2 0040 H | Peripheral Group 3 |
| <RLIN32_base> | FFD2 0080 H | Peripheral Group 3 |
| <RLIN33_base> | FFD2 00COH | Peripheral Group 3 |
| <RLIN34_base> | FFD2 0100H | Peripheral Group 3 |
| <RLIN35_base> | FFD2 0140H | Peripheral Group 3 |

### 19.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.
Table 19.5 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| RLIN3n | LIN communication clock source | CLK_LSB |
|  | Register access clock | CLK_HSB |

### 19.1.4 Interrupt Requests

RLIN3 interrupt requests are listed in the following table.
Table 19.6 Interrupt Requests

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RLIN30 |  |  |  |  |  |
| INTRLIN30UR0 | INTRLIN3nUR0 $(\mathrm{n}=0)$ | RLIN30 transmit interrupt | 404 | group0-153 | group1-61 |
| INTRLIN30UR1 | INTRLIN3nUR1 $(\mathrm{n}=0)$ | RLIN30 receive completion interrupt | 405 | group0-154 | group1-62 |
| INTRLIN30UR2 | INTRLIN3nUR2 $(\mathrm{n}=0)$ | RLIN30 status interrupt | 406 | - | - |
| RLIN31 |  |  |  |  |  |
| INTRLIN31UR0 | INTRLIN3nUR0 $(\mathrm{n}=1)$ | RLIN31 transmit interrupt | 407 | group0-155 | group1-63 |
| INTRLIN31UR1 | INTRLIN3nUR1 $(\mathrm{n}=1)$ | RLIN31 receive completion interrupt | 408 | group0-156 | group1-64 |
| INTRLIN31UR2 | INTRLIN3nUR2 $(\mathrm{n}=1)$ | RLIN31 status interrupt | 409 | - | - |
| RLIN32 |  |  |  |  |  |
| INTRLIN32UR0 | INTRLIN3nUR0 $(n=2)$ | RLIN32 transmit interrupt | 410 | group0-157 | group1-65 |
| INTRLIN32UR1 | INTRLIN3nUR1 $(\mathrm{n}=2)$ | RLIN32 receive completion interrupt | 411 | group0-158 | group1-66 |
| INTRLIN32UR2 | INTRLIN3nUR2 $(n=2)$ | RLIN32 status interrupt | 412 | - | - |
| RLIN33 |  |  |  |  |  |
| INTRLIN33UR0 | INTRLIN3nUR0 $(\mathrm{n}=3)$ | RLIN33 transmit interrupt | 413 | group0-159 | group1-67 |
| INTRLIN33UR1 | INTRLIN3nUR1 $(n=3)$ | RLIN33 receive completion interrupt | 414 | group0-160 | group1-68 |
| INTRLIN33UR2 | INTRLIN3nUR2 $(\mathrm{n}=3)$ | RLIN33 status interrupt | 415 | - | - |
| RLIN34 |  |  |  |  |  |
| INTRLIN34UR0 | INTRLIN3nUR0 $(n=4)$ | RLIN34 transmit interrupt | 416 | group0-161 | group1-69 |
| INTRLIN34UR1 | INTRLIN3nUR1 $(n=4)$ | RLIN34 receive completion interrupt | 417 | group0-162 | group1-70 |
| INTRLIN34UR2 | INTRLIN3nUR2 $(\mathrm{n}=4)$ | RLIN34 status interrupt | 418 | - | - |
| RLIN35 |  |  |  |  |  |
| INTRLIN35UR0 | INTRLIN3nUR0 $(n=5)$ | RLIN35 transmit interrupt | 419 | group0-163 | group1-71 |
| INTRLIN35UR1 | INTRLIN3nUR1 $(n=5)$ | RLIN35 receive completion interrupt | 420 | group0-164 | group1-72 |
| INTRLIN35UR2 | INTRLIN3nUR2 $(n=5)$ | RLIN35 status interrupt | 421 | - | - |

### 19.1.5 Reset Sources

RLIN3 reset sources are listed in the following table. RLIN3 is initialized by these reset sources.
Table 19.7 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module <br> Reset |  |
| RLIN3n | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | JTAG Reset |

### 19.1.6 External Input/Output Signals

External input/output signals of RLIN3 are listed below.
Table 19.8 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| RLIN30 |  |  |
| RLIN3nRX ( $\mathrm{n}=0$ ) | RLIN30 receive data input | LRX0 |
| RLIN3nTX ( $\mathrm{n}=0$ ) | RLIN30 transmit data output | LTX0 |
| RLIN31 |  |  |
| RLIN3nRX ( $\mathrm{n}=1$ ) | RLIN31 receive data input | LRX1 |
| RLIN3nTX ( $\mathrm{n}=1$ ) | RLIN31 transmit data output | LTX1 |
| RLIN32 |  |  |
| RLIN3nRX ( $\mathrm{n}=2$ ) | RLIN32 receive data input | LRX2 |
| RLIN3nTX ( $\mathrm{n}=2$ ) | RLIN32 transmit data output | LTX2 |
| RLIN33 |  |  |
| RLIN3nRX ( $\mathrm{n}=3$ ) | RLIN33 receive data input | LRX3 |
| RLIN3nTX ( $\mathrm{n}=3$ ) | RLIN33 transmit data output | LTX3 |
| RLIN34 |  |  |
| RLIN3nRX ( $\mathrm{n}=4$ ) | RLIN34 receive data input | LRX4 |
| RLIN3nTX ( $\mathrm{n}=4$ ) | RLIN34 transmit data output | LTX4 |
| RLIN35 |  |  |
| RLIN3nRX ( $\mathrm{n}=5$ ) | RLIN35 receive data input | LRX5 |
| RLIN3nTX ( $\mathrm{n}=5$ ) | RLIN35 transmit data output | LTX5 |
| CAUTION |  |  |

This AC specification is only applied to the specific pin groups. For details, please refer to Appendix file "Limited_conditions_for_AC_specification.xlsx".

### 19.2 Overview

### 19.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.
The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, LIN slave or UART.

## LIN master

- LIN reset mode
- LIN mode (LIN master mode)
- LIN wake-up mode
- LIN operation mode
- LIN Self-Test mode

## LIN slave

- LIN reset mode
- LIN mode (LIN slave mode [auto baud rate] or LIN slave mode [fixed baud rate])
- LIN wake-up mode
- LIN operation mode
- LIN Self-Test mode

## UART

- LIN reset mode
- UART mode

Table 19.9 shows the LIN/UART interface specifications.
Table 19.9 LIN/UART Interface Specifications (1/3)

| Item |  | Specifications |
| :---: | :---: | :---: |
| LIN communication function | Protocol | LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602 |
|  | Variable frame structure | Master - Break transmission width: 13 to 28 Tbits <br> - Break delimiter transmission width: 1 to 4 Tbits <br> - Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 <br> - Transmission response space width: 0 to 7 Tbits*1 <br> - Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) <br> - Transmission wake-up width: 1 to 16 Tbits |
|  |  | Slave - Break reception width: 9.5 or 10.5 Tbits [for fixed baud rate] <br> : 10 or 11 Tbits [for auto baud rate] <br> - Transmission response space width: 0 to 7 Tbits <br> - Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) <br> - Transmission wake-up width: 1 to 16 Tbits |
|  | Checksum | - Automatic operation for both transmission and reception <br> - Classic or enhanced selectable (for each frame) |

Response field Variable from 0 to 8 bytes
data byte count Multi-byte (9 or more bytes) response transmission and reception also possible

Frame Master - Mode in which header transmission and response transmission/reception are started communication with a single transmission start request
modes

- Mode in which header transmission and response transmission are started with separate transmission start requests(frame separate mode)
Slave - Mode in which header is automatically received with fixed baud rate
- Mode in which header is automatically received with the baud rate set according to the sync field measurement result of the sync field and break field detected

| Wake-up | LIN wake-up mode provided |
| :--- | :--- |
| transmission | $\bullet$ Wake-up transmission (1 to 16 Tbits) |

and reception - Wake-up reception
Low-level width of input signals measured

| LIN communication function | Status | Master | - Successful frame/wake-up transmission <br> - Successful header transmission <br> - Successful frame/wake-up reception*2 <br> - Successful data 1 reception <br> - Error detection <br> - Operation mode <br> (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN Self-Test mode) |
| :---: | :---: | :---: | :---: |
|  |  | Slave | - Successful response/wake-up transmission <br> - Successful response/wake-up reception*2 <br> - Successful header reception <br> - Successful data 1 reception <br> - Error detection <br> - Operation mode <br> (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN Self-Test mode) |

Table 19.9 LIN/UART Interface Specifications (2/3)

| Item |  | Specifications |
| :---: | :---: | :---: |
| LIN communication function | Error status | Master • Bit error <br> - Checksum error <br> - Frame timeout error/response timeout error <br> - Physical bus error <br> - Framing error <br> - Response preparation error |
|  |  | Slave - Bit error <br> - Checksum error <br> - Frame timeout error/response timeout error <br> - Sync field error <br> - ID parity error <br> - Framing error <br> - Response preparation error |
|  | Baud rate selection | Baud rates conforming to the LIN specifications generated using baud rate generator |
|  | Test mode | Self-Test mode for user evaluation |
|  | Interrupt function | Master - Successful header/frame/wake-up transmission <br> - Successful frame/wake-up reception*2 <br> - Error detection |
|  |  | Slave - Successful response/wake-up transmission <br> - Successful header/response/wake-up reception*2 <br> - Error detection |
| UART communication function | Data buffer | - Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1 . Character length of 7,8 , and 9 bits supported) <br> - UART buffer (exclusively for transmission; variable data length from 1 to 9 . Character length of 7 and 8 bits supported) <br> - Reception data buffer (exclusively for reception; data length of 1 . Character length of 7,8 , and 9 bits supported) |
|  | Data format | Character length: 7 or 8 bits <br> Length of 9 bits supported by using the expansion bit. |
|  |  | Transmission stop bit: 1 or 2 bits |
|  |  | Parity function: odd, even, 0, or none |
|  |  | LSB- or MSB-first transfer selectable |
|  |  | Reverse input/output of transmission/reception data possible |
|  | Status | - Transmission status <br> - Reception status <br> - Successful UART buffer transmission <br> - Error detection <br> - Expansion bit detection <br> - ID match <br> - Reset mode status |
|  | Error status | - Bit error <br> - Framing error <br> - Parity error <br> - Overrun error |
|  | Baud rate selection | With the built-in baud rate generator, any baud rate can be set. |

Table 19.9 LIN/UART Interface Specifications (3/3)

| Item |  | Specifications |
| :---: | :---: | :---: |
| UART communication function |  | When a certain expansion bit is at the expected level, the data received can be compared to the 8bit data preset in the register. |
|  |  | Reception of the stop bit is guaranteed (start of transmission can be delayed when start of transmission is attempted during reception of the stop bit). |
|  | Interrupt function | - Transmission start/complete <br> - Reception complete <br> - Status/error detection |

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.
Note 2. For wake-up reception, the input signal low-level width count is indicated.

### 19.2.2 Block Diagram

Figure 19.1 shows a block diagram of the LIN/UART interface.

Note 1. For the LIN communication clock source, see Table 19.5.

Figure 19.1 LIN/UART Interface Block Diagram

### 19.2.3 Terms Used in Block Diagram

- RLIN3nTX, RLIN3nRX:
- LINn baud rate generator:
- LINn registers:
- LINn interrupt control circuit:

LIN/UART interface I/O pins
Generates the LIN/UART interface communication clock.
LIN/UART interface registers
Controls interrupt requests generated by the LIN/UART interface

### 19.3 Registers

### 19.3.1 List of Registers

RLIN3 registers are listed in the following table.
For details about <RLIN3n_base>, see Section 19.1.2, Register Base Addresses.

Table 19.10 List of Registers

| Module Name | Register Name | Symbol | Address | LIN <br> Master | LIN Slave | UART | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RLN3n | LIN / UART Wake-Up Baud Rate Select Register | RLN3nLWBR | <RLIN3n_base> + 01H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Baud Rate Prescaler 01 Register | RLN3nLBRP01 | <RLIN3n_base> + 02H | - | $\checkmark$ | $\checkmark$ | 16 | - |
| RLN3n | LIN / UART Baud Rate Prescaler 0 Register | RLN3nLBRP0 | <RLIN3n_base> + 02 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Baud Rate Prescaler 1 Register | RLN3nLBRP1 | <RLIN3n_base> + 03 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN Self-Test Control Register | RLN3nLSTC | <RLIN3n_base> + 04H | $\checkmark$ | $\checkmark$ | - | 8 | - |
| RLN3n | LIN / UART Mode Register | RLN3nLMD | <RLIN3n_base> + 08H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN Break Field Configuration Register/ UART Configuration Register | RLN3nLBFC | <RLIN3n_base> + 09 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Space Configuration Register | RLN3nLSC | <RLIN3n_base> + $0 \mathrm{AH}_{H}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN Wake-Up Configuration Register | RLN3nLWUP | <RLIN3n_base> + $0 \mathrm{OB}_{\mathrm{H}}$ | $\checkmark$ | $\checkmark$ | - | 8 | - |
| RLN3n | LIN Interrupt Enable Register | RLN3nLIE | <RLIN3n_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | $\checkmark$ | $\checkmark$ | - | 8 | - |
| RLN3n | LIN / UART Error Detection Enable Register | RLN3nLEDE | <RLIN3n_base> + 0D ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Control Register | RLN3nLCUC | <RLIN3n_base> + $0 \mathrm{E}_{\mathrm{H}}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Transmission Control Register | RLN3nLTRC | <RLIN3n_base> + 10 H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Mode Status Register | RLN3nLMST | <RLIN3n_base> + 11 H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Status Register | RLN3nLST | <RLIN3n_base> + 12H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Error Status Register | RLN3nLEST | <RLIN3n_base> + 13 H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Data Field Configuration Register | RLN3nLDFC | <RLIN3n_base> + 14 H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART ID Buffer Register | RLN3nLIDB | <RLIN3n_base> + 15 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN Checksum Buffer Register | RLN3nLCBR | <RLIN3n_base> + 16 H | $\checkmark$ | $\checkmark$ | - | 8 | - |
| RLN3n | UART Data Buffer 0 Register | RLN3nLUDB0 | <RLIN3n_base> + 17 H | - | - | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Data Buffer 1 Register | RLN3nLDBR1 | <RLIN3n_base> + 18H | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Data Buffer 2 Register | RLN3nLDBR2 | <RLIN3n_base> + 19 ${ }_{\text {H }}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Data Buffer 3 Register | RLN3nLDBR3 | <RLIN3n_base> + $1 \mathrm{~A}_{H}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |
| RLN3n | LIN / UART Data Buffer 4 Register | RLN3nLDBR4 | $<\mathrm{RLIN} 3 n \_$base> $+1 \mathrm{~B}_{\mathrm{H}}$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 8 | - |

| RLN3n | UART Wait Transmission Data Register H | RLN3nLUWTDRH | <RLIN3n_base> + 29 ${ }_{\text {H }}$ | - | - | $\checkmark$ | 8 | - |

Note: $\quad \checkmark$ : Used, 一: Not used

When writing to an unused register, write the value after reset.

### 19.3.2 LIN Master Related Registers

### 19.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Table 19.11 RLN3nLWBR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select b7 b4 $000 \text { 0: } 16 \text { samplings }$ <br> Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | $\begin{aligned} & \text { Prescaler Clock Select } \\ & \qquad \begin{array}{ll} \text { b3 } & \text { b1 } \\ 0 & 0 \end{array} 0: 1 / 1 \\ & 0 \end{aligned} 01: 1 / 2$ |
| 0 | LWBR0 | Wake-up Baud Rate Select <br> 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3) <br> 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x) |

Configure the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register $=00_{\mathrm{B}}$ ), set these bits to $0000_{\mathrm{B}}$ ( 16 sampling).

## LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

## LWBRO Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0 . This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1 . Setting the LWBR0 bit to 1 selects fa as the LIN system clock (fLIN) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 us or longer to be detected in the LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

### 19.3.2.2 RLN3nLBRPO — LIN Baud Rate Prescaler 0 Register

Value after reset: $\quad 00_{H}$

Table 19.12 RLN3nLBRPO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | LBRP0[7:0] | Assuming that the value set in this register is $\mathrm{N}(0$ to 255$)$, the baud rate prescaler divides the <br> frequency of the prescaler clock by $\mathrm{N}+1$. <br>  |
|  | Setting range: $00_{\mathrm{H}}$ to $\mathrm{FF}_{\mathrm{H}}$ |  |

Configure the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
The value set in this register is used to control the frequency of baud rate clock sources $\mathrm{fa}, \mathrm{fb}$, and fc .
Assuming that the value set in this register is N , baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by $\mathrm{N}+1$.

Registers RLN3nLBRP0 and RLN3nLBRP1 can be accessed as RLN3nLBRP01 in 16-bit units.

### 19.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Value after reset: $\quad 00_{H}$

Table 19.13 RLN3nLBRP1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | LBRP1[7:0] | Assuming that the value set in this register is $\mathrm{M}(0$ to 255$)$, the baud rate prescaler divides the <br> frequency of the prescaler clock by $\mathrm{M}+1$. <br>  |
|  | Setting range: $00_{\mathrm{H}}$ to $\mathrm{FF}_{\mathrm{H}}$ |  |

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
The value set in this register is used to control the frequency of baud rate clock source fd.
Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by $\mathrm{M}+1$.

Registers RLN3nLBRP0 and RLN3nLBRP1 can be accessed as RLN3nLBRP01 in 16-bit units.

### 19.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Value after reset: $\quad 00_{H}$

Table 19.14 RLN3nLSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | - | LIN Self-Test Mode Entry |
|  |  | In writing to this bit, write value is meaningful only when A7H,58H, and 01H are written |
|  | successively to this register in LIN Self-Test mode. In other cases, write value is ignored. |  |
| 0 | LSTM | LIN Self-Test Mode |
|  | $0:$ The module is not in LIN Self-Test mode. |  |
|  |  | 1: The module is in LIN Self-Test mode. |

The RLN3nLSTC register cancels protection of LIN Self-Test mode.
Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Writing A7H, 58 H , and 01 H successively to the RLN3nLSTC register places the module into LIN Self-Test mode.
When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1 .
Do not write any other value during successive writing. For making transition to LIN Self-Test mode, see Section

### 19.5.5, LIN Self-Test Mode.

When read, bits 6 to 1 return " 000000 B", and bit 7 returns an undefined value.

## LSTM Bit (LIN Self-Test Mode)

When transition to LIN Self-Test mode is completed, the LSTM bit is set to 1 .
For exiting LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $\mathrm{A} 7_{\mathrm{H}}$, $58_{\mathrm{H}}$, and $01_{\mathrm{H}}$.

### 19.3.2.5 RLN3nLMD — LIN Mode Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | LRDNFS | LIOS | LCKS[1:0] |  | LMD[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.15 RLN3nLMD Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. <br> When writing, write the value after reset. |
| 5 | LRDNFS | LIN Reception Data Noise Filter Disable <br> 0 : The noise filter is enabled. <br> 1: The noise filter is disabled. |
| 4 | LIOS | LIN Interrupt Output Select <br> 0: Not supported, setting is prohibited. <br> 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used. |
| 3, 2 | LCKS[1:0] | LIN System Clock Select <br> b3 b2 <br> 0 0: fa (Clock generated by baud rate prescaler 0 ) <br> $0 \quad 1$ : fb (1/2 clock generated by baud rate prescaler 0 ) <br> $1 \quad 0$ : fc ( $1 / 8$ clock generated by baud rate prescaler 0 ) <br> 1 1: fd (1/2 clock generated by baud rate prescaler 1 ) |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select <br> b1 b0 <br> 0 0: LIN master mode |

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode)

## LRDNFS Bit (LIN Reception Data Noise Filtering Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

## LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, Not supported, setting is prohibited.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see Section 19.4, Interrupt Sources.
The LIOS bit must always be set when using LIN mode operation, in order to enable the interrupt generation by the RLIN3 module. For UART mode, this bit is not relevant.

## LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With $00_{\mathrm{B}}$ set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0 ).

With $01_{\mathrm{B}}$ set, the protocol controller is provided with fb ( $1 / 2$ clock generated by baud rate prescaler 0 ).
With $10_{\mathrm{B}}$ set, the protocol controller is provided with fc ( $1 / 8$ clock generated by baud rate prescaler 0 ).
With $11_{\mathrm{B}}$ set, the protocol controller is provided with $\mathrm{fd}(1 / 2$ clock generated by baud rate prescaler 1 ).
When $1_{\mathrm{B}}$ is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), and the RLN3nLMST register is $01_{\mathrm{H}}$ (in LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

## LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to $00_{\mathrm{B}}$.

### 19.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | BDT[1:0] |  | BLT[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.16 RLN3nLBFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7,6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 5, 4 | BDT[1:0] | Transmission Break Delimiter (High Level) Width Select <br> b5 b4 |
|  |  | 0 0: 1 Tbit |
|  |  | 0 1:2 Tbits |
|  |  | $10: 3$ Tbits |
|  |  | 1 1:4 Tbits |
| 3 to 0 | BLT[3:0] | Transmission Break (Low Level) Width Select |
|  |  | b3 b0 |
|  |  | 0000 : 13 Tbits |
|  |  | $0001: 14$ Tbits |
|  |  | $0010: 15$ Tbits |
|  |  | : |
|  |  | $1110: 27$ Tbits |
|  |  | 1111 : 28 Tbits |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_{B}$ (in LIN reset mode).
Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

## BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be set.

## BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be set.

### 19.3.2.7 RLN3nLSC — LIN Space Configuration Register

## Value after reset: $\quad 00_{H}$

Table 19.17 RLN3nLSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select |
|  |  | b5 b4 |
|  |  | 0 0: 0 Tbit |
|  |  | 0 1:1 Tbit |
|  |  | 1 0: 2 Tbits |
|  |  | 1 1:3 Tbits |
| 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Inter-Byte Space (Header)/Response Space Select |
|  |  | b2 b0 |
|  |  | 00000 Tbit |
|  |  | 00 1: 1 Tbit |
|  |  | 010 : 2 Tbits |
|  |  | 011 : 3 Tbits |
|  |  | 100 : 4 Tbits |
|  |  | $101: 5$ Tbits |
|  |  | 110 : 6 Tbits |
|  |  | 111 : 7 Tbits |

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_{B}$ (in LIN reset mode).
Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

## IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.

## IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the response space before response transmission.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

### 19.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Value after reset: $\quad 00_{H}$

Table 19.18 RLN3nLWUP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low Level Width Select |
|  |  | b7 b4 |
|  |  | $0000: 1$ Tbit |
|  |  | 0001 : 2 Tbits |
|  |  | 0010 : 3 Tbits |
|  |  | 0011 : 4 Tbits |
|  |  | : |
|  |  | $1100: 13$ Tbits |
|  |  | 110 1: 14 Tbits |
|  |  | $1110: 15$ Tbits |
|  |  | 1111 : 16 Tbits |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.
With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

### 19.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SHIE | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 19.19 RLN3nLIE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 | SHIE | Successful Header Transmission Interrupt Enable |
|  |  | 0: Disables successful header transmission interrupt request. |
|  |  | 1: Enables successful header transmission interrupt request. |
| 2 | ERRIE | Error Detection Interrupt Enable |
|  |  | 0: Disables error detection interrupt request. |
|  |  | 1: Enables error detection interrupt request. |
| 1 | SRCIE | 0: Disables successful frame/wake-up reception interrupt request. |
|  |  | 1: Enables successful frame/wake-up reception interrupt request. |
| 0 |  | Successful Frame/Wake-up Transmission Interrupt Enable |
|  |  | 0: Disables successful frame/wake-up transmission interrupt request. |
|  |  | 1: Enables successful frame/wake-up transmission interrupt request. |

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## SHIE Bit (Successful Header Transmission Interrupt Enable)

The SHIE bit enables or disables interrupt requests upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1 .

## ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.

Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors.
Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

## FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).

With 0 set, the interrupt request for successful RLIN3n reception is not generated when the FRC flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for successful RLIN3n reception is generated when the FRC flag in the RLN3nLST register is set to 1 .

## FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal. With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1 .

With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1 .

### 19.3.2.10 RLN3nLEDE —LIN Error Detection Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | LTES | - | - | - | FERE | FTERE | PbERE | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R/W | R/W | R/W | R/W |

Table 19.20 RLN3nLEDE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | LTES | Timeout Error Select |
|  |  | 0: Frame timeout error |
|  |  | 1: Response timeout error |
| 6 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable |
|  |  | 0: Disables framing error detection. |
|  |  | 1: Enables framing error detection. |
| 2 | Timeout Error Detection Enable |  |
|  |  | 0: Disables frame/response timeout error detection. |
|  |  | 1: Enables frame/response timeout error detection. |
| 1 |  | Physical Bus Error Detection Enable |
|  |  | 0: Disables physical bus error detection. |
|  |  | 1: Enables physical bus error detection. |
| 0 |  | Bit Error Detection Enable |
|  |  | 0: Disables bit error detection. |
|  |  | 1: Enables bit error detection. |

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode)

## LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function is used for frame timeout.
With 1 set, the timeout function is used for response timeout.
For details on the timeout error, see Section 19.5.3.7, Error Status.

## FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1 , the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see Section 19.5.3.7, Error Status.

## FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error. With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.

When this bit is set to 1 , the detection result is indicated in the FTER flag in the RLN3nLEST register. With the LTES bit, either the frame timeout error or response timeout error can be selected.

Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see Section 19.5.3.7, Error Status.
Timeout error should be disabled for data group communication.

## PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1 , the detection result is indicated in the PBER flag in the RLN3nLEST register. For details on the physical bus error, see Section 19.5.3.7, Error Status.

## BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1 , the detection result is indicated in the BER flag in the RLN3nLEST register. For details on the bit error, see Section 19.5.3.7, Error Status.

### 19.3.2.11 RLN3nLCUC — LIN Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | OM1 | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 19.21 RLN3nLCUC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 1 | OM1 | LIN Mode Select |
|  | $0:$ LIN wake-up mode. |  |
|  | 1: LIN operation mode. |  |
| 0 | OM0 | LIN Reset |
|  | $0:$ LIN reset mode. |  |
|  | $1:$ LIN reset mode is canceled. |  |

Set the RLN3nLCUC register to $01_{\mathrm{H}}$ to transition to LIN wake-up or to $03_{\mathrm{H}}$ to transition to LIN operation mode after exiting LIN reset mode.

In LIN Self-Test mode, set the RLN3nLCUC register to $03_{\mathrm{H}}$ after a transition to LIN Self-Test mode is completed.
After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

## OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode.
With 1 set, LIN operation mode.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1 .

## OMO Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode is caused.
With 1 set, LIN reset mode is canceled.

### 19.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | RTS | FTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 19.22 RLN3nLTRC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 1 | RTS | Response Transmission/Reception Start |
|  |  | 0: Response transmission/reception is stopped in frame separate mode. |
|  |  | 1: Response transmission/reception is started in frame separate mode. |
| 0 | FTS | Frame Transmission/Wake-up Transmission /Reception Start |
|  |  | 0: Frame Transmission/wake-up transmission/reception is stopped. |
|  |  | 1: Frame Transmission/wake-up transmission reception is started. |

## RTS Bit (Response Transmission/Reception Start)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1 ) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write $02_{\mathrm{H}}$ to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

## FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission and reception.
Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

### 19.3.2.13 RLN3nLMST — LIN Mode Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 19.23 RLN3nLMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | Writing is ignored. |  |
| 1 | OMM1 | LIN Mode Status Monitor |
|  | $0:$ LIN wake-up mode. |  |
|  | 1: LIN operation mode. |  |
| 0 | OMM0 | LIN Reset Status Monitor |
|  | $0:$ LIN reset mode. |  |
|  | $1:$ Not in LIN reset mode. |  |

## OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

## OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.
It takes 3 peripheral clock cycles +4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

### 19.3.2.14 RLN3nLST — LIN Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | HTRC | D1RC | - | - | ERR | - | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

Table 19.24 RLN3nLST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | HTRC | Successful Header Transmission Flag <br> 0: Header transmission has not been completed. <br> 1: Header transmission has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag <br> 0: Data 1 reception has not been completed. <br> 1: Data 1 reception has been completed. |
| 5, 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag <br> 0 : No error has been detected. <br> 1: Error has been detected. |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | FRC | Successful Frame/Wake-up Reception Flag <br> 0: Frame or wake-up reception has not been completed. <br> 1: Frame or wake-up reception has been completed. |
| 0 | FTC | Successful Frame/Wake-up Transmission Flag <br> 0: Frame or wake-up transmission has not been completed. <br> 1: Frame or wake-up transmission has been completed. |

The RLN3nLST register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1 ).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_{\mathrm{H}}$.
To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

## HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.

## D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated.

To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1 ), write 0 to the bit in LIN operation mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

## ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

## FRC Flag (Successful Frame/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLN3n reception complete is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1 ), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

## FTC Flag (Successful Frame/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 19.3.2.15 RLN3nLEST — LIN Error Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RPER | - | CSER | - | FER | FTER | PBER | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R | R/W | R/W | R/W | R/W |

Table 19.25 RLN3nLEST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | RPER | Response Preparation Error Flag <br> 0 : Response preparation error has not been detected. <br> 1: Response preparation error has been detected. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CSER | Checksum Error Flag <br> 0 : Checksum error has not been detected. <br> 1: Checksum error has been detected. |
| 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | FER | Framing Error Flag <br> 0 : Framing error has not been detected. <br> 1: Framing error has been detected. |
| 2 | FTER | Timeout Error Flag <br> 0: Frame/response timeout error has not been detected. <br> 1: Frame/response timeout error has been detected. |
| 1 | PBER | Physical Bus Error Flag <br> 0: Physical bus error has not been detected. <br> 1: Physical bus error has been detected. |
| 0 | BER | Bit Error Flag <br> 0 : Bit error has not been detected. <br> 1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1 ).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_{\mathrm{H}}$.
When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

## RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. This happens, if response preparation was not completed before the first byte of a response has been received.

This bit is cleared automatically when LTRC.FTS is set.

## CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 upon checksum error detection.
This bit is cleared automatically when LTRC.FTS is set.

## FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. This bit is cleared automatically when LTRC.FTS is set.

## FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. This bit is cleared automatically when
LTRC.FTS is set.

## PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. This bit is cleared automatically when LTRC.FTS is set.

## BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. This bit is cleared automatically when LTRC.FTS is set.

### 19.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | LSS | FSM | CSM | RFT | RFDL[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.26 RLN3nLDFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | LSS | Transmission/Reception Continuation Select <br> 0 : The data group to be transmitted/received next is the last one. <br> 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.) |
| 6 | FSM | Frame Separate Mode Select <br> 0 : Frame separate mode is not set. <br> 1: Frame separate mode is set. |
| 5 | CSM | Checksum Select <br> 0: Classic checksum <br> 1: Enhanced checksum |
| 4 | RFT | Response Field Communication Direction Select <br> 0: Reception <br> 1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select b3 b0 <br> 000 0: 0 byte (+ checksum) <br> 000 1: 1 byte (+ checksum) <br> 0010 : 2 bytes (+ checksum) <br> 0111 : 7 bytes (+ checksum) <br> 1000 : 8 bytes (+ checksum) <br> 100 1: 8 bytes (+ checksum) <br> 1010 : 8 bytes (+ checksum) <br> 1111 : 8 bytes (+ checksum) |

## LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.
With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

## FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the

RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register. With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0 ), set the FSM bit to 0 . When causing a transition to LIN Self-Test mode, set this bit to 0 before transition.
For details on frame separate mode, see Section 19.5.3.4(1), Transmission of LIN Frames.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1 .

## CSM Bit (Checksum Select)

The CSM bit sets the checksum mode
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see Section 19.5.3.7, Error Status.

Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0 ) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

## RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed. Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

## RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0 ).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0 ).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0 ).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group
transmission/reception (RTS bit in the RLN3nLTRC register is 0 ).
Only the last data group (the LSS bit is 0 ) includes the checksum, and no other groups (the LSS bit is 1 ) include the checksum.

### 19.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IDP1 | IDP0 | ID[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.27 RLN3nLIDB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | IDP1 | Parity Setting (P1) |
|  |  | Sets the parity bits (P1) to be transmitted in the ID field. |
| 6 | IDP0 | Parity Setting (P0) |
|  |  | Sets the parity bits (P0) to be transmitted in the ID field. |
| 5 to 0 | ID[5:0] | ID Setting |
|  | Sets the 6-bit ID value to be transmitted in the ID field. |  |

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN Self-Test mode, this register operates as described below.
Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.

## IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

## ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

### 19.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

## Value after reset: $\quad 00_{H}$

Table 19.28 RLN3nLCBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CKSM[7:0] | Holds the checksum data transmitted or received. |

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):

The value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.

- When the RFT bit in the RLN3nLDFC register is 0 (reception):

The value received can be read from the register. Read the value after reception is completed.
Writing to this register is invalid.
In LIN Self-Test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):

After completion of the frame transmission (after loopback), the reversed value of the received value can be read.

- When the RFT bit in the RLN3nLDFC register is 0 (reception):

Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.
Set the this register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for other data groups.

### 19.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b=1 to 8)

Value after reset: $\quad 00_{H}$

Table 19.29 RLN3nLDBRb Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or reads the received data. |
|  |  | Setting range: $00_{\mathrm{H}}$ to $\mathrm{FF}_{\mathrm{H}}$ |

- For response transmission:

These registers set the data to be transmitted in the response field.
Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 0 (not frame separate mode)
- FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)
or
- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For response reception:

These registers hold the data received in the response field.
The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)

- For transmission of response data of 9 bytes or more:

Use these registers with the following settings.

- RFT in RLN3nLDFC register is 1 (transmission)
- FSM in RLN3nLDFC register is 1 (frame separate mode)
- RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For reception of response data of 9 bytes or more:

Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN Self-Test mode, these registers operate as described below.
Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.

### 19.3.3 LIN Slave Related Registers

### 19.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Value after reset: $\quad 00_{H}$

Table 19.30 RLN3nLWBR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select <br> b7 b4 <br> 0000 : 16 sampling <br> 001 1: 4 sampling <br> 011 1: 8 sampling <br> Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] | Prescaler Clock Select b3 b1 $0000: 1 / 1$ 0 |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
When the communication is performed in LIN slave mode (fixed baud rate) (LMD[1:0] bits in the RLN3nLMD register $=11_{\mathrm{B}}$ ), set these bits to " $0000_{\mathrm{B}}$ ( 16 sampling).
When the communication is performed in LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register $=10_{\mathrm{B}}$ ), set these bits to " $0011_{\mathrm{B}}$ " ( 4 sampling) or " $0111_{\mathrm{B}}$ " (8 sampling).

## LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler. The LIN communication clock source is divided by this prescaler.

In LIN slave mode (auto baud rate) (LMD[1:0] bits in the RLN3nLMD register $=10_{\mathrm{B}}$ ), set these bits so that the prescaler clock becomes as follows according to the target baud rate.

| [Target baud rate] | [Prescaler clock] |
| :--- | :--- |
| 1 kbps to $20 \mathrm{kbps}:$ | $4 \mathrm{MHz}^{* 1}$ |
| 1 kbps to 2.4 kbps (excluding 2.4 kbps ): | 4 MHz |
| 2.4 kbps to $20 \mathrm{kbps}:$ | 8 MHz to 12 MHz |

Note 1. Use the clock with NSPB bits set to "0011B" (four samplings).

### 19.3.3.2 RLN3nLBRP01 — LIN Baud Rate Prescaler 01 Register

Table 19.31 RLN3nLBRP01 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | BRP[15:0] | Assuming that the value set in this register is $L(0$ to 65535$)$, the baud rate prescaler divides <br> the frequency of the prescaler clock by $L+1$. |
|  |  | Setting range: $0000_{H}$ to FFFF $_{H}$ |

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L +1 .

The RLN3nLBRP01 register can be accessed in 8-bit units by registers RLN3nLBRP0 and RLN3nLBRP1.

### 19.3.3.3 RLN3nLSTC — LIN Self-Test Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | LSTM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.32 RLN3nLSTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | - | LIN Self-Test Mode Entry |
|  |  | In writing to this bit, the write value is meaningful only when A7H,58H, and 01H are written |
|  |  | successively to this register in LIN Self-Test mode. In other cases, the write value is ignored. |
| 0 | LSTM | LIN Self-Test Mode |
|  | $0:$ LIN Self-Test mode is not set. |  |
|  |  | 1: LIN Self-Test mode is set. |

The RLN3nLSTC register cancels protection of LIN Self-Test mode.
Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Writing $\mathrm{A} 7_{\mathrm{H}}, 58_{\mathrm{H}}$, and $01_{\mathrm{H}}$ successively to the RLN3nLSTC register places the module into LIN Self-Test mode.
When successive writing is completed thus placing LIN Self-Test mode to be entered, the LSTM bit is set to 1 .
Do not write any other value during successive writing.
For making transition to LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.
When reading bits 6 to 1 , they return " $000000_{\mathrm{B}}$ ", and reading bit 7 , it returns an undefined value.

## LSTM Bits (LIN Self-Test Mode)

When transition to LIN Self-Test mode is completed, the LSTM bit is set to 1 .
For exiting LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $\mathrm{A} 7_{\mathrm{H}}$, $58_{\mathrm{H}}$, and $01_{\mathrm{H}}$.

### 19.3.3.4 RLN3nLMD — LIN Mode Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | LRDNFS | LIOS | - | - | LMD[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R/W | R/W |

Table 19.33 RLN3nLMD Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | LRDNFS | LIN Reception Data Noise Filtering Disable <br> 0 : The noise filter is enabled. <br> 1: The noise filter is disabled. |
| 4 | LIOS | LIN Interrupt Output Select <br> 0 : Not supported, setting is prohibited. <br> 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used. |
| 3, 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | LMD[1:0] | LIN/UART Mode Select <br> b1 b0 <br> 1 0: LIN slave mode with auto baud rate <br> 1 1: LIN slave mode with fixed baud rate |

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (LIN reset mode).

## LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

## LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, not supported, setting is prohibited.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n reception status interrupt are generated from the LIN/UART interface.
For each interrupt source, see Section 19.4, Interrupt Sources.
The LIOS bit must always be set when using LIN mode operation, in order to enable the interrupt generation by the RLIN3n module. For UART mode, this bit is not relevant.

## LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use this module as an LIN slave, set these bits to " $10_{\mathrm{B}}$ " (auto baud rate) or " $11_{\mathrm{B}}$ " (fixed baud rate).

### 19.3.3.5 RLN3nLBFC — LIN Break Field Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | LBLT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 19.34 RLN3nLBFC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 0 | LBLT | Reception Break (Low-Level) Detection Width Setting |
|  |  | 0: A break (low-level) is detected in 9.5 or 10 Tbits |
|  |  | 1: A break (low-level) is detected in 10.5 or 11 Tbits |
|  |  |  |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (LIN reset mode).

## LBLT Bit (Reception Break (Low-Level) Detection Width Setting)

- When RLN3nLMD.LMD is " $10_{\mathrm{B}}$ " (in LIN slave mode (auto baud rate))
- 0: Low-level width of 10 Tbits or longer is detected.
- 1: Low-level width of 11 Tbits or longer is detected.
- When RLN3nLMD.LMD is " $11_{\mathrm{B}}$ " (in LIN slave mode (fixed baud rate))
- 0: Low-level width of 9.5 Tbits or longer is detected.
- 1: Low-level width of 10.5 Tbits or longer is detected.

### 19.3.3.6 RLN3nLSC — LIN Space Configuration Register

Value after reset: $\quad 00_{H}$

Table 19.35 RLN3nLSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 5, 4 | IBS[1:0] | Inter-Byte Space Select b5 b4 |
|  |  | 0 0: 0 Tbit |
|  |  | 0 1:1 Tbit |
|  |  | 1 0: 2 Tbits |
|  |  | 1 1:3 Tbits |
| 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 2 to 0 | IBHS[2:0] | Response Space Setting |
|  |  | b2 b0 |
|  |  | 0 0-0 0:0 Tbit |
|  |  | $0 \quad 0 \quad 1: 1$ Tbit |
|  |  | $0100: 2$ Tbits |
|  |  | 01183 Tbits |
|  |  | $1000: 4$ Tbits |
|  |  | 10 1:5 Tbits |
|  |  | $110: 6$ Tbits |
|  |  | 1 1 1:7 Tbits |

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (LIN reset mode).
This register is enabled only for response transmission, and disabled for response reception.
Some combinations of the setting values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

## IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the response transmission.
0 Tbit to 3 Tbits can be set.

## IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

These bits set the transmission width of the response space.
0 Tbit to 7 Tbits can be set.

### 19.3.3.7 RLN3nLWUP — LIN Wake-Up Configuration Register

Value after reset: $\quad 00_{H}$

Table 19.36 RLN3nLWUP Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | WUTL[3:0] | Wake-up Transmission Low level Width Select b7 b4 <br> 000 0: 1 Tbit <br> 000 1: 2 Tbits <br> 001 0: 3 Tbits <br> 0011 : 4 Tbits <br> 110 0: 13 Tbits <br> 110 1: 14 Tbits <br> 1110 : 15 Tbits <br> 111 1: 16 Tbits |
| 3 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low-level width of the wake-up frame transmission.
1 Tbit to 16 Tbits can be set.

### 19.3.3.8 RLN3nLIE — LIN Interrupt Enable Register

## Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SHIE | ERRIE | FRCIE | FTCIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 19.37 RLN3nLIE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 | SHIE | Successful Header Reception Interrupt Enable |
|  |  | 0: Disables successful header reception interrupt request. |
|  |  | 1: Enables successful header reception interrupt request. |
| 2 | ERRIE | Error Detection Interrupt Enable |
|  |  | 0: Disables error detection interrupt request. |
|  |  | 1: Enables error detection interrupt request. |
| 1 |  | Successful Response/Wake-up Reception Interrupt Enable |
|  |  | 0: Disables successful Response/wake-up reception interrupt request. |
|  |  | 1: Enables successful Response/wake-up reception interrupt request. |
| 0 |  | Successful Response/Wake-up Transmission Interrupt Enable |
|  |  | 0: Disables successful Response/wake-up transmission interrupt request. |
|  |  |  |

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## SHIE Bit (Successful Header Reception Interrupt Enable)

The SHIE bit enables or disables an interrupt request upon successful reception of a header.
With 0 set, the interrupt request for RLIN3n reception complete is not generated when the HTRC flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for RLIN3n reception complete is generated when the HTRC flag in the RLN3nLST register is set to 1 .

## ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for RLIN3n status is generated when the ERR flag in the RLN3nLST register is set to 1.

Error types that are interrupt sources are the bit error, frame/response timeout error, framing error, sync filed error, ID parity error, checksum error, and response preparation error.
Detection of the bit error, frame/response timeout error, sync filed error, ID parity error, and framing error can be enabled or disabled using the RLN3nLEDE register.

## FRCIE Bit (Successful Response/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a response or a wake-up frame (input signal low-level width count).

With 0 set, the interrupt is not generated when the FTC flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt is generated when the FTC flag in the RLN3nLST register is set to 1 .

## FTCIE Bit (Successful Response/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a response or a wake-up frame. With 0 set, the interrupt request for successful RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1 .
With 1 set, the interrupt request for successful RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1 .

### 19.3.3.9 RLN3nLEDE — LIN Error Detection Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | LTES | IPERE | - | SFERE | FERE | TERE | - | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W |

Table 19.38 RLN3nLEDE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | LTES | Timeout Error Select <br> 0: Frame timeout error <br> 1: Response timeout error |
| 6 | IPERE | ID Parity Error Detection Enable <br> 0: Disables ID Parity error detection. <br> 1: Enables ID Parity error detection. |
| 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | SFERE | Sync Field Error Detection Enable <br> 0: Disables Sync Field error detection. <br> 1: Enables Sync Field error detection. |
| 3 | FERE | Framing Error Detection Enable <br> 0 : Disables framing error detection. <br> 1: Enables framing error detection. |
| 2 | TERE | Timeout Error Detection Enable <br> 0: Disables frame/response timeout error detection. <br> 1: Enables frame/response timeout error detection. |
| 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BERE | Bit Error Detection Enable <br> 0 : Disables bit error detection. <br> 1: Enables bit error detection. |

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function operates as frame timeout.
With 1 set, the timeout function operates as response timeout.
For details on the timeout error, see Section 19.5.3.7, Error Status.

## IPERE Bit (ID Parity Error Detection Enable)

This bit enables or disables detection of the ID parity error.
With 0 set, the ID parity error is not detected.
With 1 set, the ID parity error is detected.
When this bit is set to 1 , the detection result is reflected in the IPER flag in the RLN3nLEST register.
For details on the ID parity error, see Section 19.5.3.7, Error Status.

## SFERE Bit (Sync Field Error Detection Enable)

This bit enables or disables detection of the sync field error.
With 0 set, the sync field error is not detected.
With 1 set, the sync field error is detected.
Regardless of the setting of this bit, when a sync field error is detected, this module waits for the next header.
When this bit is set to 1 , the detection result is reflected in the SFER flag in the RLN3nLEST register.
For details on the sync filed error, see Section 19.5.3.7, Error Status.

## FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
Set this bit to 1 . The detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see Section 19.5.3.7, Error Status.

## TERE Bit (Timeout Error Detection Enable)

The TERE bit enables or disables detection of the frame timeout error or the response timeout error. With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1 , the detection result is reflected in the TER flag in the RLN3nLEST register. With the LTES bit, either the frame timeout error or response timeout error can be selected.
The timeout error should not be used in LIN slave mode [auto baud rate] (when the LMD[1:0] bits in the RLN3nLMD register are " $10_{\mathrm{B}}$ ").
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see Section 19.5.3.7, Error Status.

## BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1 , the detection result is reflected in the BER flag in the RLN3nLEST register.
For details on the bit error, see Section 19.5.3.7, Error Status.

### 19.3.3.10 RLN3nLCUC — LIN Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | 0 | 0 | 0 | 0 |

Table 19.39 RLN3nLCUC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 1 | OM1 | LIN Mode Select |
|  | $0:$ LIN wake-up mode. |  |
|  | 1: LIN operation mode. |  |
| 0 | OM0 | LIN Reset |
|  | $0:$ LIN reset mode. |  |
|  | $1:$ LIN reset mode is canceled. |  |

Set the RLN3nLCUC register to $01_{\mathrm{H}}$ to transition to LIN wake-up mode or to $03_{\mathrm{H}}$ to transition to LIN operation mode after exiting LIN reset mode.

In LIN Self-Test mode, set the RLN3nLCUC register to $03_{\mathrm{H}}$ after a transition to LIN Self-Test mode is completed.
After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

## OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific LIN operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
With 0 set, LIN wake-up mode is caused.
With 1 set, LIN operation mode is caused.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1 .

## OMO Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
With 0 set, LIN reset mode.
With 1 set, LIN reset mode is canceled.
It takes 3 peripheral clock cycles +4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

### 19.3.3.11 RLN3nLTRC — LIN Transmission Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | LNRR | RTS |  |

Table 19.40 RLN3nLTRC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 2 | LNRR | No LIN Response Request |
|  |  | 0: Response for the reception ID |
|  | 1: No response for the reception ID |  |
| 1 | RTS | Response Transmission/Reception Start |
|  |  | 0: Response transmission/reception is stopped. |
|  |  | 1: Response transmission/reception is started. |
| 0 | FTS | LIN Communication Start |
|  |  | 0: Header reception/wake-up transmission/reception is stopped. |
|  |  | 1: Header reception/wake-up transmission reception is started. |

## LNRR Bit (No LIN Response Request)

Set this bit to 1 if no response is to be transmitted/received after receiving the header and checking the received ID. Once set, this bit is automatically cleared to 0 upon detection of new sync field or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write $04_{\mathrm{H}}$ using the store instruction.
Do not set this bit and the RTS bit to 1 simultaneously.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode). Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).

## RTS Bit (Response Transmission/Reception Start)

Set this bit to 1 to start response transmission or reception after receiving the header and checking the received ID. Once set, this bit is automatically cleared to 0 upon completion of response transmission or reception (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write $02_{\mathrm{H}}$ to the RLN3nLTRC register using the store instruction.
Do not set this bit and the LNRR bit to 1 simultaneously
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_{B}$ (in LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (header reception or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 upon completion of data group transmission/reception or transition to LIN reset mode.

## FTS Bit (LIN Communication Start)

Set this bit to 1 to start header reception or wake-up transmission/reception.
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
This bit is set to 0 upon completion of wake-up communication and transition to LIN reset mode.

### 19.3.3.12 RLN3nLMST — LIN Mode Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | OMM1 | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 19.41 RLN3nLMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 1 | OMM1 | LIN Mode Status Monitor |
|  | $0:$ LIN wake-up mode. |  |
|  | 1: LIN operation mode. |  |
| 0 | OMM0 | LIN Reset Status Monitor |
|  | $0:$ LIN reset mode. |  |
|  |  | $1:$ The module is not in LIN reset mode. |

## OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

## OMMO Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.
It takes 3 peripheral clock cycles +4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

### 19.3.3.13 RLN3nLST — LIN Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | HTRC | D1RC | - | - | ERR | - | FRC | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R/W | R/W |

Table 19.42 RLN3nLST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | HTRC | Successful Header Reception Flag <br> 0 : Header reception has not been completed. <br> 1: Header reception has been completed. |
| 6 | D1RC | Successful Data 1 Reception Flag <br> 0: Data 1 reception has not been completed. <br> 1: Data 1 reception has been completed. |
| 5, 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3 | ERR | Error Detection Flag <br> 0 : No error has been detected. <br> 1: Error has been detected. |
| 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | FRC | Successful Response/Wake-up Reception Flag <br> 0 : Response or wake-up reception has not been completed. <br> 1: Response or wake-up reception has been completed. |
| 0 | FTC | Successful Response/Wake-up Transmission Flag <br> 0: Response or wake-up transmission has not been completed. <br> 1: Response or wake-up transmission has been completed. |

The RLN3nLST register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1 ).

In LIN reset mode, writing a value to this register is disabled. In LIN reset mode, the register retains $00_{\mathrm{H}}$.
To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

## HTRC Flag (Successful Header Reception Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.

## D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. Write 0 to clear this bit.

When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

## ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). However, if an error is detected while this bit is 1 , an interrupt is not generated. To clear the ERR flag to 0 , write 0 to the RPER, IPER, CSER, SFER, FER, TER, and BER flags in the RLN3nLEST register. This clears the ERR flag to 0 .

## FRC Flag (Successful Response/Wake-up Reception Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of response or wake-up reception. Here, an interrupt request for successful RLIN3n reception is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

## FTC Flag (Successful Response/Wake-up Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.

The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). This bit is cleared automatically when LTRC.FTS is set.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

### 19.3.3.14 RLN3nLEST — LIN Error Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RPER | IPER | CSER | SFER | FER | TER | - | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W |

Table 19.43 RLN3nLEST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | RPER | Response Preparation Error Flag <br> 0 : Response preparation error has not been detected. <br> 1: Response preparation error has been detected. |
| 6 | IPER | ID Parity Error Flag <br> 0 ID parity error has not been detected. <br> 1: ID parity error has been detected. |
| 5 | CSER | Checksum Error Flag <br> 0 : Checksum error has not been detected. <br> 1: Checksum error has been detected. |
| 4 | SFER | Sync Field Error Flag <br> 0 : Sync field error has not been detected. <br> 1: Sync field error has been detected. |
| 3 | FER | Framing Error Flag <br> 0 : Framing error has not been detected. <br> 1: Framing error has been detected. |
| 2 | TER | Timeout Error Flag <br> 0 : Frame/response timeout error has not been detected. <br> 1: Frame/response timeout error has been detected. |
| 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BER | Bit Error Flag <br> 0 : Bit error has not been detected. <br> 1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains $00_{\mathrm{H}}$.
To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

## RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 when response preparation is not completed before reception of the first byte of response is completed. Write 0 to clear this bit.

## IPER Flag (ID Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written. When the IPERE bit of the RLN3nLEDE register is 1 (ID parity error detection enabled), this bit is set to 1 upon ID parity error detection. Write 0 to clear this bit.

## CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to when the received checksum value during response reception does not match the internally calculated checksum value. Write 0 to clear this bit.

## SFER Flag (Sync Field Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that has been retained before 1 is written. This bit is set to 1 if the sync field is not detected as " 55 H " and the break low width is more than or equal to the configured break low width. Write 0 to clear this bit.

## FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FER flag is set to 1 when a ' 0 ' value is sampled as STOP bit during reception and the corresponding error detection is enabled. Write 0 to clear this bit.

## TER Flag (Timeout Error Flag)

Only 0 can be written to the TER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
This flag is set to 1 when the internal timeout counter (frame or response timeout) reaches the error threshold value (calculated automatically) and the corresponding error detection is enabled. Write 0 to clear this bit.

## BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The BER flag is set to 1 when the sampled bit value does not match the transmitted bit value during transmission and the corresponding error detection is enabled. Write 0 to clear this bit.

### 19.3.3.15 RLN3nLDFC — LIN Data Field Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | LSS | - | LCS | RCDS | RFDL[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.44 RLN3nLDFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | LSS | Transmission/Reception Continuation Select <br> 0 : The data group to be transmitted/received next is the last one. <br> 1: The data group to be transmitted/received next is not the last one. (Data transmission/reception continues without waiting for reception of the next header.) |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | LCS | Checksum Select <br> 0: Classic checksum mode <br> 1: Enhanced checksum mode |
| 4 | RCDS | Response Field Communication Direction Select <br> 0: Reception <br> 1: Transmission |
| 3 to 0 | RFDL[3:0] | Response Field Length Select b3 b0 <br> 000 0: 0 byte (+ checksum) <br> 000 1: 1 byte (+ checksum) <br> 001 0: 2 bytes (+ checksum) <br> 011 1: 7 bytes (+ checksum) <br> 100 0: 8 bytes (+ checksum) <br> 100 1: 8 bytes (+ checksum) <br> 1010 : 8 bytes (+ checksum) <br> 111 1: 8 bytes (+ checksum) |

## LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received. With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
During LIN communication, do not set " 1 " to this bit.
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

## LCS Bit (Checksum Select)

The LCS bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the TERE bit in the RLN3nLEDE register is 1 ), the specific timeout time depends on
the setting of this bit. For details on the bit error, see Section 19.5.3.7, Error Status.
When the length of the response field data is 0 bytes (the RFDL bit is 0 ), do not set this bit to " 1 " (enhanced).
When response data of 9 bytes or more is to be transmitted or received, do not change the LCS bit setting after the first data group through the last data group
During transmission or reception of response data of 9 bytes or more, only the last data group (the LSS bit is 0 ) includes the checksum, and no other groups (the LSS bit is 1 ) include the checksum.

When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1 .
Set this bit when the RTS bit is 0 (response transmission/reception stopped).

## RCDS Bit (Response Field Communication Direction Select)

This bit selects the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed. Set this bit when the RTS bit in the RLN3nLTRC register is 0 in LIN operation mode (response transmission/reception stopped) or when the FTS bit is 0 in LIN wake-up mode (header reception or wake-up transmission/reception stopped). When response data of 9 bytes or more is to be transmitted or received, do not change this bit setting after the first data group through the last data group

## RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
Set these bits when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception stopped).
When response data of 9 bytes or more is to be transmitted or received, only the last data group (the LSS bit is 0 ) includes the checksum, and no other groups (the LSS bit in the RLN3nLDFC register is 1 ) include the checksum.

### 19.3.3.16 RLN3nLIDB — LIN ID Buffer Register

Value after reset: $\quad 00_{H}$

Table 19.45 RLN3nLIDB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | IDP[1:0] | Parity Setting <br>  <br> 5 to 0 |
|  | Stores the parity bits (P0 and P1) to be received in the ID field. |  |

The value in the RLN3nLIDB register is enabled after the completion of header reception. In LIN mode (LIN operation mode, LIN wake-up mode), writing to this register is disabled.

In LIN Self-Test mode, the operation is as follows.
Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.

## IDP[1:0] Bits (Parity Setting)

The IDP bits store the parity bits ( P 0 and P 1 ) received in the ID field of the LIN frame. IDP0 is for P 0 and IDP1 is for P1.

When the IPERE bit in the RLN3nLEDE register is 1 (ID parity detection enabled), the received value and the value calculated internally are checked. If they do not match, IPER (ID parity error flag) is set.

## ID[5:0] Bits (ID Setting)

The ID bits store the 6-bit ID value received in the ID field of the LIN frame.

### 19.3.3.17 RLN3nLCBR — LIN Checksum Buffer Register

Value after reset: $\quad 00_{H}$

Table 19.46 RLN3nLCBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CKSM[7:0] | Holds the transmitted or received checksum data. |

In LIN operation mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):

The value transmitted can be read from the register. Read the value after transmission is completed.
Writing to this register is invalid.

- When the RCDS bit in the RLN3nLDFC register is 0 (reception):

The value received can be read from the register. Read the value after reception is completed.
Writing to this register is invalid.
When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for the other data groups.

In LIN Self-Test mode, this register operates as follows:

- When the RCDS bit in the RLN3nLDFC register is 1 (transmission):

After completion of the frame transmission (after loopback), the reversed value of the received value can be read.

- When the RCDS bit in the RLN3nLDFC register is 0 (reception):

Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.
Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

### 19.3.3.18 RLN3nLDBRb — LIN Data Buffer b Register (b=1 to 8)

Value after reset: $\quad 00_{H}$

Table 19.47 RLN3nLDBRb Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | LDB[7:0] | Sets the data to be transmitted or holds the received data. <br>  <br>  <br>  |

- For response transmission:

The RLN3nLDBRb registers set the data to be transmitted in the response field.
Set these registers when the RTS bit in the RLN3nLTRC register is 0 (response transmission/reception is halted).

- For response reception:

The RLN3nLDBRb registers hold the data received in the response field.
The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
Do not read these registers when the RTS bit is 1 (response transmission/reception is started)

In LIN Self-Test mode, the operation is as follows.
Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.

### 19.3.4 UART Related Registers

### 19.3.4.1 RLN3nLWBR — UART Wake-Up Baud Rate Select Register

Value after reset: $\quad 00_{H}$

Table 19.48 RLN3nLWBR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | NSPB[3:0] | Bit Sampling Count Select <br> b7 b4 <br> 010 1: 6 sampling <br> 011 0: 7 sampling <br> 011 1: 8 sampling <br> 1000 : 9 sampling <br> 100 1: 10 sampling <br> 1010 : 11 sampling <br> 101 1: 12 sampling <br> 1100 : 13 sampling <br> 110 1: 14 sampling <br> 1110 : 15 sampling <br> 111 1: 16 sampling <br> Settings other than the above are prohibited. |
| 3 to 1 | LPRS[2:0] |  |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Set the LN3nLWBR register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In UART mode, it is possible to set the NSPB bits from 6 sampling to 16 sampling.

## LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

### 19.3.4.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Table 19.49 RLN3nLBRP01 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | BRP [15:0] | Assuming that the value set in this register is $L(0$ to 65535$)$, the baud rate prescaler divides <br> the frequency of the prescaler clock by $L+1$. |
|  |  | Setting range: $0000_{H}$ to FFFF $_{H}$ |

Assuming that the value set in this register is $L$, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by $\mathrm{L}+1$.

The RLN3nLBRP01 register can be accessed in 8-bit units by the registers RLN3nLBRP0 and RLN3nLBRP1.

### 19.3.4.3 RLN3nLMD — UART Mode Register

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | LRDNFS | - | - | - | LMD[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R | R | R/W | R/W |

Table 19.50 RLN3nLMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 5 | LRDNFS | UART Reception Data Noise Filtering Disable |
|  |  | $0:$ The noise filter is enabled. |
|  |  | 1: The noise filter is disabled. |
| 4 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 1,0 | LIN/UART Mode Select |  |
|  |  | b1 b0 |
|  | 0 | $1:$ UART mode |
|  |  |  |

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).

## LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

## LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to $01_{\mathrm{B}}$.

### 19.3.4.4 RLN3nLBFC — UART Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | UTPS | URPS | UPS[1:0] |  | USBLS | UBOS | UBLS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 19.51 RLN3nLBFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 6 | UTPS | UART Output Polarity Switch |
|  |  | 0: Transmit data normal output |
|  |  | 1: Transmit data inverted output |
| 5 | URPS | UART Input Polarity Switch |
|  |  | 0: Reception data normal output |
|  |  | 1: Reception data inverted output |
| 4, 3 | UPS[1:0] | UART Parity Select |
|  |  | 00: Parity disabled |
|  |  | 01: Even parity |
|  |  | 10: 0 parity |
|  |  | 11: Odd parity |
| 2 | USBLS | UART Stop Bit length Select |
|  |  | 0 : Stop bit:1 bit |
|  |  | 1: Stop bit: 2 bits |
| 1 | UBOS | UART Transfer Format Order Select |
|  |  | 0: LSB first |
|  |  | 1: MSB first |
| 0 | UBLS | UART Character Length Select |
|  |  | 0: UART 8 bits communication |
|  |  | 1: UART 7 bits communication |

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is $0_{B}$ (LIN reset mode).

## UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, inverted transmit data is output.
The setting of this bit is valid for all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of URPS bit.

## URPS Bit (UART Input Polarity Switch)

Sets the input polarity for UART communication.
With 0 set, receive data is input without inversion.
With 1 set, receive data is input with inversion.
The setting of this bit is valid for all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of UTPS bit.

## UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to " $00_{\mathrm{B}}$ ", data is transmitted/received without the parity.
[Transmission]
A parity bit is not added to transmit data.
[Reception]
Data is received without parity processing. Therefore, a parity error does not occur.
- When these bits are set to " 01 B ", data is transmitted/received with the even parity.
[Transmission]
If the number of 1 s in transmit data is odd, " 1 " is added to the parity bit. If the number of 1 s in transmit data is even, " 0 " is added to the parity bit.
[Reception]
If the number of 1 s in receive data including the parity bit is odd, a parity error occurs.
- When these bits are set to " $10_{\mathrm{B}}$ ", data is transmitted/received with 0 parity.

## [Transmission]

Regardless of the number of 1 s in transmit data, " 0 " is added to the parity bit.

## [Reception]

The value of the parity bit is not judged. Therefore, no parity error occurs.

- When these bits are set to " $11_{\mathrm{B}}$ ", data is transmitted/received with the odd parity.

## [Transmission]

If the number of 1 s in transmit data is odd, " 0 " is added to the parity bit. If the number of 1 s in transmit data is even, " 1 " is added to the parity bit.

## [Reception]

If the number of 1 s in receive data including the parity bit is even, a parity error occurs.

## USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

## UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

## UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1 ), the setting of this bit is invalid.

### 19.3.4.5 RLN3nLSC — UART Space Configuration Register

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | IBS [1:0] |  | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R |

Table 19.52 RLN3nLSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 5,4 | IBS[1:0] | Inter-Byte Space Select |
|  |  | b5 b4 |
|  | $0 \quad 0: 0$ Tbit |  |
|  | 0 | $1: 1$ Tbit |
|  | 1 | $0: 2$ Tbits |
|  | 1 | $1: 3$ Tbits |
|  |  | Reserved |
|  |  |  |
|  |  | When read, the value after reset is returned. |
|  |  |  |

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is $0_{B}$ (in LIN reset mode).

## IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space during multi-byte UART transmission. 0 to 3 Tbits can be set.

### 19.3.4.6 RLN3nLEDE —UART Error Detection Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | FERE | OERE | - | BERE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R | R/W |

Table 19.53 RLN3nLEDE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 | FERE | Framing Error Detection Enable |
|  |  | 0 : Disables framing error detection. |
|  |  | 1: Enables framing error detection. |
| 2 | OERE | Overrun Error Detection Enable |
|  |  | 0 : Disables overrun error detection. |
|  |  | 1: Enables overrun error detection. |
| 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 0 | BERE | Bit Error Detection Enable |
|  |  | 0: Disables bit error detection. |
|  |  | 1: Enables bit error detection. |

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is $0_{B}$ (in LIN reset mode).

## FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see Section 19.5.4.5, Error Status.

## OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1 , the detection result is reflected in the OER flag in the RLN3nLEST register.
For details on the overrun error, see Section 19.5.4.5, Error Status.

## BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1 , the detection result is indicated in the BER flag in the RLN3nLEST register.
In full-duplex communication, do not set this bit to " 1 ".
Do not set this register when the NSPB bits in the RLN3nLWBR register are $0101_{\mathrm{B}}$ ( 6 samplings) and the LRDNFS bit
in the RLN3nLMD register is 0 (noise filtering is enabled).
For details on the bit error, see Section 19.5.4.5, Error Status.

### 19.3.4.7 RLN3nLCUC — UART Control Register

## Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 19.54 RLN3nLCUC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 0 | OM0 | LIN Reset |
|  | $0:$ LIN reset mode. |  |
|  | $1:$ LIN reset mode is canceled. |  |

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

## OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to reset mode or canceling reset mode.
With 0 set, reset mode.
With 1 set, reset mode is canceled.
It takes 3 peripheral clock cycles +4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

### 19.3.4.8 RLN3nLTRC — UART Transmission Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | RTS | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R |

Table 19.55 RLN3nLTRC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 1 | RTS | UART Buffer Transmission Start |
|  |  | $0:$ UART Buffer transmission is stopped. |
|  |  | 1: UART Buffer transmission is started. |
| 0 |  | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |

## RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to " 1 ".
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enabled) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. Moreover, this bit is automatically cleared to 0 upon transition to reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode). When writing 1 to this bit while the UTSW bit in the RLN3nLDFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the stop bit of reception data is completed), write only during the reception of stop bit.

### 19.3.4.9 RLN3nLMST — UART Mode Status Register

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OMM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 19.56 RLN3nLMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | OMM0 | LIN Reset Status Monitor |
|  | $0:$ LIN reset mode. |  |
|  | 1: Not in LIN reset mode. |  |

## OMMO Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.
It takes 3 peripheral clock cycles +4 communication clock cycles, until the OMM0 bit in the RLN3nLMST register reflects the OM0 bit setting in the RLN3nLCUC register.

### 19.3.4.10 RLN3nLST — UART Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | URS | UTS | ERR | - | - | FTC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 19.57 RLN3nLST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | URS | UART Reception Status Flag <br> 0 : Reception is not operated. <br> 1: Reception is operated. |
| 4 | UTS | UART Transmission Status Flag <br> 0 : Transmission is not operated. <br> 1: Transmission is operated. |
| 3 | ERR | Error Detection Flag <br> 0 : No error has been detected. <br> 1: Error has been detected. |
| 2, 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | FTC | Successful UART Buffer Transmission Flag <br> 0: UART buffer transmission has not been completed. <br> 1: UART buffer transmission has been completed. |

The RLN3nLST register is automatically cleared to " $00_{\mathrm{H}}$ " upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains " $00_{\mathrm{H}}$ ". To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

## URS Flag (UART Reception Status Flag)

At the start of the reception, this flag is set to 1 .
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0 . While reception is stopped, this flag retains 0 .
The reception is ended under the following condition.

- Sampling point of the first bit of the stop bits

## UTS Flag (UART Transmission Status Flag)

At the start of the transmission, this flag is set to 1 . During the transmission, this flag retains 1 . The transmission is started under the following conditions.

- When transmission data is set to the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the end of transmission.
The transmission is ended under the following conditions.

- When transmission of data set in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not set
- When the UART buffer transmission is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)
- When transmission operation enable bit UTOE in register LUOER is cleared.

## ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or upon ID matching (when at least one of the flags of the RLN3nLEST register is 1). At this time, an interrupt request for RLIN3n status is generated. However, when this bit is 1 , an interrupt is not generated upon detection of an error, detection of an expansion bit, or upon ID matching. To clear the bit to 0 , write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

## FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written. Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. At this time, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

### 19.3.4.11 RLN3nLEST — UART Error Status Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | UPER | IDMT | EXBT | FER | OER | - | BER |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R | R/W |

Table 19.58 RLN3nLEST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | UPER | Parity Error Flag <br> 0: Parity error has not been detected. <br> 1: Parity error has been detected. |
| 5 | IDMT | ID Matching Flag <br> 0 : The receive data does not match with the ID value. <br> 1: The receive data matches with the ID value. |
| 4 | EXBT | Expanded Bit Detection Flag <br> 0 : Expanded bit has not been detected. <br> 1: Expanded bit has been detected. |
| 3 | FER | Framing Error Flag <br> 0 : Framing error has not been detected. <br> 1: Framing error has been detected. |
| 2 | OER | Overrun Error Flag <br> 0 : Overrun error has not been detected. <br> 1: Overrun error has been detected. |
| 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | BER | Bit Error Flag <br> 0: Bit error has not been detected. <br> 1: Bit error has been detected. |

The RLN3nLEST register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of $00_{\mathrm{H}}$ is held. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

## UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written. This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

## IDMT Flag (ID Matching Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written. The IDMT flag becomes 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)
- The UEBDCE bit in the RLN3nLUOR1 register is 1 (data comparison after expansion bit is detected)
- The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
- The value of the value of the 8-bit of the received data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

## EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1 .
Write 0 to clear this flag.

## FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value it was before 1 was written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.
Framing error is detected always on the first stop bit, regardless of the stop bit amount setting.

## OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value Write 0 to clear this flag.
The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

## BER Flag (Bit Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written. The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
Write 0 to clear this flag.

### 19.3.4.12 RLN3nLDFC — UART Data Field Configuration Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | UTSW | - | MDL[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W |

Table 19.59 RLN3nLDFC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 5 | UTSW | UART Transmission Start Wait |
|  |  | 0 : When UART buffer transmission is requested, transmission is started immediately. |
|  |  | 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed. |
| 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  |  | When writing, write the value after reset. |
| 3 to 0 | MDL[3:0] | UART Buffer Data Length Select b3 b0 |
|  |  | 0000 : 9 bytes |
|  |  | 000 1: 1 bytes |
|  |  | 001 0: 2 bytes |
|  |  | 0011 : 3 bytes |
|  |  | 0100 : 4 bytes |
|  |  | $0101: 5$ bytes |
|  |  | 0110 : 6 bytes |
|  |  | 0111 : 7 bytes |
|  |  | 1000 : 8 bytes |
|  |  | $1001: 9$ bytes |
|  |  | 1010 : 9 bytes |
|  |  | : |
|  |  | 1111 : 9 bytes |

## UTSW Bit (UART Transmission Start Wait)

This bit controls the start timing of UART buffer transmission.
With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1 . In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

## MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

### 19.3.4.13 RLN3nLIDB — UART ID Buffer Register

Value after reset: $\quad 00_{H}$

Table 19.60 RLN3nLIDB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | ID[7:0] | ID value that is referred for the expansion bit data comparison is set |

## ID Bits (ID)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (receive operation is not in progress).

### 19.3.4.14 RLN3nLUDB0 — UART Data Buffer 0 Register

Value after reset: $\quad 00_{H}$

Table 19.61 RLN3nLUDB0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | UDB[7:0] | Value of UART transmission data |

When transmitting 9-byte data from the UART buffer transmission (the RLN3nLDFC.MDL bit is $0_{\mathrm{H}}$ or $9_{\mathrm{H}}$ ), set the first data to be transmitted.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 19.62 shows the bit arrangement according to the settings for communication format.
For details about the UART buffer transmission, see Section 19.5.4.1(2) UART Buffer Transmission.
Table 19.62 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

|  | RLN3nLUDB0 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | - | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 7-bit; MSB first | - | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 |
| 8-bit; LSB first | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 8-bit; MSB first | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 | Bit 7 |

### 19.3.4.15 RLN3nLDBRb — UART Data Buffer b Register ( $b=1$ to 8)

Value after reset: $\quad 00_{H}$

Table 19.63 RLN3nLDBRb Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | LDB[7:0] | Value of UART transmission data |

This register specifies the data transmitted from the UART buffer.
Write to these registers when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).
Table 19.64 shows the bit arrangement according to the set communication format.
For details about the UART buffer transmission, see Section 19.5.4.1(2) UART Buffer Transmission.
Table 19.64 Bit Arrangement of the RLN3nLDBRb Register According to Each Communication Format

|  | RLN3nLDBRb |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | - | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 7-bit; MSB first | - | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 |
| 8-bit; LSB first | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| 8-bit; MSB first | Bit 0 | Bit 1 | Bit 2 | Bit 3 | Bit 4 | Bit 5 | Bit 6 | Bit 7 |

### 19.3.4.16 RLN3nLUOER — UART Operation Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | UROE | Utoe |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 19.65 RLN3nLUOER Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 1 | UROE | UART Reception Enable |
|  | $0:$ Disables reception. |  |
|  | 1: Enables reception. |  |
| 0 | UTOE | UART Transmission Enable |
|  | $0:$ Disables transmission. |  |
|  | 1: Enables transmission. |  |

The RLN3nLUOER register is automatically cleared to $00_{\mathrm{H}}$ upon transition to LIN reset mode.
In LIN reset mode, this register cannot be written to.
In LIN reset mode, the register retains $00_{\mathrm{H}}$.

## UROE Bit (UART Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (in LIN reset mode) to transition to the LIN reset mode. However, the transmit operation is also suspended at this time.

Do not set this bit to 1 when data transmission from the UART buffer is in progress.

## UTOE Bit (UART Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (in LIN reset mode) to transition to the LIN reset mode. However, the receive operation is also suspended at this time.

### 19.3.4.17 RLN3nLUOR1 — UART Option Register 1

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | UECD | UTIGTS | UEBDCE | UEBDL | UEBE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 19.66 RLN3nLUOR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 4 | UECD | UART Expansion Bit Comparison Disable |
|  |  | 0: Enables expansion bit comparison. |
|  |  | 1: Disables expansion bit comparison. |
| 3 | UTIGTS | UART Transmission Interrupt Generation Timing Select |
|  |  | 0: Transmission interrupt is generated at the start of transmission. |
|  |  | UART Expansmission interrupt is generated at the completion of transmission. |
| 2 | UEBDL | 0: Disables data comparison after an expansion bit is detected. |
|  |  | 1: Enables data comparison after an expansion bit is detected. |
| 1 |  | UART Expansion Bit Detection Level Select |
|  |  | 0: Selects expansion bit value 0 as the expansion bit detection level. |
|  |  | 1: Selects expansion bit value 1 as the expansion bit detection level. |
| 0 |  | UART Expansion Bit Enable |
|  |  | 0: Disables expansion bit operation. |
|  |  |  |

## UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).
With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.
With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.
Do not set this bit to 1 when the UEBDCE bit is 1 (data comparison after expansion bit is detected).

## UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit sets the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is generated only at the completion of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

## UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8 -bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.

Set this bit when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

## UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit sets the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (comparison of the expansion bit is enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

## UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is $0_{\mathrm{B}}$ (in LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

### 19.3.4.18 RLN3nLUTDR — UART Transmission Data Register

Table 19.67 RLN3nLUTDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. |
|  | When writing, write the value after reset. |  |
| 8 to 0 | UTD[8:0] | Value of UART transmission data. |
|  |  | Setting range: $000_{\mathrm{H}}$ to $1 \mathrm{FF}_{\mathrm{H}}$ |

The RLN3nLUTDR register sets the data to be transmitted from the transmit data register.
Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.
This register can be accessed in 8 bits.
In 9-bit communication mode, do not attempt 8-bit access.
Do not write data to this register when data transmission from the UART buffer is in progress.
Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.
Table 19.68 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

|  | RLN3nLUTDR |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | - | - | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | - | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | - | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

### 19.3.4.19 RLN3nLURDR — UART Reception Data Register

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | URD [8:0] |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 19.69 RLN3nLURDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 8 to 0 | URD [8:0] | Value of UART reception data. |
|  |  | Setting range: $000_{\mathrm{H}}$ to 1 FF |

The RLN3nLURDR allows the reception data to be read from the receive data register.
When the UROE bit in the RLN3nLUOER register is 1, the reception data is stored in this register and can be read out.
This register is updated when the stop bit of the receive data is received.
This register is also updated when an error is caused by the parity or stop bit.
However, the value of this register is not updated upon occurrence of an overrun error when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). The value of this register is updated upon occurrence of an overrun error when the OERE bit is 0 (overrun error detection disabled).

Read this register upon occurrence of a receive error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8 bits.
However, during expansion bit use (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.
Table 19.70 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

|  | RLN3nLURDR |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | - | - | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | - | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | - | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

### 19.3.4.20 RLN3nLUWTDR — UART Wait Transmission Data Register

Value after reset: $\quad 0000_{H}$

Table 19.71 RLN3nLUWTDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. <br>  <br>  <br> When writing, write the value after reset. |
| UWTD[8:0] | Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit <br> reception to be completed. <br> Setting range: $000_{\mathrm{H}}$ to $1 \mathrm{FF}_{\mathrm{H}}$ |  |

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.
Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.
Use this register only to switch from reception to transmission in half-duplex communication.
The user should write to this register only while the stop bit is being received.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the RLN3nLUTDR register value is actually read.
In 9-bit communication mode, do not attempt 8-bit access.
Do not write data to this register when data transmission from the UART buffer is in progress.
The table below shows the bit arrangement according to the set communication format.
Table 19.72 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

|  | RLN3nLUWTDR |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | b8 | b7 | b6 | b5 | b4 | b3 | b2 | b1 | b0 |
| 7-bit; LSB first | - | - | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 7-bit; MSB first | - | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 |
| 8-bit; LSB first | - | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 8-bit; MSB first | - | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 |
| 9-bit; LSB first | Bit8 | Bit7 | Bit6 | Bit5 | Bit4 | Bit3 | Bit2 | Bit1 | Bit0 |
| 9-bit; MSB first | Bit0 | Bit1 | Bit2 | Bit3 | Bit4 | Bit5 | Bit6 | Bit7 | Bit8 |

### 19.4 Interrupt Sources

The LIN/UART interface generates three types of interrupt requests.

- RLIN3n successful transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt source.

Table 19.73 lists the sources for each interrupt.
Table 19.73 Interrupt Sources

|  |  | LIOS bit in RLN3nLMD register is $1^{* 1}$ |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | RLIN3n Transmission Interrupt | RLIN3n Reception Interrupt | RLIN3n Status Interrupt |
| LIN mode | LIN master mode | - Successful frame transmission <br> - Successful wake-up transmission <br> - Successful header transmission | - Successful response reception <br> - Successful wake-up reception | - Bit error <br> - Physical bus error <br> - Frame/response timeout error <br> - Framing error <br> - Checksum error <br> - Response preparation error |
|  | LIN slave mode | - Successful response transmission <br> - Successful wake-up transmission | - Successful response reception <br> - Successful wake-up reception <br> - Successful header reception | - Bit error <br> - Frame/response timeout error <br> - Framing error <br> - Sync field error <br> - Checksum error <br> - ID parity error <br> - Response preparation error |
| UART mode |  | - Transmission start/successful transmission | - Successful reception <br> - Expansion bit mismatch | - Bit error <br> - Overrun error <br> - Framing error <br> - Expansion bit detection <br> - ID match <br> - Parity error |

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1 .

### 19.5 Operation

### 19.5.1 Modes

The LIN/UART interface provides the following four modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
- LIN master mode
- LIN slave mode [auto baud rate]
- LIN slave mode [fixed baud rate]
- UART mode
- LIN Self-Test mode

Figure 19.2 shows mode transitions. Table 19.74 describes mode transition conditions. Table 19.75 lists operations available in each mode.

Figure 19.2 Mode Transitions

Table 19.74 Transition Condition of Each Mode

Table 19.75 Operations Available in Each Mode

| LIN Mode |  |  |  |
| :--- | :--- | :--- | :--- |
| LIN Master Mode | LIN Slave Mode [auto baud rate] <br> LIN Slave Mode [fixed baud rate] | UART Mode | LIN Self-Test Mode |
| Header transmission | Header reception | Response transmission | UART transmission |
| Response transmission | RART reception <br> Response reception <br> Rake-up transmission <br> Wake-up reception <br> Wake-up reception | Error detection <br> Wake-up reception <br> Error detection | Error detection |

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN Self-Test mode, see Section 19.5.5, LIN Self-Test Mode.

### 19.5.2 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (in LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (in LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN Self-Test mode can be made.
When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLSTC register
- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register ( $\mathrm{b}=1$ to 8 )
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

### 19.5.3 LIN Mode

LIN mode can operate in the following submodes:
LIN master mode, LIN slave mode [auto baud rate], and LIN slave mode [fixed baud rate].
In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $00_{\mathrm{B}}$ (in LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either $01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either $01_{\mathrm{B}}$ to $11_{\mathrm{B}}$.

In LIN slave mode [auto baud rate] and LIN slave mode [fixed baud rate], header reception, response transmission, response reception, wake-up transmission, wake-up reception, and error detection can be performed.

The LIN slave mode [auto baud rate] allows automatic detection of the break field and the sync field, and sets a baud rate based on the results of measurement of a sync field. The baud rate can be set to 1 kbps to 20 kbps .

Set the LPRS[2:0] bits in the RLN3nLWBR register so that the prescaler clock (with the frequency of the LIN communication clock source divided by the prescaler) becomes as follows according to the target baud rate.

| [Target baud rate] | [Prescaler clock] |
| :--- | :--- |
| 1 kbps to $20 \mathrm{kbps}:$ | $4 \mathrm{MHz}^{* 1}$ |
| 1 kbps to 2.4 kbps (excluding 2.4 kbps): | 4 MHz |
| 2.4 kbps to $20 \mathrm{kbps}:$ | 8 MHz to 12 MHz |

Note 1. Use the clock with NSPB[3:0] bits in the RLN3nLWBR register set to "00118" (four samplings).

LIN slave mode [fixed baud rate] allows automatic detection of the break field, sync field, and ID field at a baud rate that is set in advance by the baud rate generator.

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $10_{\mathrm{B}}$ (in LIN slave mode [auto baud rate]) and setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ sets LIN slave mode [auto baud rate]; and setting the LMD bits in the RLN3nLMD register to $11_{\mathrm{B}}$ (in LIN slave mode [fixed baud rate]), and setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ sets LIN slave mode [fixed baud rate], turning the OMM1 and OMM0 bits in the RLN3nLMST register to $01_{B}$ or $11_{B}$.

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 19.3 shows the transition of operation modes. Table 19.76 describes the transition conditions of operation modes.

Figure 19.3 Transition of Operation Modes

Table 19.76 Transition Condition for Operation Mode

|  | Operation Mode Transition |  | Transition Condition |
| :---: | :---: | :---: | :---: |
| (1) | LIN reset mode | $\rightarrow$ LIN mode <br> - LIN operation mode | LMD bits in RLN3nLMD register $=00_{B}$ or $10_{B}$ or $11_{B}$ and OM1 and OM0 bits in RLN3nLCUC register $=11_{\mathrm{B}}$ |
| (2) | LIN reset mode | $\rightarrow$ LIN mode <br> - LIN wake-up mode | LMD bits in RLN3nLMD register $=00_{B}$ or $10_{B}$ or $11_{B}$ and OM1 and OM0 bits in RLN3nLCUC register $=01_{B}$ |
| (3) | LIN mode <br> - LIN operation mode <br> - LIN wake-up mode | $\rightarrow$ LIN reset mode | OM0 bit in RLN3nLCUC register $=0_{B}$ |
| $\begin{gathered} (4) \\ * 1 \end{gathered}$ | LIN mode <br> - LIN operation mode | $\rightarrow$ LIN mode <br> - LIN wake-up mode | OM1 and OM0 bits in RLN3nLCUC register $=01_{\text {B }}$ |
| (5) | LIN mode <br> - LIN wake-up mode | $\rightarrow$ LIN mode <br> - LIN operation mode | OM1 and OM0 bits in RLN3nLCUC register $=11_{\text {B }}$ |

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).
(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to $11_{\mathrm{B}}$ changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to $11_{\mathrm{B}}$. Communication settings should be performed after the OMM1 and OMM0 bits have become $11_{\mathrm{B}}$.
(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to $01_{B}$ changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to $01_{\mathrm{B}}$. Communication settings should be performed after the OMM1 and OMM0 bits have become $01_{\mathrm{B}}$.

### 19.5.3.1 LIN Master Mode

## (1) Header Transmission

Figure 19.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission.
Table 19.77 describes the processing in header transmission.

Figure 19.4 Operation in Header Transmission

Table 19.77 Processing in Header Transmission

| Software Processing | LIN/UART Interface Processing |
| :---: | :---: |
| (1) - Sets a baud rate <br> - Sets noise filter ON/OFF <br> - Enables interrupt <br> - Enables error detection <br> - Sets frame configuration parameters <br> - Changes the LIN/UART interface to the LIN master mode: LIN operation mode <br> - Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data) | Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle) |
| (2) Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started) | Transmits a break. |
| (3) Waits for an interrupt request | Transmits a break delimiter. |
| (4) | Transmits a sync field ( $55_{\text {H }}$ ). |
| (5) | Transmits an inter-byte space (header). |
| (6) | Transmits an ID field. |
| (7) | Sets a successful header transmission flag. |
| NOTE |  |
| For information about error detection conditions, see Section | 9.5.3.7, Error Status. |

## (2) Response Transmission

Figure 19.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. Table 19.78 describes the processing in response transmission.

Figure 19.5 Operation in Response Transmission

Table 19.78 Processing in Response Transmission

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (1) | [When in frame separate mode] <br> - Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/reception started) <br> [When not in frame separate mode] <br> - Waits for an interrupt request | [When in frame separate mode] <br> - Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. <br> - When the bit is set to 1 , sends a response space. <br> [When not in frame separate mode] <br> - Sends a response space. |
| (2) | Waits for an interrupt request | Transmits 1st data byte. |
| (3) |  | Transmits an inter-byte space. |
| (4) |  | - Transmits 2nd data byte. <br> - Transmits an inter-byte space <br> - Transmits 3rd data byte. <br> - Transmits an inter-byte space <br> (Repeats as many times as needed to reach the data length specified in bits RFDL[3:0] in the RLN3nLDFC register, and stops the transmission when the BER flag in the RLN3nLEST register is 1 (bit error detected). If an error occurs, the Checksum transmission in item (5) is not performed). |
| (5) |  | Transmits the checksum. |
| (6) |  | - Sets a successful frame/wake-up transmission flag. <br> - Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) <br> [When in frame separate mode] <br> - Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception is halted). |
| (7) | - Processing after communication <br> - Checks the RLN3nLST register, and clears flags. | Idle |

NOTE
For information about error detection conditions, see Section 19.5.3.7, Error Status.

## (3) Response Reception

Figure 19.6 shows the operation of the LIN/UART interface (LIN master mode) in response reception. Table 19.79 describes the processing in response reception.

Figure 19.6 Operation in Response Reception

Table 19.79 Processing in Response Reception

| Software Processing | LIN/UART Interface Processing |
| :---: | :---: |
| (1) - When in frame separate mode Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) <br> - When in frame combined mode Waits for an interrupt request (no processing) | - When in frame separate mode <br> Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. When the bit is set to 1 , waits for detection of a start bit. <br> - When in frame combined mode Waits for detection of a start bit. |
| (2) | Receives 1st data byte when the start bit is detected. |
| (3) | Sets the successful 1st data byte reception flag. |
| (4) | - Receives 2nd data byte when the start bit is detected. <br> - Receives 3rd data byte when the start bit is detected. <br> (Repeats the reception of data bytes as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register, and stops the reception when any bit in the RLN3nLEST register is 1 (bit error detected). If an error occurs, the checksum determination in item (5) is not performed). <br> - Receives the checksum when the start bit is detected. |
| (5) | - Determines the checksum. <br> - Sets the successful frame/wake-up reception flag. <br> - Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped). |
| (6) - Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags. | Idle |
| NOTE |  |

For information about error detection conditions, see Section 19.5.3.7, Error Status.

### 19.5.3.2 LIN Slave Mode

## (1) Header Reception

Figure 19.7 shows the operation of the LIN/UART interface (LIN slave mode) in header reception.
Table 19.80 describes the processing in header reception.

Figure 19.7 Operation in Header Reception

Table 19.80 Processing in Header Reception

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |

| (7) | - Checks the RLN3nLST register, and clears flags. <br> - Checks the RLN3nLIDB register, and prepares a | - Completes a header reception process. <br> - Waits for a response request. |

## NOTE

The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the following Sync field and ID field) continues regardless of whether an error occurred. For information about error detection conditions, see Section

### 19.5.3.7, Error Status.

## [Auto Baud Rate Correction Function]

In LIN slave mode [auto baud rate], the system always measures the low-level widths that are received. If the first "Low level" width is 10 times (if the BLT bit of the RLN3nLBFC register is " 0 ") or 11 times (if the BLT bit of the RLN3nLBFC register is " 1 ") or greater than the bit width calculated from the average of the starting 2 bits (the period of the consecutive falling edges from the beginning of the sync field) of the sync field, the system concludes that the detection of break field was successful, the system verifies that the data in the sync field is $55_{\mathrm{H}}$. If the data in the sync field is indeed $55_{\mathrm{H}}$ and the system judges that sync field reception was successful, the system automatically sets the baud rate correction result to the RLN3nLBRP01 register.

If data is received up to the ID field without error, a successful header reception interrupt is generated at the stop bit position.

On the other hand, if the data in the sync field is not $55_{\mathrm{H}}$ and the system judges that sync field reception failed, the system sets the sync field error flag and an error interrupt is generated. In that case, baud rate correction is not performed and the LIN/UART interface waits for the detection of the next break field (low level).

Figure 19.8 Header Reception in LIN Slave Mode [Auto Baud Rate] (in Normal Operation)

Figure 19.9 Header Reception in LIN Slave Mode [Auto Baud Rate] (Sync Field Error)

## (2) Response Transmission

Figure 19.10 shows the operation of the LIN/UART interface (LIN slave mode) in response transmission. Table 19.81 describes the processing in response transmission.

Figure 19.10 Operation in Response Transmission

Table 19.81 Processing in Response Transmission

If an error occurs, the checksum transmission in item (5) is not performed). |
| (5) |  | Transmits the checksum. |
| (6) |  | - Sets the successful response/wake-up transmission flag. <br> - Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped). <br> [In frame separate mode] <br> - Sets the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped). |
| (7) | - Processing after communication Checks the RLN3nLST register, and clears flags. | - Completes the response transmission process. <br> - Waits for a new break. |

## NOTE

- For information about error detection, see Section 19.5.3.7, Error Status.
- The LIN/UART interface allows reception of break fields during frame transmission/reception. In that case, a framing error, bit error or other error may be detected at the stop bit position of the frame before the break field is received, and a status interrupt may occur as a result. However, reception of a new header (the following Sync field and ID field) continues regardless of whether an error occurred.

## (3) Response Reception

Figure 19.11 shows the operation of the LIN/UART interface (LIN slave mode) in response reception. Table 19.82 describes the processing in response reception.

Figure 19.11 Operation in Response Reception

Table 19.82 Processing in Response Reception

|  | Software Processing | LIN/UART Interface Processing |

|  | software |
|  | - Completes the frame reception process |
|  | • Waits for a new break |

### 19.5.3.3 Data Transmission/Reception

## (1) Data Transmission

One bit of data is transmitted per 1 Tbit.
The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see

## Section 19.5.3.7, Error Status.).

In LIN master mode and LIN slave mode [fixed baud rate], 1 Tbit is generated to be 16 fLIN , and thus the sampling point for received data are at the 13 th clock cycle ( $81.25 \%$ position).

In LIN slave mode [auto baud rate], if 1 Tbit is generated to be 4 fLIN , the sampling point for received data is at the third clock cycle ( $75 \%$ position). If 1 Tbit is generated to be 8 fLIN , the sampling point for received data is at the 7 th clock cycle ( $87.5 \%$ position).
Figure 19.13 shows an example of data transmission timing.

Figure 19.13 Example of Data Transmission Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

## (2) Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The data byte is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.
The LIN/UART interface has a noise filter function for reception data. If the LRDNFS bit in the RLN3nLMD register is 0 , the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1 , the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

Figure 19.14 shows an example of data reception timing.

Figure 19.14 Example of Data Reception Timing (LIN Master Mode, LIN Slave Mode [Fixed Baud Rate])

### 19.5.3.4 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface sends or receives data continuously.

## (1) Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 19.15 shows the LIN transmission processing and the required buffers.

Figure 19.15 LIN Transmission Processing and Required Buffer

## [Frame separate mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.
In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.
When the transmission of a header is finished, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or more in LIN master mode.

## (2) Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 19.16 shows the LIN reception processing and the required buffers.

Figure 19.16 LIN Reception Processing and Required Buffer

## [Reception of 1st Data Byte]

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

## (3) Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or more can also be transmitted and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is longer than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the last data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the last data group.

If it is the last data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the last data group), and a checksum should be appended to the last data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0 , the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

NOTE
In LIN slave mode, the LIN/UART interface can detect a new break field during the transmission or reception of a response.

### 19.5.3.5 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

## (1) Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (in LIN master mode: response transmission), or setting the RCDS bit in the RLN3nLDFC register to 1 (in LIN slave mode: response transmission), and then the FTS bit in the RLN3nLTRC register to 1 (frame transmission, header reception or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to $0100_{\mathrm{B}}$ ( 5 Tbits ), $260 \mu \mathrm{~s}$ low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level width is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame response or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame response/wakeup transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 19.17 shows the wake-up transmission timing.

Figure 19.17 Wake-up Transmission Timing

## (2) Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5 -Tbit or longer low-level width of the input signal of fLIN to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation can be executed without changing the baud rate generator setting when switching between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0 . When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1 . Setting the LWBR0 bit to 1 sets the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200 bps while fa is selected, an input signal with a low-level width of 130 us or longer can be measured in LIN wake-up mode regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception), or the RCDS bit in the RLN3nLDFC register to 0 (in LIN slave mode: response reception), and then set the FTS bit in the RLN3nLTRC register to 1 (frame transmission (header reception) or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame response/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame response or wakeup reception interrupt enabled), an interrupt request for successful RLIN3n reception is generated.

Figure 19.18 Input Signal Low Level Count Function

## (3) Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected by the LIN/UART interface.

### 19.5.3.6 Status

In LIN mode operation, the LIN/UART interface can detect seven types of statuses.
The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, and successful header transmission/reception, can generate interrupt requests.

Table 19.84 shows the types of statuses available in LIN master mode. Table 19.85 lists the types of statuses available in LIN slave mode [auto baud rate] and in LIN slave mode [fixed baud rate].

Table 19.84 Types of Statuses in LIN Master Mode

| Status | Status Set Condition | Status Clear Condition | Operation Mode Capable of Status Detection | Corresponding Bit | Interrupt |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode. | After the OMO bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode. | All modes | OMM0 bit in RLN3nLMST register | - |
| Operation mode | After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode. | After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode. | - LIN operation mode <br> - LIN wake-up mode | OMM1 bit in RLN3nLMST register | - |
| Frame/wake-up <br> transmission <br> end | When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully. | - When another communication is started (When the FTS bit in the RLN3nLTRC register is set) <br> - When cleared by software <br> - After transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | FTC flag in RLN3nLST register | $\checkmark$ |
| Frame/wake-up reception end | When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully. | - When another communication is started (When the FTS bit in the RLN3nLTRC register is set) <br> - When cleared by software <br> - After transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | FRC flag in RLN3nLST register | $\checkmark$ |
| Error detection | If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | - When another communication is started (When the FTS bit in the RLN3nLTRC register is set) <br> - When cleared by software*1 <br> - After transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | ERR flag in RLN3nLST register | $\checkmark$ |
| 1st data byte reception end | The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2 | - When another communication is started (When the FTS bit in the RLN3nLTRC register is set) <br> - When cleared by software <br> - After transition to LIN reset mode | LIN operation mode | D1RC flag in RLN3nLST register | - |
| Header <br> transmission <br> end | When a header field is transmitted successfully. | - When another communication is started (When the FTS bit in the RLN3nLTRC register is set) <br> - When cleared by software <br> - After transition to LIN reset mode | LIN operation mode | HTRC flag in RLN3nLST register | $\checkmark$ |

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.
Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are $0000_{\mathrm{B}}$ ( 0 -byte + checksum).

Table 19.85 Types of Statuses in LIN Slave Mode

| Status | Status Set Condition | Status Clear Condition | Operation Mode Capable of Status Detection | Correspondi ng Bit | Interrupt |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Reset | After the OMO bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode. | After the OMO bit of the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode. | All modes | OMMO bit in RLN3nLMST register |  |
| Operation mode | After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode. | - After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/UART interface enters LIN wake-up mode. | - LIN operation mode <br> - LIN wake-up mode | OMM1 bit in RLN3nLMST register | - |
| Frame/ <br> wake-up <br> transmission end | When a response field, a wake-up signal, or a data group is transmitted successfully. | - When cleared by software <br> -Transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | FTC flag in RLN3nLST register | $\checkmark$ |
| Frame/ <br> wake-up <br> reception end | When a response field, a wake-up signal, or a data group is received successfully. | - When cleared by software <br> -Transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | FRC flag in RLN3nLST register | $\checkmark$ |
| Error detection | If any of the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | - When cleared by software ${ }^{* 1}$ <br> -Transition to LIN reset mode | - LIN operation mode <br> - LIN wake-up mode | ERR flag in RLN3nLST register | $\checkmark$ |
| 1st data byte reception end | The RCDS bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte for each data group is received successfully.*2 | - When cleared by software <br> -Transition to LIN reset mode | LIN operation mode | D1RC flag in RLN3nLST register | - |
| Header reception end | When a header field is received successfully. | - When cleared by software <br> -Transition to LIN reset mode | LIN operation mode | HTRC flag in RLN3nLST register | $\checkmark$ |

Note 1. In LIN wake-up mode or LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, IPER flag, CSER flag, SFER flag, FER flag, TER flag, or BER flag in the RLN3nLEST register.
Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are $0000_{\mathrm{B}}$ ( 0 -byte + checksum).

### 19.5.3.7 Error Status

## (1) LIN Master Mode

## (a) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

All error statuses are interrupt factors.
Table 19.86 shows the types of error statuses.
Table 19.86 Types of Error Statuses in LIN Master Mode

| Status | Error Detection Condition | Operation Mode Capable of Error Detection | Commun ication | Enable/ Disable Detection | Corresponding Bit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1,*2 | - LIN operation mode <br> - LIN wake-up mode | Cancel | Enabled | BER flag in RLN3nLEST register |
| Physical bus error | - LIN bus detected a high level when sending a break <br> - LIN bus detected a low level when sending a break delimiter <br> - LIN bus detected a high level when sending a wake-up | - LIN operation mode <br> - LIN wake-up mode | Cancel | Enabled | PBER flag in RLN3nLEST register |
| Timeout error | A frame or response transmission/reception is not completed within a given time*3 | LIN operation mode | Cancel | Enabled | FTER flag in RLN3nLEST register |
| Framing error | In response field reception, a stop bit of each data byte is low level | LIN operation mode | Cancel | Enabled | FER flag in RLN3nLEST register |
| Checksum error | In response field reception, the result of checksum indicates an error | LIN operation mode | - | Disabled | CSER flag in RLN3nLEST register |
| Response preparation error | One of the following conditions occurs in frame separate mode during a multi-byte response reception: <br> - After header transmission is complete, the first byte of receive data is received before a response transmission/reception request is set. <br> - After the previous data group reception is complete, the first byte of receive data is received before a transmission/reception request for the next data group is set. | LIN operation mode | Cancel | Disabled | RPER flag in RLN3nLEST register |

Note 1. If a bit error is detected, processing is stopped after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is suspended immediately after the bit which had the error is sent. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.
Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.
Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and can be calculated from the following formula.

When the FSM bit in the RLN3nLDFC registers is 1 (frame separation mode), the timeout time is that for eight bytes until the RTS bit of the RLN3nLTRC register is set. Once the RTS bit is set, the timeout time is re-set to the time based on the response field data length (the RFDL[3:0] bits in the RLN3nLDFC register).

## [Frame timeout]

When classic is selected (when the CSM bit in RLN3nLDFC is 0 ): Timeout time $=49+($ number of data bytes +1$) \times 14$ [Tbit] When enhanced is selected (when the CSM bit in RLN3nLDFC is 1 ): Timeout time $=48+($ number of data bytes +1$) \times 14$ [Tbit]

Page 1134 of 4595

The aforementioned timeout time is a time longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced is selected.

## [Response timeout]

Timeout time $=($ number of data bytes +1$) \times 14$ [Tbit]
When an error is detected, the timeout error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

## (b) Target Time Area for LIN Error Detection

Figure 19.19 shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

Figure 19.19 Target Time Area for LIN Error Detection (LIN Master Mode)

## (2) LIN Slave Mode

## (a) Types of Error Statuses

The LIN/UART interface can detect seven types of error statuses in LIN slave mode [auto baud rate] or in LIN slave mode [fixed baud rate]. These error statuses can be verified by checking the corresponding bits in the RLN3nLEST register.

Table 19.87 shows the types of error statuses.
Table 19.87 Types of Error Statuses in LIN Slave Mode

| Status | Error Detection Condition | Operation Mode Capable of Error Detection | Communication | Enable/Disable <br> Detection | Corresponding Bit |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bit error | The transmitted data and the data on the LIN bus monitored by the receive pin do not match*1*2 | - LIN operation mode <br> - LIN wake-up mode | Cancel | Enabled | BER flag in RLN3nLEST register |
| Timeout error | A frame or response transmission/reception is not completed within a given time*3 | LIN operation mode | Cancel | Enabled | TER flag in RLN3nLEST register |
| Framing error | In frame reception, a stop bit of each data byte is low level | LIN operation mode | Cancel | Enabled | FER flag in RLN3nLEST register |
| Sync field error | If the width of the break low level is greater than the width set by the LBLT bit in the RLN3nLBFC register and the sync field is not $55_{\mathrm{H}}$ | LIN operation mode | Cancel | Enabled*4 | SFER flag in RLN3nLEST register |
| Checksum error | In response field reception, the result of checksum indicates an error | LIN operation mode | -*5 | Disabled | CSER flag in <br> RLN3nLEST <br> register |
| ID parity error | If the received ID parity bit does not match the value that is automatically calculated by the LIN/UART interface | LIN operation mode | Cancel | Enabled | IPER flag in RLN3nLEST register |
| Response preparation error | - After the reception of a header, response preparation is not completed in time before the first byte of reception data is received <br> - In multi-byte response reception, the reception preparation for the next data group is not completed in time before the first byte of the next data group reception data is received. | LIN operation mode | Cancel | Disabled | RPER flag in RLN3nLEST register |

Note 1. If a bit error is detected, processing is stopped after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is suspended immediately after the bit which had the error is sent. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the error-causing bit is sent.

Note 2. In a multi-byte response transmission, bit errors are also detected between data groups.
Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the LCS bit in the RLN3nLDFC register), and this can be calculated according to the following formula. The timeout period until the RTS or LNRR bit of the RLN3nLTRC register is set is 8 data bytes. When the RTS bit is set, the timeout time is reset to the time based on the response field data length (RFDL[3:0] bits of the RLN3nLDFC register). When the LNRR bit is set, the timeout function stops.

## [Frame timeout]

When classic is selected (when the LCS bit in RLN3nLDFC is 0 ): Timeout time $=49+($ number of data bytes +1 ) $\times 14$ [Tbit] When enhance is selected (when the LCS bit in RLN3nLDFC is 1): Timeout time $=48+$ (number of data bytes +1 ) $\times 14$ [Tbit] The aforementioned timeout time is a time longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced is selected.

## [Response timeout]

Timeout time $=($ number of data bytes +1$) \times 14$ [Tbit]
When an error is detected, timeout error detection function stops
Note 4. Only reflection of the result to the SFER flag can be enabled/disabled. Error detection cannot be enabled/disabled.
Note 5. Checksum judgment is performed upon completion of response frame reception. In case of an error, the successful reception flag is not set to 1 .

The error status is cleared by software or at a transition to LIN reset mode.

## (b) Target Time Area for LIN Error Detection

Figure 19.20 shows the time domain in which the LIN/UART interface in slave mode performs monitoring for error detection.

Figure 19.20 Target Time Area for LIN Error Detection (LIN Slave Mode)

### 19.5.4 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to $01_{\mathrm{B}}$ (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1 .

### 19.5.4.1 Transmission

Figure 19.21 shows LIN/UART interface (in UART mode) transmission operations;
Table 19.88 shows LIN/UART interface (in UART mode) transmission processing.

Figure 19.21 LIN/UART Interface (in UART Mode) Transmission Operation

Table 19.88 LIN/UART Interface (UART Mode) Transmission Processing (1/2)

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (1) | - Sets a baud rate. <br> - Sets noise filter ON/OFF. <br> - Enables error detection <br> - Sets data format. <br> - Sets an interrupt generation timing. <br> - Clears the LIN/UART interface from LIN reset mode. <br> - Sets the transmit enable bit (UTOE bit) to 1 . | - Waits for a transmission trigger (RLN3nLUTDR register) by software. |
| (2) | - Sets the transmit data to the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR). | - Sets the transmit status flag. |
| (3) | - Waits an interrupt request. | - Transmits a start bit (for switching between transmission and reception in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see Section 19.5.4.1(4) Transmission Start Wait Function. <br> - [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <br> - Outputs a transmission interrupt. |
| (4) | [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <br> - When transmitting data continuously, sets another piece of transmission data in the UART transmit data register (RLN3nLUTDR register), waits for the generation of an interrupt request. | Transmits the data set in the UART (for wait) transmit data register. |
| (5) |  | Transmits a parity bit when parity is used. |
| (6) |  | Transmits 1 or 2 stop bits. |

Table 19.88 LIN/UART Interface (UART Mode) Transmission Processing (2/2)

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (7) | [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <br> - If another item of transmission data is set, goes to step (3). | [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] <br> - If another piece of transmission data is set, goes to step (3). <br> - If another piece of transmission data is not set, clears the transmit status flag. |
|  | [When the UTIGTS bit is 1 (a transmission interrupt is generated upon end of transmission)] <br> - When transmitting data continuously, goes to step (2). | [When the UTIGTS bit is 1 (a transmission interrupt is generated upon end of transmission)] <br> - Generates RLIN3n transmission interrupt request. <br> - Clears the transmission status flag. |

## (1) Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. Figure 19.22 shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the end of transmission.

Figure 19.22 Operation Example of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the end of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the end of transmission of final data needs to be known.

## (2) UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers, and thus it is capable of performing continuous transmissions through the use of UART buffers.

Figure 19.23 shows the UART buffer transmission operation of the LIN/UART interface (in UART mode).
Table 19.89 describes the UART buffer data transmission processing.

Figure 19.23 UART Buffer Transmission of LIN/UART Interface (in UART Mode)

Table 19.89 UART Buffer Transmission Processing of LIN/UART Interface (in UART Mode) (1/2)

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (1) | - Sets a baud rate <br> - Sets noise filter ON/OFF <br> - Enables error detection <br> - Sets data format <br> - Sets an interrupt generation timing to the end of transmission. <br> - Clears the LIN/UART interface from LIN reset mode. <br> - Sets the transmit enable bit (UTOE bit) to 1 | - Waits for a transmission trigger (RTS bit) by software |
| (2) | - Sets the UART buffer data length and whether the system must wait for the start of transmission. <br> - Sets the transmission data in the UART data buffer 0 register (RLN3nLUDB0) and the LIN data buffer b register (RLN3nLDBRb). (b=1 to 8) <br> - Sets the UART buffer data transmission start bit (RTS). | - Sets the transmit status flag. |
| (3) | Waits for an interrupt request. | Transmits a start bit. <br> (When switching from reception to transmission during halfduplex communication, transmits the start bit upon completion of the stop bit for reception. For details about this function, see Section 19.5.4.1(4) Transmission Start Wait Function.) |
| (4) |  | Transmits the data set in the UART data buffer 0 register (RLN3nLUDB0) and the LIN/UART data buffer b register (RLN3nLDBRb). |
| (5) |  | Transmits a parity bit when parity is used. |
| (6) |  | Transmits 1 or 2 stop bits <br> (When the number of data set in UART buffer data length select bits is 1 , proceeds to (12).) |

Table 19.89 UART Buffer Transmission Processing of LIN/UART Interface (in UART Mode) (2/2)

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (7) | Waits for an interrupt request. | Transmits an inter-byte space (idle). |
|  |  | Repeats steps (3) to (7) until frame count -1 that was set in the UART buffer data length select bits is reached. |
| (8) |  | Transmits a start bit. |
| (9) |  | Transmits the data set in the LIN/UART data buffer b register (RLN3nLDBRb). |
| (10) |  | Transmits a parity bit when parity is used. |
| (11) |  | Transmits 1 or 2 stop bits. |
| (12) |  | - Sets the successful buffer transmission flag. <br> - Clears the UART Buffer Transmission Start bit (RTS). <br> - A transmission interrupt request signal. <br> - Clears the transmission status flag. |

(13) - Checks the RLN3nLST register, and clears flags

- In the case of continuous data transmission, goes to step (2).

## (a) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data areas 1 to 9 . The RLN3nLUDB0 register is used only if 9-byte transmission is set. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending upon the length of data involved. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data areas 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between transmission data items can be set in the IBS bit in the RLN3nLSC register.
Figure 19.24 shows a UART buffer and the transmission processing.

Figure 19.24 UART Buffer and Transmission Processing

## (3) Data Transmission

One bit of data is transmitted per Tbit.
In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag in the RLN3nLEST register (see Section 19.5.4.5, Error Status). The timing at which the input pin is sampled during data transmission can vary depending upon the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in Table 19.90.
Table 19.90 Error Detection Timing in UART Mode

| Sampling Count Per Bit | Bit Error Detection Timing |
| :--- | :--- |
| 6 samples | 3rd clock cycle +1 prescaler clock |
| 7 samples | 4th clock cycle +1 prescaler clock |
| 8 samples | 4th clock cycle +1 prescaler clock |
| 9 samples | 5th clock cycle +1 prescaler clock |
| 10 samples | 5th clock cycle +1 prescaler clock |
| 11 samples | 6th clock cycle +1 prescaler clock |
| 12 samples | 6th clock cycle +1 prescaler clock |
| 13 samples | 7th clock cycle +1 prescaler clock |
| 14 samples | 7th clock cycle +1 prescaler clock |
| 15 samples | 8th clock cycle +1 prescaler clock |
| 16 samples | 8th clock cycle +1 prescaler clock |

Example of Data Transmission Timing (when 1 Tbit $=16$ Sampling) is shown in Figure 19.25.

Figure 19.25 Example of Data Transmission Timing (When 1 Tbit = 16 Sampling)

## (4) Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, set data in the RLN3nLUWTDR register, which is used only for the wait function, instead of setting transmission data in the RLN3nLUTDR register as a start-of-transmission request. When transmitting from the UART buffer, set 1 (UART buffer transmission started) in the RTS bit in the RLN3nLTRC register with 1 set in the UTSW bit in the RLN3nLDFC register. In such a case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

It should be noted that even if the UART stop bit length selection bit (USBLS) in RLN3nBLFC register is 1 (stop bits $=$ 2 bits), delay is made only for 1 bits.

Figure 19.26 shows the operation of transmission wait function.

Figure 19.26 Case When Transmit Data Is Set While Stop Bits Are Being Received

### 19.5.4.2 Reception

Figure 19.27 shows the LIN/UART interface (in UART mode) reception operation. Table 19.91 shows the LIN/UART interface (in UART mode) reception processing.

Figure 19.27 LIN/UART Interface (in UART Mode) Reception Operation

Table 19.91 LIN/UART Interface (in UART Mode) Reception Processing

|  | Software Processing | LIN/UART Interface Processing |
| :---: | :---: | :---: |
| (1) | - Sets a baud rate. <br> - Sets noise filter ON/OFF. <br> - Enables error detection. <br> - Sets data format. <br> - Clears the LIN/UART interface from LIN reset mode. <br> - Sets the receive enable bit (UROE bit) to 1. | - Waits for the reception to be enabled by software. <br> - Waits for detection of a start bit. |
| (2) | Waits for an interrupt request. | - Waits for a falling edge from the reception pin, and detects a start bit. <br> - Sets the reception status flag. |
| (3) |  | Receives data. |
| (4) |  | Receives a parity bit when parity is used. |
| (5) |  | Receives only 1 stop bit. |
| (6) |  | - Generates a successful RLIN3n reception interrupt request. <br> - Clears the reception status flag. |
| (7) | Checks the RLN3nLST register, and clears flags | Waits for a falling edge from the reception pin. |

## (1) Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The Data Byte is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and $\{($ the number of sampling +1$) / 2\} /$ (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.
After the start bit is detected, 1 bit is sampled per Tbit.
However, when the BERE bit in the RLN3nLEDE register is 1 , the sampling point is the same as the bit error detection timing.
The LIN/UART interface has a noise filtering function for received data. If the LRDNFS bit in the RLN3nLMD register is 0 , the noise filter is used. For a sampling value, the value determined by a 3 -samplings majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 19.28 shows an example of data reception timing.

Figure 19.28 Example of Data Reception Timing (When Sampling Count is 16 in 1 Tbit)

### 19.5.4.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1 .

## (1) Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and by writing the 9 -bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR).

Figure 19.29 Transmission Example When Expansion Bit is Enabled (LSB First)

## (2) Expansion Bit Reception

With the LIN/UART interface (in UART mode), 9-bit data can always be received without requiring a comparison of expansion bits, provided that the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 , the expansion bit comparison disable bit (UECD) is 1 , and the expansion bit data comparison enable bit (UEBDCE) is 0. Irrespective of the particular setting of the expansion bit detection level selection bit (UEBDL) in the UART option register 1 (RLN3nLUOR1), a successful RLIN3n reception interrupt is generated when 9-bit data is received.

Figure 19.30 Expansion Bit Reception Example (LSB First)

## (3) Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 , the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0 .

If the level that was set in the expansion bit detection level selection bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, successful RLIN3n reception interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 19.31 shows an example when the expansion bit detection level selection bit (UEBDL) is set to 0 .

Figure 19.31 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL $=0$ )

NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0,2 , or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a successful RLIN3n reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

## (4) Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 , the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, and if the level that was set by the expansion bit detection level selection bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits, excluding the expansion bit in the received data, with the a pre-set RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

- Generates an RLIN3n status interrupt
- Sets an expansion bit detection flag (EXBT)
- Sets an ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n reception interrupt is not generated.
If the result of the comparison is not a match, no successful RLIN3n reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1 . The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0 , make the change before the reception of another set of data is finished.
Figure 19.32 shows an example when the expansion bit detection level selection bit (UEBDL) is set to 0 .

Note: If a reception error (parity error, framing error, or overrun error) occurs, an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs and the result of comparison is a match, the EXBT and IDMT are also set to 1 .

Figure 19.32 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL $=0$ )

### 19.5.4.4 Status

In UART mode, the LIN/UART interface can detect five types of statuses.
Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.
Table 19.92 shows the types of statuses available in UART mode.
Table 19.92 Types of Statuses in UART Mode

| Status | Status Set Condition | Status Clear Condition | Corresponding Bit | Interrupt |
| :---: | :---: | :---: | :---: | :---: |
| Reset | After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode. | After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode. | OMM0 bit in RLN3nLMST register | - |
| Successful UART buffer transmission | When the transmission is finished of data equal to the length set in the MDL bits in the RLN3nLDFC register. <br> - When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), the transmission of the last data of the data length set by the MDL bit in the RLN3nLDFC register is started. <br> - When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon end of transmission), the transmission of the data length set by the MDL bit in the RLN3nLDFC register is ended. | - When cleared by software <br> - Transition to LIN reset mode | FTC flag in RLN3nLST register | $\checkmark$ |
| Error detection | If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected). | - When cleared by software*1 <br> - Transition to LIN reset mode | ERR flag in RLN3nLST register | $\checkmark$ |
| Transmission status | - When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. <br> - When 1 is written to the RTS bit in the RLN3nLTRC register. | - The transmission of the data set in the RLN3nLUTDR or RLN3nLUWTDR register is complete, but another transmission data item is not set <br> - The transmission of the data in the UART buffer is complete, and the RTS bit in the RLN3nLTRC register is cleared <br> - Transition to LIN reset mode | UTS flag in RLN3nLST register | - |
| Reception status | - When a start bit is detected. | - When a sampling point for stop bits is detected <br> - Transition to LIN reset mode | URS flag in RLN3nLST register | - |

Note: Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when the LIN reset mode is being canceled sets the ERR flag in the RLN3nLST register to 0 .

### 19.5.4.5 Error Status

## Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be verified by using the corresponding bits in the RLN3nLEST register.

Table 19.93 shows available status types.
Table 19.93 Types of Statuses in UART Mode

| Status | Error Detection Condition | Communication | Enable/ <br> Disable <br> Detection | Corresponding Bit |
| :---: | :---: | :---: | :---: | :---: |
| Bit error | The transmitted data and the data monitored on the receive pin do not match*1 | Continues until the transmission of the set transmission data is finished. | Enabled | BER flag in RLN3nLEST register |
| Overrun error | After received data is stored in the RLN3nLURDR register, another data item is received before the data is read. (In this case, no data is stored in the RLN3nLURDR register). | (Reception is finished by the time this error is detected) | Enabled | OER flag in RLN3nLEST register |
| Framing error | When the first stop bit is low level in the reception processing. | (Reception is finished by the time this error is detected) | Enabled | FER flag in RLN3nLEST register |
| Parity error | The received parity value fails to match the parity value calculated from the received data | Continues until the data reception is finished. | Disabled*2 | UPER flag in RLN3nLEST register |
| Expansion bit detection | The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register. | - | Enabled | EXBT flag in RLN3nLEST register |
| ID match detection | The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8bit receive data excluding the expansion bit matches the value of the RLN3nLIDB register. | - | Enabled | IDMT flag in RLN3nLEST register |

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).
Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to $10_{\mathrm{B}}$ (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

### 19.5.5 LIN Self-Test Mode

The LIN/UART interface provides a LIN Self-Test mode.
When the LIN/UART interface enters the LIN Self-Test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected to the LIN/UART interface internally. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN Self-Test mode can perform tests exclusively in LIN mode.

The Self-Test can be performed in the following four modes:

- LIN master Self-Test mode (transmission): Header transmission and response transmission
- LIN master Self-Test mode (reception): Header transmission and response reception
- LIN slave Self-Test mode (transmission): Header reception and response transmission
- LIN slave Self-Test mode (reception): Header reception and response reception

In LIN Self-Test mode, operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/ 16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to $0000_{\mathrm{B}}$ or $1111_{\mathrm{B}}$.)
(The LPRS bits in the RLN3nLWBR register should be set to $000_{\text {B. }}$.)
In addition, in LIN Self-Test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- LIN slave mode (Auto baud rate)
- Frame/response timeout error

Do not use these functions.

Figure 19.33 Connection in LIN Reset Mode, LIN Mode, and UART Mode

Figure 19.34 Connection in LIN Self-Test Mode

### 19.5.5.1 Transitioning to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN Self-Test mode.
The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN Self-Test mode.
To transition to LIN Self-Test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN Self-Test control register as shown below:

- Transition to LIN reset mode

Set the OM0 bit in the RLN3nLCUC register to 0 (in LIN reset mode).
Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (in LIN reset mode).

- Select a LIN mode

LMD bits in RLN3nLMD $=00_{B}$ (in LIN master mode) or $11_{\mathrm{B}}$ (in LIN slave mode [fixed baud rate])

- 1st write: RLN3nLSTC register $=10100111_{\text {в }}\left(\right.$ A $\left._{\mathrm{H}}\right)$
- 2nd write: RLN3nLSTC register $=01011000_{\text {в }}\left(58_{\mathrm{H}}\right)$
- 3rd write: RLN3nLSTC register $=00000001_{\mathrm{B}}\left(01_{\mathrm{H}}\right)$
- Verify the transition to LIN Self-Test mode

Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (in LIN Self-Test mode).

If the key of the first write $\left(\mathrm{A} 7_{\mathrm{H}}\right)$ is written twice by mistake, the transition to LIN Self-Test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN Self-Test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

### 19.5.5.2 Transmission in LIN Master Self-Test Mode

To execute a Self-Test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.

RLN3nLWBR register $=0000000 \mathrm{x}_{\mathrm{B}}$
RLN3nLBRP0 register $=\operatorname{xxxx} \mathrm{xxxx}_{\mathrm{B}}{ }^{* 1}$
RLN3nLBRP1 register $=x x x x x_{x x x_{B}}{ }^{* 1}$
RLN3nLMD register $=00 \mathrm{xx} \times x 00_{\mathrm{B}}{ }^{* 1}$

- Set the interrupt enable and error enable related registers.

RLN3nLIE register $=0000 \mathrm{xxxx}_{\mathrm{B}}{ }^{* 2}$
RLN3nLEDE register $=\mathrm{x} 000 \times \mathrm{x}^{\mathrm{x}} \mathrm{x}_{\mathrm{B}}$

- Set the break field and space related registers.

RLN3nLBFC register $=00 \mathrm{xx}_{\mathrm{xxxx}}^{B}$
RLN3nLSC register $=00 \mathrm{xx} 0 \mathrm{xxx}_{\mathrm{B}}$

- Release from the LIN reset mode.

Write $11_{\mathrm{B}}$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are $11_{\mathrm{B}}$.

- Set the transmit frame related registers.

RLN3nLDFC register $=00 \times 1{x x x x_{B}}$
RLN3nLIDB register $=x x x x x x x x_{B}$
RLN3nLDRB1 to RLN3nLDRB8 registers $=\operatorname{xxxx}^{x^{x}} x^{x}$

- Header transmission $\rightarrow$ response transmission started

Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
The LIN master Self-Test mode (transmission) is executed. In this mode, interrupt is generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/UART interface. To suspend the LIN master Self-Test mode (transmission) being executed, write 0 (in LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.

- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb ( $b=1$ to 8 ), and RLN3nLCBR registers (the data is stored as a reversed value because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified.
Note 1. The following register settings are not reflected to the operation of the LIN Self-Test mode. The RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.
Note 2. If necessary, set the related registers described in Section 6, Interrupts.
Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled). The time required from the setting of the successful header transmission flag to the setting of the successful
frame/wake-up transmission flag is calculated by the following formula.
$10 \times$ (number of data bytes +1 ) [Tbit]
1 Tbit $=1 /$ frequency of LIN communication clock source $\times 16$

### 19.5.5.3 Reception in LIN Master Self-Test Mode

To execute a Self-Test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.

```
RLN3nLWBR register = 0000 000 }\mp@subsup{\textrm{x}}{\textrm{B}}{
RLN3nLBRP0 register = xxxx xxxx }\mp@subsup{}{B}{**1
RLN3nLBRP1 register = xxxx xxxx }\mp@subsup{}{B}{*}\mp@subsup{}{}{*
RLN3nLMD register = 00xx xx00B*1
```

- Set the interrupt enable and error enable related registers.

RLN3nLIE register $=0000 \mathrm{xxxx}_{\mathrm{B}}{ }^{* 2}$
RLN3nLEDE register $=\mathrm{x} 000 \times \mathrm{x}^{\mathrm{x}} \mathrm{x}_{\mathrm{B}}$

- Set the break field and space related registers.

RLN3nLBFC register $=00 \mathrm{xx}_{\mathrm{xxx}}^{\mathrm{B}}$
RLN3nLSC register $=00 \mathrm{xx} 0 \mathrm{xxx}_{\mathrm{B}}{ }^{* 1}$

- Release from the LIN reset mode.

Write $11_{\mathrm{B}}$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are $11_{\text {B }}$.

- Set the reception frame related registers.

RLN3nLDFC register $=00 \times 0 x_{x x_{B}}$
RLN3nLIDB register $=x x x x x_{x} x_{B}$
RLN3nLDRB1 to RLN3nLDRB8 registers $=x_{x x x} x_{x x x_{B}}$
RLN3nCBR register $=x x x x x x x x_{B}$
Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.

- Header transmission $\rightarrow$ response reception started

Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started). The LIN master Self-Test mode (reception) is executed. In this mode, interrupt is generated, and status and error status are also updated. To suspend the LIN master Self-Test mode (reception) being executed, write 0 (in LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.

- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb ( $b=1$ to 8 ), and RLN3nLCBR registers (the data is stored as a reversed value because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

## Note: $\quad \mathrm{x}$ : Don't care

Note 1. The following register settings are not reflected to the operation of the LIN Self-Test mode. The RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.
Note 2. If necessary, set the related registers described in Section 6, Interrupts.
Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not
completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

Note 4. The time required from the setting of the successful header transmission flag to the setting of the successful frame/wake-up reception flag is calculated by the following formula.

$$
\begin{aligned}
& 10 \times(\text { number of data bytes }+1)[\text { Tbit }] \\
& 1 \text { Tbit }=1 / \text { LIN communication clock source } \times 16
\end{aligned}
$$

### 19.5.5.4 Transmission in LIN Slave Self-Test Mode

To execute a Self-Test on LIN slave transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.

```
RLN3nLWBR register = 0000 0000 B
RLN3nLBRP0 register = xxxx xxxx }\mp@subsup{}{B}{**
RLN3nLBRP1 register = xxxx xxxxB**
RLN3nLMD register = 00xx 0011 
```

- Set the interrupt enable and error enable related registers.

RLN3nLIE register $=0000 \mathrm{xxxx}_{\mathrm{B}}{ }^{* 2}$
RLN3nLEDE register $=\mathrm{xx} 0 \mathrm{x} \times 00 \mathrm{x}_{\mathrm{B}}$

- Set the break field and space related registers.

RLN3nLBFC register $=0000000 \mathrm{x}_{\mathrm{B}}{ }^{* 3}$
RLN3nLSC register $=00 x x 0001_{B}$

- Release from the LIN reset mode.

Write $11_{\mathrm{B}}$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are $11_{\mathrm{B}}$.

- Set the transmit frame related registers.

RLN3nLDFC register $=00 \times 1 \mathrm{xxxx}_{B}$
RLN3nLIDB register $=x x x x x_{x x x_{B}}$
RLN3nLDBR1 to RLN3nLDBR8 registers $=x_{x x x} \mathrm{xxxx}_{\mathrm{B}}$

- Header reception $\rightarrow$ response transmission started

Set the FTS bit in the RLN3nLTRC register to 1 (The header reception and the response transmission are executed in this order, without manipulating the RTS bit in the RLN3nLTRC register.).
The LIN slave Self-Test mode (transmission) is executed. In this mode, interrupt is generated, and status and error status are also updated.
The checksum is automatically calculated by the LIN/UART interface. To suspend the LIN slave Self-Test mode (transmission) being executed, write 0 (in LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.

- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb ( $b=1$ to 8 ), and RLN3nLCBR registers (the data is stored as a reversed value because the transmitted value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Arbitrary value can be specified
Note 1. The following register settings are not reflected to the operation of the LIN Self-Test mode. The RLN3nLBRP0 register, and the RLN3nLBRP1 register. Therefore, those settings are not necessary.
Note 2. If necessary, set the related registers described in Section 6, Interrupts.
Note 3. According to the setting of this register, 9.5 -Tbit or 10.5 -Tbit width break is output from the internal RLIN3nTX.
Note 4. When the successful header reception interrupt and the successful response transmission interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response transmission interrupt, the SHIE bit in the

RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the setting of the successful header reception flag to the setting of the successful response/wake-up transmission flag is calculated by using the following formula.
$10 \times$ (number of data bytes +1 ) [Tbit]
1 Tbit $=1 /$ frequency of LIN communication clock source $\times 16$

### 19.5.5.5 Reception in LIN Slave Self-Test Mode

To execute a Self-Test on LIN slave reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.

```
RLN3nLWBR register = 0000 0000 B
RLN3nLBRP0 register = xxxx xxxx }\mp@subsup{}{B}{**
RLN3nLBRP1 register = xxxx xxxx }\mp@subsup{}{B}{*}\mp@subsup{}{}{*
RLN3nLMD register = 00xx 0011 B
```

- Set the interrupt enable and error enable related registers.

RLN3nLIE register $=0000 \mathrm{xxxx}_{\mathrm{B}}{ }^{* 2}$
RLN3nLEDE register $=\mathrm{xx} 0 \mathrm{x} \times 00 \mathrm{x}_{\mathrm{B}}$

- Set the break field and space related registers.

RLN3nLBFC register $=0000000 \mathrm{x}_{\mathrm{B}}{ }^{* 3}$
RLN3nLSC register $=00 \mathrm{xx} 0001_{\mathrm{B}}{ }^{* 1}$

- Release from the LIN reset mode.

Write $11_{\mathrm{B}}$ to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are $11_{\mathrm{B}}$.

- Set the reception frame related registers.

RLN3nLDFC register $=00 x 0{x x x x_{B}}$
RLN3nLIDB register $=x x x x x_{x x x_{B}}$
RLN3nLDBR1 to RLN3nLDBR8 registers $=x_{x x x} \operatorname{xxxx}_{B}$
RLN3nCBR register $=x x x x x x x x_{B}$
Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.

- Header reception $\rightarrow$ response reception started

Set the FTS bit in the RLN3nLTRC register to 1 (header reception or wake-up transmission/reception started).
(Without any setting of the RTS bit in the RLN3nLTRC register, the header reception and the response reception are executed in this order.)
The LIN slave Self-Test mode (reception) is executed. In this mode, interrupt is generated, and status and error status are also updated. To suspend the LIN slave Self-Test mode (reception) being executed, write 0 (in LIN reset mode) to the OM0 bit in the RLN3nLCUC register for transition to LIN reset mode.

- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb ( $b=1$ to 8 ), and RLN3nLCBR registers (the data is stored as a reversed value because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: $\quad \mathrm{x}$ : Arbitrary value can be specified
Note 1. The following register settings are not reflected to the operation of the LIN Self-Test mode. The RLN3nLBRP0 register, the RLN3nLBRP1 register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in Section 6, Interrupts.
Note 3. According to the setting of this register, 9.5 -Tbit or 10.5 -Tbit width break is output from the internal RLIN3nTX.
Note 4. When the successful header reception interrupt and the successful response reception interrupt are used in the same interrupt processing, if the software processing of the successful header reception interrupt is not completed before the generation of the successful response reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header reception interrupt enabled).
The time required from the setting of the successful header reception flag to the setting of the successful response/wake-up reception flag is calculated by the following formula.
$10 \times$ (number of data bytes +1 ) [Tbit]
1 Tbit $=1 /$ frequency of LIN communication clock source $\times 16$

### 19.5.5.6 Terminating LIN Self-Test Mode

To terminate LIN Self-Test mode, perform the procedure below:

- Write 0 (in LIN reset mode) to the OM0 bit in the RLN3nLCUC register.

If the OMM1 and OMM0 bits in the RLN3nLMST register are not $11_{\mathrm{B}}$, write $11_{\mathrm{B}}$ to the OM 1 and OM 0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to $11_{\mathrm{B}}$, transition to LIN reset mode.

- Verify the cancelation of LIN Self-Test mode.

Read the LSTM bit in the RLN3nLSTC register; confirm that it is 0 (not in LIN Self-Test mode).

- Verify the transition to LIN reset mode.

Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (in LIN reset mode).

### 19.5.6 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samplings is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generator to be used is switched according to the mode.

### 19.5.6.1 LIN Master Mode

Figure 19.35 shows a block diagram of baud rate generation in LIN master mode.

Note 1. For the LIN communication clock source, see Section 19.1.3, Clock Supply.
Note 2. When the value in RLN3nLBRPO register is $N(N=0$ to 255$)$, the clock frequency is divided by $N+1$.
Note 3. When the value in RLN3nLBRP1 register is $\mathrm{M}(\mathrm{M}=0$ to 255$)$, the clock frequency is divided by $\mathrm{M}+1$.

Figure 19.35 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is $307200 \mathrm{~Hz}(=19200 \times 16)$, the resulting system clock frequencies are $\mathrm{fa}=19200 \times 16, \mathrm{fb}=9600 \times 16$, and $\mathrm{fc}=2400 \times 16$. These system clock frequencies are divided by 16 in the bit timing generator, enabling bit rates of $19200 \mathrm{bps}, 9600 \mathrm{bps}$ and 2400 bps , to be generated. Also, by setting the RLN3nLBRP1 register so that fd is $166672 \mathrm{~Hz}(=10417 \times 16)$, the resulting system clock frequency is $\mathrm{fd}=10417 \times 16$. This system clock frequency is divided by 16 in the bit timing generator, enabling 10417 bps to be generated.

Table 19.94 shows examples of baud rate (19200, 9600, 2400, and 10417 bps ) generation for each LIN communication clock source frequency, and also the corresponding errors.

Table 19.94 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Master Mode

| LIN communication clock source | Prescaler | Baud rate generator 0 (MN+1) frequencydivided | Baud rate generator 1 (MN+1) frequencydivided | System Clock | Baud rate | Error |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CLK_LSB | 1/1 | 130 | - | fa | 19230.77 | +0.16\% |
|  |  | - | 120 | fd | 10416.67 | -0.003\% |
|  |  | 130 | - | fb | 9615.38 | +0.16\% |
|  |  | 130 | - | fc | 2403.85 | +0.16\% |

NOTE
Bit sampling count is 16 sampling (RLIN3nLWBR.NSPB[3:0] = 0000 ${ }_{\mathrm{B}}$ ).

### 19.5.6.2 LIN Slave Mode

Figure $\mathbf{1 9 . 3 6}$ shows a block diagram of baud rate generation in LIN slave mode.

Note 1. For the LIN communication clock source, see Section 19.1.3, Clock Supply.

Figure 19.36 Block Diagram of Baud Rate Generation in LIN Slave Mode

Table 19.95 shows examples of baud rate (19200, 10417, 9600, and 2400 bps ) generation for each peripheral function clock frequency, and also the corresponding errors.

Table 19.95 Examples of Baud Rate (19200, 10417, 9600, and 2400 bps) Generation in LIN Slave Mode [Fix Baud Rate]

|  |  | Baud rate generator 01 <br> $(M N+1) ~ f r e q u e n c y-d i v i d e d ~$ |  |  |  |  | Baud rate | Error |
| :--- | :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: |
| LIN communication clock source | Prescaler | $1 / 1$ | - | 19230.77 |  |  |  |  |
| CLK_LSB |  | 130 | 10416.67 | $+0.16 \%$ |  |  |  |  |
|  |  | 130 | 9615.38 | $-0.003 \%$ |  |  |  |  |

NOTE
The bit sampling count is 16 sampling (RLN3nLWBR.NSPB[3:0] $=0000_{B}$ ).

### 19.5.6.3 UART Mode

Figure 19.37 shows a block diagram of baud rate generation in UART mode.

Note 1. For the LIN communication clock source, see Section 19.1.3, Clock Supply.

Figure 19.37 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:
<UART baud rate>
$=\{$ LIN communication clock source frequency $\} \times($ RLN3nLWBR.LPRS[2:0] selection clock $) \div($ RLN3nLBRP01 +1$)$
$\div$ \{RLN3nLWBR.NSPB[3:0] selection count $\}$ [bps]
Table 19.96 lists the examples of baud rate ( $6600000,38400,31250,19200,9600,4800,2400$ and 1200 bps ) generation for each LIN communication clock source frequency, and also the corresponding errors.

Table 19.96 UART Baud Rate Setting Examples (when LIN communication clock source $=40 \mathrm{MHz}$ )

| UART Baud Rate (Target Baud Rate) | Prescaler | Baud rate generator 01 (MN+1) frequency-divided | Baud rate | Error |
| :---: | :---: | :---: | :---: | :---: |
| 1200 bps | 1/2 | 1042 | 1199.62 | -0.03\% |
| 2400 bps | 1/2 | 521 | 2399.23 | -0.03\% |
| 4800 bps | 1/2 | 260 | 4807.69 | +0.16\% |
| 9600 bps | 1/2 | 130 | 9615.38 | +0.16\% |
| 19200 bps | 1/2 | 65 | 19230.77 | +0.16\% |
| 31250 bps | 1/2 | 40 | 31250.00 | 0.00\% |
| 38400 bps | 1/2 | 33 | 37878.79 | -1.36\% |
| 6600000 bps | 1/1 | 0 | 6666666.67 | -1.36\% |

## NOTE

The bit sampling count for each baud rate is written below.
6.6 Mbps : 6 sampling (RLN3nLWBR.NSPB[3:0] = 0101 B )
other than 6.6 Mbps : 16 sampling (RLN3nLWBR.NSPB[3:0] = 11111 )

### 19.5.7 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (use the noise filter), the noise filter is enabled. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 19.38 shows the configuration of the noise filter, Figure 19.39 shows an example of a noise filter circuit, and Figure 19.40 shows the determination of the received data when the noise filter is used.

Figure 19.38 Configuration of Noise Filter

Figure 19.39 Example of Noise Filter Circuit

Figure 19.40 Determination of Received Data when Noise Filter is Used

## Section 20 CANFD Interface (RS-CANFD)

### 20.1 Features of RS-CANFD

### 20.1.1 Units and Channels

This microcontroller has the following number of RS-CANFD units.
Table 20.1 Number of Units (for E2x-FCC1)

| Product Name | RH850/E2x-FCC1 |  |  |  |
| :--- | :--- | :--- | :---: | :---: |
|  | 373 Pins | 292 Pins |  |  |
| Number of Units | 1 | 1 |  |  |
| Name |  |  |  |  |

Table 20.2 Number of Units (for E2M)

|  | RH850/E2M |  |
| :--- | :--- | :--- |
| Product Name | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Name |  |  |

The individual products have the CANFD interface channels listed below.
Table 20.3 Unit Configurations and Channels (for E2x-FCC1)

| Unit Name |  | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- | :--- |
|  | Channel Name | 373 Pins | 292 Pins |
|  | $\checkmark$ | $\checkmark$ |  |
|  | CAN0 | $\checkmark$ | $\checkmark$ |
|  | CAN1 | $\checkmark$ | $\checkmark$ |
|  | CAN2 | $\checkmark$ | $\checkmark$ |
|  | CAN3 | $\checkmark$ | $\checkmark$ |

Table 20.4 Unit Configurations and Channels (for E2M)

| Unit Name |  | RH850/E2M |  |
| :--- | :--- | :--- | :--- |
|  | Channel Name | 373 Pins | 292 Pins |
|  | CAN0 | $\checkmark$ | $\checkmark$ |
|  | CAN1 | $\checkmark$ | $\checkmark$ |
|  | CAN2 | $\checkmark$ | $\checkmark$ |
|  | CAN3 | $\checkmark$ | $\checkmark$ |

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 20.5 Indices

| Index | Meaning |
| :---: | :---: |
| n | Throughout this section, the individual RS-CANFD units are generically indicated by the index " n ". |
| m | Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index " m ". |
| j | The individual registers associated with receive rule table are generically indicated by the index "j". $\mathrm{j}=0$ to 15 . |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index " $k$ ". $\mathrm{k}=0$ to [channel $\mathrm{m} \times 3+2$ ]; |
| x | The individual receive FIFO buffers are generically identified by the index " $x$ ". $\mathrm{x}=0$ to 7 . |
| d | Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d". classical CAN mode: $d=0$ or 1 , CAN FD mode: $d=0$ to 15 . |
| q | The individual receive buffers are generically indicated by the index " $q$ ". $\mathrm{q}=0$ to [channel $\mathrm{m} \times 16+15$ ]. |
| p | The individual transmit buffers are generically indicated by the index " p ". $\mathrm{p}=0$ to [channel $\mathrm{m} \times 16+15$ ]. |
| b | Data field registers of receive buffers and transmit buffers are identified by "b". classical CAN mode: $b=0$ or 1, CAN FD mode: $b=0$ to 4 . |
| r | The individual RAM tests for CAN are generically indicated by the index " $r$ ". $r=0$ to 63. |
| y | The registers not covered above are indicated by the letter " y ". |

Note: When writing a value to bits in the register that are outside of the index range on the product, write the value after reset to these bits.

The following table lists the values of indices for individual products.
Table 20.6 Indices for Individual Products

| Indices for Individual Products |  |
| :---: | :---: |
| E2x-FCC1 | E2M |
| $n=0$ | $\mathrm{n}=0$ |
| $\mathrm{~m}=0$ to 4 | $\mathrm{~m}=0$ to 4 |
| $\mathrm{j}=0$ to 15 | $\mathrm{j}=0$ to 15 |
| $\mathrm{k}=0$ to 14 | $\mathrm{k}=0$ to 14 |
| $x=0$ to 7 | $\mathrm{x}=0$ to 7 |
| $\mathrm{~d}=0,1^{* 1}$ | $\mathrm{~d}=0,1^{* 1}$ |
| $\mathrm{~d}=0$ to $15^{* 2}$ | $\mathrm{~d}=0$ to $15^{* 2}$ |
| $\mathrm{q}=0$ to 79 | $\mathrm{q}=0$ to 79 |
| $\mathrm{p}=0$ to 79 | $\mathrm{p}=0$ to 79 |
| $\mathrm{~b}=0,1^{* 1}$ | $\mathrm{~b}=0,1^{* 1}$ |
| $\mathrm{~b}=0$ to $4^{* 2}$ | $\mathrm{~b}=0$ to $4^{* 2}$ |
| $r=0$ to 63 | $\mathrm{r}=0$ to 63 |
| $\mathrm{y}=0$ to 2 | $\mathrm{y}=0$ to 2 |

Note 1. In classical CAN mode
Note 2. In CAN FD mode

### 20.1.2 Register Base Address

The base addresses of registers in RSCFDn are described in the list below.
All Access to RSCFDn register addresses are given as address offsets to the base address.
Table 20.7 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <RSCFD0_base> | FFD0 $0000_{\mathrm{H}}$ | Peripheral Group 3 |

### 20.1.3 Clock Supply

The clocks listed below are supplied to the RSCFDn.
Table 20.8 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| RSCFDn | clk_xincan | CLK_MOSC |
|  | clkc | CLK_LSB |
|  | pclk $^{* 1}$ | CLK_HSB |

Note 1. pclk must satisfy the following conditions so that no event of the CAN engine clock is overlooked. - pclk $\geq 2 \times$ clkc

- pclk $\geq 2 \times$ clk_xincan

### 20.1.4 Interrupt Requests

The RSCFDn interrupt requests are listed in the following table.
Table 20.9 Interrupt Requests (for E2x-FCC1)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :---: | :---: | :---: | :---: |
| RSCFD0 |  |  |  |
| INTRCANGERR0 | INTRCANGERR | RSCFD0 global error interrupt | 379 |
| INTRCANGRECCO | INTRCANGRECC | RSCFD0 receive FIFO interrupt | 380 |
| INTRCANOERR | INTRCANmERR ( $m=0$ ) | CAN0 error interrupt | 381 |
| INTRCANOREC | INTRCANmREC ( $m=0$ ) | CAN0 transmit/receive FIFO receive completion interrupt | 382 |
| INTRCANOTRX | INTRCANmTRX ( $m=0$ ) | CAN0 transmit interrupt | 383 |
| INTRCAN1ERR | INTRCANmERR (m = 1) | CAN1 error interrupt | 384 |
| INTRCAN1REC | INTRCANmREC ( $\mathrm{m}=1$ ) | CAN1 transmit/receive FIFO receive completion interrupt | 385 |
| INTRCAN1TRX | INTRCANmTRX ( $m=1$ ) | CAN1 transmit interrupt | 386 |
| INTRCAN2ERR | INTRCANmERR (m = 2 ) | CAN2 error interrupt | 387 |
| INTRCAN2REC | INTRCANmREC (m = 2) | CAN2 transmit/receive FIFO receive completion interrupt | 388 |
| INTRCAN2TRX | INTRCANmTRX ( $m=2$ ) | CAN2 transmit interrupt | 389 |
| INTRCAN3ERR | INTRCANmERR ( $m=3$ ) | CAN3 error interrupt | 390 |
| INTRCAN3REC | INTRCANmREC ( $\mathrm{m}=3$ ) | CAN3 transmit/receive FIFO receive completion interrupt | 391 |
| INTRCAN3TRX | INTRCANmTRX ( $\mathrm{m}=3$ ) | CAN3 transmit interrupt | 392 |
| INTRCAN4ERR | INTRCANmERR ( $\mathrm{m}=4$ ) | CAN4 error interrupt | 393 |
| INTRCAN4REC | INTRCANmREC ( $m=4$ ) | CAN4 transmit/receive FIFO receive completion interrupt | 394 |
| INTRCAN4TRX | INTRCANmTRX ( $m=4$ ) | CAN4 transmit interrupt | 395 |

Table 20.10 Interrupt Requests (for E2M)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :---: | :---: | :---: | :---: |
| RSCFD0 |  |  |  |
| INTRCANGERR0 | INTRCANGERR | RSCFD0 global error interrupt | 379 |
| INTRCANGRECC0 | INTRCANGRECC | RSCFD0 receive FIFO interrupt | 380 |
| INTRCANOERR | INTRCANmERR ( $\mathrm{m}=0$ ) | CAN0 error interrupt | 381 |
| INTRCANOREC | INTRCANmREC ( $\mathrm{m}=0$ ) | CAN0 transmit/receive FIFO receive completion interrupt | 382 |
| INTRCANOTRX | INTRCANmTRX ( $\mathrm{m}=0$ ) | CAN0 transmit interrupt | 383 |
| INTRCAN1ERR | INTRCANmERR (m = 1) | CAN1 error interrupt | 384 |
| INTRCAN1REC | INTRCANmREC ( $\mathrm{m}=1$ ) | CAN1 transmit/receive FIFO receive completion interrupt | 385 |
| INTRCAN1TRX | INTRCANmTRX ( $\mathrm{m}=1$ ) | CAN1 transmit interrupt | 386 |
| INTRCAN2ERR | INTRCANmERR (m = 2) | CAN2 error interrupt | 387 |
| INTRCAN2REC | INTRCANmREC (m = 2) | CAN2 transmit/receive FIFO receive completion interrupt | 388 |
| INTRCAN2TRX | INTRCANmTRX ( $\mathrm{m}=2$ ) | CAN2 transmit interrupt | 389 |
| INTRCAN3ERR | INTRCANmERR (m=3) | CAN3 error interrupt | 390 |
| INTRCAN3REC | INTRCANmREC ( $\mathrm{m}=3$ ) | CAN3 transmit/receive FIFO receive completion interrupt | 391 |
| INTRCAN3TRX | INTRCANmTRX ( $\mathrm{m}=3$ ) | CAN3 transmit interrupt | 392 |
| INTRCAN4ERR | INTRCANmERR ( $\mathrm{m}=4$ ) | CAN4 error interrupt | 393 |
| INTRCAN4REC | INTRCANmREC ( $\mathrm{m}=4$ ) | CAN4 transmit/receive FIFO receive completion interrupt | 394 |
| INTRCAN4TRX | INTRCANmTRX ( $\mathrm{m}=4$ ) | CAN4 transmit interrupt | 395 |

Table 20.11 DMA Trigger Numbers (for E2x-FCC1)

|  |  |  | sDMA Trigger | DTS Trigger |
| :--- | :--- | :--- | :--- | :--- |
| Interrupt Symbol Name | Unit Interrupt Signal | Description | Number | Number |
| INTRCANRFDREQ7 | can_rf_dmareq[7] | Receive FIFO DMA request 7 | group0-131 | group1-39 |
| INTRCANRFDREQ6 | can_rf_dmareq[6] | Receive FIFO DMA request 6 | group0-130 | group1-38 |
| INTRCANRFDREQ5 | can_rf_dmareq[5] | Receive FIFO DMA request 5 | group0-129 | group1-37 |
| INTRCANRFDREQ4 | can_rf_dmareq[4] | Receive FIFO DMA request 4 | group0-128 | group1-36 |
| INTRCANRFDREQ3 | can_rf_dmareq[3] | Receive FIFO DMA request 3 | group0-127 | group1-35 |
| INTRCANRFDREQ2 | can_rf_dmareq[2] | Receive FIFO DMA request 2 | group0-126 | group1-34 |
| INTRCANRFDREQ1 | can_rf_dmareq[1] | Receive FIFO DMA request 1 | group0-125 | group1-33 |
| INTRCANRFDREQ0 | can_rf_dmareq[0] | Receive FIFO DMA request 0 | group0-124 | group1-32 |
| INTRCANCFDREQ4 | can_cf_dmareq[4] | Common FIFO DMA request 4 | group0-136 | group1-44 |
| INTRCANCFDREQ3 | can_cf_dmareq[3] | Common FIFO DMA request 3 | group0-135 | group1-43 |
| INTRCANCFDREQ2 | can_cf_dmareq[2] | Common FIFO DMA request 2 | group0-134 | group1-42 |
| INTRCANCFDREQ1 | can_cf_dmareq[1] | Common FIFO DMA request 1 | group0-133 | group1-41 |
| INTRCANCFDREQ0 | can_cf_dmareq[0] | Common FIFO DMA request 0 | group0-132 | group1-40 |

Table 20.12 DMA Trigger Numbers (for E2M)

| Interrupt Symbol Name | Unit Interrupt Signal | Description | sDMA Trigger <br> Number | DTS Trigger <br> Number |
| :--- | :--- | :--- | :--- | :--- |
| INTRCANRFDREQ7 | can_rf_dmareq[7] | Receive FIFO DMA request 7 | group0-131 | group1-39 |
| INTRCANRFDREQ6 | can_rf_dmareq[6] | Receive FIFO DMA request 6 | group0-130 | group1-38 |
| INTRCANRFDREQ5 | can_rf_dmareq[5] | Receive FIFO DMA request 5 | group0-129 | group1-37 |
| INTRCANRFDREQ4 | can_rf_dmareq[4] | Receive FIFO DMA request 4 | group0-128 | group1-36 |
| INTRCANRFDREQ3 | can_rf_dmareq[3] | Receive FIFO DMA request 3 | group0-127 | group1-35 |
| INTRCANRFDREQ2 | can_rf_dmareq[2] | Receive FIFO DMA request 2 | group0-126 | group1-34 |
| INTRCANRFDREQ1 | can_rf_dmareq[1] | Receive FIFO DMA request 1 | group0-125 | group1-33 |
| INTRCANRFDREQ0 | can_rf_dmareq[0] | Receive FIFO DMA request 0 | group0-124 | group1-32 |
| INTRCANCFDREQ4 | can_cf_dmareq[4] | Common FIFO DMA request 4 | group0-136 | group1-44 |
| INTRCANCFDREQ3 | can_cf_dmareq[3] | Common FIFO DMA request 3 | group0-135 | group1-43 |
| INTRCANCFDREQ2 | can_cf_dmareq[2] | Common FIFO DMA request 2 | group0-134 | group1-42 |
| INTRCANCFDREQ1 | can_cf_dmareq[1] | Common FIFO DMA request 1 | group0-133 | group1-41 |
| INTRCANCFDREQ0 | can_cf_dmareq[0] | Common FIFO DMA request 0 | group0-132 | group1-40 |

### 20.1.5 Reset Sources

RSCFDn reset sources are listed in the following table. RSCFDn is initialized by these reset sources.
Table 20.13 Reset sources

|  |  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module <br> Reset |  |
| RSCFDn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | JTAG <br> Reset |

### 20.1.6 External Input/Output Signals

External input/output signals of RSCFDn are listed below.
Table 20.14 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| RSCFD0 | CANm receive data input | CRXm |
| CANmRX | CANm transmit data output | CTXm |
| CANmTX |  |  |

This AC specification is only applied to the specific pin groups. For details, refer to Appendix file "Limited_conditions_for_AC_specification.xlsx".

### 20.2 Overview

### 20.2.1 Functional Outline

Table 20.15 shows the RS-CANFD module specifications. Figure 20.1 shows the RS-CANFD module block diagram.

Table 20.15 RS-CANFD Module Specifications (1/3)

| Item | Specification |
| :---: | :---: |
| Protocol | ISO11898-1 compliant |
|  | Using CAN FD frames is selectable by switching interface modes. |
| Communication speed | Classical CAN mode: |
|  | - Up to 1 Mbps |
|  | Communication speed (CANm bit time clock) $=$ $\qquad$ |
|  | $\text { CANm bit time }=\mathrm{CANmTq} \times \mathrm{Tq} \text { count per bit }$ |
|  | (BRP[9:0] bits in the RSCANnCmCFG register + 1) |
|  | CANmTq $=\longrightarrow$ fCAN |

## CAN FD mode:

- Nominal bit rate: up to 1 Mbps ; data bit rate: up to 8 Mbps

Transmission rate (CANm nominal bit time clock) $=\frac{1}{\text { CANm nominal bit time }}$ Transmission rate (CANm data bit time clock) $=\frac{1}{\text { CANm data bit time }}$

CANm nominal bit time $=\mathrm{CANmTq}(\mathrm{N}) \times$ Tq count per nominal bit CANm data bit time $=C A N m T q(D) \times T q$ count per data a bit
$\operatorname{CANmTq}(\mathrm{N})=\frac{(\text { NBRP[9:0] bits in the RSCFDnCFDCmNCFG register }+1)}{\text { fCAN }}$
$\mathrm{CANmTq}(\mathrm{D})=\frac{(\text { DBRP[7:0] bits in the RSCFDnCFDCmDCFG register }+1)}{\mathrm{fCAN}}$
fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register)

|  | $\text { m = see Table } 20.6$ <br> Tq: Time quantum |
| :---: | :---: |
| Buffer | 400 buffers in total <br> - Individual buffers: 80 buffers ( 16 buffers $\times 5$ channels) <br> Transmit buffer: 16 buffers per channel <br> Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) <br> - Shared buffers: 320 buffers for all channels <br> Receive buffer: 0 to 80 buffers for all channels <br> Receive FIFO buffer: 8 FIFO buffers for all channels (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) <br> - ECC protected |
| Reception function | - Receives data frames and remote frames. <br> - Selects ID format (standard ID, extended ID, or both IDs) to be received. <br> - Sets interrupt enable/disable for each FIFO. <br> - Mirror function (CAN node receives its own transmitted message.) <br> - Timestamp function (to record message reception time as a 16 -bit timer value) |

Table 20.15 RS-CANFD Module Specifications (2/3)

| Item | Specification |
| :---: | :---: |
| Reception filter function | - Selects receive messages according to 320 receive rules. <br> - Sets the number of receive rules (0 to 128) for each channel. <br> - Acceptance filter processing: Sets ID and mask for each receive rule. <br> - DLC filter processing: Sets DLC check value for each acceptance rule. |
| Receive message transfer function | - Routing function <br> Transfer receive messages to arbitrary destinations (can be transferred to up to 8 buffers) <br> Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer <br> - Label addition function <br> Stores label information together with the message in a receive buffer and FIFO buffer. |
| Transmission function | - Transmits data frames and remote frames. <br> - Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. <br> - Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. <br> - Selects ID priority transmission or transmit buffer number priority transmission. <br> - Transmit request can be aborted (possible to confirm with a flag) <br> - One-shot transmission function |
| Interval transmission function | Transmit messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmitted messages. <br> Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information. |
| Gateway function | A received message is automatically routed to a different channel. |
| Bus off recovery mode selection | Selects the method for returning from bus off state. <br> - ISO11898-1 compliant <br> - Automatic entry to channel halt mode at bus-off entry <br> - Automatic entry to channel halt mode at bus-off end <br> - Entry to channel halt mode by program request <br> - Transition to the error-active state by program request (forcible return from bus-off) |
| Error status monitoring | - Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). <br> - Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) <br> - Reads the error counter. <br> - Monitors DLC errors. |
| Interrupt source | 17 sources <br> - Global interrupts (2 sources) <br> Receive FIFO interrupt <br> Global error interrupt <br> - Channel interrupts (3 sources/channel) <br> CANm transmit interrupt ( $\mathrm{m}=$ see Table 20.6) <br> - CANm transmit complete interrupt <br> - CANm transmit abort interrupt <br> - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) <br> - CANm transmit history interrupt <br> - CANm transmit queue interrupt <br> CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CANFD module. |
| CAN communication clock | The source is selectable on-chip peripheral clock (clkc) or crystal clock (clk_xincan). |

Table 20.15 RS-CANFD Module Specifications (3/3)

| Item | Specification |
| :--- | :--- |
| Test function | Test function for user evaluation |
|  | - Listen-only mode |
|  | - Self-test mode 0 (external loopback) |
|  | - Self-test mode 1 (internal loopback) |
|  | - Restricted operation mode |
|  | - RAM test (read/write test) |
|  | - Inter-channel communication test [CRC error test enabled] |

### 20.2.2 Interface Modes

The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

### 20.2.3 CAN FD Protocol

This product supports CAN FD according to the ISO 11898-1(2015) protocol.

### 20.2.4 Block Diagram

Note: $\quad \mathrm{m}=$ see Table 20.6
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 20.1 RS-CANFD Module Block Diagram

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See Section 20.11.1.3, Communication Speed Setting.

### 20.3 Registers (Classical CAN Mode)

### 20.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.
For details about <RSCFDn_base>, see Section 20.1.2, Register Base Address.
For details about registers initialized in Global reset mode or Channel reset mode, see following.

- Table 20.186, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 20.187, Registers Initialized Only in Global Reset Mode

Table 20.16 List of Registers (1/4)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Interface Mode-Related Registers |  |  |  |  |  |
| RSCANn | Global Interface Mode Select Register | RSCANnGRMCFG | <RSCFDn_base> + 04FC ${ }_{\text {H }}$ | 8,16,32 | - |
| Channel-Related Registers |  |  |  |  |  |
| RSCANn | Channel m Configuration Register | RSCANnCmCFG | $\begin{aligned} & \text { <RSCFDn_base> }+0000_{\mathrm{H}}+ \\ & \left(10_{\mathrm{H}} \times \mathrm{m}\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Channel m Control Register | RSCANnCmCTR | $\begin{aligned} & \text { <RSCFDn_base> }+0004_{H}+ \\ & \left(10_{H} \times m\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Channel m Status Register | RSCANnCmSTS | $\begin{aligned} & \text { <RSCFDn_base> }+0008_{\mathrm{H}}+ \\ & \left(10_{\mathrm{H}} \times \mathrm{m}\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Channel m Error Flag Register | RSCANnCmERFL | $\begin{aligned} & \text { <RSCFDn_base> + } 000 \mathrm{C}_{\mathrm{H}}+ \\ & \left(10_{\mathrm{H}} \times \mathrm{m}\right) \end{aligned}$ | 8,16,32 | - |
| Global-Related Registers |  |  |  |  |  |
| RSCANn | Global Configuration Register | RSCANnGCFG | <RSCFDn_base> + 0084 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global Control Register | RSCANnGCTR | <RSCFDn_base> + 0088 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global Status Register | RSCANnGSTS | <RSCFDn_base> + 008C ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global Error Flag Register | RSCANnGERFL | <RSCFDn_base> + 0090 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global Timestamp Counter Register | RSCANnGTSC | <RSCFDn_base> + 0094 ${ }_{\text {H }}$ | 16,32 | - |
| RSCANn | Global TX Interrupt Status Register 0 | RSCANnGTINTSTS0 | <RSCFDn_base> + 0460 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global TX Interrupt Status Register 1 | RSCANnGTINTSTS1 | <RSCFDn_base> + 0464 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Global FD Configuration Register | RSCANnGFDCFG | <RSCFDn_base> + 0474 ${ }_{\text {H }}$ | 8,16,32 | - |
| Receive Rule-Related Registers |  |  |  |  |  |
| RSCANn | Receive Rule Entry Control Register | RSCANnGAFLECTR | <RSCFDn_base> + 0098 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Receive Rule Configuration Register 0 | RSCANnGAFLCFG0 | <RSCFDn_base> + 009C ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Receive Rule Configuration Register 1 | RSCANnGAFLCFG1 | <RSCFDn_base> + 00A0 ${ }_{\text {H }}$ | 8,16,32 | - |
| RSCANn | Receive Rule ID Register j | RSCANnGAFLIDj | $\begin{aligned} & \text { <RSCFDn_base> }+0500_{H}+ \\ & \left(10_{\mathrm{H}} \times \mathrm{j}\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Receive Rule Mask Register j | RSCANnGAFLMj | $\begin{aligned} & \text { <RSCFDn_base> + 0504 }{ }_{H}+ \\ & \left(10_{H} \times \mathrm{j}\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Receive Rule Pointer 0 Register j | 'RSCANnGAFLP0 | $\begin{aligned} & \text { <RSCFDn_base> }+0508_{\mathrm{H}}+ \\ & \left(10_{\mathrm{H}} \times \mathrm{j}\right) \end{aligned}$ | 8,16,32 | - |
| RSCANn | Receive Rule Pointer 1 Register j | 'RSCANnGAFLP1 | $\begin{aligned} & \text { <RSCFDn_base> }+050 C_{H}+ \\ & \left(10_{H} \times j\right) \end{aligned}$ | 8,16,32 | - |

Table 20.16 List of Registers (2/4)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Receive Buffer-Related Registers |  |  |  |  |  |
| RSCANn | Receive Buffer Number Register | RSCANnRMNB | <RSCFDn_base> + 00A4 ${ }_{\text {H }}$ | 8,16,32 | - |

| $1110_{B}$ | Transmit buffer $16 \times \mathrm{m}+15$ to $16 \times \mathrm{m}+1$ |
| $1111_{B}$ | Transmit buffer $16 \times \mathrm{m}+15$ to $16 \times \mathrm{m}+0$ |

### 20.3.2 Details of Interface Mode-Related Registers

### 20.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register

Table 20.21 RSCANnGRMCFG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |
| 0 | RCMC | Interface Mode Select |
|  | $0:$ Classical CAN mode |  |
|  |  | 1: CAN FD mode |
|  |  |  |

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

## RCMC Bit

Setting this bit to 0 makes classical CAN mode available.
Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode.
To switch the RS-CANFD module from CAN FD mode to classical CAN mode, set the values after reset to all respective registers and bits allocated only to the register map in CAN FD mode, and then modify the value of RSCANnGRMCFG register.

### 20.3.3 Details of Channel-Related Registers

### 20.3.3.1 RSCANnCmCFG - Channel m Configuration Register

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.22 RSCANnCmCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19 to 16 | TSEG1 [3:0] | ```Time Segment 1 Control b19 b18 b17 b16 0}0000\mathrm{ 0: Setting is prohibited for channels for CAN communications. 0}00001\mathrm{ 1:Setting is prohibited for channels for CAN communications. 0 0 0 0}10010,6T 0}101818:7T 0}101181:8T 1 0}0000:9T 1 0}00\mathrm{ 1:10Tq 1 0 1 0: 11Tq 1 0 1 1:12Tq 1 1 0 0: 13Tq 1 1 0 1:14Tq 1 1 1 0: 15 Tq 1 1 1 1:16 Tq``` |
| 15 to 10 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 9 to 0 | BRP [9:0] | Prescaler Division Ratio Setting <br> When these bits are set to $P(0$ to 1023), the baud rate prescaler divides fCAN by $P+1$. |

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see Section 20.11.1, Initial Settings.

## SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq , inclusive.

Set a value less than or equal to the value of the TSEG2 bits.

## TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq , inclusive.
Set a value smaller than the value of the TSEG1 bits.

## TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).

Allowed values are 4 Tq to 16 Tq , inclusive.

## BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler $((\operatorname{BRP}[9: 0])+1)$. One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

### 20.3.3.2 RSCANnCmCTR — Channel m Control Register

Note: For the value of index " m ", see Table 20.6.

## CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1 ).

When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

## CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

## CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

## ERRD Bit

This bit is used to control display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is cleared to 0 , if any error is detected while the flags of bits $14-8$ in the RSCANnCmERFL register are all 0 , only the flags of the first error event are set to 1 . If two or more errors occur in first error event, all the flags of the detected errors are set to 1 .

When this bit is set to 1 , all the flags of errors that have occurred are set to 1 regardless of the error occurrence order. Modify this bit only in channel reset mode or channel halt mode.

## BOM[1:0] Bits

These bits are used to select a bus off recovery mode of the RS-CANFD module.
When the $\operatorname{BOM}[1: 0]$ bits are set to $00_{\mathrm{B}}$, return from the bus off state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the $\operatorname{BOM}[1: 0]$ bits are set to $01_{\mathrm{B}}$, the CHMDC[1:0] bits in the RSCANnCmCTR register ( $\mathrm{m}=$ see Table 20.6) are set to $10_{\mathrm{B}}$ and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to $00_{\mathrm{H}}$.

When the RS-CANFD module reaches the bus off state when the $\operatorname{BOM}[1: 0]$ bits are set to $10_{\mathrm{B}}$, the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_{\mathrm{H}}$.

When the $\operatorname{BOM}[1: 0]$ bits are set to $11_{\mathrm{B}}$ and the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_{\mathrm{H}}$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the $\mathrm{CHMDC}[1: 0]$ bits are set to $10_{\mathrm{B}}$, a bus off recovery interrupt request is generated.

When the RS-CANFD module transitions to channel halt mode (at bus off entry when the BOM[1:0] bits are $01_{\mathrm{B}}$ or at bus off end when the $\operatorname{BOM}[1: 0]$ bits are $10_{\mathrm{B}}$ ), if the $\operatorname{CHMDC}[1: 0]$ bits are written by a program at the same time, writing by a program takes precedence. Modify BOM[1:0] bits in channel reset mode.

## TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1 , an interrupt request is generated. Modify this bit only in channel reset mode.

## ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## RTBO Bit

Setting this bit to 1 (forcible return from the bus off state) in the bus off state changes the state forcibly from the bus off state to the error active state. This bit is automatically cleared to 0 . Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to $00_{\mathrm{H}}$ and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request due to return from the bus off state is generated. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are $00_{B}$ (ISO11898-1 compliant).
A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

## CSLPR Bit

Setting this bit to 1 places the channel in channel stop mode.
Clearing this bit to 0 makes the channel leave from channel stop mode.
Do not rewrite this bit in channel communication mode or in channel halt mode.

## CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 20.6.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set these bits to $11_{\mathrm{B}}$. When the RS-CANFD module has transitioned to channel halt mode by the setting of the $\operatorname{BOM}[1: 0]$ bits, the $\mathrm{CHMDC}[1: 0]$ bits are automatically set to $10_{\mathrm{B}}$.

### 20.3.3.3 RSCANnCmSTS — Channel m Status Register

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: $00000005_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 20.24 RSCANnCmSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | TEC [7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC [7:0] | The receive error counter (REC) can be read. |
| 15 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 7 | COMSTS | Communication Status Flag <br> 0 : Communication is not ready. <br> 1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag <br> 0 : Bus idle, in transmission, or bus off state <br> 1: In reception |
| 5 | TRMSTS | Transmit Status Flag <br> 0 : Bus idle or in reception <br> 1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag <br> 0 : Not in bus off state <br> 1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag <br> 0 : Not in error passive state <br> 1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag <br> 0 : Not in channel stop mode <br> 1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag <br> 0 : Not in channel halt mode <br> 1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag <br> 0 : Not in channel reset mode <br> 1: In channel reset mode |

## TEC[7:0] Bits

These bits indicate the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

## REC[7:0] Bits

These bits indicate the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

## COMSTS Flag

This flag indicates that communication is ready.
This flag is set to 1 when the RS-CANFD module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

## RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

## TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

## BOSTS Flag

This flag is set to 1 when the TEC[7:0] value exceeds 255 and the RS-CANFD module has entered the bus off state (TEC[7:0] value $>255$ ), and is cleared to 0 when the RS-CANFD module has exited the bus off state.

## EPSTS Flag

This flag is set to 1 when the TEC[7:0] or REC[7:0] value exceeds 127 and the RS-CANFD module has entered the error passive state ( $128 \leq$ TEC[7:0] value $\leq 255$ or $128 \leq \operatorname{REC}[7: 0]$ value), and is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

## CSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel stop mode, and is cleared to 0 when the RS-CANFD module has returned from channel stop mode.

## CHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel halt mode, and is cleared to 0 when the RS-CANFD module has exited channel halt mode.

## CRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to channel reset mode, and is cleared to 0 when the RS-CANFD module has transitioned to channel communication mode or channel halt mode. This flag remains 1 if the RS-CANFD module transitions from channel reset mode to channel stop mode.

### 20.3.3.4 RSCANnCmERFL — Channel m Error Flag Register

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | CRCREG[14:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | ADERR | B0ERR | B1ERR | CERR | AERR | FERR | SERR | ALF | BLF | OVLF | BORF | BOEF | EPF | EWF | BEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | $\mathrm{R} / \mathrm{W}^{* 1}$ |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.25 RSCANnCmERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data |
|  |  | A CRC value calculated based on the transmitted message or received message is indicated. |
| 15 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag |
|  |  | 0: No ACK delimiter error is detected. |
|  |  | 1: ACK delimiter error is detected. |
| 13 | B0ERR | Dominant Bit Error Flag |
|  |  | 0: No dominant bit error is detected. |
|  |  | 1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag |
|  |  | 0: No recessive bit error is detected. |
|  |  | 1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag |
|  |  | 0 : No CRC error is detected. |
|  |  | 1: CRC error is detected. |
| 10 | AERR | ACK Error Flag |
|  |  | 0: No ACK error is detected. |
|  |  | 1: ACK error is detected. |
| 9 | FERR | Form Error Flag |
|  |  | 0: No form error is detected. |
|  |  | 1: Form error is detected. |
| 8 | SERR | Stuff Error Flag |
|  |  | 0 : No stuff error is detected. |
|  |  | 1: Stuff error is detected. |
| 7 | ALF | Arbitration Lost Flag |
|  |  | 0 : No arbitration lost is detected. |
|  |  | 1: Arbitration lost is detected. |

Table 20.25 RSCANnCmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 6 | BLF | Bus Lock Flag <br> 0 : No channel bus lock is detected. <br> 1: Channel bus lock is detected. |
| 5 | OVLF | Overload Flag <br> 0 : No overload is detected. <br> 1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag <br> 0 : No bus off recovery is detected. <br> 1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag <br> 0 : No bus off entry is detected. <br> 1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag <br> 0 : No error passive is detected. <br> 1: Error passive is detected. |
| 1 | EWF | Error Warning Flag <br> 0 : No error warning is detected. <br> 1: Error warning is detected. |
| 0 | BEF | Bus Error Flag <br> 0 : No channel bus error is detected. <br> 1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1 . The channel reset mode transition clears all of these flags to 0 .
If the ERRD bit in the RSCANnCmCTR register is set to 0 (i.e., only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are set to 1 by the error event if bits 14 to 8 were all 0 when the error occurred.

## CRCREG[14:0] Flags

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmitted or received message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0 . This bit is always 0 in channel reset mode.

## ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

## BOERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

## B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

## CERR Flag

This flag is set to 1 when a CRC error has been detected.

## AERR Flag

This flag is set to 1 when an ACK error has been detected.

## FERR Flag

This flag is set to 1 when a form error has been detected.

## SERR Flag

This flag is set to 1 when a stuff error has been detected.

## ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

## BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been modified from 1 to 0 .
- The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been modified from 1 to 0 .

## OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

## BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in either of the following cases before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to $01_{\mathrm{B}}$ (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM [1:0] bits in the RSCANnCmCTR register are set to $01_{\mathrm{B}}$ (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to $10_{\mathrm{B}}$ (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to $11_{\mathrm{B}}$ (transition to channel halt mode upon a request from the program during bus off).

## BOEF Flag

This flag is set to 1 when the state becomes bus off state (TEC[7:0] value $>255$ ). This flag is also set to 1 when the state becomes bus off state with the BOM[1:0] bits in the RSCANnCmCTR register ( $\mathrm{m}=$ see Table 20.6) are set to $01_{\mathrm{B}}$ (transition to channel halt mode at bus off entry).

## EPF Flag

This flag is set to 1 when the error passive state is entered $((128 \leq \mathrm{TEC}[7: 0] \leq 255)$ or $(128 \leq \mathrm{REC}[7: 0]))$. This flag is set to 1 only when the $\operatorname{REC}[7: 0]$ or TEC[7:0] value exceeds 127 for the first time. Therefore, if the program writes 0 to this flag with the $\operatorname{REC}[7: 0]$ or TEC[7:0] value remaining over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then either the REC[7:0] or TEC[7:0] value exceeds 127 again.

## EWF Flag

This flag is set to 1 only when the $\operatorname{REC}[7: 0]$ or TEC[7:0] value exceeds 95 for the first time. Therefore, if the program writes 0 to this flag with the REC[7:0] or TEC[7:0] value remaining over 95, this bit is not set to 1 until both REC [7:0] and $\operatorname{TEC}[7: 0]$ values become 95 or less and then either the $\operatorname{REC}[7: 0]$ or $\operatorname{TEC}[7: 0]$ value exceeds 95 again.

## BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1 .

## NOTE

To clear the flag of this register to 0 , use a store instruction to write " 0 " to that flag and " 1 " to the other flags.

### 20.3.4 Details of Global-Related Registers

### 20.3.4.1 RSCANnGCFG - Global Configuration Register

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | TSP[3:0] | Timestamp Clock Source Division b11 b10 b9 b8 $\begin{array}{llll}0 & 0 & 0 & 0\end{array}$ Not divided $0 \quad 0 \quad 0 \quad 1$ : Divided by 2 $\begin{array}{llll}0 & 0 & 1 & 0\end{array}$ : Divided by 4 $\begin{array}{llll}0 & 0 & 1 & 1 \text { : Divided by } 8\end{array}$ $\begin{array}{llll}0 & 1 & 0 & 0\end{array}$ : Divided by 16 $\begin{array}{llll}0 & 1 & 0 & 1 \text { : Divided by } 32\end{array}$ $\begin{array}{llll}0 & 1 & 1 & 0\end{array}$ : Divided by 64 $\begin{array}{llll}0 & 1 & 1 & 1 \text { : Divided by } 128\end{array}$ $\begin{array}{llll}1 & 0 & 0 & 0\end{array}$ : Divided by 256 10001 : Divided by 512 $\begin{array}{llll}1 & 0 & 1 & 0\end{array}$ : Divided by 1024 $\begin{array}{llll}1 & 0 & 1 & 1 \text { : Divided by } 2048\end{array}$ $\begin{array}{llll}1 & 1 & 0 & 0\end{array}$ : Divided by 4096 $\begin{array}{llll}1 & 1 & 0 & 1 \text { : Divided by } 8192\end{array}$ $\begin{array}{llll}1 & 1 & 1 & 0\end{array}$ : Divided by 16384 <br> $\begin{array}{llll}1 & 1 & 1 & 1 \text { : Divided by } 32768\end{array}$ |
| 7 | TMTSCE | Transmission Timestamp Enable <br> 0 : Transmission timestamp is disabled. <br> 1: Transmission timestamp is enabled. |
| 6 | EEFE | ECC Error Flag Enable <br> 0 : The ECC error flag is disabled. <br> 1: The ECC error flag is enabled. |
| 5 | - | Reserved <br> When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 4 | DCS | CAN Clock Source Select <br> 0: clkc <br> 1: clk_xincan |
| 3 | MME | Mirror Function Enable <br> 0 : Mirror function is disabled. <br> 1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable <br> 0 : DLC replacement is disabled. <br> 1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable <br> 0 : DLC check is disabled. <br> 1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select <br> 0: ID priority <br> 1: Transmit buffer number priority |

Note 1. Set TSBTCS[2:0] to $000_{\mathrm{B}}$ before select pclk/2 as the timestamp count source.

Modify the RSCANnGCFG register in global reset mode.

## ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. For details, see Section 20.8.3.1, Interval Transmission Function.

## TSBTCS[2:0] Bits

When the TSSS bit is 1 , these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

## TSSS Bit

This bit is used to select a clock source of the timestamp counter.

## TSP[3:0] Bits

These bits specify the prescaler used to divide the clock source (selected by the TSBTCS[2:0] and TSSS bits) to generate the timestamp counter clock signal.

## TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

## EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

## DCS Bit

When this bit is set to 0 , clkc is used as the clock source of the CAN clock (fCAN).
When this bit is set to 1 , the main clock is used as the clock source of the CAN clock (fCAN).

## MME Bit

Setting this bit to 1 makes the mirror function available.

## DRE Bit

When the DRE bit is set to 1 , the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of $00_{\mathrm{H}}$ is stored in the data byte that exceeds the DLC value of the receive rule.

When the DCE bit is set to 1 (DLC check is enabled), the DLC replacement function is available.

## DCE Bit

Setting this bit to 1 makes the DLC check function available. Set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to $0000_{\mathrm{B}}$ before clearing the DCE bit in the RSCANnGCFG register to 0 .

## TPRI Bit

This bit is used to set the transmit priority.
When this bit is set to 0 , ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1 , transmit buffer number priority is selected and the lowestnumbered transmit buffer among those specified for transmission takes precedence.

When using the transmit queue, clear this bit to 0 .

### 20.3.4.2 RSCANnGCTR — Global Control Register

| Value after reset: 00000005 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | TSRST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

|  | - | - | - | - | - | THLEIE | MEIE | DEIE | - | - | - | - | - | GSLPR | GMD | [1:0] |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 20.27 RSCANnGCTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 16 | TSRST | Timestamp Counter Reset <br> Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0 . |
| 15 to 11 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 10 | THLEIE | Transmit History Buffer Overflow Interrupt Enable <br> 0 : Transmit history buffer overflow interrupt is disabled. <br> 1: Transmit history buffer overflow interrupt is enabled. |
| 9 | MEIE | FIFO Message Lost Interrupt Enable <br> 0 : FIFO message lost interrupt is disabled. <br> 1: FIFO message lost interrupt is enabled. |
| 8 | DEIE | DLC Error Interrupt Enable <br> 0: DLC error interrupt is disabled. <br> 1: DLC error interrupt is enabled. |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | GSLPR | Global Stop Mode <br> 0 : Other than global stop mode <br> 1: Global stop mode |
| 1, 0 | GMDC[1:0] | Global Mode Select <br> b1 b0 <br> 0 0: Global operating mode <br> 0 1: Global reset mode <br> 1 0: Global test mode <br> 1 1: Setting prohibited |

## TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1 , the RSCANnGTSC register is cleared to $0000_{\mathrm{H}}$.

## THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## GSLPR Bit

Setting this bit to 1 places the RS-CANFD module in global stop mode.
Clearing this bit to 0 releases the RS-CANFD module from global stop mode.
Do not modify this bit from 0 to 1 in global operation mode or global test mode.

## GMDC[1:0] Bits

These bits are used to select a mode of the entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see Section 20.6.1, Global Modes. Setting the GSLPR bit to 1 in global reset mode makes the RS-CANFD module transition to global stop mode.

### 20.3.4.3 RSCANnGSTS — Global Status Register

Table 20.28 RSCANnGSTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag |
|  |  | 0: CAN RAM initialization is completed. |
|  | 1: CAN RAM initialization is ongoing. |  |
| 2 | GSLPSTS | Global Stop Status Flag |
|  |  | 0: Not in global stop mode |
|  |  | 1: In global stop mode |
| 1 | Global Test Status Flag |  |
|  |  | 0: Not in global test mode |
|  |  | 1: In global test mode |
| 0 | GRSTSTS | Global Reset Status Flag |
|  |  | $0:$ Not in global reset mode |
|  |  | 1: In global reset mode |
|  |  |  |

## GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.
This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

## GSLPSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global stop mode, and is cleared to 0 when the RSCANFD module has returned from global stop mode.

## GHLTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global test mode, and is cleared to 0 when the RSCANFD module has exited global test mode.

## GRSTSTS Flag

This flag is set to 1 when the RS-CANFD module has transitioned to global reset mode, and is cleared to 0 when the RS-CANFD module has exited global reset mode. This flag remains 1 if the RS-CANFD module has transitioned from global reset mode to global stop mode.

### 20.3.4.4 RSCANnGERFL — Global Error Flag Register

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | EEF4 | EEF3 | EEF2 | EEF1 | EEFO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 | R/W*1 | R/W*1 | R/W*1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.29 RSCANnGERFL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
| reset. |  |  |

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

## EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel $\mathrm{m}(\mathrm{m}=$ see Table 20.6), the EEFm flag is set to 1 , disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

## THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register ( $\mathrm{m}=$ see Table 20.6) is set to 1 .

This flag is cleared to 0 when the THLELT flags of all channels are set to 0 .

## MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register ( $\mathrm{x}=$ see Table 20.6) or the CFMLT flags in the RSCANnCFSTSk register ( $\mathrm{k}=$ see Table 20.6) is set to 1 .

This flag is cleared to 0 when all the RFMLT flags and CFMLT flags are set to 0 .

## DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. This flag can be cleared to 0 by writing 0 by the program.

NOTE
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

### 20.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

Table 20.30 RSCANnGTSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 15 to 0 | TS[15:0] | Timestamp value |
|  |  | The timestamp counter value can be read. |
|  |  | Counter value: $0000_{\text {H }}$ to $\mathrm{FFFF}_{\mathrm{H}}$ |

## TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. The TS[15:0] value at the time when the SOF of the received message is detected is stored in the receive buffer or the FIFO buffer. The timestamp counter is initialized in global reset mode.

Start timing and stop timing of the timestamp counter depend on the count source.

- When the TSSS bit value in the RSCANnGCFG register is 0 (pclk):

The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode. This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.

- When the TSSS bit value in the RSCANnGCFG register is 1 (CANm bit time clock):

The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode. This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 20.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | THIF3 | CFTIF3 | TQIF3 | TAIF3 | TSIF3 | - | - | - | THIF2 | CFTIF2 | TQIF2 | TAIF2 | TSIF2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | R | R | R | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | R*1 | R*1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | THIF1 | CFTIF1 | TQIF1 | TAIF1 | TSIF1 | - | - | - | THIFO | CFTIFO | TQIFO | TAIF0 | TSIF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | R | R | R | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ |

Note 1. The bit is automatically cleared in global reset or channel reset mode.
Table 20.31 RSCANnGTINTSTS0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 28 | THIF3 | Unit Channel 3 Transmit History Interrupt Status Flag |
|  |  | 0 : Transmit history interrupt is not requested. |
|  |  | 1: Transmit history interrupt is requested. |
| 27 | CFTIF3 | Unit Channel 3 Transmit/receive FIFO Transmit Interrupt Status Flag |
|  |  | 0: Transmit/receive FIFO transmit interrupt is not requested. |
|  |  | 1: Transmit/receive FIFO transmit interrupt is requested. |
| 26 | TQIF3 | Unit Channel 3 Transmit Queue Interrupt Status Flag |
|  |  | 0 : Transmit queue interrupt is not requested. |
|  |  | 1: Transmit queue interrupt is requested. |
| 25 | TAIF3 | Unit Channel 3 Transmit Buffer Abort Interrupt Status Flag |
|  |  | 0 : Transmit buffer abort interrupt is not requested. |
|  |  | 1: Transmit buffer abort interrupt is requested |
| 24 | TSIF3 | Unit Channel 3 Transmit Buffer Transmit Complete Interrupt Status Flag |
|  |  | 0 : Transmit buffer transmit complete interrupt is not requested. |
|  |  | 1: Transmit buffer transmit complete interrupt is requested. |
| 23 to 21 | - |  |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 20 | THIF2 | Unit Channel 2 Transmit History Interrupt Status Flag |
|  |  | 0: Transmit history interrupt is not requested. |
|  |  | 1: Transmit history interrupt is requested. |
| 19 | CFTIF2 | Unit Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag |
|  |  | 0: Transmit/receive FIFO transmit interrupt is not requested. |
|  |  | 1: Transmit/receive FIFO transmit interrupt is requested. |
| 18 | TQIF2 | Unit Channel 2 Transmit Queue Interrupt Status Flag |
|  |  | 0: Transmit queue interrupt is not requested. |
|  |  | 1: Transmit queue interrupt is requested. |
| 17 | TAIF2 | Unit Channel 2 Transmit Buffer Abort Interrupt Status Flag |
|  |  | 0: Transmit buffer abort interrupt is not requested. |
|  |  | 1: Transmit buffer abort interrupt is requested |

Table 20.31 RSCANnGTINTSTS0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 16 | TSIF2 | Unit Channel 2 Transmit Buffer Transmit Complete Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
