| 9 | TAIF1 | Unit Channel 1 Transmit Buffer Abort Interrupt Status Flag <br> 0 : Transmit buffer abort interrupt is not requested. <br> 1: Transmit buffer abort interrupt is requested |
| 8 | TSIF1 | Unit Channel 1 Transmit Buffer Transmit Complete Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 4 | THIF0 | Unit Channel 0 Transmit History Interrupt Status Flag <br> 0 : Transmit history interrupt is not requested. <br> 1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Unit Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag <br> 0: Transmit/receive FIFO transmit interrupt is not requested. <br> 1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Unit Channel 0 Transmit Queue Interrupt Status Flag <br> 0 : Transmit queue interrupt is not requested. <br> 1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Unit Channel 0 Transmit Buffer Abort Interrupt Status Flag <br> 0 : Transmit buffer abort interrupt is not requested. <br> 1: Transmit buffer abort interrupt is requested |
| 0 | TSIF0 | Unit Channel 0 Transmit Buffer Transmit Complete Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |

## TSIFm Bit

When the RSCANnTMIECy.TMIEp bit is set to 1 (transmit buffer interrupt is enabled) and corresponding
RSCANnTMSTSp.TMTRF[1:0] flags are set to $10_{\mathrm{B}}$ (transmission has been completed, without transmit abort request)
or $11_{\mathrm{B}}$ (transmission has been completed, with transmit abort request), the TSIFm bit becomes 1 .
The TSIFm flag becomes 0 by setting $00_{\text {B }}$ to all the TMTRF[1:0] flags which satisfy the condition to lead TSIFm $=1$. The TSIFm flag also becomes 0 by setting the TMIEp bit to 0 .

## TAIFm Bit

When the RSCANnCmCTR.TAIE bit is set to 1 (transmit abort interrupt is enabled) and the
RSCANnTMSTSp.TMTRF[1:0] flags are $01_{\mathrm{B}}$ (transmit abort has been completed), the TAIFm bit becomes 1 .
The TAIFm flag becomes 0 by setting $00_{\mathrm{B}}$ to all the TMTRF[1:0] flags of which transmit abort has been completed.

## TQIFm Bit

When the RSCANnTXQCCm.TXQIE bit is set to 1 (transmit queue interrupt is enabled) and the RSCANnTXQSTSm.TXQIF bit is set to 1 (a transmit queue interrupt request is present), the TQIFm bit becomes 1 .

When the RSCANnTXQSTSm.TXQIF bit (transmit queue interrupt request) is set to 0 , the TQIFm bit becomes 0 . The TQIFm flag also becomes 0 by setting the TXQIE bit to 0 .

## CFTIFm Bit

When the RSCANnCFCCk.CFTXIE bit is set to 1 (transmit/receive FIFO transmit interrupt is enabled) and the RSCANnCFSTSk.CFTXIF bit is set to 1 (a transmit/receive FIFO transmit interrupt request is present), the CFTIFm bit becomes 1 .

The CFTIFm bit becomes 0 by setting all the RSCANnCFSTSk.CFTXIF bits to 0 . The CFTIFm flag also becomes 0 by setting the CFTXIE bit to 0 .

## THIFm Bit

When the RSCANnTHLCCm.THLIE bit is set to 1 (transmit history interrupt is enabled) and the RSCANnTHLSTSm.THLIF bit is set to 1 (a transmit history interrupt request is present), the THIFm bit becomes 1 .

The THIFm bit becomes 0 by setting the RSCANnTHLSTSm.THLIF bit to 0 . The THIFm flag also becomes 0 by setting the THLIE bit to 0 .

### 20.3.4.7 RSCANnGTINTSTS1 — Global TX Interrupt Status Register 1

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{* 1}$ | $\mathrm{R}^{\star 1}$ |

Note 1. The bit is automatically cleared in global reset or channel reset mode.
Table 20.32 RSCANnGTINTSTS1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
| reset. |  |  |

## TSIFm Bit

When the RSCANnTMIECy.TMIE bit is set to 1 (transmit buffer interrupt is enabled) and corresponding RSCANnTMSTSp.TMTRF[1:0] flags are set to $10_{\mathrm{B}}$ (transmission has been completed, without transmit abort request) or $11_{\mathrm{B}}$ (transmission has been completed, with transmit abort request), the TSIFm bit becomes 1 .

The TSIFm flag becomes 0 by setting $00_{\mathrm{B}}$ to all the TMTRF[1:0] flags which satisfy the condition to lead TSIFm $=1$. The TSIFm flag also becomes 0 by setting the TMIE bit to 0 .

## TAIFm Bit

When the RSCANnCmCTR.TAIE bit is set to 1 (transmit abort interrupt is enabled) and the RSCANnTMSTSp.TMTRF[1:0] flags are $01_{\mathrm{B}}$ (transmit abort has been completed), the TAIFm bit becomes 1 .

The TAIFm flag becomes 0 by setting $00_{\mathrm{B}}$ to all the TMTRF[1:0] flags of which transmit abort has been completed.

## TQIFm Bit

When the RSCANnTXQCCm.TXQIE bit is set to 1 (transmit queue interrupt is enabled) and the RSCANnTXQSTSm.TXQIF bit is set to 1 (a transmit queue interrupt request is present), the TQIFm bit becomes 1 .

When the RSCANnTXQSTSm.TXQIF bit (transmit queue interrupt request) is set to 0 , the TQIFm bit becomes 0 . The TQIFm flag also becomes 0 by setting the TXQIE bit to 0 .

## CFTIFm Bit

When the RSCANnCFCCk.CFTXIE bit is set to 1 (transmit/receive FIFO transmit interrupt is enabled) and the RSCANnCFSTSk.CFTXIF bit is set to 1 (a transmit/receive FIFO transmit interrupt request is present), the CFTIFm bit becomes 1 .

The CFTIFm bit becomes 0 by setting all the RSCANnCFSTSk.CFTXIF bits to 0 . The CFTIFm flag also becomes 0 by setting the CFTXIE bit to 0 .

## THIFm Bit

When the RSCANnTHLCCm.THLIE bit is set to 1 (transmit history interrupt is enabled) and the RSCANnTHLSTSm.THLIF bit is set to 1 (a transmit history interrupt request is present), the THIFm bit becomes 1 . The THIFm bit becomes 0 by setting the RSCANnTHLSTSm.THLIF bit to 0 . The THIFm flag also becomes 0 by setting the THLIE bit to 0 .

### 20.3.4.8 RSCANnGFDCFG — Global FD Configuration Register

Table 20.33 RSCANnGFDCFG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 9 to 8 | TSCCFG[1:0] | Timestamp capture configuration <br> b9 b8 |
|  |  | 0 0: Captured at a sample point in the SOF bit |
|  |  | 0 1: Captured when a valid frame has been transmitted/received |
|  |  | 10 Setting prohibited |
|  |  | 1 1: Setting prohibited |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 0 | - | Reserved |
|  |  | When read, an undefined value is returned. The write value should be the value after reset. |

## TSCCFG Bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

### 20.3.5 Details of Receive Rule-Related Registers

### 20.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | AFL DAE | - | - | - | AFLPN[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 20.34 RSCANnGAFLECTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 8 | AFLDAE | Receive Rule Table Write Enable |
|  |  | 0: Receive rule table write is disabled. |
|  |  | 1: Receive rule table write is enabled. |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 4 to 0 | AFLPN [4:0] | Receive Rule Table Page Number Configuration |
|  |  | A page number can be selected in the range of page $0\left(0000 \mathrm{~B}_{\mathrm{B}}\right)$ to page $19\left(10011_{\mathrm{B}}\right)$. |

## AFLDAE Bit

Setting this bit to 0 disables data writing to the receive rule table. After data writing to the receive rule table is completed, set this bit to 0 to disable writing to the receive rule table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 in global reset mode.

## AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.
Set these bits to a value within a range of $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$.

### 20.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Table 20.35 RSCANnGAFLCFG0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | RNC0[7:0] | Number of Rules for Unit Channel 0 |
|  |  | The number of rules for channel 0 |
| 23 to 16 | RNC1[7:0] | Number of Rules for Unit Channel 1 |
|  |  | The number of rules for channel 1 |
| 15 to 8 | RNC2[7:0] | Number of Rules for Unit Channel 2 |
|  |  | The number of rules for channel 2 |
| 7 to 0 | $\mathrm{RNC3}[7: 0]$ | Number of Rules for Unit Channel 3 |
|  |  | The number of rules for channel 3 |

Modify the RSCANnGAFLCFG0 register in global reset mode.
Up to " $64 \times$ (number of channels)" rules can be registered to the receive rule tables in the entire module. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128 .
- The total of the number of rules allocated to each channel is not larger than the number of rules permitted to the entire unit.

## RNCO[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 0 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 1 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 2 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 3 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

### 20.3.5.3 RSCANnGAFLCFG1 — Receive Rule Configuration Register 1

Table 20.36 RSCANnGAFLCFG1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RNC4[7:0] | Number of Rules for Unit Channel 4 |
|  |  | The number of rules for channel 4 |
| 23 to 0 | - | Reserved |
|  |  | These bits are always read as 0. The write value should always be 0. |

Modify the RSCANnGAFLCFG1 register in global reset mode.
Up to " $64 \times$ (number of channels)" rules can be registered to the receive rule tables in the entire module. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128 .
- The total number of rules allocated to each channel is not larger than the number of rules permitted to the entire unit.

## RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 4 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

### 20.3.5.4 RSCANnGAFLIDj — Receive Rule ID Register j

Note: For the value of index " j ", see Table 20.6.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\begin{gathered} \text { GAFLID } \\ \mathrm{E} \end{gathered}$ | $\begin{aligned} & \text { GAFLR } \\ & \text { TR } \end{aligned}$ | $\begin{array}{\|c} \hline \text { GAFLL } \\ \text { B } \end{array}$ | GAFLID[28:16] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GAFLID[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.37 RSCANnGAFLIDj Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | GAFLIDE | IDE Select |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | GAFLRTR | RTR Select |
|  |  | 0: Data frame |
|  | 1: Remote frame |  |
| 29 | GAFLLB | Receive Rule Target Message Select |
|  |  | 0: When a message transmitted from another CAN node is received |
|  |  | 1: When a message transmitted from own node is received |
| 28 to 0 | GAFLID[28:0] | ID Setting |
|  |  | Set the ID of the receive rule. |
|  |  | For the standard ID, set the ID in bits 10 to 0 and set bits 28 to 11 to 0. |

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

## GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

## GAFLLB Bit

Setting this bit to 0 causes data processing to be performed using the receive rule when a message transmitted from another CAN node is received.

Setting this bit is to 1 when the mirror function is used causes data processing to be performed using the receive rule when a message transmitted from the own CAN node is received.

## GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID set by these bits is compared with the ID in the received message during the acceptance filter processing.

### 20.3.5.5 RSCANnGAFLMj — Receive Rule Mask Register j

Note: For the value of index " j ", see Table 20.6.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLIDEM Bit

When this bit is set to 1 , filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0 , the IDs of all the receive messages and the specified IDs are regarded as matched.
To set the GAFLIDEM bit to 0 , set all the GAFLIDM[28:0] bits to 0 at the same time.

## GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

## GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bits of the receive rule.

### 20.3.5.6 RSCANnGAFLPO_ - Receive Rule Pointer 0 Register j

Note: For the value of index " j ", see Table 20.6.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to $0000_{\text {B }}$ disables the DLC check function, allowing messages with any data length to pass the DLC check.

## GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

## GAFLRMV Bit

When this bit is set to 1 , received messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

## GAFLRMDP[6:0] Bits

These bits are used to select the number of a receive buffer that stores received messages having passed through the filter when the GAFLRMV bit is set to 1 . Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

### 20.3.5.7 RSCANnGAFLP1 $\mathbf{j}$ - Receive Rule Pointer 1 Register j

Note: For the value of index " j ", see Table 20.6.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | GAFLFDP[22:16] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 20.40 | RSCANnGAFLP1 ز Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 23 | - |  |  | Reserved |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |  |  |  |  |  |  |  |  |  |  |  |  |
| 22 to 8 | GAFLFDP[22:8] |  |  | Transmit/Receive FIFO Buffer k Select <br> (Bit position -8 = target transmit/receive FIFO buffer number k ) <br> 0 : Transmit/receive FIFO buffer is not selected. <br> 1: Transmit/receive FIFO buffer is selected. |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 7 to 0 | GAFLFDP[7:0] |  |  | Receive FIFO Buffer x Select <br> (Bit position = target receive FIFO buffer number x ) <br> 0 : Receive FIFO buffer is not selected. <br> 1: Receive FIFO buffer is selected. |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLFDP [22:0] Bits

These bits are used to specify FIFO buffers that store received messages having passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (a receive buffer is used), up to seven FIFO buffers are selectable. Selectable buffers are receive FIFO buffers and the transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCANnCFCCk register are set to $00_{\mathrm{B}}$ (receive mode) or $10_{\mathrm{B}}$ (gateway mode).

### 20.3.6 Details of Receive Buffer-Related Registers

### 20.3.6.1 RSCANnRMNB — Receive Buffer Number Register

| Value after reset: $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 20.41 RSCANnRMNB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after <br> reset. |
| 7 to 0 | NRXMB [7:0] | Receive Buffer Number Configuration <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  |
|  | Set the number of receive buffers. |  |

Modify the RSCANnRMNB register in global reset mode.
NRXMB[7:0] Bits
These bits are used to set the total number of receive buffers of the entire RS-CANFD module. The maximum value is " $16 \times$ (number of channels)".

Setting all of these bits 0 makes receive buffers unavailable.

### 20.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register y

Note: For the value of index " y ", see Table 20.6.

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 20.42 RSCANnRMNDy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RMNSq | Receive Buffer Receive Complete Flag $q(q=y \times 32+31$ to $\mathrm{y} \times 32+0)$ |
|  |  | $0:$ Receive buffer $q$ contains no new message. |
|  | 1: Receive buffer $q$ contains a new message. |  |

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

## RMNSq Flags ( $q$ = see Table 20.6)

Each flag is set to 1 when a process starts to store a message in the corresponding receive buffer.
To clear these flags to 0 , write 0 by the program. Use a store instruction to write " 0 " to the flag and " 1 " to other flags. These bits cannot be set to 0 while a message is being stored. Time for storing a message is 10 pclk clock cycles.

These flags are cleared to 0 in global reset mode.

### 20.3.6.3 RSCANnRMIDq — Receive Buffer ID Register q

Note: For the value of index " q ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | RMID[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.43 RSCANnRMIDq Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RMIDE | Receive Buffer IDE |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | RMRTR | Receive Buffer RTR |
|  |  | 0: Data frame |
|  |  | 1: Remote frame |

## RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

## RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

## RMID[28:0] Bits

These bits indicate the ID of the message stored in the receive buffer.

### 20.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register q

Note: For the value of index " $q$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.44 RSCANnRMPTRq Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | RMDLC [3:0] | Receive Buffer DLC Data b31 b30 b29 b28 $\begin{array}{llll}0 & 0 & 0 & 0\end{array}$ : No data byte $\begin{array}{llll}0 & 0 & 0 & 1: 1 \\ 1\end{array}$ data byte $\begin{array}{llll}0 & 0 & 1 & 0: 2 \\ 2\end{array}$ data bytes $\begin{array}{llll}0 & 0 & 1 & 1: 3\end{array}$ data bytes $\begin{array}{llll}0 & 1 & 0 & 0: 4 \text { data bytes }\end{array}$ $\begin{array}{llll}0 & 1 & 0 & 1: 5 \\ \text { data bytes }\end{array}$ $\begin{array}{llll}0 & 1 & 1 & 0: 6 \text { data bytes }\end{array}$0 1 1 $1: 7$ 1 X X X: 8 data bytes |
| 27 to 16 | RMPTR [11:0] | Receive Buffer Label Data <br> Label information of the received message can be read. |
| 15 to 0 | RMTS [15:0] | Receive Buffer Timestamp Data <br> Timestamp value of the received message can be read. |

## RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

## RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

## RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

### 20.3.6.5 RSCANnRMDFO_q — Receive Buffer Data Field 0 Register q

Note: For the value of index "q", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.45 RSCANnRMDFO_q Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | RMDB3 [7:0] | Receive Buffer Data Byte 3 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 23 to 16 | RMDB2 [7:0] | Receive Buffer Data Byte 2 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 15 to 8 | RMDB1 [7:0] | Receive Buffer Data Byte 1 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 7 to 0 | RMDB0 [7:0] | Receive Buffer Data Byte 0 |
|  |  | Data in the message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$

### 20.3.6.6 RSCANnRMDF1_q — Receive Buffer Data Field 1 Register q

Note: For the value of index "q", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RMDB7[7:0] |  |  |  |  |  |  |  | RMDB6[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RMDB5[7:0] |  |  |  |  |  |  |  | RMDB4[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.46 RSCANnRMDF1_q Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | RMDB7 [7:0] | Receive Buffer Data Byte 7 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 23 to 16 | RMDB6 [7:0] | Receive Buffer Data Byte 6 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 15 to 8 | RMDB5 [7:0] | Receive Buffer Data Byte 5 |
|  |  | Data in the message stored in the receive buffer can be read. |
| 7 to 0 | RMDB4 [7:0] | Receive Buffer Data Byte 4 |
|  |  | Data in the message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

### 20.3.7 Details of Receive FIFO Buffer-Related Registers

### 20.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.47 RSCANnRFCCx Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 15 to 13 | RFIGCV [2:0] | Receive FIFO Interrupt Request Timing Select <br> b15 b14 b13 <br> $0 \quad 0 \quad 0$ : When FIFO is $1 / 8$ full. <br> $0 \quad 0 \quad$ 1: When FIFO is $2 / 8$ full. <br> $0 \quad 1 \quad 0$ : When FIFO is $3 / 8$ full. <br> 01 1: When FIFO is $4 / 8$ full. <br> 100 : When FIFO is $5 / 8$ full. <br> 10 1: When FIFO is $6 / 8$ full. <br> 11 0: When FIFO is $7 / 8$ full. <br> 11 1: When FIFO is full. |
| 12 | RFIM | Receive FIFO Interrupt Source Select <br> 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. <br> 1: An interrupt occurs each time a message has been received. |
| 11 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 10 to 8 | RFDC [2:0] | Receive FIFO Buffer Depth Configuration <br> b10 b9 b8 <br> 0 0 0: 0 messages <br> $0 \quad 0 \quad 1: 4$ messages <br> 0 1 0: 8 messages <br> 0 1 1: 16 messages <br> $1000: 32$ messages <br> 1 0 1:48 messages <br> 11 0: 64 messages <br> 1 1:128 messages |
| 7 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |

Table 20.47 RSCANnRFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | RFIE | Receive FIFO Interrupt Enable |
|  | 0: Receive FIFO interrupt is disabled. |  |
|  | 1: Receive FIFO interrupt is enabled. |  |
| 0 | RFE | Receive FIFO Buffer Enable |
|  | 0: No receive FIFO buffer is used. |  |
|  | 1: Receive FIFO buffers are used. |  |

## RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).
When the RFDC[2:0] bits are set to $001_{\mathrm{B}}$ (4 messages), set the RFIGCV[2:0] bits to $001_{\mathrm{B}}, 011_{\mathrm{B}}, 101_{\mathrm{B}}$, or $111_{\mathrm{B}}$. Modify these bits in global reset mode.

## RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit in global reset mode.

## RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. If these bits are set to $000_{\mathrm{B}}$, do not use any receive FIFO buffer. Modify these bits in global reset mode.

## RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit with the RFE bit is set to 0 (no receive FIFO buffer is used).

## RFE Bit

Setting the RFE bit to 1 enables the use of receive FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (the receive FIFO buffer contains no unread message (buffer empty)). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 20.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $\quad 00000001_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RFMC[7:0] |  |  |  |  |  |  |  | - | - | - | - | RFIF | RFMLT | RFFLL | RFEMP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.48 RSCANnRFSTSx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter <br> The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | RFIF | Receive FIFO Interrupt Request Flag <br> 0: No receive FIFO interrupt request is present. <br> 1: A receive FIFO interrupt request is present. |
| 2 | RFMLT | Receive FIFO Message Lost Flag <br> 0: No receive FIFO message is lost. <br> 1: A receive FIFO message is lost. |
| 1 | RFFLL | Receive FIFO Buffer Full Status Flag <br> 0 : The receive FIFO buffer is not full. <br> 1: The receive FIFO buffer is full. |
| 0 | RFEMP | Receive FIFO Buffer Empty Status Flag <br> 0 : The receive FIFO buffer contains unread messages. <br> 1: The receive FIFO buffer contains no unread message (buffer empty). |

## RFMC[7:0] Flags

These flags indicate the number of unread messages in the receive FIFO buffer. These flags become $00_{\mathrm{H}}$ when the RFE bit in the RSCANnRFCCx register is set to 0 .

This flag is $00_{\mathrm{H}}$ in global reset mode.

## RFIF Flag

This flag is set to 1 when the conditions for receive FIFO interrupt request generation set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are satisfied. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0 , the program must write 0 to the corresponding flags to be cleared.

When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## RFMLT Flag

This flag is set to 1 if it is attempted to store a new message when the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.
Modify this bit in global operating mode or global test mode.
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0 . This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

## RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message is stored in the receive FIFO buffer.
NOTE
To clear the RFMLT or RFIF flag to 0 , use a store instruction to write " 0 " to the given flag and " 1 " to the other flags. Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently clear the flags.

### 20.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.49 RSCANnRFPCTRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | When writing to these bits, write the value after reset. |
| 7 to 0 | RFPC [7:0] | Receive FIFO Pointer Control <br>  |
|  | When FF <br> r is written to these bits, the read pointer moves to the next unread message in the <br> receive FIFO buffer. |  |

## RFPC[7:0] Bits

When $\mathrm{FF}_{\mathrm{H}}$ is written to the RFPC[7:0] bits, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented by 1. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write $\mathrm{FF}_{\mathrm{H}}$ to the RFPC[7:0] bits.

Write $\mathrm{FF}_{\mathrm{H}}$ to these bits when the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 20.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 20.50 RSCANnRFIDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RFIDE | Receive FIFO Buffer IDE |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | RFRTR | Receive FIFO Buffer RTR |
|  |  | 0: Data frame |
|  | 1: Remote frame |  |
| 29 |  | Reserved |
|  |  | When read, the value after reset is returned. |
| 28 to 0 | RFID [28:0] | Receive FIFO Buffer ID Data |
|  |  | The standard ID or extended ID of received message can be read. |
|  |  | Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0. |

## RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

## RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

## RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 20.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.51 RSCANnRFPTRx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | RFDLC [3:0] | Receive FIFO Buffer DLC Data b31 b30 b29 b28 <br> $\begin{array}{llll}0 & 0 & 0 & 0: 0\end{array} 0$ data bytes <br> $0 \quad 0 \quad 0 \quad 1: 1$ data byte <br> $\begin{array}{llll}0 & 0 & 1 & 0: 2\end{array} 2$ data bytes <br> $\begin{array}{llll}0 & 0 & 1 & 1: 3\end{array}$ data bytes <br> $\begin{array}{llll}0 & 1 & 0 & 0: 4 \text { data bytes }\end{array}$ <br> $\begin{array}{llll}0 & 1 & 0 & 1: 5 \\ \text { data bytes }\end{array}$ <br> $\begin{array}{llll}0 & 1 & 1 & 0: 6 \\ 0\end{array}$ <br> $\begin{array}{llll}0 & 1 & 1 & 1: 7 \\ & \text { data bytes }\end{array}$ <br> 1 X X X : 8 data bytes |
| 27 to 16 | RFPTR [11:0] | Receive FIFO Buffer Label Data <br> Label information of the received message can be read. |
| 15 to 0 | RFTS [15:0] | Receive FIFO Buffer Timestamp Data <br> Timestamp value of the received message can be read. |

## RFDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive FIFO buffer.

## RFPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive FIFO buffer.

## RFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive FIFO buffer.

### 20.3.7.6 RSCANnRFDFO_x — Receive FIFO Buffer Access Data Field 0 Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.52 RSCANnRFDFO_x Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RFDB3 [7:0] | Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | RFDB2 [7:0] | Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | RFDB1 [7:0] | Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | RFDB0 [7:0] | Receive FIFO Buffer Data Byte 0 |
|  |  | Data in the message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

### 20.3.7.7 RSCANnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.53 RSCANnRFDF1_x Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RFDB7 [7:0] | Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | RFDB6 [7:0] | Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | RFDB5 [7:0] | Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | RFDB4 [7:0] | Receive FIFO Buffer Data Byte 4 |
|  |  | Data in the message stored in the receive FIFO buffer can be read. |

When the RFDLC[3:0] value in the RSCANnRFPTRx register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

### 20.3.8 Details of Transmit/Receive FIFO Buffer-Related Registers

### 20.3.8.1 RSCANnCFCCk — Transmit/Receive FIFO Buffer Configuration and Control Register k

Note: For the value of index " k ", see Table 20.6.

Table 20.54 RSCANnCFCCk Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | CFITT[7:0] | Set a message transmission interval. Set value: $0^{H}$ to $\mathrm{FF}_{\mathrm{H}}$ |
| 23 to 20 | CFTML[3:0] | Transmit Buffer Link Configuration <br> Set the transmit buffer number to be linked to the transmit/receive FIFO buffer. |
| 19 | CFITR | Transmit/Receive FIFO Interval Timer Resolution <br> 0: Clock obtained by dividing pclk/2 by the value of the ITRCP [15:0] bits <br> 1: Clock obtained by dividing pclk/2 by "the value of ITRCP [15:0] bits $x$ 10" |
| 18 | CFITSS | Transmit/Receive FIFO Interval Timer Source Select <br> 0 : Clock selected by the CFITR bit ( $\mathrm{x} 1 / \mathrm{x} 10$ cycles) <br> 1: Bit time clock of the corresponding channel (FIFO is linked to the fixed channel.) |
| 17 to 16 | CFM[1:0] | Transmit/Receive FIFO Mode Select <br> b17 b16 <br> 0 0: Receive mode <br> 0 1: Transmit mode <br> 1 0: Gateway mode <br> 1 1: Setting prohibited |

Table 20.54 RSCANnCFCCk Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 12 | CFIM | Transmit/Receive FIFO Interrupt Source Select <br> 0 : <br> - Receive mode / gateway mode <br> When the number of received messages meets the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. <br> - Transmit mode / gateway mode <br> When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. <br> 1: <br> - Receive mode / gateway mode <br> A FIFO receive interrupt request is generated each time a message has been received. <br> - Transmit mode / gateway mode <br> FIFO transmit interrupt request is generated each time a message has been transmitted. |
| 11 | - | Reserved <br> When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 10 to 8 | CFDC [2:0] | Transmit/Receive FIFO Buffer Depth Configuration <br> b10 b9 b8 <br> $0 \quad 0 \quad 0: 0$ messages <br> $0 \quad 0 \quad 1: 4$ messages <br> 01 0: 8 messages <br> $\begin{array}{lll}0 & 1 & 1: 16 \text { messages }\end{array}$ <br> 10 0: 32 messages <br> 1 0 1:48 messages <br> 11 0: 64 messages <br> 1 1: 128 messages |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | CFTXIE | Transmit/Receive FIFO Transmit Interrupt Enable <br> 0: Transmit/receive FIFO transmit interrupt is disabled. <br> 1: Transmit/receive FIFO transmit interrupt is enabled. |
| 1 | CFRXIE | Transmit/Receive FIFO Receive Interrupt Enable <br> 0: Transmit/receive FIFO receive interrupt is disabled. <br> 1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | Transmit/Receive FIFO Buffer Enable <br> 0 : No transmit/receive FIFO buffer is used. <br> 1: Transmit/receive FIFO buffers are used. |

## CFITT[7:0] Bits

These bits are used to set a message transmission interval for continuous message transmission from a transmit/receive FIFO buffer whose CFM $[1: 0]$ bits are set to $01_{\mathrm{B}}$ (transmit mode) or $10_{\mathrm{B}}$ (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

## CFTML[3:0] Bits

These bits are used to set the number of the transmission buffer to be linked to the transmission and reception FIFO buffers when the CFM[1:0] bits are set to $01_{\mathrm{B}}$ (transmission mode) or $10_{\mathrm{B}}$ (gateway mode). Three transmission and reception FIFO buffers are available per channel and channel number m to which FIFO buffer k is allocated is the integer part of the quotient $\mathrm{k} / 3$. The number p of the transmission buffer to be linked to FIFO buffer k will be ( $16 \times \mathrm{m}$ ) + CFTML[3:0]. (see Table 20.19)

For the relationship between transmission and reception FIFO buffer k and transmission buffer p, see Table 20.17 and
Table 20.18 Setting the CFDC[2:0] bits to $001_{\mathrm{B}}$ or greater enables the setting of the CFTML[3:0] bits.
Do not make a link to the transmission queue of the same channel or any transmission buffer allocated to the transmission queue. Modify these bits in global reset mode.

## CFITR Bit

This bit is enabled when the CFITSS bit is 0 .
When this bit is 0 , the interval timer clock source is selected as the pclk/2 divided by the value of the ITRCP [15:0] bits of the RSCANnGCFG register.

When this bit is 1 , the interval timer clock source is selected as the $\mathrm{pclk} / 2$ divided by (ITRCP [15:0] bits $\times 10$ ) of the RSCANnGCFG register.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

## CFITSS Bit

When this bit is 0 , the clock selected by the CFITR bit is the count source of the interval timer.
When this bit is 1 , the bit time clock of the channel that is liked to FIFO is the count source of the interval timer.
Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

## CFM[1:0] Bits

These bits are used to select a transmit/receive FIFO mode. Modify these bits in global reset mode.

## CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to $00_{\mathrm{B}}$ (receive mode) or $10_{\mathrm{B}}$ (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to $001_{\mathrm{B}}$ (4 messages), set the CFIGCV[2:0] bits to $001_{\mathrm{B}}, 011_{\mathrm{B}}, 101_{\mathrm{B}}$, or $111_{\mathrm{B}}$.
Modify these bits only in global reset mode.

## CFIM Bits

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit in global reset mode.

## CFDC[2:0] Bit

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. If no transmit/receive FIFO buffer is used, set these bits to $000_{\mathrm{B}}$. Modify these bits only in global reset mode.

## CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the CFSTSk register becomes 1 , a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit when the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

## CFRXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register becomes 1 , a transmit/receive FIFO receive interrupt request is generated.

Modify this bit when the CFE bit is set to 0 .

## CFE Bit

Setting this bit to 1 enables the use of transmit/receive FIFO buffers.
When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or to be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission,

CAN bus error detection, or arbitration lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

### 20.3.8.2 RSCANnCFSTSk — Transmit/Receive FIFO Buffer Status Register $\mathbf{k}$

Note: For the value of index " k ", see Table 20.6.
Value after reset: 0000 0001H

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.55 RSCANnCFSTSk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 15 to 8 | CFMC [7:0] | Transmit/Receive FIFO Message Counter |
|  |  | The number of messages stored in the transmit/receive FIFO buffer is indicated. |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag |
|  |  | 0: No transmit/receive FIFO transmit interrupt request is present. |
|  |  | 1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag |
|  |  | 0: No transmit/receive FIFO receive interrupt request is present. |
|  |  | 1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag |
|  |  | 0 : No transmit/receive FIFO message is lost. |
|  |  | 1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | Transmit/Receive FIFO Buffer Full Status Flag |
|  |  | 0 : The transmit/receive FIFO buffer is not full. |
|  |  | 1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag |
|  |  | 0: The transmit/receive FIFO buffer contains messages. |
|  |  | 1: The transmit/receive FIFO buffer contains no message (buffer empty). |

## CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): Number of untransmitted messages in the buffer
- When CFM [1:0] value is $00_{\mathrm{B}}$ (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM [1:0] value is $00_{\mathrm{B}}$ : global reset mode
- When CFM [1:0] value is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0 .

## CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM $[1: 0]$ value is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurred.
The CFTXIF flag is set to 0 when any of the following conditions is met.
- When 0 is written in the CFTXIF flag.
- When the $\mathrm{CFM}[1: 0]$ value is $00_{\mathrm{B}}$ : global reset mode
- When the CFM [1:0] is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM $[1: 0]$ value is $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$ and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurred.
The CFRXIF flag is set to 0 when any of the following conditions is met.
- When 0 is written in the CFRXIF flag.
- When the CFM[1:0] value is $00_{\mathrm{B}}$ : global reset mode
- When the CFM $[1: 0]$ is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When transmit or receive FIFO buffer is full, and a new message is stored in this register. In this case, a new message is terminated.

The CFMLT flag is set to 0 when any of the following conditions is met.

- When 0 is written in the CFMLT flag.
- When the CFM[1:0] value is $00_{\mathrm{B}}$ : global reset mode
- When the CFM[1:0] is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit and receive FIFO buffer is equal to the FIFO buffer stages set by the CFDC[2:0] bits in the RSCANnCFCCk register

The CFFLL flag is set to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit and receive FIFO buffer is smaller than the FIFO buffer stages set by the CFDC[2:0] bits.
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not during transmit abort
- When the CFM[1:0] value is $00_{\mathrm{B}}$ : global reset mode
- When the CFM[1:0] is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : channel reset mode

## CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM [1:0] value is $00_{\mathrm{B}}$ : All messages have been read or global reset mode.
- When the CFM [1:0] value is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : All messages have been transmitted or channel reset mode.
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not during transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] value is $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : Any one of received messages has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] value is $01_{\mathrm{B}}$ : A value $\mathrm{FF}_{\mathrm{H}}$ has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0k, and RSCANnCFDF1k registers.

NOTE
To clear the CFTXIF, CFRXIF, and CFMLT flags to 0 , the program must write 0 to the corresponding flag to be cleared. When writing 0 , using a store instruction, set 1 to other flags.

### 20.3.8.3 RSCANnCFPCTRk — Transmit/Receive FIFO Buffer Pointer Control Register k

Note: For the value of index "k", see Table 20.6.

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | w | w | W | W | W | W | W | W |

Table 20.56 RSCANnCFPCTRk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When writing to these bits, write the value after reset. |
| 7 to 0 | CFPC [7:0] | Transmit/Receive FIFO Pointer Control |
|  |  | - Receive mode: |
|  |  | Writing $\mathrm{FF}_{H}$ to these bits move the read pointer to the next unread message in the transmit/receive FIFO buffer. |
|  |  | - Transmit mode: |
|  |  | Writing $\mathrm{FF}_{\mathrm{H}}$ to these bits move the write pointer to the next stage of the transmit/receive FIFO buffer. |
|  |  | - Gateway mode: |
|  |  | Setting prohibited |

## CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is $00_{\mathrm{B}}$ ):

Writing $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits move the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented by 1 . Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages in the transmit/receive FIFO buffer, and then write $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits. When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is $01_{\mathrm{B}}$ ):

Writing $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits store the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and move the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1 . Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers and then write $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits.
When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is $10_{\mathrm{B}}$ ):

Setting prohibited

### 20.3.8.4 RSCANnCFIDk — Transmit/Receive FIFO Buffer Access ID Register $\mathbf{k}$

Note: For the value of index "k", see Table 20.6.

| Value after reset: $00000000^{\mathbf{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 20.57 RSCANnCFIDk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CFIDE | Transmit/Receive FIFO Buffer IDE bit <br> 0: Standard ID <br> 1: Extended ID |
| 30 | CFRTR | Transmit/Receive FIFO Buffer RTR bit <br> 0: Data frame <br> 1: Remote frame |
| 29 | THLEN | Transmit History Data Store Enable bit <br> This bit is valid only when the CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode). <br> 0 : Transmit history data is not stored in the buffer. <br> 1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID [28:0] | Transmit/Receive FIFO Buffer ID Data <br> - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): <br> Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11 . <br> - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): <br> Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0 . Bits 28 to 11 are read as 0 . |

This register can be written only when the CFM[1:0] value of the RSCANnCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register can be read only when the $\mathrm{CFM}[1: 0]$ value is $00_{\mathrm{B}}$ (receive mode). This register should not be read or written when the CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode).

## CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

## CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM [1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

## THLEN Bit

When this bit is set to 1 , the transmit history data (label information, buffer number, and buffer type) of transmitted messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode).

## CFID[28:0] Bits

These bits indicate the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$.

These bits set the ID of the message to be transmitted from the transmit/receive FIFO buffer when the
$\mathrm{CFM}[1: 0]$ value is $01_{\mathrm{B}}$.

### 20.3.8.5 RSCANnCFPTRk — Transmit/Receive FIFO Buffer Access Pointer Register $\mathbf{k}$

Note: For the value of index " k ", see Table 20.6.

Table 20.58 RSCANnCFPTRk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | CFDLC [3:0] | Transmit/Receive FIFO Buffer DLC Data |
| 27 to 16 | CFPTR [11:0] | Transmit/Receive FIFO Buffer Label Data <br> - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): Set the label information to be stored in the transmit history buffer. Only CFPTR[7:0] bits are valid. <br> - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): The label information of the received message can be read. |
| 15 to 0 | CFTS [15:0] | Transmit/Receive FIFO Buffer Timestamp Data <br> These bits are valid only when the CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode). The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value of the RSCANnCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register is readable only when the CFM[1:0] value is $00_{B}$ (receive mode). This register should not be read or written when the $\mathrm{CFM}[1: 0]$ value is $10_{\mathrm{B}}$ (gateway mode).

## CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If 9-byte or more data length is set, 8-byte data is transmitted.

## CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM [1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

## CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.
These bits are valid when the $\operatorname{CFM}[1: 0]$ value is $00_{B}$.

### 20.3.8.6 RSCANnCFDFO_k - Transmit/Receive FIFO Buffer Access Data Field 0 Register k

Note: For the value of index " $k$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CFDB3[7:0] |  |  |  |  |  |  |  | CFDB2[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | CFDB1[7:0] |  |  |  |  |  |  |  | CFDB0[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.59 RSCANnCFDF0_k Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | CFDB3 [7:0] | Transmit/Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | CFDB2 [7:0] | Transmit/Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | CFDB1 [7:0] | Transmit/Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | CFDB0 [7:0] | Transmit/Receive FIFO Buffer Data Byte 0 |
|  |  | - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): Set the data of the transmit/receive FIFO |
|  | buffer. |  |
|  |  | - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): The message data stored in the |
|  | transmit/receive FIFO buffer can be read. |  |

This register can be written only when the CFM[1:0] value of the RSCANnCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register can be read only when the $\mathrm{CFM}[1: 0]$ value is $00_{\mathrm{B}}$ (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

This register should not be read or written when the CFM[1:0] value is $10_{B}$ (gateway mode).

### 20.3.8.7 RSCANnCFDF1_k — Transmit/Receive FIFO Buffer Access Data Field 1 Register k

Note: For the value of index " $k$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.60 RSCANnCFDF1_k Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | CFDB7 [7:0] | Transmit/Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | CFDB6 [7:0] | Transmit/Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | CFDB5 [7:0] | Transmit/Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | CFDB4 [7:0] | Transmit/Receive FIFO Buffer Data Byte 4 |
|  |  | - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): Set the data of the transmit/receive FIFO |
|  | buffer. |  |
|  |  | - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): The message data stored in the |
|  | transmit/receive FIFO buffer can be read. |  |

This register is writable only when the CFM[1:0] value of the RSCANnCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register is readable only when the $\mathrm{CFM}[1: 0]$ value is $00_{\mathrm{B}}$ (receive mode). When the $\mathrm{CFDLC}[3: 0]$ value in the RSCANnCFPTRk register is smaller than $1000_{\mathrm{B}}$, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

This register should not be read or written when the CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode)

### 20.3.9 Details of FIFO Staus-Related Registers

### 20.3.9.1 RSCANnFESTS — FIFO Empty Status Register

Value after reset: $\quad 03 F F$ FFFF $_{H}$

Table 20.61 RSCANnFESTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 22 | CF14EMP | Transmit/Receive FIFO Buffer Empty Status Flag |
| 21 | CF13EMP | 0: Transmit/receive FIFO buffer k contains a message. |
| 20 | CF12EMP | 1: Transmit/receive FIFO buffer $k$ contains no message. |
| 19 | CF11EMP |  |
| 18 | CF10EMP |  |
| 17 | CF9EMP |  |
| 16 | CF8EMP |  |
| 15 | CF7EMP |  |
| 14 | CF6EMP |  |
| 13 | CF5EMP |  |
| 12 | CF4EMP |  |
| 11 | CF3EMP |  |
| 10 | CF2EMP |  |
| 9 | CF1EMP |  |
| 8 | CFOEMP |  |
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag |
| 6 | RF6EMP | 0 : Receive FIFO buffer $x$ contains an unread message. |
| 5 | RF5EMP | 1: Receive FIFO buffer $x$ contains no unread message. |
| 4 | RF4EMP |  |
| 3 | RF3EMP |  |
| 2 | RF2EMP |  |
| 1 | RF1EMP |  |
| 0 | RF0EMP |  |

The RSCANnFESTS register is set to 003F $\mathrm{FFFF}_{\mathrm{H}}$ in global reset mode.

## CFkEMP Flag ( $k=$ see Table 20.6)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0 .

RFxEMP Flag ( $\mathbf{x}=$ see Table 20.6)
The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0 .

### 20.3.9.2 RSCANnFFSTS — FIFO Full Status Register

Table 20.62 RSCANnFFSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 22 | CF14FLL | Transmit/Receive FIFO Buffer Full Status Flag |
| 21 | CF13FLL | 0 : Transmit/receive FIFO buffer k is not full. |
| 20 | CF12FLL | 1: Transmit/receive FIFO buffer $k$ is full. |
| 19 | CF11FLL |  |
| 18 | CF10FLL |  |
| 17 | CF9FLL |  |
| 16 | CF8FLL |  |
| 15 | CF7FLL |  |
| 14 | CF6FLL |  |
| 13 | CF5FLL |  |
| 12 | CF4FLL |  |
| 11 | CF3FLL |  |
| 10 | CF2FLL |  |
| 9 | CF1FLL |  |
| 8 | CF0FLL |  |
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag |
| 6 | RF6FLL | 0 : Receive FIFO buffer x is not full. |
| 5 | RF5FLL | 1: Receive FIFO buffer $x$ is full. ( $\mathrm{x}=$ see Table 20.6) |
| 4 | RF4FLL | (x = see Table 20.6) |
| 3 | RF3FLL |  |
| 2 | RF2FLL |  |
| 1 | RF1FLL |  |
| 0 | RF0FLL |  |

The RSCANnFFSTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.

## CFkFLL Flag ( $k=$ see Table 20.6)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full). When the CFFLL flag is cleared to 0 , the CFkFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full).

## RFxFLL Flag ( $\mathbf{x}=$ see Table 20.6)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0 .

### 20.3.9.3 RSCANnFMSTS - FIFO Message Lost Status Register

| Value after reset: |  |  | $0000000 \mathrm{OH}^{\text {H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved <br> When read, the value after reset is returned. |
| 22 | CF14MLT | Transmit/Receive FIFO Buffer Message Lost Status Flag |
| 21 | CF13MLT | 0 : No transmit/receive FIFO buffer k message is lost. |
| 20 | CF12MLT | 1: A transmit/receive FIFO buffer $k$ message is lost. |
| 19 | CF11MLT |  |
| 18 | CF10MLT |  |
| 17 | CF9MLT |  |
| 16 | CF8MLT |  |
| 15 | CF7MLT |  |
| 14 | CF6MLT |  |
| 13 | CF5MLT |  |
| 12 | CF4MLT |  |
| 11 | CF3MLT |  |
| 10 | CF2MLT |  |
| 9 | CF1MLT |  |
| 8 | CFOMLT |  |
| 7 | RF7MLT | Receive FIFO Buffer Message Lost Status Flag |
| 6 | RF6MLT | 0 : No receive FIFO buffer x message is lost. |
| 5 | RF5MLT | 1: A receive FIFO buffer $x$ message is lost. |
| 4 | RF4MLT | ( $\mathrm{-}$ see Table 20.6) |
| 3 | RF3MLT |  |
| 2 | RF2MLT |  |
| 1 | RF1MLT |  |
| 0 | RFOMLT |  |

The RSCANnFMSTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.

## CFkMLT Flag ( $\mathbf{k}=$ see Table 20.6)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0 , the CFkMLT flag is cleared to 0 .

## RFxMLT Flag ( $\mathrm{x}=$ see Table 20.6)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0 , the RFxMLT flag is cleared to 0 .

### 20.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Value after reset: 00000000 H

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 20.64 RSCANnRFISTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When read, the value after reset is returned. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag <br>  <br> 6 |
| 5 | RF6IF | 0: No receive FIFO buffer $x$ interrupt request is present. <br> 1: A receive FIFO buffer $x$ interrupt request is present. <br> (x = see Table 20.6) |
| 4 | RF5IF |  |
| 3 | RF4IF |  |
| 2 | RF2IF |  |
| 1 | RF1IF |  |
| 0 | RF0IF |  |

The RSCANnRFISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
RFxIF Flag ( $\mathbf{x}=$ see Table 20.6)
The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0 , the RFxIF flag is cleared to 0 .

### 20.3.9.5 RSCANnCFRISTS — Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.65 RSCANnCFRISTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved <br> When read, the value after reset is returned. |
| 14 | CF14RXIF | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag |
| 13 | CF13RXIF | 0 : No transmit/receive FIFO buffer k receive interrupt request is present. |
| 12 | CF12RXIF | 1: A transmit/receive FIFO buffer k receive interrupt request is present. |
| 11 | CF11RXIF |  |
| 10 | CF10RXIF |  |
| 9 | CF9RXIF |  |
| 8 | CF8RXIF |  |
| 7 | CF7RXIF |  |
| 6 | CF6RXIF |  |
| 5 | CF5RXIF |  |
| 4 | CF4RXIF |  |
| 3 | CF3RXIF |  |
| 2 | CF2RXIF |  |
| 1 | CF1RXIF |  |
| 0 | CFORXIF |  |

The RSCANnCFRISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
CFxRXIF Flag ( $k=$ see Table 20.6)
The CFxRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0 , the CFxRXIF flag is cleared to 0 .

### 20.3.9.6 RSCANnCFTISTS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register

## Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | $\begin{gathered} \text { CF14TX } \\ \text { IF } \end{gathered}$ | $\underset{\text { IF }}{\substack{\text { CF13TX } \\ \hline}}$ | $\underset{\mathrm{IF}}{\mathrm{CF} 12 \mathrm{TX}}$ | $\underset{\substack{\text { CF11TX } \\ \text { IF }}}{ }$ | $\underset{\text { IF }}{\text { CF10TX }}$ | $\underset{F}{\text { CF9TXI }}$ | $\underset{F}{\text { CF8TXI }}$ | $\underset{F}{\text { CF7TXI }}$ | $\underset{F}{\text { CF6TXI }}$ | $\underset{\mathrm{F}}{\mathrm{CF5TXI}}$ | $\underset{F}{C F 4 T X I}$ | $\underset{F}{\text { CF3TXI }}$ | $\underset{\mathrm{F}}{\mathrm{CF} 2 \mathrm{XI}}$ | $\begin{gathered} \text { CF1TXI } \\ \text { F1 } \end{gathered}$ | $\begin{gathered} \text { CFOTXI } \\ \mathrm{F} \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.66 RSCANnCFTISTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved <br> When read, the value after reset is returned. |
| 14 | CF14TXIF | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag |
| 13 | CF13TXIF | 0 : No transmit/receive FIFO buffer $k$ transmit interrupt request is present. |
| 12 | CF12TXIF | 1: A transmit/receive FIFO buffer $k$ transmit interrupt request is present. |
| 11 | CF11TXIF |  |
| 10 | CF10TXIF |  |
| 9 | CF9TXIF |  |
| 8 | CF8TXIF |  |
| 7 | CF7TXIF |  |
| 6 | CF6TXIF |  |
| 5 | CF5TXIF |  |
| 4 | CF4TXIF |  |
| 3 | CF3TXIF |  |
| 2 | CF2TXIF |  |
| 1 | CF1TXIF |  |
| 0 | CFOTXIF |  |

The RSCANnCFTISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
CFkTXIF Flag ( $k=$ see Table 20.6)
The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0 , the CFkTXIF flag is cleared to 0 .

### 20.3.10 Details of Transmit Buffer-Related Registers

### 20.3.10.1 RSCANnTMCp - Transmit Buffer Control Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W*1 |

Note 1. The only effective value for writing to this bit is 1 , which sets the bit. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.67 RSCANnTMCp Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |
| 2 | TMOM | One-Shot Transmission Enable |
|  |  | $0:$ One-shot transmission is disabled. |
|  | 1: One-shot transmission is enabled. |  |
| 1 | TMTAR | Transmit Abort Request |
|  | $0:$ Transmit abort is not requested. |  |
|  |  | 1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request |
|  |  | 0: Transmission is not requested. |
|  |  |  |
|  |  |  |

When the RSCANnTMCp register meets any of the following conditions, set it to $00_{\mathrm{H}}$.

- The RSCANnTMCp register ( $\mathrm{p}=\mathrm{m} \times 16+$ the value of the CFTML[3:0] bits) corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register.
- The RSCANnTMCp register $(\mathrm{p}=(\mathrm{m} \times 16+15)$ to $(\mathrm{m} \times 16+15$ the value of the TXQDC[3:0] bits $))$ corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm register ( $\mathrm{m}=$ see Table 20.6).

All of the bits in the RSCANnTMCp register are 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

## TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0 . To set the TMOM bit to 1 , also set the TMTR bit together.

## TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or to be transmitted next cannot be aborted.

When the TMTR bit is set to 1 , the TMTAR bit can be set to 1 .

The TMTAR bit is cleared to 0 when any of the following conditions is set. It is not cleared to 0 by writing 0 by the program.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the timing when the program writes 1 to this bit, this bit becomes 0 .

## TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.
The TMTR bit is cleared to 0 when any of the following conditions is met. It is not cleared to 0 by writing 0 by the program.

- Transmission has been completed.
- Transmit abort has been completed by setting the TMTAR bit to 1 .
- An error or arbitration lost has been detected with the TMOM bit set to 1 .

Set the TMTR bit to 1 when the TMTRF[1:0] flag in the RSCANnTMSTSp register is $00_{B}$.

### 20.3.10.2 RSCANnTMSTSp - Transmit Buffer Status Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | TMTARM | TMTRM |  |  | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

Table 20.68 RSCANnTMSTSp Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |

All of the bits in the RSCANnTMSTSp register are cleared to 0 in channel reset mode.

## TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1 , and is cleared to 0 when the TMTAR bit is set to 0 .

## TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1 , and is cleared to 0 when the TMTR bit is set to 0 .

## TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.
$00_{\mathrm{B}}$ : Transmission is in progress or no transmit request is present.
$01_{\mathrm{B}}$ : Transmission from the transmit buffer was aborted.
$10_{\mathrm{B}}$ : Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).
$11_{\mathrm{B}}$ : Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write $00_{\mathrm{B}}$ to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than $00_{\mathrm{B}}$ to this flag.

## TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or stopped due to a bus error or arbitration lost.

### 20.3.10.3 RSCANnTMIDp - Transmit Buffer ID Register p

Note: For the value of index " p ", see Table 20.6.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | TMIDE | TMRTR | THLEN | TMID[28:16] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TMID[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.69 RSCANnTMIDp Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | TMIDE | Transmit Buffer IDE |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | TMRTR | Transmit Buffer RTR |
|  |  | 0: Data frame |
|  | 1: Remote frame |  |
| 29 | THLEN | Transmit History Data Store Enable |
|  |  | 0: Transmit history data is not stored in the buffer. |
|  |  | 1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID [28:0] | Transmit Buffer ID Data |
|  |  | Set standard ID or extended ID. |
|  |  |  |
|  |  |  |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to any transmit/receive FIFO buffer, do not write data to this register. Write data only to the transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ when this register is allocated to the transmit queue.

## TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

## TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

## THLEN Bit

Setting this bit to 1 stores a transmitted message in the transmit history buffer after transmission is completed.

## TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 20.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.70 RSCANnTMPTRp Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | TMDLC [3:0] | Transmit Buffer DLC Data <br> b31 b30 b29 b28 <br> 0$0^{0} 00 \quad 0: 0$ data bytes0 0 0 $1: 1$ data byte <br> 0 0 1 $0: 2$ data bytes <br> 0 0 1 $1: 3$ data bytes <br> 0 1 0 $0: 4$ data bytes <br> 0 1 0 $1: 5$ data bytes <br> 0 1 1 $0: 6$ data bytes <br> 0 1 1 $1: 7$ data bytes <br> 1 $x$ $x$ $x: 8$ data bytes |
| 27 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 23 to 16 | TMPTR [7:0] | Transmit Buffer Label Data <br> Set the label information to be stored in the transmit history buffer. |
| 15 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to any transmit/receive FIFO buffer, do not write data to this register. Write data only to the transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ when this register is allocated to the transmit queue.

## TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the setting for the data length is $1001_{\mathrm{B}}$ or above, 8 -byte data is transmitted.

When the TMRTR bit is set to 1 (remote frame), these bits set the data length of the message to be requested.

## TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 20.3.10.5 RSCANnTMDFO_p - Transmit Buffer Data Field 0 Register p

Note: For the value of index "p", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 20.71 RSCANnTMDFO_p Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | TMDB3 [7:0] | Transmit Buffer Data Byte 3 |
| 23 to 16 | TMDB2 [7:0] | Transmit Buffer Data Byte 2 |
| 15 to 8 | TMDB1 [7:0] | Transmit Buffer Data Byte 1 |
| 7 to 0 | TMDB0 [7:0] | Transmit Buffer Data Byte 0 |
|  |  |  |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to any transmit/receive FIFO buffer, do not write data to this register. Write data only to the transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ when this register is allocated to the transmit queue.

### 20.3.10.6 RSCANnTMDF1_p — Transmit Buffer Data Field 1 Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 20.72 RSCANnTMDF1_p Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | TMDB7 [7:0] | Transmit Buffer Data Byte 7 |
| 23 to 16 | TMDB6 [7:0] | Transmit Buffer Data Byte 6 |
| 15 to 8 | TMDB5 [7:0] | Transmit Buffer Data Byte 5 |
| 7 to 0 | TMDB4 [7:0] | Transmit Buffer Data Byte 4 |
|  |  |  |

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to any transmit/receive FIFO buffer, do not write data to this register. Write data only to the transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ when this register is allocated to the transmit queue.

### 20.3.10.7 RSCANnTMIECy — Transmit Buffer Interrupt Enable Configuration Register y

Note: For the value of index " y ", see Table 20.6.

Table 20.73 RSCANnTMIECy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMIEp | Transmit Buffer Interrupt Enable bits $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ Transmit buffer interrupt is disabled. |  |
|  | 1: Transmit buffer interrupt is enabled. |  |

## TMIEp Bits ( $\mathbf{p}=$ see Table 20.6)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to the bits corresponding to the transmit buffers linked to transmit/receive FIFO buffers or the transmit buffers allocated to the transmit queue.

Table 20.74 shows the bit allocation.

Table 20.74 TMIEp Bit Allocation

| Bit Position | Channel | Transmit Buffer No. |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 15 | 0 | 15 |
| 16 | 1 | 0 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 30 | 1 | 14 |
| 31 | 2 | 15 |
| 32 | 2 | 0 |
| 33 | $\cdot$ | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 47 | 2 | $\cdot$ |
| 48 | 3 | 15 |
| $\cdot$ | $\cdot$ | 0 |

| 63 | 3 | 14 |

### 20.3.11 Details of Transmit Buffer Status-Related Registers

### 20.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register y

Note: For the value of index " $y$ ", see Table 20.6.
Value after reset: 00000000 H

Table 20.75 RSCANnTMTRSTSy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ No transmit request is present. |  |
|  | 1: A transmit request is present. |  |

## TMTRSTSp Flags ( $\mathbf{p}=$ see Table 20.6)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.
When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1 .
The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 20.76 shows the bit allocation.

Table 20.76 TMTRSTSp Bit Allocation

| Bit Position | Channel | Transmit Buffer No. |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 15 | 1 | 15 |
| 16 | $\cdot$ | 0 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | 1 | $\cdot$ |

|  | $0:$ No transmit abort request is present. |  |
|  | 1: A transmit abort request is present. |  |

## TMTARSTSp Flags ( $p=$ see Table 20.6)

These flags indicate the status of the TMTAR bit in the RSCANnTMCp register.
When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1 .
The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 20.78 shows the bit allocation.

Table 20.78 TMTARSTSp Bit Allocation

| Bit Position | Channel | Transmit Buffer No. |

|  |  | $0:$ Transmission has not been completed. |
|  | 1: Transmission has been completed. |  |

## TMTCSTSp Flags ( $p=$ see Table 20.6)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to $10_{\mathrm{B}}$ (transmission has been completed (without transmit abort request)) or $11_{\mathrm{B}}$ (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1 .

These flags are cleared to 0 when the TMTRF[1:0] flag is set to $00_{\mathrm{B}}$ or in channel reset mode.
Table $\mathbf{2 0 . 8 0}$ shows the bit allocation.

Table 20.80 TMTCSTSp Bit Allocation

Table 20.81 RSCANnTMTASTSy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ Transmission is not aborted. |  |
|  | 1: Transmission is aborted. |  |

## TMTASTSp Flags ( $p=$ see Table 20.6)

When the TMTRF[1:0] flag in the RSCANnTMSTSp register is set to $01_{\mathrm{B}}$ (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1 .

These flags are cleared to 0 when the TMTRF[1:0] flag is set to $00_{\mathrm{B}}$ or in channel reset mode.
Table 20.82 shows the bit allocation.

Table 20.82 TMTASTSp Bit Allocation

| Bit Position | Channel | Transmit Buffer No. |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |

### 20.3.12 Details of Transmit Queue-Related Registers

### 20.3.12.1 RSCANnTXQCCm - Transmit Queue Configuration and Control Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 20.83 RSCANnTXQCCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select bit <br> 0 : When the buffer becomes empty upon completion of message transmission, a transmit queue interrupt source occurs. <br> 1: A transmit queue interrupt source occurs each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable <br> 0 : Transmit queue interrupt is disabled. <br> 1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC [3:0] | Transmit Queue Depth Configuration <br> Setting these bits to g ( $\mathrm{g}=2$ to 15 ) makes the " $\mathrm{g}+1$ " transmit queue available. Setting these bits to 0 disables the transmit queue. <br> Setting these bits to 1 is prohibited. |
| 7 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable <br> 0 : The transmit queue is not used. <br> 1: The transmit queue is used. |

## TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

## TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.
Set the TXQE bit to 0 when modifying the TXQIE bit.

## TXQDC[3:0] Bits

These bits are used to set the number of transmit buffers to be allocated to the transmit queue. Transmit buffers are allocated to the transmit queues in the descending order of buffer numbers from $(\mathrm{m} \times 16+15)$ to $(\mathrm{m} \times 16+0)$. see Table 20.20. For an example of buffer allocation, see Figure 20.9. Modify these bits only in the channel reset mode.

## TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Set the TXQDC[3:0] bits to $0010_{\mathrm{B}}$ or more before setting the TXQE bit to 1 .

### 20.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $00000001_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | TXQIF | $\underset{\mathrm{L}}{\mathrm{TXQFL}}$ | $\underset{\mathrm{P}}{\text { TXQEM }}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.84 RSCANnTXQSTSm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | - | Reserved |
|  |  | When read, the undefined value is returned. When writing to these bits, write the value after reset. |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag |
|  |  | 0 : No transmit queue interrupt request is present. |
|  |  | 1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | Transmit Queue Full Status Flag |
|  |  | 0 : The transmit queue is not full. |
|  |  | 1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag |
|  |  | 0 : The transmit queue contains messages. |
|  |  | 1: The transmit queue contains no message (transmit queue empty). |

## TXQIF Flag

The TXQIF flag is set to 1 when the interrupt source set by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

## TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

## TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is placed in the transmit queue.
This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 20.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register m

Note: For the value of index " m ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.85 RSCANnTXQPCTRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br>  |
| When read, the value after reset is returned. When writing to these bits, write the value after |  |  |
| reset. 0 | TXQPC [7:0] | Transmit Queue Pointer Control <br> Writing FF $_{\mathrm{H}}$ to these bits move the write pointer of the transmit queue to the next queue. |

## TXQPC[7:0] Bits

Writing $\mathrm{FF}_{\mathrm{H}}$ to the TXQPC[7:0] bits move the write pointer to the next transmit queue and generates a transmit request for the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, RSCANnTMDF1_p registers ( $\mathrm{p}=15,31,47,63,79$ ) before writing $\mathrm{FF}_{H}$ to the TXQPC[7:0] bits.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (the transmit queue is not full).

### 20.3.13 Details of Transmit History-Related Registers

### 20.3.13.1 RSCANnTHLCCm — Transmit History List Configuration and Control Register m

Note: For the value of index " $m$ ", see Table 20.6.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 20.86 RSCANnTHLCCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 11 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after <br> reset. |
| 10 | THLDTE | Transmit History Target Buffer Select |
|  |  | 0: Entries from transmit/receive FIFO buffers and transmit queue |
|  | 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue |  |

## THLDTE Bit

When this bit is set to 0 , the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1 , the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

## THLIM Bit

This bit is used to select a transmit history interrupt source.
Modify this bit only in channel reset mode.

## THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit with the THLE bit is set to 0 .

## THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of the transmitted messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.
This bit is cleared to 0 in channel reset mode.

### 20.3.13.2 RSCANnTHLSTSm — Transmit History List Status Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $\quad 00000001_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | THLMC[4:0] |  |  |  |  | - | - | - | - | THLIF | THLELT | THLFLL | $\underset{\mathrm{P}}{\text { THLEM }}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the status. Any other writing to the bit results in retention of the status and does not change the value.

Table 20.87 RSCANnTHLSTSm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | THLMC [4:0] | Transmit History Buffer Unread Data Counter |
|  |  | These bits indicate the number of unread data stored in the transmit history buffer. |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag |
|  |  | 0 : No transmit history interrupt request is present. |
|  |  | 1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag |
|  |  | 0: Transmit history buffer overflow has not occurred. |
|  |  | 1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit History Buffer Full Status Flag |
|  |  | 0: Transmit history buffer is not full. |
|  |  | 1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag |
|  |  | 0: Transmit history buffer contains unread data. |
|  |  | 1: Transmit history buffer contains no unread data (buffer empty). |

## THLMC[4:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer.
These bits are cleared to 0 in channel reset mode.
THLIF Flag
The THLIF flag is set to 1 when the interrupt source set by the THLIM bit in the RSCANnTHLCCm register has occurred.

This flag is cleared to 0 in channel reset mode or by writing 0 to this flag by the program.
To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## THLELT Flag

The THLELT flag is set to 1 when it is attempted to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by writing 0 to this flag.

To clear the flag of the register to 0 , the program must write 0 to the given flag. When writing 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

## THLFLL Flag

The THLFLL flag is set to 1 when 16 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 16 . This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

## THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE
To clear the THLIF and THLELT flags to 0 , the program must write 0 to the corresponding flag to be cleared. When writing 0 , using a store instruction, set 1 to other flags.

### 20.3.13.3 RSCANnTHLPCTRm — Transmit History List Pointer Control Register m

Note: For the value of index " m ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.88 RSCANnTHLPCTRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When writing to these bits, write the value after reset. |
| 7 to 0 | THLPC [7:0] | Transmit History List Pointer Control <br> Writing FF <br> $H$ <br> buffer. to these bits move the read pointer to the next unread data in the transmit history |

## THLPC[7:0] Bits

When the THLPC[7:0] bits are set to $\mathrm{FF}_{\mathrm{H}}$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented by 1 . After reading the RSCANnTHLACCm register, write $\mathrm{FF}_{\mathrm{H}}$ to the THLPC[7:0] bits.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0 .

### 20.3.13.4 RSCANnTHLACCm — Transmit History List Access Register m

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | TMTS[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TID[7:0] |  |  |  |  |  |  |  | - | BN[3:0] |  |  |  | BT[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.89 RSCANnTHLACCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | TMTS[15:0] | Timestamp Data |
|  |  | The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | Label Data |
|  |  | The label information of stored data can be read. |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 6 to 3 | BN[3:0] | Buffer Number Data |
|  |  | The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | Buffer Type Data |
|  |  | b2 b1 b0 |
|  |  | $\begin{array}{llll}0 & 0 & \text { 1: Transmit buffer }\end{array}$ |
|  |  | 01 0: Transmit/receive FIFO buffer |
|  |  | 10 0: Transmit queue |

## TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1 , timestamp values in transmit history data stored in the transmit history buffer is displayed. When the TMTSCE bit is 0 , the TMTS[15:0] bits are always read as 0 .

## TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

## BN[3:0] Bits

These bits indicate the transmit source buffer number of transmit history data stored in the transmit history buffer.

## BT[2:0] Bits

These bits indicate the transmit source buffer type of transmit history data stored in the transmit history buffer.

### 20.3.14 Details of Test-Related Registers

### 20.3.14.1 RSCANnGTSTCFG - Global Test Configuration Register

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 20.90 RSCANnGTSTCFG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 22 to 16 | RTMPS [6:0] | RAM Test Page Configuration |
|  |  | Set a value within a range of page $0\left(00_{\mathrm{H}}\right)$ to page $49\left(31_{\mathrm{H}}\right)$. |
| 15 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 4 | C4ICBCE | CAN4 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN4 inter-channel communication test is disabled. |
|  |  | 1: CAN4 inter-channel communication test is enabled. |
| 3 | C3ICBCE | CAN3 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN3 inter-channel communication test is disabled. |
|  |  | 1: CAN3 inter-channel communication test is enabled. |
| 2 | C2ICBCE | CAN2 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN2 inter-channel communication test is disabled. |
|  |  | 1: CAN2 inter-channel communication test is enabled. |
| 1 | C1ICBCE | CAN1 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN1 inter-channel communication test is disabled. |
|  |  | 1: CAN1 inter-channel communication test is enabled. |
| 0 | COICBCE | CAN0 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN0 inter-channel communication test is disabled. |
|  |  | 1: CAN0 inter-channel communication test is enabled. |

Modify the RSCANnGTSTCFG register in global test mode.

## RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value from $00_{\mathrm{H}}$ to $31_{\mathrm{H}}$.

## C4ICBCE Bit

Setting this bit to 1 enables channel 4 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C3ICBCE Bit

Setting this bit to 1 enables channel 3 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C2ICBCE Bit

Setting this bit to 1 enables channel 2 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C1ICBCE Bit

Setting this bit to 1 enables channel 1 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## COICBCE Bit

Setting this bit to 1 enables channel 0 inter-channel communication test. This bit is cleared to 0 in global reset mode.

### 20.3.14.2 RSCANnGTSTCTR — Global Test Control Register

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | RTME | - | $\begin{array}{\|c} \hline \text { ICBCT } \\ \mathrm{ME} \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

Table 20.91 RSCANnGTSTCTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | RTME | RAM Test Enable |
|  |  | 0 : RAM test is disabled. |
|  |  | 1: RAM test is enabled. |
| 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 0 | ICBCTME | Inter-Channel Communication Test Enable |
|  |  | 0 : Inter-channel communication test is disabled. |
|  |  | 1: Inter-channel communication test is enabled. |

## RTME Bit

Setting this bit to 1 enables RAM test. Modify this bit only in global test mode.
This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to $10_{\mathrm{B}}$ (global test mode).
2. Set the RTME bit to 1 .
3. Check that the RTME bit is set to 1 .

For the setting procedure of RAM test, see Figure 20.37.

## ICBCTME Bit

When this bit is set to 1 , a communication test is enabled between the channels for which the CmICBCE bit ( $\mathrm{m}=$ see Table 20.6) in the RSCANnGTSTCFG register has been set to 1 . Modify the ICBCTME bit only in global test mode. This bit is cleared to 0 in global reset mode.

### 20.3.14.3 RSCANnGLOCKK — Global Lock Key Register

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.
Table 20.92 RSCANnGLOCKK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br>  <br>  <br> 15 to 0 |
|  | When read, the value after reset is returned. When writing to these bits, write the value after |  |
|  | reset. |  |

The RSCANnGLOCKK register is a write-only register to release protection of special test bits. For protection released data, Section 20.11.4.2, Procedure for Releasing the Protection.

## LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the GTSTCTR register.

After the protection has been released, writing to the I/O register area of CAN ( $<$ RSCFDn_base $>+0000_{\mathrm{H}}$ to $<$ RSCFDn_base $>+04 \mathrm{FF}_{\mathrm{H}}$ ), excluding the RAM, enables the protection again.

Reading from the register of the CAN I/O register area or reading from/wring to other areas does not enable the protection.

### 20.3.14.4 RSCANnRPGACCr — RAM Test Page Access Register r

Note: For the value of index "r", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.93 RSCANnRPGACCr Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDTA [31:0] | RAM Data Test Access |
|  |  | Data can be read and written in CAN RAM. |

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register can be read and written when the RTME bit is set to 1 .

### 20.4 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

### 20.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.
For details about <RSCFDn_base>, see Section 20.1.2, Register Base Address.
For details about registers initialized in Global reset mode or Channel reset mode, see following.

- Table 20.186, Registers Initialized in Global Reset Mode or Channel Reset Mode
- Table 20.187, Registers Initialized Only in Global Reset Mode

Table 20.94 List of Registers (1/4)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Interface Mode-Related Registers |  |  |  |  |  |
| RSCFDn | Global Interface Mode Select Register | RSCFDnCFDGRMCFG | <RSCFDn_base> + 04FC ${ }_{\text {H }}$ | 8,16,32 | - |
| Channel-Related Registers |  |  |  |  |  |
| RSCFDn | Channel m Nominal Bit Rate Configuration Register | RSCFDnCFDCmNCFG | $\begin{aligned} & \text { <RSCFDn_base> }+0000_{H}+ \\ & \left(10_{H} \times \mathrm{m}\right) \end{aligned}$ | 8,16,32 | - |
| RSCFDn | Channel m Control Register | RSCFDnCFDCmCTR | $\begin{aligned} & \text { <RSCFDn_base> }+0004_{H}+ \\ & \left(10_{H} \times m\right) \end{aligned}$ | 8,16,32 | - |
| RSCFDn | Channel m Status Register | RSCFDnCFDCmSTS | $\begin{aligned} & \text { <RSCFDn_base> }+0008_{H}+ \\ & \left(10_{H} \times m\right) \end{aligned}$ | 8,16,32 | - |

Table 20.99 RSCFDnCFDGRMCFG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | Interface Mode Select |
|  | $0:$ Classical CAN mode |  |
|  | 1: CAN FD mode |  |

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

## RCMC Bit

Setting this bit to 0 makes classical CAN mode available.
Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode.
To switch the RS-CAN FD module from classical CAN mode to CAN FD mode, set the values after reset to all respective registers and bits allocated only to the register map in classical CAN mode, and then modify the value of RSCFDnCFDGRMCFG register.

### 20.4.3 Details of Channel-Related Registers

### 20.4.3.1 RSCFDnCFDCmNCFG — Channel m Nominal Bit Rate Configuration Register

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.100 RSCFDnCFDCmNCFG Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |

|  |  | $\begin{array}{lllll}1 & 1 & 1 & 1 & 1: 32 ~ T q\end{array}$ |
| 10 | - | Reserved |
|  |  | This bit is read as the value after reset. The write value should be the value after reset. |

Table 20.100 RSCFDnCFDCmNCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 9 to 0 | NBRP[9:0] | Nominal Bit Rate Prescaler Division Ratio Setting |
|  |  | When the set value $=P(0$ to 1023), the nominal bit rate prescaler divides fCAN by $(P+1)$. |

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings for bit timing parameters, see Section 20.11.1, Initial Settings.

## NTSEG2[4:0] Bits

These bits specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.
Possible values are 2 to 32 Tq .
Set a value smaller than the value of the NTSEG1[6:0] bits.

## NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

Possible values are 4 to 128 Tq.

## NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. A value of 1 to 32 Tq is settable. Specify a value equal to or smaller than the NTSEG2[4:0] value.

## NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) +1 ) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

The NBRP[9:0] value and the DBRP[7:0] value should be equal and the two corresponding bit rate values are different according to the respective segment values.

### 20.4.3.2 RSCFDnCFDCmCTR — Channel m Control Register

## ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1 , restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is $00_{\mathrm{B}}$ (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

## CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1 ). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.

## CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

## CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

## ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.
When this bit is clear to 0 , if any error is detected while the flags of bits 14 to 8 in the RSCFDnCFDCmERFL register are all 0 , only the flags of the first error event are set to 1 . If two or more errors occur in the first error event, all the flags of the detected errors are set to 1 .
When this bit is set to 1 , all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.
Modify this bit only in channel reset mode or channel halt mode.

## BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.
When the $\operatorname{BOM}[1: 0]$ bits are set to $00_{\mathrm{B}}$, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to $01_{\mathrm{B}}$, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register ( $\mathrm{m}=$ see Table 20.6) are set to $10_{\mathrm{B}}$ and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to $00_{\mathrm{H}}$.

When the RS-CANFD module reaches the bus off state when the BOM [1:0] bits are set to $10_{\mathrm{B}}$, the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the $\operatorname{TEC}[7: 0]$ and $\operatorname{REC}[7: 0]$ bits are cleared to $00_{\mathrm{H}}$.

When the BOM $[1: 0]$ bits are set to $11_{\mathrm{B}}$ and the $\mathrm{CHMDC}[1: 0]$ bits are set to $10_{\mathrm{B}}$ while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to $00_{\mathrm{H}}$. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the $\mathrm{CHMDC}[1: 0]$ bits are set to $10_{\mathrm{B}}$, a bus off recovery interrupt request is generated. If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are $01_{\mathrm{B}}$ or at bus off end when the BOM[1:0] bits are $10_{\mathrm{B}}$ ), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

## TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1 , an interrupt request occurs. Modify this bit only in channel reset mode.

## SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1 , an interrupt request occurs. Modify this bit only in channel reset mode.

## EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1 , an interrupt request occurs. Modify this bit only in channel reset mode.

## TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1 , an interrupt request is generated. Modify this bit only in channel reset mode.

## ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1 , an error interrupt request is generated. Modify this bit only in channel reset mode.

## RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns from the bus off state to the error active state. This bit is automatically cleared to 0 . Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to $00_{\mathrm{H}}$ and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are $00_{\mathrm{B}}$ (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCFD module transitions to the error active state. Set this bit to 1 in channel communication mode.

## CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

## CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see Section 20.6.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to $11_{\mathrm{B}}$. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to $10_{\mathrm{B}}$.

### 20.4.3.3 RSCFDnCFDCmSTS — Channel m Status Register

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: |  |  | $00000005_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | TEC[7:0] |  |  |  |  |  |  |  | REC[7:0] |  |  |  |  |  |  |  |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | ESIF | $\begin{gathered} \mathrm{COMST} \\ \mathrm{~S} \end{gathered}$ | $\begin{gathered} \text { RECST } \\ S \end{gathered}$ | $\begin{gathered} \text { TRMST } \\ \mathrm{S} \end{gathered}$ | BOSTS | EPSTS | $\begin{array}{\|c} \hline \text { CSLPS } \\ \text { TS } \end{array}$ | $\begin{gathered} \mathrm{CHLTS} \\ \text { TS } \end{gathered}$ | $\begin{gathered} \text { CRSTS } \\ \text { TS } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ | R | R | R | R | R | R | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.102 RSCFDnCFDCmSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | TEC[7:0] | The transmit error counter (TEC) can be read. |
| 23 to 16 | REC[7:0] | The receive error counter (REC) can be read. |
| 15 to 9 | - | Reserved <br> These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | ESIF | Error State Indication Flag <br> 0: No CAN FD message whose ESI bit is recessive has been received. <br> 1: At least one CAN FD message whose ESI bit is recessive has been received. |
| 7 | COMSTS | Communication Status Flag <br> 0 : Communication is not ready. <br> 1: Communication is ready. |
| 6 | RECSTS | Receive Status Flag <br> 0 : Bus idle, in transmission or bus off state <br> 1: In reception |
| 5 | TRMSTS | Transmit Status Flag <br> 0 : Bus idle or in reception <br> 1: In transmission or bus off state |
| 4 | BOSTS | Bus Off Status Flag <br> 0 : Not in bus off state <br> 1: In bus off state |
| 3 | EPSTS | Error Passive Status Flag <br> 0 : Not in error passive state <br> 1: In error passive state |
| 2 | CSLPSTS | Channel Stop Status Flag <br> 0 : Not in channel stop mode <br> 1: In channel stop mode |
| 1 | CHLTSTS | Channel Halt Status Flag <br> 0 : Not in channel halt mode <br> 1: In channel halt mode |
| 0 | CRSTSTS | Channel Reset Status Flag <br> 0 : Not in channel reset mode <br> 1: In channel reset mode |

## TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

## REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

## ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1 . In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0 , write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1 ) timing matches the writing 0 (by the program) timing, this flag is set to 1 .

This flag is set to 0 in channel reset mode.

## COMSTS Flag

This bit indicates that communication is ready.
This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

## RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

## TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

## BOSTS Flag

This flag is set to 1 when the bus off state $(\operatorname{TEC}[7: 0]>255)$ is entered. It is cleared to 0 when the CAN module has exited the bus off state.

## EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state $((128 \leq \operatorname{TEC}[7: 0] \leq 255)$ or ( $128 \leq$ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

## CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

## CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

## CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

### 20.4.3.4 RSCFDnCFDCmERFL — Channel m Error Flag Register

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | CRCREG[14:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | ADERR | BOERR | B1ERR | CERR | AERR | FERR | SERR | ALF | BLF | OVLF | BORF | BOEF | EPF | EWF | BEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | R/W*1 | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.103 RSCFDnCFDCmERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 30 to 16 | CRCREG[14:0] | CRC Calculation Data (CRC length:15 bits) |
|  |  | A CRC value calculated based on the transmit message or receive message is indicated. |
| 15 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 14 | ADERR | ACK Delimiter Error Flag |
|  |  | 0: No ACK delimiter error is detected. |
|  |  | 1: ACK delimiter error is detected. |
| 13 | B0ERR | Dominant Bit Error Flag |
|  |  | 0: No dominant bit error is detected. |
|  |  | 1: Dominant bit error is detected. |
| 12 | B1ERR | Recessive Bit Error Flag |
|  |  | 0: No recessive bit error is detected. |
|  |  | 1: Recessive bit error is detected. |
| 11 | CERR | CRC Error Flag |
|  |  | 0 : No CRC error is detected. |
|  |  | 1: CRC error is detected. |
| 10 | AERR | ACK Error Flag |
|  |  | 0 : No ACK error is detected. |
|  |  | 1: ACK error is detected. |
| 9 | FERR | Form Error Flag |
|  |  | 0: No form error is detected. |
|  |  | 1: Form error is detected. |
| 8 | SERR | Stuff Error Flag |
|  |  | 0 : No stuff error is detected. |
|  |  | 1: Stuff error is detected. |
| 7 | ALF | Arbitration-lost Flag |
|  |  | 0 : No arbitration-lost is detected. |
|  |  | 1: Arbitration-lost is detected. |

Table 20.103 RSCFDnCFDCmERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 6 | BLF | Bus Lock Flag |
|  |  | 0 : No channel bus lock is detected. |
|  |  | 1: Channel bus lock is detected. |
| 5 | OVLF | Overload Flag |
|  |  | 0 : No overload is detected. |
|  |  | 1: Overload is detected. |
| 4 | BORF | Bus Off Recovery Flag |
|  |  | 0 : No bus off recovery is detected. |
|  |  | 1: Bus off recovery is detected. |
| 3 | BOEF | Bus Off Entry Flag |
|  |  | 0 : No bus off entry is detected. |
|  |  | 1: Bus off entry is detected. |
| 2 | EPF | Error Passive Flag |
|  |  | 0 : No error passive is detected. |
|  |  | 1: Error passive is detected. |
| 1 | EWF | Error Warning Flag |
|  |  | 0 : No error warning is detected. |
|  |  | 1: Error warning is detected. |
| 0 | BEF | Bus Error Flag |
|  |  | 0 : No channel bus error is detected. |
|  |  | 1: Channel bus error is detected. |

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is set to 1 . Transition to channel reset mode resets these flags to 0 .

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (i.e., only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

## CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length $=15$ bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0 . These bits are always 0 in channel reset mode.

## ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

## BOERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

## B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

## CERR Flag

This flag is set to 1 when a CRC error has been detected.

## AERR Flag

This flag is set to 1 when an ACK error has been detected.

## FERR Flag

This flag is set to 1 when a form error has been detected.

## SERR Flag

This flag is set to 1 when a stuff error has been detected.

## ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

## BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0 .
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0 .

## OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

## BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to $01_{\mathrm{B}}$ (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM [1:0] bits in the RSCFDnCFDCmCTR register are set to $01_{\mathrm{B}}$ (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to $10_{\mathrm{B}}$ (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the $\mathrm{BOM}[1: 0]$ bits set to $11_{\mathrm{B}}$ (transition to channel halt mode upon a request from the program during bus off).

## BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value $>255$ ). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCFDnCFDCmCTR register ( $\mathrm{m}=$ see Table 20.6) are set to $01_{\mathrm{B}}$ (transition to channel halt mode at bus off entry).

## EPF Flag

This flag is set to 1 when the error passive state is entered (REC[7:0] or TEC[7:0] value $>127$ ).
This flag is set to 1 only when the $\operatorname{REC}[7: 0]$ or TEC[7:0] value first exceeds 127 . Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

## EWF Flag

This flag is set to 1 only when the $\operatorname{REC}[7: 0]$ or TEC[7:0] value first exceeds 95 . Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

## BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1 .

NOTE
To clear the flag of this register to 0 , use a store instruction to write " 0 " to the given flag and " 1 " to the other flags.

### 20.4.3.5 RSCFDnCFDCmDCFG — Channel m Data Bit Rate Configuration Register

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | $110: 7 \mathrm{Tq}$ |
|  |  | 1 1 1:8 Tq |

Table 20.104 RSCFDnCFDCmDCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19 to 16 | DTSEG1[3:0] | Data Bit Rate Time Segment 1 Control ```b19 b18 b17 b16 0}00000:Setting is prohibited for channels for CAN communications 0}00001:2 Tq 0 0 0}101000:5 Tq 0}10 0 0 1 0}0000:9 Tq 10}00\mathrm{ 1:10 Tq 1 0 1 0: 11 Tq 1 0 1 1:12 Tq 1 1 0 0: 13 Tq 1 1 0 1:14 Tq 1 1 1 0: 15 Tq 1 1 1 1:16 Tq``` |
| 15 to 8 | - | Reserved <br> These bits are read as the value after reset. The write value should be the value after reset. |
| 7 to 0 | DBRP[7:0] | Data Bit Rate Prescaler Division Ratio Setting <br> When the set value $=P(0$ to 255$)$, the data bit rate prescaler divides fCAN by $(P+1)$. |

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see Section 20.11.1, Initial Settings.

## DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. Possible values are 1 to 8 Tq . Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

## DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of data bit rate.
Possible values are 2 to 8 Tq.
Specify a value equal to or smaller than the DTSEG1[3:0] bits value.

## DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

Possible values are 2 to 16 Tq .

## DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].
To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

### 20.4.3.6 RSCFDnCFDCmFDCFG — Channel m CAN FD Configuration Register

Note: For the value of index " $m$ ", see Table 20.6.

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 30 | - | Reserved |
|  |  | These bits are read as the value after reset. The write value should be the value after reset. |
| 29 | REFE | Reception data edge filter enable |
|  |  | 0 : Reception data edge filter is disabled |
|  |  | 1: Reception data edge filter is enabled |
| 28 | FDOE | FD only enable |
|  |  | 0 : FD-only mode is disabled |
|  |  | 1: FD-only mode is enabled |
| 27 | TMME | Transmit Buffer Merge Mode Enable |
|  |  | 0 : Transmit buffer merge mode is disabled. |
|  |  | 1: Transmit buffer merge mode is enabled. |
| 26 | GWBRS | Gateway BRS |
|  |  | 0: A frame is transmitted with the BRS bit in the received frame set to 0. |
|  |  | 1: A frame is transmitted with the BRS bit in the received frame set to 1. |
| 25 | GWFDF | Gateway FDF |
|  |  | 0 : A frame is transmitted regarding the received frame as a classical CAN frame. |
|  |  | 1: A frame is transmitted regarding the received frame as a CAN FD frame. |
| 24 | GWEN | CAN-CAN FD Gateway Enable |
|  |  | 0: The CAN-CAN FD gateway is disabled. |
|  |  | 1: The CAN-CAN FD gateway is enabled. |
| 23 | - | Reserved |
|  |  | This bit is read as the value after reset. The write value should be the value after reset. |
| 22 to 16 | TDCO[6:0] | Transmitter Delay Compensation Offset |
|  |  | These bits are set to the transmitter delay compensation offset value. |
| 15 to 11 | - | Reserved |
|  |  | These bits are read as the value after reset. The write value should be the value after reset. |
| 10 | ESIC | Error State Display Mode Select |
|  |  | 0 : Always displays the node error state. |
|  |  | 1: When the node is not in the error passive state: Displays the message buffer error state. |
|  |  | When the node is in the error passive state: |
|  |  | Displays the node error state. |

Table 20.105 RSCFDnCFDCmFDCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9 | TDCE | Transmitter Delay Compensation Enable <br> 0 : Transmitter delay compensation is disabled. <br> 1: Transmitter delay compensation is enabled. |
| 8 | TDCOC | Transmitter Delay Compensation Measurement Select <br> 0 : Measurement and offset <br> 1: Only offset |
| 7 to 3 | - | Reserved <br> These bits are read as the value after reset. The write value should be the value after reset. |
| 2 to 0 | EOCCFG[2:0] | Error Occurrence Counting Method Select <br> b2 b1 b0 <br> $\begin{array}{lll}0 & 0 & 0\end{array}$ : All transmit messages and receive messages <br> $0 \quad 0 \quad$ 1: All transmit messages <br> $\begin{array}{lll}0 & 1 & 0\end{array}$ : All receive messages <br> 01 1: Setting prohibited <br> 10 0: Only data phase of transmitted or received CAN FD message <br> 10 1: Only data phase of transmitted CAN FD message <br> 11 0: Only data phase of received CAN FD message <br> 11 1: Setting prohibited |

## REFE Bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

## FDOE Bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

## TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

## GWBRS Bit

When the GWEN bit is 1 , the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. When the GWFDF bit is set to 0 , write 0 to this bit. Modify this bit only in channel reset mode.

## GWFDF Bit

When the GWEN bit is 1 , the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

## GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to $10_{\mathrm{B}}$ (gateway mode).
Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is $1001_{\mathrm{B}}$ or more and the GWFDF bit is set to 1 (CAN FD frame), the DLC value is replaced with $1000_{\mathrm{B}}$.
While this bit is set to 1 , do not perform routing the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is set to 1 , the following frame should be transmitted from the channel according to the setting of GWFDF.

- When GWFDF bit is set to 0 , only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1 , only CAN FD frame should be transmitted.

Modify this bit only in channel reset mode.
Table 20.106 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 20.106 Operation when the CAN-CAN FD Gateway is Enabled

| Receive Frame |  |  | GWFDF Bit | Transmit Frame |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Format | BRS Bit | Received DLC Value |  | Format | BRS Bit | DLC Value to be Transmitted |
| Classical CAN | None | DLC $\leq 1000{ }_{\text {B }}$ | 0 | Classical CAN | None | Not replaced |
|  |  | DLC > 1000 ${ }_{\text {B }}$ |  |  |  |  |
| CAN FD | Arbitrary | DLC $\leq 1000{ }_{\text {B }}$ |  |  |  |  |
| Classical CAN | None | DLC $\leq 1000{ }_{B}$ | 1 | CAN FD | According to GWBRS bit setting | Not replaced |
|  |  | DLC $>1000_{B}$ |  |  |  | Replaced with $1000_{B}$ |
| CAN FD | Arbitrary | DLC $\leq 1000{ }_{\text {B }}$ |  |  |  | Not replaced |

## TDCO[6:0] Bits

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register. These bits are based on CAN clock frequency(fCAN).

When the TDCOC bit is set to 0 , the transmitter delay compensation result equals to the total value of the measured delay value and the $\operatorname{TDCO}[6: 0]$ value (rounded down to the nearest integer Tq ).

When the TDCOC bit is set to 1 , the transmitter delay compensation result equals to the $\operatorname{TDCO}[6: 0]$ value.
The SSP offset value $=($ set value of TDCO[6:0] bits +1$)$.
Modify these bits only in channel reset mode or channel halt mode.

## ESIC Bit

When the ESIC bit is set to 1 , if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is set to 0 , the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 20.107 ESI Value to Be Transmitted

| ESIC Bit | Channel Status | ESI Value to be Transmitted |
| :--- | :--- | :--- |
| 0 | Error active | 0 (error active node) |
|  | Error passive | 1 (error passive node) |
| 1 | Error active | ESI value set in the transmit/receive FIFO buffer or transmit buffer |
|  |  | (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the |
|  | RSCFDnCFDTMFDCTRp register) |  |
|  | Error passive | 1 (error passive node) |
|  |  |  |

## TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

## TDCOC Bit

When this bit is set to 0 , the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is set to 1 , the SSP position is defined only by the SSP offset value.
Modify this bit only in channel reset mode or channel halt mode.

## EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

### 20.4.3.7 RSCFDnCFDCmFDCTR — Channel m CAN FD Control Register

Note: For the value of index " m ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.108 RSCFDnCFDCmFDCTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | SOCCLR | Successful Occurrence Counter Clear <br> Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read <br> as 0. |
| 0 | EOCCLR | Error Occurrence Counter Clear <br> Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0. |

## SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register).
This bit is automatically cleared to 0 .

## EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0 .

### 20.4.3.8 RSCFDnCFDCmFDSTS — Channel m CAN FD Status Register

Note: For the value of index " m ", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SOC[7:0] |  |  |  |  |  |  |  | EOC[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | SOCO | EOCO | TDCVF |  |  |  | R |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W*1 | R/W*1 | R/W*1 | R | R | R | R | R | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.109 RSCFDnCFDCmFDSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | SOC[7:0] | Successful Occurrence Counter <br> The successful occurrence counter value can be read. |
| 23 to 16 | EOC[7:0] | Error Occurrence Counter <br> The error occurrence counter value can be read. |
| 15 to 10 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 9 | SOCO | Successful Occurrence Counter Overflow Flag <br> 0 : The successful occurrence counter does not overflow. <br> 1: The successful occurrence counter has overflowed. |
| 8 | EOCO | Error Occurrence Counter Overflow Flag <br> 0 : The error occurrence counter does not overflow. <br> 1: The error occurrence counter has overflowed. |
| 7 | TDCVF | Transmitter Delay Compensation Violation Flag <br> 0 : No transmitter delay compensation violation is present. <br> 1: A transmitter delay compensation violation is present. |
| 6 to 0 | TDCR[6:0] | Transmitter Delay Compensation Result Status <br> The transmitter delay compensation result can be read. |

## SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches $\mathrm{FF}_{\mathrm{H}}$. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

## EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches $\mathrm{FF}_{\mathrm{H}}$.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

## SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.
This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached $\mathrm{FF}_{\mathrm{H}}$. This flag is set to 0 in channel reset mode.

## EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.
This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached $\mathrm{FF}_{\mathrm{H}}$. This flag is set to 0 in channel reset mode.

## TDCVF Flag

This bit indicates violation of transmitter delay compensation.
The transmit data is compared with the reception CAN bus level delayed due to the transceiver's loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

This bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate).

This flag is set to 0 in channel reset mode.

## TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).
This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.
These flags are updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RSCFDnCFDCmFDCFG register is set to 1 (transmitter delay compensation enable) and also the TDCOC bit in the RSCFDnCFDCmFDCFG register is set to 0 (measurement and offset).
This flag is set to 0 in channel reset mode.

NOTE
To clear the flag of this register to 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

### 20.4.3.9 RSCFDnCFDCmFDCRC - Channel m CAN FD CRC Register

Note: For the value of index " m ", see Table 20.6.
Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - |  | SC |  |  | - | - | - | CRCREG[20:16] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | CRCREG[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.110 RSCFDnCFDCmFDCRC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 27 to 24 | SCNT[3:0] | Stuff count bit |
|  |  | Indicate a value of the stuff count in a CAN FD frame. |
|  |  | Bits 25 to 27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. |
|  |  | Bit 24 indicates an even parity value of bits 25 to 27. |
| 23 to 21 | - | Reserved |
|  |  | These bits are read as 0 . The write value should be always 0 . |
| 20 to 0 | CRCREG[20:0] | CRC Calculation Data (CRC Length:17 Bit or 21 Bit) |
|  |  | These bits show the CRC value calculated based on the transmit message or receive message. |
|  |  | When the CRC length is 17 bits, bits b20 to b17 are read as 0 . |

## SCNT[3:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0 . These flags are updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

## CRCREG[20:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length $=17$ or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0 . When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0 .

These bits are cleared to 0 in channel reset mode.

### 20.4.4 Details of Global-Related Registers

### 20.4.4.1 RSCFDnCFDGCFG - Global Configuration Register

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 20.111 RSCFDnCFDGCFG Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 5 | CMPOC | Payload Overflow Mode Select |
|  |  | 0: No message is stored. |
|  |  | 1: Messages are stored and payloads exceeding the buffer size are discarded. |
| 4 | DCS | CAN Clock Source Select |
|  |  | 0: clkc |
|  |  | 1: clk_xincan |
| 3 | MME | Mirror Function Enable |
|  |  | 0 : Mirror function is disabled. |
|  |  | 1: Mirror function is enabled. |
| 2 | DRE | DLC Replacement Enable |
|  |  | 0 : DLC replacement is disabled. |
|  |  | 1: DLC replacement is enabled. |
| 1 | DCE | DLC Check Enable |
|  |  | 0 : DLC check is disabled. |
|  |  | 1: DLC check is enabled. |
| 0 | TPRI | Transmit Priority Select |
|  |  | 0: ID priority |
|  |  | 1: Transmit buffer number priority |

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to $000 \mathrm{~B}_{\mathrm{B}}$.
Modify the RSCFDnCFDGCFG register only in global reset mode.

## ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See Section 20.8.3.1, Interval Transmission Function.

## TSBTCS[2:0] Bits

When the TSSS bit is 1 , these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

## TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

## TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

## CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.
When this bit is 0 , the received message in which the payload overflows is not stored in the buffer.
When this bit is 1 , the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer's payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

## DCS Bit

When this bit is set to 0 , clkc is used as the clock source of the CAN clock (fCAN).
When this bit is set to 1 , clk_xincan is used as the clock source of the CAN clock (fCAN).

## MME Bit

Setting this bit to 1 makes the mirror function available.

## DRE Bit

When the DRE bit is set to 1 , the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of $00_{\mathrm{H}}$ is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

## DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to $0000_{\mathrm{B}}$ before clearing the DCE bit in the RSCFDnCFDGCFG register to 0 .

## TPRI Bit

This bit is used to set the transmit priority.
When this bit is set to 0 , ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1 , transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0 .

### 20.4.4.2 RSCFDnCFDGCTR — Global Control Register

| Value after reset: |  |  | 0000 0005 ${ }_{\text {H }}$ |  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | 0 : DLC error interrupt is disabled. |
|  |  | 1: DLC error interrupt is enabled. |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | GSLPR | Global Stop Mode |
|  |  | 0: Other than global stop mode |
|  |  | 1: Global stop mode |
| 1,0 | GMDC[1:0] | Global Mode Select <br> b1 b0 |
|  |  | 0 0: Global operating mode |
|  |  | 0 1: Global reset mode |
|  |  | 1 0: Global test mode |
|  |  | 1 1: Setting prohibited |

## TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1 , the RSCFDnCFDGTSC register is cleared to $0000_{\mathrm{H}}$.

## CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1 , an interrupt request occurs. Modify this bit only in global reset mode.

## THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1 , an interrupt request is generated. Modify this bit only in global reset mode.

## GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 releases the RS-CANFD module from global stop mode.
This bit should not be modified in global operating mode or global test mode.

## GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see Section 20.6.1, Global Modes. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module into global stop mode.

### 20.4.4.3 RSCFDnCFDGSTS - Global Status Register

| Value after reset: $0000000 \mathrm{D}_{\text {н }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.113 RSCFDnCFDGSTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 3 | GRAMINIT | CAN RAM Initialization Status Flag |
|  |  | 0: CAN RAM initialization is completed. |
|  | 1: CAN RAM initialization is ongoing. |  |
| 2 | GSLPSTS | Global Stop Status Flag |
|  | 0: Not in global stop mode |  |
|  | 1: In global stop mode |  |
| 1 | GHLTSTS | Global Test Status Flag |
|  | $0:$ Not in global test mode |  |
|  | 1: In global test mode |  |
| 0 | GRSTSTS | Global Reset Status Flag |
|  | $0:$ Not in global reset mode |  |
|  |  | 1: In global reset mode |

## GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.
This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

## GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

## GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

## GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

### 20.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | EEF4 | EEF3 | EEF2 | EEF1 | EEFO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ | R/W*1 | R/W* ${ }^{* 1}$ | R/W*1 | R/W*1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | CMPOF | THLES | MES | DEF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.114 RSCFDnCFDGERFL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing these bits, write the value after reset. |
| 20 | EEF4 | ECC Error Flag for Unit Channel 4 |
|  |  | 0: No 2-bit ECC error when deciding transmission priority |
|  |  | 1: A 2-bit ECC error when deciding transmission priority |
| 19 | EEF3 | ECC Error Flag for Unit Channel 3 |
|  |  | 0 : No 2-bit ECC error when deciding transmission priority |
|  |  | 1: A 2-bit ECC error when deciding transmission priority |
| 18 | EEF2 | ECC Error Flag for Unit Channel 2 |
|  |  | 0: No 2-bit ECC error when deciding transmission priority |
|  |  | 1: A 2-bit ECC error when deciding transmission priority |
| 17 | EEF1 | ECC Error Flag for Unit Channel 1 |
|  |  | 0: No 2-bit ECC error when deciding transmission priority |
|  |  | 1: A 2-bit ECC error when deciding transmission priority |
| 16 | EEF0 | ECC Error Flag for Unit Channel 0 |
|  |  | 0: No 2-bit ECC error when deciding transmission priority |
|  |  | 1: A 2-bit ECC error when deciding transmission priority |
| $\begin{aligned} & 15 \text { to } 14, \\ & 7 \text { to } 6,4 \end{aligned}$ | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 13 to 8,5 | - | Reserved |
|  |  | When read, the undefined value is returned. When writing these bits, write the value after reset. |
| 3 | CMPOF | Payload Overflow Flag |
|  |  | 0: No payload overflow has occurred. |
|  |  | 1: A payload overflow has occurred. |
| 2 | THLES |  |
|  |  | 0: No transmit history buffer overflow has occurred. |
|  |  | 1: A transmit history buffer overflow has occurred. |
| 1 | MES | FIFO Message Lost Status Flag |
|  |  | 0: No FIFO message lost error has occurred. |
|  |  | 1: A FIFO message lost error has occurred. |

Table 20.114 RSCFDnCFDGERFL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | DEF | DLC Error Flag |
|  |  | $0:$ No DLC error has occurred. |
|  | 1: A DLC error has occurred. |  |

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

## EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of unit channel m ( $\mathrm{m}=$ see Table 20.6), the EEFm flag is set to 1 , disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

## CMPOF Flag

When a payload overflow occurs in any of channel $\mathrm{m}(\mathrm{m}=$ see Table 20.6), the CMPOF flag is set to 1 .
This flag can be cleared to 0 by writing 0 to this bit by the program.THLES Flag
The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register ( $\mathrm{m}=$ see Table 20.6) is set to 1 .

This flag is cleared to 0 when the THLELT flags of all channels are set to 0 .

## MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register ( $\mathrm{x}=$ see Table 20.6) or the CFMLT flags in the RSCFDnCFDCFSTSk register ( $k=$ see Table 20.6) is set to 1 .

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0 .

## DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE
To clear the flag of this register to 0 , use a store instruction to write 0 to the given flag and 1 to the other flags.

### 20.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Table 20.115 RSCFDnCFDGTSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 15 to 0 | TS[15:0] | Timestamp Value |
|  |  | The timestamp counter value can be read. |
|  | Counter Value: $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$ |  |

## TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):

The timestamp counter starts counting when the RS-CANFD module has transitioned to global operating mode.
This counter stops counting when the RS-CANFD module has transitioned to global stop mode or global test mode.

- When the TSSS bit is 1 (CANm nominal bit time clock):

The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

### 20.4.4.6 RSCFDnCFDGTINTSTSO — Global TX Interrupt Status Register 0

| Value after reset: |  |  | $0000000 \mathrm{OH}^{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 20.116 RSCFDnCFDGTINTSTSO Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 16 | TSIF2 | Unit Channel 2 Transmit Buffer Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |
| 15 to 13 | - | Reserved <br> These bits are read as the value after reset. |
| 12 | THIF1 | Unit Channel 1 Transmit History Interrupt Status Flag <br> 0 : Transmit history interrupt is not requested. <br> 1: Transmit history interrupt is requested. |
| 11 | CFTIF1 | Unit Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag <br> 0: Transmit/receive FIFO transmit interrupt is not requested. <br> 1: Transmit/receive FIFO transmit interrupt is requested. |
| 10 | TQIF1 | Unit Channel 1 Transmit Queue Interrupt Status Flag <br> 0 : Transmit queue interrupt is not requested. <br> 1: Transmit queue interrupt is requested. |
| 9 | TAIF1 | Unit Channel 1 Transmit Buffer Abort Interrupt Status Flag <br> 0 : Transmit buffer abort interrupt is not requested. <br> 1: Transmit buffer abort interrupt is requested. |
| 8 | TSIF1 | Unit Channel 1 Transmit Buffer Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |
| 7 to 5 | - | Reserved <br> These bits are read as the value after reset. |
| 4 | THIF0 | Unit Channel 0 Transmit History Interrupt Status Flag <br> 0 : Transmit history interrupt is not requested. <br> 1: Transmit history interrupt is requested. |
| 3 | CFTIF0 | Unit Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag <br> 0: Transmit/receive FIFO transmit interrupt is not requested. <br> 1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF0 | Unit Channel 0 Transmit Queue Interrupt Status Flag <br> 0 : Transmit queue interrupt is not requested. <br> 1: Transmit queue interrupt is requested. |
| 1 | TAIF0 | Unit Channel 0 Transmit Buffer Abort Interrupt Status Flag <br> 0 : Transmit buffer abort interrupt is not requested. <br> 1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF0 | Unit Channel 0 Transmit Buffer Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |

## TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RSCFDnCFDTMSTSp register are set to $10_{\mathrm{B}}$ (transmit completed without abort request) or $11_{\mathrm{B}}$ (transmit completed with abort request).
When the TMTRF[1:0] flags are cleared to $00_{\mathrm{B}}$ under the condition that the TSIFm bit can be set to 1 , this flag is cleared to 0 . In addition, clearing the TMIEp bit to 0 also clears this flag to 0 .

## TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $01_{\mathrm{B}}$ (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to $00_{\mathrm{B}}$ after the transmit abort is completed.

## TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0 , this bit is cleared to 0 . This flag is also cleared to 0 when the TXQIE bit is cleared to 0 .

## CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1 .

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1 , this bit is cleared to 0 . This flag is also cleared to 0 when the CFTXIE bit is cleared to 0 .

## THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0 , this bit is cleared to 0 . This flag is also cleared to 0 when the THLIE bit is cleared to 0 .

### 20.4.4.7 RSCFDnCFDGTINTSTS1 — Global TX Interrupt Status Register 1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.
Table 20.117 RSCFDnCFDGTINTSTS1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 5 | - | Reserved <br> These bits are read as the value after reset. <br> When writing to these bits, write the value after reset. |
| 4 | THIF4 | Unit Channel 4 Transmit Buffer Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |
| 3 | CFTIF4 | Unit Channel 4 Transmit/receive FIFO Transmit Interrupt Status Flag <br> 0: Transmit/receive FIFO transmit interrupt is not requested. <br> 1: Transmit/receive FIFO transmit interrupt is requested. |
| 2 | TQIF4 | Unit Channel 4 Transmit Queue Interrupt Status Flag <br> 0 : Transmit queue interrupt is not requested. <br> 1: Transmit queue interrupt is requested. |
| 1 | TAIF4 | Unit Channel 4 Transmit Buffer Abort Interrupt Status Flag <br> 0 : Transmit buffer abort interrupt is not requested. <br> 1: Transmit buffer abort interrupt is requested. |
| 0 | TSIF4 | Unit Channel 4 Transmit Buffer Interrupt Status Flag <br> 0 : Transmit buffer transmit complete interrupt is not requested. <br> 1: Transmit buffer transmit complete interrupt is requested. |

## TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $10_{\mathrm{B}}$ (transmit completed without abort request) or $11_{\mathrm{B}}$ (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to $00_{\mathrm{B}}$ under the condition that the TSIFm bit can be set to 1 , this flag is cleared to 0 . In addition, clearing the TMIEp bit to 0 also clears this flag to 0 .

## TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to $01_{\mathrm{B}}$ (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to $00_{\mathrm{B}}$ after the transmit abort is completed.

## TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0 , this bit is cleared to 0 . This flag is also cleared to 0 when the TXQIE bit is cleared to 0 .

## CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1 .

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1 , this bit is cleared to 0 . This flag is also cleared to 0 when the CFTXIE bit is cleared to 0 .

## THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0 , this bit is cleared to 0 . This flag is also cleared to 0 when the THLIE bit is cleared to 0 .

### 20.4.4.8 RSCFDnCFDGFDCFG - Global FD Configuration Register

Table 20.118 RSCFDnCFDGFDCFG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 9 to 8 | TSCCFG[1:0] | Timestamp capture setting <br> b9 b8 <br> 0 0: Timestamp capture at the sample point of SOF(start of frame) <br> 0 1: Timestamp capture at frame valid indication <br> 10 : Timestamp capture at the sample point of RES bit*1 <br> 1 1: Setting prohibited |
| 7 to 1 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 0 | RPED | Protocol exception event detection disable bit <br> 0: Protocol exception event detection is enabled <br> 1: Protocol exception event detection is disabled |

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

## TSCCFG Bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

## RPED Bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1 , the event is regarded as a form error and an error frame will be output.

Modify this bit only in global reset mode.

### 20.4.5 Details of Receive Rule-Related Registers

### 20.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | $\underset{\mathrm{E}}{\mathrm{AFLDA}}$ | - | - | - | AFLPN[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 20.119 RSCFDnCFDGAFLECTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br>  <br>  <br>  <br>  <br>  <br>  <br>  <br>  These bits are read as the value after reset. |
|  | The write value should be the value after reset. |  |

## AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

## AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.
Set these bits to a value within a range of $00000_{\mathrm{B}}$ to $10011_{\mathrm{B}}$.
For details about the receive rule table, see Section 20.7.1, Data Processing Using the Receive Rule Table.

### 20.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Table 20.120 RSCFDnCFDGAFLCFG0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | RNC0[7:0] | Number of Rules for Unit Channel 0 |
|  |  | Set the number of receive rules exclusively used for channel 0 . |
| 23 to 16 | RNC1[7:0] | Number of Rules for Unit Channel 1 |
|  |  | Set the number of receive rules exclusively used for channel 1. |
| 15 to 8 | RNC2[7:0] | Number of Rules for Unit Channel 2 |
|  |  | Set the number of receive rules exclusively used for channel 2. |
| 7 to 0 | RNC3[7:0] | Number of Rules for Unit Channel 3 |
|  |  | Set the number of receive rules exclusively used for channel 3 . |

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.
Up to $64 \times$ (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128 .
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

## RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 0 receive rule table.
Set these bits to a value within the range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 1 receive rule table.
Set these bits to a value within the range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 2 receive rule table.
Set these bits to a value within the range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

## RNC3[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 3 receive rule table.
Set these bits to a value within the range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

### 20.4.5.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1

Table 20.121 RSCFDnCFDGAFLCFG1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RNC4[7:0] | Number of Rules for Unit Channel 4 <br>  <br> 23 to 0 |
|  | - | Set the number of receive rules exclusively used for channel 4. |

Modify the RSCFDnGAFLCFG1 register only in global reset mode.
Up to " $64 \times$ (number of channels)" rules can be registered to the receive rule tables in the entire module. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128 .
- The total of the number of rules allocated to each channel is not larger than the number of rules permitted to the entire module.

## RNC4[7:0] Bits

These bits are used to set the number of rules to be registered in the unit channel 4 receive rule table.
Set these bits to a value within a range of $00_{\mathrm{H}}$ to $80_{\mathrm{H}}$.

### 20.4.5.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register j

Note: For the value of index " j ", see Table 20.6.

Table 20.122 RSCFDnCFDGAFLIDj Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | GAFLIDE | IDE Select |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | GAFLRTR | RTR Select |
|  |  | 0: Data frame |
|  |  | 1: Remote frame |
| 29 | GAFLLB | Receive Rule Target Message Select |
|  |  | 0: When a message transmitted from another CAN node is received |
|  |  | 1: When the own transmitted message is received |
| 28 to 0 | GAFLID[28:0] | Set the ID of the receive rule. |
|  |  | For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0. |

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

## GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

## GAFLLB Bit

When this bit is set to 0 , data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

## GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

### 20.4.5.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register j

Note: For the value of index " j ", see Table 20.6.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\begin{array}{\|c\|} \hline \text { GAFLID } \\ \text { EM } \end{array}$ | GAFLR TRM | - | GAFLIDM[28:16] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GAFLIDM[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.123 RSCFDnCFDGAFLMj Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | GAFLIDEM | IDE Mask |
|  | 0: The IDE bit is not compared. |  |
|  | 1: The IDE bit is compared. |  |
| 30 | GAFLRTRM | RTR Mask |
|  |  | 0: The RTR bit is not compared. |
|  | 1: The RTR bit is compared. |  |
| 29 | Reserved |  |
|  |  | These bits are read as the value after reset. |
|  |  | The write value should be the value after reset. |
| 28 to 0 | GAFLIDM[28:0] | ID Mask |
|  |  | 0: The corresponding ID bit is not compared. |
|  |  |  |
|  |  |  |

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLIDEM Bit

When this bit is set to 1 , filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.
When this bit is cleared to 0 , the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0 , set all the GAFLIDM[28:0] bits to 0 at the same time.

## GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

## GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

### 20.4.5.6 RSCFDnCFDGAFLP0 $\mathbf{j}$ - Receive Rule Pointer 0 Register j

Note: For the value of index " j ", see Table 20.6.

Table 20.124 RSCFDnCFDGAFLP0_j Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 28 | GAFLDLC[3:0] | Receive Rule DLC |  |  |  |  |  |
|  |  | b31 | b30 | b29 | b28 | Classical CAN Frame | CAN FD Frame |
|  |  | 0 | 0 | 0 | 0 | DLC check is disabled |  |
|  |  | 0 | 0 | 0 | 1 | 1 data bytes |  |
|  |  | 0 | 0 | 1 | 0 | 2 data bytes |  |
|  |  | 0 | 0 | 1 | 1 | 3 data bytes |  |
|  |  | 0 | 1 | 0 | 0 | 4 data bytes |  |
|  |  | 0 | 1 | 0 | 1 | 5 data bytes |  |
|  |  | 0 | 1 | 1 | 0 | 6 data bytes |  |
|  |  | 0 | 1 | 1 | 1 | 7 data bytes |  |
|  |  | 1 | 0 | 0 | 0 | 8 data bytes |  |
|  |  | 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
|  |  | 1 | 0 | 1 | 0 |  | 16 data bytes |
|  |  | 1 | 0 | 1 | 1 |  | 20 data bytes |
|  |  | 1 | 1 | 0 | 0 |  | 24 data bytes |
|  |  | 1 | 1 | 0 | 1 |  | 32 data bytes |
|  |  | 1 | 1 | 1 | 0 |  | 48 data bytes |
|  |  | 1 | 1 | 1 | 1 |  | 64 data bytes |
| 27 to 16 | GAFLPTR[11:0] | Receive Rule Label <br> Set the 12-bit label information. |  |  |  |  |  |
| 15 | GAFLRMV | Receive Buffer Enable <br> 0 : No receive buffer is used. <br> 1: A receive buffer is used. |  |  |  |  |  |
| 14 to 8 | GAFLRMDP[6:0] | Receive Buffer Number Select <br> Set the receive buffer number to store receive messages. |  |  |  |  |  |
| 7 to 0 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |  |  |  |  |  |

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to $0000_{\mathrm{B}}$ disables the DLC check function allowing messages with any data length to pass the DLC check.

## GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

## GAFLRMV Bit

When this bit is set to 1 , receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

## GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1 . Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

### 20.4.5.7 RSCFDnCFDGAFLP1 $\mathbf{j}$ - Receive Rule Pointer 1 Register j

Note: For the value of index " j ", see Table 20.6.

Table 20.125 RSCFDnCFDGAFLP1_j Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | - | Reserved |
|  |  | These bits are read as the value after reset. |
|  | The write value should be the value after reset. |  |
| 22 to 8 | GAFLFDP[22:8] | Transmit/Receive FIFO Buffer k Select |
|  |  | (Bit position -8 = target transmit/receive FIFO buffer number k) |
|  |  | 0: Transmit/receive FIFO buffer is not selected. |
|  |  | 1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP[7:0] | Receive FIFO Buffer x Select |
|  |  | (Bit position = target receive FIFO buffer number $x$ ) |
|  |  | 0: Receive FIFO buffer is not selected. |
|  |  | 1: Receive FIFO buffer is selected. |

Modify the RSCFDnCFDGAFLP1 $\_$j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

## GAFLFDP Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to $00_{\mathrm{B}}$ (receive mode) or $10_{\mathrm{B}}$ (gateway mode) can be selected.

### 20.4.6 Details of Receive Buffer-Related Registers

### 20.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | RMPL | [1:0] |  |  |  | NRX | [7:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.126 RSCFDnCFDRMNB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 10 | - | Reserved |
|  |  | These bits are read as the value after reset. |
|  | The write value should be the value after reset. |  |
| 9,8 | RMPLS[1:0] | Receive Buffer Payload Storage Size Select |
|  |  | b9 b8 |
|  | 0 | $0: 8$ bytes |
|  | 0 | $1: 12$ bytes |
|  | 1 | $0: 16$ bytes |
|  |  | 1 |
|  |  | Receive Buffer Number Configuration |
|  |  | Set the number of receive buffers. |
| 7 to 0 | NRXB[7:0] | Set a value of 0 to 80. |
|  |  |  |

Modify the RSCFDnCFDRMNB register only in global reset mode.

## RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

## NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is $16 \times$ (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

### 20.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register y

Note: For the value of index " y ", see Table 20.6.

Table 20.127 RSCFDnCFDRMNDy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RMNSq | Receive Buffer Receive Complete Flag $q(q=y \times 32+31$ to $y \times 32+0)$ |
|  | 0 : There is no new message in receive buffer $q$. |  |
|  | 1: There is a new message in receive buffer $q$. |  |

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

## RMNSq Flags ( $q=$ see Table 20.6)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.
To clear a flag to 0 , the program must write 0 to the flag. Use a store instruction to write " 0 " to the flag and " 1 " to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is $00_{\mathrm{B}}$ ( 8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is $11_{\mathrm{B}}$ ( 20 bytes), the message storing time is 18 pclk clock cycles. ( 2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

### 20.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register q

Note: For the value of index "q", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RMIDE | RMRTR | - | RMID[28:16] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RMID[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.128 RSCFDnCFDRMIDq Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RMIDE | Receive Buffer IDE |
|  |  | 0: Standard ID |
|  | 1: Extended ID |  |
| 30 | RMRTR | Receive Buffer RTR/RRS |
|  |  | - When the received message is a classical CAN frame |
|  |  | 0: Data frame |
|  |  | 1: Remote frame |
|  |  | The RRS bit value of the received message can be read. |
| 29 |  | Reserved |
|  |  | These bits are read as the value after reset. |
| 28 to 0 | RMID[28:0] | Receive Buffer ID Data |
|  |  | These bits contain the standard ID or extended ID of the received message. |
|  |  |  |
|  |  |  |

## RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

## RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

## RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

### 20.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register q

Note: For the value of index "q", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | RM | [3:0] |  | RMPTR[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RMTS[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.129 RSCFDnCFDRMPTRq Register Contents

| Bit Position | Bit Name | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 31 to 28 | RMDLC[3:0] | Receive Buffer DLC Data |  |  |  |  |  |
|  |  | b31 | b30 | b29 | b28 | Classical CAN Frame | CAN FD Frame |
|  |  | 0 | 0 | 0 | 0 | 0 data bytes |  |
|  |  | 0 | 0 | 0 | 1 | 1 data bytes |  |
|  |  | 0 | 0 | 1 | 0 | 2 data bytes |  |
|  |  | 0 | 0 | 1 | 1 | 3 data bytes |  |
|  |  | 0 | 1 | 0 | 0 | 4 data bytes |  |
|  |  | 0 | 1 | 0 | 1 | 5 data bytes |  |
|  |  | 0 | 1 | 1 | 0 | 6 data bytes |  |
|  |  | 0 | 1 | 1 | 1 | 7 data bytes |  |
|  |  | 1 | 0 | 0 | 0 | 8 data bytes |  |
|  |  | 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |

|  |  | 1 | 1 | 0 | 0 |  | 24 data bytes |
|  |  | 1 | 1 | 0 | 1 |  | 32 data bytes |
|  |  | 1 | 1 | 1 | 0 |  | 48 data bytes |
|  |  | 1 | 1 | 1 | 1 |  | 64 data bytes |
| 27 to 16 | RMPTR[11:0] | Receive Buffer Label Data |  |  |  |  |  |
| 15 to 0 | RMTS[15:0] | Receive Buffer Timestamp Data <br> Timestamp value of the received message. |  |  |  |  |  |

## RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

## RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

## RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

### 20.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register q

Note: For the value of index "q", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.130 RSCFDnCFDRMFDSTSq Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 2 | RMFDF | FDF |
|  |  | $0:$ Classical CAN frame |
|  | 1: CAN FD frame |  |
| 1 | RMBRS | BRS |
|  |  | $0:$ The bit rate in the data area does not change. |
|  |  | 1: The bit rate in the data area changes. |
| 0 | RMESI | ESI |
|  |  | 1: Error active node passive node |
|  |  |  |

## RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

## RMBRS Bit

When the RMFDF bit is set to 1 , this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0 , this bit is always read as 0 .

## RMESI Bit

When the RMFDF bit is set to 1 , this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0 , this bit is always read as 0 .

### 20.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register q

Note: For the value of index "b" and "q", see Table 20.6.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | RMDB4 $\times \mathrm{b}+3$ [7:0] |  |  |  |  |  |  |  | RMDB4 $\times \mathrm{b}+2$ [7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RMDB4 $\times \mathrm{b}+1$ [7:0] |  |  |  |  |  |  |  | RMDB4 $\times \mathrm{b}+0$ [7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.131 RSCFDnCFDRMDFb_q Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RMDB4 $\times \mathrm{b}+3[7: 0]$ | Receive Buffer Data Byte $4 \times \mathrm{b}+3$ |
| 23 to 16 | RMDB4 $\times \mathrm{b}+2[7: 0]$ | Receive Buffer Data Byte $4 \times \mathrm{b}+2$ |
| 15 to 8 | RMDB4 $\times \mathrm{b}+1[7: 0]$ | Receive Buffer Data Byte $4 \times \mathrm{b}+1$ |
| 7 to 0 | RMDB4 $\times \mathrm{b}+0[7: 0]$ | Receive Buffer Data Byte $4 \times \mathrm{b}+0$ |
|  |  | Data for a message stored in the receive buffer can be read. |

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area that exceeds the specified size.

### 20.4.7 Details of Receive FIFO Buffer-Related Registers

### 20.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.132 RSCFDnCFDRFCCx Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |
| 15 to 13 | RFIGCV[2:0] | Receive FIFO Interrupt Request Timing Select <br> b15 b14 b13 <br> $0 \quad 0 \quad 0$ : When FIFO is $1 / 8$ full. <br> $0 \quad 0 \quad 1$ : When FIFO is $2 / 8$ full. <br> $0 \quad 1 \quad 0$ : When FIFO is $3 / 8$ full. <br> 01 1: When FIFO is $4 / 8$ full. <br> 100 : When FIFO is $5 / 8$ full. <br> 10 1: When FIFO is $6 / 8$ full. <br> 11 0: When FIFO is $7 / 8$ full. <br> 11 1: When FIFO is full. |
| 12 | RFIM | Receive FIFO Interrupt Source Select <br> 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. <br> 1: An interrupt occurs each time a message has been received. |
| 11 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |
| 10 to 8 | RFDC[2:0] | Receive FIFO Buffer Depth Configuration <br> b10 b9 b8 <br> $0 \quad 0 \quad 0: 0$ messages <br> $0 \quad 0 \quad 1: 4$ messages <br> 01 0:8 messages <br> 01 1: 16 messages <br> 10 0: 32 messages <br> 10 1: 48 messages <br> 11 0: 64 messages <br> 1 1: 128 messages |
| 7 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |

Table 20.132 RSCFDnCFDRFCCx Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 6 to 4 | RFPLS[2:0] | Receive FIFO Buffer Payload Storage Size Select <br> b6 b5 b4 <br> $0 \quad 0 \quad 0: 8$ bytes <br> $0 \quad 0 \quad 1: 12$ bytes <br> 010 0: 16 bytes <br> $\begin{array}{lll}0 & 1 & 1: 20 \text { bytes }\end{array}$ <br> $1000: 24$ bytes <br> $10 \quad 1: 32$ bytes <br> 11 0: 48 bytes <br> 1 1 1: 64 bytes |
| 3, 2 | - | Reserved <br> These bits are read as the value after reset. The write value should be the value after reset. |
| 1 | RFIE | Receive FIFO Interrupt Enable <br> 0: Receive FIFO interrupt is disabled. <br> 1: Receive FIFO interrupt is enabled. |
| 0 | RFE | Receive FIFO Buffer Enable <br> 0 : No receive FIFO buffer is used. <br> 1: Receive FIFO buffers are used. |

## RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to $001_{\mathrm{B}}$ (4 messages), set the RFIGCV[2:0] bits to $001_{\mathrm{B}}, 011_{\mathrm{B}}, 101_{\mathrm{B}}$, or $111_{\mathrm{B}}$. Modify these bits only in global reset mode.

## RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

## RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to $000_{\mathrm{B}}$, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

## RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

## RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

## RFE Bit

Setting the RFE bit to 1 enables the use of FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

### 20.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $\quad 00000001_{\mathrm{H}}$

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.133 RSCFDnCFDRFSTSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br> These bits are read as the value after reset. <br> When writing to these bits, write the value after reset. |
| 15 to 8 | RFMC[7:0] | Receive FIFO Unread Message Counter <br> The number of unread messages stored in the receive FIFO buffer is displayed. |
| 7 to 4 | - | Reserved |
|  |  | These bits are read as the value after reset. |
|  |  | When writing to these bits, write the value after reset. |

## RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes $00_{\mathrm{H}}$ when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 .

This flag is $00_{\mathrm{H}}$ in global reset mode.

## RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0 , the program must write 0 to the corresponding flags to be cleared. When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.
Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0 , the program must write 0 to the corresponding flags to be cleared. When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0 . This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

## RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when a received message is in the receive FIFO buffer.
NOTE
To clear the RFMLT or RFIF flag to 0 , use a store instruction to write " 0 " to the given flag and " 1 " to the other flags.

### 20.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | RFPC[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

Table 20.134 RSCFDnCFDRFPCTRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br>  <br> 7 to 0 |
|  | RFPC[7:0] | Receive FIFO Pointer Control <br>  |
|  | When these bits are set to FF $_{H}$, the read pointer moves to the next unread message in the <br> receive FIFO buffer. |  |

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

## RFPC[7:0] Bits

When the RFPC[7:0] bits are set to $\mathrm{FF}_{\mathrm{H}}$, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented by 1. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write $\mathrm{FF}_{\mathrm{H}}$ to the RFPC[7:0] bits.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

### 20.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RFIDE | RFRTR | - | RFID[28:16] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.135 RSCFDnCFDRFIDx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RFIDE | Receive FIFO Buffer IDE <br> 0: Standard ID <br> 1: Extended ID |
| 30 | RFRTR | Receive FIFO Buffer RTR/RRS <br> - When the received message is a classical CAN frame <br> 0: Data frame <br> 1: Remote frame <br> - When the received message is a CAN FD frame The RRS bit value of the received message can be read. |
| 29 | - | Reserved <br> These bits are read as the value after reset. |
| 28 to 0 | RFID[28:0] | Receive FIFO Buffer ID Data <br> The standard ID or extended ID of received message can be read. Read bits 10 to 0 for standard ID. Bits 28 to 11 are read as 0 . |

## RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

## RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

## RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

### 20.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register $\mathbf{x}$

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | 0 | 1 | 1 | 1 | 7 data bytes |  |
|  |  | 1 | 0 | 0 | 0 | 8 data bytes |  |
|  |  | 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
|  |  | 1 | 0 | 1 | 0 |  | 16 data bytes |
|  |  | 1 | 0 | 1 | 1 |  | 20 data bytes |
|  |  | 1 | 1 | 0 | 0 |  | 24 data bytes |
|  |  | 1 | 1 | 0 | 1 |  | 32 data bytes |
|  |  | 1 | 1 | 1 | 0 |  | 48 data bytes |
|  |  | 1 | 1 | 1 | 1 |  | 64 data bytes |
| 27 to 16 | RFPTR[11:0] | Receive FIFO Buffer Label Data <br> Label information of the received message can be read. |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
| 15 to 0 | RFTS[15:0] | Receive FIFO Buffer Timestamp Data Timestamp value of the received message can be read. |  |  |  |  |  |

## RFDLC[3:0] Bits

These bits contain the data length of the message stored in the receive FIFO buffer.

## RFPTR[11:0] Bits

These bits contain the label information of the message stored in the receive FIFO buffer.

## RFTS[15:0] Bits

These bits contain the timestamp value of the message stored in the receive FIFO buffer.

### 20.4.7.6 RSCFDnCFDRFFDSTSx — Receive FIFO CAN FD Status Register x

Note: For the value of index "x", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.137 RSCFDnCFDRFFDSTSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 2 | RFFDF | FDF |
|  |  | $0:$ Classical CAN frame |
|  | 1: CAN FD frame |  |
| 1 | RFBRS | BRS |
|  |  | $0:$ The bit rate in the data area does not change. |
|  |  | 1: The bit rate in the data area changes. |
| 0 | RFESI | $0:$ Error active node |
|  |  | 1: Error passive node |
|  |  |  |

## RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

## RFBRS Bit

When the RFFDF bit is set to 1 , this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0 , this bit is always read as 0 .

## RFESI Bit

When the RFFDF bit is set to 1 , this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0 , this bit is always read as 0 .

### 20.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register x

Note: For the value of index "d" and "x", see Table 20.6.

| Value after reset: $00000000^{\mathbf{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 20.138 RSCFDnCFDRFDFd_x Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | RFDB4 $\times d+3[7: 0]$ | Receive Buffer Data Byte $4 \times d+3$ |
| 23 to 16 | RFDB4 $\times d+2[7: 0]$ | Receive Buffer Data Byte $4 \times d+2$ |
| 15 to 8 | RFDB4 $\times d+1[7: 0]$ | Receive Buffer Data Byte $4 \times d+1$ |
| 7 to 0 | RFDB4 $\times d+0[7: 0]$ |  |
|  |  | Deceive Buffer Data Byte $4 \times d+0$ |

When the RFDLC[3:0] value in the RSCFDnCFDRFPTRx register is smaller than the payload storage size of the receive FIFO buffer, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

Specify the payload storage size of the receive FIFO buffer by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. Do not read or write the RSCFDnCFDRFDFd_x register corresponding to an area that exceeds the specified size.

### 20.4.8 Details of Transmit/Receive FIFO Buffer Related Registers

### 20.4.8.1 RSCFDnCFDCFCCk — Transmit/Receive FIFO Buffer Configuration and Control Register $\mathbf{k}$

Note: For the value of index " k ", see Table 20.6.

Table 20.139 RSCFDnCFDCFCCk Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | CFITT[7:0] | Set a message transmission interval. Set Value: $00_{\mathrm{H}}$ to $\mathrm{FF}_{\mathrm{H}}$ |

| 3 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |
| 2 | CFTXIE | Transmit/Receive FIFO Transmit Interrupt Enable <br> 0: Transmit/receive FIFO transmit interrupt is disabled. <br> 1: Transmit/receive FIFO transmit interrupt is enabled. |
| 1 | CFRXIE | Transmit/Receive FIFO Receive Interrupt Enable <br> 0 : Transmit/receive FIFO receive interrupt is disabled. <br> 1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | Transmit/Receive FIFO Buffer Enable <br> 0 : No transmit/receive FIFO buffer is used. <br> 1: Transmit/receive FIFO buffers are used. |

## CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to $01_{\mathrm{B}}$ (transmit mode) or $10_{\mathrm{B}}$ (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

## CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM [1:0] bits are set to $01_{\mathrm{B}}$ (transmit mode) or $10_{\mathrm{B}}$ (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number $m$ of FIFO buffer $k$ is calculated as $m=k / 3$ (integral quotient). The actual assigned transmit buffer number p linked to FIFO buffer $k$ will be ( $(16 \times m)+$ CFTML[3:0]). See Table 20.97.

See Table 20.95 and Table 20.96, as for the relationship between transmit/receive FIFO buffer $k$ and transmit buffer p.

Setting the CFDC[2:0] bits to $001_{\mathrm{B}}$ or more enables the setting of the CFTML[3:0] bits.
Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

## CFITR Bit

This bit is enabled when the CFITSS bit is 0 .
When this bit is 0 , the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1 , the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register $\times 10$ ).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

## CFITSS Bit

When this bit is 0 , the clock selected by the CFITR bit is the count source of the interval timer.
When this bit is 1 , the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

## CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

## CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to $00_{\mathrm{B}}$ (receive mode) or $10_{\mathrm{B}}$ (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to $001_{\mathrm{B}}$ ( 4 messages), set the CFIGCV[2:0] bits to $001_{\mathrm{B}}, 011_{\mathrm{B}}, 101_{\mathrm{B}}$, or $111_{\mathrm{B}}$.
Modify these bits only in global reset mode.

## CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

## CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to $000_{\mathrm{B}}$, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

## CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

## CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 , a transmit/receive FIFO transmit interrupt request is generated.
Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

## CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 , a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0 .

## CFE Bit

Setting this bit to 1 enables the transmit/receive FIFO buffers.
When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

### 20.4.8.2 RSCFDnCFDCFSTSk — Transmit/Receive FIFO Buffer Status Register k

Note: For the value of index " k ", see Table 20.6.

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.140 RSCFDnCFDCFSTSk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved <br> These bits are read as the value after reset. <br> When writing to these bits, write the value after reset. |
| 15 to 8 | CFMC[7:0] | Transmit/Receive FIFO Message Counter <br> The number of messages stored in the transmit/receive FIFO buffer. |
| 7 to 5 | - | Reserved <br> These bits are read as the value after reset. <br> When writing to these bits, write the value after reset. |
| 4 | CFTXIF | Transmit/Receive FIFO Transmit Interrupt Request Flag <br> 0: No transmit/receive FIFO transmit interrupt request is present. <br> 1: A transmit/receive FIFO transmit interrupt request is present. |
| 3 | CFRXIF | Transmit/Receive FIFO Receive Interrupt Request Flag <br> 0: No transmit/receive FIFO receive interrupt request is present. <br> 1: A transmit/receive FIFO receive interrupt request is present. |
| 2 | CFMLT | Transmit/Receive FIFO Message Lost Flag <br> 0: No transmit/receive FIFO message is lost. <br> 1: A transmit/receive FIFO message is lost. |
| 1 | CFFLL | Transmit/Receive FIFO Buffer Full Status Flag <br> 0 : The transmit/receive FIFO buffer is not full. <br> 1: The transmit/receive FIFO buffer is full. |
| 0 | CFEMP | Transmit/Receive FIFO Buffer Empty Status Flag <br> 0: The transmit/receive FIFO buffer contains messages. <br> 1: The transmit/receive FIFO buffer contains no message (buffer empty). |

## CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM [1:0] value is $01_{\mathrm{B}}$ (transmit mode): Number of untransmitted messages in the buffer
- When CFM [1:0] value is $00_{\mathrm{B}}$ (receive mode): Number of unread received messages in the buffer
- When CFM [1:0] value is $10_{\mathrm{B}}$ (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM [1:0] value is $00_{\mathrm{B}}$ : In global reset mode
- When CFM[1:0] value is $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0 .

CFTXIF Flag
The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM [1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$, and the interrupt source selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM $[1: 0]$ bits are set to $00_{\mathrm{B}}$ : In global reset mode
- When the CFM [1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0 , the program must write 0 to the corresponding flag to be cleared. When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM $[1: 0]$ bits are set to $00_{\mathrm{B}}$ : In global reset mode
- When the CFM[1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : In channel reset mode

Write 0 to this flag in global operating mode or global test mode.
To clear the flags of the register to 0 , the program must write 0 to the corresponding flag to be cleared.
When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to $00_{\mathrm{B}}$ : In global reset mode
- When the CFM [1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : In channel reset mode

Write 0 to this flag in global operating mode or global test mode
To clear the flags of the register to 0 , the program must write 0 to the corresponding flag to be cleared. When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to $00_{\mathrm{B}}$ : In global reset mode
- When the CFM [1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : In channel reset mode

## CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_{\mathrm{B}}$ : All messages have been read, or in global reset mode
- When the CFM [1:0] bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$ : At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to $01_{\mathrm{B}}$ : A value of $\mathrm{FF}_{\mathrm{H}}$ has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

## NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0 , the program must write 0 . When writing, use a store instruction to write " 0 " to the given flag and " 1 " to other flags.

### 20.4.8.3 RSCFDnCFDCFPCTRk — Transmit/Receive FIFO Buffer Pointer Control Register k

Note: For the value of index " $k$ ", see Table 20.6.

Table 20.141 RSCFDnCFDCFPCTRk Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | The write value should be the value after reset. |
| 7 to 0 | CFPC[7:0] | Transmit/Receive FIFO Pointer Control |
|  |  | - Receive mode: |
|  |  | Writing $\mathrm{FF}_{H}$ to these bits move the read pointer to the next unread message in the transmit/receive FIFO buffer. |
|  |  | - Transmit mode: |
|  |  | Writing $\mathrm{FF}_{H}$ to these bits move the write pointer to the next stage of the transmit/receive FIFO buffer. |
|  |  | - Gateway mode: |
|  |  | Setting prohibited |

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer ( $\mathrm{k}=3 \times \mathrm{m}$ ) allocated to channel $m$ and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

## CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $00_{\mathrm{B}}$ ):

Writing $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits move the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented by 1 . Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits.
When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_{\mathrm{B}}$ ):

Writing $\mathrm{FF}_{\mathrm{H}}$ to the CFPC[7:0] bits store the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and move the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1 . Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing $\mathrm{FF}_{\mathrm{H}}$ to the $\mathrm{CFPC}[7: 0]$ bits.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).

- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is $10_{\mathrm{B}}$ ):

Setting prohibited

### 20.4.8.4 RSCFDnCFDCFIDk — Transmit/Receive FIFO Buffer Access ID Register k

Note: For the value of index " k ", see Table 20.6.

| 29 | THLEN | Transmit History Data Store Enable <br> This bit is valid only when the CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode). <br> 0 : Transmit history data is not stored in the buffer. <br> 1: Transmit history data is stored in the buffer. |
| 28 to 0 | CFID[28:0] | Transmit/Receive FIFO Buffer ID Data <br> - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. <br> - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): <br> Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0 . Bits 28 to 11 are read as 0 . |

This register can be written only when the CFM [1:0] value in the RSCFDnCFDCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register is can be read only when the CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode).

## CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

## CFRTR Bit

If the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is $01_{\mathrm{B}}$, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0 .

## THLEN Bit

When this bit is set to 1 , the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode).

## CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{B}$.

When the CFM[1:0] value is $01_{\mathrm{B}}$, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

### 20.4.8.5 RSCFDnCFDCFPTRk — Transmit/Receive FIFO Buffer Access Pointer Register k

Note: For the value of index "k", see Table 20.6.

|  |  | 1 | 1 | 1 | 0 |  | 48 data bytes |
|  |  | 1 | 1 | 1 | 1 |  | 64 data bytes |
| 27 to 16 | CFPTR[11:0] | Transmit/Receive FIFO Buffer Label Data <br> - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): <br> Set the label information to be stored in the transmit history buffer. <br> Only bits CFPTR[7:0] are valid. <br> - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): <br> The label information of the received message can be read. |  |  |  |  |  |
| 15 to 0 | CFTS[15:0] | Transmit/Receive FIFO Buffer Timestamp Data <br> These bits are valid only when the CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode). The timestamp value of the received message can be read. |  |  |  |  |  |

This register can be written only when the CFM [1:0] value in the RSCFDnCFDCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register can be read only when the $\mathrm{CFM}[1: 0]$ value is $00_{\mathrm{B}}$ (receive mode). This register should not be read or written when the CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode).

## CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM [1:0] value is $00_{B}$.

When the CFM[1:0] value is $01_{\mathrm{B}}$, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to $1001_{\mathrm{B}}$ or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (CAN frame), 8 -byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):

A value of $0000_{\mathrm{B}}$ to $1111_{\mathrm{B}}$ is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by $\mathrm{CC}_{\mathrm{H}}$.

- When TMME bit = 1 (transmit buffer merge mode enabled):

Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

## CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is $00_{\mathrm{B}}$. When the CFM[1:0] value is $01_{\mathrm{B}}$, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

## CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.
These bits are valid when the CFM[1:0] value is $00_{B}$.

### 20.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/Status Register $\mathbf{k}$

Note: For the value of index "k", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | CFFDF | CFBRS | CFESI |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 20.144 RSCFDnCFDCFFDCSTSk Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are read as the value after reset. |
|  | The write value should be the value after reset. |  |
| 2 | CFFDF | FDF |
|  |  | $0:$ Classical CAN frame |
|  | 1: CAN FD frame |  |
| 1 | CFBRS | BRS |
|  |  | 0: The bit rate in the data area does not change. |
|  |  | 1: The bit rate in the data area changes. |
| 0 | EFESI |  |
|  |  | 0: Error active node |
|  |  |  |
|  |  |  |

This register can be written only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is $01_{\mathrm{B}}$ (transmit mode). This register can be read only when the CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode). Do not read or write this register when the $\mathrm{CFM}[1: 0]$ value is $10_{\mathrm{B}}$ (gateway mode).

## CFFDF Bit

When the CFM [1:0] value is $00_{\mathrm{B}}$, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the $\mathrm{CFM}[1: 0]$ value is $01_{\mathrm{B}}$, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.
CFBRS Bit
When the CFM [1:0] value is $00_{\mathrm{B}}$, if the CFFDF bit is set to 1 , this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0 , this bit is always read as 0 .

When the CFM[1:0] value is $01_{\mathrm{B}}$, if the CFFDF bit is set to 1 , this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is set to 0 , write 0 to this bit.

## CFESI Bit

When the CFM[1:0] value is $00_{\mathrm{B}}$, if the CFFDF bit is set to 1 , this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0 , this bit is always read as 0 .

When the CFM [1:0] value is $01_{\mathrm{B}}$, if the CFFDF bit is set to 1 , this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is set to 0 , write 0 to this bit.

### 20.4.8.7 RSCFDnCFDCFDFd_k — Transmit/Receive FIFO Buffer Access Data Field d Register k

Note: For the value of index "d" and "k", see Table 20.6.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

|  | CFDB4 $\times \mathrm{d}+1$ [7:0] |  |  |  |  |  |  |  | CFDB4 $\times \mathrm{d}+0$ [7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.145 RSCFDnCFDCFDFd_k Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | CFDB4 $\times \mathrm{d}+3$ [7:0] | Transmit/Receive FIFO Buffer Data Byte $4 \times \mathrm{d}+3$ |
| 23 to 16 | CFDB4 $\times \mathrm{d}+2$ [7:0] | Transmit/Receive FIFO Buffer Data Byte $4 \times d+2$ |
| 15 to 8 | CFDB4 $\times \mathrm{d}+1$ [7:0] | Transmit/Receive FIFO Buffer Data Byte $4 \times \mathrm{d}+1$ |
| 7 to 0 | CFDB4 $\times \mathrm{d}+0$ [7:0] | - When CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode): <br> Set the transmit/receive FIFO buffer data. <br> - When CFM[1:0] value is $00_{\mathrm{B}}$ (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |

This register can be written only when the CFM [1:0] value in the RSCFDnCFDCFCCk register is $01_{\mathrm{B}}$ (transmit mode).
This register can be read only when the CFM[1:0] value is $00_{B}$ (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as $00_{\mathrm{H}}$.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area that exceeds the specified size.

This register should not be read or written when the CFM[1:0] value is $10_{\mathrm{B}}$ (gateway mode).

### 20.4.9 Details of FIFO Status-Related Registers

### 20.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Table 20.146 RSCFDnCFDFESTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved <br> These bits are read as the value after reset. |
| 22 | CF14EMP | Transmit/Receive FIFO Buffer Empty Status Flag |
| 21 | CF13EMP | 0: Transmit/receive FIFO buffer k contains a message. |
| 20 | CF12EMP | 1: Transmit/receive FIFO buffer k contains no message. |
| 19 | CF11EMP |  |
| 18 | CF10EMP |  |
| 17 | CF9EMP |  |
| 16 | CF8EMP |  |
| 15 | CF7EMP |  |
| 14 | CF6EMP |  |
| 13 | CF5EMP |  |
| 12 | CF4EMP |  |
| 11 | CF3EMP |  |
| 10 | CF2EMP |  |
| 9 | CF1EMP |  |
| 8 | CF0EMP |  |
| 7 | RF7EMP | Receive FIFO Buffer Empty Status Flag |
| 6 | RF6EMP | 0 : Receive FIFO buffer $x$ contains an unread message. |
| 5 | RF5EMP | 1: Receive FIFO buffer $x$ contains no unread message. |
| 4 | RF4EMP |  |
| 3 | RF3EMP |  |
| 2 | RF2EMP |  |
| 1 | RF1EMP |  |
| 0 | RF0EMP |  |

The RSCFDnCFDFESTS register is set to $03 \mathrm{FF} \mathrm{FFFF}_{\mathrm{H}}$ in global reset mode.

## CFkEMP Flag ( $k=$ see Table 20.6)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0 .

## RFxEMP Flag ( $\mathrm{x}=$ see Table 20.6)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0 .

| 17 | CF9FLL |  |
| 16 | CF8FLL |  |
| 15 | CF7FLL |  |
| 14 | CF6FLL |  |
| 13 | CF5FLL |  |
| 12 | CF4FLL |  |
| 11 | CF3FLL |  |
| 10 | CF2FLL |  |
| 9 | CF1FLL |  |
| 8 | CFOFLL |  |
| 7 | RF7FLL | Receive FIFO Buffer Full Status Flag |
| 6 | RF6FLL | 0 : Receive FIFO buffer $x$ is not full. |
| 5 | RF5FLL | 1: Receive FIFO buffer $x$ is full. |
| 4 | RF4FLL |  |
| 3 | RF3FLL |  |
| 2 | RF2FLL |  |
| 1 | RF1FLL |  |
| 0 | RF0FLL |  |

The RSCFDnCFDFFSTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.

## CFkFLL Flag ( $k=$ see Table 20.6)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0 .

## RFxFLL Flag ( $\mathrm{x}=$ see Table 20.6)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0 .

### 20.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 20.148 RSCFDnCFDFMSTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 22 | CF14MLT | Transmit/Receive FIFO Buffer Message Lost Status Flag |
| 21 | CF13MLT | 0 : No transmit/receive FIFO buffer k message is lost. |
| 20 | CF12MLT | 1: A transmit/receive FIFO buffer $k$ message is lost. |
| 19 | CF11MLT |  |
| 18 | CF10MLT |  |
| 17 | CF9MLT |  |
| 16 | CF8MLT |  |
| 15 | CF7MLT |  |
| 14 | CF6MLT |  |
| 13 | CF5MLT |  |
| 12 | CF4MLT |  |
| 11 | CF3MLT |  |
| 10 | CF2MLT |  |
| 9 | CF1MLT |  |
| 8 | CFOMLT |  |
| 7 | RF7MLT | Receive FIFO Buffer Message Lost Status Flag |
| 6 | RF6MLT | 0 : No receive FIFO buffer $x$ message is lost. |
| 5 | RF5MLT | 1: A receive FIFO buffer $x$ message is lost. ( $\mathrm{x}=$ see Table 20.6) |
| 4 | RF4MLT |  |
| 3 | RF3MLT |  |
| 2 | RF2MLT |  |
| 1 | RF1MLT |  |
| 0 | RFOMLT |  |

The RSCFDnCFDFMSTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.

## CFkMLT Flag ( $k=$ see Table 20.6)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0 , the CFkMLT flag is cleared to 0 .

## RFxMLT Flag ( $\mathrm{x}=$ see Table 20.6)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0 , the RFxMLT flag is cleared to 0 .

### 20.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Table 20.149 RSCFDnCFDRFISTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 7 | RF7IF | Receive FIFO Buffer Interrupt Request Status Flag |
| 6 | RF6IF | 0 : No receive FIFO buffer $x$ interrupt request is present. |
| 5 | RF5IF | 1: A receive FIFO buffer $x$ interrupt request is present. |
| 4 | RF4IF |  |
| 3 | RF3IF |  |
| 2 | RF2IF |  |
| 1 | RF1IF |  |
| 0 | RFOIF |  |

The RSCFDnCFDRFISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
RFxIF Flag ( $\mathbf{x}=$ see Table 20.6)
The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0 , the RFxIF flag is cleared to 0 .

### 20.4.9.5 RSCFDnCFDCFRISTS — Transmit/Receive FIFO Buffer Receive Interrupt Flag Status Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.150 RSCFDnCFDCFRISTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 14 | CF14RXIF | Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag |
| 13 | CF13RXIF | 0 : No transmit/receive FIFO buffer k receive interrupt request is present. |
| 12 | CF12RXIF | 1: A transmit/receive FIFO buffer k receive interrupt request is present. |
| 11 | CF11RXIF |  |
| 10 | CF10RXIF |  |
| 9 | CF9RXIF |  |
| 8 | CF8RXIF |  |
| 7 | CF7RXIF |  |
| 6 | CF6RXIF |  |
| 5 | CF5RXIF |  |
| 4 | CF4RXIF |  |
| 3 | CF3RXIF |  |
| 2 | CF2RXIF |  |
| 1 | CF1RXIF |  |
| 0 | CFORXIF |  |

The RSCFDnCFDCFRISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
CFkRXIF Flag ( $k=$ see Table 20.6)
The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0 , the CFkRXIF flag is cleared to 0 .

### 20.4.9.6 RSCFDnCFDCFTISTS — Transmit/Receive FIFO Buffer Transmit Interrupt Flag Status Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.151 RSCFDnCFDCFTISTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved |
|  |  | These bits are read as the value after reset. |
| 14 | CF14TXIF | Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag |
| 13 | CF13TXIF | 0 : No transmit/receive FIFO buffer $k$ transmit interrupt request is present. |
| 12 | CF12TXIF | 1: A transmit/receive FIFO buffer $k$ transmit interrupt request is present. |
| 11 | CF11TXIF |  |
| 10 | CF10TXIF |  |
| 9 | CF9TXIF |  |
| 8 | CF8TXIF |  |
| 7 | CF7TXIF |  |
| 6 | CF6TXIF |  |
| 5 | CF5TXIF |  |
| 4 | CF4TXIF |  |
| 3 | CF3TXIF |  |
| 2 | CF2TXIF |  |
| 1 | CF1TXIF |  |
| 0 | CFOTXIF |  |

The RSCFDnCFDCFTISTS register is cleared to $00000000_{\mathrm{H}}$ in global reset mode.
CFkTXIF Flag ( $k=$ see Table 20.6)
The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0 , the CFkTXIF flag is cleared to 0 .

### 20.4.10 Details of FIFO DMA-Related Registers

### 20.4.10.1 RSCFDnCFDCDTCT - DMA Enable Register

Table 20.152 RSCFDnCFDCDTCT Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |
| 12 | CFDMAE4 | DMA Transfer Enable for Transmit/Receive FIFO buffer 12 <br> 0: DMA Transfer Request disabled for Transmit/Receive FIFO buffer 12 <br> 1: DMA Transfer Request enabled for Transmit/Receive FIFO buffer 12 |
| 11 | CFDMAE3 | DMA Transfer Enable for Transmit/Receive FIFO buffer 9 <br> 0: DMA Transfer Request disabled for Transmit/Receive FIFO buffer 9 <br> 1: DMA Transfer Request enabled for Transmit/Receive FIFO buffer 9 |
| 10 | CFDMAE2 | DMA Transfer Enable for Transmit/Receive FIFO buffer 6 <br> 0: DMA Transfer Request disabled for Transmit/Receive FIFO buffer 6 <br> 1: DMA Transfer Request enabled for Transmit/Receive FIFO buffer 6 |
| 9 | CFDMAE1 | DMA Transfer Enable for Transmit/Receive FIFO buffer 3 <br> 0: DMA Transfer Request disabled for Transmit/Receive FIFO buffer 3 <br> 1: DMA Transfer Request enabled for Transmit/Receive FIFO buffer 3 |
| 8 | CFDMAE0 | DMA Transfer Enable for Transmit/Receive FIFO buffer 0 <br> 0: DMA Transfer Request disabled for Transmit/Receive FIFO buffer 0 <br> 1: DMA Transfer Request enabled for Transmit/Receive FIFO buffer 0 |
| 7 | RFDMAE7 | DMA Transfer Enable for Receive FIFO buffer 7 <br> 0: DMA Transfer Request disabled for Receive FIFO buffer 7 <br> 1: DMA Transfer Request enabled for Receive FIFO buffer 7 |
| 6 | RFDMAE6 | DMA Transfer Enable for Receive FIFO buffer 6 <br> 0: DMA Transfer Request disabled for Receive FIFO buffer 6 <br> 1: DMA Transfer Request enabled for Receive FIFO buffer 6 |
| 5 | RFDMAE5 | DMA Transfer Enable for Receive FIFO buffer 5 <br> 0: DMA Transfer Request disabled for Receive FIFO buffer 5 <br> 1: DMA Transfer Request enabled for Receive FIFO buffer 5 |
| 4 | RFDMAE4 | DMA Transfer Enable for Receive FIFO buffer 4 <br> 0: DMA Transfer Request disabled for Receive FIFO buffer 4 <br> 1: DMA Transfer Request enabled for Receive FIFO buffer 4 |
| 3 | RFDMAE3 | DMA Transfer Enable for Receive FIFO buffer 3 <br> 0: DMA Transfer Request disabled for Receive FIFO buffer 3 <br> 1: DMA Transfer Request enabled for Receive FIFO buffer 3 |

Table 20.152 RSCFDnCFDCDTCT Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 | RFDMAE2 | DMA Transfer Enable for Receive FIFO buffer 2 |
|  |  | 0: DMA Transfer Request disabled for Receive FIFO buffer 2 |
|  | 1: DMA Transfer Request enabled for Receive FIFO buffer 2 |  |
| 1 | RFDMAE1 | DMA Transfer Enable for Receive FIFO buffer 1 |
|  |  | 0: DMA Transfer Request disabled for Receive FIFO buffer 1 |
|  | 1: DMA Transfer Request enabled for Receive FIFO buffer 1 |  |
| 0 | RFDMAE0 | DMA Transfer Enable for Receive FIFO buffer 0 |
|  |  | 0: DMA Transfer Request disabled for Receive FIFO buffer 0 |
|  |  | 1: DMA Transfer Request enabled for Receive FIFO buffer 0 |

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

## CFDMAEi Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer $3 \times \mathrm{m}$ (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to $00_{\mathrm{B}}$ (receive mode).

Set this bit to 0 when the CFM[1:0] value is $01_{\mathrm{B}}$ (transmit mode) or $10_{\mathrm{B}}$ (gateway mode).

## RFDMAEe Bit

This bit is used to enable DMA transfer for receive FIFO buffer $x$. ( $x=$ see Table 20.6)

### 20.4.10.2 RSCFDnCFDCDTSTS - DMA Status Register

| Value after reset: |  |  | 0000 0000H |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 9 | CFDMASTS1 | DMA Transfer Status for Transmit/Receive FIFO Buffer 3 <br> 0: DMA transfer of transmit/receive FIFO buffer 3 is not in progress. <br> 1: DMA transfer of transmit/receive FIFO buffer 3 is in progress. |
| 8 | CFDMASTS0 | DMA Transfer Status for Transmit/Receive FIFO Buffer 0 <br> 0: DMA transfer of transmit/receive FIFO buffer 0 is not in progress. <br> 1: DMA transfer of transmit/receive FIFO buffer 0 is in progress. |
| 7 | RFDMASTS7 | DMA Transfer Status for Receive FIFO Buffer 7 <br> 0: DMA transfer of receive FIFO buffer 7 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 7 is in progress. |
| 6 | RFDMASTS6 | DMA Transfer Status for Receive FIFO Buffer 6 <br> 0 : DMA transfer of receive FIFO buffer 6 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 6 is in progress. |
| 5 | RFDMASTS5 | DMA Transfer Status for Receive FIFO Buffer 5 <br> 0 : DMA transfer of receive FIFO buffer 5 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 5 is in progress. |
| 4 | RFDMASTS4 | DMA Transfer Status for Receive FIFO Buffer 4 <br> 0: DMA transfer of receive FIFO buffer 4 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 4 is in progress. |
| 3 | RFDMASTS3 | DMA Transfer Status for Receive FIFO Buffer 3 <br> 0: DMA transfer of receive FIFO buffer 3 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 3 is in progress. |
| 2 | RFDMASTS2 | DMA Transfer Status for Receive FIFO Buffer 2 <br> 0: DMA transfer of receive FIFO buffer 2 is not in progress. <br> 1: DMA transfer of receive FIFO buffer 2 is in progress. |

Table 20.153 RSCFDnCFDCDTSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | RFDMASTS1 | DMA Transfer Status for Receive FIFO Buffer 1 |
|  | 0: DMA transfer of receive FIFO buffer 1 is not in progress. |  |
|  | 1: DMA transfer of receive FIFO buffer 1 is in progress. |  |
| 0 | RFDMASTS0 | DMA Transfer Status for Receive FIFO Buffer 0 |
|  | $0:$ DMA transfer of receive FIFO buffer 0 is not in progress. |  |
|  | 1: DMA transfer of receive FIFO buffer 0 is in progress. |  |

## CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 ) for the transmit/receive FIFO buffer $3 \times \mathrm{m}$ (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.
When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0 ), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).
These bits are cleared to 0 in global reset mode.

## RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer $x$ and the receive FIFO buffer contains one of more messages, the RFDMASTSx bit is set to 1 indicating that DMA transfer is in progress.
When all messages in the receive FIFO buffer $x$ have been transferred or DMA transfer is disabled (RFDMAEx bit $=0$ ), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area)
These bits are cleared to 0 in global reset mode.

### 20.4.11 Details of Transmit Buffer-Related Registers

### 20.4.11.1 RSCFDnCFDTMCp - Transmit Buffer Control Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | TMOM | TMTAR | TMTR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W*1 | R/W* ${ }^{* 1}$ |

Note 1. The only effective value for writing to this bit is 1 , which sets the bit. Otherwise writing to the bit results in retention of its state.
Table 20.154 RSCFDnCFDTMCp Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved |
|  |  | These bits are read as the value after reset. |
|  | The write value should be the value after reset. |  |
| 2 | TMOM | One-Shot Transmission Enable |
|  | $0:$ One-shot transmission is disabled. |  |
|  | 1: One-shot transmission is enabled. |  |
| 1 | TMTAR | Transmit Abort Request |
|  |  | 0: Transmit abort is not requested. |
|  |  | 1: Transmit abort is requested. |
| 0 | TMTR | Transmit Request |
|  |  | 0: Transmission is not requested. |
|  |  | 1: Transmission is requested. |
|  |  |  |

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to $00_{\mathrm{H}}$.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register ( $\mathrm{p}=\mathrm{m} \times 16+$ the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm ( $\mathrm{m}=$ see Table 20.6) register $(\mathrm{p}=(\mathrm{m} \times 16+15)$ to $(\mathrm{m} \times 16+15$. the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register $(\mathrm{p}=(\mathrm{m} \times 16)+1,(\mathrm{~m} \times 16)+2,(\mathrm{~m} \times 16)+4$, or $(\mathrm{m} \times 16)+5)$ corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

All of the bits in the RSCFDnCFDTMCp register are cleared to 0 in channel reset mode. Modify the
RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

## TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0 . Set the TMOM bit to 1 together with the TMTR bit.

## TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1 .
The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0 .

## TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.
The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1 .
- An error or arbitration-lost has been detected with the TMOM bit set to 1 .

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is $00_{\mathrm{B}}$.

### 20.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register p

Note: For the value of index "p", see Table 20.6.
Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | TMTARM | TMTRM | TMTRF[1:0] |  | TMTSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R |

Table 20.155 RSCFDnCFDTMSTSp Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | - | Reserved <br> These bits are read as the value after reset. <br> The write value should be the value after reset. |
| 4 | TMTARM | Transmit Buffer Transmit Abort Request Status Flag <br> 0 : No transmit abort request is present. <br> 1: A transmit abort request is present. |
| 3 | TMTRM | Transmit Buffer Transmit Request Status Flag <br> 0 : No transmit request is present. <br> 1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | Transmit Buffer Transmit Result Status Flag <br> b2 b1 <br> 0 0: Transmission is in progress or no transmit request is present. <br> 0 1: Transmit abort has been completed. <br> 1 0: Transmission has been completed (without transmit abort request). <br> 1 1: Transmission has been completed (with transmit abort request). |
| 0 | TMTSTS | Transmit Buffer Transmit Status Flag <br> 0 : Transmission is not in progress. <br> 1: Transmission is in progress. |

All of the bits in the RSCFDnCFDTMSTSp register are cleared to 0 in channel reset mode.

## TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1 .
The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0 .

## TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1 .
The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0 .
TMTRF[1:0] Flag
This flag indicates the result of transmission from the transmit buffer.
$00_{\mathrm{B}}$ : Transmission is in progress or no transmit request is present.
$01_{\mathrm{B}}$ : Transmission from the transmit buffer was aborted.
$10_{\mathrm{B}}$ : Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).
$11_{\mathrm{B}}$ : Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write $00_{\mathrm{B}}$ to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than $00_{\mathrm{B}}$ to this flag.

## TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

### 20.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register p

Note: For the value of index " p ", see Table 20.6.

Table 20.156 RSCFDnCFDTMIDp Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | TMIDE | Transmit Buffer IDE |
|  |  | 0: Standard ID |
|  |  | 1: Extended ID |
| 30 | TMRTR | Transmit Buffer RTR/RRS |
|  |  | - When the transmit message is a classical CAN frame |
|  |  | 0 : Data frame |
|  |  | 1: Remote frame |
|  |  | - When the transmit message is a CAN FD frame |
|  |  | Write 0 to this bit. |
| 29 | THLEN | Transmit History Data Store Enable |
|  |  | 0 : Transmit history data is not stored in the buffer. |
|  |  | 1: Transmit history data is stored in the buffer. |
| 28 to 0 | TMID[28:0] | Transmit Buffer ID Data |
|  |  | Set standard ID or extended ID. |
|  |  | For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11 . |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ for the corresponding channel.

## TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

## TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.
Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

## THLEN Bit

When this bit is set to 1 , the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

## TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

### 20.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TMDLC[3:0] |  |  |  | - | - | - | - | TMPTR[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.157 RSCFDnCFDTMPTRp Register Contents

| Bit Position <br> 31 to 28 | Bit Name TMDLC[3:0] | Function |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Transmit Buffer DLC Data |  |  |  |  |  |
|  |  | b31 | b30 | b29 | b28 | Classical CAN Frame | CAN FD Frame |
|  |  | 0 | 0 | 0 | 0 | 0 data bytes |  |
|  |  | 0 | 0 | 0 | 1 | 1 data bytes |  |
|  |  | 0 | 0 | 1 | 0 | 2 data bytes |  |
|  |  | 0 | 0 | 1 | 1 | 3 data bytes |  |
|  |  | 0 | 1 | 0 | 0 | 4 data bytes |  |
|  |  | 0 | 1 | 0 | 1 | 5 data bytes |  |
|  |  | 0 | 1 | 1 | 0 | 6 data bytes |  |
|  |  | 0 | 1 | 1 | 1 | 7 data bytes |  |
|  |  | 1 | 0 | 0 | 0 | 8 data bytes |  |
|  |  | 1 | 0 | 0 | 1 | 8 data bytes | 12 data bytes |
|  |  | 1 | 0 | 1 | 0 |  | 16 data bytes |
|  |  | 1 | 0 | 1 | 1 |  | 20 data bytes |
|  |  | 1 | 1 | 0 | 0 |  | 24 data bytes |
|  |  | 1 | 1 | 0 | 1 |  | 32 data bytes |
|  |  | 1 | 1 | 1 | 0 |  | 48 data bytes |
|  |  | 1 | 1 | 1 | 1 |  | 64 data bytes |
| 27 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |  |  |  |  |  |
| 23 to 16 | TMPTR[7:0] | Transmit Buffer Label Data <br> Set the label information to be stored in the transmit history buffer. |  |  |  |  |  |
| 15 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |  |  |  |  |  |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer $p(p=m \times 16+15)$ for the corresponding channel.

## TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to $1001_{\mathrm{B}}$ or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit $=0$ (transmit buffer merge mode disabled):

A value of $0000_{B}$ to $1111_{\mathrm{B}}$ can be set. If a value larger than $1100_{\mathrm{B}}$ is set, payloads exceeding 20 bytes are padded by $\mathrm{CC}_{\mathrm{H}}$.

- When the TMME bit $=1$ (transmit buffer merge mode enabled):

When the corresponding transmit buffer number $\mathrm{p}=(\mathrm{m} \times 16)+0$ or $(\mathrm{m} \times 16)+3$, a value of $0000_{\mathrm{B}}$ to $1111_{\mathrm{B}}$ can be set. In other cases, set a value of $0000_{\mathrm{B}}$ to $1011_{\mathrm{B}}$ ( 20 data bytes).

When the TMRTR bit is 1 (remote frame), these bits set the length of the message to be requested.

## TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

### 20.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register p

Note: For the value of index " p ", see Table 20.6.
Value after reset: $\quad 00000000_{H}$

Table 20.158 RSCFDnCFDTMFDCTRp Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMFDF | FDF |
|  |  | 0: Classical CAN frame |
|  | 1: CAN FD frame |  |
| 1 | TMBRS | BRS |
|  |  | $0:$ The bit rate in the data area does not change. |
|  |  | 1: The bit rate in the data area changes. |
| 0 | ESI |  |
|  |  | 0: Error active node |
|  |  | 1: Error passive node |
|  |  |  |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ of the corresponding channel.

## TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.
TMBRS Bit
When this bit is set to 1 while the TMFDF bit is set to 1 , the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is 0 , write set to 0 to this bit.

## TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is set to 1 . The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is set to 0 , write 0 to this bit.

### 20.4.11.6 RSCFDnCFDTMDFb_p - Transmit Buffer Data Field b Register p

Note: For the value of index " b " and " p ", see Table 20.6.

Table 20.159 RSCFDnCFDTMDFb_p Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | TMDB4 $\times \mathrm{b}+3[7: 0]$ | Transmit Buffer Data Byte $4 \times \mathrm{b}+3$ |
| 23 to 16 | TMDB4 $\times \mathrm{b}+2[7: 0]$ | Transmit Buffer Data Byte $4 \times \mathrm{b}+2$ |
| 15 to 8 | TMDB4 $\times \mathrm{b}+1[7: 0]$ | Transmit Buffer Data Byte $4 \times \mathrm{b}+1$ |
| 7 to 0 | TMDB4 $\times \mathrm{b}+0[7: 0]$ |  |
|  |  | Transmit Buffer Data Byte $4 \times \mathrm{b}+0$ |

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer $\mathrm{p}(\mathrm{p}=\mathrm{m} \times 16+15)$ for the corresponding channel.

### 20.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register y

Note: For the value of index " y ", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { TMIEp } \\ (p=y \times \\ 32+31) \end{gathered}$ | $\left(\begin{array}{l} \text { TMIEp } \\ (p=y \times \\ 32+30) \end{array}\right.$ | $\left\lvert\, \begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+29) \end{aligned}\right.$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+28) \end{aligned}$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+27) \end{aligned}$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+26) \end{aligned}$ | $\left\lvert\, \begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+25) \end{aligned}\right.$ | $\left(\begin{array}{l} \text { TMIEp } \\ (p=y \times \\ 32+24) \end{array}\right.$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+23) \end{aligned}$ | $\begin{gathered} \text { TMIEp } \\ (\mathrm{p}=\mathrm{y} \times \\ 32+22) \end{gathered}$ | $\left(\begin{array}{l} \text { TMIEp } \\ (p=y \times \\ 32+21) \end{array}\right.$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+20) \end{aligned}$ | $\begin{gathered} \text { TMIEp } \\ (p=y \times \\ 32+19) \end{gathered}$ | $\left(\begin{array}{l} \text { TMIEp } \\ (p=y \times \\ 32+18) \end{array}\right.$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+17) \end{aligned}$ | $\begin{gathered} \text { TMIEp } \\ (p=y \times \\ 32+16) \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\begin{gathered} \text { TMIEp } \\ (\mathrm{p}=\mathrm{y} \times \\ 32+15) \end{gathered}$ | $\left\lvert\, \begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+14) \end{aligned}\right.$ | $\begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+13) \end{aligned}$ | $\left\lvert\, \begin{aligned} & \text { TMIEp } \\ & (p=y \times \\ & 32+12) \end{aligned}\right.$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+11) \end{array}$ | $\begin{array}{\|l\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+10) \end{array}$ | $\begin{array}{\|l\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+9) \end{array}$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+8) \end{array}$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+7) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+6) \\ \hline \end{array}$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (\mathrm{p}=\mathrm{y} \times \\ 32+5) \\ \hline \end{array}$ | $\left\|\begin{array}{c} \text { TMIEp } \\ (p=y \times \\ 32+4) \end{array}\right\|$ | $\begin{array}{\|c\|} \hline \text { TMIEp } \\ (p=y \times \\ 32+3) \\ \hline \end{array}$ | $\left\|\begin{array}{c} \text { TMIEp } \\ (p=y \times \\ 32+2) \end{array}\right\|$ | TMIEp $\left\lvert\, \begin{aligned} & (p=y \times \\ & 32+1) \end{aligned}\right.$ | $\left\lvert\, \begin{gathered} \text { TMIEp } \\ (\mathrm{p}=\mathrm{y} \times \\ 32+0) \end{gathered}\right.$ |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 20.160 RSCFDnCFDTMIECy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMIEp | Transmit Buffer Interrupt Enable $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ Transmit buffer interrupt is disabled |  |
|  | 1: Transmit buffer interrupt is enabled |  |

## TMIEp Bits ( $\mathbf{p}=$ see Table 20.6)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0 .

Table 20.161 shows the bit assignment.

Table 20.161 TMIEp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | 0 | $\cdot$ |
| 15 | 1 | 15 |
| 16 | $\cdot$ | 0 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 30 | 1 | $\cdot$ |
| 31 | 2 | 14 |
| 32 | 2 | 15 |
| 33 | $\cdot$ | 0 |
| $\cdot$ | $\cdot$ | 1 |
| 47 | 2 | $\cdot$ |
| 48 | 3 | $\cdot$ |

| 31 to 0 | TMTRSTSp | Transmit Buffer Transmit Request Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ No transmit request is present. |  |
|  | 1: A transmit request is present. |  |

## TMTRSTSp Flags ( $\mathbf{p}=$ see Table 20.6)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.
When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1 .
The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 20.163 shows the bit assignment.

Table 20.163 TMTRSTSp Bit Assignment

|  | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.164 RSCFDnCFDTMTARSTSy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMTARSTSp | Transmit Buffer Transmit Abort Request Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ No transmit abort request is present. |  |
|  | $1:$ A transmit abort request is present. |  |

## TMTARSTSp Flags ( $p=$ see Table 20.6)

These flags indicate the status of the TMTAR bit in the RSCFDnCFDTMCp register.
When the TMTAR bit is set to 1 (transmit abort is requested), the corresponding TMTARSTSp flag is set to 1 .
The corresponding TMTARSTSp flag is cleared to 0 when the TMTAR bit is set to 0 (transmit abort is not requested) or in channel reset mode.

Table 20.165 shows the bit assignment.

Table 20.165 TMTARSTSp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |

| $\cdot$ | 4 | 0 |
| 78 | 4 | 1 |

### 20.4.12.3 RSCFDnCFDTMTCSTSy — Transmit Buffer Transmit Complete Status Register y

Note: For the value of index "y", see Table 20.6.

Table 20.166 RSCFDnCFDTMTCSTSy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMTCSTSp | Transmit Buffer Transmit Complete Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ Transmission has not been completed. |  |
|  | 1: Transmission has been completed. |  |

## TMTCSTSp Flags ( $p=$ see Table 20.6)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to $10_{\mathrm{B}}$ (transmission has been completed (without transmit abort request)) or $11_{\mathrm{B}}$ (transmission has been completed (with transmit abort request)), the corresponding TMTCSTSp flag is set to 1 .

To clear the TMTCSTSp flag to 0 , set the corresponding TMTRF[1:0] flag to $00_{\mathrm{B}}$. This flag is cleared to 0 in channel reset mode.

Table 20.167 shows the bit assignment.

Table 20.167 TMTCSTSp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |
| 15 | 0 | 15 |
| 16 | $\cdot$ | 0 |
| $\cdot$ | $\cdot$ | $\cdot$ |

| 65 | 4 | 15 |
| 78 | 4 | 0 |
| 79 | 4 | 1 |

### 20.4.12.4 RSCFDnCFDTMTASTSy — Transmit Buffer Transmit Abort Status Register y

Note: For the value of index "y", see Table 20.6.

Table 20.168 RSCFDnCFDTMTASTSy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TMTASTSp | Transmit Buffer Transmit Abort Status Flag $p(p=y \times 32+31$ to $y \times 32+0)$ |
|  | $0:$ Transmission is not aborted |  |
|  | 1: Transmission is aborted |  |

## TMTASTSp Flags ( $p=$ see Table 20.6)

When the TMTRF[1:0] flag in the RSCFDnCFDTMSTSp register is set to $01_{\mathrm{B}}$ (transmit abort has been completed), the corresponding TMTASTSp flag is set to 1 .

To clear the TMTASTSp flag to 0 , set the corresponding TMTRF[1:0] flag to $00_{\mathrm{B}}$. This flag is cleared to 0 in channel reset mode.

Table 20.169 shows the bit assignment.

Table 20.169 TMTASTSp Bit Assignment

| Bit Position | Channel | Transmit Buffer Number |
| :--- | :--- | :--- |
| 0 | 0 | 0 |
| 1 | 0 | 1 |
| $\cdot$ | $\cdot$ | $\cdot$ |
| $\cdot$ | $\cdot$ | $\cdot$ |

| 65 | 4 | 15 |
| 7 | 4 | 0 |
| 79 | 4 | 1 |

### 20.4.13 Details of Transmit Queue-Related Registers

### 20.4.13.1 RSCFDnCFDTXQCCm - Transmit Queue Configuration and Control Register m

Note: For the value of index " $m$ ", see Table 20.6.

Value after reset: $\quad 00000000 \mathrm{H}$

Table 20.170 RSCFDnCFDTXQCCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 13 | TXQIM | Transmit Queue Interrupt Source Select |
|  |  | 0 : When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. |
|  |  | 1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | Transmit Queue Interrupt Enable |
|  |  | 0 : Transmit queue interrupt is disabled. |
|  |  | 1: Transmit queue interrupt is enabled. |
| 11 to 8 | TXQDC[3:0] | Transmit Queue Depth Configuration |
|  |  | Setting these bits to $\mathrm{g}(\mathrm{g}=2$ to 15) makes the ( $\mathrm{g}+1$ ) transmit queue available. |
|  |  | Setting these bits to 0 disables the transmit queue. |
|  |  | Setting these bits to 1 is prohibited. |
|  |  | For transmit buffer merge mode, set g to 2 to 9 . |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 0 | TXQE | Transmit Queue Enable |
|  |  | 0 : The transmit queue is not used. |
|  |  | 1: The transmit queue is used. |

## TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

## TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.
Set the TXQE bit to 0 before modifying the TXQIE bit.

## TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from $(m \times 16+15)$ to $(m \times 16+0)$. see
Table 20.98. For examples of how buffer allocation is done, see Figure 20.9.
When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers ( $\mathrm{m} \times$ $16+5)$ to $(\mathrm{m} \times 16+0)$ are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15 .

Modify these bits only in channel reset mode.

## TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1 , set the TXQDC[3:0] bits to $0010_{\mathrm{B}}$ or more.

### 20.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register m

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: $\quad 00000001 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | TXQIF | $\underset{L}{\text { TXQFL }}$ | $\begin{gathered} \text { TXQEM } \\ \mathrm{P} \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W*1 | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.171 RSCFDnCFDTXQSTSm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | - | Reserved |
|  |  | When read, the undefined value is returned. When writing to these bits, write the value after reset. |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | TXQIF | Transmit Queue Interrupt Request Flag |
|  |  | 0 : No transmit queue interrupt request is present. |
|  |  | 1: A transmit queue interrupt request is present. |
| 1 | TXQFLL | Transmit Queue Full Status Flag |
|  |  | 0 : The transmit queue is not full. |
|  |  | 1: The transmit queue is full. |
| 0 | TXQEMP | Transmit Queue Empty Status Flag |
|  |  | 0: The transmit queue contains messages. |
|  |  | 1: The transmit queue contains no message (transmit queue empty). |

## TXQIF Flag

The TXQIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

## TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

## TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message stored in the transmit queue.
This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

### 20.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $00000000_{\mathrm{H}}$

Table 20.172 RSCFDnCFDTXQPCTRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | The write value should be the value after reset. |
| 7 to 0 | TXQPC[7:0] | Transmit Queue Pointer Control |
|  |  | Writing FF F $_{H}$ to these bits move the write pointer of the transmit queue to the next queue buffer. |

## TXQPC[7:0] Bits

Writing $\mathrm{FF}_{\mathrm{H}}$ to the TXQPC[7:0] bits move the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp,
RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers $(p=15,31,47,63,79)$ before writing $\mathrm{FF}_{\mathrm{H}}$ to the TXQPC[7:0] bits.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (The transmit queue is not full).

### 20.4.14 Details of Transmit History-Related Registers

### 20.4.14.1 RSCFDnCFDTHLCCm — Transmit History List Configuration and Control Register m

Note: For the value of index " m ", see Table 20.6.

Table 20.173 RSCFDnCFDTHLCCm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 11 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after <br> reset. |
| 10 | THLDTE | Transmit History Target Buffer Select |
|  |  | 0: Entries from transmit/receive FIFO buffers and transmit queue |
|  |  | 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue |

## THLDTE Bit

When this bit is set to 0 , the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1 , the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

## THLIM Bit

This bit is used to select a transmit history interrupt source.
Modify this bit only in channel reset mode.

## THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0 .

## THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.
This bit is cleared to 0 in channel reset mode.

### 20.4.14.2 RSCFDnCFDTHLSTSm — Transmit History List Status Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $\quad 00000001_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | THLMC[4:0] |  |  |  |  | - | - | - | - | THLIF | THLELT | THLFLL | $\underset{\mathrm{P}}{\mathrm{THLEM}}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | $\mathrm{R} / \mathrm{W}^{* 1}$ | $\mathrm{R} / \mathrm{W}^{* 1}$ | R | R |

Note 1. The only effective value for writing to this flag bit is 0 , which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 20.174 RSCFDnCFDTHLSTSm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | THLMC[4:0] | Transmit History Buffer Unread Data Counter <br> These bits indicate the number of unread data stored in the transmit history buffer. |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | THLIF | Transmit History Interrupt Request Flag <br> 0 : No transmit history interrupt request is present. <br> 1: A transmit history interrupt request is present. |
| 2 | THLELT | Transmit History Buffer Overflow Flag <br> 0 : Transmit history buffer overflow has not occurred. <br> 1: Transmit history buffer overflow has occurred. |
| 1 | THLFLL | Transmit history Buffer Full Status Flag <br> 0 : Transmit history buffer is not full. <br> 1: Transmit history buffer is full. |
| 0 | THLEMP | Transmit History Buffer Empty Status Flag <br> 0 : Transmit history buffer contains unread data. <br> 1: Transmit history buffer contains no unread data (buffer empty). |

## THLMC[4:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

## THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.
To clear the flags of the register to 0 , the program must write 0 to the corresponding flag to be cleared.
When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0 , the program must write 0 to the corresponding flag to be cleared.
When writing 0 , using store instruction, set the bit to be set to " 0 " to " 0 ", and the bits not to be set to " 0 " to " 1 ".

## THLFLL Flag

The THLFLL flag is set to 1 when 16 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 16 . This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

## THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.
This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE
To clear THLIF or THLELT flag to 0 , the program must write 0 . When writing, use a store instruction to write " 0 " to the given flag and " 1 " to other flags.

### 20.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History List Pointer Control Register m

Note: For the value of index " $m$ ", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 20.175 RSCFDnCFDTHLPCTRm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> When writing to these bits, write the value after reset. |
| 7 to 0 | THLPC[7:0] | Transmit History List Pointer Control <br> Writing FF <br> H to these bits move the read pointer to the next unread data in the transmit history <br> buffer. |

## THLPC[7:0] Bits

When the THLPC[7:0] bits are set to $\mathrm{FF}_{\mathrm{H}}$, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented by 1 . Write $\mathrm{FF}_{H}$ to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing $\mathrm{FF}_{\mathrm{H}}$ to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0 .

### 20.4.14.4 RSCFDnCFDTHLACCm — Transmit History List Access Register m

Note: For the value of index " $m$ ", see Table 20.6.

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | TMTS[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TID[7:0] |  |  |  |  |  |  |  | - | BN[3:0] |  |  |  | BT[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 20.176 RSCFDnCFDTHLACCm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | TMTS[15:0] | Timestamp Data |
|  |  | The timestamp data of stored data can be read. |
| 15 to 8 | TID[7:0] | Label Data |
|  |  | The label information of stored data can be read. |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 6 to 3 | BN[3:0] | Buffer Number Data |
|  |  | The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read. |
| 2 to 0 | BT[2:0] | Buffer Type Data |
|  |  | 0001 1: Transmit buffer |
|  |  | 0110 : Transmit/receive FIFO buffer |
|  |  | 1000 : Transmit queue |

## TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer is displayed.

## TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

## BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

## BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

### 20.4.15 Details of Test-Related Registers

### 20.4.15.1 RSCFDnCFDGTSTCFG - Global Test Configuration Register

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | $\underset{E}{C 4 I C B C}$ | $\underset{E}{\text { C3ICBC }}$ | $\underset{E}{\mathrm{C} 2 \mathrm{ICBC}}$ | $\underset{E}{\text { C1ICBC }}$ | $\underset{E}{\text { CoICBC }}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

Table 20.177 RSCFDnCFDGTSTCFG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | RAM Test Page Configuration |
|  |  | Set a value within a range of page $0\left(00_{\mathrm{H}}\right)$ to page $69\left(45_{\mathrm{H}}\right)$. |
| 15 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 4 | C4ICBCE | CAN4 Inter-channel Communication Test Enable |
|  |  | 0 : CAN4 inter-channel communication test is disabled. |
|  |  | 1: CAN4 inter-channel communication test is enabled. |
| 3 | C3ICBCE | CAN3 Inter-channel Communication Test Enable |
|  |  | 0 : CAN3 inter-channel communication test is disabled. |
|  |  | 1: CAN3 inter-channel communication test is enabled. |
| 2 | C2ICBCE | CAN2 Inter-channel Communication Test Enable |
|  |  | 0 : CAN2 inter-channel communication test is disabled. |
|  |  | 1: CAN2 inter-channel communication test is enabled. |
| 1 | C1ICBCE | CAN1 Inter-Channel Communication Test Enable |
|  |  | 0 : CAN1 inter-channel communication test is disabled. |
|  |  | 1: CAN1 inter-channel communication test is enabled. |
| 0 | COICBCE | CANO Inter-Channel Communication Test Enable |
|  |  | 0 : CAN0 inter-channel communication test is disabled. |
|  |  | 1: CAN0 inter-channel communication test is enabled. |

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

## RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of $00_{\mathrm{H}}$ to $45_{\mathrm{H}}$, inclusive. In CAN FD mode, do not access more than 96 bytes in the last page (RTMPS=45H) during RAM test.

## C4ICBCE Bit

Setting this bit to 1 enables the channel 4 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C3ICBCE Bit

Setting this bit to 1 enables the channel 3 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

## COICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.
This bit is cleared to 0 in global reset mode.

### 20.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | RTME | - | $\begin{array}{\|l} \hline \text { ICBCT } \\ \text { ME } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

Table 20.178 RSCFDnCFDGTSTCTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |
| 2 | RTME | RAM Test Enable |
|  | 0: RAM test is disabled. |  |
|  |  | 1: RAM test is enabled. |
| 1 | Reserved |  |
|  |  | When read, the value after reset is returned. When writing to these bits, write the value after |
|  | reset. |  |
| 0 | Inter-Channel Communication Test Enable |  |
|  |  | 0: Inter-channel communication test is disabled. |
|  |  |  |
|  |  |  |

## RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.
This bit is cleared to 0 in global reset mode.

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to $10_{\mathrm{B}}$ (Global test mode).
2. Set the RTME bit to 1 .
3. Check that the RTME bit is set to 1 .

For the setting procedure of RAM test, see Figure 20.37.

## ICBCTME Bit

When this bit is set to 1 , a communication test is enabled between the channels for which the CmICBCE bit ( $\mathrm{m}=$ see Table 20.6) in the RSCFDnCFDGTSTCFG register has been set to 1 . Modify the ICBCTME bit only in global test mode. This bit is cleared to 0 in global reset mode.

### 20.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Value after reset: 00000000 H

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.
Table 20.179 RSCFDnCFDGLOCKK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When writing these bits, write the value after reset. |
| 15 to 0 | LOCK[15:0] | Lock Key |
|  |  | These bits are key bits to release protection of test mode. |

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.
For the protection release data, see Section 20.11.4.2, Procedure for Releasing the Protection.

## LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area ( $<$ RSCFDn_base $>+0000_{\mathrm{H}}$ to $<$ RSCFDn_base $>+$ $05 \mathrm{FF}_{\mathrm{H}}$ ) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

### 20.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register r

Note: For the value of index "r", see Table 20.6.
Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 20.180 RSCFDnCFDRPGACCr Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDTA[31:0] | RAM Data Test Access |
|  |  | RAM data for CAN can be read and written. |

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register can be read and written when the RTME bit is set to 1 .

### 20.5 Interrupt Sources and DMA Trigger

### 20.5.1 Interrupt Sources

The RS-CANFD module has 17 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 interrupts per unit):
- Receive FIFO interrupt
- Global error interrupt
- Channel interrupts ( 3 interrupts per channel):

CANm transmit interrupt ( $\mathrm{m}=$ see Table 20.6)

- CANm transmit complete interrupt
- CANm transmit abort interrupt
- CANm transmit/receive FIFO transmit complete interrupt (in transmit mode or gateway mode)
- CANm transmit history interrupt
- CANm transmit queue interrupt

CANm transmit/receive FIFO receive complete interrupt (in receive mode or gateway mode)
CANm error interrupt
When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In this case, when the interrupt enable bit is 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the interrupt request. The interrupt request is kept being output until the interrupt request flag is cleared.

Table 20.181 lists the CAN interrupt sources. Figure 20.2 shows the CAN global interrupt block diagram, and Figure 20.3 shows the CAN channel interrupt block diagram.

Table 20.181 List of CAN Interrupt Sources (1/2)

|  |  | Interrupt Source | Corresponding Interrupt Request Flag | Corresponding Interrupt Enable Bit |
| :---: | :---: | :---: | :---: | :---: |
| Global interrupts | Receive FIFO | Receive FIFO 0 | RFIF flag in the RSCFDn(CFD)RFSTS0 register | RFIE bit in the RSCFDn(CFD)RFCCO register |
|  |  | Receive FIFO 1 | RFIF flag in the RSCFDn(CFD)RFSTS1 register | RFIE bit in the RSCFDn(CFD)RFCC1 register |
|  |  | Receive FIFO 2 | RFIF flag in the RSCFDn(CFD)RFSTS2 register | RFIE bit in the RSCFDn(CFD)RFCC2 register |
|  |  | Receive FIFO 3 | RFIF flag in the RSCFDn(CFD)RFSTS3 register | RFIE bit in the RSCFDn(CFD)RFCC3 register |
|  |  | Receive FIFO 4 | RFIF flag in the RSCFDn(CFD)RFSTS4 register | RFIE bit in the RSCFDn(CFD)RFCC4 register |
|  |  | Receive FIFO 5 | RFIF flag in the RSCFDn(CFD)RFSTS5 register | RFIE bit in the RSCFDn(CFD)RFCC5 register |
|  |  | Receive FIFO 6 | RFIF flag in the RSCFDn(CFD)RFSTS6 register | RFIE bit in the RSCFDn(CFD)RFCC6 register |
|  |  | Receive FIFO 7 | RFIF flag in the RSCFDn(CFD)RFSTS7 register | RFIE bit in the RSCFDn(CFD)RFCC7 register |
| Global interrupts | Global error |  | - DEF flag in the RSCFDn(CFD)GERFL register <br> - MES flag in the RSCFDn(CFD)GERFL register <br> - THLES flag in the RSCFDn(CFD)GERFL register <br> - CMPOF flag in the RSCFDnCFDGERFL register | - DEIE bit in the RSCFDn(CFD)GCTR register <br> - MEIE bit in the RSCFDn(CFD)GCTR register <br> - THLEIE bit in the RSCFDn(CFD)GCTR register <br> - CMPOFIE bit in the RSCFDnCFDGCTR register |
| Channel interrupts ( $m$ = see Table 20.6) | CANm transmit | CANm transmit complete | TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register | TMIE bit in the RSCFDn(CFD)TMIECy register |
|  |  | CANm transmit abort | TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register | TAIE bit in the RSCFDn(CFD)CmCTR register |
|  |  | CANm transmit/receive FIFO transmit complete | CFTXIF flag in the RSCFDn(CFD)CFSTSk register | CFTXIE bit in the RSCFDn(CFD)CFCCk register |
|  |  | CANm transmit queue | TXQIF flag in the RSCFDn(CFD)TXQSTSm register | TXQIE bit in the RSCFDn(CFD)TXQCCm register |
|  |  | CANm transmit history | THLIF flag in the RSCFDn(CFD)THLSTSm register | THLIE bit in the RSCFDn(CFD)THLCCm register |
|  | CANm transmit/receive FIFO receive complete |  | CFRXIF flag in the RSCFDn(CFD)CFSTSk register | CFRXIE bit in the RSCFDn(CFD)CFCCk register |

Table 20.181 List of CAN Interrupt Sources (2/2)

|  | Interrupt Source | Corresponding Interrupt Request Flag | Corresponding Interrupt Enable Bit |

Figure 20.2 CAN Global Interrupt Block Diagram

Figure 20.3 CAN Channel Interrupt Block Diagram

### 20.5.2 DMA Triger (Only in CAN FD Mode)

In CAN FD mode, receive FIFO buffers can be related to DMA channels. The following 13 FIFO buffers can be related.

- All receive FIFO buffers $x$ ( $x=$ see Table 20.6)
- The first transmit/receive FIFO buffer $\mathrm{k}(\mathrm{k}=3 \times \mathrm{m}, \mathrm{m}=$ see Table 20.6) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

### 20.6 CAN Modes

The RS-CANFD module has four global modes to control entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in Section 20.6.1, Global Modes, and details of channel modes are described in Section 20.6.2, Channel Modes.

- Global stop mode: Stops clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channel.
- Channel halt mode: Stops CAN communication and performs channel test.
- Channel communication mode: Performs CAN communication.

### 20.6.1 Global Modes

Figure 20.4 shows the transitions of global modes.

Figure 20.4 Transitions of Global Modes

Channel modes may transition in accordance with transitions of global modes. Table $\mathbf{2 0 . 1 8 2}$ shows the transitions of channel modes depending on the global mode setting (GMDC[1:0] bits and GSLPR bit).

Table 20.182 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

|  | Channel Mode after Setting |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Channel Mode before <br> Setting | GMDC[1:0] $=00_{\mathrm{B}}$ <br> GSLPR $=0$ <br> (Global Operating) | GMDC $1: 0]=10_{\mathrm{B}}$ <br> GSLPR $=0$ <br> (Global Test) | GMDC[1:0] $=01_{\mathrm{B}}$ | GMDC[1:0] $=01_{\mathrm{B}}$ |
| Channel communication | Channel communication | Channel halt | (Global Reset) |  |
| GSLPR $=1$ |  |  |  |  |
| Channel halt | Channel halt | Channel halt | Channel reset | Transition prohibited |
| Channel reset | Channel reset | Channel reset | Channel reset | Transition prohibited |
| Channel stop | Channel stop | Channel stop | Channel stop | Channel stop |

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register.

Table 20.183 shows the transition time between each global mode.
Table 20.183 Transition Time of Global Mode

| Mode before Transition | Mode after Transition | Maximum Transition Time |
| :--- | :--- | :--- |
| Global stop | Global reset | 3 clocks of pclk |
| Global reset | Global stop | 3 clocks of pclk |
| Global reset | Global test | 10 clocks of pclk |
| Global reset | Global operation | 10 clocks of pclk |
| Global test | Global reset | Two CAN bit times*1,*2 |
| Global test | Global operation | 3 clocks of pclk |
| Global operation | Global reset | Two CAN bit times*1,*2 |
| Global operation | Global test | 2 times of CAN frame*1 |

Note 1. CAN frame time of the channel whose communication speed is lowest among the channels in use.
Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

### 20.6.1.1 Global Stop Mode

In global stop mode, the CAN clocks do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. In global stop mode, only the clock for CPU writing to the GSLPR bit is running.
After the MCU is reset, the RS-CANFD module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each RSCFDn(CFD)CmCTR register to 1 (channel stop mode). If all channels are forcibly caused to transition to channel stop mode, the RS-CANFD module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

### 20.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. Table $\mathbf{2 0 . 1 8 6}$ and Table $\mathbf{2 0 . 1 8 7}$ list the registers to be initialized.
Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to $01_{\mathrm{B}}$ sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register ( $\mathrm{m}=$ see Table 20.6) to $01_{\mathrm{B}}$ (channel reset mode). If all channels are forcibly caused to transition to channel reset mode, the RS-CANFD module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to $01_{B}$ ).

### 20.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the RS-CANFD module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to $10_{\mathrm{B}}$ sets the CHMDC[1:0] bits in each RSCFDn(CFD)CmCTR register to $10_{\mathrm{B}}$ (channel halt mode). If all channels are forcibly caused to transition to channel halt mode, the RS-CANFD module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

### 20.6.1.4 Global Operating Mode

In global operating mode, entire RS-CANFD module operates.
When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to $00_{\mathrm{B}}$, the RS-CANFD module transitions to global operating mode.

### 20.6.2 Channel Modes

Figure 20.5 shows a channel mode state transition chart. Table 20.184 shows transition time between channel modes.

Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register ( $m=$ see Table 20.6) BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
When BOM[1:0] = 01 : Transition to channel halt CHMDC when TEC exceeds 255
When $\operatorname{BOM}[1: 0]=10_{\mathrm{B}}$ : Transition to channel halt CHMDC when 11 consecutive recessive bits have been detected 128 times When BOM[1:0] = $11_{\mathrm{B}}$ : Transition to channel halt CHMDC when the CHMDC[1:0] bits are set to $10_{B}$

Note 2. While the CAN bus is locked to the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Note 3. When 11 consecutive recessive bits are detected 128 times before the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$.

Figure 20.5 Channel Mode State Transition Chart

Table 20.184 Transition Time of Channel Mode ( $m=$ see Table 20.6)

| Mode before Transition | Mode after Transition | Maximum Transition Time |
| :--- | :--- | :--- |
| Channel stop | Channel reset | 3 clocks of pclk |
| Channel reset | Channel stop | 3 clocks of pclk |
| Channel reset | Channel halt | 3 CANm bit time ${ }^{\star 1}$ |
| Channel reset | Channel communication | 4 CANm bit time*1 |
| Channel halt | Channel reset | 2 CANm bit times ${ }^{\star 1}$ |
| Channel halt | Channel communication | 4 CANm bit times*1 |
| Channel communication | Channel reset | 2 CANm bit times*1 |
| Channel communication | Channel halt | 2 times of CANm frame |

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

### 20.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited (except write to CSLPR bit). Register values are retained.

Each channel enters channel stop mode after the MCU is reset. The channel transitions to channel stop mode when the CSLPR bit in the RSCFDn(CFD)CmCTR register ( $\mathrm{m}=$ see Table 20.6) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

### 20.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. Table 20.186 lists the registers to be initialized.
When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to $01_{\mathrm{B}}$ (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. Table 20.185 shows the operation when the CHMDC[1:0] bits are set to $01_{\mathrm{B}}$ (channel reset mode) during CAN communication.

### 20.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.
Table 20.185 shows operation when the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ (channel halt mode) during CAN communication.

Table 20.185 Operation When a Channel Transitions to Channel Reset Mode/Channel Halt Mode

| Mode | During Reception | During Transmission | Bus Off State |
| :---: | :---: | :---: | :---: |
| Channel reset (CHMDC[1:0] = "018") | Transitions to channel reset mode before reception is completed.*1 | Transitions to channel reset mode before transmission is completed.*1 | Transitions to channel reset mode before bus off recovery is completed. |
| $\begin{aligned} & \text { Channel halt *3 } \\ & \text { (CHMDC[1:0] = } \\ & \text { "10B") } \end{aligned}$ | Transitions to channel halt mode after reception is completed.*2 | Transitions to channel halt mode after transmission is completed. | [When BOM[1:0] = 00 ${ }_{\text {B }}$ ] |
|  |  |  | Transitions to channel halt mode (CHMDC[1:0] = 10 ${ }_{B}$ ) only after bus off recovery. |
|  |  |  | [When BOM[1:0] = 01 ${ }_{\text {B }}$ ] |
|  |  |  | Transitions to channel halt mode automatically when the condition for transition to bus off state is met. |
|  |  |  | [When BOM[1:0] = 10 ${ }_{\mathrm{B}}$ ] |
|  |  |  | Transitions to channel halt mode automatically after bus off recovery is completed. |
|  |  |  | [When BOM[1:0] = 11 ${ }_{\text {B }}$ ] |
|  |  |  | Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to $10_{\text {B }}$ before bus off recovery is completed. |

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to $10_{\mathrm{B}}$ and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to $01_{\mathrm{B}}$.
Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.
Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then transition to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

### 20.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel is in the following communication states during CAN communication.

- Idle : Neither reception nor transmission is in progress.
- Reception : Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off : Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to $00_{\mathrm{B}}$, the channel transitions to channel communication mode. After that, when 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register ( $\mathrm{m}=$ see Table 20.6) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

### 20.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications. How to return from the bus off state is set by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM $[1: 0]=00_{\mathrm{B}}$ :

Bus off recovery is compliant with the CAN specification. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to $00_{\mathrm{H}}$, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the $\mathrm{CHMDC}[1: 0]$ bits in the $\mathrm{RSCFDn}(\mathrm{CFD}) \mathrm{CmCTR}$ register are set to $10_{\mathrm{B}}$ (channel halt mode) in the bus off state, the channel transitions to channel halt mode after completion of bus off recovery (11 consecutive recessive bits have been detected 128 times).

- When BOM $[1: 0]=01_{\mathrm{B}}$ :

When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_{\mathrm{H}}$ but the BORF flag is not set to 1 and a bus off recovery interrupt request is not generated.

- When $\operatorname{BOM}[1: 0]=10_{\mathrm{B}}$ :

When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$. After completion of bus off recovery ( 11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_{\mathrm{H}}$ and the BORF flag is set to 1 , and bus off recovery interrupt request is generated.

- When BOM[1:0] = $11_{\mathrm{B}}$ :

When the CHMDC[1:0] bits are set to $10_{\mathrm{B}}$ in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to $00_{\mathrm{H}}$ but the BORF flag is not set to 1 . And bus off recovery interrupt request is not generated.
However, the BORF flag becomes 1, and bus off recovery interrupt request is generated if a RS-CANFD module transitions to error active state (by detecting 11 consecutive recessive bits 128 times) before CHMDC[1:0] bits are set to $10_{\mathrm{B}}$.

If the channel transitions to channel halt mode by the RS-CANFD module simultaneously when the program writes a value to the CHMDC[1:0] bits, writing by the program takes precedence. An automatic transition to channel halt mode when the $\operatorname{BOM}[1: 0]$ bits are set to $01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ is made only when the CHMDC[1:0] bits are $00_{\mathrm{B}}$ (channel communication mode).

Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows forcible return from the bus off state. As soon as the RTBO bit is set to 1 , the state changes to the error active state. After 11 consecutive recessive bits have been detected, the RS-CANFD module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to $00_{\mathrm{H}}$. Write 1 to the RTBO bit when the BOM[1:0] value is $00_{\mathrm{B}}$. Writing 1 to the RTBO bit in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0 .

### 20.6.3 Initializing Registers by Transition to CAN Mode

Table 20.186 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, Table 20.187 lists bits and flags to be initialized only by a transition to global reset mode.

Table 20.186 Registers Initialized in Global Reset Mode or Channel Reset Mode

| Register | Bit / Flag |
| :--- | :--- |
| RSCFDn(CFD)CmCTR register | (ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0] |
| RSCFDn(CFD)CmSTS register | CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0] |
| RSCFDn(CFD)CmERFL register | CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, <br> OVLF, BORF, BOEF, EPF, EWF, BEF |
| RSCFDnCFDCmFDCTR register | EOCCLR, SOCCLR |
| RSCFDnCFDCmFDSTS register | SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0] |
| RSCFDnCFDCmFDCRC register | CRCREG[20:0], SCNT[3:0] |
| RSCFDn(CFD)CFCCk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], |
| RSCFDn(CFD)CFTISTS register | CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF |
| RSCFDn(CFD)TMCp register | CFkTXIF |
| RSCFDn(CFD)TMSTSp register | TMTARM, TMTRM, TMTRF[1:0], TMTSTS |
| RSCFDn(CFD)TMTRSTSy register | TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTARSTSy register | TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTCSTSy register | TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTASTSy register | TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TXQCCm register | TXQE |
| RSCFDn(CFD)TXQSTSm register | TXQIF, TXQFLL, TXQEMP |
| RSCFDn(CFD)THLCCm register | THLE |
| RSCFDn(CFD)THLSTSm register | THLMC[4:0], THLIF, THLELT, THLFLL,THLEMP |
| RSCFDn(CFD)GTINTSTS1 register | TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 3) |

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

Table 20.187 Registers Initialized Only in Global Reset Mode

| Register | Bit / Flag |
| :--- | :--- |
| RSCFDn(CFD)GSTS register | GHLTSTS |
| RSCFDn(CFD)GERFL register | EEF0, EEF1, EEF2, EEF3, EEF4, (CMPOF), THLES, MES, DEF |
| RSCFDn(CFD)GTSC register | TS[15:0] |
| RSCFDn(CFD)RMNDy register | RMNSq |
| RSCFDn(CFD)RFCCx register | RFE |
| RSCFDn(CFD)RFSTSx register | RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP |
| RSCFDn(CFD)CFCCk register | When transmit/receive FIFO buffer is in receive mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmitreceive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, <br> CFTXIF, CFRXIF, CFMLT |
| RSCFDn(CFD)FESTS register | CFkEMP, RFxEMP |
| RSCFDn(CFD)FFSTS register | CFkFLL, RFxFLL |
| RSCFDn(CFD)FMSTS register | CFkMLT, RFxMLT |
| RSCFDn(CFD)RFISTS register | RFxIF |
| RSCFDn(CFD)CFRISTS register | CFkRXIF |
| RSCFDnCFDCDTCT register | CFDMAEm, RFDMAEx |
| RSCFDnCFDCDTSTS register | CFDMASTSm, RFDMASTSx |
| RSCFDn(CFD)GTSTCFG register | RTMPS[6:0], COICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE |
| RSCFDn(CFD)GTSTCTR register | RTME, ICBCTME |

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

### 20.7 Reception Functions

There are two reception types.

- Reception by receive buffers:

0 to 80 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest received data can always be read.

- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):

Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of the number specified by the buffer depth can be stored in FIFO buffers and can be read sequentially from the oldest.

### 20.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows selected messages to be stored in the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to " $64 \times$ number of channels" receive rules can be registered in the entire module.
(Up to 320 receive rules can be registered in this module that has five channels.)
Set receive rules for each channel. No receive rule can be shared with other channels. If receive rules are not set, no message can be received. Figure 20.6 illustrates how receive rules are registered, giving an example using 2 channels of RS-CANFD.

Figure 20.6 Registration of Receive Rules (in the case of setting channel 0 and 1 )

## CAUTION

Set receive rules of each channel in succession.
It is not possible to set channel 0 receive rules and channel 1 receive rules alternately.

Each receive rule consists of 16 bytes of the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0j, and RSCFDn(CFD)GAFLP1j registers ( $\mathrm{j}=$ see Table 20.6). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function. The RSCFDn(CFD)GAFLMj register is used to set mask. The RSCFDn(CFD)GAFLP0j register is used to set label information to be added, DLC value, and destination receive buffer. The RSCFDn(CFD)GAFLP1j register is used to set a destination FIFO buffer. Up to 16 receive rules can be set per page.

### 20.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. Bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the lowest-numbered receive rule. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

GAFLIDE, GAFLRTR, GAFLID: Bits in the RSCFDn(CDF)GAFLIDj register GAFLIDEM, GAFLRTRM, GAFLIDM: Mask bits in the RSCFDn(CDF)GAFLMj register

Acceptance determination signal
0 : Does not pass the acceptance filter processing. (Not stored in the buffer)
1: Passes the acceptance filter processing.

Note: j = see Table 20.6

Figure 20.7 Acceptance Filter Function

### 20.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is performed for messages that pass through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value of the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message. In this case, a value of $00_{\mathrm{H}}$ is written to data bytes that are larger than the DLC value of the receive rule.

When the DLC value of the received message is smaller than that of the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

### 20.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers set to receive mode or gateway mode. Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0j register ( $\mathrm{j}=$ see Table 20.6) and by the RSCFDn(CFD)GAFLP1j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to 8 buffers.
In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0 , the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1 , the received message is stored in the buffer with payloads exceeding the storage size being discarded, and depending on the DRE bit in the RSCFDnCFDGCFG register the received DLC value or the DLC value of the receive rule is stored in the buffer.

### 20.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits of the RSCFDn(CFD)GAFLP0j register.

### 20.7.1.5 Mirror Function Processing

The mirror function allows reception of messages transmitted from the own CAN node. The mirror function is enabled by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are applied to the data processing for messages received from other CAN nodes. When messages transmitted from the own CAN node are received, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

### 20.7.1.6 Timestamp

The timestamp counter is a 16 -bit free-running counter used for recording the message reception time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GFDCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, the clock source is selectable from pclk/2 or the CANm bit time clock ( $\mathrm{m}=$ see Table 20.6). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The clock obtained by dividing the selected clock source by the TSP[3:0] value of the RSCFDn(CFD)GCFG register is used as the count source of the timestamp counter.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to $0000_{\mathrm{H}}$ by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1 .

TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000в.

Figure 20.8 Timestamp Function Block Diagram

### 20.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:

Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.

- Transmission using transmit/receive FIFO buffers (transmit mode):

Each channel has three FIFO buffers. Up to 128 messages can be saved in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes a target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.

- Transmission using transmit queues:

Up to 16 transmit buffers per channel can be allocated to transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer number $(16 \times \mathrm{m})+15$ is used as a common access window. Transmit buffers are allocated to transmit queues in descending order of buffer numbers. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID numbers.

Figure 20.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

Figure 20.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

### 20.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or queues in the same channel, transmit priority is determined.
The priority is determined by using one of the following methods.

- ID priority (TPRI bit $=0$ )
- Transmit buffer number priority $($ TPRI bit $=1)$

The setting of the TPRI bit in the RSCFDn(CFD)GCFG register is effective in all CAN channels.
When the TPRI bit is set to 0 , messages are transmitted according to the priority of stored message IDs. Priority of IDs conforms to the CAN bus arbitration specification defined in the CAN specification. Targets of priority determination are IDs of messages placed in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), and transmit queues. When one or more transmit queues are used, select the ID priority method. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes a target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the same FIFO buffer becomes a target of priority determination. When transmit queues are used, all messages in transmit queues are targets of priority determination. If the same ID is set for two or more buffers, the buffer with a lower number takes precedence.

When the TPRI bit is set to 1 , the message in the transmit buffer whose number is the lowest among buffers having transmit requests are transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to the linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit setting. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

### 20.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) of a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

Transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register ( $\mathrm{p}=$ see Table 20.6). When transmit completes successfully, the TMTRF[1:0] flag is set to $10_{\mathrm{B}}$ (transmission has been completed (without transmit abort request)) or $11_{\mathrm{B}}$ (transmission has been completed (with transmit abort request)).

### 20.8.2.1 Transmit Abort Function

Setting the TMTAR bit in the RSCFDn(CFD)TMCp register to 1 (transmit abort is requested) cancels the transmit request from a transmit buffer for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present). When transmit abort is completed, the TMTRF[1:0] flag of the RSCFDn(CFD)TMSTSp register is set to $01_{\mathrm{B}}$ (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0 ).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, if an arbitration lost or an error has occurred while a message for which the TMTAR bit is set to 1 is being transmitted, retransmission is not performed.

### 20.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit of the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration lost or an error occurs, retransmission is not performed.

One-shot transmission result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to $10_{\mathrm{B}}$ or $11_{\mathrm{B}}$. When an arbitration lost or an error has occurred, the TMTRF[1:0] flag is set to $01_{\mathrm{B}}$ (transmit abort has been completed).

### 20.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers $(16 \times m)+0$ to $(16 \times m)+2$ and transmit buffers $(16 \times \mathrm{m})+3$ to $(16 \times \mathrm{m})+5$ are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

### 20.8.3 Transmission Using FIFO Buffers

A single transmit/receive FIFO buffer can save as many messages as specified by the CFDC[2:0] bits of the RSCFDn(CFD)CFCCk register ( $k$ = see Table 20.6). Messages are transmitted sequentially on a first-in, first out basis.

Each Transmit/receive FIFO buffers are linked to transmit buffers selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit of the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority determination is applied only to the message to be transmitted next in a FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0 , all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

### 20.8.3.1 Interval Transmission Function

To transmit messages continuously from the same transmit/receive FIFO buffer that is set to transmit mode or gateway mode, message transmission interval time can be set.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit set to 1 in the RSCFDn(CFD)CFCCk register, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0 .

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to $00_{\mathrm{H}}$.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to $00_{\mathrm{B}}$, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to $10_{\mathrm{B}}$, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits $\times 10$ ). When the CFITR and CFITSS bits are set to $\mathrm{x} 1_{\mathrm{B}}$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode. (Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode).

The interval time is calculated by the following formulae where M is the ITRCP[15:0] value and N is the CFITT[7:0] value.

- When CFITR and CFITSS bits are $00_{\text {B }}$

- When CFITR and CFITSS bits are $10_{\text {B }}$

$$
\frac{1}{\text { pclk frequency }} \times 2 \times \mathrm{M} \times 10 \times \mathrm{N}
$$

- When CFITR and CFITSS bits are $\mathrm{x} 1_{\mathrm{B}}$

Figure 20.10 shows the interval timer block diagram.

ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCFDn(CFD)CFCCk register

Note: $m=$ see Table 20.6, $k=$ see Table 20.6,
Note 1. Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode.

Figure 20.10 Interval Timer Block Diagram

Figure 20.11 shows the interval timer timing chart.

Interval time (theoretical value) $=\frac{2}{\text { pclk frequency }} \times($ set ITRCP[15:0] value $) \times$ set CFITT[7:0] value

ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register (The set value is 500 in this figure.) CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 20.11 Interval Timer Timing Chart

1. The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time has a margin of error of up to one interval timer count.
2. The interval timer is decremented by 1 upon the next count enable signal.
3. When the interval timer has decreased to 0 , the transmit/receive FIFO buffer issues a transmit request.
4. When the transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request.
Transmission start may delay up to 1164 pclk clock cycles if several internal processing including receive filter processing, message routing, and transmit priority determination is performed at all channels.

### 20.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and the transmit buffer $(16 \times \mathrm{m})+15$ is used as a common access window.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of the storing order. If two messages having the same ID are stored in a transmit queue, these messages are not always be transmitted in the storing order in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0 , the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no message (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when the message in it is not being transmitted or is not to be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration lost when the message in it is being transmitted or to be transmitted next.

When the TXQE bit is cleared to 0 , all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

### 20.8.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by $\mathrm{CC}_{\mathrm{H}}$.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0 ).

- Transmit/receive FIFO set to transmission or gateway mode:

When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

- Transmit buffer (including transmit queue):

When the payload length of the transmit DLC exceeds 20 bytes
When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

### 20.8.6 Transmit History Function

Information of transmitted messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. Whether to store transmit history data for each message can be set by the THLEN bit in the RSCFDn(CFD)CFIDk register ( $k=$ see Table 20.6).

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 152 cycles of pclk in classical CAN mode or 420 pclk cycles in CAN FD mode.

## - Buffer type

$001_{\mathrm{B}}$ : Transmit buffer
$010_{\mathrm{B}}$ : Transmit/receive FIFO buffer
$100_{\mathrm{B}}$ : Transmit queue

- Buffer number

Number assigned to source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See Table 20.188.

- Label data

Label information of transmitted message

- Timestamp

Value of the transmit message (When the TMTSCE bit is 1 in classical CAN mode)
Table 20.188 Transmit History Data Buffer Numbers

| Buffer type |  |  |  |
| :---: | :---: | :---: | :---: |
| Buffer No. | 001 ${ }_{\text {B }}$ | 010 ${ }_{\text {B }}$ | $100{ }_{\text {B }}$ |
| 0000 ${ }_{\text {B }}$ | Transmit buffer $16 \times \mathrm{m}+0$ | Numbers of transmit buffers linked to transmit/receive FIFO buffers by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register ( $k=$ see Table 20.6) | Numbers of transmit buffers allocated to the transmit queue that performed transmission |
| $0001_{B}$ | Transmit buffer $16 \times \mathrm{m}+1$ |  |  |
| $0010_{B}$ | Transmit buffer $16 \times \mathrm{m}+2$ |  |  |
| $0011_{\text {B }}$ | Transmit buffer $16 \times \mathrm{m}+3$ |  |  |
| 0100 ${ }_{\text {B }}$ | Transmit buffer $16 \times \mathrm{m}+4$ |  |  |
| 0101B | Transmit buffer $16 \times \mathrm{m}+5$ |  |  |
| 0110 ${ }_{\text {B }}$ | Transmit buffer $16 \times \mathrm{m}+6$ |  |  |
| 0111 ${ }_{\text {B }}$ | Transmit buffer $16 \times \mathrm{m}+7$ |  |  |
| $1000_{B}$ | Transmit buffer $16 \times \mathrm{m}+8$ |  |  |
| $1001_{B}$ | Transmit buffer $16 \times \mathrm{m}+9$ |  |  |
| $1010_{B}$ | Transmit buffer $16 \times \mathrm{m}+10$ |  |  |
| $1011_{B}$ | Transmit buffer $16 \times \mathrm{m}+11$ |  |  |
| $1100_{B}$ | Transmit buffer $16 \times \mathrm{m}+12$ |  |  |
| $1101_{B}$ | Transmit buffer $16 \times \mathrm{m}+13$ |  |  |
| $1110_{B}$ | Transmit buffer $16 \times \mathrm{m}+14$ |  |  |
| $1111_{B}$ | Transmit buffer $16 \times \mathrm{m}+15$ |  |  |

Label data is used to identify each message. A unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see Section 20.7.1.6, Timestamp.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If it is attempted to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

### 20.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, received massages can be transmitted from an arbitrary channel without CPU intervention.

When a transmit/receive FIFO buffer for which the CFM[1:0] bits of the RSCFDn(CFD)CFCCk register are set to $10_{B}$ (gateway mode) is selected by the RSCFDn(CFD)GAFLP1j register, messages that passed through the filter processing of the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes a target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 . When the CFE bit is set to 0 , the CFEMP flag becomes 1 at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration lost when the message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0 , all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

### 20.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode)

When the gateway function is to be used in CAN FD mode, frames for transmission can be replaced with classical CAN frames or CAN FD frames.

The CAN-CAN FD gateway is enabled when the GWEN bit in the RSCFDnCFDCmFDCFG register is set to 1 . The GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register can be used to select the FDF and BRS bits of the transmission frame. If the DLC value of the received CAN frame is $1001_{\mathrm{B}}$ or above and the setting of the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with $1000_{\mathrm{B}}$.

While the CAN-CAN FD gateway is enabled, do not route the following frames.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

Also, while the CAN-CAN FD gateway is enabled, transmit only the following frames from the corresponding channel by setting GWFDF.

- When GWFDF $=0$, transmit only classical CAN frames.
- When GWFDF $=1$, transmit only CAN FD frames.

### 20.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
- Standard test mode
- Listen-only mode
- Self-test mode 0 (external loopback mode)
- Self-test mode 1 (internal loopback mode)
- Restricted operation mode (only in CAN FD mode)
- Global tests: Performed in entire module
- RAM test (read/write test)
- Inter-channel communication test (CRC error test enabled)

### 20.10.1 Standard Test Mode

Standard test mode allows CRC test. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length $=15$ bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length $=17$ or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see Section 20.10.6.1, CRC Error Test.

### 20.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.
Do not make a transmit request from any buffer or queue in listen-only mode.
Figure 20.12 shows the connection when listen-only mode is selected.

Note: $m=$ see Table 20.6

Figure 20.12 Connection When Listen-Only Mode is Selected

### 20.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, messages transmitted from a channel are compared with the receive rule of the same channel. Messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register ( $\mathrm{j}=$ see Table 20.6) is set to 0 (when a message transmitted from another CAN node is received).

If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

### 20.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.
In self-test mode 0 , transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure $\mathbf{2 0 . 1 3}$ shows the connection when self-test mode 0 is selected.

Figure 20.13 Connection When Self-Test Mode 0 is Selected

### 20.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin ( $m=$ see Table 20.6) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 20.14 shows the connection when self-test mode 1 is selected.

Note: $m=$ see Table 20.6

Figure 20.14 Connection When Self-Test Mode 1 is Selected

### 20.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error. A desired transmission request can be made for transmission without restrictions.

### 20.10.5 RAM Test Mode

The RAM test function allows accesses to all CAN RAM addresses. RAM initialization which is performed after resetting the MCU does not initialize all CAN RAM areas.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. A RAM test page is selected by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register ( $\mathrm{r}=$ see Table 20.6).

The available total RAM size is shown below.
In classical CAN mode:
12640 bytes $\left(3160_{H}\right)$
In CAN FD mode:
17760 bytes $\left(4560_{\mathrm{H}}\right)$
In CAN FD mode, do not access more than 96 bytes in the last page (RTMPS $=45_{\mathrm{H}}$ ) during RAM test.

### 20.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally and mutually connecting CAN channels. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel. Channels not included in the test must be placed in channel halt mode.

Figure 20.15 shows the connection for inter-channel communication test.

Figure 20.15 Connection for Inter-Channel Communication Test

### 20.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

## Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

## Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID's upper 5-bit value is $10000_{\mathrm{B}}$ or ID's upper 6-bit value is $011111_{\mathrm{B}}$ is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

### 20.11 RS-CANFD Setting Procedure

### 20.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 6322 pclk cycles.

The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Configure CAN settings after the GRAMINIT flag is cleared to 0 . Figure $\mathbf{2 0 . 1 6}$ shows the CAN setting procedure after the MCU is reset.

Note: $\quad m=$ see Table 20.6; $j=$ see Table 20.6
Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.
Note 2. The setting must satisfy the following condition.
CAN clock $\leq \mathrm{pclk} / 2$

Figure 20.16 CAN Setting Procedure after the MCU is Reset

Page 1466 of 4595

### 20.11.1.1 Clock Setting

Set the CAN clock (fCAN) which is the clock source of the RS-CANFD module. Select clkc or clk_xincan by the DCS bit in the RSCFDn(CFD)GCFG register.

### 20.11.1.2 Bit Timing Setting

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register.

Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq ). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDnGCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode ( $\mathrm{CANmTq}(\mathrm{N})$ clock and $\mathrm{CANmTq}(\mathrm{D})$ clock). Be sure to specify the same values for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFDCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

Figure 20.17 shows the bit timing chart. Table 20.189 shows an example of bit timing setting.

Classical CAN mode:
SS = 1 Tq fixed
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG1 to a range of 4 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set SJW to a range of 1 Tq to 4 Tq
Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
TSEG1 > TSEG2 $\geq$ SJW

CAN FD mode
Nominal bit rate SS = 1 Tq fixed

DATA bit rate
SS = 1 Tq fixed
Set TSEG1 to a range of 2 Tq to 16 Tq
Set TSEG2 to a range of 2 Tq to 8 Tq
Set TSEG2 to a range of 2 Tq to 8 Ta
Set SJW to a range of 1 Tq to 8 Tq
Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tc
TSEG1 $\geq$ TSEG2 $\geq$ SJW

- SS (synchronization segment):

The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the interframe Space.
Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.

- TSEG1 (Time segment 1 ):

TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice
of the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.

- TSEG2 (Time segment 2):

TSEG2 is a segment that compensates phase error due to an error in frequency.

- SJW (Resynchronization jump width)

The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

### 20.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

Figure 20.18 shows the CAN clock control block diagram, and Table 20.190 and Table 20.191 show an example of the communication speed setting.

Note: $\mathrm{m}=$ see Table 20.6

| Nominal bit rate 500 kbps | Nominal 80 Tq (1) <br> Data bit rate 2 Mbps | Nominal bit rate 40 Tq (1) <br> Data 20 Tq (1) rate 10 Tq (1) |

Note: Values in ( ) are baud rate prescaler division values.

### 20.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.
Up to 16 receive rules can be registered per page. Specify pages 0 to 19 (for 5-channel unit) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable by the AFLDAE bit.

Figure 20.19 shows the receive rule setting procedure.

Figure 20.19 Receive Rule Setting Procedure

### 20.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

In classical CAN mode, up to 5120 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 320 buffers are available, and 16 bytes are used per buffer.

Configure the buffers so that the following conditions are met.
Number of receive buffers + total number of depth of receive FIFO buffers $x$

+ total number of depth of transmit/receive FIFO buffers $\mathrm{k} \leq 320$ buffers
In CAN FD mode, up to 8960 bytes of the RAM can be used in receive buffers and FIFO buffers.
Configure the buffers so that the following conditions are met.
Number of receive buffers $\times(12+$ payload storage size $)+$ total of (number of depth $\times(12+$ payload storage size $))$ of receive FIFO buffers $x+$ total of (number of depth $\times(12+$ payload storage size $)$ ) of transmit/receive FIFO buffers $k$ $\leq 8960$ bytes.

Figure 20.20 shows the buffer configuration. Figure 20.21 shows the buffer setting procedure.

Figure 20.20 Buffer Configuration

## CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

Note: $k=$ see Table 20.6, $x=$ see Table 20.6

Figure 20.21 Buffer Setting Procedure

### 20.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode)

A high baud rate is used in the data phase in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0 , the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.)

Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing.

Note: Bit n: Bit in the data phase
TDCO[6:0]: Bits in the RSCFDnCFDCmFDCFG register

Figure 20.22 SSP timing

When the TDCOC bit is 1 , the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0 , the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 fCAN). (CANm bit time is the value of data bit rate.)

When the TDCE bit is set to (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

### 20.11.2 Reception Procedure

### 20.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register ( $\mathrm{y}=$ see Table 20.6, $\mathrm{q}=$ see Table 20.6) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq,
RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCFDn(CFD)RMDFb_q ( $\mathrm{b}=0$ or 1 in classical CAN mode, $\mathrm{b}=0$ to 4 in CAN FD mode). If the next message has been received before the current message is read from the receive buffer, the message is overwritten.

Figure 20.23 shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.

Note: $y=$ see Table 20.6, $q=$ see Table 20.6;
$\mathrm{b}=0$ or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 20.23 Receive Buffer Reading Procedure

Note: $y=$ see Table 20.6, $q=$ see Table 20.6
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 20.24 Receive Buffer Reception Timing Chart
(1) When the ID field of a message has been received, the acceptance filter processing starts.
(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (receive buffer n contains a new message). If any other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.
(4) When the ID field of the next message has been received, the acceptance filter processing starts.
(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(6) When the corresponding RMNSq flag is cleared to 0 (receive buffer $n$ contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag cannot be cleared to 0 during storage of messages.

### 20.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or transmit/receive FIFO buffers that are set to receive mode or gateway mode, the corresponding message counter (RFMC[7:0] bits in the
RSCFDn(CFD)RFSTSx register ( $\mathrm{x}=$ see Table 20.6) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register ( $k=$ see Table 20.6) is incremented by 1 . At this time, if the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCFDn(CFD)RFDFd_x ( $\mathrm{d}=0$ or 1 in classical CAN mode, $\mathrm{d}=0$ to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full.).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).
If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0 . The program must clear the interrupt request flag to 0 .

Note: $\mathrm{k}=$ see Table 20.6; $\mathrm{d}=0$ or 1 (classical CAN mode); 0 to 15 (CAN FD mode)

Figure 20.25 Transmit/Receive FIFO Buffer Reading Procedure

When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 20.192 Payload Storage Area of Receive FIFO Buffer

| Setting of RFPLS[2:0] Bits | Payload Storage <br> Size | Corresponding Data Field Registers |
| :--- | :--- | :--- |
| $000_{\mathrm{B}}$ | 8 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x |
| $001_{\mathrm{B}}$ | 12 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x |
| $010_{\mathrm{B}}$ | 16 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x |
| $011_{\mathrm{B}}$ | 20 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x |
| $100_{\mathrm{B}}$ | 24 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x |
| $101_{\mathrm{B}}$ | 32 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x |
| $110_{\mathrm{B}}$ | 48 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x |
| $111_{\mathrm{B}}$ | 64 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x |

Table 20.193 Payload Storage Area of Transmit/Receive FIFO Buffer

| Setting of CFPLS[2:0] Bits | Payload Storage <br> Size | Corresponding Data Field Registers |
| :--- | :--- | :--- |
| $000_{\mathrm{B}}$ | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| $001_{\mathrm{B}}$ | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| $010_{\mathrm{B}}$ | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| $011_{\mathrm{B}}$ | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| $100_{\mathrm{B}}$ | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| $101_{\mathrm{B}}$ | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| $110_{\mathrm{B}}$ | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| $111_{\mathrm{B}}$ | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |

CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC $2: 00]$ RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], CFEMP, RFIF: Flags in the RSCFDn(CFD)FRSTSx register

Note: $\mathrm{k}=$ see Table 20.6, $\mathrm{x}=$ see Table 20.6

Figure 20.26 FIFO Buffer Reception Timing Chart
(1) When the ID field of a message has been received, the acceptance filter processing starts.
(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is $001_{\mathrm{B}}$ or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented by 1 and becomes $01_{\mathrm{H}}$. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be cleared to 0 by the program.
(4) When the ID field of the next message has been received, the acceptance filter processing starts.
(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDn(CFD)CFDF_k, and RSCFDn(CFD)CFDFk registers and write $\mathrm{FF}_{\mathrm{H}}$ to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is decremented by 1 and become $00_{\mathrm{H}}$, and the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).
(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
(7) The message having passed through the DLC filter process is stored in the transmit/receive FIFO buffer which is set to receive mode, when the CFE bit is set to 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] bits are set to $001_{\mathrm{B}}$ or more. The CFMC[7:0] value is incremented by 1 to $01_{\mathrm{H}}$. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present). The message is stored in the receive FIFO buffer when the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used.) and RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to $001_{\mathrm{B}}$ or more. The RFMC[7:0] value in the RSCFDn(CFD)RFSTSx register is incremented by 1 to $01_{\mathrm{H}}$. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt request occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

### 20.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers $x$ ( $x=$ see Table 20.6)
- The first transmit/receive FIFO buffer $k$ allocated to channel $m(k=3 \times m, m=$ see Table 20.6)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address(*1) for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented by 1 . After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

### 20.11.3 Transmission Procedure

### 20.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 20.27 shows the procedure for transmission from transmit buffers.
Figure 20.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. Figure 20.29 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

Figure 20.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers $(16 \times m)+0$ and transmit buffers $(16 \times m)+3$. At this time, transmit buffers $(16 \times m)$ +1 to $(16 \times m)+2$ and transmit buffers $(16 \times m)+4$ to $(16 \times m)+5$ are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. Table 20.194 shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0 .

Table 20.194 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

| Transmit Buffer | Offset from Base Address | Symbol | Register Function in Transmit Buffer Merge Mode |
| :---: | :---: | :---: | :---: |
| Transmit buffer 0 | $4000_{\mathrm{H}}$ | RSCFDnCFDTMID0 | Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit, and IDE bit |
|  | 4004 ${ }_{\text {H }}$ | RSCFDnCFDTMPTR0 | Transmit buffer 0 label data and DLC data |
|  | 4008 ${ }_{\text {H }}$ | RSCFDnCFDTMFDCTR0 | Transmit buffer 0 ESI bit, BRS bit, and FDF bit |
|  | $400 \mathrm{C}_{\mathrm{H}}$ to $401 \mathrm{C}_{\mathrm{H}}$ | RSCFDnCFDTMDFO_0 to RSCFDnCFDTMDF4_0 | Transmit buffer 0 data bytes $0,1,2$, and 3 to transmit buffer 0 data bytes $16,17,18$, and 19 |
| Transmit buffer 1 | $4020_{\text {H }}$ | RSCFDnCFDTMID1 | Transmit buffer 0 data bytes 20,21,22, and 23 |
|  | 4024 ${ }_{\text {H }}$ | RSCFDnCFDTMPTR1 | Transmit buffer 0 data bytes 24,25,26, and 27 |
|  | $4028_{\text {H }}$ | RSCFDnCFDTMFDCTR1 | Transmit buffer 0 data bytes 28,29,30, and 31 |
|  | $402 \mathrm{C}_{\mathrm{H}}$ to 403C H | $\begin{aligned} & \text { RSCFDnCFDTMDF0_1 } \\ & \text { to RSCFDnCFDTMDF4_1 } \end{aligned}$ | Transmit buffer 0 data bytes 32,33,34, and 35 to transmit buffer 0 data bytes $48,49,50$, and 51 |
| Transmit buffer 2 | 4040 ${ }^{\text {H }}$ | RSCFDnCFDTMID2 | Transmit buffer 0 data bytes 52,53,54, and 55 |

Figure 20.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)
(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer "a" is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. Some delay may occur in the determination time if any other channels are performing the transmit priority determination processing. However, it does not affect the transmission interval because the determination will be completed before bit 3 of intermission.
(3) When transmit completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to $10_{\mathrm{B}}$ (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0 . When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_{\mathrm{B}}$ (transmission is in progress or no transmit request is present).
(4) Before starting the next transmission, set the TMTRF[1:0] flag to $00_{\mathrm{B}}$. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is $00_{\mathrm{B}}$.

If an arbitration-lost occurs after transmission started, the TMTSTS flag is cleared to 0 . The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search for the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration lost, the priority determination processing is reexecuted during transmission of an error frame.
When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1 ).

Figure 20.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)
(1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer "a" is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
(2) When the transmit buffer is determined for the next transmission or is in progress of transmission, message transmission is not aborted unless an error or arbitration lost occurs even if the TMTAR bit is set to 1 (transmit abort is requested).
(3) The priority determination starts with the CRC delimiter for the next transmission. In this timing chart, buffer "b" is not selected as the next transmit buffer. Some delay may occur in the determination time if any other channels are performing the transmit priority determination processing. However, it does not affect the transmission interval because the determination will be completed before bit 3 of intermission.
(4) When transmit completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to $11_{B}$ (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0 . When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_{\mathrm{B}}$ (transmission is in progress or no transmit request is present).
(5) When another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), the TMTR bit cannot be cleared to 0 if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority.
(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to $01_{B}$. When the transmit buffer is neither transmitting data nor selected as the next transmit buffer and when priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to $01_{\mathrm{B}}$. At this time, the TMTR and TMTAR bits are cleared to 0 . When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to $00_{\mathrm{B}}$.

If an arbitration lost occurs after the CAN channel started transmission, the TMTSTS bit is cleared to 0 . The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search for the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration lost, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1 ).

### 20.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure $\mathbf{2 0 . 3 0}$ shows the procedure for transmission from transmit/receive FIFO buffers.
Figure 20.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. Figure $\mathbf{2 0 . 3 2}$ shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

Note: $\mathrm{k}=$ see Table 20.6; $\mathrm{d}=0$ or 1 (classical CAN mode); 0 to 15 (CAN FD mode)

Figure 20.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 20.195 Payload Storage Area of Transmit/Receive FIFO Buffer

| Setting of CFPLS[2:0] Bits | Payload Storage <br> Size | Corresponding Data Field Registers |
| :--- | :--- | :--- |
| $000_{\mathrm{B}}$ | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| $001_{\mathrm{B}}$ | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| $010_{\mathrm{B}}$ | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| $011_{\mathrm{B}}$ | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| $100_{\mathrm{B}}$ | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| $101_{\mathrm{B}}$ | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| $110_{\mathrm{B}}$ | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| $111_{\mathrm{B}}$ | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |

Figure 20.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)
(1) While the CAN bus is idle, the priority determination processing starts to determine the highest-priority transmit message when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used), the CFDC[2:0] value in the $\mathrm{RSCFDn}(\mathrm{CFD}) \mathrm{CFCCa}$ register is $001_{\mathrm{B}}$ (4 messages) or more, and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is $01_{\mathrm{H}}$ or more. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer "a" of channel 0 .
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. Some delay may occur in the determination time if any other channels are performing the transmit priority determination processing. However, it does not affect the transmission interval because the determination will be completed before bit 3 of intermission.
(3) When transmit completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented by 1 . Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present).
(4) The CFTXIF flag can be cleared by the program.
(5) Message transmission from transmit/receive FIFO buffer " b " of channel 0 completes and the CFMC[7:0] value in the RSCFDn $(\mathrm{CFD})$ CFSTSb register is decremented by 1 . The CFMC[7:0] bits are cleared to $00_{\mathrm{H}}$ and therefore the

CFEMP flag in the RSCFDn(CFD)CFSTSb register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1 . It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa register and RSCFDn(CFD)CFSTSb register are set to 1 (the transmit/receive FIFO buffer is full).

Figure 20.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)
(1) While the CAN bus is idle, the priority determination processing starts to determine the highest-priority transmit message when the CFE bit in the RSCFDn(CFD)CFCCa register ( $\mathrm{a}=0$ to 11 ) is 1 (transmit/receive FIFO buffers are used), the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is $001_{\mathrm{B}}$ (4 messages) or more, and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is $01_{\mathrm{H}}$ or more. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0 .
(2) When transmission is in progress or the transmit/receive FIFO buffer is determined for the next transmission, message transmission is not aborted unless an error or arbitration lost occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).
(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. Some delay may occur in the determination time if any other channels are performing the transmit priority determination processing. However, it does not affect the transmission interval because the determination will be completed before bit 3 of intermission.
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to $00_{\mathrm{H}}$. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The CFTXIF flag can be cleared by the program.
(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer "b"), transmit/receive FIFO buffers "b" cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSb register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)
(6) After the internal processing time has passed, transmit/receive FIFO buffers " b " are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSb register are cleared to $00_{\mathrm{H}}$ and the CFEMP flag is set to 1 . When the transmit/receive FIFO buffer " $b$ " is neither transmitting data nor selected as the next transmit buffer and when priority determination is not in progress, the transmit/receive FIFO " b " buffer is immediately disabled. (The CFMC[7:0] bits are cleared to $00_{\mathrm{H}}$ and the CFEMP flag is set to 1 .)

### 20.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 20.33 shows the procedure for transmission from the transmit queue.

Note: $\quad p=m \times 16+15, m=$ see Table 20.6

Figure 20.33 Procedure for Transmission from the Transmit Queue

### 20.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing $\mathrm{FF}_{\mathrm{H}}$ to the corresponding RSCFDn(CFD)THLPCTRm register ( $\mathrm{m}=$ see Table 20.6) after reading a set of data.
Figure 20.34 shows the transmit history buffer reading procedure.

Note: $m=$ see Table 20.6

Figure 20.34 Transmit History Buffer Reading Procedure

### 20.11.4 Test Settings

### 20.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by receiving messages transmitted from the own node.
Figure 20.35 shows the self-test mode setting procedure.

Note: $m=$ see Table 20.6

Figure 20.35 Self-Test Mode Setting Procedure

### 20.11.4.2 Procedure for Releasing the Protection

Since the global test function in Table 20.196 is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1 .

Table 20.196 Protection Release Data for Test Function

| Test Function | Protection Release Data 1 | Protection Release Data 2 | Target Bit |
| :--- | :--- | :--- | :--- |
| RAM test | $7575_{H}$ | $8 A 8 A_{H}$ | RTME bit in the RSCFDn(CFD)GTSTCTR <br> register |

If an incorrect value is written to the $\operatorname{LOCK}[15: 0]$ bits, restart from writing the protection release data 1. Figure 20.36 shows the procedure for releasing the protection.

Figure 20.36 Protection Release Procedure

### 20.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before ending the RAM test, write $00000000_{\mathrm{H}}$ to all pages of the CAN RAM.

Figure 20.37 shows the RAM test setting procedure.

Figure 20.37 RAM Test Setting Procedure

### 20.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication test can be performed by transmitting and receiving data between different channels.
Figure 20.38 shows the inter-channel communication test setting procedure.

Figure 20.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

### 20.12 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDn(CFD)GRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register ( $m=$ see Table 20.6) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the lowest rule number. If the same ID, IDE bit, or RTR bit value is set in multiple receive rules, the lowest-numbered receive rule is used to pass the received message through the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp register) of the corresponding transmit buffer to $00_{\mathrm{H}}$. The status register (RSCFDn(CFD)TMSTSp register) of the corresponding transmit buffer should not be used. Flags in other status registers (RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS2, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS2, RSCFDn(CFD)TMTCSTS0 to RSCFDn(CFD)TMTCSTS2, and RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS2 registers), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues, remain unchanged. Set the enable bit in the corresponding interrupt enable register (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2 register) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write $00_{\mathrm{H}}$ to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to the same transmit buffer.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt is made to store a new message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- In the case of registers that access the RAM, the value after reset shown in Section 20.3, Registers (Classical CAN Mode) and Section 20.4, Registers (CAN FD Mode) indicate the values cleared by initialization of the CAN RAM. Values before clearing are undefined. The following registers apply.
- Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
- Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)
- Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
- Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
- Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
- Transmit history access register (RSCFDn(CFD)THLACCm register)
- RAM test page access register (RSCFDn(CFD)RPGACCr register)
- The values of unused receive buffers (the RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

## Section 21 FlexRay (FLXA)

This section contains a generic description of the FlexRay (FLXA).
The first part of this section describes the features specified to this product, such as the number of units and register base addresses.

The remainder of this section describes the FLXA functions and registers.

### 21.1 Features of FLXA

### 21.1.1 Number of Units

This microcontroller has the following number of FLXA units.
Table $21.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 Series |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Name | FLXAn $(\mathrm{n}=0)$ | FLXAn $(\mathrm{n}=0)$ |

Table 21.2 Unit Configurations and Channels

|  |  |  | RH850/E2x-FCC1 Series |  |
| :--- | :--- | :--- | :--- | :---: |
| Unit Name | No. of Channels | 373 Pins | 292 Pins |  |
| FLXA0 | 2 (A ch, B ch) | $\checkmark$ | $\checkmark$ |  |

Table 21.3 Index

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual FLXA units are identified by the index " n "; <br> For example, the FlexRay control register of FLXAn is described as FLXAnFROC. |

### 21.1.2 Register Base Address

The FLXAn base addresses are listed in the following table.
FLXAn register addresses are given as offsets from the base addresses in general.
Table 21.4 Register Base Address

| Base Address Name | Base address | Bus Group |
| :--- | :--- | :--- |
| <FLXAO_base> | $10020000_{H}$ | H-Bus Group 1 |

### 21.1.3 Clock Supply

The FLXAn clock supply is shown in the following table.
Table 21.5 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| FLXAn | Bus clock | CLK_HBUS |
|  | FlexRay sample clock | CLK_HSB |

### 21.1.4 Interrupt Requests

The FLXAn interrupt requests are listed in the following table.
Table $21.6 \quad$ Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FLXA0 |  |  |  |  |  |
| INTFLXAOLINE0 | INTFLXAnLINEO $(\mathrm{n}=0)$ | Universal interrupt for FLXA0 | 486 | - | - |
| INTFLXAOLINE1 | INTFLXAnLINE1 $(\mathrm{n}=0)$ | Universal interrupt for FLXA0 | 487 | - | - |
| INTFLXAOTIM0 | INTFLXAnTIMO $(\mathrm{n}=0)$ | Timer 0 interrupt for FLXA0 | 488 | - | - |
| INTFLXA0TIM1 | INTFLXAnTIM1 $(n=0)$ | Timer 1 interrupt for FLXA0 | 489 | - | - |
| INTFLXA0TIM2 | INTFLXAnTIM2 $(\mathrm{n}=0)$ | Timer 2 interrupt for FLXA0 | 490 | - | - |
| INTFLXA0FDA | INTFLXAnFDA $(\mathrm{n}=0)$ | FIFO data available interrupt for FLXA0 | 491 | - | - |
| INTFLXA0FW | INTFLXAnFW $(\mathrm{n}=0)$ | FIFO transfer warning interrupt for FLXA0 | 492 | - | - |
| INTFLXA0OW | INTFLXAnOW $(\mathrm{n}=0)$ | Output transfer warning interrupt for FLXAO | 493 | - | - |
| INTFLXA0OT | INTFLXAnOT $(\mathrm{n}=0)$ | Output transfer done interrupt for FLXA0 | 494 | - | - |
| INTFLXAOIQF | INTFLXAnIQF $(\mathrm{n}=0)$ | Input queue full interrupt for FLXA0 | 495 | - | - |
| INTFLXAOIQE | INTFLXAnIQE $(\mathrm{n}=0)$ | Input queue empty interrupt for FLXA0 | 496 | - | - |

### 21.1.5 Reset Sources

FLXAn reset sources are listed in the following table. FLXAn is initialized by the following reset signal.
Table 21.7 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module <br> Reset | JTAG Reset |
| FLXAn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 21.1.6 External Input/Output Signals

The external input/output signals of FLXAn are listed below.
Table 21.8 External Input/Output Signals

| Unit Signal Name |  | Outline |
| :--- | :--- | :--- |
| FLXA0 | Alternative Port Pin Signal |  |
| FLXAORXDA | Channel A receive data input | FRORXDA |
| FLXA0RXDB | Channel B receive data input | FRORXDB |
| FLXA0TXDA | Channel A transmit data output | FROTXDA |
| FLXA0TXDB | Channel B transmit data output | FROTXDB |
| FLXAOTXENA | Channel A transmit enable | FROENA |
| FLXAOTXENB | Channel B transmit enable | FROENB |
| CAUTION |  |  |

This AC specification is applied to the specific pin groups only. For details, please refer to Appendix file "Limited_conditions_for_AC_specification.xlsx".

### 21.2 Overview

### 21.2.1 Functional Overview

For communication on a FlexRay network, individual message buffers with up to 254 data bytes are configurable. The message storage consists of a single-ported Message RAM that holds up to 128 message buffers. All functions concerning the handling of messages are implemented in the message handler. Those functions are the acceptance filtering, the transfer of messages between the two FlexRay channel protocol controllers and the message RAM, maintaining the transmission schedule as well as providing message status information.

The register set of the FlexRay IP module can be accessed directly by an external host via the module's host interface. These registers are used to control/configure/monitor the FlexRay channel protocol controllers, message handler, global time unit, system universal control, frame and symbol processing, network management, and interrupt control, to access the message RAM via input/output buffer, and to control the data transfer between the message RAM and the Local RAM/Cluster RAM.

The FlexRay IP module supports the following features:

| Item | Specification |
| :---: | :---: |
| Communication | Conformance with FlexRay protocol specification v2.1 |
| Data transfer rate | Up to $10 \mathrm{Mbit} / \mathrm{s}$ on each channel |
| FlexRay channels | 2 (channels A and B) |
| Message buffer | Up to 128 message buffers configurable |
|  | Configuration of message buffers with different payload lengths possible |
|  | Each message buffer can be configured as receive buffer, as transmit buffer or as part of the receive FIFO |
|  | Filtering for slot counter, cycle counter, and channel |
| Message RAM | 8 KB of message RAM for storage, for example: |
|  | 128 message buffers with max. 48 byte data section |
|  | Up to 30 message buffers with 254 byte data section |
| FIFO | One configurable receive FIFO |
| Message buffer access | By host CPU via input and output buffer Input buffer: Holds message to be transferred to the message RAM Output buffer: Holds message read from the message RAM |
|  | By data transfer function <br> Input transfer: Message buffer content is transferred from Local RAM/Cluster RAM to message RAM on CPU request <br> Output transfer: Message buffer content is transferred from message RAM to Local RAM/Cluster RAM automatically |
| Network management | Automatic HW support |
| Interrupts | Maskable module interrupts |
| Timer | Two absolute timers (Timer0, Timer2) One relative timer (Timer1) <br> One stop watch timer |

### 21.2.2 Block Diagram

Figure 21.1 FlexRay IP Block Diagram

## Input Buffer (IBF)

For write access to the message buffers configured in the message RAM, the host can write the header and data section for a specific message buffer to the input buffer. The message handler then transfers the data from the input buffer to the selected message buffer in the message RAM.

## Output Buffer (OBF)

For read access to a message buffer configured in the message RAM, the message handler transfers the selected message buffer to the output buffer. After the transfer has completed, the host can read the header and data section of the transferred message buffer from the output buffer.

## Message Handler (MHD)

The FlexRay message handler controls data transfers between the following components:

- Input/output buffer and message RAM
- Transient Buffer RAMs of the two FlexRay protocol controllers and message RAM

## Message RAM (MRAM)

The message RAM consists of a single-ported RAM that stores up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

## Transient Buffer RAM (TBF A/B)

Stores the data section of two complete messages.

## FlexRay Channel Protocol Controllers (PRT A/B)

The FlexRay channel protocol controllers consist of shift register and FlexRay protocol FSM. They are connected to the Transient Buffer RAMs for intermediate message storage and to the physical layer via bus driver (BD).

They have the following functionality:

- Control and check of bit timing
- Reception/transmission of FlexRay frames and symbols
- Check of header CRC
- Generation/checking of frame CRC
- Interfacing to bus driver

## Global Time Unit (GTU)

The global time unit performs the following functions:

- Generation of microtick
- Generation of macrotick
- Fault tolerant clock synchronization by FTM algorithm
- Rate correction
- Offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislotting)
- Support of external clock correction

## System Universal Controller (SUC)

The system universal controller controls the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

## Frame and Symbol Processing (FSP)

The frame and symbol processing controls the following functions:

- Checks the correct timing of frames and symbols
- Tests the syntactical and semantical correctness of received frames
- Sets the slot status flags

## Network Management (NEM)

Handles the network management vector.

## Interrupt Control (INT)

The interrupt controller performs the following functions:

- Provides error and status interrupt flags
- Enable/disable interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enable/disable module interrupt lines

## Timer (TIM)

The timer module includes the following macrotick timers:

- Two absolute timers
- One relative timer
- One stop watch timer

## Transfer Handler (TRH)

Handles the data transfer between Local RAM/Cluster RAM and FlexRay module.
The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the Local RAM/Cluster RAM to the message RAM
- Transfer of payload data for transmit buffer from the Local RAM/Cluster RAM to the message RAM
- Transfer of buffer configuration data and payload data for transmit buffer from the Local RAM/Cluster RAM to the message RAM
- Automatic transfer of payload data from receive buffer to the Local RAM/Cluster RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the Local RAM/Cluster RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Cluster RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Cluster RAM

The terms and abbreviations used in this section are given below.

| Term | Meaning |
| :---: | :---: |
| BD | Bus driver |
| BSS | Byte start sequence |
| CAS | Collision Avoidance Symbol |
| CC | Communication controller |
| CHI | Controller host interface |
| CIF | Host interface |
| CRC | CRC check (Cyclic Redundancy Check) |
| FES | Frame end sequence |
| FSS | Frame Start Sequence |
| FIFO | First In First Out |
| FSM | Finite State Machine |
| FSP | Frame and Symbol Processing Block |
| FTM | Fault Tolerant Midpoint |
| GIF | Generic Interface Block |
| GTU | Global Time Unit Block) |
| IBF | Input Buffer |
| INT | Interrupt Control Block |
| MBF | Message Buffer RAM |
| MHD | Message Handler Block |
| MT | Macrotick |
| MTS | Media Access Test Symbol |
| NCT | Network Communication Time |
| NEM | Network Management Block |
| NIT | Network Idle Time |
| NM | Network Management |
| OBF | Output Buffer |
| PE | Protocol Engine |
| POC | Protocol Operation Control |
| PRT | Protocol Controller Block |
| SDL | Specification and Description Language |
| SUC | System Universal Control Block |
| TBF | Transient Buffer |
| TDMA | Time Division Multiple Access |
| TRH | Transfer Handler |
| TSS | Transmission Start Sequence |
| TT-D | Time Triggered Distributed synchronization |
| $\mu \mathrm{T}$ | Microtick |
| WUP | Wakeup Pattern |
| WUS | Wakeup Symbol |

### 21.3 Registers

### 21.3.1 List of Registers

The FLXAn registers are listed in the following table.
For details on $<$ FLXAn_base $>$, see Section 21.1.2, Register Base Address.
Table $21.9 \quad$ List of Registers (1/4)

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FLXAn | FlexRay Operation Control Register | FLXAnFROC | <FLXAn_base> + 0004H | 8, 16, 32 | - |
|  | FlexRay Operation Status Register | FLXAnFROS | <FLXAn_base> + 000C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Lock Register | FLXAnFRLCK | <FLXAn_base> + 001C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Error Interrupt Register | FLXAnFREIR | <FLXAn_base> + 0020 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Status Interrupt Register | FLXAnFRSIR | <FLXAn_base> + 0024 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Error Interrupt Line Select Register | FLXAnFREILS | <FLXAn_base> + 0028 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Status Interrupt Line Select Register | FLXAnFRSILS | <FLXAn_base> + 002C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Error Interrupt Enable Set Register | FLXAnFREIES | <FLXAn_base> + 0030 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Error Interrupt Enable Reset Register | FLXAnFREIER | <FLXAn_base> + 0034H | 8, 16, 32 | - |
|  | FlexRay Status Interrupt Enable Set Register | FLXAnFRSIES | <FLXAn_base> + 0038 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Status Interrupt Enable Reset Register | FLXAnFRSIER | <FLXAn_base> + 003C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Interrupt Line Enable Register | FLXAnFRILE | <FLXAn_base> + 0040 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Timer 0 Configuration Register | FLXAnFRTOC | <FLXAn_base> + 0044 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Timer 1 Configuration Register | FLXAnFRT1C | <FLXAn_base> + 0048 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Stop Watch Register 1 | FLXAnFRSTPW1 | <FLXAn_base> + 004C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Stop Watch Register 2 | FLXAnFRSTPW2 | <FLXAn_base> + 0050 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay SUC Configuration Register 1 | FLXAnFRSUCC1 | <FLXAn_base> + 0080 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay SUC Configuration Register 2 | FLXAnFRSUCC2 | <FLXAn_base> + 0084 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay SUC Configuration Register 3 | FLXAnFRSUCC3 | <FLXAn_base> + 0088 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay NEM Configuration Register | FLXAnFRNEMC | <FLXAn_base> + 008C ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay PRT Configuration Register 1 | FLXAnFRPRTC1 | <FLXAn_base> + 0090 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay PRT Configuration Register 2 | FLXAnFRPRTC2 | <FLXAn_base> + 0094 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay MHD Configuration Register | FLXAnFRMHDC | <FLXAn_base> + 0098 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 1 | FLXAnFRGTUC1 | <FLXAn_base> + 00A0 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 2 | FLXAnFRGTUC2 | <FLXAn_base> + 00A4 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 3 | FLXAnFRGTUC3 | <FLXAn_base> + 00A8 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 4 | FLXAnFRGTUC4 | <FLXAn_base> + 00AC ${ }_{H}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 5 | FLXAnFRGTUC5 | <FLXAn_base> + 00B0 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 6 | FLXAnFRGTUC6 | <FLXAn_base> + 00B4 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 7 | FLXAnFRGTUC7 | <FLXAn_base> + 00B8 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 8 | FLXAnFRGTUC8 | <FLXAn_base> + 00BC ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 9 | FLXAnFRGTUC9 | <FLXAn_base> + $00 \mathrm{CO}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | FlexRay GTU Configuration Register 10 | FLXAnFRGTUC10 | <FLXAn_base> + 00C4H | 8, 16, 32 | - |

Table 21.9 List of Registers (2/4)

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FLXAn | FlexRay GTU Configuration Register 11 | FLXAnFRGTUC11 | <FLXAn_base> + 00C8 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay CC Status Vector Register | FLXAnFRCCSV | <FLXAn_base> + 0100 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay CC Error Vector Register | FLXAnFRCCEV | <FLXAn_base> + 0104 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Slot Counter Value Register | FLXAnFRSCV | <FLXAn_base> + 0110 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Macrotick and Cycle Counter Value Register | FLXAnFRMTCCV | <FLXAn_base> + 0114 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Rate Correction Value Register | FLXAnFRRCV | <FLXAn_base> + 0118 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | FlexRay Offset Correction Value Register | FLXAnFROCV | <FLXAn_base> + 011 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | FlexRay Sync Frame Status Register | FLXAnFRSFS | <FLXAn_base> + 0120 ${ }_{\text {H }}$ | 8, 16, 32 | - |

Table 21.10 FLXAnFROC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 18 | T2IE | Timer 2 Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 17 | T1IE | Timer 1 Interrupt Enable Bit <br> 0: Disabled <br> 1: Enabled |
| 16 | TOIE | Timer 0 Interrupt Enable Bit <br> 0: Disabled <br> 15 |
| 15 to Enabled |  |  |

## (1) FLXAnFROC.T2IE

Timer 2 interrupt enable bit
This bit controls the timer 2 interrupt.
0 : Disabled
No interrupt will be requested and the timer 2 interrupt line will be released if held pending.
1: Enabled
Timer 2 interrupt will be asserted when FLXAnFROTS.T2IS is ' 1 '.

## (2) FLXAnFROC.T1IE

Timer 1 interrupt enable bit
The user should only set this bit to ' 1 ' when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TI1E should be ' 0 ').
This bit controls the timer 1 interrupt.
0 : Disabled
No interrupt will be requested and the timer 1 interrupt line will be released if held pending.
1: Enabled
Timer 1 interrupt will be asserted when FLXAnFROTS.T1IS is ' 1 '.

## (3) FLXAnFROC.TOIE

Timer 0 interrupt enable bit
The user should only set this bit to ' 1 ' when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TIOE should be ' 0 ').
This bit controls the timer 0 interrupt.
0 : Disabled
No interrupt will be requested and the timer 0 interrupt line will be released if held pending.
1: Enabled
Timer 0 interrupt will be asserted when FLXAnFROTS.T0IS is ' 1 '.

## (4) FLXAnFROC.OEP

Operation enable bit protection bit
This bit protects against unintended write access to the OE bit.
0 : OE bit is unprotected
Write access to the OE bit is enabled
1: OE bit is protected
Write access to the OE bit is disabled

## (5) FLXAnFROC.BEC

Byte endian control bit
The user should only change this bit when FLXAnFROS.OS is ' 1 '.
This bit controls the byte order on reading and writing the FlexRay network management vector register
(FLXAnFRNMVx), FlexRay write data section (FLXAnFRWRDSx) and FlexRay read data section
(FLXAnFRRDDSx). This bit also controls the byte order when reading or writing FlexRay payload data using the data transfer function.
For details about the byte alignment, please refer to Section 21.4.17, Byte Alignment.
0 : Little endian
Byte alignment in FLXAnFRNMVx, FLXAnFRWRDSx and FLXAnFRRDDSx is in little endian style.
1: Big endian
Byte alignment in FLXAnFRNMVx, FLXAnFRWRDSx and FLXAnFRRDDSx is in big endian style.

## (6) FLXAnFROC.OE

Operation enable bit
The user can only write to this bit when FLXAnFROC.OEP is ' 0 '.
The user should only write this bit with ' 0 ' when FLXAnFROS.OS is ' 1 '.
The user should only write this bit with ' 1 ' when FLXAnFROS.OS is ' 0 ' and the FlexRay sample clock is enabled. This bit controls the operation state and serves the software reset of the FlexRay module. The operation status bit (FLXAnFROS.OS) indicates whether or not the FlexRay module is in reset state.

0: Operation stopped SW reset
Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.
1: Operation Enabled
Reset state of the FlexRay module is released.

### 21.3.2.2 FLXAnFROS - FlexRay Operation Status Register

Do not rewrite this register using bit manipulation instructions.

Table 21.11 FLXAnFROS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 19 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 18 | T2IS | Timer 2 Interrupt Status Bit <br> 0 : Timer 2 has not matched the conditions configured in the FLXAnFRT2C register <br> 1: Timer 2 matched the conditions configured in the FLXAnFRT2C register |
| 17 | T1IS | Timer 1 Interrupt Status Bit <br> 0: Timer 1 has not matched the conditions configured in the FLXAnFRT1C register <br> 1: Timer 1 matched the conditions configured in the FLXAnFRT1C register |
| 16 | TOIS | Timer 0 Interrupt Status Bit <br> 0: Timer 0 has not matched the conditions configured in the FLXAnFRTOC register <br> 1: Timer 0 matched the conditions configured in the FLXAnFRTOC register |
| 15 to 1 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 0 | OS | Operation Status Bit <br> 0: Operation disabled, reset state <br> 1: Operation enabled |

## (1) FLXAnFROS.T2IS

Timer 2 Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
This bit represents that Timer 2 has matched the state configured in the FLXAnFRT2C register.
If enabled in FLXAnFROC.T2IE the timer 2 interrupt is generated when FLXAnFROS.T2IS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROS.T2IS.
This bit is cleared when FLXAnFROS.OS changes from ' 1 ' to ' 0 '.
[Setting condition]
This bit is set when Timer 2 matches the state configured in FLXAnFRT2C register.

## (2) FLXAnFROS.T1IS

Timer 1 Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
This bit indicates that Timer 1 has matched the state configured in FLXAnFRT1C register.
If enabled in FLXAnFROC.T1IE, the timer 1 interrupt is generated when FLXAnFROS.T1IS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROS.T1IS.
This bit is cleared when FLXAnFROS.OS changes from ' 1 ' to ' 0 '.
[Setting condition]
This bit is set when Timer 1 matches the state configured in the FLXAnFRT1C register.

## (3) FLXAnFROS.TOIS

Timer 0 Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
This bit represents that the Timer 0 has matched the state configured in the FLXAnFRT0C register.
If enabled in FLXAnFROC.T0IE, the timer 1 interrupt is generated when FLXAnFROS.T0IS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROS.T0IS.
This bit is cleared when FLXAnFROS.OS changes from ' 1 ' to ' 0 '.
[Setting condition]
This bit is set when Timer 0 matches the state configured in the FLXAnFRT0C register.

## (4) FLXAnFROS.OS

Operation Status Bit
This bit indicates whether the FlexRay module is in the reset or the operation state.
When FLXAnFROS.OS is ' 0 ', the FlexRay module gets initialized and registers mapped to the address area $<$ FLXAn_base $>+0010_{\mathrm{H}}$ to $<$ FLXAn_base $>+0 \mathrm{FFF}_{\mathrm{H}}$ cannot be accessed; read access from these registers will return undefined data.
When FLXAnFROS.OS is ' 1 ', it is possible to access the address area $<$ FLXAn_base $>+0010_{\mathrm{H}}$ to $<$ FLXAn_base $>+$ $0 \mathrm{FFF}_{\mathrm{H}}$ and to perform FlexRay communication.
When FLXAnFROS.OS changes from ' 0 ' to ' 1 ', all registers in the address range $<$ FLXAn_base $>+0010_{\mathrm{H}}$ to $<$ FLXAn_base $>+0 \mathrm{FFF}_{\mathrm{H}}$ are set to the "Values after reset".
[Clearing condition]
When FLXAnFROC.OE is set to ' 0 ', it takes up to two peripheral bus clock cycles until FLXAnFROS.OS is set to '0'.
[Setting condition]
When FLXAnFROC.OE is set to ' 1 ', it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until FLXAnFROS.OS is set to ' 1 '.

### 21.3.3 Special Registers

### 21.3.3.1 FLXAnFRLCK — FlexRay Lock Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | CLK[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.12 FLXAnFRLCK Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. <br> 7 to 0 |

## (1) FLXAnFRLCK.CLK

Configuration Lock Key
The lock register is write-only. Reading the register will return $00000000_{\mathrm{H}}$.
To leave CONFIG state by writing FLXAnFRSUCC1.CMD (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the configuration lock key and the write access to the FLXAnFRSUCC1 register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: FLXAnFRLCK.CLK $=$ " $11001110_{\mathrm{B}} "\left(\mathrm{CE}_{\mathrm{H}}\right)$
Second write: FLXAnFRLCK.CLK = "0011 0001B" $\left(31_{\mathrm{H}}\right)$
Third write: FLXAnFRSUCC1.CMD

## CAUTION

In case that the host uses 8/16-bit accesses to write the listed bit fields, the programmer has to ensure that no "dummy accesses", e.g. to the remaining register bytes/words, are inserted by the compiler.

### 21.3.4 Interrupt Registers

### 21.3.4.1 FLXAnFREIR — FlexRay Error Interrupt Register

Do not rewrite this register using bit manipulation instructions.
The flags are set when the CC detects one of the listed error conditions. The flags remain set until the host clears them.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.13 FLXAnFREIR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 26 | TABB | Transmission Across Boundary Channel B Flag <br> 0: No transmission across slot boundary detected on channel B <br> 1: Transmission across slot boundary detected on channel B |
| 25 | LTVB | Latest Transmit Violation Channel B Flag <br> 0: No latest transmit violation detected on channel B <br> 1: Latest transmit violation detected on channel B |
| 24 |  | Error Detected on Channel B Flag <br> 0: No error detected on channel B |
| 18 |  | 1: Error detected on channel B |

Table 21.13 FLXAnFREIR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 11 | MHF | Message Handler Constraints Flag <br> 0: No message handler failure detected <br> 1: Message handler failure detected |
| 10 |  | IOBA |
|  |  | Illegal Output Buffer Access Flag |
|  |  | 0: No illegal host access to output buffer occurred |
|  |  | 1: Illegal host access to output buffer occurred |

## (1) FLXAnFREIR.TABB

Transmission Across Boundary Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals to the host that a transmission across a slot boundary occurred for channel B.

## (2) FLXAnFREIR.LTVB

Latest Transmit Violation Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals the latest transmit violation on channel B to the host.

## (3) FLXAnFREIR.EDB

Error Detected on Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This bit is set whenever one of flags FLXAnFRACS.SEDB, FLXAnFRACS.CEDB, FLXAnFRACS.CIB, FLXAnFRACS.SBVB changes from ' 0 ' to ' 1 '.
(4) FLXAnFREIR.TABA

Transmission Across Boundary Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals to the host that a transmission across a slot boundary occurred for channel A.

## (5) FLXAnFREIR.LTVA

Latest Transmit Violation Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals the latest transmit violation on channel A to the host.

## (6) FLXAnFREIR.EDA

Error Detected on Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This bit is set whenever one of flags FLXAnFRACS.SEDA, FLXAnFRACS.CEDA, FLXAnFRACS.CIA, FLXAnFRACS.SBVA changes from ' 0 ' to ' 1 '.

## (7) FLXAnFREIR.MHF

Message Handler Constraints Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals a message handler constraints violation condition. It is set whenever one of flags
FLXAnFRMHDF.SNUA, FLXAnFRMHDF.SNUB, FLXAnFRMHDF.FNFA, FLXAnFRMHDF.FNFB, FLXAnFRMHDF.TBFA, FLXAnFRMHDF.TBFB, FLXAnFRMHDF.WAHP changes from ' 0 ' to ' 1 '.

## (8) FLXAnFREIR.IOBA

Illegal Output Buffer Access Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set by the CC when the host requests the transfer of a message buffer from the message RAM to the output buffer while FLXAnFROBCR.OBSYS is set to ' 1 '.

## (9) FLXAnFREIR.IIBA

Illegal Input Buffer Access Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set by the CC when the host wants to modify a message buffer via input buffer and one of the following conditions applies:

1. The CC is not in CONFIG or DEFAULT_CONFIG state and the host writes to the input buffer command request register to modify the:

- Header section of message buffer 0,1 if configured for transmission in key slot
- Header section of static message buffers with buffer number < FLXAnFRMRC.FDB while FLXAnFRMRC.SEC = " 01 "
- Header section of any static or dynamic message buffer while FLXAnFRMRC.SEC $=$ " 1 x "
- Header and/or data section of any message buffer belonging to the receive FIFO

2. The host writes to any register of the input buffer while FLXAnFRIBCR.IBSYH is set to ' 1 '.
(10) FLXAnFREIR.EFA

## Empty FIFO Access Flag

Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set by the CC when the host requests the transfer of a message from the receive FIFO via output buffer while the receive FIFO is empty.

## (11) FLXAnFREIR.RFO

Receive FIFO Overrun Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. The actual state of the FIFO is monitored in register FLXAnFRFSR.

## (12) FLXAnFREIR.AERR

Access Error Flag
Writing 0 in this bit has no effect.
This bit is cleared by writing ' 1 ' to it.
Notifies of an access error.
When the AMR, ATBF1, or ATBF2 bit in the FLXAnFRMHDS register changes from 0 to 1 , this bit is set to 1 .

## (13) FLXAnFREIR.CCL

CHI Command Locked Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because
the execution of the previous CHI command has not yet completed. In this case, bit FLXAnFREIR.CNA is also set to ' 1 '.

## (14) FLXAnFREIR.CCF

## Clock Correction Failure Flag

Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set at the end of the communication cycle whenever one of the following errors occurs:

- Missing offset and/or rate correction
- Clock correction limit reached

The clock correction status is monitored in registers FLXAnFRCCEV and FLXAnFRSFS. A failure may occur during startup, therefore bit FLXAnFREIR.CCF should be set to " 0 " after the CC enters NORMAL_ACTIVE state.

## (15) FLXAnFREIR.SFO

Sync Frame Overflow Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
It is set to " 1 " when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last double cycle exceeds the maximum number of sync frames as defined by FLXAnFRGTUC2.SNM.

## (16) FLXAnFREIR.SFBM

Sync Frames Below Minimum Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to " 1 " at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. missing offset and/or missing rate correction). The clock correction status is monitored in FLXAnFRCCEV and FLXAnFRSFS.
This flag may be set to " 1 " during startup. Therefore this flag should be set to " 0 " by the host after the CC enters NORMAL_ACTIVE state.

## (17) FLXAnFREIR.CNA

## Command Not Accepted Flag

Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked ( $\mathrm{CCL}=$ ' 1 ').

## (18) FLXAnFREIR.PEMC

## POC Error Mode Changed Flag

Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to " 1 " whenever the error mode signaled by FLXAnFRCCEV.ERRM has changed.

### 21.3.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register

Do not rewrite this register using bit manipulation instructions.
The flags are set when the CC detects one of the listed events. The flags remain set until the host clears them.

| Value after reset: |  | 0000 0000H |  | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## (1) FLXAnFRSIR.MTSB

MTS Received on Channel B Flag (vSS!ValidMTSB)
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
Media Access Test Symbol (MTS) received on channel B during the preceding symbol window.
Updated by the CC for each channel at the end of the symbol window.

## (2) FLXAnFRSIR.WUPB

Wakeup Pattern Channel B Flag
Writing ' 0 ' has no effect on the bit value.

This bit is cleared by writing ' 1 ' to it.
This flag is set to " 1 " when a wakeup pattern is received on channel B in either of the following states:

- WAKEUP
- READY
- STARTUP

## (3) FLXAnFRSIR.MTSA

MTS Received on Channel A Flag (vSS!ValidMTSA)
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
Media Access Test Symbol (MTS) received on channel A during the preceding symbol window.
Updated by the CC for each channel at the end of the symbol window.

## (4) FLXAnFRSIR.WUPA

Wakeup Pattern Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to " 1 " when a wakeup pattern was received on channel A in either of the following states:

- WAKEUP
- READY
- STARTUP

## (5) FLXAnFRSIR.SDS

Start of Dynamic Segment Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set by the CC when the dynamic segment starts.

## (6) FLXAnFRSIR.MBSI

Message Buffer Status Interrupt Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set by the CC when the message buffer status FLXAnFRMBS has changed and if bit MBI of that message buffer is " 1 " (see Table 21.106, Header Section of a Message Buffer in the Message RAM).

## (7) FLXAnFRSIR.SUCS

Startup Normal End Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever a startup completed successfully and the CC entered NORMAL_ACTIVE state.

## (8) FLXAnFRSIR.SWE

Stop Watch Event Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set after a stop watch activation when the actual cycle counter and macrotick value are stored in the Stop Watch register (see Section 21.3.5.4, FLXAnFRSTPW1 — FlexRay Stop Watch Register 1).

## (9) FLXAnFRSIR.TOBC

Transfer Output Buffer Completed Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever a transfer from the message RAM to the output buffer has completed and FLXAnFROBCR.OBSYS has been reset by the message handler.

## (10) FLXAnFRSIR.TIBC

Transfer Input Buffer Completed Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever a transfer from input buffer to the message RAM has completed and FLXAnFRIBCR.IBSYS has been reset by the message handler.

## (11) FLXAnFRSIR.TI1

Timer Interrupt 1 Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever timer 1 matches the conditions configured in register FLXAnFRT1C.
INTFLXAnTIM1 is generated when the T1IE bit in the FLXAnFROC register is effective.

## (12) FLXAnFRSIR.TIO

Timer Interrupt 0 Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever timer 0 matches the conditions configured in register FLXAnFRT0C.
INTFLXAnTIM0 is generated when the T0IE bit in the FLXAnFROC register is effective.
(13) FLXAnFRSIR.NMVC

Network Management Vector Changed Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This bit is set when a change in the Network Management Vector occurs.

## (14) FLXAnFRSIR.RFCL

Receive FIFO Critical Level Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set when the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level as configured by FLXAnFRFCL.CL.

## (15) FLXAnFRSIR.RFNE

Receive FIFO Not Empty Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set when a received valid frame is transferred to the empty receive FIFO. The current state of the receive FIFO can be read in register FLXAnFRFSR.

## (16) FLXAnFRSIR.RXI

Receive Interrupt Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set whenever the set condition of a message buffers ND flag is fulfilled (see Section 21.3.9.6, FLXAnFRNDATi — FlexRay New Data Register $\mathbf{i}(\mathbf{i}=1$ to 4$)$ ), and if bit MBI of that message buffer is set to 1 (see Table 21.106, Header Section of a Message Buffer in the Message RAM).

## (17) FLXAnFRSIR.TXI

Transmit Interrupt Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set at the end of frame transmission if bit MBI in the respective message buffer is set to 1 (see Table
21.106, Header Section of a Message Buffer in the Message RAM)

## (18) FLXAnFRSIR.CYCS

Cycle Start Interrupt Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to " 1 " every time a communication cycle starts.

## (19) FLXAnFRSIR.CAS

Collision Avoidance Symbol Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set during STARTUP state when a CAS or an expected CAS was received.

## (20) FLXAnFRSIR.WST

Wakeup Status Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set when FLXAnFRCCSV.WSV changes to a value other than UNDEFINED.

### 21.3.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register

The FlexRay error interrupt line select register assigns an interrupt generated by a specific error interrupt flag from register FLXAnFREIR to one of the two module interrupt lines (INTFLXAnLINE0 or INTFLXAnLINE1).

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

### 21.3.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register

The settings in the FlexRay error interrupt enable set register (FLXAnFREIES) and FlexRay error interrupt enable reset register (FLXAnFREIER) determine which status changes in the FlexRay error interrupt register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing ' 0 ' has no effect on the bit value.
Writing ' 1 ' sets the interrupt enable bit.

Table 21.17 FLXAnFREIES Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 26 | TABBE | Transmission Violation Across Boundary Channel B Interrupt Enable Bit <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |

### 21.3.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register

The settings in the FlexRay error interrupt enable set register (FLXAnFREIES) and FlexRay error interrupt enable reset register (FLXAnFREIER) determine which status changes in the FlexRay error interrupt register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing ' 0 ' has no effect on the bit value.
Writing ' 1 ' clears the interrupt enable bit.

Table 21.18 FLXAnFREIER Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |

### 21.3.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register

The settings in the FlexRay status interrupt enable set register (FLXAnFRSIES) and FlexRay status interrupt enable reset register (FLXAnFRSIER) determine which status changes in the FlexRay status interrupt register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing ' 0 ' has no effect on the bit value.
Writing ' 1 ' sets the interrupt enable bit.

Table 21.19 FLXAnFRSIES Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |

### 21.3.4.8 FLXAnFRSIER — FlexRay Status Interrupt Enable Reset Register

The settings in the FlexRay status interrupt enable set register (FLXAnFRSIES) and FlexRay status interrupt enable reset register (FLXAnFRSIER) determine which status changes in the FlexRay status interrupt register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing ' 0 ' has no effect on the bit value.
Writing ' 1 ' clears the interrupt enable bit.

Table 21.20 FLXAnFRSIER Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |

### 21.3.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register

Each of the two module interrupt lines (INTFLXAnLINE0, INTFLXAnLINE1) can be enabled or disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 21.21 FLXAnFRILE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 1 | EINT1 | Enable FlexRay Interrupt Line 1 Bit <br> $0:$ INTFLXAnLINE1 disabled <br> 1: INTFLXAnLINE1 enabled |
| 0 | EINT0 | Enable FlexRay Interrupt Line 0 Bit <br> 0: INTFLXAnLINEO disabled <br> 1: INTFLXAnLINE0 enabled |

### 21.3.5 FlexRay Timer Registers

### 21.3.5.1 FLXAnFRTOC — FlexRay Timer 0 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 0 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 0 expires, FLXAnFRSIR.TI0 and FLXAnFROS.T0IS are set to ' 1 '. A timer 0 interrupt then occurs while the FLXAnFROC.T0IE bit is effective.

## CAUTION

The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0 .

Table 21.22 FLXAnFRTOC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 16 | TOMO[13:0] | Timer 0 Macrotick Offset Bit <br> Timer 0 macrotick offset |
| 15 | - | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 14 to 8 | TOCC[6:0] | Timer 0 Cycle Code Bit <br> Timer 0 cycle code |
| 7 to 2 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 1 | TOMS | Timer 0 Mode Select Bit <br> 0: Single-shot mode <br> 1: Continuous mode |
| 0 | TORC | Timer 0 Run Control Bit <br> 0: Timer 0 halted <br> 1: Timer 0 running |

## (1) FLXAnFRTOC.TOMO

Timer 0 Macrotick Offset Bit
Before reconfiguration of the timer, the timer has to be halted first by writing ' 0 ' to bit FLXAnFRT0C.T0RC.
Configures the macrotick offset from the beginning of the communication cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

## (2) FLXAnFRTOC.TOCC

Timer 0 Cycle Code Bit
Before reconfiguration of the timer, the timer has to be halted first by writing ' 0 ' to bit FLXAnFRT0C.T0RC.
The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code, see Section 21.4.8.2, Cycle Counter Filtering.

## (3) FLXAnFRTOC.TOMS

Timer 0 Mode Select Bit
Before reconfiguration of the timer, the timer has to be halted first by writing ' 0 ' to bit FLXAnFRT0C.T0RC.
Configures the timer run mode. In Single-shot mode, the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

## (4) FLXAnFRTOC.TORC

## Timer 0 Run Control Bit

Timer 0 can be activated (set FLXAnFRT0C.T0RC to ' 1 ') when the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.
Timer 0 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

### 21.3.5.2 FLXAnFRT1C — FlexRay Timer 1 Configuration Register

This register is a relative timer. After the specified number of macroticks (MT) has expired, a FlexRay timer 1 interrupt is asserted. When the FlexRay timer 1 expires, FLXAnFRSIR.TI1 and FLXAnFROS.T1IS are set to ' 1 '. A timer 1 interrupt then occurs while the FLXAnFROC.T1IE bit is effective.

| Value after reset: |  |  | 00020000H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 21.23 FLXAnFRT1C Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 16 | T1MC[13:0] | Timer 1 Macrotick Count Bit <br> Timer 1 macrotick count |
| 15 to 2 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 1 | T1MS | Timer 1 Mode Select Bit <br> $0:$ Single-shot mode <br> $1:$ Continuous mode |
| 0 | T1RC | Timer 1 Run Control Bit <br> $0:$ Timer 1 halted |
|  |  | 1: Timer 1 running |

## (1) FLXAnFRT1C.T1MC

Timer 1 Macrotick Count Bit
Before reconfiguration of the timer, the timer has to be halted first by writing ' 0 ' to bit FLXAnFRT1C.T1RC.
Valid values are 2 to 16383 MT in continuous mode
Valid values are 1 to 16383 MT in single-shot mode
When the configured macrotick count is reached, the FlexRay timer 1 interrupt is generated.

## (2) FLXAnFRT1C.T1MS

## Timer 1 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing ' 0 ' to bit FLXAnFRT1C.T1RC.
Configures the timer run mode. In Single-shot mode, the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

## (3) FLXAnFRT1C.T1RC

Timer 1 Run Control Bit
Timer 1 can be activated (set FLXAnFRT1C.T1RC to ' 1 ') as long as the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.
Timer 1 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

### 21.3.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 2 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 2 expires, FLXAnFROS.T2IS are set to ' 1 '. A timer 2 interrupt then occurs while the FLXAnFROC.T2IE bit is effective.
FlexRay timer 2 has the same absolute timer features as FlexRay timer 0.

## CAUTION

The configuration of timer 2 is compared against the macrotick counter value, there is no separate counter for timer 2.

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

Table 21.24 FLXAnFRT2C Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 29 to 16 | T2MO[13:0] | Timer 2 Macrotick Offset Bit Timer 2 macrotick offset |
| 15 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 14 to 8 | T2CC[6:0] | Timer 2 Cycle Code Bit Timer 2 cycle code |
| 7 to 2 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 1 | T2MS | Timer 2 Mode Select Bit <br> 0 : Single-shot mode <br> 1: Continuous mode |
| 0 | T2RC | Timer 2 Run Control Bit <br> 0 : Timer 2 halted <br> 1: Timer 2 running |

## (1) FLXAnFRT2C.T2MO

Timer 2 Macrotick Offset Bit
Write 0 to the FLXAnFRT2C.T2RC bit and halt the timer before changing the value of the timer.
Configures the macrotick offset from the beginning of the communication cycle where the timer 2 interrupt is generated. The timer 2 interrupt is generated at this offset for each cycle of the cycle set.

## (2) FLXAnFRT2C.T2CC

Timer 2 Cycle Code Bit
Before reconfiguration of the timer, the timer has to be halted first by writing 0 to bit FLXAnFRT2C.T2RC.
Configures the cycle set that generates timer 2 interrupt with the 7 -bit timer 2 cycle code. For details, see Section

### 21.4.8.2, Cycle Counter Filtering.

## (3) FLXAnFRT2C.T2MS

Timer 2 Mode Select Bit
Before reconfiguration of the timer, the timer has to be halted first by writing 0 to bit FLXAnFRT2C.T2RC.
Configures the timer run mode. In single-shot mode, the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

## (4) FLXAnFRT2C.T2RC

Timer 2 Run Control Bit
Timer 2 can be operated when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state. (set FLXAnFRT2C.T2RC to ' 1 ')
Timer 2 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

### 21.3.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1

The stop watch is activated by the following trigger events.

- INTFLXAnLINE0 or INTFLXAnLINE1
- Writing bit FLXAnFRSTPW1.SSWT to ' 1 '

With the macrotick counter increment following next to the stop watch activation, the actual cycle counter and macrotick values are captured in register FLXAnFRSTPW1 while the slot counter values for channels A and B are captured in register FLXAnFRSTPW2.

| Value after reset: |  |  | 0000 0000 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 0 | ESWT | Enable Hardware Stop Watch Trigger Bit <br> 0: Stop watch trigger disabled <br> 1: Stop watch trigger enabled |

## (1) FLXAnFRSTPW1.SMTV

Stop Watch Captured Macrotick Value Bit
State of the macrotick counter when the stop watch event occurred.

## (2) FLXAnFRSTPW1.SCCV

Stop Watch Captured Cycle Counter Value Bit
State of the cycle counter when the stop watch event occurred.

## (3) FLXAnFRSTPW1.EINT1

Enable FlexRay Interrupt 1 Trigger Bit
Enables stop watch trigger by INTFLXAnLINE1 when FLXAnFRSTPW1.ESWT = ' 1 '.

## (4) FLXAnFRSTPW1.EINTO

Enable FlexRay Interrupt 0 Trigger Bit
Enables stop watch trigger by INTFLXAnLINE0 when FLXAnFRSTPW1.ESWT = ' 1 '.

## (5) FLXAnFRSTPW1.SSWT

Software Stop Watch Trigger Bit
Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to ' 1 ' simultaneously. In this case, the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.
Writing 1 in this bit activates the stop watch. This bit is reset to ' 0 ' after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

## (6) FLXAnFRSTPW1.EDGE

Stop Watch Trigger Edge Select Bit

## (7) FLXAnFRSTPW1.SWMS

Stop Watch Mode Select Bit
(8) FLXAnFRSTPW1.ESWT

Enable Stop Watch Trigger Bit
Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to ' 1 ' simultaneously. In this case, the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.
If enabled, an INTFLXAnLINE0 event or an INTFLXAnLINE1 event activates the stop watch.
In single-shot mode, this bit is reset to ' 0 ' after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

### 21.3.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | SSCVB[10:0] |  |  |  |  |  |  |  |  |  |  |

|  | - | - | - | - | - | SSCVA[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.26 FLXAnFRSTPW2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 26 to 16 | SSCVB[10:0] | Stop Watch Captured Slot Counter Value Channel B |
| 15 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 10 to 0 | SSCVA[10:0] | Stop Watch Captured Slot Counter Value Channel A |

## (1) FLXAnFRSTPW2.SSCVB

Stop Watch Captured Slot Counter Value Channel B
State of the slot counter for channel B when the stop watch event occurred.

## (2) FLXAnFRSTPW2.SSCVA

Stop Watch Captured Slot Counter Value Channel A
State of the slot counter for channel A when the stop watch event occurred.

### 21.3.6 CC Control Registers

This section describes the registers provided by the CC to allow the host to control the operation of the CC. The FlexRay protocol specification requires the host to write application configuration data in CONFIG state only. Please note that the configuration registers are not locked for writing in DEFAULT_CONFIG state.

The configuration data is reset when DEFAULT_CONFIG state is entered from reset. To change POC state from DEFAULT_CONFIG to CONFIG state, the host has to apply CHI command CONFIG. If the host wants the CC to leave CONFIG state, the host has to execute the lock release sequence as described in Section 21.3.3.1,
FLXAnFRLCK — FlexRay Lock Register.

### 21.3.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1

Table 21.27 FLXAnFRSUCC1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 28 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 27 | CCHB | Connected to Channel B Bit <br> Configures pChannels <br> 0: Node not connected to channel B <br>  |
|  |  | CCHA Node connected to channel B (default after reset) |

Table 21.27 FLXAnFRSUCC1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 22 | TSM | Transmission Slot Mode Bit Configures pSingleSlotEnabled <br> 0: ALL Slot Mode <br> 1: SINGLE Slot Mode (default after hard reset) |
| 21 | WUCS | Wakeup Channel Select Bit Configures pWakeupChannel <br> 0 : Send wakeup pattern on channel A <br> 1: Send wakeup pattern on channel B |
| 20 to 16 | PTA[4:0] | Passive to Active Bit <br> Configure pAllowPassiveToActive |
| 15 to 11 | CSA[4:0] | Cold Start Attempts Bit Configure gColdStartAttempts |
| 10 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 9 | TXSY | Transmit Sync Frame in Key Slot Bit <br> Configure pKeySlotUsedForSync <br> 0 : No sync frame transmission in key slot, node is neither sync nor coldstart node <br> 1: Key slot used to transmit sync frame, node is sync node |
| 8 | TXST | Transmit Startup Frame in Key Slot Bit <br> Configure pKeySlotUsedForStartup <br> 0: No startup frame transmission in key slot, node is non-coldstarter <br> 1: Key slot used to transmit startup frame, node is leading or following coldstarter |
| 7 | PBSY | POC Busy Flag <br> 0: POC not busy, FLXAnFRSUCC1.CMD writeable 1: POC is busy, FLXAnFRSUCC1.CMD locked |
| 6 to 4 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 3 to 0 | CMD[3:0] | ```CHI Command Vector Bit 0000: command_not_accepted 0001: CONFIG 0010: READY 0011: WAKEUP 0100: RUN 0101: ALL_SLOTS 0110: HALT 0111: FREEZE 1000: SEND_MTS 1001: ALLOW_COLDSTART 1010: RESET_STATUS_INDICATORS 1100: CLEAR_RAMS others: reserved``` |

## (1) FLXAnFRSUCC1.CCHB

Connected to Channel B Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Configures whether the node is connected to channel B (pChannels).

## (2) FLXAnFRSUCC1.CCHA

Connected to Channel A Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Configures whether the node is connected to channel A (pChannels).

## (3) FLXAnFRSUCC1.MTSB

Select Channel B for MTS Transmission Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. FLXAnFRSUCC1.MTSB may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in
Section 21.3.3.1, FLXAnFRLCK — FlexRay Lock Register. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to ' 1 ', an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD $=$ " $1000_{\mathrm{B}}$ ".
The bit selects channel B for MTS symbol transmission.

## (4) FLXAnFRSUCC1.MTSA

Select Channel A for MTS Transmission Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. FLXAnFRSUCC1.MTSA may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in Section 21.3.3.1, FLXAnFRLCK — FlexRay Lock Register. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to ' 1 ', an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD $=" 1000_{\mathrm{B}} "$.
The bit selects channel A for MTS symbol transmission.

## (5) FLXAnFRSUCC1.HCSE

Halt due to Clock Sync Error Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

## (6) FLXAnFRSUCC1.TSM

Transmission Slot Mode Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Selects the initial transmission slot mode (pSingleSlotEnabled). In SINGLE slot mode, the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 or that of message buffers 0 and 1 depending on bit FLXAnFRMRC.SPLM. In case FLXAnFRSUCC1.TSM = ' 1 ', message buffer 0 or message buffers 0,1 can be (re)configured in DEFAULT_CONFIG or CONFIG state only. In ALL slot mode, the CC may transmit in all slots. FLXAnFRSUCC1.TSM is a configuration bit that can only be set or reset by the host.
The CC changes to ALL slot mode when the host successfully applied the ALL_SLOTS command by writing FLXAnFRSUCC1.CMD $=$ " $0101_{\mathrm{B}}$ " in POC state NORMAL_ACTIVE or NORMAL_PASSIVE. The actual slot mode is monitored by FLXAnFRCCSV.SLM.

## (7) FLXAnFRSUCC1.WUCS

## Wakeup Channel Select Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
With this bit, the host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

## (8) FLXAnFRSUCC1.PTA

Passive to Active Condition Setting Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Valid values are 0 to 31 even/odd cycle pairs.
Defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state (pAllowPassiveToActive).
If set to " $00000_{\mathrm{B}}$ ", the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

## (9) FLXAnFRSUCC1.CSA

Cold Start Attempt Count Setting Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Must be identical in all nodes of a cluster.
Valid values are 2 to 31 .
Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

## (10) FLXAnFRSUCC1.TXSY

Transmit Sync Frame in Key Slot Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

## CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY be set for coldstart nodes.

## (11) FLXAnFRSUCC1.TXST

Transmit Startup Frame in Key Slot Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

## CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY be set for coldstart nodes.

## (12) FLXAnFRSUCC1.PBSY

POC Busy Flag
Signals that the POC is busy and cannot accept a command from the host. FLXAnFRSUCC1.CMD is locked against write accesses.
Set to ' 1 ' after reset during initialization of internal RAM blocks.

## (13) FLXAnFRSUCC1.CMD

## CHI Command Vector Bit

The host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector FLXAnFRSUCC1.CMD will be reset to " 0000 " = command_not_accepted, and flag FLXAnFREIR.CNA will be set to ' 1 '.
In general the host must check FLXAnFRSUCC1.PBSY before writing a new CHI command.
In case the previous CHI command has not yet completed, FLXAnFREIR.CCL is set to ' 1 ' together with FLXAnFREIR.CNA; the CHI command needs to be repeated.
Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will FLXAnFREIR.CNA be set.
Reading FLXAnFRSUCC1.CMD shows whether the last CHI command was accepted. The actual POC state is monitored by FLXAnFRCCSV.POCS.

## Command_not_accepted

FLXAnFRSUCC1.CMD is reset to " $0000_{\mathrm{B}}$ " due to one of the following conditions:

- Illegal command applied by the host
- Host applied command to leave CONFIG state without preceding config lock key
- Host applied new command while execution of the previous host command has not completed
- Host writes command_not_accepted

When FLXAnFRSUCC1.CMD is reset to " $0000_{\mathrm{B}}$ ", FLXAnFREIR.CNA is set to ' 1 ' an interrupt is generated when it is enabled. Commands that are not accepted are not executed.

## CONFIG

Go to POC state CONFIG when called in POC state DEFAULT_CONFIG or READY. When called in HALT state, the CC transits to POC state DEFAULT_CONFIG. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $00000_{\mathrm{B}}$ " = command_not_accepted.

## READY

Go to POC state READY when called in POC state CONFIG, NORMAL_ACTIVE, NORMAL_PASSIVE, STARTUP, or WAKEUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$
command_not_accepted.

## WAKEUP

Go to POC state WAKEUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " = command_not_accepted.

## RUN

Go to POC state STARTUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$ command_not_accepted.

## ALL_SLOTS

Leave SINGLE slot mode and go to ALL-SLOTS mode after successful startup/integration at the next end of cycle when called in POC state NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$ command_not_accepted.

## HALT

Set halt request FLXAnFRCCSV.HRQ to ' 1 ' and go to POC state HALT at the next end of cycle when called in POC state NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " = command_not_accepted.
FREEZE
Set the freeze status indicator FLXAnFRCCSV.FSI to ' 1 ' and go to POC state HALT immediately. Can be called from any state.

## SEND_MTS

Send single MTS symbol during the next following symbol window on the channel configured by FLXAnFRSUCC1.MTSA, FLXAnFRSUCC1.MTSB, when called in POC state NORMAL_ACTIVE after CC entered ALL slot mode (FLXAnFRCCSV.SLM $=$ " 11 "). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$ command_not_accepted.

## ALLOW_COLDSTART

The command resets FLXAnFRCCSV.CSI to enable the node to become leading coldstarter. When called in state DEFAULT_CONFIG, CONFIG, or HALT, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$ command_not_accepted. To become leading coldstarter, it is also required that both FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY be set.

## RESET_STATUS_INDICATORS

Resets status flags FLXAnFRCCSV.CSNI, FLXAnFRCCSV.CSAI, and FLXAnFRCCSV.WSV, according to $I P s d m$ and E-Ray 1.0.3 specification v1.2.7 to their default values. Can be called in POC states READY and STARTUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $0000_{\mathrm{B}}$ " $=$ command_not_accepted.

## CLEAR_RAMS

Sets FLXAnFRMHDS.CRAM to ' 1 ' when called in DEFAULT_CONFIG or CONFIG state. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " $00000_{\mathrm{B}}$ " $=$ command_not_accepted.
FLXAnFRMHDS.CRAM is also set to ' 1 ' when the CC leaves reset. By setting FLXAnFRMHDS.CRAM, all internal RAM blocks are initialized to zero. During the initialization of the RAMs, FLXAnFRSUCC1.PBSY will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR_RAMS. The initialization of the internal RAM block requires 2048 bus clock cycles. There should be no host access to input buffer or output buffer during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR_RAMS.
Before asserting CHI command CLEAR_RAMS, confirm that no transfer between message RAM and input buffer or output buffer or the Transient Buffer RAMs is ongoing and that the data transfer handler is disabled (FLXAnFRITS.ITS $=0$ and FLXAnFROTS.OTS $=0$ ). This command also resets the message buffer status registers FLXAnFRMHDS, FLXAnFRLDTS, FLXAnFRFSR, FLXAnFRMHDF, FLXAnFRTXRQ1/2/3/4, FLXAnFRNDAT1/2/3/4, and FLXAnFRMBSC1/2/3/4.

## CAUTIONS

1. All accepted commands with the exception of CLEAR_RAMS and SEND_MTS will cause a change of the POC state in the FlexRay domain after at most 8 cycles of the slower of the two clocks "bus clock" and "FlexRay sample clock", assuming that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register FLXAnFRCCSV will show data that is additionally delayed by synchronization from the FlexRay domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks "bus clock" and "FlexRay sample clock".
2. When a terminal restarts transfer as a leading coldstart node after transfer was stopped by using the FREEZE or READY command, the startup frame may not be transmitted in cycle 0 . This depends on the internal state of the FlexRay module. This phenomenon occurs when the startup frame is set in a slot with a number from 1 to 7 . This does not occur in ColdStart after a hardware reset.
Even if this occurs, the second trial of ColdStart will succeed. ColdStart time becomes longer, but ColdStart will not be affected by the occurrence.
To avoid this, allocate the Startup/Sync frame in static slot 8 or higher.

Table 21.28 below references the CHI commands from the FlexRay Protocol Specification to the FlexRay CHI command vector FLXAnFRSUCC1.CMD.

Table 21.28 Reference to CHI Host Command Summary from FlexRay Protocol Specification

| CHI Command | Where Processed (POC States) | CHI Command Vector CMD |
| :--- | :--- | :--- |
| ALL_SLOTS | POC: normal active, POC: normal passive | ALL_SLOTS |
| ALLOW_COLDSTART | All except POC: default config, <br> POC: config, POC: halt | ALLOW_COLDSTART |
| CONFIG | POC: default config, POC: ready | CONFIG |
| CONFIG_COMPLETE | POC: config | Unlock sequence \& READY |
| DEFAULT_CONFIG | POC: halt | CONFIG |
| FREEZE | All | FREEZE |
| HALT | POC: normal active, POC: normal passive | HALT |
| READY | All except POC: default config, <br> POC: config, POC: ready, POC: halt | READY |
| RUN | POC: ready | RUN |
| WAKEUP | POC: ready | WAKEUP |

### 21.3.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2

Value after reset: $0100{0504_{H}}^{H}$

Table 21.29 FLXAnFRSUCC2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 28 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 27 to 24 | LTN[3:0] | Listen Timeout Noise Bit <br> Configure (gListenNoise -1$)$ |
| 23 to 21 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 20 to 0 | LT[20:0] | Listen Timeout Bit <br> Configure pdListenTimeout |

## (1) FLXAnFRSUCC2.LTN

Listen Timeout Noise Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 16.
FLXAnFRSUCC2.LTN must be configured identically in all nodes of a cluster.
Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

## CAUTION

The wakeup/startup noise timeout is calculated as follows:
pdListenTimeout $\times$ gListenNoise $=$ FLXAnFRSUCC2.LT $\times($ FLXAnFRSUCC2.LTN +1$)$.

## (2) FLXAnFRSUCC2.LT

## Listen Timeout Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1284 to $1283846 \mu \mathrm{~T}$.
Configures wakeup/startup listen timeout in $\mu \mathrm{T}$.

### 21.3.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3

| Value after reset: $\quad 00000011_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 21.30 FLXAnFRSUCC3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 7 to 4 | WCF[3:0] | Maximum Without Clock Correction Fatal Bit (condition for transition to HALT state) <br> Configure gMaxWithoutClockCorrectionFatal |
| 3 to 0 | WCP[3:0] | Maximum Without Clock Correction Passive Bit (condition for transition to <br> NORMAL_PASSIVE state) <br> Configure gMaxWithoutClockCorrectionPassive |

## (1) FLXAnFRSUCC3.WCF

Maximum Without Clock Correction Fatal Bit (condition for transition to HALT state)
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 15 cycle pairs.
Setting must be identical in all nodes of a cluster.
Defines the number of consecutive even/odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

## CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set.

## (2) FLXAnFRSUCC3.WCP

Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state)
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 15 cycle pairs.
Setting must be identical in all nodes of a cluster.
Defines the number of consecutive even/odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE to NORMAL_PASSIVE state.

### 21.3.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register

## Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 21.31 FLXAnFRNEMC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 3 to 0 | NML[3:0] | Network Management Vector Length Bit <br> Configure gNetworkManagementVectorLength |

## (1) FLXAnFRNEMC.NML

## Network Management Vector Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 12 bytes.
The configured length must be identical in all nodes of a cluster.
These bits configure the length of the NM vector.

### 21.3.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1

Value after reset: $\quad 084 \mathrm{C} 0633_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 21.32 FLXAnFRPRTC1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | RWP[5:0] | Repetitions of Tx Wakeup Pattern Bit Configure pWakeupPattern |
| 25 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 24 to 16 | RXW[8:0] | Wakeup Symbol Receive Window Length Bit Configure gdWakeupSymbolRxWindow |
| 15, 14 | BRP[1:0] | Baud Rate Prescaler Bit <br> Configure gdSampleClockPeriod and pSamplesPerMicrotick <br> 00: 10 Mbps <br> 01: 5 Mbps <br> 10: 2.5 Mbps <br> 11: 2.5 Mbps |
| 13, 12 | SPP[1:0] | Strobe Point Position Bit <br> Configure Strobe point position <br> 00: Sample 5 <br> 01: Sample 4 <br> 10: Sample 6 <br> 11: Sample 5 |
| 11 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 10 to 4 | CASM[6:0] | Collision Avoidance Symbol Max Bit Configure gdCASRxLowMax |
| 3 to 0 | TSST[3:0] | Transmission Start Sequence Transmitter Bit Configure gdTSSTransmitter |

## (1) FLXAnFRPRTC1.RWP

Repetitions of Tx Wakeup Pattern Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 63 .
Configures the number of repetitions (sequences) of the Tx wakeup symbol.

## (2) FLXAnFRPRTC1.RXW

Wakeup Symbol Receive Window Length Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 76 to 301 bit times.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

## (3) FLXAnFRPRTC1.BRP

## Baud Rate Prescaler Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz . One bit time always consists of 8 samples independent of the configured baud rate.

```
00 = 10 MBit/s
    gdSampleClockPeriod = 12.5 ns=1 * 'sample clock'
    pSamplesPerMicrotick = 2 (1 \muT = 25 ns)
```

```
01 = 5 MBit/s
    gdSampleClockPeriod = 25 ns =2 * 'sample clock'
    pSamplesPerMicrotick = 1 (1 }\mu\textrm{T}=25\textrm{ns}
10, 11 = 2.5 MBit/s
    gdSampleClockPeriod = 50 ns = 4 * 'sample clock'
    pSamplesPerMicrotick = 1 (1 \muT = 50 ns)
```

## (4) FLXAnFRPRTC1.SPP

## Strobe Point Position Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Defines the sample count value for strobing. The strobed bit value is set to the voted value when the sample count is incremented to the value configured by FLXAnFRPRTC1.SPP.

## CAUTION

The current revision 2.1 of the FlexRay protocol requires that FLXAnFRPRTC1.SPP = " $00_{B}$ ". The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.

## (5) FLXAnFRPRTC1.CASM

Collision Avoidance Symbol Max Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
CASM6 is fixed to ' 1 '.
Valid values are 67 to 99 bit times.
Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

## (6) FLXAnFRPRTC1.TSST

Transmission Start Sequence Transmitter Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 3 to 15 bit times.
Must be identical in all nodes of a cluster.
Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times ( 1 bit time $=4 \mu \mathrm{~T}=100 \mathrm{~ns}$ at 10 Mbps ).

### 21.3.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2

Value after reset: $\quad 0 F 2 \mathrm{D} 0 \mathrm{AO} \mathrm{E}_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 21.33 FLXAnFRPRTC2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 24 | TXL[5:0] | Wakeup Symbol Transmit Low Bit <br> Configure gdWakeupSymbolTxLow |
| 23 to 16 | TXI[7:0] | Wakeup Symbol Transmit Idle Bit <br> Configure gdWakeupSymbolTxIdle |
| 15,14 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 13 to 8 | RXL[5:0] | Wakeup Symbol Receive Low Bit <br> Configure gdWakeupSymboIRxLow |
| 7,6 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 5 to 0 | RXI[5:0] | Wakeup Symbol Rx Idle Bit <br> Configure gdWakeupSymbolRxIdle |

## (1) FLXAnFRPRTC2.TXL

## Wakeup Symbol Transmit Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 15 to 60 bit times.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

## (2) FLXAnFRPRTC2.TXI

Wakeup Symbol Transmit Idle Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 45 to 180 bit times.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

## (3) FLXAnFRPRTC2.RXL

Wakeup Symbol Receive Low Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 10 to 55 bit times.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

## (4) FLXAnFRPRTC2.RXI

Wakeup Symbol Rx Idle Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 14 to 59 bit times.
Must be identical in all nodes of a cluster.
Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

### 21.3.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 21.34 FLXAnFRMHDC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 29 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 28 to 16 | SLT[12:0] | Start of Latest Transmit Bit <br> Configure pLatestTx |
| 15 to 7 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 6 to 0 | SFDL[6:0] | Static Frame Data Length Bit <br> Configure gPayloadLengthStatic |

## (1) FLXAnFRMHDC.SLT

## Start of Latest Transmit Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7981 minislots.
Configures the maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if FLXAnFRMHDC.SLT is set to zero.

## (2) FLXAnFRMHDC.SFDL

## Static Frame Data Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 127 .
The payload length must be identical in all nodes of a cluster.
Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

### 21.3.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1

Value after reset: $\quad 00000280_{\mathrm{H}}$

Table 21.35 FLXAnFRGTUC1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 19 to 0 | UT[19:0] | Microtick per Cycle Bit <br> Configure pMicroPerCycle |

## (1) FLXAnFRGTUC1.UT

Microtick per Cycle Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 640 to $640000 \mu \mathrm{~T}$.
Configures the duration of the communication cycle in microticks.

### 21.3.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2

Value after reset: $\quad 0002000 A_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | SNM[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | MPC[13:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.36 FLXAnFRGTUC2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 19 to 16 | SNM[3:0] | Sync Node Max |
| 15,14 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 13 to 0 | MPC[13:0] | Macrotick Per Cycle Bit <br> Configure gMacroPerCycle |

## (1) FLXAnFRGTUC2.SNM

Sync Node Max Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 15.
Must be identical in all nodes of a cluster.
Maximum number of frames within a cluster with sync frame indicator bit SYN set to ' 1 '.

## (2) FLXAnFRGTUC2.MPC

## Macrotick Per Cycle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 10 to 16000 MT .
The cycle length must be identical in all nodes of a cluster.
Configures the duration of one communication cycle in macroticks.

### 21.3.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3

Table 21.37 FLXAnFRGTUC3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | - | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 30 to 24 | MIOB[6:0] | Macrotick Initial Offset Channel B Bit <br> Configure pMacrolnitialOffset[B] |
| 23 | MIOA[6:0] | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 22 to 16 | Macrotick Initial Offset Channel A Bit <br> Configure pMacrolnitialOffset[A] |  |
| 15 to 8 | UIOB[7:0] | Microtick Initial Offset Channel B Bit <br> Configure pMicroInitialOffset[B] |
| 7 to 0 | UIOA[7:0] | Microtick Initial Offset Channel A Bit <br> Configure pMicroInitialOffset[A] |

## (1) FLXAnFRGTUC3.MIOB

## Macrotick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 72 MT.
Must be identical in all nodes of a cluster
Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration

## (2) FLXAnFRGTUC3.MIOA

## Macrotick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 72 MT.
Must be identical in all nodes of a cluster
Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration

## (3) FLXAnFRGTUC3.UIOB

## Microtick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Valid values are 0 to $240 \mu \mathrm{~T}$.
Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [B] and therefore has to be set for each channel independently.

## (4) FLXAnFRGTUC3.UIOA

Microtick Initial Offset Channel A Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Valid values are 0 to $240 \mu \mathrm{~T}$.
Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [A] and therefore has to be set for each channel independently.

### 21.3.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4

For details about configuration of FLXAnFRGTUC4.NIT and FLXAnFRGTUC4.OCS, see Section 21.4.2(5), Configuration of NIT Start and Offset Correction Start.

Table 21.38 FLXAnFRGTUC4 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 16 | OCS[13:0] | Offset Correction Start Bit <br> Configure (gOffsetCorrectionStart - 1) |
| 15,14 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 13 to 0 | NIT[13:0] | Network Idle Time Start Bit <br> Configure (gMacroPerCycle -gdNIT - 1) |

## (1) FLXAnFRGTUC4.OCS

Offset Correction Start Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 8 to 15998 MT.
For cluster consisting of E-Ray implementations only, it is sufficient to program FLXAnFRGTUC4.OCS = FLXAnFRGTUC4.NIT + 1 .

Must be identical in all nodes of a cluster.
Determines the start of the offset correction within the NIT phase, calculated from start of cycle.

## (2) FLXAnFRGTUC4.NIT

## Network Idle Time Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 7 to 15997 MT.
Must be identical in all nodes of a cluster.
Configures the starting point of the Network Idle Time NIT at the end of the communication cycle expressed in terms of macroticks from the beginning of the cycle. The start of NIT is recognized if Macrotick $=$ gMacroPerCycle -gdNIT -1 and the increment pulse of Macrotick is set.

### 21.3.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5

Table 21.39 FLXAnFRGTUC5 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | DEC[7:0] | Decoding Correction Bit <br> Configure pDecodingCorrection |
| 23 to 21 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 20 to 16 | CDD[4:0] | Cluster Drift Damping Bit <br> Configure pClusterDriftDamping |
| 15 to 8 | DCB[7:0] | Delay Compensation Channel B Bit <br> Configure pDelayCompensation[B] |
| 7 to 0 | DCA[7:0] | Delay Compensation Channel A Bit <br> Configure pDelayCompensation[A] |

## (1) FLXAnFRGTUC5.DEC

Decoding Correction Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 14 to $143 \mu \mathrm{~T}$.
Configures the decoding correction value in microticks used to determine the primary time reference point.

## (2) FLXAnFRGTUC5.CDD

Cluster Drift Damping Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $20 \mu \mathrm{~T}$.
Configures the cluster drift damping value in microticks used in clock synchronization to minimize accumulation of rounding errors.

## (3) FLXAnFRGTUC5.DCB

Delay Compensation Channel B Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $200 \mu \mathrm{~T}$.
Used to compensate for reception delays on channel B. This covers assumed propagation delay up to
cPropagationDelayMax for microticks in the range of 0.0125 to $0.05 \mu \mathrm{~s}$. In practice, the minimum of the propagation delays of all sync nodes should be applied.

## (4) FLXAnFRGTUC5.DCA

Delay Compensation Channel A Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $200 \mu \mathrm{~T}$.
Used to compensate for reception delays on channel A. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to $0.05 \mu \mathrm{~s}$. In practice, the minimum of the propagation delays of all sync nodes should be applied.

### 21.3.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6

Value after reset: $\quad 00020000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | MOD[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | ASR[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.40 FLXAnFRGTUC6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 26 to 16 | MOD[10:0] | Maximum Oscillator Drift Bit <br> Configure pdMaxDrift |
| 15 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 10 to 0 | ASR[10:0] | Accepted Startup Range Bit <br> Configure pdAcceptedStartupRange |

## (1) FLXAnFRGTUC6.MOD

## Maximum Oscillator Drift Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to $1923 \mu \mathrm{~T}$.
Maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in $\mu \mathrm{T}$.

## (2) FLXAnFRGTUC6.ASR

## Accepted Startup Range Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $1875 \mu \mathrm{~T}$.
Number of microticks constituting the expanded range of measured deviation for startup frames during integration.

### 21.3.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7

| Value after reset: $00020004_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | NSS[9:0] |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | SSL[9:0] |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.41 FLXAnFRGTUC7 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 26 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 25 to 16 | NSS[9:0] | Number of Static Slots Bit <br> Configure gNumberOfStaticSlots |
| 15 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 to 0 | SSL[9:0] | Static Slot Length Bit <br> Configure gdStaticSlot |

## (1) FLXAnFRGTUC7.NSS

Number of Static Slots Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 1023 .
The number of static slots must be identical in all nodes of a cluster.
Configures the number of static slots in a cycle.

## (2) FLXAnFRGTUC7.SSL

Static Slot Length Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 4 to 659 MT.
The static slot length must be identical in all nodes of a cluster.
Configures the length of a static slot in macroticks.

### 21.3.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8

Value after reset: $00000002_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | NMS[12:0] |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | MSL[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.42 FLXAnFRGTUC8 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 29 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 28 to 16 | NMS[12:0] | Number of Minislots Bit <br> Configure gNumberOfMinislots |
| 15 to 6 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 5 to 0 | MSL[5:0] | Minislot Length Bit <br> Configure gdMinislot |

## (1) FLXAnFRGTUC8.NMS

Number of Minislots Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 7986 .
The number of minislots must be identical in all nodes of a cluster.
Configures the number of minislots within the dynamic segment of a cycle.

## (2) FLXAnFRGTUC8.MSL

Minislot Length Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to 63 MT .
The minislot length must be identical in all nodes of a cluster.
Configures the length of a minislot in macroticks.

### 21.3.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9

Table 21.43 FLXAnFRGTUC9 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 18 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 17,16 | DSI[1:0] | Dynamic Slot Idle Phase Bit <br> Configure gdDynamicSlotldlePhase |
| 15 to 13 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 12 to 8 | MAPO[4:0] | Minislot Action Point Offset Bit <br> Configure gdMinislotActionPointOffset |
| 7,6 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 5 to 0 | APO[5:0] | Action Point Offset Bit <br> Configure gdActionPointOffset |

## (1) FLXAnFRGTUC9.DSI

Dynamic Slot Idle Phase Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to 2 Minislots.
Must be identical in all nodes of a cluster.
Configures the duration of the dynamic slot idle phase in the number of minislots. The duration has to be greater than or equal to the idle detection time.

## (2) FLXAnFRGTUC9.MAPO

Minislot Action Point Offset Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 31 MT.
Must be identical in all nodes of a cluster.
Configures the action point offset in macroticks within the minislots of the dynamic segment.

## (3) FLXAnFRGTUC9.APO

Action Point Offset Bit
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 1 to 63 MT.
Must be identical in all nodes of a cluster.
Configures the action point offset in macroticks within static slots and symbol window.

### 21.3.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10

Table 21.44 FLXAnFRGTUC10 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. <br> 26 to 16 <br> MRC[10:0] |
| 15,14 | - | Maximum Rate Correction Bit <br> Configure pRateCorrectionOut |
| 13 to 0 | MOC[13:0] | Reserved <br> These bits are always read as 0. When writing, always write 0. |

## (1) FLXAnFRGTUC10.MRC

## Maximum Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 2 to $1923 \mu \mathrm{~T}$.
Holds the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm. The CC checks only the internal rate correction value against the maximum rate correction value (absolute value).

## (2) FLXAnFRGTUC10.MOC

## Maximum Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 5 to $15266 \mu \mathrm{~T}$.
Holds the maximum permitted offset correction value (absolute value) to be applied by the internal clock synchronization algorithm (absolute value). The CC checks only the internal offset correction value against the maximum offset correction value.

### 21.3.6.18 FLXAnFRGTUC11 - FlexRay GTU Configuration Register 11

Table 21.45 FLXAnFRGTUC11 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 26 to 24 | ERC[2:0] | External Rate Correction Bit Configure pExternRateCorrection |
| 23 to 19 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 18 to 16 | EOC[2:0] | External Offset Correction Bit Configure pExternOffsetCorrection |
| 15 to 10 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 9, 8 | ERCC[1:0] | External Rate Correction Control Bit Configure vExternRateControl 00: External rate correction is prohibited. <br> 01: External rate correction is prohibited. <br> 10: Subtract <br> 11: Add |
| 7 to 2 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 1, 0 | EOCC[1:0] | External Offset Correction Control Bit <br> Configure vExternOffsetControl <br> 00: External offset correction is prohibited. <br> 01: External offset correction is prohibited. <br> 10: Subtract <br> 11: Add |

## (1) FLXAnFRGTUC11.ERC

## External Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $7 \mu \mathrm{~T}$.
Holds the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted or added from or to the calculated rate correction value. The value is applied during NIT.

## (2) FLXAnFRGTUC11.EOC

## External Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
Valid values are 0 to $7 \mu \mathrm{~T}$.
Holds the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted from or added to the calculated offset correction value. The value is applied during NIT.

## (3) FLXAnFRGTUC11.ERCC

## External Rate Correction Control Bit

Should be modified only outside NIT (Network Idle Time).
By writing to FLXAnFRGTUC11.ERCC the external rate correction is enabled as specified below.
$00_{B}=$ External rate correction is prohibited.
$01_{\mathrm{B}}=$ External rate correction is prohibited.
$10_{\mathrm{B}}=$ Subtract
External rate correction value subtracted from calculated rate correction value
$11_{\mathrm{B}}=$ Add
External rate correction value added to calculated rate correction value

## (4) FLXAnFRGTUC11.EOCC

## External Offset Correction Control Bit

Should be modified only outside NIT (Network Idle Time).
By writing to FLXAnFRGTUC11.EOCC the external offset correction is enabled as specified below.
$00_{\mathrm{B}}=$ External offset correction is prohibited.
$01_{B}=$ External offset correction is prohibited.
$10_{\mathrm{B}}=$ Subtract
External offset correction value subtracted from calculated offset correction value
$11_{\mathrm{B}}=$ Add
External offset correction value added to calculated offset correction value

### 21.3.7 CC Status Registers

During 8/16-bit accesses to status variables coded with more than $8 / 16$-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

### 21.3.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register

| Value after reset: $\quad 0010 \mathbf{4 0 0 0}_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.46 FLXAnFRCCSV Register Contents (1/2)

| Bit | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 24 | PSL[5:0] | POC Status Log Flags <br> Status of FLXAnFRCCSV.POCS immediately before entering HALT state. |
| 23 to 19 | RCA[4:0] | Remaining Coldstart Attempts Flags <br> Indicate vRemainingColdstartAttempts |
| 18 to 16 | WSV[2:0] | Wakeup Status Flags <br> Indicate vPOC!WakeupStatus |
| 15 | - | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 14 | CSI | Cold Start Inhibit Flag <br> Indicates vColdStartInhibit <br> $0:$ Cold starting of node enabled <br> $1:$ Cold starting of node disabled |
| 13 | CSAI | Coldstart Abort Indicator Flag |
| 12 | - | Coldstart Noise Indicator Flag <br> Indicates vPOC!ColdstartNoise |
| 11,10 | Reserved <br> These bits are always read as 0. When writing, always write 0. |  |
| 9,8 | SLot Mode Flags <br> Indicate vPOC!SlotMode <br> 00: SINGLE <br> 01: reserved <br> 10: ALL_PENDING <br> 11: ALL |  |

Table 21.46 FLXAnFRCCSV Register Contents (2/2)

| Bit | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | HRQ | Halt Request Flag <br> Indicates vPOC!CHIHaltRequest |
| 6 | FSI | Freeze Status Indicator Flag <br> Indicates vPOC!Freeze |
| 5 to 0 | POCS[5:0] | Protocol Operation Control Status Flags |

## (1) FLXAnFRCCSV.PSL

## POC Status Log Flags

Set the value of FLXAnFRCCSV.POCS immediately before entering HALT state.
Set to HALT when FREEZE command is applied during HALT state and FLXAnFRCCSV.FSI is not already set, i.e. the HALT state was not reached by FREEZE command.
Reset to " $000000_{\mathrm{B}}$ " when leaving HALT state.

## (2) FLXAnFRCCSV.RCA

Remaining Coldstart Attempts Flags
Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).
The initial value of FLXAnFRCCSV.RCA during CONFIG and DEFAULT_CONFIG state is also FLXAnFRSUCC1.CSA.
The RUN command resets this counter to the maximum number of coldstart attempts as configured by FLXAnFRSUCC1.CSA.

## (3) FLXAnFRCCSV.WSV

Wakeup Status Flags
Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).
Reset to " 0 " when entering Wakeup state, by CHI command RESET_STATUS_INDICATORS, or by transition from DEFAULT_CONFIG to CONFIG state
$000_{\mathrm{B}}=$ UNDEFINED
Wakeup not yet executed by the CC.
$001_{\mathrm{B}}=$ RECEIVED_HEADER
Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP_LISTEN state.

010 ${ }_{\mathrm{B}}=$ RECEIVED_WUP
Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP_LISTEN state.
$011_{\mathrm{B}}=$ COLLISION_HEADER
Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.
$100_{\mathrm{B}}=$ COLLISION_WUP
Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.

## $101_{\mathrm{B}}=$ COLLISION - UNKNOWN

Set when the CC stops wakeup by leaving WAKEUP_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.

## $110_{\mathrm{B}}=$ TRANSMITTED

Set when the CC has successfully completed the transmission of the wakeup pattern.
$111_{\mathrm{B}}=$ reserved

## (4) FLXAnFRCCSV.CSI

## Cold Start Inhibit Flag

Indicates that the node is disabled from cold starting (vColdStartInhibit).
The flag is set to " 1 " whenever the POC enters READY state due to CHI command READY.
The flag has to be reset under control of the host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD $=$ " $1001_{\mathrm{B}}$ ").

## (5) FLXAnFRCCSV.CSAI

Coldstart Abort Indicator Flag
Indicates that a coldstart attempt was aborted.
Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

## (6) FLXAnFRCCSV.CSNI

Coldstart Noise Indicator Flag
Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).
Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

## (7) FLXAnFRCCSV.SLM

## Slot Mode Flags

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL_ACTIVE, and NORMAL_PASSIVE.

Default value is SINGLE. Changes to ALL, depending on FLXAnFRSUCC1.TSM.
In NORMAL_ACTIVE or NORMAL_PASSIVE state the CHI command ALL_SLOTS will change the slot mode from SINGLE over ALL_PENDING to ALL.
Set FLXAnFRSUCC1.TSM to SINGLE except for NORMAL_ACTIVE or NORMAL_PASSIVE.

## (8) FLXAnFRCCSV.HRQ

## Halt Request Flag

Indicates that a request from the host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).
Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

## （9）FLXAnFRCCSV．FSI

## Freeze Status Indicator Flag

Indicates that the POC has entered the HALT state due to CHI command FREEZE or due to an error condition requiring an immediate POC halt（vPOC！Freeze）．
Reset by transition from HALT to DEFAULT＿CONFIG state．

## （10）FLXAnFRCCSV．POCS

Protocol Operation Control Status Flag
Indicates the actual state of operation of the CC Protocol Operation Control

```
000000 B = DEFAULT_CONFIG state
0000011B = READY state
00 0010B = NORMAL_ACTIVE state
000011直 = NORMAL_PASSIVE state
000100 B = HALT state
00 0110B ...00 1110}\mp@subsup{|}{\textrm{B}}{= reserved
0011111 }=\mathrm{ = CONFIG state
```

Indicates the actual state of operation of the POC in the wakeup path

```
010000 B = WAKEUP_STANDBY state
010001 }\mp@subsup{}{\textrm{B}}{=}=\mathrm{ WAKEUP_LISTEN state
01 0010 }=\mathrm{ = WAKEUP_SEND state
01 0011的 = WAKEUP_DETECT state
```

Indicates the actual state of operation of the POC in the startup path

```
100000B = STARTUP_PREPARE state
100001 
100010}\mp@subsup{\textrm{B}}{=}{= COLDSTART_COLLISION_RESOLUTION state
100011皂= COLDSTART_CONSISTENCY_CHECK state
100100B = COLDSTART_GAP state
100101旵 = COLDSTART_JOIN State
100110 B = INTEGRATION_COLDSTART_CHECK state
10 01111 
10 1000B = INTEGRATION_CONSISTENCY_CHECK state
10 1001B = INITIALIZE_SCHEDULE state
10 1010B = ABORT_STARTUP state
10 1011要= STARTUP_SUCCESS state
```

Other than above $=$ reserved

### 21.3.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.47 FLXAnFRCCEV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 13 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 12 to 8 | PTAC[4:0] | Passive to Active Count Flag <br> Indicate vAllowPassiveToActive |
| 7,6 | ERRM[1:0] | Error Mode Flags <br> Indicate vPOC!ErrorMode <br> 00: ACTIVE <br> $01: ~ P A S S I V E ~$ |
|  |  | 10: COMM_HALT <br> $11: ~ r e s e r v e d ~$ |
| 5,4 | CCFC[3:0] | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 3 to 0 | Clock Correction Failed Counter <br> Indicate vClockCorrectionFailed |  |

## (1) FLXAnFRCCEV.PTAC

Passive to Active Count Flag
Indicates the number of consecutive even/odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL_PASSIVE state to NORMAL_ACTIVE state. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA -1.
Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

## (2) FLXAnFRCCEV.ERRM

## Error Mode Flags

Indicates the actual error mode of the POC (vPOC!ErrorMode).
Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

## (3) FLXAnFRCCEV.CCFC

## Clock Correction Failed Counter

Indicates the clock correction failed counter of the POC (vClockCorrectionFailed).
The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the
missing offset correction error or missing rate correction error are active.
The Clock Correction Failed Counter is reset to ' 0 ' at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.
The Clock Correction Failed Counter stops at 15.
Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

### 21.3.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register

Value after reset: $\quad 00000000^{\mathbf{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 21.48 FLXAnFRSCV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 26 to 16 | SCCB[10:0] | Slot Counter Channel B <br> Indicates vSlotCounter[B] |
| 15 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 10 to 0 | SCCA[10:0] | Slot Counter Channel A <br> Indicates vSlotCounter[A] |

## (1) FLXAnFRSCV.SCCB

## Slot Counter Channel B

Current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and reset at the start of a communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFRSCV.SCCA

Slot Counter Channel A
Current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and reset at the start of a communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state.

### 21.3.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.49 FLXAnFRMTCCV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 22 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 21 to 16 | CCV[5:0] | Cycle Counter Value <br> Indicates vCycleCounter |
| 15,14 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 13 to 0 | MTV[13:0] | Macrotick Value <br> Indicates vMacrotick |

## (1) FLXAnFRMTCCV.CCV

Cycle Counter Value
Current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFRMTCCV.MTV

## Macrotick Value

Current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state.

### 21.3.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | $\mathrm{RCV}[11: 0]$ |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.50 FLXAnFRRCV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 11 to 0 | RCV[11:0] | Rate Correction Value Flags <br> Indicates vRateCorrection |

## (1) FLXAnFRRCV.RCV

Rate Correction Value Flags
Indicates internal rate correction value (vRateCorrection/ two's complement) before limitation. If the
FLXAnFRRCV.RCV value exceeds the limits defined by FLXAnFRGTUC10.MRC, flag FLXAnFRSFS.RCLR is set
to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## CAUTION

The external rate correction value is added to the limited rate correction value.

### 21.3.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 21.51 FLXAnFROCV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 19 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 18 to 0 | OCV[18:0] | Offset Correction Value Flags <br> Indicate vOffsetCorrection |

## (1) FLXAnFROCV.OCV

Offset Correction Value Flags
Indicate offset correction value (vOffsetCorrection/ two's complement) before limitation. If the FLXAnFROCV.OCV value exceeds the limits defined by FLXAnFRGTUC10.MOC, flag FLXAnFRSFS.OCLR is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## CAUTION

The external offset correction value is added to the limited offset correction value.

### 21.3.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register

| Value after reset: |  |  | $0000000 \mathrm{OH}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | RCLR | MRCS | OCLR | mocs |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | VSBO[3:0] |  |  |  | VSBE[3:0] |  |  |  | VSAO[3:0] |  |  |  | VSAE[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.52 FLXAnFRSFS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 19 | RCLR | Rate Correction Limit Reached Flag <br> 0: Rate correction below limit <br> 1: Rate correction limit reached |
| 18 | MRCS | Missing Rate Correction Signal Flag <br> 0: Rate correction signal valid <br> 1: Missing rate correction signal |
| 17 | OCLR | Offset Correction Limit Reached Flag <br> 0 : Offset correction below limit <br> 1: Offset correction limit reached |
| 16 | MOCS | Missing Offset Correction Signal Flag <br> 0 : Offset correction signal valid <br> 1: Missing offset correction signal |
| 15 to 12 | VSBO[3:0] | Valid Sync Frames Channel B, odd communication cycle |
| 11 to 8 | VSBE[3:0] | Valid Sync Frames Channel B, even communication cycle |
| 7 to 4 | VSAO[3:0] | Valid Sync Frames Channel A, odd communication cycle |
| 3 to 0 | VSAE[3:0] | Valid Sync Frames Channel A, even communication cycle |

## (1) FLXAnFRSFS.RCLR

Rate Correction Limit Reached Flag
The rate correction limit reached flag signals to the host that the rate correction value has exceeded its limit as defined by FLXAnFRGTUC10.MRC10 - MRC0. The flag is updated by the CC at start of offset correction phase.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

## (2) FLXAnFRSFS.MRCS

## Missing Rate Correction Signal Flag

The missing rate correction flag signals to the host that no rate correction calculation can be performed because no pairs of even/odd sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

## (3) FLXAnFRSFS.OCLR

Offset Correction Limit Reached Flag
The offset correction limit reached flag signals to the host that the offset correction value has exceeded its limit as defined by FLXAnFRGTUC10.MOC. The flag is updated by the CC at start of offset correction phase
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

## (4) FLXAnFRSFS.MOCS

Missing Offset Correction Signal Flag
The missing offset correction flag signals to the host that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

## (5) FLXAnFRSFS.VSBO

Valid Sync Frames Channel B, odd communication cycle
These bits are only valid when FLXAnFRSUCC1.CCHB is ' 1 '.
Holds the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY, the value is incremented by one. The value is updated during the NIT of each odd communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state

## (6) FLXAnFRSFS.VSBE

Valid Sync Frames Channel B, even communication cycle
These bits are only valid when FLXAnFRSUCC1.CCHB is ' 1 '.
Holds the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY, the value is incremented by one. The value is updated during the NIT of each even communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state

## (7) FLXAnFRSFS.VSAO

Valid Sync Frames Channel A, odd communication cycle
These bits are only valid when FLXAnFRSUCC1.CCHA is ' 1 '.
Holds the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY, the value is incremented by one. The value is updated during the NIT of each odd communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state

## (8) FLXAnFRSFS.VSAE

Valid Sync Frames Channel A, even communication cycle
These bits are only valid when FLXAnFRSUCC1.CCHA is ' 1 '.
Holds the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY, the value is incremented by one. The value is updated during the NIT of each even communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

### 21.3.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register

Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

Table 21.53 FLXAnFRSWNIT Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 11 | SBNB | Slot Boundary Violation during NIT Channel B Flag <br> 0 : No slot boundary violation detected <br> 1: Slot boundary violation during NIT detected on channel B |
| 10 | SENB | Syntax Error during NIT Channel B Flag <br> 0 : No syntax error detected <br> 1: Syntax error during NIT detected on channel B |
| 9 | SBNA | Slot Boundary Violation during NIT Channel A Flag <br> 0 : No slot boundary violation detected <br> 1: Slot boundary violation during NIT detected on channel A |
| 8 | SENA | Syntax Error during NIT Channel A Flag <br> 0 : No syntax error detected <br> 1: Syntax error during NIT detected on channel A |
| 7 | MTSB | MTS Received on Channel B Flag <br> 0: No MTS symbol received on channel B <br> 1: MTS symbol received on channel B |
| 6 | MTSA | MTS Received on Channel A Flag <br> 0: No MTS symbol received on channel A <br> 1: MTS symbol received on channel A |
| 5 | TCSB | Transmission Conflict in Symbol Window Channel B Flag <br> 0: No transmission conflict detected <br> 1: Transmission conflict in symbol window detected on channel B |
| 4 | SBSB | Slot Boundary Violation in Symbol Window Channel B Flag <br> 0 : No slot boundary violation detected <br> 1: Slot boundary violation during symbol window detected on channel $B$ |

Table 21.53 FLXAnFRSWNIT Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 | SESB | Syntax Error in Symbol Window Channel B Flag <br> 0: No syntax error detected <br>  |
|  |  | 1: Syntax error during symbol window detected on channel B |
| 2 |  | Transmission Conflict in Symbol Window Channel A Flag |
|  |  | 0: No transmission conflict detected |
|  |  | 1: Transmission conflict in symbol window detected on channel A |
| 1 |  | Slot Boundary Violation in Symbol Window Channel A Flag |
|  |  | 0: No slot boundary violation detected |
|  |  | 1: Slot boundary violation during symbol window detected on channel A |
| 0 |  | Syntax Error in Symbol Window Channel A Flag |
|  |  | 0: No syntax error detected |
|  |  | 1: Syntax error during symbol window detected on channel A |

## (1) FLXAnFRSWNIT.SBNB

Indicates a Slot Boundary Violation during NIT Channel B Flag (vSS!BViolationB).
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFRSWNIT.SENB

Indicates a Syntax Error during NIT Channel B Flag (vSS!SyntaxErrorB). Reset when leaving CONFIG state or when entering STARTUP state.

## (3) FLXAnFRSWNIT.SBNA

Indicates a Slot Boundary Violation during NIT Channel A Flag (vSS!BViolationA). Reset when leaving CONFIG state or when entering STARTUP state.

## (4) FLXAnFRSWNIT.SENA

Indicates a Syntax Error during NIT Channel A Flag (vSS!SyntaxErrorA). Reset when leaving CONFIG state or when entering STARTUP state.

## (5) FLXAnFRSWNIT.MTSB

Indicates a MTS Received on Channel B Flag (vSS!ValidMTSB).
Media Access Test symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.
When this bit is set to ' 1 ', also interrupt flag FLXAnFRSIR.MTSB is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (6) FLXAnFRSWNIT.MTSA

Indicates a MTS Received on Channel A Flag (vSS!ValidMTSA).
Media Access Test symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.
When this bit is set to ' 1 ', also interrupt flag FLXAnFRSIR.MTSA is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (7) FLXAnFRSWNIT.TCSB

Indicates a Transmission Conflict in Symbol Window Channel B Flag (vSS!TxConflictB). Reset when leaving CONFIG state or when entering STARTUP state.

## (8) FLXAnFRSWNIT.SBSB

Indicates a Slot Boundary Violation in Symbol Window Channel B Flag (vSS!BViolationB). Reset when leaving CONFIG state or when entering STARTUP state.

## (9) FLXAnFRSWNIT.SESB

Indicates a Syntax Error in Symbol Window Channel B Flag (vSS!SyntaxErrorB). Reset when leaving CONFIG state or when entering STARTUP state.

## (10) FLXAnFRSWNIT.TCSA

Indicates a Transmission Conflict in Symbol Window Channel A Flag (vSS!TxConflictA). Reset when leaving CONFIG state or when entering STARTUP state.

## (11) FLXAnFRSWNIT.SBSA

Indicates a Slot Boundary Violation in Symbol Window Channel A Flag (vSS!BViolationA). Reset when leaving CONFIG state or when entering STARTUP state.

## (12) FLXAnFRSWNIT.SESA

Indicates a Syntax Error in Symbol Window Channel A Flag (vSS! SyntaxErrorA). Reset when leaving CONFIG state or when entering STARTUP state.

### 21.3.7.9 FLXAnFRACS — FlexRay Aggregated Channel Status Register

Do not rewrite this register using bit manipulation instructions.
The aggregated channel status provides the host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.
The status data is updated (set) after each slot and aggregated until it is reset by the host.
During startup, the status data is not updated.

Table 21.54 FLXAnFRACS Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 12 | SBVB | Slot Boundary Violation on Channel B Flag <br> 0 : No slot boundary violation observed <br> 1: Slot boundary violation(s) observed on channel B |
| 11 | CIB | Communication Indicator Channel B Flag <br> 0 : No valid frame(s) received in slots containing any additional communication <br> 1: Valid frame(s) received on channel $B$ in slots containing any additional communication |
| 10 | CEDB | Content Error Detected on Channel B Flag <br> 0 : No frame with content error received <br> 1: Frame(s) with content error received on channel B |
| 9 | SEDB | Syntax Error Detected on Channel B Flag <br> 0: No syntax error observed <br> 1: Syntax error(s) observed on channel B |
| 8 | VFRB | Valid Frame Received on Channel B Flag <br> 0 : No valid frame received <br> 1: Valid frame(s) received on channel B |
| 7 to 5 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 4 | SBVA | Slot Boundary Violation on Channel A Flag <br> 0: No slot boundary violation observed <br> 1: Slot boundary violation(s) observed on channel A |

Table 21.54 FLXAnFRACS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 | CIA | Communication Indicator Channel A Flag <br> 0: No valid frame(s) received in slots containing any additional communication <br> 1: Valid frame(s) received on channel A in slots containing any additional communication |
| 2 | CEDA | Content Error Detected on Channel A Flag <br> 0: No frame with content error received <br> 1: Frame(s) with content error received on channel A |
| 1 | SEDA | Syntax Error Detected on Channel A Flag <br> 0: No syntax error observed |
|  |  | 1: Syntax error(s) observed on channel A |

## (1) FLXAnFRACS.SBVB

Slot Boundary Violation on Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDB is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFRACS.CIB

Communication Indicator Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more valid frames were received on channel B in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDB is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
The set condition of the flag FLXAnFRACS.CIB is also fulfilled if there is only a single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

## (3) FLXAnFRACS.CEDB

Content Error Detected on Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDB is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (4) FLXAnFRACS.SEDB

Syntax Error Detected on Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDB is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (5) FLXAnFRACS.VFRB

Valid Frame Received on Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more valid frames were received on channel B in any static or dynamic slot during the observation period. Reset when leaving CONFIG state or when entering STARTUP state.

## (6) FLXAnFRACS.SBVA

Slot Boundary Violation on Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
Slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDA is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (7) FLXAnFRACS.CIA

Communication Indicator Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame, and had one of syntax error, content error, or slot boundary violation.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDA is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
The set condition of the flag FLXAnFRACS.CIA is also fulfilled if there is only a single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

## (8) FLXAnFRACS.CEDA

Content Error Detected on Channel A Flag
Writing '0' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDA is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

RENESAS

## (9) FLXAnFRACS.SEDA

Syntax Error Detected on Channel A Flag
Writing '0' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.EDA is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.

## (10) FLXAnFRACS.VFRA

Valid Frame Received on Channel A Flag Writing '0' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
One or more valid frames were received on channel A in any static or dynamic slot during the observation period.
Reset when leaving CONFIG state or when entering STARTUP state.

### 21.3.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m ( $\mathrm{m}=1$ to 15)

Registers FLXAnFRESID1 to FLXAnFRESID15 hold the frame IDs of the sync frames received in even communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFRESID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register FLXAnFRESID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFRESID1.RXEA, FLXAnFRESID1.RXEB are set. The value is updated during the NIT of each even communication cycle.

Table 21.55 FLXAnFRESIDm ( $\mathrm{m}=1$ to 15) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 15 | RXEB | Received/Configured Even Sync ID on Channel B Flag <br> 0: No sync frame received on channel B or node not configured to transmit sync frames <br> 1: Sync frame received on channel B or node configured to transmit sync frames |
| 14 | RXEA | Received/Configured Even Sync ID on Channel A Flag <br> 0: No sync frame received on channel A or node not configured to transmit sync frames <br> 1: Sync frame received on channel A or node configured to transmit sync frames |
| 13 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 to 0 | EID[9:0] | Even Sync ID Flags (vsSyncIDListA,B even) |

## (1) FLXAnFRESIDm.RXEB

Received/Configured Even Sync ID on Channel B Flag
Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot indicated by the FLXAnFRESID1.EID.
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFRESIDm.RXEA

Received/Configured Even Sync ID on Channel A Flag
Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot indicated by FLXAnFRESID1.EID.
Reset when leaving CONFIG state or when entering STARTUP state.

## (3) FLXAnFRESIDm.EID

Even Sync ID Flags (vsSyncIDListA, B even)
Sync frame ID even communication cycle
Reset when leaving CONFIG state or when entering STARTUP state.

### 21.3.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m (m=1 to 15)

Registers FLXAnFROSID1 to FLXAnFROSID15 hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronization up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFROSID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register FLXAnFROSID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFROSID1.RXOA and FLXAnFROSID1.RXOB are set. The value is updated during the NIT of each odd communication cycle.

Table 21.56 FLXAnFROSIDm Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 15 | RXOB | Received/Configured Odd Sync ID on Channel B Flag <br> 0: No sync frame received on channel B or node not configured to transmit sync frames <br> 1: Sync frame received on channel B or node configured to transmit sync frames |
| 14 | RXOA | Received/Configured Odd Sync ID on Channel A Flag <br> 0: No sync frame received on channel A or node not configured to transmit sync frames <br> $1:$ Sync frame received on channel A or node configured to transmit sync frames |
| 13 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 to 0 | OID[9:0] | Odd Sync ID Flags (vsSyncIDListA,B odd) |

## (1) FLXAnFROSIDm.RXOB

Received/Configured Odd Sync ID on Channel B Flag
Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot indicated by the FLXAnFROSID1.OID.
Reset when leaving CONFIG state or when entering STARTUP state.

## (2) FLXAnFROSIDm.RXOA

Received/Configured Odd Sync ID on Channel A Flag
Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot indicated by the FLXAnFRISID1.OID.
Reset when leaving CONFIG state or when entering STARTUP state.

## (3) FLXAnFROSIDm.OID

Odd Sync ID Flags (vsSyncIDListA,B odd)
Sync frame ID odd communication cycle.
Reset when leaving CONFIG state or when entering STARTUP state

### 21.3.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m (m=1 to 3 )

The three network management registers hold the accrued NM vector (see Section 21.4.7, Network Management).
The CC updates the NM vector at the end of each communication cycle as long as the CC is either in
NORMAL_ACTIVE or NORMAL_PASSIVE state.
NMVn-bytes exceeding the configured NM vector length are not valid.
For information about the byte alignment of the received NM vector in this register (see Section 21.4.17, Byte
Alignment).

Table 21.57 FLXAnFRNMVm Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 0 | NM[31:0] | NM Vector the three network management vector registers hold the accrued NM vector (configurable 0 to 12 bytes). The NM vector to be held is generated by bit-wise logic OR for each NM vector received on each channel (valid static frames with PPI = ' 1 ') (see Section 21.4.7, Network Management). <br> For information about the byte alignment of the received NM vector in this register, (see Section 21.4.17, Byte Alignment). <br> NMVn-bytes exceeding the configured NM vector length are not valid. <br> The register contents are updated at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state. <br> These bits are cleared when leaving CONFIG state or when entering STARTUP state. |

### 21.3.8 Message Buffer Control Registers

### 21.3.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register

The message RAM configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The message RAM can be divided into up three different areas: static buffer area, static and dynamic buffer area, FIFO area. If present, the static buffer area starts at message buffer 0 .

The start of the static and dynamic buffer area is configured by FLXAnFRMRC.FDB. FLXAnFRMRC.FDB defines the end of the static buffer area. If no static buffer area is present, the static and dynamic buffer area starts at message buffer 0 .

The start of the FIFO area is configured by FLXAnFRMRC.FFB. FLXAnFRMRC.FFB defines the end of the previous area, which can be either the static buffer area or the static and dynamic buffer area.

If no static buffer area and no static and dynamic buffer area is present, the FIFO area starts at message buffer 0 .
With FLXAnFRMRC.LCB, the end of the last configured area is configured. This can be the static buffer area, the static and dynamic buffer area, or the FIFO area.

Figure 21.2 shows an example configuration of the message RAM where all the areas are configured.

Figure 21.2 Message RAM Organization

## CAUTIONS

1. If the node is configured as a sync node (FLXAnFRSUCC1.TXSY = ' 1 ') or for single slot mode operation (FLXAnFRSUCC1.TSM = ' 1 '), message buffers 0 and 1 are reserved for sync frames or single slot frames and have to be configured with the node-specific key slot ID. If the node is neither configured as a sync node nor for single slot operation, message buffers 0 and 1 are treated like all other message buffers.
2. The maximum number of header sections is 128 . This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section can be configured separately for each message buffer. For details, see Section 21.4.13, Message RAM.
3. If two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the "static buffers" or at the beginning of the "static + dynamic buffers" section.
4. The FlexRay protocol specification requires that each node send a frame in its key slot. Therefore, at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement, a maximum number of 127 message buffers can be assigned to the FIFO. Nevertheless, a non-protocol-conforming configuration without a transmission slot in the static segment would still be operational.
5. The payload length and the length of the data section need to be configured identically for all message buffers belonging to the FIFO via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. When the CC is not in DEFAULT_CONFIG or CONFIG state, reconfiguration of message buffers belonging to the FIFO is locked.

Table 21.58 FLXAnFRMRC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 26 | SPLM | Sync Frame Payload Multiplex <br> 0 : Writing to message buffer 0 is prohibited. <br> 1: Writing to message buffer 0 or 1 is prohibited. |
| 25, 24 | SEC[1:0] | Secure Buffers <br> 00: Writing is enabled for all buffers. <br> 01: Writing is prohibited to static buffer and FIFO, limited transmission <br> 10: Writing is prohibited for all buffers. <br> 11: Writing is prohibited for all buffers, limited transmission |
| 23 to 16 | LCB[7:0] | Last Configured Buffer <br> 0 to 127: Number of message buffers is FLXAnFRMRF.LCB + 1 <br> 128: No message buffer configured |
| 15 to 8 | FFB[7:0] | First Buffer of FIFO <br> 0: All message buffers assigned to the FIFO <br> 1 to 127: Message buffers from FLXAnFRMRC.FFB to FLXAnFRMRC.LCB assigned to the FIFO <br> 128: No message buffer configured |
| 7 to 0 | FDB[7:0] | First Dynamic Buffer <br> 0 : No group of message buffers exclusively for the static segment configured 1 to 127: Message buffers 0 to FLXAnFRMRC.FDB - 1 reserved for static segment <br> 128: No dynamic message buffers configured |

## (1) FLXAnFRMRC.SPLM

Sync Frame Payload Multiplex
The user can only write to this bit when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
This bit is only enabled if the node is configured as a sync node (FLXAnFRSUCC1.TXSY $=$ ' 1 ') or for single slot mode operation (FLXAnFRSUCC1.TSM $=$ ' 1 ').
When this bit is set to ' 1 ', message buffers 0 and 1 are dedicated for sync frame transmission with separate payload data on channels A and B.
When this bit is set to ' 0 ', sync frames are transmitted from message buffer 0 with the same payload data on all channels configured. Note that the channel filter configuration for message buffer 0 and message buffer 1 are selected according to this SPLM bit setting.

## (2) FLXAnFRMRC.SEC

## Secure Buffer

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
These bits are disabled when the CC is in DEFAULT_CONFIG or CONFIG state.
For temporary unlocking, see Section 21.4.13.4, Host Handling of Access Errors.
$00_{\mathrm{B}}=$ Writing is enabled for all buffers.
Reconfiguration of message buffers enabled with numbers < FLXAnFRMRC.FFB enabled
Exception: In nodes configured for sync frame transmission or for single slot mode operation, writing to message buffer 0 (and if FLXAnFRMRC.SPLM = ' 1 ', also message buffer 1 ) is prohibited.
$01_{\mathrm{B}}=$ static buffers locked, FIFO locked, limited transmission
Reconfiguration of message buffers with numbers $<$ FLXAnFRMRC.FDB and with numbers $\geq$ FLXAnFRMRC.FFB locked and transmission of message buffers for static segment with numbers $\geq$ FLXAnFRMRC.FDB disabled
$10_{\mathrm{B}}=$ all buffers locked
Writing to any message buffer is prohibited.
$11_{\mathrm{B}}=$ Writing to any buffers is prohibited.
Reconfiguration of all message buffer locked and transmission of message buffers for static segment with numbers $\geq$ FLXAnFRMRC.FDB disabled

## (3) FLXAnFRMRC.LCB

## Last Buffer Setting

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.LCB $\geq$ FLXAnFRMRC.FDB.
When a FIFO area is configured (FLXAnFRMRC.FFB $<128$ ), the user should configure FLXAnFRMRC.LCB $\geq$ FLXAnFRMRC.FFB.
(4) FLXAnFRMRC.FFB

FIFO First Buffer Setting
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.FFB > FLXAnFRMRC.FDB.

## (5) FLXAnFRMRC.FDB

First Dynamic Buffer Setting
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

### 21.3.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register

The FIFO Rejection Filter defines the user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask Register, this register determines whether a message is rejected by the FIFO.

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.59 FLXAnFRFRF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 25 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 24 | RNF | Reject Null Frames <br> 0: Null frames are stored in the FIFO <br> 1: Reject all null frames |
| 23 | RSS | Reject in Static Segment <br> 0 : FIFO also used for static segment <br> 1: Reject messages in static segment |
| 22 to 16 | CYF[6:0] | Cycle Counter Filter |
| 15 to 13 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 12 to 2 | FID[10:0] | Frame ID Filter 0 to 2047: Frame ID filter values |
| 1, 0 | CH[1:0] | Channel Filter <br> 00: receive on both channels <br> 01: receive only on channel B <br> 10: receive only on channel $A$ <br> 11: Reception prohibited |

## (1) FLXAnFRFRF.RNF

Reject Null Frame
The user can only write to this bit when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. If this bit is set to ' 1 ', received null frames are not stored in the FIFO.

## (2) FLXAnFRFRF.RSS

## Reject in Static Segment

The user can only write to this bit when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
If this bit is set to ' 1 ', the FIFO is used only for the dynamic segment.

## (3) FLXAnFRFRF.CYF

Cycle Counter Filter
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles that are not specified by FLXAnFRFRF.CYF, all frames are rejected. For details about the configuration of the cycle counter filter, see Section 21.4.8.2, Cycle Counter Filtering.

## (4) FLXAnFRFRF.FID

Frame ID Filter
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG. Determines the frame ID to be rejected by the FIFO. With the additional configuration of register FLXAnFRFRFM, the corresponding frame ID filter bits are ignored. When FLXAnFRFRFM.MFID is zero, a frame ID filter value of zero means that there is no frame ID to be rejected.

## (5) FLXAnFRFRF.CH

Channel Filter
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
If reception on both channels is configured, also in the static segment, both frames (from channels A and B) are always stored in the FIFO, even if they are identical.

### 21.3.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register

The FlexRay FIFO Rejection Filter Mask Register specifies the frame ID filter bits relevant to rejection filtering. If a bit is set to ' 1 ', it indicates that the corresponding bit in the FLXAnFRFRF register will not be considered for rejection filtering.

Table 21.60 FLXAnFRFRFM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 13 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 12 to 2 | MFID[10:0] | Mask Frame ID Filter <br> $0:$ Corresponding frame ID filter bit is used for rejection filtering <br> $1:$ Ignore corresponding frame ID filter bit. |
| 1,0 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |

## (1) FLXAnFRFRFM.MFID

Mask Frame ID Filter
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

### 21.3.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register

Value after reset: $\quad 00000080_{\mathrm{H}}$

Table 21.61 FLXAnFRFCL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 7 to 0 | CL[7:0] | Critical Level Setting <br> Critical level setting |

## (1) FLXAnFRFCL.CL

Critical Level Setting
The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.
When the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level configured by FLXAnFRFCL.CL, the receive FIFO critical level flag FLXAnFRFSR.RFCL is set to 1 .
If FLXAnFRFCL.CL is programmed to values $>128$, bit FLXAnFRFSR.RFCL is never set to 1 .

### 21.3.9 Message Buffer Status Registers

### 21.3.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register

Do not rewrite this register using bit manipulation instructions.

| Value after reset: |  |  | $00000080^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | MBU[6:0] |  |  |  |  |  |  | - | MBT[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | FMB[6:0] |  |  |  |  |  |  | CRAM | MFMB | FMBD | ATBF2 | ATBF1 | AMR | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R |

Table 21.62 FLXAnFRMHDS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 30 to 24 | MBU[6:0] | Message Buffer Updated Flags |
| 23 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 22 to 16 | MBT[6:0] | Message Buffer Transmitted Flags |
| 15 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 14 to 8 | FMB[6:0] | Faulty Message Buffer Number Flags |
| 7 | CRAM | Internal RAM Clear Flag <br> 0: No execution of the CHI command CLEAR_RAMS <br> 1: Execution of the CHI command CLEAR_RAMS ongoing |
| 6 | MFMB | Multiple Faulty Message Buffer Detection Flag <br> 0: No additional faulty message buffer <br> 1: Additional faulty message buffer was detected while the FMBD flag is set to 1. |
| 5 | FMBD | Faulty Message Buffer Detection Flag <br> 0 : No faulty message buffer <br> 1: Message buffer referenced by FLXAnFRMHDS.FMB holds faulty data with a parity error. |
| 4 | ATBF2 | Transient Buffer RAM B Access Error Flag <br> 0: No access error <br> 1: Access error occurred when reading the RAM B. |
| 3 | ATBF1 | Transient Buffer RAM A Access Error Flag <br> 0: No access error <br> 1: Access error occurred when reading the RAM A. |
| 2 | AMR | Message RAM Access Error Flag <br> 0 : No access error <br> 1: Access error occurred when reading the message RAM. |
| 1, 0 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 |

## (1) FLXAnFRMHDS.MBU

## Message Buffer Updated Flags

These flags indicate the number of the message buffer that was updated last by the CC. For this message buffer, the respective ND and/or MBC flag in the FLXAnFRNDAT1/2/3/4 registers and the FLXAnFRMBSC1/2/3/4 registers are also set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRMHDS.MBT

## Message Buffer Transmitted Flags

These flags indicate the number of the last successfully transmitted message buffer.
If the message buffer is configured for single-shot mode, the respective TXR flags in the FLXAnFRTXRQ1/2/3/4 registers are reset to ' 0 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (3) FLXAnFRMHDS.FMB

Faulty Message Buffer Number Flags
These flags indicate that an access error occurred when reading from the message buffer referenced by FLXAnFRMHDS.FMB.

The value of this flag is only valid whenever one of AMR flag, ATBF1 flag, ATBF2 flag, or FMBD flag in the FLXAnFRMHDS register is set to 1 .
This flag is not updated while the FLXAnFRMHDS.FMBD flag is 1 .
This flag is cleared by the CHI command CLEAR_RAMS.

## (4) FLXAnFRMHDS.CRAM

Internal RAM Clear Flag
This flag indicates that the CHI command CLEAR_RAMS is ongoing (all bits of the message RAM, input buffer, output buffer and Transient Buffer RAM are written to ' 0 ').
This flag is set by the CHI command CLEAR_RAMS.

## (5) FLXAnFRMHDS.MFMB

Multiple Faulty Message Buffer Detection Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This bit indicates that an additional faulty message buffer was detected while the FMBD flag is set. This bit is cleared by the CHI command CLEAR_RAMS.

## (6) FLXAnFRMHDS.FMBD

Faulty Message Buffer Detection Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This bit indicates that the message buffer referenced by FLXAnFRMHDS.FMB holds faulty data due to an access error.
This bit is cleared by the CHI command CLEAR_RAMS.

## (7) FLXAnFRMHDS.ATBF2

Transient Buffer RAM B Access Error Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag indicates that an access error occurred when reading the Transient Buffer RAM B.

## CAUTION

When this flag changes from ' 0 ' to ' 1 ', the AERR bit in the FLXAnFREIR register is set to ' 1 '. This flag can be reset by the CHI command CLEAR_RAMS.

## (8) FLXAnFRMHDS.ATBF1

Transient Buffer RAM A Access Error Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag indicates that an access error occurred when reading the Transient Buffer RAM A.

## CAUTION

When this flag changes from ' 0 ' to ' 1 ', the AERR bit in the FLXAnFREIR register is set to ' 1 '. This flag can be reset by the CHI command CLEAR_RAMS.

## (9) FLXAnFRMHDS.AMR

Message RAM Access Error Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag indicates that an access error occurred when reading the message RAM.

## CAUTION

When this flag changes from ' 0 ' to ' 1 ', the AERR bit in the FLXAnFREIR register is set to ' 1 '. This flag can be reset by the CHI command CLEAR_RAMS.

### 21.3.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | LDTB[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | LDTA[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.63 FLXAnFRLDTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 27 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. <br> 26 to 16 LDTB[10:0] |
| 15 to 11 | - | Last Dynamic Transmission Channel B Flags |
| 10 to 0 | LDTA[10:0] | Reserved <br> These bits are always read as 0. When writing, always write 0. |

## (1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flags
Store the value of vSlotCounter at the time of the last frame transmission on channel B in the dynamic segment.
Updated at the end of the dynamic segment and reset to zero if no frame was transmitted during the dynamic segment. Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flags
Store the value of vSlotCounter at the time of the last frame transmission on channel A in the dynamic segment.
Updated at the end of the dynamic segment and reset to zero if no frame was transmitted during the dynamic segment.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

### 21.3.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

Value after reset: $00000000_{\mathrm{H}}$

Table 21.64 FLXAnFRFSR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 15 to 8 | RFFL[7:0] | Receive FIFO Fill Level Flags |
| 7 to 3 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 2 | RFO | Receive FIFO Overrun Flag <br>  |
|  |  | 0: No receive FIFO overrun is detected |
|  |  | Receive FIFO Critical Level Flag |
|  |  | 0: Receive FIFO is below critical level |
| 1 | RFNE | Receive FIFO Not Empty Flag |
|  |  | $0:$ Receive FIFO is empty |
| 0 |  | 1: Receive FIFO is not empty |

## (1) FLXAnFRFSR.RFFL

Receive FIFO Fill Level Flags
Indicate the number of FIFO buffers filled with new data not yet read by the host. Maximum value is 128.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRFSR.RFO

## Receive FIFO Overrun Flag

The flag is set to ' 1 ' by the CC when a receive FIFO overrun is detected.
When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag FLXAnFREIR.RFO is set to ' 1 '.
The flag is cleared when the FIFO is read.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (3) FLXAnFRFSR.RFCL

Receive FIFO Critical Level Flag
This flag is set to ' 1 ' when the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level as configured by FLXAnFRFCL.CL.
When FLXAnFRFSR.RFCL changes from ' 0 ' to ' 1 ', bit FLXAnFRSIR.RFCL is set to ' 1 ', and if enabled, an interrupt is generated.
The flag is cleared by the CC as soon as FLXAnFRFSR.RFFL drops below FLXAnFRFCL.CL.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (4) FLXAnFRFSR.RFNE

Receive FIFO Not Empty Flag
This flag is set to ' 1 ' by the CC when a received valid frame (data or null frame depending on rejection mask) is transferred to the FIFO. In addition, interrupt flag FLXAnFRSIR.RFNE is set to ' 1 '.
The bit is reset to ' 0 ' after the host has read all messages from the FIFO.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

### 21.3.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Do not rewrite this register using bit manipulation instructions.
Some constraints exist for the message handler regarding bus clock frequency, message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in FLXAnFRMHDF.

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | WAHP | TNSB | TNSA | TBFB | TBFA | FNFB | FNFA | SNUB | SNUA |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.65 FLXAnFRMHDF Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 8 | WAHP | Write Attempt to Header Partition Flag <br> 0: No write attempt to header partition <br> 1: A write attempt to header partition |
| 7 | TNSB | Transmission Not Started Channel B Flag <br>  |
|  |  | 0: No transmission not started on channel B |
|  |  | 1: Transmission not started on channel B |

Table 21.65 FLXAnFRMHDF Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | SNUB | Status Not Updated Channel B Flag |
|  |  | 0: No overload condition occurred when updating MBS for channel B |
|  |  | 1: Message buffer status (FLXAnFRMBS) for channel B not updated |
| 0 | SNUA | Status Not Updated Channel A Flag |
|  |  | $0:$ No overload condition occurred when updating MBS for channel A |
|  |  | 1: Message buffer status (FLXAnFRMBS) for channel A not updated |

## (1) FLXAnFRMHDF.WAHP

Write Attempt to Header Partition Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
Outside DEFAULT_CONFIG and CONFIG state, this flag is set to ' 1 ' when the message handler tries to write message data into the header partition of the message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.
When this flag changes from ' 0 ' to ' 1 ', in addition interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (2) FLXAnFRMHDF.TNSB Flag

Transmission Not Started Channel B
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when the message handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (3) FLXAnFRMHDF.TNSA

Transmission Not Started Channel A Flag Writing ' 0 ' has no effect on the bit value. This bit is cleared by writing ' 1 ' to it.
This flag is set when the message handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (4) FLXAnFRMHDF.TBFB

Temporary Buffer Access Failure B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when a read or write access to TBF B requested by PRT (protocol controller) B could not complete within the specified time.

When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (5) FLXAnFRMHDF.TBFA

Temporary Buffer Access Failure A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' by the CC when a read or write access to TBF A requested by PRT A could not complete within the specified time.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (6) FLXAnFRMHDF.FNFB

Find Sequence Not Finished Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when the message handler, due to overload condition, was not able to finish a find sequence (scan of message RAM for matching message buffer).
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (7) FLXAnFRMHDF.FNFA

Find Sequence Not Finished Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when the message handler, due to overload condition, was not able to finish a find sequence (scan of message RAM for matching message buffer).
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (8) FLXAnFRMHDF.SNUB

Status Not Updated Channel B Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when the message handler, due to overload condition, was not able to update a message buffer's status MBS.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

## (9) FLXAnFRMHDF.SNUA

Status Not Updated Channel A Flag
Writing ' 0 ' has no effect on the bit value.
This bit is cleared by writing ' 1 ' to it.
This flag is set to ' 1 ' when the message handler, due to overload condition, was not able to update a message buffer's status MBS.
When this flag changes from ' 0 ' to ' 1 ', interrupt flag FLXAnFREIR.MHF is set to ' 1 '.
Reset when leaving CONFIG state or when entering STARTUP state.
Reset by the CHI command CLEAR_RAMS.

### 21.3.9.5 FLXAnFRTXRQi — FlexRay Transmission Request Register $\mathbf{i}$ ( $\mathbf{i = 1}$ to 4)

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are evaluated for transmit buffers only. If the number of configured message buffers is less than 128, the remaining TXR flags have no meaning.

Table 21.66 FLXAnFRTXRQi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TXRo[31:0] | Transmission Request Flag o |

## (1) FLXAnFRTXRQi.TXRo $(0=(i-1) \times 32$ to $(i \times 32-1))$

Transmission Request Flag o
If the flag is set to ' 1 ', the respective message buffer is ready for transmission or transmission of this message buffer is in progress.
In single-shot mode, the flags are reset to ' 0 ' after transmission has completed.
This bit is cleared by the CHI command CLEAR_RAMS.

### 21.3.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i=1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128 , the remaining ND flags have no meaning.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 21.67 FLXAnFRNDATi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | NDm[31:0] | New Data Flag m |

## (1) FLXAnFRNDATi.NDm $(m=(i-1) \times 32$ to $(i \times 32-1))$

New Data Flag m
The flags are set to ' 1 ' when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.
The flags are not set to ' 1 ' after reception of null frames except for message buffers belonging to the receive FIFO.
An ND flag is reset to ' 0 ' when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the output buffer.
Reset when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

### 21.3.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register $\mathbf{i}(i=1$ to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128 , the remaining MBC flags have no meaning.

Table 21.68 FLXAnFRMBSCi ( $\mathrm{i}=1$ to 4) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MBCm[31:0] | Message Buffer Status Changed Flag m |

## (1) FLXAnFRMBSCi.MBCm $(m=(i-1) \times 32$ to $(i \times 32-1))$

Message Buffer Status Changed Flag m
Indicates whether the message handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see Section 21.3.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register and Section 21.4.13.1, Header Partition) of the respective message buffer.

An MBC flag is reset to ' 0 ' when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the output buffer.
Reset when leaving CONFIG state or when entering STARTUP state.
This bit is cleared by the CHI command CLEAR_RAMS.

### 21.3.10 Input Buffer

The input buffer (IBF) has a double structure of IBF host and IBF shadow. While the host can write to IBF host, the transfer to the message RAM is done from IBF shadow. The input buffer holds the header and data sections to be transferred to the selected message buffer in the message RAM. It is used to configure the message buffers in the message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the message RAM from the input buffer, the message buffer status as described in Section 21.3.11.5, FLXAnFRMBS - FlexRay Message Buffer Status Register is automatically reset to 0 .

The header sections of message buffers belonging to the receive FIFO can only be configured or reconfigured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers, only the payload length and the data pointer can be configured via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask registers.
The data transfer between input buffer (IBF) and message RAM is described in detail in Section 21.4.12.2, Host
Access to Message RAM.
These registers cannot be written when the input data transfer function shown Section 21.4.16.1, Input Data Transfer is used and the FLXAnFRITS.ITS bit is 1.

### 21.3.10.1 FLXAnFRWRDS $\mathbf{x}$ — FlexRay Write Data Section Register x ( $\mathrm{x}=1$ to 64)

This register holds the data words to be transferred to the data section of the specified message buffer. The number of data words (DWx) written to the message RAM is defined by the payload length configured in the FLXAnFRWRHS2.PLC bit.

Table 21.69 FLXAnFRWRDSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MD[31:0] | Message Data |

## (1) FLXAnFRWRDSx.MD

Message Data Bits
For information about the byte alignment of the message data in this register, see Section 21.4.17, Byte Alignment.

## CAUTIONS

1. In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
2. When writing to FLXAnFRWRDSx, each 32-bit word has to be filled up by access in a single 32-bit unit, in two consecutive 16-bit units, or in four consecutive 8 -bit units before transfer from the input buffer to the message RAM will start. If not all bytes of a 32 -bit word have been written by the host ( 8 - or 16 -bit access only), FLXAnFRWRDSx holds partly undefined data.
Reset by the CHI command CLEAR_RAMS.

### 21.3.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

| Value after reset: |  |  | $0000000 \mathrm{OH}^{\text {H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 21.70 FLXAnFRWRHS1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 29 | MBI | Message Buffer Interrupt <br> 0 : The corresponding message buffer interrupt is disabled <br> 1: The corresponding message buffer interrupt is enabled |
| 28 | TXM | Transmission Mode <br> 0 : Continuous mode <br> 1: Single-shot mode |
| 27 | PPIT | Payload Preamble Indicator Transmit <br> 0 : Payload Preamble Indicator is set to ' 0 ' <br> 1: Payload Preamble Indicator is set to ' 1 ' |
| 26 | CFG | Message Buffer Direction Configuration <br> 0 : The corresponding buffer is configured as receive buffer <br> 1: The corresponding buffer is configured as transmit buffer |
| 25,24 | CH[1:0] | Channel Filter Control |
| 23 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 22 to 16 | CYC[6:0] | Cycle Code |
| 15 to 11 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 10 to 0 | FID[10:0] | Frame ID |

## (1) FLXAnFRWRHS1.MBI

Message Buffer Interrupt Enable
This bit enables the receive/transmit interrupt for the corresponding message buffer.
After a dedicated receive buffer has been updated by the message handler, flag FLXAnFRSIR.RXI and/or
FLXAnFRSIR.MBSI are set to ' 1 '. After a transmission has completed, flag FLXAnFRSIR.TXI is set to ' 1 '.

## (2) FLXAnFRWRHS1.TXM

Transmission Mode Setting
This bit selects transmit mode of the corresponding message buffer. For transmit mode, see Section 21.4.9.3,
Transmit Buffers.

## (3) FLXAnFRWRHS1.PPIT

## Payload Preamble Indicator Transmit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames of the corresponding message buffer.
If the bit is set to ' 1 ' in a static message buffer, the respective message buffer holds network management information. If the bit is set to ' 1 ' in a dynamic message buffer, the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the host.

## (4) FLXAnFRWRHS1.CFG

## Message Buffer Direction Configuration

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO, the bit is disabled.
If an unused area of at least 32 bits is not allocated at the start of the data partition, set this bit to 1 to select allocation of the data section of the message buffer as a transmission buffer immediately following (after the last buffer of) the header partition.

## (5) FLXAnFRWRHS1.CH

## Channel Filter Control

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

| CH[1:0] | Transmit Buffer transmit frame on | Receive Buffer store frame received from |
| :--- | :--- | :--- |
| 00 | Transmission prohibited | ignore frame |
| 01 | channel A | channel A |
| 10 | channel B | channel B |
| 11 | both channels (static segment only) | channel A or B (store first semantically valid frame; static segment only) |
| CAUTION |  |  |

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to ' 1 ', no transmission nor reception of frames is performed. (same function as $\mathrm{CH}={ }^{0} 00_{\mathrm{B}}$ ")

## (6) FLXAnFRWRHS1.CYC

## Cycle Code

The 7-bit cycle code determines the cycle set used for cycle counter filtering.
For details about the configuration of the cycle code, see Section 21.4.8.2, Cycle Counter Filtering.

## (7) FLXAnFRWRHS1.FID

## Frame ID

Frame ID of the selected message buffer. The frame ID defines the slot number for transmission/reception of the respective message.
Message buffers with frame $\mathrm{ID}=$ ' 0 ' are considered as invalid.

### 21.3.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

Value after reset: $\quad 00000000^{\mathbf{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | PLC[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | CRC[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.71 FLXAnFRWRHS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 22 to 16 | PLC[6:0] | Payload Length Configured |
| 15 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 10 to 0 | CRC[10:0] | Header CRC (vRF!Header!HeaderCRC) <br> Receive Buffer: Configuration is not required <br> Transmit Buffer: Header CRC is configured |

## (1) FLXAnFRWRHS2.PLC

Payload Length Configured
Length of data section (number of 2-byte words) as configured by the host.
During static segment, the static frame payload length as configured by FLXAnFRMHDC.SFDL defines the payload length for all static frames. If the payload length configured by FLXAnFRWRHS2.PLC is shorter than this value, padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is " $0000_{\mathrm{H}}$ " (see Section 21.4.9.3, Transmit Buffers).

## (2) FLXAnFRWRHS2.CRC

## Header CRC (vRF!Header!HeaderCRC)

Setting of the receive buffer is not required.
Transmitting of the message buffer needs the header CRC calculation and setting.
For calculation of the header CRC, the payload length of the frame to be sent has to be considered. In static segment, the payload length of all frames is configured by FLXAnFRMHDC.SFDL.

### 21.3.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 21.72 FLXAnFRWRHS3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. <br> 10 to 0 |

(1) FLXAnFRWRHS3.DP

Data Pointer
Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the message RAM.

### 21.3.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the message RAM selected by register FLXAnFRIBCR is updated. When IBF host and IBF shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

Value after reset: $00000000_{\mathrm{H}}$

Table 21.73 FLXAnFRIBCM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 19 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 18 | STXRS | Set Transmission Request Shadow Flag <br> 0: Reset TXR flag <br> 1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished) |
| 17 | LDSS | Load Data Section Shadow Flag <br> 0: Data section is not updated <br> 1: Data section is transferred (transfer ongoing or finished) |
| 16 | LHSS | Load Header Section Shadow Flag <br> 0 : Header section is not updated <br> 1: Header is transferred (transfer ongoing or finished) |
| 15 to 3 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 2 | STXRH | Set Transmission Request Host Bit <br> 0: Reset TXR flag <br> 1: Set TXR flag, transmit buffer released for transmission |
| 1 | LDSH | Load Data Section Host Bit <br> 0 : Data section is not updated <br> 1: Data section is transferred |
| 0 | LHSH | Load Header Section Host Bit <br> 0 : Header section is not updated <br> 1: Header is transferred |

## (1) FLXAnFRIBCM.STXRS

Set Transmission Request Shadow Flag
(2) FLXAnFRIBCM.LDSS

Load Data Section Shadow Flag
(3) FLXAnFRIBCM.LHSS

Load Header Section Shadow Flag

## (4) FLXAnFRIBCM.STXRH

Set Transmission Request Host Bit
If this bit is set to ' 1 ', the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1/2/3/4 registers to release the message buffer for transmission. In single-shot mode, the flag is cleared after transmission has completed. TXR is enabled for transmit buffers only.

## (5) FLXAnFRIBCM.LDSH

Set Load Data Section Host Bit
(6) FLXAnFRIBCM.LHSH

Set Load Header Section Host Bit

### 21.3.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the host writes the number of the target message buffer in the message RAM to FLXAnFRIBCR.IBRH, IBF host and IBF shadow are switched. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also switched (see Section 21.4.12.2(1), Data Transfer from Input Buffer to Message RAM).

With this write operation, the FLXAnFRIBCR.IBSYS is set to ' 1 '. The message handler then starts to transfer the contents of IBF shadow to the message buffer in the message RAM selected by FLXAnFRIBCR.IBRS.

After the transfer between IBF shadow and the message RAM has completed, FLXAnFRIBCR.IBSYS is set back to ' 0 ' and the next transfer to the message RAM may be started by the host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is ' 1 ', FLXAnFRIBCR.IBSYH is set to ' 1 '. After completion of the ongoing data transfer from IBF Shadow to the message RAM, IBF host and IBF shadow are switched, FLXAnFRIBCR.IBSYH is reset to ' 0 '. FLXAnFRIBCR.IBSYS remains set to ' 1 ', and the next transfer to the message RAM is started. In addition, the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also switched.

Any write access to an input buffer register while both FLXAnFRIBCR.IBSYS and FLXAnFRIBCR.IBSYH are set to ' 1 ' will cause the error flag FLXAnFREIR.IIBA to be set to ' 1 '.

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 21.74 FLXAnFRIBCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | IBSYS | Input Buffer Busy Shadow Flag <br> 0: Transfer between IBF shadow and message RAM completed <br> 1: Transfer between IBF shadow and message RAM in progress |
| 30 to 23 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 22 to 16 | IBRS[6:0] | IBSYH |
| 15 | Input Buffer Request ShadowFlags <br> 0: No request pending <br> 1: Request while transfer between IBF shadow and message RAM in progress |  |
| 14 to 7 | Reserved <br> These bits are always read as 0. When writing, always write 0. |  |
| 6 to 0 | IBRH[6:0] | Input Buffer Request Host |

## (1) FLXAnFRIBCR.IBSYS

Input Buffer Busy Shadow Flag
Set to ' 1 ' after writing FLXAnFRIBCR.IBRH.
This bit indicates transmitting between the IBF shadow and the message RAM is ongoing.
When the transfer between IBF shadow and the message RAM has completed, FLXAnFRIBCR.IBSYS is set back to ' 0 '.

## (2) FLXAnFRIBCR.IBRS

Input Buffer Request Shadow Flags
Number of the target message buffer actually updated or lately updated.

## (3) FLXAnFRIBCR.IBSYH

Input Buffer Busy Host Flag
Set to ' 1 ' by writing FLXAnFRIBCR.IBRH while FLXAnFRIBCR.IBSYS is still ' 1 '.
This bit indicates transmitting between the IBF shadow and the message RAM is ongoing.
After the ongoing transfer between IBF shadow and the message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to ' 0 '.

## (4) FLXAnFRIBCR.IBRH

Input Buffer Request Host
Selects the target message buffer in the message RAM for data transfer from Input Buffer.

### 21.3.11 Output Buffer

The output buffer has a double structure of output buffer host and output buffer shadow and is used to read out message buffers from the message RAM. While the host can read from OBF host, the message handler transfers the selected message buffer from message RAM to output buffer shadow. The data transfer between message RAM and OBF is described in Section 21.4.12.2(2), Data Transfer from Message RAM to Output Buffer.

These registers cannot be written when the output data transfer function shown in Section 21.4.16.2, Output Data Transfer, in output data transfer is used and the FLXAnFROTS.OTS bit is 1.

### 21.3.11.1 FLXAnFRRDDSx — FlexRay Read Data Section Register $x$ ( $x=1$ to 64)

These registers hold the data words read from the data section of the specified message buffer. The number of data words read from the message RAM is defined by the payload length configured in the FLXAnFRRDHS2.PLC bit.

Table 21.75 FLXAnFRRDDSx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MD[31:0] | Message Data Flags |

## (1) FLXAnFRRDDSx.MD

## Message Data Flags

For information about the byte alignment of the data words in this register, see Section 21.4.17, Byte Alignment.

## CAUTION

In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
Reset by the CHI command CLEAR_RAMS.

### 21.3.11.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1

| Value after reset: $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 27 | CFG | Payload Preamble Indicator Transmit Flag |
| 26 | CH[1:0] | Message Buffer Direction Configuration Bit Flag |
| 25,24 | CYC[6:0] | Channel Filter Control Flag <br> 23 <br> 22 to 16 |
| 15 to 11 | - | This bit is always read as 0. When writing, always write 0. |
| 10 to 0 | FID[10:0] | Reserved <br> These bits are always read as 0. When writing, always write 0. |

## (1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Enable Flag
Values as configured by the host via FLXAnFRWRHS1.MBI.
In case that the message buffer read from the message RAM belongs to the receive FIFO, this bit is set to ' 0 '.

## (2) FLXAnFRRDHS1.TXM

Transmission Mode Flag
Values as configured by the host via FLXAnFRWRHS1.TXM.
In case that the message buffer read from the message RAM belongs to the receive FIFO, this bit is set to ' 0 '.

## (3) FLXAnFRRDHS1.PPIT

Payload Preamble Indicator Transmit Flag
Values as configured by the host via FLXAnFRWRHS1.PPIT.
In case that the message buffer read from the message RAM belongs to the receive FIFO, this bit is set to ' 0 '.

## (4) FLXAnFRRDHS1.CFG

Message Buffer Direction Configuration Flag
Values as configured by the host via FLXAnFRWRHS1.CFG.
In case that the message buffer read from the message RAM belongs to the receive FIFO, this bit is set to ' 0 '.

## (5) FLXAnFRRDHS1.CH

Channel Filter Control Flag
Values as configured by the host via FLXAnFRWRHS1.CH.
In case that the message buffer read from the message RAM belongs to the receive FIFO, these bits are set to ' 0 '.

## (6) FLXAnFRRDHS1.CYC

Cycle Code
Values as configured by the host via FLXAnFRWRHS1.CYC.
In case that the message buffer read from the message RAM belongs to the receive FIFO, these bits are set to ' 0 '.

## (7) FLXAnFRRDHS1.FID

## Frame ID

Values as configured by the host via FLXAnFRWRHS1.FID
In case that the message buffer read from the message RAM belongs to the receive FIFO, these bits are holding the received frame ID.

### 21.3.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2

## Value after reset: $00000000_{\mathrm{H}}$

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, FLXAnFRWRHS2 is updated from data frames only.

Table 21.77 FLXAnFRRDHS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | - | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 30 to 24 | PLR[6:0] | Receive Frame Payload Length Flags (vRF!Header!Length) |
| 23 | - | Reserved <br> This bit is always read as 0. When writing, always write 0. |
| 22 to 16 | PLC[6:0] | Configured Payload Length Flags |
| 15 to 11 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 10 to 0 | CRC[10:0] | Header CRC Flags (vRF!Header!HeaderCRC) |

## (1) FLXAnFRRDHS2.PLR

Receive Frame Payload Length Flags (vRF!Header!Length)
Payload length (vRF!Header!Length) value updated from received data frames (exception: To be updated even through null frames are received in the message buffer specified to the receive FIFO).

## (2) FLXAnFRRDHS2.PLC

Configured Payload Length Flags
Length of data section (number of 2-byte words) as configured by the host.

## (3) FLXAnFRRDHS2.CRC

Header CRC Flags (vRF!Header!HeaderCRC)
Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames
Transmit Buffer: Header CRC configured by the host

## (4) Data storage

When a message is stored into a message buffer, the following processes with respect to payload length received and payload length configured are implemented:

## FLXAnFRRDHS2.PLR > FLXAnFRRDHS2.PLC:

The payload data stored in the message buffer is truncated to the payload length configured if FLXAnFRRDHS2.PLC even or else truncated to FLXAnFRRDHS2.PLC +1 .

FLXAnFRRDHS2.PLR < = FLXAnFRRDHS2.PLC:
The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by FLXAnFRRDHS2.PLC are filled with undefined value.

FLXAnFRRDHS2.PLR = zero:
The message buffer's data section is filled with undefined value.
FLXAnFRRDHS2.PLC = zero:
No data section is configured in the message buffer. No data is stored into the message buffer's data section.

## CAUTION

1. The message RAM is organized in 4-byte words. When received data is stored into a message buffer's data section, the number of 2-byte data words written into the message buffer is FLXAnFRRDHS2.PLC rounded to the next even value.
2. FLXAnFRRDHS2.PLC should be configured identical for all message buffers belonging to the receive FIFO.

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, FLXAnFRWRHS2 is updated from data frames only.

### 21.3.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, FLXAnFRWRHS3 is updated from data frames only.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

## (1) FLXAnFRRDHS3.RES

Reserved Bit Indicator Flag (vRF!Header!Reserved)
Reflects the value of the received reserved bit. The reserved bit is transmitted as ' 0 '.

## (2) FLXAnFRRDHS3.PPI

Payload Preamble Indicator Flag (vRF!Header!PPIndicator)
The payload preamble indicator defines whether a network management vector or message ID is contained in the payload segment of the received frame.
$0=$ The payload segment of the received frame does not contain a network management vector nor a message ID
$1=$ Static segment: contains network management vector is included in the first part of the payload
Dynamic segment: contains message ID in the first part of the payload

## (3) FLXAnFRRDHS3.NFI

Null Frame Indicator Flag (vRF!Header!NFIndicator)
Is set to ' 1 ' after storage of the first received data frame.

## (4) FLXAnFRRDHS3.SYN

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)
A sync frame is indicated by the sync frame indicator.
(5) FLXAnFRRDHS3.SFI

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)
A startup frame is indicated by the startup frame indicator.

## (6) FLXAnFRRDHS3.RCI

Received on Channel Indicator Flag (vSS!Channel)
Indicates the channel from which the received data frame was taken to update the respective receive buffer.

## (7) FLXAnFRRDHS3.RCC

## Receive Cycle Count (vRF!Header!CycleCount)

Cycle counter value updated from received data frame is read.

## (8) FLXAnFRRDHS3.DP

Data Pointer Flags
This flag indicates the position of the first 32-bit word of the data section of the addressed message buffer in the message RAM.
The bit value is the same as that set in the FLXAnFRWRHS3.DP bit.

### 21.3.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.
If only one channel ( A or B ) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel-specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the host updates a message buffer via input buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive/transmit filtering, see Section 21.4.8, Filtering and Masking, Section 21.4.9, Transmit Process and Section 21.4.10, Receive Process.

Whenever the message handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB, the respective message buffer's MBC flag in registers FLXAnFRMBSC1/2/3/4 is set.

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 6 | SVOA | Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA) <br> 0 : No slot boundary violation observed on channel A <br> 1: Slot boundary violation observed on channel A |
| 5 | CEOB | Content Error Observed on Channel B Flag (vSS!ContentErrorB) <br> 0 : No content error observed on channel B <br> 1: Content error observed on channel $B$ |
| 4 | CEOA | Content Error Observed on Channel A Flag(vSS!ContentErrorA) <br> 0 : No content error observed on channel A <br> 1: Content error observed on channel $A$ |

Table 21.79 FLXAnFRMBS Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 | SEOB | Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB) <br> 0: No syntax error observed on channel B <br> 1: Syntax error observed on channel B |
| 2 | SEOA | Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA) <br> 0: No syntax error observed on channel A <br> 1: Syntax error observed on channel A |
| 1 | VFRB | Valid Frame Received on Channel B Flag (vSS!ValidFrameB) <br> 0: No valid frame received on channel B |
|  |  | 1: Valid frame received on channel B |
| 0 | VFRA | Valid Frame Received on Channel A Flag (vSS!ValidFrameA) <br> 0: No valid frame received on channel A <br> 1: Valid frame received on channel A |

## (1) FLXAnFRMBS.RESS

## Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as ' 0 '.
For receive buffers (FLXAnFRWRHS1.CFG = ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.

## (2) FLXAnFRMBS.PPIS

## Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.
For receive buffers (FLXAnFRWRHS1.CFG $=$ ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.
$0=$ PPI indicator set to ' 0 '
The payload segment of the received frame does not contain a network management vector or a message ID
$1=$ PPI indicator set to ' 1 ',
Static segment: contains network management vector at the beginning of the payload
Dynamic segment: contains message ID at the beginning of the payload

## (3) FLXAnFRMBS.NFIS

Null Frame Indicator Status Flag (vRF!Header!NFIndicator)
If set to ' 0 ' the payload segment of the received frame contains no usable data.
For receive buffers (FLXAnFRWRHS1.CFG = ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.

## (4) FLXAnFRMBS.SYNS

Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator)
A sync frame is indicated by the sync frame indicator.
For receive buffers (FLXAnFRWRHS1.CFG $=$ ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.

## (5) FLXAnFRMBS.SFIS

Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator)
The startup frame indicator specifies a startup frame.
For receive buffers (FLXAnFRWRHS1.CFG = ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.

## (6) FLXAnFRMBS.RCIS

Received Channel Indicator Status Flag (vSS!Channel)
Indicates the channel on which the frame was received.
For receive buffers (FLXAnFRWRHS1.CFG $=$ ' 0 '), this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers, the flag has no meaning and should be ignored.

## (7) FLXAnFRMBS.CCS

Cycle Count Status Flag
Actual cycle count at a status update is read.

## (8) FLXAnFRMBS.FTB

Frame Transmitted on Channel B Flag
Indicates that this node has transmitted a data frame in the configured slot on channel B.

## CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTB can only be reset by the host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where the bit is set to ' 1 '.

## (9) FLXAnFRMBS.FTA

Frame Transmitted on Channel A Flag
Indicates that this node has transmitted a data frame in the configured slot on channel A.

## CAUTION

The FlexRay protocol specification requires that FLXAnFRMBS.FTA can only be reset by the host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where this bit is set to ' 1 '.

## (10) FLXAnFRMBS.MLST

## Message Lost Flag

The flag is set in case the host did not read the message before the message buffer was updated from a received data frame.
Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset to ' 0 ' by a host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers ND flag was reset to ' 0 ' by reading out the message buffer via OBF.

## (11) FLXAnFRMBS.ESB

## Empty Slot Channel B Flag

In an empty slot, the bus is in idle state. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

## (12) FLXAnFRMBS.ESA

Empty Slot Channel A Flag
In an empty slot, the bus is in idle state. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

## (13) FLXAnFRMBS.TCIB

Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)
A transmission conflict indication is set to ' 1 ' if a transmission conflict has occurred on channel B.

## (14) FLXAnFRMBS.TCIA

Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)
A transmission conflict indication is set if a transmission conflict has occurred on channel A.
(15) FLXAnFRMBS.SVOB

Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)
A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on channel B.
(16) FLXAnFRMBS.SVOA

Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)
A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on channel A.

## (17) FLXAnFRMBS.CEOB

Content Error Observed on Channel B Flag (vSS!ContentErrorB)
A content error was observed in the assigned slot on channel B.

## (18) FLXAnFRMBS.CEOA

Content Error Observed on Channel A Flag (vSS!ContentErrorA) A content error was observed in the assigned slot on channel A.
(19) FLXAnFRMBS.SEOB

Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)
A syntax error was observed in the assigned slot on channel B.

## (20) FLXAnFRMBS.SEOA

Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)
A syntax error was observed in the assigned slot on channel A.

## (21) FLXAnFRMBS.VFRB

Valid Frame Received on Channel B Flag (vSS!ValidFrameB)
This flag is set to " 1 " when a valid frame was received on channel B.

## (22) FLXAnFRMBS.VFRA

Valid Frame Received on Channel A Flag (vSS!ValidFrameA)
This flag is set to " 1 " when a valid frame was received on channel A.

### 21.3.11.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register

This register configures how the output buffer is updated from the message buffer in the message RAM selected by FLXAnFROBCR.OBRS.

Mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to the register internal storage when a message RAM transfer is requested by FLXAnFROBCR.REQ.

When OBF host and OBF shadow are switched, mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are switched with the register internal storage to keep them attached to the respective output buffer transfer.

The data transfer between output buffer and message RAM is described in detail in Section 21.4.12.2(2), Data

## Transfer from Message RAM to Output Buffer.

## CAUTION

After the transfer of the header section from the message RAM to OBF shadow has completed, the message buffer status changed flag MBC of the selected message buffer in the FLXAnFRMBSC1/2/3/4 registers is cleared. After the transfer of the data section from the message RAM to OBF shadow has completed, the new data flag ND of the selected message buffer in the FLXAnFRNDAT1/2/3/4 registers is cleared.

Read Data Section Shadow Bit

## (4) FLXAnFROBCM.RHSS

Read Header Section Shadow Bit

### 21.3.11.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register

After setting bit FLXAnFROBCR.REQ to ' 1 ' while FLXAnFROBCR.OBSYS is ' 0 ', FLXAnFROBCR.OBSYS is automatically set to ' 1 ', FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the message RAM to OBF shadow is started. When the transfer between the message RAM and OBF shadow has completed, this is signaled by setting FLXAnFROBCM.OBSYS back to ' 0 '.

By setting bit FLXAnFROBCR.VIEW to ' 1 ' while FLXAnFROBCR.OBSYS is ' 0 ', OBF host and OBF shadow are switched. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are switched with the register FLXAnFROBCM internal storage to keep them attached to the respective output buffer transfer.
FLXAnFROBCR.OBRH signals the number of the message buffer currently accessible by the host.
If bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are set to ' 1 ' with the same write access while FLXAnFROBCR.OBSYS is ' 0 ', FLXAnFROBCR.OBSYS is automatically set to ' 1 ' and OBF shadow and OBF host are switched. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are switched with the registers internal storage to keep them attached to the respective output buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, and the transfer of the selected message buffer from the message RAM to OBF shadow is started. While the transfer is ongoing the host can read the message buffer transferred by the previous transfer from OBF host. When the current transfer between message RAM and OBF shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to ' 0 '.

Any write access to FLXAnFROBCR[15:8] while FLXAnFROBCR.OBSYS is set to ' 1 ' will cause the error flag FLXAnFREIR.IOBA to be set to ' 1 '. In this case, this write access has no effect and the output buffer will not be changed.

The data transfer between output buffer and message RAM is described in detail in Section 21.4.12.2(2), Data
Transfer from Message RAM to Output Buffer.

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 21.81 FLXAnFROBCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 22 to 16 | OBRH[6:0] | Output Buffer Request Host Flag |
| 15 | OBSYS | Output Buffer Busy Shadow Flag <br> 0: No transfer in progress <br> 1: Transfer between message RAM and OBF shadow in progress |

Table 21.81 FLXAnFROBCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 14 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 | REQ | Request Message RAM Transfer Bit <br> 0: No request <br> 1: Transfer to OBF shadow requested |
| 8 | VIEW | View Shadow Buffer Bit <br> 0: No action <br> 1: Switch OBF shadow and OBF host |
| 7 |  | Reserved |
| 6 to 0 | OBRS[6:0] | This bit is always read as 0. When writing, always write 0. |

## (1) FLXAnFROBCR.OBRH

Output Buffer Request Host Flag
Indicate number of message buffer currently accessible by the host via FLXAnFRRDHS1 to FLXAnFRRDHS3, FLXAnFRMBS, and FLXAnFRRDDS1 to FLXAnFRRDDS64.
By writing FLXAnFROBCR.VIEW to ' 1 ', OBF host is switched and the transferred message buffer is accessible by the host.

## (2) FLXAnFROBCR.OBSYS

Output Buffer Busy Shadow Flag
Set to ' 1 ' after setting bit FLXAnFROBCR.REQ. When the transfer between the message RAM and OBF shadow has completed, FLXAnFROBCR.OBSYS is set back to ' 0 '.

## (3) FLXAnFROBCR.REQ

Request Message RAM Transfer Bit
Only writeable while FLXAnFROBCR.OBSYS = ' 0 '.
Requests transfer of message buffer addressed by FLXAnFROBCR.OBRS from message RAM to OBF shadow.

## (4) FLXAnFROBCR.VIEW

View Shadow Buffer Bit
Only writeable while FLXAnFROBCR.OBSYS $=$ ' 0 '.
Toggles between OBF shadow and OBF host.

## (5) FLXAnFROBCR.OBRS

Output Buffer Request Shadow Bit
Only writeable while FLXAnFROBCR.OBSYS $=$ ' 0 '.
Indicate number of source message buffer to be transferred from the message RAM to OBF shadow.
If the number of the first message buffer of the receive FIFO is written to this register, the message buffer addressed by the GET Index (GIDX, see Section 21.4.11, FIFO Function) is transferred to OBF shadow.

### 21.3.12 Data Transfer Control Register

### 21.3.12.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 21.82 FLXAnFRITC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 23 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 22 to 16 | ITM[6:0] | Input Queue Table Max Bit <br> These bits configure the number of entries in the input pointer table the input buffer handler <br> can maintain in the input queue. |
| 15 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 | IQEIE | Input Queue Empty Interrupt Enable Bit <br> $0:$ Disabled <br> 1: Enabled |
| 8 | - | Input Queue Full Interrupt Enable Bit <br> $0:$ Disabled <br> 1: Enabled |
| 7 to 2 |  | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 1 | IQHR | Input Queue Halt Request Bit <br> $0:$ Input queue run request <br> 1: Input queue halt request |
| 0 | Input Transfer Enable Bit <br> $0:$ Operation Disable request <br> 1: Operation Enable request |  |

## (1) FLXAnFRITC.ITM

## Input Queue Table Max Bit

The user can only write to this bit when FLXAnFRITS.ITS is ' 0 '.
These bits configure the number of entries in the input pointer table the input buffer handler can maintain in the input queue.
Valid values are $00_{\mathrm{H}}$ ( 1 queue entry) to $7 \mathrm{~F}_{\mathrm{H}}$ ( 128 queue entries).
Note that each entry requires two long words in the input pointer table.

## (2) FLXAnFRITC.IQEIE

## Input Queue Empty Interrupt Enable Bit

This bit controls the input queue empty interrupt.
0 : Disabled
No interrupt will be requested and the input queue empty interrupt will be not generated.
1: Enabled
Input queue empty interrupt will be generated when FLXAnFRITS.IQEIS is ' 1 '.

## (3) FLXAnFRITC.IQFIE

Input Queue Full Interrupt Enable Bit
This bit controls the input queue full interrupt.
0 : Disabled
No interrupt will be requested and the input queue full interrupt will be not generated.
1: Enabled
Input queue full interrupt will be generated when FLXAnFRITS.IQFIS is ' 1 '.

## (4) FLXAnFRITC.IQHR

## Input Queue Halt Request Bit

The IQHR bit should not be set to ' 1 ' when FLXAnFRITS.ITS is ' 0 '.
This bit requests a halt of the input queue.
The status of the halt request is shown in the FLXAnFRITS.IQH register.
Refer to Section 21.4.16.1(5), Halting the Input Queue about usage of this bit.
0 : Input queue run request
The input queue resumes their operation.
1: Input queue halt request
The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

## (5) FLXAnFRITC.ITE

Input Transfer Enable Bit
The user should only set this bit to ' 1 ' when FLXAnFRIBCR.IBSYS is ' 0 '.
The user should only set this bit to ' 0 ' when FLXAnFRITC.IQHR ' 0 '. Otherwise committed input transfers get lost.
This bit controls the operation mode of the input transfer queue.
The operation status of the input transfer queue function is shown in FLXAnFRITS.ITS.
Refer to Section 21.4.16.1(1), Activation and Deactivation about usage of this bit.
0: Operation Disable request
The input transfer queue gets disabled when it becomes empty.
1: Operation Enable request
The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

### 21.3.12.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | FTM[4:0] |  |  |  |  |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

Table 21.83 FLXAnFROTC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 20 to 16 | FTM[4:0] | FIFO Table Max Bit <br> Configure the number of FIFO entries the output transfer handler can maintain in the Local <br> RAM/Cluster RAM. |
| 15 to 12 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 11 | FWIE | FIFO Transfer Warning Interrupt Enable Bit |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 10 |  | Output Transfer Warning Interrupt Enable Bit |
|  |  | 0: Disabled |
| 9 | OIE Enabled |  |

## (1) FLXAnFROTC.FTM

## FIFO Table Max Bit

The user can only write to these bits when FLXAnFROTS.OTS is ' 0 '.
These bits configure the number of FIFO entries the output transfer handler can maintain in the Local RAM/Cluster RAM.
Valid values are $00_{\mathrm{H}}$ ( 1 FIFO entry) to $1 \mathrm{~F}_{\mathrm{H}}$ ( 32 FIFO entries).

## (2) FLXAnFROTC.FWIE

FIFO transfer Warning Interrupt Enable Bit
This bit controls the FIFO transfer warning interrupt.
0 : Disabled
No interrupt will be requested and the FIFO transfer warning interrupt will be not generated.
1: Enabled
FIFO transfer warning interrupt will be generated when FLXAnFROTS.FWIS is ' 1 '.

## (3) FLXAnFROTC.OWIE

Output Transfer Warning Interrupt Enable Bit
This bit controls the output transfer warning interrupt.
0: Disabled
No interrupt will be requested and the output transfer warning interrupt will be not generated.
1: Enabled
Output transfer warning interrupt will be generated when FLXAnFROTS.OWIS is ' 1 '.

## (4) FLXAnFROTC.FIE

FIFO Transfer Interrupt Enable Bit
This bit controls the FIFO transfer interrupt.
0: Disabled
No interrupt will be requested and the FIFO transfer interrupt will be not generated.
1: Enabled
FIFO transfer interrupt will be generated when FLXAnFROTS.FIS is ' 1 '.

## (5) FLXAnFROTC.OIE

Output Transfer Interrupt Enable Bit
This bit controls the output transfer interrupt.
0 : Disabled
No interrupt will be requested and the output transfer interrupt will be not generated.
1: Enabled
Output transfer interrupt will be generated when FLXAnFROTS.OTIS is ' 1 '.

## (6) FLXAnFROTC.OTCS

Output Transfer Condition Select Bit
The user can only write to this bit when FLXAnFROTS.OTS is ' 0 '.
This bit controls the output transfer condition.
0 : New data only mode
The ND bits in the FLXAnFRNDATi registers are used to detect a transfer condition for dedicated receive buffer
1: New data and status changed mode
The ND bits in the FLXAnFRNDATi registers and the MBC bits in the FLXAnFRMBSCi register are used to detect a transfer condition for dedicated transmit and receive buffer

## (7) FLXAnFROTC.OTE

Output Transfer Enable Bit
The user should only set this bit to ' 1 ' when FLXAnFROBCR.OBSYS is ' 0 '.
This bit controls the operation mode of the output transfer function.
The operation status of the output buffer transfer function is shown in FLXAnFROTS.OTS.
Refer to Section 21.4.16.2(1), Activation and Deactivation about usage of this bit.
0 : Operation Disable request
The output buffer transfer gets disabled.
An active message buffer transfer will be completed but no further transfer will start.
1: Operation Enable request
The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.
The user should not change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

### 21.3.12.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register

Table 21.84 FLXAnFRIBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ITA[31:0] | Input Table Base Address Bit <br> These bits configure the base address of the input pointer table. |

## (1) FLXAnFRIBA.ITA

Input Table Base Address Bit
The user can only write to these bits when FLXAnFRITS.ITS is ' 0 '.
The address should be 32 bit aligned, thus the bits FLXAnFRIBA.ITA[1:0] are always ' 0 '.
These bits configure the base address of the input pointer table.
The table is used for the input transfer queue transferring message buffers from the Local RAM/Cluster RAM into the FlexRay internal message RAM.
The size of the input queue is configured in FLXAnFRITC.ITM.
Note that each entry requires two long words in the input pointer table.

### 21.3.12.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register

Table 21.85 FLXAnFRFBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FTA[31:0] | FIFO Pointer Table Base Address Bit <br> These bits configure the base address of the FIFO pointer table. |

## (1) FLXAnFRFBA.FTA

FIFO Pointer Table Base Address Bit
The user can only write to these bits when FLXAnFROTS.OTS is ' 0 '.
The address should be 32 bit aligned, thus the bits FLXAnFRFBA.FTA[1:0] are always ' 0 '.
These bits configure the base address of the FIFO pointer table.
The table is used for message buffers transferred from the FlexRay internal FIFO to the Local RAM/Cluster RAM.
The size of the FIFO is configured in FLXAnFROTC.FTM.

### 21.3.12.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register

Table 21.86 FLXAnFROBA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OTA[31:0] | Output Pointer Table Base Address Bit <br> These bits configure the base address of the output pointer table. |

## (1) FLXAnFROBA.OTA

Output Pointer Table Base Address Bit
The user can only write to these bits when FLXAnFROTS.OTS is ' 0 '.
The address should be 32 bit aligned, thus the bits FLXAnFROBA.OTA[1:0] are always ' 0 '.
These bits configure the base address of the output pointer table.
The table is used for message buffers transferred from the FlexRay internal message RAM to the Local RAM/Cluster RAM.
The size of the table depends on the utilization of the FlexRay internal message RAM and can have up to 128 entries.

### 21.3.12.6 FLXAnFRIQC — FlexRay Input Queue Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | IMBNR[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W |

Table 21.87 FLXAnFRIQC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 6 to 0 | IMBNR[6:0] | Input Message Buffer Number Bit <br> Message buffer number added to the input queue |

## (1) FLXAnFRIQC.IMBNR

Input Message Buffer Number Bit
The user can only write to these bits when FLXAnFRITS.IQFP is ' 0 '.
The user should not write to this register when FLXAnFRITS.ITS is ' 0 ' or when FLXAnFRITC.ITE is ' 0 '.
These bits are read as " 0 ".
This value specifies the message buffer added to the input queue.
The number has to be identical to FLXAnFRWRHS4.IMBNR (see Section 21.4.16.1(3), Input Pointer Table) of the input pointer table.
The address to the input data structure has to be provided in the input pointer table at the put index (FLXAnFRITS.IPIDX) before writing to this register.
Writing to this register increments the input put index (FLXAnFRITS.IPIDX).

### 21.3.12.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register

Value after reset: $\quad 00000000^{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | UIDX[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 21.88 FLXAnFRUIR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 7 to 0 | UIDX[7:0] | User Requested Input Index Bit <br> Input pointer table index requested for input transfer |

## (1) FLXAnFRUIR.UIDX

User Requested Input Index Bit
The user can only write to these bits when FLXAnFRITS.UIRP is ' 0 '.
The user should not write to this register when FLXAnFRITS.ITS is ' 0 '.
The user should not write to this register when FLXAnFRITS.UIRP is ' 1 '.
The user should not write to this register when FLXAnFRITS.IQH is ' 1 '.
The user should only write FLXAnFRITC.ITM + 1 to this register.
This value configures the user input pointer table index requested for input transfer.
The address to the input data structure has to be provided in the input pointer table at the index UIDX before writing to this register.
When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.
In opposite to queued input transfers, the related DA flag in the FLXAnFRDA register is not affected by the user input transfer.

### 21.3.12.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register

Table 21.89 FLXAnFRUOR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 10 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 9 | URDS | User Request Read Data Section Bit <br> 0: Data section is not transferred <br> 1: Data section is transferred |
| 8,7 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 6 to 0 | UMBNR[6:0] | User Requested Output Message Buffer Number Bit <br> Message buffer number requested for output transfer |

## (1) FLXAnFRUOR.URDS

User Request Read Data Section Bit
The user can only write to this bit when FLXAnFROTS.UORP is ' 0 '.
The user should not write to this register when FLXAnFROTS.OTS is ' 0 '.
The user should not write to this register when FLXAnFROTS.UORP is ' 1 '.
0 : Data section is not transferred
The data section of the message buffer selected by the bits UMBNR is not requested
1: Data section is transferred
The data section of the message buffer selected by the bits UMBNR is requested

## (2) FLXAnFRUOR.UMBNR

User Requested output Message Buffer Number Bit
The user can only write to these bits when FLXAnFROTS.UORP is ' 0 '.
The user should not write to this register when FLXAnFROTS.OTS is ' 0 '.
The user should not write to this register when FLXAnFROTS.UORP is ' 1 '.
The user should restrict this bit to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.
When writing to this register, the header sections and the optional data section (configurable by URDS) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

### 21.3.13 Data Transfer Status Register

### 21.3.13.1 FLXAnFRITS — FlexRay Input Transfer Status Register

Do not rewrite this register using bit manipulation instructions.

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 2 | UIRP | User Input Transfer Request Pending Bit <br> 0 : No user input transfer request pending <br> 1: User input transfer request pending |

Table 21.90 FLXAnFRITS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | IQH | Input Queue Halted Bit |
|  |  | $0:$ Input queue not halted |
|  |  | $1:$ Input queue halted |
| 0 | ITS | Input Transfer Status Bit |
|  |  | $0:$ Disabled |
|  |  | $1:$ Enabled |

## (1) FLXAnFRITS.IGIDX

Input Queue Get Index Bit
These bits are only valid when FLXAnFRITS.IQH is ' 1 '
These bits represent the input pointer index the input queue handler will transfer next.
Valid values are $00_{\mathrm{H}}$ to FLXAnFRITC.ITM.
The get index is incremented when the input data structure has been transferred from the Local RAM/Cluster RAM and the related DA flag in the FLXAnFRDA register is cleared.
The index is set to $00_{\mathrm{H}}$ when FLXAnFRITS.ITS changes from ' 0 ' to ' 1 '.

## (2) FLXAnFRITS.IPIDX

Input Queue Put Index Bit
These bits represent the index where the next input data structure pointer in the input pointer table should be stored.
Valid values are $00_{\mathrm{H}}$ to FLXAnFRITC.ITM.
After reaching the maximum value, the put index continues from $00_{\mathrm{H}}$.
The index is incremented when writing to FLXAnFRIQC.IMBNR.
The index is set to $00_{\mathrm{H}}$ when FLXAnFRITS.ITS changes from ' 0 ' to ' 1 '.

## (3) FLXAnFRITS.IQFP

## Input Queue Full Condition Pending Bit

This bit represents that the input queue is full.
There should be no further input transfer requests, by writing to FLXAnFRIQC.IMBNR, as long as FLXAnFRITS.IQFP is ' 1 '.
[Clearing condition]
This bit is cleared by there is one free entry in the input queue.
[Setting condition]
This bit is set when all entries in the input queue are occupied.

## (4) FLXAnFRITS.IQEIS

Input Queue Empty Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
If enabled in FLXAnFRITC.IQEIE the input queue empty interrupt is generated when FLXAnFRITS.IQEIS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRITS.IQEIS.
This bit is cleared when FLXAnFRITS.ITS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

## (5) FLXAnFRITS.IQFIS

## Input Queue Full Interrupt Status Bit

Writing ' 0 ' has no effect on the bit value.
If enabled in FLXAnFRITC.IQFIE, the input queue full interrupt is generated when FLXAnFRITS.IQFIS is ' 1 '.
This flag is intended as an interrupt status flag. It does not represent the current input queue status; for this status, refer to FLXAnFRITS.IQFP.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRITS.IQFIS.
This bit is cleared when FLXAnFRITS.ITS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when all entries in the input queue are occupied.

## (6) FLXAnFRITS.UIRP

User Input Transfer Request Pending Bit
This bit represents that the user input transfer is still pending.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is ' 1 '.
[Clearing condition]
This bit is cleared when the user input transfer request is processed by the input transfer handler.
[Setting condition]
This bit is set by writing to FLXAnFRUIR.UIDX.

## (7) FLXAnFRITS.IQH

Input Queue Halted Bit
This bit represents the status of the input queue.
There should be no further write access to FLXAnFRUIR.UIDX when this bit is ' 1 '.
[Clearing condition]
This bit is cleared when FLXAnFRITC.IQHR is set to ' 0 '.
[Setting condition]
This bit is set immediately when FLXAnFRITC.IQHR is set to ' 1 ' and there is no ongoing input transfer.
This bit is set only after an ongoing input transfer has been completed and FLXAnFRITC.IQHR is set to ' 1 '.

## (8) FLXAnFRITS.ITS

## Input Transfer Status Bit

This bit represents the status of the input queue handler.
While this bit is ' 1 ', there should be no read or write access to the address area $<$ FLXAn_base $>+0400_{\mathrm{H}}$ to
$<$ FLXAn_base $>+05 \mathrm{FF}_{\mathrm{H}}$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD.
The input transfer queue indexes and related status flags are set to ' 0 ' when FLXAnFRITS.ITS changes from ' 0 ' to ' 1 '.
[Clearing condition]
This bit is cleared immediately when FLXAnFRITC.ITE is set to ' 0 ' and there are no pending input transfers.
This bit is cleared after all pending requests have been processed and FLXAnFRITC.ITE is ' 0 '.
[Setting condition]
This bit is set when FLXAnFRITC.ITE is set to ' 1 '.

### 21.3.13.2 FLXAnFROTS — FlexRay Output Transfer Status Register

Do not rewrite this register using bit manipulation instructions.

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 21.91 FLXAnFROTS Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 29 to 24 | FFL[5:0] | FIFO Fill Level Bit <br> Represent the number of unprocessed output FIFO structures |
| 23 to 21 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 20 to 16 | FGIDX[4:0] | FIFO Get Index Bit <br> Represent the get index in the FIFO pointer table |
| 15 | FWP | FIFO Transfer Warning Condition Pending Bit |
|  |  | 0: No FIFO transfer warning condition pending |
|  |  | 1: FIFO transfer warning condition pending |

Table 21.91 FLXAnFROTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | OTIS | Output Transfer Interrupt Status Bit <br> 0: No output structure updated in Local RAM/Cluster RAM <br> 1: Output structure updated in Local RAM/Cluster RAM |
| 7 to 3 | - | Reserved <br> These bits are always read as 0 . When writing, always write 0 . |
| 2 | UORP | User Output Transfer Request Pending Bit <br> 0 : No user output transfer request pending <br> 1: User output transfer request pending |
| 1 | - | Reserved <br> This bit is always read as 0 . When writing, always write 0 . |
| 0 | OTS | Output Transfer Status Bit <br> 0: Disabled <br> 1: Enabled |

## (1) FLXAnFROTS.FFL

## FIFO Fill Level Bit

These bits represent the number of available output FIFO structures in the Local RAM/Cluster RAM.
Valid values are $00_{\mathrm{H}}$ to FLXAnFROTC.FTM +1 .
The value $00_{\mathrm{H}}$ represents that the FIFO is empty.
The value FLXAnFROTC.FTM + 1 represents that the FIFO is full and no further FIFO transfers will be done.
These bits are incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the Local RAM/Cluster RAM.
The FIFO fill level is decremented when the user releases a FIFO data structure in the Local RAM/Cluster RAM by writing ' 1 ' to FLXAnFROTS.FDA.
The FIFO fill level is set to $00_{\mathrm{H}}$ when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.

## (2) FLXAnFROTS.FGIDX

## FIFO Get Index Bit

These bits represent the index where the current output data structure pointer in the FIFO pointer table is available for reading.
Valid values are $00_{\mathrm{H}}$ to FLXAnFROTC.FTM.
After reaching the maximum value, the get index continues from $00_{\mathrm{H}}$.
The index is incremented when a FIFO data structure is released by writing ' 1 ' to FLXAnFROTS.FDA.
The index is set to $00_{\mathrm{H}}$ when FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.

## (3) FLXAnFROTS.FWP

FIFO Transfer Warning Condition Pending Bit
This bit represents the FIFO transfer warning condition.
[Clearing condition]
This bit is cleared when there are free output data structures (FLXAnFROTS.FFL $\leq$ FLXAnFROTC.FTM).
This bit is cleared when FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

## (4) FLXAnFROTS.OWP

Output Transfer Warning Condition Pending Bit
This bit represents the output transfer warning condition.
[Clearing condition]
This bit is cleared when all output structure pointers that have a pending output handler transfer condition detected, are released (for dedicated transmit and receive message buffers or the user output transfer request).
[Setting condition]
This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or the user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to ' 1 ').

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to ' 1 ' due to the input transfer request).

## (5) FLXAnFROTS.FDA

## FIFO Data Available Bit

Writing ' 0 ' has no effect on the bit value.
When this bit is ' 1 ', the next valid output data structure is available.
The related data structure pointer is in the FIFO pointer table at FLXAnFROTS.FGIDX.
Writing ' 1 ' to FLXAnFROTS.FDA

- Increments FLXAnFROTS.FGIDX and
- Decrements the FIFO fill level (FLXAnFROTS.FFL)

If there are still unprocessed data structures, FLXAnFROTS.FDA remains ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROTS.FDA and the FIFO fill level becomes $00_{\mathrm{H}}$.
This bit is cleared when the FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when there is at least one FIFO data structure available in the Local RAM/Cluster RAM.

## (6) FLXAnFROTS.FWIS

## FIFO Transfer Warning Interrupt Status Bit

Writing ' 0 ' has no effect on the bit value.
If the FLXAnFROTC.FWIE is enabled, the FIFO transfer warning interrupt is generated when FLXAnFROTS.FWIS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROTS.FWIS.
This bit is cleared when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.

## [Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

## (7) FLXAnFROTS.OWIS

Output Transfer Warning Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
If enabled in FLXAnFROTC.OWIE, the FIFO transfer warning interrupt is generated when FLXAnFROTS.OWIS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROTS.OWIS.
This bit is cleared when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.

## [Setting condition]

This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or the user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to ' 1 ').

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to ' 1 ' due to the input transfer request).

## (8) FLXAnFROTS.FIS

## FIFO Transfer Interrupt Status Bit

Writing ' 0 ' has no effect on the bit value.
If enabled in FLXAnFROTC.FIE the FIFO transfer interrupt is generated when FLXAnFROTS.FIS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROTS.FIS.
This bit is cleared when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when a FIFO data structure is updated by the transfer handler or the FFL bit changes from $00_{\mathrm{H}}$ to $01_{\mathrm{H}}$.

## (9) FLXAnFROTS.OTIS

Output Transfer Interrupt Status Bit
Writing ' 0 ' has no effect on the bit value.
If enabled in FLXAnFROTC.OIE, the output transfer interrupt is generated when FLXAnFROTS.OTIS is ' 1 '.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFROTS.OTIS.
This bit is cleared when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by the user output transfer request).

## (10) FLXAnFROTS.UORP

## User Output Transfer Request Pending Bit

This bit represents that the user output transfer is still pending.
There should be no further write access to FLXAnFRUOR.UMBNR when this bit is ' 1 '.
[Clearing condition]
This bit is cleared when the user output transfer request is processed by the output transfer handler.
This bit is cleared when bit FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Setting condition]
This bit is set by writing to FLXAnFRUOR.UMBNR.

## (11) FLXAnFROTS.OTS

Output Transfer Status Bit
This bit represents the status of the output transfer handler.
While this bit is ' 1 ', no read or write access to the address area $<$ FLXAn_base $>+0600_{\mathrm{H}}$ to $<$ FLXAn_base $>+07 \mathrm{FF}_{\mathrm{H}}$ cannot be made and no CLEAR_RAMS command to the FLXAnFRSUCC1.CMD cannot be provided.
While this bit is ' 1 ', the user cannot change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.
The output hander transfer indexes and related status flags are set to ' 0 ' when FLXAnFROTS.OTS changes from ' 0 ' to ' 1 '.
[Clearing condition]
This bit is cleared immediately when FLXAnFROTC.OTE is set to ' 0 ' and there are no ongoing output transfers. This bit is cleared after an ongoing transfer has been completed and FLXAnFROTC.OTE is ' 0 '.
[Setting condition]
This bit is set when FLXAnFROTC.OTE is set to ' 1 '.

### 21.3.13.3 FLXAnFRAES — FlexRay Access Error Status Register

Do not rewrite this register using bit manipulation instructions.

Table 21.92 FLXAnFRAES Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved <br> These bits are always read as 0. When writing, always write 0. |
| 11 | MAE | Multiple Access Errors Bit <br> 0: No multiple access errors occurred <br> 1: Multiple access errors occurred |
| 10 | FAE | FIFO Transfer Access Error Bit |
|  |  | 0: No access error occurred during FIFO transfer |
|  |  | 1: Access error occurred during FIFO transfer |

## (1) FLXAnFRAES.MAE

Multiple Access Errors Bit
Writing ' 0 ' has no effect on the bit value.
This bit represents that there were multiple access errors during a data transfer.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRAES.MAE.
[Setting condition]
This bit is set when one of bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is set and

- an access to an protected address occurred during a FIFO data transfer or
- an access to an protected address occurred during an output data transfer or
- an access to an protected address occurred during an input data transfer

## (2) FLXAnFRAES.FAE

## FIFO Transfer Access Error Bit

Writing ' 0 ' has no effect on the bit value.
This bit indicates that there was an access error during a FIFO data transfer.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRAES.FAE.
[Setting condition]
This bit is set when a Local RAM/Cluster RAM access error was detected during a FIFO transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are ' 0 '.

## (3) FLXAnFRAES.OAE

## Output Transfer Access Error Bit

Writing ' 0 ' has no effect on the bit value.
This bit indicates that there was an access error during an output data transfer.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRAES.OAE.

## [Setting condition]

This bit is set when a Local RAM/Cluster RAM access error was detected during an output transfer and the bits FLXAnFRAES.FAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are ' 0 '.

## (4) FLXAnFRAES.IAE

## Input Transfer Access Error Bit

Writing ' 0 ' has no effect on the bit value.
This bit indicates that there was an access error during an input data transfer.
[Clearing condition]
This bit is cleared by writing ' 1 ' to FLXAnFRAES.IAE.
[Setting condition]
This bit is set when a Local RAM/Cluster RAM access error was detected during an output transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.FAE and FLXAnFRAES.MAE are ' 0 '.

## (5) FLXAnFRAES.EIDX

## Error Index Bit

This value is only valid when one of bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is ' 1 '. When bit FLXAnFRAES.FAE is ' 1 ', FLXAnFRAES.EIDX holds the used FIFO put index when an access error has occurred.
When bit FLXAnFRAES.OAE is ' 1 ', FLXAnFRAES.EIDX holds the used output table entry (which is related to message buffer number) when an access error has occurred.
When bit FLXAnFRAES.IAE is ' 1 ', FLXAnFRAES.EIDX holds the used input pointer table get index when an access error has occurred during the input transfer or user requested input transfer.
These bits are updated when one of bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE changes from ' 0 ' to ' 1 '.

### 21.3.13.4 FLXAnFRAEA — FlexRay Access Error Address Register

Value after reset: $\quad 00000000^{H}$

Table 21.93 FLXAnFRAEA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | AEA[31:0] | Access Error Address Bit <br> Address in the Local RAM/Cluster RAM when an access error has occurred |

## (1) FLXAnFRAEA.AEA

## Access Error Address Bit

This value is only valid when one of bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is ' 1 '. These bits represent the address of the access error indicated in the FLXAnFRAES register.
These bits are updated when one of bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE changes from ' 0 ' to ' 1 '.

### 21.3.13.5 FLXAnFRDAi - FlexRay Message Data Available Register i $\mathbf{i}=\mathbf{0}$ to $\mathbf{3}$ )

Do not rewrite this register using bit manipulation instructions.

Table 21.94 FLXAnFRDAi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | Dab[31:0] | Data Available b Bit |
|  |  | $0:$ No data available for destination |
|  |  | 1: Data available for destination |

## (1) FLXAnFRDAi.DAb $(b=i \times 32$ to $((i+1) \times 32)-1)$

## Data Available b Bit

The user should not write ' 1 ' to bits that are ' 0 '.
To maintain the status of input transfers, the user should not clear bits related to input transfers.
This register is used for input and output transfers.
Each flag corresponds to a FlexRay message buffer.

## [Clearing condition]

- Input transfer:

This bit is cleared when the input data structure has been transferred from the Local RAM/Cluster RAM. The data structure and the data structure pointer can be changed when the related flag is ' 0 '.

- Output transfer:

This bit is cleared by writing ' 1 ' to it.
[Setting condition]

- Input transfer:

This bit is set when the corresponding message buffer number has been written to FLXAnFRIQC.IMBNR.
As long as this bit is ' 1 ', the input data structure and the data structure pointer corresponding to this input transfer request should not be changed.

- Output transfer:

This bit is set when the output data structure corresponding to this message buffer has been updated.
As long as this bit is ' 1 ', the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is ' 1 ', the application can change the output data structure pointer in the output pointer table for this message buffer number.

### 21.4 Operation

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification.

### 21.4.1 FlexRay Module Operation Control

### 21.4.1.1 FlexRay Module Enable

After hardware reset or after the FlexRay module has been disabled (following Section 21.4.1.2, FlexRay Module Disable) the FlexRay module is in the reset state (FLXAnFROS.OS is ' 0 ') and the clocks of the FlexRay core module are disabled.

Figure 21.3 FlexRay Enable Flow

### 21.4.1.2 FlexRay Module Disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the FLXAnFROC.OE register only when the FlexRay module is in HALT, CONFIG or DEFAULT_CONFIG state.
Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.
If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see
Section 21.4.16.1(1), Activation and Deactivation for suspending input transfer function and Section
21.4.16.2(2), Activation and Deactivation for suspending output transfer).

The following flow should be executed to disable the FlexRay module.

Figure 21.4 Flexray Disable Flow

### 21.4.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to set up the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following four elements:

- Static Segment
- Dynamic Segment (optional)
- Symbol Window (optional)
- Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel, the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid, which means that they use the same synchronized macrotick.

Figure 21.5 Structure of Communication Cycle

## (1) Static Segment

The Static Segment is characterized by the following features:

- Time slots of fixed length (optionally protected by bus guardian)
- Start of frame transmission at action point of the respective static slot
- Payload length same for all frames on both channels
<Parameters>
Number of Static Slots (FLXAnFRGTUC7.NSS)
Static Slot Length (FLXAnFRGTUC7.SSL)
Payload Length Static (FLXAnFRMHDC.SFDL)
Action Point Offset (FLXAnFRGTUC9.APO)

## (2) Dynamic Segment

The Dynamic Segment is characterized by the following features:

- All controllers have bus access (no bus guardian protection possible)
- Variable payload length and duration of slots, different for both channels
- Start of transmission at minislot action point
<Parameters>
Number of Minislots (FLXAnFRGTUC8.NMS)
Minislot Length (FLXAnFRGTUC8.MSL)
Minislot Action Point Offset (FLXAnFRGTUC9.MAPO)
Start of Latest Transmit (last minislot) (FLXAnFRMHDC.SLT)

## (3) Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are sent in NORMAL_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

- Send single symbol
- Transmission of the MTS symbol starts at the symbol windows action point
<Parameters>
Symbol Window Action Point Offset (FLXAnFRGTUC9.APO) (same as for static slots)
Network Idle Time Start (FLXAnFRGTUC4.NIT)

## (4) Network Idle Time (NIT)

During network idle time, the CC has to perform the following tasks:

- Calculate clock correction terms (offset and rate)
- Distribute offset correction over multiple macroticks after offset correction start
- Perform cluster cycle related tasks
<Parameters>
Network Idle Time Start Position Setting (FLXAnFRGTUC4.NIT)
Offset Correction Start Position Setting (FLXAnFRGTUC4.OCS)

## (5) Configuration of NIT Start and Offset Correction Start

Figure 21.6 Configuration of NIT Start and Offset Correction Start

The number of macroticks per cycle gMacroPerCycle is assumed to be m . It is configured by programming FLXAnFRGTUC2. $\mathrm{MPC}=\mathrm{m}$.

The static/dynamic segment starts with macrotick 0 and ends with macrotick n :
$\mathrm{n}=$ static segment length + dynamic segment offset + dynamic segment length -1 MT
$\mathrm{n}=\mathrm{gNumberOfStaticSlots} \cdot \mathrm{gdStaticSlot}+$ dynamic segment offset $+\mathrm{gNumberOfMinislots} \cdot \mathrm{gdMinislot}-1$ MT
The static segment length is configured by FLXAnFRGTUC7.SSL and FLXAnFRGTUC7.NSS.
The dynamic segment length is configured by FLXAnFRGTUC8.MSL and FLXAnFRGTUC8.NMS.
The dynamic segment offset is:
If gdActionPointOffset $\leq$ gdMinislotActionPointOffset:
dynamic segment offset $=0 \mathrm{MT}$
Else if gdActionPointOffset > gdMinislotActionPointOffset:
dynamic segment offset $=$ gdActionPointOffset - gdMinislotActionPointOffset
The NIT starts with macrotick $k+1$ and ends with the last macrotick of cycle $m-1$. It has to be configured by setting FLXAnFRGTUC4.NIT = k.
For the FlexRay module, the offset correction start is required to be FLXAnFRGTUC4.OCS $\geq$ FLXAnFRGTUC4.NIT $+1=\mathrm{k}+1$.
The length of the symbol window results from the number of macroticks between the end of the static/dynamic segment and the beginning of the NIT. It can be calculated by the number of macroticks $(\mathrm{k}-\mathrm{n})$.

### 21.4.3 Communication Modes

The FlexRay Protocol Specification defines the Time-Triggered Distributed (TT-D) mode.

### 21.4.3.1 Time-triggered Distributed (TT-D)

In TT-D mode, the following configurations are possible:

- Pure static: Minimum 2 or more static slots + symbol window (optional)
- Mixed static/dynamic: Minimum 2 or more static slots + dynamic segment + symbol window (optional)

A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

### 21.4.4 Clock Synchronization

In TT-D mode, a distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

### 21.4.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values; the cycle (cycle counter) and the cycle time (macrotick counter).

Cluster specific:

- Macrotick $(\mathrm{MT})=$ basic unit of time measurement in a FlexRay network, a macrotick consists of an integer number of microticks ( $\mu \mathrm{T}$ )
- Cycle length $=$ duration of a communication cycle in units of macroticks (MT)

### 21.4.4.2 Local Time

Internally, nodes time their behavior with microtick resolution. Microticks are time units derived from the oscillator clock tick of the specific node. Therefore, microticks are controller-specific units. They may have different durations in different controllers. The precision of a node's local time difference measurements is a microtick ( $\mu \mathrm{T}$ ).

Node specific:

- Oscillator clock $\rightarrow$ prescaler $\rightarrow$ microtick $(\mu \mathrm{T})$
- $\mu \mathrm{T}=$ basic unit of time measurement in a CC, clock correction is done in units of $\mu \mathrm{Ts}$
- Cycle counter + macrotick counter $=$ node's local view of the global time

### 21.4.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster, a sync node has to send its sync frame on both channels.

For synchronization in FlexRay, the following constraints have to be considered:

- Max. of one sync frame per node in one communication cycle
- Max. of 15 sync frames per cluster in one communication cycle
- Every node has to use a preconfigured number of sync frames (FLXAnFRGTUC2.SNM) for clock synchronization
- Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization, the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster, the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details, see FlexRay protocol specification, section 8.
(1) Offset (phase) Correction

- Only deviation values measured and stored in the current cycle used
- For a two channel node, the smaller value will be taken
- Calculation during NIT of every communication cycle
- Offset correction value calculated in even cycles used for error checking only
- Checked against limit values
- Correction value is a signed integer number of $\mu \mathrm{Ts}$
- Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction startup to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened or shortened)
(2) Rate (frequency) Correction
- Pairs of deviation values measured and stored in even/odd cycle pair used
- For a two channel node, the average of the differences from the two channels is used
- Calculated during NIT of odd numbered cycles
- Cluster drift damping is performed using global damping value
- Checked against limit values
- Correction value is a signed integer number of $\mu \mathrm{Ts}$
- Distributed over macroticks comprising the next even/odd cycle pair (MTs lengthened or shortened)

## (3) Sync Frame Transmission

Sync frame transmission is only possible from buffers 0 and 1 . Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case, bit FLXAnFRMRC.SPLM has to be programmed to ' 1 '.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re)configured in DEFAULT_CONFIG or CONFIG state only. For nodes transmitting sync frames FLXAnFRSUCC1.TXSY must be set to ' 1 '.
(4) External Clock Synchronization

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary, even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

- External offset/rate correction value is a signed integer
- External offset/rate correction value is added to calculated offset/rate correction value
- Aggregated offset/rate correction term (external + internal) is not checked against configured limits

### 21.4.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in a single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set FLXAnFREIR.PEMC to ' 1 ' and may trigger an interrupt to the host if enabled. The actual error mode is signaled by FLXAnFRCCEV.ERRM.

Table 21.95 Error Modes of the POC (Degradation Model)

| Error Mode | Activity |
| :--- | :--- |
| ACTIVE | Full operation, State: NORMAL_ACTIVE <br> The CC is fully synchronized and supports the cluster wide clock synchronization. The host is informed of any <br> error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags <br> from registers FLXAnFREIR and FLXAnFRSIR. |
| PASSIVE | Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed <br> The CC stops transmitting frames and symbols, but received frames are still processed. Clock synchronization <br> mechanisms are continued based on received frames. No active contribution to the cluster wide clock <br> synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by <br> reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. |
| COMM_HALT | Operation halted, State: HALT, CC self rescue not allowed <br> The CC stops frame and symbol processing, clock synchronization processing, and the macrotick generation. <br> The host has still access to error and status information by reading the error and status interrupt flags from <br> registers FLXAnFREIR and FLXAnFRSIR. The bus drivers are disabled. |

### 21.4.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the "maximum without clock correction passive" limit defined by FLXAnFRSUCC3.WCP, the POC transits from NORMAL_ACTIVE to NORMAL_PASSIVE state. When it reaches the "maximum without clock correction fatal" limit defined by FLXAnFRSUCC3.WCF, it transits from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

The Clock Correction Failed Counter FLXAnFRCCEV.CCFC allows the host to monitor the duration of the inability of a node to compute clock correction terms after the CC passes the protocol startup phase. The counter will be incremented by one at the end of any odd communication cycle during which either the missing offset correction FLXAnFRSFS.MOCS or the missing rate correction FLXAnFRSFS.MRCS flag is set to ' 1 '.

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction FLXAnFRSFS.MOCS nor the missing rate correction FLXAnFRSFS.MRCS flag is set to ' 1 '.

The Clock Correction Failed Counter stops incrementing when the "maximum without clock correction fatal" value FLXAnFRSUCC3.WCF is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL_ACTIVE state is entered.

## CAUTION

The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set to ' 1 '.

### 21.4.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL_PASSIVE to NORMAL_ACTIVE state. FLXAnFRSUCC1.PTA defines the number of consecutive even/odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state. If FLXAnFRSUCC1.PTA is set to zero, the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

### 21.4.5.3 HALT Command

In case the host wants to stop FlexRay communication of the local node, it can bring the CC into HALT state by asserting the HALT command. This can be done by writing FLXAnFRSUCC1.CMD $=$ " 0110 ". In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to assure that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.
When called in NORMAL_ACTIVE or NORMAL_PASSIVE state, the POC transits to HALT state at the end of the current cycle. When called in any other state, FLXAnFRSUCC1.CMD will be reset to " 0000 " = command_not_accepted and bit FLXAnFREIR.CNA is set to ' 1 '. If enabled, an interrupt to the host is generated.

### 21.4.5.4 FREEZE Command

In case the host detects a severe error condition, it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing FLXAnFRSUCC1.CMD $=$ " 0111 ". The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

## CAUTION

When a terminal restarts transfer as a leading coldstart node after transfer was stopped by using the FREEZE or READY command, the startup frame may not be transmitted in cycle 0 . This depends on the internal state of the FlexRay module. This phenomenon occurs when the startup frame is set in a slot with a number from 1 to 7 .

This phenomenon does not occur in a coldstart after a hardware reset.
Even if this phenomenon does occur, a second try of the coldstart will succeed.
While the coldstart time will be prolonged, this phenomenon does not otherwise affect a coldstart of the FlexRay system. To avoid this phenomenon, allocate the Startup/Sync frame to static slot 8 or a slot with a higher number.

### 21.4.6 Communication Controller States

### 21.4.6.1 Communication Controller State Diagram

Figure 21.7 Overall State Diagram of FlexRay Communication Controller

State transitions are controlled by reset, FLXAnFR0RXDA, FLXAnFR0RXDB, by the POC state machine, and by the CHI command vector FLXAnFRSUCC1.CMD.

The CC transits from all states to HALT state after application of the FREEZE command (FLXAnFRSUCC1.CMD = "0111B").

Table 21.96 State Transitions of FlexRay Overall State Machine

| T\# | Condition | From | To |
| :---: | :---: | :---: | :---: |
| 1 | Reset | All States | DEFAULT_CONFIG |
| 2 | Command CONFIG, FLXAnFRSUCC1.CMD = "00013" | DEFAULT_CONFIG | CONFIG |
| 3 | Unlock sequence followed by command READY, $\text { FLXAnFRSUCC } 1 . C M D=" 0010_{\mathrm{B}} "$ | CONFIG | READ |
| 4 | Command CONFIG, FLXAnFRSUCC1.CMD = "00018" | READY | CONFIG |
| 5 | Command WAKEUP, FLXAnFRSUCC1.CMD $=$ "0011 ${ }_{\text {B }}$ " | READY | WAKEUP |
| 6 | Complete transmission of wakeup pattern or received WUP or received frame header or wakeup collision or command READY, FLXAnFRSUCC1.CMD $=$ "0010 ${ }^{\text {B }}$ | WAKEUP | READY |
| 7 | Command RUN, FLXAnFRSUCC1.CMD = "0100 ${ }^{\text {e }}$ " | READY | STARTUP |
| 8 | Successful STARTUP | STARTUP | NORMAL_ACTIVE |
| 9 | Clock Correction Failed counter reached Maximum Without Clock Correction Passive limit configured by FLXAnFRSUCC3.WCP | NORMAL_ACTIVE | NORMAL_PASSIVE |
| 10 | Number of valid correction terms reached the Passive to Active limit configured by FLXAnFRSUCC1.PTA | NORMAL_PASSIVE | NORMAL_ACTIVE |
| 11 | Command READY, FLXAnFRSUCC1.CMD $=$ "0010 ${ }^{\text {B }}$ " | STARTUP, NORMAL_ACTIVE, NORMAL_PASSIVE | READY |
| 12 | Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1. HCSE set to ' 1 ' or command HALT, FLXAnFRSUCC1.CMD = "0110 ${ }^{\text {B }}$ " | NORMAL_ACTIVE | HALT |
| 13 | Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF when bit FLXAnFRSUCC1.HCSE set to ' 1 ' or command HALT, FLXAnFRSUCC1.CMD = "0110B" | NORMAL_PASSIVE | HALT |
| 14 | Command FREEZE, FLXAnFRSUCC1.CMD = "0111 ${ }^{\text {" }}$ | All States | HALT |
| 15 | Command CONFIG, FLXAnFRSUCC1.CMD = "00018" | HALT | DEFAULT_CONFIG |

### 21.4.6.2 DEFAULT_CONFIG State

In DEFAULT_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

- When the reset is applied (HW reset or SW reset)
- When exiting from HALT state

To leave DEFAULT_CONFIG state, the host has to write FLXAnFRSUCC1.CMD $=$ " $0001_{\mathrm{B}}$ ". The CC then transits to CONFIG state.

### 21.4.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

- When exiting from DEFAULT_CONFIG state
- When exiting from READY state

When the state has been entered via HALT and DEFAULT_CONFIG state, the host can analyze status information and configuration. Before leaving CONFIG state, the host has to ensure that the configuration is fault-free.
To leave CONFIG state, the host has to perform the unlock sequence as described in Section 21.3.3.1,
FLXAnFRLCK - FlexRay Lock Register. Directly after unlocking the CONFIG state, the host has to write FLXAnFRSUCC1.CMD to enter the next state.

## CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the message RAM are not affected by the transition of the POC from CONFIG to READY state.

When the CC is in CONFIG state, it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this, the host has to ensure that all message RAM transfers have finished before turning off the clocks.

### 21.4.6.4 READY State

After unlocking CONFIG state and writing FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}}$ ", the CC enters READY state. From this state, the CC can transit to WAKEUP state and perform a cluster wake-up or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

- When exiting from CONFIG, WAKEUP, STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state by writing FLXAnFRSUCC1.CMD $=" 0010_{\mathrm{B}} "($ READY command $)$.

The CC exits from this state

- To CONFIG state by writing FLXAnFRSUCC1.CMD $=$ " $0001_{\mathrm{B}}$ " (CONFIG command)
- To WAKEUP state by writing FLXAnFRSUCC1.CMD $=$ " $0011_{\mathrm{B}} "$ (WAKEUP command)
- To STARTUP state by writing FLXAnFRSUCC1.CMD = " $0100_{\mathrm{B}}$ " (RUN command)

Internal counters and the CC status flags are reset when the CC enters STARTUP state.

## CAUTION

Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the message RAM are not affected by the transition of the POC from READY to STARTUP state.

### 21.4.6.5 WAKEUP State

The description below is intended to help configure wake-up for the FlexRay IP module. A detailed description of the wake-up procedure together with the respective SDL diagrams can be found in FlexRay protocol specification v2.1, Section 7.1.

The CC enters this state

- When exiting from READY state by writing FLXAnFRSUCC1.CMD = "0011 ${ }_{\mathrm{B}}$ " (WAKEUP command).

The CC exits from this state to READY state

- After complete non-aborted transmission of wakeup pattern (WUP)
- After WUP reception
- After detecting a WUP collision
- After reception of a frame header
- By writing FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}} "($ READY command $)$

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and the CC to perform the cluster wakeup. The CC provides to the host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup can be performed on only one channel at a time. The host has to configure the wakeup channel while the CC is in CONFIG state by writing FLXAnFRSUCC1.WUCS. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup, the CC returns to READY state and signals the change of the wakeup status to the host by setting flag FLXAnFRSIR.WST. The wakeup status vector can be read from FLXAnFRCCSV.WSV. If a valid wakeup pattern was received also, either flag FLXAnFRSIR.WUPA or flag FLXAnFRSIR.WUPB is set to ' 1 '.

Figure 21.8 Structure of POC State WAKEUP

Table 21.97 State Transitions WAKEUP

| T\# | Condition | From | To |
| :--- | :--- | :--- | :--- |
| enter | Host commands change to WAKEUP state by writing <br> FLXAnFRSUCC1.CMD = "0011"" (WAKEUP command) | READY | WAKEUP |
| 1 | CHI command WAKEUP triggers wakeup FSM to transit to <br> WAKEUP_LISTEN state | WAKEUP_STANDBY | WAKEUP_LISTEN |
| 2 | Received WUP on wakeup channel selected by bit <br> FLXAnFRSUCC1.WUCS or frame header on either available <br> channel | WAKEUP_LISTEN | WAKEUP_STANDBY |
| 3 | Timer event | WAKEUP_LISTEN | WAKEUP_SEND |
| 4 | Complete, non-aborted transmission of wakeup pattern | WAKEUP_SEND | WAKEUP_STANDBY |
| 5 | Collision detected | WAKEUP_SEND | WAKEUP_DETECT |
| 6 | Wakeup timer expired or WUP detected on wakeup channel <br> selected by bit FLXAnFRSUCC1.WUCS or frame header received <br> on either available | WAKEUP_DETECT | WAKEUP_STANDBY |
| exit | Wakeup completed (after T2 or T4 or T6) or host commands <br> change to READY state by writing FLXAnFRSUCC1.CMD $=$ <br> "0010B" (READY command). This command also resets the wakeup <br> FSM to WAKEUP_STANDBY state | WAKEUP | READY |

The WAKEUP_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the parameters Listen Timeout FLXAnFRSUCC2.LT and Listen Timeout Noise FLXAnFRSUCC2.LTN. Listen Timeout enables a fast cluster wakeup in case of a noise free environment, while Listen Timeout Noise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP_SEND state, the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup, the host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP_DETECT state, the CC attempts to identify the reason for the wakeup collision detected in WAKEUP_SEND state. The monitoring is limited by the expiration of listen timeout as configured by FLXAnFRSUCC2.LT. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP_DETECT is left after expiration of listen timeout; in this case, the reason for wakeup collision is unknown.

The host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification recommends that two different CCs shall awake the two channels.

## (1) Host Activities

The host must coordinate the wakeup of the two channels and must decide whether or not to wake a specific channel. The sending of the wakeup pattern is initiated by the host. The wakeup pattern is detected by the remote BDs and signaled to their respective local hosts.

Wakeup procedure controlled by host (single-channel wakeup):

- Configure the CC in CONFIG state
- Select wakeup channel by programming bit FLXAnFRSUCC1.WUCS
- Check local BDs for whether a WUP was received
- Activate BD of selected wakeup channel
- Command CC to enter READY state
- Command CC to start wakeup on the configured channel by writing FLXAnFRSUCC1.CMD $=$ " 0011 "
- CC enters WAKEUP
- CC returns to READY state and signals status of wakeup attempt to the host
- Wait predefined time to allow the other nodes to wakeup and configure themselves
- Coldstart node:
- In a dual channel cluster, wait for WUP on the other channel
- Reset coldstart inhibit flag FLXAnFRCCSV.CSI by writing FLXAnFRSUCC1.CMD = "1001" (ALLOW_COLDSTART command)
- Command CC to enter startup by writing FLXAnFRSUCC1.CMD = "0100" (RUN command)

Wakeup procedure triggered by BD:

- Wakeup recognized by BD
- BD triggers power-up of host (if required)
- BD signals wakeup event to host
- Host configures its local CC
- If necessary, host commands wakeup of second channel and waits predefined time to allow the other nodes to wake up and configure themselves
- Host commands CC to enter STARTUP state by writing FLXAnFRSUCC1.CMD = "0100" (RUN command)

## (2) Wakeup Pattern (WUP)

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers FLXAnFRPRTC1 and FLXAnFRPRTC2.

- Single channel wakeup, wakeup symbol may not be sent on both channels at the same time
- Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)
- Wakeup symbol must be configured identically in all nodes of a cluster
- Wakeup symbol transmit low time configured by FLXAnFRPRTC2.TXL
- Wakeup symbol idle time used to listen for activity on the bus, configured by FLXAnFRPRTC2.TXI
- A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup
- Number of repetitions configurable by FLXAnFRPRTC1.RWP (2 to 63 repetitions)
- Wakeup symbol receive window length configured by FLXAnFRPRTC1.RXW
- Wakeup symbol receive low time configured by FLXAnFRPRTC2.RXL
- Wakeup symbol receive idle time configured by FLXAnFRPRTC2.RXI

Figure 21.9 Timing of Wakeup Pattern

### 21.4.6.6 STARTUP State

This section describes the configuration of startup for the FlexRay module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in FlexRay protocol specification v2.1, section 7.2.

Any node entering STARTUP state that has coldstart capability should ensure that both channels attached have been awakened before initiating coldstart.

The required time for complete wake-up and configuration vary for each node and star. Since at least two nodes are necessary to start up cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is specified for initial synchronization of all nodes. In general, a node may enter NORMAL_ACTIVE state via following paths (see Figure 21.10):

- Coldstart path initiating the schedule synchronization (Leading coldstart node)
- Coldstart path joining other coldstart nodes (Following coldstart node)
- Integration path integrating into an existing communication schedule (all other nodes).

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY set to ' 1 '. Message buffer 0 holds the key slot ID, which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set to ' 1 '.

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to start up.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by FLXAnFRSUCC1.CSA.

A non-coldstart node requires at least two startup frames from distinct nodes for integration.
It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable on the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

Figure 21.10 State Diagram Time-triggered Startup

## (1) Coldstart Inhibit Mode

In coldstart inhibit mode, the node is prevented from initializing the TDMA communication schedule. If bit FLXAnFRCCSV.CSI is set to ' 1 ', the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit FLXAnFRCCSV.CSI is set to ' 1 ' whenever the POC enters READY state. The bit has to be cleared by issuing the CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = "1001") by a program.

## (2) Startup Timeouts

The CC supplies two different $\mu \mathrm{T}$ timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART_LISTEN state) with the intention of starting up communication.

## CAUTION

The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values FLXAnFRSUCC2.LT and FLXAnFRSUCC2.LTN.

## (a) Startup Timeout

The startup timeout limits the monitoring time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming FLXAnFRSUCC2.LT (see Section 21.3.6.2, FLXAnFRSUCC2 - FlexRay SUC Configuration Register 2).

The startup timeout is:
pdListenTimeout $=$ FLXAnFRSUCC2.LT

The startup timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Both channels reaching idle state while in COLDSTART_LISTEN state

The startup timer is stopped:

- If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART_LISTEN state.
- When the COLDSTART_LISTEN state is left

Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

## (b) Startup Noise Timeout

At the same time that the startup timer is started for the first time (transition from STARTUP_PREPARE state to COLDSTART_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming FLXAnFRSUCC2.LTN (see Section 21.3.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2).

The startup noise timeout is:
pdListenTimeout * gListenNoise $=$ FLXAnFRSUCC2.LT * $($ FLXAnFRSUCC2.LTN +1$)$

The startup noise timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART_LISTEN state

The startup noise timer is stopped when the COLDSTART_LISTEN state is left.
Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer will not be restarted when random channel activity is detected, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

## (3) Path of Leading Coldstart Node (initiating coldstart)

When a coldstart node enters COLDSTART_LISTEN, it listens to its attached channels.
If no communication is detected, the node enters the COLDSTART_COLLISION_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART_COLLISION_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART_CONSISTENCY_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART_CONSISTENCY_CHECK and enters NORMAL_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by FLXAnFRSUCC1.CSA. The number of remaining coldstarts attempts can be read from FLXAnFRCCSV.RCA. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART_LISTEN state only if this value is 2 or larger and it may enter the COLDSTART_COLLISION_RESOLUTION state only if this value is 1 or larger. If the number of coldstart attempts is 1 , coldstart is inhibited but integration is still possible.

## (4) Path of Following Coldstart Node (responding to Leading Coldstart Node)

When a coldstart node enters the COLDSTART_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_COLDSTART_CHECK state is entered.

In INTEGRATION_COLDSTART_CHECK state, it is assured that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still valid. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART_JOIN state is entered.

In COLDSTART_JOIN state, following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules match with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node leaves COLDSTART_JOIN state and enters NORMAL_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

## (5) Path of Non-Coldstart Node

When a non-coldstart node enters the INTEGRATION LISTEN state, it listens to its attached channels.
As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_CONSISTENCY_CHECK state is entered.

In INTEGRATION_CONSISTENCY_CHECK state, the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2 ) are sending startup frames that agree with the node's own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle, less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to detect two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

### 21.4.6.7 NORMAL_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even/odd cycle pairs required).

In NORMAL_ACTIVE state, the CC supports regular communication functions.

- The CC performs transmissions and reception on the FlexRay bus as configured
- Clock synchronization is running
- The host interface is operational

The CC exits from that state to

- HALT state by writing FLXAnFRSUCC1.CMD = "0110 $"$ (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD $=$ " $0111_{\mathrm{B}} "$ (FREEZE command, immediately)
- HALT state due to change of the error state from ACTIVE to COMM_HALT
- NORMAL_PASSIVE state due to change of the error state from ACTIVE to PASSIVE
- READY state by writing FLXAnFRSUCC1.CMD $=$ " $0010_{\mathrm{B}}$ " (READY command)

### 21.4.6.8 NORMAL_PASSIVE State

NORMAL_PASSIVE state is entered from NORMAL_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

## In NORMAL_PASSIVE state

- The CC performs reception on the FlexRay bus
- The CC does not transmit any frames or symbols on the FlexRay bus
- Clock synchronization is running
- The host interface is operational

The CC exits from this state to

- HALT state by writing FLXAnFRSUCC1.CMD $=" 0110_{\mathrm{B}}$ " (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111 ${ }_{\mathrm{B}}$ " (FREEZE command, immediately)
- HALT state due to change of the error state from PASSIVE to COMM_HALT
- NORMAL_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA - 1
- To READY state by writing FLXAnFRSUCC1.CMD = "0010 $"$ (READY command)

### 21.4.6.9 HALT State

In this state, all communication (reception and transmission) is stopped.
The CC enters this state

- By writing FLXAnFRSUCC1.CMD = "0110B" (HALT command) while the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state
- By writing FLXAnFRSUCC1.CMD $=$ " $0111_{\mathrm{B}} "$ (FREEZE command) from all states
- When exiting from NORMAL_ACTIVE state because the FLXAnFRSUCC1.HCSE is set to ' 1 ' and the clock correction failed counter reached the "maximum without clock correction fatal" limit.
- When exiting from NORMAL_PASSIVE state because the FLXAnFRSUCC1.HCSE is set to ' 1 ' and the clock correction failed counter reached the "maximum without clock correction fatal" limit.

The CC exits from this state to DEFAULT_CONFIG state

- By writing FLXAnFRSUCC1.CMD = " $0001_{\mathrm{B}} "($ CONFIG command $)$

When the CC enters HALT state, all configuration and status data are maintained for analyzing purposes.
When the host writes FLXAnFRSUCC1.CMD $=" 0110_{\mathrm{B}} "$ (HALT command), the CC sets bit FLXAnFRCCSV.HRQ to ' 1 ' and enters HALT state at the next end of cycle.

When the host writes FLXAnFRSUCC1.CMD = "01111" (FREEZE command), the CC enters HALT state immediately and sets bit FLXAnFRCCSV.FSI to ' 1 '.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

### 21.4.7 Network Management

The accrued Network Management (NM) vector can be read from registers FLXAnFRNMV1...3. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle. The length of the NM vector can be configured from 0 to 12 bytes by FLXAnFRNEMC.NML. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set as ' 1 ', bit PPIT in the header section of the respective transmit buffer has to be set to ' 1 ' via FLXAnFRWRHS1.PPIT. In addition the host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the host.
Section 21.4.17, Byte Alignment, for byte alignment of the received NM vector in registers FLXAnFRNMV1 to FLXAnFRNMV3.

## CAUTIONS

1. In case a message buffer is configured for transmission/reception of network management frames, the payload length configured in header 2 of that message buffer should be equal to or greater than the length of the NM vector configured by FLXAnFRNEMC.NML.
2. When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case FLXAnFRNMV1... 3 holds the value from the cycle before.

### 21.4.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated/transmitted if the required matches occur. Filtering is done on:

- Slot Counter
- Cycle Counter
- Channel ID

The following filter combinations for acceptance/transmit filtering are allowed:

- Slot Counter + Channel ID
- Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

## CAUTION

For the FIFO, the acceptance filter is configured by the FIFO Rejection Filter (FLXAnFRFRF) and the FIFO Rejection Filter Mask (FLXAnFRFRFM).

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled, the configured cycle filter value must also match.

### 21.4.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

### 21.4.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the concept of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 or 1 is configured to hold the startup/sync frame or the single slot frame by bits FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, cycle counter filtering for message buffer 0 or 1 shall be disabled.

## CAUTION

Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.

The set of cycle numbers belonging to a cycle set is determined as described in Table 21.98.
Table 21.98 Definition of Cycle Set

| Cycle Code | Matching Cycle Counter Values |
| :--- | :--- |
| Ob000000x | All Cycles |
| Ob000001c | Every second Cycle at (Cycle Count) $\bmod 2=c$ |
| Ob00001cc | Every fourth Cycle at (Cycle Count) mod4 $=\mathrm{cc}$ |
| Ob0001ccc | Every eighth Cycle at (Cycle Count) mod8 = ccc |
| Ob001cccc | Every sixteenth Cycle at (Cycle Count) mod16 = cccc |
| Ob01ccccc | Every thirty-second Cycle at (Cycle Count) mod32 = ccccc |
| Ob1cccccc | Every sixty-fourth Cycle at (Cycle Count) mod64 = cccccc |

Table 21.99 below gives some examples for valid cycle sets to be used for cycle counter filtering.
Table 21.99 Examples for Valid Cycle Sets

| Cycle Code | Matching Cycle Counter Values |
| :--- | :--- |
| Ob0000011 | $1-3-5-7-\ldots .-63$ |
| Ob0000100 | $0-4-8-12-\ldots .-60$ |
| Ob0001110 | $6-14-22-30-\ldots .-62$ |
| Ob0011000 | $8-24-40-56$ |
| Ob0100011 | $3-35$ |
| Ob1001001 | 9 |

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer's cycle set. Channel ID and frame ID must also be match.

The frame is transmitted when the cycle code set in the transmit buffer matches the current cycle counter value. Channel ID and frame ID must also be match.

### 21.4.8.3 Channel ID Filtering

There is a 2-bit channel filtering control field (CH) located in the header section of each message buffer in the message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers (see Table 21.100).

Table 21.100 Channel Filtering Configuration

| $\mathrm{CH}[1: 0]$ | Transmit Buffer Transmit Frame | Receive Bufferstore Valid Receive Frame |
| :--- | :--- | :--- |
| $11_{\mathrm{B}}$ | on both channels (static segment only) | received on channel A or B (store first semantically valid frame, static <br> segment only) |
| $10_{\mathrm{B}}$ | on channel B | received on channel B |
| $01_{\mathrm{B}}$ | on channel A | received on channel A |
| $00_{B}$ | Transmission prohibited | ignore frame |

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels ( $\mathrm{CH}=" 11_{\mathrm{B}}$ ").

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels $\left(\mathrm{CH}=" 11_{\mathrm{B}} "\right)$.

## CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to ' 1 ', no frames are transmitted and received frames are ignored (same function as $\mathrm{CH}=$ " $00_{\mathrm{B}}$ ").

### 21.4.8.4 FIFO Filtering

For FIFO filtering, registers FLXAnFRFRF and FLXAnFRFRFM are used. The FIFO filter consists of channel filter FLXAnFRFRF.CH, frame ID filter FLXAnFRFRF.FID, and cycle counter filter FLXAnFRFRF.CYF. Registers FLXAnFRFRF and FLXAnFRFRFM can be configured in DEFAULT_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected.
A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by FLXAnFRFRF and FLXAnFRFRFM register settings, and if there is no matching dedicated receive buffer.

### 21.4.9 Transmit Process

### 21.4.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the input buffer has to be started by writing to the Input Buffer Command Request register (FLXAnFRIBCR) latest at this time.

### 21.4.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment, different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the input buffer has to be started by writing to the Input Buffer Command Request register (FLXAnFRIBCR) latest at this time.

The start of latest transmit configured by FLXAnFRMHDC.SLT defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

### 21.4.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the corresponding message buffer to ' 1 ' via FLXAnFRWRHS1.

There exist the following possibilities to assign a transmit buffer to the CC channels:

- Static segment: channel A or channel B,
channel A and channel B.
- Dynamic segment: channel A or channel B.

Message buffers 0 and 1 are dedicated to hold the startup frame, the sync frame, or the designated single slot frame as configured by FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, respectively. In this case, they can be reconfigured in DEFAULT_CONFIG or CONFIG state only. This ensures that any node transmits at most one startup/sync frame per communication cycle. Transmission of startup/sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see Section 21.4.12.1, Reconfiguration of Message
Buffers. Due to the structure of the data partition in the message RAM (to be referenced by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not sent out in the corresponding communication cycle.

The CC does not have the capability to calculate the header CRC. The header CRC needs to be provided to all transmit buffers by a program. If network management is required, the host has to set the PPIT bit in the header section of the
respective message buffer to ' 1 ' and write the network management information to the data section of the message buffer (see Section 21.4.7, Network Management).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by FLXAnFRMHDC.SFDL, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is " $0000_{\mathrm{H}}$ ".

## CAUTION

In case of an odd payload length ( $\mathrm{PLC}=1,3,5, \ldots$ ), the application has to write zero to the last 16 bits of the message buffers data section to ensure that the padding pattern is " 0000 H ".

Each transmit buffer provides a transmission mode flag TXM that allows the host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in single-shot mode. If this bit is cleared, the transmitter operates in continuous mode.

In single-shot mode, the CC resets the respective TXR flag to ' 0 ' after transmission has completed. Now the host may update the transmit buffer.

In continuous mode, the CC does not reset the respective transmission request flag TXR to ' 0 ' after successful transmission. In this case a frame is sent out each time the filter criteria match. The TXR flag can be reset to ' 0 ' by the host by writing the respective message buffer number to the FLXAnFRIBCR register while bit FLXAnFRIBCM.STXRH is set to ' 0 '.

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

### 21.4.9.4 Frame Transmission

The following steps are required to prepare a message buffer for transmission:

- Configure the transmit buffer in the message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Write the data section of the transmit buffer via FLXAnFRWRDSx
- Transfer the configuration and message data from input buffer to the message RAM by writing the number of the target message buffer to register FLXAnFRIBCR
- If configured in register FLXAnFRIBCM, the transmission request flag TXR for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
- Check whether the message buffer has been transmitted by checking the respective TXR bit (TXR = ' 0 ') in the FLXAnFRTXRQ1/2/3/4 registers (single-shot mode only).

After transmission has completed, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 register is reset to ' 0 ' (singleshot mode), and if bit MBI in the header section of the message buffer is set to ' 1 ', flag FLXAnFRSIR.TXI is set to ' 1 '. If enabled, an interrupt is generated.

### 21.4.9.5 Null Frame Transmission

If in the static segment the host does not set the transmission request flag to ' 1 ' before transmit time, the CC transmits a null frame with the null frame indication bit set to ' 0 ' and the payload data set to zero.

In the following cases, the CC transmits a null frame:

- If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set to ' 1 ' $(\mathrm{TXR}=$ ' 0 ').
- No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status FLXAnFRMBS is updated.

Null frames are not transmitted in the dynamic segment.

### 21.4.10 Receive Process

### 21.4.10.1 Dedicated Receive Buffers

Some FlexRay message buffers can be configured as dedicated receive buffers by programming bit CFG in the header section of the respective message buffer to ' 0 ' via FLXAnFRWRHS1.

The following possibilities exist to assign a receive buffer to the CC channels:

- Static segment: channel A or channel B, channel A and channel B (the CC stores the first semantically valid frame)
- Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see Section 21.4.12.1, Reconfiguration of Message Buffers). If a message buffer is reconfigured (header section updated) during runtime, it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

### 21.4.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

- Configure the receive buffer in the message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Transfer the configuration from input buffer to the message RAM by writing the number of the target message buffer to register FLXAnFRIBCR

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective ND flag in the FLXAnFRNDAT $1 / 2 / 3 / 4$ registers is set to ' 1 ', and, if bit MBI in the header section of that message buffer is set to ' 1 ', flag FLXAnFRSIR.RXI is set to ' 1 '. If enabled, an interrupt is generated.

In case that bit ND was already set to ' 1 ' when the message handler updates the message buffer, bit FLXAnFRMBS.MLST of the respective message buffer is set to ' 1 ' and the unprocessed message data is lost.

If a frame was not received, or if a null frame or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status FLXAnFRMBS is updated.
When the message handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 registers is set to ' 1 ', and if bit MBI in the header section of that message buffer is set, flag FLXAnFRSIR.MBSI is set to ' 1 '. If enabled an interrupt is generated.

If the payload length of a received frame PLR is longer than the value programmed by PLC in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the message RAM via the output buffer, proceed as described in Section 21.4.12.2(2), Data Transfer from Message RAM to Output Buffer.

## CAUTION

The ND and MBC flags are automatically cleared by the message handler when the payload data and the header of a received message have been transferred to the output buffer, respectively.

### 21.4.10.3 Null Frame Reception

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status FLXAnFRMBS of the matching message buffer is updated from the received null frame. All bits in headers 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the message handler changes the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 register is set to ' 1 ', and if bit MBI in the header section of that message buffer is set to ' 1 ', flag FLXAnFRSIR.MBSI is set to ' 1 '. If enabled, an interrupt is generated.

### 21.4.11 FIFO Function

### 21.4.11.1 Description

Some message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by FLXAnFRMRC.FFB and ending with the message buffer referenced by FLXAnFRMRC.LCB. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case, frame ID, payload length, receive cycle count, and the message buffer status FLXAnFRMBS of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. It indicates that the FIFO is not empty when the RFNE flag in the FLXAnFRSIR register is set to ' 1 ', the receive FIFO fill level FLXAnFRFSR.RFFL is equal to or greater than the critical level configured by FLXAnFRSIR.RFCL bit when FLXAnFRFCL.RFCL bit is 1 , and A FIFO overrun has been detected when FLXAnFREIR.RFO is 1, respectively. If enabled, interrupts are generated.

If null frames are not removed by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received, it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the output buffer. The PUT Index Register and the GET Index Register are not accessible by the host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag FLXAnFREIR.RFO to ' 1 '.

When the PUT index (PIDX) differs from the GET index (GIDX), it indicates that the FIFO is not empty. In this case, flag FLXAnFRSIR.RFNE is set to ' 1 '. This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in Figure $\mathbf{2 1 . 1 1}$ for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (FLXAnFRFRF) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit FLXAnFRFRF.RSS is set to ' 1 ', all messages received in the static segment are rejected by the FIFO. If bit FLXAnFRFRF.RNF is set to ' 1 ', received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (FLXAnFRFRFM) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked 'don't care' for rejection filtering.

Figure 21.11 FIFO Status: Empty, Not Empty, Overrun

### 21.4.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT_CONFIG or CONFIG state. While the CC is in DEFAULT_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured need to be programmed to the same value via FLXAnFRWRHS2.PLC. The data pointer to the first 32-bit word of the data section of the respective message buffer in the message RAM has to be configured via FLXAnFRWRHS3.DP.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask registers. The values configured in the header sections of the message buffers belonging to the FIFO, with exception of DP and PLC, have no meaning.

## CAUTIONS

1. It is recommended to program the MBI bits of the message buffers belonging to the FIFO to ' 0 ' via FLXAnFRWRHS1.MBI to avoid generation of RX interrupts.
2. If the payload length of a received frame is longer than the value programmed by FLXAnFRWRHS2.PLC in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.

### 21.4.11.3 Access to the FIFO

(1) When the output buffer is used:

For FIFO access outside DEFAULT_CONFIG and CONFIG state, the host has to trigger a transfer from the message RAM to the output buffer by writing the number of the first message buffer of the FIFO (referenced by FLXAnFRMRC.FFB) to the register FLXAnFROBCR. The message handler then transfers the message buffer addressed by the GET index register (GIDX) to the output buffer. After this transfer the GET index register (GIDX) is incremented.
(2) When the data transfer function is used:

The message received in FIFO can be transferred to the Local RAM/Cluster RAM by using the output data transfer function. For the output data transfer function, see Section 21.4.16.2, Output Data Transfer.

### 21.4.12 Message Handling

The message handler controls data transfers between the input/output buffer and the message RAM and between the message RAM and the two temporary buffers.

Access to the message buffers stored in the message RAM is done under control of the message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the host to the message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to FLXAnFRGTUC7.NSS. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from FLXAnFRGTUC7.NSS + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

Access of the host to the message buffer contents using the input or output buffer function is described in this subsection. Access to the message buffer contents using the data transfer function is mentioned in Section 21.4.16, Usage of Data Transfer.

### 21.4.12.1 Reconfiguration of Message Buffers

In case that an application needs to handle with more than 128 different messages, static and dynamic message buffers can be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via input buffer registers FLXAnFRWRHS1...3.

Reconfiguration has to be enabled via control bits FLXAnFRMRC.SEC in the message RAM Configuration register.
If a message buffer has not been transmitted/updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission/reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted/updated from a received frame in the cycle where it was reconfigured.
The message RAM is scanned according to Table 21.101 Scan of Message RAM below.
Table 21.101 Scan of Message RAM

| Start of Scan In Slot | Scan for Slots |
| :--- | :--- |
| 1 | $2 \ldots 15,1$ (next cycle) |
| 8 | $16 \ldots 23,1$ (next cycle) |
| 16 | $24 \ldots 31,1$ (next cycle) |
| 24 | $32 \ldots 39,1$ (next cycle) |
| $\ldots$ | $\ldots$ |

A message RAM scan is terminated with the start of NIT regardless of whether it has completed or not. The scan of the message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by FLXAnFRMRC.FDB. In case a message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by FLXAnFRMRC.FDB.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the followings have to be considered:

- If the message buffer to be reconfigured for slot 1 is part of the "Static Buffers", it will only be detected if it is reconfigured before the last message RAM scan in the static segment of the actual cycle evaluates this message buffer.
- If the message buffer to be reconfigured for slot 1 is part of the "Static + Dynamic Buffers", it will be detected if it is reconfigured before the last message RAM scan in the actual cycle evaluates this message buffer.
- The start of NIT terminates the message RAM scan. In case the message RAM scan has not evaluated the reconfigured message buffer by this point in time, the message buffer will not be considered for the next cycle.

## CAUTION

Reconfiguration of message buffers may lead to the loss of messages and therefore has to be performed very carefully. In the worst case (reconfiguration in consecutive cycles), a message buffer may never be transmitted or may not be updated from a received frame.

### 21.4.12.2 Host Access to Message RAM

The message transfer between input buffer and message RAM as well as between message RAM and output buffer is triggered by the host by writing the number of the target and source message buffer to be accessed to FLXAnFRIBCR or FLXAnFROBCR register.

The FLXAnFRIBCM and FLXAnFROBCM registers can be used to write/read header and data section of the selected message buffer separately.

If bit FLXAnFRIBCM.STXR is set to ' 1 ', the transmission request flag TXR of the selected message buffer is automatically set to ' 1 ' after the message buffer has been updated. If bit FLXAnFRIBCM.STXR is reset to ' 0 ', the transmission request flag TXR of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.
Input buffer (IBF) and output buffer (OBF) are built up as a double buffer structure. One half of this double buffer structure is accessible by the host (IBF host or OBF host), while the other half (IBF shadow or OBF shadow) is accessed by the message handler for data transfers between IBF/OBF and message RAM.

Figure 21.12 Host Access to Message RAM

## (1) Data Transfer from Input Buffer to Message RAM

To configure or update a message buffer in the message RAM, the host has to write the data to FLXAnFRWRDSx and the header to FLXAnFRWRHS1...3. The specific action is selected by configuring the FlexRay input buffer command mask register FLXAnFRIBCM.

When the host writes the number of the target message buffer in the message RAM to FLXAnFRIBCR.IBRH, IBF host and IBF shadow are switched (see Figure 21.13).

Figure 21.13 Double Buffer Structure Input Buffer

In addition the bits in the FLXAnFRIBCM and FLXAnFRIBCR registers are also switched while they hold the value in each IBF section (see Figure 21.14).

Figure 21.14 Switching of FLXAnFRIBCM and FLXAnFRIBCR Bits

With this write operation, bit FLXAnFRIBCR.IBSYS is set to ' 1 '. The message handler then starts to transfer the contents of IBF shadow to the message buffer in the message RAM selected by FLXAnFRIBCR.IBRS.

While the message handler transfers the data from IBF shadow to the target message buffer in the message RAM, the host can write the next message to IBF host. After the transfer between IBF shadow and the message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to ' 0 ' and the next transfer to the message RAM may be started by the host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.
If a write access to FLXAnFRIBCR.IBRH is made while FLXAnFRIBCR.IBSYS is ' 1 ', FLXAnFRIBCR.IBSYH is set to ' 1 '. After completion of the ongoing data transfer from IBF shadow to the message RAM, IBF host and IBF shadow are switched, FLXAnFRIBCR.IBSYH is reset to ' 0 ', FLXAnFRIBCR.IBSYS remains set to ' 1 ', and the next transfer to the message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS and the command mask flags are also switched.

Example of an 8/16/32-bit host access sequence:
Configure or update $n$-th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1... 3
- Write command mask: set FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

Configure or update $(\mathrm{n}+1)$ th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSx
- Write header section to FLXAnFRWRHS1... 3
- Write command mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

## CAUTION

Any write access to IBF while FLXAnFRIBCR.IBSYH is ' 1 ' will set error flag FLXAnFREIR.IIBA to ' 1 '. In this case, the write access is ignored.

Table 21.102 Assignment of FLXAnFRIBCM Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 18 | r | STXRS | Set Transmission Request Shadow Flag (ongoing or finished) |
| 17 | r | LDSS | Load Data Section Shadow Flag (ongoing or finished |
| 16 | r | LHSS | Load Header Section Shadow Flag (ongoing or finished) |
| 2 | r/w | STXRH | Set Transmission Request Host |
| 1 | r/w | LDSH | Load Data Section Host |
| 0 | r/w | LHSH | Load Header Section Host |

Table 21.103 Assignment of FLXAnFRIBCR Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 31 | r | IBSYS | IBF Busy Shadow Flag, signals ongoing transfer from IBF Shadow to message RAM |
| $22 \ldots 16$ | r | IBRS | IBF Request Shadow Flag, number of message buffer currently or lately updated |
| 15 | r | IBSYH | IBF Busy Host Flag, transfer request pending for message buffer referenced by IBRH |
| $6 \ldots 0$ | r/w | IBRH | IBF Request Host, number of message buffer to be updated next |

## (2) Data Transfer from Message RAM to Output Buffer

To read a message buffer from the message RAM, the host has to write to register FLXAnFROBCR to trigger the data transfer as configured in FLXAnFROBCM. After the transfer has completed, the host can read the transferred data from FLXAnFRRDDSx, FLXAnFRRDHS1...3, and FLXAnFRMBS.

Figure 21.15 Double Buffer Structure Output Buffer

OBF host and OBF shadow as well as bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS, FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH and bits FLXAnFROBCR.OBRS, FLXAnFROBCR.OBRH are switched under control of bits FLXAnFROBCR.VIEW and FLXAnFROBCR.REQ.

Writing bit FLXAnFROBCR.REQ to ' 1 ' copies bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS and bits FLXAnFROBCR.OBRS to an internal memory (see Figure 21.16).

After setting FLXAnFROBCR.REQ to ' 1 ', FLXAnFROBCR.OBSYS is set to ' 1 ', and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the message RAM to OBF shadow is started. After the transfer between the message RAM and OBF shadow has completed, the FLXAnFROBCR.OBSYS bit is set back to ' 0 '. Bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW can only be set to ' 1 ' while FLXAnFROBCR.OBSYS is ' 0 '.

Figure 21.16 Switching of FLXAnFROBCM and FLXAnFROBCR Bits

OBF host and OBF shadow are switched by setting bit FLXAnFROBCR.VIEW to ' 1 ' while bit FLXAnFROBCR.OBSYS is ' 0 ' (see Figure 21.15).

In addition, bits FLXAnFROBCR.OBRH and bits FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH are switched with the registers internal memory, thus assuring that the message buffer number stored in FLXAnFROBCR.OBRH and the mask configuration stored in FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH matches the transferred data stored in OBF host (see Figure 21.16).

Now the host can read the transferred message buffer from OBF host while the message handler transfers the next message from the message RAM to OBF shadow.

If bits REQ and VIEW are set to ' 1 ' with the same write access while FLXAnFROBSYS is ' 0 ', FLXAnFROBSYS is automatically set to ' 1 ' and OBF shadow and OBF host are switched. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are switched with the registers internal storage to keep them attached to the respective output buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal memory, and the transfer of the selected message buffer from the message RAM to OBF shadow is started. While the transfer is ongoing the host can read the message buffer transferred by the previous transfer from OBF host. When the current transfer between message RAM and OBF shadow has completed, completion of the transfer is notified by setting FLXAnFROBCR.OBSYS back to ' 0 '.

Example of an 8/16/32-bit host access to a single message buffer:
If a single message buffer has to be read out, two separate write accesses to FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are necessary:

- Wait until FLXAnFROBCR.OBSYS is reset
- Write output buffer command mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS
- Request transfer of message buffer to OBF shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of and 8-bit host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).
- Wait until FLXAnFROBCR.OBSYS is reset
- Toggle OBF shadow and OBF host by writing FLXAnFROBCR.VIEW = ' 1 '
- Read out transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1...3, and FLXAnFRMBS

Example of an $8 / 16 / 32$-bit host access sequence:
Request transfer of 1st message buffer to OBF shadow

- Wait until FLXAnFROBCR.OBSYS is reset
- Write output buffer command mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 1st message buffer
- Request transfer of 1st message buffer to OBF shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).

Toggle OBF shadow and OBF host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to ' 0 '
- Write output buffer command mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 2nd message buffer
- Toggle OBF shadow and OBF host and start transfer of 2nd message buffer to OBF shadow simultaneously by writing FLXAnFROBCR.OBRS of 2nd message buffer, FLXAnFROBCR.REQ, and FLXAnFROBCR.VIEW (in
case of and 8-bit host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW).
- Read out 1 st transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1...3, and FLXAnFRMBS

Demand access to last requested message buffer without a request of another message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to ' 0 '
- Demand access to last transferred message buffer by writing FLXAnFROBCR.VIEW
- Read out last transferred message buffer by reading FLXAnFRRDDSx, FLXAnFRRDHS1...3, and FLXAnFRMBS

Table 21.104 Assignment of FLXAnFROBCM Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| 17 | r | RDSH | Data Section Accessible |
| 16 | r | RHSH | Header Section Accessible |
| 1 | r/w | RDSS | Read Data Section Shadow |
| 0 | r/w | RHSS | Read Header Section Shadow |

Table 21.105 Assignment of FLXAnFROBCR Bits

| Pos. | Access | Bit | Function |
| :--- | :--- | :--- | :--- |
| $22 \ldots 16$ | r | OBRH | OBF Host Transfer Request Flag, <br> number of message buffer accessible |
| 15 | r | OBSYS | OBF Busy Shadow Flag, <br> signals ongoing transfer from message RAM to OBF shadow |
| 9 | r/w | REQ | Request transfer from message RAM to OBF shadow |
| 8 | r/w | VIEW | View OBF Shadow, swap OBF shadow and OBF host |
| $6 \ldots 0$ | r/w | OBRS | OBF Request Shadow, number of message buffer for next request |

### 21.4.12.3 FlexRay Protocol Controller Access to Message RAM

The two temporary buffers (TBF A and TBF B) are used to buffer the data for transfer between the two FlexRay protocol controllers and the message RAM.

Each temporary buffer is build up as a double buffer, and able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding protocol controller while the other one is accessible by the message handler.

If for example the message handler writes the next message to be sent to temporary buffer Tx, the FlexRay channel protocol controller can access temporary buffer Rx to store the message it is actually receiving. During transmission of the message stored in temporary buffer Tx, the message handler transfers the last received message stored in temporary buffer Rx to the message RAM (if it passes acceptance filtering) and updates the corresponding message buffer.

Data transfers between the temporary buffers and the shift registers of the FlexRay channel protocol controllers are done in words of 32 bit. This enables the use of a 32 bit shift register regardless of the length of the FlexRay messages.

Figure 21.17 Access to Temporary Buffers

### 21.4.13 Message RAM

To avoid conflicts between host access to the message RAM and FlexRay message reception/transmission, the host cannot directly access the message buffers in the message RAM. These accesses are handled via the input and output buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame ( $0 \ldots 254$ ), the message RAM has a structure as shown in Figure 21.18.

When the message buffer of the data section to be allocated after the header partition is set as a reception buffer (by setting the FLXAnFRWRHS1.CFG bit to 0 ) or as a reception FIFO buffer, set an unused area of at least 32 bits at the start of the data section. In this case, the data partition can be started from the nth word in the message RAM where $n$ calculated from (the setting of the FLXAnFRMRC.LCB[7:0] bits +1 ) $\times 4+1$.

When the message buffer of the data section to be allocated after the header partition is set as a transmission buffer (by setting the FLXAnFRWRHS1.CFG bit to 1), the data partition can be started from the nth word in the message RAM where n calculated from (the setting of the FLXAnFRMRC.LCB[7:0] bits +1 ) $\times 4$.

Figure 21.18 Configuration Example of Message Buffers in the Message RAM

## Header Partition

Stores header sections of the configured message buffers:

- Supports a maximum of 128 message buffers
- Each message buffer has a header section of four 32-bit words
- Header 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition

## Data Partition

Flexible storage of data sections with different length. Some maximum values are:

- 30 message buffers with 254 byte data section each
- Or 56 message buffers with 128 byte data section each
- Or 128 message buffers with 48 byte data section each

## CAUTION

Header partition + data partition may not occupy more than 2048 32-bit words.

### 21.4.13.1 Header Partition

The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the message RAM as listed in Table 21.106 below. Configuration of the header sections of the message buffers is done via IBF (FLXAnFRWRHS1...3). Read access to the header sections is done via OBF (FLXAnFRRDHS $1 \ldots 3+$ FLXAnFRMBS). The data pointer has to be calculated by the user to define the starting point of the data section for the corresponding message buffer in the data partition of the message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT_CONFIG or CONFIG state only.
The header section of each message buffer occupies four 32-bit words in the header partition of the message RAM. The header of message buffer 0 starts with the first word in the message RAM.

For transmit buffers the Header CRC has to be calculated by the host.
The followings are updated from received valid data frames only:
Payload Length Received (PLR bit), Receive Cycle Count (RCC bit), Received on Channel Indicator (RCI bit), Startup Frame Indicator (SFI bit), Sync Frame Indicator (SYN bit), Null Frame Indicator (NFI bit), Payload Preamble Indicator (PPI bit), and Reserved Bit (RES).

Table 21.106 Header Section of a Message Buffer in the Message RAM

## (1) Header Section 1 (word 0)

Write access via FLXAnFRWRHS1, read access via FLXAnFRRDHS1:

- Frame ID

Slot counter filtering configuration

- Cycle Code

Cycle counter filtering configuration

- CH

Channel filtering configuration

- CFG

Message buffer direction configuration: reception or transmission

- PPIT

Payload Preamble Indicator Transmit

- TXM

Transmit mode configuration: single-shot or continuous

- MBI

Message buffer receive/transmit interrupt enable

## (2) Header Section 2 (word 1)

Write access via FLXAnFRWRHS2, read access via FLXAnFRRDHS2:

- Header CRC

Transmit Buffer: Configured by the host (calculated from frame header)
Receive Buffer: Updated from received frame

- Payload Length Configured

Length of data section (2-byte words) as configured by the host

- Payload Length Received

Length of payload segment (2-byte words) stored from received frame

## (3) Header Section 3 (word 2)

Write access via FLXAnFRWRHS3, read access via FLXAnFRRDHS3:

- Data Pointer

Pointer to the beginning of the corresponding data section in the data partition

Read access via FLXAnFRRDHS3, valid for receive buffers only, updated from received frames:

- Receive Cycle Count

Cycle count from received frame

- RCI

Received on Channel Indicator

- SFI

Startup Frame Indicator

- SYN

Sync Frame Indicator

- NFI

Null Frame Indicator

- PPI

Payload Preamble Indicator

- RES

Reserved bit

## (4) Message Buffer Status FLXAnFRMBS (word 3)

Read access via FLXAnFRMBS, updated by the CC at the end of the configured slot.

- VFRA

Valid Frame Received on channel A

- VFRB

Valid Frame Received on channel B

- SEOA

Syntax Error Observed on channel A

- SEOB

Syntax Error Observed on channel B

- TCIA

Transmission Conflict Indication channel A

- TCIB

Transmission Conflict Indication channel B

- ESA

Empty Slot Channel A

- ESB

Empty Slot Channel B

- MLST

Message Lost

- FTA

Frame Transmitted on Channel A

- FTB

Frame Transmitted on Channel B

- Cycle Count Status

Actual cycle count when status was updated

- RCIS

Received on Channel Indicator Status

- SFIS

Startup Frame Indicator Status

- SYNS

Sync Frame Indicator Status

- NFIS

Null Frame Indicator Status

- PPIS

Payload Preamble Indicator Status

- RESS

Reserved bit Status

### 21.4.13.2 Data Partition

The data partition of the message RAM stores the data sections of the message buffers configured for reception/transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay protocol controllers and the message RAM as well as between the host interface and the message RAM, the physical width of the message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the message RAM the user has to ensure that the data pointers point to addresses within the data partition. Table 21.107 below shows an example how the data sections of the configured message buffers can be stored in the data partition of the message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32 -bit word are unused (see Table 21.107 below).

Table 21.107 Example for Structure of the Data Partition in the Message RAM

| Bit <br> Word | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ... | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  |
| ... | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  | Unused |  |  |  |  |  |  |  |

### 21.4.13.3 Message Data Integrity Check

A data integrity checking mechanism is implemented in the FlexRay core to assure the integrity of the data stored in the related RAM. Each RAM has a checksum generator and checker attached as shown in. Figure 21.19.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2 and the faulty message buffer indicators FLXAnFRMHDS.FMBD, FLXAnFRMHDS.MFMB, FLXAnFRMHDS.FMB are located in the FlexRay message handler status register. These single access error flags control the error interrupt flag FLXAnFREIR.AERR.

Figure 21.19 shows the data paths between the input buffer, temporary buffer and message RAM.

Figure 21.19 Checksum Generation and Check

When an access error has been detected the following actions will be performed:
In all cases:

- The respective access error flag in FLXAnFRMHDS register is set
- The access error flag FLXAnFREIR.AERR is set and, if enabled, a module interrupt to the host will be generated.

Additionally in specific cases:
(1) Access error during data transfer from input buffer 1 or 2 to message RAM when reading header section of respective message buffer from message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
- The data section of the corresponding message buffer is not updated.
- Transmit buffer: Transmission request for the corresponding message buffer is not set.
(2) Access error during scan of header sections in message RAM:
- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
- The message buffer is ignored (skipped).
(3) Access error during data transfer from message RAM to temporary buffer 1 or 2:
- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
- Frame is not transmitted. After the frame CRC is set to 0 , the frame that is being transmitted is invalidated.
(4) Access error during data transfer from temporary buffer 1 or 2 to message RAM when reading header section of respective message buffer from message RAM:
- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
- The data section of the corresponding message buffer is not updated.
(5) Access error during data transfer from message RAM to output buffer:
- The access error flag FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
(6) Access error during a data transfer from temporary buffer 1 or 2 to protocol controller 1 or 2 :
- FLXAnFRMHDS.ATBF1 and FLXAnFRMHDS.ATBF2 bits are set.
- After the frame CRC is set to 0 , the frame that is being transmitted is invalidated.
(7) Access error during data transfer from temporary buffer 1 or 2 to message RAM when reading temporary buffer 1 or 2 :
- FLXAnFRMHDS.ATBF1 and FLXAnFRMHDS.ATBF2 bits are set.
- FLXAnFRMHDS.FMBD bit is set to indicate that there is an error in the message buffer to which FLXAnFRMHDS.FMB points.
- FLXAnFRMHDS.FMB indicates the number of the message buffer that has an error.
(8) Access error during data read of Transient Buffer RAM 1 or 2:
- When an access error occurs while the message handler read a frame with network management information (PPI = ' 1 ') from Transient Buffer RAM 1 or 2, the corresponding network management vector registers FLXAnFRNMV1 to 3 are not updated from this frame.

### 21.4.13.4 Host Handling of Access Errors

Access error caused by temporary bit flips can be fixed by:

## (1) Self-healing

Access errors located in the data section of message RAM, Transient Buffer RAM A or Transient Buffer RAM B is overwritten with the next write access to the disturbed bit(s) caused by host access or by FlexRay communication.

## (2) CLEAR_RAMS Command

The POC command CLEAR_RAMS initializes the message RAM to zero, when called in the DEFAULT_CONFIG or CONFIG state.

## (3) Temporary Unlocking of Header Section

An access error in the header section of a locked message buffer can be fixed by a transfer from the input buffer to the locked buffer header section. For this transfer, the write access to the FLXAnFRIBCR (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see Section 21.3.3.1, FLXAnFRLCK — FlexRay Lock Register).

For that single transfer the message buffer header is unlocked, regardless of whether it belongs to the FIFO or whether its locking is controlled by FLXAnFRMRC.SEC, and will be updated with new data.

### 21.4.14 Interrupts

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the host to react very quickly on specific error conditions, status changes, or timer events. On the other hand, too many interrupts can cause the host to miss deadlines required by the application. Therefore the CC supports enable and disable controls for each individual interrupt source separately.

An interrupt may be triggered when

- An error was detected
- A status flag is set to ' 1 '
- A timer reaches a configured value
- A message transfer from input buffer to message RAM or from message ram to output buffer has completed
- A message transfer from the Local RAM/Cluster RAM to message RAM or from message RAM to Local RAM/Cluster RAM has completed
- A stop watch event occurred.

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The host has access to the actual status and error information by reading registers FLXAnFREIR, FLXAnFRSIR, FLXAnFROS, FLXAnFROTS and FLXAnFRITS.

The general purpose interrupt lines to the host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in FLXAnFREIES and FLXAnFRSIES. In addition each of the two interrupt lines can be enabled or disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

The input data transfer interrupt lines to the host, INTFLXAnIQE, INTFLXAnIQF, are controlled by the enabled interrupts in FLXAnFRITS. In addition each of the input data transfer interrupts can be enabled or disabled separately by programming the related bits in FLXAnFRITC.

The output data transfer interrupt lines to the host, INTFLXAnFW, INTFLXAnOW, INTFLXAnFDA, INTFLXAnOT, are controlled by the enabled interrupts in FLXAnFROTS. In addition each of the output data transfer interrupts can be enabled or disabled separately by programming the related bits in FLXAnFROTC.

The three timer interrupts lines to the host are controlled by the enabled interrupts in FLXAnFROS. In addition, each of the interrupt lines can be enabled or disabled separately by programming bit FLXAnFROC.T0IE, FLXAnFROC.T1IE and FLXAnFROC.T2IE.

When a transfer between IBF/OBF and the message RAM has completed, bit FLXAnFRSIR.TIBC or FLXAnFRSIR.TOBC is set to ' 1 '.

### 21.4.15 Assignment of FlexRay Configuration Parameters

Table 21.108 FlexRay Configuration Parameters (1/2)

| Parameter | Bit(field) |
| :---: | :---: |
| pKeySlotusedForStartup | FLXAnFRSUCC1.TXST |
| pKeySlotUsedForSync | FLXAnFRSUCC1.TXSY |
| gColdStartAttempts | FLXAnFRSUCC1.CSA |
| pAllowPassiveToActive | FLXAnFRSUCC1.PTA |
| pWakeupChannel | FLXAnFRSUCC1.WUCS |
| pSingleSlotEnabled | FLXAnFRSUCC1.TSM |
| pAllowHaltDueToClock | FLXAnFRSUCC1.HCSE |

| pExternRateCorrection | FLXAnFRGTUC11.ERC |

### 21.4.16 Usage of Data Transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the Local RAM/Cluster RAM (user RAM) and have transfers between the FlexRay internal message RAM and the Local RAM/Cluster RAM and vice versa with minimum CPU support. The data in the Local RAM/Cluster RAM should be indexed by data structure pointers located in data pointer tables stored in the Local RAM/Cluster RAM.

Data transfer from the Local RAM/Cluster RAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.

A data transfer from the FlexRay internal message RAM to the Local RAM/Cluster RAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.

The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application cannot directly access message buffers using the FlexRay output buffer.

### 21.4.16.1 Input Data Transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the Local RAM/Cluster RAM to the FlexRay internal message RAM with minimum CPU support.

## (1) Activation and Deactivation

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (FLXAnFRITS.IPIDX) and get index (FLXAnFRITS.IGIDX) to zero. In addition, set the interrupt status flags in the FLXAnFRITS register (IQEIS and IQFIS) to ' 0 '.

Figure 21.20 Input Transfer Enable Flow

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function is disabled (status indicated by FLXAnFRITS.ITS), user requested input transfers and all committed input transfers will be completed.

Figure 21.21 Input Transfer Disable Flow

## (2) Input Data Structure

The application has to reserve a location in the Local RAM/Cluster RAM to provide the content for message buffer configuration (input data structure).

The location of this input data structure needs to also be defined by an input data structure pointer located in the Local RAM/Cluster RAM.

Figure 21.22 Input Data Structure

In general the input data structure consists of two sections, the header and the data section.
The header section consists of FLXAnFRWRHS1, FLXAnFRWRHS2, FLXAnFRWRHS3 and the data section pointer. For bit alignment and bit function in the header section, see Section 21.4.13.1, Header Partition.

Depending on the settings in the control field (FLXAnFRWRHS4) located in the input pointer table, the data structure pointer is a reference to the address of FLXAnFRWRHS1 or FLXAnFRWRDS1. The data structure pointer has to be aligned to a 32 bit address.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to ' 1 ' it is required to provide a valid header section. In this case, FLXAnFRWRHS1 is the first element of the data structure.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to ' 0 ' a header section is not required. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to ' 1 ' it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (FLXAnFRWRDS1) and has to be aligned to a 32 bit address.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to ' 0 ' a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by FLXAnFROC.BEC. For information about the payload data alignment within the data section, refer to Section 21.4.13.1, Header Partition and Section 21.4.17, Byte Alignment.

The length of the data section and the size to be allocated in the Local RAM/Cluster RAM depend on the configuration of the bits DSL in the address related to FLXAnFRWRHS4.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by FLXAnFRWRHS2.PLC is used. The application has to ensure that a proper number of data words are provided in the Local RAM/Cluster RAM. In case the buffer is configured by FLXAnFRWRHS2.PLC to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

## (3) Input Pointer Table

To transfer data from the input data structures located in the Local RAM/Cluster RAM to the FlexRay internal message RAM, the related input data structure pointer and control field need to be added to the input pointer table which is located in the Local RAM/Cluster RAM.

The location of the first element of this table is identified by the input pointer table base address (FLXAnFRIBA.ITA). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (FLXAnFRITC.ITM).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

Input pointer table size (byte) $=((($ FLXAnFRITC.ITM +1$) \times \mathrm{D} \times 2) \times 4$

## Equation 1

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table.
The pointer table index related to this entry and hence the number to be written to FLXAnFRUIR.UIDX, is FLXAnFRITC.ITM +1 . The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

User input address $=$ FLXAnFRIBA.ITA + Input pointer table size

## Equation 2

Figure 21.23 Input Pointer Table

The input pointer table holds the control field FLXAnFRWRHS4 and the pointers to the Local RAM/Cluster RAM location where the message buffer content (header section and/or data section) is stored.

The application has to write FLXAnFRWRHS4 and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

## FLXAnFRWRHS4:

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | DSL[5:0] |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | INV | STR | LDS | LHS | - | IMBNR[6:0] |  |  |  |  |  |  |
| Value after reset | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| R/W | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

Table 21.109 FLXAnFRWRHS4 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 22 | - | Reserved <br> The read value is undefined. When writing, always write 0 . |
| 21 to 16 | DSL | Data Section Length <br> Specifies the length of the data section in terms of 32 bit values. |
| 15 to 12 | - | Reserved <br> The read value is undefined. When writing, always write 0. |
| 11 | INV | Invalidate Entry <br> 0 : The data structure is valid and will be transferred to the FlexRay internal message RAM. <br> 1: The data structure is invalid. FlexRay internal message RAM is not updated using this input pointer entry. |
| 10 | STR | Set Transmission Request <br> 0 : The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to ' 0 '. No data from this message buffer is transmitted. <br> 1: The bit FLXAnFRTXRQx.TXR for the message buffer selected by the bits IMBNR is set to '1' to release the message buffer for transmission. The application should not set the bit STR to '1' for receive buffers. |
| 9 | LDS | Load Data Section <br> 0: No update of data section <br> 1: Data section for the message buffer selected by the bits IMBNR is updated. |
| 8 | LHS | Load Header Section <br> 0 : No update of header section <br> 1: Header section for the message buffer selected by the bits IMBNR is updated. |
| 7 | - | Reserved <br> The read value is undefined. When writing, always write 0 . |
| 6 to 0 | IMBNR | Message Buffer Number Update <br> Select the target message buffer number in the FlexRay internal message RAM for transfer. |

Note that the LHS bit cannot be set for protected message buffers.
The bit LDS defines if the data section of the message buffer selected by the bits IMBNR is updated.
If LDS is set to ' 1 ', $(\mathrm{DSL}+1) 32$-bit words of payload data are transferred from the Local RAM/Cluster RAM to the message buffer selected by the bits IMBNR.

If LDS is set to ' 0 ', no payload data is transferred from the Local RAM/Cluster RAM.
Note that the payload transferred is independent from the configured payload length (bits PLC in the address related to FLXAnFRWRHS2).

The bit INV can be used to invalidate a transmitted data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see Section 21.4.16.1(5), Halting the Input Queue).

When this bit is set to ' 1 ', the message buffer number IMBNR is not updated. When the bit is set to ' 0 ', the message buffer number IMBNR is updated.

## (4) Transfer Function of Input Data Structure

To use the input data structure transfer function, the input transfer has to be activated (see Section 21.4.16.1(1), Activation and Deactivation). The activation process requires the setup of the input pointer table (see Section 21.4.16.1(3), Input Pointer Table) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer is enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.

To transmit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (FLXAnFRIQC.IMBNR). Afterwards the application increments the application internal put index.

By writing to the input queue control register the data available flag (FLXAnFRDAi.DA[IMBNR]) is automatically set to ' 1 '. The input transfer handler also maintains the put index pointer in the status register (FLXAnFRITS.IPIDX).

In case the input queue is full (number of queued input transfer requests is equal to the input queue table size), FLXAnFRITS.IQFP and FLXAnFRITS.IQFIS are set to ' 1 '. The input queue full condition pending flag (FLXAnFRITS.IQFP) changes from ' 1 ' to ' 0 ' when there are entries in the input queue available, whereby the input queue full interrupt status flag (FLXAnFRITS.IQFIS) needs to be cleared by the application.

The application cannot make any further write access to the bit IMBNR in the FLXAnFRIQC register as long as the bit IQFP in the FLXAnFRITS register is ' 1 '.

In case the input queue becomes empty (number of queued input transfer requests changes to zero)
FLXAnFRITS.IQEIS is set to ' 1 '.
The input queue empty interrupt status flag (FLXAnFRITS.IQEIS) needs to be cleared by the application.
The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in FLXAnFRITS.IGIDX. Note that the index is referring to the input entry, but not the address offset in the input pointer table.

If the input queue is not empty, the transfer handler reads the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to ' 0 ' and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see Section 21.4.16.1(5), Halting the Input Queue) no FlexRay internal message buffer is updated and the related data available flag is automatically set to ' 0 '. The change of the data available flag can be used to confirm the cancellation of a transmit request.

Figure 21.24 Input Pointer Table

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (FLXAnFRWRHS4.LDS $=$ ' 0 ', FLXAnFRWRHS4.LHS $=$ ' 1 ') to be updated in the FlexRay module.

## (5) Halting the Input Queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.
To cancel data structures already committed to the input queue, the queue can be halted by writing ' 1 ' to FLXAnFRITC.IQHR.

After the ongoing input transfer has been completed, the queue is halted and FLXAnFRITS.IQH changes from ' 0 ' to ' 1 '.

To invalidate an entry of the input queue, FLXAnFRWRHS4.INV has to be set to ' 1 '. All other bits in FWRHS4 cannot be changed.

Following flow shall be used to analyze whether a transmitted message has been already transferred to the FlexRay internal message RAM or not.

Figure 21.25 Input Table Analysis

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see Section 21.4.16.1(6), Transfer Function of User Requested Input Transfers).

## (6) Transfer Function of User Requested Input Transfers

To use this function, the input transfer has to be activated (see Section 21.4.16.1(1), Activation and Deactivation).

The application is capable, by using FLXAnFRUIR.UIDX, to request a transfer of an input data structure. The user input transfer request is executed first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. Add the table entry for the user input transfer request after the end of the input pointer table (see Section 21.4.16.1(3), Input Pointer Table).

To transmit this table entry to the input handler, the application has to write the index (FLXAnFRITC.ITM +1 ) to the user input transfer request register (FLXAnFRUIR.UIDX).

By writing to the user input transfer request register, the user input transfer request pending flag (FLXAnFRITS.UIRP) is automatically set to ' 1 '.

As long as this flag is ' 1 ', the application cannot make any further user input transfer requests.
The user input transfer request pending flag (FLXAnFRITS.UIRP) changes from ' 1 ' to ' 0 ' when the requested input transfer is completed. Subsequently, the pending transfers are processed.

### 21.4.16.2 Output Data Transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the Local RAM/Cluster RAM by the output data handler. The output data handler can also transfer the message buffer content to the Local RAM/Cluster RAM on application request. When enabled, the output handler is also capable of initiating a transfer when the message buffer status has changed.

## (1) Activation and Deactivation

The output data transfer function should be activated before usage. The activation of the output transfer handler will initialize the FIFO put and get index pointer and FIFO fill level (FLXAnFROTS.FGIDX and FLXAnFROTS.FFL) to zero, set the bits FLXAnFROTS.FDA, FLXAnFROTS.OWP, FLXAnFROTS.FWP and FLXAnFROTS.UORP to ' 0 '. Also the interrupt status flags FLXAnFROTS.OTIS, FLXAnFROTS.FIS, FLXAnFROTS.OWIS and FLXAnFROTS.FWIS) are set to ' 0 '.

The activation has no effect on the data available flags (FLXAnFRDAi.DA) which are related to the dedicated buffers; these flags have to be cleared by the application.

Figure 21.26 Output Transfer Enable Flow

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time FLXAnFROTS.OTS remains ' 1 '.
When FLXAnFROTS.OTS changes from ' 1 ' to ' 0 ', the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

Figure 21.27 Output Transfer Disable Flow

## (2) Output Transfer Data Structure

The data in the Local RAM/Cluster RAM is stored in an output data structure. The locations of the output data structures are determined by output data structure pointers also located in the Local RAM/Cluster RAM. The output data structure and indexing is visualized in Figure 21.28.

Figure 21.28 Output Data Structure

The output data structure consists of two sections, the header and data section. The header section consists of FLXAnFRRDHS1, FLXAnFRRDHS2, FLXAnFRRDHS3, FLXAnFRMBS and the data section pointer. FLXAnFRRDHS1 is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of FLXAnFRRDHS1. For information about the bit alignment and bit function within the header section, refer to Section 21.4.13.1, Header Partition.

FLXAnFRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of FLXAnFRRDDS1 and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit BEC in the FLXAnFROC register. For information about the payload data alignment within the data section, refer to Section 21.4.13.2, Data Partition.

The length of the data section and the total structure size to be allocated in the Local RAM/Cluster RAM depend on the configured payload length (FLXAnFRRDHS2.PLC) of the related message buffer. In case the configured payload length is an odd number of words or the received payload length (FLXAnFRRDHS2.PLR) is shorter than the configured payload length, the remaining data words in the Local RAM/Cluster RAM are unused and cannot be used by the application.

The output data structure is unique for all three kinds of output transfers. In case only the header section is transferred, the data section pointer is not evaluated by the output handler and the data section remains unchanged.

## (3) Output Pointer Table

For the output data transfer function, the application needs to set up an output pointer table in the Local RAM/Cluster RAM. The location of the first element of this table must be programmed into the output pointer table base address (FLXAnFROBA.OTA). This base address has to be aligned to a 32 bit address.

The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number that will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the Local RAM/Cluster RAM location where a memory space is reserved for the target message buffer content (header section and data section).

There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see Figure 21.29) the output pointer table starts with the entry for message buffer number 0 at the address configured in FLXAnFROBA.OTA and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address OTA +4 , message buffer 2 at address OTA +8 , etc.) for all possible message buffers.

When a set ND bit is the only transfer condition (FLXAnFROTC.OTCS is set to 0 ), only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set ND bit or a set MBC bit is the transfer condition (FLXAnFROTC.OTCS is set to 1 ), all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

## (4) FIFO Output Pointer Table

The FlexRay module internal FIFO can be extended by a queued buffer structure in the Local RAM/Cluster RAM.
If the FlexRay module internal FIFO is used, the application needs to set up the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (FLXAnFRFBA.FTA). This base address has to be aligned to a 32 bit address.

The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (FLXAnFROTC.FTM).

The FIFO pointer table holds pointers (output data structure pointers) to the Local RAM/Cluster RAM location where a memory space is reserved for the target message buffer content (header section and data section). For each table entry, a data pointer shall be configured in this table.

## (5) Transfer Function of Dedicated Message Buffers

To use this transfer function, the output transfer has to be activated (see Section 21.4.16.2(1), Activation and Deactivation). The activation process requires setting up the output pointer table (see Section 21.4.16.2(3), Output Pointer Table) in order to specify the destination location (output data structures) for the data to transfer. Figure 21.29 shows how the output pointer table references the output data structures.

Figure 21.29 Output Data Structure and Indexing

With FLXAnFROTC.OTCS, the output transfer condition can be selected between 'New data only mode' and the 'New data and status changed mode'.

In 'New data only mode', an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer that causes the related ND flag in the FLXAnFRNDATi register to be set. The ND flag in the FLXAnFRNDATi register is automatically set to ' 0 ' during the transfer procedure. The header section is also transferred and hence the MBC flag in the FLXAnFRMBSCi register is set to ' 0 '.

In 'New data and status changed mode', an output data transfer is initiated as described in 'New data only mode'. In addition, an output data transfer is initiated when only the message buffer status has been changed, which causes the related MBC flag in the FLXAnFRMBSCi register to be set. In this case, only the header section is transferred. The MBC flag in the FLXAnFRMBSCi register is automatically set to ' 0 ' during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure, the corresponding data available flag in the FLXAnFRDAi ( $\mathrm{i}=0$ to 3 ) registers is set to ' 1 '. The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (FLXAnFROTS.OTIS).

As long as the data available flag remains ' 1 ', the corresponding output data structure will not be updated.

In the case

- The data available flag is ' 1 ' and a valid received message was stored or
- When FLXAnFROTC.OTCS is ' 1 ' and the message buffer status was updated,
the output transfer warning interrupt flag (FLXAnFROTS.OWIS) is set to ' 1 ', notifying the application that new data is available but the output data structure transfer cannot be processed. In addition, the FLXAnFROTS.OWP flag, which continuously indicates the status of the output transfer warning condition, is set to ' 1 '.

If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (FLXAnFRMBS.MLST) is set to ' 1 '. This flag can be evaluated after the message buffer has been transferred into an output data structure.

The following sections describe how output data structures can be handled.

## (a) Data Section Copy Method

One option is to copy the information from the output data structure to a different location of the Local RAM/Cluster RAM and then to release the output data structure by clearing the related data enable flag. The application can use the copied information for further processing.

## (b) Data Structure Pointer Method

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data enable flag. The changed output data pointer should refer to a free data structure. The application needs to use the old data structure for further processing.

## (c) Data Section Pointer Method

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data enable flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

## (6) Transfer Function of FIFO Message Buffers

To use this buffer transfer function, the output transfer has to be activated (see Section 21.4.16.2(1), Activation and Deactivation). The activation process requires the setup of the FIFO pointer table (see Section 21.4.16.2(4), FIFO Output Pointer Table) in order to specify a location in the Local RAM/Cluster RAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.
After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (FLXAnFROTS.FIS) and FLXAnFROTS.FDA are set to ' 1 '. The bit FLXAnFROTS.FIS can be used as an interrupt source. The bit FLXAnFROTS.FDA indicates that the FIFO is not empty.

Up to FLXAnFROTS.FTM output structures configured in the register can be queued.
The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure. The FIFO reception handler also maintains a get index which is flagged in FLXAnFROTS.FGIDX. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (initially set to the zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing ' 1 ' to
FLXAnFROTS.FDA. By comparing the put index and the get index, the FIFO handler acquires the current fill level of the queued buffer structure.

The current FIFO fill level is set in FLXAnFROTS.FFL. When FLXAnFROTS.FDA is ' 1 ', there is at least one entry in the FIFO queue.

In case the queued buffer structure in the Local RAM/Cluster RAM is full (FLXAnFROTS.FFL = FLXAnFROTC.FTM +1 ), no further transfers are initialized, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (FLXAnFROTS.FWIS) is set to ' 1 '.

In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure will be overwritten. The related status flags and configuration registers of the FlexRay core module are used to generate desired warning notifications.

Figure 21.30 FIFO Pointer Table

## (7) Transfer Function of User Output Transfer Requests

To use this transfer function, the output transfer has to be activated (Section 21.4.16.2(1), Activation and Deactivation). The activation process requires to set up the output pointer table (see Section 21.4.16.2(4), FIFO Output Pointer Table) in order to specify the location in the Local RAM/Cluster RAM reserved for the transfer of the data (output data structures).

The application can, by using FLXAnFRUOR.UMBNR, request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO cannot be requested.

The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting FLXAnFRUOR.URDS to ' 1 '. The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.

The data available status and transfer blocking by the DA bits in the FLXAnFRDAi register is also used for the user requested transfers. Therefore, the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) needs to be released before the transfer request is made.

After writing to FLXAnFRUOR.UMBNR, the bit FLXAnFROTS.UORP is set to ' 1 ' to indicate that there is a pending user transfer request. When the transfer has been processed, the bit FLXAnFROTS.UORP is set to ' 0 ', the bit FLXAnFROTS.OTIS is set to ' 1 ' and the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) is set to ' 1 '.

User output transfer requests cannot be queued. The application needs to check the bit FLXAnFROTS.UORP before writing to FLXAnFRUOR.UMBNR.

User output transfer requests cannot be made for message buffers that are pending in the input transfer queue.

Figure 21.31 User Output Transfer Request Flow

Note that it may be possible that the data structure addressed by the user request is being updated due to a receive message buffer update (which causes the bit DA in the FLXAnFRDAi register to be set). This DA flag setting inhibits the user output transfer request. Therefore, polling FLXAnFROTS.UORP is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits FLXAnFROTS.OTIS or the DA bit in the FLXAnFRDAi register can be used instead. The exact flow depends on the software architecture.

### 21.4.16.3 Data Structure Transfer Scheduling

The different types of transfer requests are checked cyclically. In order to guarantee a certain transfer time, the different types of transfers have different priorities.

Use requested input transfers that have highest priority followed by the transfer of data structures to be transmitted into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

## (1) All Dedicated Message Buffers in Ascending Order

When FLXAnFROTC.OTCS is set to ' 0 ', set flags in the FLXAnFRNDATi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is ' 0 ').

When FLXAnFROTC.OTCS is set to ' 1 ', set flags in the FLXAnFRNDATi register or set flags in the FLXAnFRMBSCi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is ' 0 ').

## (2) Flexray Internal FIFO

When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.

## (3) User Output Request

If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer is generated.

### 21.4.16.4 Behavior in Case of Data Transfer Access Error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the FLXAnFRAES register is set.

The ongoing transfer is immediately terminated but completed transfers are processed and may generate further access errors. Any following access errors are only flagged in FLXAnFRAES.MAE. The other status flags are not updated.

## (1) Access Error During Input Transfer

When an access error occurs during an input transfer:

- The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated
- The address the FlexRay module attempted to access is written in the FLXAnFRAEA register
- FLXAnFRAES.IAE is set to ' 1 '
- The input pointer table index is flagged in FLXAnFRAES.EIDX
- In case of a normal input transfer the transfer related DA bit in the FLXAnFRDAi register is set to ' 0 '
- In case of the user input transfer request FLXAnFRITS.UIRP is set to ' 0 '

With the given status information, the application is able to identify and correct the faulty data structure.
In addition the application needs to clear the input access error flag (FLXAnFRAES.IAE).

## (2) Access Error During Output Transfer

When an access error occurs during an output transfer:

- The ongoing transfer is immediately terminated but the update of the data structure may be started.
- The address that the FlexRay module intended to access is written in the FLXAnFRAEA register
- FLXAnFRAES.OAE is set to ' 1 '
- The output pointer table index is flagged in FLXAnFRAES.EIDX
- In case of a normal output transfer, the related DA flag in the FLXAnFRDAi register remains ' 0 ' and no output transfer interrupt is generated
- In case of the user output transfer request, FLXAnFROTS.UORP is set to ' 0 '

With the given status information, the application is able to identify and correct the faulty data structure. The data structure in the Local RAM/Cluster RAM cannot be treated as valid.

In addition the application needs to clear the output access error flag (FLXAnFRAES.OAE).
The FlexRay module internal transfer of the message buffer is completed before the Local RAM/Cluster RAM access error is detected. The output transfer cannot be resumed. To avoid loss of data, the application can perform the user output transfer request of this message buffer to a correct Local RAM/Cluster RAM location.

## (3) Access Error During FIFO Transfer

When an access error occurs during an FIFO transfer:

- The ongoing transfer is immediately terminated
- The address, the FlexRay module intended to access to, is written in the FLXAnFRAEA register
- FLXAnFRAES.FAE is set to ' 1 '
- The FIFO pointer table index is written in FLXAnFRAES.EIDX
- The FIFO index pointer is not changed and hence the FIFO status flags are unchanged

With the given status information, the application is able to identify and correct the faulty data structure.
In addition, the application needs to clear the FIFO access error flag (FLXAnFRAES.FAE).
The data in the Local RAM/Cluster RAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

### 21.4.16.5 Behaviors in Case of RAM Read Errors

The FlexRay internal message RAM has an ECC checking mechanism. In case an uncorrectable RAM read error occurs, the application has to analyze the status in the FLXAnFRMHDS register and re-execute as described in Section 21.4.16.3, Data Structure Transfer Scheduling. The input and output transfer handler re-executes also on these errors detected in the message RAM when the error is related to an active transfer.

In addition, Transient Buffer RAM A and Transient Buffer RAM B have an ECC checking mechanism as well.
An uncorrectable RAM read errors does not affect the data transfer functionality but have to be handled as described in Section 21.4.13.1(4), Message Buffer Status FLXAnFRMBS (word 3).

In all cases, data causing a read error is never transferred to the Local RAM/Cluster RAM. If there is no recovery available in the application, the message is lost.

## (1) Read Error during Transfer from TBF to MBF

This internal transfer is performed for each valid FlexRay message received.
A read error can only occur when the header section in the FlexRay message RAM (see read error flags in FLXAnFRMHDS) is read. In this case, the message buffer needs to be re-configured.

For dedicated receive message buffers, the related ND flag in the FLXAnFRNDATi register will not be set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers, the ND flag in the FLXAnFRNDATi register is not set, but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However, if the read error is still present in the header section, updating of the output data structure will not start (see Section 21.4.16.5(2), Read Error during Transfer from MBF to OBF); thus the data in the Local RAM/Cluster RAM remains correct.

Note that the correction or any other reconfiguration of FIFO related to message buffers, while there are pending FIFO transfers, may result in incorrect data in the Local RAM/Cluster RAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before reactivation of the output data transfer.

## (2) Read Error during Transfer from MBF to OBF

This internal transfer is performed for every output data transfer (dedicated reception, FIFO, user requested).
A read error can occur in the header and data section (see read error flags in FLXAnFRMHDS). In both cases, the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer, the output data structure will not be updated and the data enable bit will not be set to ' 1 '. The FIFO put index and the FIFO fill level are not changed also. In case of user output transfer request, FLXAnFROTS.UORP is set to ' 0 ' even if there was no update of the output data structure.

## (3) Read Error during Transfer from IBF to MBF

This internal transfer is performed for every input data transfer.
A read error can occur only when the header section requested (the bit LHS in FLXAnFRWRHS4 is set to " 0 ") cannot be updated due to the reading of the header section from the message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

When a read error occurs during the input data transfer, the actually transferred message in the input queue is lost.

## (4) Message RAM Read Errors

Read errors when reading the header section are flagged in the FLXAnFRMHDS register.
Depending on the buffer type and set buffer protection, the message buffer may not be reconfigured.
The input transfer function cannot be used to reconfigure a locked message buffer using the method described in Section 21.4.13.4(3), Temporary Unlocking of Header Section.

Before reconfiguring a locked buffer, the user needs to disable the input transfer function and the output transfer function.

### 21.4.17 Byte Alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with FLXAnFROC.BEC a byte alignment function to support different byte ordering styles.

Figure 21.32 shows the payload byte alignment in a FlexRay frame.

Figure 21.32 Byte Alignment on the FlexRay Bus

### 21.4.17.1 Little Endian Alignment

When FLXAnFROC.BEC is ' 0 ', the byte alignment is set to Little Endian.

## (1) FLXAnFRNMVm (m= 1 to 3 )

The byte alignment of the NMV bytes is as follows.

## (2) FLXAnFRWRDSx (x=1 to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as follows.

- FLXAnFRWRDSx.MD[7:0] = Data axx $^{4}$
- FLXAnFRWRDSx.MD[15:8] = Data $_{4 x-3}$
- FLXAnFRWRDSx.MD[23:16] = Data $_{4 x-2}$
- FLXAnFRWRDSx.MD[31:24] $=$ Data $_{4 \mathrm{x}-1}$

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[7:0], FLXAnFRWRDSx.MD [15:8], FLXAnFRWRDSx.MD [23:16], FLXAnFRWRDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

## (3) FLXAnFRRDDSx (x=1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure are as follows.

- FLXAnFRRDDSx.MD[7:0] = Data $_{4 x-4}$
- FLXAnFRRDDSx.MD[15:8] = Data $_{4 x-3}$
- FLXAnFRRDDSx.MD[23:16] = Data $_{4 x-2}$
- $\operatorname{FLXAnFRRDDSx.MD[31:24]~}=$ Data $_{4 x-1}$

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD[15:8], FLXAnFRRDDSx.MD[23:16], FLXAnFRRDDSx.MD[31:24] with the most significant bit (MSB) transmitted first.

### 21.4.17.2 Big Endian Alignment

When FLXAnFROC.BEC is ' 1 ', the byte alignment is set to Big Endian.

## (1) FLXAnFRNMVm (m=1 to 3 )

The byte alignment of the NMV bytes is as follows.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FLXAn | Data 0 |  |  |  |  |  |  |  | Data 1 |  |  |  |  |  |  |  | Data 2 |  |  |  |  |  |  |  | Data 3 |  |  |  |  |  |  |  |
| FRNMV1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| FLXAn | Data 4 |  |  |  |  |  |  |  | Data 5 |  |  |  |  |  |  |  | Data 6 |  |  |  |  |  |  |  | Data 7 |  |  |  |  |  |  |  |
| FRNMV2 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| FLXAn | Data 8 |  |  |  |  |  |  |  | Data 9 |  |  |  |  |  |  |  | Data 10 |  |  |  |  |  |  |  | Data 11 |  |  |  |  |  |  |  |
| FRNMV3 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

## (2) FLXAnFRWRDSx ( $x=1$ to 64 )

The byte alignment for the message payload in the FlexRay input buffer and the input data structure are as follows.

- FLXAnFRWRDSx.MD[7:0] = Data $_{4 x-1}$
- FLXAnFRWRDSx.MD[15:8] = Data $_{4 x-2}$
- FLXAnFRWRDSx.MD[23:16] = Data $_{4 x-3}$
- FLXAnFRWRDSx.MD[31:24] = Data $_{4 x-4}$

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[31:24], FLXAnFRWRDSx.MD[23:16], FLXAnFRWRDSx.MD[15:8], and FLXAnFRWRDSx.MD[7:0] with the most significant bit (MSB) transmitted first.

## (3) FLXAnFRRDDSx (x=1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure are as follows.

- FLXAnFRRDDSx.MD[7:0] = Data $_{4 x-1}$
- FLXAnFRRDDSx.MD[15:8] = Data $_{4 x-2}$
- FLXAnFRRDDSx.MD[23:16] = Data $_{4 x-3}$
- FLXAnFRRDDSx.MD[31:24] $=$ Data $_{4 x-4}$

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD [15:8],
FLXAnFRRDDSx.MD [23:16], FLXAnFRRDDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

## Section 22 Renesas High Speed Bus (RHSB)

This section contains a generic description of the Renesas high speed bus (RHSB).
The first part in this section describes the features specific to this microcontroller including register base addresses and input/output signals. The ensuing sections describe the functions and registers of RHSB.

### 22.1 Features of RHSB

### 22.1.1 Number of Units

This microcontroller has the following number of Renesas high speed bus (RHSB) units.
Table 22.1 Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Unit Name | RHSBj $(\mathrm{j}=0,1)$ | RHSBj $(\mathrm{j}=0,1)$ |
|  |  |  |
| RH850/E2M |  |  |
|  | Rumber of Units |  |
| Nu Pins | 2 | 292 Pins |
| Unit Name | RHSBj $(\mathrm{j}=0,1)$ | 2 |

Table 22.2 Indices

| Index | Description |
| :--- | :--- |
| $j$ | The individual RHSB units are identified by the index " $j "(j=0,1)$. |
| $x$ | The individual chip select signals are identified by the index " $x$ " $(x=0,1)$. |
| $y$ | The individual upstream serial input signals are identified by the index " $y$ " $(y=0,1)$. |
| $k$ | The individual sub XBARs are identified by the index " $k$ " $(k=0,1,2,3)$. |

Table 22.3 RHSB Chip Select Index

| RHSB Instance | RHSB Chip Select Index |
| :--- | :--- |
| RHSB0 | RHSB0CSDx $(x=0,1)$ |
| RHSB1 | RHSB1CSDx $(x=0,1)$ |
| Table 22.4 | RHSB Upstream Serial Input Index |
| RHSB Channels | RHSB Upstream Serial Input Index |
| RHSB0 | RHSB0SIy $(y=0,1)$ |
| RHSB1 | RHSB1SIy $(y=0,1)$ |

### 22.1.2 Register Base Addresses

The RHSB base addresses are listed in the following table.
The RHSB register addresses are given as offsets from the base address.
Table 22.5 Register Base Addresses

| RHSBj | RHSBj_Base | Bus Group |
| :--- | :--- | :--- |
| <RHSB0_base> | FFEE $0000_{H}$ | Peripheral Group 6 |
| <RHSB1_base> | FFEE $1000_{H}$ | Peripheral Group 6 |

### 22.1.3 Clock Supply

The RHSB clock supply is shown in the following table.
Table 22.6 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| RHSBj | PCLK | CLK_LSB |
|  | clkc | CLK_RHSB |

### 22.1.4 Interrupt Requests

The RHSB interrupt requests are listed in the following table.
Table 22.7 Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number | DMA Trigger Number |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | sDMA | DTS |
| RHSB0 |  |  |  |  |  |
| INTRHSB0L0 | RHSBODTSF / RHSB0DTF | Data frame transmission started <br> Data frame transmission complete | 467 | - | - |
| INTRHSB0L1 | RHSB0CTF / <br> RHSBOTSF | Command frame transmission complete Transmission started | 468 | - | - |
| INTRHSB0L2 | RHSB0ETF | Emergency frame transmission complete | 469 | - | - |
| INTRHSB0L3 | RHSB0DRF | Data receive | 470 | - | - |
| INTRHSB0L4 | RHSBOUEF / <br> RHSBOTOF / <br> RHSB0DLF | Upstream error Timeout detected Data lost | 471 | - | - |
| INTRHSB0DWNDATADMA | RHSB0DTSF | Data frame transmission started | - | group0-189 | group1-97 |
| INTRHSBODWNCMDDMA | RHSB0CTF | Command frame transmission complete | - | group0-191 | group1-99 |
| INTRHSB0UPDMA | RHSB0DRF | Data receive | - | group0-190 | group1-98 |
| RHSB1 |  |  |  |  |  |
| INTRHSB1L0 | RHSB1DTSF / RHSB1DTF | Data frame transmission started Data frame transmission complete | 472 | - | - |
| INTRHSB1L1 | $\begin{aligned} & \text { RHSB1CTF / } \\ & \text { RHSB1TSF } \end{aligned}$ | Command frame transmission complete Transmission started | 473 | - | - |
| INTRHSB1L2 | RHSB1ETF | Emergency frame transmission complete | 474 | - | - |
| INTRHSB1L3 | RHSB1DRF | Data receive | 475 | - | - |
| INTRHSB1L4 | RHSB1UEF / <br> RHSB1TOF / <br> RHSB1DLF | Upstream error <br> Timeout detected <br> Data lost | 476 | - | - |
| INTRHSB1DWNDATADMA | RHSB1DTSF | Data frame transmission started | - | group0-192 | group1-100 |
| INTRHSB1DWNCMDDMA | RHSB1CTF | Command frame transmission complete | - | group0-194 | group1-102 |
| INTRHSB1UPDMA | RHSB1DRF | Data receive | - | group0-193 | group1-101 |

### 22.1.5 Reset Sources

The RHSB reset sources are listed in the following table. RHSB is initialized by these reset sources.
Table 22.8 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| RHSB0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| RHSB1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 22.1.6 External Input/Output Signals

The external input/output signals of RHSB are listed below.
Table 22.9 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| RHSB0 |  |  |
| RHSB0FCLP | RHSB0 downstream serial clock differential output | RHSB0FCLP |
| RHSB0FCLN | RHSB0 downstream serial clock differential output | RHSB0FCLN |
| RHSB0SOP | RHSB0 downstream serial data differential output | RHSB0SOP |
| RHSB0SON | RHSB0 downstream serial data differential output | RHSB0SON |
| RHSB0CSD0 | RHSB0 Slave 0 downstream chip selected output | RHSB0CSD0 |
| RHSB0CSD1 | RHSB0 Slave 1 downstream chip selected output | RHSB0CSD1 |
| RHSB0SI0 | RHSB0 Slave 0 upstream serial input | RHSB0SI0 |
| RHSB0SI1 | RHSB0 Slave 1 upstream serial input | RHSB0SI1 |
| RHSB0EMRG | RHSB0 Emergency input | RHSB0EMRG |
| RHSB1 |  |  |
| RHSB1FCLP | RHSB1 downstream serial clock differential output | RHSB1FCLP |
| RHSB1FCLN | RHSB1 downstream serial clock differential output | RHSB1FCLN |
| RHSB1SOP | RHSB1 downstream serial data differential output | RHSB1SOP |
| RHSB1SON | RHSB1 downstream serial data differential output | RHSB1SON |
| RHSB1CSD0 | RHSB1 Slave 0 downstream chip selected output | RHSB1CSD0 |
| RHSB1CSD1 | RHSB1 Slave 1 downstream chip selected output | RHSB1CSD1 |
| RHSB1SI0 | RHSB1 Slave 0 upstream serial input | RHSB1SI0 |
| RHSB1SI1 | RHSB1 Slave 1 upstream serial input | RHSB1SI1 |
| RHSB1EMRG | RHSB1 Emergency input | RHSB1EMRG |

To enable single-ended signaling, disable (set " 0 " to) each LVDS in the "(4) LVDSCTRLB - LVDS Control B Register", "(5) LVDSCTRLC - LVDS Control C Register" described in Section 2.4.2.4, Other Registers.
The pins that can be used for single-ended signaling are as follows:
(1) Pins available for single-ended signaling when LVDS is disabled

P13_1: RHSB0FCLP, P13_3: RHSB0SOP
P10_0: RHSB1FCLP, P10_2: RHSB1SOP
(2) Pins available for single-ended signaling with no LVDS setting

P12_4: RHSB0FCLP, P12_2: RHSB0SOP

The following pins are not available for single-ended signaling even when LVDS is disabled.
P13_0: RHSB0FCLN, P13_2: RHSB0SON
P10_1: RHSB1FCLN, P10_3: RHSB1SON

## CAUTION

This AC specification is applied to the specific pin groups only. For details, see Appendix file "Limited_conditions_for_AC_specification.xlsx".

### 22.2 Overview

The RHSB is designed to be used as a master node and provides two chip selects. It is designed to be compliant with MSC 1.0 (BOSCH/Infineon, July 2003) specification and MSC 1.0.0 (IPextreme, June 27, 2007).

### 22.2.1 Functional Overview

### 22.2.1.1 Downstream Channel Communication Functions

- Downstream communication
- Synchronous serial transmission
- Clock phase is selectable and clock activity is configurable during passive phases
- Configurable repetition period is independent from data frame length (1 to 512 ${ }_{\mathrm{D}}$ bits (data bit))
- Configurable downstream bit rate is $\mathrm{f}_{\mathrm{DW}}=\mathrm{f}_{\mathrm{PE}} / \mathrm{x}$ with $\mathrm{x}=(2,4,5,8,16,32,64,128,256)$. $\mathrm{f}_{\mathrm{PE}}$ is typically 80 MHz .160 MHz can be selected by using OPBT8.
- Indication of the status of ongoing downstream transmission, for evaluation purposes
- Up to 2 slaves are supported with this individual configuration
- Active level of the chip select and data bits
- Selection bit for data frame present/not present
- Length of assertion time ( 0 to $7_{\mathrm{D}}$ bits) and of de-assertion time ( 0 to $7_{\mathrm{D}}$ bits)
- Selectable pin types of downstream channel interface (FCL, SO): LVDS output drivers or GPIO pins.
- The LVDS driver is compliant with the ANSI/TIA/EIA-644 standard.
- Downstream data frame
- Each data frame (1 to 64 bits) is composed of 1 to 4 DFTEs with individual length specification.
- The user can define an individual source for each bit of a DFTE (e.g. timer input, data register).
- The frame passive phase after each data frame is configurable from 1 to 64 bits.
- Three transmission modes to schedule data transmission
- Downstream command frame
- Command frame transmission with/without request of remote data
- Dedicated register is available for defining 1 to 32 bits for command frame transmission.
- Three different methods to insert command frames into the data frame schedule
- Emergency function
- Handling of emergency condition can be enabled/disabled.
- Emergency condition is identified by an input pin of the MCU with programmable active level.
- Emergency input is selectable between level and edge sensitive.
- After transmission of an emergency frame, data transmission can be stopped automatically.
- Emergency data transmission DFTE bits are individually programmable through a dedicated register.

### 22.2.1.2 Upstream Channel Communication Functions

- Upstream communication
- Asynchronous serial reception
- Automatic selection of slave configuration when applying a command frame with data request
- Timeout detection can be activated to monitor slave response on a command frame with data request
- Status indication of ongoing upstream reception transmission, for evaluation purposes.
- Up to 2 slaves are supported for upstream communication with individual configurations.
- Active level of data line
- Frame with 8 or 12 data bits, even or odd parity bit, and 2 or 3 stop bits
- Upstream bit rate derived from downstream bit rate
- $f_{U P}=f_{D W} / 2^{x}$ with $x=3$ to 9 ; results in $/ 8$ to $/ 512$ with $f_{P E}=80 \mathrm{MHz}$
$-f_{U P}=f_{D W} / 2^{x}$ with $x=4$ to 9 ; results in $/ 16$ to $/ 512$ with $f_{P E}=160 \mathrm{MHz}$
- Upstream status of up to 2 slaves
- Valid data received
- Data lost (overrun of data register)
- Timeout error
- Receive error (parity bit error or stop bit error)

### 22.2.1.3 Other Features

The RHSB module supports a test mode for key-on test. In this test mode, a simple check of the data path is possible by loopback of downstream transmission to the upstream reception.

### 22.2.1.4 Caution

This product supports only the driving ability with the setting of drive strength 4 (High) as the output buffer characteristics of pins (driving ability) for the chip select signals of the RHSB. For setting of output buffer characteristics, see the PUCCn Register in Section 2, Pin Function.

### 22.2.2 Block Diagram

Figure 22.1 shows a top level block diagram of the RHSB module.

Figure 22.1 Block Diagram of RHSB

The $\operatorname{tmr}[63: 0]$ bits of the timer correspond to the signals selected by XBAR. For details on XBAR, see Section 22.6, Cross Bar (XBAR).

### 22.3 Registers

This section describes in detail the I/O registers of the RHSB module.
In case of a concurrent update of the same register bit, RHSB module write (hardware write) has higher priority than CPU write (software write).

### 22.3.1 List of Registers

The register map of a RHSB module is shown in Table 22.10.
The RHSB module remains in reset while RHSBjGC.RHSBjOPS indicates the RESET state.
For further information about the RHSB operation modes, see Section 22.4, Operation.
The module specific base address of a RHSB module needs to be added to each of the specified offset addresses.
Table 22.10 List of Registers

| Module Name | Register Name | Symbol*1 | Address | Access Size | Access Protect |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RHSBj | Global Configuration Register | RHSBjGC | <RHSBj_base> + $00{ }_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Module Status Register | RHSBjMSR | $<$ RHSBj_base $^{\text {+ }}+08_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Downstream Configuration Register | RHSBjDCR | <RHSBj_base> + 10 ${ }_{\text {H }}$ | 32, 16 | - |
| RHSBj | Data Element Configuration Register | RHSBjDEC | <RHSBj_base> + 14 ${ }_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Slave Device Configuration Register $\mathrm{i}(\mathrm{i}=0)$ | RHSBjSDCi | <RHSBj_base> $+18_{\text {H }}+4 \times \mathrm{i}$ | 32, 16 | - |
| RHSBj | Data Element Bit Assignment Register m ( $\mathrm{m}=$ 0 to 3) | RHSBjDEBAm | $\begin{aligned} & \text { <RHSBj_base> }+20_{H}+4 \times \\ & m \end{aligned}$ | 32, 16 | - |
| RHSBj | Emergency Bit Enable Register i ( $\mathrm{i}=0,1$ ) | RHSBjEBEi | <RHSBj_base> $+30_{\text {H }}+4 \times \mathrm{i}$ | 32, 16 | - |
| RHSBj | Downstream Transmission Control Register | RHSBjDTC | <RHSBj_base> $+38_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Downstream Command Data Register | RHSBjDCD | <RHSBj_base> $+3 \mathrm{C}_{\mathrm{H}}$ | 32, 16 | - |
| RHSBj | Downstream Data Register i ( $\mathrm{i}=0,1$ ) | RHSBjDDRi | $<\mathrm{RHSBj}_{\text {_ }}$ base $>+40_{\mathrm{H}}+4 \times \mathrm{i}$ | 32, 16 | - |
| RHSBj | Downstream Emergency Data Register $\mathrm{i}(\mathrm{i}=0$, 1) | RHSBjDEDi | $<$ RHSBj_base $^{\text {c }}+48_{\text {H }}+4 \times \mathrm{i}$ | 32, 16 | - |
| RHSBj | Upstream Configuration Register | RHSBjUCR | <RHSBj_base> + 50 ${ }_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Upstream Channel Configuration Register | RHSBjUCC | <RHSBj_base> + 54 ${ }_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Upstream Channel Selection Register | RHSBjUCS | $<$ RHSBj_base $^{\text {+ }}+58_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Upstream Data Read Register | RHSBjUDR | <RHSBj_base> $+5 \mathrm{C}_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Upstream Data Register $\mathrm{i}(\mathrm{i}=0,1$ ) | RHSBjUDi | $<\mathrm{RHSBj}_{\text {_ base }}>+60_{\mathrm{H}}+4 \times \mathrm{i}$ | 32, 16, 8 | - |
| RHSBj | Upstream Status Summary Register | RHSBjUSS | <RHSBj_base> $+70_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Interrupt Control Register | RHSBjIC | <RHSBj_base> + 74 ${ }_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Interrupt Status Register | RHSBjIS | $<$ RHSBj_base $^{\text {+ }}+78_{\text {H }}$ | 32, 16, 8 | - |
| RHSBj | Downstream Configuration Register for Period 1 | RHSBjDCR1 | <RHSBj_base> + 7 $\mathrm{CH}_{\mathrm{H}}$ | 32, 16, 8 | - |

The access size mentioned in Table 22.10 is obligatory for write accesses. In addition, all registers can be read in 8-, 16 - and 32-bit units.

The user should not write to bits a value specified as 'invalid' in the I/O register description.

### 22.3.2 Legend

This section explains the module state dependent abbreviations used for the I/O registers description in Section 22.3.3, Description of the Registers in the Common Controller to Section 22.3.6, Interrupt Registers.

- Conditions:
<Indexes used for register and register bit names>
i: Universal index
m: Index related to DFTE m
n : Index related to slave n

### 22.3.3 Description of the Registers in the Common Controller

### 22.3.3.1 RHSBjGC — Global Configuration Register

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 22.11 RHSBjGC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 19 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 18 | RHSBjDCDE | Downstream Command DMA Request Enable |
|  |  | $\mathrm{O}_{\mathrm{B}}$ : Downstream command DMA request is disabled. |
|  |  | $1_{\mathrm{B}}$ : Downstream command DMA request is enabled. |
| 17 | RHSBjDDE | Downstream Data DMA Request Enable |
|  |  | $0_{\mathrm{B}}$ : Downstream data DMA request is disabled. |
|  |  | $1_{B}$ : Downstream data DMA request is enabled. |
| 16 | RHSBjUDE | Upstream DMA Request Enable |
|  |  | $0_{B}$ : Upstream DMA request is disabled. |
|  |  | $1_{\mathrm{B}}$ : Upstream DMA request is enabled. |
| 15 to 2 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 1, 0 | RHSBjOPS[1:0] | Operation Status |
|  |  | $00_{\mathrm{B}}$ : RESET state |
|  |  | 018: CONFIG state |
|  |  | $10_{\mathrm{B}}$ : ACTIVE state |
|  |  | $11_{\mathrm{B}}$ : TEST state |

## Downstream Command DMA Request Enable (RHSBjGC.RHSBjDCDE)

The user should not set this bit to $1_{\mathrm{B}}$ when RHSBjIS.RHSBjCTF is used as interrupt source (RHSBjIC.RHSBjCTIE is $\left.1_{B}\right)$.

This bit defines if the downstream command data register (RHSBjDCD) and downstream transmission control register (RHSBjDTC) are updated by downstream DMA transfer and command data are transferred to slaves when RHSBjIS.RHSBjCTF is $1_{\mathrm{B}}$.

For details about downstream command DMA, see Section 22.5.6.2, DMA Usage for Downstream Command Transmission.

## Downstream Data DMA Enable (RHSBjGC.RHSBjDDE)

The user should not set this bit to $1_{\mathrm{B}}$ when RHSBjIS.RHSBjDTSF is used as interrupt source (RHSBjIC.RHSBj DTSIE is $1_{B}$ ).

This bit defines if the downstream data registers (RHSBjDDRi) are updated by downstream DMA transfer when RHSBjIS.RHSBjDTSF is $1_{\mathrm{B}}$.

For details about downstream data DMA, see Section 22.5.6.1, DMA Usage for Downstream Data
Transmission.

## Upstream DMA Enable (RHSBjGC.RHSBjUDE)

The user should not set this bit to $1_{\mathrm{B}}$ when RHSBjIS.RHSBjDRF is used as interrupt source (RHSBjIC.RHSBjDRIE is $\left.1_{B}\right)$.

This bit defines if the upstream data register (RHSBjUDR) is transferred by upstream DMA when RHSBjIS.RHSBjDRF is $1_{\mathrm{B}}$.

For details about upstream DMA, see 22.5.6.3, DMA Usage for Upstream Data Reception.

## Operation Status (RHSBjGC.RHSBjOPS)

The user cannot write $11_{\mathrm{B}}$ (TEST) to these bits while RHSBjGC.RHSBjOPS is $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$. The user cannot write $10_{\mathrm{B}}$ (ACTIVE) to these bits while RHSBjGC.RHSBjOPS is $00_{\mathrm{B}}$ or $11_{\mathrm{B}}$. These bits define the current operation state of the RHSB module.

## See Section 22.4, Operation.

### 22.3.3.2 RHSBjMSR — Module Status Register

Table 22.12 RHSBjMSR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 26 to 24 | RHSBjDFA[2:0] | Downstream Frame Activity |
|  |  | $000_{\mathrm{B}}$ : Inter-frame passive or disabled |
|  |  | $001{ }_{\mathrm{B}}$ : Passive phase of data frame |
|  |  | $010_{\mathrm{B}}$ : Active phase of command frame |
|  |  | $011_{\mathrm{B}}$ : Passive phase of command frame |
|  |  | $100_{\mathrm{B}}$ : Active phase of data frame (DFTE0) |
|  |  | 101 $1_{\mathrm{B}}$ : Active phase of data frame (DFTE1) |
|  |  | $110_{\mathrm{B}}$ : Active phase of data frame (DFTE2) |
|  |  | $111_{\mathrm{B}}$ : Active phase of data frame (DFTE3) |
| 23 to 17 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 16 | RHSBjTPS | Transmission Period Status |
|  |  | $0_{\mathrm{B}}: \text { Period } 0$ |
|  |  | 18: Period 1 |
| 15 to 1 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 0 | RHSBjUFA | Upstream Frame Activity |
|  |  | $\mathrm{O}_{\mathrm{B}}$ : Upstream is idle |
|  |  | $1_{\mathrm{B}}$ : Upstream frame decoding is ongoing |

## Downstream Frame Activity (RHSBjMSR.RHSBjDFA)

These bits indicate details of the downstream frame transmission. These bits are only valid when the downstream communication rate is equal to or falls below 5 megabits per second.

DTFE being transferred is flagged for the active phase of a data frame. A flag is placed in the slave select bit (assert phase or deassert phase) as a part of related DFTE.
[Changing conditions]

- These bits are updated when the downstream communication phase changes.
- These bits are updated when the number of DFTE used for transmission changes.
- These bits are set to $000_{\mathrm{B}}$ when entering CONFIG state.

## Transmission Period Status (RHSBjTPS bit in RHSBjMSR)

- This bit is only valid in multi-period repetition mode.
- This bit counts and specifies the transmission period.
- This bit starts to operate from $0_{\mathrm{B}}$ when a transmission starts.
[Changing condition]
When multi-period repetition mode is selected, this bit is updated at the timing of time tick.
[Setting conditions]
- When a user writes $1_{\mathrm{B}}$ to the RHSBjDTE bit in RHSBjDTC, reading the value of this bit returns $1_{\mathrm{B}}$.
- When the emergency function enable bit (the RHSBjEE bit in RHSBjDCR) is set to $11_{\mathrm{B}}$, reading the value of this bit returns $1_{\mathrm{B}}$.
- When entering the CONFIG state, reading the value of this bit returns $1_{\mathrm{B}}$.

## Upstream Frame Activity (RHSBjMSR.RHSBjUFA)

This bit indicates that the upstream decoder has detected a start bit and a frame is currently being decoded.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when the upstream decoder leaves RX-Active state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when the upstream decoder enters RX-Active state.

### 22.3.4 Downstream (Tx) Registers

### 22.3.4.1 RHSBjDCR — Downstream Configuration Register

Table 22.13 RHSBjDCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | RHSBjSLS[1:0] | Sequence Length Setting |
|  |  | 008: 1 DFTE (DFTE0) |
|  |  | 018: 2 DFTEs (DFTE0, DFTE1) |
|  |  | $10_{B}$ : 3 DFTEs (DFTE0 to DFTE2) |
|  |  | 11 ${ }_{\mathrm{B}}$ : 4 DFTEs (DFTE0 to DFTE3) |
| 29 to 24 | RHSBjDFP[5:0] | Data Frame Passive Length |
|  |  | Length of the data frame passive phase |
| 23 to 20 | RHSBjDBR[3:0] | Downstream Bit Rate |
|  |  | 0 ${ }_{\text {d }}$ : Invalid |
|  |  | $1_{\text {D }}: f_{\text {DW }}=f_{\text {PE }} / 2$ |
|  |  | 2 D : Invalid |
|  |  | $3_{\text {D }}: f_{\text {DW }}=f_{\text {PEI }} / 4$ |
|  |  | $4_{\text {D }}: f_{\text {DW }}=\mathrm{f}_{\text {PE }} / 5$ |
|  |  | 5 D : Invalid |
|  |  | 6 D : Invalid |
|  |  | $7_{\mathrm{D}}: \mathrm{ffW}=\mathrm{f}_{\text {PE }} / 8$ |
|  |  | $8_{\text {D }}: f_{\text {DW }}=f_{\text {PE }} / 16$ |
|  |  | $9_{D}: f_{\text {DW }}=f_{\text {PE }} / 32$ |
|  |  | 10D: $f_{\text {DW }}=f_{\text {PE }} / 64$ |
|  |  | 11 ${ }_{\text {d }}: \mathrm{f}_{\mathrm{DW}}=\mathrm{f}_{\text {PE }} / 128$ |
|  |  | Others: $\mathrm{f}_{\mathrm{DW}}=\mathrm{f}_{\mathrm{PE}} / 256$ |
| 19, 18 | RHSBjCIM[1:0] | Command Frame Insertion Method |
|  |  | $00_{B}$ : Time-slot method |
|  |  | 018: Immediate method |
|  |  | $10_{\mathrm{B}}$ : Best-effort method |
|  |  | $11_{\mathrm{B}}$ : Invalid |

Table 22.13 RHSBjDCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 17 | RHSBjCTD | Command Frame Transmission Delay <br> $0_{B}$ : No restriction <br> $1_{\mathrm{B}}$ : Transmission of consecutive command frames prevented |
| 16 to 8 | RHSBjREP[8:0] | Repetition Period Length <br> Length of the data frame repetition period |
| 7 | RHSBjCLP | Clock Line Phase <br> $0_{B}$ : Change on rising edge <br> $1_{\mathrm{B}}$ : Change on falling edge |
| 6 | RHSBjCAC | Clock Active Control <br> $0_{B}$ : Clock is inactive during the passive phases <br> $1_{\mathrm{B}}$ : Clock is always active |

## Sequence Length Setting (RHSBjDCR.RHSBjSLS)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the number of DFTEs used to assemble one downstream data frame.

## Data Frame Passive Length (RHSBjDCR.RHSBjDFP)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the length of the frame passive phase ( $1_{D}$ to $64_{D}$ bits) for data frames.
When these bits are $0_{\mathrm{D}}$, the frame passive phase has the length of $1_{\mathrm{D}}$ bit.
Note that a frame passive phase of $1_{D}$ bit is not valid according to the MSC specifications.

## Downstream Bit Rate (RHSBjDCR.RHSBjDBR)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define how the downstream bit rate is derived from the $\mathrm{f}_{\mathrm{PE}}$ clock.

## Command Frame Insertion Method (RHSBjDCR.RHSBjCIM)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines how a command frame is inserted into an ongoing downstream schedule.
The following methods are available:

- Time-slot method:

Command frame transmission is delayed to be handled within the defined repetition period. The repetition period is not affected by command frame transmission.

- Immediate method:

Command frame transmission is handled as soon as possible. The repetition period can be re-adjusted in case of command frame transmission.

- Best-effort method:

Command frame transmission is handled as soon as possible with minimum impact to the data frame transmission. The repetition period is not affected by command frame transmission.

## Command Frame Transmission Delay (RHSBjDCR.RHSBjCTD)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if the command frame transmission is restricted to have at least one data frame between two command frames.

## Repetition Period Length (RHSBjDCR.RHSBjREP)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the length of the repetition period ( $1_{D}$ to $512_{\text {D }}$ bits) used for downstream communication in singleperiod repetition mode and multi-period repetition mode.

That is, when these bits are $0_{D}$, the repetition period is $1_{D}$ bit.
See Section 22.5.1.3, Downstream Modes, (2) Repetition Mode (Single-Period Repetition, Multi-Period Repetition) for details.

## Clock Line Phase (RHSBjDCR.RHSBjCLP)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if the serial data line (RHSBjSOP, RHSBjSON) and the chip select lines (RHSBjCSD0, RHSBjCSD1) are changing with the rising or falling edge of the serial clock line (RHSBjFCLP, RHSBjFCLN).

## Clock Active Control (RHSBjDCR.RHSBjCAC)

This bit defines the activity of the downstream serial clock line (RHSBjFCLP, RHSBjFCLN) during the passive phases. During active phases, the clock is always active.

## Emergency Input Enable (RHSBjDCR.RHSBjEE)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits enable the emergency function of the RHSB module.
In addition, these bits define if the data transmission is stopped after an emergency frame has been transmitted.

## Emergency Input Mode (RHSBjDCR.RHSBjEIM)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines how the emergency condition is derived from the external emergency signal (RHSBjEMRG).

## Emergency Input Polarity (RHSBjDCR.RHSBjEIP)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines the active level of the external emergency signal (RHSBjEMRG).

## Downstream Mode Select (RHSBjDCR.RHSBjDMS)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the timing mode of the downstream channel.

### 22.3.4.2 RHSBjDCR1 — Downstream Configuration Register for Period 1

Value after reset: $\quad 00000000^{\mathbf{H}}$

Table 22.14 RHSBjDCR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31,30 | RHSBjSLS1[1:0] | Sequence Length Setting for Period 1 |
|  |  | 00B: 1 DFTE (DFTE0) |
|  | 01B: 2 DFTEs (DFTE0, DFTE1) |  |
|  | 10B: 3 DFTEs (DFTE0 to DFTE2) |  |
|  | 11B: 4 DFTEs (DFTE0 to DFTE3) |  |
| 29 to 0 | - | Reserved. |
|  |  | These bits are always read as 0. The write value should be always 0. |

## Sequence Length Setting for Period 1 (RHSBjDCR1.RHSBjSLS1)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the number of DFTEs used to assemble one downstream data frame.
These bits are available only in multi-period repetition mode. RHSBjDCR1.RHSBjSLS1 value should be equal to or smaller than RHSBjDCR.RHSBjSLS value.

### 22.3.4.3 RHSBjDEC — Data Element Configuration Register

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |

Table 22.15 RHSBjDEC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 29, 28 | RHSBjSSD0[1:0] | Slave Selected for DFTE0 |
|  |  | Slave selected when transmitting DFTE0 |
| 27 to 24 | RHSBjNDB0[3:0] | Number of Data Bits 0 |
|  |  | Number of data bits used from DFTE0 |
| 23, 22 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 21, 20 | RHSBjSSD1[1:0] | Slave Selected for DFTE1 |
|  |  | Slave selected when transmitting DFTE1 |
| 19 to 16 | RHSBjNDB1[3:0] | Number of Data Bits 1 |
|  |  | Number of data bits used from DFTE1 |
| 15, 14 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 13, 12 | RHSBjSSD2 [1:0] | Slave Selected for DFTE2 |
|  |  | Slave selected when transmitting DFTE2 |
| 11 to 8 | RHSBjNDB2[3:0] | Number of Data Bits 2 |
|  |  | Number of data bits used from DFTE2 |
| 7, 6 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 5, 4 | RHSBjSSD3 [1:0] | Slave Selected for DFTE3 |
|  |  | Slave selected when transmitting DFTE3 |
| 3 to 0 | RHSBjNDB3[3:0] | Number of Data Bits 3 |
|  |  | Number of data bits used from DFTE3 |

## Slave Selected for DFTEm (RHSBjDEC.RHSBjSSDm) ( $m=0$ to 3 )

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define which slave is addressed by downstream frame transmission element m (DFTEm). Setting $10_{\mathrm{B}}$ and $11_{\mathrm{B}}$ is prohibited.

## Number of Data Bits $m$ (RHSBjDEC.RHSBjNDBm) ( $m=0$ to 3 )

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the number of bits ( 1 to 16) used from DFTEm for data frame transmission.
When these bits are $0_{\mathrm{D}}, 1$ bit from DFTEm is transmitted.

### 22.3.4.4 RHSBjSDCi — Slave Device Configuration Register i(i=0)

Value after reset: $\quad 00000000_{\mathrm{H}}$

Note: $n=2 \times i($ for bits 31 to 16$)$
$\mathrm{n}=2 \times \mathrm{i}+1$ (for bits 15 to 0 )
Table 22.16 RHSBjSDCi Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 26 to 24 | RHSBjAPLn[2:0] | Assertion Phase Length |
|  |  | Assertion phase length for slave 0 |
| 23, 22 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 21 | RHSBjCSLPn | Chip Select Line Polarity |
|  |  | Chip select line polarity for slave 0 |
|  |  | $0_{B}$ : Active high |
|  |  | $1_{\mathrm{B}}$ : Active low |
| 20 | RHSBjSOLPn | Serial Out Line Polarity |
|  |  | Serial out line polarity for slave 0 |
|  |  | $0_{B}$ : Inversion disabled |
|  |  | $1_{B}$ : Inversion enabled |
| 19 | RHSBjCPSn | Content Phase Selection Bit Enable |
|  |  | Content phase selection bit enable for slave 0 |
|  |  | $0_{B}$ : No selection bit is present |
|  |  | $1_{\mathrm{B}}$ : Selection bit is present |
| 18 to 16 | RHSBjDPLn[2:0] | Deassertion Phase Length |
|  |  | Deassertion phase length for slave 0 |
| 15 to 11 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 10 to 8 | RHSBjAPLn[2:0] | Assertion Phase Length |
|  |  | Assertion phase length for slave 1 |
| 7, 6 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 5 | RHSBjCSLPn | Chip Select Line Polarity |
|  |  | Chip select line polarity for slave 1 |
|  |  | $0_{B}$ : Active high |
|  |  | $1_{\mathrm{B}}$ : Active low |

Table 22.16 RHSBjSDCi Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 | RHSBjSOLPn | Serial Out Line Polarity |
|  |  | Serial out line polarity for slave 1 |
|  | $0_{\mathrm{B}}:$ Inversion disabled |  |
|  | $1_{\mathrm{B}}:$ Inversion enabled |  |
| 3 | RHSBjCPSn | Content Phase Selection Bit Enable |
|  |  | Content phase selection bit enable for slave 1 |
|  |  | $0_{\mathrm{B}}:$ No selection bit is present |
|  |  | $1_{\mathrm{B}}:$ Selection bit is present |
| 2 to 0 | RHSBjDPLn[2:0] | Deassertion Phase Length |
|  |  | Deassertion phase length for slave 1 |

## Assertion Phase Length (RHSBjSDCi.RHSBjAPLn) ( $\mathrm{n}=\mathbf{0}, \mathbf{1}$ )

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the assertion phase ( $0_{D}$ to $7_{D}$ bits) used for frames transmitted to slave $n$. If these bits are $0_{D}$, no assertion phase is present.

## Chip Select Line Polarity (RHSBjSDCi.RHSBjCSLPn) ( $\mathbf{n}=\mathbf{0}, \mathbf{1}$ )

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines the polarity of the chip select line $(\operatorname{RHSBjCSDn}(\mathrm{n}=0,1))$ for slave n .

## Serial Out Line Polarity (RHSBjSDCi.RHSBjSOLPn) (n = 0, 1)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines the inversion of the serial data line (RHSBjSOP, $\operatorname{RHSBjSON}(j=0,1)$ ) when slave n is selected.

## Content Phase Selection Bit enable (RHSBjSDCi.RHSBjCPSn) ( $\mathrm{n}=\mathbf{0}, \mathbf{1}$ )

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if there is a selection bit in data frames transmitted to slave n .
Note that in command frames, the selection bit is always present.

## Deassertion Phase Length (RHSBjSDCi.RHSBjDPLn) ( $\mathrm{n}=\mathbf{0}, 1$ )

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the deassertion phase ( $0_{\mathrm{D}}$ to $7_{\mathrm{D}}$ bits) used for frames transmitted to slave n . If these bits are $0_{\mathrm{D}}$, no deassertion phase is present.

### 22.3.4.5 RHSBjDEBAm — Data Element Bit Assignment Register m (m = 0 to 3 )

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | Data source select for bit 12 in DFTEm |
| 23, 22 | RHSBjDSS11 [1:0] | Data Source Select 11 |
|  |  | Data source select for bit 11 in DFTEm |
| 21, 20 | RHSBjDSS10 [1:0] | Data Source Select 10 |
|  |  | Data source select for bit 10 in DFTEm |
| 19, 18 | RHSBjDSS9 [1:0] | Data Source Select 9 |
|  |  | Data source select for bit 9 in DFTEm |
| 17, 16 | RHSBjDSS8 [1:0] | Data Source Select 8 |
|  |  | Data source select for bit 8 in DFTEm |
| 15, 14 | RHSBjDSS7 [1:0] | Data Source Select 7 |
|  |  | Data source select for bit 7 in DFTEm |
| 13, 12 | RHSBjDSS6 [1:0] | Data Source Select 6 |
|  |  | Data source select for bit 6 in DFTEm |
| 11, 10 | RHSBjDSS5 [1:0] | Data Source Select 5 |
|  |  | Data source select for bit 5 in DFTEm |
| 9, 8 | RHSBjDSS4 [1:0] | Data Source Select 4 |
|  |  | Data source select for bit 4 in DFTEm |
| 7, 6 | RHSBjDSS3 [1:0] | Data Source Select 3 |
|  |  | Data source select for bit 3 in DFTEm |
| 5, 4 | RHSBjDSS2 [1:0] | Data Source Select 2 |
|  |  | Data source select for bit 2 in DFTEm |
| 3, 2 | RHSBjDSS1 [1:0] | Data Source Select 1 |
|  |  | Data source select for bit 1 in DFTEm |

Table 22.17 RHSBjDEBAm Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1,0 | RHSBjDSS0 [1:0] | Data Source Select 0 <br>  |

Data Source Select i (RHSBjDEBAm.RHSBjDSSi) ( $\mathrm{i}=0$ to 15 )
The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the data source of bit i in RHSBjDFTEm.
$00_{\mathrm{B}}$ : Bit from timer input is selected
$01_{\mathrm{B}}$ : Inverted bit from timer input is selected
$10_{\mathrm{B}}$ : Bit from downstream data register RHSBjDDR0 or RHSBjDDR1 is selected
$11_{\mathrm{B}}$ : Invalid
See Section 22.5.1.6, Data Frame Assembling for details about the bit selection and the bit mapping.

### 22.3.4.6 RHSBjEBEi - Emergency Bit Enable Register $\mathbf{i}(\mathbf{i}=\mathbf{0}, \mathbf{1})$

Value after reset: $00000000_{\mathrm{H}}$

Table 22.18 RHSBjEBEi Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | RHSBjEBE $[15+32 \times i: 8+32 \times i]$ | Emergency Bit Enable <br> Emergency Enable of DFTE $\mathrm{i} \times 2$ (DFTE0, DFTE2) |
| 23 to 16 | RHSBjEBE $[7+32 \times i: 32 \times i]$ | $\mathrm{O}_{\mathrm{B}}$ : Emergency function for this bit is disabled $1_{\mathrm{B}}$ : Emergency function for this bit is enabled |
| 15 to 8 | RHSBjEBE $\begin{aligned} & {[31+32 \times i: 24+32 \times} \\ & i] \end{aligned}$ | Emergency Bit Enable <br> Emergency Enable of DFTE $1+i \times 2$ (DFTE1, DFTE3) $0_{\mathrm{B}}$ : Emergency function for this bit is disabled |
| 7 to 0 | RHSBjEBE $\begin{aligned} & {[23+32 \times i: 16+32 \times} \\ & \text { i] } \end{aligned}$ | $1_{B}$ : Emergency function for this bit is enabled |

## Emergency Bit Enable (RHSBjEBEi.RHSBjEBE)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define if the emergency function is enabled for a data frame bit.
Each bit enables the emergency function for the corresponding bit in an RHSBjDFTE.RHSBjDFTE0 is controlled by RHSBjEBE0[31:16], RHSBjDFTE1 by RHSBjEBE0[15:0], RHSBjDFTE2 by RHS-BjEBE1[31:16] and RHSBjDFTE3 by RHSBjEBE1[15:0].

See Section 22.5.1.6, Data Frame Assembling for details.

### 22.3.4.7 RHSBjDTC — Downstream Transmission Control Register

Do not rewrite this register by using a bit-manipulation instruction.

Table 22.19 RHSBjDTC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 28 to 24 | RHSBjNCB[4:0] | Number of Command Bits <br> Number of bits used for command frame transmission |
| 23, 22 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 21, 20 | RHSBjSSCF [1:0] | Slave Selection for Command Frame <br> $00_{\mathrm{B}}$ : Command is send to slave 0 <br> $01_{\mathrm{B}}$ : Command is send to slave 1 <br> $10_{\mathrm{B}}$ : Setting prohibited <br> $11_{\mathrm{B}}$ : Setting prohibited. |
| 19, 18 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 17, 16 | RHSBjCTR [1:0] | Command Transmission Request <br> $00_{\mathrm{B}}$ : No request <br> $01_{\mathrm{B}}$ : Requests a command that does not require a response from the receive slave. <br> $10_{\mathrm{B}}$ : Invalid <br> $11_{\mathrm{B}}$ : Requests a command that requires a response from the receive slave. |
| 15 to 2 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 1 | RHSBjTSR | Transmission Stop Request <br> $0_{B}$ : No action <br> $1_{\mathrm{B}}$ : Request pending |
| 0 | RHSBjDTE | Data Transmission Enable <br> $0_{\mathrm{B}}$ : Disabled <br> $1_{\mathrm{B}}$ : Enabled |

## Number of Command Bits (RHSBjDTC.RHSBjNCB)

The user can write to these bits only if RHSBjDTC.RHSBjCTR is $00_{\mathrm{B}}$.
The user should not write to these bits if downstream command DMA is enabled (RHS-BjGC.RHSBjDCDE is $1_{\mathrm{B}}$ ). These bits define the number of bits (1 to 32) used from the RHSBjDCD register for command frame transmission.

When these bits are $0_{D}, 1$ bit from the RHSBjDCD register is transmitted.

## Slave Selection for Command Frame (RHSBjDTC.RHSBjSSCF)

The user can write to these bits only if RHSBjDTC.RHSBjCTR is $00_{\mathrm{B}}$.
The user should not write to these bits if downstream command DMA is enabled (RHS-BjGC.RHSBjDCDE is $1_{\mathrm{B}}$ ).
These bits define the slave addressed for command frame transmission.

## Command Transmission Request (RHSBjDTC.RHSBjCTR)

The user cannot write to these bits if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
The user cannot write $11_{\mathrm{B}}$ to these bits if RHSBjUCS.RHSBjBSY is $1_{\mathrm{B}}$.
The user can write to these bits only if RHSBjDTC.RHSBjCTR is $00_{\mathrm{B}}$.
The user should not write to these bits if downstream command DMA is enabled (RHS-BjGC.RHSBjDCDE is $1_{\mathrm{B}}$ ).
These bits are used to request a command frame transmission.
[Changing conditions]

- These bits are set to $00_{\mathrm{B}}$ when a command frame has been transmitted.
- These bits are set to $00_{\mathrm{B}}$ when entering the CONFIG state.

## Transmission Stop Request (RHSBjDTC.RHSBjTSR)

The user can only write $1_{\mathrm{B}}$ to this bit.
The user cannot set this bit to $1_{\mathrm{B}}$ if RHSBjDTC.RHSBjDTE is $0_{\mathrm{B}}$.
This bit defines if the data transmission should be stopped when there is no ongoing data frame transmission.
[Clearing conditions]
This bit is set to $0_{\mathrm{B}}$ when data transmission is disabled (RHSBjDTC.RHSBjDTE is $0_{\mathrm{B}}$ ).

## Data Transmission Enable (RHSBjDTC.RHSBjDTE)

The user cannot write to this bit if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
The user can only write $1_{\mathrm{B}}$ to this bit.
This bit defines if the data frame transmission is enabled.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when there is a transmission stop request (RHSBjDTC.RHSBjTSR is $1_{\mathrm{B}}$ ) and this request has been processed.
- This bit is set to $0_{\mathrm{B}}$ when emergency condition detection and automatic stop is enabled (RHSBjDCR.RHSBjEE is $11_{B}$ ) and an emergency frame has been transmitted.
- This bit is set to $0_{\mathrm{B}}$ when the CONFIG state is entered.

### 22.3.4.8 RHSBjDCD — Downstream Command Data Register

Value after reset: $00000000_{\mathrm{H}}$

Table 22.20 RHSBjDCD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RHSBjCB[31:0] | Command Bit |
|  |  | These bits define the data for command frame transmission |

## Command Bit (RHSBjDCD.RHSBjCB)

The user can write to these bits only if RHSBjDTC.RHSBjCTR is $00_{\mathrm{B}}$.
The user should not write to these bits if downstream command DMA is enabled (RHS-BjGC.RHSBjDCDE is $1_{\mathrm{B}}$ ).
These bits define the data bits used to assemble command frames.
The transmission order is LSB first.
See Section 22.5.1.7, Command Frame Assembling for details.

### 22.3.4.9 RHSBjDDRi — Downstream Data Register $\mathbf{i}(\mathbf{i}=\mathbf{0}, 1)$

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 22.21 RHSBjDDRi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | RHSBjDB | Data Bit |
|  | $[15+32 \times \mathrm{i}: 32 \times \mathrm{i}]$ | These bits define the data of DFTE $\mathrm{i} \times 2$ (DFTE0, DFTE2) |
| 15 to 0 | RHSBjDB | Data Bit |
|  | $[31+32 \times \mathrm{i}: 16+32 \times$ | These bits define the data of DFTE $1+\mathrm{i} \times 2$ (DFTE1, DFTE3) |
|  | $\mathrm{i}]$ |  |

## Data Bit (RHSBjDDRi.RHSBjDB)

The user can write to these bits only if RHSBjIS.RHSBjDTSF is $1_{\mathrm{B}}$ or only if RHSBjDTC.RHSBjDTE is $0_{\mathrm{B}}$.
If the user writes to these bits in other cases, the write operation is ignored and the written data is lost.
The user should not write to these bits if downstream data DMA is enabled (RHSBjGC.RHSBjDDE is $1_{\mathrm{B}}$ ).
These bits define the data bits of the RHSBjDFTEs used to assemble data frames.
The transmission order of each RHSBjDFTE is LSB first.
RHSBjDFTE0 is assembled from RHSBjDDR0[31:16], RHSBjDFTE1 from RHSBjDDR0[15:0], RHSBjDFTE2 from RHSBjDDR1[31:16] and RHSBjDFTE3 from RHSBjDDR1[15:0].

See Section 22.5.1.6, Data Frame Assembling for details.
Which bits of RHSBjDDRi can be a trigger of downstream transmission when written depends on RHSBjDCR.RHSBjSLS (the number of DFTE to be used).

For details, see Section 22.5.1.10, Data Update and Data Frame Transmission Request.

### 22.3.4.10 RHSBjDEDi — Downstream Emergency Data Register i(i=0,1)

Value after reset: $00000000_{\mathrm{H}}$

Table 22.22 RHSBjDEDi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | RHSBjEB | Emergency Data Bit |
|  | $[15+32 \times \mathrm{i}: 32 \times \mathrm{i}]$ | These bits define the emergency data of DFTE $\mathrm{i} \times 2$ (DFTE0, DFTE2) |
| 15 to 0 | RHSBjEB | Emergency Data Bit |
|  | $[31+32 \times \mathrm{i}: 16+32 \times$ | These bits define the emergency data of DFTE $1+\mathrm{i} \times 2$ (DFTE1, DFTE3) |
|  | $\mathrm{i}]$ |  |

## Emergency Data Bit (RHSBjDEDi.RHSBjEB)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the bits of the RHSBjDFTEs used to assemble data frames under emergency condition.
RHSBjDFTE0 is assembled from RHSBjDED0[31:16], RHSBjDFTE1 from RHSBjDED0[15:0], RHSBjDFTE2 from RHSBjDED1[31:16] and RHSBjDFTE3 from RHSBjDED1[15:0].

See Section 22.5.1.6, Data Frame Assembling for details.

### 22.3.5 Upstream (Rx) Registers

### 22.3.5.1 RHSBjUCR — Upstream Configuration Register

| Value after reset: $\quad 00001800 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | RHSBjRTO[4:0] |  |  |  |  | - | - | - | - | $\begin{aligned} & \text { RHSBj } \\ & \text { UE } \end{aligned}$ | RHSBj TOE | RHSBj UMS | RHSBj FSM |
| Value after reset | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 22.23 RHSBjUCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 12 to 8 | RHSBjRTO[4:0] | Reception Timeout Period |
|  |  | Timeout period in U bits |
| 7 to 4 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 3 | RHSBjUE | Upstream Enable |
|  |  | $0_{B}$ : Disabled |
|  |  | $1_{\mathrm{B}}$ : Enabled |
| 2 | RHSBjTOE | Timeout Enable |
|  |  | $0_{B}$ : Disabled |
|  |  | $1_{\mathrm{B}}$ : Enabled |
| 1 | RHSBjUMS | Upstream Mode Select |
|  |  | $0_{B}$ : Dedicated mode |
|  |  | $1_{\mathrm{B}}$ : Shared mode |
| 0 | RHSBjFSM | Frame Storing Method |
|  |  | $\mathrm{O}_{\mathrm{B}}$ : Normal storing method |
|  |  | $1_{B}$ : Addressed storing method |
|  |  | For details, see Section 22.5.2.4, Frame Storing. |

## Reception Timeout Period (RHSBjUCR.RHSBjRTO)

These bits define the number of nominal upstream bit times before the timeout counter expires.
When these bits are $24_{\mathrm{D}}\left(18_{\mathrm{H}}\right)$, the timeout period has a length of 25 U bits.

## Upstream Enable (RHSBjUCR.RHSBjUE)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if reception on the upstream channels is enabled.

## Timeout Enable (RHSBjUCR.RHSBjTOE)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if the timeout function is enabled.

## Upstream Mode Select (RHSBjUCR.RHSBjUMS)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG)
This bit defines how the slaves are connected to the serial input lines of the RHSB module.

## Frame Storing Method (RHSBjUCR.RHSBjFSM)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines where the result of upstream decoding is stored.

### 22.3.5.2 RHSBjUCC — Upstream Channel Configuration Register

| Value after reset: |  |  | OFOF OFOF $\mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit |  | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\begin{aligned} & \text { RHSBj } \\ & \text { UFTO } \end{aligned}$ | $\begin{aligned} & \text { RHSBj } \\ & \text { SBNO } \end{aligned}$ | $\begin{aligned} & \text { RHSBj } \\ & \text { ILPO } \end{aligned}$ | $\begin{aligned} & \text { RHSBj } \\ & \text { PC0 } \end{aligned}$ | $\begin{gathered} \text { RHSBjUBRO } \\ {[3: 0]} \end{gathered}$ |  |  |  | $\begin{array}{\|l\|} \hline \text { RHSBj } \\ \text { UFT1 } \end{array}$ | $\begin{array}{\|l\|} \hline \text { RHSBj } \\ \text { SBN1 } \end{array}$ | RHSBj ILP1 | $\begin{array}{\|c} \text { RHSBj } \\ \text { PC1 } \end{array}$ | $\begin{gathered} \text { RHSBjUBR1 } \\ {[3: 0]} \end{gathered}$ |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 22.24 RHSBjUCC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | RHSBjUFT0 | Upstream Frame Type <br> Defines if upstream frame on channel 0 uses an 8-bit or 12-bit data format |
| 30 | RHSBjSBN0 | Stop Bit Number <br> Defines if upstream frame on channel 0 uses 2 or 3 stop bit format |
| 29 | RHSBjLLP0 | Serial Input Line Polarity <br> Defines if the serial input line of channel 0 (RHSBjSI0) is inverted |
| 28 | RHSBjUBR0[3:0] | Parity Control <br>  <br> 27 to 24 |
| 23 | RHSBjUFT1 | Defines if upstream frame on channel 0 uses even or odd parity |

## Upstream Frame Type (RHSBjUCC.RHSBjUFTn)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines the number of data bits of an upstream frame received on channel $n$.
$0_{\mathrm{B}}$ : 8-bit data field format
$1_{\mathrm{B}}$ : 12-bit data field format (including 4-bit address)

## Stop Bit Number (RHSBjUCC.RHSBjSBNn)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).

This bit defines the number of stop bits of an upstream frame received on channel $n$.
$0_{\mathrm{B}}: 2$ stop bits format
$1_{\mathrm{B}}: 3$ stop bits format

## Serial Input Line Polarity (RHSBjUCC.RHSBjILPn)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines if there is an inversion of the serial input line of channel $n$.
$0_{\mathrm{B}}$ : Inversion disabled
$1_{\mathrm{B}}$ : Inversion enabled
Note that when RHSBjUCR.RHSBjUMS is shared mode, RHSBjILP0 is used for all four channels (RHS-BjILP1 are ignored).

## Parity Control (RHSBjUCC.RHSBjPCn)

The user can write to this bit only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
This bit defines the parity bit interpretation of an upstream frame received on channel $n$.

$$
\begin{aligned}
& 0_{\mathrm{B}} \text { : Even parity } \\
& 1_{\mathrm{B}} \text { : Odd parity }
\end{aligned}
$$

## Upstream Bit Rate (RHSBjUCC.RHSBjUBRn)

The user can write to these bits only if RHSBjGC.RHSBjOPS is $01_{\mathrm{B}}$ (CONFIG).
These bits define the relation between the upstream bit rate and downstream bit rate for channel n .

$$
\begin{aligned}
& 0_{D}: \text { Setting prohibited } \\
& 1_{D}: \text { Setting prohibited } \\
& 2_{D}: \text { Setting prohibited } \\
& 3_{D}: f_{U P}=f_{D W} / 8 \\
& 4_{D}: f_{U P}=f_{D W} / 16 \\
& 5_{D}: f_{U P}=f_{D W} / 32 \\
& 6_{D}: f_{U P}=f_{D W} / 64 \\
& 7_{D}: f_{U P}=f_{D W} / 128 \\
& 8_{D}: f_{U P}=f_{D W} / 256 \\
& \text { Others: } f_{U P}=f_{D W} / 512
\end{aligned}
$$

Not all combinations of upstream and downstream bit rates are valid. See Section 22.5.2.5, Upstream Bit Rates for details.

### 22.3.5.3 RHSBjUCS — Upstream Channel Selection Register

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\begin{aligned} & \text { RHSBj } \\ & \text { BSY } \end{aligned}$ | - | - | - | - | - | $\begin{gathered} \text { RHSBjACC } \\ {[1: 0]} \end{gathered}$ |  | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 22.25 RHSBjUCS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RHSBjBSY | Busy |
|  |  | $0_{B}$ : Configuration ready |
|  |  | $1_{\mathrm{B}}$ : Processing configuration change |
| 30 to 26 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 25, 24 | RHSBjACC[1:0] | Active Channel Configuration |
|  |  | $00_{\mathrm{B}}$ : Configuration given for channel 0 |
|  |  | $01_{\mathrm{B}}$ : Configuration given for channel 1 |
|  |  | $10_{\mathrm{B}}$ : Setting prohibited |
|  |  | $11_{\mathrm{B}}$ : Setting prohibited |
| 23 to 0 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |

## Busy (RHSBjUCS.RHSBjBSY)

This bit indicates that the RHSB module is processing the change of active channel configuration.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when the change of active channel configuration has been processed.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting conditions]
- This bit is set to $1_{\mathrm{B}}$ when RHSBjUCS.RHSBjACC changes and RHSBjGC.RHSBjOPS is not $01_{\mathrm{B}}$ (CONFIG).
- This bit is set to $1_{\mathrm{B}}$ when leaving the CONFIG state.

## Active Channel Configuration (RHSBjUCS.RHSBjACC)

The user cannot write to these bits if RHSBjUCS.RHSBjBYS is $1_{\mathrm{B}}$.
The user should not write to these bits after starting a command transmission by using an upstream data request (by setting RHSBjDTC.RHSBjCTR to $11_{\mathrm{B}}$ ) until the upstream reception has been completed. The exact period where an upstream reception is expected is application specific.

These bits define the channel configuration specified in RHSBjUCC register to be used for upstream reception. In dedicated mode (RHSBjUCR.RHSBjUMS $=0_{\mathrm{B}}$ ), these bits also define the serial input line.

Note that an ongoing reception is aborted and the timeout detection is deactivated when these bits are being changed.

## [Changing condition]

These bits are updated to the value of RHSBjDTC.RHSBjSSCF when the user requests a command transmission with upstream data request by setting RHSBjDTC.RHSBjCTR to $11_{\mathrm{B}}$.

### 22.3.5.4 RHSBjUDR — Upstream Data Read Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | $25 \quad 24$ | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 18 | RHSBjFERR | Frame Error <br> $0_{B}$ : No stop bit error detected <br> $1_{\mathrm{B}}$ : Stop bit error detected |
| 17 | RHSBjPERR | Parity Error <br> $0_{\mathrm{B}}$ : No parity error detected <br> $1_{\mathrm{B}}$ : Parity error detected |
| 16 | RHSBjND | New Data <br> $0_{B}$ : No new reception of a fault free frame $1_{\mathrm{B}}$ : New frame received without fault |
| 15 to 12 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |

Table 22.26 RHSBjUDR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 11 to 8 | RHSBjEDF[3:0] | Extended Data Field |
|  |  | 4-bit extended data field of last received frame |
| 7 to 0 | RHSBjDF[7:0] | Data Field |
|  |  | 8-bit data field of last received frame |

The user should not read the RHSBjUDR register when upstream DMA is enabled (RHSBjGC.RHSBjUDE is $1_{B}$ ). Note that reading this register sets RHSBjIS.RHSBjDRF to $0_{\mathrm{B}}$ and sets RHSBjUDi.RHSBjND of channel i to $0_{\mathrm{B}}$. Channel number i is shown by RHSBjUDR.RHSBjLUD.

## New Data Summary (RHSBjUDR.RHSBjNDSi)

These bits indicate the value of RHSBjUDi.RHSBjND from channel $\mathrm{i}(\mathrm{i}=0,1)$.
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjND changes.

## Last Updated Data (RHSBjUDR.RHSBjLUD)

These bits indicate the number of Upstream Data register (RHSBjUDi) where the last data update occurred.
[Changing condition]
This bit is updated when the set condition of one of the RHSBjUDi.RHSBjND bits is fulfilled.

## Data Lost (RHSBjUDR.RHSBjDL)

This bit indicates the value of RHSBjUDi.RHSBjDL from channel i. Channel number $i$ is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjDL (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## Timeout Detected (RHSBjUDR.RHSBjTO)

This bit indicates the value of RHSBjUDi.RHSBjTO from channel i. Channel number i is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjTO (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## Frame Error (RHSBjUDR.RHSBjFERR)

This bit indicates the value of RHSBjUDi.RHSBjFERR from channel $i$. Channel number $i$ is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjFERR (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## Parity Error (RHSBjUDR.RHSBjPERR)

This bit indicates the value of RHSBjUDi.RHSBjPERR from channel $i$. Channel number $i$ is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjPERR (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## New Data (RHSBjUDR.RHSBjND)

This bit indicates the value of RHSBjUDi.RHSBjND from channel i. Channel number i is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjND (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## Extended Data Field (RHSBjUDR.RHSBjEDF)

This bit indicates the value of RHSBjUDi.RHSBjEDF from channel i. Channel number i is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjEDF (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

## Data Field (RHSBjUDR.RHSBjDF)

This bit indicates the value of RHSBjUDi.RHSBjDF from channel $i$. Channel number $i$ is shown by RHSBjUDR.RHSBjLUD.
[Changing condition]
This bit is updated when RHSBjUDR.RHSBjLUD or RHSBjUDi.RHSBjDF (with $\mathrm{i}=$ RHSBjUDR.RHSBjLUD) changes.

### 22.3.5.5 RHSBjUDi — Upstream Data Register $\mathbf{i}(\mathbf{i}=\mathbf{0}, 1)$

Do not clear the RHSBjDL, RHSBjTO, RHSBjFERR, RHSBjPERR, and RHSBjND bits in this register by using a bitmanipulation instruction.

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 22.27 RHSBjUDi Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 20 | RHSBjDL | Data Lost |
|  |  | $\mathrm{O}_{\mathrm{B}}$ : No data loss detected |
|  |  | $1_{\mathrm{B}}$ : Data lost situation detected |
| 19 | RHSBjTO | Timeout Detected |
|  |  | $0_{B}$ : No timeout detected |
|  |  | $1_{\mathrm{B}}$ : Timeout detected |
| 18 | RHSBjFERR | Frame Error |
|  |  | $0_{B}$ : No stop bit error detected |
|  |  | $1_{B}$ : Stop bit error detected |
| 17 | RHSBjPERR | Parity Error |
|  |  | $0_{B}$ : No parity error detected |
|  |  | $1_{\mathrm{B}}$ : Parity error detected |
| 16 | RHSBjND | New Data |
|  |  | $0_{B}$ : No valid data available |
|  |  | $1_{\mathrm{B}}$ : Valid data available |
| 15 to 12 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 11 to 8 | RHSBjEDF[3:0] | Extended Data Field |
|  |  | 4-bit extended data field of received frame |
| 7 to 0 | RHSBjDF[7:0] | Data Field |
|  |  | 8-bit data field of received frame |

## Data Lost (RHSBjUDi.RHSBjDL)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a fault free frame was received on channel i while the RHSBjND bit in this register is $1_{\mathrm{B}}$.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{B}$ when the set condition of ND fulfilled while the ND bit in this register is $1_{B}$.

## Timeout Detected (RHSBjUDi.RHSBjTO)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that there was no valid reception after a command frame transmission based on an upstream data request within the timeout period.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when the timeout counter expires and RHSBjUCS.RHSBjACC is indexing this channel.

## Frame Error (RHSBjUDi.RHSBjFERR)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a frame with stop bit error was received on channel i.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{B}$ after an upstream reception with at least one faulty stop bit.

## Parity Error (RHSBjUDi.RHSBjPERR)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a frame with parity error was received on channel i.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.

## [Setting condition]

This bit is set to $1_{\mathrm{B}}$ after an upstream reception with faulty parity bit.

## New Data (RHSBjUDi.RHSBjND)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that RHSBjUDi.RHSBjEDF and RHSBjUDi.RHSBjDF containing valid data were received on channel i.

## [Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when there is a read access to the RHSBjUDR and RHSBjUDR.RHSBjLUD is indexing this channel.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.

## [Setting condition]

This bit is set to $1_{\mathrm{B}}$ after an upstream reception without parity and without stop bit errors.

## Extended Data Field (RHSBjUDi.RHSBjEDF)

These bits indicate the 4-bit extended data field bits of received message.
When using an 8-bit data format, these bits are undefined.
[Changing condition]
These bits are updated when the set condition of RHSBjND is fulfilled.

## Data Field (RHSBjUDi.RHSBjDF)

These bits indicate the 8 -bit data field of received message.
[Changing condition]
These bits are updated when the set condition of RHSBjND is fulfilled.

### 22.3.5.6 RHSBjUSS — Upstream Status Summary Register

Table 22.28 RHSBjUSS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 28 | RHSBjDL0 | Data Lost |
|  |  | Data lost indication of channel 0 (RHSBjUD0.RHSBjDL). |
| 27 | RHSBjTOO | Timeout Detected |
|  |  | Timeout indication of channel 0 (RHSBjUD0.RHSBjTO). |
| 26 | RHSBjFERR0 | Frame Error |
|  |  | Frame error indication of channel 0 (RHSBjUD0.RHSBjFERR). |
| 25 | RHSBjPERR0 | Parity Error |
|  |  | Parity error indication of channel 0 (RHSBjUD0.RHSBjPERR). |
| 24 | RHSBjND0 | New Data |
|  |  | New data indication of channel 0 (RHSBjUDO.RHSBjND). |
| 23 to 21 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |
| 20 | RHSBjDL1 | Data Lost |
|  |  | Data lost indication of channel 1 (RHSBjUD1.RHSBjDL). |
| 19 | RHSBjTO1 | Timeout Detected |
|  |  | Timeout indication of channel 1 (RHSBjUD1.RHSBjTO). |
| 18 | RHSBjFERR1 | Frame Error |
|  |  | Frame error indication of channel 1 (RHSBjUD1.RHSBjFERR). |
| 17 | RHSBjPERR1 | Parity Error |
|  |  | Parity error indication of channel 1 (RHSBjUD1.RHSBjPERR). |
| 16 | RHSBjND1 | New Data |
|  |  | New data indication of channel 1 (RHSBjUD1.RHSBjND). |
| 15 to 0 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |

## Data Lost (RHSBjUSS.RHSBjDLi)

This bit indicates the value of RHSBjUDi.RHSBjDL from channel i.
$0_{B}$ : No data loss detected
$1_{B}$ : Data loss detected
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjDL changes.

## Timeout Detected (RHSBjUSS.RHSBjTOi)

This bit indicates the value of RHSBjUDi.RHSBjTO from channel i.
$0_{\mathrm{B}}$ : No timeout detected
$1_{\mathrm{B}}$ : Timeout detected
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjTO changes.

## Frame Error (RHSBjUSS.RHSBjFERRi)

This bit indicates the value of RHSBjUDi.RHSBjFERR from channel i.
$0_{\mathrm{B}}$ : No stop bit error detected
$1_{\mathrm{B}}$ : Stop bit error detected
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjFERR changes.

## Parity Error (RHSBjUSS.RHSBjPERRi)

This bit indicates the value of RHSBjUDi.RHSBjPERR from channel i.
$0_{B}$ : No parity error detected
$1_{\mathrm{B}}$ : Parity error detected
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjPERR changes.

## New Data (RHSBjUSS.RHSBjNDi)

This bit indicates the value of RHSBjUDi.RHSBjND from channel i.
$0_{\mathrm{B}}$ : No valid data available
$1_{\mathrm{B}}$ : Valid data available
[Changing condition]
This bit is updated when RHSBjUDi.RHSBjND changes.

### 22.3.6 Interrupt Registers

### 22.3.6.1 RHSBjIC — Interrupt Control Register

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

| 18 | RHSBjCTIE | Command Frame Transmission Done Interrupt Enable |
|  |  | $0_{B}$ : Disabled |
|  |  | $1_{\mathrm{B}}$ : Enabled |
| 17 | RHSBjDTIE | Data Frame Transmission Done Interrupt Enable |
|  |  | $0_{B}$ : Disabled |
|  |  | $1_{\mathrm{B}}$ : Enabled |
| 16 | RHSBjDTSIE | Data Frame Transmission Started Interrupt Enable |
|  |  | $0_{\mathrm{B}}$ : Disabled |
|  |  | 1 B : Enabled |
| 15 to 0 | - | Reserved. |
|  |  | These bits are always read as 0 . The write value should be always 0 . |

## Data Lost Interrupt Enable (RHSBjIC.RHSBjDLIE)

While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjDLF is $1_{\mathrm{B}}$.

## Timeout Detected Interrupt Enable (RHSBjIC.RHSBjTOIE)

While this bit is $1_{B}$, an interrupt will be generated if RHSBjIS.RHSBjTOF is $1_{B}$.

## Upstream Error Interrupt Enable (RHSBjIC.RHSBjUEIE)

While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjUEF is $1_{\mathrm{B}}$.

## Data Received Interrupt Enable (RHSBjIC.RHSBjDRIE)

The user should not set this bit to $1_{\mathrm{B}}$ when the upstream DMA support is enabled (RHSBjGC.RHSBjUDE is $1_{\mathrm{B}}$ ).
While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjDRF is $1_{\mathrm{B}}$.

## Transmission Started Interrupt Enable (RHSBjIC.RHSBjTSIE)

While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjTSF is $1_{\mathrm{B}}$.

## Emergency Frame Transmission Done Interrupt Enable (RHSBjIC.RHSBjETIE)

While this bit is $1_{B}$, an interrupt will be generated if RHSBjIS.RHSBjETF is $1_{B}$.

## Command Frame Transmission Done Interrupt Enable (RHSBjIC.RHSBjCTIE)

The user should not set this bit to $1_{\mathrm{B}}$ when downstream command DMA transfer is enabled (RHSBjGC.RHSBjDCDE is $1_{B}$ ).

While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjCTF is $1_{\mathrm{B}}$.

## Data Frame Transmission Done Interrupt Enable (RHSBjIC.RHSBjDTIE)

While this bit is $1_{\mathrm{B}}$, an interrupt will be generated if RHSBjIS.RHSBjDTF is $1_{\mathrm{B}}$.

## Data Frame Transmission Started Interrupt Enable (RHSBjIC.RHSBjDTSIE)

The user should not set this bit to $1_{B}$ when the downstream data DMA support is enabled (RHSBjGC.RHSBjDDE is $\left.1_{B}\right)$.

While this bit is $1_{B}$, an interrupt will be generated if RHSBjIS.RHSBjDTSF is $1_{B}$.

### 22.3.6.2 RHSBjIS — Interrupt Status Register

Do not clear the bits in this register by using a bit-manipulation instruction.

Table 22.30 RHSBjIS Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 27 | RHSBjDLF | Data Lost Flag <br> $0_{B}$ : No data loss detected <br> $1_{\mathrm{B}}$ : Data loss detected |
| 26 | RHSBjTOF | Timeout Detected Flag <br> $0_{\mathrm{B}}$ : No timeout detected <br> $1_{\mathrm{B}}$ : Timeout detected |
| 25 | RHSBjUEF | Upstream Error Flag <br> $0_{B}$ : No receive error detected <br> $1_{\mathrm{B}}$ : Receive error detected |
| 24 | RHSBjDRF | Data Received Flag <br> $0_{B}$ : No reception of new valid data <br> $1_{\mathrm{B}}$ : Reception of new valid data |
| 23 to 21 | - | Reserved. <br> These bits are always read as 0 . The write value should be always 0 . |
| 20 | RHSBjTSF | Transmission Started Flag <br> $0_{\mathrm{B}}$ : No transmission started <br> $1_{\mathrm{B}}$ : Transmission has been started |
| 19 | RHSBjETF | Emergency Frame Transmission Done Flag <br> $0_{B}$ : No emergency transmission <br> $1_{\mathrm{B}}$ : Emergency frame has been transmitted |
| 18 | RHSBjCTF | Command Frame Transmission Done Flag <br> $0_{\mathrm{B}}$ : No command frame transmission <br> $1_{\mathrm{B}}$ : Command frame has been transmitted |
| 17 | RHSBjDTF | Data Frame Transmission Done Flag <br> $0_{B}$ : No data frame transmission <br> $1_{\mathrm{B}}$ : Data frame has been transmitted |
| 16 | RHSBjDTSF | Data Frame Transmission Started Flag <br> $0_{B}$ : No data transmission has been started <br> $1_{\mathrm{B}}$ : Data transmission has been started |

Table 22.30 RHSBjIS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 9 | - | Reserved. |
|  |  | These bits are always read as 0. The write value should be always 0. |
| 8 | RHSBjERF | Emergency Signal Rising Flag |
|  |  | $0_{B}$ : No edge detected |
|  | $1_{B}$ : Edge detected |  |
| 7 to 0 | - | Reserved. |
|  |  | These bits are always read as 0. The write value should be always 0. |

## Data Lost Flag (RHSBjIS.RHSBjDLF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that data lost has been detected on at least one channel.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when all RHSBjUDi.RHSBjDL $(\mathrm{i}=0,1)$ flags are $0_{\mathrm{B}}$.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{B}$ when the set condition of at least one of these flags (RHSBjUDi.RHSBjDL with $\left.i=0,1\right)$ is fulfilled.

## Timeout Detected Flag (RHSBjIS.RHSBjTOF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that there was no valid reception requested by a command frame transmission within the timeout period.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when the timeout counter expires.

## Upstream Error Flag (RHSBjIS.RHSBjUEF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a frame with parity or stop bit error was received.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when all RHSBjUDi.RHSBjFERR $(\mathrm{i}=0,1)$ and all RHSBjUDi.RHSBjPERR $(\mathrm{i}=0,1)$ flags are $0_{\mathrm{B}}$.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting conditions]
- This bit is set to $1_{B}$ when the set condition of at least one of these flags (RHSBjUDi.RHSBjFERR with $\mathrm{i}=0,1$ ) is fulfilled.
- This bit is set to $1_{B}$ when the set condition of at least one of these flags (RHSBjUDi.RHSBjPERR with $i=0,1$ ) is fulfilled.

## Data Received Flag (RHSBjIS.RHSBjDRF)

The user can only write $0_{\mathrm{B}}$ to this bit.
The user should not set this bit to $0_{\mathrm{B}}$ when upstream DMA is enabled (RHSBjGC.RHSBjUDE is $1_{\mathrm{B}}$ ).
This bit indicates that at least one RHSBjUDi register is updated with new valid data.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when all RHSBjUDi.RHSBjND $(\mathrm{i}=0,1)$ flag are $0_{\mathrm{B}}$.
- This bit is set to $0_{\mathrm{B}}$ when there is a read access to RHSBjUDR.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{B}$ when the set condition of at least one of these flags (RHSBjUDi.RHSBjND with $\left.i=0,1\right)$ is fulfilled.

## Transmission Started Flag (RHSBjIS.RHSBjTSF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a command or data frame transmission has been started.
[Clearing condition]
This bit is set to $0_{B}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when a new frame transmission starts.

## Emergency Frame Transmission Done Flag (RHSBjIS.RHSBjETF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that a data frame assembled under emergency condition has been transmitted.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when an emergency frame has been transmitted.

## Command Frame Transmission Done Flag (RHSBjIS.RHSBjCTF)

The user can only write $0_{\mathrm{B}}$ to this bit.
The user should not set this bit to $0_{\mathrm{B}}$ when downstream command DMA transfer is enabled (RHSBjGC.RHSBjDCDE is $1_{B}$ ).

This bit indicates that a command frame has been transmitted.
[Clearing conditions]

- This bit is set to $0_{B}$ when a new command frame transmission is requested.
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when a command frame has been transmitted.

## Data Frame Transmission Done Flag (RHSBjIS.RHSBjDTF)

The user can only write $0_{B}$ to this bit.
This bit indicates that a data frame has been transmitted.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when the last active portions of the downstream data registers (RHSBjDDRi) are written (see Section 22.5.1.10, Data Update and Data Frame Transmission Request).
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting condition]
This bit is set to $1_{\mathrm{B}}$ when a data frame has been transmitted.

## Data Frame Transmission Started Flag (RHSBjIS.RHSBjDTSF)

The user can only write $0_{\mathrm{B}}$ to this bit
The user should not set this bit to $0_{\mathrm{B}}$ when downstream data DMA is enabled (RHSBjGC.RHSBjDDE is $1_{\mathrm{B}}$ ).
This bit indicates that a data frame transmission has been started.
When this bit is $0_{\mathrm{B}}$, data frame transmission is disabled or the downstream data registers (RHSBjDDRi) contain pending transmit data.

When this bit is $1_{\mathrm{B}}$, data frame transmission has been started. The downstream data registers can be updated to define the data for the next data frame.
[Clearing conditions]

- This bit is set to $0_{\mathrm{B}}$ when last active portions of the downstream data registers (RHSBjDDRi) are written (seeSection 22.5.1.10, Data Update and Data Frame Transmission Request).
- This bit is set to $0_{\mathrm{B}}$ when data frame transmission gets disabled (RHSBjDTC.RHSBjDTE changes from $1_{\mathrm{B}}$ to $0_{\mathrm{B}}$ ).
- This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting conditions]
- This bit is set to $1_{\mathrm{B}}$ when a data frame transmission starts.
- This bit is set to $1_{\mathrm{B}}$ when data frame transmission gets enabled (RHSBjDTC.RHSBjDTE changes from $0_{\mathrm{B}}$ to $1_{\mathrm{B}}$ ) and RHSBjDCR.RHSBjDMS is $01_{\mathrm{B}}$ (TRIGGERED).

## Emergency Signal Rising Flag (RHSBjIS.RHSBjERF)

The user can only write $0_{\mathrm{B}}$ to this bit.
This bit indicates that an edge to the active level of the external emergency signal (RHSBjEMRG $(\mathrm{j}=0,1)$ ) has been detected.
[Clearing condition]
This bit is set to $0_{\mathrm{B}}$ when entering the CONFIG state.
[Setting conditions]

- This bit is set to $1_{\mathrm{B}}$ when a transition from inactive to active level of the emergency signal has been detected while RHSBjGC.RHSBjOPS is ACTIVE or TEST.
- This bit is set to $1_{\mathrm{B}}$ when there is an active level of the emergency signal when leaving the CONFIG state.

### 22.4 Operation

After the release of MCU's hardware reset, the RHSB module is in RESET state. The user can trigger changes of the operation state by writing the target state to RHSBjGC.RHSBjOPS.
The current operation state is indicated by RHSBjGC.RHSBjOPS.

Figure 22.2 Module State Transitions

Figure 22.2 illustrates the implemented operation states and the possible state transitions. The RESET state can be entered from all operation states (TEST, CONFIG, ACTIVE).

### 22.4.1 Operation Description

### 22.4.1.1 RESET State

The RESET state is considered as the power down and reset state of the RHSB module. All internal clocks are stopped to reduce the power consumption. All configuration, control and status registers are reset.
The user can only write to RHSBjGC.RHSBjOPS to leave the RESET state. All other registers are reset and writing to these registers does not have any effect.

### 22.4.1.2 CONFIG State

In the CONFIG state, the user has write access to all registers to define the module configuration.

### 22.4.1.3 ACTIVE State

In the ACTIVE state, the RHSB module is able to perform up- and downstream communication.
Upstream communication can only be used in ACTIVE state when this function is enabled by RHSBjUCR.RHSBjUE.
Downstream communication can be individually enabled and disabled during ACTIVE and TEST state in the RHSBjDTC register.

### 22.4.1.4 TEST State

The TEST state is intended to support key-on testing and fault localization. By looping back the downstream data to the upstream channel, the RHSB internal data paths can be checked.

See Section 22.5.4, Test Mode Operation for details and restrictions of this mode.

### 22.4.2 Activation of the RHSB Module (Leaving RESET State)

This flow should be used to leave the RESET state. The flow assumes that the peripheral bus clock and the RHSB engine clock are already enabled.

Figure 22.3 Software Flow to Leave RESET State

Note that the port function and direction registers of the MCU need to be configured before the RHSB module can perform active operation. To prevent invalid levels on the downstream chip select lines, it is recommended to define the correct active level for these lines before setting the MCU pin functions to the RHSB.

### 22.4.3 Deactivation of the RHSB Module (Entering RESET State)

This flow should be used to enter the RESET state. Once this flow is executed, the peripheral bus clock and the RHSB engine clock can be disabled and the functions of the MCU ports can be changed.

Figure 22.4 Software Flow to Enter RESET State

If the module enters the RESET state, ongoing transmission is aborted, ongoing reception is lost and the RHSB output lines are changed to their reset levels.

Note that when using the flow mentioned in Figure 22.5, it is possible to enter RESET state without influencing an ongoing transmission.

### 22.4.4 Changing between Operation States (ACTIVE, CONFIG, TEST)

Changing the operation state of the RHSB module is triggered by writing the target state to RHSBjGC.RHSBjOPS. The successful processing of the state transition is observable in RHSBjGC.RHSBjOPS.

### 22.4.5 Leaving ACTIVE State without Interrupting Ongoing Transmission

When the ACTIVE state is left, any ongoing transmissions are aborted. This may result in invalid reception on the downstream receiver side (slave).

Using this flow, interruption of an ongoing transmission can be prevented when changing the operation state to CONFIG or RESET.

Figure 22.5 Software Flow to Leave ACTIVE/TEST State without Interruption of Ongoing Transmissions

The same flow can be used to leave the TEST state.

### 22.5 Operating Procedures

### 22.5.1 Downstream Communication

The RHSB module uses synchronous serial transmission for downstream communication.
In addition to the synchronous serial frame, the downstream communication defines a set of communication phases to serve up to two slaves by one frame and to define a repetition period for cyclic transmission.

There are different modes and configuration parameters available to schedule the downstream communication according the application requirements. This downstream configuration is defined by the registers described in Section

### 22.3.4, Downstream (Tx) Registers.

The diagram in Figure 22.6 illustrates the functional blocks of the downstream engine. Downstream communication is explained in detail in this section.

This block indicates the downstream related configuration parameters and the downstream control interface handled by the application software.

## Downstream Control:

This block provides the main function of the downstream engine. It schedules the transmission, controls the frame assembling, generates the downstream communication signals (RHS-BjFCLP/RHSBjFCLN ( $j=0,1$ ), RHSBjCSD0-1 $(\mathrm{j}=0,1)$ ) and triggers the downstream related status flags in the RHSBjIS register.

## Serialize:

The serialization block captures the assembled data at frame start and provides the downstream phase related information to the serial data line (RHSBjSOP/RHSBjSON $(\mathrm{j}=0,1)$ ) of the downstream interface.

## Assembling:

This multiplexing logic selects the data source for each data bit.

Figure 22.6 Block Diagram of Downstream Configuration

### 22.5.1.1 Downstream Communication Phases

The downstream communication is composed of different phases.
These phases are used by the RHSB module.

- Active phases:
- Assertion phase:

The serial data line is invalid This optional phase allows the selected slave to get prepared for the content phase.

- Content phase:

The serial data line is valid during this phase content is transmitted to the selected slave.

- Deassertion phase:

The serial data line is invalid Optional phase after content is transmitted to the selected slave.

- Passive phases:
- Frame passive phase:

This phase is part of each frame and defines a minimum time of inactivation before the next frame starts.

- Inter-frame passive phase:

This phase describes the time, where no frame is transmitted (bus is idle).
An inter-frame passive phase occurs, depending on the downstream mode and the downstream configuration.

A frame consists of the active phases and the frame passive phase.
Figure 22.7 illustrates the phases of downstream communication. The frame shown in this figure addresses one slave (slave 0 ). The mode dependent clock during the passive phases is shown by dotted lines. All phases, including the optional ones, are shown in the ordering used for transmission.

Figure 22.8 illustrates the phases of downstream communication of a frame addressing two slaves (slave 0 and slave 1). The optional assertion and deassertion phases are individually configurable for each slave.

In Figure 22.7 and Figure 22.8, the select signal of the slaves are configured as active high; the clock line phase is set to rising edge.

Figure 22.7 Downstream Communication Phases

Note: $\quad j=0,1$

Figure 22.8 Downstream Communication Phases of a Frame Addressing Two Slaves

For evaluation purposes, the user can monitor the communication phases by reading RHSBjMSR. Note that this function is not available for all downstream bit rates.

### 22.5.1.2 Frame Dependent Flagging

Figure 22.9 illustrates the RHSB internal processing flow of command and data frame transmission. The scheduling when a command or data frame is transmitted is mode dependent and explained in Section 22.5.1.3, Downstream Modes.

The flows described in Figure 22.8 are used as macros in the mode description of Section 22.5.1.3, Downstream Modes.

Figure 22.9 Internal Transmission Processing of Command and Data Frames

The flagging related to command and data frame transmission is illustrated in Figure 22.10. A gray background illustrates values that depend on previous user interaction but have no influence on the transmission.

In triggered mode, RHSBjIS.RHSBjDTSF is always $0_{\mathrm{B}}$ immediately before a data frame transmission starts. In other modes, the value can be $0_{B}$ or $1_{B}$.

The timing marks A to F refer to the marks in Figure 22.9.

Figure 22.10 Command and Data Frame Related Flagging

When an emergency frame is transmitted, the RHSBjIS.RHSBjETF is rising at the same time as RHSBjIS.RHSBjDTF (timing F).

### 22.5.1.3 Downstream Modes

The RHSB module supports different downstream transmission modes that can be selected during CONFIG state.
These modes are available and can be configured in RHSBjDCR.RHSBjDMS:

- Triggered mode

The RHSB module starts downstream communication immediately on user request (software triggered).

- Single-period repetition mode

The RHSB module starts downstream communication in a defined repetition period. The cyclic transmission is independent from user interaction.

- Multi-period repetition mode

The RHSB module starts downstream communication in two defined repetition periods. The cyclic transmission is independent from user interaction.

In all modes, transmission of data frames is only possible when the data transmission is enabled by setting RHSBjDTC.RHSBjDTE to $1_{\mathrm{B}}$.

Except in triggered mode, it is recommended to initialize the downstream data registers with valid data before enabling data transmission because a data frame transmission is immediately started when RHSBjDTC.RHSBjDTE changes from $0_{B}$ to $1_{B}$.

The RHSB module is able to transmit command frames independent from the downstream mode and regardless of whether data transmission is enabled.

## (1) Triggered Mode

In this mode, transmission of data frames is triggered by the user. Each trigger starts the transmission of one data frame. There is no repetition period defined for this mode, the transmission is controlled by the software execution timing.

These configuration parameters are ignored in triggered mode:

- Command frame insertion mode (RHSBjDCR.RHSBjCIM)
- Command frame transmission delay (RHSBjDCR.RHSBjCTD)
- Repetition period length (RHSBjDCR.RHSBjREP)

A data frame transmission is triggered when RHSBjIS.RHSBjDTSF is $0_{\mathrm{B}}$. This bit can be cleared by writing $0_{\mathrm{B}}$ to RHSBjIS.RHSBjDTSF (keep data unchanged) or by updating the downstream data registers (RHSBjDDRi). See
Section 22.5.1.10, Data Update and Data Frame Transmission Request for details about data update and data frame transmission request.

The flow shown in Figure 22.11 assumes that the RHSB module is in triggered mode and that the data transmission is enabled.

The details about command and data frame transmission (colored ovals) are shown in Figure 22.9.
The flow is started when the following configuration is applied:

- RHSBjGC.RHSBjOPS is ACTIVE
- RHSBjDCR.RHSBjDMS is triggered
- RHSBjDTC.RHSBjDTE is $1_{B}$

The flow is immediately aborted when the RHSB module leaves the ACTIVE state.

Figure 22.11 Internal Transmission Processing in Triggered Mode when Data Transmission is Enabled

Figure 22.12 illustrates the downstream communication in case of concurrent command and data frame transmission requests. If there is a pending request when a frame transmission ends, the next frame is transmitted immediately.

Figure 22.12 Example of Concurrent Command/Data Transmission Requests in Triggered Mode

## (a) Command Frame Transmission in Triggered Mode

Command frame transmission has higher priority than data frame transmission as shown in the transmission processing figure. The user needs to schedule data and command frame transmission to be consistent with the requirements of the application.

When the data transmission is disabled (RHSBjDTC.RHSBjDTE $=0_{\mathrm{B}}$ ) a command frame is immediately transmitted when the request is pending. This command frame transmission is not controlled by the internal transmission processing as shown in Figure 22.11.

## (2) Repetition Mode (Single-Period Repetition, Multi-Period Repetition)

In this mode transmission of data frames is done periodically.
A periodical time tick defines the repetition period of the cyclic data transmission.
The fixed repetition period used in this mode is controlled by the RHSB module.
Using RHSBjDTC.RHSBjDTE and RHSBjDTC.RHSBjTSR, the user can start and stop the cyclic data transmission in repetition mode. The RHSB module ensures that disabling of data transmission will not interrupt an ongoing transmission.

In repetition mode, the trigger of data frame transmission is independent from RHSBjIS.RHSBjDTSF.
However the values from the downstream data registers (RHSBjDDRi) are used to assemble the transmission data.

## (a) Repetition Period Definition

The repetition period is defined by RHSBjDCR.RHSBjREP. The minimum repetition period should be at least the data frame length.

When the repetition period is bigger than the data frame length, there is an inter-frame passive phase between two data frames as illustrated in Figure 22.13.

Figure 22.13 Transmission Timing in Repetition Mode

The length of a data frame can be calculated as the sum of these configuration parameters:

- Assertion phase length (RHSBjSDCi.RHSBjAPLn) of all addressed slaves
- Data frame selection bit (RHSBjSDCi.RHSBjCPSn) of all addressed slaves
- Deassertion phase length (RHSBjSDCi.RHSBjDPLn) of all addressed slaves
- Number of data bits (RHSBjDEC.RHSBjNDBm) of all used DFTEs (RHSBjDCR.RHSBjSLS and RHSBjDCR1.RHSBj.SLS1 (multi-period repetition mode))
- Data frame passive phase length (RHSBjDCR.RHSBjDFP)

The user should not configure a repetition period (RHSBjDCR.RHSBjREP) less than 8 peripheral bus clock cycles. As example: With a typical peripheral bus clock (CLK_LSB) frequency of 40 MHz , this results in a minimal repetition period of $0.2 \mu \mathrm{~s}$.

The transmission period count in single-period repetition mode holds "period 0 " and that in multi-period repetition mode toggles between "period 0 " and "period 1" repeatedly as illustrated in Figure 22.13.

The sequence length in single-period repetition mode is defined by RHSBjDCR.RHSBjSLS for period 0 . The sequence length in multi-period repetition mode is defined by RHSBjDCR.RHSBjSLS for period 0 and RHSBjDCR1.RHSBjSLS1 for period 1.

## (b) Command Frame Transmission

Command frame transmission has higher priority than data frame transmission. Depending on configuration parameter RHSBjDCR.RHSBjCTD, transmission of consecutive command frames can be prevented.

Different command frame insertion methods are available. They differ in the strategy for the case when a command frame is transmitted and how data transmission is affected by command frame insertion. All insertion methods (controlled by RHSBjDCR.RHSBjCIM) are explained in detail in Section 22.5.1.3(3), Command Frame Insertion Methods in Single-Period Repetition Mode.

## (3) Command Frame Insertion Methods in Single-Period Repetition Mode

In single-period repetition mode, a request for command transmission comes asynchronously with respect to the repetition period. The RHSB module supports different strategies controlled by RHSBjDCR.RHSBjCIM, on how to insert command frames into the repetition schedule.

If data transmission is disabled (RHSBjDTC.RHSBjDTE is $0_{B}$ ), a command frame is immediately transmitted when the request is pending. In addition, the restriction about consecutive command frames (RHSBjDCR.RHSBjCTD is $1_{B}$ ) is ignored.

## (a) Time-Slot Method

When this method is selected, the RHSB module processes command and data frames aligned to the time ticks. The command frames substitute data frames within the repetition period.

Figure 22.14 Examples of Command Insertion Using Time-Slot Method

## (b) Immediate Method

When this method is selected, the RHSB module processes a command frame transmission request as soon as possible (immediately during inter-frame passive phase or when a data frame ends). The command frame transmission is not aligned to the repetition period.
If a data frame transmission cannot be started at the origin time tick because a command frame has broken the repetition period, the data transmission is processed as soon as possible. The repetition period is re-adjusted.

Figure 22.15 Examples of Command Insertion Using Immediate Method

It is possible to insert more than one command frame between two data frames if this is allowed from the configuration. Also in this case a re-adjust of the repetition period happens if a command frame breaks the repetition period.

## (c) Best-Effort Method

When this method is selected, the RHSB module starts command frame transmission only

- At the end of a data frame transmission or
- When the command frame transmission will end within the inter-frame passive phase.

The repetition time grid is not adjusted when using the best-effort insertion method.
If the command frame is shorter than or equal to the inter-frame passive phase, command frame transmission has no influence on the data frame transmission (see case B) in Figure 22.16). If possible from configuration, more than one command frame can be transmitted during the repetition period.

If the command frame is longer than the inter-frame passive phase, command frame transmission influences the data frame transmission (see case C) in Figure 22.16). The data transmission is processed as soon as possible.

If a data frame transmission is influenced by another data frame (shifted by command frame transmission), the data frame is not processed (see case D) in Figure 22.16).

Figure 22.16 Examples of Command Insertion Using Best-Effort Method

### 22.5.1.4 Command Frame Insertion Methods in Multi-Period Repetition Mode

In Multi-Period repetition mode, a request for command transmission comes asynchronously with respect to the repetition period.

## (1) Best-Effort Method

Multi-Period repetition mode supports only Best-effort method. When this method is selected, the RHSB module starts command frame transmission only

- At the end of a data frame transmission in period 1.

The repetition time grid is not adjusted when using the best-effort insertion method.
If the command frame is shorter than or equal to the inter-frame passive phase in period 1 , command frame transmission has no influence on the data frame transmission (see cases B), C), D), E), F) and G) in Figure 22.17). If possible from configuration, more than one command frame can be transmitted during the repetition period.

If the command frame is longer than the inter-frame passive phase, command frame transmission influences the data frame transmission (see case H) in Figure 22.17). The transferred command and data are not guaranteed.

If a data frame transmission is influenced by another data frame (shifted by command frame transmission), the data frame is not processed (see case I) in Figure 22.17). The transferred command and data are not guaranteed.

The processing of the best-effort method is also mentioned in transmission processing flows as shown in Figure 22.17.

Note: Case $A$ ) shows a schedule with no command requests.
Cases $B, C$, and $D$ ) show command frame insertion when a command request comes in period 0 . The command frame is shifted after the end of data frame in period 1.
Case E) shows command frame insertion when a command request comes at a data frame in period 1. The command frame is shifted after the end of data frame in period 1.
Case F) shows command frame insertion when a command request comes at an inter-frame passive phase and
the command length is shorter than the rest of the inter-frame passive length.
Case G) shows command frame insertion when a command request comes at an inter-frame passive phase and the command length is longer than the rest of the inter-frame passive length.
Cases H) and I) show command frame insertion where the command frame length is longer than the inter-frame passive length. This setting is prohibited. Transferred data after the command frame are not guaranteed until the user writes RHSBjDTC.RHSBjTSR to 1B.

Figure 22.17 Examples of Command Insertion Using Best-Effort Method in Multi-Period Repetition Mode

### 22.5.1.5 Physical Frame Format

## (1) Clock Line

The serial clock line (RHSBjFCLP/RHSBjFCLN $(\mathrm{j}=0,1)$ ) provides the timing information from the MSC master to the MSC slave modules. The clock line and the clock phase are common for all slaves.

The user can configure by setting RHSBjDCR.RHSBjCLP whether the serial data line (RHSBjSOP/RHSBjSON ( $\mathrm{j}=0$, $1)$ ) and the chip select lines (RHSBjCSD0-1 $(\mathrm{j}=0,1)$ ) are changing their values with rising edge or falling edge of the serial clock line ( $\mathrm{RHSBjFCLP} / \mathrm{RHSBjFCLN}(\mathrm{j}=0,1)$ ).

Note that RHSBjDCR.RHSBjCLP is directly influencing the level on the serial clock line (RHSBjFCLP/RHSBjFCLN $(j=0,1)$ ).

The user is able to configure the serial clock activity by RHSBjDCR.RHSBjCAC anytime. The RHSB module guarantees a glitch free clock signal on the serial clock line (RHSBjFCLP/RHSBjFCLN $(\mathrm{j}=0,1)$ ).
The configuration given by RHSBjDCR.RHSBjCAC is not affecting the clock activity during the active phases; for proper downstream communication, the clock is required during active phases. RHSBjDCR.RHSBjCAC only affects clock activity during the passive phases; for downstream communication, the clock is not required during passive phases.

An active serial clock line may be required in some applications by a connected slave (e.g. if a slave uses the downstream clock to handle the upstream communication).

## (2) Individual Slave Configuration

For each slave, the user can independently program in CONFIG state:

- The active level of the chip select line (RHSBjSDCi.RHSBjCSLPn)
- The active level of the serial data line (RHSBjSDCi.RHSBjSOLPn)
- The assertion phase length (RHSBjSDCi.RHSBjAPLn)
- The deassertion phase length (RHSBjSDCi.RHSBjDPLn)
- The presence of a selection bit in data frames (RHSBjSDCi.RHSBjCPSn)

Note that the active level configuration for the chip select lines is directly visible at the outputs of the RHSB module.

## (3) Downstream Frame Encoding

The selection bit is $0_{\mathrm{B}}$ for data frames and $1_{\mathrm{B}}$ for command frames.
The serial data line (RHSBjSOP/RHSBjSON $(j=0,1)$ ) is specified as 'invalid' for the assertion and deassertion phases; the RHSB module is transmitting $1_{B}$ during these phases. Note that the level on the serial data line depends on the individual slave configuration (RHSBjSDCi.RHSBjSOLPn).

An enabled inversion of the serial data line happens as long as slave n is selected.
The inversion of the serial data line is only configurable for active phases; the RHSB module sets serial data line (RHSBjSOP/RHSBjSON $(\mathrm{j}=0,1)$ ) to high level during passive phases independent from RHSBjSDCi.RHSBjSOLPn.

Figure 22.18 illustrates a data frame encoding in the case of two slaves with active high chip select lines. The frame transmits a data word of 3 bits (value is $03_{\mathrm{H}}$ ) to slave 0 and to slave 1 . The configuration of both slaves is identical except that the data line for slave 1 is inverted.

Figure 22.18 Frame Encoding Example

The RHSB module assembles the downstream frame directly before the transmission starts (as marked in Figure
22.18). This assembling timing is independent from the downstream mode (RHSBjDCR.RHSBjDMS) and the frame type (command/data frame).

### 22.5.1.6 Data Frame Assembling

A data frame is a stream of un-correlated bits sent to up to 2 slaves. There is an individual chip select line for each slave indicating which content is for which slave. Two chip select signals are not simultaneously active. Only one chip select signal can be activated at a time.

A data frame is composed by up to 4 downstream frame transmission elements (DFTEs).
The number of DFTEs used is defined by RHSBjDCR.RHSBjSLS.
For each DFTE, the user can configure:

- The slave assigned to (RHSBjDEC.RHSBjSSDm)
- Presence of an optional selection bit in each content phase (RHSBjSDCi.RHSBjCPSn)
- The number of used data bits (RHSBjDEC.RHSBjNDBm)

If a slave needs more than one DFTE, the user should assign consecutive DFTEs to the same slave. These DFTEs are combined into one content phase.

Note that it is possible to assign nonconsecutive DFTEs to the same slave (e.g. DFTE0 and DFTE2); in this case, each DFTE defines its own content phase.

The DFTEs are always placed in ascending order inside a data frame. Because the DFTE/slave assignment is freely configurable, the ordering of slave selection is not restricted by the fixed DFTE order.

## (1) Data Source Configuration

For each bit of a DFTE the user can configure independently the data source by setting RHSBjDEBAm.RHSBjDSSn as:

- Timer input (tmr)
- Timer input inverted
- Downstream data register

The relation between DFTEs and the data sources is shown in Table 22.31. The diagram in Figure 22.19 illustrates this relation for one bit and includes the emergency case.
For details about the mapping of timer inputs see Section 22.6, Cross Bar (XBAR).
Table 22.31 Relation of DFTEs and Data Sources

|  | Timer Input | Data Input | Bit Assignment | Emergency Data | Emergency Enable |
| :--- | :--- | :--- | :--- | :--- | :--- |
| DFTE0[15:0] | $\operatorname{tmr}[15: 0]$ | DDR0[31:16] | DEBA0[31:0] | DED0[31:16] | EBE0[31:16] |
| DFTE1[15:0] | $\operatorname{tmr[31:16]~}$ | DDR0[15:0] | DEBA1[31:0] | DED0[15:0] | EBE0[15:0] |
| DFTE2[15:0] | $\operatorname{tmr[47:32]~}$ | DDR1[31:16] | DEBA2[31:0] | DED1[31:16] | EBE1[31:16] |
| DFTE3[15:0] | $\operatorname{tmr[63:48]~}$ | DDR1[15:0] | DEBA3[31:0] | DED1[15:0] | EBE1[15:0] |

Figure 22.19 Data Source Selection for One Bit of a DFTE

The 'transmission bit n' signal in Figure 22.19 indicates the value of bit n . This signal is used by the RHSB module to assemble the content of a data frame when starting the data frame transmission.

## (2) Data Frame DFTE Mapping

Table 22.32 shows all possible configurations of data bits available for each slave depending on the number of used slaves. The slaves are named A to D to illustrate that there is no dependency between the DFTEs and slave number. If there is a range of assigned DFTEs given, these DFTEs have to be consecutive.

Table 22.32 Combinations of DFTEs and Data Bits Assignments to Slaves

| Number of Slaves | Slave A Bits | Slave B Bits | Slave C Bits | Slave D Bits | DFTE Assignment |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 slave (A) | 1 to 64 | - | - | - | 1 to 4 DFTEs to slave A |
| 2 slaves (A, B) | 1 to 48 | 1 to 16 | - | 1 to 3 DFTEs to slave A |  |
|  |  |  | 1 to 32 | - | - |
| 2 slaves (A, B) | 1 to 32 |  |  | 1 to 2 DFTEs to slave A |  |
|  |  |  |  | 1 to 2 DFTEs to slave $B$ |  |

Figure 22.20 shows an example of a downstream frame to be transmitted to slave A assembled from DFTE1 and DFTE2. The slave device A is configured in RHSBjSDCi register as: $\mathrm{RHSBjAPLn}=1, \operatorname{RHSBjCSLPn}=0$, RHSBjSOLPn $=0$, RHSBjCPSn $=1$, RHSBjDPLn $=1$ (active high, assertion and deassertion phase of $1_{D}$ bit, selection bit is present). For DFTE1, 3 data bits are configured (RHSBjDEC.RHSBjNDB1 = 2), and for DFTE2, 13 data bits are configured (RHSBjDEC.RHSBjNDB2 $=12$ ).

Figure 22.20 Example Bit Mapping when Combining Two DFTEs

### 22.5.1.7 Command Frame Assembling

The command frame is a stream of correlated bits sent to one slave. There is only one content phase available in a command frame.

The content phase of a command frame always contains a selection bit.
The number of data bits that are sent in the content phase from the RHSBjDCD register is configurable from 1 to 32 bits. This number can be changed individually for each command frame transmission by RHSBjDTC.RHSBjNCB.

The frame passive phase of command frames is fixed to $2_{D}$ bits.
The length of assertion and deassertion phase depends on the slave device configuration in RHSBjSDCi register as used for data frames.

Figure 22.21 shows an example of a command frame with 5 bits (RHSBjDTC.RHSBjNCB $=4$ ) to be transmitted to slave A. The slave device A is configured in RHSBjSDCi register as: $\mathrm{RHSBjAPLn}=1, \operatorname{RHSBjCSLPn}=0$, RHSBjSOLPn $=0$, RHSBjDPLn $=1$ (active high, assertion and deassertion phase of $1_{\text {D }}$ bit).

Figure 22.21 Command Frame Bit Mapping

### 22.5.1.8 Emergency Function

The emergency function of the RHSB modules supports an automatic transmission of pre-defined data to slaves in case of emergency. The emergency function controls only the content of data frames; the scheduling of data transmission is not affected.

The external emergency signal (RHSBjEMRG $(\mathrm{j}=0,1)$ ) which is available as primary input pin of the MCU, is evaluated to derive the emergency condition.

The emergency function can be globally enabled/disabled using RHSBjDCR.RHSBjEE. Additionally, the user can individually select via RHSBjEBEi.RHSBjEBE for each bit of each DFTE if there should be any action taken in an emergency case.

When the RHSB module detects the emergency condition, the data source of the selected DFTE bits is forced to the corresponding value defined in the downstream emergency data registers (RHSBjDEDi). This selection is illustrated in Figure 22.17.

To use the emergency function, the user should:

- Configure the active level of the emergency signal (RHSBjDCR.RHSBjEIP).
- Configure the mode indicating how the emergency condition is derived from the emergency signal (RHSBjDCR.RHSBjEIM).
- Enable the emergency function and define the usage of automatic stop capability (RHSBjDCR.RHSBjEE).
- Select the action in an emergency case for the individual DFTE bits (RHSBjEBEi.RHSBjEBE).
- Define the emergency data for the individual DFTE bits (RHSBjDEDi.RHSBjEB).

Figure 22.22 illustrates how the emergency condition (internal emergency signal) is derived from the level of the external emergency signal (RHSBjEMRG $(\mathrm{j}=0,1)$ ). The RHSB module requires stable levels on the external emergency signal that are longer than three peripheral bus clock cycles (CLK_LSB).

Figure 22.22 Detection of Emergency Condition

The RHSB module uses the internal emergency signal when assembling a data frame. To transmit an emergency frame the internal emergency signal has to be active at assembling time (when the data frame starts).

Even if the emergency function is not used (RHSBjDCR.RHSBjEE is $00_{\text {B }}$ ), the user can read RHSBjIS.RHSBjERF to get informed about the emergency case detection.

## (1) Edge Sensitive Input Mode

The emergency input mode is edge sensitive when RHSBjDCR.RHSBjEIM is $0_{\mathrm{B}}$
When the RHSB module detects an edge where the external emergency signal goes active, the RHSBjIS.RHSBjERF flag is set to $1_{B}$.

This flag needs to be cleared by the user.
When using the edge sensitive input mode, the user must ensure that the RHSBjIS.RHSBjERF flag is $1_{\mathrm{B}}$ until an emergency frame is transmitted. The RHSBjIS.RHSBjETF flag indicates that the emergency frame has been transmitted.

Note that an edge will be detected when the ACTIVE state is entered while there is an active level at the external emergency signal.

## (2) Level Sensitive Input Mode

The emergency input mode is level sensitive when RHSBjDCR.RHSBjEIM is $1_{\mathrm{B}}$.
When using the level sensitive input mode, the user must ensure that the external emergency signal is on the active level for one repetition period or longer in single-period repetition mode or for two repetition periods or longer in multiperiod repetition mode. If shorter, the RHSB module may not detect emergencies.

## (3) Automatic Stop Function

When the emergency function is enabled by RHSBjDCR.RHSBjEE, the user defines if the data transmission should be automatically stopped after the transmission of the first emergency frame.

When RHSBjDCR.RHSBjEE is set to $01_{\mathrm{B}}$ (emergency condition detection enabled, no stop), the automatic stop function is inactive. The RHSB module transmits emergency frames as long as the emergency condition (see Figure 22.22) is true.

When the emergency condition changes to false, the RHSB module continues with transmission of normal data frames.
When RHSBjDCR.RHSBjEE is set to $11_{\mathrm{B}}$ (emergency condition detection and automatic stop enabled), the RHSB module transmits exactly one emergency frame in single-period repetition mode or the RHSB module transmits one or two emergency frames in multi-period repetition mode when the emergency condition is true.

After transmitting the emergency frame to all slaves, the data transmission is automatically stopped (RHSBjDTC.RHSBjDTE changes to $0_{B}$ ) after period 0 as illustrated in Figure 22.23. Independent from the downstream mode (RHSBjDCR.RHSBjDMS), no data transmission is possible until the user enables this by setting DTC.DTE to $1_{B}$. After setting DTC.DTE to $1_{\mathrm{B}}$, the RHSB module restarts transmission of DFTE0 data from period 0 .

Figure 22.23 Automatic Stop Function in Repetition Mode

### 22.5.1.9 Downstream Bit Rates

The downstream bit rate ( $\mathrm{f}_{\mathrm{DW}}$ ) is derived from the RHSB engine clock source frequency ( $\mathrm{f}_{\mathrm{PE}}$ ).
With the divider value x defined by RHSBjDCR.RHSBjDBR, the downstream bit rate can be calculated as a function of the RHSB engine clock source frequency:

$$
\mathrm{f}_{\mathrm{DW}}=\mathrm{f}_{\mathrm{PE}} / \mathrm{x}
$$

With $\mathrm{f}_{\text {PE }}$ of 80 MHz , these downstream bit rates can be achieved.
Table 22.33 Possible Downstream Bit Rates with an RHSB Engine Clock Source of 80 MHz

| RHSBjDCR. |  | 3 | 4 | 7 | 8 | 9 | 10 | 11 | 12 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RHSBjDBR | 1 | 2 | 4 | 5 | 8 | 16 | 32 | 64 | 128 |
| $x$ | $40 \mathrm{Mbit} / \mathrm{s}$ | $20 \mathrm{Mbit} / \mathrm{s}$ | $16 \mathrm{Mbit} / \mathrm{s}$ | $10 \mathrm{Mbit} / \mathrm{s}$ | $5 \mathrm{Mbit} / \mathrm{s}$ | $2.5 \mathrm{Mbit} / \mathrm{s}$ | $1.25 \mathrm{Mbit} / \mathrm{s}$ | $625 \mathrm{kbit} / \mathrm{s}$ | $312.5 \mathrm{kbit} / \mathrm{s}$ |
| Bit rate |  |  |  |  |  |  |  |  |  |

With $\mathrm{f}_{\text {PE }}$ of 160 MHz these downstream bit rates can be achieved.
Table 22.34 Possible Downstream Bit Rates with an RHSB Engine Clock Source of 160 MHz

| RHSBjDCR. |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RHSBjDBR | 1 | 3 | 4 | 7 | 8 | 9 | 10 | 11 | 12 |
| $x$ | 2 | 4 | 5 | 8 | 16 | 32 | 64 | 128 | 256 |
| Bit rate | $80 \mathrm{Mbit} / \mathrm{s}$ | $40 \mathrm{Mbit} / \mathrm{s}$ | $32 \mathrm{Mbit} / \mathrm{s}$ | $20 \mathrm{Mbit} / \mathrm{s}$ | $10 \mathrm{Mbit} / \mathrm{s}$ | $5 \mathrm{Mbit} / \mathrm{s}$ | $2.5 \mathrm{Mbit} / \mathrm{s}$ | $1.25 \mathrm{Mbit} / \mathrm{s}$ | $625 \mathrm{kbit} / \mathrm{s}$ |

When the divider value x is odd, the duty cycle of the clock signals on the serial clock line (RHSBjFCLP/RHSBjFCLN) will not be $50 \%$. In this case, the first phase of the clock signal becomes 1 clock cycle longer than that of $f_{\text {PEE }}$.

Example: When x is 5 and RHSBjDCR.RHSBjCLP is $0_{\mathrm{B}}$, the widths at high and low level of the clock signal are 3 cycles of $f_{P E}$ and 2 cycles of $f_{P E}$, respectively. When $x$ is 5 and RHSBjDCR.RHSBjCLP is $1_{B}$, the widths at low and high level of the clock signal are 3 cycles of $f_{\text {PE }}$ and 2 cycles of $f_{\text {PE }}$, respectively.

### 22.5.1.10 Data Update and Data Frame Transmission Request

By setting RHSBjIS.RHSBjDTSF to $0_{\mathrm{B}}$, the user acknowledges the data transmission start event and informs the RHSB module that new data is available.

RHSBjIS.RHSBjDTSF can be set to $0_{\mathrm{B}}$ by two strategies:

- Writing the RHSBjIS.RHSBjDTSF flag directly to $0_{B}$
- Data configured in RHSBjDDRi is used for the next transmission
- Writing to RHSBjDDRi register (by the user or by DMA)
- New data written to RHSBjDDRi is used for the next transmission

The write DDRi method allows an optimized transmission flow because it automatically sets RHSBjIS.RHSBjDTSF to $0_{B}$ and hence starts the transmission.

When a write to an RHSBjDDRi triggers a transmission depends on the configuration parameter RHSBjDCR.RHSBjSLS (number of used DFTEs).

- RHSBjDCR.RHSBjSLS is $00_{\mathrm{B}}$ ( 1 DFTE is used): Writing to RHSBjDDR0[31:16] (DFTE0)
- RHSBjDCR.RHSBjSLS is $01_{\mathrm{B}}$ (2 DFTEs are used): Writing to RHSBjDDR0[15:0] (DFTE1)
- RHSBjDCR.RHSBjSLS is $10_{\mathrm{B}}$ (3 DFTEs are used): Writing to RHSBjDDR1[31:16] (DFTE2)
- RHSBjDCR.RHSBjSLS is $11_{\mathrm{B}}$ (4 DFTEs are used): Writing to RHSBjDDR1[15:0] (DFTE3)

Even if RHSBjDCR1.RHSBjSLS1 (number of used DFTEs for period 1) is available in multi-period repetition mode, when a write to an RHSBjDDRi triggers a transmission depends on the configuration parameter RHSBjDCR.RHSBjSLS (number of used DFTEs). If RHSBjDCR1.RHSBjSLS1 is smaller than RHSBjDCR.RHSBjSLS, the user should write dummy data to RHSBjDDRi defined by RHSBjDCR.RHSBjSLS.

- RHSBjDCR.RHSBjSLS is $00_{\mathrm{B}}$ (1 DFTEs is used): Writing to RHSBjDDR0[31:16] (DFTE0)
- RHSBjDCR.RHSBjSLS is $01_{\mathrm{B}}$ (2 DFTEs are used): Writing to RHSBjDDR0[15:0] (DFTE1)
- RHSBjDCR.RHSBjSLS is $10_{\mathrm{B}}$ (3 DFTEs are used): Writing to RHSBjDDR1[31:16] (DFTE2)
- RHSBjDCR.RHSBjSLS is $11_{\mathrm{B}}$ (4 DFTEs are used): Writing to RHSBjDDR1[15:0] (DFTE3)

The data frame transmission started flag (RHSBjIS.RHSBjDTSF) is set to $1_{\mathrm{B}}$ when the assembling has been performed at the start of the data frame transmission.

RHSBjIS.RHSBjDTSF equal to $1_{\mathrm{B}}$ indicates that a data frame transmission has been started and so the downstream data registers can be written with new transmit data.

In addition, the RHSBjIS.RHSBjDTSF is set to $1_{\mathrm{B}}$ when data transmission is initially enabled by RHSBjDTC.RHSBjDTE to prevent a data frame transmission without explicit software trigger.

Updating RHSBjDDRi while a data frame is transmitted does not affect the ongoing transmission but it requires an additional data transmission.

As there is write protection of the downstream data registers (RHSBjDDRi) while there is new data pending for transmission, it is guaranteed that written downstream data will be transmitted at least one time.

## (1) Scheduling of Downstream Data Update

The user can update the downstream data by using the following as a trigger.

- Data Frame Transmission Started

New data can be supplied in a timely manner. In this case, RHSBjIS.RHSBjDTSF is used as a trigger.

- Data Frame Transmission Done

New data is supplied upon completion of data frame transmission. In this case, RHSBjIS.RHSBjDTF is used as a trigger.

Write operations to RHSBjDDRi, RHSBjIS.RHSBjDTSF and RHSBjIS.RHSBjDTF are cleared. It is recommendable to use only one of these write operations as a trigger of downstream data update.

### 22.5.1.11 Command Frame Transmission Request

The transmission of command frames is always triggered when the user writes to RHSBjDTC.RHSBjCTR. On each request, the transmission of one command frame is started. The method for how command frames are inserted into the downstream communication depends on the selected mode and a set of configuration parameters; for details, see the detailed mode description.

When RHSBjDTC.RHSBjCTR is set to a value not equal to $00_{\mathrm{B}}$, a command frame transmission is scheduled. After completion of the command frame transmission, RHSBjDTC.RHSBjCTR is automatically set to $00_{\mathrm{B}}$ and the user is able to set a new request.

### 22.5.2 Upstream Communication

The RHSB module uses asynchronous serial reception for upstream communication.
There are two upstream channels available to connect up to two slaves with the RHSB module. Only one channel can be selected as the active channel at one time. Any activity on the channel that is not selected is ignored.

It is possible to receive consecutive upstream frames sent on the same serial input line.
Reception of upstream communication is only supported when the user has enabled this function by setting RHSBjUCR.RHSBjUE to $1_{\mathrm{B}}$ in CONFIG state.

The diagram in Figure 22.24 illustrates the functional blocks of the upstream engine. The detailed upstream communication is explained in this section.

Note: $\mathrm{j}=0,1$

## Upstream Configuration:

This block indicates the upstream related configuration parameters and the upstream control interface handled by the application software.

## Upstream Control:

This block provides the main function of the upstream engine. It selects the active serial data input line (RHSBjSIO-1 ( $\mathrm{j}=0,1$ )) and the corresponding configuration, provides the start bit detection, schedules the sampling and observes the frame syntax. In addition, this block controls the storage of the received information in the upstream data registers (RHSBjUDi) and provides the required decoding status.

## De-serialize:

The de-serialization block stores the received payload and provides this information for storage in the upstream data registers.

## Upstream Data Buffer:

This block includes the upstream data registers and the control logic to select one RHSBjUDi for updating. In addition, the upstream related status flags in the RHSBjIS register are controlled by this block.

Figure 22.24 Block Diagram of Upstream

### 22.5.2.1 Upstream Modes

The RHSB module has two upstream modes with different methods for how the slaves are connected to the serial input lines. These upstream modes can be configured by RHSBjUCR.RHSBjUMS:

- Dedicated input mode
- Each slave is connected to an individual serial input line.
- The active serial input line is selected by RHSBjUCS.RHSBjACC.
- Shared input mode
- All slaves are connected on the serial input line 0 .
- The active serial input line is always line 0 independently of the value in RHSBjUCS.RHSBjACC.

Note that when using the Shared input mode, the unused serial input lines are not required to be configured as RHSB inputs in the MCU port function registers.

Note: $\quad j=0,1$

Figure 22.25 Slave Connection and Selection for Upstream Communication

Figure 22.25 illustrates how the serial input lines are connected to the upstream engine. The shown 'Logic' ensures that in shared mode, input line 0 is always used, independent from the value of RHSBjUCS.RHSBjACC. The shown 'RHSBjUCS.RHSBjACC changes' information is used by the upstream engine to abort an ongoing reception when the selected channel changes.

### 22.5.2.2 Individual Slave Configuration

The RHSB module supports for each slave an individual upstream configuration. The usage of different channel configurations is independent from the upstream mode (RHSBjUCR.RHSBjUMS). For each channel, the user can program via the RHSBjUCC register:

- The frame type (8 or 12 bit format)
- The number of stop bits (2 or 3)
- The parity type (even or odd)
- The upstream bit rate (see Section 22.5.2.5, Upstream Bit Rates for details)

The serial input line polarity is independent from RHSBjUCS.RHSBjACC. The inversion function configured by RHSBjUCC.RHSBjILPn is fixed and assigned to a serial input line $n$. Thus, RHSBjUCC.RHSBjILP0 is used for all two channels in shared input mode.

The configuration used by the upstream engine to decode upstream frames is defined by RHSBjUCS.RHSBjACC.
There are two ways to change the active upstream configuration:

- Direct request for configuration change by writing to RHSBjUCS.RHSBjACC.
- Request of a command transmission with upstream data request by writing $11_{\mathrm{B}}$ to RHSBjDTC.RHSBjCTR.

### 22.5.2.3 Frame Format Types

The RHSB module supports two frame types for upstream communication that only differ in the number of data bits (8 or 12 bit ). Other configuration options are not influenced by the frame type.
When the parity type is even, the number of $1_{B}$ bits inside the parity covered area is even $(0,2,4,6,8,10$ and 12$)$.
When the parity type is odd, the number of $1_{\mathrm{B}}$ bits inside the parity covered area is odd ( $1,3,5,7,9,11$ and 13 ).
Figure 22.26 and Figure 22.27 show an upstream frame with non-inverted data line.

Figure 22.26 Upstream Frame Format with 8 Data Bits (12- or 13-Bit Frame)

Figure 22.27 Upstream Frame Format with 12 Data Bits (16- or 17-Bit Frame)

### 22.5.2.4 Frame Storing

The RHSB module offers two upstream data registers (RHSBjUDi) where the upstream engine stores its decoding results. There are two methods selectable in RHSBjUCR.RHSBjFSM defining how the RHSBjUDi is selected for updating.

Note that the decoding of an ongoing reception is aborted when RHSBjUCS.RHSBjACC changes. In this case, no decoding result is stored.

## (1) Normal Storage Method

This method is used when RHSBjUCR.RHSBjFSM is $0_{\mathrm{B}}$.
The storage strategy is identical for frames of 8-bit and 12-bit format.
The active channel configuration (RHSBjUCS.RHSBjACC) defines the upstream data register to store the decoding results. The target can be identified by these relations:

- When RHSBjUCS.RHSBjACC is $00_{\mathrm{B}}$, RHSBjUD0 is updated
- When RHSBjUCS.RHSBjACC is $01_{\mathrm{B}}$, RHSBjUD1 is updated

## (2) Addressed Storage Method

This method is used when RHSBjUCR.RHSBjFSM is $1_{\mathrm{B}}$.
When the frame type is configured as 8-bit format, the target is always RHSBjUD0.
When the frame type is configures as 12 -bit format, the target depends on the received extended data field (EDF, see Figure 22.25). The target can be identified by these relations:

- When RHSBjEDF[3:2] is $00_{\mathrm{B}}$, RHSBjUD0 is updated
- When RHSBjEDF[3:2] is $01_{\mathrm{B}}$, RHSBjUD1 is updated

Note also in case of a faulty reception (parity or stop bit error detected), the received extended data field is used to identify the target for updating the error flags.

### 22.5.2.5 Upstream Bit Rates

The upstream bit rate ( $\mathrm{f}_{\mathrm{UP}}$ ) is derived from the downstream bit rate ( $\mathrm{f}_{\mathrm{DW}}$ ).
The bit rate is configured for each channel individually by RHSBjUCC.RHSBjUBRn.
With ( $\mathrm{x}=$ RHSBjUCC.RHSBjUBRn), the upstream bit rate used by channel n can be calculated as a function of the downstream bit rate such that:

$$
f_{\mathrm{UP}}=\mathrm{f}_{\mathrm{DW}} / 2^{\mathrm{x}}
$$

Because the RHSB module samples each upstream bit 8 times, the maximal upstream bit rate is $1 / 8$ of the RHSB engine clock source frequency ( $\mathrm{f}_{\mathrm{PE}} / 8$ ). However, set this RHSB module to 16 -frequency division at 5 MHz or lower.

### 22.5.2.6 Update of Decoding Status

The upstream engine updates one of the RHSBjUDi registers after the decoding of an upstream frame has been completed (after the last stop bit).

When the decoder has detected a parity or stop bit error, the related error flags (RHSBjFERR or RHSBjPERR or both) are set in the corresponding RHSBjUDi register.

When the decoder has not detected parity nor stop bit errors, this frame is judged as a valid frame and these parts of the corresponding RHSBjUDi are updated:

- New data flag (RHSBjND) is set to $1_{B}$
- Data field (RHSBjDF) is updated
- Extended data field (RHSBjEDF) is updated in case of 12-bit frames
- Data lost flag (RHSBjDL) is set to $1_{B}$ if the new data flag was already $1_{B}$

### 22.5.3 Timeout Detection

The concept of timeout detection realized by the RHSB module is linked to the concept of "command transmission with data request". The concept assumes this flow:

Step 1: Master requests data from slave x by sending a command frame.
Step 2: Slave x answers the master by sending the requested data on the upstream channel.
From an application point of view the master expects to receive an answer from slave x within a certain period (timeout period). This expectation is processed by the timeout detection function.

To use the timeout detection function the user should enable the upstream reception ( $\mathrm{RHSBjUCR} . \mathrm{RHSBjUE}$ is $1_{\mathrm{B}}$ ) and should enable the timeout function (RHSBjUCR.RHSBjTOE is $1_{B}$ ).

Note: $\mathrm{j}=0,1$

Figure 22.28 Block Diagram of Timeout

The diagram in Figure 22.28 illustrates the scope of timeout detection block. It is controlled by the downstream and upstream engine. The timeout detection controls RHSBjIS.RHSBjTOF. The detection of a timeout has no influence on an ongoing reception.

Note that the timeout detection cannot distinguish between the reception due to the request and other receptions. For example, if the shared input mode configuration is used and two slaves are transmitting upstream frames during the timeout period. The user must ensure that in fault free operation, only one upstream reception can happen during the timeout period.

Figure 22.29 Example of Timeout Detection

The example shown in Figure 22.29 illustrates the typical timing of the timeout detection.
In the first case, the user issues a command frame transmission with data request for slave A . The downstream configuration is updated, and then a command frame is scheduled for transmission. After the end of transmission, the timeout period starts. The valid response of the slave is decoded before the timeout period ends.

In the second case, the user issues a command frame transmission with data request for slave B. In this case, the timeout period ends before a valid response was decoded.

### 22.5.3.1 Command Transmission with Remote Data Request

To perform a command transmission with data request, the user must follow this flow:

- Writing the command data to the RHSBjDCD register
- Define the target slave by writing to RHSBjDTC.RHSBjSSCF
- Request command transmission with data request by writing 11 $1_{\mathrm{B}}$ to RHSBjDTC.RHSBjCTR

Writing of the command to RHSBjDRC.RHSBjCTR generates triggers from the RHSB module to carry out these actions:

- Update of the active slave configuration (RHSBjUCS.RHSBjACC) with the target slave number (RHSBjDTC.RHSBjSSCF)
- Abort an ongoing reception if the active slave changes
- Transmit the command frame on the downstream channel
- Start timeout counter when the command transmission has been completed

When there is a valid reception on the upstream channel, the RHSB module judges the remote data request as handled and the timeout counter is stopped.

When there is no valid reception on the upstream channel before the timeout counter elapses, the remote data request is judged as failed and the timeout is flagged by setting RHSBjUDi.RHSBjTO and RHSBjIS.RHSBjTOF to $1_{\mathrm{B}}$.

### 22.5.3.2 Timeout Detection Details

The timeout counter uses the nominal upstream bit time for timeout detection. The timeout counter is not influenced by possible resynchronization effects during start bit decoding.

The timeout counter is initialized to the value (RHSBjUCR.RHSBjRTO +1$) \times 8(\mathrm{U}$ bit), when the command frame transmission has been completed (end of frame passive phase).

The timeout counter is decremented with every sample period ( U bit $/ 8$ ) used by the decoder according to the active slave configuration (RHSBjUCC.RHSBjUBRn).

The timeout counter stops when:

- There is a valid reception decoded on the upstream channel or
- The timeout counter elapse or
- The decoding is aborted (e.g. by changing the RHSBjUCS.RHSBjACC)

Note that there is no synchronization between the downstream frame passive phase end and the upstream sample points. Thus, the first timeout counter decrement can happen between $1_{\mathrm{D}}$ bit and $1 \mathrm{Ubit} / 8$.

### 22.5.4 Test Mode Operation

The RHSB module is able to support key-on tests when RHSBjGC.RHSBjOPS is TEST.
The aim of the test mode is to transmit data on the downstream channel and receive the same data as an upstream frame. Because the upstream engine can only decode UART-like frames, such pattern needs to be emulated within the SPI-like downstream frame.

Since the downstream and upstream paths in the RHSB module are independent, the test mode allows good test coverage of all RHSB flags.

While the test mode is active, the serial input lines are disconnected from the upstream engine and the outputs are driven with fixed levels:

- The serial output line (RHSBjSOP/RHSBjSON) is driven with a high level
- The serial clock line (RHSBjFCLP/RHSBjFCLN) is driven with a level depending on the clock line phase (low level when RHSBjDCR.RHSBjCLP is $0_{\mathrm{B}}$ )
- The chip select lines (RHSBjCSD0-1) are driven with a level depending on the chip select line polarity (low level when RHSBjSDCi.RHSBjCSLPn is $0_{\mathrm{B}}$ )

Figure 22.30 illustrates the details about the position of the loop-back multiplexer. Only the inversion of the downstream data (RHSBjSDCi.RHSBjSOLPn) is influencing the test mode; all other inversions are out of scope.

The loop-back multiplexer connects the internal serial data (RHSBjSOP/RHSBjSON) signal to one upstream channel. The channel is selected by an active internal chip select. Thus, all two upstream channels can be checked.

Figure 22.30 Loop-Back Connection in Test Mode

The test mode should be carried out under the following conditions:

- The downstream bit rate divider should be $\mathrm{f}_{\mathrm{DW}}=\mathrm{f}_{\mathrm{PE}} / 8$ (this results in the maximum bit rate of $10 \mathrm{MBit} / \mathrm{s}$ when using 80 MHz RHSB engine clock source frequency). The user should set RHSBjDCR.RHSBjDBR to $7_{\mathrm{D}}$.
- The upstream bit rate should be equal to the downstream bit rate $\left(f_{U P}=f_{D W}\right)$. The user should set RHSBjUCC.RHSBjUBRn to $0_{\mathrm{D}}$ for all two upstream channels.

### 22.5.4.1 Test Mode Data Generation

Figure 22.31 shows an example of how the bits of a command frame are received by the upstream channel. The example uses non inverted downstream data without assertion/deassertion phases and assumes a 12-bit format with two stop bits.

On the downstream data line, a command frame is transmitted for slave 1 , and the receiver has to be connected to the same slave by setting RHSBjUCS.RHSBjACC to $01_{\text {B }}$.

Note: $\quad j=0,1$

Figure 22.31 Example of How a Command Frame is Received by the Upstream Engine

By writing a pattern into the RHSBjDCD register, the user is able to check the parity logic and the stop bit error detection. In addition, it is possible to check all 32 bits of the RHSBjDCD register, the command length configuration, the assertion/deassertion phase lengths and the data inversion.

Similar checks are also possible with data frames. Note that only the data for the select slave is received, even if multiple slaves are addressed in the data frame.

### 22.5.5 Interrupts

The RHSB module has 9 sources that can be used for interrupt request generation.
The interrupt status flags are cleared by the user when writing the flags to $0_{B}$. Writing $1_{B}$ has no effect. For some interrupt flags, there are additional functional clear conditions defined to allow an optimized software flow. These interrupt flags are marked by * in the interrupt source lists in Section 22.5.5.1, Downstream Related Interrupts (Transmission) and Section 22.5.5.2, Upstream Related Interrupts (Reception).

When the RHSB module is in the RESET state or CONFIG state, an interrupt request is not generated.

### 22.5.5.1 Downstream Related Interrupts (Transmission)

- Interrupt line 0
- Data frame transmission started (RHSBjDTSF) *
- Data frame transmission done (RHSBjDTF) *
- Interrupt line 1
- Command frame transmission done (RHSBjCTF) *
- Transmission started (RHSBjTSF)
- Interrupt line 2
- Emergency frame transmission done (RHSBjETF)

### 22.5.5.2 Upstream Related Interrupts (Reception)

- Interrupt line 3
- Data received (RHSBjDRF) *
- Interrupt line 4
- Upstream error (RHSBjUEF) *
- Timeout detected (RHSBjTOF)
- Data lost (RHSBjDLF) *

By reading the RHSBjUSS register, the user can get informed about the complete upstream status.

### 22.5.5.3 Interrupt Request Details

There is an individual interrupt status flag in the RHSBjIS register (RHSBjIS.RHSBjxF) and an individual interrupt enable bit in the RHSBjIC register (RHSBjIC.RHSBjxIE) for each interrupt source (x).

The function of the interrupt status is independent from the interrupt enable. The interrupt enable controls only if an interrupt request is made to the MCU's interrupt controller.

Figure 22.32 illustrates how an interrupt request is generated and the realization of the interrupt grouping.

Figure 22.32 Interrupt Grouping (Example of Two Interrupts x and y )

### 22.5.6 DMA Capability

### 22.5.6.1 DMA Usage for Downstream Data Transmission

The downstream data DMA function is intended to serve applications where pre-calculated data tables are stored in the memory (RAM or FLASH) defining the pattern the RHSB module has to transfer to slaves.

A downstream data DMA transfer is started when RHSBjIS.RHSBjDTSF is $1_{B}$ and DMA is enabled by RHSBjGC.RHSBjDDE.

The user should not use RHSBjIS.RHSBjDTSF as interrupt source (RHSBjIC.RHSBjDTSIE should be set to $0_{\mathrm{B}}$ ) when using downstream data DMA. In addition, the user should not write to the downstream data registers (RHSBjDDRi) nor set RHSBjIS.RHSBjDTSF to $0_{\mathrm{B}}$.

In Figure 22.33, case 1) shows normal DMA transfer of downstream data for transmission. In case 2), the DMAC is not able to supply downstream data within the repetition cycle, the DMAC retransmits the last data that it wrote.
Accordingly, define a repetition cycle that is longer than the time the DMAC will take to supply the downstream data.

Figure 22.33 Downstream Data DMA Timing

## (1) Configuring and Enabling Flow to Use Downstream Data DMA

These configurations should be done during CONFIG state:

- Set RHSBjDCR.RHSBjDMS to $01_{\mathrm{B}}$ (triggered mode)
- Set RHSBjIC.RHSBjDTSIE to $0_{\text {B }}$
- Set all other configuration parameters according to the application requirements
- Configure the DMA controller to serve the required data to the RHSB module
- Target in the RHSB module is the RHSBjDDR0 register
- Number of transferred data words depends on RHSBjDCR.RHSBjSLS

These actions can be done in ACTIVE state according to the application requirements:

- Write initial data to RHSBjDDRi registers
- The first DMA transfer after setting RHSBjDTC.RHSBjDTE to $1_{\mathrm{B}}$ is requested after a data frame with this initial data has been transmitted
- Enable or disable the downstream data transmission by setting RHSBjDTC.RHSBjDTE or RHSBjDTC.RHSBjTSR to $1_{\mathrm{B}}$.
- Enable or disable the downstream data DMA function (RHSBjGC.RHSBjDDE)

While the downstream data DMA is enabled, RHSBjIS.RHSBjDTSF equal to $1_{\mathrm{B}}$ indicates a pending DMA transfer.

## (2) Data Layout in Memory for Downstream Data DMA

The layout of the data to be transferred from the memory to the RHSBjDDRi registers of the RHSB module depends on the data frame configuration in RHSBjDCR.RHSBjSLS.

Because the DMA request (RHSBjIS.RHSBjDTSF) is cleared by writing to the downstream data registers (RHSBjDDRi), the user must ensure that the transferred amount of data matches the required data for transmission (see Section 22.5.1.10, Data Update and Data Frame Transmission Request for details about the request mapping). The RHSB module allows writing more than the required data to the RHSBjDDRi registers. Therefore, there is no functional restriction when the DMA controller supports only 32 bit transfers.

Note that when using 16-bit transfers, the user must ensure that the upper part (bits [31:16]) of the downstream data registers are written first.

### 22.5.6.2 DMA Usage for Downstream Command Transmission

The downstream command DMA function is intended to serve applications where command data tables are stored in the memory (RAM or FLASH) the RHSB module has to transfer to slaves.

A downstream command DMA transfer is started when RHSBjIS.RHSBjCTF is $1_{B}$ and DMA is enabled by RHSBjGC.RHSBjDCDE.

The user should not use RHSBjIS.RHSBjCTF as interrupt source (RHSBjIC.RHSBjCTIE should be set to $0_{\mathrm{B}}$ ) when using downstream command DMA. In addition, the user should not write to the downstream command data register (RHSBjDCD) nor downstream transmission control register (RHSBjDTC), nor set RHSBjIS.RHSBjCTF to $0_{\mathrm{B}}$.

## (1) Configuring and Enabling Flow to Use Downstream Command DMA

These configurations should be done during CONFIG state:

- Set RHSBjIC.RHSBjCTIE to $0_{\text {B }}$
- Set all other configuration parameters according to the application requirements
- Configure the DMA controller to serve the required data to the RHSB module
- Targets in the RHSB module are the RHSBjDCD register and RHSBjDTC register
- Number of transferred command bits depends on RHSBjDTC.RHSBjNCB

These actions can be done in ACTIVE state according to the application requirements:

- Write command data to RHSBjDCD register and configuration parameters to RHSBjDTC register
- Enable or disable the downstream command DMA function (RHSBjGC.RHSBjDCDE)

While the downstream command DMA is enabled, RHSBjIS.RHSBjCTF equal to $1_{\mathrm{B}}$ indicates a pending DMA transfer.

## (2) Command Data Layout in Memory for Downstream Command DMA

The layout of the command data to be transferred from the memory to the RHSBjDCD register of the RHSB module depends on the command frame configuration in RHSBjDTC.RHSBjNCB.

Because the DMA request (RHSBjIS.RHSBjCTF) is cleared by writing to the command transmission request (RHSBjDTC.RHSBjCTR), the user must ensure that the transferred amount of command data fits to the required command for transmission. The RHSB module allows writing more than the required data to the RHSBjDCD register. Therefore, there is no functional restriction when the DMA controller supports only 32 bit transfers.

Note that when using 16 bit transfers the user must ensure that the upper part (bits [31:16]) of the downstream command data register is written first.

### 22.5.6.3 DMA Usage for Upstream Data Reception

The upstream DMA function is intended to store a set of upstream frames into the memory.
An upstream DMA transfer is started when RHSBjIS.RHSBjDRF is $1_{\mathrm{B}}$ and DMA is enabled by RHSBjGC.RHSBjUDE.
The user should not use RHSBjIS.RHSBjDRF as interrupt source (RHSBjIC.RHSBjDRIE should be set to $0_{\mathrm{B}}$ ) when using upstream DMA. In addition, the user should not read from the upstream data read registers (RHSBjUDR) nor set RHSBjUDi.RHSBjND to $0_{\mathrm{B}}$ nor set RHSBjIS.RHSBjDRF to $0_{\mathrm{B}}$.

When the DMA controller is not able to process the new received data in a timely manner, a received message might be lost because it is no longer available in the RHSBjUDR (even if still available in the related RHSBjUDi). The software gets informed about the overrun by the RHSBjUDR.RHSBjNDS bits and about data lost by RHSBjUDi.RHSBjDL.

## (1) Configuring and Enabling Flow to Use Upstream DMA

These configurations should be done during CONFIG state:

- Set RHSBjUCR.RHSBjUE to $1_{B}$
- Set RHSBjIC.RHSBjDRIE to $0_{B}$
- Set all other configuration parameters according to the application requirements
- Configure the DMA controller to serve the required data to the RHSB module
- Source in the RHSB module is RHSBjUDR
- Number of transferred data ( $8,16,32$ bits) depends on the application requirements

These actions can be done in ACTIVE state according to the application requirements:

- Request data from the slaves (e.g. by command frame)
- Enable or disable the upstream DMA function (RHSBjGC.RHSBjUDE)
- Evaluate the upstream error interrupts to handle upstream problems

While the upstream DMA is enabled, RHSBjIS.RHSBjDRF equal to $1_{\mathrm{B}}$ indicates a pending DMA transfer.

## (2) Data Layout in Memory for Upstream DMA

The DMA transfer should only use the RHSBjUDR as source for the DMA transfer. Whether all 32 bits of the RHSBjUDR are transferred to the memory or only a part ( 8 or 16 bits) depends on the application requirements.

When the DMA controller reads from the RHSBjUDR, the related new data flag in an RHSBjUDi register is set to $0_{\mathrm{B}}$. In addition, RHSBjIS.RHSBjDRF is set to $0_{\mathrm{B}}$. Note that the error flags in the RHSBjUDi registers are not affected by DMA transfer.

### 22.6 Cross Bar (XBAR)

### 22.6.1 Overview

XBAR is configured of the following functions.

## - RHSB XBAR

The RHSB XBAR selects signals from the timer and GPIO with the multiplexer and outputs arbitrary signals to the RHSB. The number of units of RHSB is two. Each RHSB has one XBAR. Each XBAR has four 16-bit sub XBARs. The output of signals to the RHSB is specified by setting the RHSBGjCRkH, RHSBGjCRkL and RHSBGjCROk registers.

### 22.6.1.1 Number of Units

This microcontroller has the following number of units of the Renesas high speed bus Cross bar (RHSB XBAR).
Table 22.35 Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Unit Name | RHSB XBARj $(\mathrm{j}=0,1)$ | RHSB XBARj $(\mathrm{j}=0,1)$ |

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Unit Name | RHSB XBARj $(j=0,1)$ | RHSB XBARj $(j=0,1)$ |

### 22.6.1.2 Register Base Addresses

The RHSB XBAR base addresses are listed in the following table.
The RHSB XBAR register addresses are given as offsets from the base address in general.
Table 22.36 Register Base Addresses

| RHSB XBARj | RHSBj_Base | Bus Group |
| :--- | :--- | :--- |
| <RHSB_XBAR0_base> | FFED D000 |  |
| <RHSB_XBAR1_base> | FFED D800 | Peripheral Group 2L |

### 22.6.1.3 Clock Supply

The RHSB XBAR clock supply is shown in the following table.
Table 22.37 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| RHSB XBARj | PCLK | CLK_LSB |

Note: j=0,1

### 22.6.1.4 Reset Source

The RHSB XBAR reset sources are listed in the following table. RHSB XBAR is initialized by these reset sources.
Table 22.38 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module <br> Reset | JTAG <br> Reset |
| RHSB XBAR0 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| RHSB XBAR1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 22.6.2 Module Configuration

### 22.6.2.1 RHSB XBAR Configuration

When ATU-V is used, the RHSB cross bar is selection logic that connects ATU- V/GPIO and RHSB. The RHSB cross bar has four 16-bit sub XBARs for each RHSB channel.

See Table 30.13 Block Configuration about usable channels.

Figure 22.34 RHSB XBAR Configuration when ATU-V is Used

When GTM is used, the RHSB cross bar is selection logic that connects GTM/GPIO and RHSB. The RHSB cross bar has four 16-bit sub XBARs for each RHSB channel.

Figure 22.35 RHSB XBAR Configuration when GTM is Used

The RHSB cross bar has four 16-bit sub XBARs in the 1st stage. The timer signals can be selected by setting the RHSBGjCRkH and RHSBGjCRkL registers in the 16-bit sub XBAR. The GPIO signals or the timer signals, which are selected in the 1st stage, are selected by setting the RHSBGjCROk registers in the 2nd stage.

Figure 22.36 RHSB XBAR Block Diagram when ATU-V is Used

Figure 22.37 RHSB XBAR Block diagram when GTM is Used

### 22.6.3 Registers

### 22.6.3.1 List of Registers

The following tables show the address allocation of the RHSB XBAR registers.
Table 22.39 RHSB XBAR Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RHSB XBARj | Microsecond Bus Control Register H | RHSBGjCROH | <RHSB_XBARj_base> + 00 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register L | RHSBGjCR0L | <RHSB_XBARj_base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register H | RHSBGjCR1H | <RHSB_XBARj_base> + 08 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register L | RHSBGjCR1L | <RHSB_XBARj_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register H | RHSBGjCR2H | <RHSB_XBARj_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register L | RHSBGjCR2L | <RHSB_XBARj_base> + 14 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register H | RHSBGjCR3H | <RHSB_XBARj_base> + 18 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register L | RHSBGjCR3L | <RHSB_XBARj_base> $+1 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register Out | RHSBGjCRO0 | <RHSB_XBARj_base> + $2 \mathrm{H}_{\mathrm{H}}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register Out | RHSBGjCRO1 | <RHSBj_XBARj_base> + $24_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register Out | RHSBGjCRO2 | <RHSB_XBARj_base> $+28_{\text {H }}$ | 8, 16, 32 | - |
| RHSB XBARj | Microsecond Bus Control Register Out | RHSBGjCRO3 | <RHSB_XBARj_base> + 2C H | 8, 16, 32 | - |

Note: $\mathrm{j}=0,1$.
When ATU-V is used, see Section 22.6.3.2, RHSBGjCRkH - Microsecond Bus Control Register $\mathbf{H}$ to Section 22.6.3.4, RHSBGjCROk — Microsecond Bus Control Register Out.

When GTM is used, see Section 22.6.3.5, RHSBGjCRkH — Microsecond Bus Control Register H to Section 22.6.3.7, RHSBGjCROk — Microsecond Bus Control Register Out.

### 22.6.3.2 RHSBGjCRkH — Microsecond Bus Control Register H (ATU-V)

RHSBGjCRkH is a register that selects the upper bits of signals to be output to the RHSB from signals received from the ATU and GPIO. This register supports ATU timer C, timer D, timer E and GPIO signals.

Do not change the setting of the bits in this register while any of the ATU timer C, timer D, timer E, or GPIO are working.
$\mathrm{j}=0,1$.
$\mathrm{k}=0$ to 3 .

Table 22.40 RHSBGjCRkH Register (ATU-V) Contents (1/8)

### 22.6.3.3 RHSBGjCRkL — Microsecond Bus Control Register L (ATU-V)

RHSBGjCRkL is a register that selects the lower bits of the signals to be output to the RHSB from signals received from the ATU and GPIO. This register supports ATU timer C, timer D, timer E and GPIO signals.

Do not change the settings of the bits in this register while any of the ATU timer C, timer D, timer E, and GPIO are working.

RHSBGjCRkL can be read and written in byte units.
$\mathrm{j}=0,1$.
$\mathrm{k}=0$ to 3 .

Value after reset: $\quad 00000000_{\mathrm{H}}$

### 22.6.3.4 RHSBGjCROk — Microsecond Bus Control Register Out (ATU-V)

RHSBGjCROk is a register that selects signals to be output to the RHSB from signals received from the ATU and GPIO. This register supports ATU timer C, timer D, timer E and GPIO signals.

Do not change the settings of the bits in this register while any of the ATU timer C, timer D, timer E or GPIO are working.

### 22.6.3.5 RHSBGjCRkH — Microsecond Bus Control Register H (GTM)

RHSBGjCRkH is a register that selects the upper bits of signals to be output to the RHSB from signals received from the GTM and GPIO. This register supports GTM TOM, GTM ATOM and GPIO signals.

Do not change the settings of the bits in this register while any of GTM TOM, GTM ATOM or GPIO are working.
$j=0,1$.
$\mathrm{k}=0$ to 3 .

Value after reset: $\quad 00000000_{\mathrm{H}}$

### 22.6.3.6 RHSBGjCRkL — Microsecond Bus Control Register L (GTM)

RHSBGjCRkL is a register that selects the lower bits of signals to be output to the RHSB from signals received from the GTM and GPIO. This register supports GTM TOM, GTM ATOM and GPIO signals.

Do not change the setting of the bits in this register while any of GTM TOM, GTM ATOM or GPIO are working.
$j=0,1$.
$\mathrm{k}=0$ to 3 .

Value after reset: $00000000_{\mathrm{H}}$

### 22.6.3.7 RHSBGjCROk — Microsecond Bus Control Register Out (GTM)

RHSBGjCROk is a register that selects the signals to be output to the RHSB from signals received from the GTM and GPIO. This register supports GTM TOM, GTM ATOM and GPIO signals.

Do not change the settings of the bits in this register while any of GTM TOM, GTM ATOM or GPIO are working.
$j=0,1$.
$\mathrm{k}=0$ to 3 .

Table 22.45 RHSBGjCROk Register (GTM) Contents (4/4)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 to 0 | MjMDOk0 | These bits select the signal of the zeroth bit. |
|  | $00:$ P50_[0] is selected $(k=0) /$ |  |
| P51_[0] is selected $(k=1) /$ |  |  |
| P52_[0] is selected $(k=2) /$ |  |  |
| P53_[0] is selected $(k=3)$. |  |  |
|  | $01:$ Select output from Table $1-1$ is selected |  |
|  | 10: Setting prohibited. ${ }^{* 1}$ |  |
|  | 11: Setting prohibited. ${ }^{* 1}$ |  |

Note 1. If this is selected, the low level is output.

### 22.6.4 Operation

The number of units of RHSB is two, each of which has one XBAR. XBAR has four 16-bit sub XBARs in the $1^{\text {st }}$ stage. The timer signals can be selected by setting the RHSBGjCRkH and RHSBGjCRkL registers in the 16-bit sub XBAR. The GPIO signals or the timer signals, which are selected in the $1^{\text {st }}$ stage, are selected by setting of the RHSBGjCROk registers in the $2^{\text {nd }}$ stage.

### 22.6.4.1 List of Bits that can be Selected in XBAR when Connected with RHSB and ATU-V is Used

See Table 30.13, Block Configuration about usable channels.

## Section 23 Single Edge Nibble Transmission (RSENT)

This section describes the Renesas single edge nibble transmission (RSENT) module.

### 23.1 Features of RSENT

### 23.1.1 Number of Channels

This microcontroller has the following number of RSENT channels.
Table 23.1 Number of Channels

| Product Name | RH850/E2x-FCC1 |  |  |
| :--- | :--- | :--- | :---: |
|  | 373 pins | 292 pins |  |
|  | 17 | 17 |  |
| Unit Name | RSENTn ( $\mathrm{n}=0$ to 16) |  |  |

Table 23.2 Number of Channels

| Product Name | RH850/E2M |  |
| :---: | :---: | :---: |
|  | 373 pins | 292 pins |
| Number of Channels | 17 | 17 |
| Name | RSENTn ( $\mathrm{n}=0$ to 16) |  |
| Table 23.3 Ind | ndex |  |
| Index | Description |  |
| n T | This section identifies each RSENT channel by " $n$ " (" $n$ " is channel numbers.). For example, the RSENT timestamp register of RSENTn is described as RSENTnTSPC. |  |

### 23.1.2 Register Base Addresses

The RSENT register base addresses are given as offsets from the base address <RSENTn_base>.
The following table shows the base addresses <RSENTn_base> for each RSENT.
Table 23.4 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :---: | :---: | :---: |
| <RSENTO_base> | FFCF $0000_{\text {H }}$ | Peripheral Group 6 |
| <RSENT1_base> | FFCF $0080_{\text {H }}$ | Peripheral Group 6 |
| <RSENT2_base> | FFCF $0^{0100}{ }_{H}$ | Peripheral Group 6 |
| <RSENT3_base> | FFCF $0^{0180}{ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT4_base> | FFCF 0200 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT5_base> | FFCF 0280 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT6_base> | FFCF $0300{ }_{H}$ | Peripheral Group 6 |
| <RSENT7_base> | FFCF 0380 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT8_base> | FFCF 0400 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT9_base> | FFCF 0480 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT10_base> | FFCF 0500 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT11_base> | FFCF $0580_{\text {H }}$ | Peripheral Group 6 |
| <RSENT12_base> | FFCF $0600_{\mathrm{H}}$ | Peripheral Group 6 |
| <RSENT13_base> | FFCF 0680 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT14_base> | FFCF 0700 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT15_base> | FFCF 0780 ${ }_{\text {H }}$ | Peripheral Group 6 |
| <RSENT16_base> | FFCF 0800 ${ }_{\text {H }}$ | Peripheral Group 6 |

### 23.1.3 Clock Supply

The RSENT clock supply is shown in the following table.
Table 23.5 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| RSENTn | clkc (RSENT communication clock) | CLK_LSB |
|  | PCLK | CLK_LSB |

### 23.1.4 Interrupts Requests

The RSENT interrupt requests are listed in the following table.
Table 23.6 Interrupt Requests (1/2)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RSENT0 |  |  |  |  |  |
| INTRSENTORI | INTSENTORI | RSENT receive interrupt | 422 | group0-165 | group1-73 |

### 23.1.5 Reset Source

The RSENT reset source is listed in the following table. RSENT is initialized by the reset source.
Table 23.7 Reset Source

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| RSENTn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 23.1.6 External Input/Output Signals

The external input/output signals of RSENT are listed below.
Table 23.8 External Input/Output Signals (1/2)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| RSENT0 |  |  |
| sent_rx | RSENT data input | RSENTORX |
| sent_spc | RSENT data output | RSENTOSPCO |
| RSENT1 |  |  |
| sent_rx | RSENT data input | RSENT1RX |
| sent_spc | RSENT data output | RSENT1SPCO |
| RSENT2 |  |  |
| sent_rx | RSENT data input | RSENT2RX |
| sent_spc | RSENT data output | RSENT2SPCO |
| RSENT3 |  |  |
| sent_rx | RSENT data input | RSENT3RX |
| sent_spc | RSENT data output | RSENT3SPCO |
| RSENT4 |  |  |
| sent_rx | RSENT data input | RSENT4RX |
| sent_spc | RSENT data output | RSENT4SPCO |
| RSENT5 |  |  |
| sent_rx | RSENT data input | RSENT5RX |
| sent_spc | RSENT data output | RSENT5SPCO |
| RSENT6 |  |  |
| sent_rx | RSENT data input | RSENT6RX |
| sent_spc | RSENT data output | RSENT6SPCO |
| RSENT7 |  |  |
| sent_rx | RSENT data input | RSENT7RX |
| sent_spc | RSENT data output | RSENT7SPCO |
| RSENT8 |  |  |
| sent_rx | RSENT data input | RSENT8RX |
| sent_spc | RSENT data output | RSENT8SPCO |
| RSENT9 |  |  |
| sent_rx | RSENT data input | RSENT9RX |
| sent_spc | RSENT data output | RSENT9SPCO |
| RSENT10 |  |  |
| sent_rx | RSENT data input | RSENT10RX |
| sent_spc | RSENT data output | RSENT10SPCO |
| RSENT11 |  |  |
| sent_rx | RSENT data input | RSENT11RX |
| sent_spc | RSENT data output | RSENT11SPCO |
| RSENT12 |  |  |
| sent_rx | RSENT data input | RSENT12RX |
| sent_spc | RSENT data output | RSENT12SPCO |

Table 23.8 External Input/Output Signals (2/2)

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| RSENT13 |  |  |
| sent_rx | RSENT data input | RSENT13RX |
| sent_spc | RSENT data output | RSENT13SPCO |
| RSENT14 |  |  |
| sent_rx | RSENT data input | RSENT14RX |
| sent_spc | RSENT data output | RSENT14SPCO |
| RSENT15 |  |  |
| sent_rx | RSENT data input | RSENT15RX |
| sent_spc | RSENT data output | RSENT15SPCO |
| RSENT16 |  |  |
| sent_rx | RSENT data input | RSENT16RX |
| sent_spc | RSENT data output | RSENT16SPCO |

### 23.2 Overview

### 23.2.1 Functional Overview

- The RSENT interface supports the standard specification SAE J2716_201604 functions.
- Triple speed expansion tick time: Clock cycle ( $1 \mu \mathrm{~s}$ to $90 \mu \mathrm{~s}$ )
- Variable data transmission rate
- up to 74.9 kbps (based on 8 nibble data at $3 \mu \mathrm{~s}$ clock rate)
- up to 224.7 kbps (based on 8 nibble data at $1 \mu \mathrm{~s}$ clock rate)
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line.
- Transmission frame with up to 8 data nibbles + status / communication nibbles.
- Data transmission protected with CRC is available.
- CRC data can be read with the RSENTnSRXD.SCRC bits.
- Calibration phrase in each data frame (RSENTnCPL.CPLV bits)
- 1-wire interface (sent_rx and sent_spc share a single terminal.)
- Multiple sensors can be connected to the RSENT channel that has the standard expansion function.
- Received data from sensors is detected by software or DMA.
- Timestamp function is supported: Master can only be set for RSENT0.

For others, slave can only be set (RSENTnTSPC.TMS bit).

### 23.2.2 Block Diagram

Figure 23.1 shows a block diagram of the RSENT interface.

Figure 23.1 Block Diagram of RSENT

### 23.3 Registers

### 23.3.1 List of Registers

The RSENT registers are listed in the following table. For details about <RSENTn_base>, see Section 23.1.2,
Register Base Address.
Table 23.9 List of Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RSENTn | RSENT Timestamp Register | RSENTnTSPC | <RSENTn_base> + 0000 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Timestamp Counter Register | RSENTnTSC | <RSENTn_base> + 0004 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Communication Configuration Register | RSENTnCC | <RSENTn_base> + 0010 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Baud Rate Prescaler Register | RSENTnBRP | <RSENTn_base> + 0014 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Interrupt/DMA Enable Register | RSENTnIDE | <RSENTn_base> + 0018 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Mode Control Register | RSENTnMDC | <RSENTn_base> + 001 $\mathrm{C}_{\mathrm{H}}$ | 32 | - |
|  | RSENT SPC Transmission Register | RSENTnSPCT | <RSENTn_base> + 0020 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Mode Status Register | RSENTnMST | <RSENTn_base> + 0024 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Communication Status Register | RSENTnCS | <RSENTn_base> + 0028 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Communication Status Clear Register | RSENTnCSC | <RSENTn_base> + 002C ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Slow Channel Receive Timestamp Register | RSENTnSRTS | <RSENTn_base> + 0030 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Slow Channel Receive Data Register | RSENTnSRXD | <RSENTn_base> + 0034 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Calibration Pulse Length Register | RSENTnCPL | <RSENTn_base> + 0038 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Message Length Register | RSENTnML | <RSENTn_base> + 003C ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Fast Channel Receive Timestamp Register | RSENTnFRTS | <RSENTn_base> + 0040 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Fast Channel Receive Data Register | RSENTnFRXD | <RSENTn_base> + 0044 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Calibration Pulse Length Mirror Register | RSENTnCPLM | <RSENTn_base> + 0050 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Message Length Mirror Register | RSENTnMLM | <RSENTn_base> + 0054 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Fast Channel Receive TimeStamp Mirror Register | RSENTnFRTSM | <RSENTn_base> + 0058 ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Expanded Fast Channel Receive Data Register 0 | RSENTnEFRD0 | <RSENTn_base> + 005C ${ }_{\text {H }}$ | 32 | - |
|  | RSENT Expanded Fast Channel Receive Data Register 1 | RSENTnEFRD1 | <RSENTn_base> + 0060 ${ }_{\text {H }}$ | 32 | - |

### 23.3.2 RSENTnTSPC — RSENT Timestamp Register

Table 23.10 RSENTnTSPC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 16 | TMS | Timestamp Mode Selection |
|  |  | 0: Master mode |
|  |  | 1: Slave mode |
| 15 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 14 to 8 | TTM[6:0] | Timestamp Tick Multiplier |
|  |  | $0000000_{\mathrm{B}}: 1$ |
|  |  | $0000001_{\mathrm{B}}: 2$ |
|  |  | $0000010_{\mathrm{B}}: 3$ |
|  |  | : |
|  |  | 11111118: 128 |
| 7 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TTPV[6:0] | Timestamp Tick Prescaler Value |
|  |  | $00100111_{\mathrm{B}}: 40$ |
|  |  | Other than above: Setting prohibited |

Write the above value in the TTPV bits for transmission / reception via the RSENT.

## Timestamp Mode Selection (RSENTnTSPC.TMS)

This bit defines the timestamp counter synchronization mode.
For information about the timestamp clock settings, see Section 23.4.2.1, Timestamp.
When this bit is set to 0 , the timestamp counter operates in master mode.
When writing $00000000_{\mathrm{H}}$ to RSENTnTSC, the timestamp counter is cleared. In addition all RSENT timestamp counters operating as slave of RSENT are also cleared.
When this bit is set to 1 , the timestamp counter operates in slave mode.
The timestamp counter is only cleared by writing $00000000_{\mathrm{H}}$ to the timestamp counter of RSENT that operates in master mode.

The CPU can only write to this bit if the RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 B).
The RSENT operating in slave mode should have the same timestamp counter prescaler settings as the RSENT that
operates in master mode.
The CPU should not set this bit to 1 for RSENT that operates in master mode.
NOTE
In this product series, RSENTO is the only channel that can be set as a master.
Before synchronizing the timestamp counter, be sure to set RSENT0 and other channels as master mode and slave mode, respectively.

Synchronization of the timestamp counter when the above setting is not made is not guaranteed.

## Timestamp Tick Multiplier (RSENTnTSPC.TTM)

These bits define the multiplication value of the $1-\mu$ s time tick used for the timestamp counter.
For the timestamp clock configuration, see Section 23.4.2.1, Timestamp.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 B).

## Timestamp Tick Prescaler Value (RSENTnTSPC.TTPV)

These bits define the prescaler value to generate a $1-\mu$ s clock tick.
For the timestamp clock configuration, see Section 23.4.2.1, Timestamp.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).
The CPU should configure this value in such a way that, based on the supplied communication clock, a 1- $\mu$ s clock tick is generated.

### 23.3.3 RSENTnTSC — RSENT Timestamp Counter Register

Table 23.11 RSENTnTSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TS[31:0] | Timestamp counter value |

## Timestamp (RSENTnTSC.TS)

These bits indicate the current timestamp counter value.
The CPU can only write to these bits values other than $00000000_{\mathrm{H}}$ if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).
When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS $=1$ ), writing to this register has no effect when RSENT is in either of the OPERATION IDLE or OP-ERATION ACTIVE mode (the RSENTnMST.OMS bits are either $011_{\mathrm{B}}$ or $101_{\mathrm{B}}$ ).
The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when RSENT is in either of the OP-ERATION IDLE or OPERATION ACTIVE mode (the RSENTnMST.OMS bits are either $011_{\mathrm{B}}$ or $101_{\mathrm{B}}$ ).
When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS $=0$ ), the CPU writes $00000000_{\mathrm{H}}$ to these bits and RSENTnTSC.TS is set to $00000000_{\mathrm{H}}$.

When the slave mode setting is made for the timestamp counter (RSENTnTSPC.TMS $=1$ ), writing $00000000_{\mathrm{H}}$ to the RSENT0TSC.TS bit leads to the RSENTnTSC.TS bits being set to $00000000_{\mathrm{H}}$.
For timestamp mode selection, see Section 23.4.2.1, Timestamp.

### 23.3.4 RSENTnCC - RSENT Communication Configuration Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 23.12 RSENTnCC Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :---: | :---: |
| 3 to 1 | NDN[2:0] | Number of Data Nibbles |
|  |  | $000_{\mathrm{B}}: 1$ data nibble |
|  | $001_{\mathrm{B}}: 2$ data nibbles |  |
|  | $010_{\mathrm{B}}: 3$ data nibbles |  |
|  | $011_{\mathrm{B}}: 4$ data nibbles |  |
|  | $100_{\mathrm{B}}: 5$ data nibbles |  |
|  | $101_{\mathrm{B}}: 6$ data nibbles |  |
|  | $110_{\mathrm{B}}: 7$ data nibbles |  |
|  |  | $111_{\mathrm{B}}: 8$ data nibbles |
| 0 | SPCE | SPC Mode Enable |
|  |  | $0:$ SPC mode disabled |
|  |  | $1:$ SPC mode enabled |

## SPC Output Polarity Control (RSENTnCC.SOPC)

When this bit is set to 0 , the SPC pulse is sent as an active high signal. The default output value is low level. When this bit is set to 1 , the SPC pulse is sent as an active low signal. The default output value is high level. For the SPC operation, see also Section 23.4.4, SPC Function.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## Frame Check Method (RSENTnCC.FCM)

When this bit is set to 0 , the current calibration pulse is compared with the next received calibration pulse. The buffer update mechanism operates according to the preferred option as described in SAE J2716 2010. When this bit is set to 1 , the current calibration pulse is compared with the previously received calibration pulse. The buffer update mechanism operates according to the second option as described in SAE J2716 2010. This mechanism should be used only if extra latency to process the second calibration pulse cannot be tolerated. For the buffer update timings, see also Section 23.4.3.2(3), Fast Channel Message Reception. The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## Slow Channel CRC Check Disable (RSENTnCC.SCCD)

When this bit is set to $1, \mathrm{CRC}$ check for the slow channel is disabled. In this case, messages are stored in the slow channel message buffer with the received CRC.
When this bit is set to 1 , the RSENTnCS.SCS bit is not set.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## Fast Channel CRC Check Disable (RSENTnCC.FCCD)

When this bit is set to 1 , CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message buffer with the received CRC.
When this bit is set to 1 , the RSENTnCS.FCS bit is not set.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 B).

## Date Nibble CRC Format (RSENTnCC.DCF)

This bit selects between the SAE J2716 2016 data nibble CRC format and the legacy format.
When this bit is set to 0 , the recommended CRC implementation according to SAE J2716 2016 is selected.
When this bit is set to 1, the legacy CRC implementation according to SAE J2716 2008 is selected.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (RSENTnMST.OMS = 0018).

## Serial Message Format (RSENTnCC.SMF)

These bits define the serial message format expected to be received for automatic extraction.
When these bits are set to $00_{\mathrm{B}}$, no serial message is extracted and the communication and status nibble are provided in the RSENTnSRXD register.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

The CPU shall set these bits to 00 when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to RSENT.

## Pause Pulse Type Configuration (RSENTnCC.PPTC)

This bit defines the pause pulse type.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001{ }_{B}$ ).
The CPU should not set this bit to 1 when the RSENTnCC.PPC bit is set to 0 .

## Pause Pulse Configuration (RSENTnCC.PPC)

This bit defines the presence or absence of the pause pulse.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## Number of Data Nibbles (RSENTnCC.NDN)

These bits define the number of data nibbles included in a SENT message.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{B}$ ).

## SPC Mode Enable (RSENTnCC.SPCE)

This bit enables the SPC mode.
For details about SPC mode operation, see also Section 23.4.4, SPC Function.
The CPU can only write to this bit if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001 B).

### 23.3.5 RSENTnBRP — RSENT Baud Rate Prescaler Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | $\text { 11111110 }: 127$ |
|  |  | $1111111^{\text {B }} 128$ |
| 7 to 5 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |

Table 23.13 RSENTnBPR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 to 0 | SCMV[4:0] | Sample Clock Multiplication Value |
|  |  | $00000_{\mathrm{B}}: 1$ |
|  | $0001_{\mathrm{B}}: 2$ |  |
|  | $00010_{\mathrm{B}}: 3$ |  |
|  | $:$ |  |
|  | $11110_{\mathrm{B}}: 31$ |  |
|  | $1111_{\mathrm{B}}: 32$ |  |

## Time Tick Decimal Fraction (RSENTnBRP.TTF)

These bits define the decimal part of the tick length in $0.1-\mu$ s granularity.
For the tick length configuration, see Section 23.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## Time Tick Integer (RSENTnBRP.TTI)

These bits define the integer part of the tick length.
For the tick length configuration, see Section 23.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## Sample Clock Division Value (RSENTnBRP.SCDV)

These bits define the division value for the sample clock generation logic.
For the RSENTnBRP settings, see Section 23.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

## Sample Clock Multiplication Value (RSENTnBRP.SCMV)

These bits define the multiplication value for the sample clock generation logic.
For the RSENTnBRP settings, see Section 23.4.2.2(2), RX and SPC Tick Settings.
The CPU can only write to these bits if RSENT is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_{\mathrm{B}}$ ).

### 23.3.6 RSENTnIDE — RSENT Interrupt / DMA Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 23.14 RSENTnIDE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | - | Reserved. <br> When read, the value after reset is read. When writing, write the value after reset. |
| 10 | SEIE | Slow Channel Encoding Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 9 | SMIE | Slow Channel Message Lost Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 8 | SCIE | Slow Channel CRC Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 7 | NRIE | No Response Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 6 | CVIE | Calibration Pulse Length Variation Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 5 | CLIE | Calibration Pulse Length Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 4 | FNIE | Fast Channel Nibble Count Error Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 3 | FEIE | Fast Channel Nibble Encoding Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 2 | FMIE | Fast Channel Message Lost Interrupt Enable <br> 0: Interrupt disabled <br> 1: Interrupt enabled |
| 1 | FCIE | Fast Channel CRC Error Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |
| 0 | FRIE | Fast Channel Receive Interrupt Enable <br> 0 : Interrupt disabled <br> 1: Interrupt enabled |

## Slow Channel Encoding Error Interrupt Enable (RSENTnIDE.SEIE)

This bit enables the generation of the slow channel encoding error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Slow Channel Message Lost Interrupt Enable (RSENTnIDE.SMIE)

This bit enables the generation of the slow channel message lost interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Slow ChanneI CRC Error Interrupt Enable (RSENTnIDE.SCIE)

This bit enables the generation of the slow channel CRC error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## No Response Error Interrupt Enable (RSENTnIDE.NRIE)

This bit enables the generation of the no response error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ). The CPU should not set this bit when the SPC mode is disabled (RSENTnCC.SPCE set to 0 ).

## Calibration Pulse Length Variation Error Interrupt Enable (RSENTnIDE.CVIE)

This bit enables the generation of the calibration pulse length variation error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).
Calibration Pulse Length Error Interrupt Enable (RSENTnIDE.CLIE)
This bit enables the generation of the calibration pulse length error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{B}$ ).

## Fast Channel Nibble Count Error Interrupt Enable (RSENTnIDE.FNIE)

This bit enables the generation of the fast channel nibble count error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Fast Channel Nibble Encoding Error Interrupt Enable (RSENTnIDE.FEIE)

This bit enables the generation of the fast channel nibble encoding error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Fast Channel Message Lost Interrupt Enable (RSENTnIDE.FMIE)

This bit enables the generation of the fast channel message lost interrupt.
The CPU cannot write to this bit if the RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Fast Channel CRC Error Interrupt Enable (RSENTnIDE.FCIE)

This bit enables the generation of the fast channel CRC error interrupt.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

## Fast Channel Receive Interrupt Enable (RSENTnIDE.FRIE)

This bit enables the generation of the fast channel receive interrupt.
The fast channel receive interrupt can be also used to notify a DMA request.
The CPU cannot write to this bit if RSENT is in the RESET mode (the RSENTnMST.OMS bits are $000_{\mathrm{B}}$ ).

### 23.3.7 RSENTnMDC — RSENT Mode Control Register

Table 23.15 RSENTnMDC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | OMC[2:0] | Operation Mode Control |
|  | $000_{\mathrm{B}}:$ RESET |  |
|  | $001_{\mathrm{B}}:$ CONFIGURATION |  |
|  | $011_{\mathrm{B}}:$ OPERATION IDLE |  |
|  | $101_{\mathrm{B}}:$ OPERATION ACTIVE |  |
|  |  | Other than above: Setting prohibited |

## Operation Mode Control (RSENTnMDC.OMC)

These bits are used to control the operation mode of RSENT.

- $000_{\mathrm{B}}$ : RESET

In RESET mode, the mode can only be changed to CONFIGURATION mode.

- 001 ${ }_{\mathrm{B}}$ : CONFIGURATION

In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.

- $011_{\mathrm{B}}$ : OPERATION IDLE

In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.

- $101_{\mathrm{B}}$ : OPERATION ACTIVE

In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to proceed to the OPERATION IDLE mode first.

For the recommended methods to change between operation modes, see Section 23.4.3.1, Changing Operation Modes.

- Other than above: Setting prohibited

The CPU should not write any other value than listed above into this register.
The CPU should follow the mode change flows as shown in Section 23.4.3.1, Changing Operation Modes.

### 23.3.8 RSENTnSPCT — RSENT SPC Transmission Register

Table 23.16 RSENTnSPCT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 7 | - | Reserved. |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TLL[6:0] | Length of the Trigger Low Phase in Ticks |
|  |  | $0000000_{\mathrm{B}}: 1$ tick |
| $000001_{\mathrm{B}}: 2$ ticks |  |  |
|  | $0000010_{\mathrm{B}}: 3$ ticks |  |
|  |  |  |
|  |  | $111110_{\mathrm{B}}: 127$ ticks |
|  |  | $111111_{\mathrm{B}}: 128$ ticks |

## Trigger Low Length (RSENTnSPCT.TLL)

These bits define the length of the SPC trigger pulse.
When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent immediately independently of the current status of the RSENT.
For details about SPC communication, see Section 23.4.4, SPC Function.
The CPU can only write to these bits if RSENT is in the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are $101_{\mathrm{B}}$ ) and SPC communication is enabled (RSENTnCC.SPCE is 1 ).
It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.
After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

### 23.3.9 RSENTnMST — RSENT Mode Status Register

Table 23.17 RSENTnMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 2 to 0 | OMS[2:0] | Operation Mode Status |
|  | $000_{\mathrm{B}}:$ RESET |  |
|  | $001_{\mathrm{B}}:$ CONFIGURATION |  |
|  | $011_{\mathrm{B}}:$ OPERATION IDLE |  |
|  | $101_{\mathrm{B}}:$ OPERATION ACTIVE |  |
|  | Other than above: Reserved |  |
|  |  |  |

## Operation Mode Status (RSENTnMST.OMS)

These bits indicate the current operation mode.
These bits are read only.
These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- $000_{\mathrm{B}}$ : RESET mode

When in RESET mode, all registers are set to their reset values, and write access to all registers except the RSENTnMDC register is disabled.
When in RESET mode, SENT communication is disabled.

- 001 ${ }_{\mathrm{B}}$ : CONFIGURATION mode

When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC registers), configuration registers (RSENTnCC and RSENTnBRP registers), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.
When in CONFIGURATION mode, SENT communication is disabled.
When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.

- $011_{\mathrm{B}}$ : OPERATION IDLE mode

In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.
When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

- 101 : OPERATION ACTIVE mode

In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.

- Other than above: Reserved

### 23.3.10 RSENTnCS — RSENT Communication Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## Slow Channel Encoding Error Status (RSENTnCS.SES)

This bit represents the slow channel encoding error status.
This bit is read only.
In the short serial message format ( $\mathrm{RSENTnCC} . \operatorname{SMF}=01_{\mathrm{B}}$ ), this bit is set when the sequence on serial start bit (status \& communication nibble bit \#3) is different from "1000 $000000000000_{\mathrm{B}}$ " (a single 1 and 150 s ).
In the enhanced serial message format ( $\mathrm{RSENTnCC} . S M F=10_{\mathrm{B}}$ ), this bit is set after receiving the serial message start frame (sequence on status \& communication nibble bit 3 is $01111110_{\mathrm{B}}$ ), and if bit 13 or bit 18 are not received as " 0 ". This bit is cleared by writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Slow Channel Message Lost Status (RSENTnCS.SMS)

This bit represents the slow channel message lost status.
This bit is read only.
This bit is set when there is an attempt to update the slow channel message buffer, but the previous message has not been read yet.
This bit is cleared by writing 1 to RSENTnCSC.SEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Slow Channel CRC Error Status (RSENTnCS.SCS)

This bit represents the slow channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0 ).

This bit is cleared by writing 1 to RSENTnCSC.SCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

## No Response Error Status (RSENTnCS.NRS)

This bit represents the no response error status.
This bit is read only.
This bit is set when

- The CPU writes to the RSENTnSPCT.TLL bits
- SPC mode enabled (RSENTnCC.SPCE set to 1 )
- No complete response was received from the sensor for the previous SPC trigger

This bit is set after 4 PCLK +5 clkc (Maximum time) from the CPU writes to the RSENTnSPCT.TLL.
This bit is cleared by writing 1 to RSENTnCSC.NRC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

## Calibration Pulse Length Variation Error Status (RSENTnCS.CVS)

This bit represents the calibration pulse length variation error status.
This bit is read only.
When RSENTnCC.PPTC is 0 , then this bit is set when two successive calibration pulses differ by more than $1.5625 \%$. When RSENTnCC.PPTC is 1 , this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.
This bit is cleared by writing 1 to RSENTnCSC.CVC.

This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{B}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Calibration Pulse Length Error Status (RSENTnCS.CLS)

This bit represents the calibration pulse length error status.
This bit is read only
This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of $25 \%$ from specification length ( 56 clock ticks)).
This bit is cleared by writing 1 to RSENTnCSC.CLC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION). If the set condition occurs simultaneously with the clear condition, the bit is set.

## Fast Channel Nibble Count Error Status (RSENTnCS.FNS)

This bit represents the fast channel nibble count error status.
This bit is read only.
This bit is set when there is an unexpected number of falling edges between two calibration pulses.
This bit is cleared by writing 1 to RSENTnCSC.FNC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Fast Channel Nibble Encoding Error Status (RSENTnCS.FES)

This bit represents the fast channel nibble encoding error status.
This bit is read only.
This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks. This bit is cleared by writing 1 to RSENTnCSC.FEC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Fast Channel Message Lost Status (RSENTnCS.FMS)

This bit represents the fast channel message lost status.
This bit is read only.
This bit is set when the fast channel message buffer is updated, but the previous messages in the foreground and background buffer have not been read yet.
This bit is cleared by writing 1 to RSENTnCSC.FMC.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Fast Channel CRC Error Status (RSENTnCS.FCS)

This bit represents the fast channel CRC error status.
This bit is read only.
This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0 ).

This bit is cleared by writing 1 to RSENTnCSC.FCC.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{B}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

## Fast Channel Receive Status (RSENTnCS.FRS)

This bit represents the fast channel receive status.
This bit is read only.
This bit is set when the fast channel receive message buffer was updated.
This bit is cleared when the CPU reads the RSENTnFRXD.FND bit.

This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).
If the set condition occurs simultaneously with the clear condition, the bit is set.

### 23.3.11 RSENTnCSC — RSENT Communication Status Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

Table 23.19 RSENTnCSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | - | Reserved. <br> When read, the value after reset is read. When writing, write the value after reset. |
| 10 | SEC | Slow Channel Encoding Error Interrupt Clear <br> 0 : - <br> 1: Clear |
| 9 | SMC | Slow Channel Message Lost Interrupt Clear <br> $0:-$ <br> 1: Clear |
| 8 | SCC | Slow Channel CRC Error Interrupt Clear <br> $0:-$ <br> 1: Clear |
| 7 | NRC | No Response Error Interrupt Clear 0: - <br> 1: Clear |
| 6 | CVC | Calibration Pulse Length Variation Error Interrupt Clear $0:-$ <br> 1: Clear |
| 5 | CLC | Calibration Pulse Length Error Interrupt Clear $0:-$ <br> 1: Clear |
| 4 | FNC | Fast Channel Nibble Count Error Interrupt Clear <br> $0:$ - <br> 1: Clear |
| 3 | FEC | Fast Channel Nibble Encoding Error Interrupt Clear <br> 0: - <br> 1: Clear |
| 2 | FMC | Fast Channel Message Lost Interrupt Clear $0:-$ <br> 1: Clear |
| 1 | FCC | Fast Channel CRC Error Interrupt Clear $0:-$ <br> 1: Clear |
| 0 | - | Reserved. <br> When read, the value after reset is read. When writing, write the value after reset. |

## Slow Channel Encoding Error Clear (RSENTnCSC.SEC)

Writing 1 sets RSENTnCS.SES to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Slow Channel Message Lost Clear (RSENTnCSC.SMC)

Writing 1 sets RSENTnCS.SMS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Slow Channel CRC Error Clear (RSENTnCSC.SCC)

Writing 1 sets RSENTnCS.SCS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## No Response Error Clear (RSENTnCSC.NRC)

Writing 1 sets RSENTnCS.NRS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Calibration Pulse Length Variation Error Clear (RSENTnCSC.CVC)

Writing 1 sets RSENTnCS.CVS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Calibration Pulse Length Error Clear (RSENTnCSC.CLC)

Writing 1 sets RSENTnCS.CLS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Fast Channel Nibble Count Error Clear (RSENTnCSC.FNC)

Writing 1 sets RSENTnCS.FNS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Fast Channel Nibble Encoding Error Clear (RSENTnCSC.FEC)

Writing 1 sets RSENTnCS.FES to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

## Fast Channel Message Lost Clear (RSENTnCSC.FMC)

Writing 1 sets RSENTnCS.FMS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .
Fast Channel CRC Error Clear (RSENTnCSC.FCC)
Writing 1 sets RSENTnCS.FCS to 0 .
Writing 0 has no effect.
This bit is always read as 0 .

### 23.3.12 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

Table 23.20 RSENTnSRTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | STS | Slow Channel Receive Timestamp |

## Slow Channel Timestamp (RSENTnSRTS.STS)

These bits are read only.
These bits are updated when the slow channel receive buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.13 RSENTnSRXD — RSENT Slow Channel Receive Data Register

| Value after reset: |  |  | $00000000{ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | SND | - | SCRC[5:0] |  |  |  |  |  | - | - | - | SMGC | IDD[19:16] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | IDD[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 23.21 RSENTnSRXD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | SND | Slow Channel New Data <br> 0: Slow channel frame data is not updated since last read. <br> 1: Slow channel frame data is updated since last read. |
| 30 | - | Reserved. <br> When read, the value after reset is read. |
| 29 to 24 | SCRC[5:0] | Slow Channel CRC Data |
| 23 to 21 | - | Reserved. <br>  <br> 20 |
|  | SMGC read, the value after reset is read. |  |
| 19 to 0 | IDD[19:0] | Slow Channel Configuration |
|  |  | 0: The slow channel receive message buffer is not updated. |

## Slow Channel New Data (RSENTnSRXD.SND)

This bit indicates that the slow channel message buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel receive message buffer is updated.
This bit is cleared automatically whenever it is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

## Slow Channel CRC (RSENTnSRXD.SCRC)

These bits represent the slow channel CRC data.
These bits are read only.
These bits are updated when the slow channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001B (CONFIGURATION).

## Slow Channel Configuration (RSENTnSRXD.SMGC)

This bit represents the slow channel configuration bit data.
This bit is read only.
This bit is updated when the slow channel receive message buffer is updated.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

## ID / Data (RSENTnSRXD.IDD)

These bits represent the slow channel data and ID information.
The alignment within this register depends on the message format. For details, see Section 23.4.3.2(5), Slow

## Channel Message Reception.

These bits are read only.
These bits are updated when the slow channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.14 RSENTnCPL — RSENT Calibration Pulse Length Register

Table 23.22 RSENTnCPL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 16 to 0 | CPLV[16:0] | Calibration Pulse Length Value of Received Message |

## Calibration Pulse Length Value (RSENTnCPL.CPLV)

These bits are used by the CPU to calculate the ratio of two consecutive calibration pulses or the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.
These bits are read only.
In modes other than pause pulse with fixed message length (RSENTnCC.PPTC $=1$ ) or SPC mode (RSENTnCC.SPCE $=1$ ), these bits are invalid and should not be used.

These bits are updated with the measured calibration pulse length in sample clock ticks when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.15 RSENTnML — RSENT Message Length Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 23.23 RSENTnML Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 20 to 0 | MLV[20:0] | Message length of received message |

## Message Length Value (RSENTnML.MLV)

These bits are used by the CPU to calculate the ratio of the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.
These bits are read only.
In modes other than pause pulse with fixed message length, these bits are invalid and should not be used.
These bits are updated with the measured message length in sample clock ticks when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.16 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

Value after reset: $00000000_{\mathrm{H}}$

Table 23.24 RSENTnFRTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FTS[31:0] | Fast Channel Receive Timestamp |

## Fast Channel Timestamp (RSENTnFRTS.FTS)

These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.17 RSENTnFRXD — RSENT Fast Channel Receive Data Register

Table 23.25 RSENTnFRXD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | SNDM | Slow Channel New Data Mirror |
|  |  | $0:$ Slow channel frame data is not updated since last read. |
|  | 1: Slow channel frame data is updated since last read. |  |
| 30 | FND | Fast Channel New Data |
|  |  | 0: Fast channel frame data is not updated since last read. |
|  | 1: Fast channel frame data is updated since last read. |  |
| 29,28 | FCCN[1:0] | Fast Channel Communication Nibble bits [1:0] |
| 27 to 24 | FCRC[3:0] | Fast Channel CRC Data |
| 23 to 0 | ND[23:0] | Fast Channel Nibble Data |

## Slow Channel New Data Mirror (RSENTnFRXD.SNDM)

This bit indicates that the slow channel message buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel receive message buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
This bit is cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

## Fast Channel New Data (RSENTnFRXD.FND)

This bit indicates that the fast channel message buffer is holding data that has not been read.
This bit is read only.
This bit is set when the fast channel receive message buffer is updated.
This bit is cleared automatically whenever it is read RSENTnFRXD or RSENTnEFRD1.
This bit is cleared when the RSENTnMST.OMS bits are changed to $001_{\text {в }}$ (CONFIGURATION).

## Fast Channel Status and Communication Nibble (RSENTnFRXD.FCCN)

These bits represent the fast channel status and communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## Fast Channel CRC (RSENTnFRXD.FCRC)

These bits represent the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to $001_{\text {B }}$ (CONFIGURATION).

## Nibble Data (RSENTnFRXD.ND)

These bits representi the fast channel nibble data.
The alignment of the nibble data depends on nibble data count (RSENTnCC.NDN). For details, see Section

### 23.4.3.2(3), Fast Channel Message Reception.

These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when the RSENTnMST.OMS bits are changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.18 RSENTnCPLM — RSENT Calibration Pulse Length Mirror Register

Value after reset: $00000000_{\mathrm{H}}$

Table 23.26 RSENTnCPLM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 16 to 0 | CPLVM[16:0] | Calibration pulse length Value (Mirror) of received message |

## Calibration Pulse Length Value Mirror (RSENTnCPLM.CPLVM)

These bits are mirror bits of RSENTnCPL.CPLV.
These bits are read only.
In modes other than pause pulse with fixed message length (RSENTnCC.PPTC $=1$ ) or SPC mode (RSENTnCC.SPCE $=1$ ), these bits are invalid and should not be used.
These bits are updated with the measured calibration pulse length in sample clock ticks when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.19 RSENTnMLM — RSENT Message Length Mirror Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 23.27 RSENTnMLM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 21 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 20 to 0 | MLV[20:0] | Message length value (Mirror) of received message |

## Message Length Value Mirror (RSENTnMLM.MLVM)

These bits are mirror bits of RSENTnML.MLV.
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.20 RSENTnFRTSM — RSENT Fast Channel Receive Timestamp Mirror Register

Table 23.28 RSENTnFRTSM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FRTSM[31:0] | Fast channel receive Timestamp (Mirror) |

## Fast Channel TimeStamp Mirror (RSENTnFRTSM.FTSM)

These bits are mirror bits of RSENTnFRTS.FTS.
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.21 RSENTnEFRD0 — RSENT Expanded Fast Channel Receive Data Register 0

| Value after reset: $\quad 0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 23.29 RSENTnEFRD0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved. |
|  |  | When read, the value after reset is read. |
| 7 | SNDM | Slow channel New Data (Mirror) |
|  |  | 0: Slow channel frame data not updated since last read |
|  |  | 1: Slow channel frame data updated since last read |
| 6 | FND | Fast channel New Data |
|  |  | 0: Fast channel frame data not updated since last read |
|  |  | 1: Fast channel frame data updated since last read |
| 5 to 4 | FCCN[1:0] | Fast Channel Communication Nibble bits [1:0] |
| 3 to 0 | FCRC[3:0] | Fast channel CRC data |

## Slow Channel New Data Mirror (RSENTn EFRDO.SNDM)

This bit indicates that the slow channel message buffer is holding data that has not been read.
This bit is read only.
This bit is set when the slow channel receive message buffer is updated.
This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.
This bit is cleared when RSENTnMST.OMS is changed to 001 $1_{\mathrm{B}}$ (CONFIGURATION).

## Fast Channel New Data (RSENTnEFRDO.FND)

This bit indicates that the fast channel message buffer is holding data that has not been read.
This bit is read only.
This bit is set when the fast channel receive message buffer is updated.
This bit is cleared automatically whenever it is read RSENTnFRXD or RSENTnEFRD1.
This bit is cleared when RSENTnMST.OMS is changed to 001 ${ }_{\mathrm{B}}$ (CONFIGURATION).

## Fast Channel Communication Nibble (RSENTnEFRDO.FCCN)

These bits represent the fast channel communication nibble bits [1:0].
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

## Fast Channel CRC (RSENTn EFRD0.FCRC)

These bits represent the fast channel CRC data.
These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.3.22 RSENTnEFRD1 — RSENT Expanded Fast Channel Receive Data Register 1

Value after reset: $00000000_{\mathrm{H}}$

Table 23.30 RSENTnEFRD1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ND[31:0] | Nibble Data |
|  |  | Fast channel nibble data |

## Nibble Data (RSENTnEFRD1.ND)

These bits represent the fast channel nibble data.
The alignment of the nibble data depends on nibble count. For details, refer to Section 23.4.3.2(3), Fast Channel

## Message Reception.

These bits are read only.
These bits are updated when the fast channel receive message buffer is updated.
These bits are cleared when RSENTnMST.OMS is changed to $001_{\mathrm{B}}$ (CONFIGURATION).

### 23.4 Operation

### 23.4.1 Modes of Operation

RSENTn operates in any of the following modes:

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

The mode transitions should follow the flow in Section 23.4.3.1, Changing Operation Modes.
The RSENTnMST.OMS bit can be used to confirm the current operation mode.

Figure 23.2 shows the possible transitions between the channel modes:

Figure 23.2 Transition between Operation Modes

### 23.4.1.1 RESET Mode

This mode is the initial mode that the RSENT automatically enters after release from the hardware reset (MCU reset). Its purpose is to provide a clean reset of the registers in RSENT.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to $000_{\text {B }}$. In this state, all configuration, control (except RSENTnMDC.OMC bits), and status registers are set to their reset value. Any on-going transmission or reception process is stopped immediately and the interface pins of RSENT are set to the value after their reset.

Read access to all registers is possible in RESET mode. Write access is limited to the RSENTnMDC register.

### 23.4.1.2 CONFIGURATION Mode

The CONFIGURATION mode is entered after the RSENTnMDC.OMC bits have been set to $001_{\mathrm{B}}$. The interface pins of the RSENT are set to their default values.

In CONFIGURATION mode, all status registers (RSENTnCS) and the receive buffer registers (RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD, RSENTnCPLM, RSENTnMLM, RSENTnFRTSM, RSENTnEFRD0, RSENTnEFRD1) are set to their default value.

Read access to all registers is possible in this state.
Write access is limited to both timestamp registers (RSENTnTSPC and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, and RSENTnMDC).

### 23.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $011_{\mathrm{B}}$.
In OPERATION IDLE mode, no reception and transmission are done.
When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in OPERATION IDLE mode.
Write access is limited to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

### 23.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $101_{\mathrm{B}}$.
In OPERATION ACTIVE mode, transmission and reception can take place.
Read access to all registers is possible in this state.
Write access is limited to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

### 23.4.1.5 Register Behavior in Operation Modes

Table 23.31 shows the register behavior when RSENT transitions to the indicated operation modes. The table also gives an overview of the access restriction in each operation mode.

Table 23.31 Register Behavior in Operation Modes

| Register Name | Symbol | Reset <br> Change | RESET Mode |  | CONFIGURATION Mode |  | OPERATION IDLE Mode |  | OPERATION ACTIVE Mode |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Change | R/W | Change | R/W | Change | R/W | Change | R/W |
| Timestamp Prescaler Configuration Register | RSENTnTSPC | 00000000 H | 00000000 H | R | Unchanged | RW | Unchanged | R | Unchanged | R |
| Timestamp Counter Register | RSENTnTSC | $00000000{ }_{\text {H }}$ | $00000000_{\mathrm{H}}$ | R | Unchanged | RW | Unchanged | R/W*1 | Unchanged | $\mathrm{R} \mathrm{W}^{* 1}$ |
| Communication Configuration Register | RSENTnCC | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | Unchanged | RW | Unchanged | R | Unchanged | R |
| Baud Rate Prescaler Register | RSENTnBRP | 00000000 H | $00000000{ }_{\text {H }}$ | R | Unchanged | RW | Unchanged | R | Unchanged | R |
| Interrupt/DMA Enable Register | RSENTnIDE | 00000000 H | 00000000 H | R | Unchanged | RW | Unchanged | RW | Unchanged | RNW |
| Mode Control Register | RSENTnMDC | $00000000{ }_{\text {H }}$ | $00000000{ }_{\text {H }}$ | RW | Unchanged | RW | Unchanged | RW | Unchanged | RNW |
| SPC Transmission Register | RSENTnSPCT | $00000000{ }_{\text {H }}$ | $00000000{ }_{\text {H }}$ | R | Unchanged | R | Unchanged | R | Unchanged | RW |
| Mode Status Register | RSENTnMST | $00000000_{\text {H }}$ | $00000000_{\mathrm{H}}$ | R | 0000 0001H | R | 0000 0003H | R | 0000 0005H | R |
| Communication Status Register | RSENTnCS | 00000000 H | 00000000 H | R | 00000000 H | R | Unchanged | R | Unchanged | R |
| Communication Status Clear Register | RSENTnCSC | 00000000 н | $00000000{ }_{\text {H }}$ | R | Unchanged | RW | Unchanged | RW | Unchanged | RNW |
| Slow channel Receive Timestamp Register | RSENTnSRTS | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | 0000 0000H | R | Unchanged | R | Unchanged | R |
| Slow channel Receive Data Register | RSENTnSRXD | 0000 0000 ${ }_{\text {H }}$ | $00000000{ }_{\text {H }}$ | R | $00000000_{\text {H }}$ | R | Unchanged | R | Unchanged | R |
| Calibration Pulse Length Register | RSENTnCPL | 00000000 н | 0000 0000н | R | 0000 0000н | R | Unchanged | R | Unchanged | R |
| Message Length Register | RSENTnML | $00000000_{\text {H }}$ | $00000000_{\mathrm{H}}$ | R | $00000000_{H}$ | R | Unchanged | R | Unchanged | R |
| Fast channel Receive Timestamp Register | RSENTnFRTS | $00000000_{\text {H }}$ | $00000000_{\mathrm{H}}$ | R | $00000000^{H}$ | R | Unchanged | R | Unchanged | R |
| Fast channel Receive Data Register | RSENTnFRXD | 00000000 H | 0000 0000н | R | 0000 0000н | R | Unchanged | R | Unchanged | R |
| Calibration Pulse Length Mirror Register | RSENTnCPLM | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Message Length Mirror Register | RSENTnMLM | $00000000{ }_{\text {H }}$ | $00000000_{\text {H }}$ | R | $00000000_{H}$ | R | Unchanged | R | Unchanged | R |
| Fast channel Receive Timestamp Mirror Register | RSENTnFRTSM | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | $00000000_{\mathrm{H}}$ | R | Unchanged | R | Unchanged | R |
| Expanded Fast channel Receive Data Register0 | RSENTnEFRD0 | $00000000_{\text {H }}$ | 0000 0000 ${ }_{\text {H }}$ | R | $00000000^{H}$ | R | Unchanged | R | Unchanged | R |
| Expanded Fast channel Receive <br> Data r Register1 | RSENTnEFRD1 | $00000000_{\text {H }}$ | $00000000_{\text {H }}$ | R | $00000000_{H}$ | R | Unchanged | R | Unchanged | R |

Note 1. R/W: Means write restriction exists.

### 23.4.1.6 Mode Status Change Timing

This section shows the change timing of the RSENTnMST.OMS register, i.e. the timing properties of the arrows in Figure 23.2. Table 23.32 shows the change timing with respect to falling edge detection, PCLK, clkc and sample clock.

Table 23.32 Mode Status Change Timing

| RESET $\rightarrow$ CONFIG | 5 PCLK +3 clkc |
| :--- | :--- |
| CONFIG $\rightarrow$ OPA | 5 PCLK +6 clkc |
| OPA $\rightarrow$ OPI | Falling edge of next frame sync nibble +5 sample clocks +4 clkc +4 PCLK |
| OPI $\rightarrow$ CONFIG | 4 PCLK +4 clkc |
| OPA $\rightarrow$ CONFIG | 4 PCLK +7 clkc +1 sample clock +1 PCLK - safety margin for user $)$ |
| OPI $\rightarrow$ OPA | 5 PCLK +6 clkc |

In case frame reception has not started so far (falling edge of calibration pulse of 1st frame not detected)

| OPA $\rightarrow$ OPI | 5 PCLK +1 sample clock +7 clkc |
| :--- | :--- |

Note: Latency of each mode to reset is immediate after CPU write.
OPI means "OPERATION IDLE mode".
OPA means "OPERATION ACTIVE mode".

### 23.4.2 Clock Configuration

### 23.4.2.1 Timestamp

## (1) Timestamp Clock Configuration

RSENT incorporates the timestamp counter.
Depending on the supplied communication frequency(clkc), the user should configure the RSENTnTSPC.TTPV bits to set the output of prescaler TPV to $1 \mu$ s clock tick.

Depending on the configured tick lengths, the resolution can be decreased by configuring the RSENTnTSPC.TTM bits. The already divided input frequency is divided further by the value of the RSENTnTSPC.TTM bits.

Figure 23.3 Timestamp Counter Clock Generation

## (2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when RSENT is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU can reset the timestamp counter by writing $00000000_{\mathrm{H}}$ to the RSENTnTSC.TS bits when RSENT is in OPERATION_IDLE or OPERATION_ACTIVE mode.

When timestamp counters are configured to operate in slave mode ( RSENTnTSPC.TMS $=1$ ), the timestamp counter is cleared when the CPU writes $00000000_{\mathrm{H}}$ to the RSENTnTSC.TS bits of the channel set in the master when RSENT is in OPERATION_IDLE or OPERATION ACTIVE mode.

Make the same settings for the timestamp counter prescalers of channels operating in master mode and slave mode.
When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.
The current timestamp counter value can be read from the RSENTnTSC.TS bits.
When RSENT is in OPERATION ACTIVE mode, each received message is stored with its related timestamp.
Timestamp values are taken for fast channel and slow channel data.
The timestamp value is captured when the calibration pulse is detected.
The timestamp value for the fast channel is stored in the RSENTnFRTS.FTS bits or RSENTnFRTSM.FTSM bits register field when the fast channel receive message buffer is updated.

The timestamp value for the slow channel is stored in the RSENTnSRTS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message. In case timestamp counter synchronization is required, the following flow should be used.

Figure 23.4 Timestamp Counter Synchronization

Synchronization of the timestamp can be done if the state of the master module has changed to OPERATION_ACTIVE or OPERATION_IDLE.

### 23.4.2.2 Communication Clock Configuration

## (1) RX BRP Setting

"RSENT communication clock frequency ( $\mathrm{f}_{\text {COMMUNICATION)" }}$ is multiplied by the configured lowest term fraction set by RSENTnBRP.SCDV and RSENTnBRP.SCMV to generate the sample clock.

The RSENTnBRP.SCDV and RSENTnBRP.SCMV values should be selected in such a way that a sample clock frequency ( $\mathrm{f}_{\text {SAMPLE }}$ ) of 16 MHz is generated according to the following formula.

$$
f_{\text {SAMPLE }}=16 \mathrm{MHz}=f_{\text {COMMUNICATION }} \times \frac{\text { Sample Clock Multiplication Value }(\text { RSENTnBRP.SCMV+1) }}{\text { Sample Clock Division Value }(\text { RSENTnBRP.SCDV }+1)}
$$

Where Sample Clock Multiplication Value (RSENTnBRP.SCMV) $=00001_{B}$,
Sample Clock Division Value (RSENTnBRP.SCDV) $=0000100_{\mathrm{B}}$,
$\mathrm{f}_{\text {COMMUNICATION }}=40 \mathrm{MHz}$
$\mathrm{f}_{\text {SAMPLE }}=40 \times 2 / 5=16 \mathrm{MHz}$

## (2) RX and SPC Tick Settings

The used tick length in the RX and SPC functions can be configured with the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths from $1.0 \mu$ s to $90.0 \mu$ s with a resolution of $0.1 \mu$ s can be configured.

The RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$
T_{\text {Tick }}=T_{\text {RSENTnBRP.TTI }}+T_{\text {RSENTnBRP.TTF }}
$$

Where RSENTnBRP.TTI $=0000000_{\mathrm{B}}$, RSENTnBRP.TTF $=0011_{\mathrm{B}}$
$\mathrm{T}_{\text {Tick }}=1+0.3=1.3 \mu \mathrm{~s}$

### 23.4.3 RSENT Operation

When starting transfer through RSENTn in this product series, be sure to make the pin settings corresponding to the RSENTn interface, then follow the flow for the individual settings described in this section.

For details about the pin settings, see Section 2, Pin Function.

### 23.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode, RSENT begins to receive messages or SPC communication can be started depending on the configuration.

Figure 23.5 shows the communication enable flow assuming that the RSENT is in RESET mode.

Figure 23.5 Communication Enable Flow

To leave OPERATION ACTIVE mode, communication should be disabled first by transitioning to OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

However, when the SPC is enabled (RSENTnCC.SPCE $=1$ ) and the SPC trigger transmission has not been requested after the previous SPC communication has been completed (e.g. successful reception for the previous SPC request), the RSENT can directly enter the CONFIGURATION mode.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the RSENTnCC.SPCE bit.
(1) RSENTnCC.SPCE $=0$

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated (see Section 23.4.3.2(3), Fast Channel Message Reception).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.
(2) RSENTnCC.SPCE $=1$

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered by writing CONFIGURATION to the RSENTnMDC.OMC bits and waiting for the RSENTnMST.OMS to transition to CONFIGURATION.

Once CONFIGURATION mode is entered, the remaining status and message information stored in RSENT is lost since status and message information is cleared in CONFIGURATION mode.

Figure 23.6 shows the communication disable flow assuming that RSENT is in OPERATION ACTIVE mode.

Figure 23.6 Communication Stop Flow

### 23.4.3.2 Message Reception

SENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

Figure 23.7 SENT Received Message Structure

## (1) Calibration Pulse Reception

Within the calibration pulse reception phase, the internally generated clock tick is adjusted to the transmit clock speed. In addition, the calibration pulse is used to end the previous message and perform message diagnostics. RSENT supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC $=0$ ). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1 .

## (2) Data Nibble Reception

The receive function of RSENT is a straightforward capture and compare function. The RSENT receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (in \# of clock ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in Table 23.33 below.

Table 23.33 Data Nibble Encoding

| Nibble Period (\# Clock Ticks) | Nibble Value (Binary) |
| :--- | :--- |
| 12 | $0000_{\mathrm{B}}$ |
| 13 | $0001_{\mathrm{B}}$ |
| 14 | $0010_{\mathrm{B}}$ |
| 15 | $0011_{\mathrm{B}}$ |
| 16 | $0100_{\mathrm{B}}$ |
| 17 | $0101_{\mathrm{B}}$ |
| 18 | $010_{\mathrm{B}}$ |
| 19 | $0111_{\mathrm{B}}$ |
| 20 | $1000_{\mathrm{B}}$ |
| 21 | $1001_{\mathrm{B}}$ |
| 22 | $1010_{\mathrm{B}}$ |
| 23 | $1011_{\mathrm{B}}$ |
| 24 | $1100_{\mathrm{B}}$ |
| 25 | $1101_{\mathrm{B}}$ |
| 26 | $1110_{\mathrm{B}}$ |

The received data nibbles are composed into a SENT message that is then stored in the fast channel receive message buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

## (3) Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.
A fast channel receive buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

These registers are arranged on successive addresses for a transfer of the register content into memory using DMA.
The RSENT is equipped with a double receive buffer structure that allows the storage of two complete SENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

Figure 23.8 Fast Channel Receive Message Buffer

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM and RSENTnEFRD0.SNDM bits) is not updated any more until the RSENTnFRXD or RSENTnEFRD1 register is read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND and RSENTnEFRD0.FND bits are set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When the foreground receive buffer is holding an unprocessed message (the RSENTnFRXD.FND and RSENTnEFRD0.FND bits are 1), any further incoming message is placed in the background receive buffer. The background receive buffer is updated with any further incoming messages. In case an un-processed message in the background receive buffer is overwritten, the RSENTnCS.FMS bit is set to 1 .
When the CPU reads the RSENTnFRXD or RSENTnEFRD1 register and there is valid data in the background buffer, the data previously located in the background receive buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.
When the RSENTnFRXD.FND and RSENTnEFRD0.FND / RSENTnCS.FRS bits are not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

Figure 23.9 Fast Channel Receive Buffer Update Timing

The update timing of the receive buffer depends on the applied configuration as shown in Figure 23.10 to Figure 23.13.

The RSENTnFRTS register is updated with the current timestamp counter register value when the calibration pulse is detected.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).
Table 23.34 Data Nibble Alignment in RSENTnFRXD Register

| RSENTnFRXD |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RSENTnCC.NDN | $23: 20$ | $19: 16$ | $15: 12$ | $11: 8$ | $7: 4$ | 3:0 |
| $000_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 |
| $001_{\mathrm{B}}$ | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 |

(1) SAE operation with variable message length and preferred check method (RSENTnCC.SPCE $=0$, RSENTnCC. $\cdot$ PPTC $=0$, RSENTnCC. $F C M=0$ )

In this operation mode, RSENT automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2010 specification. In this mode, message diagnostics is done after the calibration pulse is received following a message.

If this check is passed, the receive message buffer is updated.
If this check is not passed, the receive message buffer is not updated and RSENTnCS.CVS is set to 1 .

Figure 23.10 Buffer Update in Variable Message Length Mode and Preferred Check Method
(2) SAE operation with variable message length and optional check method (RSENTnCC. $\operatorname{SPCE}=0$, RSENTnCC. $\operatorname{PPTC}=0$, RSENTnCC. $F C M=1$ )
In this operation mode, RSENT automatically performs the check for successive calibration pulse variation according to the optional frame check method as described in the J2716 2010 specification. In this mode, the calibration pulse of the current frame is compared with the calibration pulse of the last valid preceding frame.
If this check is passed, the receive message buffer is updated.
If this check is not passed, the receive message buffer is not updated and RSENTnCS.CVS is set to 1 .

Figure 23.11 Buffer Update in Variable Message Length Mode and Optional Check Method
(3) SAE operation with fixed message length (RSENTnCC.SPCE $=0$, , $\operatorname{SENTnCC} \cdot \mathrm{PPTC}=1$, and RSENTnCC.PPC =1)

In this mode, RSENT does not perform the check for calibration pulse and message length ratio according to the preferred option in the J2716 2010 specification. In this mode, RSENT provides the calibration pulse length in the RSENTnCPL register and the message length in-formation in the RSENTnML register. The numbers provided are based on samples.
The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU needs to calculate the ratio and either accept or discard the message.

Figure 23.12 Buffer Update in Fixed Message Length Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.
(4) $\operatorname{SPC}$ operation (RSENTnCC.SPCE $=1)$

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. Within SAE SENT communication, the calibration pulse or pause pulse aborts the previous message. In SPC communication, the sensor only sends data following a SPC trigger request. An end pulse sent by the sensor aborts the message. The message buffer is updated at the beginning of the end pulse.

Figure 23.13 Buffer Update in SPC Mode

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.
RSENT provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples. The CPU needs to calculate the ratio of calibration pulses and/or message length and either accept or discard the message.

In case of variable message length mode, RSENT cannot perform this check because the receive timing of the next calibration pulse depends on the next SPC trigger timing.

## (4) Fast Channel Reception Flow

In Figure 23.14, the recommended reception flow for the fast channel receive buffer is shown.
When using a polling or event driven method, the CPU should only read the setting of the RSENTnCS.FRS bit to check the availability of new fast channel data.

Figure 23.14 Fast Channel Reception Flow

In any case, the CPU should keep the order in reading the receive buffer registers as shown in the flow. The RSENTnFRXD or RSENTnEFRD0 register should be the last register to be accessed.

The handling of the slow channel receive buffer is described in Section 23.4.3.2(6), Slow Channel Reception Flow.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

## (5) Slow Channel Message Reception

RSENT supports extraction of the slow message out of the fast channel messages by using the status and communication nibble bits 3 and 2 out of the status and communication nibble. In order to enable the slow channel extraction, the CPU should set the RSENTnCC.SMF bits to the expected serial message format.

When no serial message extraction is selected ( RSENTnCC.SMF $=00_{\mathrm{B}}$ ), the RSENTnSRXD register becomes part of the fast channel receive buffer structure (including buffer 2) and the RSENTnSRTS register should be ignored. The communication and status nibble is placed in the RSENTnSRXD.IDD bits. Furthermore, no slow channel new data and slow channel message lost flags are generated.

In order to receive the slow channel serial message, all fast channel serial messages contributing to a slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel does not impact the reception on the slow channel.
A slow channel receive buffer is composed of the slow channel receive timestamp register (RSENTnSRTS) and the slow channel receive data register (RSENTnSRXD).

Contrary to the fast channel receive buffer, the slow channel receive buffer does not support a double receive buffer structure; only a single receive buffer structure is available.

Message decoding and assembling is done in a separate register stage.

Figure 23.15 Slow Channel Receive Message Buffer

The slow channel receive buffer is updated at the same time as the fast channel receive buffer that holds the last status and communication nibble required for the slow channel message. The RSENT-nSRXD.SND bit is set to 1 at the same time.

Further updates to the buffer are not carried out until after the RSENTnSRXD.SND bit has been read.
When the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1 ), any further incoming message is lost (the slow channel receive buffer is not updated) and RSENTnCS.SMS is set to 1 .

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.

The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

Figure 23.16 Slow Channel Receive Buffer Update Timing

The data alignment in the RSENTnSRDX register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

Table 23.36 Data Alignment in RSENTnSRXD Register

| RSENTn | RSENTnSRXD. | RSENTnSRXD. | RSENTnSRXD. | RSENTnSRXD. | RSENTnSRXD. | RSENTnSRXD. |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| CC.SMF | SMGC | IDD[19:16] | IDD[15:12] | IDD[11:8] | IDD[7:4] | IDD[3:0] |
| $00_{B}$ | Undefined | Undefined | Undefined | Undefined | Undefined | C \& S nibble |

## (6) Slow Channel Reception Flow

In Figure 23.17, the recommended reception flow for the slow channel receive buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

Figure 23.17 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel receive buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed last.

## (7) DMA Flow

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD or RSENTnEFRD1 register should be the last register to be accessed using the 32 -bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

Figure 23.18 DMA Reception Flow

Figure 23.19 DMA Reception Flow (Data Nibble are 6 or Less)

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1 , then the user needs to read the slow channel receive buffer if needed.

## (8) Error Flagging

Message lost errors (shown in RSENTnCS.SMS, RSENTnCS.FMS) are flagged when a new message's diagnostics pass before the previous message is read.

The SPC communication error (shown in RSENTnCS.NRS) is flagged when the CPU writes to RSENTnSPCT.TLL before/during response reception.

The update timings for fast channel reception errors (RSENTnCS.CVS, RSENTnCS.CLS, RSENTnCS.FNS, RSENTnCS.FES and RSENTnCS.FCS) and slow channel reception errors (RSENTnCS.SCS and RSENTnCS.SES) depends on the configuration of RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC and RSENTnCC.PPTC. The update timings for each configuration are shown in Table 23.37 and Table 23.38.

In case a nibble encoding error or calibration pulse length error is detected, message reception is terminated immediately. No further error flagging for this message is done. Message decoding starts again after a calibration pulse without calibration length error (RSENTnCS.CLS) is detected.

Table 23.37 Error Flag Set Timing when RSENTnCC.SPCE $=0$

| RSENTnCC.SPCE | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RSENTnCC.FCM | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| RSENTnCC.PPC | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| RSENTnCC.PPTC | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| RSENTnCS.FCS | EC | X | EC | IM | IM | X | IM | IM |
| RSENTnCS.FES | EC | X | EC | IM | IM | X | IM | IM |
| RSENTnCS.FNS | EC | X | EC | - | - | X | - | - |
| RSENTnCS.SCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.SES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CLS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CVS | EC | X | EC | - | EC | X | EC | - |

Note: EC: End of calibration pulse
IM: Immediately when detected
-: Not set
X : Invalid configuration

NOTE
When RSENTnCC.PPC and RSENTnCC.PPTC are set to 1 , the mode is pause pulse with fixed message length.
In this mode, this diagnostic can be used as the receiver does not need to wait for the next calibration pulse to diagnose the current received frame, so RSENTnCS.FNS and RSENTnCS.CVS are not set.

Table 23.38 Error Flag Set Timing when RSENTnCC.SPCE $=1$

| RSENTnCC.SPCE | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| RSENTnCC.FCM | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |
| RSENTnCC.PPC | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| RSENTnCC.PPTC | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 |
| RSENTnCS.FCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.FES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.FNS | - | X | - | - | - | X | - | - |
| RSENTnCS.SCS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.SES | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CLS | IM | X | IM | IM | IM | X | IM | IM |
| RSENTnCS.CVS | - | X | - | - | - | X | - | - |

Note: EC: End of calibration pulse
IM: Immediately when detected
—: Not set
X: Invalid configuration

## NOTE

In case the sensor stops communication, no buffer update or status update for last message takes place. The SW should take care of this by timeout checks.

SPC mode, started by the SPC trigger from the starting point, is a mode for one-frame communication.
The Error flags are immediately set when they are detected. Therefore, RSENTnCS.FNE and RSENT-nCS.CVS are not set.

When a transition to OPERATION IDLE is configured in RSENTnMDC.OMC and an error for the calibration or the fast channel reception is detected in the message in which the mode transition was requested, the error is not flagged and the message is aborted.
In case of a fast channel encoding error or a calibration pulse length error, the OPERATION IDLE mode is entered immediately.

In case of a fast channel nibble count error, fast channel CRC error, or fast channel calibration pulse variation error, the OPERATION IDLE state is entered at the end of the next STATUS/COM nibble.

RESENTnCS.FNS is only set after a valid calibration pulse was detected and all following nibbles have a valid length ( $\geq 12$ ticks and $\leq 27$ ticks) or no nibble was received between two valid calibration pulses.

RSENTnCS.FES is only set if the nibble with an encoding error occurred in the communication and status nibble, CRC nibble or in one of the expected data nibbles.

If SPC is enabled (RSENTnCC.SPCE = 1), RSENTnCS.CLS is set if a calibration pulse was expected but the pulse length does not meet the calibration pulse range. If SPC is disabled (RSENTnCC.SPCE $=0$ ), RSENTnCS.CLS is set only after a valid calibration pulse has been received and a calibration pulse was expected but the pulse length does not meet the calibration pulse range.
During re-synchronization, additional error flags might be set, which does not affect the reception of the following frame.

### 23.4.4 SPC Function

RSENT supports an extension of the SAE J2716 specification known as SPC.
The user can enable or disable the SPC extension by setting the RSENTnCC.SPCE bit.
In SPC mode, the RX line will be driven low to initiate SENT message transmission. This can be realized by controlling an external transistor by the RSENTnSPCO pin.

The user can configure the polarity of the RSENTnSPCO port.
The text below describes the behavior of the RSENTnSPCO port with the default settings of RSENTnCC.SOPC. When the default value of RSENTnCC.SOPC is changed, the polarity is inverted.

The RX line will be held low for a configured length of tick time specified in the RSENTnSPCT.TLL bits. The tick time is configured with the RSENTnBRP.TTI bits and the RSENTnBRP.TTF bits, which are equal to the transmission tick time. For details, see Section 23.4.2.2(2), RX and SPC Tick Settings.

Figure 23.20 and Figure 23.21 show an example of the SPC circuit connection.

Figure 23.20 Example of the Circuit for two-wire interface

Figure 23.21 Example of the Circuit for One-wire interface

In a single sensor system, this function can be used to trigger data transmission from the sensor. Further data can be sent to the sensor by varying the trigger pulse length. In a multi sensor system, this function can be used to address a dedicated sensor and request a data transmission.

Once RSENT SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When a transmission is triggered, the trigger pulse with the configured length is sent. Then a frame reception is expected. After frame reception was done, a new trigger pulse can be sent.

Writing to RSENTnSPCT.TLL requests a SPC trigger transmission. After writing to RSENTnSPCT.TLL, the CPU should read RSENTnCS.NRS to check whether the previous request was completed or not.

The CPU has to wait for more than 10 pclk cycles before RSENTnCS.NRS is set.
In case RSENTnCS.NRS is set, no SPC trigger is sent and any potentially ongoing reception at this time is aborted. The CPU should clear RSENTnCS.NRS by writing 1 to RSENTnCSC.NRC. The CPU can write again to RSENTnSPCT.TLL to request a SPC trigger transmission.

In case RSENTnCS.NRS is not set, the CPU should set a reception timeout counter in software. If a reception occurs before the timeout counter elapses, the user should process the received slow and fast channel data as shown in the fast channel reception flow (Figure 23.14) and slow channel reception flow (Figure 23.17).

When the timeout counter elapses without any successful reception, the addressed sensor seems not to send any valid response. The CPU should analyze the RSENTnCS register to analyze the reason for no successful reception. A new request can be made considering that when RSENTnCS.NRS gets set, no SPC trigger is sent.

The purpose of the timeout function is to define a timeout window for response reception in software.
Figure 23.22 shows the transmission flow with a timeout function implemented in software. The timeout function is optional and can be omitted if not needed.

Figure 23.22 Transmission Flow

### 23.4.4.1 Multiplexing of the RSENTnRX and RSENTnSPCO Pin Functions

The RSENTnRX input pin and RSENTnSPCO output pin functions are assigned to the same multiplexed pin.
Two functions can be used on the pin, when it is set for an N -ch open-drain configuration.
Figure 23.23 shows an example of the circuit for connection to an external transistor.

Figure 23.23 Multiplexing of the RSENTnRX and RSENTnSPCO Pin Functions

Connect the sent_spc signal, which is an RSENT output signal, to an N-ch open drain I/O buffer.
RSENT is able to control the polarity of setnt_spc output and the polarity of the pin output by setting the RSENTnCC.SOPC bit and the PINVn register of the I/O buffer, respectively. These registers must be set in an appropriate combination.
Table 23.39 lists the register settings when the RSENTnRX and RSENTnSPCO pin functions share the same pin.
Table 23.39 Setting for Multiplexing of the RSENTnRX and RSENTnSPCO Pin Functions

| Register Name |  | Setting Value | Description |
| :---: | :---: | :---: | :---: |
| PMCn | Port mode control register | 1 | Alternative mode |
| PMn | Port mode register | 0 | Output mode (output enabled) |
| PIPCn | Port IP control register | 0 | I/O mode is controlled by PMn.PMn_m (software or hardware I/O control) |
| PBDCn | Port bi-direction control register | 1 | Bi -direction mode is enabled |
| PODCn | Port open-drain control register | 1 | N-ch open drain (PODCn_m = 1 or PODCEn_m $=0$ ) |
| PODCEn | Port open-drain expansion register | 0 | N -ch open drain (PODCn_m = 1 or PODCEn_m $=0$ ) |
| PINVn | Port output level inversion register | 0 | The pin output level is not inverted (active low when RSENTnCC.SOPC = 1) |
|  |  | 1 | The pin output level is inverted (active high when RSENTnCC.SOPC = 0) |
| PFCn | Port function control register | - | Specify an alternative function of the pins. For details, see Table 2.9, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1). |
| PFCEn | Port function control expansion register | - |  |
| PFCAEn | Port function control additional expansion register | - |  |
| PFCEAEn | Port function control extra additional expansion register | - |  |

### 23.4.5 Interrupts and Checks

RSENT provides two interrupt lines.
The successful fast channel receive interrupt notifies the CPU that the fast channel receive buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).
The status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether or not a status flag in the RSENTnCS register contributes to the generation of an interrupt event can be set individually.

The execution of CRC checks can be disabled for the slow channel and fast channel individually. In case a check is disabled, the CRC of the received message is not checked and the related error flag is never set.

Figure 23.24 Interrupt Structure

Table 23.40 gives an overview of the relationship between set status flags and the buffer update.
Table 23.40 Status Flag Influence to Receive Buffer Behavior

| RSENTnCS | Fast Channel Receive Buffer | Slow Channel Receive Buffer |
| :--- | :--- | :--- |
| FRS | Updated | Updated if all status and communication nibbles of slow channel <br> messages are received and RSENTnCS.SES $=0$ and <br> RSENTnCS.SCS $=0$ |
| FCS | Not updated | Not impacted. <br> Fast channel CRC does not cover the communication and status <br> nibble |
| FMS | Background buffer overwritten | Not impacted |
| FES | Not updated | Receive process aborted. Search for new start condition |
| FNS | Not updated | Receive process aborted. Search for new start condition |
| CLS | Not updated | Receive process aborted. Search for new start condition |
| CVS | Not updated | Receive process aborted. Search for new start condition |
| NRS | Not updated | Receive process aborted. Search for new start condition |
| SCS | Not impacted | Message lost |
| SMS | Not impacted | Receive process aborted. Search for new start condition |
| SES |  |  |

## Section 24 Ethernet Controller (ETNC)

This section describes the Ethernet Controller module (ETNC).
This module has an Ethernet Controller (ETHERC) and Direct Memory Access Controller (EDMAC).
The first subsection describes all the characteristics specific to ETNC such as channels, register base addresses, and input/output signal names.

The second and subsequent subsections describe the functions of ETNC.

### 24.1 Features of ETNC

### 24.1.1 Number of Units and Channels

The ETNC includes one physical channel. This physical channel features MAC layer interface ports through which the MCU can be connected to the physical layer LSI (PHY-LSI) , allowing transmission and reception of frames compliant with the Ethernet/IEEE802.3 standard.

Table $24.1 \quad$ Number of Channels

|  | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
| Product Name | 373 pins | 292 pins |
| Number of Channels | 1 | 1 |
| Name | ETNCn $(\mathrm{n}=0)$ |  |

Table 24.2 Number of Channels

|  | RH850/E2M |  |
| :--- | :--- | :--- |
| Product Name | 373 pins | 292 pins |
| Number of Channels | 1 | 1 |
| Name | ETNCn $(\mathrm{n}=0)$ |  |

Table $24.3 \quad$ Indices

| Index | Description |
| :--- | :--- |
| n | Throughout this section, chip select areas are identified by " n " $(\mathrm{n}=0)$. |
|  | For example, the ETHERC Status Register is described as ETNCnECSR. |

### 24.1.2 Register Addresses

The ETNCn register address is expressed as an offset from the base address <ETNCn_base>.
The following table shows the base address <ETNCn_base> of ETNCn.
Table 24.4 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ETNCO_base> | $10024000_{\mathrm{H}}$ | H-Bus Group 2 |

### 24.1.3 Clock Supply

The ETNCn clock supplies are shown in the following table.
Table 24.5 Clock Supply

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- | :--- |
| ETNCn | PCLKA $\quad$ (register access clock) | CLK_HBUS |
|  | MII_TX_CLK $\quad$ (MII Transfer clock $(25 \mathrm{MHz})$ ) | MII_TX_CLK (external input clock) |
|  | MII_RX_CLK $\quad$ (MII Receipt clock $(25 \mathrm{MHz}))$ | MII_RX_CLK (external input clock) |
|  | REF50CK $\quad$ (RMII Reference clock $(50 \mathrm{MHz}))$ | REF50CK (external input clock) |

### 24.1.4 Interrupt Requests

The ETNCn interrupt requests are listed in the following table.
Table 24.6 Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Description | Interrupt Number | sDMA Trigger Number | DTS Trigger <br> Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| INTETNC0 | INTETNCn ( $\mathrm{n}=0$ ) | Ethernet interrupt | 485 | - | - |

### 24.1.5 Reset Source

The ETNCn reset source is listed in the following table. ETNCn is initialized by the following reset source.
Table 24.7 Reset Source

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| ETNCn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 24.1.6 External Input/Output Signals

The following table shows the input/output pins of ETHERC (for the MII/ RMII mode).
Table 24.8 and Table 24.9 list the ETHERC I/O pins and Table $\mathbf{2 4 . 1 0}$ lists the other PHY-LSI pins.
Table 24.8 Input/Output Pins of ETHERC in Operation MII Mode

| Operating Mode | Pin Name | I/O | Description |
| :---: | :---: | :---: | :---: |
| MII mode | MII_TX_CLK | Input | MII Transmit clock <br> Timing reference signal for outputting the MII_TX_EN, MII_TXD3 to MII_TXDO, and MII_TX_ER signals. |
|  | MII_RX_CLK | Input | MII Receive clock <br> Timing reference signal for inputting the MII_RX_DV, MII_RXD3 to MII_RXDO, and MII_RX_ER signals. |
|  | MII_TX_EN | Output | MII Transmit data enable output (valid) <br> This signal indicates that valid transmit data has been output to pins MII_TXD3 to MII_TXD0. |
|  | MII_TXD3 <br> MII_TXD2 <br> MII_TXD1 <br> MII_TXD0 | Output | 4-bit MII transmit data output |
|  | MII_TX_ER*1 | Output | MII Transmit error output <br> This signal notifies the PHY-LSI that an error occurred during transmission. |
|  | MII_RX_DV | Input | MII Receive data enable input (valid) <br> This signal indicates that valid receive data has been input from pins MII_RXD3 to MII_RXD0. |
|  | MII_RXD3 <br> MII_RXD2 <br> MII_RXD1 <br> MII_RXD0 | Input | 4-bit MII receive data |
|  | MII_RX_ER | Input | MII Receive error input <br> This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC. |
|  | MII_CRS | Input | MII Carrier detection signal |
|  | MII_COL | Input | MII Collision detection signal |
|  | MDC | Output | PHY Management data clock <br> Reference clock signal for transmitting management data with the PHY-LSI . |
|  | MDIO | I/O | PHY Management data I/O <br> Bidirectional data signal for exchanging management data with the PHY-LSI. |

Note: MII signals are compliant with IEEE802.3u.
Note 1. Always output low level.

Table 24.9 Input/Output Pins of ETHERC in Operation RMII Mode

| Operating Mode | Pin Name | I/O | Description |
| :---: | :---: | :---: | :---: |
| RMII mode | REF50CK | Input | RMII Reference clock <br> Timing reference signal for pins RMII_TX_EN, RMII_TXD1 to RMII_TXDO, RMII_CRS_DV, RMII_RXD1 to RMII_RXDO, and RMII_RX_ER. |
|  | RMII_TX_EN | Output | RMII Transmit data enable output (valid) <br> This signal indicates that valid transmit data has been output to pins RMII_TXD1 to RMII_TXDO. |
|  | $\begin{array}{\|l} \text { RMII_TXD1 } \\ \text { RMII_TXD0 } \end{array}$ | Output | 2-bit RMII transmit data output |
|  | RMII_CRS_DV | Input | RMII Carrier sense detection signal/receive data valid <br> This signal indicates that valid receive data has been input from pins RMII_RXD1 to RMII_RXDO. |
|  | $\begin{aligned} & \text { RMII_RXD1 } \\ & \text { RMII_RXDO } \end{aligned}$ | Input | 2-bit RMII receive data |
|  | RMII_RX_ER | Input | RMII Receive error <br> This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC. |
|  | MDC | Output | PHY Management data clock <br> Reference clock signal for transmitting management data with the PHY-LSI |
|  | MDIO | I/O | PHY Management data I/O <br> Bidirectional data signal for exchanging management data with the PHY-LSI. |

Note: MII signals are compliant with IEEE802.3u.

Table 24.10 Other PHY-LSI Pins

| Operating Mode | Pin Name | I/O | Description |
| :--- | :--- | :--- | :--- |
| Other signals | LINKSTA | Input | PHY Link status input from the PHY-LSI |
|  | EXOUT | Output | External output pin |
|  | WOL | Output | Wake-On-LAN. This signal indicates that a Magic Packet has been received. |

Figure 24.1 and Figure 24.2 show examples of connecting the MCU to the PHY-LSI.
Figure 24.1 shows the connection with PHY-LSI in MII mode.

Figure 24.1 Example of Connection with the PHY-LSI in MII Mode

Figure 24.2 shows the connection with PHY-LSI in RMII mode.

Figure 24.2 Example of Connection with PHY-LSI in RMII Mode

### 24.2 Overview

### 24.2.1 Functional Overview

This MCU has a one-channel Ethernet controller (ETHERC) compliant with the Ethernet or IEEE802.3 Media Access Control (MAC) layer protocol. The ETHERC channel features an MAC layer interface through which the MCU can be connected tothe physical layer LSI (PHY-LSI), allowing transmission and reception of frames compliant with the Ethernet/IEEE802.3 standard. The ETHERC is connected to the Ethernet Controller's Direct Memory Access Controller (EDMAC), so data can be transferred without using the CPU .

The EDMAC controls most of the transmit/receive buffer management operations for communications. This reduces the load on the CPU and allows efficient data transmission and reception. The data transfers are controlled according to the information (referred to as descriptors) on the memory.

Table 24.11 lists the ETHERC and EDMAC specifications. Figure 24.3 shows the ETHERC and EDMAC configuration.

Figure 24.4 shows the configuration of descriptors and transmit/receive buffers on the memory.
Table 24.11 ETHERC and EDMAC Specifications

| Item | Description |
| :--- | :--- |
| Protocol | Flow control compliant with IEEE802.3x |
| Data transmission/reception | $\bullet$ Frames compliant with the Ethernet/IEEE802.3 standard can be transmitted and received. |
| Bit rate | Supports 10 Mbps and 100 Mbps |
| Operation modes | Supports full-duplex and half-duplex modes |
| Interfaces | Media Independent Interface (MII), Reduced Media Independent Interface (RMII), compliant <br> with the IEEE802.3u standard |
| Functions | $\bullet$ Magic Packet ${ }^{\mathrm{TM}+1}$ detection, Wake-On-LAN (WOL) signal output |
| Low power consumption function | The EDMAC can be set to the module-stop state to reduce power consumption. |

Note 1. Magic Packet is a trademark of Advanced Micro Devices, Inc.

### 24.2.2 Block Diagram

The following figures show block diagrams of the ETNC module.
The ETHERC can transfer the transmitted or received Ethernet frame data to and from the transmit/receive buffer in the memory at high speed using a dedicated direct memory access controller (EDMAC).

Figure 24.3 shows the ETHERC and EDMAC configuration.

Figure 24.3 ETHERC and EDMAC Configuration

Figure 24.4 shows the Descriptors and Transmit/Receive Buffers on the Memory:

Figure 24.4 Configuration of Descriptors and Transmit/Receive Buffers on the Memory

### 24.3 Registers

### 24.3.1 List of Registers

Table 24.12 shows the registers of ETHERC.
Table 24.12 List of Registers of ETHERC

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ETNCn | ETHERC Mode Register | ETNCnECMR | <ETNCn_base> + 0100 ${ }_{\text {H }}$ | 32 | - |
|  | Receive Frame Maximum Length Register | ETNCnRFLR | <ETNCn_base> + 0108H | 32 | - |
|  | ETHERC Status Register | ETNCnECSR | <ETNCn_base> + 0110 ${ }_{\text {H }}$ | 32 | - |
|  | ETHERC Interrupt Enable Register | ETNCnECSIPR | <ETNCn_base> + 0118 ${ }_{\text {H }}$ | 32 | - |
|  | PHY Interface Register | ETNCnPIR | <ETNCn_base> + 0120 ${ }_{\text {H }}$ | 32 | - |
|  | PHY Status Register | ETNCnPSR | <ETNCn_base> + 0128 ${ }_{\text {H }}$ | 32 | - |
|  | Random Number Generation Counter Limit Setting Register | ETNCnRDMLR | <ETNCn_base> + 0140 ${ }_{\text {H }}$ | 32 | - |
|  | Interpacket Gap Register | ETNCnIPGR | <ETNCn_base> + 0150 ${ }_{\text {H }}$ | 32 | - |
|  | Automatic PAUSE Frame Register | ETNCnAPR | <ETNCn_base> + 0154 ${ }_{\text {H }}$ | 32 | - |
|  | Manual PAUSE Frame Register | ETNCnMPR | <ETNCn_base> + 0158 ${ }_{\text {H }}$ | 32 | - |
|  | Received PAUSE Frame Counter | ETNCnRFCF | <ETNCn_base> + 0160 ${ }_{\text {H }}$ | 32 | - |
|  | PAUSE Frame Retransmit Count Setting Register | ETNCnTPAUSER | <ETNCn_base> + 0164 ${ }_{\text {H }}$ | 32 | - |
|  | PAUSE Frame Retransmit Counter Register | ETNCnTPAUSECR | <ETNCn_base> + 0168H | 32 | - |
|  | Broadcast Frame Receive Count Setting Register | ETNCnBCFRR | <ETNCn_base> + 016C ${ }_{\text {H }}$ | 32 | - |
|  | MAC Address Upper Bit Register | ETNCnMAHR | <ETNCn_base> + 01C0 ${ }_{\text {H }}$ | 32 | - |
|  | MAC Address Lower Bit Register | ETNCnMALR | <ETNCn_base> + 01C8H | 32 | - |
|  | Transmit Retry Over Counter Register | ETNCnTROCR | <ETNCn_base> + 01D0 ${ }_{\text {H }}$ | 32 | - |
|  | Late Collision Detect Counter Register | ETNCnCDCR | <ETNCn_base> + 01D4 ${ }_{\text {H }}$ | 32 | - |
|  | Lost Carrier Counter Register | ETNCnLCCR | <ETNCn_base> + 01D8 ${ }_{\text {H }}$ | 32 | - |

### 24.3.2 ETHERC Registers

### 24.3.2.1 ETNCnECMR — ETHERC Mode Register

The ETNCnECMR register controls the ETHERC operations.
Set bits in the ETNCnECMR register, excluding the TE and RE bits, during initialization after a reset. When rewriting this register other than during the initialization process, set the ETNCnEDMR.SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | TPC | ZPF | PFR | RXF | TXF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | PRCEF | - | - | MPDE | - | - | RE | TE | - | ILB | RTM | DM | PRM |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R/W | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W |

Table 24.14 ETNCnECMR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 20 | TPC | PAUSE Frame Transmit |
|  |  | 0 : PAUSE frame is transmitted even during a PAUSE period. |
|  |  | 1: PAUSE frame is not transmitted during a PAUSE period. |
| 19 | ZPF | 0 Time PAUSE Frame Enable |
|  |  | 0 : PAUSE frame with a pause_time parameter of 0 is not used. |
|  |  | 1: PAUSE frame with a pause_time parameter of 0 is used. |
| 18 | PFR | PAUSE Frame Receive Mode |
|  |  | 0: PAUSE frame is not transferred to the EDMAC. |
|  |  | 1: PAUSE frame is transferred to the EDMAC. |
| 17 | RXF | Receive Flow Control Operating Mode |
|  |  | 0 : PAUSE frame detection is disabled. |
|  |  | 1: PAUSE frame detection is enabled. |
| 16 | TXF | Transmit Flow Control Operating Mode |
|  |  | 0 : Automatic PAUSE frame transmission is disabled. (PAUSE frame is not automatically transmitted.) |
|  |  | 1: Automatic PAUSE frame transmission is enabled. (PAUSE frame is automatically transmitted as required.) |
| 15 to 13 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 12 | PRCEF | CRC Error Frame Receive Mode |
|  |  | 0 : EDMAC is notified of a CRC error. |
|  |  | 1: EDMAC is not notified of a CRC error. |
| 11 and 10 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |

Table 24.14 ETNCnECMR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9 | MPDE | Magic Packet Detection Enable <br> 0 : Magic Packet detection is disabled. <br> 1: Magic Packet detection is enabled. |
| 8 and 7 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 6 | RE | Reception Enable <br> 0 : Receive function is disabled. <br> 1: Receive function is enabled. |
| 5 | TE | Transmission Enable <br> 0 : Transmit function is disabled. <br> 1: Transmit function is enabled. |
| 4 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 3 | ILB | Internal Loopback Mode <br> 0: Normal data transmission or reception is performed. <br> 1: Data is looped back in the ETHERC when full-duplex mode is selected. |
| 2 | RTM | Bit Rate <br> 0: 10 Mbps <br> 1: 100 Mbps |
| 1 | DM | Duplex Mode <br> 0: Half-duplex mode <br> 1: Full-duplex mode |
| 0 | PRM | Promiscuous Mode <br> 0 : Promiscuous mode is disabled. <br> 1: Promiscuous mode is enabled. |

## 0 Time PAUSE Frame Enable (ZPF Bit)

When the ZPF bit is 1, a PAUSE frame with a pause_time parameter of 0 is transmitted if the PAUSE frame transmit request is canceled before the PAUSE time of the previously transmitted PAUSE frame has elapsed. After the PAUSE frame with a pause_time parameter of 0 is received, the ETHERC is ready for transmission.
When the ZPF bit is 0 , even if the PAUSE frame transmit request from the receive FIFO is canceled, the next PAUSE frame is not transmitted until the PAUSE time of the previously transmitted PAUSE frame has elapsed. When a PAUSE frame with a pause_time parameter of 0 is received, the PAUSE frame is discarded.

## CRC Error Frame Receive Mode (PRCEF Bit)

When the PRCEF bit is set to 1, the EDMAC is not notified that a CRC error has occurred even if the error is detected in a receive frame. Accordingly, the ETNCnEESR.CERF flag and RFS0 bit in receive descriptor 0 (RD0) do not become 1.

## Reception Enable (RE Bit)

When the RE bit is set to 1 , the ETHERC receive function is enabled.
When the RE bit is set to 0 , the receive function is disabled after the frame being processed is completely received.

## Transmission Enable (TE Bit)

When the TE bit is set to 1 , the ETHERC transmit function is enabled.
When the TE bit is set to 0 , the transmit function is disabled after the frame being processed is completely transmitted.

## Internal Loopback Mode (ILB Bit)

When the ILB bit is set to 1 , transmit frames can be looped back in the MCU. Set the DM bit to 1 (full-duplex mode) to perform a loopback test.

## Bit Rate (RTM Bit)

The RTM bit sets the bit rate when the RMII is selected.

## Promiscuous Mode (PRM Bit)

When the PRM bit is set to 1 , the ETHERC operates in promiscuous mode where all Ethernet frames are received. In promiscuous mode, the ETHERC receives all valid frames regardless of whether or not the address matches the destination address or broadcast address and regardless of the multicast bit setting.

### 24.3.2.2 ETNCnRFLR — Receive Frame Maximum Length Register

The ETNCnRFLR register sets the maximum frame length that can be received by the MCU. Set the length in bytes.
Do not rewrite this register while the ETNCnECMR.RE bit is 1 (receive function is enabled).

Table 24.15 ETNCnRFLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 11 to 0 | RFL[11:0] | Receive Frame Maximum Length |
|  |  | The set value becomes the maximum frame length. The minimum value that can be set is |
|  |  | 1,518 bytes, and the maximum value that can be set is 2,048 bytes. Values that are less than |
|  |  | 2,518 bytes are regarded as 1,518 bytes, and values larger than 2,048 bytes are regarded as |
|  |  |  |

## Receive Frame Maximum Length (RFL[11:0] Bits)

The RFL[11:0] bits set a frame length to be checked. When the number of bytes for fields from the destination address to the frame check sequence (FCS) of the received frame exceeds the RFL[11:0] bit value, the EDMAC is notified of a frame-too-long error.
When the received frame length exceeds the RFL[11:0] bit value, the excess data is discarded.

### 24.3.2.3 ETNCnECSR - ETHERC Status Register

The ETNCnECSR register indicates the status of the ETHERC.
When any flag in the ETNCnECSR register becomes 1 while the corresponding bit in the ETNCnECSIPR (ETHERC Interrupt Enable Register) register is 1 (interrupt is reported), the ETNCnEESR.ECI flag becomes 1.

Note 1. Write 1 to clear the flag.
Table 24.16 ETNCnECSR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 5 | BFR | Continuous Broadcast Frame Reception Flag |
|  |  | 0: Continuous reception of broadcast frames has not been detected. |
|  |  | 1: Continuous reception of broadcast frames has been detected. |
| 4 | PSRTO | PAUSE Frame Retransmit Over Flag |
|  |  | 0: PAUSE frame retransmit count has not reached the upper limit. |
|  |  | 1: PAUSE frame retransmit count has reached the upper limit. |
| 3 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 2 | LCHNG | Link Signal Change Flag |
|  |  | 0 : Change in the LINKSTA signal has not been detected. |
|  |  | 1: Change in the LINKSTA signal has been detected (high to low, or low to high). |
| 1 | MPD | Magic Packet Detect Flag |
|  |  | 0: Magic Packet has not been detected. |
|  |  | 1: Magic Packet has been detected. |
| 0 | ICD | False Carrier Detect Flag |
|  |  | 0: PHY-LSI has not detected a false carrier on the line. |
|  |  | 1: PHY-LSI has detected a false carrier on the line. |

## PAUSE Frame Retransmit Over Flag (PSRTO Flag)

The PSRTO flag indicates that the number of retransmissions has reached the value set in the TPAUSER register when retransmitting a PAUSE frame while automatic PAUSE frame transmission is enabled.

## Link Signal Change Flag (LCHNG Flag)

The LCHNG flag indicates that LINKSTA signal input from the PHY-LSI has changed from high to low, or from low to high.
Refer to the PSR.LMON flag for the current link status.

## False Carrier Detect Flag (ICD Flag)

The ICD flag indicates that the PHY-LSI has detected a false carrier on the line.
The ICD flag becomes 1 when a receive error signal shown in Figure $\mathbf{2 4 . 1 0}$ is received from the PHY-LSI. Note that the information may not be correct when signals input from the PHY-LSI change faster than software recognizes the change. Check the timing of the PHY-LSI.

### 24.3.2.4 ETNCnECSIPR — ETHERC Interrupt Enable Register

The ETNCnECSIPR register selects whether or not to notify the EDMAC of the status indicated by the ETNCnECSR register. Each bit corresponds to the flag in the ETNCnECSR register that has the same bit number.

Table 24.17 ETNCnECSIPR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 5 | BFSIPR | Continuous Broadcast Frame Reception Interrupt Enable |
|  |  | 0 : Notification of continuous broadcast frame reception interrupt is disabled. |
|  |  | 1: Notification of continuous broadcast frame reception interrupt is enabled. |
| 4 | PSRTOIP | PAUSE Frame Retransmit Over Interrupt Enable |
|  |  | 0: Notification of PAUSE frame retransmit over interrupt is disabled. |
|  |  | 1: Notification of PAUSE frame retransmit over interrupt is enabled. |
| 3 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 2 | LCHNGIP | LINK Signal Change Interrupt Enable |
|  |  | 0: Notification of LINKSTA signal change interrupt is disabled. |
|  |  | 1: Notification of LINKSTA signal change interrupt is enabled. |
| 1 | MPDIP | Magic Packet Detect Interrupt Enable |
|  |  | 0: Notification of the Magic Packet detect interrupt is disabled. |
|  |  | 1: Notification of the Magic Packet detect interrupt is enabled. |
| 0 | ICDIP | False Carrier Detect Interrupt Enable |
|  |  | 0 : Notification of the false carrier detect interrupt is disabled. |
|  |  | 1: Notification of the false carrier detect interrupt is enabled. |

### 24.3.2.5 ETNCnPIR — PHY Interface Register

The ETNCnPIR register is used to access registers in the PHY-LSI via the MII or RMII. The management clock and management data are controlled by software.

Refer to Section 24.4.1.4, Accessing MII/RMII Registers for details on accessing MII and RMII registers.

Table 24.18 ETNCnPIR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 3 | MDI | MII/RMII Management Data-In |
|  |  | This bit indicates the level of the MDIOpin. The write value should be 0. |
| 2 | MDO | MII/RMII Management Data-Out |
|  |  | The MDO bit value is output from the MDIOpin when the MMD bit is 1 (write). The value is not output when the MMD bit is 0 (read). |
| 1 | MMD | MII/RMII Management Mode |
|  |  | 0: Read |
|  |  | 1: Write |
| 0 | MDC | MII/RMII Management Data Clock |
|  |  | The MDC bit value is output from the MDCpin to supply the management data clock to the MII or RMII. |

### 24.3.2.6 ETNCnPSR — PHY Status Register

The ETNCnPSR register is used to monitor interface signals from the PHY-LSI.

Value after reset: $0000000 \mathrm{X}_{\mathrm{H}}$

Table 24.19 ETNCnPSR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 0 | LMON | LINKSTA Pin Status Flag |
|  |  | The link status can be read by connecting the link signal output from the PHY-LSI to the |
|  | LINKSTA pin. For details on the polarity, refer to the specifications of the connected PHY-LSI. |  |

### 24.3.2.7 ETNCnRDMLR — Random Number Generation Counter Limit Setting Register

The ETNCnRDMLR register sets the maximum value for the counter used in the random number generator.
Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled) or while the ETNCnECMR.RE bit is 1 (receive function is enabled).

Table 24.20 ETNCnRDMLR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 20 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 19 to 0 | RMD[19:0] | Random Number Generation Counter |
|  |  | $00000_{\mathrm{H}}$ : Normal operation |
|  | $00001_{\mathrm{H}}$ to FFFFF $_{\mathrm{H}}$ : Maximum value of counter. |  |

### 24.3.2.8 ETNCnIPGR — Interpacket Gap Register

The ETNCnIPGR register sets the interpacket gap (IPG) value.
Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled) or while the ETNCnECMR.RE bit is 1 (receive function is enabled).

Refer to Section 24.4.1.6, Adjusting Transmission Efficiency by Changing the IPG for details on the IPG.

Table 24.21 ETNCnIPGR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 5 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 4 to 0 | IPG[4:0] | Interpacket Gap |
|  | $00_{\mathrm{H}}: 16$ bit times |  |
| $01_{\mathrm{H}}: 20$ bit times |  |  |
| $\vdots$ |  |  |
|  | $14_{\mathrm{H}}: 96$ bit times (initial value) |  |
| $\vdots$ |  |  |
|  | $1 \mathrm{~F}_{\mathrm{H}}: 140$ bit times |  |
|  |  |  |

### 24.3.2.9 ETNCnAPR — Automatic PAUSE Frame Register

The ETNCnAPR register sets the PAUSE time of the PAUSE frame that is automatically transmitted. The value set in the ETNCnAPR register is used for the pause_time parameter of the PAUSE frame.

Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled) or while the ETNCnECMR.RE bit is 1 (receive function is enabled).

Table 24.22 ETNCnAPR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |

### 24.3.2.10 ETNCnMPR — Manual PAUSE Frame Register

The ETNCnMPR register sets the PAUSE time of the PAUSE frame that is manually transmitted. The value set in the ETNCnMPR register is used for the pause_time parameter of the PAUSE frame.

When a value is set to this register, a PAUSE frame is transmitted. Rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled).

Table 24.23 ETNCnMPR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved <br> The read value is 0. The write value should be 0. |
| 15 to 0 | MP[15:0] | Manual PAUSE Time Setting <br> These bits set the value of the pause_time parameter for a PAUSE frame that is manually <br> transmitted. Transmission is not performed until the set value multiplied by 512 bit times has <br> elapsed. <br> The read value is undefined. |

### 24.3.2.11 ETNCnRFCF — Received PAUSE Frame Counter

The ETNCnRFCF register is a counter indicating the number of received PAUSE frames. The counter is reset after this register is read.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 24.24 ETNCnRFCF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | The read value is 0. |
| 7 to 0 | RPAUSE[7:0] | Received PAUSE Frame Count |
|  |  | Number of received PAUSE frames. |

### 24.3.2.12 ETNCnTPAUSER — PAUSE Frame Retransmit Count Setting Register

The ETNCnTPAUSER register selects the maximum number of times a PAUSE frame is automatically transmitted.
Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled).

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TPAUSE[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 24.25 | ETNCnTPAUSER Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 16 | - |  |  | Reserved |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | The read value is 0 . The write value should be 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 0 | TPAUSE[15:0] |  |  | Automatic PAUSE Frame Retransmit Setting |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | $0000_{\mathrm{H}}$ : Number of retransmissions is unlimited. |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | $0001_{\mathrm{H}}$ : Maximum number of retransmissions is 1 . $\vdots$ |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | FFFF $_{\mathrm{H}}$ : Maximum number of retransmissions is 65,535 . |  |  |  |  |  |  |  |  |  |  |  |  |

### 24.3.2.13 ETNCnTPAUSECR — PAUSE Frame Retransmit Counter Register

The ETNCnTPAUSECR register is a counter indicating the number of times a PAUSE frame was automatically retransmitted. The counter is reset after this register is read.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 24.26 ETNCnTPAUSECR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | The read value is 0. |
| 7 to 0 | TXP[7:0] | PAUSE Frame Retransmit Count |
|  |  | Number of times a PAUSE frame was retransmitted. |

### 24.3.2.14 ETNCnBCFRR — Broadcast Frame Receive Count Setting Register

The ETNCnBCFRR register sets the number of times broadcast frames can be received continuously. When the number of received frames exceeds the ETNCnBCF[15:0] bit value, the excess broadcast frames are discarded.

Do not rewrite this register while the ETNCnECMR.RE bit is 1 (receive function is enabled).

Table 24.27 ETNCnBCFRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 15 to 0 | BCF[15:0] | Broadcast Frame Continuous Receive Count Setting |
|  | $0000_{\mathrm{H}}:$ Number of receptions is unlimited. |  |
|  | $0001_{\mathrm{H}}:$ Receive 1 frame. |  |
| $\vdots$ |  |  |
|  |  | FFFF $_{\mathrm{H}}:$ |
|  |  |  |
|  |  |  |

### 24.3.2.15 ETNCnMAHR — MAC Address Upper Bit Register

The ETNCnMAHR register sets the upper 32 bits (b47 to b16) of the 48 -bit MAC address. For example, if the MAC address is $01-23-45-67-89-\mathrm{AB}$, set the register to 01234567 H .

Set the ETNCnMAHR register during initialization after a reset. Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled) or while the ETNCnECMR.RE bit is 1 (receive function is enabled). When rewriting this register, set the ETNCnEDMR.SWR bit to 1 to reset the EDMAC and ETHERC and then set this register again.

Table 24.28 ETNCnMAHR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MA[47:16] | MAC address [47-16] |
|  |  | These bits set the upper 32 bits of the MAC address. |

### 24.3.2.16 ETNCnMALR — MAC Address Lower Bit Register

The ETNCnMALR register sets the lower 16 bits of the 48 -bit MAC address. For example, if the MAC address is 01-$23-45-67-89-\mathrm{AB}$, set the register to $000089 \mathrm{AB}_{\mathrm{H}}$.

Set the ETNCnMALR register during initialization after a reset. Do not rewrite this register while the ETNCnECMR.TE bit is 1 (transmit function is enabled) or while the ETNCnECMR.RE bit is 1 (receive function is enabled). When rewriting this register, set the ETNCnEDMR.SWR bit to 1 to reset the EDMAC and ETHERC and then set this register again.

Table 24.29 ETNCnMALR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 15 to 0 | MA[15:0] | MAC address [15-0] |
|  |  | These bits set the lower 16 bits of the MAC address. |

### 24.3.2.17 ETNCnTROCR — Transmit Retry Over Counter Register

The ETNCnTROCR register is a counter indicating the number of frames that fail to be retransmitted.
The ETNCnTROCR register is incremented by 1 when a frame fails to be retransmitted 15 times. The counter stops when the ETNCnTROCR register value becomes FFFF FFFF $_{\mathrm{H}}$. The counter value becomes 0 by writing any value to the ETNCnTROCR register.

Note 1. This register is cleared to 0 by writing any value to TROC.
Table 24.30 ETNCnTROCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TROC[31:0] | Transmit Retry Over Count |
|  |  | These bits indicate the number of frames that were unable to be transmitted in 16 |
|  |  | transmission attempts including the retransfer. |

### 24.3.2.18 ETNCnCDCR — Late Collision Detect Counter Register

The ETNCnCDCR register is a counter indicating the number of late collisions that have been detected since transmission started.

When the ETNCnCDCR register value becomes $\operatorname{FFFF}_{\operatorname{FFFF}}^{\mathrm{H}}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnCDCR register.

Note 1. This register is cleared to 0 by writing any value to CDCR.
Table 24.31 ETNCnCDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | COSDC[31:0] | Delayed Collision Detect Count |
|  |  | These bits indicate the number of late collisions since the start of data transmission. |

### 24.3.2.19 ETNCnLCCR — Lost Carrier Counter Register

The ETNCnLCCR register is a counter indicating the number of times a loss of carrier is detected during frame transmission.

When the ETNCnLCCR register value becomes FFFF FFFF $_{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnLCCR register.

Note 1. This register is cleared to 0 by writing any value to LCCR.
Table 24.32 ETNCnLCCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | LCC[31:0] | Lost Carrier Count |
|  |  | These bits indicate the number of times the carrier was lost during data transmission. |

### 24.3.2.20 ETNCnCNDCR — Carrier Not Detected Counter Register

The ETNCnCNDCR register is a counter indicating the number of times a carrier is not detected during preamble transmission.

When the ETNCnCNDCR register value becomes FFFF FFFF ${ }_{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnCNDCR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnCNDCR.
Table 24.33 ETNCnCNDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CNDC[31:0] | Carrier Non Detected Count |
|  |  | These bits indicate the number of times the carrier was not detected during preamble |
|  | transmission. |  |

### 24.3.2.21 ETNCnCEFCR — CRC Error Frame Receive Counter Register

The ETNCnCEFCR register is a counter indicating the number of received frames where a CRC error has been detected.

When the ETNCnCEFCR register value becomes FFFF FFFF $_{\mathrm{H}}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnCEFCR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnCEFCR.

Table 24.34 ETNCnCEFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CEFC[31:0] | CRC Error Frame Count |
|  |  | These bits indicate the number of CRC error frames received. |

### 24.3.2.22 ETNCnFRECR — Frame Receive Error Counter Register

The ETNCnFRECR register is a counter indicating the number of times a frame receive error has occurred. The PHYLSI notifies the ETHERC of the frame receive error using the MII_RX_ER pin.

The ETNCnFRECR register is incremented each time the MII_RX_ER pin becomes high. When the ETNCnFRECR register value becomes $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnFRECR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnFRECR.
Table 24.35 ETNCnFRECR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | FREC[31:0] | Frame Receive Error Count |
|  |  | These bits indicate the number of errors during frame reception. |

### 24.3.2.23 ETNCnTSFRCR — Too-Short Frame Receive Counter Register

The ETNCnTSFRCR register is a counter indicating the number of times a short frame that is shorter than 64 bytes has been received. When the ETNCnTSFRCR register value becomes FFFF FFFF ${ }_{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnTSFRCR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnTSFRCR.
Table 24.36 ETNCnTSFRCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TSFC[31:0] | Too-Short Frame Receive Count |
|  |  | These bits indicate the number of frames received with a length of less than 64 bytes. |

### 24.3.2.24 ETNCnTLFRCR - Too-Long Frame Receive Counter Register

The ETNCnTLFRCR register is a counter indicating the number of times a long frame that is longer than the ETNCnRFLR register value has been received.

When the ETNCnTLFRCR register value becomes $\operatorname{FFFF}$ FFFF $_{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnTLFRCR register.

Note that the ETNCnTLFRCR register is not incremented when a frame is received with the alignment error. In this case, the ETNCnRFCR register is incremented.

Note 1. This register is cleared to 0 by writing any value to ETNCnTLFRCR.

Table 24.37 ETNCnTLFRCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TLFC[31:0] | Too-Long Frame Receive Count |
|  |  | These bits indicate the number of frames received with a length exceeding the value of the |
|  | ETNCnRFLR register. |  |

### 24.3.2.25 ETNCnRFCR — Received Alignment Error Frame Counter Register

The ETNCnRFCR register is a counter indicating the number of times a frame has been received with the alignment error (frame is not an integral number of octets).

When the ETNCnRFCR register value becomes FFFF $_{\text {FFFF }}^{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnRFCR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnRFCR.
Table 24.38 ETNCnRFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RFC[31:0] | Residual-Bit Frame Receive Count |
|  |  | These bits indicate the number of frames received containing residual bits. |

### 24.3.2.26 ETNCnMAFCR — Multicast Address Frame Receive Counter Register

The ETNCnMAFCR register is a counter indicating the number of times a frame with a multicast address set has been received.

When the ETNCnMAFCR register value becomes FFFF $_{\text {FFFF }}^{H}$, the counter stops. The counter value becomes 0 by writing any value to the ETNCnMAFCR register.

Note 1. This register is cleared to 0 by writing any value to ETNCnMAFCR.
Table 24.39 ETNCnMAFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | MAFC[31:0] | Multicast Address Frame Count |
|  |  | These bits indicate the number of multicast frames received. |

### 24.3.3 EDMAC Registers

### 24.3.3.1 ETNCnEDMR — EDMAC Mode Register

The ETNCnEDMR register controls EDMAC operations.
Set the ETNCnEDMR register during the initialization process after a reset. When rewriting this register other than during the initialization process, set the SWR bit to 1 to reset the EDMAC and ETHERC, and then set this register again. If the ETHERC and EDMAC are reset during data transmission or reception, abnormal data may be sent on the line. Do not rewrite this register while the ETHERC transmit or receive function is enabled. It takes 64 cycles of the peripheral module clock (PCLKA) to initialize the ETHERC and EDMAC. Complete the initialization process before accessing registers in the ETHERC and EDMAC.

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | DE |  |  | - | - | - | SWR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R | R | R | R/W |

Table 24.40 ETNCnEDMR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 7 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 6 | DE | Big Endian Mode/Little Endian Mode*1 |
|  |  | 0 : Big endian mode |
|  |  | 1: Little endian mode |
| 5 and 4 | DL[1:0] | Transmit/Receive Descriptor Length b5 b4 |
|  |  | $\begin{array}{lll}0 & \text { 0: } 16 \text { bytes }\end{array}$ |
|  |  | $\begin{array}{ll}0 & 1: 32\end{array} 3$ bytes |
|  |  | 1 0: 64 bytes |
|  |  | 1 1: 16 bytes |
| 3 to 1 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 0 | SWR | Software Reset |
|  |  | When 1 is written, the corresponding channels of the EDMAC and ETHERC are reset. The ETNCnTDLAR, ETNCnRDLAR, ETNCnRMFCR, ETNCnTFUCR, and ETNCnRFOCR registers are not reset by this bit. The read value is 0 . |

Note 1. This setting applies to data for the transmit / receive buffer. It does not apply to transmit / receive descriptors and registers.

### 24.3.3.2 ETNCnEDTRR — EDMAC Transmit Request Register

The ETNCnEDTRR register controls EDMAC transmission.
After the EDMAC has transmitted one frame, it reads the next descriptor. When the TD0.TACT bit in the descriptor is 1, the EDMAC continues transmission. When the TD0.TACT bit is 0 , the EDMAC sets the TR bit to 0 and stops transmission.

Table 24.41 ETNCnEDTRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 0 | TR | Transmit Request |
|  |  | When 1 is written, the EDMAC reads the corresponding descriptor and transmits frames |
|  | whose TD0.TACT bit is 1. The TR bit becomes 0 after all the valid frames are transmitted. |  |
|  | Writing 0 to this bit has no effect. |  |

### 24.3.3.3 ETNCnEDRRR — EDMAC Receive Request Register

The ETNCnEDRRR register controls EDMAC reception.
When the RR bit becomes 1, the EDMAC reads the receive descriptor. When the RD0.RACT bit is 1 , the EDMAC waits for a receive request from the ETHERC.
When the EDMAC has received data equivalent to the receive buffer size, it reads the next descriptor and waits to receive a frame. If the RD0.RACT bit is 0 , the EDMAC sets the RR bit to 0 and stops reception.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | RR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 24.42 ETNCnEDRRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 0 | RR | Receive Request |
|  |  | $0:$ Receive function is disabled. ${ }^{* 1}$ |
|  |  | 1: Receive descriptor is read, and the receive function is enabled. |

Note 1. If the receive function is disabled during frame reception, write-back to the receive descriptor is not performed successfully. Subsequent pointers for reading a receive descriptor become abnormal and the EDMAC cannot operate normally. In this case, to enable the EDMAC receive function again, execute a software reset by setting the ETNCnEDMR.SWR bit to 1. To disable the EDMAC receive function without resetting the EDMAC, set the ETNCnECMR.RE bit to 0 . Next, after the EDMAC has completed reception and write-back to the receive descriptor has been confirmed, set the RR bit to 0 .

### 24.3.3.4 ETNCnTDLAR — Transmit Descriptor List Start Address Register

The ETNCnTDLAR register sets the start address of the transmit descriptor list.
Allocate each descriptor on the corresponding boundary according to the descriptor length selected by the ETNCnEDMR.DL[1:0] bits.

Do not rewrite the TDLAR register during transmission. Rewrite the ETNCnTDLAR register while the ETNCnEDTRR.TR bit is 0 .

Table 24.43 ETNCnTDLAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TDLA [31:0] | Transmit Descriptor Start Address |
|  |  | These bits set start address of the transmit descriptor list. Set the start address according to |
|  | the descriptor length selected by the ETNCnEDMR.DL[1:0] bits. |  |
|  | 16-byte boundary: Lower 4 bits $=0000_{\mathrm{B}}$ |  |
|  | 32-byte boundary: Lower 5 bits $=00000_{\mathrm{B}}$ |  |
|  | 64-byte boundary: Lower 6 bits $=000000_{\mathrm{B}}$ |  |

### 24.3.3.5 ETNCnRDLAR — Receive Descriptor List Start Address Register

The ETNCnRDLAR register sets the start address of the receive descriptor list.
Allocate each descriptor on the corresponding boundary according to the descriptor length selected by the ETNCnEDMR.DL[1:0] bits.

Do not rewrite the ETNCnRDLAR register during reception. Rewrite the ETNCnRDLAR register while the ETNCnEDRRR.RR bit is 0 .

Table 24.44 ETNCnRDLAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDLA[31:0] | Receive Descriptor Start Address |
|  |  | These bits set the start address of the receive descriptor list. Set the start address according |
|  | to the descriptor length selected by the ETNCnEDMR.DL[1:0] bits. |  |
|  | 16-byte boundary: Lower 4 bits $=0000_{\mathrm{B}}$ |  |
|  | 32-byte boundary: Lower 5 bits $=00000_{\mathrm{B}}$ |  |
|  | 64-byte boundary: Lower 6 bits $=000000_{\mathrm{B}}$ |  |

### 24.3.3.6 ETNCnEESR - ETHERC/EDMAC Status Register

The ETNCnEESR register indicates the ETHERC and EDMAC communication status.
Each flag in the ETNCnEESR register can be output as an interrupt request signal (INTETNCn) from the EDMAC. Each flag, excluding the ECI flag, becomes 0 by writing 1 . The value of each flag is not changed by writing 0 . Each interrupt source can be enabled by the corresponding bit in the ETNCnEESIPR register.

| Value after reset: |  |  | $00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | TWB | - | - | - | TABT | RABT | RFCOF | ADE | ECI | TC | TDE | TFUF | FR | RDE | RFOF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|  | - | - | - | - | CND | DLC | $C D$ | TRO | RMAF | - | - | RRF | RTLF | RTSF | PRE | CERF |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

Table 24.45 ETNCnEESR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 30 | TWB | Write-Back Complete Flag |
|  |  | 0: Write-back has not been completed, or no transmission has been requested. |
|  |  | 1: Write-back to the transmit descriptor has been completed. |
| 29 to 27 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 26 | TABT | Transmit Abort Detect Flag |
|  |  | 0: Frame transmission has not been aborted or no transmission has been requested. |
|  |  | 1: Frame transmission has been aborted. |
| 25 | RABT | Receive Abort Detect Flag |
|  |  | 0: Frame reception has not been aborted or no reception has been requested. |
|  |  | 1: Frame reception has been aborted. |
| 24 | RFCOF | Receive Frame Counter Overflow Flag |
|  |  | 0: Receive frame counter has not overflowed. |
|  |  | 1: Receive frame counter has overflowed. |
| 23 | ADE | Address Error Flag |
|  |  | 0: Invalid memory address has not been detected (normal operation). |
|  |  | 1: Invalid memory address has been detected.*2 |
| 22 | ECI | ETHERC Status Register Source Flag |
|  |  | 0: ETHERC status interrupt source has not been detected. |
|  |  | 1: ETHERC status interrupt source has been detected. |
| 21 | TC | Frame Transfer Complete Flag |
|  |  | 0: Transfer has not been completed, or no transfer has been requested. |
|  |  | 1: All frames indicated by the transmit descriptor have been completely transferred to the transmit FIFO. |

Table 24.45 ETNCnEESR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 20 | TDE | Transmit Descriptor Empty Flag <br> 0 : The EDMAC detects that the transmit descriptor valid bit (TD0.TACT) is 1. <br> 1: The EDMAC detects that the transmit descriptor valid bit (TD0.TACT) is 0. |
| 19 | TFUF | Transmit FIFO Underflow Flag <br> 0 : Underflow has not occurred. <br> 1: Underflow has occurred. |
| 18 | FR | Frame Receive Flag <br> 0: Frame has not been received. <br> 1: Frame has been received. Update of the receive descriptor is complete. |
| 17 | RDE | Receive Descriptor Empty Flag <br> 0 : The EDMAC detects that the receive descriptor valid bit (RDO.RACT) is 1. <br> 1: The EDMAC detects that the receive descriptor valid bit (RD0.RACT) is 0 . |
| 16 | RFOF | Receive FIFO Overflow Flag <br> 0: Overflow has not occurred. <br> 1: Overflow has occurred. |
| 15 to 12 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 11 | CND | Carrier Not Detected Flag <br> 0 : A carrier was detected before the start of transmission. <br> 1: A carrier was not detected during preamble transmission. |
| 10 | DLC | Loss of Carrier Detected Flag <br> 0 : Loss of carrier has not been detected. <br> 1: Loss of carrier was detected during frame transmission. |
| 9 | $C D$ | Late Collision Detected Flag <br> 0: Late collision has not been detected. <br> 1: Late collision was detected during frame transmission. |
| 8 | TRO | Transmit Retry Over Flag <br> 0 : Transmit retry-over condition has not been detected. <br> 1: Transmit retry-over condition has been detected. |
| 7 | RMAF | Multicast Address Frame Receive Flag <br> 0: Multicast address frame has not been received. <br> 1: Multicast address frame has been received. |
| 6 and 5 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 4 | RRF | Alignment Error Flag <br> 0 : Alignment error has not been detected. <br> 1: Alignment error has been detected. |
| 3 | RTLF | Frame-Too-Long Error Flag <br> 0 : Frame-too-long error has not been detected. <br> 1: Frame-too-long error has been detected. |
| 2 | RTSF | Frame-Too-Short Error Flag <br> 0: Frame-too-short error has not been detected. <br> 1: Frame-too-short error has been detected. |
| 1 | PRE | PHY-LSI Receive Error Flag <br> 0 : PHY-LSI receive error has not been detected. <br> 1: PHY-LSI receive error has been detected. |
| 0 | CERF | CRC Error Flag <br> 0 : CRC error has not been detected. <br> 1: CRC error has been detected. |

Note 1. The ECI flag is read only. When the source in the ETNCnECSR register is cleared, the ECI flag is also cleared.
Note 2. When an address error is detected, the EDMAC halts the current process. To resume the operation, set the EDMR.SWR bit to 1 (EDMAC and ETHERC are reset) and then configure the EDMAC and ETHERC again.

## Write-Back Complete Flag (TWB Flag)

The TWB flag indicates that EDMAC has completed writing back to the descriptor after frame transmission. Note that this flag becomes 1 after each frame transmission when the ETNCnTRIMD.TIM bit is 0 . This flag becomes 1 only when the ETNCnTRIMD.TIS bit is 1 .

## Transmit Abort Detect Flag (TABT Flag)

The TABT flag indicates that the ETHERC has aborted frame transmission due to transmit retry over, loss of carrier, no carrier detection, or another error.

## Receive Abort Detect Flag (RABT Flag)

The RABT flag indicates that the ETHERC has aborted frame reception due to a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or another error.

## Receive Frame Counter Overflow Flag (RFCOF Flag)

The RFCOF flag indicates that the next frame reception has started even though the number of frames stored in the receive FIFO has reached the maximum number of frames ( 16 frames). Note that the received frame is discarded while the RFCOF flag is 1 .

## Address Error Flag (ADE Flag)

The ADE flag indicates that the memory address that the EDMAC tried to transfer is invalid.

## ETHERC Status Register Source Flag (ECI Flag)

The ECI flag becomes 1 when an interrupt request is generated by the ETNCnECSR register.

## Frame Transfer Complete Flag (TC Flag)

The TC flag indicates that all the data specified by the transmit descriptor has been transmitted from the ETHERC. This flag becomes 1 when one frame has been transmitted in single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0. TACT bit in the next transmit descriptor is 0 . After frame transmission is completed, the EDMAC writes the transfer status back to the descriptor.

## Transmit Descriptor Empty Flag (TDE Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor is indicating that the frame is not complete (TD0.TFP[1:0] bits are $10_{\mathrm{B}}$ or $00_{\mathrm{B}}$ ) in multi-buffer frame transmission. As a result, an incomplete frame may be sent.
When this flag becomes 1 , perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission.
Transmission starts from the address stored in the TDLAR register.

## Transmit FIFO Underflow Flag (TFUF Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data has been sent on the line.

## Frame Receive Flag (FR Flag)

The FR flag indicates that a frame has been received and the receive descriptor has been updated. The FR flag becomes 1 every time a frame is received.

## Receive Descriptor Empty Flag (RDE Flag)

The RDE flag indicates that the read receive descriptor is invalid.
When this flag becomes 1 , set the RD0.RACT bit in the receive descriptor to 1 and set the ETNCnEDRRR.RR bit to 1 to resume reception.

## Receive FIFO Overflow Flag (RFOF Flag)

The RFOF flag indicates that the receive FIFO has overflowed during frame reception.

## Carrier Not Detected Flag (CND Flag)

The CND flag becomes 1 when a carrier was not detected during preamble transmission.

## Loss of Carrier Detected Flag (DLC Flag)

The DLC flag indicates that a loss of carrier was detected during frame transmission.

## Late Collision Detected Flag (CD Flag)

The CD flag indicates that a late collision was detected during frame transmission.

## Transmit Retry Over Flag (TRO Flag)

The TRO flag indicates that a collision occurred again during the 15th retry of frame transmission.

## Multicast Address Frame Receive Flag (RMAF Flag)

The RMAF flag indicates that a multicast frame has been received.

## Alignment Error Flag (RRF Flag)

The RRF flag indicates that a frame is not an integral number of octets. The last word that is not an integral number of octets is not transferred.

## Frame-Too-Long Error Flag (RTLF Flag)

The RTLF flag indicates that a received frame is greater than the upper limit of the receive frame length set in the ETNCnRFLR register. The excess data is discarded.

Frame-Too-Short Error Flag (RTSF Flag)
The RTSF flag indicates that a received frame was less than 64 bytes.

## PHY-LSY Receive Error Flag (PRE Flag)

The PRE flag indicates the RX_ER signal output from the PHY-LSI is high.

## CRC Error Flag (CERF Flag)

The CERF flag becomes 1 when an error is detected in checking the frame check sequence (FCS) field of the receive frame.

### 24.3.3.7 ETNCnEESIPR — ETHERC/EDMAC Status Interrupt Enable Register

The ETNCnEESIPR register enables interrupt requests corresponding to bits in the ETNCnEESR register. When a bit in this register is 1 , the corresponding interrupt request is enabled.

Table 24.46 ETNCnEESIPR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 30 | TWBIP | Write-Back Complete Interrupt Request Enable |
|  |  | 0 : Write-back complete interrupt request is disabled. |
|  |  | 1: Write-back complete interrupt request is enabled. |
| 29 to 27 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 26 | TABTIP | Transmit Abort Detected Interrupt Request Enable |
|  |  | 0: Transmit abort detected interrupt request is disabled. |
|  |  | 1: Transmit abort detected interrupt request is enabled. |
| 25 | RABTIP | Receive Abort Detected Interrupt Request Enable |
|  |  | 0 : Receive abort detected interrupt request is disabled. |
|  |  | 1: Receive abort detected interrupt request is enabled. |
| 24 | RFCOFIP | Receive Frame Counter Overflow Interrupt Request Enable |
|  |  | 0 : Receive frame counter overflow interrupt request is disabled. |
|  |  | 1: Receive frame counter overflow interrupt request is enabled. |
| 23 | ADEIP | Address Error Interrupt Request Enable |
|  |  | 0: Address error interrupt request is disabled. |
|  |  | 1: Address error interrupt request is enabled. |
| 22 | ECIIP | ETHERC Status Register Source Interrupt Request Enable |
|  |  | 0: ETHERC status interrupt request is disabled. |
|  |  | 1: ETHERC status interrupt request is enabled. |
| 21 | TCIP | Frame Transfer Complete Interrupt Request Enable |
|  |  | 0: Frame transmission complete interrupt request is disabled. |
|  |  | 1: Frame transmission complete interrupt request is enabled. |
| 20 | TDEIP | Transmit Descriptor Empty Interrupt Request Enable |
|  |  | 0: Transmit descriptor empty interrupt request is disabled. |
|  |  | 1: Transmit descriptor empty interrupt request is enabled. |
| 19 | TFUFIP | Transmit FIFO Underflow Interrupt Request Enable |
|  |  | 0: Underflow interrupt request is disabled. |
|  |  | 1: Underflow interrupt request is enabled. |

Table 24.46 ETNCnEESIPR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 18 | FRIP | Frame Receive Interrupt Request Enable <br> 0 : Frame reception interrupt request is disabled. <br> 1: Frame reception interrupt request is enabled. |
| 17 | RDEIP | Receive Descriptor Empty Interrupt Request Enable <br> 0 : Receive descriptor empty interrupt request is disabled. <br> 1: Receive descriptor empty interrupt request is enabled. |
| 16 | RFOFIP | Receive FIFO Overflow Interrupt Request Enable <br> 0 : Overflow interrupt request is disabled. <br> 1: Overflow interrupt request is enabled. |
| 15 to 12 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 11 | CNDIP | Carrier Not Detected Interrupt Request Enable <br> 0 : Carrier not detected interrupt request is disabled. <br> 1: Carrier not detected interrupt request is enabled. |
| 10 | DLCIP | Loss of Carrier Detected Interrupt Request Enable <br> 0 : Loss of carrier detected interrupt request is disabled. <br> 1: Loss of carrier detected interrupt request is enabled. |
| 9 | CDIP | Late Collision Detected Interrupt Request Enable <br> 0 : Late collision detected interrupt request is disabled. <br> 1: Late collision detected interrupt request is enabled. |
| 8 | TROIP | Transmit Retry Over Interrupt Request Enable <br> 0: Transmit retry over interrupt request is disabled. <br> 1: Transmit retry over interrupt request is enabled. |
| 7 | RMAFIP | Multicast Address Frame Receive Interrupt Request Enable <br> 0 : Multicast address frame receive interrupt request is disabled. <br> 1: Multicast address frame receive interrupt request is enabled. |
| 6 and 5 | - | Reserved <br> The read value is 0 . The write value should be 0 . |
| 4 | RRFIP | Alignment Error Interrupt Request Enable <br> 0 : Alignment error interrupt request is disabled. <br> 1: Alignment error interrupt request is enabled. |
| 3 | RTLFIP | Frame-Too-Long Error Interrupt Request Enable <br> 0 : Frame-too-long error interrupt request is disabled. <br> 1: Frame-too-long error interrupt request is enabled. |
| 2 | RTSFIP | Frame-Too-Short Error Interrupt Request Enable <br> 0 : Frame-too-short error interrupt request is disabled. <br> 1: Frame-too-short error interrupt request is enabled. |
| 1 | PREIP | PHY-LSI Receive Error Interrupt Request Enable <br> 0 : PHY-LSI receive error interrupt request is disabled. <br> 1: PHY-LSI receive error interrupt request is enabled. |
| 0 | CERFIP | CRC Error Interrupt Request Enable <br> 0 : CRC error interrupt request is disabled. <br> 1: CRC error interrupt request is enabled. |

### 24.3.3.8 ETNCnTRSCER — ETHERC/EDMAC Transmit/Receive Status Copy Enable Register

The ETNCnTRSCER register selects whether the receive status indicated by the ETNCnEESR.RMAF and RRF flags is reflected in the RFE bit of the receive descriptor as a summary. The bits in the ETNCnTRSCER register correspond to bits in the ETNCnEESR register that have the same number. When setting the RMAFCE or RRFCE bit to 0 , the corresponding receive status (ETNCnEESR.EESR.RMAF or RRF flag) is reflected in the RFE bit of the receive descriptor. When setting the RMAFCE or RRFCE bit to 1 , the corresponding receive status is not reflected in the RFE bit.

Value after reset: $00000000_{\mathrm{H}}$

Table 24.47 ETNCnTRSCER Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 7 | RMAFCE | RMAF Flag Copy Enable |
|  |  | 0: The ETNCnEESR.EESR.RMAF flag status is reflected in the RDO.RFE bit of the receive descriptor. |
|  |  | 1: The ETNCnEESR.EESR.RMAF flag status is not reflected in the RDO.RFE bit of the receive descriptor. |
| 6 and 5 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 4 | RRFCE | RRF Flag Copy Enable |
|  |  | 0 : The ETNCnEESR.EESR.RRF flag status is reflected in the RD0.RFE bit of the receive descriptor. |
|  |  | 1: The ETNCnEESR.EESR.RRF flag status is not reflected in the RD0.RFE bit of the receive descriptor. |
| 3 to 0 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |

### 24.3.3.9 ETNCnRMFCR — Missed-Frame Counter Register

The ETNCnRMFCR register indicates that the number of frames that could not be stored in the receive FIFO and were therefore discarded during reception. When the receive FIFO overflows, it stops receiving data, and the remaining frames are discarded. At the same time, the ETNCnRMFCR register value is incremented. When the ETNCnRMFCR register value reaches $\mathrm{FFFF}_{\mathrm{H}}$, incrementing is halted. When any value is written to the ETNCnRMFCR register, the counter value becomes 0 .

For the frame that has not been completely received, after data in the receive FIFO is transferred to the receive buffer, the RACT bit in the receive descriptor 0 (RD0) becomes 0 (descriptor disabled), the RFS9 bit becomes 1 (receive FIFO overflow), and the ETNCnEESR.RFOF flag becomes 1 (overflow has occurred).

Table 24.48 ETNCnRMFCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
| 15 to 0 | MFC[15:0] | The read value is 0. The write value should be 0. |
|  | These bits indicate the number of frames that were discarded and not transferred to the <br> receive buffer during reception. |  |

### 24.3.3.10 ETNCnTFTR — Transmit FIFO Threshold Register

The ETNCnTFTR register sets the transmit FIFO threshold at which the first transmission starts. The actual threshold is the set value multiplied by 4 .

The ETHERC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes set in the ETNCnTFTR register, when the transmit FIFO is full, or when one frame of data has been completely written. Set the ETNCnTFTR register while the ETNCnEDTRR.TR bit is 0 .

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | TFT[10:0] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 24.49 ETNCnTFTR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 10 to 0 | TFT[10:0] | Transmit FIFO Threshold |
|  |  | $000 \mathrm{H}_{\text {: }}$ Store and forward mode |
|  |  | 001 H to 00CH: Setting prohibited |
|  |  | $00 \mathrm{D}_{\mathrm{H}}$ to 200 H : The threshold is the set value multiplied by 4. |
|  |  | Example: |
|  |  | 00DH: 52 bytes |
|  |  | 040н: 256 bytes |
|  |  | 100): 1024 bytes |
|  |  | 200н: 2048 bytes |
|  |  | $201_{H}$ to $7 \mathrm{FF}_{H}$ : Setting prohibited |
| NOTES |  |  |

1. When starting transmission before one frame of data has been completely written, take care to prevent an underflow.
2. To prevent a transmit underflow, using the initial value (store and forward mode) is recommended.

### 24.3.3.11 ETNCnFDR — FIFO Depth Register

The ETNCnFDR register sets the transmit and receive FIFO depths.
Set this register to $00000707_{\mathrm{H}}$ before starting transmission and reception.

Table 24.50 ETNCnFDR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 13 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 12 to 8 | TFD[4:0] | Transmit FIFO Depth b12 b8 |
|  |  | 00111: 2048 bytes |
|  |  | Settings other than above are prohibited. |
| 7 to 5 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 4 to 0 | RFD[4:0] | Receive FIFO Depth |
|  |  | b4 b0 |
|  |  | 00111:1968 bytes |
|  |  | Settings other than above are prohibited. |

### 24.3.3.12 ETNCnRMCR — Receive Method Control Register

The ETNCnRMCR register sets how to control the ETNCnEDRRR.RR bit when receiving a frame.
Since the ETNCnEDRRR.RR bit becomes 0 when one frame has been received while the RNR bit is 0 , the RR bit needs to be set to 1 by software to receive the subsequent frame.

Since the ETNCnEDRRR.RR bit does not become 0 when one frame has been received while the RNR bit is 1 , the EDMAC reads the next receive descriptor and continues receiving frames. It is recommended to set the RNR bit to 1 when receiving data continuously.

Set the ETNCnRMCR register while the ETNCnEDRRR.RR bit is 0 .

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | RNR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 24.51 ETNCnRMCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | The read value is 0. The write value should be 0. |
| 0 | RNR | Receive Request Reset |
|  | $0:$ ETNCnEDRRR.RR bit (receive request bit) is set to 0 when one frame has been |  |
|  | received. |  |
|  | 1: ETNCnEDRRR.RR bit (receive request bit) is not set to 0 when one frame has been |  |
|  | received. |  |

### 24.3.3.13 ETNCnTFUCR — Transmit FIFO Underflow Counter

The ETNCnTFUCR register indicates how many times the transmit FIFO has underflowed.
The counter value becomes 0 by writing any value to the ETNCnTFUCR register.

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | UNDER[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 24.52 | ETNCnTFUCR Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 16 | - |  |  | Reserved |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | The read value is 0 . The write value should be 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 0 | UNDER[15:0] |  |  | Transmit FIFO Underflow Count |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | These bits indicate how many times the transmit FIFO has underflowed. The counter stops when the counter value reaches FFFF $_{H}$. |  |  |  |  |  |  |  |  |  |  |  |  |

### 24.3.3.14 ETNCnRFOCR — Receive FIFO Overflow Counter

The ETNCnRFOCR register indicates how many times the receive FIFO has overflowed.
The counter value becomes 0 by writing any value to the ETNCnRFOCR register.

| Value after reset: 0000 0000н |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|  | OVER[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 24.53 | ETNCnRFOCR Register Contents |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 16 | - |  |  | Reserved |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | The read value is 0 . The write value should be 0 . |  |  |  |  |  |  |  |  |  |  |  |  |
| 15 to 0 | OVER[15:0] |  |  | Receive FIFO Overflow Count |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | These bits indicate how many times the receive FIFO has overflowed. The counter stops when the counter value reaches FFFF $_{\mathrm{H}}$. |  |  |  |  |  |  |  |  |  |  |  |  |

### 24.3.3.15 ETNCnIOSR — Independent Output Signal Setting Register

The ETNCnIOSR register selects the output level of the ETHERC external output (EXOUT) pin in external loopback mode.

The ELB bit value is output to the EXOUT pin of the MCU as is, and can be used to set loopback mode for the PHYLSI. To use the loopback function of the PHY-LSI through this register, the PHY-LSI needs to be provided with the pin to be connected to the EXOUT pin.

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

### 24.3.3.16 ETNCnFCFTR — Flow Control Start FIFO Threshold Setting Register

The ETNCnFCFTR register sets the ETHERC flow control (sets the threshold for automatically transmitting a PAUSE frame).

The threshold can be set using the data size (RFDO[2:0] bits) and the number of frames (RFFO[2:0] bits) stored in the receive FIFO. The flow control starts when the stored data size or number of stored frames reaches the threshold.

| Value after reset: $00070007_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 24.3.3.17 ETNCnRPADIR — Receive Data Padding Insert Register

The ETNCnRPADIR register sets insertion of padding for received data. The padding value is $00_{\mathrm{H}}$.
Set the ETNCnEDMR.SWR bit to 1 to reset before rewriting the ETNCnPRADIR register.

Table 24.56 ETNCnRPADIR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 18 | - | Reserved |
|  |  | The read value is 0 . The write value should be 0 . |
| 17 and 16 | PADS[1:0] | Padding Size <br> b17 b16 |
|  |  | 0 0: No padding is inserted. |
|  |  | $0 \quad 1: 1$ byte is inserted. |
|  |  | 1 0: 2 bytes are inserted. |
|  |  | 1 1:3 bytes are inserted. |

|  |  | The read value is 0 . The write value should be 0 . |
| 5 to 0 | PADR[5:0] | Padding Slot |
|  |  | $00_{\mathrm{H}}$ : Padding is inserted at the head of received data. |
|  |  | $01_{\mathrm{H}}$ : Padding is inserted between the 1 st byte and 2nd byte of received data. |
|  |  | $3 \mathrm{E}_{\mathrm{H}}:$ Padding is inserted between the 62 nd byte and 63 rd byte of received data. $3 F_{H}$ : Padding is inserted between the 63rd byte and 64th byte of received data |

### 24.3.3.18 ETNCnTRIMD — Transmit Interrupt Setting Register

The ETNCnTRIMD register sets transmit interrupt mode and enables/disables the transmit interrupt.
When the condition set in this register is satisfied, the ETNCnEESR.TWB flag becomes 1, and an interrupt request is output when the ETNCnEESIPR.TWBIP bit is 1.

Table 24.57 ETNCnTRIMD Register Contents

### 24.3.3.19 ETNCnRBWAR — Receive Buffer Write Address Register

The ETNCnRBWAR register indicates the last address that the EDMAC wrote data to when writing to the receive buffer.

Refer to the address indicated by the ETNCnRBWAR register to find out which address in the receive buffer the EDMAC is writing data to. Note that the address that the EDMAC is outputting to the receive buffer may not match the read value of the ETNCnRBWAR register during data reception.

The ETNCnRBWAR register is read only. Do not write to this register.

Table 24.58 ETNCnRBWAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RBWA[31:0] | The ETNCnRBWAR register is read only. Do not write to this register. |

### 24.3.3.20 ETNCnRDFAR — Receive Descriptor Fetch Address Register

The ETNCnRDFAR register indicates the start address of the last fetched receive descriptor when the EDMAC fetches descriptor information from the receive descriptor.

Refer to the address indicated by the ETNCnRDFAR register to find out which receive descriptor information the EDMAC is using for the current processing. Note that the address of the receive descriptor that the EDMAC fetches may not match the read value of the ETNCnRDFAR register during data reception.

The ETNCnRDFAR register is read only. Do not write to this register.

Table 24.59 ETNCnRDFAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RDFA[31:0] | Receive Descriptor Fetch Address |
|  |  | The ETNCnRDFAR register is read only. Do not write to this register. |

### 24.3.3.21 ETNCnTBRAR — Transmit Buffer Read Address Register

The ETNCnTBRAR register indicates the last address that the EDMAC has read data from when reading data from the transmit buffer.

Refer to the address indicated by the ETNCnTBRAR register to find out which address in the transmit buffer the EDMAC is reading from. Note that the address that the EDMAC is outputting to the transmit buffer may not match the read value of the ETNCnTBRAR register.

The ETNCnTBRAR register is read only. Do not write to this register.

Table 24.60 ETNCnTBRAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TBRA[31:0] | Transmit Buffer Read Address |
|  |  | The ETNCnTBRAR register is read only. Do not write to this register. |

### 24.3.3.22 ETNCnTDFAR — Transmit Descriptor Fetch Address Register

The ETNCnTDFAR register indicates the start address of the last fetched transmit descriptor when the EDMAC fetches descriptor information from the transmit descriptor.

Refer to the address indicated by the ETNCnTDFAR register to find out which transmit descriptor information the EDMAC is using for the current processing.

Note that the address of the transmit descriptor that the EDMAC fetches may not match the read value of the ETNCnTDFAR register.

The ETNCnTDFAR register is read only. Do not write to this register.

Table 24.61 ETNCnTDFAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TDFA[31:0] | Transmit Descriptor Fetch Address |
|  |  | The ETNCnTDFAR register is read only. Do not write to this register. |

### 24.4 Operation

### 24.4.1 ETHERC Operation

This section is an overview of the ETHERC operations. The ETHERC supports flow control compliant with IEEE802.3x, and can transmit and receive PAUSE frames.

### 24.4.1.1 Transmission

The ETHERC transmitter assembles transmit data into a frame and outputs it to the MII/RMII when a transmit request is received from the EDMAC. The frame transmitted via the MII/RMII is transmitted on the line by the PHY-LSI.

Figure 24.5 shows the state transitions of the ETHERC transmitter.

Note 1. Preparation for retransmission includes transmitting a jam signal and adjusting transmission time intervals using the back off algorithm after a collision is detected.

Note 2. Preparation for retransmission is performed only when a collision is detected within 512 bit times, only a jam signal is transmitted and processing using the back off algorithm is not performed.

Figure 24.5 ETHERC Transmitter State Transitions

1. When setting the ETNCnECMR.TE bit to 1 , the ETHERC enters the transmit idle state.
2. When a transmit request is received from the EDMAC, the ETHERC enters the carrier sense state. The ETHERC waits for the interpacket gap and then transmits a preamble to the MII/RMII. When full-duplex mode is selected, it is not required to sense a carrier, so the ETHERC transmits a preamble immediately after receiving a transmit request from the EDMAC.
3. The ETHERC transmits the Start Frame Delimiter (SFD), transmit data, and CRC sequentially. When the transmission is completed successfully, the ETHERC notifies the EDMAC of successful completion, and the EDMAC sets the ETNCnEESR.TC flag to 1. When a late collision or loss of carrier is detected during data transmission, the ETHERC stops the transmission and notifies the EDMAC of the error.
4. After the time for the interpacket gap has elapsed, the ETHERC enters the idle state and then continues transmission if transmit data remains.

### 24.4.1.2 Reception

The ETHERC receiver separates the frame input from the MII/RMII into the preamble, SFD, receive data, and CRC, and transmits only receive data (destination address, source address, type/length, data/LLC).

Figure 24.6 shows the state transitions of the ETHERC receiver.

Figure 24.6 ETHERC Receiver State Transitions

1. ETHERC enters the receive idle state by setting the ETNCnECMR.RE bit to 1 .
2. When the SFD following the preamble of the receive packet is detected, the ETHERC starts reception. If the received SFD is invalid, the ETHERC discards the frame.
3. In normal mode, the ETHERC starts data reception when the destination address of the receive frame is the address of the MCU or the receive frame is broadcast frame or multicast frame. In promiscuous mode, the ETHERC starts data reception regardless of the receive frame type.
4. After receiving data from the MII/RMII, the ETHERC performs the CRC check. The ETHERC notifies the EDMAC of the CRC check result. After the received data is transferred to the receive buffer, the CRC check result is written back to the receive descriptor as a status. The result is also reflected in the ETNCnEESR.CERF flag.
5. If the ETNCnECMR.RE bit is 1 after one frame has been received, the ETHERC prepares to receive the next frame.

### 24.4.1.3 Frame Timings

(1) MII Frame Timings

Figure 24.7 to Figure 24.11 show the MII frame timings.

Figure 24.7 MII Frame Transmit Timing during Normal Transmission

Figure 24.8 MII Frame Transmit Timing When Collision Occurs

Figure 24.9 MII Frame Receive Timing during Normal Reception

Figure 24.10 MII Frame Receive Timing for Receive Error Notification

Figure 24.11 MII Fame Receive Timing for False Carrier Notification

## (2) RMII Frame Timings

Figure 24.12 to Figure 24.14 show the RMII frame timings.

Figure 24.12 RMII Frame Transmit Timing during Normal Transmission

Figure 24.13 RMII Frame Receive Timing during Normal Reception

Figure 24.14 RMII Frame Receive Timing When False Carrier Is Detected

### 24.4.1.4 Accessing MII/RMII Registers

Use the ETNCnPIR register to access the MII/RMII registers in the PHY-LSI. Serial data in the MII/RMII management frame format is transmitted and received via the MDC and MDIO pins controlled by software.

## (1) MII/RMII Management Frame Format

Table 24.62 lists the MII/RMII management frame format.
Table 24.62 MII/RMII Management Frame Format

| Access Type |  | MII/RMII Management Frame |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :---: |
|  | Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA |  |

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send $01_{B}$.
- OP (operation code): Send $10_{\mathrm{B}}$ for read or $01_{\mathrm{B}}$ for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits.
- When the PHY-LSI address is 1 , send $00001_{\mathrm{B}}$.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI.
- When the register address is 1 , send $00001_{\mathrm{B}}$.
- TA (turnaround): 2-bit turnaround time to avoid contention between the register address and data during a read operation
- Send $10_{\mathrm{B}}$ during a write operation.
- Release the bus for 1 bit during a read operation ( Z is output) (indicated as Z 0 because 0 is output from the PHY-LSI in the next clock cycle).
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII / RMII management format
- Release the bus during a write operation ( Z is output).
- During a read operation, no control is required since a bus has already been released.

## (2) MII/RMII Register Access Procedure

Access to the MII/RMII registers includes writing data in 1-bit units, reading data in 1-bit units, and releasing the bus.
Figure 24.15 to Figure 24.18 show examples of the MII/RMII register access timing. The access timing differs depending on the PHY-LSI type.

```
(1) Write to PHY interface register
ETNCnPIR.MMD bit «1 (Write)
ETNCnPIR.MDO bit « Write data
ETNCnPIR.MDC bit «-0
```

(2) Write to PHY interface register ETNCnPIR.MMD bit $\longleftarrow 1$ (Write) ETNCnPIR.MDO bit $\longleftarrow$ Write data ETNCnPIR.MDC bit $\longleftarrow 1$

(3) Write to PHY interface register

ETNCnPIR.MMD bit $\longleftarrow 1$ (Write)
ETNCnPIR.MDO bit $\longleftarrow$ Write data
ETNCnPIR.MDC bit $\longleftarrow 0$

Figure 24.15 1-Bit Data Write Flow

```
(1) Write to PHY interface register
ETNCnPIR.MMD bit \(\longleftarrow 0\) (read) ETNCnPIR.MDC bit \(\longleftarrow 0\)
```

(2) Write to PHY interface register

ETNCnPIR.MMD bit $\longleftarrow 0$ (read) ETNCnPIR.MDC bit $\longleftarrow 1$
(3) Write to PHY interface register

ETNCnPIR.MMD bit $\longleftarrow 0$ (read)
ETNCnPIR.MDC bit $\longleftarrow 0$

The PHY-LSI drives MDIO low.

Figure 24.16 Bus Release Flow (TA in Read Operation in Table 24.62)

Figure 24.17 1-Bit Data Read Flow

Figure 24.18 Bus Release Flow (IDLE in Write Operation in Table 24.62)

### 24.4.1.5 Magic Packet Detection

The ETHERC supports Wake-On-LAN (WOL). WOL is a function used to detect a Magic Packet transmitted from a host device or other device and exit a low power consumption state such as HALT mode. When the ETHERC detects a Magic Packet, high level is output from the WOL pin. Write 1 to the ETNCnEDMR.SWR bit to set the WOL pin to low.

Since a Magic Packet is transmitted in broadcast mode, the Magic Packet is received regardless of the destination MAC address selected in the format. The ETHERC outputs a high level from the WOL pin only when the destination MAC address matches its own MAC address. Refer to the technical documentation provided by Advanced Micro Devices, Inc. for details on the Magic Packet. The following describes an example of the procedure to use WOL in the MCU.

1. Set the CPU to disable the INTETNCn interrupt request.
2. Set the ETNCnECMR.MPDE bit to 1 to enable Magic Packet detection. Set the ETNCnECMR.RE bit to 1 to enable reception.
3. Set the ETNCnECSIPR.MPDIP bit to 1 to enable notification of the Magic Packet detect interrupt.
4. Set the ETNCnEESIPR.ECIIP bit to 1 to enable the ETHERC status register source interrupt.
5. Set the CPU to enable the INTETNCn interrupt request.
6. Change the CPU operating mode to low power mode.
7. When a Magic Packet is detected, an interrupt request is sent to the CPU. A high level is output from the WOL pin to notify peripheral devices that the Magic Packet has been detected.

## (1) Notes on Magic Packet Detection

The ETHERC receives packets, including broadcast packets, even when waiting to receive a Magic Packet. Therefore, receive data may have been stored in the receive FIFO of the EDMAC when a Magic Packet is detected. Also, flags in ETNCnECSR and ETNCnEESR registers may have been changed. When returning to normal operation by detecting a Magic Packet, set the ETNCnEDMR.SWR bit to 1 to reset the ETHERC and EDMAC.

### 24.4.1.6 Adjusting Transmission Efficiency by Changing the IPG

The IPG is a non-transmit period between transmit frames. The ETHERC can change the value of the IPG. Transmission efficiency can be increased or decreased by setting the ETNCnIPGR register. The typical value of the IPG is specified by the IEEE802.3 standard. When changing the setting, confirm that all devices operate normally in the same network.

Figure 24.19 Differences in Transmission Efficiency Based on Changes in the IPG

### 24.4.1.7 Flow Control

The ETHERC can perform flow control compliant with IEEE802.3x in full-duplex mode, and the receiver and transmitter can be set individually. PAUSE frames can be transmitted automatically or manually.

## (1) Automatic PAUSE Frame Transmission

When the ETNCnECMR.TXF bit is set to 1, automatic PAUSE frame transmission is enabled. A PAUSE frame is automatically transmitted by a PAUSE frame transmit request from the EDMAC. The ETNCnAPR.AP[15:0] bit value is used for the pause_time parameter of the PAUSE frame.

After a PAUSE frame is transmitted, if the EDMAC is still requesting PAUSE frame transmission when the PAUSE time elapses, a PAUSE frame is transmitted again. The maximum number of PAUSE frame retransmissions can be set in the ETNCnTPAUSER.TPAUSE[15:0] bits. Once the maximum number of retransmissions is reached, subsequent PAUSE frames are not transmitted.

Figure 24.20 shows the procedure to set automatic PAUSE frame transmission.

Figure 24.20 Example of Procedure to Set Automatic PAUSE Frame Transmission

## (2) Manual PAUSE Frame Transmission

A PAUSE frame can be manually transmitted at any time. Writing the pause_time parameter of the PAUSE frame to the ETNCnMPR.MP[15:0] bits by software causes the ETHERC to transmit a PAUSE frame once. When transmitting a PAUSE frame more than once, write to the ETNCnMPR.MP[15:0] bits for each transmission.

## (3) PAUSE Frame Reception

When setting the ETNCnECMR.RXF bit to 1, PAUSE frame detection is enabled. After a PAUSE frame is received, the ETHERC completes transmitting the current frame and waits for the PAUSE time of the received PAUSE frame to elapse before the next frame can be transmitted. Also, the ETHERC increments the ETNCnRFCF.RPAUSE[7:0] bit value.

However, while waiting for the PAUSE time to elapse, if a PAUSE frame that contains a pause_time parameter of 0 is received and the ETNCnECMR.ZPF bit is 1, the ETHERC becomes ready to transmit.

### 24.4.1.8 Interrupts

When a flag in the ECSR register becomes 1 and the corresponding bit in the ETNCnECSIPR register is 1 , the ETHERC notifies the EDMAC of the status as an interrupt source. After receiving the notification, the EDMAC sets the ETNCnEESR.ECI flag to 1 . When the ETNCnEESIPR.ECIIP bit is 1 , the EDMAC sends an INTETNCn interrupt request to the CPU. See Section 24.4.2, EDMAC Operations for details.

### 24.4.2 EDMAC Operations

This section provides an overview of the EDMAC operations.

### 24.4.2.1 Descriptor Lists and Data Buffers

To transfer data using the EDMAC, create transmit and receive descriptor lists on the memory, set the start address of the transmit descriptor list to the ETNCnTDLAR register, and set the start address of the receive descriptor list to the RDLAR register. Also, transmit and receive buffers corresponding to each descriptor are required.

Align the descriptor list on the appropriate address boundary according to the descriptor length set by the ETNCnEDMR.DL[1:0] bits. The transmit buffer can be aligned on a long word boundary, word boundary, or byte boundary. When the valid transmit buffer size is 16 bytes or less, align it on a 32-byte boundary. Align the receive buffer on a 32-byte boundary. Set different addresses for the transmit and receive descriptors and buffers for EDMAC.

## (1) Transmit Descriptor

Figure 24.21 shows the relationship between a transmit descriptor and the transmit buffer. A transmit descriptor consists of TD0 to TD2. The transmit frame and transmit buffer configuration can be selected from one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the transmit descriptor.

Do not set transmission buffer length (TBL) to 32 bytes or less
The value after reset of each transmission descriptor is $0000_{\mathrm{H}}$. If the transmission buffer length (TBL) is set to 0 to 32 bytes, operation indicated by the descriptor is not guaranteed.

Note 1. The padding size is determined according to the descriptor length (16/32/64 bytes)

Figure 24.21 Relationship between Transmit Descriptor and Transmit Buffer
NOTE
A transmit descriptor ring has to be prepared for at least five buffers. If transmit descriptor rings are set to less than five buffers, the transmit descriptor rings may be looped two times by one transmit request, because fetching all descriptors in the ring finishes before the write back process of the first buffers transmission completion.
(a) Transmit Descriptor 0 (TDO)

| Bit | Symbol | Bit Name | Description |
| :--- | :--- | :--- | :--- |
| b25 to b0 | TFS | Transmit Frame Status | Set all bits to 0 when creating a descriptor. After write-back, <br> the bits indicate the following: <br> TFS26 to TFS9: Reserved |

Note: Bits for write-back are underlined.
TD0 indicates the transmit frame settings, and the status after transmission.

## Transmit Frame Error (TFE Bit)

When the TFE bit is 1 , it indicates that one or more of the TFS bits is 1 .

## Transmit Frame Position (TFP[1:0] Bits)

The TFP[1:0] bits indicate which part of a transmit frame corresponds to the transmit buffer indicated by this descriptor. The TFP[1:0] and TD1.TBL bit settings must be logically consistent in the previous and next descriptors.

## Transmit Descriptor Valid (TACT Bit)

The TACT bit indicates that this descriptor is valid. The TACT bit is set to 1 by software. This bit becomes 0 when the transmit frame has been transferred or when the transmission is aborted.
(b) Transmit Descriptor 1 (TD1)

| Bit | Symbol | Bit Name | Description | R/W |
| :--- | :--- | :--- | :--- | :--- | :--- |
| b15 to b0 | - | Reserved | The read value is 0. The write value should be 0. | R |
| b31 to b16 | TBL | Transmit Buffer Length | Set a valid byte length of the corresponding transmit buffer. <br> Set a value equal to or greater than 1. | R/W |

Note: TD1 is used to set a valid byte length of the transmit buffer.
(c) Transmit Descriptor 2 (TD2)

| Bit | Symbol | Bit Name | Description | R/W |
| :--- | :--- | :--- | :--- | :--- |
| b31 to b0 | TBA | Transmit Buffer Address | Set the start address of the transmit buffer. When the <br> TD1.TBL bit value is 1 to 16 bytes, align it on a 32-byte <br> boundary. | R/W |
|  |  |  |  |  |

Note: TD2 is used to set the start address of the transmit buffer.

## (2) Receive Descriptor

Figure 24.22 shows the relationship between a receive descriptor and the receive buffer. The receive frame and receive buffer configuration can be selected from one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the receive descriptor. If the receive buffer length (RBL) is set to 0 , operation indicated by the descriptor is not guaranteed.

Note 1. The padding size is determined by the descriptor length ( $16 / 32 / 64$ bytes)

Figure 24.22 Relationship between Receive Descriptor and Receive Buffer
(a) Receive Descriptor 0 (RDO)

| Bit | Symbol | Bit Name |
| :--- | :--- | :--- |
| b26 to b0 | Rescription |  |
|  | Receive Frame Status | Set all bits to 0 when creating a descriptor. After write-back, <br> the bits indicate the following: <br> RFS26 to RFS10: Reserved <br> RFS9: Receive FIFO overflow (the value is equivalent to <br> the ETNCnEESR.RFOF flag). |
|  | RFS8: Receive abort is detected (the value is equivalent to |  |
| the ETNCnEESR.RABT flag). |  |  |
|  | RFS7: Multicast address frame is received (the value is |  |
| equivalent to the ETNCnEESR.RMAF flag). |  |  |
|  | RFS6 and RFS5: Reserved |  |
| RFS4: Alignment error is detected (the value is equivalent |  |  |
| to the ETNCnEESR.RRF flag). |  |  |
|  | RFS3: Frame-too-long error (the value is equivalent to the |  |
| ETNCnEESR.RTLF flag) |  |  |

When each bit becomes 1 , it indicates that the corresponding error has occurred during frame reception. When any of the RFS bits becomes 1, the RFE bit also becomes 1 (set the ETNCnTRSCER register to select whether bits RFS7 and RFS4 are reflected in the RFE bit). When any bit from RFS3 to RFS0 becomes 1, the RFS8 bit also becomes 1.

| b27 | RFE | Receive Frame Error | 0 : No error has occurred in the received frame. <br> 1: An error has occurred in the received frame. | R/W |
| :---: | :---: | :---: | :---: | :---: |
| b29, b28 | RFP[1:0] | Receive Frame Position | b29 b28 <br> $0 \quad 0$ : Receive buffer indicated by this descriptor is the middle of a receive frame (frame information is incomplete). <br> 0 1: Receive buffer indicated by this descriptor is the end of a receive frame (frame information is complete). <br> 10 : Receive buffer indicated by this descriptor is the head of a receive frame (frame information is incomplete). <br> 1 1: Receive buffer indicated by this descriptor is all of a receive frame (one buffer per frame). | R/W |
| b30 | RDLE | Receive Descriptor List End | When this bit is 1 , it indicates that this descriptor is the last one of the descriptor list. | R/W |
| b31 | RACT | Receive Descriptor Valid | Indicates that this descriptor is valid. | R/W |

Note: Bits for write-back are underlined. RD0 indicates the receive frame status.

## Receive Frame Error (RFE Bit)

When the RFE bit is 1 , it indicates that one or more of the RFS bits is 1 (set the ETNCnTRSCER register to select whether bits RFS7 and RFS4 of ETNCn are reflected in the RFE bit).

## Receive Frame Position (RFP[1:0] Bits)

The RFP[1:0] bits indicate which part of a receive frame corresponds to the receive buffer indicated by this descriptor.

## Receive Descriptor Valid (RACT Bit)

The RACT bit indicates that this descriptor is valid. The RACT bit is set to 1 by software. This bit becomes 0 when all data has been transferred to the receive buffer indicated by RD2 or when the receive buffer becomes full.
(b) Receive Descriptor 1 (RD1)

| Bit | Symbol | Bit Name | Description | R/W |
| :--- | :--- | :--- | :--- | :--- |
| b15 to b0 | RFL | Receive Frame Length | These bits indicate the length (number of bytes) of the receive R/W <br> frame stored in the buffer. |  |
|  |  | The number of bytes for padding set by the ETNCnRPADIR <br> register is not included. These bits are written back to the <br> descriptor corresponding to the end of a frame. |  |  |
| b31 to b16 | RBL | Receive Buffer Length | These bits indicate the byte length of the corresponding <br> receive buffer. Set an integral multiple of 32 as the buffer <br> length. | R/W |

Note: Bits for write-back are underlined
RD1 indicates the receive buffer length. When reception is completed, the receive frame length is written back.
(c) Receive Descriptor 2 (RD2)

| Bit | Symbol | Bit Name | Description | R/W |
| :--- | :--- | :--- | :--- | :--- |
| b31 to b0 | RBA | Receive Buffer Address | These bits indicate the start address of the receive buffer. | R/W |
|  |  |  | Align the buffer address on a 32-byte boundary. |  |

Note: RD2 indicates the start address of the receive buffer.

Page 2081 of 4595

### 24.4.2.2 Transmission

When the ETNCnEDTRR.TR bit is set to 1 while the ETNCnECMR.TE bit is 1 , the EDMAC reads the descriptor following the previously used descriptor in the transmit descriptor list (or the descriptor indicated by the ETNCnTDLAR register after a reset). When the TACT bit is 1 in the transmit descriptor (TD0), the EDMAC sequentially reads transmit data from the start address of the transmit buffer indicated by transmit descriptor 2 (TD2) and transfers it to the ETHERC via the transmit FIFO. The ETHERC creates a transmit frame and starts transmission to the MII / RMII. When all data indicated by the TD1.TBL bit is transferred, write-back is performed according to the TD0.TFP[1:0] bits as follows:

- When the TD0.TFP [1:0] bits are $00_{\mathrm{B}}$ or $10_{\mathrm{B}}$ (frame information is incomplete), the TD0.TACT bit is written back.
- When the TD0.TFP[1:0] bits are $01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ (frame information is complete), the TD0.TACT, TD0.TFS, and TD0.TFE bits are written back.

When the TD0.TACT bit in the read descriptor is 1 , the EDMAC continues reading descriptors and transmits frames. When the TD0.TACT bit in the read descriptor is 0 , the EDMAC sets the ETNCnEDTRR.TR bit to 0 and stops transmission.

Figure 24.23 Example of Transmission Flow

### 24.4.2.3 Reception

When the ETNCnEDRRR.RR bit is set to 1 while the ETNCnECMR.RE bit is 1 , the EDMAC reads the receive descriptor following the previously used descriptor (or descriptor indicated by the RDLAR register after a reset) and then waits for reception. While the RD0.RACT bit is 1 , if the data stored in the receive FIFO is 32 bytes or more, or if the end byte of the frame is stored in the receive buffer, the EDMAC transfers data from the receive FIFO to the receive buffer indicated by receive descriptor $2(\mathrm{RD} 2)$. If the data length of the received frame is longer than the buffer length set by the RBL bit in receive descriptor 1 (RD1), the EDMAC writes back $10_{\mathrm{B}}$ or $00_{\mathrm{B}}$ to the RD0.RFP[1:0] bits and 0 to the RD0.RACT bit when the receive buffer becomes full, and then the EDMAC reads the next data. After that, the EDMAC transfers data to another receive buffer. When the frame reception is complete or when the frame reception is aborted by an error, the EDMAC writes back $11_{\mathrm{B}}$ or $01_{\mathrm{B}}$ to the RD0.RFP[1:0] bits, 0 to the RD0.RACT bit, and the receive frame length to the RD1.RFL bit. When the ETNCnRMCR.RNR bit is 1, the EDMAC reads the next descriptor and waits for reception. When the RNR bit is 0 , the EDMAC sets the ETNCnEDRRR.RR bit to 0 and stops reception.

Figure 24.24 Example of Reception Flow

### 24.4.2.4 Multi-Buffer Frame Transmission

## (1) Error Processing While Transmitting a Multi-Buffer Frame

If an error occurs during multi-buffer frame transmission, the EDMAC performs the processing shown in Figure

### 24.25 .

In the figure, when the TACT bit of transmit descriptor 0 (TD0) is 0 , the descriptor indicates that all data in the buffer has been successfully transmitted. When the TACT bit is 1 , the descriptor indicates that data in the buffer has not yet been transmitted. If a frame transmit error*1 occurs in the head or middle of the frame while the TD0.TACT bit is 1 , the EDMAC stops data transmission from the transmit FIFO and EDMAC data transfer, and sets the TD0.TACT bit to 0 . After that, the EDMAC reads the next descriptor to see if the descriptor indicates the middle of the frame (TD0.TFP[1:0] bits are $00_{B}$ ) or the end of the frame (TD0.TFP[1:0] bits are $01_{B}$ ). When the descriptor indicates the middle of the frame, the EDMAC sets the TD0.TACT bit to 0 and reads the next descriptor. When the descriptor indicates the end of the frame, the EDMAC not only sets the TD0.TACT bit to 0 , but also writes back to the TD0.TFE and TD0.TFS bits. After an error occurs, data in the buffer is not transmitted until write-back to the descriptor for the end of the frame. When the corresponding transmit error interrupt is enabled in the ETNCnEESIPR register, an interrupt request is generated immediately after write-back to the descriptor for the end of the frame.

Note 1. For ETNCn, these errors are a transmit retry-over condition error, late collision error, loss of carrier error, and a carrier not detected error.

Figure 24.25 EDMAC Operation After a Transmit Error Occurs

## (2) Error Processing While Receiving a Multi-Buffer Frame

If an error occurs during multi-buffer frame reception, the EDMAC performs the processing shown in Figure 24.26.
In the figure, when the RACT bit of receive descriptor 0 (RD0) is 0 , the descriptor indicates that data has been successfully received in the buffer. When the RACT bit is 1 , the descriptor indicates that data has not yet been received in the buffer. If a frame receive error*1 occurs, the EDMAC stops receiving data of the frame, but it transfers data that has already been stored in the receive FIFO to the receive buffer.

When the receive buffer becomes full during transfer, the EDMAC sets the RACT bit to 0 and the RFP[1:0] bits to $10_{\mathrm{B}}$ or $00_{\mathrm{B}}$ and reads the next descriptor. After all data in the receive FIFO has been transferred, the EDMAC writes back the status to the descriptor.

When the corresponding receive error interrupt is enabled in the ETNCnEESIPR register, an interrupt request is generated immediately after write-back to the descriptor. When there is a request to receive a new frame, the EDMAC continues reception using the descriptor following the descriptor where the error occurred.

Note 1. For ETNCn, these errors are a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, and alignment error.

Figure 24.26 EDMAC Operation after Receive Error Occurs

### 24.4.2.5 Interrupts

When any of the status flags in the ETNCnEESR register becomes 1 while the corresponding interrupt request enable bit in the ETNCnEESIPR register is 1, ETNCn outputs an INTETNCn interrupt request to the CPU.

### 24.5 Usage Notes

### 24.5.1 Operation in Each Communication Mode

The bridge function of MII-to-RMII and RMII-to-MII is realized by converting the receive signal from RMII to MII and the transmit signal from MII to RMII by using the MII2RMII block. The operation is performed in multiple different communication modes depending on the setting of the mode signal.

Table 24.63 lists the mode settings in each communication mode.
Table 24.63 Operation State in Each Communication Mode

|  | I/F specifications | MII | RMII | RMII | RMII | RMII |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | Communication rate | $10 / 100 \mathrm{Mbps}$ | 10 Mbps | 10 Mbps | 100 Mbps | 100 Mbps |
| Communication Mode | Communication system | Full/half duplex | Half duplex | Full duplex | Half duplex | Full duplex |
| Register setting | OPBT8.ETN_RMII_SEL | 0 | 1 |  |  |  |
|  | ETNCnECMR.RTM bit | - | 0 | 1 | 0 | 1 |
|  | ETNCnECMR.DM bit | - | 0 | 1 | 0 |  |

### 24.5.2 Conditions for the LCHNG Flag to Become 1

The ETNCnECSR.LCHNG flag may become 1 even when the input level of the LINKSTA pin remains the same. In this case, a high level is input to the LINKSTA pin when setting the Pin function to assign the LINKSTA signal to a port or when releasing the ETHERC and EDMAC software reset using the ETNCnEDMR.SWR bit. The ETNCnECSR.LCHNG flag becomes 1 because the LINKSTA signal in the ETHERC is fixed to low level regardless of the level input to the external pin while the Pin function does not assign the LINKSTA signal or during the ETHERC and EDMAC software reset.

To avoid wrongly generating a link signal change interrupt, clear the ETNCnECSR.LCHNG flag and then set the ETNCnECSIPR.LCHNGIP bit to 1.

### 24.5.3 Input to the RMII_RX_ER Pin While the RMII is Selected

When the width of a reception error signal received from the PHY-LSI is only one cycle of the REF50CK clock (50 MHz ) while the RMII is selected, the signal is not recognized as an error signal.

### 24.5.4 Stopping the EDMAC during Operations

When stopping EDMAC operations by using a sleep instruction or module-stop function while the EDMAC is running, confirm that the ETNCnEDTRR.TR and ETNCnEDRRR.RR bits are 0. If the EDMAC is stopped while the ETNCnEDTRR.TR or ETNCnEDRRR.RR bit is 1, the data for the frame that is being transmitted or received may not be complete, and EDMAC operation after exiting the sleep mode or module-stop state will not be guaranteed.

## Section 25 Peripheral Sensor Interface 5 S (PSI5-S)

This section contains a generic description of peripheral sensor interface 5 S (PSI5-S).
The first part of this section describes the specific properties of this product, such as the number of channels and register base addresses.

The remainder of this section describes the functions and registers of PSI5-S.

### 25.1 Features of PSI5-S

### 25.1.1 Units and Channels

This product contains a PSI5-S with the number of channels shown below.
Table $25.1 \quad$ Number of Channels

| Product Name | RH850/E2x-FCC1 Series |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  | 1 | 1 |
| Name | PSI5S |  |

### 25.1.2 Register Base Address

The base address <PSI5S_base> of PSI5-S is shown listed in Table 25.2.
Table 25.2 Register Base Address <PSI5S_base>

| PSI5-S Channel | PSI5-S Base Address | Bus Group |
| :--- | :--- | :--- |
| <PSI5S_base> | FFD5 $0000_{\mathrm{H}}$ | Peripheral Group 3 |

### 25.1.3 Clock Supply

The clocks supplied by and to PSI5-S are listed in the following table.
Table 25.3 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| PSI5S | PCLK (bus clock) | CLK_HSB |
|  | UART communication clock | CLK_HSB |
|  | UART communication multiply clock | CLK_UHSB |

### 25.1.4 Interrupt Requests

The PSI5-S interrupt requests are listed in the following table.
Table 25.4 Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |
| :--- | :--- | :--- | :--- |
| INTPSI5SINTCH0 | int_psis_ch0 | Communication interrupt for CH0 | 396 |
| INTPSI5SINTCH1 | int_psis_ch1 | Communication interrupt for CH1 | 397 |
| INTPSI5SINTCH2 | int_psis_ch2 | Communication interrupt for CH2 | 398 |
| INTPSI5SINTCH3 | int_psis_ch3 | Communication interrupt for CH3 | 399 |
| INTPSI5SINTCH4 | int_psis_ch4 | Communication interrupt for CH4 | 400 |
| INTPSI5SINTCH5 | int_psis_ch5 | Communication interrupt for CH5 | 401 |
| INTPSI5SINTCH6 | int_psis_ch6 | Communication interrupt for CH6 | 402 |
| INTPSI5SINTCH7 | int_psis_ch7 | Communication interrupt for CH7 | 403 |

The PSI5-S DMA requests are listed in the following table.
Table 25.5 DMA Requests

| Interrupt Symbol Name | Unit Signal | Outline | sDMA Trigger | DTS Trigger |
| :--- | :--- | :--- | :--- | :--- |
| INTPSI5SRXDMACH0 | dma_psis_ch0_rx | PSI5-S DMA request (CH0 RX) | group0-138 | group1-46 |
| INTPSI5SRXDMACH1 | dma_psis_ch1_rx | PSI5-S DMA request (CH1 RX) | group0-139 | group1-47 |
| INTPSI5SRXDMACH2 | dma_psis_ch2_rx | PSI5-S DMA request (CH2 RX) | group0-140 | group1-48 |
| INTPSI5SRXDMACH3 | dma_psis_ch3_rx | PSI5-S DMA request (CH3 RX) | group0-141 | group1-49 |
| INTPSI5SRXDMACH4 | dma_psis_ch4_rx | PSI5-S DMA request (CH4 RX) | group0-142 | group1-50 |
| INTPSI5SRXDMACH5 | dma_psis_ch5_rx | PSI5-S DMA request (CH5 RX) | group0-143 | group1-51 |
| INTPSI5SRXDMACH6 | dma_psis_ch6_rx | PSI5-S DMA request (CH6 RX) | group0-144 | group1-52 |
| INTPSI5SRXDMACH7 | dma_psis_ch7_rx | PSI5-S DMA request (CH7 RX) / UART RX | group0-145 | group1-53 |
| INTPSI5STXDMACH1 | dma_psis_ch1_tx | PSI5-S DMA request (CH1 TX) | group0-146 | group1-54 |
| INTPSI5STXDMACH2 | dma_psis_ch2_tx | PSI5-S DMA request (CH2 TX) | group0-147 | group1-55 |
| INTPSI5STXDMACH3 | dma_psis_ch3_tx | PSI5-S DMA request (CH3 TX) | group0-148 | group1-56 |
| INTPSI5STXDMACH4 | dma_psis_ch4_tx | PSI5-S DMA request (CH4 TX) | group0-149 | group1-57 |
| INTPSI5STXDMACH5 | dma_psis_ch5_tx | PSI5-S DMA request (CH5 TX) | group0-150 | group1-58 |
| INTPSI5STXDMACH6 | dma_psis_ch6_tx | PSI5-S DMA request (CH6 TX) | group0-151 | group1-59 |
| INTPSI5STXDMACH7 | dma_psis_ch7_tx | PSI5-S DMA request (CH7 TX) / UART TX | group0-152 | group1-60 |

### 25.1.5 Reset Sources

Table 25.6 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up Reset | System <br> Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| PSI5S | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 25.1.6 External Input/Output Signals

PSI5-S has the input/output pins listed in Table 25.7.
Table 25.7 Pin Configuration

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| PSI5S | UART Rx data | PSISRX |
| psis_rx_data | UART Tx data | PSISTX |
| psis_tx_data | PSISCLK |  |
| psis_tx_sclk | UART clock |  |

## CAUTION

This AC specification is only applied to the specific pin groups. For details, refer to Appendix file "Limited_conditions_for_AC_specification.xIsx".

### 25.2 Outline of Functions

### 25.2.1 Functional Overview

PSI5-S performs UART communication with an external transceiver (PSI5 transceiver).
PSI5-S implements a peripheral sensor interface compliant with PSI5 Version 2.2 via the external transceiver.
This document describes the general specifications of PSI5-S.
The following table lists the features of PSI5-S.
Table 25.8 Features

| Item | Specification |
| :--- | :--- |
| UART communication | Sampling clock output(*1): 6.67 MHz to 26.67 MHz |
|  | Baud rate ${ }^{* 2}$ ): 1.333 Mbps to 5.333 Mbps |
|  | Frame format (total of 10 or 11 bits) |
|  | - Start bit: 1 bit |
|  | - Data: 8 bits |
|  | - Parity: None, even parity, 0 parity, or odd parity (can be specified separately for reception and |
|  | - Stop bit: 1 bit |
| Sensor-to-ECU | - Possible reception of eight channels of frame data |
| communication | - Possible reception of 8 -bit to $28-$ bit payload |
|  | - Possible storage of the CRC and parity bits attached to the data in received frames |
|  | - Monitoring of the number of packets in received frames |
|  | - Timestamp function for received messages. |
|  | - Monitoring of the received frames by WDT. |
| ECU-to-sensor | - Automatic calculation of the CRC value to be added to frame data |
| communication | - Output format selectable from frame 1 to frame 4 |
| Other interface | Interrupt output |
|  | - Eight channels (Ch0 to Ch7) |
|  | DMA request output |
|  | - Eight channels (Ch0 to Ch7) for reception and seven channels (Ch1 to Ch7) for transmission |

Note 1. For details about the clock specifications, see Section 25.5.1, Common Setting.
Note 2. For details about the baud rate of UART communication, Section 25.5.1, Common Setting.

### 25.2.1.1 Terms

Table 25.9 Abbreviations

| HW | Hardware |
| :--- | :--- |
| SW | Software |
| PSI5 | Peripheral Sensor Interface 5 |
| UART | Universal Asynchronous Receiver Transmitter |
| Mbps | Megabits per second |
| SFR | Special Function Register |
| ECU | Engine Control Unit |
| Ch | Channel |
| Frm | Frame |
| Sync | Synchronous |
| Async | Asynchronous |
| Rx | Receive |
| Tx | Transmit |
| WDT | Watchdog Timer |
| MB | MailBox |
| INT | Interrupt |
| DDSR | Downstream Data Snift Register |
| GTM | Generic Timer Module |

A "packet" means a UART frame.
A "packet frame" means a group of three to six packets (UART frames) that are received from a transceiver.
A "PSI5 frame" means data that is reconstructed from a packet frame after removing start, stop, and parity bits from the packet frame.

Figure 25.1 Definitions of Packet and Frames (without Parity)

Figure 25.2 Definitions of Packet and Frames (with Parity)

The PSI5 frame format is as follows.

Figure 25.3 PSI5 Frame Format

Figure 25.4 PSI5-S Block Diagram

The following table lists the functions of PSI5-S.
Table 25.10 PSI5-S Function List

| No. | Name | Function |
| :--- | :--- | :--- |
| $(1)$ | P-Bus interface | P-Bus interface (write/read access) |
| $(2)$ | SFR | Special function registers (detect some kinds of errors) |
| $(3)$ | Noise filter | Removes signals of less than 37.5 ns. |
| $(4)$ | Reset | Generates an asynchronous reset via input reset signal or software setting. |
| $(5)$ | Loopback | UART loopback setting |
| $(6)$ | UART Rx | UART receiver |
| $(7)$ | UART Tx | UART transmitter |
| $(8)$ | Gen UART clock | Generates the UART communication clock. |
| $(9)$ | PSI5 Rx | Restores PSI5 frame data from UART reception data. |
|  |  | Checks for errors in reception data. |
| $(10)$ | Timestamp | GSI5 frame data is watched by WDT. |
| $(11)$ | PSI5 Tx | When a header or synchronization pulse is received, the timestamp value is captured. |
| $(12)$ | Gen Sync pulse | Generates ECU-to-sensor data. |
| $(13)$ | Interrupt | Generates an interrupt signal when an interrupt factor occurs. |
| $(14)$ | DMA request | Generates a DMA request signal when a DMAC request factor occurs. |

### 25.3 Registers

### 25.3.1 List of Registers

### 25.3.1.1 Common Register/Config

The PSI5-S registers are listed in the following table.
For details on $<$ PSI5S_base $>$, see Section 25.1.2, Register Base Address.
Table 25.11 List of Registers (1/13)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| PSI5S | PSI5-S/UART Operation Enable register | PSI5SPUOEB | <PSI5S_base> + 000 ${ }_{\text {H }}$ | 8,16, 32 | - |

### 25.3.2 Common Register/Config

### 25.3.2.1 PSI5SPUOEB — PSI5-S/UART Operation Enable Register

Table 25.12 PSI5SPUOEB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | OPEN | Operation enable |
|  | 0: Disable |  |
|  | 1: Enable |  |
|  | The value 1 can be written to this bit |  |
|  | when PUOS.ACSTS is 0 ( $=$ configuration mode). |  |
|  | The value 0 can be written to this bit at any time. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  |  |  |

### 25.3.2.2 PSI5SPUOMD — PSI5-S/UART Operation Mode Register

Value after reset: $\quad 00000000^{H}$

Table 25.13 PSI5SPUOMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | OPMD | Operation mode select |
|  | $0:$ UART mode |  |
|  |  | 1: PSI5S mode |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |
|  |  |  |

### 25.3.2.3 PSI5SPUOS — PSI5-S/UART Operation Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | MSTS | ACSTS | SWSTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.14 PSI5SPUOS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 2 | MSTS | Mode status |
|  |  | 0: UART mode (PSI5SPUOEB.OPEN = 1, PSI5SPUOMD.OPMD = 0) |
|  |  | 1: PSI5S mode (PSI5SPUOEB.OPEN = 1, PSI5SPUOMD.OPMD = 1) |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 1 | ACSTS | Active status |
|  |  | 0: Not Active (Configuration mode: PSI5SPUOEB.OPEN = 0) |
|  |  | 1: Active (UART mode or PSI5S mode: PSI5SPUOEB.OPEN = 1) |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | SWSTS | Software (SW) reset status |
|  |  | 0 : SW reset not asserted |
|  |  | 1: SW reset asserted |
|  |  | Writing 1 to PSI5SPUSWR.SWRST sets this bit to1. |
|  |  | This bit is read as 1 during SW reset execution. |
|  |  | After SW reset execution, the bit is cleared to 0 . |

### 25.3.2.4 PSI5SPUNFST — PSI5-S/UART Noise Filter Set Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.15 PSI5SPUNFST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | NFSET | Noise filter setting |
|  | $0:$ Disable |  |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |
|  |  |  |

### 25.3.2.5 PSI5SPUSWR — PSI5-S/UART Software Reset Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.16 PSI5SPUSWR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | SWRST | Software (SW) reset |
|  | $0:$ Ignored |  |
|  | 1: Start software reset for PSI5-S |  |
|  |  | This bit is always read as 0. |

### 25.3.2.6 PSI5SPRMBC — PSI5-S Receive MailBox Data Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.17 PSI5SPRMBC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | MBCLR | MailBox clear |
|  |  | All MailBox data clear |
|  | $0:$ Ignored |  |
|  | $1:$ All MailBox data cleared to 0 |  |
|  |  | This bit is always read as 0. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |

### 25.3.2.7 PSI5SPUCLB — PSI5-S/UART Communication Loop Back Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.18 PSI5SUCLB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 7 to 1 | TMKV | Test Mode Key Values |
|  |  | Test mode key values for loopback test function |
|  |  | These bits are always read as 0 . |
| 0 | LBEN | 3 rd write value of loopback test sequence enable |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | Test function set sequence is described in Section 25.5.11.1, Loopback Test Setting Procedure. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.8 PSI5SPUPTS — PSI5-S/UART Rx/Tx Parity Set Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | UTPRTY[1:0] |  | - | - | - | - | - | - | URPRTY[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

Table 25.19 PSI5SUPTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 9 to 8 | UTPRTY[1:0] | UART Tx Parity |
|  |  | $00_{\mathrm{B}}$ : Parity disable |
|  |  | 01 ${ }_{\mathrm{B}}$ : Even parity |
|  |  | $10_{\mathrm{B}}$ : 0 parity (Parity is always 0 ) |
|  |  | $11_{\mathrm{B}}$ : Odd parity |
|  |  | When the CPU sets parity to disable ( $=00_{\mathrm{B}}$ ), a packet (UART frame) is composed of 1 start bit, 8 data bits and 1 stop bit ( 10 bits in total). |
|  |  | Otherwise, a packet (UART frame) is composed of 1 start bit, 8 data bits, 1 parity bit and 1 stop bit (11 bits in total). |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 to 0 | URPRTY[1:0] | UART Rx parity |
|  |  | $00_{\mathrm{B}}$ : Parity disable |
|  |  | $01_{\mathrm{B}}$ : Even parity |
|  |  | $10_{\mathrm{B}}$ : Parity don't care |
|  |  | $11_{\mathrm{B}}$ : Odd parity |
|  |  | When the CPU sets parity to disable ( $=00_{\mathrm{B}}$ ), a packet (UART frame) is composed of 1 start bit, 8 data bits and 1 stop bit ( 10 bits in total). |
|  |  | Otherwise, a packet (UART frame) is composed of 1 start bit, 8 data bits, 1 parity bit and 1 stop bit (11 bits in total). |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.9 PSI5SPUBCE — PSI5-S/UART Baud Rate Clock Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.20 PSI5SUBCE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | SCKEN | UART clock (Psis_tx_sclk) output enable |
|  | $0:$ Disable |  |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |
|  |  |  |

### 25.3.2.10 PSI5SPUBPR — PSI5-S/UART Baud Rate Paramater Register

Value after reset: $\quad 00040000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | RXOSMP[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | SCKDIV[7:0] |  |  |  |  |  |  |  | - | SCKPRS[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.21 PSI5SUBPR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 19 to 16 | RXOSMP[3:0] | RX Over sample number |
|  |  | 0 to 3: Setting prohibited |
|  |  | 4: 5 samples |
|  |  | $\cdots$ |
|  |  | $x: x+1$ samples |
|  |  | $\ldots$ |
|  |  | 15: 16 samples |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 15 to 8 | SCKDIV[7:0] | Clock divide value of UART SCLK(psis_tx_sclk) |
|  |  | $0=1 / 1$ |
|  |  | $1=1 / 2$ |
|  |  | $\ldots$ |
|  |  | $x=1 /(x+1)$ |
|  |  | $\cdots$ |
|  |  | $255=1 / 256$ |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 | - | Reserved |
|  |  | This bit is always read as 0 . The write value is ignored. |
| 6 to 0 | SCKPRS[6:0] | Prescaler of UART SCLK(psis_tx_sclk) |
|  |  | $0=1 / 1$ |
|  |  | $1=1 / 2$ |
|  |  | $\cdots$ |
|  |  | $x=1 /(x+1)$ |
|  |  | $\ldots$ |
|  |  | $127=1 / 128$ |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.11 PSI5SPTPS — PSI5-S Timestamp Prescaler Register

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | TSPRSU[9:0] |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | TSPRSL[6:0] |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.22 PSI5SPTPS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 25 to 16 | TSPRSU[9:0] | Timestamp prescaler (upper) |
|  |  | These bits define the load data of the timestamp prescaler counter (upper 10 bits). |
|  |  | These bits configure a max 1 ms enable pulse from a $1 \mu \mathrm{~s}$ enable pulse |
|  |  | The timestamp prescaler counter (upper) loads this setting and starts counting down until it reaches 1. |
|  |  | Loading and counting down count are continuously repeated. |
|  |  | When the timestamp prescaler counter (upper) becomes 1 , the timestamp tick is output. If the CPU sets 0 to these bits, this pulse is not output. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 15 to 7 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 6 to 0 | TSPRSL[6:0] | Timestamp prescaler (lower) |
|  |  | These bits define the load data of the timestamp prescaler counter (lower 7 bits). |
|  |  | The timestamp prescaler counter (lower) loads this setting and starts counting down until it reaches 1. |
|  |  | Loading and counting down count are continuously repeated. |
|  |  | These bits configure a $1 \mu$ s clock from PCLK. |
|  |  | When the timestamp prescaler counter (lower) becomes 1, a $1 \mu$ s enable pulse is output. |
|  |  | When the CPU sets 0 to these bits, the $1 \mu$ s enable pulse is not output. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.12 PSI5SPTCAS — PSI5-S Timestamp Counter A Select Register

| Value after reset: |  |  | 0000 0000H |  | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 |  |  |  |  |  |  |  |  |  |  |  |  |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { TSCAC } \\ \text { LS } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { TSCAE } \\ \text { BS } \end{array}$ | - | - | - | - | - | - | - | $\left\lvert\, \begin{gathered} \text { TSCAC } \\ \text { KS } \end{gathered}\right.$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

Table 25.23 PSI5SPTCAS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 16 | TSCACLS | Timestamp counter A clear select |
|  |  | 0 : Signal generated by PSI5-S is selected |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 15 to 9 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 8 | TSCAEBS | Timestamp counter A enable select |
|  |  | 0 : Signal generated by PSI5-S is selected (= PTCAE.TSCAEB \|| PATCE.ATSCEB). |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | TSCACKS | Timestamp counter A clock select |
|  |  | 0 : Signal generated by PSI5-S is selected |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.13 PSI5SPTCBS — PSI5-S Timestamp Counter B Select Register

| Value after reset: |  |  | $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { TSCBC } \\ \text { LS } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

|  | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { TSCBE } \\ \text { BS } \end{array}$ | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { TSCBC } \\ \text { KS } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R/W |

Table 25.24 PSI5SPTCBS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 16 | TSCBCLS | Timestamp counter B clear select |
|  |  | 0: Signal generated by PSI5-S is selected |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 15 to 9 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 8 | TSCBEBS | Timestamp counter B enable select |
|  |  | 0: Signal generated by PSI5-S is selected |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | TSCBCKS | Timestamp counter B clock select |
|  |  | 0 : Signal generated by PSI5-S is selected |
|  |  | 1: GTM output is selected |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.14 PSI5SPTCAE — PSI5-S Timestamp Counter A Enable Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\underset{\mathrm{B}}{\mathrm{TSCAE}}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Table 25.25 PSI5SPTCAE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | TSCAEB | Timestamp counter A enable |
|  | 0 0: Disable |  |
|  | 1: Enable |  |
|  | When PSI5SPTCAS.TSCAEBS is 0 , this bit is selected and is used for timestamp counterA. |  |
|  | When PSI5SPTCAS.TSCAEBS is 1 , this bit is disabled. |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSISSPUOS.MSTS is 1 (= PSI5S mode). |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  |  |  |

### 25.3.2.15 PSI5SPTCAC — PSI5-S Timestamp Counter A Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { TSCAC } \\ \text { LR } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.26 PSI5SPTCAC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | TSCACLR | Timestamp counter A clear |
|  | 0 : Ignored |  |
|  | 1: Clear timestamp counterA |  |
|  | When PSI5SPTCAS.TSCACLS is 0 , this bit is enabled and uses timestamp counter A clear. |  |
|  | When PSI5SPTCAS.TSCACLS is 1 , this bit is disabled. |  |
|  | This bit is always read as 0. |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSISSPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |  |

### 25.3.2.16 PSI5SPTCBE — PSI5-S Timestamp Counter B Enable Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\left\lvert\, \begin{gathered} \text { TSCBE } \\ \mathrm{B} \end{gathered}\right.$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.27 PSI5SPTCBE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | TSCBEB | Timestamp counter B enable |
|  | 0 0: Disable |  |
|  | 1: Enable |  |
|  | When PSI5SPTCBS.TSCBEBS is 0 , this bit is enabled and is used for timestamp counter B. |  |
|  | When PSI5SPTCBS.TSCBEBS is 1 , this bit is disabled. |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSISSPUOS.MSTS is 1 (= PSI5S mode). |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  |  |  |

### 25.3.2.17 PSI5SPTCBC — PSI5-S Timestamp Counter B Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { TSCBC } \\ \text { LR } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.28 PSI5SPTCBC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | TSCBCLR | Timestamp counter B clear |
|  | 0 : Ignored |  |
|  | 1: Clears timestamp counter B |  |
|  | When PSI5SPTCBS.TSCBCLS is 0 , this bit is enabled and uses timestamp counter B clear. |  |
|  | When PSI5SPTCBS.TSCBCLS is 1 , this bit is not used. |  |
|  | This bit is always read as 0. |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSISSPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |  |

### 25.3.2.18 PSI5SPATCE — PSI5-S All Timestamp Counter Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\left\lvert\, \begin{gathered} \text { ATSCE } \\ \text { B } \end{gathered}\right.$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.29 PSI5SPATCE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | ATSCEB | All timestamp counter enable |
|  |  | 0 : Ignored |
|  |  | Timestamp counter A is enabled according to the setting of PSI5SPTCAE.TSCAEB |
|  |  | Timestamp counter $B$ is enabled according to the setting of PSI5SPTCBE.TSCBEB |
|  |  | 1: All timestamp counters are enabled regardless of the settings of PSI5SPTCAE.TSCAEB / PSI5SPTCBE.TSCBEB. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.19 PSI5SPATCC — PSI5-S All Timestamp Counter Clear Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | ATSCC LR |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.30 PSI5SPATCC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | ATSCCLR | All Timestamp Counters Clear |
|  | 0 : Ignored |  |
|  | 1: Clears all Timestamp counter |  |
|  | When PSI5SPTCAS.TSCACLS is 0 , this bit is enabled clearing timestamp counter A. |  |
|  | When PSI5SPTCAS.TSCACLS is 1 , this bit is disabled. |  |
|  | When PSI5SPTCBS.TSCBCLS is 0 , this bit is enabled clearing timestamp counter B. |  |
|  | When PSI5SPTCBS.TSCBCLS is 1 , this bit is disabled. |  |
|  | This bit is always read as 0. |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |  |

### 25.3.2.20 PSI5SUCRIE — UART Communication Rx Interrupt Enable

| Value after reset: |  |  | 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | IERFIN | IEROE | IERFE | IERPE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 25.31 PSI5SUCRIE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 3 | IERFIN | Interrupt enable of UART Rx finish flag |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTRFIN. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 2 | IEROE | Interrupt enable of UART Rx overrun error flag |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTRFOE. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 1 | IERFE | Interrupt enable of UART Rx framing error flag |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTRFE. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | IERPE | Interrupt enable of UART Rx parity error flag |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTRPE. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.21 PSI5SUCTIE — UART Communication Tx Interrupt Enable

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | IETFIN | IETOW $\mathrm{E}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 25.32 PSI5SUCTIE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | IETFIN | Interrupt enable of UART Tx finish flag |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTTFIN. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | IETOWE | Interrupt enable of UART Tx overwrite error flag |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit controls interrupt by PSI5SUCRS.UTTFOWE. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.2.22 PSI5SUCDRE — UART Communication DMA Request Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{array}{\|c} \text { DRQEU } \\ \text { TFN } \end{array}$ | $\begin{gathered} \text { DRQEU } \\ \text { RFN } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 25.33 PSI5SUCDRE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | DRQEUTFN | DMA request enable at UART Tx finish |
|  | 0: Disable |  |
|  | 1: Enable |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
| 0 | DRQEURFN | DMA request enable at UART Rx finish |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |
|  |  | PSI5SPUOS.ACSTS is 1 and PSISSPUOS.MSTS is 0 (= UART mode). |
|  |  |  |
|  |  |  |

### 25.3.3 Common Register/Rx

### 25.3.3.1 PSI5SUCRD — UART Communication Rx Data Register

Value after reset: 00000000 H

Table 25.34 PSI5SUCRD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 7 to 0 | UTRDT[7:0] | UART read data |
|  |  | When the stop bit of the Rx UART frame is detected in UART mode, PSI5SUCRD.UTRDT is |
| stored. |  |  |
|  |  | If the next UART frame finishes before the CPU has read this address, PSI5SUCRS.UTROE |
|  | is set to 1 and this register is overwritten with new data. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |

### 25.3.3.2 PSI5SUCRS — UART Communication Rx Status Register

Table 25.35 PSI5SUCRS Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | Reserved |  |
|  | These bits are always read as 0. The write value is ignored. |  |
| 3 | UART Rx finish flag |  |
|  | 0: A frame is not received successfully |  |
|  | 1: A frame is received successfully |  |
|  | When the stop bit of the UART frame is detected in UART mode without any error occurring, |  |
|  | this bit is set to 1 and an interrupt (int_psis_ch0) and DMA request (dma_psis_ch7_rx) occur. |  |
|  | This bit is cleared by writing 1 to PSI5SUCRSC.UTRFINCL. |  |
|  | When PSI5SUCRS.UTRFIN is set and 1 is written to PSI5SUCRSC.UTRFINCL in the same |  |
|  | clock cycle, PSI5SUCRS.UTRFIN remains 1. |  |

Table 25.35 PSI5SUCRS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | UTRPE | UART Rx parity error |
|  | $0:$ No error |  |
|  | 1: A parity error detected |  |
|  | If the stop bit of the UART frame is detected in UART mode when a parity error has been |  |
|  | detected, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. |  |
|  | If a framing error or Rx overrun error occurs during stop bit detection, this bit remains 0. |  |
|  | This bit is cleared by writing 1 to PSI5SUCRSC.UTRPECL. |  |
|  | When PSI5SUCRS.UTRPE is set and 1 is written to PSI5SUCRSC.UTRPECL in the same |  |
|  | clock cycle, PSI5SUCRSC.UTRPE remains 1. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |  |
|  |  |  |

### 25.3.3.3 PSI5SUCRSC — UART Communication Rx Status Clear Register

Value after reset: $\quad 00000000^{\mathbf{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | UTRFIN CL | UTROE CL | UTRFE CL | UTRPE CL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 25.36 PSI5SUCRSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 3 | UTRFINCL | UART Rx finish flag clear |
|  |  | 0: Ignored |
|  |  | 1: UART Rx finish flag (PSI5SUCRS.UTRFIN) clear |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
| 2 | UTROECL | UART Rx overrun error clear |
|  |  | 0 : Ignored |
|  |  | 1: Overrun error (PSI5SUCRS.UTROE) clear |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
| 1 | UTRFECL | UART Rx framing error clear |
|  |  | 0: Ignored |
|  |  | 1: Framing error (PSI5SUCRS.UTRFE) clear |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
| 0 | UTRPECL | UART Rx parity error clear |
|  |  | 0: Ignored |
|  |  | 1: Parity error (PSI5SUCRS.UTRPE) clear |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |

### 25.3.4 Common Register/Tx

### 25.3.4.1 PSI5SPTFST — PSI5-S Tx Frame Start Register

Value after reset: 00000000 H

Table 25.37 PSI5SPTFST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | TXST | Tx start |
|  |  | PSI5-S command data transmission start |
|  |  | 0: Ignored |
|  |  | 1: Transmission start |
|  |  | When the CPU writes 1 to this bit, 1-8 command data (PSI5SPTFD1.TDT1 to PTFD2.TDT8) transmission starts. |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

### 25.3.4.2 PSI5SPTFNM — PSI5-S Tx Frame Number Register

Value after reset: $\quad 00000000^{\mathbf{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | TXNUM[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 25.38 PSI5SPTFNM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 2 to 0 | TXNUM[2:0] | Tx command data number |
|  | $000_{\mathrm{B}}: 1$ packet (UART frame) send (PSI5SPTFD1.TDT1) |  |
|  | $001_{\mathrm{B}}: 2$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD1.TDT2) |  |
|  | $010_{\mathrm{B}}: 3$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD1.TDT3) |  |
|  | $011_{\mathrm{B}}: 4$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD1.TDT4) |  |
|  | $100_{\mathrm{B}}: 5$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD2.TDT5) |  |
|  | $101_{\mathrm{B}}: 6$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD2.TDT6) |  |
|  | $110_{\mathrm{B}}: 7$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD2.TDT7) |  |
|  | $111_{\mathrm{B}}: 8$ packet (UART frame) send (PSI5SPTFD1.TDT1 to PSI5SPTFD2.TDT8) |  |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |
|  |  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |  |

### 25.3.4.3 PSI5SPTFD1 - PSI5-S Tx Frame Data1 Register

| Value after reset: |  |  | 0000 0000 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | TDT4[7:0] |  |  |  |  |  |  |  | TDT3[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | TDT2[7:0] |  |  |  |  |  |  |  | TDT1[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.39 PSI5SPTFD1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | TDT4[7:0] | These bits define the transmission data of the 4th packet (UART frame). |
|  |  | When PSI5SPTFNM.TXNUM is less than 3 , this setting is ignored. |
|  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |  |
|  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |  |
|  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
| 23 to 16 | TDT3[7:0] | These bits define the transmission data of the 3rd packet (UART frame). |
|  |  | When PSI5SPTFNM.TXNUM is less than 2 , this setting is ignored. |
|  |  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |

### 25.3.4.4 PSI5SPTFD2 - PSI5-S Tx Frame Data2 Register

Table 25.40 PSI5SPTFD2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | TDT8[7:0] | These bits define the transmission data of the 8th packet. |
|  |  | When PSI5SPTFNM.TXNUM is less than 7, these setting are ignored. |
|  |  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 23 to 16 | TDT7[7:0] | These bits define the transmission data of the 7th packet. |
|  |  | When PSI5SPTFNM.TXNUM is less than 6, these setting are ignored. |
|  |  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 15 to 8 | TDT6[7:0] | These bits define the transmission data of the 6th packet. |
|  |  | When PSI5SPTFNM.TXNUM is less than 5, these setting are ignored. |
|  |  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 to 0 | TDT5[7:0] | These bits define the transmission data of the 5th packet. |
|  |  | When PSI5SPTFNM.TXNUM is less than 4, these setting are ignored. |
|  |  | These bits cannot be written when PSI5SPTFS.TXSTS is 1. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.4.5 PSI5SPTFS — PSI5-S Tx Frame Status Register

Value after reset: $00000000_{\mathrm{H}}$

Table 25.41 PSI5SPTFS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | TXSTS | Tx status |
|  | $0:$ Transmission not busy |  |
|  | 1: Transmission busy |  |
|  | When the CPU sets 1to PSI5SPTFST.TXST, this bit is set to 1. |  |
|  | When all transmission data (PSI5SPTFD1, PSI5SPTFD2) has been sent to the Tx shifter, this |  |
|  | bit is reset to 0. |  |
|  | When this bit is 1, PSI5SPTFD1 and PSI5SPTFD2 cannot be written. |  |
|  | This bit is read only. The write value is ignored. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
|  |  |  |

### 25.3.4.6 PSI5SPTFIS — PSI5-S Tx FIFO Status Register

Value after reset: $\quad 00000001 \mathrm{H}$

Table 25.42 PSI5SPTFIS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored |
| 1 | TXFFFL | Tx FIFO full |
|  |  | 0 : Not full |
|  |  | 1: Full |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | TXFFEP | Tx FIFO empty |
|  |  | 0: Not empty |
|  |  | 1: Empty |
|  |  | This bit is set to 1 by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is set to 1 when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

### 25.3.4.7 PSI5SUCTD — UART Communication Tx Data Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.43 PSI5SUCTD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 7 to 0 | UTTDT[7:0] | UART transmission data |
|  |  | These bits cannot be written when PSI5SUCTM.UTTBBF is 1. |
|  | When the CPU writes 1 to PSI5SUCTD.UTTDT in PSI5SUCTM.UTTBBF, |  |
|  | PSI5SUCTS.UTTOWE is set to 1. |  |

### 25.3.4.8 PSI5SUCTM — UART Communication Tx Monitoring Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | UTTF | $\underset{\mathrm{F}}{\text { UTTBB }}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.44 PSI5SUCTM Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | UTTF | UART transmission flag |
|  |  | 0: Not transmitting |
|  |  | 1: Transmitting |
|  |  | When stop bit output ends without any subsequent write data, this bit is reset to 0 . |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | UTTBBF | UART Tx shifter busy flag |
|  |  | 0: Permitted to write to PSI5SUCTD.UTTDT |
|  |  | 1: Prohibited to write to PSI5SUCTD.UTTDT |
|  |  | This bit shows status of Tx shifter busy in UART mode. |
|  |  | When CPU writes PSI5SUCTD.UTTDT, this bit is set to 1. |
|  |  | When PSI5SUCTD.UTTDT data is stored in the Tx shifter, this bit is reset to 0 . |
|  |  | When this bit is 1, PSI5SUCTD.UTTDT cannot be written. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

### 25.3.4.9 PSI5SUCTS — UART Communication Tx Status Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | UTTFIN | $\underset{\mathrm{E}}{\mathrm{UTTOW}}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |  |

Table 25.45 PSI5SUCTS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | UTTFIN | UART transmission finish |
|  |  | 0 : Transmission not finished |
|  |  | 1: A UART frame transmission has finished |
|  |  | When PSI5SUCTD.UTTDT data is sent to the Tx shifter, this bit is set to 1 and an interrupt (int_psis_ch1) and DMA request (dma_psis_ch7_tx) occur. |
|  |  | This bit is cleared by writing 1 to PSI5SUCTSC.UTTFINCL. |
|  |  | When PSI5SUCTS.UTTFIN is set and 1 is written to PSI5SUCTSC.UTTFINCL in the same clock cycle, PSI5SUCTS.UTTFIN remains 1. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | UTTOWE | UART transmission overwrite error |
|  |  | 0: No error |
|  |  | 1: Overwrite error |
|  |  | When the CPU writes 1 to PSI5SUCTD.UTTDT in PSI5SUCTM.UTTBBF, this bit sets to 1 and an interrupt (int_psis_ch1) occurs. |
|  |  | This bit is cleared by writing 1 to PSI5SUCTSC.UTTOWECL. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

### 25.3.4.10 PSI5SUCTSC — UART Communication Tx Status Clear Register

Value after reset: $\quad 00000000_{H}$

Table 25.46 PSI5SUCTSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | UTTFINCL | UART Tx finish flag clear |
|  |  | 0 : Ignored |
|  |  | 1: UART Tx finish flag (PSI5SUCTS.UTTFIN) clear |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |
| 0 | UTTOWECL | UART Tx overwrite error clear |
|  |  | 0 : Ignored |
|  |  | 1: Overwrite error (PSI5SUCTS.UTTOWE) clear |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 0 (= UART mode). |

### 25.3.5 Ch0 Register/Config

### 25.3.5.1 PSI5SPRCF10 — PSI5-S Receive Config1 Ch0 Register

Table 25.47 PSI5SPRCF10 Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | - | Reserved <br> These bits are always read as 0 . The write value is ignored. |
| 27 to 24 | PFRMIDLE[3:0] | Packet frame idle <br> Minimum packet frame gap (all channel) <br> 0 : The next packet frame is detected after 1 gap. <br> 1: The next packet frame is detected after 2 gaps. ... <br> n : The next packet frame is detected after $\mathrm{n}+1$ gaps. <br> ... <br> 15: The next packet frame is detected after 16 gaps. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 23 to 21 | F6PKT[2:0] | Frame 6 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 6 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is set to 3 <br> $100_{\mathrm{B}}$ : Packet number is set to 4 <br> $101_{\mathrm{B}}$ : Packet number is set to 5 <br> $110_{\mathrm{B}}$ : Packet number is set to 6 <br> Other than above: Setting prohibited <br> "Frame 6" is a packet frame whose FID is $101_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 20 to 18 | F5PKT[2:0] | Frame 5 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 5 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> "Frame 5 " is a packet frame whose FID is $100_{\mathrm{B}}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.47 PSI5SPRCF10 Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 17 to 15 | F4PKT[2:0] | Frame 4 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 4 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited "Frame 4" is a packet frame whose FID is $011_{\mathrm{B}}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 14 to 12 | F3PKT[2:0] | Frame 3 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 3 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> "Frame 3 " is a packet frame whose FID is $010_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 11 to 9 | F2PKT[2:0] | Frame 2 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 2 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> "Frame 2" is a packet frame whose FID is $001_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 8 to 6 | F1PKT[2:0] | Frame 1 packet number (Ch0) <br> $000_{\mathrm{B}}$ : Frame 2 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> "Frame 1 " is a packet frame whose FID is $000_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 5 to 4 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. $\begin{aligned} & * 1 \\ & * 2 \end{aligned}$ |
| 3 | TSCS | Timestamp counter select (Ch0) <br> 0 : Select timestamp counter B <br> 1: Select timestamp counter A <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 2 | TSEN | Timestamp capture enable (Ch0) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.47 PSI5SPRCF10 Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | RFCPS | Rx frame checksum CRC/parity select (Ch0) |
|  | $0:$ Parity select |  |
|  |  | 1: CRC select |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
| 0 | Channel enable (Ch0) |  |
|  | $0:$ Disable |  |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |

Note 1. bit[5]: Channel 0 does not have SYSEL, because channel 0 does not transmit.
Note 2. bit[4]: Channel 0 does not have TSCTS (Timestamp capture trigger select), because channel 0 has only 1 kind of capture trigger.

### 25.3.5.2 PSI5SPRCF20 — PSI5-S Receive Config2 Ch0 Register

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 25.48 PSI5SPRCF20 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 30 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 29 to 25 | F6PAYLD[4:0] | The payload bit length of packet frame 6 (Ch0) |
|  |  | 8: Sets 8 |
|  |  | $\cdots$ |
|  |  | $x$ : Sets x |
|  |  | $\ldots$ |
|  |  | 28: Sets 28 |
|  |  | Other than above: Setting prohibited |
|  |  | If the initial value (0) is set to these bits, it is handled as 8. |
|  |  | These bits are used to determine the CRC/parity calculation scope. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 24 to 20 | F5PAYLD[4:0] |  |
|  |  | 8: Sets 8 |
|  |  |  |
|  |  | $x \text { : Sets } x$ |
|  |  | ... |
|  |  | 28: Sets 28 |
|  |  | Other than above: Setting prohibited |
|  |  | If the initial value (0) is set to these bits, it is handled as 8. |
|  |  | These bits are used to determine the CRC/parity calculation scope. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.48 PSI5SPRCF20 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 19 to 15 | F4PAYLD[4:0] | The payload bit length of packet frame 4 (Ch0) <br> 8: Sets 8 <br> ... <br> x : Sets x <br> ... <br> 28: Sets 28 <br> Other than above: Setting prohibited <br> If the initial value (0) is set to these bits, it is handled as 8. <br> These bits are used to determine the CRC/parity calculation scope. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 14 to 10 | F3PAYLD[4:0] | The payload bit length of packet frame 3 (Ch0) <br> 8: Sets 8 <br> x : Sets x <br> ... <br> 28: Sets 28 <br> Other than above: Setting prohibited <br> If the initial value (0) is set to these bits, it is handled as 8. <br> These bits are used to determine the CRC/parity calculation scope. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 9 to 5 | F2PAYLD[4:0] | The payload bit length of packet frame 2 (Ch0) <br> 8: Sets 8 <br> $x$ : Sets $x$ <br> 28: Sets 28 <br> Other than above: Setting prohibited <br> If the initial value (0) is set to these bits, it is handled as 8. <br> These bits are used to determine the CRC/parity calculation scope. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 4 to 0 | F1PAYLD[4:0] | The payload bit length of packet frame 1 (Ch0) <br> 8: Sets 8 <br> ... <br> x : Sets x <br> ... <br> 28: Sets 28 <br> Other than above: Setting prohibited <br> If the initial value (0) is set to these bits, it is handled as 8. <br> These bits are used to determine the CRC/parity calculation scope. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.5.3 PSI5SPWDE0 — PSI5-S WDT Enable Ch0 Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | WDTEB |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.49 PSI5SPWDE0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | WDTEB | Watchdog timer of Rx frame enable (Ch0) |
|  | $0:$ Disable |  |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |
|  |  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing to PSI5SPUSWR.SWRST. |
|  |  |  |

### 25.3.5.4 PSI5SPWDPO — PSI5-S WDT Prescaler Ch0 Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.50 PSI5SPWDP0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 11 to 0 | WDTPRS[11:0] | Watchdog timer prescaler (Ch0) |
|  | $0:$ Stop watchdog timer |  |
|  |  | 1 to 4095 : Enabled at 1 clock/ $x$ clock ( $x: 1$ to 4095) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |
|  |  |  |

### 25.3.5.5 PSI5SPWDEV0 — PSI5-S WDT Expiration Value Ch0 Register

Table 25.51 PSI5SPWDEV0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 23 to 0 | WDTEX[23:0] | Watchdog timer expiration value (Ch0) |
|  |  | These bits define the expiration value of the watchdog timer for Rx packet frame monitor in |
|  | Ch0. |  |
|  | When the watchdog counter counts down to 0 from this setting value, the watchdog timer is |  |
|  | judged to have expired. |  |
|  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |  |
|  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  |  |  |

### 25.3.5.6 PSI5SPCIEO — PSI5-S CPU Interrupt Enable Ch0 Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | $\left\|\begin{array}{c} \text { IEBCTF } \\ \mathrm{N} \end{array}\right\|$ | - | - | IEBRFN | $\left\lvert\, \begin{gathered} \text { IEBRFE } \\ X \end{gathered}\right.$ | $\begin{gathered} \text { IEBRFL } \\ K \end{gathered}$ | $\underset{\mathrm{V}}{\mathrm{IE}}$ | $\begin{gathered} \text { IEBRW } \\ \text { DT } \end{gathered}$ | - | $\left\|\begin{array}{c} \text { IEBUTF } \\ \mathrm{R} \end{array}\right\|$ | \|IEBUTP | $\underset{T}{\text { IEBTRS }}$ | IEBPT | $\begin{array}{\|c} \mathrm{IEBCR} \\ \mathrm{C} \end{array}$ | $\begin{gathered} \text { IEBXCR } \\ \mathrm{C} \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.52 PSI5SPCIE0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 14 | IEBCTFN | Interrupt enable of command Tx finish (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 13 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 11 | IEBRFN | Interrupt enable of Rx packet frame finish flag (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 10 | IEBRFEX | Interrupt enable of Rx frame excess error (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 9 | IEBRFLK | Interrupt enable of Rx frame lack error (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 8 | IEBROV | Interrupt enable of Rx overrun error (Ch0) |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.52 PSI5SPCIE0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | IEBRWDT | Interrupt enable of Rx WDT error (Ch0) |
|  | 0: Disable |  |
|  | 1: Enable |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
| 6 | Reserved |  |
|  |  | This bit is always read as 0. The write value is ignored. |

### 25.3.5.7 PSI5SPDRE0 — PSI5-S DMA Transfer Request Enable Ch0 Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | DRQE WDT | $\begin{gathered} \text { DRQER } \\ \text { FN } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 25.53 PSI5SPDRE0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | DRQEWDT | Enable of DMA request by the WDT error (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | DRQERFN | Enable of DMA request by the channel data Rx finish (Ch0) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.6 Ch0 Register/Rx

### 25.3.6.1 PSI5SPRESO — PSI5-S Receive Error Status Ch0 Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.54 PSI5SPRES0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | RERRF2 | Rx error at packet frame 2 (Ch0) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of "Rx overrun error", "Rx WDT error", "UART framing error", "UART parity error", "transceiver status error", "payload data parity error", "payload data CRC error" or "packet frame XCRC error" in packet frame2 of Ch0 has occurred. |
|  |  | This bit is cleared when writing 0b1 to PSI5SPRESC0.RERRCLF2. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | RERRF1 | Rx error at packet frame 1 (Ch0) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error" , "payload data parity error",or "payload data CRC error" in packet frame1 of Ch0 has occurred. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

[^9]
### 25.3.6.2 PSI5SPRESCO — PSI5-S Receive Error Status Clear Ch0 Register

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Table 25.55 PSI5SPRESC0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 | RERRCLF2 | Rx error clear for packet frame 2 (Ch0) |
|  |  | 0: Ignored |
|  |  | 1: Clears PSI5SPRES0.RERRF2 |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 0 | RERRCLF1 | Rx error clear for packet frame1(Ch0) |
|  |  | 0: Ignored |
|  |  | 1: Clears PSI5SPRES0.RERRF1 |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

[^10]
### 25.3.6.3 PSI5SPTCDT0 — PSI5-S Timestamp Capture Data Ch0 Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.56 PSI5SPTCDT0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 23 to 0 | TSCD[23:0] | Timestamp capture data (Ch0) |
|  |  | These bits are cleared by writing 1 to PSI5SPTCDC0.TSCCLR. |
|  |  | These bits are cleared by writing 0 to PSI5SPRCF10.TSEN. |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.6.4 PSI5SPTCDC0 — PSI5-S Timestamp Capture Data Clear Ch0 Register

Value after reset: $\quad 00000000_{H}$

Table 25.57 PSI5SPTCDC0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | TSCCLR | Timestamp capture clear(Ch0) |
|  | $0:$ Ignored |  |
|  | 1: Clears timestamp capture |  |
|  |  | This bit is always read as 0. |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |
|  |  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

### 25.3.7 Ch0 Register/Interrupt

### 25.3.7.1 PSI5SPCISO — PSI5-S CPU Interrupt Status Ch0 Register

| Value after reset: 00000000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | $\left\|\begin{array}{c} \text { ISTCTF } \\ \mathrm{N} \end{array}\right\|$ | - | - | ISTRFN | $\left\lvert\, \begin{gathered} \text { ISTRFE } \\ X \end{gathered}\right.$ | $\underset{\mathrm{K}}{\mathrm{ISTRFL}}$ | ISTROV | $\begin{gathered} \text { ISTRW } \\ \text { DT } \end{gathered}$ | - | $\left\lvert\, \begin{gathered} \text { ISTUTF } \\ R \end{gathered}\right.$ | $=\underset{\mathrm{T}}{\operatorname{ISTUTP}}$ | $\underset{\mathrm{T}}{\text { ISTTRS }}$ | ISTPT | ISTCRC | $\begin{gathered} \text { ISTXCR } \\ \mathrm{C} \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.58 PSI5SPCIS0 Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 15 | Reserved |  |
|  | These bits are always read as 0 . The write value is ignored. |  |
| 14 | ISTCTFN | Interrupt status of command Tx finish |
|  | 0: PSI5-S command transmission has not finished |  |
|  | 1: PSI5-S command transmission has finished |  |
|  |  | When the last command sent to the Tx shifter, a PSI5-S frame is stored in a MB and the frame |
|  |  | has no errors, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. |
|  |  | This bit is cleared by writing 1 to PSI5SPCISC0.ISTCCTFN. |
|  |  | When PSI5SPCIS0.ISTCTFN is set and 1 is written to PSI5SPCISC0.ISTCCTFN in the same |
|  | clock cycle, PSI5SPCIS0.ISTCTFN remains 1. |  |

Table 25.58 PSI5SPCIS0 Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9 | ISTRFLK | Interrupt status of Rx frame lack error (Ch0) |
|  |  | 0 : No error |
|  |  | 1: Error detected |
|  |  | When a packet frame gap is detected while the packet is under PSI5SPRCF10.FmPKT ( $\mathrm{m}=1$ to 6), this bit is set to 1 and an interrupt (int_psis_ch0) occurs. |
|  |  | This bit is cleared by writing 1 to PSI5SPCISC0.ISTCRFLK. |
|  |  | When PSI5SPCIS0.ISTRFLK is set and 1 is written to PSI5SPCISC0. ISTCRFLK in the same clock cycle, PSI5SPCIS0.ISTRFLK remains 1. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 8 | ISTROV | Interrupt status of Rx overrun error (Ch0) |
|  |  | 0 : No error |
|  |  | 1: Error detected |

When an attempt is made to store the next PSI5-S frame in a MB before the CPU has read that MB, this bit is set to 1 and an interrupt (int_psis_ch0) occurs.
This bit is cleared by writing 1 to PSI5SPCISC0.ISTCROV.
When PSI5SPCISC0.ISTROV is set and 1 is written to PSI5SPCISC0.ISTCROV in the same clock cycle, PSI5SPCISC0.ISTROV remains 1.
This bit is cleared by writing 1 to PSI5SPUSWR.SWRST.
This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode).

| ISTRWDT | Interrupt status of Rx WDT error (Ch0) |
| :--- | :--- | :--- |
| 0: No error |  |
| 1: Error detected |  |
|  | When a WDT error occurs in PSI5S mode, this bit is set to 1 and an interrupt (int_psis_ch0) |
| and DMA request (dma_psis_ch0_rx) occur. |  |
|  | This bit is cleared by writing 1 to PSI5SPCISC0.ISTCRWDT. |
|  | When PSI5SPCIS0.ISTRWDT is set and 1 is written to PSI5SPCISC0.ISTCRWDT in the |
|  | same clock cycle, PSI5SPCIS0.ISTRWDT remains 1. |

Table 25.58 PSI5SPCIS0 Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 | ISTTRST | Interrupt status of Rx transceiver status error (Ch0) <br> 0 : No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a transceiver status error occurs, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. <br> This bit is cleared by writing 1 to PSI5SPCISC0.ISTCTRST. <br> When PSI5SPCIS0.ISTTRST is set and 1 is written to PSI5SPCISC0.ISTCTRST in the same clock cycle, PSI5SPCIS0.ISTTRST remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 2 | ISTPT | Interrupt status of payload data parity error (Ch0) <br> 0: No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a payload data parity error occurs, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. <br> This bit is cleared by writing 1 to PSI5SPCISC0.ISTCPT. <br> When PSI5SPCIS0.ISTPT is set and 1 is written to PSI5SPCISC0.ISTCPT in the same clock cycle, PSI5SPCIS0.ISTPT remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 1 | ISTCRC | Interrupt status of payload data CRC error (Ch0) <br> 0: No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a payload data CRC error occurs, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. <br> This bit is cleared by writing 1 to PSI5SPCISC0.ISTCCRC. <br> When PSI5SPCIS0.ISTCRC is set and 1 is written to PSI5SPCISC0.ISTCCRC in the same clock cycle, PSI5SPCIS0.ISTCRC remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | ISTXCRC | Interrupt status of packet frame XCRC error (Ch0) <br> 0 : No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and an XCRC error occurs, this bit is set to 1 and an interrupt (int_psis_ch0) occurs. <br> This bit is cleared by writing 1 to PSI5SPCISC0.ISTCXCRC. <br> When PSI5SPCIS0.ISTXCRC is set and 1 is written to PSI5SPCISC0.ISTCXCRC in the same clock cycle, PSI5SPCIS0.ISTXCRC remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

### 25.3.7.2 PSI5SPCISCO — PSI5-S CPU Interrupt Status Clear Ch0 Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.59 PSI5SPCISC0 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 15 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 14 | ISTCCTFN | Interrupt status of command Tx finish (Ch0) |
|  |  | 0 : Ignored |
|  |  | 1: Clears PSI5SPCIS0.ISCTFN |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 13 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 11 | ISTCRFN | Interrupt status of Rx finish (Ch0) |
|  |  | 0: Ignored |
|  |  | 1: Clears PSI5SPCIS0.ISTRFN |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 10 | ISTCRFEX | Interrupt status of Rx frame excess error (Ch0) |
|  |  | 0 : Ignored |
|  |  | 1: Clears PSI5SPCIS0.ISTRFEX |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 9 | ISTCRFLK | Interrupt status of Rx frame lack error (Ch0) |
|  |  | 0: Ignored |
|  |  | 1: Clears PSI5SPCIS0.ISTRFLK |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 8 | ISTCROV | Interrupt status of Rx overrun error (Ch0) |
|  |  | 0: Ignored |
|  |  | 1: Clears PSI5SPCIS0.ISTROV |
|  |  | This bit is always read as 0 . |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

Table 25.59 PSI5SPCISC0 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ISTCRWDT | Interrupt status of Rx WDT error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTRWDT <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 6 | - | Reserved <br> This bit is always read as 0 . The write value is ignored. |
| 5 | ISTCUTFR | Interrupt status of Rx UART framing error (Ch0) <br> 0: Ignored <br> 1: Clears PSI5SPCIS0.ISTUTFR <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 4 | ISTCUTPT | Interrupt status of Rx UART parity error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTUTPT <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 3 | ISTCTRST | Interrupt status of Rx transceiver status error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTTRST <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 2 | ISTCPT | Interrupt status of payload data parity error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTPT <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 1 | ISTCCRC | Interrupt status of payload data CRC error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTCRC <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 0 | ISTCXCRC | Interrupt status of packet frame XCRC error (Ch0) <br> 0 : Ignored <br> 1: Clears PSI5SPCIS0.ISTXCRC <br> This bit is always read as 0 . <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

### 25.3.8 Ch $\boldsymbol{n}$ Register/Config ( $\boldsymbol{n}: 1$ to 7 )

### 25.3.8.1 PSI5SPRCF1n — PSI5-S Receive Config1 Chn Register (n: 1 to 7)

Value after reset: $00000000_{\mathrm{H}}$

Table 25.60 PSI5SPRCF1n Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 23 to 21 | F6PKT[2:0] | Frame 6 packet number (Ch $n$ ) |
|  |  | $000_{B}$ : Frame 6 data is ignored |
|  |  | $011_{\mathrm{B}}$ : Packet number is to set 3 |
|  |  | $100_{\mathrm{B}}$ : Packet number is to set 4 |
|  |  | $101_{\mathrm{B}}$ : Packet number is to set 5 |
|  |  | 110 B : Packet number is to set 6 |
|  |  | Other than above: Setting prohibited |
|  |  | The packet number means the number of UART frames number per packet frame. |
|  |  | "Frame 6" is the packet frame whose FID is $101_{B}$. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 20 to 18 | F5PKT[2:0] | Frame 5 packet number (Ch $n$ ) |
|  |  | $000_{B}$ : Frame 5 data is ignored |
|  |  | $011_{\mathrm{B}}$ : Packet number is to set 3 |
|  |  | $100_{\mathrm{B}}$ : Packet number is to set 4 |
|  |  | $101_{\mathrm{B}}$ : Packet number is to set 5 |
|  |  | $110_{\mathrm{B}}$ : Packet number is to set 6 |
|  |  | Other than above: Setting prohibited |
|  |  | The packet number means the number of UART frames number per packet frame. |
|  |  | "Frame 5 " is the packet frame whose FID is 100 B . |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.60 PSI5SPRCF1n Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 17 to 15 | F4PKT[2:0] | Frame 4 packet number (Ch $n$ ) <br> $000_{\mathrm{B}}$ : Frame 4 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> The packet number means the number of UART frames number per packet frame. "Frame 4" is the packet frame whose FID is $011_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 14 to 12 | F3PKT[2:0] | Frame 3 packet number (Ch $n$ ) <br> $000_{\mathrm{B}}$ : Frame 3 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> The packet number means the number of UART frames number per packet frame. "Frame 3 " is the packet frame whose FID is $010_{\mathrm{B}}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 11 to 9 | F2PKT[2:0] | Frame 2 packet number (Ch $n$ ) <br> $000_{\mathrm{B}}$ : Frame 2 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> The packet number means the number of UART frames number per packet frame. <br> "Frame 2" is the packet frame whose FID is 001 ${ }_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 8 to 6 | F1PKT[2:0] | Frame 1 packet number (Ch $n$ ) <br> $000_{\mathrm{B}}$ : Frame 1 data is ignored <br> $011_{\mathrm{B}}$ : Packet number is to set 3 <br> $100_{\mathrm{B}}$ : Packet number is to set 4 <br> $101_{\mathrm{B}}$ : Packet number is to set 5 <br> $110_{\mathrm{B}}$ : Packet number is to set 6 <br> Other than above: Setting prohibited <br> The packet number means the number of UART frames number per packet frame. <br> "Frame 1" is the packet frame whose FID is $000_{B}$. <br> These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 5 | SYSEL | Asynchronous mode/synchronous mode select <br> 0: Synchronous mode <br> 1: Asynchronous mode <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.60 PSI5SPRCF1n Register Contents (3/3)

\begin{tabular}{|c|c|c|}
\hline Bit Position \& Bit Name \& Function <br>

\hline 4 \& TSCTS \& | Timestamp capture trigger select (Ch $n$ ) |
| :--- |
| 0 : Transmission synchronous pulse timing selected |
| 1: Header receive timing selected ( $\mathrm{CH} n$ ) |
| This bit can be written when PSI5S`PUOS.ACSTS is 0 (= configuration mode). |
| This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. | <br>

\hline 3 \& TSCS \& | Timestamp counter select (Ch $n$ ) |
| :--- |
| 0 : Timestamp counter $B$ selected |
| 1: Timestamp counter A selected |
| This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
| This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. | <br>

\hline 2 \& TSEN \& | Timestamp capture enable (Ch $n$ ) |
| :--- |
| 0: Disable |
| 1: Enable |
| This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. | <br>

\hline 1 \& RFCPS \& | Rx frame checksum CRC/parity select (Ch $n$ ) |
| :--- |
| 0 : Parity selected |
| 1: CRC selected |
| This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. | <br>

\hline 0 \& CHEN \& | Channel enable ( $\mathrm{Ch} n$ ) |
| :--- |
| 0: Disable |
| 1: Enable |
| This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. | <br>

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 25.62 PSI5SPWDEn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | WDTEB | Watchdog Timer of Rx frame Enable (Ch $n$ ) |
|  | $0:$ Disable |  |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) and when |
|  |  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  |  |

Note: n : 1 to 7

### 25.3.8.4 PSI5SPWDPn — PSI5-S WDT Prescaler Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.63 PSI5SPWDPn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 11 to 0 | WDTPRS[11:0] | Watchdog timer prescaler (Ch $n$ ) |
|  |  | 0 Stop WDT timer |
|  |  | 1 to 4095 : Enabled at 1 clock/ $x$ clock ( $x: 1$ to 4095) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $\mathrm{n}: 1$ to 7

### 25.3.8.5 PSI5SPWDEVn — PSI5-S WDT Expiration Value Chn Register

Value after reset: $\quad 00000000_{H}$

Table 25.64 PSI5SPWDEVn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 23 to 0 | WDTEX[23:0] | Watchdog timer expiration value (Ch $n$ ) |
|  |  | When the watchdog counter counts down to 0 from this setting value, the watchdog timer is |
|  | judged to have expired. |  |
|  | $(n: 1$ to 7$)$ |  |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  |  |

Note: n: 1 to 7

### 25.3.8.6 PSI5SPTCDn — PSI5-S Tx Command Data Chn Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 25.65 PSI5SPTCDn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 15 to 11 | ATRSCMD[4:0] | Alternate transport command (Ch $n$ ) |
|  |  | When ECU-to-sensor data is 1 , select this command. ( $n: 1$ to 7) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 10 to 8 | ACHID[2:0] | Alternate transport ChID (Ch $n$ ) |
|  |  | When ECU-to-sensor data is 1 , select this ChID. ( $n$ : 1 to 7) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 to 3 | TRSCMD[4:0] | Transport command (Ch $n$ ) |
|  |  | When ECU-to-sensor data is 0 , select this command. $\text { ( } n: 1 \text { to } 7 \text { ) }$ |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 2 to 0 | CHID[2:0] | Transport ChID (Ch $n$ ) |
|  |  | When ECU-to-sensor data is 0 , select this ChID. ( $n$ : 1 to 7) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $n: 1$ to 7

### 25.3.8.7 PSI5SPCIEn — PSI5-S CPU Interrupt Enable Chn Register

Table 25.66 PSI5SPCIEn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 13 | IEBDDSFN | Interrupt enable of DDSR finish flag (Ch $n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 12 | IEBDDSOW | Interrupt enable of DDSR overwrite (Ch $n$ ) |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 11 | IEBRFN | Interrupt enable of Rx frame finish flag (Ch $n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 10 | IEBRFEX | Interrupt enable of Rx frame excess error (Ch $n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 9 | IEBRFLK | Interrupt enable of Rx frame lack error (Ch $n$ ) |
|  |  | 0 : Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

Table 25.66 PSI5SPCIEn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | IEBROV | Interrupt enable of Rx overrun error (Ch $n$ ) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 7 | IEBRWDT | Interrupt enable of Rx frame WDT error (Ch $n$ ) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 6 to 4 | - | Reserved <br> These bits are always read as 0 . The write value is ignored. |
| 3 | IEBTRST | Interrupt enable of Rx transceiver status error (Ch $n$ ) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 2 | IEBPT | Interrupt enable of parity error (Ch $n$ ) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 1 | IEBCRC | Interrupt enable of CRC error (Ch $n$ ) <br> 0: Disable <br> 1: Enable <br> This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | - | Reserved <br> This bit is always read as 0 . The write value is ignored. |

Note: $n: 1$ to 7

Table 25.67 PSI5SPDREn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 3 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 2 | DRQETFN | DMA request enable at ddsr Tx finish (Ch $n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 1 | DRQEWDT | DMA request enable at WDT (Ch $n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 0 | DRQERFN | DMA request enable at Rx finish ( $\mathrm{Ch} n$ ) |
|  |  | 0: Disable |
|  |  | 1: Enable |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

[^11]
### 25.3.8.9 PSI5SPSTPn — PSI5-S Sync Trigger Prescaler Chn Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | STPRS[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 25.68 PSI5SPSTPn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 11 to 0 | STPRS[11:0] | Synchronous trigger generation counter's prescaler (Ch $n$ ) |
|  |  | 0: Enabled at 1 clock/1 clock |
|  |  | 1: Enabled at 1 clock/2 clock |
|  |  | $\cdots$ |
|  |  | $x$ : Enabled at $1 \operatorname{clock} /(x+1)$ clock |
|  |  | ... |
|  |  | 4095: Enabled at 1 clock/4096 clock |
|  |  | When PSI5SPSTSn.STSEL is 0 , these bits are enabled. |
|  |  | When PSI5SPSTSn.STSEL is 1, these bits are disabled. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $n: 1$ to 7

### 25.3.8.10 PSI5SPSTEVn — PSI5-S Sync Trigger Expiration Value Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.69 PSI5SPSTEVn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 23 to 0 | STEX[23:0] | Synchronous trigger generation counter expiration value (Ch $n$ ) |
|  |  | When PSI5SPSTSn.STSEL is 0 , these bits are enabled. |
|  |  | When PSI5SPSTSn.STSEL is 1 , these bits are disabled. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  |  |
|  |  |  |

Note: $n: 1$ to 7

### 25.3.8.11 PSI5SPSTSn — PSI5-S Sync Trigger Select Ch n Register

Value after reset: $00000000_{\mathrm{H}}$

Table 25.70 PSI5SPSTSn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | STSEL | Sync trigger select |
|  |  | Synchronous trigger select (Ch $n$ ) |
|  | $0:$ Signal generated by PSI5-S is selected |  |
|  | 1: GTM output is selected, |  |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  |  |

Note: $n$ : 1 to 7

### 25.3.9 Ch $\boldsymbol{n}$ Register/Rx ( $n$ : 1 to 7)

### 25.3.9.1 PSI5SPRESn — PSI5-S Receive Error Status Chn Register

| Value after reset: |  |  | 0000 0000н |  |  |  |  |  |  |  |  |  |  |  |  |  |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.71 PSI5SPRESn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 5 | RERRF6 | Rx error at packet frame 6 (Ch $n$ ) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of " $R x$ overrun error", "transceiver status error", "payload data parity error", or "payload data CRC error" in packet frame6 of Ch $n$ has occurred. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 4 | RERRF5 | Rx error at packet frame 5 (Ch $n$ ) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error", "payload data parity error", or "payload data CRC error" in packet frame5 of Ch $n$ has occurred. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 3 | RERRF4 | Rx error at packet frame 4 (Ch n) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error", "payload data parity error", or "payload data CRC error" in packet frame4 of Ch $n$ has occurred. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 2 | RERRF3 | Rx error at packet frame 3 (Ch n) |
|  |  | 0: No error |
|  |  | 1: An error has occurred |
|  |  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error", "payload data parity error", or "payload data CRC error" in packet frame3 of Ch $n$ has occurred. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

Table 25.71 PSI5SPRESn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | RERRF2 | Rx error at packet frame 2 (Ch $n$ ) |
|  | 0: No error |  |
|  | 1: An error has occurred |  |
|  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error", "payload data |  |
|  | parity error", or "payload data CRC error" in packet frame2 of Ch $n$ has occurred. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |  |
| 0 | Rer error at packet frame 1 (Ch $n$ ) |  |
|  | 0: No error |  |
|  | 1: An error has occurred |  |
|  | This bit is set to 1 when any of "Rx overrun error", "transceiver status error", "payload data |  |
|  | parity error", or "payload data CRC error" in packet frame1 of Ch $n$ has occurred. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |  |
|  |  |  |

Note: $n: 1$ to 7

Table 25.72 PSI5SPRESCn Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 5 | RERRCLF6 | Rx error clear packet Frame6 (Ch $n$ ) |
|  |  | 0: Ignored |
|  |  | 1: Clear PSI5SPRESn.RERRF6 |
|  |  | This bit is always read as 0 . |
|  |  | ( $n$ : 1 to 7) |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 4 | RERRCLF5 | Rx error clear packet Frame5 (Ch $n$ ) |
|  |  | 0: Ignored |
|  |  | 1: Clear PSI5SPRESn.RERRF5 |
|  |  | This bit is always read as 0 . |
|  |  | ( $n$ : 1 to 7) |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 3 | RERRCLF4 | Rx error clear packet Frame4 (Ch $n$ ) |
|  |  | 0 : Ignored |
|  |  | 1: Clear PSI5SPRESn.RERRF4 |
|  |  | This bit is always read as 0 . |
|  |  | ( $n$ : 1 to 7) |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 2 | RERRCLF3 | Rx error clear packet Frame3 (Ch $n$ ) |
|  |  | 0: Ignored |
|  |  | 1: Clear PSI5SPRESn.RERRF3 |
|  |  | This bit is always read as 0 . |
|  |  |  |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

Table 25.72 PSI5SPRESCn Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 1 | RERRCLF2 | Rx error clear packet Frame2 (Ch $n$ ) <br> 0: Ignored <br> 1: Clear PSI5SPRESn.RERRF2 <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 0 | RERRCLF1 | Rx error clear packet Frame1 (Ch $n$ ) <br> 0 : Ignored <br> 1: Clear PSI5SPRESn.RERRF1 <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

Note: $n: 1$ to 7

### 25.3.9.3 PSI5SPTCDTn — PSI5-S Timestamp Capture Data Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.73 PSI5SPTCDTn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 23 to 0 | TSCD[23:0] | Timestamp capture data (Ch $n$ ) |
|  |  | These bits are cleared by writing 1 to PSI5SPTCDCn.TSCCLR. |
|  |  | These bits are cleared by writing 0 to PSI5SPRCF1n.TSEN. |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $n: 1$ to 7

### 25.3.9.4 PSI5SPTCDCn — PSI5-S Timestamp Capture Data Clear Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.74 PSI5SPTCDCn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value is ignored. |
| 0 | TSCCLR | Timestamp capture clear (Ch $n$ ) |
|  | $0:$ Ignored |  |
|  | 1: Clear timestamp capture data (PSI5SPDCDn.TSCD) |  |
|  | This bit is always read as 0. |  |
|  | $(n: 1$ to 7 ) |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when |  |
|  |  | PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  |  |

Note: $n: 1$ to 7

### 25.3.10 Ch $n$ Register/Tx ( $n$ : 1 to 7)

### 25.3.10.1 PSI5SPDDTPn — PSI5-S DDSR Type Chn Register

Value after reset: $\quad 00000000 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | DDSRTYPE[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

Note: $n$ : 1 to 7

Table 25.75 PSI5SPDDTPn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | - | .Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 1 to 0 | DDSRTYPE[1:0] | DDSR transmission type ( $\mathrm{Ch} n$ ) |
|  |  | ( $n$ : 1 to 7) |
|  |  | 00 B : Frame 1 (Short) |
|  |  | 014 ${ }_{\mathrm{B}}$ : Frame 2 (Long) |
|  |  | 108: Frame 3 (XLong) |
|  |  | $11_{\mathrm{B}}$ : Frame 4 (XXLong) |
|  |  | Writing to these bits is prohibited when PSI5SPDDSn.DDSRSTS is 1. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |

### 25.3.10.2 PSI5SPDDDn — PSI5-S DDSR Data Chn Register

Table 25.76 PSI5SPDDDn Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 23 to 4 | DDSRDT[19:0] | DDSR transmission data (Ch $n$ ) |
|  |  | These bits cannot be written when PSI5SPDDSn.DDSRSTS is 1. |
|  |  | When PSI5SPDDTPn.DDSRTYPE is 0, DDSR transmission data uses the 3 LSBs. PSI5SPDDDn.DDSRDT [19:3] should be set to all 1's. |
|  |  | When PSI5SPDDTPn.DDSRTYPE is 1, DDSR transmission data uses the 13 LSBs. PSI5SPDDDn.DDSRDT [19:13] should be set to all 1's. |
|  |  | When PSI5SPDDTPn.DDSRTYPE is 2, DDSR transmission data uses the 19 LSBs. PSI5SPDDDn.DDSRDT [19] should be set to all 1's. |
|  |  | When PSI5SPDDTPn.DDSRTYPE is 3, DDSR transmission data uses 20bits. |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |
| 3 to 0 | DDSRADR[3:0] | DDSR transmission address (Ch n) |
|  |  | These bits cannot be written when PSI5SPDDSn.DDSRSTS is 1. ( $n$ : 1 to 7) |
|  |  | These bits can be written when PSI5SPUOS.ACSTS is 0 (= configuration mode) or when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $n: 1$ to 7

### 25.3.10.3 PSI5SPDDSn — PSI5-S DDSR Status Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 25.77 PSI5SPDDSn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | DDSRSTS | DDSR status |
|  | $0:$ DDSR transmission is not in progress |  |
|  | 1: DDSR transmission is in progress |  |
|  | In PSI5S mode, writing to PSI5SPDDDn sets this bit to 1. |  |
|  | When the last data of PSI5SPDDDn is written to the Tx shifter, this bit becomes 0. |  |
|  | PSI5SPDDDn is cannot written when PSI5SPDDSn.DDSRSTS is 1. |  |
|  | This bit is cleared by writing 1 to PSI5SPDDSPn.DDSRSTP. |  |
|  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |  |
|  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |  |
|  |  |  |

Note: $n: 1$ to 7

### 25.3.10.4 PSI5SPDDSPn — PSI5-S DDSR Stop Chn Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 25.78 PSI5SPDDSPn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 0 | DDSRSTP | DDSR Tx stop (Ch $n$ ) |
|  | $0:$ Ignored |  |
|  | 1: Stop transmission |  |
|  | When this bit is written, PSI5SPDDSn.DDSRSTS is reset to 0. |  |
|  | This bit is always read as 0. |  |
|  | $(n: 1$ to 7$)$ |  |
|  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S |  |
|  | mode). |  |
|  |  |  |

Note: $n$ : 1 to 7

### 25.3.11 Ch $\boldsymbol{n}$ Register/Interrupt ( $\boldsymbol{n}$ : 1 to 7)

Table 25.79 PSI5SPCISn Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved |
|  |  | These bits are always read as 0 . The write value is ignored. |
| 13 | ISTDDSFN | CPU interrupt status of DDSR finish (Ch $n$ ) |
|  |  | 0 : DDSR transmission has not finished |
|  |  | 1: DDSR transmission has finished |
|  |  | When PSI5SPDDDn data is written to the Tx shifter, this bit is set to 1 and an interrupt (int_psis_chn) and DMA request (dma_psis_chn_tx) occur. |
|  |  | ( $n=1$ to 7) |
|  |  | This bit is cleared by writing 1 to PSI5SPCISCn.ISTCDDSFN. |
|  |  | When PSI5SPCISn.ISTDDSFN is set and 1 is written to PSI5SPCISCn.ISTCDDSFN in the same clock cycle, PSI5SPCISn.ISTDDSFN remains 1. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 12 | ISTDDSOW | CPU interrupt status of DDSR overwrite error (Ch $n$ ) |
|  |  | 0 : No error |
|  |  | 1: Error detected |
|  |  | When the CPU writes 1 to PSI5SPDDDn in PSI5SPDDSn.DDSRSTS, this bit is set to 1 and an interrupt (int_psis_chn) occurs. $(n: 1 \text { to } 7)$ |
|  |  | This bit is cleared by writing 1 to PSI5SPCISCn.ISTCDDSOW. |
|  |  | When PSI5SPCISn.ISTDDSOW is set and 1 is written to PSI5SPCISCn.ISTCDDSOW in the same clock cycle, PSI5SPCISn.ISTDDSOW remains 1. |
|  |  | This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. |
|  |  | This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |

Table 25.79 PSI5SPCISn Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 11 | Interrupt status of Rx finish (Ch $n$ ) |  |
|  | $0:$ PSI5-S frame is not received successfully |  |
|  | 1: PSI5-S frame is received successfully |  |
|  | When a PSI5-S frame is stored in a MB and the PSI5-S frame has no errors (no mailbox |  |
|  | overrun error), this bit is set to 1 and an interrupt (int_psis_chn) and DMA request |  |
|  | (dma_psis_chn_rx) occur. |  |
|  | (n: 1 to 7 ) |  |
|  | This bit is cleared by writing 1 to PSI5SPCISCn.ISTCRFN. |  |
|  | When PSI5SPCISn.ISTRFN is set and 1 is written to PSI5SPCISCn.ISTCRFN in the same |  |
|  | clock cycle, PSI5SPCISn.ISTRFN remains 1. |  |

Table 25.79 PSI5SPCISn Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ISTRWDT | Interrupt status of Rx WDT error (Ch $n$ ) <br> 0: No error <br> 1: Error detected <br> When an WDT error occurs in PSI5S mode, this bit is set to 1 and an interrupt (int_psis_chn) and DMA request (dma_psis_chn_rx) occur. <br> ( $n$ : 1 to 7 ) <br> This bit is cleared by writing 1 to PSI5SPCISCn.ISTCRWDT. <br> When PSI5SPCISn.ISTRWDT is set and 1 is written to PSI5SPCISCn.ISTCRWDT in the same clock cycle, PSI5SPCISn.ISTRWDT remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 6 to 4 | - | Reserved <br> These bits are always read as 0 . The write value is ignored. *1 |
| 3 | ISTTRST | Interrupt status of Rx transceiver status error (Ch $n$ ) <br> 0: No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a transceiver status error occurs, this bit is set to 1 and an interrupt (int_psis_chn) occurs. <br> ( $n$ : 1 to 7 ) <br> This bit is cleared by writing 1 to PSI5SPCISCn.ISTCTRST. <br> When PSI5SPCISn.ISTTRST is set and 1 is written to PSI5SPCISCn.ISTCTRST in the same clock cycle, PSI5SPCISn.ISTTRST remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 2 | ISTPT | Interrupt status of payload data parity error (Ch $n$ ) <br> 0: No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a payload data parity error occurs, this bit is set to 1and an interrupt (int_psis_chn) occurs. <br> ( $n$ : 1 to 7 ) <br> This bit is cleared by writing 1 to PSI5SPCISCn.ISTCTPT. <br> When PSI5SPCISn.ISTPT is set and 1 is written to PSI5SPCISCn.ISTCPT in the same clock cycle, PSI5SPCISn.ISTPT remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 1 | ISTCRC | Interrupt status of payload data CRC error (Ch $n$ ) <br> 0 : No error <br> 1: Error detected <br> When a PSI5-S frame is stored in a MB and a payload data CRC error occurs, this bit is set to 1and an interrupt (int_psis_chn) occurs. <br> ( $n$ : 1 to 7 ) <br> This bit is cleared by writing 1 to PSI5SPCISCn.ISTCCRC. <br> When PSI5SPCISn.ISTCRC is set and 1 is written to PSI5SPCISCn.ISTCCRC in the same clock cycle, PSI5SPCISn.ISTCRC remains 1. <br> This bit is cleared by writing 1 to PSI5SPUSWR.SWRST. <br> This bit is cleared when PSI5SPUOS.ACSTS is changed to 0 (= configuration mode). |
| 0 | - | Reserved <br> This bit is always read as 0 . The write value is ignored. *1 |

Note: $n: 1$ to 7
Note 1. $\mathrm{b}[5][4][0]$ : These bits are not reserved in not Ch0. If these errors (UART framing error, UART parity error, XCRC Error) occur, the error is stored in channel 0 , frame 2.

### 25.3.11.2 PSI5SPCISCn — PSI5-S CPU Interrupt Status Clear Chn Register

Table 25.80 PSI5SPCISCn Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved <br> These bits are always read as 0 . The write value is ignored. |
| 13 | ISTCDDSFN | Interrupt status clear DDSR Tx finish (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTDDSFN <br> This bit defines about clearance of CPU interrupt status of DDSR finish (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTDDSFN). <br> When this bit is written to 1, PSI5SPCIS0.ISTDDSFN is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 12 | ISTCDDSOW | Interrupt status clear DDSr overwrite error <br> Clear at CPU interrupt status of DDSR overwrite error(Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTDDSOW <br> This bit defines about clearance of CPU interrupt status of DDSR overwrite (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTDDSOW). <br> When this bit is written to $1, \mathrm{PSI} 5$ SPCIS0.ISTDDSOW is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 11 | ISTCRFN | Interrupt status clear Rx finish <br> Clear at CPU interrupt status of Rx finish (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTRFN <br> This bit defines about clearance of CPU interrupt status of Rx finish (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTRFN). <br> When this bit is written to $1, \mathrm{PSI} 5 \mathrm{SPCISn}$.ISTRFN is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |

Table 25.80 PSI5SPCISCn Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 10 | ISTCRFEX | Interrupt status clear Rx frame excess error <br> Clear at CPU interrupt status of Rx frame excess error (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTRFEX <br> This bit defines about clearance of CPU interrupt status of Rx frame (packet) (Ch $n$ ) excess error in PSI5S mode (PSI5SPCISn.ISTRFEX). <br> When this bit is written to 1, PSI5SPCISn.ISTRFEX is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 9 | ISTCRFLK | Interrupt status clear Rx frame lack error <br> Clear at CPU interrupt status of Rx frame lack error (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTRFLK <br> This bit defines about clearance of CPU interrupt status of Rx frame (packet) (Ch $n$ ) lack error (Chn) in PSI5S mode (PSI5SPCISn.ISTRFLK). <br> When this bit is written to $1, \mathrm{PSI} 5$ SPCISn.ISTRFLK is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 8 | ISTCROV | Interrupt status clear Rx overrun error <br> Clears at CPU interrupt status of Rx overrun error (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTROV <br> This bit defines about clearance of CPU interrupt status of overrun error (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTROV). <br> When this bit is written to $1, \mathrm{PSI} 5$ SPCISn.ISTROV is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 7 | ISTCRWDT | Interrupt status clear Rx WDT error <br> Clear at CPU interrupt status of Rx WDT error (Chn) <br> 0 : Ignored <br> 1: Clear PSI5SPCISn.ISTRWDT <br> This bit defines about clearance of CPU interrupt status of WDT error (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTRWDT). <br> When this bit is written to 1, PSI5SPCISn.ISTRWDT is cleared to 0 . <br> This bit is always read as 0 . <br> ( $n$ : 1 to 7 ) <br> This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 6 to 4 | - | Reserved <br> These bits are always read as 0 . The write value is ignored. |

Table 25.80 PSI5SPCISCn Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 | ISTCTRST | Interrupt status clear RX transceiver status error |
|  |  | Clear at CPU interrupt status of Rx transceiver status error (Chn) |
|  |  | 0: Ignored |
|  |  | 1: Clear PSI5SPCISn.ISTTRST |
|  |  | This bit defines about clearance of CPU interrupt status of transceiver status error (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTTRST). |
|  |  | When this bit is written to $1, \mathrm{PSI} 5 \mathrm{SPCISn}$.ISTTRST is cleared to 0 . |
|  |  | This bit is always read as 0 . |
|  |  | ( $n: 1$ to 7) |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 2 | ISTCPT | Interrupt status clear parity error |
|  |  | Clear at CPU interrupt status of payload data parity error (Chn) |
|  |  | 0 : Ignored |
|  |  | 1: Clear PSI5SPCISn.ISTPT |
|  |  | This bit defines about clearance of CPU interrupt status of payload data parity error (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTPT). |
|  |  | When this bit is written to $1, \mathrm{PSI} 5 \mathrm{SPCISn}$.ISTPT is cleared to 0 . |
|  |  | This bit is always read as 0 . |
|  |  | ( $n$ : 1 to 7) |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 1 | ISTCCRC | Interrupt status clear CRC error |
|  |  | Clear at CPU interrupt status of payload data CRC error (Chn) |
|  |  | 0: Ignored |
|  |  | 1: Clear PSI5SPCISn.ISTCRC |
|  |  | This bit defines about clearance of CPU interrupt status of payload data CRC error (Ch $n$ ) in PSI5S mode (PSI5SPCISn.ISTCRC). |
|  |  | When this bit is written to 1 , PSI5SPCISn.ISTCRC is cleared to 0 . |
|  |  | This bit is always read as 0 . $\text { ( } n: 1 \text { to } 7 \text { ) }$ |
|  |  | This bit can be written when PSI5SPUOS.ACSTS is 1 and PSI5SPUOS.MSTS is 1 (= PSI5S mode). |
| 0 | - | Reserved |
|  |  | This bit is always read as 0 . The write value is ignored. |

Note: $n: 1$ to 7

|  |  | These bits are cleared by writing 1 to PSI5SPRMBC.MBCLR. |
|  |  | These bits are cleared by writing 1 to PSI5SPUSWR.SWRST. |

Note: $n: 1$ to 7
$m: 1$ to 6
Frm, frame: packet frame

### 25.4 Operation Modes

PSI5-S has three operation modes: Configuration, PSI5S, and UART modes.
The operation mode state machine controls the transition of PSI5-S between these operation modes.
Figure $\mathbf{2 5 . 5}$ shows the state transitions controlled by the operation mode state machine.

Figure 25.5 State Transitions by Operation Mode State Machine

Table 25.87 below describes the individual states:
Table 25.87 Operation Modes (States)

| No | Operation Mode | Explanation |
| :--- | :--- | :--- |
| 1 | Configuration | Configuration operation mode |
|  | mode | $\bullet$ Setting SFR of PSI5-S. |
| 2 | PSI5S | PSI5-S operation mode |
|  | mode | $\bullet$ Communication of a PSI5 frame is performed. |
| 3 | UART | UART operation mode |
|  | mode | $\bullet$ Communication of UART packet frame. |

When the PSI5-S is not transmitting after 16 PCLK cycles of setting of returning to the configuration mode from PSI5S mode or UART mode, the PSI5-S returns to the configuration mode.

When the PSI5-S is transmitting after 16 PCLK cycles of setting of returning to the configuration mode, the PSI5-S returns to the configuration mode in the following timing:

In UART mode: The PSI5-S ends transmission operation of the 2 UART frames at the maximum.
In PSI5S mode: The PSI5-S ends transmission operation of the 9 UART frames at the maximum.
NOTE
Even during reception, the PSI5-S stops reception operation and returns to the reception standby state.

Interrupt and DMA request when the PSI5-S return to the configuration mode is following:
Interrupt: PSI5-S does not generate interrupts after 14 or more PCLK cycles of returning to the configuration mode. Note that, because interrupt status flags are cleared when the PSI5-S returns to the configuration mode, interrupt status cannot be read if the PSI5-S returns to the configuration mode after it has issued an interrupt.

DMA request: PSI5-S does not issue DMA requests after 14 or more PCLK cycles of returning to the configuration mode.

### 25.5 Setting Procedures

Figure 25.6 shows the setting procedure to use PSI5-S in PSI5S mode.

Figure 25.6 PSI5S Mode Setting Procedure
(1) Specify the common settings. For details, see Section 25.5.1, Common Setting Procedure.
(2) Set up PSI5S mode. For details, see Section 25.5.2, PSI5S Mode Setting Procedure.
(3) Set up the transceiver. For details, see Section 25.5.4, Procedure for Transmitting Transceiver Commands.

Figure 25.7 shows the setting procedure to use the PSI5-S in UART mode.

Figure 25.7 UART Mode Setting Procedure
(1) Specify the common settings. For details, see Section 25.5.1, Common Setting Procedure.
(2) Set up the UART mode. For details, see Section 25.5.3, UART Mode Setting Procedure.

### 25.5.1 Common Setting Procedure

This section describes the common setting procedure to use the PSI5-S in PSI5-S or UART mode.
Perform the procedure shown in Figure 25.8 below when the PSI5-S is in configuration mode.

Figure 25.8 Common Setting Procedure
(1) PSI5SPUOEB: PSI5-S/UART Operation Enable register Change the operation mode to configuration mode.
(2) PSI5SPUOS: PSI5-S /UART Operation Status register

Wait until PSI5-S transitions to the configuration mode.
(3) PSI5SPUNFST: PSI5-S/UART Noise Filter Set register

Specify whether to use a noise filter for the signal input to the psis_rx_data pin, which is a UART Rx pin.
(4) PSI5SPUPTS: PSI5-S/UART rx/tx Parity Set register

Specify the parity bit settings for both UART reception and UART transmission.
(5) PSI5SPUBPR: PSI5-S/UART Baud rate Parameter register

Specify the baud rate for UART communication. The baud rate is determined by the oversample number, clock division ratio, and division ratio of the prescaler.
The clock division ratio and the division ratio of the prescaler are also used to set the frequency of the sampling clock (psis_tx_sclk).

Calculate the baud rate of UART communication using the following formula:
Baud rate $=[$ psis_clk frequency $] *(1 /$ prescaler division ratio $) *(1 /$ clock division ratio $) *(1 /$ oversample number $)$

Example: Prescaler division ratio $=1($ PCKPRS setting $=0)$
Clock division ratio $=3($ SCKDIV setting $=2)$
Oversample number $=5($ RXOSMP setting $=4)$
The calculation result is as follows:
Baud rate $=80 \mathrm{MHz} *(1 / 1) *(1 / 3) *(1 / 5)=5.33 \mathrm{Mbps}$

Calculate the frequency of the sampling clock using the following formula:
psis_tx_sclk $=[$ psis_mult_clk frequency] $*(1 / 2) *(1 /$ prescaler division ratio $) *(1 /$ clock division ratio $)$

Example: Prescaler division ratio $=1($ PCKPRS setting $=0)$
Clock division ratio $=3($ SCKDIV setting $=2)$
The calculation result is as follows:

$$
\text { psis_tx_sclk }=160 \mathrm{MHz} *(1 / 2) *(1 / 1) *(1 / 3)=26.67 \mathrm{MHz}
$$

If the output of the psis_tx_sclk signal is required, specify the following setting:
(6) PSI5SPUBCE: PSI5-S/UART Baud rate Clock Enable register

Specify whether to enable the output of psis_tx_sclk clock.

### 25.5.2 PSI5S Mode Setting Procedure

This section describes the setting procedure to use PSI5-S in PSI5S mode.
Perform the procedure shown in Figure 25.9 below after performing the procedure described in Section 25.5.1,
Common Setting.

Figure 25.9 PSI5S Mode Setting Procedure
(1) Set up PSI5 frame reception. For details, see Section 25.5.2.1, PSI5 Frame Reception Setting.
(2) Set up the WDT. For details, see Section 25.5.2.2, WDT Settin.
(3) Set up timestamps. For details, see Section 25.5.2.3, Timestamp Setting.
(4) Set up interrupts. For details, see Section 25.5.2.4, Interrupt Setting.
(5) Set up DMA transfer requests. For details, see Section 25.5.2.5, DMA Transfer Request Setting.
(6) Setup synchronization pulse. For details, see Section 25.5.2.6, Synchronization Pulse Setting Procedure.
(7) Set up Tx command. For details, see Section 25.5.2.7, Tx Command Setting Procedure.
(8) PSI5SPUOMD: PSI5-S/UART Operation Mode register Set the operation mode to PSI5S mode.
(9) PSI5SPUOEB: PSI5-S/UART Operation Enable register Start the operation of PSI5-S.

### 25.5.2.1 PSI5 Frame Reception Setting

This section describes how to set up PSI5 frame reception.
Perform the procedure shown in Figure 25.10 below for channel 0 and the required channels among channels 1 to 7 .

Figure 25.10 PSI5 Frame Reception Setting Procedure
(1) PSI5SPRCF10: PSI5-S Receive Config1 ch0 register

Specify the desired settings in the PSI5 frame reception configuration 1 register for channel 0 .
(2) PSI5SPRCF20: PSI5-S Receive Config2 ch0 register

Specify the desired settings in the PSI5 frame reception configuration 2 register for channel 0.
(3) PSI5SPRCF1 $n$ : PSI5-S Receive Config1 ch $n$ register ( $n=1$ to 7 )

Specify the desired settings in the PSI5 frame reception configuration 1 register for channel $n$.
(4) PSI5SPRCF2n: PSI5-S Receive Config2 ch $n$ register ( $n=1$ to 7 )

Specify the desired settings in the PSI5 frame reception configuration 2 register for channel $n$.

The value of the PSI5SPRCF1 $n$.FmPKT[2:0] bits is determined by the relationship between the values of the PSI5SPRCF1n.RFCPS and PSI5SPRCF2n.FmPAYLD[4:0] bits as shown in Table 25.88. Note that if a value other than those shown in the table is set to the PSI5SPRCF1n.FmPKT[2:0] bits, the operation of PSI5-S will be unpredictable. ( $n=1$ to $7, m=1$ to 6 )

Table 25.88 List of PRCF1n.FmPKT[2:0] Settings

| PSI5SPRCF2n.FmPAYLD[4:0] | PSI5SPRCF1n.FmPKT[2:0] |  |
| :---: | :---: | :---: |
|  | PSI5SPRCF1n. RFCPS = 0 (Checksum of $R x$ frame is parity) | PSI5SPRCF1n. RFCPS = 1 <br> (Checksum of $R x$ frame is CRC) |
| 8 | $3_{\mathrm{H}}$ | $4_{H}$ |
| 9 | $3_{H}$ | $4_{H}$ |
| 10 | $4_{H}$ | $4_{H}$ |
| 11 | $4_{H}$ | $4_{H}$ |
| 12 | $4_{H}$ | $4_{H}$ |
| 13 | $4_{H}$ | $4_{H}$ |
| 14 | $4_{H}$ | $4_{H}$ |
| 15 | $4_{H}$ | 4H |
| 16 | $4_{H}$ | $5_{\mathrm{H}}$ |
| 17 | $4_{H}$ | $5_{\text {H }}$ |
| 18 | $5_{\text {H }}$ | $5_{\text {H }}$ |
| 19 | $5_{\text {H }}$ | $5_{\text {H }}$ |
| 20 | $5_{\text {H }}$ | $5_{\text {H }}$ |
| 21 | $5_{H}$ | $5_{H}$ |
| 22 | $5_{\text {H }}$ | $5_{\text {H }}$ |
| 23 | $5_{\text {H }}$ | $5_{\text {H }}$ |
| 24 | $5_{H}$ | $6_{H}$ |
| 25 | $5_{\text {H }}$ | $6_{\text {H }}$ |
| 26 | $6_{\text {H }}$ | $6^{\text {H }}$ |
| 27 | $6_{\text {H }}$ | $6_{\text {H }}$ |
| 28 | $6_{H}$ | $6_{H}$ |

Note: $n=1$ to $7, m=1$ to 6

## (1) PSI5 Frame Reception Setting (No Payload Checksum in Reception Frame)

IF there is no Payload Checksum in a reply frame from a transceiver (excluding the Payload bit number of 10, 18 and 24 bits), the Rx Frame checksum CRC/Parity Select bit (PSI5SPRCF1n.RFCPS) is set as Parity $(=0)$ and the payload parity error is ignored. PSI5-S recognizes the stuffing bit as a parity bit.
For the procedure of the frame reception from a transceiver, see Section 25.5.6.3, Response Frame from Transceiver Reception.

### 25.5.2.2 WDT Setting

This section describes how to set up the WDT.
Perform the procedure shown in Figure $\mathbf{2 5 . 1 1}$ below for the channels that require the WDT.

Note: $n=0$ to 7

Figure 25.11 WDT Setting Procedure
(1) PSI5SPWDP $n$ : PSI5-S WDT Prescaler $\operatorname{ch} n$ register

Specify the WDT prescaler settings for channel $n$. ( $n: 0$ to 7)
(2) PSI5SPWDEV $n$ : PSI5-S WDT Expiration Value ch $n$ register

Specify the expiration value of the WDT for channel $n$. ( $n: 0$ to 7 )
(3) PSI5SPWDE $n$ : PSI5-S WDT Enable ch $n$ register

Enable the WDT for channel $n$. ( $n$ : 0 to 7)
The WDT can be enabled when PSI5-S is in either the PSI5-S_active or configuration state.

### 25.5.2.3 Timestamp Setting

This section describes how to set up timestamp counters A and B.
Perform the procedure shown in Figure $\mathbf{2 5 . 1 2}$ below for the timestamps to be used. Figure $\mathbf{2 5 . 1 2}$ shows the setting procedure to control timestamp counters A and B separately.

Figure 25.12 Timestamp Setting Procedure (for Separate Control)
(1) PSI5SPTPS: PSI5-S Timestamp Prescaler register

Specify the settings of the timestamp prescaler.
(2) PSI5SPTCAS: PSI5-S Timestamp Counter A Select register

Select the clear signal, enable signal, and clock signal for timestamp counter A.
(3) PSI5SPTCAE: PSI5-S Timestamp Counter A Enable register

Enable the operation of timestamp counter A. By this setting, timestamp counter A starts.
(4) PSI5SPTCBS: PSI5-S Timestamp Counter B Select register

Select the clear signal, enable signal, and clock signal for timestamp counter B.
(5) PSI5SPTCBE: PSI5-S Timestamp Counter B Enable register

Enable the operation of timestamp counter B.

Figure $\mathbf{2 5 . 1 3}$ below shows a different setting procedure than the above to control timestamp counters A and B together.

Figure 25.13 Timestamp Setting Procedure (for Batch Control)
(1) PSI5SPTPS: PSI5-S Timestamp Prescaler register

Specify the settings of the timestamp prescaler.
(2) PSI5SPTCAS: PSI5-S Timestamp Counter A Select register

Select the clear signal, enable signal, and clock signal for timestamp counter A.
(3) PSI5SPTCBS: PSI5-S Timestamp Counter B Select register

Select the clear signal, enable signal, and clock signal for timestamp counter B.
(4) PSI5SPATCE: PSI5-S All Timestamp Counter Enable register

Enable the operation of timestamp counters A and B together. By this setting, timestamp counters A and B start.

Note that clear instructions can also be issued for timestamp counters A and B separately or in a batched manner.

### 25.5.2.4 Interrupt Setting

This section describes how to set up interrupts.
Perform the procedure shown in Figure $\mathbf{2 5 . 1 4}$ below for the required channels among channels 0 to 7 .

Figure 25.14 Interrupt Setting Procedure
(1) PSI5SPCIE $n$ : PSI5-S CPU Interrupt Enable ch $n$ register ( $n: 0$ to 7)

Specify the settings of the interrupt enable bits according to the interrupt factors.

Table 25.89 below lists the enable bits in the interrupt enable register.
Table 25.89 Interrupt Enable Register Bits

| Register Symbol | Bit Symbol | Factor |
| :--- | :--- | :--- |
| PSI5SPCIE0 | IEBXCRC | XCRC error |
| PSI5SPCIE(0 to 7) | IEBCRC | CRC error |
| PSI5SPCIE(0 to 7) | IEBPT | Parity error |
| PSI5SPCIE(0 to 7) | IEBTRST | Transceiver status error |
| PSI5SPCIE0 | IEBUTPT | UART Rx parity error |
| PSI5SPCIE0 | IEBUTFR | UART Rx framing error |
| PSI5SPCIE(0 to 7) | IEBRWDT | WDT error |
| PSI5SPCIE(0 to 7) | IEBROV | PSI5 frame reception overrun error |
| PSI5SPCIE(0 to 7) | IEBRFLK | PSI5 frame lack error |
| PSI5SPCIE(0 to 7) | IEBRFEX | PSI5 frame excess error |
| PSI5SPCIE(0 to 7) | IEBRFN | PSI5 frame reception finish |
| PSI5SPCIE(1 to 7) | IEBDDSOW | DDSR overwrite error |
| PSI5SPCIE(1 to 7) | IEBDDSFN | DDSR transmit finish |
| PSI5SPCIE0 | IEBCTFN | Command data transmit finish |

### 25.5.2.5 DMA Transfer Request Setting

This section describes how to set up DMA transfer requests.
Perform the procedure shown in Figure 25.15 below for the required channels among channels 0 to 7 .

Figure 25.15 DMA Transfer Request Enable Setting Procedure

When enabling the output of DMA transfer requests, check the contents of the following status register:
(1) PSI5SPDRE $n$ : PSI5-S DMA transfer Request Enable ch $n$ register ( $n: 0$ to 7) Enable the output of DMA transfer requests.

Table $\mathbf{2 5 . 9 0}$ below lists the enable bits in the transfer request enable register.
Table 25.90 DMA Transfer Request Enable Register Bits

| Register Symbol | Bit Symbol | Factor |
| :--- | :--- | :--- |
| PSI5SPDRE(0 to 7) | DRQERFN | PSI5 last frame reception finish |
| PSI5SPDRE $(0$ to 7$)$ | DRQEWDT | WDT error |
| PSI5SPDRE(1 to 7$)$ | DRQETFN | DDSR transmit finish |

### 25.5.2.6 Synchronization Pulse Setting Procedure

This section describes how to set up a synchronization pulse.
Perform the procedure shown in Figure $\mathbf{2 5 . 1 6}$ below for the channels that require a synchronization pulse.

Note: $n=0$ to 7

Figure 25.16 Synchronization Pulse Setting Procedure
(1) PSI5SPSTP $n$ : PSI5-S Sync Trigger Prescaler ch $n$ register.

Specify settings of the sync trigger prescaler for channel $n$. ( $n: 1$ to 7 )
(2) PSI5SPSTEV $n$ : PSI5-S Sync Trigger Expiration Value ch $n$ register.

Specify settings of the sync trigger expiration value for channel $n$. ( $n: 1$ to 7 )
(3) PSI5SPSTS $n$ : PSI5-S Sync Trigger Select ch $n$ register.

Specify settings of the selection of synchronous trigger for channel $n$. ( $n: 1$ to 7 )

### 25.5.2.7 Tx Command Setting Procedure

This section describes how to set up the Tx command data for ECU-to-sensor communication.
Perform the procedure shown in Figure $\mathbf{2 5 . 1 7}$ below for the Tx command of each channels that requires a synchronization pulse.

Note: $n=0$ to 7

Figure 25.17 Tx Command Setting Procedure
(1) PSI5SPTCD $n$ : PSI5-S Tx command Data ch $n$ register.

Specify the settings of the Tx command for channel $n$. ( $n: 1$ to 7)

### 25.5.3 UART Mode Setting Procedure

PSI5-S has a UART mode in which PSI5-S can operate as a UART with limited functions.
For details on the UART specifications, see Table 25.8, Features.
Perform the procedure shown in Figure 25.18 below after performing the procedure described in Section 25.5.1,
Common Setting Procedure.

Figure 25.18 UART Mode Setting Procedure
(1) PSI5SUCRIE: UART Communication Rx Interrupt Enable register

Specify settings of the interrupts at the end of UART frame reception, at the occurrence of a UART overrun error, at the occurrence of a UART framing error and at the occurrence of a UART parity error.
(2) PSI5SUCTIE: UART Communication Tx Interrupt Enable register

Specify settings of the interrupts at the end of UART frame transmission and at the occurrence of a UART overwrite error.
(3) PSI5SUCDRE: UART Communication DMA Request Enable register

Specify settings of the DMA transfer requests at the end of UART reception and at the end of UART transmission.
(4) PSI5SPUOMD: PSI5-S/UART Operation Mode register

Set the operation mode to UART mode.
(5) PSI5SPUOEB: PSI5-S/UART Operation Enable register Start the operation of PSI5-S.

### 25.5.4 Procedure for Transmitting Transceiver Commands

This section describes how to transmit commands for an externally connected PSI5 transceiver.
Perform this setting procedure after performing the procedure described in Section 25.5.2, PSI5S Mode Setting

## Procedure.

PSI5 frame reception setting of Ch 0 is required, because the response frame from the transceiver is stored in Ch 0 MB .
(See Section 25.5.2.1, PSI5 Frame Reception Setting)

Figure 25.19 Transceiver Setting Procedure
(1) PSI5SPTFS: PSI5-S Tx Frame Status register

Read the TXSTS bit to check that the UART is not busy with transmission (TXSTS $=0$ ). If the UART is busy (TXSTS = 1), wait until it is not busy.
(2) PSI5SPTFD1: PSI5-S Tx Frame Data1 register

Sequentially set the 1 st to 4 th bytes of the data to be transmitted continuously in this register. If the continuously transmitted data is less than 4 bytes, set only the data to be transmitted.
(3) PSI5SPTFD2: PSI5-S Tx Frame Data2 register

Sequentially set the 5 th to 8 th bytes of the data to be transmitted continuously in this register. If the continuously transmitted data is less than 9 bytes, set only the data to be transmitted.
(4) PSI5SPTFNM: PSI5-S Tx Frame Number register

Set the number of bytes to be transmitted continuously in this register.
(5) PSI5SPTFST: PSI5-S Tx Frame Start register

Start continuous transmission.

As an example, Table 25.91 below describes the settings of PSI5SPTFD1, PSI5SPTFD2, and PSI5SPTFNM registers to set up the external transceiver that uses the command format shown below in Figure 25.20.

Figure 25.20 Example of Command Format

Table 25.91 List of Register Settings

| Register Symbol | Bit Symbol | Value |
| :--- | :--- | :--- |
| PSI5SPTFD1 | TDT1[7:0] | $\{$ Cm[4:0],Ch[2:0]\} |
| PSI5SPTFD1 | TDT2[7:0] | $\{0 \mathrm{b00,A[5:0]} \mathrm{\}}$ |
| PSI5SPTFD1 | TDT3[7:0] | $\mathrm{D}[7: 0]$ |
| PSI5SPTFD1 | TDT4[7:0] | $\mathrm{D}[15: 8]$ |
| PSI5SPTFD2 | TDT5[7:0] | $\mathrm{N} / \mathrm{A}$ |
| PSI5SPTFD2 | TDT6[7:0] | $\mathrm{N} / \mathrm{A}$ |
| PSI5SPTFD2 | TDT7[7:0] | $\mathrm{N} / \mathrm{A}$ |
| PSI5SPTFD2 | TDT8[7:0] | $\mathrm{N} / \mathrm{A}$ |
| PSI5SPTFNM | TXNUM[2:0] | $0 \times 3$ |

### 25.5.5 DDSR Transmission Procedure

This section describes how to perform DDSR transmission.
Perform the procedure shown in Figure 25.21 below for channels 1 to 7.
This procedure must be performed when the operation mode is PSI5S mode.

Note: $n=1$ to 7

Figure 25.21 DDSR Transmission Procedure
(1) PSI5SPDDS $n$. DDSRSTS: PSI5-S DDSR Status $\mathrm{Ch} n$ register ( $n: 1$ to 7)

Check the DDSR transmission status. When the DDSRSTS bit is 1 , wait until the value changes to 0 .
Note that if DDSR transmit data is written to the PSI5SPDDD $n$ register when the DDSRSTS bit is 1 , an overwrite error occurs. For details, see Section 25.6.2.9, Abnormal Transmission (Transmission Error).
(2) PSI5SPDDTP $n$ : PSI5-S DDSR Type Chn register ( $n: 1$ to 7 )

Specify the type of ECU-to-sensor data.
(3) PSI5SPDDD $n$ : PSI5-S DDSR Data Ch $n$ register ( $n: 1$ to 7)

Set DDSR transmit data in this register.

Figure $\mathbf{2 5 . 2 2}$ shows the procedure of DDSR overwrite error processing.

Figure 25.22 DDSR Overwrite Error Processing Procedure
(1) PCISn: PSI5-S CPU Interrupt Status ch $n$ register. ( $n: 0$ to 7)

Read PSI5SPCIS $n$ to check whether the DDSR overwrite error is set (PSI5SPCIS $n=1$ ). If the DDSR overwrite error is not set (PSI5SPCIS $n=0$ ), finish the processing.
(2) PSI5SPCISCn: PSI5-S CPU Interrupt Status ch $n$ register. ( $n: 0$ to 7)

Clear the DDSR overwrite error.
(3) Perform the processing to be done when a DDSR overwrite error occurs.

### 25.5.6 PSI5 Frame Reception Procedures

### 25.5.6.1 Normal Reception

This section describes the procedure of PSI5 frame reception.
PSI5-S can receive PSI5 frames only in PSI5S mode.
Figure 25.23 shows the operations to normally receive PSI5 frames.

Figure 25.23 Procedure of Normal Reception of PSI5 Frames
(1) PSI5SPRES $n$ : PSI5-S Receive Error Status ch $n$ register ( $n: 0$ to 7)

Check the frame that caused the interrupt. (This step is optional.)
(2) PSI5SPRESC $n$ : PSI5-S Receive Error Status Clear ch $n$ register ( $n$ : 0 to 7)

Clear the flag indicating the status of the frame that caused the interrupt. (This operation is optional.)
(3) PSI5SPCISn: PSI5-S CPU Interrupt Status $\operatorname{ch} n$ register ( $n: 0$ to 7)

Read the PSI5-S interrupt status register to check that the ISTRFN bit is set.
(4) PSI5SPCISCn: PSI5-S CPU Interrupt Status chn register ( $n: 0$ to 7 )

Clear the flag indicating the end of frame reception.
(5) PSI5SPMB $n m$ S: PSI5-S receive MailBox $\operatorname{ch} n$ frmm Status register ( $n: 0$ to 7, $m: 1$ to 6)

PSI5SPMBnmD: PSI5-S receive MailBox ch $n$ frm $m$ Data register ( $n: 0$ to 7, $m: 1$ to 6)
PSI5SPMBnmT: PSI5-S receive MailBox $\operatorname{ch} n$ frm $m$ Timestamp register ( $n: 0$ to 7, $m: 1$ to 6)
Read the PSI5 frame status, data, and timestamp stored in the mailbox.
(6) If the ISTRFN bit is not set, perform error processing.

### 25.5.6.2 Abnormal Reception

This section describes how to process an error during PSI5 frame reception.
For the processes from the occurrence of an interrupt to the reading of the interrupt status, see processes (1) and (2) in
Figure 25.24.

Figure 25.24 Procedure of Error Processing in PSI5 Frame Reception
(1) Check the cause of the error indicated in the PSI5-S interrupt status register.
(2) PSI5SPCISCn: PSI5-S CPU Interrupt Status chn register ( $n: 0$ to 7 )

If an error-cause flag is set, clear the flag.
(3) Perform the error processing that corresponds to the indicated cause of the error.

Figure 25.72 shows the occurrence timing of errors other than WDT errors during PSI5 frame reception.
For the occurrence timing of WDT errors, see Section 25.6.2.8, Abnormal Reception (WDT Error).

### 25.5.6.3 Response Frame from Transceiver Reception

This section describes the procedure of the response frame from the transceiver reception.

Figure 25.25 Procedure of Response Frame from Transceiver Reception
(1) PSI5SPRES0: PSI5-S Receive Error Status ch0 register.

Check the error frame that caused the interrupt.
(2) PSI5SPCIS0: PSI5-S CPU Interrupt Status ch0 register.

Read the PSI5-S interrupt status register to check that the ISTRFN bit is set.
(3) PSI5SPCISC0: PSI5-S CPU Interrupt Status ch0 register.

Clear the flag indicating the end of frame reception.
(4) PSI5SPMB0mS: PSI5-S receive MailBox ch0 frmm Status register (m: 1 to 2)

PSI5SPMB0 $m$ D: PSI5-S receive MailBox ch0 frmm Data register ( $m: 1$ to 2)
PSI5SPMB0 $m$ T: PSI5-S receive MailBox ch0 frm $m$ Timestamp register ( $m$ : 1 to 2)
Read the PSI5 frame status, data, and timestamp stored in the mailbox.
(5) PSI5SPRESC0: PSI5-S Receive Error Status Clear ch0 register.

Clear the flag indicating the error of frame 2.
(6) When the following cases, perform error processing.

- The flag indicating the end of reception is not set.
- The error frame occurs in frame 2 of ch0.
- The error frame occurs in frame 1 of ch0, and it has been set to other than a payload data parity error.
(7) PSI5SPRESC0: PSI5-S Receive Error Status Clear ch0 register.

Clear the flag indicating the error of frame 1.
(8) PSI5SPCIS0: PSI5-S CPU Interrupt Status ch0 register.

Read the PSI5-S CPU Interrupt Status ch0 register to check that none of the flags except the ISTPT bit have been set.
(9) PSI5SPCISC0: PSI5-S CPU Interrupt Status ch0 register.

Clear the flag indicating the payload data parity error.

For the setting of frame reception from a transceiver, see Section 25.5.2.1(1), PSI5 Frame Reception Setting
(No Payload Checksum in Reception Frame).

### 25.5.7 Initialization and Operation Stop Procedures

### 25.5.7.1 Initialization by Software Reset

This section describes how to initialize PSI5-S by a software reset.

Figure 25.26 Initialization by Software Reset Procedure
(1) PSI5SPUSWR: PSI5-S/UART Software Reset register Issue a software reset.
(2) PSI5SPUOS: PSI5-S/UART Operation Status register Wait until the SW reset bit changes to 0 .

### 25.5.7.2 DDSR Transmission Stop

This section describes how to stop DDSR transmission.
The transmission stop operation can be performed for individual channels.

Note: $n=1$ to 7

Figure 25.27 DDSR Transmission Stop Operation Procedure
(1) PSI5SPDDSP $n$ : PSI5-S DDSR Stop ch $n$ register ( $n: 1$ to 7)

Stop data transmission from DDSR.

### 25.5.7.3 MailBox Initialization

This section describes the operation to initialize mailboxes (MBs).
This operation initializes the MBs for all channels together.
This operation must be performed when PSI5-S is in configuration mode.

Figure 25.28 Mailbox Initialization Procedure
(1) PSI5SPRMBC: PSI5-S Receive MailBox Data Clear register Write 1 to the MBCLR bit to clear the mailboxes.

### 25.5.8 Interrupt Processing Procedures

### 25.5.8.1 Interrupt Processing in PSI5S Mode

This section describes how to process interrupts in PSI5S mode.
Interrupts occur on individual channels.
This interrupt processing operation can be used for channels 0 to 7 .

Note: $n=0$ to 7
Note 1. When $n=0: m=9$ to 7,5 to 0
When $n=1$ to 7 : $m=11$ to 7,5 to 1

Figure 25.29 Interrupt Processing Procedure
(1) PSI5SPRES $n$ : PSI5-S Receive Error Status ch $n$ register ( $n: 0$ to 7)

Check the frame that caused the reception error. (This step is optional.)
(2) PSI5SPRESCn: PSI5-S Receive Error Status Clear chn register ( $n: 0$ to 7)

Clear the flag indicating the status of the frame that caused the reception error. (This step is optional.)
(3) PSI5SPCIS $n$ : PSI5-S CPU Interrupt Status ch $n$ register ( $n: 0$ to 7)

Read the interrupt status register, and check all interrupt factors.
(4) PSI5SPCISC $n$ : PSI5-S CPU Interrupt Status ch $n$ register ( $n: 0$ to 7)

Clear the bit corresponding to the relevant interrupt factor.
(5) Perform the interrupt process that corresponds to the interrupt factor.

Note that processes (3) and (4) must be performed for each interrupt factor bit.

### 25.5.8.2 Interrupt Processing in UART Mode

This section describes how to process interrupts in UART mode.
Interrupts can occur during both UART reception and UART transmission.
For the processing of interrupts during UART reception, see Section 25.5.10.1, UART Reception.
For the processing of interrupts during UART transmission, see Section 25.5.10.2, UART Transmission.

### 25.5.9 DMA Request Processing Procedures

### 25.5.9.1 DMA Request (Reception) Processing in PSI5S Mode

This section describes how to process DMA requests (reception) in PSI5S mode.
DMA requests (reception) can occur on individual channels.
This request processing operation can be used for channels 0 to 7 .

Figure 25.30 Procedure of DMA Request (Reception) Processing in PSI5S Mode
(1) PSI5SPMBnmS: PSI5-S Receive MailBox ch0 Frm1 Status register (when $n=0, m=1$ to 2 ; when $n=1$ to $7, m=$ 1 to 6)
PSI5SPMBnmD: PSI5-S Receive MailBox ch0 Frm1 Data register (when $n=0, m=1$ to 2 ; when $n=1$ to $7, m=1$ to 6)
PSI5SPMBnmT: PSI5-S Receive MailBox ch0 Frm1 Timestamp register (when $n=0, m=1$ to 2 ; when $n=1$ to 7, $m=1$ to 6)
Check the mailbox data corresponding to the relevant frame.
NOTE
In asynchronous mode of Ch1 to Ch0, the data storage position is switched from frm1 to frm2, ..., frm6, and frm1, in this order, each time a PSI5 frame is received. Therefore, when received data is to be read by DMA, storage addresses must be managed by software. (Data storage position of Ch0 is always frm1.)

### 25.5.9.2 DMA Request (Transmission) Processing in PSI5S Mode

This section describes how to process DMA requests (transmission) in PSI5S mode.
DMA requests (transmission) can occur on individual channels.
This request processing operation can be used for channels 0 to 7 .

Note: $n=1$ to 7

Figure 25.31 Procedure of DMA Request (Transmission) Processing in PSI5S Mode
(1) PSI5SPDDD $n$ : PSI5-S DDSR Data Ch $n$ register ( $n$ : 1 to 7)

Set transmit data in DDSR.

### 25.5.9.3 DMA Request (Reception) Processing in UART Mode

This section describes how to process DMA requests (reception) in UART mode.
DMA requests (reception) occur on channel 7.

Figure 25.32 Procedure of DMA Request (Reception) Processing in UART Mode
(1) PSI5SUCRD: UART Communication Rx Data register

Read receive data from this register.

### 25.5.9.4 DMA Request (Transmission) Processing in UART Mode

This section describes how to process DMA requests (transmission) in UART mode.
DMA requests (transmission) occur on channel 7.

Figure 25.33 Procedure of DMA Request (Transmission) Processing in UART Mode
(1) PSI5SUCTD: UART Communication Tx Data register Write transmit data to this register.

### 25.5.10 UART Mode Communication Procedures

This section describes UART communication procedures.
UART communication can be performed only in UART mode.

### 25.5.10.1 UART Reception

Figure 25.34 below shows the processing procedure of normal UART reception.

Figure 25.34 UART Reception Procedure
(1) PSI5SUCRS: UART Communication Rx Status register

Read the UART reception status register, and check that the flag indicating the end of reception is set.
(2) PSI5SUCRSC: UART Communication Rx Status Clear register

If the flag indicating the end of reception is set, clear it.
(3) PSI5SUCRD: UART Communication Rx Data register

Read receive data from this register.
Note: If this step is skipped, a reception overrun error occurs at the time of receiving the next data.
(4) If the flag indicating the end of reception is not set, perform error processing.

Figure $\mathbf{2 5 . 3 5}$ shows the processing to be performed when a reception overrun error, receive framing error, or receive parity error occurs.

Figure 25.35 UART Reception Error Processing Procedure
(1) Check the states of error factor bits in the UART reception status register.
(2) PSI5SUCRSC: UART Communication Rx Status Clear register If an error-cause flag is set, clear the flag.
(3) Perform the processing corresponding to the indicated error cause.

### 25.5.10.2 UART Transmission

The procedure of UART transmission uses the UART transmission busy flag or the transmission end interrupt.
Figure $\mathbf{2 5 . 3 6}$ shows the UART transmission procedure using the UART transmission busy flag.

Figure 25.36 UART Transmission Procedure (Using UART Transmission Busy Flag)
(1) PSI5SUCTM: UART Communication Tx Monitoring register

Read the UART communication Tx monitoring register to check that the UART Tx buffer is not busy.
(2) PSI5SUCTD: UART Communication Tx Data register

Write transmit data to this register.
(3) PSI5SUCTM: UART Communication Tx Monitoring register

Read the UART communication Tx monitoring register to check that the UART Tx buffer is not busy.

Figure 25.37 below shows the UART transmission procedure using the transmission end interrupt.
Because no transmission end interrupt of the previous transmission is generated for the first transmission operation, the UART transmission busy flag must be used for the first transmission operation and the transmission end interrupt thereafter.

Figure 25.37 UART Transmission Procedure (Using Transmission End Interrupt)
(1) PSI5SUCTS: UART Communication Tx Status register Read the UART communication status register to check that the UART is ready for transmission.
(2) PSI5SUCTD: UART Communication Tx Data register Write transmit data to this register.
(3) Wait until a channel 1 interrupt occurs. When it occurs, proceed to step (4).
(4) PSI5SUCTS: UART Communication Tx Status register

Read the UART communication status register to check that the transmission end flag is set and the overwrite error flag is not set.
(5) PSI5SUCTSC: Uart Communication Tx Status Clear register

Clear the flag indicating the end of transmission.
(6) To continue the processing, proceed to step (2). If not, finish the processing.
(7) Perform the corresponding error processing, see Figure 25.38.

Figure 25.38 below shows the procedure of the processing to be performed when a transmission overwrite error occurs.

Figure 25.38 UART Transmission Error Processing Procedure
(1) PSI5SUCTS: UART Communication Tx Status register

Read the UART communication status register to check that the transmission overwrite error flag is set. If the flag is not set, finish the processing.
(2) PSI5SUCTSC: UART Communication Tx Status Clear register

Clear the transmission overwrite error flag.
(3) Perform the processing to be done when a transmission overwrite error occurs.

### 25.5.11 Loopback Test

### 25.5.11.1 Loopback Test Setting Procedure

This setting procedure must be performed after the common setting procedure (Section 25.5.1, Common Setting Procedure).

Figure 25.39 below shows the Loopback test setting procedure.
PSI5-S enters the test mode only when the values below are written to the register in the order shown in the figure three times.

If a different value is written midway, the whole procedure becomes invalid. In such a case, perform three new writes from the beginning.

Figure 25.39 Loopback Test Setting Procedure

Then PSI5S mode setting (Section 25.5.2, PSI5S Mode Setting Procedure) is performed
The loopback test is performed under the following conditions:

- Communication mode is asynchronous mode.
- Sync commands are not transmitted (sync pulses are not generated).

### 25.5.11.2 Loopback Test Procedure

This section describes the procedure to perform a loopback test.
As an example, Figure $\mathbf{2 5 . 4 0}$ below shows the procedure of the loopback test in which a PSI5 frame (five packets) on pseudo channel $n$ ( $n: 1$ to 7 ) are turned back to the reception block and the reception of the frame is checked by using a special function register (SFR).

Note: $n=1$ to 7

Figure 25.40 Loopback Test Procedure
(1) PSI5SPTFD1: PSI5-S Tx Frame Data1 register

In this register, set the first to fourth bytes of the data (PSI5 frame on pseudo channel $n[n: 1$ to 7$]$ ) to be transmitted continuously.
(2) PSI5SPTFD2: PSI5-S Tx Frame Data2 register

In this register, set the fifth byte of the data (PSI5 frame on pseudo channel $n$ [ $n: 1$ to 7]) to be transmitted continuously.
(3) PSI5SPTFNM: PSI5-S Tx Frame Number register

Specify 5-packet transmission (0x4) in this register.
(4) PSI5SPTFST: PSI5-S Tx Frame Start register

Write 1 to this register to start transmission.
(5) Wait until an interrupt outputs on channel $n$ ( $n: 1$ to 7 ).
(6) Subsequent processes follow the PSI5 frame reception procedure described in Section 25.5.6, PSI5 Frame Reception Procedures.

### 25.5.12 Configuration Mode Entering Procedure

Figure 25.41 below shows the configuration mode entering procedure.

Figure 25.41 Configuration Mode Entering Procedure
(1) PSI5SPUOEB: PSI5-S/UART Operation EnaBle register

Stop the operation of PSI5-S.
(2) PSI5SPUOS : PSI5-S/Uart Operation Status register

Wait until the Active Status bit change to 0 .

The timing of return to the configuration mode, see Section 25.4, Operation Modes.

### 25.6 Operations

This chapter describes the functional configuration of PSI5-S and PSI5-S operations in individual operation modes.

### 25.6.1 Functional Configuration

The sections that follow describe the functions of PSI5-S.

### 25.6.1.1 PSI5-S Reception Function

PSI5-S receives sensor-to-ECU data, and stores the status (if a reception error is detected), received data, and timestamp in SFR.

Figure 25.42 below shows the block diagram for PSI5-S reception.

Figure 25.42 Block Diagram for PSI5-S Reception

For the timing of reception, see Figure 25.72.

The following figure shows the flow of data reception.

Figure 25.43 PSI5-S Reception Data Flow

### 25.6.1.2 PSI5-S Transmission Function

PSI5-S generates ECU-to-sensor data, and transmits a Sync command when it is triggered by a synchronization pulse on individual channels.

PSI5-S also has a function to transmit the data set by the CPU via SFR.
The following figure shows the block diagram for PSI5-S transmission.

Note 1. When loopback is set, UART transmission data is wrapped and not output externally.
Note 2. When data is updated by CPU write in UART mode, perform UART transmission.

Figure 25.44 Block Diagram for PSI5-S Transmission

For the timing of the transmission, see Figure 25.66.

Transmit requests between command data (Section 25.6.2.3, Normal Transmission (Command Data)) and ECU-to-sensor data (Section 25.6.2.4, Normal Transmission (ECU-to-Sensor Data)) are arbitrated, and then UART starts transmission.

Figure 25.45 below shows the block configuration related to the transmit request arbitration function.

Figure 25.45 Block Diagram for Transmit Request Arbitration

### 25.6.1.3 Timestamp Generation Function

Based on the timing of clock input from the GTM or the timing of a divided clock ( 1 to $1023 \mu \mathrm{~s}$ in $1-\mu \mathrm{s}$ steps) generated from PCLK, a timestamp counter runs to measure time. PSI5-S has two timestamp counters for timestamps A and $B$, and the timestamp counters can be enabled and cleared together or separately.

In synchronous mode of Ch1 to Ch7, the timestamp value is captured at the timing of PSI5 frame header reception or the synchronization pulse. In asynchronous mode of Ch1 to Ch7, the timestamp value is captured in the timing of PSI5 frame header reception. In asynchronous mode of Ch0, the timestamp value is captured in the timing of PSI5 frame header reception. (Ch0 is always asynchronous mode.) The timestamp value of Ch 0 is also captured at the timing of a WDT error occurs in any of the channels.

Timestamp capture values are available for channels 0 to 7 . When PSI5 frame reception ends, one of the timestamp capture values is selected according to the channel ID in the header, and used as a timestamp value. If the received frame is an invalid frame, the timestamp capture value for channel 0 is selected. Determination of invalid frames follows the specifications listed in Table 25.93 and Table 25.95. If a WDT error occurs, the timestamp capture value of Ch0 is used as the timestamp value.

Note that timestamp capture values are all zeros when the timestamp capture enable bit (PSI5SPRCF1[0:7].TSEN) is 0 (disable). Also, the timestamp capture values can be cleared by the clear bit (PSI5SPTCDC[0:7].

Figure 25.46 below shows the block diagram for the timestamp generation function.

Figure 25.46 Block Diagram for Timestamp Generation

Figure 25.47 below shows an operation in which a timestamp capture value is fetched when the header of a PSI5 frame is received, and a timestamp value is generated when PSI5 frame reception ends.

The same operation can be performed in both synchronous and asynchronous modes.

Figure 25.47 Timestamp Generation Operation (Timestamp Capture Triggered by Header Reception)

Figure 25.48 below shows an operation in which a timestamp capture value is fetched when a synchronization pulse outputs, and a timestamp value is generated when PSI5 frame reception ends.

This operation can be performed only in synchronous mode.

Figure 25.48 Timestamp Generation Operation (Timestamp Capturing Triggered by Synchronization Command Transmission)

Figure 25.49 below shows an operation in which a timestamp capture value is fetched when a WDT error occurs, and a timestamp value is generated immediately.
The same operation can be performed in both synchronous and asynchronous modes.

Figure 25.49 Timestamp Generation Operation (Capturing Triggered by WDT Error)

### 25.6.1.4 Synchronization Pulse Generation Function

The timing of the synchronization pulse for channels 0 to 7 is selected from the rising edge of the synchronization trigger signal for each channel input from the GTM or the timing of a divided clock ( 1 to $1024 \mu \mathrm{~s}$ in $1-\mu \mathrm{s}$ step) generated from PCLK.

The divided clock timing generation function operates when the function is selected in SFR and its operation is enabled (PUOEB.OPEN $=0 \times 1$ ). With other settings, counters stop with a counter value of 0 .

The following figure shows a block diagram for the synchronization pulse generation circuit:

Figure 25.50 Block Diagram for Synchronization Pulse Generation

### 25.6.2 Operations in PSI5S Mode

PSI5-S performs UART reception of four to six frames when the operation mode is set to PSI5S mode (PSI5SPUOMD.OPMD $=0 \times 1$ ) and the module operation is enabled (PSI5SPUOEB.OPEN $=0 \times 1$ ).

PSI5-S restores PSI5 frame data with corresponding functions shown in Figure $\mathbf{2 5 . 4 2}$.
After restoring the data, PSI5-S checks for reception errors, and then stores data (such as the status value generated from the received frame data, payload value of the received frame data, and the timestamp value generated as described in Section 25.6.1.3, Timestamp Generation Function) as mailbox data in SFR.

The following figure shows the flow of reception.

Figure 25.51 Flow of Reception

### 25.6.2.1 Normal Reception (in Synchronous Mode)

PSI5-S performs reception according to the flow shown in Figure 25.51.
In synchronous mode, PSI5-S starts reception with the synchronization pulse for each channel used as the trigger, and receives a specified number of PSI5 frames.

A WDT installed for each channel is used to monitor reception to determine whether the specified number of PSI5 frames are received within a specified time.

## (1) Receiving UART Frames

PSI5-S receives UART frames, and restores PSI5 frame data.
For the UART specifications, see Section 25.2.1, Functional Overview.
UART receive data is filtered by a noise filter (filtering of three prescaler cycles of data signal based on a majority decision) according to the settings.

Sampling enable generate counter and Sampling counter is reset and UART reception starts when the start bit is detected at a sampling point that starting from the falling edge detection After noise filtering.

NOTE
A sampling point is different in oversample number (odd or even).

Figure $\mathbf{2 5 . 5 2}$ and Figure $\mathbf{2 5 . 5 3}$ below show examples of UART reception.
The following example assumes that the oversample number is set to 5 .

Figure 25.52 UART Frame Reception Start (PSI5SUBPR.RXOSMP = 5 [ODD])

The following example assumes that the oversample number is set to 4 .

Figure 25.53 UART Frame Reception Start (PSI5SUBPR.RXOSMP $=4$ [EVEN])

Figure $\mathbf{2 5 . 5 4}$ below shows an example of an operation in which UART frames are received continuously.

Figure 25.54 UART Frame Reception End (Frame Continue) (PSI5SPRCF10.PFRMIDLE $=0$ )

Figure $\mathbf{2 5 . 5 5}$ below shows an example of an operation in which the last packet frame is received.

Figure 25.55 UART Frame Reception End (Packet Frame End) (PSI5SPRCF10.PFRMIDLE $=0$ )
(1) The stop bit of the last packet is detected.
(2) The asynchronous transfer processing based on PCLK and the communication clock, causes a delay of several clock cycles.
(3) After 50-60 cycles of PCLK (for restoring PSI5 frame data, determining errors and storing mailbox data), the flag indicating the end of reception is set (PSI5SPCIS0.ISTRFN $=1$ ) and an interrupt is output.

Figure $\mathbf{2 5 . 5 6}$ below shows an example of an operation in which the end of packet frame is detected.

Figure 25.56 UART Frame Reception (Channel End) (PSI5SPRCF10.PFRMIDLE=0)
(1) When the stop bit of the last packet is detected, the flag indicating the end of reception is set (PSI5SPCIS0.ISTRFN $=1$ ).
When reception of all packet frames in a channel ends, an interrupt and a DMA request are output.
(2) The asynchronous transfer processing based on PCLK and the communication clock causes a delay of several clock cycles.
(3) After 50-60 cycle of PCLK (for Restoring PSI5 frame data, determining errors and storing mailbox data), the flag indicating the end of reception is set (PSI5SPCIS0.ISTRFN $=1$ ) and an interrupt outputs.
When reception of all packet frames in a channel ends, an interrupt and a DMA request are output.

PSI5 frame data consists of a header, payload, and XCRC bits (Figure 25.3).
UART frames are input successively, and the maximum interval to the next packet frame is specified in the PSI5SPRCF10. PFRMIDLE[3:0] bits.

If the actual interval between frames exceeds the specified value, the UART frame that is received next is treated as a header.

After the header of a frame is received, the number of received packets in the frame (PSI5SPRCF1(0-7).F(1-6)PKT) is referenced according to the channel ID and frame ID in the header. The number of packets to be received is determined from the number of already received packets. When FrmID is not 0 in ch0, the number of packets to be received is 6 (maximum value). When FrmID is an illegal value ( 6 or 7 ) in ch1 to ch7, the number of packets to be received is 6 (maximum value).

If the number of packets to be received is too small or too large, a reception error occurs. For details, see Section

### 25.6.2.7, Abnormal Reception (Reception Error).

If too few packets are received, the received packets are not stored.
If a WDT error occurs, the received packets at the time of the WDT error occurrence are stored.
If too many packets are received, the received packets over the specified number are not stored.
Table 25.92 below shows the correspondence between the settings of PSI5SPRCF1(0-7).F(1-6)PKT and the number of packets to be received.

Table 25.92 PSI5 Frame Reception Packet Number

| Value of <br> PSI5SPRCF1(0 to 7).F(1 to 6)PKT | Specification |
| :--- | :--- |
| 0 | Mask the corresponding frame. (Receive data is not stored in SFR) |
| 1,2 | Setting prohibited |
| 3 to 6 | Packet number is PSI5SPRCF1(0-7).F(1-6)PKT value(3 to 6) |
| 7 | Setting prohibited |

The following figure shows the data format of a PSI5 frame when the payload bit length is min $/ \mathrm{max}$ :

Figure 25.57 PSI5 Frame Data Format (Payload = 8 Bits (min.) to 28 Bits (max.))

## (2) Restoring PSI5 Frame Data and Determining Errors

After receiving all the packets to be received, PSI5-S finishes packet frame reception and restores the PSI5 frame data.
For how to determine errors when restoring the PSI5 frame data, see Section 25.6.2.7, Abnormal Reception (Reception Error).

## (3) Generating MailBox Storage Data

After determining errors in PSI5 frame data, PSI5-S generates three types of mailbox storage data (triplet).
The three types of mailbox storage data contain the status, data, and timestamp, respectively, and have the same value of data consistency indicator (DCI) in the upper four bits.
The DCI value installed for each channel is generated by a 4-bit up-counter. The up-counter value is incremented each time PSI5 data is restored. PSI5-S is initialized by an asynchronous reset or software reset.
The following figure shows the timing of generating the DCI value.

Figure 25.58 DCI Generation Timing
Figure $\mathbf{2 5 . 5 9}$ below shows the bit format of the mailbox data (triplet).
For details, see Section 25.3.12, Ch 0 Frm m MB Data (m: 1, 2) or Section 25.3.13, Ch n Frm m MB Data ( $\mathrm{n}: 1$ to 7 ) ( $\mathrm{m}: 1$ to $\mathbf{6}$ ).

Figure 25.59 MB Data Triplet

## (4) Writing MailBox Data to SFR

After generating mailbox storage data, PSI5-S obtains the storage destination of the mailbox data in SFR by using the channel ID and frame ID in the header.

The conditions for deciding the storage destination are as follows.
Channel 0 is a virtual channel. If an XCRC error or UART reception error occurs, the received frame is determined to be an invalid frame, and the mailbox data is stored in frames on channel 0 . The mailbox data is also stored in frames on channel 0 when the frame ID is invalid or a WDT error occurs.

Table 25.93 PSI5 Frame MB Target Generate (Sync)

| XCRC error, <br> UART parity error, <br> UART framing error |  |  |
| :--- | :--- | :--- |
| No | FrmID | MB target |
|  | $0 \leq$ SFR data $\leq 5$ | Ch: Receive ChID <br> Frm: Receive FrmID |
|  | 6,7 | Ch: 0 |
| Yes | Not related | Frm: 2 |

The storage data and the storage destination when a WDT error occurs in synchronous mode are as shown in Table 25.98.

Table 25.94 below lists the 1st addresses of the frames to write mailbox data that is generated from the received channel ID and frame ID.

Table 25.94 MB write 1st Address Generate (by Frame ID)

|  |  | Write 1st Address |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Frm ID | Frame | Ch0 | Ch1 | Ch2 | Ch3 | Ch4 | Ch5 | Ch6 | Ch7 |
| 0 | Frame1 | $50 \mathrm{H}_{\mathrm{H}}$ | $548_{\text {H }}$ | $590_{\mathrm{H}}$ | 5D8 ${ }_{\text {H }}$ | 620 ${ }_{\text {H }}$ | $668_{\mathrm{H}}$ | $6 \mathrm{B0} \mathrm{H}$ | 6F8 ${ }_{\mathrm{H}}$ |
| 1 | Frame2 | $50 \mathrm{C}_{\mathrm{H}}$ | $554_{\mathrm{H}}$ | $59 \mathrm{C}_{\mathrm{H}}$ | 5E4 ${ }_{\text {H }}$ | 62C H | 674 ${ }_{\text {H }}$ | $6 \mathrm{BC}_{\mathrm{H}}$ | $704_{\text {H }}$ |
| 2 | Frame3 | $50 \mathrm{C}_{\mathrm{H}}$ | $560_{\mathrm{H}}$ | $5 \mathrm{~A} 8_{\text {H }}$ | 5 FO H | $638_{\mathrm{H}}$ | 680 ${ }_{\text {H }}$ | $6 \mathrm{C} 8_{\mathrm{H}}$ | $710_{\mathrm{H}}$ |
| 3 | Frame4 | $50 \mathrm{C}_{\mathrm{H}}$ | $56 \mathrm{C}_{\mathrm{H}}$ | $5 \mathrm{~B} 4_{\mathrm{H}}$ | $5 \mathrm{FC}_{\mathrm{H}}$ | $644_{\mathrm{H}}$ | 68C ${ }_{\text {H }}$ | 6D4 ${ }_{\text {H }}$ | $71 \mathrm{C}_{\mathrm{H}}$ |
| 4 | Frame5 | $50 \mathrm{C}_{\mathrm{H}}$ | $578{ }_{\text {H }}$ | $5 \mathrm{CO}_{\mathrm{H}}$ | $6008^{\text {H }}$ | 650 ${ }_{\text {H }}$ | 698 ${ }_{\text {H }}$ | 6E0H | $7^{728}{ }_{H}$ |
| 5 | Frame6 | $50 \mathrm{C}_{\mathrm{H}}$ | 584 ${ }_{\text {H }}$ | $5 \mathrm{CC}_{\mathrm{H}}$ | $614_{H}$ | $65 \mathrm{C}_{\mathrm{H}}$ | $6 \mathrm{~A} 4_{\mathrm{H}}$ | 6ECH | $734_{H}$ |
| 6 | Error frame | $50 \mathrm{C}_{\mathrm{H}}$ |  |  |  |  |  |  |  |
| 7 | Error frame | $50 \mathrm{C}_{\mathrm{H}}$ |  |  |  |  |  |  |  |

The mailbox data storage addresses must be in the range from $500_{\mathrm{H}}$ to $73 \mathrm{C}_{\mathrm{H}}$ shown in the address map (Table 25.11).
When mailbox data is stored in frame 3 on channel 1, the 1st address of the storage destination is $560_{\mathrm{H}}$.
After deciding the storage destination, PSI5-S stores the status in the area beginning with the 1st address, data in the area beginning with the address " 1 st address +4 ", and timestamp in the area beginning with the address " 1 st address + $8 "$.

## (5) Monitoring PSI5 Frame Reception with the WDT

With the WDT installed for each channel, PSI5-S monitors reception of the specified number of PSI5 frames to be received.

When the synchronization pulse is transmitted to the Tx shifter register after synchronization pulse input from GTM, the WDT counter fetches a specified expiration value and starts counting. When the specified number of frames are received or the WDT counter value becomes 0 , the WDT counter stops, and waits for the rising edge of the next synchronization pulse. At the rising edge of the next synchronization pulse, the WDT counter fetches a specified expiration value, and starts counting. If the WDT counter value becomes 0 , a WDT error is assumed. For details, see

## Section 25.6.2.8, Abnormal Reception (WDT Error).

The WDT expiration value (PSI5SPWDEVn.WDTEX) should be shorter than the interval time of synchronization pulse.

NOTE
Frame reception time < WDT expiration time < \{(the interval time of synchronization pulse) - (maximum arbitration delay time) $\}$
(maximum arbitration delay time) $=$ bit time * $154+50$ * (PCLK period)

The following figure shows the WDT operation (without WDT error).

Figure 25.60 WDT Operation Timing (Sync Mode) (without WDT Error)

NOTE
The WDT counter stops in 50 cycles after a stop bit of the last frame is received. A WDT error occurs in a case that the WDT counter expires within the 50 clock cycles even if the stop bit of the last frame is received.

The number of packets to be received on each channel is obtained as follows:

- When the value set in PSI5SPRCF1(0-7).F(1-6)PKT is not 0 , the frame is monitored.
- When the value set in PSI5SPRCF1(0-7).F(1-6)PKT is 0 , the frame is not monitored.

### 25.6.2.2 Normal Reception (in Asynchronous Mode)

Unlike synchronous communication, asynchronous communication does not transfer PSI5 frames in synchronization with synchronizing pulses. In asynchronous mode, PSI5-S receives PSI5 frames from the transceiver according to the packets transmitted from the sensor.

## (1) Receiving UART Frames

This operation is the same as that described in Section 25.6.2.1(1), Receiving UART Frames.

## (2) Restoring PSI5 Frame Data and Determining Errors

This operation is the same as that described in Section 25.6.2.1(2), Restoring PSI5 Frame Data and Determining Errors.

## (3) Generating MailBox Storage Data

This operation is the same as that described in Section 25.6.2.1(3), Generating MailBox Storage Data.

## (4) Writing MailBox Data to SFR

This operation is different from that described in Section 25.6.2.1(4), Writing MailBox Data to SFR in the following points.

After generating mailbox storage data, PSI5-S obtains the storage destination of the mailbox data by using the channel ID in the header and the frame ID counter*1 installed for each channel.

In asynchronous mode, the frame ID is fixed to 0 . Therefore, the frame ID is replaced with the frame ID counter in order to always store the data of the six latest frames.

Note 1. The frame ID counter is a hexadecimal counter that operates only in asynchronous mode and is incremented each time mailbox data is stored in SFR.

The following figure shows an outline of the counter operation:

Figure 25.61 Frame ID Counter (Asynchronous Mode Only)

Table 25.95 below shows the conditions for obtaining the storage destination.
Table 25.95 PSI5 Frame MB Target Generate (Async)

| XCRC error, <br> UART parity error, <br> UART framing error <br> No |  |  |
| :--- | :--- | :--- |
|  | FrmID | MB target |
|  | $\neq 0$ | Ch: Receive ChID <br> Frm: Frame ID counter data <br> (Active Asynchronous mode $)$ |
|  | $\neq 0$ | Ch: 0 |

The storage data and the storage destination when a WDT error occurs in asynchronous mode are as shown in Table 25.99.

## (5) Monitoring PSI5 Frame Reception with the WDT

With the WDT installed for each channel, PSI5-S checks that PSI5 frames are received frame by frame.

When the WDT enable bit (PSI5SPWDE(0-7).WDTEB) is set to 1 in PSI5S mode, the WDT counter fetches a specified expiration value and starts counting. Each time a frame is received or the WDT counter value becomes 0 , the WDT counter fetches the specified expiration value again and starts counting.
If the WDT counter value becomes 0 , occurrence of a WDT error is assumed. For details, see Section 25.6.2.8, Abnormal Reception (WDT Error).

The following figure shows the WDT operation (without a WDT error).

Figure 25.62 WDT Operation Timing (Asynchronous Mode) (without WDT Error)

NOTE
The WDT counter restart in 50 cycles after a stop bit of the frame is received. A WDT error occurs in a case that the WDT counter expires within the 50 clock cycles even if the stop bit of the frame is received.

### 25.6.2.3 Normal Transmission (Command Data)

After transmitting data (PSI5SPTFD1 and PSI5SPTFD2) and the number of transmit packets (PSI5SPTFNM.TXNUM) is set, PSI5-S transmits UART frames according to the specified number of transmit packets when the transmission start bit (PSI5SPTFST.TXST) is set. No idle time is set between UART frames. To maintain continuous transmission, packet frames are transmitted without idle time between them.

For the UART specifications, see Section 25.2.1, Functional Overview.
For 8-byte communication, data is transmitted in order of PSI5SPTFD1.TDT1[7:0], PSI5SPTFD1.TDT2[7:0], ..., and PSI5SPTFD2.TDT8[7:0].

The following figure shows the operation of command data transmission.

Figure 25.63 Command Data Transmission (8-byte)
(1) The PSI5SPTFS.TXSTS bit is 1 when TXST is 1 .
(2) In the timing of stop bit output, next packet data is set in the transmit data shift register (Tx shifter). The PSI5SPTFS.TXSTS bit is cleared to 0 to enable writing of the next data by the CPU.
(3) If the CPU writes transmit data continuously, packets are transmitted without idle time.
(4) The asynchronous transfer processing based on PCLK and the communication clock causes a delay of several clock cycles.

### 25.6.2.4 Normal Transmission (ECU-to-Sensor Data)

In PSI5S mode, PSI5-S transmits a Sync command in synchronization with the synchronization pulse generated by the GTM or an internal counter. Because the initial value of ECU-to-sensor data is set to all 1's, the output value of the Sync command is 1 (command data (PSI5SPTCD $n(n: 1-7)$.ATRSCMD[4:0] and PSI5SPTCD $n$ ( $n: 1-7$ ).ACHID[2:0])) unless the transmit data is updated.

After the frame type (frame 1 to frame 4) of ECU-to-sensor data and the ECU-to-sensor data (maximum data size: 20 bits, address: 4 bits) to be transmitted are set, PSI5-S generates frame data by adding CRC bits at the end of ECU-tosensor data. Note that all unused bits for ECU-to-sensor data must be 1 .

The generating polynomial for CRC is " $\mathrm{g}(\mathrm{x})=\mathrm{x} 6+\mathrm{x} 4+\mathrm{x} 3+1$ " (initial value: $010101_{\mathrm{B}}$ ) when the number of CRC bits is 6 , or " $\mathrm{g}(\mathrm{x})=\mathrm{x} 3+\mathrm{x}+1$ (initial value: 0 b 111 )" when the number of CRC bits is 3 . The range of CRC calculation is zero extension of the number of CRC bit in the MSB of ECU-to-sensor data (maximum of 24 bits). Data bits are transmitted LSB first.

Because the channels set to asynchronous mode do not use synchronization pulses, ECU-to-sensor transmission is not performed on those channels.

Table 25.96 below shows the frame types available for ECU-to-sensor data.
Table 25.96 ECU-to-Sensor Frame Types

| Value of <br> PSI5SDDSRTYPE[1:0] | Specification | Start Bit | CRC | CRC Calculation |
| :--- | :--- | :--- | :--- | :--- |
| $00_{\mathrm{B}}$ | Frame1 (Short) | $010_{\mathrm{B}}$ | 3 bits | Scope |

The following figure shows the format of frame data.

Figure 25.64 ECU-to-Sensor Data Format

After ECU-to-sensor data is generated, the data shifts bit by bit beginning with the start bit at the rising edge of a synchronization pulse for each channel.

Based on the value output by shifting, the command data in SFR is selected (from "PSI5SPTCD $n(n$ : 1-
7).ATRSCMD[4:0] and one bit of PSI5SPTCD $n(n: 1-7) . \operatorname{ACHID}[2: 0]$ " and "PSI5SPTCD $n(n: 1-7) . \operatorname{TRSCMD}[4: 0]$ and one bit of PSI5SPTCD $n(n: 1-7)$. CHID[2:0]").

When the value output by shifting is 0 , the command data in SFR is "PSI5SPTCDn( $n: 1-7$ ).TRSCMD[4:0] and one bit of PSI5SPTCD $n(n: 1-7)$.CHID[2:0]".
When the value output by shifting is 1 , the command data in $\operatorname{SFR}$ is "PSI5SPTCDn( $n: 1-7$ ).ATRSCMD[4:0] and one bit of PSI5SPTCD $n(n: 1-7) . A C H I D[2: 0]$ ".

A UART frame is generated from the selected data, and output.
The following figure shows the format of the UART frame to be output.

Figure 25.65 ECU-to-Sensor Data Format (UART Frame)

The following figure shows the operation of ECU-to-sensor data transmission.

Figure 25.66 ECU-to-Sensor Data Transmission (Frame 1)

Note 1. When DDSR data is changed, the DDSR transmission status is asserted.
Note 2. When the sync pulse (Ch1) is asserted, UART Tx data is transmitted.
Command data is selected by the shift register output value ( 0 : TRSCMD, 1: ATRSCMD).
Note 3. When the last data is transmitted, the DDSR transmission status is deasserted.

Figure 25.67 ECU-to-Sensor Data Transmit (Frame 4)

### 25.6.2.5 Normal Transmission (ECU-to-Sensor Data Transmission Stopped)

If transmission is stopped (PSI5SPDDSP(1-7).DDSRSTP $=1$ ) during ECU-to-sensor data transmission, PSI5-S performs the following operations:

- Initializing the DDSR shift register (set all 1)
- De-asserting the DDSR transmission status signal

The following figure shows the operation that is performed when ECU-to-sensor data transmission is stopped.

Figure 25.68 ECU-to-Sensor Data Transmission Stop

### 25.6.2.6 Normal Transmission (Transmit Request Arbitration)

Transmit requests are arbitrated by using the function shown in Figure 25.45 and output by UART transmission.
The priority of arbitration is: Ch 1 (high priority) $>\mathrm{Ch} 2>\mathrm{Ch} 3>\mathrm{Ch} 4>\mathrm{Ch} 5>\mathrm{Ch} 6>\mathrm{Ch} 7>\mathrm{Command}$ data (low priority)

The following figure shows an operation in which requests are input after the lower priority requests are input.

Figure 25.69 Arbitration Tx Request (max latency)

The following figure shows an operation in which all requests are input simultaneously.

Figure 25.70 Arbitration Tx Request (All Requests Share the Same Timing)

Tx request in FIFO is cleared when the operation enable register (PSI5SPUOEB.OPEN) is set to 0 .

### 25.6.2.7 Abnormal Reception (Reception Error)

After restoring a PSI5 frame, PSI5-S determines whether reception errors have occurred. Then, PSI5-S checks for XCRC errors, CRC errors, transceiver status errors, and mailbox overrun.

If mailbox overrun has occurred, the data in the mailbox will be unpredictable.
Other errors are checked for at different timings. The timing for determining other errors is as follows:
UART-related errors (parity and framing errors) are checked for when a UART frame is received.
A WDT error is determined to have occurred when the WDT counter value becomes 0 . For details, see Section

### 25.6.2.8, Abnormal Reception (WDT Error).

An error status is cleared by writing 1 to the corresponding bit in the reception status clear register. The error status is also cleared when the operation mode is switched to configuration mode.

Table 25.97 below lists PSI5 frame reception errors.
Table 25.97 PSI5 Frame Reception Errors

| Error | Detect Timing | Detection Condition |
| :--- | :--- | :--- |
| XCRC | PSI5 frame received | The agreement of XCRC (6-bit) value which was calculated from received data <br> and the reception XCRC (6-bit) value is confirmed. |
| CRC | PSI5 frame received \& | The agreement of CRC (3-bit) value which was calculated from received data and <br> the reception CRC (3-bit) value is confirmed. |
| Parity | PSI5 frame received \& | The agreement of even parity value which was calculated from received data and <br> the reception parity value is confirmed. |
| Transceiver status |  <br> error in header $\neq 0 \times 0$ | When the error status value of the received header data is other than 0. |

Note 1. When a PSI5 frame lack error is occurs, the new PSI5 frame data is not stored.
Then if a WDT error occurs, the received packets at the time of the WDT error occurrence is stored.
Note 2. When a PSI5 frame excess error is occurred, the extra data of the new PSI5 frame is not stored.

When the number of received packets exceeds the number of packets to be received, a PSI5 frame excess error, XCRC error and CRC error occur. In this case, a PSI5 frame excess error is detected for the received Ch , and the received data is stored as Ch 0 Frm 2 MB data.

The generating polynomial for XCRC is " $g(x)=\mathrm{x} 6+\mathrm{x} 4+\mathrm{x} 3+1$ ". The initial value of the XCRC bits is $010101_{\mathrm{B}}$. The generating polynomial for CRC is " $g(x)=\mathrm{x} 3+\mathrm{x}+1$ ". The initial value of the XCRC bits is $111_{\mathrm{B}}$.

The following figure shows the ranges of calculation for the XCRC and CRC values for a PSI5 frame that uses CRC and has a payload of 13 bits.

The calculation target of XCRC is PSI5 frame data excluding XCRC, and 0 extension of 6 bits to MSB.
The calculation target of CRC is the payload data, and 0 extension of 3 bits to MSB.

Figure 25.71 Calculate Area of $X C R C, C R C$

The following figure shows the detection timing of reception errors.

Figure 25.72 Sensor-to-ECU Data Is Received (Reception Error Is Detected)

The following figure shows the operation for error detection when too many or too few UART frames are received.

Figure 25.73 UART Frame Error Is Detected (Frame Lack or Frame Excess)

When the PSI5-S transitions to the PSI5-S during a PSI5 frame reception, any error of "UART framing error", "UART parity error", "payload data parity error", "Frame lack error" and "packet frame XCRC error" possibly occurs. Because the PSI5-S doesn't detect a bus idle condition when the PSI5-S transitions to the PSI5S mode.

### 25.6.2.8 Abnormal Reception (WDT Error)

The synchronous and asynchronous modes differ from each other in WDT error determination, as follows.

## (1) Synchronous Mode

When the synchronization pulse is transmitted to the Tx shifter after synchronization pulse input, the WDT value is reset to the expiration value, and, at the same time, the WDT starts the next operation. If the WDT counter reaches 0 before receiving all the packets to be received, a WDT error is assumed.

Note that the WDT starts operation again after the rising edge of the next synchronization pulse for each channel is detected.

If a WDT error occurs, an interrupt status (PSI5SPCIS[0:7].ISTRWDT) occurs. The interrupt status is cleared by writing 1 to the corresponding bit (PSI5SPCIS[0:7].ISTCRWDT) in the interrupt status clear register.

The data received until the transmission of the synchronization pulse to the Tx shifter after a WDT error is detected is not stored.

The following figure shows the operation that is performed when a WDT error occurs in synchronous mode.

Figure 25.74 WDT Operation Timing (Sync Mode) — WDT Error

Below shows the MailBox triplet when a WDT error occurs in synchronous mode.
Table 25.98 MB Data Triplet - WDT Error (Synchronous Mode)

| Case of UART Rx | Case1 | Case2 | Case3 | Case4 | Case5 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Store location | ch0/frm2 | ch0/frm2 | ch0/frm2 | ch0/frm2 | ch0/frm2 |
| DCI | Ch0 | Ch0 | Ch0 | Ch0 |  |
| CHID | Channel where WDT | Channel where WDT | Channel where WDT | CHID in the header | Channel where WDT |
|  | error detected | error detected | error detected | of the reception <br> frame | error detected |

Note 1. Not received (missing or incomplete) packet bits are "0".
Note 2. Incomplete data is stored in packets 2 to 4 and the lower 4 bits of packet 5.

The following figure shows incomplete data format and store location.

Figure 25.75 PSI5 Frame Data Format and MB Data Triplet at WDT Error

The following figure shows incomplete data format and store location.

Figure 25.76 Packet Frame Counter

The following figure shows the arbitration of the write request to Ch 0 and the operation of the interrupt and DMA request.

Figure 25.77 Write Request Arbitrated and Interrupt/DMA Output (Synchronous Mode)

The interrupt / DMA request by WDT error outputs from detection Ch after writing the MailBox of Ch 0 .
When a write request by WDT error during the write processing to Ch0/frm2, interrupt/DMA request outputs and the MB data triplet is discarded.

When a write request by another error (not WDT error) during the write processing to $\mathrm{Ch} 0 / \mathrm{frm} 2$, the interrupt/DMA request outputs and the MB data triplet write after the write processing to $\mathrm{Ch} 0 / \mathrm{frm} 2$.

## (2) Asynchronous Mode

When reception of a frame ends, the WDT value is reset to the expiration value, and, at the same time, the WDT starts the next operation. If the WDT counter reaches 0 before reception of the next frame ends, occurrence of a WDT error is assumed.

In such a case, the WDT value is reset to the initial value, and the WDT starts operation again.
The conditions for starting the first operation of the WDT are as follows.
When the WDT enable bit is set to 1 , an expiration value is set in the WDT counter. When the operation mode is subsequently switched to PSI5S mode, the WDT starts operation. If the WDT enable bit is 0 (disable), the WDT does not start operation.

If a WDT error occurs, an interrupt status (PSI5SPCIS1.ISTRWDT) occurs. The interrupt status is cleared by writing 1 to the corresponding bit (PSI5SPCISC1.ISTRWDT) in the interrupt status clear register.

The following figure shows the operation that is performed when a WDT error occurs in asynchronous mode.

Figure 25.78 WDT Operation Timing (Asynchronous Mode) (WDT Error)

Below shows the MailBox triplet when a WDT error occurs in synchronous mode:
Table 25.99 MB Data Triplet - WDT Error (Asynchronous Mode)

| Case of UART Rx | Case1 | Case2 | Case3 | Case4 | Case5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Store location | ch0/frm2 | ch0/frm2 | ch0/frm2 | ch0/frm2 | ch0/frm2 |
| DCI | Ch0 | Ch0 | Ch0 | Ch0 | Ch0 |
| CHID | Channel where WDT error detected | Channel where WDT error detected | Channel where WDT error detected | CHID in the header of the reception frame | Channel where WDT error detected |

| HEADERR | 0 | Header error | Header error | Header error | Header error |
| HEADST | 0 | HEADST in the header of reception frame | HEADST in the header of reception frame | HEADST in the header of reception frame | HEADST in the header of reception frame |
| CRCERR | 0 | 0 | 0 | CRC error | CRC error |
| CRC | 000 ${ }_{\text {B }}$ | $000{ }_{\text {B }}$ | 000 ${ }_{\text {B }}$ | CRC of reception frame data | CRC of reception frame data |
| XCRCERR | 0 | 0 | 0 | 1 | 1 |
| XCRC | 00_0000 ${ }_{\text {B }}$ | 00_0000 ${ }_{\text {B }}$ | 00_0000 ${ }_{\text {B }}$ | XCRC of reception frame data | XCRC of reception frame data |
| Payload data | 000_0000H | Incomplete frame data *1,*2,*3 | Incomplete frame data *1,*2,*3 | Payload data of received frame data | Incomplete frame data *1,*2,*3 |
| Time stamp | At WDT error detection (Ch0) | At WDT error detection (Ch0) | At WDT error detection (Ch0) | At header reception (Ch0) | At WDT error detection (Ch0) |

Note 1. Not received (missing or incomplete) packet bits are " 0 ".
Note 2. Incomplete data is stored in packets 2 to 4 and the lower 4 bits of packet 5.
Note 3. The incomplete data format is the same as synchronous mode.

The following figure shows the arbitration of the write request to Ch 0 and the operation of the interrupt and DMA request.

Note: $n=0$ to $7, m=1$ to 7

Figure 25.79 Write Request Arbitrated and Interrupt/DMA Output (Asynchronous Mode)

The interrupt request by WDT error outputs from detection Ch after writing the MailBox of Ch 0 .
The DMA request by WDT error outputs from Ch0 after writing the MailBox of Ch0.
When a write request by WDT error during the write processing to Ch0/frm2, interrupt request outputs and the MB data triplet is discarded.

When a write request by another error (not WDT error) during the write processing to Ch0/frm2, the interrupt request outputs and the MB data triplet write after the write processing to $\mathrm{Ch} 0 / \mathrm{frm} 2$.

NOTE
When UART Parity error or UART Framing error or XCRC error is occurred, the received data is stored in Frame2 of Ch0. In that case, there is possible to detect the WDT error of reception Ch , because the reception is not stored in expected Ch.

### 25.6.2.9 Abnormal Transmission (Transmission Error)

If ECU-to-sensor data is set for a channel while ECU-to-sensor data is being transmitted*1 in the same channel, an ECU-to-sensor data overwrite error is determined to have occurred.

Note 1. Period from setting the value of transmission command to storing the last data in the Tx shifter.

If an overwrite error is determined, the data written afterward is not transmitted.
Data that is already being transmitted is not affected by the overwrite error.
If an overwrite error occurs, an interrupt status signal (PSI5SPCIS1.ISTDDSOW) is asserted. The interrupt status signal is cleared by writing 1 to the corresponding bit (PSI5SPCISC1.ISTCDDSOW) in the interrupt status clear register.

The following figure shows the operation that is performed when an ECU-to-sensor data overwrite error occurs.

Note 1. If the DDSR data is changed while DDSR status $=1$, the DDSR overwrite error status is asserted.
Note 2. When all data has been outputs, the status is cleared
Note 3. 1 is written to the DDSR overwrite error clear status bit and the DDSR overwrite error status is cleared.

Figure 25.80 ECU-to-Sensor Data Transmission (Overwrite Error)

The following describes the operation that is performed when updating the ECU-to-sensor data conflicts with the start of the last data transmission triggered by a synchronization pulse.

When updating the ECU-to-sensor data occurs within 1 PLCK cycle from the start of the last data transmission triggered by a synchronization pulse, occurrence of an overwrite error is assumed.

When updating the ECU-to-sensor data occurs 2 PCLK cycles from the start of the last data transmission triggered by a synchronization pulse, occurrence of an overwrite error is not assumed.

In configuration mode, even if updating the ECU-to-sensor data occurs, PSI5-S does not start the transmission and PSI5-S does not detect an overwrite error.

Figure 25.81 ECU-to-Sensor Data Transmit (Overwrite Error Operation is Conflicted)

### 25.6.2.10 Interrupt Output

PSI5-S can output eight interrupt signals.
Interrupts can be output only when interrupt output is enabled. If an interrupt factor occurs when interrupt output is disabled, no interrupt is output, but the interrupt status is indicated.
Table $\mathbf{2 5 . 1 0 0}$ below lists the factors of interrupts that are output in PSI5S mode.
Table 25.100 Interrupt Output Timings

| Output Signal | Interrupt Output Timing |
| :--- | :--- |
| int_psis_ch0 to 7 | When MB data is received and stored to SFR. |
| int_psis_ch0 to 7 | When WDT operates, the specified time elapses, and the value matches the compare value. |
| int_psis_ch0 to 7 | When a UART frame is received and the next UART frame is received before the start of the idle <br> period. |
| int_psis_ch0 to 7 | When the last command data is stored in the Tx shifter. |
| int_psis_ch0 | When the last DDSR data is stored in the Tx shifter. |
| int_psis_ch1 to 7 | When DDSR data is written while another DDSR data is being transmitted. |
| int_psis_ch1 to 7 |  |

The following describes the interrupt statuses and how to clear them.
To clear an interrupt status, write 1 to the bit corresponding to the interrupt status in the interrupt status clear register.
Table 25.101 Interrupt Statuses

| Equipped Ch | Interrupt Status |
| :--- | :--- |
| Ch0 | XCRC error |
| Ch0 to Ch7 | CRC error |
| Ch0 to Ch7 | Parity error |
| Ch0 to Ch7 | Transceiver status error |
| Ch0 | UART Rx parity error |
| Ch0 | UART Rx framing error |
| Ch0 to Ch7 | WDT error |
| Ch0 to Ch7 | PSI5 frame reception overrun error |
| Ch0 to Ch7 | PSI5 frame lack error |
| Ch0 to Ch7 | PSI5 frame excess error |
| Ch0 to Ch7 | PSI5 frame reception finish |
| Ch1 to Ch7 | DDSR overwrite error |
| Ch1 to Ch7 | DDSR transmit finish |
| Ch0 | Command data transmit finish |

The following describes the operation in which an interrupt status occurs and is cleared.
The following figure shows interrupt output and DMA request output operations in synchronous mode:

Note 1. When the last frame is received at each Ch, a DMA request is asserted.
Note 2. When the last frame is received at each Ch but there is a frame lost, a DMA request is not asserted.

Figure 25.82 Interrupt and DMA Request Timing (Synchronous Mode)

The following figure shows interrupt output and DMA request output operations in asynchronous mode:

Figure 25.83 Interrupt and DMA Request Timing (Asynchronous Mode)

If the occurrence of an error status and the clearing of an interrupt status occur at the same time, the occurrence of the error has priority over the occurrence of the interrupt status.

The following figure shows the operation that is performed under conditions for setting and clearing interrupts.

Figure 25.84 Interrupt Operation (Conflict)

If an interrupt setting condition is met while an interrupt status bit is set, an interrupt is output.
The following figure shows the operation described above.

Figure 25.85 Interrupt Operation (Error Setting Occurs When Interrupt Status Is Set)

NOTE
A interrupt may be outputted in a period of maximum 14 PCLK even after PUOS.ACSTS becomes 0 .
Then the interrupt should be ignored.

### 25.6.2.11 DMA Request Output

PSI5-S can output 15 DMA requests (eight receive requests and seven transmit requests).
DMA requests are output only when DMA request output is enabled. DMA requests are not output when DMA request output is disabled.

Table 25.102 below lists the factors of DMA requests that are output in PSI5S mode.
Table 25.102 Timings of DMA Transfer Request Output

| Operation Mode | Equipped Channel | $\mathrm{Rx} / \mathrm{Tx}$ | DMA Request Output Factor |
| :--- | :--- | :--- | :--- |
| PSI5S mode | Ch0 to Ch7 | Rx | <Sync> |
|  |  | When last the PSI5 frame is stored in SFR. <br> <Async> <br>  |  |
|  | When a PSI5 frame is stored in SFR. |  |  |

Figure $\mathbf{2 5 . 7 4}$, Figure $\mathbf{2 5 . 7 8}$, Figure $\mathbf{2 5 . 8 2}$, and Figure $\mathbf{2 5 . 8 3}$ show the DMA request output operations for reception.

Figure 25.66 and Figure $\mathbf{2 5 . 6 7}$ show the DMA request output operations for transmission.

### 25.6.2.12 Transition to Configuration Mode

The operation of PSI5-S to return to the configuration mode is described in Section 25.4, Operation Modes.
Figure 25.86 below describes the transition to the configuration mode during reception and transmission.
When CPU writes PSI5SPUOEB.OPEN to 0 during reception, PSI5-S waits for 16 PCLK cycles and then transitions to configuration mode if the PSI5-S is not sending a frame.

Figure 25.86 Move from PSI5S Mode to Configuration Mode (Rx)

When CPU writes PSI5SPUOEB.OPEN to 0 during transmission, PSI5-S waits for 16 PCLK cycles and then transitions to configuration mode if the PSI5-S isn't sending a frame. If PSI5-S sends a frame, it transitions to configuration mode after it completes to send the frame.

Figure 25.87 Move from PSI5S Mode to Configuration Mode (Tx)

NOTE
In a case that the command to transceiver has been accepted in UART transmission module in PSI5-S when CPU writes PSI5SPUOEB.OPEN to 0, PSI5-S wait for completion of the UART transmission. The maximum period of the mode transition time is a period of 9 UART frames.

### 25.6.3 Operations in UART Mode

When the operation mode is UART mode (PSI5SPUOMD.OPMD $=0$ ) and the operation is enabled (PSI5SPUOEB.OPEN = 1), PSI5-S can perform 1-byte UART communication with external devices.

Baud rate settings (prescaler division ratio, clock division ratio, and oversample number) are described in Section

### 25.5.1, Common Setting Procedure.

For the UART specifications, see Section 25.2.1, Functional Overview.

### 25.6.3.1 Normal Reception

PSI5-S receives UART frames. Each time PSI5-S receives one UART frame, PSI5-S performs serial-to-parallel (S/P) conversion and determines whether there are any reception errors.

If no reception errors are found, PSI5-S determines that the reception is normal, and then updates the receive data register (PSI5SUCRD) and normal reception end status (PSI5SUCRS.UTRFIN).

Figure $\mathbf{2 5 . 8 8}$ shows an example of UART reception.

Figure 25.88 UART Rx (No Error)
(1) When the sampling counter value is "PSI5SPUBPR.RXOSMP/2", PSI5-S samples receive data.
(Example: When PSI5SPUBPR.RXOSMP $=4$, PSI5-S fetches receive data when the sampling counter value is 2 .)
(2) The asynchronous transfer processing based on PCLK and the communication clock causes a delay of several clock cycles.

### 25.6.3.2 Normal Transmission

When the transmit data register (PSI5SUCID) is updated, PSI5-S transmits UART frames.
When transmission ends, PSI5-S updates the transmission status (PSI5SUCTS, PSI5SUCTM).
Figure 25.89 shows an example of UART transmission.

Figure 25.89 UART Tx (No Error)
(1) When the value of transfer-request is 1 and the during-Tx signal is high level, the signal to enable writing to the transmit data shift register (Tx Shifter) is output.
(2) When the Tx-data-wait signal is high level at the start of stop bit output, the signal to enable writing to the Tx Shifter register is output.
(3) Even if the Tx Shifter register is not being used, PSI5-S is busy until asynchronous transfer ends.
(4) Even when the PSI5SUCTS.UTTFIN signal is high level, interrupts and DMA requests are generated.

Items (1) and (2) above describe the conditions for storing data in the Tx shifter.

### 25.6.3.3 Abnormal Reception (Reception Error)

After UART reception ends, parity, framing, and overrun errors are detected if they exist.
If an overrun error occurs, the data which is read from the mailbox is unpredictable.
If an error occurs, an interrupt status (see Table 25.103) occurs. The interrupt status signal is cleared by writing 1 to the corresponding bit (see Table 25.103) in the interrupt status clear register.
Table $\mathbf{2 5 . 1 0 3}$ below describes reception errors that can occur during operations in UART mode.
Table 25.103 UART Communication Rx Errors

| Error | Status | Status Clear | Detection Condition |
| :--- | :--- | :--- | :--- |
| Parity error | PSI5SUCRS.UTRPE | PSI5SUCRSC.UTRPECL | When UART stop bit is received, <br> the received parity value does not match. |
| Framing error | PSI5SUCRS.UTRFE | PSI5SUCRSC.UTRFECL | When UART stop bit is received, <br> the received stop bit value is 0. |
| Overrun error | PSI5SUCRS.UTROE | PSI5SUCRSC.UTROECL | When UART stop bit is received, a new data is <br> received before the previous data is read. ${ }^{* 1}$ |

Note 1. When the PSI5-S returns to UART mode after a transition to configuration mode, an overrun error is not detected even if a new data is received in a condition that a previous received data has not been read.

PSI5-S controls the Rx-finish timing and various errors when the stop bit is sampled (midway between stop bits).
Figure 25.90 and Figure 25.91 below show examples of operation in which an Rx overrun, framing, and parity error occur when reception ends.

If both parity and framing errors occur, occurrence of a framing error is assumed.
When no errors occur, the Rx-finish status signal is set to high level.

Figure 25.90 UART Rx (Received Error)
(1) The asynchronous transfer processing based on PCLK and the communication clock causes a delay of several clock cycles.
Figure 25.91 below describes an operation in which an overrun error is detected, as well as an example of an operation in which overrun error detection conflicts with receive data reading and an overrun error is not detected.

Figure 25.91 UART Rx (Overrun Error Is Not Detected)

The following figure shows an example of operation in which overrun error detection conflicts with receive data reading and an overrun error is detected.

Figure 25.92 UART Rx (Overrun Error Is Detected)

### 25.6.3.4 Abnormal Transmission (Transmission Error)

This section describes the transmission errors that can occur in UART mode.
A transmission error is detected if new transmit data is set while PSI5-S is busy with UART transmission.
When occurrence of an overwrite error is determined, the data written subsequently is not transmitted.
Already set data is not affected by the overwrite error, and the data is transmitted.
The interrupt status is caused by the occurrence of an overwrite error. The interrupt status can be cleared by writing 1 to the interrupt status clear register.

Table 25.104 UART Communication Tx Error

| Error | Status | Status Clear | Detection Condition |
| :--- | :--- | :--- | :--- |
| Overwrite error | PSI5SUCTS.UTTOWE | PSI5SUCTSC.UTTOWECL | CPU writes (PSI5SUCTD.UTTDT[7:0]), |
|  |  |  | while PSI5SUCTS.UTTBBF is asserted. |

The following figure shows an example of operation in which transmission errors occur.

Figure 25.93 UART Tx (Overwrite Error)
(1) If data is written to the PSI5SUCTD register with the PSI5SUCTS.UTTBSY signal set to high level, the PSI5SUCTM.UTTOWE signal is set to high level (indicating an overwrite error), and an interrupt is output.
(2) If data is written again to the PSI5SUCTD register while the PSI5SUCTS.UTTOWE signal is high level (indicating an overwrite error), an interrupt is outputs again.
(3) Even in the overwrite error status (PSI5SUCTS.UTTOWE = high level), the PSI5SUCTS.UTTFIN signal is set to high level and interrupts and DMA requests are output.
(4) This timing is a boundary for the occurrence of an overwrite error (PSI5SUCTS.UTTOWE $=$ high level). The overwrite error occurs together with transmission end (PSI5SUCTS.UTTFIN $=1$ ). In this case, both status signals are set to high level, and interrupts and DMA requests are output.

In configuration mode, even if data is written to the PSI5SUCTD register, the PSI5-S does not start the transmission and the PSI5-S does not detect overwrite error.

### 25.6.3.5 Interrupt Output

PSI5-S can output eight interrupt signals.
In UART mode, interrupts are output to channels 0 and 1.
Interrupts can be output only when interrupt output is enabled. If an interrupt factor occurs when interrupt output is disabled, no interrupt is output, but the interrupt status is indicated.

Table 25.105 below lists the factors of interrupts that are output in UART mode:
Table 25.105 Interrupt Output Timings

| Output Signal | Interrupt Output Timing |
| :--- | :--- |
| int_psis_ch0 | When UART data is received |
| int_psis_ch1 | When UART data is stored in the Tx shifter. |
| int_psis_ch1 | When UART data is written before the Tx shifter data is read. |

Table 25.106 below describes the interrupt statuses and clearing of interrupt statuses.
To clear an interrupt status, write 1 to the bit corresponding to the interrupt status in the interrupt status clear register.
Table 25.106 Interrupt Status

| Equipped Ch | Interrupt Status |
| :--- | :--- |
| Ch0 | UART Rx parity error |
| Ch0 | UART Rx framing error |
| Ch0 | UART Rx overrun error |
| Ch0 | UART Rx finish |
| Ch1 | UART Tx overwrite error |
| Ch1 | UART Tx finish |

Figure 25.90, Figure 25.91, Figure 25.92 and Figure 25.93 show interrupt output operations.

### 25.6.3.6 DMA Request Output

PSI5-S can output 15 DMA requests (eight receive requests and seven transmit requests).
In UART mode, DMA requests are output to channel 7 for reception and transmission.
DMA requests are output only when DMA request output is enabled. DMA requests are not output when DMA request output is disabled.
Table $\mathbf{2 5 . 1 0 7}$ below lists the factors of DMA requests that are output in UART mode.
Table 25.107 Timings of DMA Transfer Request Output

| Operation Mode | Equipped Ch | $\mathrm{Rx} / \mathrm{Tx}$ | DMA Request Output Factor |
| :--- | :--- | :--- | :--- |
| UART mode | Ch7 | Rx | When UART data is received (no error) |
|  | Ch7 | Tx | When UART data is stored in the Tx shifter |

Figure 25.88 and Figure 25.89 show the DMA request output operations.

### 25.6.3.7 Transition to Configuration Mode

The operation of PSI5-S to return to the configuration mode is described in Section 25.4, Operation Modes.
Figure 25.94 below describes the transition to the configuration mode during reception and transmission.
When CPU writes PSI5SPUOEB.OPEN to 0 during reception, PSI5-S waits for 16 PCLK cycles and then transitions to configuration mode if the PSI5-S isn't sending a frame.

Figure 25.94 Move from UART Mode to Configuration Mode (Rx)

When CPU writes PSI5SPUOEB.OPEN to 0 during transmission, PSI5-S waits for 16 PCLK cycles and then transitions to configuration mode if the PSI5-S isn't sending a frame. If PSI5-S is sending a frame, it will transition to configuration mode after it completes to send the frame.

Figure 25.95 Move from UART Mode to Configuration Mode (Tx)

NOTE
In a case that the command to transceiver has been accepted in UART transmission module in PSI5-S when CPU writes PSI5SPUOEB.OPEN to 0, PSI5-S wait for completion of the UART transmission. The maximum period of the mode transition time is a period of 2 UART frames.

### 25.6.4 Clearing Status Signals

Each status signal can be cleared by writing 1 to the corresponding bit in the status clear register. Note, however, that the following statuses are cleared automatically when their clearing conditions are met:

PSI5SPUOS.SWSTS: Cleared when the software reset period has passed (Figure 25.26)
PSI5SPUOS.ACSTS: Cleared when PSI5-S returns to the configuration mode
PSI5SPTFS.TXSTS: Cleared when the last byte of data is stored in the Tx shifter (Figure 25.63)
PSI5SUCTM.UTTF: Cleared when stop bits are transferred in UART mode.
PSI5SUCTM.UTTBBF: Cleared when transmit data is loaded into the transmit buffer in UART mode (Figure 25.89)

PSI5SPDDS(1-7).DDSRSTS: Cleared when the last ECU-to-sensor data is stored in the Tx shifter in PSI5S mode (Figure 25.66) or when a DDSR transmission stop request is generated (Figure 25.68)

If setting and clearing conditions are both met at the same time, setting conditions have priority over clearing conditions.

### 25.7 Note

### 25.7.1 Restrictions

- Baud rate tolerance must be within $1.5 \%$.

The minimum interval is 60 PCLK cycles from transition to configuration mode until set operation to enable (PSI5SPUOEB.OPEN = 1 ).

### 25.7.2 Notes

When the UART receive data pin is "Low" level at the transition to UART mode, the PSI5-S may detect a UART parity error or a UART framing error.

## Section 26 High Speed Serial Peripheral Interface (HS-SPI)

This section contains a generic description of the High Speed Serial Peripheral Interface (HS-SPI).
The first part of this section describes the specific properties of this product, such as the number of units and register base addresses. The remainder of the section describes the functions and registers of HS-SPI.

### 26.1 Features of HS-SPI

### 26.1.1 Units and Channels

This microcontroller has the following number of HS-SPI channels.
Table 26.1 Number of Channels (for E2x-FCC1)

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Channels | 1 | 1 |
| Name | HSPIn $(\mathrm{n}=0)$ | HSPIn $(\mathrm{n}=0)$ |

Table 26.2 Number of Channels (for E2M)

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Channels | 1 | 1 |
| Name | HSPIn $(\mathrm{n}=0)$ | HSPIn $(\mathrm{n}=0)$ |

Table 26.3 Index

| Index | Meaning |
| :--- | :--- |
| n | Throughout this section, the individual HS-SPI units are identified by the index " n ": For example, HSPInCKEN is <br> the HSPIn Clock Control Register. |

### 26.1.2 Register Base Address

HS-SPI base addresses are listed in the following table.
In general, HS-SPI register addresses are given as offsets from the base addresses.
Table 26.4 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <HSPIO_base> | FF04 $0000_{\mathrm{H}}$ | Peripheral Group 9 |

### 26.1.3 Clock Supply

Clock supply by and to HS-SPI is listed in the following table.
Table 26.5 Clock Supply

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- |
| HSPIn | PCLK | CLK_HBUS |
| HSPIn | ACLK | CLK_HBUS |
| HSPIn | TXCLK | CLK_HSB |

### 26.1.4 Interrupt Requests

The HS-SPI interrupt requests are listed in the following table.
Table 26.6 Interrupt Requests

| Interrupt Symbol <br> Name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA Trigger <br> Number | DTS Trigger <br> Number |
| :--- | :--- | :--- | :--- | :--- | :--- |
| INTHSPIOCSTART | INT_HSPI_CSTART | Communication start interrupt (slave <br> only) | 481 | - | - |
| INTHSPIOCEND | INT_HSPI_CEND | Communication complete interrupt | 482 | - | - |
| INTHSIPOERR | INT_HSPI_ERR | Communication error interrupt | 483 | - | - |
| INTHSPIOBERR | INT_HSPI_BERR | H-Bus error interrupt | 484 | - | - |

### 26.1.5 Reset Sources

HS-SPI reset sources are shown below.
HS-SPI is initialized by the following reset sources.
Table 26.7 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| HSPIn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 26.1.6 External Input/Output Signals

HSPIn external input/output signals are listed below.
Table 26.8 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| HSPIO |  |  |
| SPCK | Transmission clock | HSSPIO_CLKP/ HSSPIO_CLKN |
| SSL0 | Slave selection input signal | HSSPIO_SSLI |
| SSLO | Slave selection output signal | HSSPIO_SSL |
| MOSI/MISO | HSSPI transmission data | HSSPIO_TXDP/ HSSPIO_TXDN |
| MOSI/MISO | HSSPI reception data | HSSPIO_RXDP/ HSSPIO_RXDN |

### 26.2 Overview

The HS-SPI supports full- and half-duplex synchronous serial communication.

### 26.2.1 Functional Overview

Table $26.9 \quad$ Functional Overview of HS-SPI

| Item | Description |
| :---: | :---: |
| Communication method | - Either master or slave can be selected (multi-master is not supported) <br> - Communication mode can be set to: <br> Master: transmission or transmission/reception <br> Slave: transmission, reception, or transmission/reception <br> Master reception is not supported <br> - SPCK polarity can be selected <br> - The SPCK phase can be selected |
| Data format | - Either MSB or LSB first can be selected <br> - Either inclusion or non-inclusion of parity can be selected (the frame includes 1 parity bit when inclusion is selected); and either odd or even parity can be selected <br> - The number of data bits per frames for transfer can be selected ( $8,16,24,32,40,48,56$, or 64 bits) <br> - Up to 64 K frames are transferable per communication round |
| Bit rate | - Maximum bit rate for each communication mode [TXCLK at 80 MHz ] |
|  | Transmission $\quad$ Reception $\quad$ Transmission/Reception |
|  | Master mode 20 Mbps - 20 Mbps |
|  | Slave mode 20 Mbps 20 Mbps 20 Mbps |
|  | - The communication clock in master modecan be selected (TXCLK frequency divided by 4, 8 or 16) |
| SSL control | - 1 SSL pin (SSLO) per channel <br> - When slave mode is set: pin SSL0 is for input <br> - Delay from SSL assertion to SPCK operation start (SPCK delay) can be set Setting range: 0.5 to 4 cycles of SPCK (in increments of 0.5 per SPCK cycle) <br> - Delay from SPCK operation stop to SSL negation (SSL negation delay) can be set Setting range: 0.5 to 4 cycles of SPCK (in increments of 0.5 per SPCK cycle) <br> - Delay from SSL negation to SSL assertion of the next frame (next frame delay) can be set Setting range: 0.5 to 4 cycles of SPCK (in increments of 0.5 per SPCK cycle) Setting of delay of the next frame is ignored during burst transfer <br> - SSL polarity can be selected <br> - In master mode, burst transfer can be selected (Burst transfer is also enabled during slave transfer depending on the SSL signal of the other master device) |

Table 26.10 HS-SPI Features

| Item | Description |
| :--- | :--- |
| Buffer structure | - Transmission and reception: Each 128 bytes |
| Interrupts | - Communication start interrupt (slave only) |
|  | - Communication complete interrupt |
|  | - H-Bus error interrupt |
| Interrupt sources | - Communication start (slave only) |
|  | - Communication complete |
|  | - Virtual port reception complete (slave only) |
|  | - Reception parity error |
|  | - Reception overflow error |
|  | - H-Bus error |
| - Reception parity error |  |
|  | - Transmission underrun error (slave only) |
|  | - Reception overflow error |
|  | - H-Bus error |
| Otror detection | - A DMAC is incorporated for transfer of communication data |
|  | - Register write protection |
|  | - Loop-back testing |
|  | - Virtual port function (for slave reception) |

### 26.2.2 Block Diagram

Figure 26.1 Block Diagram of HS-SPI

- The IP configures the control registers from the peripheral bus via the peripheral bus IF.
- The control registers control the DMA master, transmission buffer, serializer, de-serializer, and reception buffer.
- Data for transmission is DMA-transferred via high speed bus from external RAM to the HS-SPI and is stored in the transmission buffer. When data is in the transmission buffer, the data is transmitted to the serializer in sequence, converted into serial data, and output from the serial output pin.
- Received data is input serially, parallelized by the de-serializer, and stored in the reception buffer. When the reception buffer becomes full, the data is DMA-transferred from the HS-SPI to the external RAM via high speed bus. HSPInCFSET[16:0], HSPInMD.FLEN[6:0], HSPInTSAR[31:0], and HSInRDAR[31:0] bit values determine the number of the frames that fill the transmission and reception buffers.
- In master mode, the HS-SPI transmitter generates the clock and transmits it to the slave.
- In slave mode, the HS-SPI uses a communication clock received from the master for the timing of communication.
- In master mode, the HS-SPI can connect one slave, and communications with the slave to be connected to SSL0.
- In slave mode, the HS-SPI can communicate with the master to which it is connected.

### 26.3 Registers

### 26.3.1 List of Registers

Table 26.11 List of Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| HSPIn | Clock Control Register | HSPInCKEN | <HSPIn_base> + $00_{\text {H }}$ | 8, 16, 32 | - |
|  | Software Reset Register | HSPInSRST | <HSPIn_base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Communication Enabling Register | HSPInEN | <HSPIn_base> + 08 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Communication Mode Register | HSPInMD | <HSPIn_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | Communication Control Register | HSPInCTL | <HSPIn_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | SSL Polarity Selection Register | HSPInSSCTL | <HSPIn_base> ${ }^{\text {+ }} 14_{\text {H }}$ | 8, 16, 32 | - |
|  | SPCK Delay Selection Register | HSPInSCKDLY | <HSPIn_base> + 18 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | SSL Negation Delay Selection Register | HSPInSSNDLY | <HSPIn_base> + $1 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | Next Frame Delay Selection Register | HSPInNFMDLY | <HSPIn_base> + $20_{\text {H }}$ | 8, 16, 32 | - |
|  | Sampling Delay Selection Register | HSPInSPLDLY | <HSPIn_base> $+24_{\text {H }}$ | 8, 16, 32 | - |
|  | Communication Clock Division Selection Register | HSPInCDIV | <HSPIn_base> $+28_{\text {H }}$ | 8, 16, 32 | - |
|  | Transmission Data Transfer Source Address Setting Register | HSPInTSAR | <HSPIn_base> + 2 $\mathrm{C}_{\text {H }}$ | 8, 16, 32 | - |
|  | Reception Data Transfer Destination Address Setting Register | HSPInRDAR | <HSPIn_base> + $30_{\text {H }}$ | 8, 16, 32 | - |
|  | Communication Frame Count Setting Register | HSPInCFSET | <HSPIn_base> + $34_{\text {H }}$ | 8, 16, 32 | - |
|  | Interrupt Enabling Register | HSPInIREN | <HSPIn_base> $+38_{\text {H }}$ | 8, 16, 32 | - |
|  | Interrupt Status Register | HSPInIRST | <HSPIn_base> $+3 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | Interrupt Status Clearing Register | HSPInIRCL | <HSPIn_base> + 40 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Operation Status Register | HSPInACTST | <HSPIn_base> $+44_{\text {H }}$ | 8, 16, 32 | - |
|  | Current Transmission Frame Count Register | HSPInCTFM | <HSPIn_base> ${ }^{\text {+ }} 48_{\text {H }}$ | 8, 16, 32 | - |
|  | Current Reception Frame Count Register | HSPInCRFM | <HSPln_base> + 4 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | Virtual Port Output Enabling Register | HSPInVPEN | <HSPIn_base> + 50 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | Reserved | - | <HSPIn_base> $+5 \mathrm{C}_{H}$ to <br> <HSPIn_base> + 68 ${ }_{\text {H }}$ | - | - |
|  | Test Mode Register | HSPInTESTMD | <HSPIn_base> + $6 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | Reserved | - | <HSPIn_base> $+70_{H}$ to <HSPIn_base> + 7C $\mathrm{C}_{\mathrm{H}}$ | - | - |

Note: When a reserved area is accessed, read value is undefined. The write value should be 0 .

### 26.3.2 HSPInCKEN - Clock Control Register

- Function: Starts and stops the HS-SPI clock
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.12 HSPInCKEN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInCKEN | Clock Operation Enabling |
|  | $0:$ ACLK and TXCLK are stopped. |  |
|  |  | 1: ACLK and TXCLK are running. |

Rewrite the register while communication is disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInCKEN Bit (Clock Operation Enabling)

This bit operates and stops clocks.
The target clocks are ACLK and TXCLK, not PCLK and SPCK.

### 26.3.3 HSPInSRST — Software Reset Register

- Function: Applies a software reset on HS-SPI
- Protection: Within scope
- Software reset: Off target

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 26.13 HSPInSRST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInSRST | Software Reset |
|  |  | $0:$ Writing is ignored. |
|  |  | 1: Software reset is applied. |

Apply a software reset while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).
When accessing other registers of the HS-SPI immediately after a software reset, read the register once before accessing other registers.

## HSPInSRST Bit (Software reset)

This bit initializes all registers of the HS-SPI except this register during a software reset.
When read, this bit is always read as 0 .

### 26.3.4 HSPInEN - Communication Enabling Register

- Function: Enables and disables communication
- Protection: Not within scope
- Software reset: Within scope (register cleared to return it to initial value)

Table 26.14 HSPInSRST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | HSPInSTATRG | Communication Start Trigger |
|  |  | $0:$ Writing is ignored. |
|  | 1: Upon completion of communication, start communication with the same settings. |  |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 |  | Communication Enabling |
|  |  | 0: Communication disabled |
|  |  | 1: Communication enabled |
|  |  |  |

Start communication by using the communication start trigger bit (HSPInSTATRG) while communication is disabled (the HSPInEN bit is 1 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInSTATRG Bit (Communication Start Trigger)

This bit starts communication.
Writing 1 to the bit starts communication with the same setting as the previous transfer.
When the virtual port output is enabled (the HSPInVPEN.HSPInVPEN bit is 1 ), communication cannot be started using this bit.

## HSPInEN Bit (Communication Enabling)

This bit enables or disables communication.
Writing 1 to the bit starts communication.
Writing 0 to the bit during communication stops the communication. If 0 is written to the bit during communication, follow the procedure described in Section 26.5.6, Suspend Communication Procedure.
Registers targeted for protection cannot be accessed while communication is enabled.

The state of the HS-SPI is defined as follows by this bit and the HSPInACTST.HSPInACTF bit.
Table 26.15 Definition of the HS-SPI State

| HSPInEN | HSPInACTST.ACTF | State of HS-SPI |
| :--- | :--- | :--- |
| 0 | 0 | Communication prohibited |
| 0 | 1 | Communication suspended |
| 1 | 0 | Communication stopped |
| 1 | 1 | Communication in progress |

### 26.3.5 HSPInMD - Communication Mode Register

- Function: Selects communication mode (Master/slave, duplex, and frame length)
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

| Value after reset: |  |  | 00080000 H |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | $21 \quad 20$ | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | HSPInFLEN[6:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00 | 1 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | $5 \quad 4$ | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | $\begin{aligned} & \text { HSPInDPMD } \\ & {[1: 0]} \end{aligned}$ | - | - | - | $\begin{gathered} \text { HSPInM } \\ \text { STR } \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 00 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W R/W | R | R | R | R/W |

Table 26.16 HSPInSRST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 22 to 16 | HSPInFLEN[6:0] | Frame Length Selection |
|  |  | 08\% : 8 bits |
|  |  | $10_{\mathrm{H}}$ : 16 bits |
|  |  | 18\%: 24 bits |
|  |  | 20н: 32 bits |
|  |  | 28\%: 40 bits |
|  |  | $30_{\text {H: }}$ : 48 bits |
|  |  | 38\%: 56 bits |
|  |  | $40_{\mathrm{H}}$ : 64 bits |
|  |  | Settings other than above are prohibited. |
| 15 to 6 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 5, 4 | HSPInDPMD[1:0] | Duplex Mode Selection |
|  |  | 00: Transmission/reception |
|  |  | 01: Transmission |
|  |  | 10: Reception (setting prohibited in master mode) |
|  |  | 11: Setting prohibited |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInMSTR | Master/Slave Mode Selection |
|  |  | 0 : Slave mode |
|  |  | 1: Master mode |

Rewrite the register while communication is disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInFLEN[6:0] Bits (Frame Length Selection)

These bits select transfer bit length of a frame. Bit values $8,16,24,32,40,48,56$, or 64 can be selected.

## HSPInDPMD[1:0] Bits (Duplex Mode Selection)

These bits select the communication direction (transmission, reception, or transmission/reception).
The combination of these bits and the HSPInMSTR bit determines the communication method.

## HSPInMSTR Bit (Master/Salve Mode Selection)

This bit selects master or slave mode.
The combination of this bit and the HSPInDPMD[1:0] bits determines the communication method.

### 26.3.6 HSPInCTL - Communication Control Register

- Function: Selects data format (MSB/LSB first, parity, clock polarity, and clock phase), communication target, and burst operation
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.17 HSPInCTL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 20 | HSPInLSBEN | LSB First Selection |
|  |  | 0: MSB first |
|  |  | 1: LSB first |
| 19, 18 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 17, 16 | HSPInPRSL[1:0] | Parity Selection |
|  |  | 00: Transmit data parity bit is not added; parity check is not performed on received data. |
|  |  | 01: Communication is performed with even parity |
|  |  | 10: Setting prohibited |
|  |  | 11: Communications is performed with odd parity |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | HSPInBRST | Burst Operation Selection |
|  |  | 0: SSL is negated for every frame |
|  |  | 1: SSL is negated after completion of transfer of all frames (burst transfer) |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | HSPInCPOL | Clock Polarity Selection |
|  |  | 0: SPCK is Low when idle |
|  |  | 1: SPCK is High when idle |

Table 26.17 HSPInCTL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 4 | HSPInCPHA | Clock Phase Selection |
|  |  | 0: Reception sampling on odd-numbered edges; bits shifted out for transmission on even- |
| numbered edges. |  |  |
|  |  | 1: Bits shifted out for transmission on odd-numbered edges; reception sampling on even- |
|  |  | numbered edges |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInLSBEN Bit (LSB First Selection)

This bit selects MSB or LSB first for communications data.
For details, see Section 26.4.3.3, MSB First and LSB First.

## HSPInPRSL[1:0] Bits (Parity Selection)

These bits select no parity bit, even parity bit, or odd parity bit for communication data.
For details, see Section 26.4.4, Parity Bit.

## HSPInBRST Bit (Burst Operation Selection)

This bit selects the control method for the SSL signal in master mode.
Setting the bit to 1 enables burst transfer.
For details, see Section 26.4.11, Burst Operation.
In slave mode, burst transfer is possible according to the operation of the SSL signal in the master device regardless of the setting of the bit.

## HSPInCPOL Bit (Clock Polarity Selection)

This bit selects polarity of communication clock (SPCK).
For details, see Section 26.4.3.2, Relationship between the Serial Clock and Serial Data.
HSPInCPHA Bit (Clock Phase Selection)
This bit selects phase of the communication clock (SPCK).
For details, see Section 26.4.3.2, Relationship between the Serial Clock and Serial Data.

### 26.3.7 HSPInSSCTL — SSL Polarity Selection Register

- Function: Selects SSL signal polarity
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.18 HSPInSSCTL Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInSSOP | SSL0 Signal Polarity Selection |
|  |  | 0: The SSL0 signal is active low. |
|  | 1: The SSL0 signal is active high. |  |

Rewrite the register while communications are disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInSSOP Bit (SSLO Signal Polarity Selection)

This bit selects the activity level of the SSL0 signal.
In slave mode, it determines the activity level of the slave selection input SSL0 signal.

### 26.3.8 HSPInSCKDLY — SPCK Delay Selection Register

- Function: Selects length of delay from SSL assertion to SPCK operation start
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.19 HSPInSCKDLY Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | HSPInSCKDLY[2:0] | SPCK Delay Selection |
|  |  | 000: 0.5 cycles of SPCK |
|  | $001: 1.0$ cycle of SPCK |  |
|  | $010: 1.5$ cycles of SPCK |  |
|  | $011: 2.0$ cycles of SPCK |  |
|  | $100: 2.5$ cycles of SPCK |  |
|  |  | $101: 3.0$ cycles of SPCK |
|  |  | $110: 3.5$ cycles of SPCK |
|  |  | $111: 4.0$ cycles of SPCK |

Rewrite the register while communications are disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInSCKDLY[2:0] Bits (SPCK Delay Selection)

These bits select length of delay from SSL assertion to SPCK operation start in master mode.
In slave mode, the setting of these bits are invalid.

### 26.3.9 HSPInSSNDLY — SSL Negation Delay Selection Register

- Function: Selects length of delay from SPCK operation stop to SSL negation
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.20 HSPInSSNDLY Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | HSPInSSNDLY[2:0] | SSL Negation Delay Selection |
|  |  | $000: 0.5$ cycles of SPCK |
|  |  | $001: 1.0$ cycle of SPCK |
|  | $010: 1.5$ cycles of SPCK |  |
|  | $011: 2.0$ cycles of SPCK |  |
|  | $100: 2.5$ cycles of SPCK |  |
|  |  | $101: 3.0$ cycles of SPCK |
|  |  | $110: 3.5$ cycles of SPCK |
|  |  | $111: 4.0$ cycles of SPCK |

Rewrite the register while communication is disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInSSNDLY[2:0] Bits (SSL Negation Delay Selection)

These bits select length of delay from SPCK operation stop to SSL negation in master mode.
In slave mode, the setting of the bits is invalid.

### 26.3.10 HSPInNFMDLY — Next Frame Delay Selection Register

- Function: Selects length of delay from SSL negation to SSL assertion of the next frame.
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.21 HSPInNFMDLY Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | HSPInNFMDLY[2:0] | Next Frame Delay Selection |
|  |  | $000: 0.5$ cycles of SPCK |
|  |  | $001: 1.0$ cycle of SPCK |
|  | $010: 1.5$ cycles of SPCK |  |
|  | $011: 2.0$ cycles of SPCK |  |
|  | $100: 2.5$ cycles of SPCK |  |
|  |  | $101: 3.0$ cycles of SPCK |
|  |  | $110: 3.5$ cycles of SPCK |
|  |  | $111: 4.0$ cycles of SPCK |

Rewrite the register while communication is disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInNFMDLY[2:0] Bits (Next Frame Delay Selection)

These bits select length of delay from SSL negation to SSL assertion of next frame in master mode.
Setting of the bits is invalid when burst transfer is selected.
In slave mode, the setting of the bits is invalid.

### 26.3.11 HSPInSPLDLY — Sampling Delay Selection Register

- Function: Selects sampling timing of reception data
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.22 HSPInSPLDLY Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | HSPInSPLDLYE | Sampling Timing Delay Enabling |
|  |  | 0: Delay of sampling timing is disabled |
|  |  | 1: Delay of sampling timing is enabled |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 1,0 |  | Selects Sampling Timing Delay |
|  |  | $00:$ Delay of 1 cycle of TXCLK |
|  |  | 01: Delay of 2 cycles of TXCLK |
|  |  | 10: Setting prohibited. |
|  |  |  |
|  |  |  |

Rewrite the register while communications are disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInSPLDLYE Bit (Sampling Timing Delay Enabling)

This bit enables or disables delay of sampling timing of received data in master mode.
In slave mode, the setting of the bits is ignored.
Setting of the bit during loop-back testing is ignored.

## HSPInSPLDLY[1:0] Bits (Sampling Timing Delay Selection)

These bits select sampling timing of received data in master mode.
When the HSPInSPLDLYE bit is 1 , the setting of the bits is effective.
In slave mode, the setting of the bits is ignored.
Setting of the bits during loop-back testing is ignored.

### 26.3.12 HSPInCDIV - Communication Clock Division Selection Register

- Function: Selects value of the divided frequency of the communication clock
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.23 HSPInCDIV Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | HSPInCDIV[2:0] | Communication Clock Frequency Division Selection |
|  |  | $000:$ TXCLK/2 |
|  | $001:$ TXCLK/4 |  |
|  | $011:$ TXCLK/8 |  |
|  |  | 111: TXCLK/16 |
|  | Other settings prohibited. |  |

Rewrite the register while communication is disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInCDIV[2:0] Bits (Communication Clock Divided Frequency Selection)

These bits select a value for the divided frequency of the communication clock (SPCK) in master mode or during loopback testing in slave mode. In slave mode except during loop-back testing, the setting of the bits is ignored.

## CAUTION

This setting must be a value that does not exceed the maximum bit rate.
The maximum bit rate is 20 Mbps

### 26.3.13 HSPInTSAR - Transmission Data Transfer Source Address Setting Register

- Function: Sets data transfer source addresses for transmission
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.24 HSPInTSAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | HSPInTSAR[31:0] | Transmission Data Transfer Source Address Setting |
|  |  | Address of the transfer source of transmission data |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the
HSPInACTST.HSPInACTF bit is 0 ).

## HSPInTSAR[31:0] Bits (Transmission Data Transfer Source Address Setting)

These bits set the address of the transfer source of data being transmitted.
Any value can be set*1. The addresses read from the external memory will be set as follows according to the specified frame length.

Note 1. Data transfer source addresses are set in multiples of 8 other than in the Cluster RAM area (The 3 lower-order bit is fixed to 0 ).
The HS-SPI does not support unaligned transfers of H-Bus other than in the Cluster RAM area.

Table 26.25 Relationship between the Frame Length and the Transmission Data Transfer Source Address

| Frame Length | HSPInMD.HSPInFLEN[6:0] | Transmission Data Transfer Source Address |  |
| :--- | :--- | :--- | :--- |
| 8 bits | $08_{\mathrm{H}}$ | HSPInTSAR[31:0] |  |
| 16 bits | $10_{\mathrm{H}}$ | $\left\{H S P I n T S A R[31: 1], 0_{\mathrm{B}}\right\}$ | (The 1 lower-order bit is fixed to 0 ) |
| 24 or 32 bits | $18_{\mathrm{H}}, 20_{\mathrm{H}}$ | $\left\{H S P I n T S A R[31: 2], 00_{\mathrm{B}}\right\}$ | (The 2 lower-order bit is fixed to 0 ) |
| $40,48,56$, or 64 bits | $28_{\mathrm{H}}, 30_{\mathrm{H}}, 38_{\mathrm{H}}, 40_{\mathrm{H}}$ | $\left\{H S P I n T S A R[31: 3], 000_{\mathrm{B}}\right\}$ | (The 3 lower-order bit is fixed to 0 ) |

The value read from the register is the set value regardless of the address for DMA transfer.

### 26.3.14 HSPInRDAR — Reception Data Transfer Destination Address Setting Register

- Function: Sets transfer destination address for received data
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.26 HSPInRDAR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | HSPInRDAR[31:0] | Reception Data Transfer Destination Address Setting |
|  |  | Assigns destination address for received data |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInRDAR[31:0] Bits (Reception Data Transfer Destination Address Setting)

These bits set the destination address for received data.
Any value can be set*1. The addresses read from the external memory are set as follows according to the specified frame length.

Note 1. Reception data transfer destination addresses are set in multiples of 8 other than in the Cluster RAM area (The 3 lower-order bit is fixed to 0 ).
The HS-SPI does not support unaligned transfers of H-Bus other than in the Cluster RAM area.

Table 26.27 Relationship between the Frame Length and the Reception Data Transfer Destination Address

| Frame Length | HSPInMD.HSPInFLEN[6:0] | Reception Data Transfer Destination Address |  |
| :--- | :--- | :--- | :--- |
| 8 bits | $08_{\mathrm{H}}$ | HSPInRDAR[31:0] |  |
| 16 bits | $10_{\mathrm{H}}$ | $\left\{H S P I n R D A R[31: 1], 0_{\mathrm{B}}\right\}$ | (The 1 lower-order bit is fixed to 0 ) |
| 24 or 32 bits | $18_{\mathrm{H}}, 20_{\mathrm{H}}$ | $\left\{H S P \ln R D R[31: 2], 00_{\mathrm{B}}\right\}$ | (The 2 lower-order bit is fixed to 0 ) |
| $40,48,56$, or 64 bits | $28_{\mathrm{H}}, 30_{\mathrm{H}}, 38_{\mathrm{H}}, 40_{\mathrm{H}}$ | $\left\{H S P \operatorname{lnRDAR[31:3],000_{\mathrm {B}}\} }\right.$ | (The 3 lower-order bit is fixed to 0 ) |

The value read from the register is the set value regardless of the address for DMA transfer.

### 26.3.15 HSPInCFSET - Communication Frame Count Setting Register

- Function: Sets number of communication frames
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.28 HSPInCFSET Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 16 to 0 | HSPInCFSET[16:0] | Communication Frame Count Setting <br> Sets the number of communication frames for transmission and reception |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInCFSET[16:0] Bits (Communication Frame Count Setting)

These bits set the number of communication frames for transmission and reception.
Setting range: up to $64-\mathrm{K}$ frame $\left(00001_{\mathrm{H}}\right.$ to $\left.10000_{\mathrm{H}}\right)$
Settings outside the range are prohibited.
In slave reception, while the virtual port output is enabled (the HSPInVPEN.HSPInVPEN bit is 1 ), setting of the register is invalid.
(The set value is ignored.)

### 26.3.16 HSPInIREN — Interrupt Enabling Register

- Function: Enables and disables output of interrupt requests
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | $\begin{gathered} \text { HSPInV } \\ \text { PE } \end{gathered}$ | - | - | $\left\|\begin{array}{c} \text { HSPInB } \\ E E \end{array}\right\|$ | $\begin{gathered} \mathrm{HSPInP} \\ \mathrm{EE} \end{gathered}$ | HSPInR OVFEE | HSPInT UDREE | HSPInC STAE | HSPInC ENDE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 26.29 HSPInIREN Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> When read, the value after reset is read. When writing, write the value after reset. |
| 8 | HSPInVPE | Virtual Port Reception Complete Interrupt Enabling <br> 0: Disables output of a communication complete interrupt request once virtual port <br> reception completed |
|  |  | 1: Enables output of a communication complete interrupt request once virtual port |
| reception completed |  |  |

Table 26.29 HSPInIREN Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 0 | HSPInCENDE | Completed Communication Interrupt Enabling |
|  |  | $0:$ Disables output of a communication complete interrupt requests once a communication |
| is completed |  |  |
|  |  | 1: Enables output of a communication complete interrupt requests once a communication |
| is completed |  |  |

Rewrite the register while communications are disabled (HSPInEN.HSPInEN bit is 0 and HSPInACTST.HSPInACTF bit is 0 ).

## HSPInVPE Bit (Virtual Port Reception Complete Interrupt Enabling)

This bit enables or disables output of a communication complete request once virtual port reception completed.

## HSPInBEE Bit (H-Bus Error Interrupt Enabling)

This bit enables or disables output of the H-Bus error interrupt request.
HSPInPEE Bit (Reception Parity Error Interrupt Enabling)
This bit enables or disables output of a communication error interrupt request when a reception parity error occurs.

## HSPInROVFEE Bit (Reception Overflow Error Interrupt Enabling)

This bit enables or disables output of a communication error interrupt request when a reception overflow error occurs.

## HSPInTUDREE Bit (Transmission Underrun Error Interrupt Enabling)

This bit enables or disables output of a communication error interrupt request when a transmission underrun error occurs.
Transmission underrun errors only occur in slave mode.

## HSPInCSTAE Bit (Communication Start Interrupt Enabling)

This bit enables or disables output of a communication start interrupt request.
Communication start interrupt requests are only issued in slave mode.

## HSPInCENDE Bit (Completed Communication Interrupt Enabling)

This bit enables or disables output of a completed communication interrupt request once a communication is completed.

### 26.3.17 HSPInIRST — Interrupt Status Register

- Function: Reports Interrupt status
- Protection: Not within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.30 HSPInIRST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 9 | - | Reserved <br> When read, the value after reset is read. |
| 8 | HSPInVPF | Virtual Port Reception Complete Flag <br> 0: Reception through the virtual port is in progress. <br> 1: Reception through the virtual port has been complete. |
| 7 to 6 | - | Reserved <br> When read, the value after reset is read. |
| 5 | HSPInBEF | H-Bus Error Flag |
|  |  | 0: No H-Bus error has occurred |
|  |  | 1: An H-Bus error has occurred |

When starting communication, clear the respective interrupt status flags to 0 and enable communication (HSPInEN.HSPInEN bit is 1), or start communication by using the communication start trigger (HSPInEN.HSPInSTATRG bit is 1).

## HSPInVPF Flag (Virtual Port Reception Completion)

This flag indicates that the received data has been transferred to the virtual port.
When the flag is 1, a communication complete interrupt request (INT_HSPI_CEND) is not output.
[Setting condition]
When all of the conditions below are satisfied:

- When one-frame of data received has been transferred to the virtual port during slave reception.
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 1
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the virtual port reception completed flag clearing bit (HSPInIRCL.HSPInVPC)

## HSPInBEF Flag (H-Bus Error)

This flag indicates that there is an H -Bus error response during a DMA transfer.
While the flag is 1, subsequent H-Bus error interrupt requests (INT_HSPI_BERR) are not output.
[Setting condition]
When all of the conditions below are satisfied:

- When an H-Bus error response is received during a DMA transfer
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 0
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the H-Bus error flag clearing bit (HSPInIRCL.HSPInBEC)

## HSPInPEF Flag (Reception Parity Error)

This flag indicates that there is a parity error in serial received data.
While the flag is 1, subsequent communication error interrupt requests (INT_HSPI_ERR) are not output.
[Setting condition]
When all of the conditions below are satisfied:

- When parity error data is received in a serial transfer
- When the HSPInEN.HSPInEN bit is 1
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the reception parity error flag clearing bit (HSPInIRCL. HSPInPEC)

## HSPInROVFEF Flag (Reception Overflow Error)

This flag indicates that the reception buffer has overflowed.
While the flag is 1, subsequent communication error interrupt requests (INT_HSPI_ERR) are not output.
[Setting condition]
When all of the conditions below are satisfied:

- When the reception buffer has overflowed.
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 0
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the reception overflow error flag clearing bit (HSPInIRCL.HSPInROVFEC)

## HSPInTUDREF Flag (Transmission Underrun Error)

This flag indicates that correct data is not output because preparation of output of data for transmission is not completed within allotted time in slave mode.
While the flag is 1, subsequent communication error interrupt requests (INT_HSPI_ERR) are not output.
[Setting condition]
When all of the conditions below are satisfied:

- When data for transmission is not correctly output in slave mode
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 0
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the transmission underrun error flag clearing bit (HSPInIRCL.HSPInTUDREC)

## HSPInCSTAF Flag (Communication Start)

This flag indicates that communication has started in slave mode.
While the flag is 1 , communication start interrupt requests (INT_HSPI_CSTART) are not output.
[Setting conditions]
When all of the conditions below are satisfied:

- When an assertion of SSL in the first frame is detected in slave mode
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 0
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the communication start flag clearing bit (HSPInIRCL.HSPInCSTAC)

## HSPInCENDF Flag (Communication Completion)

This flag indicates that communication has been completed.
While either one of the H-Bus error flag (HSPInBEF), reception overflow error flag, (HSPInROVFEF), transmission underrun error flag, (HSPInTUDREF), or this flag is 1 , a communication complete interrupt request
(INT_HSPI_CEND) is not output.
[Setting condition]
When all of the conditions below are satisfied:

- When the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) are tranferred, the conditions for transfer completion are as follows.
- Transmission/reception: When DMA transfer of the received data is complete
- Transmission: When transfer of the data for transmission is complete
- Reception: When DMA transfer of the data for reception is complete
- When the HSPInBEF flag is 0 , the HSPInROVFEF flag is 0 and the HSPInTUDREF flag is 0
- When the HSPInEN.HSPInEN bit is 1
- When the HSPInVPEN.HSPInVPEN bit is 0
[Clearing condition]
When the condition below is satisfied:
- When 1 is written to the communication complete flag clearing bit (HSPInIRCL.HSPInCENDC)

### 26.3.18 HSPInIRCL — Interrupt Status Clearing Register

- Function: Clears the interrupt status flag
- Protection: Not within scope
- Software reset: Not within scope

| Value after reset: |  |  | $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | $\begin{gathered} \text { HSPInV } \\ \text { PC } \end{gathered}$ | - | - | $\left\lvert\, \begin{gathered} \text { HSPInB } \\ \text { EC } \end{gathered}\right.$ | $\begin{gathered} \text { HSPInP } \\ \text { EC } \end{gathered}$ | HSPInR OVFEC | HSPInT UDREC | $\begin{array}{\|c\|} \hline \text { HSPInC } \\ \text { STAC } \end{array}$ | HSPInC ENDC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 26.31 HSPInIRCL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 9 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | HSPInVPC | Virtual Port Reception Complete Clearing |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The virtual port reception complete flag is cleared to 0 . |
| 7 to 6 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 5 | HSPInBEC | H-Bus Error Flag Clearing |
|  |  | 0: Writing to this bit is ignored. |
|  |  | 1: The H-Bus error flag is cleared to 0 |
| 4 | HSPInPEC | Reception Parity Error Flag Clearing |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The reception parity error flag is cleared to 0 |
| 3 | HSPInROVFEC | Reception Overflow Error Flag Clearing |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The reception overflow error flag is cleared to 0 |
| 2 | HSPInTUDREC |  |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The transmission underrun error flag is cleared to 0 |
| 1 | HSPInCSTAC | Communication Start Flag Clearing |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The communication start flag is cleared to 0 |
| 0 | HSPInCENDC | Communication Complete Flag Clearing |
|  |  | 0 : Writing to this bit is ignored. |
|  |  | 1: The communication complete flag is cleared to 0 |

When read, this register is always read as $00000000_{\mathrm{H}}$.

## HSPInVPC Bit (Virtual Port Reception Complete Flag Clearing)

This bit clears the virtual port reception complete flag (HSPInIRST.HSPInVPF) to 0 .

## HSPInBEC Bit (H-Bus Error Flag Clearing)

This bit clears the H-Bus error flag (HSPInIRST.HSPInBEF) to 0 .
HSPInPEC Bit (Reception Parity Error Flag Clearing)
This bit clears the reception parity error flag (HSPInIRST.HSPInPEF) to 0 .
HSPInROVFEC Bit (Reception Overflow Error Flag Clearing)
This bit clears the reception overflow error flag (HSPInIRST.HSPInROVFEF) to 0 .
HSPInTUDREC Bit (Transmission Underrun Error Flag Clearing)
This bit clears the transmission underrun error flag (HSPInIRST.HSPInTUDREF) to 0 .
HSPInCSTAC Bit (Communication Start Flag Clearing)
This bit clears the communication start flag (HSPInIRST.HSPInCSTAF) to 0 .
HSPInCENDC Bit (Communication Complete Flag Clearing)
This bit clears the communication complete flag (HSPInIRST.HSPInCENDF) to 0 .

### 26.3.19 HSPInACTST - Operation Status Register

- Function: Indicates operating status of the HS-SPI
- Protection: Not within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.32 HSPInACTST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 0 | HSPInACTF | Operation Status Flag |
|  | $0:$ Inactive |  |
|  |  | 1: Active |

## HSPInACTF Flag (Operation Status Flag)

This flag indicates the operating status of the HS-SPI.
[Setting conditions]

- Normal communication: When DMA transfer, serial reception or serial transmission is in progress after start communicationby using the HSPInEN.HSPInEN bit or the HSPInEN.HSPInSTATRG bit
- Virtual port communication: When the HSPInEN.HSPInEN bit is 1

## [Clearing conditions]

- Normal communication (transmission/reception or reception): When all frames specified in the HSPInCFSET register have been DMA-transferred
- Normal communication (transmission): When all frames specified in the HSPInCFSET register have been serially transmitted
- Normal communication (suspension): When DMA transfer and serial transmission stop after the HSPInEN.HSPInEN bit is set to 0
- Virtual port communication: When the HSPInEN.HSPInEN bit is 0

### 26.3.20 HSPInCTFM — Current Transmission Frame Count Register

- Function: Indicates number of current communication frames
- Protection: Not within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.33 HSPInCTFM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 16 to 0 | HSPInCTFM[16:0] | Current Transmission Frame Count <br>  |

## HSPInCTFM[16:0] Bits (Current Transmission Frame Count)

These bits indicate the number of the current communication frames.
The register indicates the number of frames that have been read from an external memory by DMA transfer.

The register is cleared to $00000000_{\mathrm{H}} 1 \mathrm{PCLK}+1$ ACLK cycles after communication is disabled (the HSPInEN.HSPInEN bit is 0 ).
The register is cleared to $00000000_{\mathrm{H}} 1 \mathrm{PCLK}+1$ ACLK cycles after communication is started by the communication start trigger bit (the HSPInEN.HSPInSTATRG bit is 1 ).

### 26.3.21 HSPInCRFM — Current Reception Frame Count Register

- Function: Indicates the number of frames currently being received
- Protection: Not within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.34 HSPInCRFM Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 16 to 0 | HSPInCRFM[16:0] | Current Received Frame Count |

## HSPInCRFM[16:0] Bits (Current Received Frame Count)

These bits indicate the number of the current received frames.
The register indicates the number of frames that have been written to an external memory by DMA transfer.

The register is cleared to $00000000_{\mathrm{H}} 1 \mathrm{PCLK}+1$ ACLK cycles after communication is disabled (the HSPInEN.HSPInEN bit is 0 ).
The register is cleared to $00000000_{\mathrm{H}} 1 \mathrm{PCLK}+1$ ACLK cycles after communication is started by using the communication start trigger bit (the HSPInEN.HSPInSTATRG bit is 1).

### 26.3.22 HSPInVPEN — Virtual Port Output Enabling Register

- Function: Enables output of received data to the virtual port
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.35 HSPInVPEN Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInVPEN | Virtual Port Output Enabling |
|  |  | $0:$ Writes received data to an external memory |
|  |  | 1: Outputs the received data to the virtual port (effective only in slave mode) |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInVPEN Bit (Virtual Port Output Enabling)

This bit enables or disables output of the data received to the virtual port in slave reception mode.
Setting this bit to 1 in slave reception mode outputs the serial received data to the virtual port.
At this time, no received data is written to an external memory.
Set the bit to 0 when writing the received data to an external memory.

This is valid only in slave reception mode while loop-back testing mode is not in use. Writing the bit to 1 in other modes (master mode when loop-back testing mode is not used, slave transmission mode, or slave transmission/reception mode) is also ignored (with no operation of the virtual port, in normal operation).
The bit is ignored when the loop-back function is operating (the operation becomes the same as when the HSPInVPEN bit is 0 ).

### 26.3.23 HSPInTESTMD - Test Mode Register

- Function: Selects normal operation or loop-back testing operation
- Protection: Within scope
- Software reset: Within scope (cleared to return it to its initial value)

Table 26.36 HSPInTESTMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HSPInLPBT | Loop-back Testing Mode |
|  |  | 0: Normal operation |
|  | 1: Loop-back testing operation |  |

Rewrite the register while communication is disabled (the HSPInEN.HSPInEN bit is 0 and the HSPInACTST.HSPInACTF bit is 0 ).

## HSPInLPBT Bit (Loop-back Testing Mode)

This bit controls loop-back testing mode for receiving data for transmission of the HS-SPI.
Setting this bit to 1 shifts to loop-back testing mode regardless of the value of the HSPInMD.HSPInDPMD[1:0] bits. A loop-back test can be run in both master and slave modes.
In slave mode, however, the test is operated with an internally generated clock without using the communications clock (SPCK).

The registers that are valid in loop-back testing mode are as follows.

- Clock Control Register (HSPInCKEN)
- Software Reset Register (HSPInSRST)
- Communication Enabling Register (HSPInEN)
- Communication Mode Register (HSPInMD)
- Communication Control Register (HSPInCTL)
- SSL Polarity Selection Register (HSPInSSCTL)
- SPCK Delay Selection Register (HSPInSCKDLY)
- SSL Negation Delay Selection Register (HSPInSSNDLY)
- Next Frame Delay Selection Register (HSPInNFMDLY)
- Communication Clock Division Selection Register (HSPInCDIV)
- Transmission Data Transfer Source Address Setting Register (HSPInTSAR)
- Reception Data Transfer Destination Address Setting Register (HSPInRDAR)
- Communication Frame Count Setting Register (HSPInCFSET)
- Interrupt Enabling Register (HSPInIREN)
- Interrupt Status Register (HSPInIRST)
- Interrupt Status Clearing Register (HSPInIRCL)
- Operation Status Register (HSPInACTST)
- Current Transmission Frame Count Register (HSPInCTFM)
- Current Reception Frame Count Register (HSPInCRFM)

### 26.4 Detailed Functional Descriptions

### 26.4.1 Overview of the HS-SPI Operation

The HS-SPI handles full- and half-duplex clock synchronous serial communications.
There are five communication modes: master transmission mode, master transmission/reception mode, slave transmission mode, slave transmission/reception mode, and slave reception mode.

When starting the HS-SPI transfer, the pin settings must be finished in advance.
For details on pin settings, see Section 2, Pin Function.

### 26.4.1.1 Master Transmission/Reception Mode

Operation of the HS-SPI in master transmission/reception mode is as follows. For the setting procedure, see Section
26.5.2.1, Transmission and Reception Setting Flows.

1. Set master/slave mode selection bit (HSPInMD.HSPIn.MSTR) to 1 .
2. Set the communication enabling bit (HSPInEN.HSPInEN) to 1 .
3. Use the DMAC in the HS-SPI to read the data for transmission from the address specified in the Transmission Data Transfer Source Address Setting Register (HSPInTSAR) and store that data in the transmission buffer.
4. Once the data for transmission has been transferred from the transmission buffer to the transmission block (serializer), transmission proceeds.
5. The SSL signal is asserted and the transmission clock is output from the SPCK pin. Data is output from the MOSI pin, synchronized with the SPCK clock.
6. Reception starts in response to the SPCK clock start.
7. The receiving block (de-serializer) stores the frame of data received from the MISO input pin in the reception buffer.
8. The DMAC in the HS-SPI transfers received data from the reception buffer to the address specified in the Reception Data Transfer Destination Address Setting Register (HSPInRDAR).
9. Once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, the SSL0 output signal is negated, and once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, a communication complete interrupt request (INT_HSPI_CEND) is output.

Figure 26.2 Operation of Master Transmission/Reception

### 26.4.1.2 Master Transmission Operation

Operation of HS-SPI in master transmission mode is as follows. For the setting procedure, see Section 26.5.2.2, Transmission Setting Flow.

1. Set the master/slave mode selection bit (HSPInMD.HSPIn.MSTR) to 1 .
2. Set the communication enabling bit (HSPInEN.HSPInEN) to 1.
3. Use the DMAC in the HS-SPI to read the data for transmission from the address specified by the Transmission Data Transfer Source Address Setting Register (HSPInTSAR) and store this data in the transmission buffer.
4. Once the data for transmission has been transferred from the transmission buffer to the transmission block (Serializer), transmission proceeds.
5. The SSL signal is asserted and the transmission clock is output from the SPCK pin. Bits are output from the MOSI pin, synchronized with the SPCK clock.
6. Once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, the SSL0 signal is negated and a communication complete interrupt request (INT_HSPI_CEND) is output.

Figure 26.3 Master Transmission Operation Example

### 26.4.1.3 Slave Transmission/Reception

Operation of the HS-SPI in slave transmission/reception mode is as follows. For the setting procedure, see Section

### 26.5.3.1, Transmission and Reception Setting Flows.

1. Set the communication enabling bit (HSPInEN.HSPInEN) to 1 .
2. Use the DMAC in HS-SPI to read data for transmission from the address specified in the Transmission Data Transfer Source Address Setting Register (HSPInTSAR) and store this data in the transmission buffer.
3. Once the data for transmission has been transferred from the transmission buffer to the transmission block (serializer), transmission proceeds.
4. During transmission, data is output from the MISO output pin, synchronized with the SPCK clock (the SPCK input pin) for the period over which SSL0 input pin is asserted.
5. Reception also proceeds in response to the SPCK clock (SPCK input pin) for the period over which the SSL0 input signal is asserted.
6. The receiving block (de-serializer) stores data frames received from the MISO input pin in the reception buffer.
7. The DMAC in the HS-SPI transfers received data from the reception buffer to the address specified in the Reception Data Transfer Destination Address Setting Register (HSPInRDAR).
8. Once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transmitted, and once the number of frames of received data specified in the Communication Frame Count Setting Register (HSPInCFSET) have been DMA-transferred, a communication complete interrupt request (INT_HSPI_CEND) is output.

Figure 26.4 Slave Transmission/Reception Operation Example

### 26.4.1.4 Slave Transmission

Operation of the HS-SPI in slave transmission mode is as follows. For the setting procedure, see Section 26.5.3.2, Transmission Setting Flow.

1. Set communication enabling bit (HSPInEN.HSPInEN) to 1 .
2. Use the DMAC in HS-SPI to read data for transmission from the address specified in the Transmission Data Transfer Source Address Setting Register (HSPInTSAR) and store this data in the transmission buffer.
3. Once the data for transmission has been transferred from the transmission buffer to the transmission block (serializer), transmission proceeds.
4. During transmission, data is output from the MISO output pin, synchronized with the SPCK clock (the SPCK input pin) for the period over which SSL0 input pin is asserted.
5. Once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, a communication complete interrupt request (INT_HSPI_CEND) is output.

Note: Bits HSPInFLEN[6:0] $=08_{H}$ (frame length: 8 bits)
Bit HSPInSSOP $=0$ (SSL negative logic)
$\mathrm{n}=$ number of frames set in the HSPInCFSET register

Figure 26.5 Slave Transmission Example

### 26.4.1.5 Slave Reception

Operation of HS-SPI in slave reception mode is as follows. For the setting procedure, see Section, 26.5.3.3,

## Reception Setting Flow.

1. Set the communications enabling bit (HSPInEN.HSPInEN) to 1 .
2. During the wait-for-reception state: Reception begins once SPCK clock (SPCK input pin) starts and continues for the period over which the SSL0 input signal is asserted.
3. The receiving block (de-serializer) stores the frame data received from the MOSI input pin in the reception buffer.
4. The DMAC in HS-SPI transfers received data from the reception buffer to the address specified in the Reception Data Transfer Destination Address Setting Register (HSPInRDAR).
5. Once the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, a communication complete interrupt request (INT_HSPI_CEND) is output.

Figure 26.6 Slave Reception Example

### 26.4.1.6 Slave Reception (When the Virtual Port Output is Enabled)

Operation of HS-SPI in slave reception mode is as follows. For the setting procedure, see Section 26.5.3.4, Virtual

## Port Reception Setting Flow

1. Set the communications enabling bit (HSPInEN.HSPInEN) to 1 .
2. During the wait-for-reception state: Reception begins once SPCK clock (SPCK input pin) starts and continues for the period over which the SSL0 input pin is asserted.
3. The receiving block (de-serializer) transfers data frames received on the MOSI input pin to the virtual port in frame units.
In this case, the received data frames are not stored in the reception buffer and are not DMA-transferred to the external memory.
4. Once the data frames have been transferred to the virtual port, a communication complete interrupt request (INT_HSPI_CEND) is output.

Figure 26.7 Slave Reception Example (When the Virtual Port Output is Enabled)

### 26.4.2 Control on the HS-SPI Pins

Table 26.37 lists controls on the pins of the HS-SPI.
Table 26.37 Relationship between Communication Mode and Pins

| Mode | Communication Mode Register (HSPInMD) |  | State of Pin |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | HSPInMSTR | HSPInDPMD[1:0] | SSLO | SPCK | MOSI | MISO |
| Master transmission/ reception | 1 | 00 | Output | Output | Output | Input |
| Master transmission |  | 01 | Output | Output | Output | Unused |
| Slave transmission/ reception | 0 | 00 | Input | Input | Input | Output*1 |
| Slave transmission |  | 01 | Input | Input | Unused | Output*1 |
| Slave reception |  | 10 | Input | Input | Input | Unused |

Note 1. State of MISO pin is output while the HSPInEN.HSPInEN bit is 1 and the SSLO signal is asserted. (State of MISO pin is Hi-Z while the SSLO signal is negated.)

### 26.4.3 Data Format

### 26.4.3.1 Frame Data Format

The frame data format is described below.
For details on parity, see Section 26.4.4, Parity Bit.

Figure 26.8 Data Length for Transfer: 8 bits, No Parity Bit, MSB First, Transmission/Reception

Figure 26.9 Data Length for Transfer: 8 Bits, Parity Bit, MSB first, Transmission/Reception

Figure 26.10 Data Length for Transfer: 8 Bits, No Parity Bit, LSB First, Transmission/Reception

Figure 26.11 Data Length for Transfer: 8 Bits, Parity Bit, LSB First, Transmission/Reception

Figure 26.12 Data Length for Transfer: 24 Bits, No Parity Bit, MSB First, Transmission/Reception

Figure 26.13 Data Length for Transfer: 24 Bits, Parity Bit, MSB First, Transmission/Reception

### 26.4.3.2 Relationship between the Serial Clock and Serial Data

The relationship between the clock and data depending on the values of the HSPInCTL.HSPInCPOL bit and HSPInCPHA bit is shown below.

- Figure 26.16 to Figure $\mathbf{2 6 . 1 9}$ are examples of MSB first.

Figure 26.16 Relationship between the SPCK Pin and Data (Mode 1 (Default): $\mathrm{HSPInCPOL}=0, \mathrm{HSPInCPHA}=1$ )

Note: In slave mode, when the SSL signal is asserted before the send data preparation is completed, data is output after asserting the SSL signal.

Figure 26.17 Relationship between the SPCK Pin and Data (Mode 0: HSPInCPOL $=0, \mathrm{HSPInCPHA}=0$ )

Note: In slave mode, when the SSL signal is asserted before the send data preparation is completed, data is output after asserting the SSL signal.

Figure 26.18 Relationship between SPCK Pin and Data (Mode 2: HSPInCPOL = 1, HSPInCPHA = 0)

Figure 26.19 Relationship between SPCK Pin and Data (Mode 3: HSPInCPOL = 1, HSPInCPHA = 1)

### 26.4.3.3 MSB First and LSB First

Either MSB or LSB first for the serial data array can be selected by setting the LSB first selection bit (HSPInCTL.HSPInLSBEN). Selection of MSB or LSB first does not affect the position of the parity bit.

Table 26.38 shows the arrangement of data in memory for both MSB and LSB first operation.
Table 26.38 Data Storage Format

|  | $\begin{aligned} & 63 \quad 56 \\ & \text { address+7 } \end{aligned}$ | $\begin{aligned} & 55 \\ & \text { address }+6 \end{aligned}$ | $\begin{aligned} & 47 \quad 40 \\ & \text { address+5 } \end{aligned}$ | $\begin{array}{lr} 39 & 32 \\ \text { address }+4 \end{array}$ | $\begin{array}{cc} 31 & 24 \\ \text { address }+3 \end{array}$ | $\begin{aligned} & 23 \\ & \text { address+2 } \end{aligned}$ | $\begin{array}{lr} 15 & 8 \\ \text { address+1 } \end{array}$ | $\begin{aligned} & 7 \quad 0 \\ & \text { address } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figure 26.20 Order of Byte Frames in MSB-First Serial Output

Figure 26.21 Order of Byte Frames in LSB-First Serial Output

### 26.4.4 Parity Bit

Parity bits are used to detect bit errors in transferred data. The same type of parity bit is used for transmission and reception.

One-bit errors can be detected through either even or odd parity.
For parity bit position within data frames, see Section 26.4.3.1, Frame Data Format.
When communication is suspended while receiving data (the HSPInEN.HSPInEN bit is 0 ), the parity cannot be calculated correctly. In this case, parity is not calculated nor is an interrupt request output.

### 26.4.4.1 Even Parity

(1) When data is transmitted

The value of the parity bit is controlled so that the number of bits with the value 1 in the transmitted data, including the parity bit itself, must be an even number.
The value of the parity bit is as follows.
An odd number of bits in the data for transmission have the value $1: 1$
An even number of bits in the data for transmission have the value 1:0
(2) When data is received

A parity error occurs when the result of counting the number of bits with the value 1 in the received data, including the parity bit, is an odd number.

### 26.4.4.2 Odd Parity

(1) When data is transmitted

The value of the parity bit is controlled so that the number of bits with the value 1 in the transmitted data, including the parity bit itself, must be an odd number.
The value of the parity bit is as follows.
An odd number of bits in the data for transmission have the value 1:0
An even number of bits in the data for transmission have the value $1: 1$
(2) When data is received

A parity error occurs when the result of counting the number of bits with the value 1 in the received data, including the parity bit, is an even number.

### 26.4.4.3 Parity Omission

A parity bit is not added to the transmitted data.
Reception of data proceeds assuming that there is no parity bit during reception. Since there is no parity bit, parity errors do not occur.

### 26.4.5 Buffer Structure

### 26.4.5.1 Structure of the Transmission Buffer

The transmission buffers form a double-buffer structure. Each transmission buffer can store 64 bytes of transmission data.
The buffer requests a transfer of data to the internal DMAC when either buffer0 or buffer1 becomes empty. During the request, the buffer can continue transmissionby using the buffer that is not empty.

Requested data transfer amounts of the internal DMAC in its transfer of the first and last portions of the data vary depending on the settings of the Transmission Data Transfer Source AddressSetting Register (HSPInTSAR), Communications Frame Count Setting Register (HSPInCFSET) and frame length selection bits (HSPInMD.HSPInFLEN[6:0]).
The internal DMAC is requested to transfer 64-byte increments of data from the buffer except for the first and last rounds of DMA transfer.

Figure 26.22 Structure of the Transmission Buffer (When Frame Data Length is $64,32,16$, or 8 bits)

### 26.4.5.2 Reception Buffer Structure

The reception buffers form a double-buffer structure. Each reception buffer can store 64 bytes of transmission data. The buffer requests a transfer of data to the internal DMAC when either buffer0 or bufferl becomes full. During the request, the buffer can continue receiving by using the buffer that is not full.

The Reception Data Transfer Destination Address Setting Register (HSPInRDAR), the Communication Frame Count Setting Register (HSPInCFSET) or frame length selection bit (HSPInMD.HSPInFLEN[6:0]) determines the amount of transmit data to be requested to the internal DMAC during DMA transfer of the first and last data.
The internal DMAC is requested to transfer 64-byte of data from the buffer except for the first and last data.

Figure 26.23 Reception Buffer Structure (Frame Lengths of 64, 32, 16, or 8 bits)

### 26.4.6 Interrupt Requests

### 26.4.6.1 Interrupt Sources

The HS-SPI issues four interrupt requests grouped into two types: INT_HSPI_BERR and INT_HSPI_CSTART, each of which is output in response to a single interrupt source, and INT_HSPI_ERR and INT_HSPI_CEND, each of which is output in response to several interrupt sources. The individual interrupt sources for INT_HSPI_ERR are overflow errors in reception, underrun errors in slave mode transmission, and parity errors in reception. The individual interrupt sources for INT_HSPI_CEND are completion of transfer and, in slave mode reception, completion of reception for the virtual port. Each interrupt request has an output enabling bit, a flag bit, and a flag clearing bit.
Writing to a flag clearing bit clears the flag. Writing 1 to the flag clearing bit corresponding to a generated interrupt clears that flag bit (writing 0 to the flag bit does not clear it.) .
An interrupt request is output as a high-level pulse with the width of 1 cycle of PCLK.
The source conditions, flag bits, and control bits for each of the interrupts are listed in Table 26.39 and interrupt requests are output with the timing shown in Figure 26.24.

Table 26.39 HS-SPI Interrupt Requests and Interrupt Sources

| Interrupt Request | Interrupt Source | Output Enabling Bit | Flag Bit | Flag Clearing Bit |
| :--- | :--- | :--- | :--- | :--- |
| INT_HSPI_BERR | H-Bus error | HSPInIREN.BEE | HSPInIRST.BEF | HSPInIRCL.BEC |
| INT_HSPI_ERR | Reception overflow error | HSPInIREN.ROVFEE | HSPInIRST.ROVFEF | HSPInIRCL.ROVFEC |
|  | Transmission underrun <br> error in slave mode | HSPInIREN.TUDREE | HSPInIRST.TUDREF | HSPInIRCL.TUDREC |
|  | Reception parity error | HSPInIREN.PEE | HSPInIRST.PEF | HSPInIRCL.PEC |
| INT_HSPI_CSTART | Communication start in <br> slave mode | HSPInIREN.CSTAE | HSPInIRST.CSTAF | HSPInIRCL.CSTAC |
| INT_HSPI_CEND | Communication <br> completion | HSPInIREN.CENDE | HSPInIRST.CENDF | HSPInIRCL.CENDC |
|  | Virtual port reception <br> completion | HSPInIREN.VPE | HSPInIRST.VPF | HSPInIRCL.VPC |

< Generation timing of the respective interrupts >

Note: Interrupts are output on the setting of the interrupt flags and are not output consecutively.

* Once an interrupt flag is set, an interrupt request is not output even if the interrupt source condition is satisfied again, unless the interrupt flag has been cleared.

Figure 26.24 Interrupt Request Output Timing Diagram

### 26.4.6.2 H-Bus Error Interrupt Requests

When receiving an error response during DMA transfer, the DMAC outputs an H-Bus error interrupt request (INT_HSPI_BERR). When an H-Bus error interrupt is generated and while the H-Bus error flag (HSPInIRST.HSPInBEF) is 1, communication complete interrupt requests (INT_HSPI_CEND) will not be output. In addition, H-Bus error interrupt request (INT_HSPI_BERR) is not output as long as the H-Bus error flag (HSPInIRST.HSPInBEF) is 1.

When a H-Bus error occurs, transmission and reception continues. Reading of data from or writing of data to an external memory does not proceed correctly, so operation is described as follows.

Transmission: When the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, transmission of data is stopped. At this time, a communication complete interrupt request (INT_HSPI_CEND) is not output. Subsequent frame data after occurrence of an H -Bus error is undefined.

Reception: When the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, reception of data is stopped. At this time, a communication complete interrupt request (INT_HSPI_CEND) is not output.
After an H-Bus error has occurred, received data frames are not stored in the external memory, so there will be a shortfall of valid data in external memory.

To start communication using the communication enabling bit (HSPInEN.HSPInEN) or the communication start trigger bit (HSPInEN.HSPInSTATRG), start by clearing the H-Bus error flag to 0 , and then enable communication (by setting the HSPInEN.HSPInEN bit to 1 ). When an H-Bus error interrupt is generated, the service routine should include processing to handle the error, suspension and initialization.

### 26.4.6.3 Error Interrupt Requests

The error interrupt request (INT_HSPI_ERR) is output in three cases:
a) When the reception buffer overflows during master transmission/reception, slave transmission/reception, or slave reception,
b) When the transmission buffer underruns during slave transmission/reception or slave transmission, or
c) When a parity error occurs during master transmission/reception, slave transmission/reception, or slave reception.

Interrupt requests (INT_HSPI_ERR) are not output in response to further errors as long as the error interrupt flag for any of these three errors is 1 .

A communication complete interrupt request (INT_HSPI_CEND) is not output as long as one of the error interrupt flags (HSPInIRST.HSPInROVFEF and HSPInIRST.HSPInTUDREF) is 1.
While the reception parity error flag (HSPInIRST.HSPInPEF) is 1 , a communication complete interrupt request (INT_HSPI_CEND) is output.

To start communication using the communication enabling bit (HSPInEN.HSPInEN) or the communication start trigger bit (HSPInEN.HSPInSTATRG), start by clearing the reception overflow error flag (HSPInIRST.HSPInROVFEF), transmission underrun error flag (HSPInIRST.HSPInTUDREF) and the reception parity error flag (HSPInIRST.HSPInPEF) to 0 . When an error interrupt is generated, the service routine should include processing to handle the error, suspension and initialization.
(1) Reception Overflows

Since the reception buffer has a double-buffer structure, one buffer can continue to receive data while performing DMA transfer of data.
Further data for storage in the reception buffers arriving while both of the buffers are full leads to a reception overflow error and setting of the reception overflow error flag (HSPInIRST.HSPInROVFEF) to 1 . However, the reception of data continues even after a reception overflow has occurred. Data in the reception buffer that was currently receiving data are overwritten in the order received, from oldest to most recent.
(2) Underruns during Slave Transmission

When the communication clock and SSL become active with the transmission buffer empty, a transmission underrun error occurs and the transmission underrun error flag (HSPInIRST.TUDREF) is set to 1 . Transmission continues even after a transmission underrun. However, valid frame data is not transmitted.
A transmission underrun is more likely if the transmission data transfer source address is close to the second half of a range between the 64-byte boundaries, since this may make it impossible to prepare data for transmission in time.
(3) Reception Parity Errors

When the parity value calculated based on the reception frame data differs from the value (HSPInCTL.HSPInPRSL[1] = 0: even parity, HSPInCTL.HSPInPRSL[1] = 1: odd parity) specified in the parity setting bit (HSPInCTL.HSPInPRSL[1:0]), a reception parity error occurs and the reception parity error flag (HSPInIRST.HSPInPEF) is set to 1 . The reception parity error flag (HSPInIRST.HSPInPEF) is set when an error is detected in the reception section (de-serializer).
Even after a reception parity error has occurred, reception continues.

### 26.4.6.4 Communication Start Interrupt Requests

When assertion of the signal on the SSL0 pin [SSL0 level is low when SSL0 polarity bit (HSPInSSCTL.HSPInSS0P) is 0 , and SSL0 level is high when the bit is 1] is detected in slave operation, a communication start interrupt request (INT_HSPI_CSTART) is output.

Communication start interrupt requests (INT_HSPI_CSTART) are not output as long as the communication start interrupt flag (HSPInIRST.HSPInCSTAF) is 1 . To start communication using the communication enabling bit (HSPInEN.HSPInEN) or the communication start trigger bit (HSPInEN.HSPInSTATRG), start by clearing the communication start interrupt flag (HSPInIRST.HSPInCSTAF) to 0 , then enable communication.

### 26.4.6.5 Communication Complete Interrupts

A communication complete interrupt request (INT_HSPI_CEND) is output when as many frames as are specified in the Communication Frame Count Setting Register (HSPInCFSET) have been transferred, or when one frame has been received while using the virtual port in slave reception.

When the virtual port is not in use (HSPInVPEN.HSPInVPEN $=0$ ), and if the H-Bus error flag (HSPInIRST.HSPInBEF), the reception overflow error flag (HSPInIRST.HSPInROVFEF), the transmission underrun error flag (HSPInIRST.HSPInTUDREF), or the communication complete flag (HSPInIRST.HSPInCENDF) is 1, communication complete interrupt requests (INT_HSPI_CEND) will not be output. When the virtual port is in use (HSPInVPEN.HSPInVPEN $=1$ ) and the virtual port reception complete flag (HSPInIRST.HSPInVPF) is 1 , communication complete interrupt requests (INT_HSPI_CEND) will not be output.

Communication complete interrupt requests (INT_HSPI_CEND) are output while the reception parity error flag (HSPInIRST.HSPInPEF) is 1.

To start communication using the communication enabling bit (HSPInEN.HSPInEN) or the communication start trigger bit (HSPInEN.HSPInSTATRG), start by clearing each interrupt status flag to 0 , and then enable communication.

### 26.4.7 Reception and Transmission during Suspension of Transfer

When the communications enabling bit (HSPInEN.HSPInEN) is set to 0 while a frame is being received (before sampling of the last bit of the frame data length specified in the frame data length setting bit (HSPInMD.HSPInFLEN[6:0])), or when the SSL0 input signal is negated [SSL0 level is high when the SSL0 polarity bit (HSPInSSCTL.HSPInSS0P) is 0 , and SSL0 level is low when the bit is 1 ], received data frames shorter than the specified length are judged to be invalid. In these cases, operation of the HS-SPI is as follows:

## $<$ Reception $>$

- When master and slave reception are suspended, the received data is discarded and not counted as being received.
- In slave reception, when the frame data judged to have been invalid is re-sent and that data is successfully received, the sent data is stored in the reception buffer and is counted as received frame data.
- When a frame judged to have been invalid is not re-sent, the number of frames for reception specified in the Communication Frame Count Setting Register (HSPInCFSET) is not attained, so a communication complete interrupt request (INT_HSPI_CEND) is not output.
If timeout is being managed outside the HS-SPI, it is judged to be a reception timeout.
<Transmission>
- When transfer is suspended during master transmission, after the frame already accepted by the transmission section has been transmitted, HS-SPI suspends transfer.
- When transfer is suspended during slave transmission, HS-SPI suspends communication without waiting for completion of transmission of a frame accepted for transmission. When transfer is suspended by negating the SSL0 input signal, if the number of frames specified in the Communication Frame Count Setting Register (HSPInCFSET) has been transferred, a communication complete interrupt request (INT_HSPI_CEND) is output. However, since transfer of frame data after suspension cannot be guaranteed, resend the frame data.

### 26.4.8 Operations in cases of Frame Overrun during Transmission

For frame overruns (transmitted frames exceeding the number specified in the Communication Frame Count Setting Register (HSPInCFSET)), if the communication clock and SSL signal are input from an external device during slave operation, the transmission section does not operate and data following the last frame is not transmitted. This does not result in a transmission underrun error.

### 26.4.9 Operation in the cases of Frame Overrun during Reception

After the number of transmitted frames reaches the value specified in the Communication Frame Count Setting Register (HSPInCFSET), any frames that exceed the specified number of frames (overrun frames) are discarded.

When an excess frame that has a reception parity error is received, an H-Bus error interrupt request (INT_HSPI_ERR) is output.

### 26.4.10 Timeouts

In slave mode, when the first assertion of the signal SSL0 pin [level is high when the SSL0 polarity bit (HSPInSSCTL.HSPInSSOP) is 0 and level is low when the bits is 1 ] is detected, a communication start interrupt request (INT_HSPI_CSTART) is output. This interrupt signal and an external timer can be used to monitor the completion of transfer within the expected period and therefore detect any communications timeout errors.

Figure 26.25 shows an example of an external timer detecting an incomplete transfer due to received data having been discarded during the transmission/reception of the second frame.

Figure 26.25 Example of Operation When a Timeout Error is Detected

### 26.4.11 Burst Operation

HS-SPI burst operation can be selected during continuous transfer in master operation by setting the burst operation selecting bit (HSPInCTL.HSPInBRST) to 1 .
(1) Normal operation (when the HSPInCTL.HSPInBRST bit is set to 0 )

In normal operation, SSL0 is negated for every frame. (The figure below is when the SSL polarity setting bit (HSPInSSCTL.HSPInSS0P) is 0)

Figure 26.26 Communication Clock and SSL Waveforms during Normal Operation
(2) Burst operation (when the HSPInCTL.HSPInBRST bit is set to 1 )

In burst operation, SSL0 is not negated after the transfer of each frame. If the load on the H-Bus becomes such that transferred data cannot be received, the communication clock (SPCK) may be stopped in the midst of burst operation while this condition persists.

Figure 26.27 Communication Clock and SSL Waveforms during Burst Operation

Figure 26.28 Waveforms When Communication Clock Stops during Burst Operation

### 26.4.12 Virtual Port Function

The received frame data can be output to the virtual port by setting the HSPInVPEN.HSPInVPEN bit. After converting MSB/LSB, received frame data is output to the virtual port in frame units. For operation using the virtual port, see

## Section 26.4.1.6, Slave Reception (When the Virtual Port Output is Enabled).

Figure 26.29 shows an example of output waveforms on the HSSPIn_RDATA[63:0] and virtual port pins.

Figure 26.29 Waveforms of Received Data Output When Virtual Port Enabled

### 26.5 Operation

### 26.5.1 Power-on, Initialization and Stop Processing Flows

Figure 26.30 is a flowchart of power-on, Figure 26.31 is a flowchart of initialization and Figure 26.32 is a flowchart of stop processing after communication is prohibited.

Figure 26.30 Power-on Flow

Figure 26.31 Initialization Flow

Figure 26.32 Stop Processing Flow

### 26.5.2 Master Mode

### 26.5.2.1 Transmission and Reception Setting Flows

Figure 26.33 shows an example of the process flow for transmission and reception settings in master mode.
When starting the transfer of HS-SPI, the pin settings must be completed in advance.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0 .
To check whether a reception parity error has occurred after communication completion, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.

Note 2. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the following registers are cleared to 0 :
The HSPInCTFM.HSPInCTFM[16:0] bits (the current transmission frame count register)
The HSPInCRFM.HSPInCRFM[16:0] bits (the current reception frame count register)

### 26.5.2.2 Transmission Setting Flow

Figure 26.34 shows an example of the flow for transmission setting in master mode.

Figure 26.34 Transmission Setting Flow Example in Master Mode

Page 2372 of 4595

### 26.5.2.3 Loop-back Test Setting Flow

Figure 26.35 shows an example of the flow for loop-back test setting in master mode.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0 .
To check whether a reception parity error has occurred after completion of communication, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.

Note 2. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the following registers are cleared to 0 :

- HSPInCTFM.HSPInCTFM[16:0] bits (the current transmission frame count register)
- HSPInCRFM.HSPInCRFM[16:0] bits (the current reception frame count register)

Figure 26.35 Master Mode Loop-back Test Setting Flow

### 26.5.3 Slave Mode

### 26.5.3.1 Transmission and Reception Setting Flows

Figure 26.36 shows an example of the process flow for transmission and reception settings in slave mode.
When starting the transfer of HS-SPI, the pin settings must be completed in advance.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0 .
To check whether a reception parity error has occurred after completion of communication, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.

Note 2. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the following registers are cleared to 0 .
The HSPInCTFM.HSPInCTFM[16:0] bits (the current transmission frame count register)
The HSPInCRFM.HSPInCRFM[16:0] bits (the current reception frame count register)

Figure 26.36 Example of Flow of Transmission/Reception Setting in Slave Mode

Page 2374 of 4595

### 26.5.3.2 Transmission Setting Flow

Figure $\mathbf{2 6 . 3 7}$ shows an example of the flow for transmission setting in slave mode.

Note 1. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the current transmission frame count register (HSPInCTFM.HSPInCTFM[16:0] bits) is cleared to 0 .

Figure 26.37 Slave Mode Transmission Setting Flow Example

### 26.5.3.3 Reception Setting Flow

Figure 26.38 shows an example of the flow for reception setting in slave mode.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0.
To check whether a reception parity error has occurred after completion of communication, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.
Note 2. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the current reception frame count register (HSPInCRFM.HSPInCRFM[16:0] bits) is cleared to 0 .

Figure 26.38 Slave Mode Reception Setting Flow Example

Page 2376 of 4595

### 26.5.3.4 Virtual Port Reception Setting Flow

Figure $\mathbf{2 6 . 3 9}$ shows an example of the flow for the reception setting using the virtual port.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0 .
To check whether a reception parity error has occurred after completion of communication, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.

Figure 26.39 Slave Mode Virtual Port Reception Setting Flow Example

### 26.5.3.5 Flow of Loop-back Test Setting

Figure 26.40 shows an example of the flow for the loop-back test setting in slave mode.

Note 1. To continue communication even after a reception parity error has occurred, clear the reception parity error interrupt enabling bit (HSPInIREN.HSPInPEE) in the interrupt enabling register to 0 .
To check whether a reception parity error has occurred after completion of communication, read the reception parity error flag (HSPInIRST.HSPInPEF) in the interrupt status register.

Note 2. When the HSPInEN.HSPInEN bit is 0 (communication disabled), the following registers are cleared to 0 :
The HSPInCTFM.HSPInCTFM[16:0] bits (the current transmission frame count register)
The HSPInCRFM.HSPInCRFM[16:0] bits (the current reception frame count register)

Figure 26.40 Slave Mode Loop-back Test Setting Flow

### 26.5.4 Flow of Re-send Using Communications Start Trigger

Figure 26.41 is a flowchart of the resend process using the communication start trigger.

Note: While the virtual port output is enabled (HSPInVPEN.HSPInVPEN $=1$ ), retransmission by using the communication start trigger is not possible.

Figure 26.41 Flow of Re-send Using the Communications Start Trigger

### 26.5.5 Error Handling Flow

Figure 26.42 is a flowchart of error handling.

Note: If the error takes the form of a parity error in reception, 'wait for generation of the INT_HSPI_CEND interrupt' without suspending communication is also possible.

Figure 26.42 Error Handling Flow

### 26.5.6 Suspend Communication Procedure

Figure 26.43 shows how to suspend communication.

Figure 26.43 Flow of Suspending Communication

### 26.5.7 Notes for Suspending Communication

Always apply a software reset to resume communication after suspension.
When a software reset is applied while SSL0 is asserted and SPCK is input while slave communication is suspended, operation of the shifters in the transmission or reception sections may become metastable. Use the upper system to ensure a state in which SSL0 is negated or SPCK is not operating.

### 26.5.8 Loop-Back Testing

The HS-SPI supports loop-back testing mode.
In loop-back testing mode, transmitted data is looped back and received by the HS-SPI. Loop-back testing modes are provided for master and slave operations.
In loop-back testing mode, the communication clock that is generated in the master transmission section and slave select signal are used for communication, regardless of master mode or slave mode.
Table $\mathbf{2 6 . 4 0}$ summarizes the serial I/F pin states in loop-back testing mode.
Table 26.40 Pin State during Loop-back Testing

| Mode | Pin State |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | SSLO | SPCK | MOSI | MISO |
|  | Fixed to inactive | Fixed to idling | Fixed to low | Input is invalid |
| Slave | Input is invalid ${ }^{\star 1}$ | Input is invalid | Input is invalid | Fixed to low*2 |

Note 1. Only output control of the MISO pin is enabled.
Note 2. The state of the MISO pin is low output while the HSPInEN.HSPInEN bit is 1 and the SSLO signal is asserted. (The state of the MISO pin is $\mathrm{Hi}-\mathrm{Z}$ while the SSLO signal is negated.)

### 26.6 Notes

### 26.6.1 Notes for Suspending Communication

Always apply a software reset to resume communication after suspension. For details, see Sections 26.4.7, Reception and Transmission during Suspension of Transfer, 26.5.6, Suspend Communication Procedure, and 26.5.7, Notes for Suspending Communication.

### 26.6.2 Register Write Protection and Software Resets

### 26.6.2.1 Write Protection

Register write protection functions only while the communication enabling bit (HSPInEN.HSPInEN) is 1 and writing to respective registers targeted for write protection is not disabled.

Write these registers for write protection while the communication enabling bit (HSPInEN.HSPInEN) is 0 and the operation status flag (HSPInACTST.HSPInACTF) is 0 .

### 26.6.2.2 Registers for Software Resets

Write protection does not depend on the status of the operation status flag (HSPInACTST.HSPInACTF). When a software reset is applied while the operation status flag (HSPInACTST.HSPInACTF) is 1, however, communication is immediately suspended even while in progress. The H-Bus transaction is also suspended.

Therefore, write the Software Reset Register while the communication enabling bit (HSPInEN.HSPInEN) is 0 and the operation status flag (HSPInACTST.HSPInACTF) is 0 .

### 26.6.2.3 Notes when Using Communications Start Trigger Bit

To use the communication start trigger bit (HSPInEN.HSPInSTATRG), write 1 to the bit while the communication enabling bit (HSPInEN.HSPInEN) is 1 and communication is disabled (when the operation status flag (HSPInACTST.HSPInACTF) is 0 ).

### 26.6.3 DMA Function

### 26.6.3.1 DMA Operation during Suspened Communication

When the communication enabling bit (HSPInEN.HSPInEN) is modified from communication enabled (HSPInEN is 1) to communication disabled (HSPInEN is 0), a DMA transfer stops after completion of the DMA transfer in progress (HBus transaction), not immediately.

### 26.6.3.2 DMA Operation in Response to H-Bus Errors

When an error response is reported by the H-Bus during DMA transfer, the H-Bus error flag (HSPInIRST.HSPInBEF) becomes 1 and DMA transfer continues.

For details on H-Bus errors, see Section 26.4.6.2, H-Bus Error Interrupt Requests.

### 26.6.3.3 Transmission Underruns in Slave Mode

If the address from which DMA transfer is to start is close to the second half of a range between the 64-byte boundaries and the address exceeds the boundary soon after the start of transfer, a transmission underrun is more likely since this may make it impossible to prepare data for transmission in time.

### 26.6.3.4 DMA Operation When Virtual Port Output Enabled

Setting the virtual port output enabling bit (HSPInVPEN.HSPInVPEN) to 1 outputs the serial received data to the virtual port (HSPI_RDATA[63:0]) in slave reception. Note that received data is not stored in the reception buffer, nor is received data DMA-transferred to external memory in this case.

### 26.6.4 Data Storage and Address Space

Store the frames of data for transmission in alignment with the external memory area. For the order of transmission data, see Figure 26.20 and Figure 26.21.

The frames for transmission are read from the external memory in units of data reading of the specified frame length.
The frame data for reception is also stored in the external memory in units of data writing of the frame data length specified by the DMAC in the HS-SPI.

Table 26.41 Relationship between the Frame Length and Data Reading/Writing Units

| Frame length | HSPInMD.HSPInFLEN[6:0] | Data reading/writing units |
| :--- | :--- | :--- |
| 8 bits | $08_{\mathrm{H}}$ | 8 bits |
| 16 bits | $10_{\mathrm{H}}$ | 16 bits |
| 24 or 32 bits | $18_{\mathrm{H}}, 20_{\mathrm{H}}$ | 32 bits |
| $40,48,56$, or 64 bits | $28_{\mathrm{H}}, 30_{\mathrm{H}}, 38_{\mathrm{H}}, 40_{\mathrm{H}}$ | 64 bits |

- The area that support unaligned transfers of HS-SPI
- When the address where reading or writing starts is not within the 64 -byte boundary, the burst length of the first HBus request is adjusted so that the second and subsequent H -Bus requests will be on 64 -byte boundaries as shown in Figure 26.44. For this reason, the first H -Bus request is unaligned transfer from within the 64-byte boundaries. The last H-Bus request is transferred to byte-lanes within the 64-byte boundaries. At this time, no data is written to the invalid data area which includes no valid data, and these data are discarded in reading.

Figure 26.44 Communication Frame Data Storage Area (8-bit Frame Data Length)

- The area that does not support unaligned transfers of HS-SPI

When the address where reading or writing is to start is not within the 64-byte boundary, the burst length of the first H Bus request is adjusted so that the second and subsequent H -Bus requests will be on 64 -byte boundaries as shown in Figure 26.45. The last H-Bus request is transferred to byte-lanes within the 64-byte boundaries. At this time, no data are written to the invalid data area, and these data are discarded in reading.

Figure 26.45 Communications Frame Data Storage Area (8-bit Frame Data Length)

### 26.6.5 Errors

### 26.6.5.1 Resume Transfer after an Error Occurs

To resume transfer after an error occurs, service routines should include processes to handle the error, suspension and initialization.

### 26.6.5.2 Operations When a Reception Overflow Occurs

The number of frames transferred from external devices becomes inconsistent in cases of reception overflow. The communication complete flag (HSPInIRST.HSPInCENDF) may not be set to 1 even after the reception overflow error flag (HSPInIRST.HSPInROVFEF) is cleared to 0 . When a reception overflow occurs, disable transfer (HSPInEN.HSPInEN $=0$ ) without waiting for completion.

### 26.6.5.3 Transmission Underrun in Slave Mode

The number of frames transferred from the external devices becomes inconsistent in cases of transmission underrun. The communication complete flag (HSPInIRST.HSPInCENDF) may not be set to 1 even after the transmission underrun error flag (HSPInIRST.HSPInTUDREF) is cleared to 0 . When a transmission underrun occurs, disable transfer (HSPInEN.HSPInEN $=0$ ) without waiting for completion.

## Section 27 Renesas High-Speed Serial I/F (RHSIF)

This section contains a generic description of the Renesas high-speed Serial I/F (RHSIF). The first part in this section describes all this product specific properties, such as the number of units and register base addresses. The remainder of this section describes the functions and registers of the RHSIF.

### 27.1 Feature

### 27.1.1 Number of Units and Channels

This microcontroller has the following number of Renesas high-speed Serial I/F (RHSIF) units.
Table 27.1 Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  | 1 | 1 |
| Name | RHSIFn $(\mathrm{n}=0)$ | RHSIFn $(\mathrm{n}=0)$ |

Table 27.2 Number of Units

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  | 1 | 1 |
| Name | RHSIFn $(\mathrm{n}=0)$ | RHSIFn $(\mathrm{n}=0)$ |

Note: Regarding the unit index " n " in this section, the individual RHSIF units are identified by the index " n ".

### 27.1.2 Register Base Address

RHSIFn base addresses are listed in the following table. RHSIFn register addresses are given as offsets from the base address in general.

Table 27.3 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <RHSIFO_L1_base> | FF00 $0000_{\mathrm{H}}$ | Peripheral Group 9 |
| <RHSIFO_L2_base> | $10000000_{\mathrm{H}}$ | H-Bus Group 0 |

### 27.1.3 Clock Supply

Clock supply by and to RHSIFn is listed in the following table.
Table 27.4 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| RHSIFn (L2) | H-Bus clock | CLK_HBUS |
| RHSIFn (L1) | PCLK | CLK_HBUS |
|  | Communication clock (Internal) <br>  <br> RHSIF0_REFCLK <br> Communication clock (External) | CLK_MOSC |

### 27.1.4 Interrupt Requests

RHSIFn interrupt requests are listed in the following table.
Table 27.5 Interrupt Requests

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number | DMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RHSIF0 |  |  |  |  |  |
| INTRHSIFOTXCMP | RHSIFnTXCMP ( $\mathrm{n}=0$ ) | Transmit complete interrupt (unit n) | 456 | - | - |
| INTRHSIFOTXEX | RHSIFnTXERR ( $\mathrm{n}=0$ ) | Transmit exception interrupt (unit n) | 457 | - | - |
| INTRHSIFORXCMP | RHSIFnRXCMP ( $n=0$ ) | Receive complete interrupt (unit $n$ ) | 458 | - | - |
| INTRHSIFORXEX | RHSIFnRXERR ( $\mathrm{n}=0$ ) | Receive exception interrupt (unit n) | 459 | - | - |
| INTRHSIFOICLCR | RHSIFnRXICLC ( $\mathrm{n}=0$ ) | ICLC receive interrupt (unit n) | 460 | - | - |
| INTRHSIFOINTCH0 | int_hsif_ch0 | Channel 0 interrupt | 461 | group0-185 | group1-93 |
| INTRHSIFOINTCH1 | int_hsif_ch1 | Channel 1 interrupt | 462 | group0-186 | group1-94 |
| INTRHSIFOINTCH2 | int_hsif_ch2 | Channel 2 interrupt | 463 | group0-187 | group1-95 |
| INTRHSIFOINTCH3 | int_hsif_ch3 | Channel 3 interrupt | 464 | group0-188 | group1-96 |
| INTRHSIFOSTR | int_hsif_str | Stream interrupt | 465 | - | - |
| INTRHSIF0ERR | int_hsif_err | Error interrupt | 466 | - | - |

### 27.1.5 Reset Sources

RHSIFn reset sources are shown below. RHSIFn is initialized by the following reset sources.
Table 27.6 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| RHSIFn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 27.1.6 External Input/Output Signals

External input/output signals of RHSIF units are listed below.
Table 27.7 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| RHSIF0 | RHSIF0 Reference clock input/output | HSIF0_REFCLK |
| RHSIF0_REFCLK | RHSIF0 receive data differential input | HSIF0_RXDN |
| RHSIFO_RXDN | RHSIF0 receive data differential input | HSIF0_RXDP |
| RHSIF0_RXDP | RHSIF0 transmission data differential output | HSIF0_TXDN |
| RHSIFO_TXDN | RHSIF0 transmission data differential output | HSIF0_TXDP |
| RHSIF0_TXDP |  |  |

### 27.2 Overview

### 27.2.1 Functional Overview

- Four channels, including one channel with data streaming capability
- Bus master interface used by target node to access shared memory
- H-Bus bus master supporting "Write/Read" command
- Writing a single 8 / 16 / 32 bit data value into the register of a target device
- Reading a single data from 8 / 16/32 bit register of a target device
- Support of 32-bit address range
- Built-in DMA controller supporting "Stream write" command
- 128 or 256-bit data transfer on streaming channel
- Up to two outstanding requests of "Stream write" are supported by the initiator
- Transfers protected by CRC16
- Programmable time outs for detection of blocked answer transfers
- Automatic frame transfer ID generation for detection of dropped frames
- Fixed priority channel selection
- Remote trigger of event/interrupt in the target device by the initiator
- Access protection from an external master
- Can configure four access windows
- Can configure access rule (Prohibited, R, W, RW) at each window
- Security function
- Authentication at the time of initial communication
- ID authentication
- Challenge and response authentication
- Point-to-point high speed serial communication between two devices
- Full duplex communication
- Supports dual mode (register configurable Master/Slave).
- Supports asynchronous data transfer at data rates up to a maximum of 160 M Baud
- Transmits and receives data, CTS, ICLC and unsolicited frames
- Supports automatic ping response generation in slave mode
- Supports detection of unsupported channel number and unsupported payload sizes
- The interface is based on IEEE 1596.3-1996 reduced range link LVDS IOs
- Built-in self test functions

### 27.2.2 Block Diagram

The following figure shows a top level block diagram of the RHSIF module.

Figure 27.1 Module Block Diagram

### 27.2.3 Communication Protocol

### 27.2.3.1 Protocol Definitions

Table $27.8 \quad$ Protocol Definitions

| Item | Definition | Comment |
| :--- | :--- | :--- |
| Master | The module that supplies the clock and controls Link initialization on the Slave interface. | L1 |
| Slave | The module that receives the clock. | L1 |
| Initiator | The module that sends an L2 frame with either the Write, Read, Stream, Event, or ID command | L2 |
| Target | The module that sends an L2 frame with either the Read Answer, ACK, or NACK command | L 2 |
| TxLink | Point-to-point connection executing transfer from Master to Slave. | L 1 |
| RxLink | Point-to-point connection executing transfer from Slave to Master. | L 1 |

### 27.2.3.2 Connection

Figure 27.2 shows the connection between master and slave of RHSIF.

Figure 27.2 Connection between Master and Slave of RHSIF

### 27.2.3.3 L1 Frame

The L1 Frame Format is shown below.
MSB

| SyncCode | L1 Header | L1 Payload $(8 / 32$ bits $)$ or | End |
| :---: | :---: | :---: | :---: |
| 16 bits | 8 bits | L2 Frame $(32 / 64 / 96 / 160 / 288$ bits $)$ | 1 bit |

## (1) SyncCode

The value in this field is assigned to SyncCode, and the value is fixed in $\mathrm{A}_{8} 4 \mathrm{~B}_{\mathrm{H}}$

| Value | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## (2) L1 Header Format

The value in this field is assigned to L1 Header.

| Bit |  | 4 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: |
| Format | PayloadSizeIndex | LogicalChannelType |  | CTS |

## (a) List of Payload Size Index

Table 27.9 shows the details of the payload size index values.
Table 27.9 List of Payload Size Index

| Payload Size Index | Payload Size | Total Frame Size*1 | Comment |
| :--- | :--- | :--- | :--- |
| 000 | 8 | 32 | Interface Control |
| 001 | 32 | 56 | - |
| 010 | 64 | 88 | - |
| 011 | 96 | 120 | - |
| 100 | 128 | 152 | Not used |
| 101 | 256 | 280 | Not used |
| 110 | 160 | 184 | - |
| 111 | 288 | 312 | - |

Note 1. "Endbit" is excluded from Total Frame Size.

## (b) List of Logical Channel Types

Table 27.10 shows the details of Logical Channel Type values.
Table 27.10 List of Logical Channel Types

| Logical Channel Type | Logical Channel Type Master | Logical Channel Type Slave |
| :--- | :--- | :--- | :--- |
| 0000 | Interface Control | Interface Control PING answer (32 bit value) |
| 0001 |  | Reserved for future use |
| 0010 |  | Reserved for future use |
| 0011 | CTS frame for flow control |  |
| 0100 | Data Channel A |  |
| 0101 | Data Channel B |  |
| 0110 | Data Channel C |  |
| 0111 | Data Channel D |  |
| $1000-1111$ | Reserved for future use |  |

(c) List of CTS

Table 27.11 shows the details of CTS values.
Table 27.11 List of CTS

| CTS | Function |
| :--- | :--- |
| 0 | BackPressure |
| 1 | Ready |

## (3) L1 Payload

The value in this field is assigned to L1 Payload as ICLC Command.

| Bit | 7 | 0 |
| :---: | :---: | :---: |
| Format | ICLC Command |  |

(a) List of ICLC Commands

Table 27.12 shows the details of ICLC command values.
Table 27.12 List of ICLC Commands

| Value (hex) | Function |
| :--- | :--- |
| $0 \times 00$ | PING (Sends by master interface. Slave sends back a fixed 32-bit payload result (0xABCDEF01)) |
| $0 \times 02$ | Slave interface PLL start (in preparation for high speed mode) |
| $0 \times 04$ | Slave interface PLL stop (after fallback from high speed mode) |
| $0 \times 08$ | Select Slow Speed mode for transfers from the Master interface to the Slave interface |
| $0 \times 10$ | Select Fast Speed mode for transfers from the Master interface to the Slave interface |
| $0 \times 20$ | Select Slow Speed mode for transfers from the Slave interface to the Master interface |
| $0 \times 80$ | Select Fast Speed mode for transfers from the Slave interface to the Master interface |
| $0 \times 31$ | Enable Slave interface transmitter |
| $0 \times 32$ | Disable Slave interface transmitter |
| $0 \times 34$ | Turn on test mode (Send 101010 ... on RX line continuously using actual configured RX line data rate; cancelled <br> by issuing "test mode off" command.) |
| $0 \times 38$ | Turn off test mode (Cancels the clock test mode and payload loopback) <br> $0 \times F F$ |

## (4) Endbit

The value in this field is assigned to Endbit.

(a) List of Endbit

Table 27.13 shows the details of the Endbit values.
Table 27.13 List of Endbit

| Endbit | Function |
| :--- | :--- |
| 0 | Normal |
| 1 | Sleep |

### 27.2.3.4 L2 Frame

The L2 Frame Format is shown below.

| MSB |
| :---: | :---: | :---: |
| L2 Header L2 Payload L2 CRC <br> 16 bits $(0 / 32 / 64 / 128 / 256$ bits $)$ 16 bits |

## (1) L2 Header Format

The value in this field is assigned to L2 Header.

## (a) Transaction ID

The value in this field is assigned to the outgoing frame. Afterwards, it is automatically increased and the new value is assigned to the next outgoing frame. It wraps around.

## (b) List of L2 Commands

Table 27.14 shows the details of the L2 Command values.
Table 27.14 List of L2 Commands

| Header Bit Number |  |  |  |  | Command |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 12 | 11 | 10 | 9 | 8 |  |
| 0 | 0 | 0 | 0 | 0 | Reads 8 bits |
| 0 | 0 | 0 | 0 | 1 | Reads 16 bits |
| 0 | 0 | 0 | 1 | 0 | Reads 32 bits |
| 0 | 0 | 0 | 1 | 1 | Reserved |
| 0 | 0 | 1 | 0 | 0 | Writes 8 bits |
| 0 | 0 | 1 | 0 | 1 | Writes 16 bits |
| 0 | 0 | 1 | 1 | 0 | Writes 32 bits |
| 0 | 0 | 1 | 1 | 1 | Reserved |
| 0 | 1 | 0 | 0 | 0 | ACK |
| 0 | 1 | 0 | 0 | 1 | NACK (ACK Error) |
| 0 | 1 | 0 | 1 | 0 | Read Answer |
| 0 | 1 | 0 | 1 | 1 | Reserved |
| 0 | 1 | 1 | 0 | 0 | Event Command (Trigger) |
| 0 | 1 | 1 | 0 | 1 | Reserved |
| 0 | 1 | 1 | 1 | 0 | Reserved |
| 0 | 1 | 1 | 1 | 1 | Reserved |
| 1 | 0 | 0 | 0 | 0 | Reserved |
| 1 | 0 | 0 | 0 | 1 | Reserved |
| 1 | 0 | 0 | 1 | 0 | ID Read (Read JTAG ID)*1 |
| 1 | 0 | 0 | 1 | 1 | Reserved |
| 1 | 0 | 1 | 0 | 0 | Reserved |
| 1 | 0 | 1 | 0 | 1 | Reserved |
| 1 | 0 | 1 | 1 | 0 | Reserved |
| 1 | 0 | 1 | 1 | 1 | Stream |
| 1 | 1 | 0 | 0 | 0 | Reserved |
| 1 | 1 | 0 | 0 | 1 | Reserved |
| 1 | 1 | 0 | 1 | 0 | Reserved |
| 1 | 1 | 0 | 1 | 1 | Reserved |
| 1 | 1 | 1 | 0 | 0 | Reserved |

Note 1 Refer to Section 46, Boundary Scan, Table 46.5 for details.

## (c) List of Channel Number

Table 27.15 shows the details of the Channel Number values.
Table 27.15 List of Channel Number

|  | Channel Number Coding in Header |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | HSSL Header (Binary) |  |  |  |
|  | Code Table I | Code Table II |  | Comment |
| 1 (channel B) | 000 | 100 | 0100 | In use |
| 2 (channel C) | 001 | 101 | 0101 | In use |
| 3 (channel D) | 010 | 110 | 0110 | In use |
| 4 (channel E) | 011 | 111 | 0111 | In use |
| 5 (channel F) | 100 | 000 | 1000 | Reserved |
| 6 (channel G) | 101 | 001 | 1001 | Reserved |
| 7 (channel H) | 110 | 111 | 010 | 1010 |

## (2) L2 Payload

The value in this field is assigned to actual data.

## (3) L2 CRC

The value in this field is assigned to CRC.

The last field of the L2 frame contains the CRC field. To setup the CRC value, this protocol uses the following algorithm:

- CRC-16-CCITT polynomial $\mathrm{x} 16+\mathrm{x} 12+\mathrm{x} 5+1$

With the following standard properties:

- seed: 0xFFFF
- calculation direction: Most significant bit first (most significant bit to least significant bit in the header, and then the most significant bit to least significant bit in the payload)
- CRC result direction: Most significant bit first

### 27.2.3.5 Data Format

## (1) Non Stream data format

Data is mapped into a 32 -bit wide frame for 8 to 16 bits with no specific data frames defined. The following pictures show the mapping of $8 / 16 / 32$ bit data into the 32 bit wide data frame.

## (2) Stream data format

## (a) 256-bit Data Stream Format

Data is transmitted in a stream frame as a sequence of 8 times a 32 -bit value. The initiator and target modules must be able to accept the data sequence in this format.

The bytes are sent with the most significant bit sent first.

$$
\text { SHIFT DIRECTION } \rightarrow
$$

LAST BYTE SHIFTED OUT

| 28 | 29 | 30 | 31 | 24 | 25 | 26 | 27 | 20 | 21 | 22 | 23 | 16 | 17 | 18 | 19 | 12 | 13 | 14 | 15 | 8 | 9 | 10 | 11 | 4 | 5 | 6 | 7 | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  |

32 bytes / 256 bits

## (b) 128-bit Data Stream Format

Data is transmitted in a stream frame as a sequence of 4 times a 32 -bit value. The initiator and target modules must be able to accept the data sequence in this format.

The bytes are sent with the most significant bit sent first.

| SHIFT DIRECTION $\rightarrow$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LAST BYTE SHIFTED OUT |  |  |  |  |  |  |  |  |  |  |  | FIRST BYTE SHIFTED OUT |  |  |  |
| $\downarrow$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  | $\downarrow$ |
| 12 | 13 | 14 | 15 | 8 | 9 | 10 | 11 | 4 | 5 | 6 | 7 | 0 | 1 | 2 | 3 |
| 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  | 32 bits |  |  |  |

### 27.2.3.6 All Sending and Receiving Frames

Figure 27.3 shows all sending and receiving frames.

Figure 27.3 All Sending and Receiving Frames

### 27.2.3.7 Number of Transfer Bits in each Frame

Table 27.16 Number of Transfer Bits in each Frame List

| \# | Layer | L1 |  |  | L2 |  |  | L1 | Total Bit | Command | Direction |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Sync | Header | Payload | Header | Payload | CRC | END |  |  |  |
| 1 | L1 | 16 | 8 | 8 | - |  |  | 1 | 33 | ICLC (w/o PingAnswer) | Master $\rightarrow$ Slave |
| 2 |  |  |  |  |  |  |  | CTS*1 |  |  |  |
| 3 |  |  |  | 32 |  |  |  | 57 | ICLC <br> PingAnswer | Slave $\rightarrow$ Master |  |
| 4 | L2 | 16 | 8 | - | 16 | - | 16 |  | 1 | 57 | ID, Event | Initiator $\rightarrow$ Target |
| 5 |  |  |  |  |  |  |  |  |  |  | ACK, NACK | Target $\rightarrow$ Initiator |
| 6 |  |  |  |  |  | 32 |  | 89 |  | Read8, Read16, Read32 | Initiator $\rightarrow$ Target |
| 7 |  |  |  |  |  |  |  |  |  | ReadAnswer | Target $\rightarrow$ Initiator |
| 8 |  |  |  |  |  | 64 |  | 121 |  | Write8, Write16, Write32 | Initiator $\rightarrow$ Target |
| 9 |  |  |  |  |  | 128 |  | 185 |  | Stream128 | Initiator $\rightarrow$ Target |
| 10 |  |  |  |  |  | 256 |  | 313 |  | Stream256 | Initiator $\rightarrow$ Target |

Note 1. Payload size is fixed to 8-bit data when transmitting and can be any size when receiving.

### 27.2.3.8 List of Command and Response

Table 27.17 List of Command and Response

| \# | Layer | Command Issue | Response |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | Normal | Abnormal |
| 1 | L1 | Ping | PingAnswer | NoResponse |
| 2 | L2 | ID | ReadAnswer | NACK |
| 3 |  | Event | ACK | NoResponse |
| 4 |  | Read8, Read16, Read32 | ReadAnswer | NACK |
| 5 |  | Write8, Write16, Write32 | ACK | NACK |
| 6 |  | Stream128, Stream256 | ACK | NACK |

### 27.2.3.9 Command Pipelining

The protocol does not allow pipelining of commands. The initiator shall not send any new command before the target has returned an answer (ACK, NACK, Read Answer). If the target receives a command before it is able to answer the previous command, it shall ignore the command.

There is one exception to this rule. Stream Commands can be pipelined. This feature is only available for Stream Commands. The initiator is allowed to send the next command before it has received an answer from the target linked per Transaction ID to the command sent before. The pipeline depth is limited to a sequence of two commands in the current protocol.
In summary, the initiator is allowed to send a Stream Command, which can be immediately followed by a second Stream Command. After the second command, the initiator has to stop and wait for an answer from the target.
The target shall be capable of receiving pipelined Stream Commands up to a pipeline depth of two Stream Commands.

### 27.3 Operation

### 27.3.1 Operation Flow

The RHSIF can perform data transmission/reception after the initial setting is configured according to the setup flow shown in Figure 27.4 below. For details about the initial setting for L2 and L1, refer to Section 27.4, Transport Layer (L2) and Section 27.5, Datalink Layer (L1), respectively.

Figure 27.4 Operation Flow

### 27.4 Transport Layer (L2)

### 27.4.1 Overview

### 27.4.1.1 Functional Overview

The Renesas High-speed Serial Interface Transport Layer IP (hereinafter referred to as "L2") is compliant with the following specifications.

L2 supports following features/functions.

- Supports 4 channels
- Supports stream transfer on channel 2
- Channel arbitration: Fixed (Higher) Ch. $0 \rightarrow \mathrm{Ch} .1 \rightarrow \mathrm{Ch} .2 \rightarrow \mathrm{Ch} .3$ (lower)
- Generates header
- Manages transaction-ID
- Supports both channel number code table I and II
- Generates and validates CRC-16
- Supports both initiator node and target node
- Initiator node function
- Generates and transmit following request Commands
- Read Command ( 8 bits, 16 bits, 32 bits)
- Write Command (8 bits, 16 bits, 32 bits)
- Event Command
- ID Command
- Stream Command (256 bits, 128 bits)
- Number of outstanding requests: Non-Stream = $1 /$ channel, Stream $=2$ (channel 2 only)
- Detects reply timeout
- The timeout value is programmable by register setting
- Implements DMA controller for stream transmission
- Target node function
- Number of acceptable requests: Non-Stream $=1 /$ channel, Stream $=2$ (channel 2 only)
- Translates HSSL Commands to H-Bus master requests
- Refer to the Section 38, Functional Safety about the H-Bus SPID setting.
- Supports the access protect function from an external master
- Supports 4 areas, independent of channel
- Can configure access rule (prohibited, read only, write only, read/write)
- Can configure memory access window
- Supports special authentication based on the security policy of this product
- 256-bit ID authentication
- "Challenge and response" authentication
- Generates and transmits the following reply Commands as target node
- ACK/NACK Command
- Read Answer Command
- Implements the DMA controller for stream reception
- Generates interrupt by receiving Event Command

### 27.4.1.2 Block Diagram

Figure 27.5 Block Diagram of L2

### 27.4.2 Registers

This section describes the L2 registers in detail.
In case of a concurrent update of the same register bit, L2 module write (hardware write) has higher priority than CPU write (software write).

### 27.4.2.1 List of Registers

The register map of an L2 module is shown in Table 27.18.
The L2 module remains in reset while RESET.
The values shown in Table 27.18 in the registers description under "Values after Reset" are related to this reset state.
For further information about the L2 operation modes, refer to Section 27.4.3, Operation.
The specific base address of a module for an L2 module needs to be added to each of the specified offset addresses.
Table 27.18 Registers Address Map

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RHSIFn | Module Mode Register | RHSIFnMMD | <RHSIFn_L2_base> + 000 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Module Control Register | RHSIFnMCT | <RHSIFn_L2_base> + 008 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Status Register | RHSIFnMST | <RHSIFn_L2_base> + 010 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Module Interrupt Status Register | RHSIFnMIST | <RHSIFn_L2_base> + 018 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Module Reply Timeout Time Register | RHSIFnMRT | <RHSIFn_L2_base> + 020 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Module Memory Window A Start Address Register | RHSIFnMWAA | <RHSIFn_L2_base> + 040 H | 32, 16, 8 | (*1) |
|  | Module Memory Window A Size Register | RHSIFnMWAS | <RHSIFn_L2_base> + 048 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Memory Window B Start Address Register | RHSIFnMWBA | <RHSIFn_L2_base> + 050 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Memory Window B Size Register | RHSIFnMWBS | <RHSIFn_L2_base> + 058 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Memory Window C Start Address Register | RHSIFnMWCA | <RHSIFn_L2_base> + 060 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Memory Window C Size Register | RHSIFnMWCS | <RHSIFn_L2_base> + 068 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Module Memory Window D Start Address Register | RHSIFnMWDA | <RHSIFn_L2_base> + 070 H | 32, 16, 8 | (*1) |
|  | Module Memory Window D Size Register | RHSIFnMWDS | <RHSIFn_L2_base> + 078 ${ }_{\text {H }}$ | 32, 16, 8 | (*1) |
|  | Stream Tx Mode Register | RHSIFnSTMD | <RHSIFn_L2_base> + 200 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Stream Tx Control Register | RHSIFnSTCT | <RHSIFn_L2_base> + 208 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Stream Tx Status Register | RHSIFnSTST | <RHSIFn_L2_base> + $210_{\text {H }}$ | 32, 16, 8 | - |
|  | Stream Tx Status Clear Register | RHSIFnSTSC | <RHSIFn_L2_base> + 218 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Stream Tx Interrupt Enable Register | RHSIFnSTIE | <RHSIFn_L2_base> + 220 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Stream Tx Source Address Register | RHSIFnSTSA | <RHSIFn_L2_base> + 228 ${ }_{\text {H }}$ | 32, 16, 8 | - |

|  | Channel 2 Read Data Register | RHSIFnCRD2 | <RHSIFn_L2_base> + 538 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Mode Register | RHSIFnCMD3 | <RHSIFn_L2_base> + 580 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Control Register | RHSIFnCCT3 | <RHSIFn_L2_base> + 588 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Status Register | RHSIFnCST3 | <RHSIFn_L2_base> + 590 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Status Clear Register | RHSIFnCSC3 | <RHSIFn_L2_base> + 598 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Interrupt Enable Register | RHSIFnCIE3 | $<$ RHSIFn_L2_base> + 5A0 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Read/Write Address Register | RHSIFnCAR3 | <RHSIFn_L2_base> + 5A8 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Write Data Register | RHSIFnCWD3 | <RHSIFn_L2_base> + 5B0 ${ }_{\text {H }}$ | 32, 16, 8 | - |
|  | Channel 3 Read Data Register | RHSIFnCRD3 | <RHSIFn_L2_base> + 5B8 ${ }_{\text {H }}$ | 32, 16, 8 | - |

Note: Addresses other than those listed above are reserved. Do not access reserved addresses.
Note 1. Data cannot be written to these bits from the IP's master port. When the RHSIF's master port writes to these bits, these bits have the read-only $(R)$ attribute. These bits can be read from all master devices. Initial value depends on specified setting. For details, refer to each section.
Note 2. Data can be read from or written to these bits only via the master port of RHSIF. When another master device such as a CPU, accesses these bits, these bits have the read-only (R) attribute.
Note 3. Data can be read from or written to these bits only from ICUM. When another master device such as a CPU accesses these bits, these bits have the read-only $(R)$ attribute.

The access size mentioned in Table 27.18 is required for write access. In addition all registers are readable by 8, 16 and 32 bit access.

The user should not access the registers marked as reserved in Table 27.18.
The user should not write bits to a value specified as "invalid" in the description of the registers.

### 27.4.2.2 Legend

This section explains the module state dependent abbreviations used for the L2 registers description.
Conditions:

- R/W: Bit is readable and writable
- R: Read-only bit; the user cannot write to this bit
- W: Write-only bit; Read value is always " 0 "

Indexes used for register and register Bit Names
The prefix of the "HSIFn" bit name is omitted.
M: The character "(M)" means " 0 ", " 1 ", " 2 ", " 3 ", " 4 ", " 5 ", " 6 " or " 7 ".
N : The character "( N )" means " 0 ", " 1 ", " 2 ", or " 3 ".
X: The character "(X)" means "A", "B", "C", or "D".

Reserved bits:

- Always read as 0
- Writing to these bits has no effect (hardware protection)

### 27.4.2.3 Detailed Register Descriptions

Detailed specifications of each register are described below.
(1) RHSIFnMMD — Module Mode Register

Table 27.19 RHSIFnMMD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CHCT | This bit specifies the type of the channel number code table to used for L2. Note that this bit |
|  |  | can only be changed at the time of initial setting. You cannot change this setting dynamically |
| during system operation. |  |  |
|  |  | $0:$ Table II $\left(\mathrm{Ch} .0=100_{\mathrm{B}}, \mathrm{Ch} .1=101_{\mathrm{B}}, \mathrm{Ch} .2=110_{\mathrm{B}}, \mathrm{Ch} .3=111_{\mathrm{B}}\right)$ |
|  |  | 1: Table I $\left(\mathrm{Ch} .0=000_{\mathrm{B}}, \mathrm{Ch} .1=001_{\mathrm{B}}, \mathrm{Ch} .2=010_{\mathrm{B}}, \mathrm{Ch} .3=011_{\mathrm{B}}\right)$ |
|  |  |  |

## (2) RHSIFnMCT — Module Control Register

Note 1. Data cannot be written to these bits from RHSIF's master port. When RHSIF's master port writes to these bits, these bits have the read-only $(R)$ attribute. These bits can be read from all master devices.

Table 27.20 RHSIFnMCT Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 14 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 13 | WDWE | This bit specifies whether to enable the write operation for memory window D . <br> 0 : Disables writing. <br> 1: Enables writing. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD $(\mathrm{N}) \cdot \operatorname{INME}(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 12 | WDRE | This bit specifies whether to enable the read operation for memory window $D$. <br> 0 : Disables reading. <br> 1: Enables reading. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD $(\mathrm{N}) \cdot \operatorname{INME}(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 11, 10 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | WCWE | This bit specifies whether to enable the write operation for memory window C . <br> 0 : Disables writing. <br> 1: Enables writing. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD $(\mathrm{N}) \cdot \operatorname{INME}(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 8 | WCRE | This bit specifies whether to enable the read operation for memory window C . <br> 0 : Disables reading. <br> 1: Enables reading. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled $(\operatorname{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{INME}(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 27.20 RHSIFnMCT Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 5 | WBWE | This bit specifies whether to enable the write operation for memory window $B$. <br> 0 : Disables writing. <br> 1: Enables writing. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled ( $\mathrm{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{INME}(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 4 | WBRE | This bit specifies whether to enable the read operation for memory window $B$. <br> 0 : Disables reading. <br> 1: Enables reading. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD(N).INME(N)=0, TNME(N)=0). |
| 3, 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | WAWE | This bit specifies whether to enable the write operation for memory window $A$. <br> 0 : Disables writing. <br> 1: Enables writing. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD(N).INME $(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |
| 0 | WARE | This bit specifies whether to enable the read operation for memory window $A$. <br> 0 : Disables reading. <br> 1: Enables reading. <br> You can change this bit only when the initiator node function and target node function of all channels are disabled (RHSIFnCMD(N).INME $(\mathrm{N})=0, \operatorname{TNME}(\mathrm{~N})=0)$. |

## (3) RHSIFnMST — Module Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.21 RHSIFnMST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | AUTS1 | This bit indicates the status of the second authentication of the link partner. |
|  | 0: Second authentication not completed. |  |
|  | 1: Second authentication completed. |  |
| 0 | AUTS0 | This bit indicates the status of the first authentication of the link partner. |
|  | 0: First authentication not completed. |  |
|  |  | 1: First authentication completed. |

## (4) RHSIFnMIST — Module Interrupt Status Register

Table 27.22 RHSIFnMIST Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | DBGS | When set to 1, this bit indicates that there is a debug interrupt factor. |
| 30 to 29 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 28 | AESS | When set to 1 , this bit indicates that there is an error interrupt factor concerning authentication or window mis-hit. |
| 27 to 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 | SRES | When set to 1 , this bit indicates that there is an error interrupt factor concerning stream reception. |
| 24 | STES | When set to 1 , this bit indicates that there is an error interrupt factor concerning stream transmission. |
| 23 | CERS3 | When set to 1, this bit indicates that there is an error interrupt factor concerning channel 3. |
| 22 | CERS2 | When set to 1 , this bit indicates that there is an error interrupt factor concerning channel 2. |
| 21 | CERS1 | When set to 1, this bit indicates that there is an error interrupt factor concerning channel 1. |
| 20 | CERSO | When set to 1 , this bit indicates that there is an error interrupt factor concerning channel 0 . |
| 19 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 18 | SRCS1 | When set to 1 , this bit indicates that there is a factor for completing stream interrupt reception (of not less than the specified size). |
| 17 | SRCSO | When set to 1 , this bit indicates that there is a factor for completing stream interrupt reception (of not less than the data size of one frame). |
| 16 | STCS | When set to 1 , this bit indicates that there is a factor for completing stream interrupt transmission. |
| 15 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 14 | TERS3 | When set to 1 , this bit indicates that there is a factor for receiving an Event Command as a channel 3 interrupt. |
| 13 | AKRS3 | When set to 1, this bit indicates that there is a factor for receiving an ACK Command as a channel 3 interrupt. |
| 12 | RARS3 | When set to 1 , this bit indicates that there is a factor for receiving a Read Answer Command as a channel 3 interrupt. |
| 11 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 10 | TERS2 | When set to 1, this bit indicates that there is a factor for receiving an Event Command as a channel 2 interrupt. |

Table 27.22 RHSIFnMIST Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 9 | AKRS2 | When set to 1, this bit indicates that there is a factor for receiving an ACK Command as a <br> channel 2 interrupt. |
| 8 | RARS2 | When set to 1, this bit indicates that there is a factor for receiving a Read Answer Command <br> as a channel 2 interrupt. |
| 7 | TERS1 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | AKRS1 | When set to 1, this bit indicates that there is a factor for receiving an Event Command as a <br> channel 1 interrupt. |
| 5 | When set to 1, this bit indicates that there is a factor for receiving an ACK Command as a <br> channel 1 interrupt. |  |
| 3 | When set to 1, this bit indicates that there is a factor for receiving a Read Answer Command <br> as a channel 1 interrupt. |  |
| 2 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |  |
| 1 | When set to 1, this bit indicates that there is a factor for receiving an Event Command as a <br> channel 0 interrupt. |  |
| 0 | When set to 1, this bit indicates that there is a factor for receiving an ACK Command as a <br> channel 0 interrupt. |  |

## (5) RHSIFnMRT — Module Reply Timeout Time Register

Table 27.23 RHSIFnMRT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 12 | RSCL[3:0] | These bits specify the reference clock for the reply timer. |
|  |  | Note that these bits can be changed only at the time of initial setting. You cannot change the setting dynamically during system operation. |
|  |  | 0000: Communication clock (cclk) |
|  |  | 0001: Communication clock (cclk) divided by 2 |
|  |  | 0010: Communication clock (cclk) divided by 4 |
|  |  | 0011: Communication clock (cclk) divided by 8 |
|  |  | 0100: Communication clock (cclk) divided by 16 |
|  |  | 0101: Communication clock (cclk) divided by 32 |
|  |  | 0110: Communication clock (cclk) divided by 64 |
|  |  | 0111: Communication clock (cclk) divided by 128 |
|  |  | 1000: Communication clock (cclk) divided by 256 |
|  |  | 1001: Communication clock (cclk) divided by 512 |
|  |  | 1010: Communication clock (cclk) divided by 1024 |
|  |  | 1011: Communication clock (cclk) divided by 2048 |
|  |  | 1100: Communication clock (cclk) divided by 4096 |
|  |  | 1101: Communication clock (cclk) divided by 8192 |
|  |  | 1110: Communication clock (cclk) divided by 16384 |
|  |  | 1111: Communication clock (cclk) divided by 32768 |
| 11, 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 to 0 | RCNT[9:0] | These bits specify the limit count for the reply timer. |
|  |  | If the pulse count of the clock specified by the RSCL bits reaches the value specified in these bits, a reply timeout is determined. |
|  |  | When 0 is specified in these bits, the reply timeout does not occur. If, however, no reply Command is detected with 0 specified in these bits, the initiator on the channel is disabled. Therefore, specifying 0 in these bits is prohibited if the system does not have a measure to recover from the status in which the initiator is disabled. |
|  |  | Note that these bits can be changed only at the time of initial setting. You cannot change the setting dynamically during system operation. |

(6) RHSIFnMW (A, B, C, D) A — Module Memory Window (A, B, C, D) Start Address Register

Note 1. This bit is readable/writable (RW) or read-only (R). For details, see the description of the bit.
Table 27.24 RHSIFnMW (A, B, C, D) A Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | MW(X)A | These bits specify the start address of the window that is allowed to be accessed when RHSIF generates an H -Bus read or write request as bus master. |
|  |  | Write 0 to all the bits lower than those corresponding to the valid size value set in RHSIFnMW(X)S. |
|  |  | Example: When the valid size is 4 kilobytes, set the MW(X)A[11:2] bits to 0000_0000_00b. |
|  |  | The MW(X)A[6:2] bits must always be 0 . |
|  |  | When RHSIFnMCT.W(X)RE $=1$ or RHSIFnMCT.W(X)WE $=1$, the value of these bits (MW(X)A) must not be changed. For details, see Section 27.4.3.1(1), Setting Memory Windows. |
|  |  | Data cannot be written to these bits from RHSIF's master port. When RHSIF's master port writes to these bits, these bits have the read-only (R) attribute. These bits can be read from all master devices. |
| 1, 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

(7) RHSIFnMW (A, B, C, D) S - Module Memory Window (A, B, C, D) Size Register

Note 1. This bit is readable/writable (R/W) or read-only (R). For details, see the description of the bit.
Table 27.25 RHSIFnMW (A, B, C, D) S Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 2 | MW(X)S | These bits specify the size of the window that is allowed to be accessed when RHSIF generates an H-Bus read or write request as bus master. Write 1 to all the bits lower than those corresponding to the valid size value, and write 0 to all the bits higher than those corresponding to the valid size value. |
|  |  | Examples of settings are as follows: |
|  |  | 0000_0000_0000_0000_0000_0000_0111_11b: 128 bytes |
|  |  | 0000_0000_0000_0000_0000_0000_1111_11b: 256 bytes |
|  |  | 0000_0000_0000_0000_0000_0001_1111_11b: 512 bytes |
|  |  | ... |
|  |  | 0011_1111_1111_1111_1111_1111_1111_11b: 1 GB |
|  |  | 0111_1111_1111_1111_1111_1111_1111_11b: 2 GB |
|  |  | 1111_1111_1111_1111_1111_1111_1111_11b: 4 GB |
|  |  | The MW(X)S[6:2] bits must always be 1. |
|  |  | When RHSIFnMCT.W(X)RE = 1 or RHSIFnMCT.W $(X) W E=1$, the value of these bits (MW (X)S) must not be changed. For details, see Section 27.4.3.1(1), Setting Memory Windows. |
|  |  | Data cannot be written to these bits from RHSIF's master port. When RHSIF's master port writes to these bits, these bits have read-only $(\mathrm{R})$ attribute. These bits can be read from all master devices. |
| 1 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

## (8) RHSIFnSTMD — Stream Tx Mode Register

Table 27.26 RHSIFnSTMD Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | STNK | This bit specifies the operation that is necessary when L2, operating as an initiator node, receives a NACK Command from a link partner in response to a Stream Command the initiator node transmitted. |
|  |  | 0: Stops the DMAC. (Same as the operation that is necessary when an error occurs) |
|  |  | 1: Continues the DMAC operation. (Same as the operation to be done when an ACK Command is received) |
|  |  | Note that this bit can be changed only at the time of initial setting. You cannot change the setting dynamically during system operation. |
| 19 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | STPS | This bit specifies the data payload size of the frame when L2, operating as an initiator node, transmits a Stream Command. |

Note: Transmission/reception in 128 bits is only available for communication between the E2 series devices with the same STPS values.

|  | $0: 256$ bits <br> $1: 128$ bits <br> Note that this bit can be changed only at the time of initial setting. You cannot change the <br> setting dynamically during system operation. |
| :--- | :--- |
| 15 to 0 | - |
| Reserved |  |
|  |  |
|  |  |
|  |  |

## (9) RHSIFnSTCT — Stream Tx Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.27 RHSIFnSTCT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STDE | This bit specifies whether to enable the DMAC. Write 1 to this bit to start the DMAC when L2, |
|  |  | operating as an initiator node, transmits a Stream Command. |
|  | 0: Disables the DMAC. |  |
|  | 1: Enables the DMAC. |  |
|  | This bit is automatically cleared when the transfer ends (normally or abnormally). For details |  |
|  | about abnormal cases, see Section 27.4 .3 .4, Stream Command Transmission by Initiator |  |
|  | Node. |  |
|  |  | During the transfer (while this bit is 1), 0 must not be written to this bit. |
|  |  |  |

## NOTE

Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the STDE bit to 1 .
(10) RHSIFnSTST — Stream Tx Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.28 RHSIFnSTST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | STE4 | This bit is set to 1 when a memory window mis-hit occurs and the DMAC stops abnormally (because of the error) after RHSIF, operating as an initiator, has started the DMAC for Stream Command transmission. |
| 22 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | STE3 | This bit is set to 1 when a transfer error occurs in the H-Bus and the DMAC stops abnormally (because of the error) after L2, operating as an initiator, has started the DMAC for Stream Command transmission. |
| 19 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | STE2 | This bit is set to 1 when a reply Command (ACK, NACK, or Read Answer) causing a transaction ID error is detected and the DMAC stops abnormally (because of the error) after L2, operating as an initiator, has started the DMAC for Stream Command transmission. |
| 4 | STE1 | This bit is set to 1 when the DMAC stops abnormally because it does not receive any response within the time set in the RHSIFnMRT bits after L2, operating as an initiator, has started the DMAC for Stream Command transmission. |
| 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | STE0 | This bit is set to 1 when an NACK Command is received and the DMAC stops abnormally after L2, operating as an initiator, has started the DMAC for Stream Command transmission. This bit is not set when RHSIFnSTMD.STNK $=1$. |
| 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STC | This bit is set to 1 when the transfer of all data ends normally after L2, operating as an initiator, has started the DMAC for Stream Command transmission. |

## (11) RHSIFnSTSC - Stream Tx Status Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.29 RHSIFnSTSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | STEC4 | Writing 1 to this bit clears the RHSIFnSTST.STE4 bit. Writing 0 to this bit is ignored. |
| 22 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | STEC3 | Writing 1 to this bit clears the RHSIFnSTST.STE3 bit. Writing 0 to this bit is ignored. |
| 19 to 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | STEC2 | Writing 1 to this bit clears the RHSIFnSTST.STE2 bit. Writing 0 to this bit is ignored. |
| 4 | STEC1 | Writing 1 to this bit clears the RHSIFnSTST.STE1 bit. Writing 0 to this bit is ignored. |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | STEC0 | Writing 1 to this bit clears the RHSIFnSTST.STE0 bit. Writing 0 to this bit is ignored. |
| 1 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | STCC | Writing 1 to this bit clears the RHSIFnSTST.STC bit. Writing 0 to this bit is ignored. |

(12) RHSIFnSTIE — Stream Tx Interrupt Enable Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | STEE4 | - | - | STEE3 | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R | R/W | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | - | - | - | - | STEE2 | STEE1 | - | STEE0 | - | STCE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R | R/W | R | R/W |

Table 27.30 RHSIFnSTIE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | STEE4 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSTST.STE4 bit. <br> 0: Does not assert int_hsif_err when the RHSIFnSTST.STE4 bit is 1. |
| 22 1: Asserts int_hsif_err when the RHSIFnSTST.STE4 bit is 1. |  |  |

(13) RHSIFnSTSA — Stream Tx Source Address Register

Table 27.31 RHSIFnSTSA Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | STSA | These bits specify the start address of the area storing the data to be transferred when L2, operating as an initiator node, starts the DMAC for Stream Command transmission. |
|  |  | When the data payload of the Stream Command to be transmitted is 256 bits (when RHSIFnSTMD.STPS = 0), the STSA[4] bit must always be 0 . |
|  |  | When RHSIFnSTCT.STDE = 1, the value of these bits (STSA) must not be changed. |
|  |  | The settings for RHSIFnSTSA and RHSIFnSTBC which causes wrap around of address is not allowed. |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

(14) RHSIFnSTBC — Stream Tx Byte Count Register

Table 27.32 RHSIFnSTBC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 25 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 to 4 | STBC | These bits specify the total number of bytes of the data to be transferred when L2, operating as an initiator node, starts the DMAC for Stream Command transmission. |
|  |  | When the data payload of the Stream Command to be transmitted is 256 bits (when RHSIFnSTMD.STPS $=0$ ), the STBC[4] bit must always be 0 . |
|  |  | When 0 is set in these bits, $2^{25}$ bytes (32 MBytes) are transferred. |
|  |  | The value read from these bits indicates the number of remaining bytes of the data. |
|  |  | When RHSIFnSTCT.STDE $=1$, the value of these bits (STBC) must not be changed. |
|  |  | The setting of RHSIFnSTSA and RHSIFnSTBC that causes wrap around of address is not allowed. |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

CAUTION: Write to unused Channel Register should not be executed

NOTE
Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the STBC bits to 1 .
(15) RHSIFnSRMD — Stream Rx Mode Register

Value after reset: $\quad 00000010_{\mathrm{H}}$

Table 27.33 RHSIFnSRMD Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | SRMC | This bit specifies the operation to be done if an error occurs when L2, operating as a target node, receives a Stream Command. |
|  |  | 0: Automatically clears the RHSIFnSRCT.SRDE bit automatically when an error occurs. <br> 1: Does not automatically clear the RHSIFnSRCT.SRDE bit automatically when an error occurs. |
|  |  | For the conditions of errors, see the description of the RHSIFnSRCT.SRDE bit. |
|  |  | Note that this bit can be changed only at the time of initial setting. You cannot change the setting dynamically during system operation. |
| 19 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | SRPS | This bit specifies the frame data payload size that is expected when L2, operating as a target node, receives a Stream Command. |
|  |  | 0: 256 bits |
|  |  | 1: 128 bits |
|  |  | Note that this bit can be changed only at the time of initial setting. You cannot change the setting dynamically during system operation. |
| 15 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

(16) RHSIFnSRCT — Stream Rx Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.34 RHSIFnSRCT Register Contents

Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the SRDE bit to 1 .

## (17) RHSIFnSRST — Stream Rx Status Register

Value after reset: $\quad 00000000_{H}$

Table 27.35 RHSIFnSRST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | SRA | This bit is set to 1 if RHSIFnSRCT.SRDE is cleared automatically because L2, operating as a target node, detects errors related to the Stream Command that is received. <br> For the conditions of errors, see the description of the RHSIFnSRCT.SRDE bit. |
| 30 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | SRE2 | This bit is set to 1 if a memory window mis-hit occurs when RHSIF, operating as a target node, transfers Stream Command data that is received to the H-Bus. |
| 22 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | SRE1 | This bit is set to 1 if Stream Command data is discarded because the data storage area is full when L2, operating as a target node, receives a Stream Command. |
| 20 | SRE0 | This bit is set to 1 if an error occurs when L2, operating as a target node, transfers Stream Command data that is received to the H -Bus. |
| 19 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | SRTA | This bit indicates the processing status of the received Stream command when L2 is operating as the target node. <br> 0 : No Command is being processed. <br> 1: Command(s) is being processed. |
| 14 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SRC1 | This bit is set to 1 when the size of unprocessed data (in the received Stream Command L2 is operating as a target node) is not less than the value set in RHSIFnSRBC. |
| 0 | SRC0 | This bit is set to 1 when the size of unprocessed data (in the received Stream Command L2 is operating as a target node) is not 0 . |

(18) RHSIFnSRSC — Stream Rx Status Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SRAC | - | - | - | - | - | - | - | SREC2 | - | SREC1 | SRECO | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | R | R | R | R | R | R | R | W | R | W | W | R | R | R | R |

Table 27.36 RHSIFnSRSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | SRAC | Writing 1 to this bit clears the RHSIFnSRST.SRA bit. <br> Writing 0 to this bit is ignored. |
| 30 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | SREC2 | Writing 1 to this bit clears the RHSIFnSRST.SRE2 bit. <br> Writing 0 to this bit is ignored. |
| 22 | SREC1 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | SREC0 | Writing 1 to this bit clears the RHSIFnSRST.SRE1 bit. <br> Writing 0 to this bit is ignored. |
| 19 | Writing 1 to this bit clears the RHSIFnSRST.SRE0 bit. <br> Writing 0 to this bit is ignored. |  |

(19) RHSIFnSRIE — Stream Rx Interrupt Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.37 RHSIFnSRIE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | SRAE | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SRA bit. <br> 0 : Does not assert int_hsif_err when the RHSIFnSRST.SRA bit is 1 . <br> 1: Asserts int_hsif_err when the RHSIFnSRST.SRA bit is 1. |
| 30 to 24 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 23 | SREE2 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SRE2 bit. <br> 0 : Does not assert int_hsif_err when the RHSIFnSRST.SRE2 bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnSRST.SRE2 bit is 1. |
| 22 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 21 | SREE1 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SRE1 bit. <br> 0 : Does not assert int_hsif_err when the RHSIFnSRST.SRE1 bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnSRST.SRE1 bit is 1. |
| 20 | SREE0 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SREO bit. <br> 0 : Does not assert int_hsif_err when the RHSIFnSRST.SREO bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnSRST.SREO bit is 1. |
| 19 to 2 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SRCE1 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SRC1 bit. <br> 0 : Does not assert int_hsif_str when the RHSIFnSRST.SRC1 bit is 1. <br> 1: Asserts int_hsif_str when the RHSIFnSRST.SRC1 bit is 1. |
| 0 | SRCE0 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnSRST.SRC0 bit. <br> 0 : Does not assert int_hsif_str when the RHSIFnSRST.SRC0 bit is 1. <br> 1: Asserts int_hsif_str when the RHSIFnSRST.SRC0 bit is 1. |

(20) RHSIFnSRDA — Stream Rx Destination Area Start Address Register

Table 27.38 RHSIFnSRDA Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 4 | SRDA | These bits specify the start address of the area to store data when L2, operating as a target node, receives a Stream Command. |
|  |  | Write 0 to all the bits lower than those corresponding to the valid size value set in RHSIFnSRDS. |
|  |  | Example: When the valid size is 4 kilobytes, set the SRDA[11:4] bits to 0000_0000_00b. |
|  |  | When the data payload of the Stream Command to be received is 256 bits (when RHSIFnSRMD.SRPS = 0), the SRDA[4] bit must always be 0. |
|  |  | When RHSIFnSRCT.SRDE = 1, the value of these bits (SRDA) must not be changed. |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

## (21) RHSIFnSRDS — Stream Rx Destination Area Size Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.39 RHSIFnSRDS Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 25 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 to 4 | SRDS | These bits specify the valid size of the area to store data when L2, operating as a target node, receives a Stream Command. Write 1 to all the bits lower than those corresponding to the valid size value, and write 0 to all the bits higher than those corresponding to the valid size value. |
|  |  | Examples of settings are as follows: |
|  |  | 0_0000_0000_0000_0000_0000b: 16 bytes |
|  |  | 0_0000_0000_0000_0000_0001b: 32 bytes |
|  |  | ... |
|  |  | 0_1111_1111_1111_1111_1111b: 16 Mbytes |
|  |  | 1_1111_1111_1111_1111_1111b: 32 Mbytes |
|  |  | When the data payload of the Stream Command to be received is 256 bits (when |
|  |  | RHSIFnSRMD.SRPS $=0$ ), the valid size must not be set to 16 bytes. |
|  |  | When RHSIFnSRCT.SRDE = 1, the value of these bits (SRDS) must not be changed. |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

## (22) RHSIFnSRBC - Stream Rx Byte Count Register

Table 27.40 RHSIFnSRBC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 25 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 to 4 | SRBC | These bits specify the number of bytes that triggers a notification when L2, operating as a target node, receives a Stream Command. When the size of unprocessed data reaches or exceeds the value specified in these bits, the RHSIFnSRST.SRC1 bit is set to 1 . |
|  |  | If the data payload of the Stream Command to be received is 256 bits (when RHSIFnSRMD.SRPS = 0), the SRBC[4] bit must always be 0 . |
|  |  | If 0 is set in these bits, a notification is triggered when the size of unprocessed data reaches $2{ }^{25}$ bytes ( 32 Mbytes). |
|  |  | When RHSIFnSRCT.SRDE = 1, the value of these bits (SRBC) must not be changed. |
| 3 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

(23) RHSIFnSRWP — Stream Rx Write Pointer Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | SRWP[24:16] |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SRWP[15:4] |  |  |  |  |  |  |  |  |  |  |  | - | - | - | SRWT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.41 RHSIFnSRWP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 to $\mathbf{4}$ | SRWP | These bits indicate the value of the write pointer (offset value from start address) to the area to <br> store received data when L2, operating as a target node, receives a Stream Command. The <br> number of valid bits of the pointer corresponds to the value set in RHSIFnSRDS. All the bits <br> higher than valid bits show 0. |
|  |  | These bits are initialized when the RHSIFnSRCT.SRDE bit changes from 0 to 1. |
| 3 to 1 | For details, see Section 27.4.3.5, Stream Command Reception by Target Node. |  |

(24) RHSIFnSRRP — Stream Rx Read Pointer Register

Table 27.42 RHSIFnSRRP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 25 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 24 to 4 | SRRP | These bits indicate the value of the read pointer (offset value from start address) to the area to <br> store received data when L2, operating as a target node, receives a Stream Command. The <br> number of valid bits of the pointer corresponds to the value set in RHSIFnSRDS. All the bits <br> higher than valid bits must be 0. |
|  |  | These bits are initialized when the RHSIFnSRCT.SRDE bit changes from 0 to 1. |
| 3 to 1 | For details, see Section 27.4.3.5, Stream Command Reception by Target Node. |  |

## NOTE

Note that when using a bit-manipulation instruction for writing to this register, the read-modify-write operation may inadvertently set the SRRP bits or the SRRT bit to 1 .
(25) RHSIFnAID (0, 1, 2, 3, 4, 5, 6, 7) — Authentication ID Data Register (0, 1, 2, 3, 4, 5, 6, 7)

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AID(M)[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | AID(M)[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|  | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |

Note 1. This bit is readable/writable (R/W) or read-only (R). For details, see the description of the bit.
Table 27.43 RHSIFnAID (0, 1, 2, 3, 4, 5, 6, 7) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | AID $(M)$ | These bits store the ID data for the first authentication (ID-based authentication). |
|  | HSIFnAID0.AID0[31:0]: ID[31:0] |  |
|  | HSIFnAID1.AID1[31:0]: ID[63:32] |  |
|  | HSIFnAID2.AID2[31:0]: ID[95:64] |  |
|  | HSIFnAID3.AID3[31:0]: ID[127:96] |  |
|  | HSIFnAID4.AID4[31:0]: ID[159:128] |  |
|  | HSIFnAID5.AID5[31:0]: ID[191:160] |  |
|  | HSIFnAID6.AID6[31:0]: ID[223:192] |  |
|  | HSIFnAID7.AID7[31:0]: ID[255:224] |  |
|  | Data can be read from or written to these bits only via the master port of L2. When another |  |
|  | master device such as a CPU accesses these bits, these bits have the read-only (R) attribute. |  |

(26) RHSIFnAAD (0, 1, 2, 3) — Authentication Answer Data Register (0, 1, 2, 3)

Note 1. This bit is readable/writable (R/W) or read-only (R). For details, see the description of the bit.

Table 27.44 RHSIFnAAD (0, 1, 2, 3) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | AAD(N) | These bits store the answer data (calculated from challenge data by the ICUM) for the second |
|  |  | authentication (challenge-and-response authentication). |
|  | RHSIFnAAD0.AAD0[31:0]: Answer Data[31:0] |  |
|  | RHSIFnAAD1.AAD1[31:0]: Answer Data[63:32] |  |
|  | RHSIFnAAD2.AAD2[31:0]: Answer Data[95:64] |  |
|  | RHSIFnAAD3.AAD3[31:0]: Answer Data[127:96] |  |
|  | Data can be read from or written to these bits only from ICUM. When another master device |  |
|  | such as a CPU accesses these bits, these bits have the read-only (R) attribute. |  |

## (27) RHSIFnARD (0, 1, 2, 3) — Authentication Response Data Register (0, 1, 2, 3)

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ARD(N)[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | $\operatorname{ARD}(\mathrm{N})[15: 0]$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 | *1 |

Note 1. This bit is readable/writable (R/W) or read-only (R). For details, see the description of the bit.
Table 27.45 RHSIFnARD (0, 1, 2, 3) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ARD $(\mathrm{N})$ | These bits store the response data for the second authentication (challenge-and-response |
|  | authentication). |  |
|  | RHSIFnARD0.ARD0[31:0]: Response Data[31:0] |  |
|  | RHSIFnARD1.ARD1[31:0]: Response Data[63:32] |  |
|  | RHSIFnARD2.ARD2[31:0]: Response Data[95:64] |  |
|  | RHSIFnARD3.ARD3[31:0]: Response Data[127:96] |  |
|  | Data can be read from or written to these bits only via the master port of L2. When another |  |
|  | master device such as a CPU accesses these bits, these bits have the read-only (R) attribute. |  |

## (28) RHSIFnAEST — Authentication Error Status Register

Table 27.46 RHSIFnAEST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 30 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | WES1 | This bit is set to 1 when RHSIF, as a target node, tries to issue H-Bus Write for Stream <br> Command that does not hit any memory window. |
| 28 | WES0 | This bit is set to 1 when RHSIF, as an initiator node, tries to issue H-Bus Read for Stream <br> Command that does not hit any memory window. |
| $27,25,23,21$ | WEW(N) | This bit is set to 1 when RHSIF, as a target node, receives Write Command on Channel (N) <br> whose targeted address does not hit any memory window. |
| $26,24,22,20$ | WER(N) | This bit is set to 1 when RHSIF, as a target node, receives Read Command on Channel (N) <br> whose targeted address does not hit any memory window. |
| 19 to 17 | Reserved |  |
| 16 | AES | This bit is set to 1 when RHSIF, as a target node, receives Stream Command on Channel (N) <br> before authentication is completed. |
| $15,11,7,3$ | This bit is set to 1 when RHSIF, as a target node, receives Write Command on Channel (N) <br> before authentication is completed. |  |
| $14,10,6,2$ | AER(N) | This bit is set to 1 when RHSIF, as a target node, receives Read Command on Channel (N) <br> before authentication is completed. |
| $13,9,5,1$, | AEI(N) | This bit is set to 1 when RHSIF, as a target node, receives ID Command on Channel (N) <br> before authentication is completed. |
| $12,8,4,0$ | AEE(N) | This bit is set to 1 when RHSIF, as a target node, receives Event Command on Channel (N) <br> before authentication is completed. |

## (29) RHSIFnAESC - Authentication Error Status Clear Register

Table 27.47 RHSIFnAESC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 30 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | WESC1 | Writing 1 to this bit clears the RHSIFnAEST.WES1 bit. |
|  |  | Writing 0 to this bit is ignored. |
| 28 | WESC0 | Writing 1 to this bit clears the RHSIFnAEST.WESO bit. |
|  |  | Writing 0 to this bit is ignored. |
| 27,25,23,21 | WEWC(N) | Writing 1 to this bit clears the RHSIFnAEST.WEW(N) bit. |
|  |  | Writing 0 to this bit is ignored. |
| 26,24,22,20 | WERC(N) | Writing 1 to this bit clears the RHSIFnAEST.WER(N) bit. |
|  |  | Writing 0 to this bit is ignored. |
| 19 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | AESC | Writing 1 to this bit clears the RHSIFnAEST.AES bit. |
|  |  | Writing 0 to this bit is ignored. |
| 15,11,7,3 | AEWC(N) | Writing 1 to this bit clears the RHSIFnAEST.AEW(N) bit. |
|  |  | Writing 0 to this bit is ignored. |
| 14,10,6,2 | AERC(N) | Writing 1 to this bit clears the RHSIFnAEST.AER(N) bit. |
|  |  | Writing 0 to this bit is ignored. |
| 13,9,5,1, | AEIC(N) | Writing 1 to this bit clears the RHSIFnAEST.AEI(N) bit. |
|  |  | Writing 0 to this bit is ignored. |
| 12,8,4,0 | AEEC(N) | Writing 1 to this bit clears the RHSIFnAEST.AEE(N) bit. |
|  |  | Writing 0 to this bit is ignored. |

(30) RHSIFnAEIE - Authentication Error Interrupt Enable Register

Table 27.48 RHSIFnAESC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 30 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | WESE1 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnAEST.WES1 bit. <br> 0 : Does not assert int_hsif_sec when the RSIFnAEST.WES1 bit is 1. <br> 1: Asserts int_hsif_sec when the RSIFnAEST.WES1 bit is 1. |
| 28 | WESE0 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnAEST.WES0 bit. <br> 0 : Does not assert int_hsif_sec when the RSIFnAEST.WES0 bit is 1. <br> 1: Asserts int_hsif_sec when the RSIFnAEST.WESO bit is 1. |
| 27,25,23,21 | WEWE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnAEST.WEW(N) bit. <br> 0 : Does not assert int_hsif_sec when the RSIFnAEST.WEW(N) bit is 1. <br> 1: Asserts int_hsif_sec when the RSIFnAEST.WEW(N) bit is 1. |
| 26,24,22,20 | WERE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnAEST.WER(N) bit. <br> 0 : Does not assert int_hsif_sec when the RSIFnAEST.WER(N) bit is 1. <br> 1: Asserts int_hsif_sec when the RSIFnAEST.WER(N) bit is 1. |
| 19 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15,11,7,3 | AEWE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnAEST.AEW(N) bit. <br> 0 : Does not assert int_hsif_sec when the RSIFnAEST.AEW(N) bit is 1 . <br> 1: Asserts int_hsif_sec when the RSIFnAEST.AEW(N) bit is 1. |
